```
**GroupBy.apply on DataFrame evaluates first group only once**

The implementation of `DataFrameGroupBy.apply()` previously evaluated the supplied function consistently twice on the first group to infer if it is safe to use a fast code path. Particularly for functions with side effects, this was an undesired behavior and may have led to surprises. (GH2936, GH2656, GH7739, GH10519, GH12155, GH20084, GH21417)

Now every group is evaluated only a single time.

```
In [17]: df = pd.DataFrame({'a': ['x', 'y'], 'b': [1, 2]})

In [18]: df
Out[18]:
   a  b
0  x  1
1  y  2
[2 rows x 2 columns]

In [19]: def func(group):
    ....:     print(group.name)
    ....:     return group
    ....:

Previous behavior:

```
In [3]: df.groupby('a').apply(func)
   x
   x
   y
Out[3]:
   a  b
0  x  1
1  y  2

New behavior:

```
In [20]: df.groupby('a').apply(func)
   x
   y
Out[20]:
   a  b
0  x  1
1  y  2
[2 rows x 2 columns]
```
**Concatenating sparse values**

When passed DataFrames whose values are sparse, `concat()` will now return a `Series` or `DataFrame` with sparse values, rather than a `SparseDataFrame` (GH25702).

```
In [21]: df = pd.DataFrame({"A": pd.SparseArray([0, 1])})
```

**Previous behavior**:

```
In [2]: type(pd.concat([df, df]))
pandas.core.sparse.frame.SparseDataFrame
```

**New behavior**:

```
In [22]: type(pd.concat([df, df]))
Out[22]: pandas.core.frame.DataFrame
```

This now matches the existing behavior of `concat` on `Series` with sparse values. `concat()` will continue to return a `SparseDataFrame` when all the values are instances of `SparseDataFrame`.

This change also affects routines using `concat()` internally, like `get_dummies()`, which now returns a `DataFrame` in all cases (previously a `SparseDataFrame` was returned if all the columns were dummy encoded, and a `DataFrame` otherwise).

Providing any `SparseSeries` or `SparseDataFrame` to `concat()` will cause a `SparseSeries` or `SparseDataFrame` to be returned, as before.

**The .str-accessor performs stricter type checks**

Due to the lack of more fine-grained dtypes, `Series.str` so far only checked whether the data was of `object` dtype. `Series.str` will now infer the dtype data within the Series; in particular, 'bytes'-only data will raise an exception (except for `Series.str.decode()`, `Series.str.get()`, `Series.str.len()`, `Series.str.slice()`), see GH23163, GH23011, GH23551.

**Previous behavior**:

```
In [1]: s = pd.Series(np.array(['a', 'ba', 'cba'], 'S'), dtype=object)
In [2]: s
Out[2]:
0   b'a'
1   b'ba'
2   b'cba'
dtype: object
In [3]: s.str.startswith(b'a')
Out[3]:
0   True
1  False
2  False
dtype: bool
```

**New behavior**:

```
In [23]: s = pd.Series(np.array(['a', 'ba', 'cba'], 'S'), dtype=object)
```

(continues on next page)
Categorical dtypes are preserved during GroupBy

Previously, columns that were categorical, but not the groupby key(s) would be converted to object dtype during groupby operations. pandas now will preserve these dtypes. (GH18502)

```
In [26]: cat = pd.Categorical(['foo', 'bar', 'bar', 'qux'], ordered=True)
In [27]: df = pd.DataFrame({'payload': [-1, -2, -1, -2], 'col': cat})
In [28]: df
Out[28]:
   payload  col
0      -1   foo
1     -2    bar
2     -1    bar
3     -2   qux
[4 rows x 2 columns]
In [29]: df.dtypes
Out[29]:
   payload      int64
     col  category
Length: 2, dtype: object
```

Previous Behavior:

```
In [5]: df.groupby('payload').first().col.dtype
Out[5]: dtype('O')
```

New Behavior:
In [30]: df.groupby('payload').first().col.dtype
Out[30]: CategoricalDtype(categories=['bar', 'foo', 'qux'], ordered=True)

Incompatible Index type unions

When performing `Index.union()` operations between objects of incompatible dtypes, the result will be a base `Index` of dtype object. This behavior holds true for unions between `Index` objects that previously would have been prohibited. The dtype of empty `Index` objects will now be evaluated before performing union operations rather than simply returning the other `Index` object. `Index.union()` can now be considered commutative, such that `A.union(B) == B.union(A)` (GH23525).

Previous behavior:

In [1]: pd.period_range('19910905', periods=2).union(pd.Int64Index([1, 2, 3]))
...:
ValueError: can only call with other PeriodIndex-ed objects
In [2]: pd.Index([], dtype=object).union(pd.Index([1, 2, 3]))
Out[2]: Int64Index([1, 2, 3], dtype='int64')

New behavior:

In [31]: pd.period_range('19910905', periods=2).union(pd.Int64Index([1, 2, 3]))
Out[31]: Index([1991-09-05, 1991-09-06, 1, 2, 3], dtype='object')
In [32]: pd.Index([], dtype=object).union(pd.Index([1, 2, 3]))
Out[32]: Index([1, 2, 3], dtype='object')

Note that integer- and floating-dtype indexes are considered “compatible”. The integer values are coerced to floating point, which may result in loss of precision. See Set operations on Index objects for more.

DataFrame GroupBy ffill/bfill no longer return group labels

The methods `ffill`, `bfill`, `pad` and `backfill` of `DataFrameGroupBy` previously included the group labels in the return value, which was inconsistent with other groupby transforms. Now only the filled values are returned. (GH21521)

In [33]: df = pd.DataFrame({"a": ['x', 'y'], "b": [1, 2]})

In [34]: df
Out[34]:
   a  b
0  x  1
1  y  2
[2 rows x 2 columns]

Previous behavior:

In [3]: df.groupby("a").ffill()
Out[3]:
   a  b
0  x  1
1  y  2
New behavior:

```python
In [35]: df.groupby("a").ffill()
Out[35]:
   b
0  1
1  2
[2 rows x 1 columns]
```

**DataFrame describe on an empty Categorical / object column will return top and freq**

When calling `DataFrame.describe()` with an empty categorical / object column, the ‘top’ and ‘freq’ columns were previously omitted, which was inconsistent with the output for non-empty columns. Now the ‘top’ and ‘freq’ columns will always be included, with `numpy.nan` in the case of an empty `DataFrame` (GH26397)

```python
In [36]: df = pd.DataFrame({"empty_col": pd.Categorical([])})
In [37]: df.describe()
Out[37]:
   empty_col
        count       0
        unique      0
```

**Previous behavior:**

```python
In [3]: df.describe()
Out[3]:
    empty_col
        count   0
        unique   0
```

**New behavior:**

```python
In [38]: df.describe()
Out[38]:
    empty_col
        count   0
        unique   0
        top      NaN
        freq     NaN
```

5.4. Version 0.25
__str__ methods now call __repr__ rather than vice versa

pandas has until now mostly defined string representations in a pandas objects’ __str__/_unicode__/__bytes__ methods, and called __str__ from the __repr__ method, if a specific __repr__ method is not found. This is not needed for Python3. In pandas 0.25, the string representations of pandas objects are now generally defined in __repr__, and calls to __str__ in general now pass the call on to the __repr__, if a specific __str__ method doesn’t exist, as is standard for Python. This change is backward compatible for direct usage of pandas, but if you subclass pandas objects and give your subclasses specific __str__/__repr__ methods, you may have to adjust your __str__/__repr__ methods (GH26495).

Indexing an IntervalIndex with Interval objects

Indexing methods for IntervalIndex have been modified to require exact matches only for Interval queries. IntervalIndex methods previously matched on any overlapping Interval. Behavior with scalar points, e.g. querying with an integer, is unchanged (GH16316).

Indexing an IntervalIndex with Interval objects

```python
In [39]: ii = pd.IntervalIndex.from_tuples([(0, 4), (1, 5), (5, 8)])

In [40]: ii
Out[40]: IntervalIndex([(0, 4], (1, 5], (5, 8]],
closed='right',
dtype='interval[int64]')
```

The in operator (__contains__) now only returns True for exact matches to Intervals in the IntervalIndex, whereas this would previously return True for any Interval overlapping an Interval in the IntervalIndex.

**Previous behavior:**

```python
In [4]: pd.Interval(1, 2, closed='neither') in ii
Out[4]: True

In [5]: pd.Interval(-10, 10, closed='both') in ii
Out[5]: True
```

**New behavior:**

```python
In [41]: pd.Interval(1, 2, closed='neither') in ii
Out[41]: False

In [42]: pd.Interval(-10, 10, closed='both') in ii
Out[42]: False
```

The get_loc() method now only returns locations for exact matches to Interval queries, as opposed to the previous behavior of returning locations for overlapping matches. A KeyError will be raised if an exact match is not found.

**Previous behavior:**

```python
In [6]: ii.get_loc(pd.Interval(1, 5))
Out[6]: array([0, 1])

In [7]: ii.get_loc(pd.Interval(2, 6))
Out[7]: array([0, 1, 2])
```
New behavior:

```python
In [6]: ii.get_loc(pd.Interval(1, 5))
Out[6]: 1

In [7]: ii.get_loc(pd.Interval(2, 6))
KeyError: Interval(2, 6, closed='right')
```

Likewise, `get_indexer()` and `get_indexer_non_unique()` will also only return locations for exact matches to `Interval` queries, with -1 denoting that an exact match was not found.

These indexing changes extend to querying a `Series` or `DataFrame` with an `IntervalIndex` index.

```python
In [43]: s = pd.Series(list('abc'), index=ii)
In [44]: s
Out[44]:
(0, 4]  a
(1, 5]  b
(5, 8]  c
Length: 3, dtype: object
```

Selecting from a `Series` or `DataFrame` using `[]` (`__getitem__`) or `loc` now only returns exact matches for `Interval` queries.

Previous behavior:

```python
In [8]: s[pd.Interval(1, 5)]
Out[8]:
(0, 4]  a
(1, 5]  b
dtype: object

In [9]: s.loc[pd.Interval(1, 5)]
Out[9]:
(0, 4]  a
(1, 5]  b
dtype: object
```

New behavior:

```python
In [45]: s[pd.Interval(1, 5)]
Out[45]: 'b'

In [46]: s.loc[pd.Interval(1, 5)]
Out[46]: 'b'
```

Similarly, a `KeyError` will be raised for non-exact matches instead of returning overlapping matches.

Previous behavior:

```python
In [9]: s[pd.Interval(2, 3)]
Out[9]:
(0, 4]  a
(1, 5]  b
dtype: object

In [10]: s.loc[pd.Interval(2, 3)]
```

(continues on next page)
Out[10]:
(0, 4]  a
(1, 5]  b
dtype: object

New behavior:

In [6]: s[pd.Interval(2, 3)]
---------------------------------------------------------------------------
KeyError: Interval(2, 3, closed='right')

In [7]: s.loc[pd.Interval(2, 3)]
---------------------------------------------------------------------------
KeyError: Interval(2, 3, closed='right')

The overlaps() method can be used to create a boolean indexer that replicates the previous behavior of returning overlapping matches.

New behavior:

In [47]: idxr = s.index.overlaps(pd.Interval(2, 3))

In [48]: idxr
Out[48]: array([ True,  True, False])

In [49]: s[idxr]
Out[49]:
(0, 4]  a
(1, 5]  b
Length: 2, dtype: object

In [50]: s.loc[idxr]
Out[50]:
(0, 4]  a
(1, 5]  b
Length: 2, dtype: object

Binary ufuncs on Series now align

Applying a binary ufunc like `numpy.power()` now aligns the inputs when both are `Series` (GH23293).

In [51]: s1 = pd.Series([1, 2, 3], index=['a', 'b', 'c'])

In [52]: s2 = pd.Series([3, 4, 5], index=['d', 'c', 'b'])

In [53]: s1
Out[53]:
a    1
b    2
c    3
Length: 3, dtype: int64

In [54]: s2
Out[54]:
d    3
Previous behavior

In [5]: np.power(s1, s2)
Out[5]:
   a    1
   b   16
   c  243
dtype: int64

New behavior

In [55]: np.power(s1, s2)
Out[55]:
   a    1.0
   b   32.0
   c   81.0
d   NaN
Length: 4, dtype: float64

This matches the behavior of other binary operations in pandas, like `Series.add()`. To retain the previous behavior, convert the other `Series` to an array before applying the ufunc.

In [56]: np.power(s1, s2.array)
Out[56]:
   a    1
   b   16
   c  243
Length: 3, dtype: int64

Categorical.argsort now places missing values at the end

`Categorical.argsort()` now places missing values at the end of the array, making it consistent with NumPy and the rest of pandas (GH21801).

In [57]: cat = pd.Categorical(['b', None, 'a'], categories=['a', 'b'], ordered=True)

Previous behavior

In [2]: cat = pd.Categorical(['b', None, 'a'], categories=['a', 'b'], ordered=True)
In [3]: cat.argsort()
Out[3]: array([1, 2, 0])
In [4]: cat[cat.argsort()]
Out[4]:
[NaN, a, b]
categories (2, object): [a < b]

New behavior
In [58]: cat.argsort()
Out[58]: array([2, 0, 1])

In [59]: cat[cat.argsort()]
Out[59]: ['a', 'b', NaN]
Categories (2, object): ['a' < 'b']

Column order is preserved when passing a list of dicts to DataFrame

Starting with Python 3.7 the key-order of dict is guaranteed. In practice, this has been true since Python 3.6. The DataFrame constructor now treats a list of dicts in the same way as it does a list of OrderedDict, i.e. preserving the order of the dicts. This change applies only when pandas is running on Python>=3.6 (GH27309).

In [60]: data = [{
    ....:     'name': 'Joe', 'state': 'NY', 'age': 18},
    ....:     'name': 'Jane', 'state': 'KY', 'age': 19, 'hobby': 'Minecraft'},
    ....:     'name': 'Jean', 'state': 'OK', 'age': 20, 'finances': 'good'}

Previous Behavior:
The columns were lexicographically sorted previously.

In [1]: pd.DataFrame(data)
Out[1]:
   age  finances  hobby  name  state
0  18     NaN    NaN   Joe   NY
1  19     NaN   Minecraft  Jane  KY
2  20  good     NaN    Jean   OK

New Behavior:
The column order now matches the insertion-order of the keys in the dict, considering all the records from top to bottom. As a consequence, the column order of the resulting DataFrame has changed compared to previous pandas versions.

In [61]: pd.DataFrame(data)
Out[61]:
   name  state  age   hobby  finances
0  Joe   NY   18      NaN     NaN
1  Jane  KY   19  Minecraft  NaN
2  Jean  OK   20      NaN   good

[3 rows x 5 columns]
Increased minimum versions for dependencies

Due to dropping support for Python 2.7, a number of optional dependencies have updated minimum versions (GH25725, GH24942, GH25752). Independently, some minimum supported versions of dependencies were updated (GH23519, GH25554). If installed, we now require:

<table>
<thead>
<tr>
<th>Package</th>
<th>Minimum Version</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>numpy</td>
<td>1.13.3</td>
<td>X</td>
</tr>
<tr>
<td>pytz</td>
<td>2015.4</td>
<td>X</td>
</tr>
<tr>
<td>python-dateutil</td>
<td>2.6.1</td>
<td>X</td>
</tr>
<tr>
<td>bottleneck</td>
<td>1.2.1</td>
<td></td>
</tr>
<tr>
<td>numexpr</td>
<td>2.6.2</td>
<td></td>
</tr>
<tr>
<td>pytest (dev)</td>
<td>4.0.2</td>
<td></td>
</tr>
</tbody>
</table>

For optional libraries the general recommendation is to use the latest version. The following table lists the lowest version per library that is currently being tested throughout the development of pandas. Optional libraries below the lowest tested version may still work, but are not considered supported.

<table>
<thead>
<tr>
<th>Package</th>
<th>Minimum Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>beautifulsoup4</td>
<td>4.6.0</td>
</tr>
<tr>
<td>fastparquet</td>
<td>0.2.1</td>
</tr>
<tr>
<td>gcsts</td>
<td>0.2.2</td>
</tr>
<tr>
<td>lxml</td>
<td>3.8.0</td>
</tr>
<tr>
<td>matplotlib</td>
<td>2.2.2</td>
</tr>
<tr>
<td>openpyxl</td>
<td>2.4.8</td>
</tr>
<tr>
<td>pyarrow</td>
<td>0.9.0</td>
</tr>
<tr>
<td>pymysql</td>
<td>0.7.1</td>
</tr>
<tr>
<td>pytables</td>
<td>3.4.2</td>
</tr>
<tr>
<td>scipy</td>
<td>0.19.0</td>
</tr>
<tr>
<td>sqlalchemy</td>
<td>1.1.4</td>
</tr>
<tr>
<td>xarray</td>
<td>0.8.2</td>
</tr>
<tr>
<td>xlrd</td>
<td>1.1.0</td>
</tr>
<tr>
<td>xlsxwriter</td>
<td>0.9.8</td>
</tr>
<tr>
<td>xlwt</td>
<td>1.2.0</td>
</tr>
</tbody>
</table>

See Dependencies and Optional dependencies for more.

Other API changes

- `DatetimeTZDtype` will now standardize pytz timezones to a common timezone instance (GH24713)
- `Timestamp` and `Timedelta` scalars now implement the `to_numpy()` method as aliases to `Timestamp.to_datetime64()` and `Timedelta.to_timedelta64()`, respectively. (GH24653)
- `Timestamp.strptime()` will now rise a `NotImplementedError` (GH25016)
- Comparing `Timestamp` with unsupported objects now returns `NotImplemented` instead of raising `TypeError`. This implies that unsupported rich comparisons are delegated to the other object, and are now consistent with Python 3 behavior for `datetime` objects (GH24011)
- Bug in `DatetimeIndex.snap()` which didn’t preserving the name of the input `Index` (GH25575)
- The `arg` argument in `pandas.core.groupby.DataFrameGroupBy.agg()` has been renamed to `func` (GH26089)
• The `arg` argument in `pandas.core.window._Window.aggregate()` has been renamed to `func` (GH26372)

• Most pandas classes had a `__bytes__` method, which was used for getting a python2-style bytestring representation of the object. This method has been removed as a part of dropping Python2 (GH26447)

• The `.str`-accessor has been disabled for 1-level `MultiIndex`, use `MultiIndex.to_flat_index()` if necessary (GH23679)

• Removed support of gtk package for clipboards (GH26563)

• Using an unsupported version of Beautiful Soup 4 will now raise an `ImportError` instead of a `ValueError` (GH27063)

• `Series.to_excel()` and `DataFrame.to_excel()` will now raise a `ValueError` when saving timezone aware data. (GH27008, GH7056)

• `ExtensionArray.argsort()` places NA values at the end of the sorted array. (GH21801)

• `DataFrame.to_hdf()` and `Series.to_hdf()` will now raise a `NotImplementedError` when saving a `MultiIndex` with extension data types for a fixed format. (GH7775)

• Passing duplicate names in `read_csv()` will now raise a `ValueError` (GH17346)

Deprecations

Sparse subclasses

The `SparseSeries` and `SparseDataFrame` subclasses are deprecated. Their functionality is better-provided by a `Series` or `DataFrame` with sparse values.

Previous way

```python
df = pd.SparseDataFrame({"A": [0, 0, 1, 2]})
df.dtypes
```

New way

```python
In [62]: df = pd.DataFrame({"A": pd.SparseArray([0, 0, 1, 2])})
In [63]: df.dtypes
```

```python
Out[63]:
A  Sparse[int64, 0]
Length: 1, dtype: object
```

The memory usage of the two approaches is identical. See `Migrating` for more (GH19239).

msgpack format

The msgpack format is deprecated as of 0.25 and will be removed in a future version. It is recommended to use pyarrow for on-the-wire transmission of pandas objects. (GH27084)
Other deprecations

- The deprecated \.ix[] indexer now raises a more visible FutureWarning instead of DeprecationWarning (GH26438).
- Deprecated the units=M (months) and units=Y (year) parameters for units of pandas.to_timedelta(), pandas.Timedelta() and pandas.TimedeltaIndex() (GH16344)
- pandas.concat() has deprecated the join_axes-keyword. Instead, use DataFrame.reindex() or DataFrame.reindex_like() on the result or on the inputs (GH21951)
- The SparseArray.values attribute is deprecated. You can use np.asarray(...) or the SparseArray.to_dense() method instead (GH26421).
- The functions pandas.to_datetime() and pandas.to_timedelta() have deprecated the box keyword. Instead, use to_numpy() or Timestamp.to_datetime64() or Timedelta.to_timedelta64(). (GH24416)
- The DataFrame.compound() and Series.compound() methods are deprecated and will be removed in a future version (GH26405).
- The internal attributes _start, _stop and _step attributes of RangeIndex have been deprecated. Use the public attributes start, stop and step instead (GH26581).
- The Series.ftype(), Series.ftypes() and DataFrame.ftypes() methods are deprecated and will be removed in a future version. Instead, use Series.dtype() and DataFrame.dtypes() (GH26705).
- The Series.get_values(), DataFrame.get_values(), Index.get_values(), SparseArray.get_values() and Categorical.get_values() methods are deprecated. One of np.asarray(...) or to_numpy() can be used instead (GH19617).
- The ‘outer’ method on NumPy ufuncs, e.g. np.subtract.outer has been deprecated on Series objects. Convert the input to an array with Series.array first (GH27186)
- Timedelta.resolution() is deprecated and replaced with Timedelta.resolution_string(). In a future version, Timedelta.resolution() will be changed to behave like the standard library datetime.timedelta.resolution (GH21344)
- read_table() has been undeprecated. (GH25220)
- Index.dtype_str is deprecated. (GH18262)
- Series.imag and Series.real are deprecated. (GH18262)
- Series.put() is deprecated. (GH18262)
- Index.item() and Series.item() is deprecated. (GH18262)
- The default value ordered=None in CategoricalDtype has been deprecated in favor of ordered=False. When converting between categorical types ordered=True must be explicitly passed in order to be preserved. (GH26336)
- Index.contains() is deprecated. Use key in index(__contains__) instead (GH17753).
- DataFrame.get_dtype_counts() is deprecated. (GH18262)
- Categorical.ravel() will return a Categorical instead of a np.ndarray (GH27199)
Removal of prior version deprecations/changes

- Removed `Panel` (GH25047, GH25191, GH25231)
- Removed the previously deprecated `sheetname` keyword in `read_excel()` (GH16442, GH20938)
- Removed the previously deprecated `TimeGrouper` (GH16942)
- Removed the previously deprecated `parse_cols` keyword in `read_excel()` (GH16488)
- Removed the previously deprecated `pd.options.html.border` (GH16970)
- Removed the previously deprecated `convert_objects` (GH11221)
- Removed the previously deprecated `select` method of `DataFrame` and `Series` (GH17633)
- Removed the previously deprecated behavior of `Series` treated as list-like in `rename_categories()` (GH17982)
- Removed the previously deprecated `DataFrame.reindex_axis` and `Series.reindex_axis` (GH17842)
- Removed the previously deprecated behavior of altering column or index labels with `Series.rename_axis()` or `DataFrame.rename_axis()` (GH17842)
- Removed the previously deprecated `tupleize_cols` keyword argument in `read_html()`, `read_csv()`, and `DataFrame.to_csv()` (GH17877, GH17820)
- Removed the previously deprecated `DataFrame.from.csv` and `Series.from_csv` (GH17812)
- Removed the previously deprecated `raise_on_error` keyword argument in `DataFrame.where()` and `DataFrame.mask()` (GH17744)
- Removed the previously deprecated `ordered` and `categories` keyword arguments in `astype` (GH17742)
- Removed the previously deprecated `cdate_range` (GH17691)
- Removed the previously deprecated `True` option for the `dropna` keyword argument in `SeriesGroupBy.nth()` (GH17493)
- Removed the previously deprecated `convert` keyword argument in `Series.take()` and `DataFrame.take()` (GH17352)
- Removed the previously deprecated behavior of arithmetic operations with `datetime.date` objects (GH21152)

Performance improvements

- Significant speedup in `SparseArray` initialization that benefits most operations, fixing performance regression introduced in v0.20.0 (GH24985)
- `DataFrame.to_stata()` is now faster when outputting data with any string or non-native endian columns (GH25045)
- Improved performance of `Series.searchsorted()`. The speedup is especially large when the dtype is int8/int16/int32 and the searched key is within the integer bounds for the dtype (GH22034)
- Improved performance of `pandas.core.groupby.GroupBy.quantile()` (GH20405)
- Improved performance of slicing and other selected operation on a `RangeIndex` (GH26565, GH26617, GH26722)
- `RangeIndex` now performs standard lookup without instantiating an actual hashtable, hence saving memory (GH16685)
• Improved performance of `read_csv()` by faster tokenizing and faster parsing of small float numbers (GH25784)

• Improved performance of `read_csv()` by faster parsing of N/A and boolean values (GH25804)

• Improved performance of `IntervalIndex.is_monotonic`, `IntervalIndex.is_monotonic_increasing` and `IntervalIndex.is_monotonic_decreasing` by removing conversion to `MultiIndex` (GH24813)

• Improved performance of `DataFrame.to_csv()` when writing datetime dtypes (GH25708)

• Improved performance of `read_csv()` by much faster parsing of MM/YYYY and DD/MM/YYYY datetime formats (GH25922)

• Improved performance of nanops for dtypes that cannot store NaNs. Speedup is particularly prominent for `Series.all()` and `Series.any()` (GH25070)

• Improved performance of `Series.map()` for dictionary mappers on categorical series by mapping the categories instead of mapping all values (GH23785)

• Improved performance of `IntervalIndex.intersection()` (GH24813)

• Improved performance of `read_csv()` by faster concatenating date columns without extra conversion to string for integer/float zero and float NaN; by faster checking the string for the possibility of being a date (GH25754)

• Improved performance of `IntervalIndex.is_unique` by removing conversion to `MultiIndex` (GH24813)

• Restored performance of `DatetimeIndex.__iter__()` by re-enabling specialized code path (GH26702)

• Improved performance when building `MultiIndex` with at least one `CategoricalIndex` level (GH22044)

• Improved performance by removing the need for a garbage collect when checking for `SettingWithCopyWarning` (GH27031)

• For `to_datetime()` changed default value of cache parameter to True (GH26043)

• Improved performance of `DatetimeIndex` and `PeriodIndex` slicing given non-unique, monotonic data (GH27136).

• Improved performance of `pd.read_json()` for index-oriented data. (GH26773)

• Improved performance of `MultiIndex.shape()` (GH27384).

**Bug fixes**

**Categorical**

• Bug in `DataFrame.at()` and `Series.at()` that would raise exception if the index was a `CategoricalIndex` (GH20629)

• Fixed bug in comparison of ordered `Categorical` that contained missing values with a scalar which sometimes incorrectly resulted in True (GH26504)

• Bug in `DataFrame.dropna()` when the `DataFrame` has a `CategoricalIndex` containing `Interval` objects incorrectly raised a `TypeError` (GH25087)
Datetimelike

- Bug in `to_datetime()` which would raise an (incorrect) `ValueError` when called with a date far into the future and the `format` argument specified instead of raising `OutOfBoundsDatetime` (GH23830)
- Bug in `to_datetime()` which would raise `InvalidIndexError`: Reindexing only valid with uniquely valued Index objects when called with `cache=True`, with `arg` including at least two different elements from the set {None, numpy.nan, pandas.NaT} (GH22305)
- Bug in `DataFrame` and `Series` where timezone aware data with `dtype='datetime64[ns]'` was not cast to naive (GH25843)
- Improved `Timestamp` type checking in various datetime functions to prevent exceptions when using a subclassed `datetime` (GH25851)
- Bug in `Series` and `DataFrame` repr where `np.datetime64('NaT')` and `np.timedelta64('NaT')` with `dtype=object` would be represented as `NaN` (GH25445)
- Bug in `to_datetime()` which does not replace the invalid argument with `NaT` when error is set to coerce (GH26122)
- Bug in adding `DateOffset` with nonzero month to `DatetimeIndex` would raise `ValueError` (GH26258)
- Bug in `to_datetime()` which raises unhandled `OverflowError` when called with mix of invalid dates and `NaN` values with `format='%Y%m%d'` and `error='coerce'` (GH25512)
- Bug in `isin()` for datetimelike indexes; `DatetimeIndex`, `TimedeltaIndex` and `PeriodIndex` where the `levels` parameter was ignored. (GH26675)
- Bug in `to_datetime()` which raises `TypeError` for `format='%Y%m%d'` when called for invalid integer dates with length >= 6 digits with `error='ignore'`
- Bug when comparing a `PeriodIndex` against a zero-dimensional numpy array (GH26689)
- Bug in constructing a `Series` or `DataFrame` from a numpy `datetime64` array with a non-ns unit and out-of-bound timestamps generating rubbish data, which will now correctly raise an `OutOfBoundsDatetime` error (GH26206).
- Bug in `date_range()` with unnecessary `OverflowError` being raised for very large or very small dates (GH26651)
- Bug where adding `Timestamp` to a `np.timedelta64` object would raise instead of returning a `Timestamp` (GH24775)
- Bug where comparing a zero-dimensional numpy array containing a `np.datetime64` object to a `Timestamp` would incorrect raise `TypeError` (GH26916)
- Bug in `to_datetime()` which would raise `ValueError`: Tz-aware `datetime.datetime` cannot be converted to `datetime64` unless `utc=True` when called with `cache=True`, with `arg` including datetime strings with different offset (GH26097)
Timedelta

- Bug in `TimedeltaIndex.intersection()` where for non-monotonic indices in some cases an empty index was returned when in fact an intersection existed (GH25913)
- Bug with comparisons between `Timedelta` and `NaT` raising `TypeError` (GH26039)
- Bug when adding or subtracting a `BusinessHour` to a `Timestamp` with the resulting time landing in a following or prior day respectively (GH26381)
- Bug when comparing a `TimedeltaIndex` against a zero-dimensional numpy array (GH26689)

Timezones

- Bug in `DatetimeIndex.to_frame()` where timezone aware data would be converted to timezone naive data (GH25809)
- Bug in `to_datetime()` with `utc=True` and datetime strings that would apply previously parsed UTC offsets to subsequent arguments (GH24992)
- Bug in `Timestamp.tz_localize()` and `Timestamp.tz_convert()` does not propagate `freq` (GH25241)
- Bug in `Series.at()` where setting `Timestamp` with timezone raises `TypeError` (GH25506)
- Bug in `DataFrame.update()` when updating with timezone aware data would return timezone naive data (GH25807)
- Bug in `to_datetime()` where an uninformative `RuntimeError` was raised when passing a naive `Timestamp` with datetime strings with mixed UTC offsets (GH25978)
- Bug in `to_datetime()` with `unit='ns'` would drop timezone information from the parsed argument (GH26168)
- Bug in `DataFrame.join()` where joining a timezone aware index with a timezone aware column would result in a column of NaN (GH26335)
- Bug in `date_range()` where ambiguous or nonexistent start or end times were not handled by the ambiguous or nonexistent keywords respectively (GH27088)
- Bug in `DatetimeIndex.union()` when combining a timezone aware and timezone unaware `DatetimeIndex` (GH21671)
- Bug when applying a numpy reduction function (e.g. `numpy.minimum()`) to a timezone aware `Series` (GH15552)

Numeric

- Bug in `to_numeric()` in which large negative numbers were being improperly handled (GH24910)
- Bug in `to_numeric()` in which numbers were being coerced to float, even though `errors` was not `coerce` (GH24910)
- Bug in `to_numeric()` in which invalid values for `errors` were being allowed (GH26466)
- Bug in `format` in which floating point complex numbers were not being formatted to proper display precision and trimming (GH25514)
- Bug in error messages in `DataFrame.corr()` and `Series.corr()`. Added the possibility of using a callable. (GH25729)
• Bug in `Series.divmod()` and `Series.rdivmod()` which would raise an (incorrect) `ValueError` rather than return a pair of `Series` objects as result (GH25557)

• Raises a helpful exception when a non-numeric index is sent to `interpolate()` with methods which require numeric index. (GH21662)

• Bug in `eval()` when comparing floats with scalar operators, for example: \( x < -0.1 \) (GH25928)

• Fixed bug where casting all-boolean array to integer extension array failed (GH25211)

• Bug in `divmod` with a `Series` object containing zeros incorrectly raising `AttributeError` (GH26987)

• Inconsistency in `Series` floor-division (\(//\)) and `divmod` filling positive//zero with NaN instead of Inf (GH27321)

Conversion

• Bug in `DataFrame.astype()` when passing a dict of columns and types the `errors` parameter was ignored. (GH25905)

Strings

• Bug in the `__name__` attribute of several methods of `Series.str`, which were set incorrectly (GH23551)

• Improved error message when passing `Series` of wrong dtype to `Series.str.cat()` (GH22722)

Interval

• Construction of `Interval` is restricted to numeric, `Timestamp` and `Timedelta` endpoints (GH23013)

• Fixed bug in `Series/DataFrame` not displaying NaN in `IntervalIndex` with missing values (GH25984)

• Bug in `IntervalIndex.get_loc()` where a `KeyError` would be incorrectly raised for a decreasing `IntervalIndex` (GH25860)

• Bug in `Index` constructor where passing mixed closed `Interval` objects would result in a `ValueError` instead of an `object` dtype `Index` (GH27172)

Indexing

• Improved exception message when calling `DataFrame.iloc()` with a list of non-numeric objects (GH25753).

• Improved exception message when calling `.iloc` or `.loc` with a boolean indexer with different length (GH26658).

• Bug in `KeyError` exception message when indexing a `MultiIndex` with a non-existent key not displaying the original key (GH27250).

• Bug in `.iloc` and `.loc` with a boolean indexer not raising an `IndexError` when too few items are passed (GH26658).
• Bug in \texttt{DataFrame.loc()} and \texttt{Series.loc()} where \texttt{KeyError} was not raised for a \texttt{MultiIndex} when the key was less than or equal to the number of levels in the \texttt{MultiIndex} (GH14885).
• Bug in which \texttt{DataFrame.append()} produced an erroneous warning indicating that a \texttt{KeyError} will be thrown in the future when the data to be appended contains new columns (GH22252).
• Bug in which \texttt{DataFrame.to_csv()} caused a segfault for a reindexed data frame, when the indices were single-level \texttt{MultiIndex} (GH26303).
• Fixed bug where assigning a \texttt{arrays.PandasArray} to a \texttt{pandas.core.frame.DataFrame} would raise error (GH26390)
• Allow keyword arguments for callable local reference used in the \texttt{DataFrame.query()} string (GH26426)
• Fixed a \texttt{KeyError} when indexing a \texttt{MultiIndex}’ level with a list containing exactly one label, which is missing (GH27148)
• Bug which produced \texttt{AttributeError} on partial matching \texttt{Timestamp} in a \texttt{MultiIndex} (GH26944)
• Bug in \texttt{Categorical} and \texttt{CategoricalIndex} with \texttt{Interval} values when using the \texttt{in} operator (\texttt{__contains__}) with objects that are not comparable to the values in the \texttt{Interval} (GH23705)
• Bug in \texttt{DataFrame.loc()} and \texttt{Dataframe.iloc()} on a \texttt{DataFrame} with a single timezone-aware \texttt{datetime64[ns]} column incorrectly returning a scalar instead of a \texttt{Series} (GH27110)
• Bug in \texttt{CategoricalIndex} and \texttt{Categorical} incorrectly raising \texttt{ValueError} instead of \texttt{TypeError} when a list is passed using the \texttt{in} operator (\texttt{__contains__}) (GH21729)
• Bug in setting a new value in a \texttt{Series} with a \texttt{Timedelta} object incorrectly casting the value to an integer (GH22717)
• Bug in \texttt{Series} setting a new key (\texttt{__setitem__}) with a timezone-aware \texttt{datetime} incorrectly raising \texttt{ValueError} (GH12862)
• Bug in \texttt{DataFrame.iloc()} when indexing with a read-only indexer (GH17192)
• Bug in \texttt{Series} setting an existing tuple key (\texttt{__setitem__}) with timezone-aware \texttt{datetime} values incorrectly raising \texttt{TypeError} (GH20441)

\textbf{Missing}

• Fixed misleading exception message in \texttt{Series.interpolate()} if argument \texttt{order} is required, but omitted (GH10633, GH24014).
• Fixed class type displayed in exception message in \texttt{DataFrame.dropna()} if invalid \texttt{axis} parameter passed (GH25555)
• A \texttt{ValueError} will now be thrown by \texttt{DataFrame.fillna()} when \texttt{limit} is not a positive integer (GH27042)
•
pandas: powerful Python data analysis toolkit, Release 1.2.2

MultIndex

- Bug in which incorrect exception raised by `Timedelta` when testing the membership of `MultiIndex` (GH24570)

IO

- Bug in `DataFrame.to_html()` where values were truncated using display options instead of outputting the full content (GH17004)
- Fixed bug in missing text when using `to_clipboard()` if copying utf-16 characters in Python 3 on Windows (GH25040)
- Bug in `read_json()` for `orient='table'` when it tries to infer dtypes by default, which is not applicable as dtypes are already defined in the JSON schema (GH21345)
- Bug in `read_json()` for `orient='table'` and float index, as it infers index dtype by default, which is not applicable because index dtype is already defined in the JSON schema (GH25433)
- Bug in `read_json()` for `orient='table'` and string of float column names, as it makes a column name type conversion to `Timestamp`, which is not applicable because column names are already defined in the JSON schema (GH25435)
- Bug in `json_normalize()` for `errors='ignore'` where missing values in the input data, were filled in resulting `DataFrame` with the string "nan" instead of `numpy.nan` (GH25468)
- `DataFrame.to_html()` now raises `TypeError` when using an invalid type for the `classes` parameter instead of `AssertionError` (GH25608)
- Bug in `DataFrame.to_string()` and `DataFrame.to_latex()` that would lead to incorrect output when the `header` keyword is used (GH16718)
- Bug in `read_csv()` not properly interpreting the UTF8 encoded filenames on Windows on Python 3.6+ (GH15086)
- Improved performance in `pandas.read_stata()` and `pandas.io.stata.StataReader` when converting columns that have missing values (GH25772)
- Bug in `DataFrame.to_html()` where header numbers would ignore display options when rounding (GH17280)
- Bug in `read_hdf()` where reading a table from an HDF5 file written directly with PyTables fails with a `ValueError` when using a sub-selection via the `start` or `stop` arguments (GH11188)
- Bug in `read_hdf()` not properly closing store after a `KeyError` is raised (GH25766)
- Improved the explanation for the failure when value labels are repeated in Stata dta files and suggested workarounds (GH25772)
- Improved `pandas.read_stata()` and `pandas.io.stata.StataReader` to read incorrectly formatted 118 format files saved by Stata (GH25960)
- Improved the `col_space` parameter in `DataFrame.to_html()` to accept a string so CSS length values can be set correctly (GH25941)
- Fixed bug in loading objects from S3 that contain # characters in the URL (GH25945)
- Adds `use_bqstorage_api` parameter to `read_gbq()` to speed up downloads of large data frames. This feature requires version 0.10.0 of the `pandas-gbq` library as well as the `google-cloud-bigquery-storage` and `fastavro` libraries. (GH26104)
- Fixed memory leak in `DataFrame.to_json()` when dealing with numeric data (GH24889)
- Bug in `read_json()` where date strings with Z were not converted to a UTC timezone (GH26168)
- Added `cache_dates=True` parameter to `read_csv()`, which allows to cache unique dates when they are parsed (GH25990)
- `DataFrame.to_excel()` now raises a `ValueError` when the caller’s dimensions exceed the limitations of Excel (GH26051)
- Fixed bug in `pandas.read_csv()` where a BOM would result in incorrect parsing using engine=’python’ (GH26545)
- `read_excel()` now raises a `ValueError` when input is of type `pandas.io.excel.ExcelFile` and engine param is passed since `pandas.io.excel.ExcelFile` has an engine defined (GH26566)
- Bug while selecting from HDFStore with `where=''` specified (GH26610).
- Fixed bug in `DataFrame.to_excel()` where custom objects (i.e. PeriodIndex) inside merged cells were not being converted into types safe for the Excel writer (GH27006)
- Bug in `read_hdf()` where reading a timezone aware DatetimeIndex would raise a TypeError (GH11926)
- Bug in `to_msgpack()` and `read_msgpack()` which would raise a `ValueError` rather than a `FileNotFoundError` for an invalid path (GH27160)
- Fixed bug in `DataFrame.to_parquet()` which would raise a `ValueError` when the dataframe had no columns (GH27339)
- Allow parsing of PeriodDtype columns when using `read_csv()` (GH26934)

### Plotting

- Fixed bug where `api.extensions.ExtensionArray` could not be used in matplotlib plotting (GH25587)
- Bug in an error message in `DataFrame.plot()`. Improved the error message if non-numerics are passed to `DataFrame.plot()` (GH25481)
- Bug in incorrect ticklabel positions when plotting an index that are non-numeric / non-datetime (GH7612, GH15912, GH22334)
- Fixed bug causing plots of PeriodIndex timeseries to fail if the frequency is a multiple of the frequency rule code (GH14763)
- Fixed bug when plotting a DatetimeIndex with `datetime.timezone.utc` timezone (GH17173)

### GroupBy/resample/rolling

- Bug in `pandas.core.resample.Resampler.agg()` with a timezone aware index where `OverflowError` would raise when passing a list of functions (GH22660)
- Bug in `pandas.core.groupby.DataFrameGroupBy.nunique()` in which the names of column levels were lost (GH23222)
- Bug in `pandas.core.groupby.GroupBy.agg()` when applying an aggregation function to timezone aware data (GH23683)
• Bug in `pandas.core.groupby.GroupBy.first()` and `pandas.core.groupby.GroupBy.last()` where timezone information would be dropped (GH21603)

• Bug in `pandas.core.groupby.GroupBy.size()` when grouping only NA values (GH23050)

• Bug in `Series.groupby()` where observed kwarg was previously ignored (GH24880)

• Bug in `Series.groupby()` where using `groupby` with a `MultiIndex` Series with a list of labels equal to the length of the series caused incorrect grouping (GH25704)

• Ensured that ordering of outputs in `groupby` aggregation functions is consistent across all versions of Python (GH25692)

• Ensured that result group order is correct when grouping on an ordered `Categorical` and specifying `observed=True` (GH25871, GH25167)

• Bug in `pandas.core.window.Rolling.min()` and `pandas.core.window.Rolling.max()` that caused a memory leak (GH25893)

• Bug in `pandas.core.window.Rolling.count()` and `pandas.core.window.Expanding.count` was previously ignoring the `axis` keyword (GH13503)

• Bug in `pandas.core.groupby.GroupBy.idmax()` and `pandas.core.groupby.GroupBy.idmin()` with datetime column would return incorrect dtype (GH25444, GH15306)

• Bug in `pandas.core.groupby.GroupBy.cumsum()`, `pandas.core.groupby.GroupBy.cumprod()`, `pandas.core.groupby.GroupBy.cummin()` and `pandas.core.groupby.GroupBy.cummax()` with categorical column having absent categories, would return incorrect result or segfault (GH16771)

• Bug in `pandas.core.groupby.GroupBy.nth()` where NA values in the grouping would return incorrect results (GH26011)

• Bug in `pandas.core.groupby.SeriesGroupBy.transform()` where transforming an empty group would raise a `ValueError` (GH26208)

• Bug in `pandas.core.frame.DataFrame.groupby()` where passing a `pandas.core.groupby.grouper.Grouper` would return incorrect groups when using the `.groups` accessor (GH26326)

• Bug in `pandas.core.groupby.GroupBy.agg()` where incorrect results are returned for uint64 columns. (GH26310)

• Bug in `pandas.core.window.Rolling.median()` and `pandas.core.window.Rolling.quantile()` where `MemoryError` is raised with empty window (GH26005)

• Bug in `pandas.core.window.Rolling.median()` and `pandas.core.window.Rolling.quantile()` where incorrect results are returned with closed='left' and closed='neither' (GH26005)

• Improved `pandas.core.window.Rolling`, `pandas.core.window.Window` and `pandas.core.window.ExponentialMovingWindow` functions to exclude nuisance columns from results instead of raising errors and raise a `DataError` only if all columns are nuisance (GH12537)

• Bug in `pandas.core.window.Rolling.max()` and `pandas.core.window.Rolling.min()` where incorrect results are returned with an empty variable window (GH26005)

• Raise a helpful exception when an unsupported weighted window function is used as an argument of `pandas.core.window.Window.aggregate()` (GH26597)
Reshaping

- Bug in `pandas.merge()` adds a string of `None`, if `None` is assigned in suffixes instead of remain the column name as-is (GH24782).
- Bug in `merge()` when merging by index name would sometimes result in an incorrectly numbered index (missing index values are now assigned NA) (GH24212, GH25009)
- `to_records()` now accepts dtypes to its `column_dtypes` parameter (GH24895)
- Bug in `concat()` where order of `OrderedDict` (and `dict` in Python 3.6+) is not respected, when passed in as `objs` argument (GH21510)
- Bug in `pivot_table()` where columns with NaN values are dropped even if `dropna` argument is `False`, when the `aggfunc` argument contains a list (GH22159)
- Bug in `concat()` where the resulting `freq` of two `DatetimeIndex` with the same `freq` would be dropped (GH3232).
- Bug in `merge()` where merging with equivalent Categorical dtypes was raising an error (GH22501)
- Bug in `DataFrame` instantiating with a dict of iterators or generators (e.g. `pd.DataFrame({'A': reversed(range(3))})`) raised an error (GH26349).
- Bug in `DataFrame` instantiating with a `range` (e.g. `pd.DataFrame(range(3))`) raised an error (GH26342).
- Bug in `DataFrame` constructor when passing non-empty tuples would cause a segmentation fault (GH25691)
- Bug in `Series.apply()` failed when the series is a timezone aware `DatetimeIndex` (GH25959)
- Bug in `pandas.cut()` where large bins could incorrectly raise an error due to an integer overflow (GH26045)
- Bug in `DataFrame.sort_index()` where an error is thrown when a multi-indexed `DataFrame` is sorted on all levels with the initial level sorted last (GH26053)
- Bug in `Series.nlargest()` treats `True` as smaller than `False` (GH26154)
- Bug in `DataFrame.pivot_table()` with a `IntervalIndex` as pivot index would raise `TypeError` (GH25814)
- Bug in which `DataFrame.from_dict()` ignored order of `OrderedDict` when `orient='index'` (GH8425).
- Bug in `DataFrame.transpose()` where transposing a DataFrame with a timezone-aware datetime column would incorrectly raise `ValueError` (GH26825)
- Bug in `pivot_table()` when pivoting a timezone aware column as the `values` would remove timezone information (GH14948)
- Bug in `merge_asof()` when specifying multiple `by` columns where one is `datetime64[ns, tz]` dtype (GH26649)
Sparse

- Significant speedup in SparseArray initialization that benefits most operations, fixing performance regression introduced in v0.20.0 (GH24985)
- Bug in SparseFrame constructor where passing None as the data would cause default_fill_value to be ignored (GH16807)
- Bug in SparseDataFrame when adding a column in which the length of values does not match length of index, AssertionError is raised instead of raising ValueError (GH25484)
- Introduce a better error message in Series.sparse.from_coo() so it returns a TypeError for inputs that are not coo matrices (GH26554)
- Bug in numpy.modf() on a SparseArray. Now a tuple of SparseArray is returned (GH26946).

Build changes

- Fix install error with PyPy on macOS (GH26536)

ExtensionArray

- Bug in factorize() when passing an ExtensionArray with a custom na_sentinel (GH25696).
- Series.count() miscounts NA values in ExtensionArrays (GH26835)
- Added Series.__array_ufunc__ to better handle NumPy ufuncs applied to Series backed by extension arrays (GH23293).
- Keyword argument deep has been removed from ExtensionArray.copy() (GH27083)

Other

- Removed unused C functions from vendored UltraJSON implementation (GH26198)
- Allow Index and RangeIndex to be passed to numpy min and max functions (GH26125)
- Use actual class name in repr of empty objects of a Series subclass (GH27001).
- Bug in DataFrame where passing an object array of timezone-aware datetime objects would incorrectly raise ValueError (GH13287)

Chapter 5. Release notes
5.5 Version 0.24

5.5.1 What’s new in 0.24.2 (March 12, 2019)

**Warning:** The 0.24.x series of releases will be the last to support Python 2. Future feature releases will support Python 3 only. See [Dropping Python 2.7](#) for more.

These are the changes in pandas 0.24.2. See [Release notes](#) for a full changelog including other versions of pandas.

### Fixed regressions

- Fixed regression in `DataFrame.all()` and `DataFrame.any()` where `bool_only=True` was ignored ([GH25101](#))
- Fixed issue in `DataFrame` construction with passing a mixed list of mixed types could segfault. ([GH25075](#))
- Fixed regression in `DataFrame.apply()` causing `RecursionError` when dict-like classes were passed as argument. ([GH25196](#))
- Fixed regression in `DataFrame.replace()` where `regex=True` was only replacing patterns matching the start of the string ([GH25259](#))
- Fixed regression in `DataFrame.duplicated()` where empty dataframe was not returning a boolean dtyped Series. ([GH25184](#))
- Fixed regression in `Series.min()` and `Series.max()` where `numeric_only=True` was ignored when the `Series` contained `Categorical` data ([GH25299](#))
- Fixed regression in subtraction between `Series` objects with `datetime64[ns]` dtype incorrectly raising `OverflowError` when the `Series` on the right contains null values ([GH25317](#))
- Fixed regression in `TimedeltaIndex` where `np.sum(index)` incorrectly returned a zero-dimensional object instead of a scalar ([GH25282](#))
- Fixed regression in `IntervalDtype` construction where passing an incorrect string with ‘Interval’ as a prefix could result in a `RecursionError`. ([GH25338](#))
- Fixed regression in creating a period-dtype array from a read-only NumPy array of period objects. ([GH25403](#))
• Fixed regression in `Categorical`, where constructing it from a categorical `Series` and an explicit `categories=` that differed from that in the `Series` created an invalid object which could trigger segfaults. (GH25318)

• Fixed regression in `to_timedelta()` losing precision when converting floating data to `Timedelta` data (GH25077).

• Fixed pip installing from source into an environment without NumPy (GH25193)

• Fixed regression in `Dataframe.replace()` where large strings of numbers would be coerced into `int64`, causing an `OverflowError` (GH25616)

• Fixed regression in `factorize()` when passing a custom `na_sentinel` value with `sort=True` (GH25409).

• Fixed regression in `DataFrame.to_csv()` writing duplicate line endings with gzip compress (GH25311)

**Bug fixes**

**I/O**

• Better handling of terminal printing when the terminal dimensions are not known (GH25080)

• Bug in reading a HDF5 table-format `DataFrame` created in Python 2, in Python 3 (GH24925)

• Bug in reading a JSON with `orient='table'` generated by `DataFrame.to_json()` with `index=False` (GH25170)

• Bug where float indexes could have misaligned values when printing (GH25061)

**Categorical**

• Bug where calling `Series.replace()` on categorical data could return a `Series` with incorrect dimensions (GH24971)

**Reshaping**

• Bug in `transform()` where applying a function to a timezone aware column would return a timezone naive result (GH24198)

• Bug in `DataFrame.join()` when joining on a timezone aware `DatetimeIndex` (GH23931)

**Visualization**

• Bug in `Series.plot()` where a secondary y axis could not be set to log scale (GH25545)

**Other**

• Bug in `Series.is_unique()` where single occurrences of NaN were not considered unique (GH25180)

• Bug in `merge()` when merging an empty `DataFrame` with an `Int64` column or a non-empty `DataFrame` with an `Int64` column that is all NaN (GH25183)

• Bug in `IntervalTree` where a `RecursionError` occurs upon construction due to an overflow when adding endpoints, which also causes `IntervalIndex` to crash during indexing operations (GH25485)

• Bug in `Series.size` raising for some extension-array-backed `Series`, rather than returning the size (GH25580)

• Bug in resampling raising for nullable integer-dtype columns (GH25580)

5.5.2 What’s new in 0.24.1 (February 3, 2019)

**Warning:** The 0.24.x series of releases will be the last to support Python 2. Future feature releases will support Python 3 only. See Dropping Python 2.7 for more.

These are the changes in pandas 0.24.1. See Release notes for a full changelog including other versions of pandas. See What’s new in 0.24.0 (January 25, 2019) for the 0.24.0 changelog.

**API changes**

**Changing the sort parameter for Index set operations**

The default `sort` value for `Index.union()` has changed from `True` to `None` (GH24959). The default `behavior`, however, remains the same: the result is sorted, unless

1. `self` and `other` are identical
2. `self` or `other` is empty
3. `self` or `other` contain values that can not be compared (a `RuntimeWarning` is raised).

This change will allow `sort=True` to mean “always sort” in a future release.

The same change applies to `Index.difference()` and `Index.symmetric_difference()`, which would not sort the result when the values could not be compared.

The `sort` option for `Index.intersection()` has changed in three ways.

1. The default has changed from `True` to `False`, to restore the pandas 0.23.4 and earlier behavior of not sorting by default.
2. The behavior of `sort=True` can now be obtained with `sort=None`. This will sort the result only if the values in `self` and `other` are not identical.
3. The value `sort=True` is no longer allowed. A future version of pandas will properly support `sort=True` meaning “always sort”.

**Fixed regressions**

- Fixed regression in `DataFrame.to_dict()` with records orient raising an `AttributeError` when the `DataFrame` contained more than 255 columns, or wrongly converting column names that were not valid python identifiers (GH24939, GH24940).
- Fixed regression in `read_sql()` when passing certain queries with MySQL/pymysql (GH24988).
- Fixed regression in `Index.intersection` incorrectly sorting the values by default (GH24959).
- Fixed regression in `merge()` when merging an empty `DataFrame` with multiple timezone-aware columns on one of the timezone-aware columns (GH25014).
- Fixed regression in `Series.rename_axis()` and `DataFrame.rename_axis()` where passing `None` failed to remove the axis name (GH25034)
- Fixed regression in `to_timedelta()` with `box=False` incorrectly returning a `datetime64` object instead of a `timedelta64` object (GH24961)
- Fixed regression where custom hashable types could not be used as column keys in `DataFrame.set_index()` (GH24969)
Bug fixes

Reshaping

• Bug in `DataFrame.groupby()` with Grouper when there is a time change (DST) and grouping frequency is '1d' (GH24972)

Visualization

• Fixed the warning for implicitly registered matplotlib converters not showing. See `Restore Matplotlib datetime converter registration` for more (GH24963).

Other

• Fixed AttributeError when printing a DataFrame’s HTML repr after accessing the IPython config object (GH25036)

5.5.3 What’s new in 0.24.0 (January 25, 2019)

Warning: The 0.24.x series of releases will be the last to support Python 2. Future feature releases will support Python 3 only. See Dropping Python 2.7 for more details.

This is a major release from 0.23.4 and includes a number of API changes, new features, enhancements, and performance improvements along with a large number of bug fixes.

Highlights include:

• Optional Integer NA Support
• New APIs for accessing the array backing a Series or Index
• A new top-level method for creating arrays
• Store Interval and Period data in a Series or DataFrame
• Support for joining on two MultiIndexes

Check the API Changes and deprecations before updating.

These are the changes in pandas 0.24.0. See Release notes for a full changelog including other versions of pandas.
Enhancements

Optional integer NA support

pandas has gained the ability to hold integer dtypes with missing values. This long requested feature is enabled through the use of extension types.

Note: IntegerArray is currently experimental. Its API or implementation may change without warning.

We can construct a Series with the specified dtype. The dtype string Int64 is a pandas ExtensionDtype. Specifying a list or array using the traditional missing value marker of np.nan will infer to integer dtype. The display of the Series will also use the NaN to indicate missing values in string outputs. (GH20700, GH20747, GH22441, GH21789, GH22346)

```
In [1]: s = pd.Series([1, 2, np.nan], dtype='Int64')
In [2]: s
Out[2]:
0   1
1   2
2   <NA>
Length: 3, dtype: Int64
```

Operations on these dtypes will propagate NaN as other pandas operations.

```
# arithmetic
In [3]: s + 1
Out[3]:
0   2
1   3
2   <NA>
Length: 3, dtype: Int64

# comparison
In [4]: s == 1
Out[4]:
0   True
1   False
2   <NA>
Length: 3, dtype: boolean

# indexing
In [5]: s.iloc[1:3]
Out[5]:
1   2
2   <NA>
Length: 2, dtype: Int64

# operate with other dtypes
In [6]: s + s.iloc[1:3].astype('Int8')
Out[6]:
0   <NA>
1    4
2   <NA>
Length: 3, dtype: Int64
```

(continues on next page)
# coerce when needed
In [7]: s + 0.01
Out[7]:
0  1.01
1  2.01
2   <NA>
Length: 3, dtype: Float64

These dtypes can operate as part of a DataFrame.

In [8]: df = pd.DataFrame({'A': s, 'B': [1, 1, 3], 'C': list('aab')})

In [9]: df
Out[9]:
      A  B  C
0    1  1  a
1    2  1  a
2   <NA> 3  b
[3 rows x 3 columns]

In [10]: df.dtypes
Out[10]:
A     Int64
B    int64
C   object
Length: 3, dtype: object

These dtypes can be merged, reshaped, and casted.

In [11]: pd.concat([df[['A']], df[['B', 'C']]], axis=1).dtypes
Out[11]:
A     Int64
B    int64
C   object
Length: 3, dtype: object

In [12]: df['A'].astype(float)
Out[12]:
0   1.0
1   2.0
2   NaN
Name: A, Length: 3, dtype: float64

Reduction and groupby operations such as sum work.

In [13]: df.sum()
Out[13]:
A    3
B    5
C   aab
Length: 3, dtype: object

In [14]: df.groupby('B').A.sum()
Out[14]:
B
(continues on next page)
Warning: The Integer NA support currently uses the capitalized dtype version, e.g. Int8 as compared to the traditional int8. This may be changed at a future date.

See Nullable integer data type for more.

Accessing the values in a Series or Index

Series.array and Index.array have been added for extracting the array backing a Series or Index. (GH19954, GH23623)

In [15]: idx = pd.period_range('2000', periods=4)
In [16]: idx.array
Out[16]:  
<PeriodArray>
Length: 4, dtype: period[D]

In [17]: pd.Series(idx).array
Out[17]:  
<PeriodArray>
Length: 4, dtype: period[D]

Historically, this would have been done with series.values, but with .values it was unclear whether the returned value would be the actual array, some transformation of it, or one of pandas custom arrays (like Categorical). For example, with PeriodIndex, .values generates a new ndarray of period objects each time.

In [18]: idx.values
Out[18]:  
array([Period('2000-01-01', 'D'), Period('2000-01-02', 'D'),
       Period('2000-01-03', 'D'), Period('2000-01-04', 'D')], dtype=object)

In [19]: id(idx.values)
Out[19]: 140118275352208

In [20]: id(idx.values)
Out[20]: 140117383988688

If you need an actual NumPy array, use Series.to_numpy() or Index.to_numpy().

In [21]: idx.to_numpy()
Out[21]:  
array([Period('2000-01-01', 'D'), Period('2000-01-02', 'D'),
       Period('2000-01-03', 'D'), Period('2000-01-04', 'D')], dtype=object)

In [22]: pd.Series(idx).to_numpy()
For Series and Indexes backed by normal NumPy arrays, `Series.array` will return a new `arrays.PandasArray`, which is a thin (no-copy) wrapper around a `numpy.ndarray`. `PandasArray` isn’t especially useful on its own, but it does provide the same interface as any extension array defined in pandas or by a third-party library.

```
In [23]: ser = pd.Series([1, 2, 3])
In [24]: ser.array
Out[24]:
<PandasArray>
[1, 2, 3]
Length: 3, dtype: int64

In [25]: ser.to_numpy()
Out[25]:
array([1, 2, 3])
```

We haven’t removed or deprecated `Series.values` or `DataFrame.values`, but we highly recommend and using `.array` or `.to_numpy()` instead.

See `Dtypes` and `Attributes and Underlying Data` for more.

### pandas.array: a new top-level method for creating arrays

A new top-level method `array()` has been added for creating 1-dimensional arrays (GH22860). This can be used to create any extension array, including extension arrays registered by 3rd party libraries. See the `dtypes docs` for more on extension arrays.

```
In [26]: pd.array([1, 2, np.nan], dtype='Int64')
Out[26]:
<IntegerArray>
[1, 2, <NA>]
Length: 3, dtype: Int64

In [27]: pd.array(['a', 'b', 'c'], dtype='category')
Out[27]:
['a', 'b', 'c']
Categories (3, object): ['a', 'b', 'c']
```

Passing data for which there isn’t dedicated extension type (e.g. float, integer, etc.) will return a new `arrays.PandasArray`, which is just a thin (no-copy) wrapper around a `numpy.ndarray` that satisfies the pandas extension array interface.

```
In [28]: pd.array([1, 2, 3])
Out[28]:
<IntegerArray>
[1, 2, 3]
Length: 3, dtype: Int64
```

On their own, a `PandasArray` isn’t a very useful object. But if you need write low-level code that works generically for any `ExtensionArray`, `PandasArray` satisfies that need.
Notice that by default, if no dtype is specified, the dtype of the returned array is inferred from the data. In particular, note that the first example of `[1, 2, np.nan]` would have returned a floating-point array, since NaN is a float.

```python
In [29]: pd.array([1, 2, np.nan])
Out[29]:
<IntegerArray>
[1, 2, <NA>]
Length: 3, dtype: Int64
```

### Storing Interval and Period data in Series and DataFrame

Interval and Period data may now be stored in a Series or DataFrame, in addition to an IntervalIndex and PeriodIndex like previously (GH19453, GH22862).

```python
In [30]: ser = pd.Series(pd.interval_range(0, 5))
In [31]: ser
Out[31]:
0 (0, 1]
1 (1, 2]
2 (2, 3]
3 (3, 4]
4 (4, 5]
Length: 5, dtype: interval

In [32]: ser.dtype
Out[32]: interval[int64]
```

For periods:

```python
In [33]: pser = pd.Series(pd.period_range("2000", freq="D", periods=5))
In [34]: pser
Out[34]:
0 2000-01-01
1 2000-01-02
2 2000-01-03
3 2000-01-04
4 2000-01-05
Length: 5, dtype: period[D]

In [35]: pser.dtype
Out[35]: period[D]
```

Previously, these would be cast to a NumPy array with object dtype. In general, this should result in better performance when storing an array of intervals or periods in a Series or column of a DataFrame.

Use `Series.array` to extract the underlying array of intervals or periods from the Series:

```python
In [36]: ser.array
Out[36]:
<IntervalArray>
[(0, 1], (1, 2], (2, 3], (3, 4], (4, 5]]
Length: 5, closed: right, dtype: interval[int64]

In [37]: pser.array
```

(continues on next page)
These return an instance of `arrays.IntervalArray` or `arrays.PeriodArray`, the new extension arrays that back interval and period data.

**Warning:** For backwards compatibility, `Series.values` continues to return a NumPy array of objects for Interval and Period data. We recommend using `Series.array` when you need the array of data stored in the `Series`, and `Series.to_numpy()` when you know you need a NumPy array.

See `Dtypes` and `Attributes and Underlying Data` for more.

### Joining with two multi-indexes

`DataFrame.merge()` and `DataFrame.join()` can now be used to join multi-indexed `Dataframe` instances on the overlapping index levels (GH6360)

See the `Merge, join, and concatenate` documentation section.

```
In [38]: index_left = pd.MultiIndex.from_tuples([('K0', 'X0'), ('K0', 'X1'),
                                              ('K1', 'X2')],
                                             names=['key', 'X'])
   ...: In [39]: left = pd.DataFrame({'A': ['A0', 'A1', 'A2'],
                                'B': ['B0', 'B1', 'B2']}, index=index_left)
   ...: In [40]: index_right = pd.MultiIndex.from_tuples([('K0', 'Y0'), ('K1', 'Y1'),
                                                 ('K2', 'Y2'), ('K2', 'Y3')],
                                                names=['key', 'Y'])
   ...: In [41]: right = pd.DataFrame({'C': ['C0', 'C1', 'C2', 'C3'],
                                'D': ['D0', 'D1', 'D2', 'D3']}, index=index_right)
   ...: In [42]: left.join(right)
Out[42]:
      A  B  C  D
   key X  Y
K0  X0  Y0  A0  B0  C0  D0
   X1  Y0  A1  B1  C0  D0
K1  X2  Y1  A2  B2  C1  D1
[3 rows x 4 columns]
```

For earlier versions this can be done using the following.

```
In [43]: pd.merge(left.reset_index(), right.reset_index(),
               on=['key'], how='inner').set_index(['key', 'X', 'Y'])
```

(continues on next page)
Function `read_html` enhancements

`read_html()` previously ignored `colspan` and `rowspan` attributes. Now it understands them, treating them as sequences of cells with the same value. (GH17054)

```python
In [44]: result = pd.read_html("...
      ....:   <table>
      ....:     <thead>
      ....:       <tr>
      ....:         <th>A</th><th>B</th><th>C</th>
      ....:       </tr>
      ....:     </thead>
      ....:     <tbody>
      ....:       <tr>
      ....:         <td colspan="2">1</td><td>2</td>
      ....:       </tr>
      ....:     </tbody>
      ....:   </table>"")

Previous behavior:

```
In [13]: result
Out [13]:
[ A B C
  0 1 2 NaN]
```

New behavior:

```
In [45]: result
Out[45]:
[ A B C
  0 1 1 2
  [1 rows x 3 columns]]
```
New Styler.pipe() method

The Styler class has gained a pipe() method. This provides a convenient way to apply users’ predefined styling functions, and can help reduce “boilerplate” when using DataFrame styling functionality repeatedly within a notebook. (GH23229)

```python
In [46]: df = pd.DataFrame({'N': [1250, 1500, 1750], 'X': [0.25, 0.35, 0.50]})

In [47]: def format_and_align(styler):
   ....:     return (styler.format({'N': '{:,}', 'X': '{:.1%}'})
   ....:         .set_properties(**{'text-align': 'right'}))
   ....:

In [48]: df.style.pipe(format_and_align).set_caption('Summary of results.')
Out[48]: <pandas.io.formats.style.Styler at 0x7f7094eb7b20>
```

Similar methods already exist for other classes in pandas, including DataFrame.pipe(), GroupBy.pipe(), and Resampler.pipe().

Renaming names in a MultiIndex

DataFrame.rename_axis() now supports index and columns arguments and Series.rename_axis() supports index argument (GH19978).

This change allows a dictionary to be passed so that some of the names of a MultiIndex can be changed.

Example:

```python
In [49]: mi = pd.MultiIndex.from_product([list('AB'), list('CD'), list('EF')],
   ....:     names=['AB', 'CD', 'EF'])
   ....:
   ....:

In [50]: df = pd.DataFrame(list(range(len(mi))), index=mi, columns=['N'])

In [51]: df
Out[51]:
   N
AB CD EF
A  C  E  0
F  1
D  E  2
B  C  E  4
F  5
D  E  6
F  7
[8 rows x 1 columns]

In [52]: df.rename_axis(index={'CD': 'New'})
Out[52]:
   N
AB New EF
A  C  E  0
F  1
D  E  2
```

(continues on next page)
See the Advanced documentation on renaming for more details.

Other enhancements

- merge() now directly allows merge between objects of type DataFrame and named Series, without the need to convert the Series object into a DataFrame beforehand (GH21220)
- ExcelWriter now accepts mode as a keyword argument, enabling append to existing workbooks when using the openpyxl engine (GH3441)
- FrozenList has gained the .union() and .difference() methods. This functionality greatly simplifies groupby’s that rely on explicitly excluding certain columns. See Splitting an object into groups for more information (GH15475, GH15506).
- DataFrame.to_parquet() now accepts index as an argument, allowing the user to override the engine’s default behavior to include or omit the dataframe’s indexes from the resulting Parquet file. (GH20768)
- read_feather() now accepts columns as an argument, allowing the user to specify which columns should be read. (GH24025)
- DataFrame.corr() and Series.corr() now accept a callable for generic calculation methods of correlation, e.g. histogram intersection (GH22684)
- DataFrame.to_string() now accepts decimal as an argument, allowing the user to specify which decimal separator should be used in the output. (GH23614)
- DataFrame.to_html() now accepts render_links as an argument, allowing the user to generate HTML with links to any URLs that appear in the DataFrame. See the section on writing HTML in the IO docs for example usage. (GH2679)
- pandas.read_csv() now supports pandas extension types as an argument to dtype, allowing the user to use pandas extension types when reading CSVs. (GH23228)
- The shift() method now accepts fill_value as an argument, allowing the user to specify a value which will be used instead of NA/NaN in the empty periods. (GH15486)
- to_datetime() now supports the %Z and %z directive when passed into format (GH13486)
- Series.mode() and DataFrame.mode() now support the dropna parameter which can be used to specify whether NaN/NaT values should be considered (GH17534)
- DataFrame.to_csv() and Series.to_csv() now support the compression keyword when a file handle is passed. (GH21227)
- Index.droplevel() is now implemented also for flat indexes, for compatibility with MultiIndex (GH21115)
- Series.droplevel() and DataFrame.droplevel() are now implemented (GH20342)
- Added support for reading from/writing to Google Cloud Storage via the gcsfs library (GH19454, GH23094)
**DataFrame.to_gbq()** and **read_gbq()** signature and documentation updated to reflect changes from the pandas-gbq library version 0.8.0. Adds a credentials argument, which enables the use of any kind of google-auth credentials (GH21627, GH22557, GH23662)

**New method HDFStore.walk()** will recursively walk the group hierarchy of an HDF5 file (GH10932)

**read_html()** copies cell data across colspan and rowspan, and it treats all-th table rows as headers if header kwarg is not given and there is nothead (GH17054)

**Series.nlargest(), Series.nsmallest(), DataFrame.nlargest(), and DataFrame.nsmallest()** now accept the value "all" for the keep argument. This keeps all ties for the nth largest/smallest value (GH16818)

**IntervalIndex** has gained the set_closed() method to change the existing closed value (GH21670)

**to_csv(), to_csv(), to_json(), and to_json()** now support compression='infer' to infer compression based on filename extension (GH15008). The default compression for to_csv, to_json, and to_pickle methods has been updated to 'infer' (GH22004).

**DataFrame.to_sql()** now supports writing TIMESTAMP WITH TIME ZONE types for supported databases. For databases that don’t support timezones, datetime data will be stored as timezone unaware local timestamps. See the Datetime data types for implications (GH9086).

**to_timedelta()** now supports iso-formatted timedelta strings (GH21877)

**Series** and **DataFrame** now support Iterable objects in the constructor (GH2193)

**DatetimeIndex** has gained the DatetimeIndex.timetz attribute. This returns the local time with timezone information. (GH21358)

**round(), ceil(), and floor()** for DatetimeIndex and Timestamp now support an ambiguous argument for handling datetimes that are rounded to ambiguous times (GH18946) and a nonexistent argument for handling datetimes that are rounded to nonexistent times. See Nonexistent times when localizing (GH22647)

The result of **resample()** is now iterable similar to **groupby()** (GH15314).

**Series.resample()** and **DataFrame.resample()** have gained the pandas.core.resample. Resampler.quantile() (GH15023).

**DataFrame.resample()** and **Series.resample()** with a **PeriodIndex** will now respect the base argument in the same fashion as with a DatetimeIndex. (GH23882)

**pandas.api.types.is_list_like()** has gained a keyword allow_sets which is True by default; if False, all instances of set will not be considered “list-like” anymore (GH23061)

**Index.to_frame()** now supports overriding column name(s) (GH22580).

**Categorical.from_codes()** now can take a dtype parameter as an alternative to passing categories and ordered (GH24398).

New attribute __git_version__ will return git commit sha of current build (GH21295).

Compatibility with Matplotlib 3.0 (GH22790).

**Added** Interval.overlaps(), arrays.IntervalArray.overlaps(), and IntervalIndex.overlaps() for determining overlaps between interval-like objects (GH21998)

**read_fwf()** now accepts keyword infer_nrows (GH15138).

**to_parquet()** now supports writing a DataFrame as a directory of parquet files partitioned by a subset of the columns when engine = 'pyarrow' (GH23283)
• `Timestamp.tz_localize()`, `DatetimeIndex.tz_localize()`, and `Series.tz_localize()` have gained the nonexistent argument for alternative handling of nonexistent times. See Nonexistent times when localizing (GH8917, GH24466)

• `Index.difference()`, `Index.intersection()`, `Index.union()`, and `Index.symmetric_difference()` now have an optional sort parameter to control whether the results should be sorted if possible (GH17839, GH24471)

• `read_excel()` now accepts `usecols` as a list of column names or callable (GH18273)

• `MultiIndex.to_flat_index()` has been added to flatten multiple levels into a single-level `Index` object.

• `DataFrame.to_stata()` and `pandas.io.stata.StataWriter117` can write mixed string columns to Stata strl format (GH23633)

• `DataFrame.between_time()` and `DataFrame.at_time()` have gained the axis parameter (GH8839)

• `DataFrame.to_records()` now accepts `index_dtypes` and `column_dtypes` parameters to allow different data types in stored column and index records (GH18146)

• `IntervalIndex` has gained the `is_overlapping` attribute to indicate if the `IntervalIndex` contains any overlapping intervals (GH23309)

• `pandas.DataFrame.to_sql()` has gained the `method` argument to control SQL insertion clause. See the insertion method section in the documentation. (GH8953)

• `DataFrame.corrwith()` now supports Spearman’s rank correlation, Kendall’s tau as well as callable correlation methods. (GH21925)

• `DataFrame.to_json()`, `DataFrame.to_csv()`, `DataFrame.to_pickle()`, and other export methods now support tilde(−) in path argument. (GH23473)

Backwards incompatible API changes

pandas 0.24.0 includes a number of API breaking changes.

Increased minimum versions for dependencies

We have updated our minimum supported versions of dependencies (GH21242, GH18742, GH23774, GH24767). If installed, we now require:

<table>
<thead>
<tr>
<th>Package</th>
<th>Minimum Version</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>numpy</td>
<td>1.12.0</td>
<td>X</td>
</tr>
<tr>
<td>bottleneck</td>
<td>1.2.0</td>
<td></td>
</tr>
<tr>
<td>fastparquet</td>
<td>0.2.1</td>
<td></td>
</tr>
<tr>
<td>matplotlib</td>
<td>2.0.0</td>
<td></td>
</tr>
<tr>
<td>numexpr</td>
<td>2.6.1</td>
<td></td>
</tr>
<tr>
<td>pandas-gbq</td>
<td>0.8.0</td>
<td></td>
</tr>
<tr>
<td>pyarrow</td>
<td>0.9.0</td>
<td></td>
</tr>
<tr>
<td>pytables</td>
<td>3.4.2</td>
<td></td>
</tr>
<tr>
<td>scipy</td>
<td>0.18.1</td>
<td></td>
</tr>
<tr>
<td>xlrd</td>
<td>1.0.0</td>
<td></td>
</tr>
<tr>
<td>pytest (dev)</td>
<td>3.6</td>
<td></td>
</tr>
</tbody>
</table>
Additionally we no longer depend on feather-format for feather based storage and replaced it with references to pyarrow (GH21639 and GH23053).

**os.linesep is used for line_terminator of DataFrame.to_csv**

`DataFrame.to_csv()` now uses `os.linesep()` rather than '\n' for the default line terminator (GH20353). This change only affects when running on Windows, where '\r\n' was used for line terminator even when '\n' was passed in `line_terminator`.

**Previous behavior** on Windows:

```
In [1]: data = pd.DataFrame({"string_with_lf": ["a\nbc"],
...:                     "string_with_crlf": ["a\r\nbc"]})

In [2]: # When passing file PATH to to_csv,
...: # line_terminator does not work, and csv is saved with '\r\n'.
...: # Also, this converts all '\n's in the data to '\r\n'.
...: data.to_csv("test.csv", index=False, line_terminator='\n')

In [3]: with open("test.csv", mode='rb') as f:
...:     print(f.read())
Out[3]: b'string_with_lf,string_with_crlf\n''a\nbc","a\r\nbc''

In [4]: # When passing file OBJECT with newline option to 
...: # to_csv, line_terminator works.
...: with open("test2.csv", mode='w', newline='\n') as f:
...:     data.to_csv(f, index=False, line_terminator='\n')

In [5]: with open("test2.csv", mode='rb') as f:
...:     print(f.read())
Out[5]: b'string_with_lf,string_with_crlf\n''a\nbc","a\r\nbc''
```

**New behavior** on Windows:

Passing `line_terminator` explicitly, set the `line_terminator` to that character.

```
In [1]: data = pd.DataFrame({"string_with_lf": ["a\nbc"],
...:                     "string_with_crlf": ["a\r\nbc"]})

In [2]: data.to_csv("test.csv", index=False, line_terminator='\n')

In [3]: with open("test.csv", mode='rb') as f:
...:     print(f.read())
Out[3]: b'string_with_lf,string_with_crlf\n''a\nbc","a\r\nbc''

On Windows, the value of `os.linesep` is '\r\n', so if `line_terminator` is not set, '\r\n' is used for line terminator.

```
In [1]: data = pd.DataFrame({"string_with_lf": ["a\nbc"],
...:                     "string_with_crlf": ["a\r\nbc"]})

In [2]: data.to_csv("test.csv", index=False)

In [3]: with open("test.csv", mode='rb') as f:
...:     print(f.read())
Out[3]: b'string_with_lf,string_with_crlf\n''a\nbc","a\r\nbc''
```
For file objects, specifying newline is not sufficient to set the line terminator. You must pass in the line_terminator explicitly, even in this case.

```python
In [1]: data = pd.DataFrame({"string_with_lf": ["a\nbc"],
                        "string_with_crlf": ["a\r\nbcc"]})
In [2]: with open("test2.csv", mode='w', newline='\n') as f:
        data.to_csv(f, index=False)
In [3]: with open("test2.csv", mode='rb') as f:
        print(f.read())
```

```
Out[3]: b'string_with_lf,string_with_crlf\n"a\nbc","a\r\nbcc"
'```

### Proper handling of np.NaN in a string data-typed column with the Python engine

There was bug in `read_excel()` and `read_csv()` with the Python engine, where missing values turned to 'nan' with dtype=str and na_filter=True. Now, these missing values are converted to the string missing indicator, np.nan. (GH20377)

**Previous behavior:**

```python
In [5]: data = 'a,b,c\n1,,3
4,5,6'
In [6]: df = pd.read_csv(StringIO(data), engine='python', dtype=str, na_filter=True)
In [7]: df.loc[0, 'b']
Out[7]: 'nan'
```

**New behavior:**

```python
In [53]: data = 'a,b,c\n1,,3\n4,5,6'
In [54]: df = pd.read_csv(StringIO(data), engine='python', dtype=str, na_filter=True)
In [55]: df.loc[0, 'b']
Out[55]: nan
```

Notice how we now instead output np.nan itself instead of a stringified form of it.

### Parsing datetime strings with timezone offsets

Previously, parsing datetime strings with UTC offsets with `to_datetime()` or `DatetimeIndex` would automatically convert the datetime to UTC without timezone localization. This is inconsistent from parsing the same datetime string with `Timestamp` which would preserve the UTC offset in the tz attribute. Now, `to_datetime()` preserves the UTC offset in the tz attribute when all the datetime strings have the same UTC offset (GH17697, GH11736, GH22457)

**Previous behavior:**

```python
In [2]: pd.to_datetime("2015-11-18 15:30:00+05:30")
Out[2]: Timestamp('2015-11-18 10:00:00')
In [3]: pd.Timestamp("2015-11-18 15:30:00+05:30")
Out[3]: Timestamp('2015-11-18 15:30:00+0530', tz='pytz.FixedOffset(330)')
```

# Different UTC offsets would automatically convert the datetimes to UTC (without a, UTC timezone)

(continues on next page)
New behavior:

```python
In [56]: pd.to_datetime("2015-11-18 15:30:00+05:30")
Out[56]: Timestamp('2015-11-18 15:30:00+0530', tz='pytz.FixedOffset(330)')
In [57]: pd.Timestamp("2015-11-18 15:30:00+05:30")
Out[57]: Timestamp('2015-11-18 15:30:00+0530', tz='pytz.FixedOffset(330)')
```

Parsing datetime strings with the same UTC offset will preserve the UTC offset in the `tz`

```python
In [58]: pd.to_datetime(["2015-11-18 15:30:00+05:30" ] * 2)
Out[58]: DatetimeIndex(["2015-11-18 15:30:00+05:30", 
                      "2015-11-18 15:30:00+05:30"], 
                      dtype='datetime64[ns, pytz.FixedOffset(330)]',
                      freq=None)
```

Parsing datetime strings with different UTC offsets will now create an Index of `datetime.datetime` objects with different UTC offsets

```python
In [59]: idx = pd.to_datetime(["2015-11-18 15:30:00+05:30", 
                           "2015-11-18 16:30:00+06:30"])
In [60]: idx
Out[60]: Index([2015-11-18 15:30:00+05:30, 2015-11-18 16:30:00+06:30],
               dtype='object')
In [61]: idx[0]
Out[61]: datetime.datetime(2015, 11, 18, 15, 30, tzinfo=tzoffset(None, 19800))
In [62]: idx[1]
Out[62]: datetime.datetime(2015, 11, 18, 16, 30, tzinfo=tzoffset(None, 23400))
```

Passing `utc=True` will mimic the previous behavior but will correctly indicate that the dates have been converted to UTC

```python
In [63]: pd.to_datetime(["2015-11-18 15:30:00+05:30", 
                      "2015-11-18 16:30:00+06:30"], utc=True)
```

Parsing mixed-timezones with `read_csv()`

`read_csv()` no longer silently converts mixed-timezone columns to UTC (GH24987).

Previous behavior

```python
>>> import io
>>> content = ""
... 2000-01-01T00:00:00+05:00
... 2000-01-01T00:00:00+06:00"
>>> df = pd.read_csv(io.StringIO(content), parse_dates=['a'])
```

(continues on next page)
New behavior

```python
In [64]: import io
In [65]: content = 'a
....: 2000-01-01T00:00:00+05:00
....: 2000-01-01T00:00:00+06:00"

In [66]: df = pd.read_csv(io.StringIO(content), parse_dates=['a'])
In [67]: df.a
Out[67]:
0 2000-01-01 00:00:00+05:00
1 2000-01-01 00:00:00+06:00
Name: a, Length: 2, dtype: object
```

As can be seen, the dtype is object; each value in the column is a string. To convert the strings to an array of datetimes, the `date_parser` argument

```python
In [68]: df = pd.read_csv(io.StringIO(content), parse_dates=['a'],
....: date_parser=lambda col: pd.to_datetime(col, utc=True))
In [69]: df.a
Out[69]:
0 1999-12-31 19:00:00+00:00
1 1999-12-31 18:00:00+00:00
Name: a, Length: 2, dtype: datetime64[ns, UTC]
```

See Parsing datetime strings with timezone offsets for more.

### Time values in `dt.end_time` and `to_timestamp(how='end')`

The time values in `Period` and `PeriodIndex` objects are now set to ‘23:59:59.999999999’ when calling `Series.dt.end_time`, `Period.end_time`, `PeriodIndex.end_time`, `Period.to_timestamp()` with `how='end'`, or `PeriodIndex.to_timestamp()` with `how='end'` (GH17157)

**Previous behavior:**

```python
In [2]: p = pd.Period('2017-01-01', 'D')
In [3]: pi = pd.PeriodIndex([p])
In [4]: pd.Series(pi).dt.end_time[0]
Out[4]: Timestamp(2017-01-01 00:00:00)
In [5]: p.end_time
```

**New behavior:**
Calling `Series.dt.end_time` will now result in a time of ‘23:59:59.999999999’ as is the case with `Period.end_time`, for example

```python
In [70]: p = pd.Period('2017-01-01', 'D')
In [71]: pi = pd.PeriodIndex([p])
In [72]: pd.Series(pi).dt.end_time[0]
Out[72]: Timestamp('2017-01-01 23:59:59.999999999')
In [73]: p.end_time
Out[73]: Timestamp('2017-01-01 23:59:59.999999999')
```

### Series.unique for timezone-aware data

The return type of `Series.unique()` for datetime with timezone values has changed from an `numpy.ndarray` of `Timestamp` objects to a `arrays.DatetimeArray` (GH24024).

```python
In [74]: ser = pd.Series([pd.Timestamp('2000', tz='UTC'),
                           pd.Timestamp('2000', tz='UTC')])

Previous behavior:

```python
In [3]: ser.unique()
Out[3]: array([Timestamp('2000-01-01 00:00:00+0000', tz='UTC')], dtype=object)
```

New behavior:

```python
In [75]: ser.unique()
Out[75]:<DatetimeArray>
['2000-01-01 00:00:00+00:00']
Length: 1, dtype: datetime64[ns, UTC]
```

### SparseArray data structure refactor

`SparseArray`, the array backing `SparseSeries` and the columns in a `SparseDataFrame`, is now an extension array (GH21978, GH19056, GH22835). To conform to this interface and for consistency with the rest of pandas, some API breaking changes were made:

- `SparseArray` is no longer a subclass of `numpy.ndarray`. To convert a `SparseArray` to a NumPy array, use `numpy.asarray()`.
- `SparseArray.dtype` and `SparseSeries.dtype` are now instances of `SparseDtype`, rather than `np.dtype`. Access the underlying dtype with `SparseDtype.subtype`.
- `numpy.asarray(sparse_array)` now returns a dense array with all the values, not just the non-fill-value values (GH14167)
- `SparseArray.take` now matches the API of `pandas.api.extensions.ExtensionArray.take` (GH19506):
  - The default value of `allow_fill` has changed from `False` to `True`.
  - The `out` and `mode` parameters are now longer accepted (previously, this raised if they were specified).
– Passing a scalar for `indices` is no longer allowed.

• The result of `concat()` with a mix of sparse and dense Series is a Series with sparse values, rather than a `SparseSeries`.

• `SparseDataFrame.combine` and `DataFrame.combine_first` no longer supports combining a sparse column with a dense column while preserving the sparse subtype. The result will be an object-dtype `SparseArray`.

• Setting `SparseArray.fill_value` to a fill value with a different dtype is now allowed.

• `DataFrame[column]` is now a `Series` with sparse values, rather than a `SparseSeries`, when slicing a single column with sparse values (GH23559).

• The result of `Series.where()` is now a `Series` with sparse values, like with other extension arrays (GH24077).

Some new warnings are issued for operations that require or are likely to materialize a large dense array:

• A `errors.PerformanceWarning` is issued when using `fillna` with a method, as a dense array is constructed to create the filled array. Filling with a value is the efficient way to fill a sparse array.

• A `errors.PerformanceWarning` is now issued when concatenating sparse Series with differing fill values. The fill value from the first sparse array continues to be used.

In addition to these API breaking changes, many `Performance Improvements and Bug Fixes have been made`.

Finally, a `Series.sparse` accessor was added to provide sparse-specific methods like `Series.sparse.from_coo()`.

```
In [76]: s = pd.Series([0, 0, 1, 1, 1], dtype='Sparse[int]')
In [77]: s.sparse密度
Out[77]: 0.6
```

get_dummies() always returns a DataFrame

Previously, when `sparse=True` was passed to `get_dummies()`, the return value could be either a `DataFrame` or a `SparseDataFrame`, depending on whether all or a just a subset of the columns were dummy-encoded. Now, a `DataFrame` is always returned (GH24284).

**Previous behavior**

The first `get_dummies()` returns a `DataFrame` because the column A is not dummy encoded. When just ["B", "C"] are passed to `get_dummies`, then all the columns are dummy-encoded, and a `SparseDataFrame` was returned.

```
In [2]: df = pd.DataFrame({"A": [1, 2], "B": ['a', 'b'], "C": ['a', 'a']})
In [3]: type(pd.get_dummies(df, sparse=True))
Out[3]: pandas.core.frame.DataFrame
In [4]: type(pd.get_dummies(df[['B', 'C']], sparse=True))
Out[4]: pandas.core.sparse.frame.SparseDataFrame
```

**New behavior**

Now, the return type is consistently a `DataFrame`.

```
```
In [78]: type(pd.get_dummies(df, sparse=True))
Out[78]: pandas.core.frame.DataFrame

In [79]: type(pd.get_dummies(df[['B', 'C']], sparse=True))
Out[79]: pandas.core.frame.DataFrame

Note: There’s no difference in memory usage between a `SparseDataFrame` and a `DataFrame` with sparse values. The memory usage will be the same as in the previous version of pandas.

raise `ValueError` in `DataFrame.to_dict(orient='index')`

Bug in `DataFrame.to_dict()` raises `ValueError` when used with `orient='index'` and a non-unique index instead of losing data (GH22801)

In [80]: df = pd.DataFrame({'a': [1, 2], 'b': [0.5, 0.75]}, index=['A', 'A'])
In [81]: df
Out[81]:
      a  b
    A  1 0.5
    A  2 0.75
[2 rows x 2 columns]
In [82]: df.to_dict(orient='index')
---------------------------------------------------------------------------
ValueError                       Traceback (most recent call last)
<ipython-input-82-f5309a7c6adb> in <module>
----> 1 df.to_dict(orient='index')
/pandas/pandas/core/frame.py in to_dict(self, orient, into)
    1603             if orient == 'infer'
    1604                 orient = infer_orient(self, into)
--> 1605                 else:
    1606                     if not self.index.is_unique:
    1607                         raise ValueError("DataFrame index must be unique for orient='index'.")

ValueError: DataFrame index must be unique for orient='index'.

Tick `DateOffset normalize` restrictions

Creating a `Tick` object (Day, Hour, Minute, Second, Milli, Micro, Nano) with normalize=True is no longer supported. This prevents unexpected behavior where addition could fail to be monotone or associative. (GH21427)

Previous behavior:

In [2]: ts = pd.Timestamp('2018-06-11 18:01:14')
In [3]: ts
Out[3]: Timestamp('2018-06-11 18:01:14')

(continues on next page)
In [4]: tic = pd.offsets.Hour(n=2, normalize=True)
   ...:
In [5]: tic
Out[5]: <2 * Hours>
In [6]: ts + tic
Out[6]: Timestamp('2018-06-11 00:00:00')
In [7]: ts + tic + tic + tic == ts + (tic + tic + tic)
Out[7]: False

**New behavior:**

In [83]: ts = pd.Timestamp('2018-06-11 18:01:14')
In [84]: tic = pd.offsets.Hour(n=2)
In [85]: ts + tic + tic + tic == ts + (tic + tic + tic)
Out[85]: True

**Period subtraction**

Subtraction of a Period from another Period will give a DateOffset, instead of an integer (GH21314)

**Previous behavior:**

In [2]: june = pd.Period('June 2018')
In [3]: april = pd.Period('April 2018')
In [4]: june - april
Out [4]: 2

**New behavior:**

In [86]: june = pd.Period('June 2018')
In [87]: april = pd.Period('April 2018')
In [88]: june - april
Out[88]: <2 * MonthEnds>

Similarly, subtraction of a Period from a PeriodIndex will now return an Index of DateOffset objects instead of an Int64Index

**Previous behavior:**

In [2]: pi = pd.period_range('June 2018', freq='M', periods=3)
In [3]: pi - pi[0]
Out[3]: Int64Index([0, 1, 2], dtype='int64')

**New behavior:**
In [89]: pi = pd.period_range('June 2018', freq='M', periods=3)

In [90]: pi - pi[0]
Out[90]: Index([<0 * MonthEnds>, <MonthEnd>, <2 * MonthEnds>], dtype='object')

**Addition/subtraction of NaN from DataFrame**

Adding or subtracting NaN from a *DataFrame* column with `timedelta64[ns]` dtype will now raise a TypeError instead of returning all-NaT. This is for compatibility with `TimedeltaIndex` and `Series` behavior (GH22163)

In [91]: df = pd.DataFrame([pd.Timedelta(days=1)])

In [92]: df
Out[92]:
      0
0  1 days
[1 rows x 1 columns]

*Previous behavior:*

In [4]: df = pd.DataFrame([pd.Timedelta(days=1)])

In [5]: df - np.nan
Out[5]:
     0
0  NaT

*New behavior:*

In [2]: df - np.nan
   ...  
   TypeError: unsupported operand type(s) for -: 'TimedeltaIndex' and 'float'

**DataFrame comparison operations broadcasting changes**

Previously, the broadcasting behavior of *DataFrame* comparison operations (==, !={}, ...) was inconsistent with the behavior of arithmetic operations (+, -, ...). The behavior of the comparison operations has been changed to match the arithmetic operations in these cases. (GH22880)

The affected cases are:

- operating against a 2-dimensional `np.ndarray` with either 1 row or 1 column will now broadcast the same way a `np.ndarray` would (GH23000).
- a list or tuple with length matching the number of rows in the `DataFrame` will now raise `ValueError` instead of operating column-by-column (GH22880).
- a list or tuple with length matching the number of columns in the `DataFrame` will now operate row-by-row instead of raising `ValueError` (GH22880).

In [93]: arr = np.arange(6).reshape(3, 2)

(continues on next page)
In [94]: df = pd.DataFrame(arr)

In [95]: df
Out[95]:
   0  1
0  0  1
1  2  3
2  4  5
[3 rows x 2 columns]

Previous behavior:

In [5]: df == arr[[0], :]
   ...: # comparison previously broadcast where arithmetic would raise
Out[5]:
   0  1
  0  True  True
  1  False False
  2  False False

In [6]: df + arr[[0], :]
   ...: # length matches number of columns;
   ...: # comparison previously raised where arithmetic would broadcast
   ...: ValueError: Unable to coerce to DataFrame, shape must be (3, 2): given (1, 2)

In [7]: df == (1, 2)
   ...: # length matches number of rows
   ...: # comparison previously broadcast where arithmetic would raise

In [8]: df + (1, 2)
Out[8]:
   0  1
  0  1  3
  1  3  5
  2  5  7

In [9]: df == (1, 2, 3)
   ...: # length matches number of rows
   ...: # comparison previously broadcast where arithmetic would raise

Out[9]:
   0  1
  0  False True
  1  True False
  2  False False

In [10]: df + (1, 2, 3)
   ...: ValueError: Unable to coerce to Series, length must be 2: given 3
   ...: New behavior:

# Comparison operations and arithmetic operations both broadcast.
In [96]: df == arr[[0], :]
Out[96]:
   0  1
  0  True  True
  1  False False
  2  False False
Dataframe arithmetic operations broadcasting changes

_DataFrame_ arithmetic operations when operating with 2-dimensional `np.ndarray` objects now broadcast in the same way as `np.ndarray` broadcast. (GH23000)
Previous behavior:

```python
In [5]: df + arr[[0], :]
# 1 row, 2 columns
...  # long output
ValueError: Unable to coerce to DataFrame, shape must be (3, 2): given (1, 2)
In [6]: df + arr[:, [1]]
# 1 column, 3 rows
...  # long output
ValueError: Unable to coerce to DataFrame, shape must be (3, 2): given (3, 1)
```

New behavior:

```python
In [103]: df + arr[[0], :]
# 1 row, 2 columns
Out[103]:
   0  1
 0  0  2
1  2  4
2  4  6
[3 rows x 2 columns]

In [104]: df + arr[:, [1]]
# 1 column, 3 rows
Out[104]:
   0  1
 0  1  2
1  5  6
2  9 10
[3 rows x 2 columns]
```

Series and Index data-dtype incompatibilities

Series and Index constructors now raise when the data is incompatible with a passed `dtype`=(GH15832)

Previous behavior:

```python
In [4]: pd.Series([-1], dtype="uint64")
Out [4]:
0   18446744073709551615
dtype: uint64
```

New behavior:

```python
In [4]: pd.Series([-1], dtype="uint64")
Out [4]:
...  # long output
OverflowError: Trying to coerce negative values to unsigned integers
```
Concatenation changes

Calling `pandas.concat()` on a `Categorical` of ints with NA values now causes them to be processed as objects when concatenating with anything other than another `Categorical` of ints (GH19214)

```
In [105]: s = pd.Series([0, 1, np.nan])
In [106]: c = pd.Series([0, 1, np.nan], dtype="category")
```

**Previous behavior**

```
In [3]: pd.concat([s, c])
Out[3]:
0   0.0
1   1.0
2  NaN
0   0.0
1   1.0
2  NaN
dtype: float64
```

**New behavior**

```
In [107]: pd.concat([s, c])
Out[107]:
0   0.0
1   1.0
2  NaN
0   0.0
1   1.0
2  NaN
Length: 6, dtype: float64
```

Datetimelike API changes

- For `DatetimeIndex` and `TimedeltaIndex` with non-None `freq` attribute, addition or subtraction of integer-dtyped array or `Index` will return an object of the same class (GH19959)
- `DateOffset` objects are now immutable. Attempting to alter one of these will now raise `AttributeError` (GH21341)
- `PeriodIndex` subtraction of another `PeriodIndex` will now return an object-dtype `Index` of `DateOffset` objects instead of raising a `TypeError` (GH20049)
- `cut()` and `qcut()` now returns a `DatetimeIndex` or `TimedeltaIndex` bins when the input is datetime or timedelta dtype respectively and `retbins=True` (GH19891)
- `DatetimeIndex.to_period()` and `Timestamp.to_period()` will issue a warning when timezone information will be lost (GH21333)
- `PeriodIndex.tz_convert()` and `PeriodIndex.tz_localize()` have been removed (GH21781)
Other API changes

- A newly constructed empty DataFrame with integer as the dtype will now only be cast to float64 if index is specified (GH22858)
- Series.str.cat() will now raise if others is a set (GH23009)
- Passing scalar values to DatetimeIndex or TimedeltaIndex will now raise TypeError instead of ValueError (GH23539)
- max_rows and max_cols parameters removed from HTMLFormatter since truncation is handled by DataFrameFormatter (GH23818)
- read_csv() will now raise a ValueError if a column with missing values is declared as having dtype bool (GH20591)
- The column order of the resultant DataFrame from MultiIndex.to_frame() is now guaranteed to match the MultiIndex.names order. (GH22420)
- Incorrectly passing a DatetimeIndex to MultiIndex.from_tuples(), rather than a sequence of tuples, now raises a TypeError rather than a ValueError (GH24024)
- pd.offsets.generate_range() argument time_rule has been removed; use offset instead (GH24157)
- In 0.23.x, pandas would raise a ValueError on a merge of a numeric column (e.g. int dtyped column) and an object dtyped column (GH9780). We have re-enabled the ability to merge object and other dtypes; pandas will still raise on a merge between a numeric and an object dtyped column that is composed only of strings (GH21681)
- Accessing a level of a MultiIndex with a duplicate name (e.g. in get_level_values()) now raises a ValueError instead of a KeyErrors (GH21678).
- Invalid construction of IntervalDtype will now always raise a TypeError rather than a ValueError if the subtype is invalid (GH21185)
- Trying to reindex a DataFrame with a non unique MultiIndex now raises a ValueError instead of an Exception (GH21770)
- Index subtraction will attempt to operate element-wise instead of raising TypeError (GH19369)
- pandas.io.formats.style.Styler supports a number-format property when using to_excel() (GH22015)
- DataFrame.corr() and Series.corr() now raise a ValueError along with a helpful error message instead of a KeyError when supplied with an invalid method (GH22298)
- shift() will now always return a copy, instead of the previous behaviour of returning self when shifting by 0 (GH22397)
- DataFrame.set_index() now gives a better (and less frequent) KeyError, raises a ValueError for incorrect types, and will not fail on duplicate column names with drop=True. (GH22484)
- Slicing a single row of a DataFrame with multiple ExtensionArrays of the same type now preserves the dtype, rather than coercing to object (GH22784)
- DateOffset attribute _cacheable and method _should_cache have been removed (GH23118)
- Series.searchsorted(), when supplied a scalar value to search for, now returns a scalar instead of an array (GH23801)
- Categorical.searchsorted(), when supplied a scalar value to search for, now returns a scalar instead of an array (GH23466).
• Categorical.searchsorted() now raises a KeyError rather than a ValueError, if a searched for key is not found in its categories (GH23466).

• Index.hasnans() and Series.hasnans() now always return a python boolean. Previously, a python or a numpy boolean could be returned, depending on circumstances (GH23294).

• The order of the arguments of DataFrame.to_html() and DataFrame.to_string() is rearranged to be consistent with each other. (GH23614)

• CategoricalIndex.reindex() now raises a ValueError if the target index is non-unique and not equal to the current index. It previously only raised if the target index was not of a categorical dtype (GH23963).

• Series.to_list() and Index.to_list() are now aliases of Series.tolist respectively Index.tolist (GH8826)

• The result of SparseSeries.unstack is now a DataFrame with sparse values, rather than a SparseDataFrame (GH24372).

• DatetimeIndex and TimedeltaIndex no longer ignore the dtype precision. Passing a non-nanosecond resolution dtype will raise a ValueError (GH24753)

Extension type changes

Equality and hashability

pandas now requires that extension dtypes be hashable (i.e. the respective ExtensionDtype objects; hashability is not a requirement for the values of the corresponding ExtensionArray). The base class implements a default __eq__ and __hash__. If you have a parametrized dtype, you should update the ExtensionDtype._metadata tuple to match the signature of your __init__ method. See pandas.api.extensions.ExtensionDtype for more (GH22476).

New and changed methods

• dropna() has been added (GH21185)

• repeat() has been added (GH24349)

• The ExtensionArray constructor, _from_sequence now take the keyword arg copy=False (GH21185)

• pandas.api.extensions.ExtensionArray.shift() added as part of the basic ExtensionArray interface (GH22387).

• searchsorted() has been added (GH24350)

• Support for reduction operations such as sum, mean via opt-in base class method override (GH22762)

• ExtensionArray.isna() is allowed to return an ExtensionArray (GH22325).

Dtype changes

• ExtensionDtype has gained the ability to instantiate from string dtypes, e.g. decimal would instantiate a registered DecimalDtype; furthermore the ExtensionDtype has gained the method construct_array_type (GH21185)

• Added ExtensionDtype._is_numeric for controlling whether an extension dtype is considered numeric (GH22290).

• Added pandas.api.types.register_extension_dtype() to register an extension type with pandas (GH22664)

• Updated the .type attribute for PeriodDtype, DatetimeTZDtype, and IntervalDtype to be instances of the dtype (Period, Timestamp, and Interval respectively) (GH22938)
Operator support

A Series based on an ExtensionArray now supports arithmetic and comparison operators (GH19577). There are two approaches for providing operator support for an ExtensionArray:

1. Define each of the operators on your ExtensionArray subclass.
2. Use an operator implementation from pandas that depends on operators that are already defined on the underlying elements (scalars) of the ExtensionArray.

See the ExtensionArray Operator Support documentation section for details on both ways of adding operator support.

Other changes

- A default repr for pandas.api.extensions.ExtensionArray is now provided (GH23601).
- ExtensionArray._formatting_values() is deprecated. Use ExtensionArray._formatter instead. (GH23601)
- An ExtensionArray with a boolean dtype now works correctly as a boolean indexer. pandas.api.types.is_bool_dtype() now properly considers them boolean (GH22326)

Bug fixes

- Bug in Series.get() for Series using ExtensionArray and integer index (GH21257)
- shift() now dispatches to ExtensionArray.shift() (GH22386)
- Series.combine() works correctly with ExtensionArray inside of Series (GH20825)
- Series.combine() with scalar argument now works for any function type (GH21248)
- Series.astype() and DataFrame.astype() now dispatch to ExtensionArray.astype() (GH21185).
- Slicing a single row of a DataFrame with multiple ExtensionArrays of the same type now preserves the dtype, rather than coercing to object (GH22784)
- Bug when concatenating multiple Series with different extension dtypes not casting to object dtype (GH22994)
- Series backed by an ExtensionArray now work with util.hash_pandas_object() (GH23066)
- DataFrame.stack() no longer converts to object dtype for DataFrames where each column has the same extension dtype. The output Series will have the same dtype as the columns (GH23077).
- Series.unstack() and DataFrame.unstack() no longer convert extension arrays to object-dtype ndarrays. Each column in the output DataFrame will now have the same dtype as the input (GH23077).
- Bug when grouping Dataframe.groupby() and aggregating on ExtensionArray it was not returning the actual ExtensionArray dtype (GH23227).
- Bug in pandas.merge() when merging on an extension array-backed column (GH23020).
Deprecations

- **MultiIndex.labels** has been deprecated and replaced by **MultiIndex.codes**. The functionality is unchanged. The new name better reflects the natures of these codes and makes the MultiIndex API more similar to the API for **CategoricalIndex** (GH13443). As a consequence, other uses of the name **labels** in MultiIndex have also been deprecated and replaced with **codes**:
  - You should initialize a MultiIndex instance using a parameter named **codes** rather than **labels**.
  - **MultiIndex.set_labels** has been deprecated in favor of **MultiIndex.set_codes()**.
  - For method **MultiIndex.copy()**, the **labels** parameter has been deprecated and replaced by a **codes** parameter.

- **DataFrame.to_stata()**, **read_stata()**, **StataReader** and **StataWriter** have deprecated the **encoding** argument. The encoding of a Stata dta file is determined by the file type and cannot be changed (GH21244)

- **MultiIndex.to_hierarchical()** is deprecated and will be removed in a future version (GH21613)

- **Series.ptp()** is deprecated. Use **numpy.ptp** instead (GH21614)

- **Series.compress()** is deprecated. Use **Series[condition]** instead (GH18262)

- The signature of **Series.to_csv()** has been uniformed to that of **DataFrame.to_csv()**: the name of the first argument is now **path_or_buf**, the order of subsequent arguments has changed, the **header** argument now defaults to True. (GH19715)

- **Categorical.from_codes()** has deprecated providing float values for the **codes** argument. (GH21767)

- **pandas.read_table()** is deprecated. Instead, use **read_csv()** passing **sep=r'\t'** if necessary. This deprecation has been removed in 0.25.0. (GH21948)

- **Series.str.cat()** has deprecated using arbitrary list-likes **within** list-likes. A list-like container may still contain many Series, Index or 1-dimensional np.ndarray, or alternatively, only scalar values. (GH21950)

- **FrozenNDArray.searchsorted()** has deprecated the **v** parameter in favor of **value** (GH14645)

- **DatetimeIndex.shift()** and **PeriodIndex.shift()** now accept **periods** argument instead of **n** for consistency with **Index.shift()** and **Series.shift()**. Using **n** throws a deprecation warning (GH22458, GH22912)

- The **fastpath** keyword of the different Index constructors is deprecated (GH23110).

- **Timestamp.tz_localize()**, **DatetimeIndex.tz_localize()**, and **Series.tz_localize()** have deprecated the **errors** argument in favor of the nonexistent argument (GH8917)

- The class **FrozenNDArray** has been deprecated. When unpickling, **FrozenNDArray** will be unpickled to np.ndarray once this class is removed (GH9031)

- The methods **DataFrame.update()** and **Panel.update()** have deprecated the **raise_conflict=False|True** keyword in favor of **errors='ignore'|'raise'** (GH23585)

- The methods **Series.str.partition()** and **Series.str.rpartition()** have deprecated the **pat** keyword in favor of **sep** (GH22676)

- Deprecated the **nthreads** keyword of **pandas.read_feather()** in favor of **use_threads** to reflect the changes in pyarrow>=0.11.0. (GH23053)

- **pandas.read_excel()** has deprecated accepting **usecols** as an integer. Please pass in a list of ints from 0 to **usecols** inclusive instead (GH23527)
• Constructing a `TimedeltaIndex` from data with `datetime64`-dtyped data is deprecated, will raise `TypeError` in a future version (GH23539)

• Constructing a `DatetimeIndex` from data with `timedelta64`-dtyped data is deprecated, will raise `TypeError` in a future version (GH23675)

• The `keep_tz=False` option (the default) of the `keep_tz` keyword of `DatetimeIndex.to_series()` is deprecated (GH17832).

• Timezone converting a tz-aware `datetime.datetime` or `Timestamp` with `Timestamp` and the `tz` argument is now deprecated. Instead, use `Timestamp.tz_convert()` (GH23579)

• `pandas.api.types.is_period()` is deprecated in favor of `pandas.api.types.is_period_dtype` (GH23917)

• `pandas.api.types.is_datetimetz()` is deprecated in favor of `pandas.api.types.is_datetime64tz` (GH23917)

• Creating a `TimedeltaIndex`, `DatetimeIndex`, or `PeriodIndex` by passing range arguments `start`, `end`, and `periods` is deprecated in favor of `timedelta_range()`, `date_range()`, or `period_range()` (GH23919)

• Passing a string alias like 'datetime64[ns, UTC]' as the unit parameter to `DatetimeTZDtype` is deprecated. Use `DatetimeTZDtype.construct_from_string` instead (GH23990).

• The `skipna` parameter of `infer_dtype()` will switch to True by default in a future version of pandas (GH17066, GH24050)

• In `Series.where()` with Categorical data, providing an `other` that is not present in the categories is deprecated. Convert the categorical to a different dtype or add the `other` to the categories first (GH24077).

• `Series.clip_lower()`, `Series.clip_upper()`, `DataFrame.clip_lower()` and `DataFrame.clip_upper()` are deprecated and will be removed in a future version. Use `Series.clip(lower=threshold)`, `Series.clip(upper=threshold)` and the equivalent `DataFrame` methods (GH24203)

• `Series.nonzero()` is deprecated and will be removed in a future version (GH18262)

• Passing an integer to `Series.fillna()` and `DataFrame.fillna()` with `timedelta64[ns]` dtypes is deprecated, will raise `TypeError` in a future version. Use `obj.fillna(pd.Timedelta(...))` instead (GH24694)

• `Series.cat.categorical`, `Series.cat.name` and `Series.cat.index` have been deprecated. Use the attributes on `Series.cat` or `Series` directly. (GH24751).

• Passing a dtype without a precision like `np.dtype('datetime64')` or `timedelta64` to `Index`, `DatetimeIndex` and `TimedeltaIndex` is now deprecated. Use the nanosecond-precision dtype instead (GH24753).

### Integer addition/subtraction with datetimes and timeldeltas is deprecated

In the past, users could—in some cases—add or subtract integers or integer-dtype arrays from `Timestamp`, `DatetimeIndex` and `TimedeltaIndex`.

This usage is now deprecated. Instead add or subtract integer multiples of the object’s `freq` attribute (GH21939, GH23878).

*Previous behavior:*
In [6]: ts + 2

In [7]: tdi = pd.timedelta_range('1D', periods=2)
In [8]: tdi - np.array([2, 1])
Out[8]: TimedeltaIndex(['-1 days', '1 days'], dtype='timedelta64[ns]', freq=None)

In [9]: dti = pd.date_range('2001-01-01', periods=2, freq='7D')
In [10]: dti + pd.Index([1, 2])
Out[10]: DatetimeIndex(['2001-01-08', '2001-01-22'], dtype='datetime64[ns]', freq=None)

New behavior:

In [109]: ts + 2 * ts.freq
In [110]: tdi = pd.timedelta_range('1D', periods=2)
In [111]: tdi - np.array([2 * tdi.freq, 1 * tdi.freq])
Out[111]: TimedeltaIndex(['-1 days', '1 days'], dtype='timedelta64[ns]', freq=None)
In [112]: dti = pd.date_range('2001-01-01', periods=2, freq='7D')
In [113]: dti + pd.Index([1 * dti.freq, 2 * dti.freq])
Out[113]: DatetimeIndex(['2001-01-08', '2001-01-22'], dtype='datetime64[ns]', freq=None)

Passing integer data and a timezone to DatetimeIndex

The behavior of DatetimeIndex when passed integer data and a timezone is changing in a future version of pandas. Previously, these were interpreted as wall times in the desired timezone. In the future, these will be interpreted as wall times in UTC, which are then converted to the desired timezone (GH24559).

The default behavior remains the same, but issues a warning:

In [3]: pd.DatetimeIndex([946684800000000000], tz="US/Central")
/bin/ipython:1: FutureWarning: Passing integer-dtype data and a timezone to DatetimeIndex. Integer values will be interpreted differently in a future version of pandas. Previously, these were viewed as datetime64[ns] values representing the wall time *in the specified timezone*. In the future, these will be viewed as datetime64[ns] values representing the wall time *in UTC*. This is similar to a nanosecond-precision UNIX epoch. To accept the future behavior, use

    pd.to_datetime(integer_data, utc=True).tz_convert(tz)

    To keep the previous behavior, use

    pd.to_datetime(integer_data).tz_localize(tz)

    #!/bin/python3
Out[3]: DatetimeIndex(['2000-01-01 00:00:00-06:00'], dtype='datetime64[ns, US/Central]', freq=None)

(continues on next page)
As the warning message explains, opt in to the future behavior by specifying that the integer values are UTC, and then converting to the final timezone:

```
In [114]: pd.to_datetime([946684800000000000], utc=True).tz_convert('US/Central')
Out[114]: DatetimeIndex(['1999-12-31 18:00:00-06:00'], dtype='datetime64[ns, US/Central]', freq=None)
```

The old behavior can be retained with by localizing directly to the final timezone:

```
In [115]: pd.to_datetime([946684800000000000]).tz_localize('US/Central')
Out[115]: DatetimeIndex(['2000-01-01 00:00:00-06:00'], dtype='datetime64[ns, US/Central]', freq=None)
```

### Converting timezone-aware Series and Index to NumPy arrays

The conversion from a `Series` or `Index` with timezone-aware datetime data will change to preserve timezones by default (GH23569).

NumPy doesn’t have a dedicated dtype for timezone-aware datetimes. In the past, converting a `Series` or `DatetimeIndex` with timezone-aware datetimes would convert to a NumPy array by

1. converting the tz-aware data to UTC
2. dropping the timezone-info
3. returning a `numpy.ndarray` with `datetime64[ns]` dtype

Future versions of pandas will preserve the timezone information by returning an object-dtype NumPy array where each value is a `pandas.Timestamp` with the correct timezone attached

```
In [116]: ser = pd.Series(pd.date_range('2000', periods=2, tz='CET'))
In [117]: ser
Out[117]:
0  2000-01-01 00:00:00+01:00
1  2000-01-02 00:00:00+01:00
Length: 2, dtype: datetime64[ns, CET]
```

The default behavior remains the same, but issues a warning

```
In [8]: np.asarray(ser)
/bin/ipython:1: FutureWarning: Converting timezone-aware DatetimeArray to timezone-naive ndarray with 'datetime64[ns]' dtype. In the future, this will return an ndarray with 'object' dtype where each element is a 'pandas.Timestamp' with the correct 'tz'.
To accept the future behavior, pass 'dtype=object'.
To keep the old behavior, pass 'dtype="datetime64[ns]"'.

#!/bin/python3
Out[8]:
array(['1999-12-31T23:00:00.000000000', '2000-01-01T23:00:00.000000000'],
dtype='datetime64[ns]')
```

The previous or future behavior can be obtained, without any warnings, by specifying the `dtype`
**Previous behavior**

```
In [118]: np.asarray(ser, dtype='datetime64[ns]')
Out[118]:
array(['1999-12-31T23:00:00.000000000', '2000-01-01T23:00:00.000000000'],
      dtype='datetime64[ns]')
```

**Future behavior**

```
# New behavior
In [119]: np.asarray(ser, dtype=object)
Out[119]:
array([Timestamp('2000-01-01 00:00:00+0100', tz='CET', freq='D'),
       Timestamp('2000-01-02 00:00:00+0100', tz='CET', freq='D')],
      dtype=object)
```

Or by using `Series.to_numpy()`

```
In [120]: ser.to_numpy()
Out[120]:
array([Timestamp('2000-01-01 00:00:00+0100', tz='CET', freq='D'),
       Timestamp('2000-01-02 00:00:00+0100', tz='CET', freq='D')],
      dtype=object)
```

```
In [121]: ser.to_numpy(dtype="datetime64[ns]")
Out[121]:
array(['1999-12-31T23:00:00.000000000', '2000-01-01T23:00:00.000000000'],
      dtype='datetime64[ns]')
```

All the above applies to a `DatetimeIndex` with tz-aware values as well.

**Removal of prior version deprecations/changes**

- The `LongPanel` and `WidePanel` classes have been removed (GH10892)
- `Series.repeat()` has renamed the `reps` argument to `repeats` (GH14645)
- Several private functions were removed from the (non-public) module `pandas.core.common` (GH22001)
- Removal of the previously deprecated module `pandas.core.datetools` (GH14105, GH14094)
- Strings passed into `DataFrame.groupby()` that refer to both column and index levels will raise a `ValueError` (GH14432)
- `Index.repeat()` and `MultiIndex.repeat()` have renamed the `n` argument to `repeats` (GH14645)
- The `Series` constructor and `.astype` method will now raise a `ValueError` if timestamp dtypes are passed in without a unit (e.g. `np.datetime64`) for the `dtype` parameter (GH15987)
- Removal of the previously deprecated `as_indexer` keyword completely from `str.match()` (GH22356, GH6581)
- The modules `pandas.types`, `pandas.computation`, and `pandas.util.decorators` have been removed (GH16157, GH16250)
- Removed the `pandas.formats.style` shim for `pandas.io.format.style.Styler` (GH16059)
- `pandas.pnow`, `pandas.match`, `pandas.groupby`, `pd.get_store`, `pd.Expr`, and `pd.Term` have been removed (GH15538, GH15940)

5.5. Version 0.24 2745
pandas: powerful Python data analysis toolkit, Release 1.2.2

- `Categorical.searchsorted()` and `Series.searchsorted()` have renamed the `v` argument to `value` (GH14645)
- `pandas.parser`, `pandas.lib`, and `pandas.tslib` have been removed (GH15537)
- `Index.searchsorted()` have renamed the `key` argument to `value` (GH14645)
- `DataFrame.consolidate` and `Series.consolidate` have been removed (GH15501)
- Removal of the previously deprecated module `pandas.json` (GH19944)
- The module `pandas.tools` has been removed (GH15358, GH16005)
- `SparseArray.get_values()` and `SparseArray.to_dense()` have dropped the `fill` parameter (GH14686)
- `DataFrame.sortlevel` and `Series.sortlevel` have been removed (GH15099)
- `SparseSeries.to_dense()` has dropped the `sparse_only` parameter (GH14686)
- `DataFrame.astype()` and `Series.astype()` have renamed the `raise_on_error` argument to `errors` (GH14967)
- `is_sequence`, `is_any_int_dtype`, and `is_floating_dtype` have been removed from `pandas.api.types` (GH16163, GH16189)

Performance improvements

- Slicing Series and DataFrames with a monotonically increasing `CategoricalIndex` is now very fast and has speed comparable to slicing with an `Int64Index`. The speed increase is both when indexing by label (using `.loc`) and position (.iloc) (GH20395) Slicing a monotonically increasing `CategoricalIndex` itself (i.e. `ci[1000:2000]`) shows similar speed improvements as above (GH21659)
- Improved performance of `CategoricalIndex.equals()` when comparing to another `CategoricalIndex` (GH24023)
- Improved performance of `Series.describe()` in case of numeric dtypes (GH21274)
- Improved performance of `pandas.core.groupby.GroupBy.rank()` when dealing with tied rankings (GH21237)
- Improved performance of `DataFrame.set_index()` with columns consisting of `Period` objects (GH21582, GH21606)
- Improved performance of `Series.at()` and `Index.get_value()` for Extension Arrays values (e.g. `Categorical`) (GH24204)
- Improved performance of membership checks in `Categorical` and `CategoricalIndex` (i.e. `x in cat`-style checks are much faster). `CategoricalIndex.contains()` is likewise much faster (GH21369, GH21508)
- Improved performance of `HDFStore.groups()` (and dependent functions like `HDFStore.keys()`), (i.e. `x in store` checks are much faster) (GH21372)
- Improved the performance of `pandas.get_dummies()` with `sparse=True` (GH21997)
- Improved performance of `IndexEngine.get_indexer_non_unique()` for sorted, non-unique indexes (GH9466)
- Improved performance of `PeriodIndex.unique()` (GH23083)
- Improved performance of `concat()` for Series objects (GH23404)
Improved performance of `DatetimeIndex.normalize()` and `Timestamp.normalize()` for timezone naive or UTC datetimes (GH23634)

Improved performance of `DatetimeIndex.tz_localize()` and various `DatetimeIndex` attributes with dateutil UTC timezone (GH23772)

Fixed a performance regression on Windows with Python 3.7 of `read_csv()` (GH23516)

Improved performance of `Categorical` constructor for `Series` objects (GH23814)

Improved performance of `where()` for `Categorical` data (GH24077)

Improved performance of iterating over a `Series`. Using `DataFrame.iteruples()` now creates iterators without internally allocating lists of all elements (GH20783)

Improved performance of `Period` constructor, additionally benefitting `PeriodArray` and `PeriodIndex` creation (GH24084, GH24118)

Improved performance of `tz-aware DatetimeArray` binary operations (GH24491)

**Bug fixes**

**Categorical**

- Bug in `Categorical.from_codes()` where NaN values in codes were silently converted to 0 (GH21767). In the future this will raise a `ValueError`. Also changes the behavior of `from_codes([1, 1, 2.0])`.

- Bug in `Categorical.sort_values()` where NaN values were always positioned in front regardless of `na_position` value. (GH22556).

- Bug when indexing with a boolean-valued `Categorical`. Now a boolean-valued `Categorical` is treated as a boolean mask (GH22665)

- Constructing a `CategoricalIndex` with empty values and boolean categories was raising a `ValueError` after a change to dtype coercion (GH22702).

- Bug in `Categorical.take()` with a user-provided `fill_value` not encoding the `fill_value`, which could result in a `ValueError`, incorrect results, or a segmentation fault (GH23296).

- In `Series.unstack()`, specifying a `fill_value` not present in the categories now raises a `TypeError` rather than ignoring the `fill_value` (GH23284)

- Bug when resampling `DataFrame.resample()` and aggregating on categorical data, the categorical dtype was getting lost. (GH23227)

- Bug in many methods of the `.str-accessor`, which always failed on calling the `CategoricalIndex.str` constructor (GH23555, GH23556)

- Bug in `Series.where()` losing the categorical dtype for categorical data (GH24077)

- Bug in `Categorical.apply()` where NaN values could be handled unpredictably. They now remain unchanged (GH24241)

- Bug in `Categorical` comparison methods incorrectly raising `ValueError` when operating against a `DataFrame` (GH24630)

- Bug in `Categorical.set_categories()` where setting fewer new categories with `rename=True` caused a segmentation fault (GH24675)
Datetimelike

- Fixed bug where two `DateOffset` objects with different `normalize` attributes could evaluate as equal (GH21404)
- Fixed bug where `Timestamp.resolution()` incorrectly returned 1-microsecond `timedelta` instead of 1-nanosecond `Timedelta` (GH21336, GH21365)
- Bug in `to_datetime()` that did not consistently return an `Index` when `box=True` was specified (GH21864)
- Bug in `DatetimeIndex` comparisons where string comparisons incorrectly raises `TypeError` (GH22074)
- Bug in `DatetimeIndex` comparisons when comparing against `timedelta64[ns]` dtyped arrays; in some cases `TypeError` was incorrectly raised, in others it incorrectly failed to raise (GH22074)
- Bug in `DatetimeIndex` comparisons when comparing against object-dtyped arrays (GH22074)
- Bug in `DataFrame` with `datetime64[ns]` dtype addition and subtraction with `Timedelta-like` objects (GH22005, GH22163)
- Bug in `DataFrame` with `datetime64[ns]` dtype addition and subtraction with `DateOffset` objects returning an object dtype instead of `datetime64[ns]` dtype (GH21610, GH22163)
- Bug in `DataFrame` with `datetime64[ns]` dtype subtracting Timestamp-like object incorrectly returned `datetime64[ns]` dtype instead of `timedelta64[ns]` dtype (GH8554, GH22163)
- Bug in `DataFrame` with `datetime64[ns]` dtype subtracting `np.datetime64` object with non-nanosecond unit failing to convert to nanoseconds (GH18874, GH22163)
- Bug in `DataFrame` comparisons against Timestamp-like objects failing to raise `TypeError` for inequality checks with mismatched types (GH8932, GH22163)
- Bug in `DataFrame` with mixed dtypes including `datetime64[ns]` incorrectly raising `TypeError` on equality comparisons (GH13128, GH22163)
- Bug in `DataFrame.values` returning a `DatetimeIndex` for a single-column `DataFrame` with tz-aware `datetime` values. Now a 2-D `numpy.ndarray` of `Timestamp` objects is returned (GH24024)
- Bug in `DataFrame.eq()` comparison against `NaT` incorrectly returning `True` or `NaN` (GH15697, GH22163)
- Bug in `DatetimeIndex` subtraction that incorrectly failed to raise `OverflowError` (GH22492, GH22508)
- Bug in `DatetimeIndex` incorrectly allowing indexing with `Timedelta` object (GH20464)
- Bug in `DatetimeIndex` where frequency was being set if original frequency was `None` (GH22150)
- Bug in rounding methods of `DatetimeIndex` (`round()`, `ceil()`, `floor()`) and `Timestamp` (`round()`, `ceil()`, `floor()`) could give rise to loss of precision (GH22591)
- Bug in `to_datetime()` with an `Index` argument that would drop the name from the result (GH21697)
- Bug in `PeriodIndex` where adding or subtracting a `timedelta` or `Tick` object produced incorrect results (GH22988)
- Bug in the `Series` repr with period-dtype data missing a space before the data (GH23601)
- Bug in `date_range()` when decrementing a start date to a past end date by a negative frequency (GH23270)
- Bug in `Series.min()` which would return `NaN` instead of `NaT` when called on a series of `NaT` (GH23282)
- Bug in `Series.combine_first()` not properly aligning categoricals, so that missing values in `self` where not filled by valid values from `other` (GH24147)
- Bug in `DataFrame.combine()` with datetimelike values raising a TypeError (GH23079)
- Bug in `date_range()` with frequency of Day or higher where dates sufficiently far in the future could wrap around to the past instead of raising OutOfBoundsDatetime (GH14187)
- Bug in `period_range()` ignoring the frequency of start and end when those are provided as Period objects (GH20535).
- Bug in `PeriodIndex` with attribute freq.n greater than 1 where adding a DateOffset object would return incorrect results (GH23215)
- Bug in `Series` that interpreted string indices as lists of characters when setting datetimelike values (GH23451)
- Bug in `DataFrame` when creating a new column from an ndarray of `Timestamp` objects with timezones creating an object-dtype column, rather than datetime with timezone (GH23932)
- Bug in `Timestamp` constructor which would drop the frequency of an input `Timestamp` (GH22311)
- Bug in `DatetimeIndex` where calling `np.array(dtindex, dtype=object)` would incorrectly return an array of long objects (GH23524)
- Bug in `Index` where passing a timezone-aware `DatetimeIndex` and dtype=object would incorrectly raise a ValueError (GH23524)
- Bug in `Index` where calling `np.array(dtindex, dtype=object)` on a timezone-naive `DatetimeIndex` would return an array of datetime objects instead of `Timestamp` objects, potentially losing nanosecond portions of the timestamps (GH23524)
- Bug in `Categorical.__setitem__` not allowing setting with another `Categorical` when both are unordered and have the same categories, but in a different order (GH24142)
- Bug in `date_range()` where using dates with millisecond resolution or higher could return incorrect values or the wrong number of values in the index (GH24110)
- Bug in `DatetimeIndex` where constructing a `DatetimeIndex` from a `Categorical` or `CategoricalIndex` would incorrectly drop timezone information (GH18664)
- Bug in `DatetimeIndex` and `TimedeltaIndex` where indexing with Ellipsis would incorrectly lose the index’s freq attribute (GH21282)
- Clarified error message produced when passing an incorrect freq argument to `DatetimeIndex` with NaT as the first entry in the passed data (GH11587)
- Bug in `to_datetime()` where box and utc arguments were ignored when passing a `DataFrame` or dict of unit mappings (GH23760)
- Bug in `Series.dt` where the cache would not update properly after an in-place operation (GH24408)
- Bug in `PeriodIndex` where comparisons against an array-like object with length 1 failed to raise ValueError (GH23078)
- Bug in `DatetimeIndex.astype()`, `PeriodIndex.astype()` and `TimedeltaIndex.astype()` ignoring the sign of the dtype for unsigned integer dtypes (GH24405).
- Fixed bug in `Series.max()` with datetime64[ns]-dtype failing to return NaT when nulls are present and skipna=False is passed (GH24265)
- Bug in `to_datetime()` where arrays of datetime objects containing both timezone-aware and timezone-naive datetimes would fail to raise ValueError (GH24569)
- Bug in `to_datetime()` with invalid datetime format doesn’t coerce input to NaT even if errors='coerce' (GH24763)
Timedelta

- Bug in DataFrame with timedelta64[ns] dtype division by timedelta-like scalar incorrectly returning timedelta64[ns] dtype instead of float64 dtype (GH20088, GH22163)
- Bug in adding a Index with object dtype to a Series with timedelta64[ns] dtype incorrectly raising (GH22390)
- Bug in multiplying a Series with numeric dtype against a timedelta object (GH22390)
- Bug in Series with numeric dtype when adding or subtracting an array or Series with timedelta64 dtypes (GH22390)
- Bug in Index with numeric dtype when multiplying or dividing an array with dtype timedelta64 (GH22390)
- Bug in TimedeltaIndex incorrectly allowing indexing with Timestamp object (GH20464)
- Fixed bug where subtracting Timedelta from an object-dtyped array would raise TypeError (GH21980)
- Fixed bug in adding a DataFrame with all-timedelta64[ns] dtypes to a DataFrame with all-integer dtypes returning incorrect results instead of raising TypeError (GH22696)
- Bug in TimedeltaIndex where adding a timezone-aware datetime scalar incorrectly returned a timezone-naive DatetimeIndex (GH23215)
- Bug in TimedeltaIndex where adding np.timedelta64('NaT') incorrectly returned an all-NaT DatetimeIndex instead of an all-NaT TimedeltaIndex (GH23215)
- Bug in Timedelta and to_timedelta() have inconsistencies in supported unit string (GH21762)
- Bug in TimedeltaIndex division where dividing by another TimedeltaIndex raised TypeError instead of returning a Float64Index (GH23829, GH22631)
- Bug in TimedeltaIndex comparison operations where comparing against non-Timedelta-like objects would raise TypeError instead of returning all-False for __eq__ and all-True for __ne__ (GH24056)
- Bug in Timedelta comparisons when comparing with a Tick object incorrectly raising TypeError (GH24710)

Timezones

- Bug in Index.shift() where an AssertionError would raise when shifting across DST (GH8616)
- Bug in Timestamp constructor where passing an invalid timezone offset designator (Z) would not raise a ValueError (GH8910)
- Bug in Timestamp.replace() where replacing at a DST boundary would retain an incorrect offset (GH7825)
- Bug in Series.replace() with datetime64[ns, tz] data when replacing NaT (GH11792)
- Bug in Timestamp when passing different string date formats with a timezone offset would produce different timezone offsets (GH12064)
- Bug when comparing a tz-naive Timestamp to a tz-aware DatetimeIndex which would coerce the DatetimeIndex to tz-naive (GH12601)
- Bug in Series.truncate() with a tz-aware DatetimeIndex which would cause a core dump (GH9243)
- Bug in Series constructor which would coerce tz-aware and tz-naive Timestamp to tz-aware (GH13051)
- Bug in Index with datetime64[ns, tz] dtype that did not localize integer data correctly (GH20964)
Bug in `DatetimeIndex` where constructing with an integer and tz would not localize correctly (GH12619)

Fixed bug where `DataFrame.describe()` and `Series.describe()` on tz-aware datetimes did not show first and last result (GH21328)

Bug in `DatetimeIndex` comparisons failing to raise `TypeError` when comparing timezone-aware `DatetimeIndex` against `np.datetime64` (GH22074)

Bug in `DataFrame` assignment with a timezone-aware scalar (GH19843)

Bug in `DataFrame.asof()` that raised a `TypeError` when attempting to compare tz-naive and tz-aware timestamps (GH21194)

Bug when constructing a `DatetimeIndex` with `Timestamp` constructed with the `replace` method across DST (GH18785)

Bug when setting a new value with `DataFrame.loc()` with a `DatetimeIndex` with a DST transition (GH18308, GH20724)

Bug in `Index.unique()` that did not re-localize tz-aware dates correctly (GH21737)

Bug when indexing a `Series` with a DST transition (GH21846)

Bug in `DataFrame.resample()` and `Series.resample()` where an `AmbiguousTimeError` or `NonExistentTimeError` would raise if a timezone aware timeseries ended on a DST transition (GH19375, GH10117)

Bug in `DataFrame.drop()` and `Series.drop()` when specifying a tz-aware Timestamp key to drop from a `DatetimeIndex` with a DST transition (GH21761)

Bug in `DatetimeIndex` constructor where `NaT` and `dateutil.tz.tzlocal` would raise an `OutOfBoundsDatetime` error (GH23807)

Bug in `DatetimeIndex.tz_localize()` and `Timestamp.tz_localize()` with `dateutil.tz.tzlocal` near a DST transition that would return an incorrectly localized datetime (GH23807)

Bug in `Timestamp` constructor where a `dateutil.tz.tzutc` timezone passed with a `datetime` argument would be converted to a `pytz.UTC` timezone (GH23807)

Bug in `to_datetime()` where `utc=True` was not respected when specifying a unit and `errors='ignore'` (GH23758)

Bug in `to_datetime()` where `utc=True` was not respected when passing a `Timestamp` (GH24415)

Bug in `DataFrame.any()` returns wrong value when `axis=1` and the data is of datetimelike type (GH23070)

Bug in `DatetimeIndex.to_period()` where a timezone aware index was converted to UTC first before creating `PeriodIndex` (GH22905)

Bug in `DataFrame.tz_localize()`, `DataFrame.tz_convert()`, `Series.tz_localize()` and `Series.tz_convert()` where `copy=False` would mutate the original argument inplace (GH6326)

Bug in `DataFrame.max()` and `DataFrame.min()` with `axis=1` where a `Series` with NaN would be returned when all columns contained the same timezone (GH10390)
Offsets

- Bug in FY5253 where date offsets could incorrectly raise an `AssertionError` in arithmetic operations (GH14774)
- Bug in `DateOffset` where keyword arguments week and milliseconds were accepted and ignored. Passing these will now raise `ValueError` (GH19398)
- Bug in adding `DateOffset` with `DataFrame` or `PeriodIndex` incorrectly raising `TypeError` (GH23215)
- Bug in comparing `DateOffset` objects with non-`DateOffset` objects, particularly strings, raising `ValueError` instead of returning `False` for equality checks and `True` for not-equal checks (GH23524)

Numeric

- Bug in `Series` `__rmatmul__` doesn’t support matrix vector multiplication (GH21530)
- Bug in `factorize()` fails with read-only array (GH12813)
- Fixed bug in `unique()` handled signed zeros inconsistently: for some inputs 0.0 and -0.0 were treated as equal and for some inputs as different. Now they are treated as equal for all inputs (GH21866)
- Bug in `DataFrame.agg()`, `DataFrame.transform()` and `DataFrame.apply()` where, when supplied with a list of functions and `axis=1` (e.g. `df.apply(['sum', 'mean'], axis=1)`), a `TypeError` was wrongly raised. For all three methods such calculation are now done correctly. (GH16679).
- Bug in `Series` comparison against datetime-like scalars and arrays (GH22074)
- Bug in `DataFrame` multiplication between boolean dtype and integer returning `object` dtype instead of integer dtype (GH22047, GH22163)
- Bug in `DataFrame.apply()` where, when supplied with a string argument and additional positional or keyword arguments (e.g. `df.apply('sum', min_count=1)`), a `TypeError` was wrongly raised (GH22376)
- Bug in `DataFrame.astype()` to extension dtype may raise `AttributeError` (GH22578)
- Bug in `DataFrame` with `timedelta64 [ns]` dtype arithmetic operations with `ndarray` with integer dtype incorrectly treating the `ndarray` as `timedelta64 [ns]` dtype (GH23114)
- Bug in `Series.rpow()` with object dtype NaN for 1 ** NA instead of 1 (GH22922).
- `Series.agg()` can now handle numpy NaN-aware methods like `numpy.nansum()` (GH19629)
- Bug in `Series.rank()` and `DataFrame.rank()` when `pct=True` and more than `2**4` rows are present resulted in percentages greater than 1.0 (GH18271)
- Calls such as `DataFrame.round()` with a non-unique `CategoricalIndex()` now return expected data. Previously, data would be improperly duplicated (GH21809).
- Added `log10`, `floor` and `ceil` to the list of supported functions in `DataFrame.eval()` (GH24139, GH24353)
- Logical operations `&`, `|`, `^` between `Series` and `Index` will no longer raise `ValueError` (GH22092)
- Checking PEP 3141 numbers in `is_scalar()` function returns `True` (GH22903)
- Reduction methods like `Series.sum()` now accept the default value of `keepdims=False` when called from a NumPy ufunc, rather than raising a `TypeError`. Full support for `keepdims` has not been implemented (GH24356).
Conversion

- Bug in `DataFrame.combine_first()` in which column types were unexpectedly converted to float (GH20699)
- Bug in `DataFrame.clip()` in which column types are not preserved and casted to float (GH24162)
- Bug in `DataFrame.clip()` when order of columns of dataframes doesn’t match, result observed is wrong in numeric values (GH20911)
- Bug in `DataFrame.astype()` where converting to an extension dtype when duplicate column names are present causes a RecursionError (GH24704)

Strings

- Bug in `Index.str.partition()` was not nan-safe (GH23558).
- Bug in `Index.str.split()` was not nan-safe (GH23677).
- Bug `Series.str.contains()` not respecting the `na` argument for a Categorical dtype Series (GH22158)
- Bug in `Index.str.cat()` when the result contained only NaN (GH24044)

Interval

- Bug in the `IntervalIndex` constructor where the `closed` parameter did not always override the inferred closed (GH19370)
- Bug in the `IntervalIndex` repr where a trailing comma was missing after the list of intervals (GH20611)
- Bug in `Interval` where scalar arithmetic operations did not retain the `closed` value (GH22313)
- Bug in `IntervalIndex` where indexing with datetime-like values raised a `KeyError` (GH20636)
- Bug in `IntervalTree` where data containing NaN triggered a warning and resulted in incorrect indexing queries with `IntervalIndex` (GH23352)

Indexing

- Bug in `DataFrame.ne()` fails if columns contain column name “dtype” (GH22383)
- The traceback from a `KeyError` when asking `.loc` for a single missing label is now shorter and more clear (GH21557)
- `PeriodIndex` now emits a `KeyError` when a malformed string is looked up, which is consistent with the behavior of `DatetimeIndex` (GH22803)
- When `.ix` is asked for a missing integer label in a `MultiIndex` with a first level of integer type, it now raises a `KeyError`, consistently with the case of a flat `Int64Index`, rather than falling back to positional indexing (GH21593)
- Bug in `Index.reindex()` when reindexing a tz-naive and tz-aware `DatetimeIndex` (GH8306)
- Bug in `Series.reindex()` when reindexing an empty series with a `datetime64[ns, tz]` dtype (GH20869)
- Bug in `DataFrame` when setting values with `.loc` and a timezone aware `DatetimeIndex` (GH11365)
**DataFrame.__getitem__** now accepts dictionaries and dictionary keys as list-likes of labels, consistently with **Series.__getitem__** (GH21294)

**Fixed DataFrame[np.nan]** when columns are non-unique (GH21428)

**Bug when indexing DatetimeIndex** with nanosecond resolution dates and timezones (GH11679)

**Bug when indexing with a Numpy array containing negative values would mutate the indexer** (GH21867)

**Bug where mixed indexes wouldn’t allow integers for .at** (GH19860)

**Float64Index.get_loc** now raises **KeyError** when boolean key passed. (GH19087)

**Bug in DataFrame.loc()** when indexing with an **IntervalIndex** (GH19977)

**Index** no longer mangles None, NaN and NaT, i.e. they are treated as three different keys. However, for numeric Index all three are still coerced to a NaN (GH22332)

**Bug in scalar in Index** if scalar is a float while the Index is of integer dtype (GH22085)

**Bug in MultiIndex.set_levels()** when levels value is not subscriptable (GH23273)

**Bug where setting a timedelta column by Index** causes it to be casted to double, and therefore lose precision (GH23511)

**Bug in Index.union()** and **Index.intersection()** where name of the Index of the result was not computed correctly for certain cases (GH9943, GH9862)

**Bug in Index slicing with boolean Index** may raise **TypeError** (GH22533)

**Bug in PeriodArray.__setitem__** when accepting slice and list-like value (GH23978)

**Bug in DatetimeIndex, TimedeltaIndex** where indexing with Ellipsis would lose their freq attribute (GH21282)

**Bug in iat** where using it to assign an incompatible value would create a new column (GH23236)

**Missing**

**Bug in DataFrame.fillna()** where a **ValueError** would raise when one column contained a datetim64[ns, tz] dtype (GH15522)

**Bug in Series.hasnans()** that could be incorrectly cached and return incorrect answers if null elements are introduced after an initial call (GH19700)

**Series.isin()** now treats all NaN-floats as equal also for np.object-dtype. This behavior is consistent with the behavior for float64 (GH22119)

**unique()** no longer mangles NaN-floats and the NaT-object for np.object-dtype, i.e. NaT is no longer coerced to a NaN-value and is treated as a different entity. (GH22295)

**DataFrame and Series** now properly handle numpy masked arrays with hardened masks. Previously, constructing a DataFrame or Series from a masked array with a hard mask would create a pandas object containing the underlying value, rather than the expected NaN. (GH24574)

**Bug in DataFrame constructor** where dtype argument was not honored when handling numpy masked record arrays. (GH24874)
MultiIndex

- Bug in `io.formats.style.Styler.applymap()` where subset= with MultiIndex slice would reduce to Series (GH19861)
- Removed compatibility for MultiIndex pickles prior to version 0.8.0; compatibility with MultiIndex pickles from version 0.13 forward is maintained (GH21654)
- `MultiIndex.get_loc_level()` (and as a consequence, .loc on a Series or DataFrame with a MultiIndex index) will now raise a KeyError, rather than returning an empty slice, if asked a label which is present in the levels but is unused (GH22221)
- MultiIndex has gained the `MultiIndex.from_frame()`, it allows constructing a MultiIndex object from a DataFrame (GH22420)
- Fix TypeError in Python 3 when creating MultiIndex in which some levels have mixed types, e.g. when some labels are tuples (GH15457)

IO

- Bug in `read_csv()` in which a column specified with CategoricalDtype of boolean categories was not being correctly coerced from string values to booleans (GH20498)
- Bug in `read_csv()` in which unicode column names were not being properly recognized with Python 2.x (GH13253)
- Bug in `DataFrame.to_sql()` when writing timezone aware data (datetime64[ns, tz] dtype) would raise a TypeError (GH9086)
- Bug in `DataFrame.to_sql()` where a naive DatetimeIndex would be written as TIMESTAMP WITH TIMEZONE type in supported databases, e.g. PostgreSQL (GH23510)
- Bug in `read_excel()` when parse_cols is specified with an empty dataset (GH9208)
- `read_html()` no longer ignores all-whitespace `<tr>` within `<thead>` when considering the skiprows and header arguments. Previously, users had to decrease their header and skiprows values on such tables to work around the issue. (GH21641)
- `read_excel()` will correctly show the deprecation warning for previously deprecated sheetname (GH17994)
- `read_csv()` and `read_table()` will throw UnicodeError and not coredump on badly encoded strings (GH22748)
- `read_csv()` will correctly parse timezone-aware datetimes (GH22256)
- Bug in `read_csv()` in which memory management was prematurely optimized for the C engine when the data was being read in chunks (GH23509)
- Bug in `read_csv()` in unnamed columns were being improperly identified when extracting a multi-index (GH23687)
- `read_sas()` will parse numbers in sas7bdat-files that have width less than 8 bytes correctly. (GH21616)
- `read_sas()` will correctly parse sas7bdat files with many columns (GH22628)
- `read_sas()` will correctly parse sas7bdat files with data page types having also bit 7 set (so page type is 128 + 256 = 384) (GH16615)
- Bug in `read_sas()` in which an incorrect error was raised on an invalid file format. (GH24548)
- Bug in `detect_client_encoding()` where potential IOError goes unhandled when importing in a mod_wsgi process due to restricted access to stdout. (GH21552)
- Bug in `DataFrame.to_html()` with `index=False` misses truncation indicators (…) on truncated DataFrame (GH15019, GH22783)
- Bug in `DataFrame.to_html()` with `index=False` when both columns and row index are MultiIndex (GH22579)
- Bug in `DataFrame.to_html()` with `index_names=False` displaying index name (GH22747)
- Bug in `DataFrame.to_html()` with `header=False` not displaying row index names (GH23788)
- Bug in `DataFrame.to_html()` with `sparsify=False` that caused it to raise TypeError (GH22887)
- Bug in `DataFrame.to_string()` that broke column alignment when `index=False` and width of first column’s values is greater than the width of first column’s header (GH16839, GH13032)
- Bug in `DataFrame.to_string()` that caused representations of `DataFrame` to not take up the whole window (GH22984)
- Bug in `DataFrame.to_csv()` where a single level MultiIndex incorrectly wrote a tuple. Now just the value of the index is written (GH19589).
- HDFStore will raise `ValueError` when the format kwarg is passed to the constructor (GH13291)
- Bug in `HDFStore.append()` when appending a `DataFrame` with an empty string column and `min_itemsize < 8` (GH12242)
- Bug in `read_csv()` in which memory leaks occurred in the C engine when parsing NaN values due to insufficient cleanup on completion or error (GH21353)
- Bug in `read_csv()` in which incorrect error messages were being raised when `skipfooter` was passed in along with `nrows`, `iterator`, or `chunksize` (GH23711)
- Bug in `read_csv()` in which `MultiIndex` index names were being improperly handled in the cases when they were not provided (GH23484)
- Bug in `read_csv()` in which unnecessary warnings were being raised when the dialect’s values conflicted with the default arguments (GH23761)
- Bug in `read_html()` in which the error message was not displaying the valid flavors when an invalid one was provided (GH23549)
- Bug in `read_excel()` in which extraneous header names were extracted, even though none were specified (GH11733)
- Bug in `read_excel()` in which column names were not being properly converted to string sometimes in Python 2.x (GH23874)
- Bug in `read_excel()` in which `index_col=None` was not being respected and parsing index columns anyway (GH18792, GH20480)
- Bug in `read_excel()` in which `usecols` was not being validated for proper column names when passed in as a string (GH20480)
- Bug in `DataFrame.to_dict()` when the resulting dict contains non-Python scalars in the case of numeric data (GH23753)
- `DataFrame.to_string()`, `DataFrame.to_html()`, `DataFrame.to_latex()` will correctly format output when a string is passed as the `float_format` argument (GH21625, GH22270)
- Bug in `read_csv()` that caused it to raise `OverflowError` when trying to use ‘inf’ as `na_value` with integer index column (GH17128)
• Bug in `read_csv()` that caused the C engine on Python 3.6+ on Windows to improperly read CSV filenames with accented or special characters (GH15086)

• Bug in `read_fwf()` in which the compression type of a file was not being properly inferred (GH22199)

• Bug in pandas.io.json.json_normalize() that caused it to raise TypeError when two consecutive elements of record_path are dicts (GH22706)

• Bug in `DataFrame.to_stata()`, pandas.io.stata.StataWriter and pandas.io.stata.StataWriter117 where a exception would leave a partially written and invalid dta file (GH23573)

• Bug in `DataFrame.to_stata()` and pandas.io.stata.StataWriter117 that produced invalid files when using strLs with non-ASCII characters (GH23573)

• Bug in HDFStore that caused it to raise ValueError when reading a Dataframe in Python 3 from fixed format written in Python 2 (GH24510)

• Bug in `DataFrame.to_string()` and more generally in the floating `repr` formatter. Zeros were not trimmed if inf was present in a columns while it was the case with NA values. Zeros are now trimmed as in the presence of NA (GH24861).

• Bug in the `repr` when truncating the number of columns and having a wide last column (GH24849).

Plotting

• Bug in `DataFrame.plot.scatter()` and `DataFrame.plot.hexbin()` caused x-axis label and tick-labels to disappear when colorbar was on in IPython inline backend (GH10611, GH10678, and GH20455)

• Bug in plotting a Series with datetimes using matplotlib.axes.Axes.scatter() (GH22039)

• Bug in `DataFrame.plot.bar()` caused bars to use multiple colors instead of a single one (GH20585)

• Bug in validating color parameter caused extra color to be appended to the given color array. This happened to multiple plotting functions using matplotlib. (GH20726)

GroupBy/resample/rolling

• Bug in pandas.core.window.Rolling.min() and pandas.core.window.Rolling.max() with closed='left', a datetime-like index and only one entry in the series leading to segfault (GH24718)

• Bug in pandas.core.groupby.GroupBy.first() and pandas.core.groupby.GroupBy.last() with as_index=False leading to the loss of timezone information (GH15884)

• Bug in `DataFrame.resample()` when downsampling across a DST boundary (GH8531)

• Bug in date anchoring for `DataFrame.resample()` with offset Day when n > 1 (GH24127)

• Bug where ValueError is wrongly raised when calling count() method of a SeriesGroupBy when the grouping variable only contains NaNs and numpy version < 1.13 (GH21956).

• Multiple bugs in pandas.core.window.Rolling.min() with closed='left' and a datetime-like index leading to incorrect results and also segfault. (GH21704)

• Bug in pandas.core.resample.Resampler.apply() when passing positional arguments to applied func (GH14615).

• Bug in `Series.resample()` when passing numpy.timedelta64 to offset kwarg (GH7687).

• Bug in pandas.core.resample.Resampler.asfreq() when frequency of TimedeltaIndex is a subperiod of a new frequency (GH13022).
• Bug in `pandas.core.groupby.SeriesGroupBy.mean()` when values were integral but could not fit inside of int64, overflowing instead. (GH22487)

• `pandas.core.groupby.RollingGroupby.agg()` and `pandas.core.groupby.ExpandingGroupby.agg()` now support multiple aggregation functions as parameters (GH15072)

• Bug in `DataFrame.resample()` and `Series.resample()` when resampling by a weekly offset (‘W’) across a DST transition (GH9119, GH21459)

• Bug in `DataFrame.expanding()` in which the axis argument was not being respected during aggregations (GH23372)

• Bug in `pandas.core.groupby.GroupBy.transform()` which caused missing values when the input function can accept a `DataFrame` but renames it (GH23455).

• Bug in `pandas.core.groupby.GroupBy.nth()` where column order was not always preserved (GH20760)

• Bug in `pandas.core.groupby.GroupBy.rank()` with method='dense' and pct=True when a group has only one member would raise a `ZeroDivisionError` (GH23666).

• Calling `pandas.core.groupby.GroupBy.rank()` with empty groups and pct=True was raising a `ZeroDivisionError` (GH22519)

• Bug in `DataFrame.resample()` when resampling NaT in `TimeDeltaIndex` (GH13223).

• Bug in `DataFrame.groupby()` did not respect the observed argument when selecting a column and instead always used observed=False (GH23970)

• Bug in `pandas.core.groupby.SeriesGroupBy.pct_change()` or `pandas.core.groupby.DataFrameGroupBy.pct_change()` would previously work across groups when calculating the percent change, where it now correctly works per group (GH21200, GH21235).

• Bug preventing hash table creation with very large number (2^32) of rows (GH22805)

• Bug in groupby when grouping on categorical causes `ValueError` and incorrect grouping if observed=True and nan is present in categorical column (GH24740, GH21151).

Reshaping

• Bug in `pandas.concat()` when joining resampled DataFrames with timezone aware index (GH13783)

• Bug in `pandas.concat()` when joining only Series the names argument of concat is no longer ignored (GH23490)

• Bug in `Series.combine_first()` with datetime64[ns, tz] dtype which would return tz-naive result (GH21469)

• Bug in `Series.where()` and `DataFrame.where()` with datetime64[ns, tz] dtype (GH21546)

• Bug in `DataFrame.where()` with an empty DataFrame and empty cond having non-bool dtype (GH21947)

• Bug in `Series.mask()` and `DataFrame.mask()` with list conditionals (GH21891)

• Bug in `DataFrame.replace()` raises RecursionError when converting OutOfBounds datetime64[ns, tz] (GH20380)

• `pandas.core.groupby.GroupBy.rank()` now raises a `ValueError` when an invalid value is passed for argument na_option (GH22124)

• Bug in `get_dummies()` with Unicode attributes in Python 2 (GH22084)

• Bug in `DataFrame.replace()` raises RecursionError when replacing empty lists (GH22083)
• Bug in `Series.replace()` and `DataFrame.replace()` when dict is used as the `to_replace` value and one key in the dict is another key’s value, the results were inconsistent between using integer key and using string key (GH20656)

• Bug in `DataFrame.drop_duplicates()` for empty DataFrame which incorrectly raises an error (GH20516)

• Bug in `pandas.wide_to_long()` when a string is passed to the stubnames argument and a column name is a substring of that stubname (GH22468)

• Bug in `merge()` when merging `datetime64[ns, tz]` data that contained a DST transition (GH18885)

• Bug in `merge_asof()` when merging on float values within defined tolerance (GH22981)

• Bug in `pandas.concat()` when concatenating a multicolumn DataFrame with tz-aware data against a DataFrame with a different number of columns (GH23189)

• Bug in `merge_asof()` where confusing error message raised when attempting to merge with missing values (GH23033)

• Bug in `DataFrame.nsmallest()` and `DataFrame.nlargest()` for dataframes that have a `MultiIndex` for columns (GH23033).

• Bug in `pandas.melt()` when passing column names that are not present in DataFrame (GH23575)

• Bug in `DataFrame.append()` with a `Series` with a dateutil timezone would raise a `TypeError` (GH23682)

• Bug in `Series` construction when passing no data and `dtype=str` (GH22477)

• Bug in `cut()` with `bins` as an overlapping `IntervalIndex` where multiple bins were returned per item instead of raising a `ValueError` (GH23980)

• Bug in `pandas.concat()` when joining `Series` datetimetz with `Series` category would lose timezone (GH23816)

• Bug in `DataFrame.join()` when joining on partial MultiIndex would drop names (GH20452).

• `DataFrame.nlargest()` and `DataFrame.nsmallest()` now returns the correct n values when keep != ‘all’ also when tied on the first columns (GH22752)

• Constructing a DataFrame with an index argument that wasn’t already an instance of `Index` was broken (GH22227).

• Bug in `DataFrame` prevented list subclasses to be used to construction (GH21226)

• Bug in `DataFrame.unstack()` and `DataFrame.pivot_table()` returning a misleading error message when the resulting DataFrame has more elements than int32 can handle. Now, the error message is improved, pointing towards the actual problem (GH20601)

• Bug in `DataFrame.unstack()` where a `ValueError` was raised when unstacking timezone aware values (GH18338)

• Bug in `DataFrame.stack()` where timezone aware values were converted to timezone naive values (GH19420)

• Bug in `merge_asof()` where a `TypeError` was raised when `by_col` were timezone aware values (GH21184)

• Bug showing an incorrect shape when throwing error during `DataFrame` construction. (GH20742)
Sparse

- Updating a boolean, datetime, or timedelta column to be Sparse now works (GH22367)
- Bug in Series.to_sparse() with Series already holding sparse data not constructing properly (GH22389)
- Providing a sparse_index to the SparseArray constructor no longer defaults the na-value to np.nan for all dtypes. The correct na_value for data.dtype is now used.
- Bug in SparseArray.nbytes under-reporting its memory usage by not including the size of its sparse index.
- Improved performance of Series.shift() for non-NA fill_value, as values are no longer converted to a dense array.
- Bug in DataFrame.groupby not including fill_value in the groups for non-NA fill_value when grouping by a sparse column (GH5078)
- Bug in unary inversion operator (~) on a SparseSeries with boolean values. The performance of this has also been improved (GH22835)
- Bug in SparseArray.unique() not returning the unique values (GH19595)
- Bug in SparseArray.nonzero() and SparseDataFrame.dropna() returning shifted/incorrect results (GH21172)
- Bug in DataFrame.apply() where dtypes would lose sparseness (GH23744)
- Bug in concat() when concatenating a list of Series with all-sparse values changing the fill_value and converting to a dense Series (GH24371)

Style

- background_gradient() now takes a text_color_threshold parameter to automatically lighten the text color based on the luminance of the background color. This improves readability with dark background colors without the need to limit the background colormap range. (GH21258)
- background_gradient() now also supports tablewise application (in addition to rowwise and columnwise) with axis=None (GH15204)
- bar() now also supports tablewise application (in addition to rowwise and columnwise) with axis=None and setting clipping range with vmin and vmax (GH21548 and GH21526). NaN values are also handled properly.

Build changes

- Building pandas for development now requires cython >= 0.28.2 (GH21688)
- Testing pandas now requires hypothesis>=3.58. You can find the Hypothesis docs here, and a pandas-specific introduction in the contributing guide. (GH22280)
- Building pandas on macOS now targets minimum macOS 10.9 if run on macOS 10.9 or above (GH23424)
Other

- Bug where C variables were declared with external linkage causing import errors if certain other C libraries were imported before pandas. (GH24113)

5.6 Version 0.23

5.6.1 What’s new in 0.23.4 (August 3, 2018)

This is a minor bug-fix release in the 0.23.x series and includes some small regression fixes and bug fixes. We recommend that all users upgrade to this version.

Warning: Starting January 1, 2019, pandas feature releases will support Python 3 only. See Dropping Python 2.7 for more.

What’s new in v0.23.4

• Fixed regressions
• Bug fixes
• Contributors
Fixed regressions

- Python 3.7 with Windows gave all missing values for rolling variance calculations (GH21813)

Bug fixes

Groupby/resample/rolling

- Bug where calling `DataFrameGroupBy.agg()` with a list of functions including `ohlc` as the non-initial element would raise a `ValueError` (GH21716)

- Bug in `roll_quantile` caused a memory leak when calling `.rolling(...).quantile(q)` with q in (0,1) (GH21965)

Missing

- Bug in `Series.clip()` and `DataFrame.clip()` cannot accept list-like threshold containing `NaN` (GH19992)

Contributors

A total of 6 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

- Jeff Reback
- MeeseeksMachine +

- chris-b1
- h-vetinari
- meeseeksdev[bot]

5.6.2 What’s new in 0.23.3 (July 7, 2018)

This release fixes a build issue with the sdist for Python 3.7 (GH21785) There are no other changes.

Contributors

A total of 2 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

- Tom Augspurger
- meeseeksdev[bot] +
5.6.3 What’s new in 0.23.2 (July 5, 2018)

This is a minor bug-fix release in the 0.23.x series and includes some small regression fixes and bug fixes. We recommend that all users upgrade to this version.

Note: pandas 0.23.2 is first pandas release that’s compatible with Python 3.7 (GH20552)

Warning: Starting January 1, 2019, pandas feature releases will support Python 3 only. See Dropping Python 2.7 for more.

What’s new in v0.23.2

- Logical reductions over entire DataFrame
- Fixed regressions
- Build changes
- Bug fixes
- Contributors

Logical reductions over entire DataFrame

`DataFrame.all()` and `DataFrame.any()` now accept `axis=None` to reduce over all axes to a scalar (GH19976)

```python
In [1]: df = pd.DataFrame({"A": [1, 2], "B": [True, False]})
In [2]: df.all(axis=None)
Out[2]: False
```

This also provides compatibility with NumPy 1.15, which now dispatches to `DataFrame.all`. With NumPy 1.15 and pandas 0.23.1 or earlier, `numpy.all()` will no longer reduce over every axis:

```python
>>> np.any(pd.DataFrame({"A": [False], "B": [False]}))
A  False
B  False
dtype: bool
```

With pandas 0.23.2, that will correctly return False, as it did with NumPy < 1.15.

```python
In [3]: np.any(pd.DataFrame({"A": [False], "B": [False]}))
Out[3]: False
```
Fixed regressions

- Fixed regression in `to_csv()` when handling file-like object incorrectly (GH21471)
- Re-allowed duplicate level names of a `MultiIndex`. Accessing a level that has a duplicate name by name still raises an error (GH19029).
- Bug in both `DataFrame.first_valid_index()` and `Series.first_valid_index()` raised for a row index having duplicate values (GH21441)
- Fixed printing of DataFrames with hierarchical columns with long names (GH21180)
- Fixed regression in `reindex()` and `groupby()` with a MultiIndex or multiple keys that contains categorical datetime-like values (GH21390).
- Fixed regression in unary negative operations with object dtype (GH21380)
- Bug in `Timestamp.ceil()` and `Timestamp.floor()` when timestamp is a multiple of the rounding frequency (GH21262)
- Fixed regression in `to_clipboard()` that defaulted to copying dataframes with space delimited instead of tab delimited (GH21104)

Build changes

- The source and binary distributions no longer include test data files, resulting in smaller download sizes. Tests relying on these data files will be skipped when using `pandas.test()` (GH19320)

Bug fixes

Conversion

- Bug in constructing `Index` with an iterator or generator (GH21470)
- Bug in `Series.nlargest()` for signed and unsigned integer dtypes when the minimum value is present (GH21426)

Indexing

- Bug in `Index.get_indexer_non_unique()` with categorical key (GH21448)
- Bug in comparison operations for `MultiIndex` where error was raised on equality / inequality comparison involving a MultiIndex with `nlevels == 1` (GH21149)
- Bug in `DataFrame.drop()` behaviour is not consistent for unique and non-unique indexes (GH21494)
- Bug in `DataFrame.duplicated()` with a large number of columns causing a ‘maximum recursion depth exceeded’ (GH21524).

I/O

- Bug in `read_csv()` that caused it to incorrectly raise an error when `nrows=0, low_memory=True, and index_col` was not `None` (GH21141)
- Bug in `json_normalize()` when formatting the `record_prefix` with integer columns (GH21536)

Categorical

- Bug in rendering `Series` with `Categorical` dtype in rare conditions under Python 2.7 (GH21002)

Timezones
• Bug in `Timestamp` and `DatetimeIndex` where passing a `Timestamp` localized after a DST transition would return a datetime before the DST transition (GH20854)

• Bug in comparing `DataFrame` with tz-aware `DatetimeIndex` columns with a DST transition that raised a `KeyError` (GH19970)

• Bug in `DatetimeIndex.shift()` where an `AssertionError` would raise when shifting across DST (GH8616)

• Bug in `Timestamp` constructor where passing an invalid timezone offset designator (`Z`) would not raise a `ValueError` (GH8910)

• Bug in `Timestamp.replace()` where replacing at a DST boundary would retain an incorrect offset (GH7825)

• Bug in `DatetimeIndex.reindex()` when reindexing a tz-naive and tz-aware `DatetimeIndex` (GH8306)

• Bug in `DatatetimeIndex.resample()` when downsampling across a DST boundary (GH8531)

Timedelta

• Bug in `Timedelta` where non-zero timedeltas shorter than 1 microsecond were considered False (GH21484)

5.6.4 What’s new in 0.23.1 (June 12, 2018)

This is a minor bug-fix release in the 0.23.x series and includes some small regression fixes and bug fixes. We recommend that all users upgrade to this version.

**Warning:** Starting January 1, 2019, pandas feature releases will support Python 3 only. See Dropping Python 2.7 for more.

What’s new in v0.23.1

- **Fixed regressions**
- **Performance improvements**
- **Bug fixes**
- **Contributors**

**Fixed regressions**

Comparing Series with datetime.date

We’ve reverted a 0.23.0 change to comparing a `Series` holding datetimes and a `datetime.date` object (GH21152). In pandas 0.22 and earlier, comparing a `Series` holding datetimes and `datetime.date` objects would coerce the `datetime.date` to a datetime before comparing. This was inconsistent with Python, NumPy, and `DatetimeIndex`, which never consider a datetime and `datetime.date` equal.

In 0.23.0, we unified operations between DatetimeIndex and Series, and in the process changed comparisons between a Series of datetimes and `datetime.date` without warning.

We’ve temporarily restored the 0.22.0 behavior, so datetimes and dates may again compare equal, but restore the 0.23.0 behavior in a future release.

To summarize, here’s the behavior in 0.22.0, 0.23.0, 0.23.1:

```
# 0.22.0... Silently coerce the datetime.date
>>> import datetime
>>> pd.Series(pd.date_range('2017', periods=2)) == datetime.date(2017, 1, 1)
0    True
1   False
dtype: bool

# 0.23.0... Do not coerce the datetime.date
>>> pd.Series(pd.date_range('2017', periods=2)) == datetime.date(2017, 1, 1)
0    False
1    False
dtype: bool

# 0.23.1... Coerce the datetime.date with a warning
>>> pd.Series(pd.date_range('2017', periods=2)) == datetime.date(2017, 1, 1)
/bin/python:1: FutureWarning: Comparing Series of datetimes with 'datetime.date'.
Currently, the 'datetime.date' is coerced to a datetime. In the future pandas will not coerce, and the values not compare equal to the 'datetime.date'.
To retain the current behavior, convert the 'datetime.date' to a
```

(continues on next page)
datetime with 'pd.Timestamp'.

```python
#!/bin/python3
0  True
1  False
dtype: bool
```

In addition, ordering comparisons will raise a `TypeError` in the future.

Other fixes

- Reverted the ability of `to_sql()` to perform multivalue inserts as this caused regression in certain cases (GH21103). In the future this will be made configurable.
- Fixed regression in the `DatetimeIndex.date` and `DatetimeIndex.time` attributes in case of timezone-aware data: `DatetimeIndex.time` returned a tz-aware time instead of tz-naive (GH21267) and `DatetimeIndex.date` returned incorrect date when the input date has a non-UTC timezone (GH21230).
- Fixed regression in `pandas.io.json.json_normalize()` when called with None values in nested levels in JSON, and to not drop keys with value as None (GH21158, GH21356).
- Bug in `to_csv()` causes encoding error when compression and encoding are specified (GH21241, GH21118)
- Bug preventing pandas from being importable with -OO optimization (GH21071)
- Bug in `Categorical.fillna()` incorrectly raising a `TypeError` when `value` the individual categories are iterable and `value` is an iterable (GH21097, GH19788)
- Fixed regression in constructors coercing NA values like None to strings when passing `dtype=str` (GH21083)
- Regression in `pivot_table()` where an ordered Categorical with missing values for the pivot’s index would give a mis-aligned result (GH21133)
- Fixed regression in merging on boolean index/columns (GH21119).

Performance improvements

- Improved performance of `CategoricalIndex.is_monotonic_increasing()`, `CategoricalIndex.is_monotonic_decreasing()` and `CategoricalIndex.is_monotonic()` (GH21025)
- Improved performance of `CategoricalIndex.is_unique()` (GH21107)

Bug fixes

Groupby/resample/rolling

- Bug in `DataFrame.agg()` where applying multiple aggregation functions to a `DataFrame` with duplicated column names would cause a stack overflow (GH21063)
- Bug in `pandas.core.groupby.GroupBy.ffill()` and `pandas.core.groupby.GroupBy.bfill()` where the fill within a grouping would not always be applied as intended due to the implementations’ use of a non-stable sort (GH21207)
- Bug in `pandas.core.groupby.GroupBy.rank()` where results did not scale to 100% when specifying method='dense' and pct=True
- Bug in `pandas.DataFrame.rolling()` and `pandas.Series.rolling()` which incorrectly accepted a 0 window size rather than raising (GH21286)
Data-type specific

- Bug in `Series.str.replace()` where the method throws `TypeError` on Python 3.5.2 (GH21078)
- Bug in `Timedelta` where passing a float with a unit would prematurely round the float precision (GH14156)
- Bug in `pandas.testing.assert_index_equal()` which raised `AssertionError` incorrectly, when comparing two `CategoricalIndex` objects with param `check_categorical=False` (GH19776)

Sparse

- Bug in `SparseArray.shape` which previously only returned the shape `SparseArray.sp_values` (GH21126)

Indexing

- Bug in `Series.reset_index()` where appropriate error was not raised with an invalid level name (GH20925)
- Bug in `interval_range()` when `start/periods` or `end/periods` are specified with float `start` or `end` (GH21161)
- Bug in `MultiIndex.set_names()` where error raised for a `MultiIndex` with `nlevels == 1` (GH21149)
- Bug in `IntervalIndex` constructors where creating an `IntervalIndex` from categorical data was not fully supported (GH21243, GH21253)
- Bug in `MultiIndex.sort_index()` which was not guaranteed to sort correctly with `level=1`; this was also causing data misalignment in particular `DataFrame.stack()` operations (GH20994, GH20945, GH21052)

Plotting

- New keywords (sharex, sharey) to turn on/off sharing of x/y-axis by subplots generated with pandas.DataFrame().groupby().boxplot() (GH20968)

I/O

- Bug in IO methods specifying `compression='zip'` which produced uncompressed zip archives (GH17778, GH21144)
- Bug in `DataFrame.to_stata()` which prevented exporting DataFrames to buffers and most file-like objects (GH21041)
- Bug in `read_stata()` and StataReader which did not correctly decode utf-8 strings on Python 3 from Stata 14 files (dta version 118) (GH21244)
- Bug in IO JSON `read_json()` reading empty JSON schema with `orient='table'` back to `DataFrame` caused an error (GH21287)

Reshaping

- Bug in `concat()` where error was raised in concatenating `Series` with numpy scalar and tuple names (GH21015)
- Bug in `concat()` warning message providing the wrong guidance for future behavior (GH21101)

Other

- Tab completion on `Index` in IPython no longer outputs deprecation warnings (GH21125)
- Bug preventing pandas being used on Windows without C++ redistributable installed (GH21106)

5.6.5 What’s new in 0.23.0 (May 15, 2018)

This is a major release from 0.22.0 and includes a number of API changes, deprecations, new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

Highlights include:

- Round-trippable JSON format with ‘table’ orient.
- Instantiation from dicts respects order for Python 3.6+.
- Dependent column arguments for assign.
- Merging / sorting on a combination of columns and index levels.
- Extending pandas with custom types.
- Excluding unobserved categories from groupby.
- Changes to make output shape of DataFrame.apply consistent.

Check the API Changes and deprecations before updating.

Warning: Starting January 1, 2019, pandas feature releases will support Python 3 only. See Dropping Python 2.7 for more.

What’s new in v0.23.0

- New features
  - JSON read/write round-trippable with orient='table'
  - Method .assign() accepts dependent arguments
  - Merging on a combination of columns and index levels
  - Sorting by a combination of columns and index levels
  - Extending pandas with custom types (experimental)
  - New observed keyword for excluding unobserved categories in GroupBy
  - Rolling/Expanding.apply() accepts raw=False to pass a Series to the function
  - DataFrame.interpolate has gained the limit_area kwarg
  - Function get_dummies now supports dtype argument
  - Timedelta mod method
  - Method .rank() handles inf values when NaN are present
  - Series.str.cat has gained the join kwarg
  - DataFrame.astype performs column-wise conversion to Categorical
  - Other enhancements

- Backwards incompatible API changes
  - Dependencies have increased minimum versions
  - Instantiation from dicts preserves dict insertion order for Python 3.6+
– Deprecate Panel
– pandas.core.common removals
– Changes to make output of DataFrame.apply consistent
– Concatenation will no longer sort
– Build changes
– Index division by zero fills correctly
– Extraction of matching patterns from strings
– Default value for the ordered parameter of CategoricalDtype
– Better pretty-printing of DataFrames in a terminal
– Datetimelike API changes
– Other API changes

• Deprecations
• Removal of prior version deprecations/changes
• Performance improvements
• Documentation changes
• Bug fixes
  – Categorical
  – Datetimelike
  – Timedelta
  – Timezones
  – Offsets
  – Numeric
  – Strings
  – Indexing
  – MultiIndex
  – IO
  – Plotting
  – GroupBy/resample/rolling
  – Sparse
  – Reshaping
  – Other

New features

JSON read/write round-trippable with `orient='table'`

A DataFrame can now be written to and subsequently read back via JSON while preserving metadata through usage of the `orient='table'` argument (see GH18912 and GH9146). Previously, none of the available `orient` values guaranteed the preservation of dtypes and index names, amongst other metadata.

```python
In [1]: df = pd.DataFrame({'foo': [1, 2, 3, 4],
                     'bar': ['a', 'b', 'c', 'd'],
                     'baz': pd.date_range('2018-01-01', freq='d', periods=4),
                     'qux': pd.Categorical(['a', 'b', 'c', 'c']),
                     'idx': pd.Index(range(4), name='idx'))

In [2]: df
Out[2]:
     foo  bar     baz             qux
    idx
0  1.0  'a' 2018-01-01 'a'
1  2.0  'b' 2018-01-02 'b'
2  3.0  'c' 2018-01-03 'c'
3  4.0  'd' 2018-01-04 'c'
       [4 rows x 4 columns]

In [3]: df.dtypes
Out[3]:
foo     int64
bar     object
baz  datetime64[ns]
qux    category
Length: 4, dtype: object

In [4]: df.to_json('test.json', orient='table')

In [5]: new_df = pd.read_json('test.json', orient='table')

In [6]: new_df
Out[6]:
     foo  bar     baz             qux
    idx
0  1.0  'a' 2018-01-01 'a'
1  2.0  'b' 2018-01-02 'b'
2  3.0  'c' 2018-01-03 'c'
3  4.0  'd' 2018-01-04 'c'
       [4 rows x 4 columns]

In [7]: new_df.dtypes
Out[7]:
foo     int64
bar     object
baz  datetime64[ns]
qux    category
Length: 4, dtype: object

Please note that the string `index` is not supported with the round trip format, as it is used by default in `write_json`
to indicate a missing index name.

```
In [8]: df.index.name = 'index'
In [9]: df.to_json('test.json', orient='table')
In [10]: new_df = pd.read_json('test.json', orient='table')
In [11]: new_df
Out[11]:
   foo  bar    baz   qux
0  1    a 2018-01-01  a
1  2    b 2018-01-02  b
2  3    c 2018-01-03  c
3  4    d 2018-01-04  c
[4 rows x 4 columns]
In [12]: new_df.dtypes
Out[12]:
foo     int64
bar     object
baz    datetime64[ns]
qux    category
Length: 4, dtype: object
```

**Method `.assign()` accepts dependent arguments**

The `DataFrame.assign()` now accepts dependent keyword arguments for python version later than 3.6 (see also PEP 468). Later keyword arguments may now refer to earlier ones if the argument is a callable. See the [documentation here](GH14207)

```
In [13]: df = pd.DataFrame({'A': [1, 2, 3]})
In [14]: df
Out[14]:
   A
0  1
1  2
2  3
[3 rows x 1 columns]
In [15]: df.assign(B=df.A, C=lambda x: x['A'] + x['B'])
Out[15]:
   A  B  C
0  1  1  2
1  2  2  4
2  3  3  6
[3 rows x 3 columns]
```

**Warning:** This may subtly change the behavior of your code when you’re using `.assign()` to update an existing column. Previously, callables referring to other variables being updated would get the “old” values.
Previous behavior:

```python
In [2]: df = pd.DataFrame({"A": [1, 2, 3]})

In [3]: df.assign(A=lambda df: df.A + 1, C=lambda df: df.A * -1)
Out[3]:
   A  C
0  2 -1
1  3 -2
2  4 -3
```

New behavior:

```python
In [16]: df.assign(A=df.A + 1, C=lambda df: df.A * -1)
Out[16]:
   A  C
0  2 -2
1  3 -3
2  4 -4
```

Merging on a combination of columns and index levels

Strings passed to `DataFrame.merge()` as the on, left_on, and right_on parameters may now refer to either column names or index level names. This enables merging `DataFrame` instances on a combination of index levels and columns without resetting indexes. See the Merge on columns and levels documentation section. (GH14355)

```python
In [17]: left_index = pd.Index(['K0', 'K0', 'K1', 'K2'], name='key1')
In [18]: left = pd.DataFrame({'A': ['A0', 'A1', 'A2', 'A3'],
                         'B': ['B0', 'B1', 'B2', 'B3'],
                         'key2': ['K0', 'K1', 'K0', 'K1'],
                         index=left_index)
In [19]: right_index = pd.Index(['K0', 'K1', 'K2', 'K2'], name='key1')
In [20]: right = pd.DataFrame({'C': ['C0', 'C1', 'C2', 'C3'],
                          'D': ['D0', 'D1', 'D2', 'D3'],
                          'key2': ['K0', 'K0', 'K0', 'K1'],
                          index=right_index)
In [21]: left.merge(right, on=['key1', 'key2'])
Out[21]:
   A  B  key2  C  D
key1
K0  A0  B0  K0  C0  D0
K1  A2  B2  K0  C1  D1
K2  A3  B3  K1  C3  D3
```

[3 rows x 5 columns]
**Sorting by a combination of columns and index levels**

Strings passed to `DataFrame.sort_values()` as the `by` parameter may now refer to either column names or index level names. This enables sorting `DataFrame` instances by a combination of index levels and columns without resetting indexes. See the *Sorting by Indexes and Values* documentation section. (GH14353)

```python
# Build MultiIndex
In [22]: idx = pd.MultiIndex.from_tuples([("a", 1), ("a", 2), ("a", 2),
                           ....:    ("b", 2), ("b", 1), ("b", 1)])

In [23]: idx.names = ['first', 'second']

# Build DataFrame
In [24]: df_multi = pd.DataFrame({'A': np.arange(6, 0, -1)},
                            index=idx)

In [25]: df_multi
Out[25]:
   A
first second
a  1   6
   2   5
   2   4
b  2   3
   1   2
   1   1

[6 rows x 1 columns]

# Sort by 'second' (index) and 'A' (column)
In [26]: df_multi.sort_values(by=["second", 'A'])
Out[26]:
   A
first second
b  1   1
   1   2
a  1   6
b  2   3
a  2   4
   2   5

[6 rows x 1 columns]
```

**Extending pandas with custom types (experimental)**

Pandas now supports storing array-like objects that aren’t necessarily 1-D NumPy arrays as columns in a `DataFrame` or values in a `Series`. This allows third-party libraries to implement extensions to NumPy’s types, similar to how pandas implemented categoricals, datetimes with timezones, periods, and intervals.

As a demonstration, we’ll use cyberpandas, which provides an `IPArray` type for storing ip addresses.

```python
In [1]: from cyberpandas import IPArray

In [2]: values = IPArray({
```
IPArray isn’t a normal 1-D NumPy array, but because it’s a pandas `ExtensionArray`, it can be stored properly inside pandas’ containers.

```python
In [3]: ser = pd.Series(values)

In [4]: ser
Out [4]:
0 0.0.0.0
1 192.168.1.1
2 2001:db8:85a3::8a2e:370:7334
dtype: ip
```

Notice that the dtype is `ip`. The missing value semantics of the underlying array are respected:

```python
In [5]: ser.isna()
Out [5]:
0  True
1  False
2  False
dtype: bool
```

For more, see the extension types documentation. If you build an extension array, publicize it on our ecosystem page.

**New observed keyword for excluding unobserved categories in GroupBy**

Grouping by a categorical includes the unobserved categories in the output. When grouping by multiple categorical columns, this means you get the cartesian product of all the categories, including combinations where there are no observations, which can result in a large number of groups. We have added a keyword `observed` to control this behavior, it defaults to `observed=False` for backward-compatibility. (GH14942, GH8138, GH15217, GH17594, GH8669, GH20583, GH20902)

```python
In [27]: cat1 = pd.Categorical(['a', 'a', 'b', 'b'], categories=['a', 'b', 'z'], ordered=True)
.....:

In [28]: cat2 = pd.Categorical(['c', 'd', 'c', 'd'], categories=['c', 'd', 'y'], ordered=True)
.....:

In [29]: df = pd.DataFrame({'A': cat1, 'B': cat2, 'values': [1, 2, 3, 4]})

In [30]: df['C'] = ['foo', 'bar'] * 2

In [31]: df
Out [31]:
     A  B  values  C
0   a  c      1  foo
1   a  d      2  bar
```

(continues on next page)
To show all values, the previous behavior:

```python
In [32]: df.groupby(["A", "B", "C"], observed=False).count()
Out[32]:
          values
    A  B  C
a  c  bar  0
   foo  1
d  bar  1
   foo  0
y  bar  0
... ... ...
z  c  foo  0
d  bar  0
   foo  0
y  bar  0
   foo  0
```

[18 rows x 1 columns]

To show only observed values:

```python
In [33]: df.groupby(["A", "B", "C"], observed=True).count()
Out[33]:
          values
    A  B  C
a  c  foo  1
d  bar  1
b  c  foo  1
d  bar  1
```

[4 rows x 1 columns]

For pivoting operations, this behavior is already controlled by the `dropna` keyword:

```python
In [34]: cat1 = pd.Categorical(["a", "a", "b", "b"],
                         categories=["a", "b", "z"], ordered=True)
....:
In [35]: cat2 = pd.Categorical(["c", "d", "c", "d"],
                         categories=["c", "d", "y"], ordered=True)
....:
In [36]: df = pd.DataFrame({"A": cat1, "B": cat2, "values": [1, 2, 3, 4]})
In [37]: df
Out[37]:
     A  B  values
0  a  c    1
1  a  d    2
2  b  c    3
3  b  d    4
```

(continues on next page)
In [38]: pd.pivot_table(df, values='values', index=['A', 'B'], dropna=True)
   ....:
Out[38]:
   values
   A  B
   a  c  1
   d  2
   b  c  3
   d  4

[4 rows x 1 columns]

In [39]: pd.pivot_table(df, values='values', index=['A', 'B'], dropna=False)
   ....:
Out[39]:
   values
   A  B
   a  c  1.0
   d  2.0
   y  NaN
   b  c  3.0
   d  4.0
   y  NaN
   z  c  NaN
   d  NaN
   y  NaN

[9 rows x 1 columns]

Rolling/Expanding.apply() accepts raw=False to pass a Series to the function

Series.rolling().apply(), DataFrame.rolling().apply(), Series.expanding().apply(), and DataFrame.expanding().apply() have gained a raw=None parameter. This is similar to DataFrame.apply(). This parameter, if True allows one to send a np.ndarray to the applied function. If False a Series will be passed. The default is None, which preserves backward compatibility, so this will default to True, sending an np.ndarray. In a future version the default will be changed to False, sending a Series. (GH5071, GH20584)

In [40]: s = pd.Series(np.arange(5), np.arange(5) + 1)

In [41]: s
Out[41]:
0    0
1    1
2    2
3    3
4    4
Length: 5, dtype: int64

Pass a Series:
In [42]: s.rolling(2, min_periods=1).apply(lambda x: x.iloc[-1], raw=False)
Out[42]:
1  0.0
2  1.0
3  2.0
4  3.0
5  4.0
Length: 5, dtype: float64

Mimic the original behavior of passing a ndarray:

In [43]: s.rolling(2, min_periods=1).apply(lambda x: x[-1], raw=True)
Out[43]:
1  0.0
2  1.0
3  2.0
4  3.0
5  4.0
Length: 5, dtype: float64

**DataFrame.interpolate** has gained the limit_area kwarg

`DataFrame.interpolate()` has gained a limit_area parameter to allow further control of which NaNs are replaced. Use limit_area='inside' to fill only NaNs surrounded by valid values or use limit_area='outside' to fill only NaNs outside the existing valid values while preserving those inside. (GH16284) See the full documentation here.

In [44]: ser = pd.Series([np.nan, np.nan, 5, np.nan, np.nan,
    ....: np.nan, 13, np.nan, np.nan])
    ....:

In [45]: ser
Out[45]:
0    NaN
1    NaN
2    5.0
3    NaN
4    NaN
5    NaN
6   13.0
7    NaN
8    NaN
Length: 9, dtype: float64

Fill one consecutive inside value in both directions

In [46]: ser.interpolate(limit_direction='both', limit_area='inside', limit=1)
Out[46]:
0    NaN
1    NaN
2    5.0
3    7.0
4    NaN
5   11.0
6   13.0
(continues on next page)
Fill all consecutive outside values backward

```
In [47]: ser.interpolate(limit_direction='backward', limit_area='outside')
Out[47]:
0   5.0
1   5.0
2   5.0
3   NaN
4   NaN
5   NaN
6  13.0
7   NaN
8   NaN
Length: 9, dtype: float64
```

Fill all consecutive outside values in both directions

```
In [48]: ser.interpolate(limit_direction='both', limit_area='outside')
Out[48]:
0   5.0
1   5.0
2   5.0
3   NaN
4   NaN
5   NaN
6  13.0
7  13.0
8  13.0
Length: 9, dtype: float64
```

**Function `get_dummies` now supports `dtype` argument**

The `get_dummies()` now accepts a `dtype` argument, which specifies a dtype for the new columns. The default remains `uint8`. (GH18330)

```
In [49]: df = pd.DataFrame({'a': [1, 2], 'b': [3, 4], 'c': [5, 6]})
In [50]: pd.get_dummies(df, columns=['c']).dtypes
Out[50]:
a   int64
b   int64
c_5  uint8
c_6  uint8
Length: 4, dtype: object
```

```
In [51]: pd.get_dummies(df, columns=['c'], dtype=bool).dtypes
Out[51]:
a   int64
b   int64
c_5  bool
```
**Timedelta mod method**

mod (%) and divmod operations are now defined on Timedelta objects when operating with either timedelta-like or with numeric arguments. See the documentation here. (GH19365)

```python
In [52]: td = pd.Timedelta(hours=37)
In [53]: td % pd.Timedelta(minutes=45)
Out[53]: Timedelta('0 days 00:15:00')
```

**Method .rank() handles inf values when NaN are present**

In previous versions, .rank() would assign inf elements NaN as their ranks. Now ranks are calculated properly. (GH6945)

```python
In [54]: s = pd.Series([-np.inf, 0, 1, np.nan, np.inf])
In [55]: s
Out[55]:
0   -inf
1     0.0
2      1.0
3     NaN
4      inf
Length: 5, dtype: float64
```

Previous behavior:

```python
In [11]: s.rank()
Out[11]:
0   1.0
1   2.0
2   3.0
3  NaN
4  NaN
dtype: float64
```

Current behavior:

```python
In [56]: s.rank()
Out[56]:
0   1.0
1   2.0
2   3.0
3  NaN
4   4.0
Length: 5, dtype: float64
```

Furthermore, previously if you rank inf or -inf values together with NaN values, the calculation won’t distinguish NaN from infinity when using ‘top’ or ‘bottom’ argument.
In [57]: s = pd.Series([np.nan, np.nan, -np.inf, -np.inf])

In [58]: s
Out[58]:
0 NaN
1 NaN
2 -inf
3 -inf
Length: 4, dtype: float64

Previous behavior:

In [15]: s.rank(na_option='top')
Out[15]:
0  2.5
1  2.5
2  2.5
3  2.5
dtype: float64

Current behavior:

In [59]: s.rank(na_option='top')
Out[59]:
0  1.5
1  1.5
2  3.5
3  3.5
Length: 4, dtype: float64

These bugs were squashed:

- Bug in DataFrame.rank() and Series.rank() when method='dense' and pct=True in which percentile ranks were not being used with the number of distinct observations (GH15630)
- Bug in Series.rank() and DataFrame.rank() when ascending='False' failed to return correct ranks for infinity if NaN were present (GH19538)
- Bug in DataFrameGroupBy.rank() where ranks were incorrect when both infinity and NaN were present (GH20561)

**Series.str.cat has gained the join kwarg**

Previously, Series.str.cat() did not – in contrast to most of pandas – align Series on their index before concatenation (see GH18657). The method has now gained a keyword join to control the manner of alignment, see examples below and here.

In v.0.23 join will default to None (meaning no alignment), but this default will change to 'left' in a future version of pandas.

In [60]: s = pd.Series(['a', 'b', 'c', 'd'])
In [61]: t = pd.Series(['b', 'd', 'e', 'c'], index=[1, 3, 4, 2])
In [62]: s.str.cat(t)
Out[62]:
0  NaN
(continues on next page)
Furthermore, `Series.str.cat()` now works for `CategoricalIndex` as well (previously raised a `ValueError`; see GH20842).

**DataFrame.astype** performs column-wise conversion to Categorical

`DataFrame.astype()` can now perform column-wise conversion to Categorical by supplying the string 'category' or a `CategoricalDtype`. Previously, attempting this would raise a `NotImplementedError`. See the `Object creation` section of the documentation for more details and examples. (GH12860, GH18099)

Supplying the string 'category' performs column-wise conversion, with only labels appearing in a given column set as categories:

```
In [64]: df = pd.DataFrame({'A': list('abca'), 'B': list('bccd'))
In [65]: df = df.astype('category')
In [66]: df['A'].dtype
Out[66]: CategoricalDtype(categories=['a', 'b', 'c'], ordered=False)
In [67]: df['B'].dtype
Out[67]: CategoricalDtype(categories=['b', 'c', 'd'], ordered=False)
```

Supplying a `CategoricalDtype` will make the categories in each column consistent with the supplied dtype:

```
In [68]: from pandas.api.types import CategoricalDtype
In [69]: cdt = CategoricalDtype(categories=list('abcd'), ordered=True)
In [70]: df = pd.DataFrame({'A': list('abca'), 'B': list('bccd'))
In [71]: df = df.astype(cdt)
In [72]: df['A'].dtype
Out[72]: CategoricalDtype(categories=['a', 'b', 'c', 'd'], ordered=True)
In [73]: df['B'].dtype
Out[73]: CategoricalDtype(categories=['a', 'b', 'c', 'd'], ordered=True)
```
Other enhancements

- Unary + now permitted for Series and DataFrame as numeric operator (GH16073)
- Better support for `to_excel()` output with the xlsxwriter engine. (GH16149)
- `pandas.tseries.frequencies.to_offset()` now accepts leading ‘+’ signs e.g. ‘+1h’. (GH18171)
- MultiIndex.unique() now supports the level= argument, to get unique values from a specific index level (GH17896)
- `pandas.io.formats.style.Styler` now has method `hide_index()` to determine whether the index will be rendered in output (GH14194)
- `pandas.io.formats.style.Styler` now has method `hide_columns()` to determine whether columns will be hidden in output (GH14194)
- Improved wording of ValueError raised in `to_datetime()` when unit= is passed with a non-convertible value (GH14350)
- `Series.fillna()` now accepts a Series or a dict as a value for a categorical dtype (GH17033)
- `pandas.read_clipboard()` updated to use qtpy, falling back to PyQt5 and then PyQt4, adding compatibility with Python3 and multiple python-qt bindings (GH17722)
- Improved wording of ValueError raised in `read_csv()` when the usecols argument cannot match all columns. (GH17301)
- `DataFrame.corrwith()` now silently drops non-numeric columns when passed a Series. Before, an exception was raised (GH18570).
- `IntervalIndex` now supports time zone aware `Interval` objects (GH18537, GH18538)
- `Series()` / `DataFrame()` tab completion also returns identifiers in the first level of a `MultiIndex()`. (GH16326)
- `read_excel()` has gained the `nrows` parameter (GH16645)
- `DataFrame.append()` can now in more cases preserve the type of the calling dataframe’s columns (e.g. if both are CategoricalIndex) (GH18359)
- `DataFrame.to_json()` and `Series.to_json()` now accept an index argument which allows the user to exclude the index from the JSON output (GH17394)
- IntervalIndex.to_tuples() has gained the na_tuple parameter to control whether NA is returned as a tuple of NA, or NA itself (GH18756)
- Categorical.rename_categories, CategoricalIndex.rename_categories and Series.cat.rename_categories can now take a callable as their argument (GH18862)
- `Interval` and `IntervalIndex` have gained a length attribute (GH18789)
- Resampler objects now have a functioning pipe method. Previously, calls to pipe were diverted to the mean method (GH17905).
- `is_scalar()` now returns True for DateOffset objects (GH18943).
- `DataFrame.pivot()` now accepts a list for the values= kwarg (GH17160).
- Added `pandas.api.extensions.register_dataframe_accessor()`, `pandas.api.extensions.register_series_accessor()`, and `pandas.api.extensions.register_index_accessor()`, accessor for libraries downstream of pandas to register custom accessors like .cat on pandas objects. See Registering Custom Accessors for more (GH14781).
IntervalIndex.astype now supports conversions between subtypes when passed an IntervalDtype (GH19197)

IntervalIndex and its associated constructor methods (from_arrays, from_breaks, from_tuples) have gained a dtype parameter (GH19262)

Added pandas.core.groupby.SeriesGroupBy.is_monotonic_increasing() and pandas.core.groupby.SeriesGroupBy.is_monotonic_decreasing() (GH17015)

For subclassed DataFrames, DataFrame.apply() will now preserve the Series subclass (if defined) when passing the data to the applied function (GH19822)

DataFrame.from_dict() now accepts a columns argument that can be used to specify the column names when orient='index' is used (GH18529)

Added option display.html.use_mathjax so MathJax can be disabled when rendering tables in Jupyter notebooks (GH19856, GH19824)

DataFrame.replace() now supports the method parameter, which can be used to specify the replacement method when to_replace is a scalar, list or tuple and value is None (GH19632)

Timestamp.month_name(), DatetimeIndex.month_name(), and Series.dt.month_name() are now available (GH12805)

Timestamp.day_name() and DatetimeIndex.day_name() are now available to return day names with a specified locale (GH12806)

DataFrame.to_sql() now performs a multi-value insert if the underlying connection supports itk rather than inserting row by row. SQLAlchemy dialects supporting multi-value inserts include: mysql, postgresql, sqlite and any dialect with supports_multivalues_insert. (GH14315, GH8953)

read_html() now accepts a displayed_only keyword argument to controls whether or not hidden elements are parsed (True by default) (GH20027)

read_html() now reads all <tbody> elements in a <table>, not just the first. (GH20690)

quantile() and quantile() now accept the interpolation keyword, linear by default (GH20497)

zip compression is supported via compression=zip in DataFrame.to_pickle(), Series.to_pickle(), DataFrame.to_csv(), Series.to_csv(), DataFrame.to_json(), Series.to_json(). (GH17778)

DataFrame.from_dict() now accepts a columns argument that can be used to specify the column names when orient='index' is used (GH18529)

WeekOfMonth constructor now supports n=0 (GH20517).

DataFrame and Series now support matrix multiplication (@) operator (GH10259) for Python>=3.5

Updated DataFrame.to_gbq() and pandas.read_gbq() signature and documentation to reflect changes from the pandas-gbq library version 0.4.0. Adds intersphinx mapping to pandas-gbq library. (GH20564)

Added new writer for exporting Stata dta files in version 117, StataWriter117. This format supports exporting strings with lengths up to 2,000,000 characters (GH16450)

to_hdf() and read_hdf() now accept an errors keyword argument to control encoding error handling (GH20835)

cut() has gained the duplicates='raise'|'drop' option to control whether to raise on duplicated edges (GH20947)

date_range(), timedelta_range(), and interval_range() now return a linearly spaced index if start, stop, and periods are specified, but freq is not. (GH20808, GH20983, GH20976)
Backwards incompatible API changes

Dependencies have increased minimum versions

We have updated our minimum supported versions of dependencies (GH15184). If installed, we now require:

<table>
<thead>
<tr>
<th>Package</th>
<th>Minimum Version</th>
<th>Required</th>
<th>Issue</th>
</tr>
</thead>
<tbody>
<tr>
<td>python-dateutil</td>
<td>2.5.0</td>
<td>X</td>
<td>GH15184</td>
</tr>
<tr>
<td>openpyxl</td>
<td>2.4.0</td>
<td></td>
<td>GH15184</td>
</tr>
<tr>
<td>beautifulsoup4</td>
<td>4.2.1</td>
<td></td>
<td>GH20082</td>
</tr>
<tr>
<td>setuptools</td>
<td>24.2.0</td>
<td></td>
<td>GH20698</td>
</tr>
</tbody>
</table>

Instantiation from dicts preserves dict insertion order for Python 3.6+

Until Python 3.6, dicts in Python had no formally defined ordering. For Python version 3.6 and later, dicts are ordered by insertion order, see PEP 468. pandas will use the dict’s insertion order, when creating a Series or DataFrame from a dict and you’re using Python version 3.6 or higher. (GH19884)

Previous behavior (and current behavior if on Python < 3.6):

```python
In [16]: pd.Series({'Income': 2000,
                  ....:     'Expenses': -1500,
                  ....:     'Taxes': -200,
                  ....:     'Net result': 300})
```

```
Out[16]:
Expenses     -1500
Income        2000
Net result    300
Taxes         -200
```

dtype: int64

Note the Series above is ordered alphabetically by the index values.

New behavior (for Python >= 3.6):

```python
In [74]: pd.Series({'Income': 2000,
                  ....:     'Expenses': -1500,
                  ....:     'Taxes': -200,
                  ....:     'Net result': 300})
```

```
Out[74]:
Income        2000
Expenses      -1500
Taxes         -200
Net result    300
```

Length: 4, dtype: int64

Notice that the Series is now ordered by insertion order. This new behavior is used for all relevant pandas types (Series, DataFrame, SparseSeries and SparseDataFrame).

If you wish to retain the old behavior while using Python >= 3.6, you can use .sort_index():

```python
In [75]: pd.Series({'Income': 2000,
                  ....:     'Expenses': -1500,
                  ....:     'Taxes': -200, (continues on next page)```
.....:  'Net result': 300}).sort_index()
.....:
Out[75]:

<table>
<thead>
<tr>
<th></th>
<th>Expenses</th>
<th>Income</th>
<th>Net result</th>
<th>Taxes</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>-1500</td>
<td>2000</td>
<td>300</td>
<td>-200</td>
</tr>
</tbody>
</table>

Length: 4, dtype: int64

**Deprecate Panel**

Panel was deprecated in the 0.20.x release, showing as a DeprecationWarning. Using Panel will now show a FutureWarning. The recommended way to represent 3-D data are with a MultiIndex on a DataFrame via the to_frame() or with the xarray package. pandas provides a to_xarray() method to automate this conversion (GH13563, GH18324).

```
In [75]: import pandas._testing as tm
In [76]: p = tm.makePanel()
In [77]: p
Out[77]:
<class 'pandas.core.panel.Panel'>
Dimensions: 3 (items) x 3 (major_axis) x 4 (minor_axis)
Items axis: ItemA to ItemC
Major_axis axis: 2000-01-03 00:00:00 to 2000-01-05 00:00:00
Minor_axis axis: A to D

Convert to a MultiIndex DataFrame
```

```
In [78]: p.to_frame()
Out[78]:

<table>
<thead>
<tr>
<th>major</th>
<th>minor</th>
<th>ItemA</th>
<th>ItemB</th>
<th>ItemC</th>
</tr>
</thead>
<tbody>
<tr>
<td>2000-01-03</td>

</tbody>
</table>

[12 rows x 3 columns]

Convert to an xarray DataArray
```

```
In [79]: p.to_xarray()
Out[79]:
<xarray.DataArray (items: 3, major_axis: 3, minor_axis: 4)>
```

array([[ 0.469112, -1.135632, 0.119209, -2.104569],
       [-0.282863, 1.212112, -1.044236, -0.494929],
       [-1.509059, -0.173215, -0.861849, 1.071804]],

       [[ 0.721555, 0.27186 , 0.276232, 0.113648],
       [-0.282863, 1.212112, -1.044236, -0.494929],
       [-1.039575, 0.56702 , -0.67369 , 0.524988]],

       [[ 0.404705, -1.039268, -1.344312, -0.10905 ],
       [ 0.721555, 0.27186 , 0.276232, 0.113648],
       [-0.706771, -0.424972, -1.087401, -1.478427],
       [-1.039575, 0.56702 , -0.67369 , 0.524988]],

       [[ 0.404705, -1.039268, -1.344312, -0.10905 ],
       [ 0.577046, -0.370647, 0.844885, 1.643563],
       [-1.039575, 0.56702 , -0.67369 , 0.524988]],

       Coordinates:
       * items (items) object 'ItemA' 'ItemB' 'ItemC'
       * major_axis (major_axis) datetime64[ns] 2000-01-03 2000-01-04 2000-01-05
       * minor_axis (minor_axis) object 'A' 'B' 'C' 'D'

pandas.core.common removals

The following error & warning messages are removed from pandas.core.common (GH13634, GH19769):

- PerformanceWarning
- UnsupportedFunctionCall
- UnsortedIndexError
- AbstractMethodError

These are available from import from pandas.errors (since 0.19.0).

Changes to make output of DataFrame.apply consistent

DataFrame.apply() was inconsistent when applying an arbitrary user-defined-function that returned a list-like with axis=1. Several bugs and inconsistencies are resolved. If the applied function returns a Series, then pandas will return a DataFrame; otherwise a Series will be returned, this includes the case where a list-like (e.g. tuple or list is returned) (GH16353, GH17437, GH17970, GH17348, GH18573, GH17602, GH18775, GH18901, GH18919).

In [76]: df = pd.DataFrame(np.tile(np.arange(3), 6).reshape(6, -1) + 1,
       ..: columns=['A', 'B', 'C'])

In [77]: df
Out[77]:
    A  B  C
0  1  2  3
1  1  2  3
2  1  2  3
3  1  2  3
4  1  2  3
5  1  2  3

Previous behavior: if the returned shape happened to match the length of original columns, this would return a DataFrame. If the return shape did not match, a Series with lists was returned.
New behavior: When the applied function returns a list-like, this will now *always* return a Series.

```python
In [78]: df.apply(lambda x: [1, 2, 3], axis=1)
Out[78]:
          0  1  2  3
0      1  2  3
1      1  2  3
2      1  2  3
3      1  2  3
4      1  2  3
5      1  2  3
Length: 6, dtype: object
```

To have expanded columns, you can use `result_type='expand'`

```python
In [80]: df.apply(lambda x: [1, 2, 3], axis=1, result_type='expand')
Out[80]:
          0  1  2  3  4  5
0      1  2  3  4  5  6
1      1  2  3  4  5  6
2      1  2  3  4  5  6
3      1  2  3  4  5  6
4      1  2  3  4  5  6
5      1  2  3  4  5  6
[6 rows x 3 columns]
```

To broadcast the result across the original columns (the old behaviour for list-likes of the correct length), you can use `result_type='broadcast'`. The shape must match the original columns.
Returning a Series allows one to control the exact return structure and column names:

```
In [82]: df.apply(lambda x: pd.Series([1, 2, 3], index=['D', 'E', 'F']), axis=1)
Out[82]:
  D  E  F
0  1  2  3
1  1  2  3
2  1  2  3
3  1  2  3
4  1  2  3
5  1  2  3
[6 rows x 3 columns]
```

**Concatenation will no longer sort**

In a future version of pandas, pandas.concat() will no longer sort the non-concatenation axis when it is not already aligned. The current behavior is the same as the previous (sorting), but now a warning is issued when sort is not specified and the non-concatenation axis is not aligned (GH4588).

```
In [83]: df1 = pd.DataFrame({"a": [1, 2], "b": [1, 2]}, columns=['b', 'a'])
In [84]: df2 = pd.DataFrame({"a": [4, 5]})
In [85]: pd.concat([df1, df2])
Out[85]:
   b  a
0  1  1
1  2  2
0  NaN 4
1  NaN 5
[4 rows x 2 columns]
```

To keep the previous behavior (sorting) and silence the warning, pass sort=True

```
In [86]: pd.concat([df1, df2], sort=True)
Out[86]:
   a  b
0  1  1.0
1  2  2.0
0  NaN 4
1  NaN 5
```

(continues on next page)
To accept the future behavior (no sorting), pass `sort=False`

Note that this change also applies to `DataFrame.append()`, which has also received a `sort` keyword for controlling this behavior.

**Build changes**

- Building pandas for development now requires `cython >= 0.24` ([GH18613](https://github.com/pandas-dev/pandas/pull/18613))
- Building from source now explicitly requires `setuptools` in `setup.py` ([GH18113](https://github.com/pandas-dev/pandas/pull/18113))
- Updated conda recipe to be in compliance with conda-build 3.0+ ([GH18002](https://github.com/pandas-dev/pandas/pull/18002))

**Index division by zero fills correctly**

Division operations on `Index` and subclasses will now fill division of positive numbers by zero with `np.inf`, division of negative numbers by zero with `-np.inf` and `0 / 0` with `np.nan`. This matches existing `Series` behavior. ([GH19322](https://github.com/pandas-dev/pandas/pull/19322), [GH19347](https://github.com/pandas-dev/pandas/pull/19347))

Previous behavior:

```python
In [6]: index = pd.Int64Index([-1, 0, 1])
In [7]: index / 0
Out[7]: Int64Index([0, 0, 0], dtype='int64')

# Previous behavior yielded different results depending on the type of zero in the divisor
In [8]: index / 0.0
Out[8]: Float64Index([-inf, nan, inf], dtype='float64')

In [9]: index = pd.UInt64Index([0, 1])
In [10]: index / np.array([0, 0], dtype=np.uint64)
Out[10]: UInt64Index([0, 0], dtype='uint64')
In [11]: pd.RangeIndex(1, 5) / 0
ZeroDivisionError: integer division or modulo by zero
```

Current behavior:

```python
In [87]: index = pd.Int64Index([-1, 0, 1])

# division by zero gives -infinity where negative,
# +infinity where positive, and NaN for 0 / 0
In [88]: index / 0
Out[88]: Float64Index([-inf, nan, inf], dtype='float64')

# The result of division by zero should not depend on
# whether the zero is int or float
In [89]: index / 0.0
Out[89]: Float64Index([-inf, nan, inf], dtype='float64')
```
In [90]: index = pd.UInt64Index([0, 1])
In [91]: index / np.array([0, 0], dtype=np.uint64)
Out[91]: Float64Index([nan, inf], dtype='float64')
In [92]: pd.RangeIndex(1, 5) / 0
Out[92]: Float64Index([inf, inf, inf, inf], dtype='float64')

**Extraction of matching patterns from strings**

By default, extracting matching patterns from strings with `str.extract()` used to return a `Series` if a single group was being extracted (a `DataFrame` if more than one group was extracted). As of pandas 0.23.0, `str.extract()` always returns a `DataFrame`, unless `expand` is set to `False`. Finally, `None` was an accepted value for the `expand` parameter (which was equivalent to `False`), but now raises a `ValueError` (GH11386).

**Previous behavior:**

In [1]: s = pd.Series(['number 10', '12 eggs'])
In [2]: extracted = s.str.extract(r'.*(\d\d).*')
In [3]: extracted
Out [3]:
0 10
1 12
[2 rows x 1 columns]
dtype: object
In [4]: type(extracted)
Out [4]: pandas.core.series.Series

**New behavior:**

In [93]: s = pd.Series(['number 10', '12 eggs'])
In [94]: extracted = s.str.extract(r'.*(\d\d).*')
In [95]: extracted
Out[95]:
    0
   0 10
   1 12
[2 rows x 1 columns]
In [96]: type(extracted)
Out[96]: pandas.core.frame.DataFrame

To restore previous behavior, simply set `expand` to `False`:

In [97]: s = pd.Series(['number 10', '12 eggs'])
In [98]: extracted = s.str.extract(r'.*(\d\d).*', expand=False)
Default value for the `ordered` parameter of `CategoricalDtype`

The default value of the `ordered` parameter for `CategoricalDtype` has changed from `False` to `None` to allow updating of categories without impacting `ordered`. Behavior should remain consistent for downstream objects, such as `Categorical` (GH18790).

In previous versions, the default value for the `ordered` parameter was `False`. This could potentially lead to the `ordered` parameter unintentionally being changed from `True` to `False` when users attempt to update categories if `ordered` is not explicitly specified, as it would silently default to `False`. The new behavior for `ordered=None` is to retain the existing value of `ordered`.

New behavior:

In [2]: from pandas.api.types import CategoricalDtype

In [3]: cat = pd.Categorical(list('abcaba'), ordered=True, categories=list('cba'))

In [4]: cat
Out[4]:
[a, b, c, a, b, a]
Categories (3, object): [c < b < a]

In [5]: cdt = CategoricalDtype(categories=list('cbad'))

In [6]: cat.astype(cdt)
Out[6]:
[a, b, c, a, b, a]
Categories (4, object): [c < b < a < d]

Notice in the example above that the converted `Categorical` has retained `ordered=True`. Had the default value for `ordered` remained as `False`, the converted `Categorical` would have become unordered, despite `ordered=False` never being explicitly specified. To change the value of `ordered`, explicitly pass it to the new `dtype`, e.g., `CategoricalDtype(categories=list('cbad'), ordered=False)`.

Note that the unintentional conversion of `ordered` discussed above did not arise in previous versions due to separate bugs that prevented `astype` from doing any type of category to category conversion (GH10696, GH18593). These bugs have been fixed in this release, and motivated changing the default value of `ordered`. 

2802 Chapter 5. Release notes
Better pretty-printing of DataFrames in a terminal

Previously, the default value for the maximum number of columns was `pd.options.display.max_columns=20`. This meant that relatively wide data frames would not fit within the terminal width, and pandas would introduce line breaks to display these 20 columns. This resulted in an output that was relatively difficult to read:

If Python runs in a terminal, the maximum number of columns is now determined automatically so that the printed data frame fits within the current terminal width (`pd.options.display.max_columns=0`) (GH17023). If Python runs as a Jupyter kernel (such as the Jupyter QtConsole or a Jupyter notebook, as well as in many IDEs), this value cannot be inferred automatically and is thus set to 20 as in previous versions. In a terminal, this results in a much nicer output:
Note that if you don’t like the new default, you can always set this option yourself. To revert to the old setting, you can run this line:

```python
pd.options.display.max_columns = 20
```

**Datetimelike API changes**

- The default `Timedelta` constructor now accepts an ISO 8601 Duration string as an argument (GH19040)

- Subtracting `NaT` from a `Series` with `dtype='datetime64[ns]'` returns a `Series` with `dtype='timedelta64[ns]'` instead of `dtype='datetime64[ns]'` (GH18808)

- Addition or subtraction of `NaT` from a `TimedeltaIndex` will return `TimedeltaIndex` instead of `DatetimeIndex` (GH19124)

- `TimedeltaIndex.shift()` and `TimedeltaIndex.shift()` will now raise `NullFrequencyError` (which subclasses `ValueError`, which was raised in older versions) when the index object frequency is `None` (GH19147)

- Addition and subtraction of `NaN` from a `Series` with `dtype='timedelta64[ns]'` will raise a `TypeError` instead of treating the `NaN` as `NaT` (GH19274)

- `NaT` division with `datetime.timedelta` will now return `NaN` instead of raising (GH17876)
• Operations between a Series with dtype='datetime64[ns]' and a PeriodIndex will correctly raise TypeError (GH18850)
• Subtraction of Series with timezone-aware dtype='datetime64[ns]' with mismatched timezones will raise TypeError instead of ValueError (GH18817)
• Timestamp will no longer silently ignore unused or invalid tz or tzinfo keyword arguments (GH17690)
• Timestamp will no longer silently ignore invalid freq arguments (GH5168)
• CacheableOffset and WeekDay are no longer available in the pandas.tseries.offsets module (GH17830)
• pandas.tseries.frequencies.get_freq_group() and pandas.tseries.frequencies.DAYS are removed from the public API (GH18034)
• Series.truncate() and DataFrame.truncate() will raise a ValueError if the index is not sorted instead of an unhelpful KeyError (GH17935)
• Series.first and DataFrame.first will now raise a TypeError rather than NotImplementedError when index is not a DatetimeIndex (GH20725).
• Series.last and DataFrame.last will now raise a TypeError rather than NotImplementedError when index is not a DatetimeIndex (GH20725).
• Restricted DateOffset keyword arguments. Previously, DateOffset subclasses allowed arbitrary keyword arguments which could lead to unexpected behavior. Now, only valid arguments will be accepted. (GH17176, GH18226).
• pandas.merge() provides a more informative error message when trying to merge on timezone-aware and timezone-naive columns (GH15800)
• For DatetimeIndex and TimedeltaIndex with freq=None, addition or subtraction of integer-dtyped array or Index will raise NullFrequencyError instead of TypeError (GH19895)
• Timestamp constructor now accepts a nanosecond keyword or positional argument (GH18898)
• DatetimeIndex will now raise an AttributeError when the tz attribute is set after instantiation (GH3746)
• DatetimeIndex with a pytz timezone will now return a consistent pytz timezone (GH18595)

Other API changes

• Series.astype() and Index.astype() with an incompatible dtype will now raise a TypeError rather than a ValueError (GH18231)
• Series construction with an object dtyped tz-aware datetime and dtype=object specified, will now return an object dtyped Series, previously this would infer the datetime dtype (GH18231)
• A Series of dtype=category constructed from an empty dict will now have categories of dtype=object rather than dtype=float64, consistently with the case in which an empty list is passed (GH18515)
• All-NaN levels in a MultiIndex are now assigned float rather than object dtype, promoting consistency with Index (GH17929).
• Levels names of a MultiIndex (when not None) are now required to be unique: trying to create a MultiIndex with repeated names will raise a ValueError (GH18872)
• Both construction and renaming of Index/MultiIndex with non-hashable name/names will now raise TypeError (GH20527)
Index.map() can now accept Series and dictionary input objects (GH12756, GH18482, GH18509).

DataFrame.unstack() will now default to filling with np.nan for object columns. (GH12815)

IntervalIndex constructor will raise if the closed parameter conflicts with how the input data is inferred to be closed (GH18421)

Inserting missing values into indexes will work for all types of indexes and automatically insert the correct type of missing value (NaN, NaT, etc.) regardless of the type passed in (GH18295)

When created with duplicate labels, MultiIndex now raises a ValueError. (GH17464)

Series.fillna() now raises a TypeError instead of a ValueError when passed a list, tuple or DataFrame as a value (GH18293)

pandas.DataFrame.merge() no longer casts a float column to object when merging on int and float columns (GH16572)

pandas.merge() now raises a ValueError when trying to merge on incompatible data types (GH9780)

The default NA value for UInt64Index has changed from 0 to NaN, which impacts methods that mask with NA, such as UInt64Index.where() (GH18398)

Refactored setup.py to use find_packages instead of explicitly listing out all subpackages (GH18535)

Rearranged the order of keyword arguments in read_excel() to align with read_csv() (GH16672)

wide_to_long() previously kept numeric-like suffixes as object dtype. Now they are cast to numeric if possible (GH17627)

In read_excel(), the comment argument is now exposed as a named parameter (GH18735)

Rearranged the order of keyword arguments in read_excel() to align with read_csv() (GH16672)

The options html.border and mode.use_inf_as_null were deprecated in prior versions, these will now show FutureWarning rather than a DeprecationWarning (GH19003)

IntervalIndex and IntervalDtype no longer support categorical, object, and string subtypes (GH19016)

IntervalDtype now returns True when compared against 'interval' regardless of subtype, and IntervalDtype.name now returns 'interval' regardless of subtype (GH18980)

KeyError now raises instead of ValueError in drop(), drop(), drop(), drop() when dropping a non-existent element in an axis with duplicates (GH19186)

Series.to_csv() now accepts a compression argument that works in the same way as the compression argument in DataFrame.to_csv() (GH18958)

Set operations (union, difference...) on IntervalIndex with incompatible index types will now raise a TypeError rather than a ValueError (GH19329)

DateOffset objects render more simply, e.g. <DateOffset: days=1> instead of <DateOffset: kwds={'days': 1}> (GH19403)

Categorical.fillna now validates its value and method keyword arguments. It now raises when both or none are specified, matching the behavior of Series.fillna() (GH19682)

pd.to_datetime('today') now returns a datetime, consistent with pd.Timestamp('today'); previously pd.to_datetime('today') returned a .normalized() datetime (GH19935)

Series.str.replace() now takes an optional regex keyword which, when set to False, uses literal string replacement rather than regex replacement (GH16808)

DatetimeIndex.strftime() and PeriodIndex.strftime() now return an Index instead of a numpy array to be consistent with similar accessors (GH20127)
• Constructing a Series from a list of length 1 no longer broadcasts this list when a longer index is specified (GH19714, GH20391).

• DataFrame.to_dict() with orient='index' no longer casts int columns to float for a DataFrame with only int and float columns (GH18580)

• A user-defined-function that is passed to Series.rolling().aggregate(), DataFrame.rolling().aggregate(), or its expanding cousins, will now always be passed a Series, rather than a np.array; .apply() only has the raw keyword, see here. This is consistent with the signatures of .aggregate() across pandas (GH20584)

• Rolling and Expanding types raise NotImplementedError upon iteration (GH11704).

Deprecations

• Series.from_array and SparseSeries.from_array are deprecated. Use the normal constructor Series(...) and SparseSeries(...) instead (GH18213).

• DataFrame.as_matrix is deprecated. Use DataFrame.values instead (GH18458).

• Series.asobject, DatetimeIndex.asobject, PeriodIndex.asobject and TimeDeltaIndex.asobject have been deprecated. Use .astype(object) instead (GH18572)

• Grouping by a tuple of keys now emits a FutureWarning and is deprecated. In the future, a tuple passed to 'by' will always refer to a single key that is the actual tuple, instead of treating the tuple as multiple keys. To retain the previous behavior, use a list instead of a tuple (GH18314)

• Series.valid is deprecated. Use Series.dropna() instead (GH18800).

• read_excel() has deprecated the skip_footer parameter. Use skipfooter instead (GH18836)

• ExcelFile.parse() has deprecated sheetname in favor of sheet_name for consistency with read_excel() (GH20920).

• The is_copy attribute is deprecated and will be removed in a future version (GH18801).

• IntervalIndex.from_intervals is deprecated in favor of the IntervalIndex constructor (GH19263)

• DataFrame.from_items is deprecated. Use DataFrame.from_dict() instead, or DataFrame.from_dict(OrderedDict()) if you wish to preserve the key order (GH17320, GH17312)

• Indexing a MultiIndex or a FloatIndex with a list containing some missing keys will now show a FutureWarning, which is consistent with other types of indexes (GH17758).

• The broadcast parameter of .apply() is deprecated in favor of result_type='broadcast' (GH18577)

• The reduce parameter of .apply() is deprecated in favor of result_type='reduce' (GH18577)

• The order parameter of factorize() is deprecated and will be removed in a future release (GH19727)

• Timestamp.weekday_name, DatetimeIndex.weekday_name, and Series.dt.weekday_name are deprecated in favor of Timestamp.day_name(), DatetimeIndex.day_name(), and Series.dt.day_name() (GH12806)

• pandas.tseries.plotting.tsplot is deprecated. Use Series.plot() instead (GH18627)

• Index.summary() is deprecated and will be removed in a future version (GH18217)

• NDFrame.get_ftype_counts() is deprecated and will be removed in a future version (GH18243)
The `convert_datetime64` parameter in `DataFrame.to_records()` has been deprecated and will be removed in a future version. The NumPy bug motivating this parameter has been resolved. The default value for this parameter has also changed from `True` to `None` (GH18160).

Series.rolling().apply(), DataFrame.rolling().apply(), Series.expanding().apply(), and DataFrame.expanding().apply() have deprecated passing an np.array by default. One will need to pass the new raw parameter to be explicit about what is passed (GH20584).

The `data`, `base`, `strides`, `flags` and `itemsize` properties of the Series and Index classes have been deprecated and will be removed in a future version (GH20419).

`DatetimeIndex.offset` is deprecated. Use `DatetimeIndex.freq` instead (GH20716).

Floor division between an integer ndarray and a `Timedelta` is deprecated. Divide by `Timedelta.value` instead (GH19761).

Setting `PeriodIndex.freq` (which was not guaranteed to work correctly) is deprecated. Use `PeriodIndex.asfreq()` instead (GH20678).

`Index.get_duplicates()` is deprecated and will be removed in a future version (GH20239).

The previous default behavior of negative indices in `Categorical.take` is deprecated. In a future version it will change from meaning missing values to meaning positional indices from the right. The future behavior is consistent with `Series.take()` (GH20664).

Passing multiple axes to the `axis` parameter in `DataFrame.dropna()` has been deprecated and will be removed in a future version (GH20987).

**Removal of prior version deprecations/changes**

- Warnings against the obsolete usage `Categorical(codes, categories)`, which were emitted for instance when the first two arguments to `Categorical()` had different dtypes, and recommended the use of `Categorical.from_codes`, have now been removed (GH8074).

- The `levels` and `labels` attributes of a MultiIndex can no longer be set directly (GH4039).

- `pd.tseries.util.pivot_annual` has been removed (deprecated since v0.19). Use `pivot_table` instead (GH18370).

- `pd.tseries.util.isleapyear` has been removed (deprecated since v0.19). Use `.is_leap_year` property in Datetime-like instead (GH18370).

- `pd.ordered_merge` has been removed (deprecated since v0.19). Use `pd.merge_ordered` instead (GH18459).

- The `SparseList` class has been removed (GH14007).

- The `pandas.io.wb` and `pandas.io.data` stub modules have been removed (GH13735).

- `Categorical.from_array` has been removed (GH13854).

- The `freq` and `how` parameters have been removed from the `rolling/expanding/ewm` methods of DataFrame and Series (deprecated since v0.18). Instead, resample before calling the methods. (GH18601 & GH18668).

- `DatetimeIndex.to_datetime`, `Timestamp.to_datetime`, `PeriodIndex.to_datetime`, and `Index.to_datetime` have been removed (GH8254, GH14096, GH14113).

- `read_csv()` has dropped the `skip_footer` parameter (GH13386).

- `read_csv()` has dropped the `as_recarray` parameter (GH13373).

- `read_csv()` has dropped the `buffer_lines` parameter (GH13360).
• `read_csv()` has dropped the `compact_ints` and `use_unsigned` parameters (GH13323)
• The Timestamp class has dropped the `offset` attribute in favor of `freq` (GH13593)
• The Series, Categorical, and Index classes have dropped the `reshape` method (GH13012)
• pandas.tseries.frequencies.get_standard_freq has been removed in favor of pandas.tseries.frequencies.to_offset (freq).rule_code (GH13874)
• The `freqstr` keyword has been removed from pandas.tseries.frequencies.to_offset in favor of `freq` (GH13874)
• The Panel4D and PanelND classes have been removed (GH13776)
• The Panel class has dropped the `to_long` and `toLong` methods (GH19077)
• The options `display.line_with` and `display.height` are removed in favor of `display.width` and `display.max_rows` respectively (GH4391, GH19107)
• The `labels` attribute of the Categorical class has been removed in favor of `Categorical.codes` (GH7768)
• The `flavor` parameter have been removed from `func:to_sql` method (GH13611)
• The modules pandas.tools.hashing and pandas.util.hashing have been removed (GH16223)
• The top-level functions `pd.rolling_*`, `pd.expanding_*` and `pd.ewm_*` have been removed (Deprecated since v0.18). Instead, use the DataFrame/Series methods `rolling`, `expanding` and `ewm` (GH18723)
• Imports from pandas.core.common for functions such as `is_datetime64_dtype` are now removed. These are located in `pandas.api.types` (GH13634, GH19769)
• The `infer_dst` keyword in `Series.tz_localize()`, `DatetimeIndex.tz_localize()` and `DatetimeIndex` have been removed. `infer_dst=True` is equivalent to `ambiguous='infer'`, and `infer_dst=False` to `ambiguous='raise'` (GH7963).
• When `.resample()` was changed from an eager to a lazy operation, like `.groupby()` in v0.18.0, we put in place compatibility (with a `FutureWarning`), so operations would continue to work. This is now fully removed, so a Resampler will no longer forward compat operations (GH20554)
• Remove long deprecated `axis=None` parameter from `.replace()` (GH20271)

Performance improvements

• Indexers on Series or DataFrame no longer create a reference cycle (GH17956)
• Added a keyword argument, `cache`, to `to_datetime()` that improved the performance of converting duplicate datetime arguments (GH11665)
• DateOffset arithmetic performance is improved (GH18218)
• Converting a Series of Timedelta objects to days, seconds, etc... sped up through vectorization of underlying methods (GH18092)
• Improved performance of `.map()` with a Series/dict input (GH15081)
• The overridden Timedelta properties of days, seconds and microseconds have been removed, leveraging their built-in Python versions instead (GH18242)
• Series construction will reduce the number of copies made of the input data in certain cases (GH17449)
• Improved performance of `Series.dt.date()` and `DatetimeIndex.date()` (GH18058)
• Improved performance of `Series.dt.time()` and `DatetimeIndex.time()` (GH18461)
• Improved performance of `IntervalIndex.symmetric_difference()` (GH18475)

• Improved performance of `DatetimeIndex` and `Series` arithmetic operations with Business-Month and Business-Quarter frequencies (GH18489)

• `Series() / DataFrame()` tab completion limits to 100 values, for better performance. (GH18587)

• Improved performance of `DataFrame.median()` with `axis=1` when bottleneck is not installed (GH16468)

• Improved performance of `MultiIndex.get_loc()` for large indexes, at the cost of a reduction in performance for small ones (GH18519)

• Improved performance of `MultiIndex.remove_unused_levels()` when there are no unused levels, at the cost of a reduction in performance when there are (GH19289)

• Improved performance of `Index.get_loc()` for non-unique indexes (GH19478)

• Improved performance of pairwise `.rolling()` and `.expanding()` with `.cov()` and `.corr()` operations (GH17917)

• Improved performance of `pandas.core.groupby.GroupBy.rank()` (GH15779)

• Improved performance of variable `.rolling()` on `.min()` and `.max()` (GH19521)

• Improved performance of `pandas.core.groupby.GroupBy.ffill()` and `pandas.core.groupby.GroupBy.bfill()` (GH11296)

• Improved performance of `pandas.core.groupby.GroupBy.any()` and `pandas.core.groupby.GroupBy.all()` (GH15435)

• Improved performance of `pandas.core.groupby.GroupBy.pct_change()` (GH19165)

• Improved performance of `Series.isin()` in the case of categorical dtypes (GH20003)

• Improved performance of `getattr(Series, attr)` when the Series has certain index types. This manifested in slow printing of large Series with a `DatetimeIndex` (GH19764)

• Fixed a performance regression for `GroupBy.nth()` and `GroupBy.last()` with some object columns (GH19283)

• Improved performance of `pandas.core.arrays.Categorical.from_codes()` (GH18501)

**Documentation changes**

Thanks to all of the contributors who participated in the pandas Documentation Sprint, which took place on March 10th. We had about 500 participants from over 30 locations across the world. You should notice that many of the API docstrings have greatly improved.

There were too many simultaneous contributions to include a release note for each improvement, but this GitHub search should give you an idea of how many docstrings were improved.

Special thanks to Marc Garcia for organizing the sprint. For more information, read the NumFOCUS blogpost recappping the sprint.

• Changed spelling of “numpy” to “NumPy”, and “python” to “Python”. (GH19017)

• Consistency when introducing code samples, using either colon or period. Rewrote some sentences for greater clarity, added more dynamic references to functions, methods and classes. (GH18941, GH18948, GH18973, GH19017)

• Added a reference to `DataFrame.assign()` in the concatenate section of the merging documentation (GH18665)
Bug fixes

Categorical

**Warning:** A class of bugs were introduced in pandas 0.21 with `CategoricalDtype` that affects the correctness of operations like `merge`, `concat`, and indexing when comparing multiple unordered `Categorical` arrays that have the same categories, but in a different order. We highly recommend upgrading or manually aligning your categories before doing these operations.

- Bug in `Categorical.equals` returning the wrong result when comparing two unordered `Categorical` arrays with the same categories, but in a different order (GH16603)
- Bug in `pandas.api.types.union_categoricals()` returning the wrong result when for unordered categoricals with the categories in a different order. This affected `pandas.concat()` with Categorical data (GH19096).
- Bug in `pandas.merge()` returning the wrong result when joining on an unordered `Categorical` that had the same categories but in a different order (GH19551)
- Bug in `CategoricalIndex.get_indexer()` returning the wrong result when `target` was an unordered `Categorical` that had the same categories as `self` but in a different order (GH19551)
- Bug in `Index.astype()` with a categorical dtype where the resultant index is not converted to a `CategoricalIndex` for all types of index (GH18630)
- Bug in `Series.astype()` and `Categorical.astype()` where an existing categorical data does not get updated (GH10696, GH18593)
- Bug in `Series.str.split()` with `expand=True` incorrectly raising an IndexError on empty strings (GH20002).
- Bug in `Index` constructor with `dtype=CategoricalDtype(...)` where categories and ordered are not maintained (GH19032)
- Bug in `Series` constructor with scalar and `dtype=CategoricalDtype(...)` where categories and ordered are not maintained (GH19565)
- Bug in `Categorical.__iter__` not converting to Python types (GH19909)
- Bug in `pandas.factorize()` returning the unique codes for the uniques. This now returns a Categorical with the same dtype as the input (GH19721)
- Bug in `pandas.factorize()` including an item for missing values in the uniques return value (GH19721)
- Bug in `Series.take()` with categorical data interpreting `-1` in `indices` as missing value markers, rather than the last element of the Series (GH20664)
Datetimelike

- Bug in `Series.__sub__()` subtracting a non-nanosecond `np.datetime64` object from a `Series` gave incorrect results (GH7996)
- Bug in `DatetimeIndex`, `TimedeltaIndex` addition and subtraction of zero-dimensional integer arrays gave incorrect results (GH19012)
- Bug in `DatetimeIndex` and `TimedeltaIndex` where adding or subtracting an array-like of `DateOffset` objects either raised (`np.array`, `pd.Index`) or broadcast incorrectly (`pd.Series`) (GH18849)
- Bug in `Series.__add__()` adding `Series` with dtype `timedelta64[ns]` to a timezone-aware `DatetimeIndex` incorrectly dropped timezone information (GH13905)
- Adding a `Period` object to a `datetime` or `Timestamp` object will now correctly raise a `TypeError` (GH17983)
- Bug in `Timestamp` where comparison with an array of `Timestamp` objects would result in a `RecursionError` (GH15183)
- Bug in `Series floor-division` where operating on a scalar `timedelta` raises an exception (GH18846)
- Bug in `DatetimeIndex` where the repr was not showing high-precision time values at the end of a day (e.g., 23:59:59.999999999) (GH19030)
- Bug in `astype()` to non-ns timedelta units would hold the incorrect dtype (GH19176, GH19223, GH12425)
- Bug in `Series truncate()` which raises `TypeError` with a monotonic `PeriodIndex` (GH17717)
- Bug in `pct_change()` using periods and freq returned different length outputs (GH7292)
- Bug in comparison of `DatetimeIndex` against `None` or `datetime.date` objects raising `TypeError` for `==` and `!=` comparisons instead of all-`False` and all-`True`, respectively (GH19301)
- Bug in `Timestamp` and `to_datetime()` where a string representing a barely out-of-bounds timestamp would be incorrectly rounded down instead of raising `OutOfBoundsDatetime` (GH19382)
- Bug in `Timestamp.floor()` `DatetimeIndex.floor()` where time stamps far in the future and past were not rounded correctly (GH19206)
- Bug in `to_datetime()` where passing an out-of-bounds datetime with `errors='coerce'` and `utc=True` would raise `OutOfBoundsDatetime` instead of parsing to `NaT` (GH19612)
- Bug in `DatetimeIndex` and `TimedeltaIndex` addition and subtraction where name of the returned object was not always set consistently. (GH19744)
- Bug in `DatetimeIndex` and `TimedeltaIndex` addition and subtraction where operations with numpy arrays raised `TypeError` (GH19847)
- Bug in `DatetimeIndex` and `TimedeltaIndex` where setting the `freq` attribute was not fully supported (GH20678)
Timedelta

- Bug in `Timedelta.__mul__()` where multiplying by NaT returned NaT instead of raising a TypeError (GH19819)
- Bug in `Series` with dtype='timedelta64[ns]' where addition or subtraction of `TimedeltaIndex` had results cast to dtype='int64' (GH17250)
- Bug in `Series` with dtype='timedelta64[ns]' where addition or subtraction of `TimedeltaIndex` could return a Series with an incorrect name (GH19043)
- Bug in `Timedelta.__floordiv__()` and `Timedelta.__rfloordiv__()` dividing by many incompatible numpy objects was incorrectly allowed (GH18846)
- Bug where dividing a scalar timedelta-like object with `TimedeltaIndex` performed the reciprocal operation (GH19125)
- Bug in `TimedeltaIndex` where division by a Series would return a `TimedeltaIndex` instead of a Series (GH19042)
- Bug in `Timedelta.__add__()`, `Timedelta.__sub__()` where adding or subtracting a np.timedelta64 object would return another np.timedelta64 instead of a Timedelta (GH19738)
- Bug in `Timedelta.__floordiv__()`, `Timedelta.__rfloordiv__()` where operating with a `Tick` object would raise a TypeError instead of returning a numeric value (GH19738)
- Bug in `Period.asfreq()` where periods near `datetime(1, 1, 1)` could be converted incorrectly (GH19643, GH19834)
- Bug in `Timedelta.total_seconds()` causing precision errors, for example `Timedelta('30S').total_seconds()==30.000000000000004` (GH19458)
- Bug in `Timedelta.__rmod__()` where operating with a numpy.timedelta64 returned a timedelta64 object instead of a Timedelta (GH19820)
- Multiplication of `TimedeltaIndex` by `TimedeltaIndex` will now raise TypeError instead of raising ValueError in cases of length mismatch (GH19333)
- Bug in indexing a `TimedeltaIndex` with a np.timedelta64 object which was raising a TypeError (GH20393)

Timezones

- Bug in creating a `Series` from an array that contains both tz-naive and tz-aware values will result in a `Series` whose dtype is tz-aware instead of object (GH16406)
- Bug in comparison of timezone-aware `DatetimeIndex` against NaT incorrectly raising TypeError (GH19276)
- Bug in `DatetimeIndex.astype()` when converting between timezone aware dtypes, and converting from timezone aware to naive (GH18951)
- Bug in comparing `DatetimeIndex`, which failed to raise TypeError when attempting to compare timezone-aware and timezone-naive datetimelike objects (GH18162)
- Bug in localization of a naive, datetime string in a `Series` constructor with a `datetime64[ns, tz]` dtype (GH174151)
- `Timestamp.replace()` will now handle Daylight Savings transitions gracefully (GH18319)
- Bug in tz-aware `DatetimeIndex` where addition/subtraction with a `TimedeltaIndex` or array with dtype='timedelta64[ns]' was incorrect (GH17558)
• Bug in `DatetimeIndex.insert()` where inserting NaT into a timezone-aware index incorrectly raised (GH16357)

• Bug in `DataFrame` constructor, where tz-aware Datetimeindex and a given column name will result in an empty `DataFrame` (GH19157)

• Bug in `Timestamp.tz_localize()` where localizing a timestamp near the minimum or maximum valid values could overflow and return a timestamp with an incorrect nanosecond value (GH12677)

• Bug when iterating over `DatetimeIndex` that was localized with fixed timezone offset that rounded nanosecond precision to microseconds (GH19603)

• Bug in `DataFrame.diff()` that raised an `IndexError` with tz-aware values (GH18578)

• Bug in `melt()` that converted tz-aware dtypes to tz-naive (GH15785)

• Bug in `Dataframe.count()` that raised a `ValueError`, if `Dataframe.dropna()` was called for a single column with timezone-aware values. (GH13407)

Offsets

• Bug in `WeekOfMonth` and `Week` where addition and subtraction did not roll correctly (GH18510, GH18672, GH18864)

• Bug in `WeekOfMonth` and `LastWeekOfMonth` where default keyword arguments for constructor raised `ValueError` (GH19142)

• Bug in `FY5253Quarter, LastWeekOfMonth` where rollback and rollforward behavior was inconsistent with addition and subtraction behavior (GH18854)

• Bug in `FY5253` where datetime addition and subtraction incremented incorrectly for dates on the year-end but not normalized to midnight (GH18845)

• Bug in `FY5253` where date offsets could incorrectly raise an `AssertionError` in arithmetic operations (GH14774)

Numeric

• Bug in `Series` constructor with an int or float list where specifying `dtype=str, dtype='str'` or `dtype='U'` failed to convert the data elements to strings (GH16605)

• Bug in `Index` multiplication and division methods where operating with a `Series` would return an `Index` object instead of a `Series` object (GH19042)

• Bug in the `DataFrame` constructor in which data containing very large positive or very large negative numbers was causing `OverflowError` (GH18584)

• Bug in `Index` constructor with `dtype='uint64'` where int-like floats were not coerced to `UInt64Index` (GH18400)

• Bug in `DataFrame` flex arithmetic (e.g. `df.add(other, fill_value=foo)`) with a `fill_value` other than None failed to raise `NotImplementedError` in corner cases where either the frame or other has length zero (GH19522)

• Multiplication and division of numeric-dtyped `Index` objects with timedelta-like scalars returns `TimedeltaIndex` instead of raising `TypeError` (GH19333)

• Bug where NaN was returned instead of 0 by `Series.pct_change()` and `DataFrame.pct_change()` when `fill_method` is not `None` (GH19873)
Strings

- Bug in `Series.str.get()` with a dictionary in the values and the index not in the keys, raising `KeyError` (GH20671)

Indexing

- Bug in `Index` construction from list of mixed type tuples (GH18505)
- Bug in `Index.drop()` when passing a list of both tuples and non-tuples (GH18304)
- Bug in `DataFrame.drop()`, `Panel.drop()`, `Series.drop()`, `Index.drop()` where no `KeyError` is raised when dropping a non-existent element from an axis that contains duplicates (GH19186)
- Bug in indexing a datetimelike `Index` that raised `ValueError` instead of `IndexError` (GH18386).
- `Index.to_series()` now accepts `index` and `name` kwargs (GH18699)
- `DatetimeIndex.to_series()` now accepts `index` and `name` kwargs (GH18699)
- Bug in indexing non-scalar value from `Series` having non-unique `Index` will return value flattened (GH17610)
- Bug in indexing with iterator containing only missing keys, which raised no error (GH20748)
- Fixed inconsistency in `.ix` between list and scalar keys when the index has integer dtype and does not include the desired keys (GH20753)
- Bug in `__setitem__` when indexing a `DataFrame` with a 2-d boolean ndarray (GH18582)
- Bug in `str.extractall` when there were no matches empty `Index` was returned instead of appropriate `MultiIndex` (GH19034)
- Bug in `IntervalIndex` where empty and purely NA data was constructed inconsistently depending on the construction method (GH18421)
- Bug in `IntervalIndex.symmetric_difference()` where the symmetric difference with a non-`IntervalIndex` did not raise (GH18475)
- Bug in `IntervalIndex` where set operations that returned an empty `IntervalIndex` had the wrong dtype (GH19101)
- Bug in `DataFrame.drop_duplicates()` where no `KeyError` is raised when passing in columns that don’t exist on the `DataFrame` (GH19726)
- Bug in `Index` subclasses constructors that ignore unexpected keyword arguments (GH19348)
- Bug in `Index.difference()` when taking difference of an `Index` with itself (GH20040)
- Bug in `DataFrame.first_valid_index()` and `DataFrame.last_valid_index()` in presence of entire rows of NaNs in the middle of values (GH20499).
- Bug in `IntervalIndex` where some indexing operations were not supported for overlapping or non-monotonic uint64 data (GH20636)
- Bug in `Series.is_unique` where extraneous output in stderr is shown if Series contains objects with `__ne__` defined (GH20661)
- Bug in `.loc` assignment with a single-element list-like incorrectly assigns as a list (GH19474)
- Bug in partial string indexing on a `Series/DataFrame` with a monotonic decreasing `DatetimeIndex` (GH19362)
- Bug in performing in-place operations on a `DataFrame` with a duplicate `Index` (GH17105)
• Bug in `IntervalIndex.get_loc()` and `IntervalIndex.get_indexer()` when used with an `IntervalIndex` containing a single interval (GH17284, GH20921)
• Bug in `.loc` with a uint64 indexer (GH20722)

**MultiIndex**

• Bug in `MultiIndex.__contains__()` where non-tuple keys would return `True` even if they had been dropped (GH19027)
• Bug in `MultiIndex.set_labels()` which would cause casting (and potentially clipping) of the new labels if the level argument is not 0 or a list like `[0, 1, ...]` (GH19057)
• Bug in `MultiIndex.get_level_values()` which would return an invalid index on level of ints with missing values (GH17924)
• Bug in `MultiIndex.unique()` when called on empty `MultiIndex` (GH20568)
• Bug in `MultiIndex.unique()` which would not preserve level names (GH20570)
• Bug in `MultiIndex.remove_unused_levels()` which would fill `nan` values (GH18417)
• Bug in `MultiIndex.from_tuples()` which would fail to take zipped tuples in python3 (GH18434)
• Bug in `MultiIndex.get_loc()` which would fail to automatically cast values between float and int (GH18818, GH15994)
• Bug in `MultiIndex.get_loc()` which would cast boolean to integer labels (GH19086)
• Bug in `MultiIndex.get_loc()` which would fail to locate keys containing `NaN` (GH18485)
• Bug in `MultiIndex.get_loc()` in large `MultiIndex`, would fail when levels had different dtypes (GH18520)
• Bug in indexing where nested indexers having only numpy arrays are handled incorrectly (GH19686)

**IO**

• `read_html()` now rewinds seekable IO objects after parse failure, before attempting to parse with a new parser. If a parser errors and the object is non-seekable, an informative error is raised suggesting the use of a different parser (GH17975)
• `DataFrame.to_html()` now has an option to add an id to the leading `<table>` tag (GH8496)
• Bug in `read_msgpack()` with a non existent file is passed in Python 2 (GH15296)
• Bug in `read_csv()` where a MultiIndex with duplicate columns was not being mangled appropriately (GH18062)
• Bug in `read_csv()` where missing values were not being handled properly when `keep_default_na=False` with dictionary `na_values` (GH19227)
• Bug in `read_csv()` causing heap corruption on 32-bit, big-endian architectures (GH20785)
• Bug in `read_sas()` where a file with 0 variables gave an `AttributeError` incorrectly. Now it gives an `EmptyDataError` (GH18184)
• Bug in `DataFrame.to_latex()` where pairs of braces meant to serve as invisible placeholders were escaped (GH18667)
• Bug in `DataFrame.to_latex()` where a `NaN` in a `MultiIndex` would cause an `IndexError` or incorrect output (GH14249)
Pandas: powerful Python data analysis toolkit, Release 1.2.2

- Bug in `DataFrame.to_latex()` where a non-string index-level name would result in an AttributeError (GH19981)
- Bug in `DataFrame.to_latex()` where the combination of an index name and the `index_names=False` option would result in incorrect output (GH18326)
- Bug in `DataFrame.to_latex()` where a MultiIndex with an empty string as its name would result in incorrect output (GH18669)
- Bug in `DataFrame.to_latex()` where missing space characters caused wrong escaping and produced non-valid latex in some cases (GH20859)
- Bug in `read_json()` where large numeric values were causing an OverflowError (GH18842)
- `Interval` now supported in `DataFrame.to_excel()` for all Excel file types (GH19242)
- `Timedelta` now supported in `DataFrame.to_excel()` for all Excel file types (GH19242, GH9155, GH19900)
- Bug in `pandas.io.stata.StataReader.value_labels()` raising an AttributeError when called on very old files. Now returns an empty dict (GH19417)
- Bug in `read_pickle()` when unpickling objects with `TimedeltaIndex` or `Float64Index` created with pandas prior to version 0.20 (GH19939)
- Bug in `pandas.io.json.json_normalize()` where sub-records are not properly normalized if any sub-records values are NoneType (GH20030)
- Bug in `usecols` parameter in `read_csv()` where error is not raised correctly when passing a string. (GH20529)
- Bug in `HDFStore.keys()` when reading a file with a soft link causes exception (GH20523)
- Bug in `HDFStore.select_column()` where a key which is not a valid store raised an AttributeError instead of a KeyError (GH17912)

Plotting

- Better error message when attempting to plot but matplotlib is not installed (GH19810).
- `DataFrame.plot()` now raises a `ValueError` when the `x` or `y` argument is improperly formed (GH18671)
- Bug in `DataFrame.plot()` when `x` and `y` arguments given as positions caused incorrect referenced columns for line, bar and area plots (GH20056)
- Bug in formatting tick labels with `datetime.time()` and fractional seconds (GH18478).
- `Series.plot.kde()` has exposed the args `ind` and `bw_method` in the docstring (GH18461). The argument `ind` may now also be an integer (number of sample points).
- `DataFrame.plot()` now supports multiple columns to the `y` argument (GH19699)
GroupBy/resample/rolling

- Bug when grouping by a single column and aggregating with a class like list or tuple (GH18079)
- Fixed regression in DataFrame.groupby() which would not emit an error when called with a tuple key not in the index (GH18798)
- Bug in DataFrame.resample() which silently ignored unsupported (or mistyped) options for label, closed and convention (GH19303)
- Bug in DataFrame.groupby() where tuples were interpreted as lists of keys rather than as keys (GH17979, GH18249)
- Bug in DataFrame.groupby() where aggregation by first/last/min/max was causing timestamps to lose precision (GH19526)
- Bug in DataFrame.transform() where particular aggregation functions were being incorrectly cast to match the dtype(s) of the grouped data (GH19200)
- Bug in DataFrame.groupby() passing the on= kwarg, and subsequently using .apply() (GH17813)
- Bug in DataFrame.resample().aggregate not raising a KeyError when aggregating a non-existent column (GH16766, GH19566)
- Bug in DataFrameGroupBy.cumsum() and DataFrameGroupBy.cumprod() when skipna was passed (GH19806)
- Bug in DataFrame.resample() that dropped timezone information (GH13238)
- Bug in DataFrame.groupby() where transformations using np.all and np.any were raising a ValueError (GH20653)
- Bug in DataFrame.resample() where ffill, bfill, pad, backfill, fillna, interpolate, and asfreq were ignoring loffset. (GH20744)
- Bug in DataFrame.groupby() when applying a function that has mixed data types and the user supplied function can fail on the grouping column (GH20949)
- Bug in DataFrameGroupBy.rolling().apply() where operations performed against the associated DataFrameGroupBy object could impact the inclusion of the grouped item(s) in the result (GH14013)

Sparse

- Bug in which creating a SparseDataFrame from a dense Series or an unsupported type raised an uncontrolled exception (GH19374)
- Bug in SparseDataFrame.to_csv causing exception (GH19384)
- Bug in SparseSeries.memory_usage which caused segfault by accessing non sparse elements (GH19368)
- Bug in constructing a SparseArray: if data is a scalar and index is defined it will coerce to float64 regardless of scalar’s dtype. (GH19163)
Reshaping

- Bug in `DataFrame.merge()` where referencing a `CategoricalIndex` by name, where the `by` kwarg would raise `KeyError` (GH20777)
- Bug in `DataFrame.stack()` which fails trying to sort mixed type levels under Python 3 (GH18310)
- Bug in `DataFrame.unstack()` which casts int to float if `columns` is a `MultiIndex` with unused levels (GH17845)
- Bug in `DataFrame.unstack()` which raises an error if `index` is a `MultiIndex` with unused labels on the unstacked level (GH18562)
- Fixed construction of a `Series` from a `dict` containing `NaN` as key (GH18480)
- Fixed construction of a `DataFrame` from a `dict` containing `NaN` as key (GH18455)
- Disabled construction of a `Series` where `len(index) > len(data) = 1`, which previously would broadcast the data item, and now raises a `ValueError` (GH18819)
- Suppressed error in the construction of a `DataFrame` from a `dict` containing scalar values when the corresponding keys are not included in the passed index (GH18600)
- Fixed (changed from `object` to `float64`) dtype of `DataFrame` initialized with axes, no data, and `dtype=int` (GH19646)
- Bug in `Series.rank()` where `Series` containing `NaT` modifies the `Series` in place (GH18521)
- Bug in `cut()` which fails when using readonly arrays (GH18773)
- Bug in `DataFrame.pivot_table()` which fails when the `aggfunc` arg is of type string. The behavior is now consistent with other methods like `agg` and `apply` (GH18713)
- Bug in `DataFrame.merge()` in which merging using `Index` objects as vectors raised an Exception (GH19427)
- Bug in `DataFrame.stack()`, `DataFrame.unstack()`, `Series.unstack()` which were not returning subclasses (GH15563)
- Bug in timezone comparisons, manifesting as a conversion of the index to UTC in `.concat()` (GH18523)
- Bug in `concat()` when concatenating sparse and dense series it returns only a `SparseDataFrame`. Should be a `DataFrame`. (GH18914, GH18686, and GH16874)
- Improved error message for `DataFrame.merge()` when there is no common merge key (GH19427)
- Bug in `DataFrame.join()` which does an `outer` instead of a `left` join when being called with multiple `DataFrames` and some have non-unique indices (GH19624)
- `Series.rename()` now accepts `axis` as a kwarg (GH18589)
- Bug in `rename()` where an Index of same-length tuples was converted to a `MultiIndex` (GH19497)
- Comparisons between `Series` and `Index` would return a `Series` with an incorrect name, ignoring the Index’s name attribute (GH19582)
- Bug in `qcut()` where datetime and timedelta data with `NaT` present raised a `ValueError` (GH19768)
- Bug in `DataFrame.iterrows()`, which would inners strings not compliant to ISO8601 to datetimes (GH19671)
- Bug in `Series` constructor with `Categorical` where a `ValueError` is not raised when an index of different length is given (GH19342)
- Bug in `DataFrame.astype()` where column metadata is lost when converting to categorical or a dictionary of dtypes (GH19920)
• Bug in `cut()` and `qcut()` where timezone information was dropped (GH19872)
• Bug in `Series` constructor with a `dtype=str`, previously raised in some cases (GH19853)
• Bug in `get_dummies()`, and `select_dtypes()`, where duplicate column names caused incorrect behavior (GH20848)
• Bug in `isna()`, which cannot handle ambiguous typed lists (GH20675)
• Bug in `concat()` which raises an error when concatenating TZ-aware dataframes and all-NaT dataframes (GH12396)
• Bug in `concat()` which raises an error when concatenating empty TZ-aware series (GH18447)

Other

• Improved error message when attempting to use a Python keyword as an identifier in a `numexpr` backed query (GH18221)
• Bug in accessing a `pandas.get_option()`, which raised `KeyError` rather than `OptionError` when looking up a non-existent option key in some cases (GH19789)
• Bug in `testing.assert_series_equal()` and `testing.assert_frame_equal()` for Series or DataFrames with differing unicode data (GH20503)

Contributors

A total of 328 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

5.7 Version 0.22

5.7.1 Version 0.22.0 (December 29, 2017)

This is a major release from 0.21.1 and includes a single, API-breaking change. We recommend that all users upgrade to this version after carefully reading the release note (singular!).

Backwards incompatible API changes

pandas 0.22.0 changes the handling of empty and all-NA sums and products. The summary is that

- The sum of an empty or all-NA Series is now 0
- The product of an empty or all-NA Series is now 1
- We’ve added a `min_count` parameter to `.sum()` and `.prod()` controlling the minimum number of valid values for the result to be valid. If fewer than `min_count` non-NA values are present, the result is NA. The default is 0. To return NaN, the 0.21 behavior, use `min_count=1`. 
Some background: In pandas 0.21, we fixed a long-standing inconsistency in the return value of all-NA series depending on whether or not bottleneck was installed. See Sum/prod of all-NaN or empty Series/DataFrames is now consistently NaN. At the same time, we changed the sum and prod of an empty Series to also be NaN.

Based on feedback, we’ve partially reverted those changes.

**Arithmetic operations**

The default sum for empty or all-NA Series is now 0.

**pandas 0.21.x**

```python
In [1]: pd.Series([]).sum()
Out[1]: nan

In [2]: pd.Series([np.nan]).sum()
Out[2]: nan
```

**pandas 0.22.0**

```python
In [1]: pd.Series([]).sum()
Out[1]: 0.0

In [2]: pd.Series([np.nan]).sum()
Out[2]: 0.0
```

The default behavior is the same as pandas 0.20.3 with bottleneck installed. It also matches the behavior of NumPy’s np.nansum on empty and all-NA arrays.

To have the sum of an empty series return NaN (the default behavior of pandas 0.20.3 without bottleneck, or pandas 0.21.x), use the `min_count` keyword.

```python
In [3]: pd.Series([]).sum(min_count=1)
Out[3]: nan
```

Thanks to the `skipna` parameter, the `.sum` on an all-NA series is conceptually the same as the `.sum` of an empty one with `skipna=True` (the default).

```python
In [4]: pd.Series([np.nan]).sum(min_count=1)  # skipna=True by default
Out[4]: nan
```

The `min_count` parameter refers to the minimum number of non-null values required for a non-NA sum or product. `Series.prod()` has been updated to behave the same as `Series.sum()`, returning 1 instead.

```python
In [5]: pd.Series([]).prod()
Out[5]: 1.0

In [6]: pd.Series([np.nan]).prod()
Out[6]: 1.0

In [7]: pd.Series([]).prod(min_count=1)
Out[7]: nan
```

These changes affect `DataFrame.sum()` and `DataFrame.prod()` as well. Finally, a few less obvious places in pandas are affected by this change.
Grouping by a Categorical

Grouping by a Categorical and summing now returns 0 instead of NaN for categories with no observations. The product now returns 1 instead of NaN.

**pandas 0.21.x**

```python
In [8]: grouper = pd.Categorical(['a', 'a'], categories=['a', 'b'])
In [9]: pd.Series([1, 2]).groupby(grouper).sum()
Out[9]:
a    3.0
b   NaN
dtype: float64
```

**pandas 0.22**

```python
In [8]: grouper = pd.Categorical(['a', 'a'], categories=['a', 'b'])
In [9]: pd.Series([1, 2]).groupby(grouper).sum()
Out[9]:
a   3
b   0
Length: 2, dtype: int64
```

To restore the 0.21 behavior of returning NaN for unobserved groups, use `min_count>=1`.

```python
In [10]: pd.Series([1, 2]).groupby(grouper).sum(min_count=1)
Out[10]:
a   3.0
b   NaN
Length: 2, dtype: float64
```

Resample

The sum and product of all-NA bins has changed from NaN to 0 for sum and 1 for product.

**pandas 0.21.x**

```python
In [11]: s = pd.Series([1, 1, np.nan, np.nan],
                   index=pd.date_range('2017', periods=4))
In [12]: s.resample('2d').sum()
Out[12]:
2017-01-01  1.0
2017-01-02  1.0
2017-01-03  NaN
2017-01-04  NaN
Freq: D, dtype: float64
```

**pandas 0.22.0**

```python
In [12]: s.resample('2d').sum()
Out[12]:
2017-01-01  2.0
2017-01-03  NaN
Freq: 2D, dtype: float64
```
In [11]: s = pd.Series([1, 1, np.nan, np.nan], index=pd.date_range("2017", periods=4))
In [12]: s.resample("2d").sum()
Out[12]:
2017-01-01  2.0
2017-01-03  0.0
Freq: 2D, Length: 2, dtype: float64

To restore the 0.21 behavior of returning NaN, use min_count>=1.

In [13]: s.resample("2d").sum(min_count=1)
Out[13]:
2017-01-01  2.0
2017-01-03  NaN
Freq: 2D, Length: 2, dtype: float64

In particular, upsampling and taking the sum or product is affected, as upsampling introduces missing values even if the original series was entirely valid.

pandas 0.21.x

In [14]: idx = pd.DatetimeIndex(['2017-01-01', '2017-01-02'])
In [15]: pd.Series([1, 2], index=idx).resample('12H').sum()
Out[15]:
2017-01-01 00:00:00  1.0
2017-01-01 12:00:00  NaN
2017-01-02 00:00:00  2.0
Freq: 12H, dtype: float64

pandas 0.22.0

In [14]: idx = pd.DatetimeIndex(['2017-01-01', '2017-01-02'])
In [15]: pd.Series([1, 2], index=idx).resample('12H').sum()
Out[15]:
2017-01-01 00:00:00  1
2017-01-01 12:00:00  0
2017-01-02 00:00:00  2
Freq: 12H, Length: 3, dtype: int64

Once again, the min_count keyword is available to restore the 0.21 behavior.

In [16]: pd.Series([1, 2], index=idx).resample('12H').sum(min_count=1)
Out[16]:
2017-01-01 00:00:00  1.0
2017-01-01 12:00:00  NaN
2017-01-02 00:00:00  2.0
Freq: 12H, Length: 3, dtype: float64
Rolling and expanding

Rolling and expanding already have a `min_periods` keyword that behaves similar to `min_count`. The only case that changes is when doing a rolling or expanding sum with `min_periods=0`. Previously this returned NaN, when fewer than `min_periods` non-NA values were in the window. Now it returns 0.

**pandas 0.21.1**

```
In [17]: s = pd.Series([np.nan, np.nan])
In [18]: s.rolling(2, min_periods=0).sum()
Out[18]:
0   NaN
1   NaN
dtype: float64
```

**pandas 0.22.0**

```
In [17]: s = pd.Series([np.nan, np.nan])
In [18]: s.rolling(2, min_periods=0).sum()
Out[18]:
0   0.0
1   0.0
Length: 2, dtype: float64
```

The default behavior of `min_periods=None`, implying that `min_periods` equals the window size, is unchanged.

**Compatibility**

If you maintain a library that should work across pandas versions, it may be easiest to exclude pandas 0.21 from your requirements. Otherwise, all your `sum()` calls would need to check if the `Series` is empty before summing.

With setuptools, in your `setup.py` use:

```
install_requires=['pandas!=0.21.*', ...]
```

With conda, use

```
requirements:
  run:
    - pandas !=0.21.0, !=0.21.1
```

Note that the inconsistency in the return value for all-NA series is still there for pandas 0.20.3 and earlier. Avoiding pandas 0.21 will only help with the empty case.

5.8 Version 0.21

5.8.1 Version 0.21.1 (December 12, 2017)

This is a minor bug-fix release in the 0.21.x series and includes some small regression fixes, bug fixes and performance improvements. We recommend that all users upgrade to this version.

Highlights include:

• Temporarily restore matplotlib datetime plotting functionality. This should resolve issues for users who implicitly relied on pandas to plot datetimes with matplotlib. See here.
• Improvements to the Parquet IO functions introduced in 0.21.0. See here.

What’s new in v0.21.1

• Restore Matplotlib datetime converter registration
• New features
  – Improvements to the Parquet IO functionality
  – Other enhancements

Restore Matplotlib datetime converter registration

pandas implements some matplotlib converters for nicely formatting the axis labels on plots with datetime or Period values. Prior to pandas 0.21.0, these were implicitly registered with matplotlib, as a side effect of import pandas.

In pandas 0.21.0, we required users to explicitly register the converter. This caused problems for some users who relied on those converters being present for regular matplotlib.pyplot plotting methods, so we’re temporarily reverting that change; pandas 0.21.1 again registers the converters on import, just like before 0.21.0.

We’ve added a new option to control the converters: pd.options.plotting.matplotlib.register_converters. By default, they are registered. Toggling this to False removes pandas’ formatters and restore any converters we overwrote when registering them (GH18301).

We’re working with the matplotlib developers to make this easier. We’re trying to balance user convenience (automatically registering the converters) with import performance and best practices (importing pandas shouldn’t have the side effect of overwriting any custom converters you’ve already set). In the future we hope to have most of the date-time formatting functionality in matplotlib, with just the pandas-specific converters in pandas. We’ll then gracefully deprecate the automatic registration of converters in favor of users explicitly registering them when they want them.

New features

Improvements to the Parquet IO functionality

- DataFrame.to_parquet() will now write non-default indexes when the underlying engine supports it. The indexes will be preserved when reading back in with read_parquet() (GH18581).
- read_parquet() now allows to specify the columns to read from a parquet file (GH18154)
- read_parquet() now allows to specify kwargs which are passed to the respective engine (GH18216)

Other enhancements

- Timestamp.timestamp() is now available in Python 2.7. (GH17329)
- Grouper and TimeGrouper now have a friendly repr output (GH18203).

Deprecations

- pandas.tseries.register has been renamed to pandas.plotting.register_matplotlib_converters() (GH18301)

Performance improvements

- Improved performance of plotting large series/dataframes (GH18236).
Bug fixes

Conversion

- Bug in `TimedeltaIndex` subtraction could incorrectly overflow when NaT is present (GH17791)
- Bug in `DatetimeIndex` subtracting datetimelike from DatetimeIndex could fail to overflow (GH18020)
- Bug in `IntervalIndex.copy()` when copying and `IntervalIndex` with non-default `closed` (GH18339)
- Bug in `DataFrame.to_dict()` where columns of datetime that are tz-aware were not converted to required arrays when used with orient='records', raising TypeError (GH18372)
- Bug in `DateTimeIndex` and `date_range()` where mismatching tz-aware start and end timezones would not raise an err if end.tzinfo is None (GH18431)
- Bug in `Series.fillna()` which raised when passed a long integer on Python 2 (GH18159).

Indexing

- Bug in a boolean comparison of a `datetime.datetime` and a `datetime64[ns]` dtype Series (GH17965)
- Bug where a `MultiIndex` with more than a million records was not raising AttributeError when trying to access a missing attribute (GH18165)
- Bug in `IntervalIndex` constructor when a list of intervals is passed with non-default `closed` (GH18334)
- Bug in `Index.putmask` when an invalid mask passed (GH18368)
- Bug in masked assignment of a `timedelta64[ns]` dtype Series, incorrectly coerced to float (GH18493)

IO

- Bug in class:`pandas.io.stata.StataReader` not converting date/time columns with display formatting addressed (GH17990). Previously columns with display formatting were normally left as ordinal numbers and not converted to datetime objects.
- Bug in `read_csv()` when reading a compressed UTF-16 encoded file (GH18071)
- Bug in `read_csv()` for handling null values in index columns when specifying na_filter=False (GH5239)
- Bug in `read_csv()` when reading numeric category fields with high cardinality (GH18186)
- Bug in `DataFrame.to_csv()` when the table had `MultiIndex` columns, and a list of strings was passed in for header (GH5539)
- Bug in parsing integer datetime-like columns with specified format in `read_sql` (GH17855).
- Bug in `DataFrame.to_msgpack()` when serializing data of the `numpy.bool_` datatype (GH18390)
- Bug in `read_json()` not decoding when reading line delimited JSON from S3 (GH17200)
- Bug in `pandas.io.json.json_normalize()` to avoid modification of meta (GH18610)
- Bug in `to_latex()` where repeated MultiIndex values were not printed even though a higher level index differed from the previous row (GH14484)
- Bug when reading NaN-only categorical columns in `HDFStore` (GH18413)
• Bug in `DataFrame.to_latex()` with `longtable=True` where a latex multicolunm always spanned over three columns (GH17959)

Plotting

• Bug in `DataFrame.plot()` and `Series.plot()` with `DatetimeIndex` where a figure generated by them is not pickleable in Python 3 (GH18439)

GroupBy/resample/rolling

• Bug in `DataFrame.resample(...).apply(...)` when there is a callable that returns different columns (GH15169)
• Bug in `DataFrame.resample(...)` when there is a time change (DST) and resampling frequency is 12h or higher (GH15549)
• Bug in `pd.DataFrameGroupBy.count()` when counting over a datetimelike column (GH13393)
• Bug in `rolling.var` where calculation is inaccurate with a zero-valued array (GH18430)

Reshaping

• Error message in `pd.merge_asof()` for key datatype mismatch now includes datatype of left and right key (GH18068)
• Bug in `pd.concat` when empty and non-empty DataFrames or Series are concatenated (GH18178 GH18187)
• Bug in `DataFrame.filter(...)` when unicode is passed as a condition in Python 2 (GH13101)
• Bug when merging empty DataFrames when `np.seterr(divide='raise')` is set (GH17776)

Numeric

• Bug in `pd.Series.rolling.skew()` and `rolling.kurt()` with all equal values has floating issue (GH18044)

Categorical

• Bug in `DataFrame.astype()` where casting to ‘category’ on an empty `DataFrame` causes a segmentation fault (GH18004)
• Error messages in the testing module have been improved when items have different `CategoricalDtype` (GH18069)
• `CategoricalIndex` can now correctly take a `pd.api.types.CategoricalDtype` as its dtype (GH18116)
• Bug in `Categorical.unique()` returning read-only codes array when all categories were NaN (GH18051)
• Bug in `DataFrame.groupby(axis=1)` with a `CategoricalIndex` (GH18432)
String

- `Series.str.split()` will now propagate NaN values across all expanded columns instead of None (GH18450)

5.8.2 Version 0.21.0 (October 27, 2017)

This is a major release from 0.20.3 and includes a number of API changes, deprecations, new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

Highlights include:

- Integration with Apache Parquet, including a new top-level `read_parquet()` function and `DataFrame.to_parquet()` method, see here.
- New user-facing `pandas.api.types.CategoricalDtype` for specifying categoricals independent of the data, see here.
- The behavior of `sum` and `prod` on all-NaN Series/DataFrames is now consistent and no longer depends on whether bottleneck is installed, and `sum` and `prod` on empty Series now return NaN instead of 0, see here.
- Compatibility fixes for pypy, see here.
- Additions to the `drop`, `reindex` and `rename` API to make them more consistent, see here.
- Addition of the new methods `DataFrame.infer_objects` (see here) and `GroupBy.pipe` (see here).
- Indexing with a list of labels, where one or more of the labels is missing, is deprecated and will raise a `KeyError` in a future version, see here.

Check the `API Changes` and `deprecations` before updating.
• **New features**
  – Integration with Apache Parquet file format
  – Method `infer_objects` type conversion
  – Improved warnings when attempting to create columns
  – Method `drop` now also accepts index/columns keywords
  – Methods `rename`, `reindex` now also accept axis keyword
  – `CategoricalDtype` for specifying categoricals
  – `GroupBy` objects now have a `pipe` method
  – `Categorical.rename_categories` accepts a dict-like
  – Other enhancements

• **Backwards incompatible API changes**
  – Dependencies have increased minimum versions
  – Sum/prod of all-NaN or empty Series/DataFrames is now consistently NaN
  – Indexing with a list with missing labels is deprecated
  – NA naming changes
  – Iteration of Series/Index will now return Python scalars
  – Indexing with a Boolean Index
  – `PeriodIndex` resampling
  – Improved error handling during item assignment in `pd.eval`
  – Dtype conversions
  – `MultiIndex` constructor with a single level
  – UTC localization with Series
  – Consistency of range functions
  – No automatic Matplotlib converters
  – Other API changes

• **Deprecations**
  – `Series.select` and `DataFrame.select`
  – `Series.argmax` and `Series.argmin`

• **Removal of prior version deprecations/changes**

• **Performance improvements**

• **Documentation changes**

• **Bug fixes**
  – Conversion
  – Indexing
  – IO
New features

Integration with Apache Parquet file format

Integration with Apache Parquet, including a new top-level `read_parquet()` and `DataFrame.to_parquet()` method, see [here](GH15838, GH17438).

Apache Parquet provides a cross-language, binary file format for reading and writing data frames efficiently. Parquet is designed to faithfully serialize and de-serialize `DataFrame` s, supporting all of the pandas dtypes, including extension dtypes such as datetime with timezones.

This functionality depends on either the `pyarrow` or `fastparquet` library. For more details, see [the IO docs on Parquet](GH11221).

Method `infer_objects` type conversion

The `DataFrame.infer_objects()` and `Series.infer_objects()` methods have been added to perform dtype inference on object columns, replacing some of the functionality of the deprecated `convert_objects` method. See the documentation [here](GH11221) for more details.

This method only performs soft conversions on object columns, converting Python objects to native types, but not any coercive conversions. For example:

```
In [1]: df = pd.DataFrame({
    ...:     'A': [1, 2, 3],
    ...:     'B': np.array([1, 2, 3], dtype='object'),
    ...:     'C': ['1', '2', '3']})

In [2]: df.dtypes
Out[2]:
A     int64
B     object
C     object
Length: 3, dtype: object

In [3]: df.infer_objects().dtypes
Out[3]:
A     int64
B     int64
C     object
Length: 3, dtype: object
```
Note that column 'C' was not converted - only scalar numeric types will be converted to a new type. Other types of conversion should be accomplished using the `to_numeric()` function (or `to_datetime()`, `to_timedelta()`).

```
In [4]: df = df.infer_objects()
In [5]: df['C'] = pd.to_numeric(df['C'], errors='coerce')
In [6]: df.dtypes
Out[6]:
A  int64
B  int64
C  int64
Length: 3, dtype: object
```

**Improved warnings when attempting to create columns**

New users are often puzzled by the relationship between column operations and attribute access on `DataFrame` instances (GH7175). One specific instance of this confusion is attempting to create a new column by setting an attribute on the `DataFrame`:

```
In [1]: df = pd.DataFrame({'one': [1., 2., 3.]})
In [2]: df.two = [4, 5, 6]
```

This does not raise any obvious exceptions, but also does not create a new column:

```
In [3]: df
Out[3]:
   one
0  1.0
1  2.0
2  3.0
```

Setting a list-like data structure into a new attribute now raises a `UserWarning` about the potential for unexpected behavior. See `Attribute Access`.

**Method `drop` now also accepts index/columns keywords**

The `drop()` method has gained `index/columns` keywords as an alternative to specifying the `axis`. This is similar to the behavior of `reindex` (GH12392).

For example:

```
In [7]: df = pd.DataFrame(np.arange(8).reshape(2, 4),
                   columns=['A', 'B', 'C', 'D'])
In [8]: df
Out[8]:
   A  B  C  D
0  0  1  2  3
1  4  5  6  7
[2 rows x 4 columns]
```
In [9]: df.drop([‘B’, ‘C’], axis=1)
Out[9]:
   A  D
0  0  3
1  4  7
[2 rows x 2 columns]

# the following is now equivalent
In [10]: df.drop(columns=[‘B’, ‘C’])
Out[10]:
   A  D
0  0  3
1  4  7
[2 rows x 2 columns]

Methods rename, reindex now also accept axis keyword

The DataFrame.rename() and DataFrame.reindex() methods have gained the axis keyword to specify the axis to target with the operation (GH12392).

Here's rename:

In [11]: df = pd.DataFrame({“A”: [1, 2, 3], “B”: [4, 5, 6]})
In [12]: df.rename(str.lower, axis=’columns’)
Out[12]:
   a  b
0  1  4
1  2  5
2  3  6
[3 rows x 2 columns]

In [13]: df.rename(id, axis=’index’)  
Out[13]:
   A  B
94641213881568  1  4
94641213881600  2  5
94641213881632  3  6
[3 rows x 2 columns]

And reindex:

In [14]: df.reindex([‘A’, ‘B’, ‘C’], axis=’columns’)  
Out[14]:
   A  B  C
0  1  4  NaN
1  2  5  NaN
2  3  6  NaN
[3 rows x 3 columns]
The “index, columns” style continues to work as before.

We highly encourage using named arguments to avoid confusion when using either style.

**CategoricalDtype for specifying categoricals**

*pandas.api.types.CategoricalDtype* has been added to the public API and expanded to include the categories and ordered attributes. A CategoricalDtype can be used to specify the set of categories and orderedness of an array, independent of the data. This can be useful for example, when converting string data to a Categorical (GH14711, GH15078, GH16015, GH17643):

```
In [18]: from pandas.api.types import CategoricalDtype
In [19]: s = pd.Series(['a', 'b', 'c', 'a'])  # strings
In [20]: dtype = CategoricalDtype(categories=['a', 'b', 'c', 'd'], ordered=True)
In [21]: s.astype(dtype)
```

```
Out[21]:
0   a
1   b
2   c
3   a
Length: 4, dtype: category
Categories (4, object): ['a' < 'b' < 'c' < 'd']
```

One place that deserves special mention is in *read_csv()*). Previously, with `dtype={'col': 'category'}`, the returned values and categories would always be strings.

2844 Chapter 5. Release notes
In [22]: data = 'A,B
a,1
b,2
c,3'

In [23]: pd.read_csv(StringIO(data), dtype={'B': 'category'}).B.cat.categories
Out[23]: Index(['1', '2', '3'], dtype='object')

Notice the “object” dtype.

With a CategoricalDtype of all numerics, datetimes, or timedeltas, we can automatically convert to the correct type

In [24]: dtype = {'B': CategoricalDtype([1, 2, 3])}

In [25]: pd.read_csv(StringIO(data), dtype=dtype).B.cat.categories
Out[25]: Int64Index([1, 2, 3], dtype='int64')

The values have been correctly interpreted as integers.

The .dtype property of a Categorical, CategoricalIndex or a Series with categorical type will now return an instance of CategoricalDtype. While the repr has changed, str(CategoricalDtype()) is still the string 'category'. We’ll take this moment to remind users that the preferred way to detect categorical data is to use pandas.api.types.is_categorical_dtype(), and not str(dtype) == 'category'.

See the CategoricalDtype docs for more.

**GroupBy objects now have a pipe method**

GroupBy objects now have a pipe method, similar to the one on DataFrame and Series, that allow for functions that take a GroupBy to be composed in a clean, readable syntax. (GH17871)

For a concrete example on combining .groupby and .pipe, imagine having a DataFrame with columns for stores, products, revenue and sold quantity. We’d like to do a groupwise calculation of prices (i.e. revenue/quantity) per store and per product. We could do this in a multi-step operation, but expressing it in terms of piping can make the code more readable.

First we set the data:

In [26]: import numpy as np

In [27]: n = 1000

In [28]: df = pd.DataFrame({'Store': np.random.choice(['Store_1', 'Store_2'], n),
                      'Product': np.random.choice(['Product_1', 'Product_2', 'Product_3'], n),
                      'Revenue': (np.random.random(n) * 50 + 10).round(2),
                      'Quantity': np.random.randint(1, 10, size=n)})

In [29]: df.head(2)
Out[29]:
    Store  Product  Revenue  Quantity
0  Store_2  Product_2    32.09        7
1  Store_1  Product_3    14.20        1

Now, to find prices per store/product, we can simply do:
In [30]: (df.groupby(['Store', 'Product'])
       ....:   .pipe(lambda grp: grp.Revenue.sum() / grp.Quantity.sum())
       ....:   .unstack().round(2))

Out[30]:

<table>
<thead>
<tr>
<th>Store</th>
<th>Product</th>
<th>Product_1</th>
<th>Product_2</th>
<th>Product_3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Store_1</td>
<td>6.73</td>
<td>6.72</td>
<td>7.14</td>
<td></td>
</tr>
<tr>
<td>Store_2</td>
<td>7.59</td>
<td>6.98</td>
<td>7.23</td>
<td></td>
</tr>
</tbody>
</table>

[2 rows x 3 columns]

See the documentation for more.

**Categorical.rename_categories accepts a dict-like**

rename_categories() now accepts a dict-like argument for new_categories. The previous categories are looked up in the dictionary’s keys and replaced if found. The behavior of missing and extra keys is the same as in DataFrame.rename().

In [31]: c = pd.Categorical(['a', 'a', 'b'])

In [32]: c.rename_categories({'a': 'eh', 'b': 'bee'})

Out[32]:
['eh', 'eh', 'bee']

Categories (2, object): ['eh', 'bee']

Warning: To assist with upgrading pandas, rename_categories treats Series as list-like. Typically, Series are considered to be dict-like (e.g. in .rename, .map). In a future version of pandas rename_categories will change to treat them as dict-like. Follow the warning message’s recommendations for writing future-proof code.

In [33]: c.rename_categories(pd.Series([0, 1], index=['a', 'c']))

FutureWarning: Treating Series 'new_categories' as a list-like and using the values. In a future version, 'rename_categories' will treat Series like a dictionary.
For dict-like, use 'new_categories.to_dict()' For list-like, use 'new_categories.values'.

Out[33]:
[0, 0, 1]

Categories (2, int64): [0, 1]

Other enhancements

**New functions or methods**

- nearest() is added to support nearest-neighbor upsampling (GH17496).
- Index has added support for a to_frame method (GH15230).
New keywords

- Added a `skipna` parameter to `infer_dtype()` to support type inference in the presence of missing values (GH17059).
- `Series.to_dict()` and `DataFrame.to_dict()` now support an `into` keyword which allows you to specify the `collections.Mapping` subclass that you would like returned. The default is `dict`, which is backwards compatible. (GH16122)
- `Series.set_axis()` and `DataFrame.set_axis()` now support the `inplace` parameter. (GH14636)
- `Series.to_pickle()` and `DataFrame.to_pickle()` have gained a `protocol` parameter (GH16252). By default, this parameter is set to `HIGHEST_PROTOCOL`.
- `read_feather()` has gained the `nthreads` parameter for multi-threaded operations (GH16359)
- `Series.to_pickle()` and `DataFrame.to_pickle()` have gained an `inplace` argument. (GH15388)
- `crosstab()` has gained a `margins_name` parameter to define the name of the row/column that will contain the totals when `margins=True`. (GH15972)
- `read_json()` now accepts a `chunksize` parameter that can be used when `lines=True`. If `chunksize` is passed, `read_json` now returns an iterator which reads in `chunksize` lines with each iteration. (GH17048)
- `read_json()` and `to_json()` now accept a `compression` argument which allows them to transparently handle compressed files. (GH17798)

Various enhancements

- Improved the import time of pandas by about 2.25x. (GH16764)
- Support for PEP 519 – Adding a file system path protocol on most readers (e.g. `read_csv()`) and writers (e.g. `DataFrame.to_csv()`) (GH13823).
- Added a `__fspath__` method to `pd.HDFStore`, `pd.ExcelFile`, and `pd.ExcelWriter` to work properly with the file system path protocol (GH13823).
- The `validate` argument for `merge()` now checks whether a merge is one-to-one, one-to-many, many-to-one, or many-to-many. If a merge is found to not be an example of specified merge type, an exception of type `MergeError` will be raised. For more, see here (GH16270)
- Added support for PEP 518 (`pyproject.toml`) to the build system (GH16745)
- `RangeIndex.append()` now returns a `RangeIndex` object when possible (GH16212)
- `Series.rename_axis()` and `DataFrame.rename_axis()` with `inplace=True` now return `None` while renaming the axis inplace. (GH15704)
- `api.types.infer_dtypes()` now infers decimals. (GH15690)
- `DataFrame.select_dtypes()` now accepts scalar values for include/exclude as well as list-like. (GH16855)
- `date_range()` now accepts ‘YS’ in addition to ‘AS’ as an alias for start of year. (GH9313)
- `date_range()` now accepts ‘Y’ in addition to ‘A’ as an alias for end of year. (GH9313)
- `DataFrame.add_prefix()` and `DataFrame.add_suffix()` now accept strings containing the ‘%’ character. (GH17151)
- Read/write methods that infer compression (`read_csv()`, `read_table()`, `read_pickle()`, and `to_pickle()`) can now infer from path-like objects, such as `pathlib.Path`. (GH17206)
pandas: powerful Python data analysis toolkit, Release 1.2.2

- `read_sas()` now recognizes much more of the most frequently used date (datetime) formats in SAS7BDAT files. (GH15871)
- `DataFrame.items()` and `Series.items()` are now present in both Python 2 and 3 and is lazy in all cases. (GH13918, GH17213)
- `pandas.io.formats.style.Styler.where()` has been implemented as a convenience for `pandas.io.formats.style.Styler.applymap()`. (GH17474)
- `MultiIndex.is_monotonic_decreasing()` has been implemented. Previously returned `False` in all cases. (GH16554)
- `read_excel()` raises `ImportError` with a better message if `xlrd` is not installed. (GH17613)
- `DataFrame.assign()` will preserve the original order of **kwargs for Python 3.6+ users instead of sorting the column names. (GH14207)
- `Series.reindex()`, `DataFrame.reindex()`, `Index.get_indexer()` now support list-like argument for tolerance. (GH17367)

Backwards incompatible API changes

Dependencies have increased minimum versions

We have updated our minimum supported versions of dependencies (GH15206, GH15543, GH15214). If installed, we now require:

<table>
<thead>
<tr>
<th>Package</th>
<th>Minimum Version</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Numpy</td>
<td>1.9.0</td>
<td>X</td>
</tr>
<tr>
<td>Matplotlib</td>
<td>1.4.3</td>
<td></td>
</tr>
<tr>
<td>Scipy</td>
<td>0.14.0</td>
<td></td>
</tr>
<tr>
<td>Bottleneck</td>
<td>1.0.0</td>
<td></td>
</tr>
</tbody>
</table>

Additionally, support has been dropped for Python 3.4 (GH15251).

Sum/prod of all-NaN or empty Series/DataFrames is now consistently NaN

**Note:** The changes described here have been partially reverted. See the v0.22.0 Whatsnew for more.

The behavior of `sum` and `prod` on all-NaN Series/DataFrames no longer depends on whether `bottleneck` is installed, and return value of `sum` and `prod` on an empty Series has changed (GH9422, GH15507).

Calling `sum` or `prod` on an empty or all-NaN Series, or columns of a DataFrame, will result in NaN. See the docs.

```python
In [33]: s = pd.Series([np.nan])
```

Previously WITHOUT `bottleneck` installed:

```python
In [2]: s.sum()
Out[2]: np.nan
```

Previously WITH `bottleneck`:

```python
```
New behavior, without regard to the bottleneck installation:

```python
In [34]: s.sum()
Out[34]: 0.0
```

Note that this also changes the sum of an empty Series. Previously this always returned 0 regardless of a bottleneck installation:

```python
In [1]: pd.Series([]).sum()
Out[1]: 0
```

but for consistency with the all-NaN case, this was changed to return NaN as well:

```python
In [35]: pd.Series([]).sum()
Out[35]: 0.0
```

### Indexing with a list with missing labels is deprecated

Previously, selecting with a list of labels, where one or more labels were missing would always succeed, returning NaN for missing labels. This will now show a `FutureWarning`. In the future this will raise a `KeyError (GH15747)`. This warning will trigger on a `DataFrame` or a `Series` for using `.loc[]` or `[]` when passing a list-of-labels with at least 1 missing label. See the [deprecation docs](https://pandas.pydata.org/pandas-docs/stable/indexing.html#deprecate-loc-reindex-listlike).

```python
In [36]: s = pd.Series([1, 2, 3])
In [37]: s
Out[37]:
      0  1
     1  2
     2  3
Length: 3, dtype: int64
```

Previous behavior

```python
In [4]: s.loc[[1, 2, 3]]
Out[4]:
1   2.0
2   3.0
3   NaN
dtype: float64
```

Current behavior

```python
In [4]: s.loc[[1, 2, 3]]
```

Passing list-likes to `.loc` or `[]` with any missing label will raise `KeyError` in the future, you can use `.reindex()` as an alternative.

See the documentation here:
The idiomatic way to achieve selecting potentially not-found elements is via \texttt{.reindex()}.

\begin{verbatim}
In [38]: s.reindex([1, 2, 3])
Out[38]:
1  2.0
2  3.0
3  NaN
Length: 3, dtype: float64
\end{verbatim}

Selection with all keys found is unchanged.

\begin{verbatim}
In [39]: s.loc[[1, 2]]
Out[39]:
1  2
2  3
Length: 2, dtype: int64
\end{verbatim}

**NA naming changes**

In order to promote more consistency among the pandas API, we have added additional top-level functions \texttt{isna()} and \texttt{notna()} that are aliases for \texttt{isnull()} and \texttt{notnull()}. The naming scheme is now more consistent with methods like \texttt{.dropna()} and \texttt{.fillna()}. Furthermore in all cases where \texttt{.isnull()} and \texttt{.notnull()} methods are defined, these have additional methods named \texttt{.isna()} and \texttt{.notna()}, these are included for classes \texttt{Categorical}, \texttt{Index}, \texttt{Series}, and \texttt{DataFrame}. (GH15001).

The configuration option \texttt{pd.options.mode.use_inf_as_null} is deprecated, and \texttt{pd.options.mode.use_inf_as_na} is added as a replacement.

**Iteration of Series/Index will now return Python scalars**

Previously, when using certain iteration methods for a \texttt{Series} with dtype \texttt{int} or \texttt{float}, you would receive a numpy scalar, e.g. \texttt{np.int64}, rather than a Python \texttt{int}. Issue (GH10904) corrected this for \texttt{Series.tolist()} and \texttt{list(Series)}. This change makes all iteration methods consistent, in particular, for \texttt{__iter__()} and \texttt{.map()}; note that this only affects int/float dtypes. (GH13236, GH13258, GH14216).

\begin{verbatim}
In [40]: s = pd.Series([1, 2, 3])
In [41]: s
Out[41]:
0  1
1  2
2  3
Length: 3, dtype: int64
\end{verbatim}

Previously:

\begin{verbatim}
In [2]: type(list(s)[0])
Out[2]: numpy.int64
\end{verbatim}
New behavior:

```python
In [42]: type(list(s)[0])
Out[42]: int
```

Furthermore this will now correctly box the results of iteration for `DataFrame.to_dict()` as well.

```python
In [43]: d = {'a': [1], 'b': ['b']}
In [44]: df = pd.DataFrame(d)
```

Previously:

```python
In [8]: type(df.to_dict()['a'][0])
Out[8]: numpy.int64
```

New behavior:

```python
In [45]: type(df.to_dict()['a'][0])
Out[45]: int
```

### Indexing with a Boolean Index

Previously when passing a boolean `Index` to `.loc`, if the index of the `Series/DataFrame` had boolean labels, you would get a label based selection, potentially duplicating result labels, rather than a boolean indexing selection (where `True` selects elements), this was inconsistent how a boolean numpy array indexed. The new behavior is to act like a boolean numpy array indexer. (GH17738)

Previous behavior:

```python
In [46]: s = pd.Series([1, 2, 3], index=[False, True, False])
In [47]: s
Out[47]:
False 1
True  2
False 3
Length: 3, dtype: int64
```

```python
In [59]: s.loc[pd.Index([True, False, True])]
Out[59]:
True  2
False 1
False 3
True  2
dtype: int64
```

Current behavior:

```python
In [48]: s.loc[pd.Index([True, False, True])]
Out[48]:
False 1
False 3
Length: 2, dtype: int64
```

Furthermore, previously if you had an index that was non-numeric (e.g. strings), then a boolean Index would raise a `KeyError`. This will now be treated as a boolean indexer.
Previously behavior:

```python
In [49]: s = pd.Series([1, 2, 3], index=['a', 'b', 'c'])

In [50]: s
Out[50]:
   a  1
   b  2
   c  3
Length: 3, dtype: int64

In [39]: s.loc[pd.Index([True, False, True])]
KeyError: "None of [Index([True, False, True], dtype='object')] are in the [index]"
```

Current behavior

```python
In [51]: s.loc[pd.Index([True, False, True])]
Out[51]:
   a  1
   c  3
Length: 2, dtype: int64
```

**PeriodIndex resampling**

In previous versions of pandas, resampling a Series/DataFrame indexed by a PeriodIndex returned a DatetimeIndex in some cases (GH12884). Resampling to a multiplied frequency now returns a PeriodIndex (GH15944). As a minor enhancement, resampling a PeriodIndex can now handle NaT values (GH13224)

Previous behavior:

```python
In [1]: pi = pd.period_range('2017-01', periods=12, freq='M')

In [2]: s = pd.Series(np.arange(12), index=pi)

In [3]: resampled = s.resample('2Q').mean()

In [4]: resampled
Out[4]:
2017-03-31  1.0
2017-09-30  5.5
2018-03-31 10.0
Freq: 2Q-DEC, dtype: float64

In [5]: resampled.index
```

New behavior:

```python
In [52]: pi = pd.period_range('2017-01', periods=12, freq='M')

In [53]: s = pd.Series(np.arange(12), index=pi)

In [54]: resampled = s.resample('2Q').mean()

In [55]: resampled
```

(continues on next page)
Out[55]:
2017Q1  2.5
2017Q3  8.5
Freq: 2Q-DEC, Length: 2, dtype: float64
In [56]: resampled.index
Out[56]: PeriodIndex(['2017Q1', '2017Q3'], dtype='period[2Q-DEC]', freq='2Q-DEC')

Upsampling and calling .ohlc() previously returned a Series, basically identical to calling .asfreq(). OHLC upsampling now returns a DataFrame with columns open, high, low and close (GH13083). This is consistent with downsampling and DatetimeIndex behavior.

Previous behavior:

In [1]: pi = pd.period_range(start='2000-01-01', freq='D', periods=10)
In [2]: s = pd.Series(np.arange(10), index=pi)
In [3]: s.resample('H').ohlc()
Out[3]:
2000-01-01 00:00 0.0
... ...
2000-01-10 23:00 NaN
Freq: H, Length: 240, dtype: float64
In [4]: s.resample('M').ohlc()
Out[4]:
open high low close
2000-01 0 9 0 9

New behavior:

In [57]: pi = pd.period_range(start='2000-01-01', freq='D', periods=10)
In [58]: s = pd.Series(np.arange(10), index=pi)
In [59]: s.resample('H').ohlc()
Out[59]:

2000-01 0 9 0 9
Improved error handling during item assignment in pd.eval

`eval()` will now raise a `ValueError` when item assignment malfunctions, or inplace operations are specified, but there is no item assignment in the expression (GH16732)

```python
In [61]: arr = np.array([1, 2, 3])
```

Previously, if you attempted the following expression, you would get a not very helpful error message:

```python
In [3]: pd.eval("a = 1 + 2", target=arr, inplace=True)
...: IndexError: only integers, slices (`:`), ellipsis (`...`), numpy.newaxis (`None`) and integer or boolean arrays are valid indices
```

This is a very long way of saying numpy arrays don’t support string-item indexing. With this change, the error message is now this:

```python
In [3]: pd.eval("a = 1 + 2", target=arr, inplace=True)
...: ValueError: Cannot assign expression output to target
```

It also used to be possible to evaluate expressions inplace, even if there was no item assignment:

```python
In [4]: pd.eval("1 + 2", target=arr, inplace=True)
Out[4]: 3
```

However, this input does not make much sense because the output is not being assigned to the target. Now, a `ValueError` will be raised when such an input is passed in:

```python
In [4]: pd.eval("1 + 2", target=arr, inplace=True)
...: ValueError: Cannot operate inplace if there is no assignment
```

Dtype conversions

Previously assignments, `.where()` and `.fillna()` with a bool assignment, would coerce to same the type (e.g. int / float), or raise for datetimelikes. These will now preserve the bools with object dtypes. (GH16821).

```python
In [62]: s = pd.Series([1, 2, 3])
```

```python
In [5]: s[1] = True
```

```python
In [6]: s
Out[6]:
0    1
1    1
2    3
dtype: int64
```

New behavior
Previously, as assignment to a datetimelike with a non-datetimelike would coerce the non-datetime-like item being assigned (GH14145).

These now coerce to object dtype.

- Inconsistent behavior in .where() with datetimelikes which would raise rather than coerce to object (GH16402)
- Bug in assignment against int64 data with np.ndarray with float64 dtype may keep int64 dtype (GH14001)

**MultiIndex constructor with a single level**

The MultiIndex constructors no longer squeezes a MultiIndex with all length-one levels down to a regular Index. This affects all the MultiIndex constructors. (GH17178)

Previous behavior:

Length 1 levels are no longer special-cased. They behave exactly as if you had length 2+ levels, so a MultiIndex is always returned from all of the MultiIndex constructors:
UTC localization with Series

Previously, `to_datetime()` did not localize datetime Series data when `utc=True` was passed. Now, `to_datetime()` will correctly localize Series with a `datetime64[ns, UTC]` dtype to be consistent with how list-like and Index data are handled. (GH6415).

Previous behavior

```python
In [69]: s = pd.Series(['20130101 00:00:00'] * 3)
```

```python
In [12]: pd.to_datetime(s, utc=True)
Out[12]:
0  2013-01-01
1  2013-01-01
2  2013-01-01
dtype: datetime64[ns]
```

New behavior

```python
In [70]: pd.to_datetime(s, utc=True)
Out[70]:
0  2013-01-01 00:00:00+00:00
1  2013-01-01 00:00:00+00:00
2  2013-01-01 00:00:00+00:00
Length: 3, dtype: datetime64[ns, UTC]
```

Additionally, DataFrames with datetime columns that were parsed by `read_sql_table()` and `read_sql_query()` will also be localized to UTC only if the original SQL columns were timezone aware datetime columns.

Consistency of range functions

In previous versions, there were some inconsistencies between the various range functions: `date_range()`, `bdate_range()`, `period_range()`, `timedelta_range()`, and `interval_range()`. (GH17471).

One of the inconsistent behaviors occurred when the `start`, `end` and `period` parameters were all specified, potentially leading to ambiguous ranges. When all three parameters were passed, `interval_range` ignored the `period` parameter, `period_range` ignored the `end` parameter, and the other range functions raised. To promote consistency among the range functions, and avoid potentially ambiguous ranges, `interval_range` and `period_range` will now raise when all three parameters are passed.

Previous behavior:

```python
In [2]: pd.interval_range(start=0, end=4, periods=6)
Out[2]:
IntervalIndex([(0, 1], (1, 2], (2, 3]],
closed='right',
dtype='interval[int64]')
```

```python
In [3]: pd.period_range(start='2017Q1', end='2017Q4', periods=6, freq='Q')
Out[3]: PeriodIndex(['2017Q1', '2017Q2', '2017Q3', '2017Q4', '2018Q1', '2018Q2'],
dtype='period[Q-DEC]', freq='Q-DEC')
```

New behavior:
In [2]: pd.interval_range(start=0, end=4, periods=6)
---------------------------------------------------------------------------
ValueError: Of the three parameters: start, end, and periods, exactly two must be
˓→specified

In [3]: pd.period_range(start='2017Q1', end='2017Q4', periods=6, freq='Q')
---------------------------------------------------------------------------
ValueError: Of the three parameters: start, end, and periods, exactly two must be
˓→specified

Additionally, the endpoint parameter end was not included in the intervals produced by interval_range. However, all other range functions include end in their output. To promote consistency among the range functions, interval_range will now include end as the right endpoint of the final interval, except if freq is specified in a way which skips end.

Previous behavior:

In [4]: pd.interval_range(start=0, end=4)
Out [4]:
IntervalIndex([(0, 1], (1, 2], (2, 3]],
closed='right',
dtype='interval[int64]')

New behavior:

In [71]: pd.interval_range(start=0, end=4)
Out [71]:
IntervalIndex([(0, 1], (1, 2], (2, 3], (3, 4]],
closed='right',
dtype='interval[int64]')

No automatic Matplotlib converters

pandas no longer registers our date, time, datetime, datetime64, and Period converters with matplotlib when pandas is imported. Matplotlib plot methods (plt.plot, ax.plot,...), will not nicely format the x-axis for DatetimeIndex or PeriodIndex values. You must explicitly register these methods:

pandas built-in Series.plot and DataFrame.plot will register these converters on first-use (GH17710).

Note: This change has been temporarily reverted in pandas 0.21.1, for more details see here.

Other API changes

• The Categorical constructor no longer accepts a scalar for the categories keyword. (GH16022)
• Accessing a non-existent attribute on a closed HDFStore will now raise an AttributeError rather than a ClosedFileError (GH16301)
• read_csv() now issues a UserWarning if the names parameter contains duplicates (GH17095)
• read_csv() now treats 'null' and 'n/a' strings as missing values by default (GH16471, GH16078)
• pandas.HDFStore’s string representation is now faster and less detailed. For the previous behavior, use pandas.HDFStore.info(). (GH16503).
• Compression defaults in HDF stores now follow pytables standards. Default is no compression and if `complib` is missing and `complevel > 0` zlib is used (GH15943)

• `Index.get_indexer_non_unique()` now returns an ndarray indexer rather than an Index: this is consistent with `Index.get_indexer()` (GH16819)

• Removed the `@slow` decorator from `pandas._testing`, which caused issues for some downstream packages’ test suites. Use `@pytest.mark.slow` instead, which achieves the same thing (GH16850)

• Moved definition of `MergeError` to the `pandas.errors` module.

• The signature of `Series.set_axis()` and `DataFrame.set_axis()` has been changed from `set_axis(axis, labels)` to `set_axis(labels, axis=0)`, for consistency with the rest of the API. The old signature is deprecated and will show a `FutureWarning` (GH14636)

• `Series.argmin()` and `Series.argmax()` will now raise a `TypeError` when used with object dtypes, instead of a `ValueError` (GH13595)

• `Period` is now immutable, and will now raise an `AttributeError` when a user tries to assign a new value to the ordinal or freq attributes (GH17116).

• `to_datetime()` when passed a tz-aware `origin=` kwarg will now raise a more informative `ValueError` rather than a `TypeError` (GH16842)

• `to_datetime()` now raises a `ValueError` when format includes `%W` or `%U` without also including day of the week and calendar year (GH16774)

• Renamed non-functional `index` to `index_col` in `read_stata()` to improve API consistency (GH16342)

• Bug in `DataFrame.drop()` caused boolean labels `False` and `True` to be treated as labels 0 and 1 respectively when dropping indices from a numeric index. This will now raise a `ValueError` (GH16877)

• Restricted `DateOffset` keyword arguments. Previously, `DateOffset` subclasses allowed arbitrary keyword arguments which could lead to unexpected behavior. Now, only valid arguments will be accepted. (GH17176).

Deprecations

• `DataFrame.from_csv()` and `Series.from_csv()` have been deprecated in favor of `read_csv()` (GH4191)

• `read_excel()` has deprecated `sheetname` in favor of `sheet_name` for consistency with `.to_excel()` (GH10559).

• `read_excel()` has deprecated `parse_cols` in favor of `usecols` for consistency with `read_csv()` (GH4988)

• `read_csv()` has deprecated the `tupleize_cols` argument. Column tuples will always be converted to a `MultiIndex` (GH17060)

• `DataFrame.to_csv()` has deprecated the `tupleize_cols` argument. MultiIndex columns will be always written as rows in the CSV file (GH17060)

• The `convert` parameter has been deprecated in the `.take()` method, as it was not being respected (GH16948)

• `pd.options.html.border` has been deprecated in favor of `pd.options.display.html.border` (GH15793).

• `SeriesGroupBy.nth()` has deprecated `True` in favor of 'all' for its kwarg `dropna` (GH11038).

• `DataFrame.as_blocks()` is deprecated, as this is exposing the internal implementation (GH17302)

• `pd.TimeGrouper` is deprecated in favor of `pandas.Grouper` (GH16747)
- `cdate_range` has been deprecated in favor of `bdate_range()`, which has gained `weekmask` and `holidays` parameters for building custom frequency date ranges. See the documentation for more details (GH17596).

- Passing `categories` or ordered kwargs to `Series.astype()` is deprecated, in favor of passing a `CategoricalDtype` (GH17636).

- `.get_value` and `.set_value` on `Series`, `DataFrame`, `Panel`, `SparseSeries`, and `SparseDataFrame` are deprecated in favor of using `.iat[]` or `.at[]` accessors (GH15269).

- Passing a non-existent column in `.to_excel(..., columns=)` is deprecated and will raise a `KeyError` in the future (GH17295).

- `raise_on_error` parameter to `Series.where()`, `Series.mask()`, `DataFrame.where()`, `DataFrame.mask()` is deprecated, in favor of `errors=` (GH14968).

- Using `DataFrame.rename_axis()` and `Series.rename_axis()` to alter index or column labels is now deprecated in favor of using `.rename.rename_axis` may still be used to alter the name of the index or columns (GH17833).

- `reindex_axis()` has been deprecated in favor of `reindex()`. See here for more (GH17833).

### Series.select and DataFrame.select

The `Series.select()` and `DataFrame.select()` methods are deprecated in favor of using `df.loc[labels.map(crit)]` (GH12401).

```python
In [72]: df = pd.DataFrame({'A': [1, 2, 3]}, index=['foo', 'bar', 'baz'])
In [3]: df.select(lambda x: x in ['bar', 'baz'])
FutureWarning: select is deprecated and will be removed in a future release. You can use .loc[crit] as a replacement
Out[3]:
    A
bar 2
baz 3
```

```python
In [73]: df.loc[df.index.map(lambda x: x in ['bar', 'baz'])]
Out[73]:
    A
bar 2
baz 3
[2 rows x 1 columns]
```

### Series.argmax and Series.argmin

The behavior of `Series.argmax()` and `Series.argmin()` have been deprecated in favor of `Series.idxmax()` and `Series.idxmin()`, respectively (GH16830).

For compatibility with NumPy arrays, `pd.Series` implements `argmax` and `argmin`. Since pandas 0.13.0, `argmax` has been an alias for `pandas.Series.idxmax()`, and `argmin` has been an alias for `pandas.Series.idxmin()`. They return the `label` of the maximum or minimum, rather than the `position`.

We’ve deprecated the current behavior of `Series.argmax` and `Series.argmin`. Using either of these will emit a `FutureWarning`. Use `Series.idxmax()` if you want the label of the maximum. Use `Series.values`. 

---

5.8. Version 0.21
argmax() if you want the position of the maximum. Likewise for the minimum. In a future release Series.argmax and Series.argmin will return the position of the maximum or minimum.

Removal of prior version deprecations/changes

- `read_excel()` has dropped the has_index_names parameter (GH10967)
- The `pd.options.display.height` configuration has been dropped (GH3663)
- The `pd.options.display.line_width` configuration has been dropped (GH2881)
- The `pd.options.display.mpl_style` configuration has been dropped (GH12190)
- Index has dropped the `.sym_diff()` method in favor of `.symmetric_difference()` (GH12591)
- Categorical has dropped the `.order()` and `.sort()` methods in favor of `.sort_values()` (GH12882)
- `eval()` and `DataFrame.eval()` have changed the default of inplace from None to False (GH11149)
- The function `get_offset_name` has been dropped in favor of the `.freqstr` attribute for an offset (GH11834)
- pandas no longer tests for compatibility with hdf5-files created with pandas < 0.11 (GH17404).

Performance improvements

- Improved performance of instantiating `SparseDataFrame` (GH16773)
- `Series.dt` no longer performs frequency inference, yielding a large speedup when accessing the attribute (GH17210)
- Improved performance of `set_categories()` by not materializing the values (GH17508)
- `Timestamp.microsecond` no longer re-computes on attribute access (GH17331)
- Improved performance of the `CategoricalIndex` for data that is already categorical dtype (GH17513)
- Improved performance of `RangeIndex.min()` and `RangeIndex.max()` by using `RangeIndex` properties to perform the computations (GH17607)

Documentation changes

- Several `NaT` method docstrings (e.g. `NaT.ctime()`) were incorrect (GH17327)
- The documentation has had references to versions < v0.17 removed and cleaned up (GH17442, GH17442, GH17404 & GH17504)

Bug fixes

Conversion

- Bug in assignment against datetime-like data with `int` may incorrectly convert to datetime-like (GH14145)
- Bug in assignment against `int64` data with `np.ndarray` with `float64` dtype may keep `int64` dtype (GH14001)
- Fixed the return type of `IntervalIndex.is_non_overlapping_monotonic` to be a Python bool for consistency with similar attributes/methods. Previously returned a `numpy.bool_` (GH17237)
• Bug in `IntervalIndex.is_non_overlapping_monotonic` when intervals are closed on both sides and overlap at a point (GH16560)
• Bug in `Series.fillna()` returns frame when `inplace=True` and `value` is dict (GH16156)
• Bug in `Timestamp.weekday_name` returning a UTC-based weekday name when localized to a timezone (GH17354)
• Bug in `Timestamp.replace` when replacing `tzinfo` around DST changes (GH15683)
• Bug in `Timedelta` construction and arithmetic that would not propagate the `Overflow` exception (GH17367)
• Bug in `astype()` converting to object dtype when passed extension type classes (DateTimeTZDtype, CategoricalDtype) rather than instances. Now a `TypeError` is raised when a class is passed (GH17780).
• Bug in `to_numeric()` in which elements were not always being coerced to numeric when `errors='coerce'` (GH17007, GH17125)
• Bug in `DataFrame` and `Series` constructors where `range` objects are converted to `int32` dtype on Windows instead of `int64` (GH16804)

Indexing

• When called with a null slice (e.g. `df.iloc[:]`), the `.iloc` and `.loc` indexers return a shallow copy of the original object. Previously they returned the original object. (GH13873).
• When called on an unsorted `MultiIndex`, the `.loc` indexer now will raise `UnsortedIndexError` only if proper slicing is used on non-sorted levels (GH16734).
• Fixes regression in 0.20.3 when indexing with a string on a `TimedeltaIndex` (GH16896).
• Fixed `TimedeltaIndex.get_loc()` handling of `np.timedelta64` inputs (GH16909).
• Fix `MultiIndex.sort_index()` ordering when `ascending` argument is a list, but not all levels are specified, or are in a different order (GH16934).
• Fixes bug where indexing with `np.inf` caused an `OverflowError` to be raised (GH16957)
• Bug in reindexing on an empty `CategoricalIndex` (GH16770)
• Fixes `DataFrame.loc` for setting with alignment and `tz-aware` `DatetimeIndex` (GH16889)
• Avoids `IndexError` when passing an Index or Series to `.iloc` with older numpy (GH17193)
• Allow unicode empty strings as placeholders in multilevel columns in Python 2 (GH17099)
• Bug in `.iloc` when used with inplace addition or assignment and an int indexer on a `MultiIndex` causing the wrong indexes to be read from and written to (GH17148)
• Bug in `.isin()` in which checking membership in empty `Series` objects raised an error (GH16991)
• Bug in `CategoricalIndex` reindexing in which specified indices containing duplicates were not being respected (GH17323)
• Bug in intersection of `RangeIndex` with negative step (GH17296)
• Bug in `IntervalIndex` where performing a scalar lookup fails for included right endpoints of non-overlapping monotonic decreasing indexes (GH16417, GH17271)
• Bug in `DataFrame.first_valid_index()` and `DataFrame.last_valid_index()` when no valid entry (GH17400)
• Bug in `Series.rename()` when called with a callable, incorrectly alters the name of the `Series`, rather than the name of the `Index`. (GH17407)
• Bug in `String.str_get()` raises `IndexError` instead of inserting NaNs when using a negative index. (GH17704)

IO

• Bug in `read_hdf()` when reading a timezone aware index from fixed format HDFStore (GH17618)
• Bug in `read_csv()` in which columns were not being thoroughly de-duplicated (GH17060)
• Bug in `read_csv()` in which specified column names were not being thoroughly de-duplicated (GH17095)
• Bug in `read_csv()` in which non integer values for the header argument generated an unhelpful / unrelated error message (GH16338)
• Bug in `read_csv()` in which memory management issues in exception handling, under certain conditions, would cause the interpreter to segfault (GH14696, GH16798).
• Bug in `read_csv()` when called with `low_memory=False` in which a CSV with at least one column > 2GB in size would incorrectly raise a `MemoryError` (GH16798).
• Bug in `read_csv()` when called with a single-element list `header` would return a DataFrame of all NaN values (GH7757)
• Bug in `DataFrame.to_csv()` defaulting to ‘ascii’ encoding in Python 3, instead of ‘utf-8’ (GH17097)
• Bug in `read_stata()` where value labels could not be read when using an iterator (GH16923)
• Bug in `read_stata()` where the index was not set (GH16342)
• Bug in `read_html()` where import check fails when run in multiple threads (GH16928)
• Bug in `read_csv()` where automatic delimiter detection caused a `TypeError` to be thrown when a bad line was encountered rather than the correct error message (GH13374)
• Bug in `DataFrame.to_html()` with `notebook=True` where DataFrames with named indices or non-MultiIndex indices had undesired horizontal or vertical alignment for column or row labels, respectively (GH16792)
• Bug in `DataFrame.to_html()` in which there was no validation of the `justify` parameter (GH17527)
• Bug in `HDFStore.select()` when reading a contiguous mixed-data table featuring VLArray (GH17021)
• Bug in `to_json()` where several conditions (including objects with unprintable symbols, objects with deep recursion, overlong labels) caused segfaults instead of raising the appropriate exception (GH14256)

Plotting

• Bug in plotting methods using `secondary_y` and `fontsize` not setting secondary axis font size (GH12565)
• Bug when plotting `timedelta` and `datetime` dtypes on y-axis (GH16953)
• Line plots no longer assume monotonic x data when calculating xlims, they show the entire lines now even for unsorted x data. (GH11310, GH11471)
• With matplotlib 2.0.0 and above, calculation of x limits for line plots is left to matplotlib, so that its new default settings are applied. (GH15495)
• Bug in `Series.plot.bar` or `DataFrame.plot.bar` with `y` not respecting user-passed color (GH16822)
• Bug causing `plotting.parallel_coordinates` to reset the random seed when using random colors (GH17525)
GroupBy/resample/rolling

- Bug in `DataFrame.resample(...)`.size() where an empty `DataFrame` did not return a `Series` (GH14962)
- Bug in `infer_freq()` causing indices with 2-day gaps during the working week to be wrongly inferred as business daily (GH16624)
- Bug in `.rolling(...).quantile()` which incorrectly used different defaults than `Series.quantile()` and `DataFrame.quantile()` (GH9413, GH16211)
- Bug in `groupby.transform()` that would coerce boolean dtypes back to float (GH16875)
- Bug in `Series.resample(...).apply()` where an empty `Series` modified the source index and did not return the name of a `Series` (GH14313)
- Bug in `.rolling(...).apply(...)` with a `DataFrame` with a `DatetimeIndex`, a window of a timedelta-convertible and `min_periods >= 1` (GH15305)
- Bug in `DataFrame.groupby` where index and column keys were not recognized correctly when the number of keys equaled the number of elements on the groupby axis (GH16859)
- Bug in `groupby.nunique()` with `TimeGrouper` which cannot handle `NaT` correctly (GH17575)
- Bug in `DataFrame.groupby` where a single level selection from a `MultiIndex` unexpectedly sorts (GH17537)
- Bug in `DataFrame.groupby` where spurious warning is raised when `Grouper` object is used to override ambiguous column name (GH17383)
- Bug in `TimeGrouper` differs when passes as a list and as a scalar (GH17530)

Sparse

- Bug in `SparseSeries` raises `AttributeError` when a dictionary is passed in as data (GH16905)
- Bug in `SparseDataFrame.fillna()` not filling all NaNs when frame was instantiated from SciPy sparse matrix (GH16112)
- Bug in `SparseSeries.unstack()` and `SparseDataFrame.stack()` (GH16614, GH15045)
- Bug in `make_sparse()` treating two numeric/boolean data, which have same bits, as same when array dtype is object (GH17574)
- `SparseArray.all()` and `SparseArray.any()` are now implemented to handle `SparseArray`, these were used but not implemented (GH17570)

Reshaping

- Joining/Merging with a non unique `PeriodIndex` raised a `TypeError` (GH16871)
- Bug in `crosstab()` where non-aligned series of integers were casted to float (GH17005)
- Bug in merging with categorical dtypes with datetimelikes incorrectly raised a `TypeError` (GH16900)
- Bug when using `isin()` on a large object series and large comparison array (GH16012)
- Fixes regression from 0.20, `Series.aggregate()` and `DataFrame.aggregate()` allow dictionaries as return values again (GH16741)
- Fixes dtype of result with integer dtype input, from `pivot_table()` when called with `margins=True` (GH17013)
- Bug in `crosstab()` where passing two `Series` with the same name raised a `KeyError` (GH13279)
- `Series.argmin()`, `Series.argmax()`, and their counterparts on `DataFrame` and groupby objects work correctly with floating point data that contains infinite values (GH13595).
- Bug in `unique()` where checking a tuple of strings raised a `TypeError` (GH17108)
- Bug in `concat()` where order of result index was unpredictable if it contained non-comparable elements (GH17344)
- Fixes regression when sorting by multiple columns on a `datetime64` dtype `Series` with `NaT` values (GH16836)
- Bug in `pivot_table()` where the result’s columns did not preserve the categorical dtype of columns when `dropna` was `False` (GH17842)
- Bug in `DataFrame.drop_duplicates` where dropping with non-unique column names raised a `ValueError` (GH17836)
- Bug in `unstack()` which, when called on a list of levels, would discard the `fillna` argument (GH13971)
- Bug in the alignment of `range` objects and other list-likes with `DataFrame` leading to operations being performed row-wise instead of column-wise (GH17901)

**Numeric**

- Bug in `.clip()` with `axis=1` and a list-like for `threshold` is passed; previously this raised `ValueError` (GH15390)
- `Series.clip()` and `DataFrame.clip()` now treat `NA` values for upper and lower arguments as `None` instead of raising `ValueError` (GH17276).

**Categorical**

- Bug in `Series.isin()` when called with a categorical (GH16639)
- Bug in the categorical constructor with empty values and categories causing the `.categories` to be an empty `Float64Index` rather than an empty `Index` with object dtype (GH17248)
- Bug in categorical operations with `Series.cat` not preserving the original `Series`’ name (GH17509)
- Bug in `DataFrame.merge()` failing for categorical columns with boolean/int data types (GH17187)
- Bug in constructing a `Categorical/CategoricalDtype` when the specified categories are of categorical type (GH17884).
PyPy

- Compatibility with PyPy in `read_csv()` with `usecols=[<unsorted ints>]` and `read_json()` (GH17351)
- Split tests into cases for CPython and PyPy where needed, which highlights the fragility of index matching with `float('nan')`, `np.nan` and `NAT` (GH17351)
- Fix `DataFrame.memory_usage()` to support PyPy. Objects on PyPy do not have a fixed size, so an approximation is used instead (GH17228)

Other

- Bug where some inplace operators were not being wrapped and produced a copy when invoked (GH12962)
- Bug in `eval()` where the `inplace` parameter was being incorrectly handled (GH16732)

5.9 Version 0.20

5.9.1 Version 0.20.3 (July 7, 2017)

This is a minor bug-fix release in the 0.20.x series and includes some small regression fixes and bug fixes. We recommend that all users upgrade to this version.

What’s new in v0.20.3

• Bug fixes
  – Conversion
  – Indexing
  – IO
  – Plotting
  – Reshaping
  – Categorical
• Contributors

Bug fixes

• Fixed a bug in failing to compute rolling computations of a column-MultiIndexed DataFrame (GH16789, GH16825)
• Fixed a pytest marker failing downstream packages’ tests suites (GH16680)

Conversion

• Bug in pickle compat prior to the v0.20.x series, when UTC is a timezone in a Series/DataFrame/Index (GH16608)
• Bug in Series construction when passing a Series with dtype='category' (GH16524).
• Bug in DataFrame.astype() when passing a Series as the dtype kwarg. (GH16717).
Indexing

- Bug in `Float64Index` causing an empty array instead of `None` to be returned from `.get(np.nan)` on a Series whose index did not contain any `NaN` s (GH8569)
- Bug in `MultiIndex.isin` causing an error when passing an empty iterable (GH16777)
- Fixed a bug in a slicing DataFrame/Series that have a `TimedeltaIndex` (GH16637)

IO

- Bug in `read_csv()` in which files weren’t opened as binary files by the C engine on Windows, causing EOF characters mid-field, which would fail (GH16039, GH16559, GH16675)
- Bug in `read_hdf()` in which reading a `Series` saved to an HDF file in ‘fixed’ format fails when an explicit `mode='r'` argument is supplied (GH16583)
- Bug in `DataFrame.to_latex()` where `bold_rows` was wrongly specified to be `True` by default, whereas in reality row labels remained non-bold whatever parameter provided. (GH16707)
- Fixed an issue with `DataFrame.style()` where generated element ids were not unique (GH16780)
- Fixed loading a DataFrame with a `PeriodIndex`, from a format='fixed' HDFStore, in Python 3, that was written in Python 2 (GH16781)

Plotting

- Fixed regression that prevented RGB and RGBA tuples from being used as color arguments (GH16233)
- Fixed an issue with `DataFrame.plot.scatter()` that incorrectly raised a `KeyError` when categorical data is used for plotting (GH16199)

Reshaping

- `PeriodIndex/TimedeltaIndex.join` was missing the `sort=` kwarg (GH16541)
- Bug in joining on a `MultiIndex` with a `category` dtype for a level (GH16627).
- Bug in `merge()` when merging/joining with multiple categorical columns (GH16767)

Categorical

- Bug in `DataFrame.sort_values` not respecting the `kind` parameter with categorical data (GH16793)

5.9.2 Version 0.20.2 (June 4, 2017)

This is a minor bug-fix release in the 0.20.x series and includes some small regression fixes, bug fixes and performance improvements. We recommend that all users upgrade to this version.

What’s new in v0.20.2

- Enhancements
- Performance improvements
- Bug fixes
  - Conversion
  - Indexing
  - IO
  - Plotting
Enhancements

- Series provides a `to_latex` method (GH16180)
- A new groupby method `ngroup()`, parallel to the existing `cumcount()`, has been added to return the group order (GH11642); see [here](#).

Performance improvements

- Performance regression fix when indexing with a list-like (GH16285)
- Performance regression fix for MultiIndexes (GH16319, GH16346)
- Improved performance of `.clip()` with scalar arguments (GH15400)
- Improved performance of groupby with categorical groupers (GH16413)
- Improved performance of `MultiIndex.remove_unused_levels()` (GH16556)

Bug fixes

- Silenced a warning on some Windows environments about “tput: terminal attributes: No such device or address” when detecting the terminal size. This fix only applies to python 3 (GH16496)
- Bug in using `pathlib.Path` or `py.path.local` objects with io functions (GH16291)
- Bug in `Index.symmetric_difference()` on two equal MultiIndex’s, results in a `TypeError` (GH13490)
- Bug in `DataFrame.update()` with `overwrite=False` and `NaN` values (GH15593)
- Passing an invalid engine to `read_csv()` now raises an informative `ValueError` rather than `UnboundLocalError` (GH16511)
- Bug in `unique()` on an array of tuples (GH16519)
- Bug in `cut()` when `labels` are set, resulting in incorrect label ordering (GH16459)
- Fixed a compatibility issue with IPython 6.0’s tab completion showing deprecation warnings on Categoricals (GH16409)
Conversion

- Bug in `to_numeric()` in which empty data inputs were causing a segfault of the interpreter (GH16302)
- Silence numpy warnings when broadcasting DataFrame to Series with comparison ops (GH16378, GH16306)

Indexing

- Bug in `DataFrame.reset_index(level=)` with single level index (GH16263)
- Bug in partial string indexing with a monotonic, but not strictly-monotonic, index incorrectly reversing the slice bounds (GH16515)
- Bug in `MultiIndex.remove_unused_levels()` that would not return a MultiIndex equal to the original. (GH16556)

IO

- Bug in `read_csv()` when comment is passed in a space delimited text file (GH16472)
- Bug in `read_csv()` not raising an exception with nonexistent columns in `usecols` when it had the correct length (GH14671)
- Bug that would force importing of the clipboard routines unnecessarily, potentially causing an import error on startup (GH16288)
- Bug that raised `IndexError` when HTML-rendering an empty DataFrame (GH15953)
- Bug in `read_csv()` in which tarfile object inputs were raising an error in Python 2.x for the C engine (GH16530)
- Bug where `DataFrame.to_html()` ignored the `index_names` parameter (GH16493)
- Bug where `pd.read_hdf()` returns numpy strings for index names (GH13492)
- Bug in `HDFStore.select_as_multiple()` where start/stop arguments were not respected (GH16209)

Plotting

- Bug in `DataFrame.plot` with a single column and a list-like color (GH3486)
- Bug in `plot` where NaT in `DatetimeIndex` results in `Timestamp.min` (GH12405)
- Bug in `DataFrame.boxplot` where `figsize` keyword was not respected for non-grouped boxplots (GH11959)
GroupBy/resample/rolling

- Bug in creating a time-based rolling window on an empty DataFrame (GH15819)
- Bug in `rolling.cov()` with offset window (GH16058)
- Bug in `.resample()` and `.groupby()` when aggregating on integers (GH16361)

Sparse

- Bug in construction of `SparseDataFrame` from `scipy.sparse.dok_matrix` (GH16179)

Reshaping

- Bug in `DataFrame.stack` with unsorted levels in MultiIndex columns (GH16323)
- Bug in `pd.wide_to_long()` where no error was raised when `i` was not a unique identifier (GH16382)
- Bug in `Series.isin(..)` with a list of tuples (GH16394)
- Bug in construction of a DataFrame with mixed dtypes including an all-NaT column. (GH16395)
- Bug in `DataFrame.agg()` and `Series.agg()` with aggregating on non-callable attributes (GH16405)

Numeric

- Bug in `.interpolate()`, where `limit_direction` was not respected when `limit=None` (default) was passed (GH16282)

Categorical

- Fixed comparison operations considering the order of the categories when both categoricals are unordered (GH16014)

Other

- Bug in `DataFrame.drop()` with an empty-list with non-unique indices (GH16270)

5.9.3 Version 0.20.1 (May 5, 2017)

This is a major release from 0.19.2 and includes a number of API changes, deprecations, new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

Highlights include:

- New .agg() API for Series/DataFrame similar to the groupby-rolling-resample API’s, see here
- Integration with the feather-format, including a new top-level pd.read_feather() and DataFrame.to_feather() method, see here.
• The .ix indexer has been deprecated, see here
• Panel has been deprecated, see here
• Addition of an IntervalIndex and Interval scalar type, see here
• Improved user API when grouping by index levels in .groupby(), see here
• Improved support for UInt64 dtypes, see here
• A new orient for JSON serialization, orient='table', that uses the Table Schema spec and that gives the possibility for a more interactive repr in the Jupyter Notebook, see here
• Experimental support for exporting styled DataFrames (DataFrame.style) to Excel, see here
• Window binary corr/cov operations now return a MultiIndexed DataFrame rather than a Panel, as Panel is now deprecated, see here
• Support for S3 handling now uses s3fs, see here
• Google BigQuery support now uses the pandas-gbq library, see here

Warning: pandas has changed the internal structure and layout of the code base. This can affect imports that are not from the top-level pandas.* namespace, please see the changes here.

Check the API Changes and deprecations before updating.

Note: This is a combined release for 0.20.0 and 0.20.1. Version 0.20.1 contains one additional change for backwards-compatibility with downstream projects using pandas’ utils routines. (GH16250)

What’s new in v0.20.0

• New features
  – Method agg API for DataFrame/Series
  – Keyword argument dtype for data IO
  – Method .to_datetime() has gained an origin parameter
  – GroupBy enhancements
  – Better support for compressed URLs in read_csv
  – Pickle file IO now supports compression
  – UInt64 support improved
  – GroupBy on categoricals
  – Table schema output
  – SciPy sparse matrix from/to SparseDataFrame
  – Excel output for styled DataFrames
  – IntervalIndex
  – Other enhancements
• Backwards incompatible API changes
- Possible incompatibility for HDF5 formats created with pandas < 0.13.0
- Map on Index types now return other Index types
- Accessing datetime fields of Index now return Index
- pd.unique will now be consistent with extension types
- S3 file handling
- Partial string indexing changes
- Concat of different float dtypes will not automatically upcast
- pandas Google BigQuery support has moved
- Memory usage for Index is more accurate
- DataFrame.sort_index changes
- GroupBy describe formatting
- Window binary corr/cov operations return a MultiIndex DataFrame
- HDFStore where string comparison
- Index.intersection and inner join now preserve the order of the left Index
- Pivot table always returns a DataFrame
- Other API changes

• Reorganization of the library: privacy changes
  - Modules privacy has changed
  - pandas.errors
  - pandas.testing
  - pandas.plotting
  - Other development changes

• Deprecations
  - Deprecate .ix
  - Deprecate Panel
  - Deprecate groupby.agg() with a dictionary when renaming
  - Deprecate .plotting
  - Other deprecations

• Removal of prior version deprecations/changes
• Performance improvements

• Bug fixes
  - Conversion
  - Indexing
  - IO
  - Plotting
New features

Method agg API for DataFrame/Series

Series & DataFrame have been enhanced to support the aggregation API. This is a familiar API from groupby, window operations, and resampling. This allows aggregation operations in a concise way by using `agg()` and `transform()`. The full documentation is here (GH1623).

Here is a sample

```python
In [1]: df = pd.DataFrame(np.random.randn(10, 3), columns=['A', 'B', 'C'],
                   index=pd.date_range('1/1/2000', periods=10))
...:
...

In [2]: df.iloc[3:7] = np.nan

In [3]: df

Out[3]:

<table>
<thead>
<tr>
<th></th>
<th>A</th>
<th>B</th>
<th>C</th>
</tr>
</thead>
<tbody>
<tr>
<td>2000-01-01</td>
<td>0.469112</td>
<td>-0.282863</td>
<td>-1.509059</td>
</tr>
<tr>
<td>2000-01-02</td>
<td>-1.135632</td>
<td>1.212112</td>
<td>-0.173215</td>
</tr>
<tr>
<td>2000-01-03</td>
<td>0.119209</td>
<td>-1.044236</td>
<td>-0.861849</td>
</tr>
<tr>
<td>2000-01-04</td>
<td>NaN</td>
<td>NaN</td>
<td>NaN</td>
</tr>
<tr>
<td>2000-01-05</td>
<td>NaN</td>
<td>NaN</td>
<td>NaN</td>
</tr>
<tr>
<td>2000-01-06</td>
<td>NaN</td>
<td>NaN</td>
<td>NaN</td>
</tr>
<tr>
<td>2000-01-07</td>
<td>NaN</td>
<td>NaN</td>
<td>NaN</td>
</tr>
<tr>
<td>2000-01-08</td>
<td>0.113648</td>
<td>-1.478427</td>
<td>0.524988</td>
</tr>
<tr>
<td>2000-01-09</td>
<td>0.404705</td>
<td>0.577046</td>
<td>-1.715002</td>
</tr>
<tr>
<td>2000-01-10</td>
<td>-1.039268</td>
<td>-0.370647</td>
<td>-1.157892</td>
</tr>
</tbody>
</table>

[10 rows x 3 columns]
```

One can operate using string function names, callables, lists, or dictionaries of these.

Using a single function is equivalent to `.apply`.

```python
In [4]: df.agg('sum')

Out[4]:

<table>
<thead>
<tr>
<th></th>
<th>A</th>
<th>B</th>
<th>C</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>-1.068226</td>
<td>-1.387015</td>
<td>-4.892029</td>
</tr>
</tbody>
</table>

Length: 3, dtype: float64
```

Multiple aggregations with a list of functions.
In [5]: df.agg(['sum', 'min'])

Out[5]:
A   B   C
sum -1.068226 -1.387015 -4.892029
min -1.135632 -1.478427 -1.715002

[2 rows x 3 columns]

Using a dict provides the ability to apply specific aggregations per column. You will get a matrix-like output of all of the aggregators. The output has one column per unique function. Those functions applied to a particular column will be NaN:

In [6]: df.agg({'A': ['sum', 'min'], 'B': ['min', 'max']})

Out[6]:
A  B
sum -1.068226 NaN
min -1.135632 -1.478427
max NaN 1.212112

[3 rows x 2 columns]

The API also supports a .transform() function for broadcasting results.

In [7]: df.transform(['abs', lambda x: x - x.min()])

Out[7]:
A   B   C
abs <lambda> abs <lambda> abs <lambda>
2000-01-01  0.469112  1.604745  0.282863  1.195563  1.509059  0.205944
2000-01-02  1.135632  0.000000  1.212112  2.690539  0.173215  1.541787
2000-01-03  0.119209  1.254841  1.044236  0.434191  0.861849  0.853153
2000-01-04  NaN  NaN  NaN  NaN  NaN  NaN
2000-01-05  NaN  NaN  NaN  NaN  NaN  NaN
2000-01-06  NaN  NaN  NaN  NaN  NaN  NaN
2000-01-07  NaN  NaN  NaN  NaN  NaN  NaN
2000-01-08  0.113648  1.249281  1.478427  0.000000  0.524988  2.239990
2000-01-09  0.404705  1.540338  0.577046  2.055473  1.715002  0.000000
2000-01-10  1.039268  0.096364  0.370647  1.107780  1.157892  0.557110

[10 rows x 6 columns]

When presented with mixed dtypes that cannot be aggregated, .agg() will only take the valid aggregations. This is similar to how groupby .agg() works. (GH15015)

In [8]: df = pd.DataFrame({'A': [1, 2, 3],
                      'B': [1., 2., 3.],
                      'C': ['foo', 'bar', 'baz'],
                      'D': pd.date_range('20130101', periods=3)})

In [9]: df.dtypes

Out[9]:
A       int64
B      float64
C      object
D  datetime64[ns]
Length: 4, dtype: object
In [10]: df.agg(['min', 'sum'])
Out[10]:
      A     B     C      D
min  1.00  1.00  bar 2013-01-01
sum  6.00  6.00  foobarbaz  NaT
[2 rows x 4 columns]

Keyword argument `dtype` for data IO

The 'python' engine for `read_csv()`, as well as the `read_fwf()` function for parsing fixed-width text files and `read_excel()` for parsing Excel files, now accept the `dtype` keyword argument for specifying the types of specific columns (GH14295). See the `io docs` for more information.

In [11]: data = "a  b
1 2
3 4"

In [12]: pd.read_fwf(StringIO(data)).dtypes
Out[12]:
a int64
b int64
Length: 2, dtype: object

In [13]: pd.read_fwf(StringIO(data), dtype={'a': 'float64', 'b': 'object'}).dtypes
Out[13]:
a float64
b object
Length: 2, dtype: object

Method `.to_datetime()` has gained an `origin` parameter

`.to_datetime()` has gained a new parameter, `origin`, to define a reference date from where to compute the resulting timestamps when parsing numerical values with a specific unit specified. (GH11276, GH11745)

For example, with 1960-01-01 as the starting date:

In [14]: pd.to_datetime([1, 2, 3], unit='D', origin=pd.Timestamp('1960-01-01'))
Out[14]: DatetimeIndex(['1960-01-02', '1960-01-03', '1960-01-04'], dtype='datetime64[ns]', freq=None)

The default is set at `origin='unix'`, which defaults to 1970-01-01 00:00:00, which is commonly called ‘unix epoch’ or POSIX time. This was the previous default, so this is a backward compatible change.

In [15]: pd.to_datetime([1, 2, 3], unit='D')
Out[15]: DatetimeIndex(['1970-01-02', '1970-01-03', '1970-01-04'], dtype='datetime64[ns]', freq=None)
GroupBy enhancements

Strings passed to DataFrame.groupby() as the by parameter may now reference either column names or index level names. Previously, only column names could be referenced. This allows to easily group by a column and index level at the same time. (GH5677)

```
In [16]: arrays = [['bar', 'bar', 'baz', 'baz', 'foo', 'foo', 'qux', 'qux'],
            ['one', 'two', 'one', 'two', 'one', 'two', 'one', 'two']]

In [17]: index = pd.MultiIndex.from_arrays(arrays, names=['first', 'second'])

In [18]: df = pd.DataFrame({'A': [1, 1, 1, 1, 2, 2, 3, 3],
                        'B': np.arange(8),
                        index=index)

In [19]: df
Out[19]:
   A  B
first second
bar one 1 0
two 1 1
baz one 1 2
two 1 3
foo one 2 4
two 2 5
qux one 3 6
two 3 7
[8 rows x 2 columns]

In [20]: df.groupby(['second', 'A']).sum()
Out[20]:
   B
second A
one 1 2
  2 4
  3 6
two 1 4
    2 5
    3 7
[6 rows x 1 columns]
```

Better support for compressed URLs in read_csv

The compression code was refactored (GH12688). As a result, reading dataframes from URLs in read_csv() or read_table() now supports additional compression methods: xz, bz2, and zip (GH14570). Previously, only gzip compression was supported. By default, compression of URLs and paths are now inferred using their file extensions. Additionally, support for bz2 compression in the python 2 C-engine improved (GH14874).

```
In [21]: url = ('https://github.com/{repo}/raw/{branch}/{path}')
   ....:   .format(repo='pandas-dev/pandas',
   ....:     branch='master',
   ....:   )
   (continues on next page)
```
Pickle file IO now supports compression

`read_pickle()`, `DataFrame.to_pickle()` and `Series.to_pickle()` can now read from and write to compressed pickle files. Compression methods can be an explicit parameter or be inferred from the file extension. See the docs here.

```
In [25]: df = pd.DataFrame({'A': np.random.randn(1000),
                           'B': 'foo',
                           'C': pd.date_range('20130101', periods=1000, freq='s')})

In [26]: df.to_pickle("data.pkl.compress", compression="gzip")

In [27]: rt = pd.read_pickle("data.pkl.compress", compression="gzip")

In [28]: rt.head()
```

```
Out[28]:
    A        B            C
0 -1.344312   foo 2013-01-01 00:00:00
1  0.844885   foo 2013-01-01 00:00:01
2  1.075770   foo 2013-01-01 00:00:02
3 -0.109050   foo 2013-01-01 00:00:03
4  1.643563   foo 2013-01-01 00:00:04
```

The default is to infer the compression type from the extension (compression='infer'):

```
In [29]: df.to_pickle("data.pkl.gz")

In [30]: rt = pd.read_pickle("data.pkl.gz")

In [31]: rt.head()
```

```
Out[31]:
    A        B            C
0 -1.344312   foo 2013-01-01 00:00:00
```
In [32]: df["A"].to_pickle("s1.pkl.bz2")

In [33]: rt = pd.read_pickle("s1.pkl.bz2")

In [34]: rt.head()

Out[34]:
0      -1.344312
1       0.844885
2       1.075770
3      -0.109050
4       1.643563
Name: A, Length: 5, dtype: float64

UInt64 support improved

pandas has significantly improved support for operations involving unsigned, or purely non-negative, integers. Previously, handling these integers would result in improper rounding or data-type casting, leading to incorrect results. Notably, a new numerical index, UInt64Index, has been created (GH14937)

In [35]: idx = pd.UInt64Index([1, 2, 3])

In [36]: df = pd.DataFrame({'A': ['a', 'b', 'c']}, index=idx)

In [37]: df.index

Out[37]: UInt64Index([1, 2, 3], dtype='uint64')

• Bug in converting object elements of array-like objects to unsigned 64-bit integers (GH4471, GH14982)
• Bug in Series.unique() in which unsigned 64-bit integers were causing overflow (GH14721)
• Bug in DataFrame construction in which unsigned 64-bit integer elements were being converted to objects (GH14881)
• Bug in pd.read_csv() in which unsigned 64-bit integer elements were being improperly converted to the wrong data types (GH14983)
• Bug in pd.unique() in which unsigned 64-bit integers were causing overflow (GH14915)
• Bug in pd.value_counts() in which unsigned 64-bit integers were being erroneously truncated in the output (GH14934)
GroupBy on categoricals

In previous versions, `.groupby(..., sort=False)` would fail with a `ValueError` when grouping on a categorical series with some categories not appearing in the data. (GH13179)

```
In [38]: chromosomes = np.r_[np.arange(1, 23).astype(str), ['X', 'Y']]

In [39]: df = pd.DataFrame({
   ....:     'A': np.random.randint(100),
   ....:     'B': np.random.randint(100),
   ....:     'C': np.random.randint(100),
   ....:     'chromosomes': pd.Categorical(np.random.choice(chromosomes, 100),
   ....:                                    categories=chromosomes,
   ....:                                    ordered=True))

In [40]: df
Out[40]:
   A  B  C  chromosomes
0  87  22  81       4
1  87  22  81      13
2  87  22  81      22
3  87  22  81       2
4  87  22  81       6
...  ...  ...  ...  ...
95  87  22  81       8
96  87  22  81      11
97  87  22   X
98  87  22  81       1
99  87  22  81      19

```
pandas: powerful Python data analysis toolkit, Release 1.2.2

Table schema output
The new orient 'table' for DataFrame.to_json() will generate a Table Schema compatible string representation of the data.
In [42]: df = pd.DataFrame(
....:
{'A': [1, 2, 3],
....:
'B': ['a', 'b', 'c'],
....:
'C': pd.date_range('2016-01-01', freq='d', periods=3)},
....:
index=pd.Index(range(3), name='idx'))
....:
In [43]: df
Out[43]:
A B
C
idx
0
1 a 2016-01-01
1
2 b 2016-01-02
2
3 c 2016-01-03
[3 rows x 3 columns]
In [44]: df.to_json(orient='table')
Out[44]: '{"schema":{"fields":[{"name":"idx","type":"integer"},{"name":"A","type":
˓→"integer"},{"name":"B","type":"string"},{"name":"C","type":"datetime"}],"primaryKey
˓→":["idx"],"pandas_version":"0.20.0"},"data":[{"idx":0,"A":1,"B":"a","C":"2016-01˓→01T00:00:00.000Z"},{"idx":1,"A":2,"B":"b","C":"2016-01-02T00:00:00.000Z"},{"idx":2,
˓→"A":3,"B":"c","C":"2016-01-03T00:00:00.000Z"}]}'

See IO: Table Schema for more information.
Additionally, the repr for DataFrame and Series can now publish this JSON Table schema representation of the
Series or DataFrame if you are using IPython (or another frontend like nteract using the Jupyter messaging protocol).
This gives frontends like the Jupyter notebook and nteract more flexibility in how they display pandas objects, since
they have more information about the data. You must enable this by setting the display.html.table_schema
option to True.
SciPy sparse matrix from/to SparseDataFrame
pandas now supports creating sparse dataframes directly from scipy.sparse.spmatrix instances. See the documentation for more information. (GH4343)
All sparse formats are supported, but matrices that are not in COOrdinate format will be converted, copying data as
needed.
from scipy.sparse import csr_matrix
arr = np.random.random(size=(1000, 5))
arr[arr < .9] = 0
sp_arr = csr_matrix(arr)
sp_arr
sdf = pd.SparseDataFrame(sp_arr)
sdf

To convert a SparseDataFrame back to sparse SciPy matrix in COO format, you can use:
sdf.to_coo()

5.9. Version 0.20

2887


Excel output for styled DataFrames

Experimental support has been added to export DataFrame.style formats to Excel using the openpyxl engine. (GH15530)

For example, after running the following, styled.xlsx renders as below:

```
In [45]: np.random.seed(24)
In [46]: df = pd.DataFrame({'A': np.linspace(1, 10, 10)})
In [47]: df = pd.concat([df, pd.DataFrame(np.random.RandomState(24).randn(10, 4),
                    columns=list('BCDE'))],
                    axis=1)
In [48]: df.iloc[0, 2] = np.nan
In [49]: df
Out[49]:
   A    B    C    D    E
0  1.0  1.329212  NaN  -0.316280  -0.990810
1  2.0  -1.070816 -1.438713  0.564417  0.295722
2  3.0  -1.626404  0.219565  0.678805  1.889273

4  5.0   1.453425  1.057737  0.165562  0.515018
5  6.0  -1.336936  0.562861  1.392855  -0.063328
6  7.0   0.121668  1.207603  -0.002040  1.627796
7  8.0   0.354493  1.037528  -0.385684  0.519818
8  9.0   1.686583  -1.325963  1.428984  -2.089354
9 10.0  -0.129820  0.631523  -0.586538  0.290720
[10 rows x 5 columns]
```

```
In [50]: styled = (df.style
    ....:     .applymap(lambda val: 'color: %s' % 'red' if val < 0 else 'black')
    ....:     .highlight_max())
```

```
In [51]: styled.to_excel('styled.xlsx', engine='openpyxl')
```

![styled.xlsx Excel output](image)
See the *Style documentation* for more detail.

**IntervalIndex**

pandas has gained an `IntervalIndex` with its own dtype, `interval` as well as the `Interval` scalar type. These allow first-class support for interval notation, specifically as a return type for the categories in `cut()` and `qcut()`. The `IntervalIndex` allows some unique indexing, see the docs. (GH7640, GH8625)

**Warning:** These indexing behaviors of the `IntervalIndex` are provisional and may change in a future version of pandas. Feedback on usage is welcome.

Previous behavior:

The returned categories were strings, representing Intervals

```python
In [1]: c = pd.cut(range(4), bins=2)

In [2]: c
Out[2]:
[(-0.003, 1.5], (-0.003, 1.5], (1.5, 3], (1.5, 3]]
Categories (2, object): [(-0.003, 1.5] < (1.5, 3]]

In [3]: c.categories
Out[3]: Index([(-0.003, 1.5]', '(1.5, 3]']

New behavior:

```python
In [52]: c = pd.cut(range(4), bins=2)

In [53]: c
Out[53]:
[(-0.003, 1.5], (-0.003, 1.5], (1.5, 3.0], (1.5, 3.0]]
Categories (2, interval[float64]): [(-0.003, 1.5] < (1.5, 3.0]]

In [54]: c.categories
Out[54]:
IntervalIndex([(0.003, 1.5], (1.5, 3.0]],
closed='right',
dtype='interval[float64]')
```

Furthermore, this allows one to bin *other* data with these same bins, with `NaN` representing a missing value similar to other dtypes.

```python
In [55]: pd.cut([0, 3, 5, 1], bins=c.categories)
Out[55]:
[(-0.003, 1.5], (1.5, 3.0], NaN, (-0.003, 1.5]]
Categories (2, interval[float64]): [(-0.003, 1.5] < (1.5, 3.0]]
```

An `IntervalIndex` can also be used in `Series` and `DataFrame` as the index.

```python
In [56]: df = pd.DataFrame({'A': range(4),
        ....:                  'B': pd.cut([0, 3, 1, 1], bins=c.categories)
        ....:              )).set_index('B')
(continues on next page)
pandas: powerful Python data analysis toolkit, Release 1.2.2

(continued from previous page)

In [57]: df
Out[57]:
    A
    B
(-0.003, 1.5]  0
(1.5, 3.0]      1
(-0.003, 1.5]  2
(-0.003, 1.5]  3

[4 rows x 1 columns]

Selecting via a specific interval:

In [58]: df.loc[pd.Interval(1.5, 3.0)]
Out[58]:
    A
Name: (1.5, 3.0], Length: 1, dtype: int64

Selecting via a scalar value that is contained in the intervals.

In [59]: df.loc[0]
Out[59]:
    A
    B
(-0.003, 1.5]  0
(-0.003, 1.5]  2
(-0.003, 1.5]  3

[3 rows x 1 columns]

Other enhancements

- DataFrame.rolling() now accepts the parameter closed='right'/'left'/'both'/'neither' to choose the rolling window-endpoint closedness. See the documentation (GH13965)
- Integration with the feather-format, including a new top-level pd.read_feather() and DataFrame.to_feather() method, see here.
- Series.str.replace() now accepts a callable, as replacement, which is passed to re.sub (GH15055)
- Series.str.replace() now accepts a compiled regular expression as a pattern (GH15446)
- Series.sort_index accepts parameters kind and na_position (GH13589, GH14444)
- DataFrame and DataFrame.groupby() have gained a nunique() method to count the distinct values over an axis (GH14336, GH15197).
- DataFrame has gained a melt() method, equivalent to pd.melt(), for unpivoting from a wide to long format (GH12640).
- pd.read_excel() now preserves sheet order when using sheetname=None (GH9930)
- Multiple offset aliases with decimal points are now supported (e.g. 0.5min is parsed as 30s) (GH8419)
- .isnull() and .notnull() have been added to Index object to make them more consistent with the Series API (GH15300)
- **New UnsortedIndexError** (subclass of `KeyError`) raised when indexing/slicing into an unsorted `MultiIndex` (`GH11897`). This allows differentiation between errors due to lack of sorting or an incorrect key. See here.
- `MultiIndex` has gained a `.to_frame()` method to convert to a DataFrame (`GH12397`).
- `pd.cut` and `pd.qcut` now support `datetime64` and `timedelta64` dtypes (`GH14714`, `GH14798`).
- `pd.qcut` has gained the `duplicates='raise'|'drop'` option to control whether to raise on duplicated edges (`GH7751`).
- `Series` provides a `.to_excel` method to output Excel files (`GH8825`).
- The `usecols` argument in `pd.read_csv()` now accepts a callable function as a value (`GH14154`).
- The `skiprows` argument in `pd.read_csv()` now accepts a callable function as a value (`GH10882`).
- The `nrows` and `chunksize` arguments in `pd.read_csv()` are supported if both are passed (`GH6774`, `GH15755`).
- `DataFrame.plot` now prints a title above each subplot if `subplots=True` and `title` is a list of strings (`GH14753`).
- `DataFrame.plot` can pass the matplotlib 2.0 default color cycle as a single string as color parameter, see here. (`GH15516`).
- `Series.interpolate()` now supports `timedelta` as an index type with `method='time'` (`GH6424`).
- Addition of a `level` keyword to `DataFrame/Series.rename` to rename labels in the specified level of a `MultiIndex` (`GH4160`).
- `DataFrame.reset_index()` will now interpret a tuple `index.name` as a key spanning across levels of columns, if this is a `MultiIndex` (`GH16164`).
- `Timedelta.isoformat` method added for formatting `Timedeltas` as an ISO 8601 duration. See the `Timedelta docs` (`GH15136`).
- `.select_dtypes()` now allows the string `datetimetz` to generically select datetimes with tz (`GH14910`).
- The `.to_latex()` method will now accept `multicolumn` and `multirow` arguments to use the accompanying LaTeX enhancements.
- `pd.merge_asof()` gained the option `direction='backward'|'forward'|'nearest'` (`GH14887`).
- `Series/DataFrame.asfreq()` have gained a `fill_value` parameter, to fill missing values (`GH3715`).
- `Series/DataFrame.resample.asfreq` have gained a `fill_value` parameter, to fill missing values during resampling (`GH3715`).
- `pandas.util.hash_pandas_object()` has gained the ability to hash a `MultiIndex` (`GH15224`).
- `Series/DataFrame.squeeze()` have gained the `axis` parameter. (`GH15339`)
- `DataFrame.to_excel()` has a new `freeze_panes` parameter to turn on Freeze Panes when exporting to Excel (`GH15160`).
- `pd.read_html()` will parse multiple header rows, creating a `MultiIndex` header. (`GH13434`).
- HTML table output skips `colspan` or `rowspan` attribute if equal to 1. (`GH15403`).
- `pandas.io.formats.style.Styler` template now has blocks for easier extension, see the example notebook (`GH15649`).
- `Styler.render()` now accepts `**kwargs` to allow user-defined variables in the template (`GH15649`).
• Compatibility with Jupyter notebook 5.0: MultiIndex column labels are left-aligned and MultiIndex row-labels are top-aligned (GH15379)

• TimedeltaIndex now has a custom date-tick formatter specifically designed for nanosecond level precision (GH8711)

• pd.api.types.union_categoricals gained the ignore_ordered argument to allow ignoring the ordered attribute of unioned categoricals (GH13410). See the categorical union docs for more information.

• DataFrame.to_latex() and DataFrame.to_string() now allow optional header aliases. (GH15536)

• Re-enable the parse_dates keyword of pd.read_excel() to parse string columns as dates (GH14326)

• Added .empty property to subclasses of Index. (GH15270)

• Enabled floor division for Timedelta and TimedeltaIndex (GH15828)

• pandas.io.json.json_normalize() gained the option errors='ignore' | 'raise'; the default is errors='raise' which is backward compatible. (GH14583)

• pandas.io.json.json_normalize() with an empty list will return an empty DataFrame (GH15534)

• pandas.io.json.json_normalize() has gained a sep option that accepts str to separate joined fields; the default is “.”, which is backward compatible. (GH14883)

• MultiIndex.remove_unused_levels() has been added to facilitate removing unused levels. (GH15694)

• pd.read_csv() will now raise a ParserError error whenever any parsing error occurs (GH15913, GH15925)

• pd.read_csv() now supports the error_bad_lines and warn_bad_lines arguments for the Python parser (GH15925)

• The display.show_dimensions option can now also be used to specify whether the length of a Series should be shown in its repr (GH7117).

• parallel_coordinates() has gained a sort_labels keyword argument that sorts class labels and the colors assigned to them (GH15908)

• Options added to allow one to turn on/off using bottleneck and numexpr, see here (GH16157)

• DataFrame.style.bar() now accepts two more options to further customize the bar chart. Bar alignment is set with align='left' | 'mid' | 'zero', the default is “left”, which is backward compatible; You can now pass a list of color=[color_negative, color_positive]. (GH14757)

Backwards incompatible API changes

Possible incompatibility for HDF5 formats created with pandas < 0.13.0

pd.TimeSeries was deprecated officially in 0.17.0, though has already been an alias since 0.13.0. It has been dropped in favor of pd.Series. (GH15098).

This may cause HDF5 files that were created in prior versions to become unreadable if pd.TimeSeries was used. This is most likely to be for pandas < 0.13.0. If you find yourself in this situation. You can use a recent prior version of pandas to read in your HDF5 files, then write them out again after applying the procedure below.
```python
In [2]: s = pd.TimeSeries([1, 2, 3], index=pd.date_range('20130101', periods=3))

In [3]: s
Out[3]:
2013-01-01  1
2013-01-02  2
2013-01-03  3
Freq: D, dtype: int64

In [4]: type(s)
Out[4]: pandas.core.series.TimeSeries

In [5]: s = pd.Series(s)

In [6]: s
Out[6]:
2013-01-01  1
2013-01-02  2
2013-01-03  3
Freq: D, dtype: int64

In [7]: type(s)
Out[7]: pandas.core.series.Series

Map on Index types now return other Index types

map on an Index now returns an Index, not a numpy array (GH12766)

```python
In [60]: idx = pd.Index([1, 2])

In [61]: idx
Out[61]: Int64Index([1, 2], dtype='int64')

In [62]: mi = pd.MultiIndex.from_tuples([(1, 2), (2, 4)])

In [63]: mi
Out[63]: MultiIndex([(1, 2),
                     (2, 4)],
                      )

Previous behavior:

```python
In [5]: idx.map(lambda x: x * 2)
Out[5]: array([2, 4])

In [6]: idx.map(lambda x: (x, x * 2))
Out[6]: array([(1, 2), (2, 4)], dtype=object)

In [7]: mi.map(lambda x: x)
Out[7]: array([(1, 2), (2, 4)], dtype=object)

In [8]: mi.map(lambda x: x[0])
Out[8]: array([1, 2])

New behavior:
```
In [64]: idx.map(lambda x: x * 2)
Out[64]: Int64Index([2, 4], dtype='int64')

In [65]: idx.map(lambda x: (x, x * 2))
Out[65]: MultiIndex([(1, 2),
                    (2, 4)],
               )

In [66]: mi.map(lambda x: x)
Out[66]: MultiIndex([(1, 2),
                    (2, 4)],
               )

In [67]: mi.map(lambda x: x[0])
Out[67]: Int64Index([1, 2], dtype='int64')

map on a Series with datetime64 values may return int64 dtypes rather than int32

In [68]: s = pd.Series(pd.date_range('2011-01-02T00:00', '2011-01-02T02:00', freq='H')
.....:    .tz_localize('Asia/Tokyo'))
.....:

In [69]: s
Out[69]:
0  2011-01-02 00:00:00+09:00
1  2011-01-02 01:00:00+09:00
2  2011-01-02 02:00:00+09:00
Length: 3, dtype: datetime64[ns, Asia/Tokyo]

Previous behavior:

In [9]: s.map(lambda x: x.hour)
Out[9]:
0   0  
1   1  
2   2  
dtype: int32

New behavior:

In [70]: s.map(lambda x: x.hour)
Out[70]:
0   0  
1   1  
2   2  
Length: 3, dtype: int64
Accessing datetime fields of Index now return Index

The datetime-related attributes (see [here](#) for an overview) of DatetimeIndex, PeriodIndex and TimedeltaIndex previously returned numpy arrays. They will now return a new Index object, except in the case of a boolean field, where the result will still be a boolean ndarray. (GH15022)

Previous behaviour:

```python
In [1]: idx = pd.date_range("2015-01-01", periods=5, freq='10H')
In [2]: idx.hour
Out[2]: array([ 0, 10, 20, 6, 16], dtype=int32)
```

New behavior:

```python
In [71]: idx = pd.date_range("2015-01-01", periods=5, freq='10H')
In [72]: idx.hour
Out[72]: Int64Index([0, 10, 20, 6, 16], dtype='int64')
```

This has the advantage that specific Index methods are still available on the result. On the other hand, this might have backward incompatibilities: e.g. compared to numpy arrays, Index objects are not mutable. To get the original ndarray, you can always convert explicitly using `np.asarray(idx.hour)`.

**pd.unique will now be consistent with extension types**

In prior versions, using `Series.unique()` and `pandas.unique()` on Categorical and tz-aware data-types would yield different return types. These are now made consistent. (GH15903)

- Datetime tz-aware

  Previous behaviour:

```python
# Series
In [5]: pd.Series([pd.Timestamp('20160101', tz='US/Eastern'), ...
               ..., pd.Timestamp('20160101', tz='US/Eastern')]).unique()
Out[5]: array([Timestamp('2016-01-01 00:00:00-0500', tz='US/Eastern')],...
\t-->dtype=object)

In [6]: pd.unique(pd.Series([pd.Timestamp('20160101', tz='US/Eastern'), ...
                       ..., pd.Timestamp('20160101', tz='US/Eastern')]))
Out[6]: array(["2016-01-01T05:00:00.000000000"], dtype='datetime64[ns]')

# Index
In [7]: pd.Index([pd.Timestamp('20160101', tz='US/Eastern'), ...
             ..., pd.Timestamp('20160101', tz='US/Eastern')]).unique()
Out[7]: DatetimeIndex(['2016-01-01 00:00:00-05:00'], dtype='datetime64[ns, US/...
\t-->Eastern'], freq=None)

In [8]: pd.unique([pd.Timestamp('20160101', tz='US/Eastern'), ...
              ..., pd.Timestamp('20160101', tz='US/Eastern')])
Out[8]: array(["2016-01-01T05:00:00.000000000"], dtype='datetime64[ns]')
```

New behavior:
# Series, returns an array of Timestamp tz-aware

In [73]: pd.Series([pd.Timestamp('20160101', tz='US/Eastern'),
        ......:       pd.Timestamp('20160101', tz='US/Eastern')]).unique()
        ......:
Out[73]: <DatetimeArray>
          ['2016-01-01 00:00:00-05:00']
        Length: 1, dtype: datetime64[ns, US/Eastern]

In [74]: pd.unique(pd.Series([pd.Timestamp('20160101', tz='US/Eastern'),
        ......:       pd.Timestamp('20160101', tz='US/Eastern')]))
        ......:
Out[74]: <DatetimeArray>
          ['2016-01-01 00:00:00-05:00']
        Length: 1, dtype: datetime64[ns, US/Eastern]

# Index, returns a DatetimeIndex

In [75]: pd.Index([pd.Timestamp('20160101', tz='US/Eastern'),
        ......:       pd.Timestamp('20160101', tz='US/Eastern')]).unique()
        ......:
Out[75]: DatetimeIndex(['2016-01-01 00:00:00-05:00'], dtype='datetime64[ns, US/Eastern]', freq=None)

In [76]: pd.unique(pd.Index([pd.Timestamp('20160101', tz='US/Eastern'),
        ......:       pd.Timestamp('20160101', tz='US/Eastern')]))
        ......:
Out[76]: DatetimeIndex(['2016-01-01 00:00:00-05:00'], dtype='datetime64[ns, US/Eastern]', freq=None)

- Categoricals

Previous behaviour:

In [1]: pd.Series(list('baabc'), dtype='category').unique()
Out[1]:
[ b, a, c]  
Categories (3, object): [b, a, c]

In [2]: pd.unique(pd.Series(list('baabc'), dtype='category'))
Out[2]: array(['b', 'a', 'c'], dtype=object)

New behavior:

# returns a Categorical

In [77]: pd.Series(list('baabc'), dtype='category').unique()
Out[77]:
[ 'b', 'a', 'c']  
Categories (3, object): ['b', 'a', 'c']

In [78]: pd.unique(pd.Series(list('baabc'), dtype='category'))
Out[78]:
[ 'b', 'a', 'c']  
Categories (3, object): ['b', 'a', 'c']
S3 file handling

pandas now uses `s3fs` for handling S3 connections. This shouldn’t break any code. However, since `s3fs` is not a required dependency, you will need to install it separately, like `boto` in prior versions of pandas. (GH11915).

Partial string indexing changes

*DatetimelIndex Partial String Indexing* now works as an exact match, provided that string resolution coincides with index resolution, including a case when both are seconds (GH14826). See *Slice vs. Exact Match* for details.

```
In [79]: df = pd.DataFrame({'a': [1, 2, 3]}, pd.DatetimeIndex(['2011-12-31 23:59:59', '2012-01-01 00:00:00', '2012-01-01 00:00:01']))

In [80]: df['2011-12-31 23:59:59']
KeyError: '2011-12-31 23:59:59'
```

Previous behavior:

```
In [4]: df['2011-12-31 23:59:59']
Out [4]:
   a
2011-12-31 23:59:59  1

In [5]: df['a']['2011-12-31 23:59:59']
Out [5]:
2011-12-31 23:59:59  1
Name: a, dtype: int64
```

New behavior:

```
In [4]: df['2011-12-31 23:59:59']
KeyError: '2011-12-31 23:59:59'
```

```
In [5]: df['a']['2011-12-31 23:59:59']
Out [5]:
1
```

Concat of different float dtypes will not automatically upcast

Previously, `concat` of multiple objects with different *float* dtypes would automatically upcast results to a dtype of *float64*. Now the smallest acceptable dtype will be used (GH13247)

```
In [80]: df1 = pd.DataFrame(np.array([[1.0], dtype=np.float32, ndmin=2))

In [81]: df1.dtypes
Out [81]:
0 float32
Length: 1, dtype: object

In [82]: df2 = pd.DataFrame(np.array([[np.nan], dtype=np.float32, ndmin=2))

In [83]: df2.dtypes
Out [83]:
0 float32
Length: 1, dtype: object
```
Previous behavior:

```
In [7]: pd.concat([df1, df2]).dtypes
Out[7]:
0   float64
    dtype: object
```

New behavior:

```
In [84]: pd.concat([df1, df2]).dtypes
Out[84]:
0   float32
Length: 1, dtype: object
```

**pandas Google BigQuery support has moved**

pandas has split off Google BigQuery support into a separate package pandas-gbq. You can conda install pandas-gbq -c conda-forge or pip install pandas-gbq to get it. The functionality of `read_gbq()` and `DataFrame.to_gbq()` remain the same with the currently released version of pandas-gbq=0.1.4. Documentation is now hosted here (GH15347)

**Memory usage for Index is more accurate**

In previous versions, showing `.memory_usage()` on a pandas structure that has an index, would only include actual index values and not include structures that facilitated fast indexing. This will generally be different for Index and MultiIndex and less-so for other index types. (GH15237)

Previous behavior:

```
In [8]: index = pd.Index(['foo', 'bar', 'baz'])
In [9]: index.memory_usage(deep=True)
Out[9]: 180
In [10]: index.get_loc('foo')
Out[10]: 0
In [11]: index.memory_usage(deep=True)
Out[11]: 180
```

New behavior:

```
In [8]: index = pd.Index(['foo', 'bar', 'baz'])
In [9]: index.memory_usage(deep=True)
Out[9]: 180
In [10]: index.get_loc('foo')
Out[10]: 0
In [11]: index.memory_usage(deep=True)
Out[11]: 260
```
**DataFrame.sort_index changes**

In certain cases, calling `.sort_index()` on a MultiIndexed DataFrame would return the same DataFrame without seeming to sort. This would happen with a lexicsorted, but non-monotonic levels. (GH15622, GH15687, GH14015, GH13431, GH15797)

This is unchanged from prior versions, but shown for illustration purposes:

```python
In [85]: df = pd.DataFrame(np.arange(6), columns=['value'],
        ....:
        index=pd.MultiIndex.from_product([list('BA'), range(3)]))

In [86]: df
Out[86]:
value
B 0 0
1 1
2 2
A 0 3
1 4
2 5
[6 rows x 1 columns]
```

```python
In [87]: df.index.is_lexsorted()
Out[87]: False

In [88]: df.index.is_monotonic
Out[88]: False
```

Sorting works as expected

```python
In [89]: df.sort_index()
Out[89]:
value
A 0 3
1 4
2 5
B 0 0
1 1
2 2
[6 rows x 1 columns]
```

```python
In [90]: df.sort_index().index.is_lexsorted()
Out[90]: True

In [91]: df.sort_index().index.is_monotonic
Out[91]: True
```

However, this example, which has a non-monotonic 2nd level, doesn’t behave as desired.

```python
In [92]: df = pd.DataFrame({'value': [1, 2, 3, 4],
        ....:
        index=pd.MultiIndex([['a', 'b'], ['bb', 'aa']],
        ....:
        [[0, 0, 1, 1], [0, 1, 0, 1]]))
```

(continues on next page)
In [93]: df
Out[93]:
   value
a bb  1
aa  2
b bb  3
aa  4
[4 rows x 1 columns]

Previous behavior:

In [11]: df.sort_index()
Out[11]:
   value
a bb  1
aa  2
b bb  3
aa  4

In [14]: df.sort_index().index.is_lexsorted()
Out[14]: True

In [15]: df.sort_index().index.is_monotonic
Out[15]: False

New behavior:

In [94]: df.sort_index()
Out[94]:
   value
a aa  2
bb  1
b aa  4
bb  3
[4 rows x 1 columns]

In [95]: df.sort_index().index.is_lexsorted()
Out[95]: True

In [96]: df.sort_index().index.is_monotonic
Out[96]: True

**GroupBy describe formatting**

The output formatting of `groupby.describe()` now labels the `describe()` metrics in the columns instead of the index. This format is consistent with `groupby.agg()` when applying multiple functions at once. (GH4792)

Previous behavior:

In [1]: df = pd.DataFrame({'A': [1, 1, 2, 2], 'B': [1, 2, 3, 4]})

In [2]: df.groupby('A').describe()
Out[2]:

(continues on next page)
In [3]: df.groupby('A').agg([np.mean, np.std, np.min, np.max])
Out[3]:

<table>
<thead>
<tr>
<th>B</th>
<th>mean</th>
<th>std</th>
<th>amin</th>
<th>amax</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>1.5000</td>
<td>0.707</td>
<td>1.00</td>
<td>2.00</td>
</tr>
<tr>
<td>2</td>
<td>3.5000</td>
<td>0.707</td>
<td>3.00</td>
<td>4.00</td>
</tr>
</tbody>
</table>

New behavior:

In [97]: df = pd.DataFrame({'A': [1, 1, 2, 2], 'B': [1, 2, 3, 4]})

In [98]: df.groupby('A').describe()
Out[98]:

<table>
<thead>
<tr>
<th>B</th>
<th>count</th>
<th>mean</th>
<th>std</th>
<th>min</th>

<td>0.707</td>
<td>3.00</td>
<td>4.00</td>
</tr>
</tbody>
</table>

[2 rows x 4 columns]
Window binary corr/cov operations return a MultiIndex DataFrame

A binary window operation, like .corr() or .cov(), when operating on a .rolling(..) .expanding(..)
or .ewm(..) object, will now return a 2-level MultiIndexed DataFrame rather than a Panel, as Panel is
now deprecated, see here. These are equivalent in function, but a MultiIndexed DataFrame enjoys more support
in pandas. See the section on Windowed Binary Operations for more information. (GH15677)

```python
In [100]: np.random.seed(1234)
In [101]: df = pd.DataFrame(np.random.rand(100, 2),
                          columns=pd.Index(['A', 'B'], name='bar'),
                          index=pd.date_range('20160101',
                          periods=100, freq='D', name='foo'))
In [102]: df.tail()
Out[102]:
bar    A   B
foo
2016-04-05  0.640880  0.126205
2016-04-06  0.171465  0.737086
2016-04-07  0.127029  0.369650
2016-04-08  0.604334  0.103104
2016-04-09  0.802374  0.945553
[5 rows x 2 columns]

Previous behavior:

```python
In [2]: df.rolling(12).corr()
Out[2]:
<class 'pandas.core.panel.Panel'>
Dimensions: 100 (items) x 2 (major_axis) x 2 (minor_axis)
Items axis: 2016-01-01 00:00:00 to 2016-04-09 00:00:00
Major_axis axis: A to B
Minor_axis axis: A to B
```

New behavior:

```python
In [103]: res = df.rolling(12).corr()
In [104]: res.tail()
Out[104]:
bar    A   B
foo   bar
2016-04-07  B  -0.132090  1.000000
2016-04-08  A  1.000000  -0.145775
          B  -0.145775  1.000000
2016-04-09  A  1.000000  0.119645
          B  0.119645  1.000000
[5 rows x 2 columns]

Retrieving a correlation matrix for a cross-section

```python
In [105]: df.rolling(12).corr().loc['2016-04-07']
Out[105]:
```

HDFStore where string comparison
In previous versions most types could be compared to string column in a HDFStore usually resulting in an invalid
comparison, returning an empty result frame. These comparisons will now raise a TypeError (GH15492)
In [106]: df = pd.DataFrame({'unparsed_date': ['2014-01-01', '2014-01-01']})
In [107]: df.to_hdf('store.h5', 'key', format='table', data_columns=True)
In [108]: df.dtypes
Out[108]:
unparsed_date
object
Length: 1, dtype: object

Previous behavior:
In [4]: pd.read_hdf('store.h5', 'key', where='unparsed_date > ts')
File "<string>", line 1
(unparsed_date > 1970-01-01 00:00:01.388552400)
^
SyntaxError: invalid token

New behavior:
In [18]: ts = pd.Timestamp('2014-01-01')
In [19]: pd.read_hdf('store.h5', 'key', where='unparsed_date > ts')
TypeError: Cannot compare 2014-01-01 00:00:00 of
type <class 'pandas.tslib.Timestamp'> to string column

Index.intersection and inner join now preserve the order of the left Index
Index.intersection() now preserves the order of the calling Index (left) instead of the other Index (right)
(GH15582). This affects inner joins, DataFrame.join() and merge(), and the .align method.
• Index.intersection
In [109]: left = pd.Index([2, 1, 0])
In [110]: left
Out[110]: Int64Index([2, 1, 0], dtype='int64')
In [111]: right = pd.Index([1, 2, 3])
In [112]: right
Out[112]: Int64Index([1, 2, 3], dtype='int64')

5.9. Version 0.20

2903


Previous behavior:

```python
In [4]: left.intersection(right)
Out[4]: Int64Index([1, 2], dtype='int64')
```

New behavior:

```python
In [113]: left.intersection(right)
Out[113]: Int64Index([2, 1], dtype='int64')
```

• **DataFrame.join and pd.merge**

```python
In [114]: left = pd.DataFrame({'a': [20, 10, 0]}, index=[2, 1, 0])
In [115]: left
Out[115]:
   a
2  20
1  10
0  0
[3 rows x 1 columns]

In [116]: right = pd.DataFrame({'b': [100, 200, 300]}, index=[1, 2, 3])
In [117]: right
Out[117]:
   b
1  100
2  200
3  300
[3 rows x 1 columns]
```

Previous behavior:

```python
In [4]: left.join(right, how='inner')
Out[4]:
   a   b
1  10  100
2  20  200
```

New behavior:

```python
In [118]: left.join(right, how='inner')
Out[118]:
   a   b
2  20  200
1  10  100
[2 rows x 2 columns]```
Pivot table always returns a DataFrame

The documentation for *pivot_table()* states that a DataFrame is always returned. Here a bug is fixed that allowed this to return a Series under certain circumstance. *(GH4386)*

```python
In [119]: df = pd.DataFrame({'col1': [3, 4, 5],
                        'col2': ['C', 'D', 'E'],
                        'col3': [1, 3, 9]})

In [120]: df
Out[120]:
     col1 col2 col3
0     3    C   1
1     4    D   3
2     5    E   9

[3 rows x 3 columns]

Previous behavior:

```python
In [2]: df.pivot_table('col1', index=['col3', 'col2'], aggfunc=np.sum)
Out[2]:
     col3 col2
1     C   3
3     D   4
9     E   5
Name: col1, dtype: int64
```

New behavior:

```python
In [121]: df.pivot_table('col1', index=['col3', 'col2'], aggfunc=np.sum)
Out[121]:
        col1
     col3 col2
1     C   3
3     D   4
9     E   5

[3 rows x 1 columns]
```

Other API changes

- numexpr version is now required to be >= 2.4.6 and it will not be used at all if this requisite is not fulfilled *(GH15213)*.
- CParserError has been renamed to ParserError in *pd.read_csv()* and will be removed in the future *(GH12665)*
- *SparseArray.cumsum()* and *SparseSeries.cumsum()* will now always return SparseArray and SparseSeries respectively *(GH12855)*
- *DataFrame.applymap()* with an empty DataFrame will return a copy of the empty DataFrame instead of a Series *(GH8222)*
- *Series.map()* now respects default values of dictionary subclasses with a __missing__ method, such as collections.Counter *(GH15999)*
pandas: powerful Python data analysis toolkit, Release 1.2.2

- `.loc` has compat with `.ix` for accepting iterators, and NamedTuples (GH15120)
- `interpolate()` and `fillna()` will raise a `ValueError` if the `limit` keyword argument is not greater than 0. (GH9217)
- `pd.read_csv()` will now issue a `ParserWarning` whenever there are conflicting values provided by the `dialect` parameter and the user (GH14898)
- `pd.read_csv()` will now raise a `ValueError` for the C engine if the quote character is larger than one byte (GH11592)
- inplace arguments now require a boolean value, else a `ValueError` is thrown (GH14189)
- pandas.api.types.is_datetime64_ns_dtype will now report True on a tz-aware dtype, similar to pandas.api.types.is_datetime64_any_dtype
- `DataFrame.asof()` will return a null filled Series instead the scalar NaN if a match is not found (GH15118)
- Specific support for `copy.copy()` and `copy.deepcopy()` functions on NDFrame objects (GH15444)
- `Series.sort_values()` accepts a one element list of bool for consistency with the behavior of `DataFrame.sort_values()` (GH15604)
- `.merge()` and `.join()` on category dtype columns will now preserve the category dtype when possible (GH10409)
- SparseDataFrame.default_fill_value will be 0, previously was nan in the return from `pd.get_dummies(..., sparse=True)` (GH15594)
- The default behaviour of `Series.str.match` has changed from extracting groups to matching the pattern. The extracting behaviour was deprecated since pandas version 0.13.0 and can be done with the `Series.str.extract` method (GH5224). As a consequence, the `as_indexer` keyword is ignored (no longer needed to specify the new behaviour) and is deprecated.
- NaT will now correctly report False for datetimelike boolean operations such as `is_month_start` (GH15781)
- NaT will now correctly return `np.nan` for Timedelta and Period accessors such as `days` and `quarter` (GH15782)
- NaT will now returns NaT for `tz_localize` and `tz_convert` methods (GH15830)
- DataFrame and Panel constructors with invalid input will now raise `ValueError` rather than `PandasError`, if called with scalar inputs and not axes (GH15541)
- DataFrame and Panel constructors with invalid input will now raise `ValueError` rather than `pandas.core.common.PandasError`, if called with scalar inputs and not axes; The exception `PandasError` is removed as well. (GH15541)
- The exception `pandas.core.common.AmbiguousIndexError` is removed as it is not referenced (GH15541)
Reorganization of the library: privacy changes

Modules privacy has changed

Some formerly public python/c/c++/cython extension modules have been moved and/or renamed. These are all removed from the public API. Furthermore, the pandas.core, pandas.compat, and pandas.util top-level modules are now considered to be PRIVATE. If indicated, a deprecation warning will be issued if you reference these modules. (GH12588)

Some new subpackages are created with public functionality that is not directly exposed in the top-level namespace: pandas.errors, pandas.plotting and pandas.testing (more details below). Together with pandas.api.types and certain functions in the pandas.io and pandas.tseries submodules, these are now the public subpackages.

Further changes:

- The function `union_categoricals()` is now importable from pandas.api.types, formerly from pandas.types.concat (GH15998)

- The type import pandas.tslib.NaTTType is deprecated and can be replaced by using `type(pandas.NaT)` (GH16146)

- The public functions in pandas.tools.hashing deprecated from that locations, but are now importable from pandas.util (GH16223)

- The modules in pandas.util: decorators, print_versions, doctools, validators, depr_module are now private. Only the functions exposed in pandas.util itself are public (GH16223)
pandas: powerful Python data analysis toolkit, Release 1.2.2

**pandas.errors**

We are adding a standard public module for all pandas exceptions & warnings `pandas.errors`. (GH14800). Previously these exceptions & warnings could be imported from `pandas.core.common` or `pandas.io.common`. These exceptions and warnings will be removed from the `*.common` locations in a future release. (GH15541)

The following are now part of this API:

```python
['DtypeWarning',
'EmptyDataError',
'OutOfBoundsDatetime',
'ParserError',
'ParserWarning',
'PerformanceWarning',
'UnsupportedFunctionCall']
```

**pandas.testing**

We are adding a standard module that exposes the public testing functions in `pandas.testing`. (GH9895). Those functions can be used when writing tests for functionality using pandas objects.

The following testing functions are now part of this API:

- `testing.assert_frame_equal()`
- `testing.assert_series_equal()`
- `testing.assert_index_equal()`

**pandas.plotting**

A new public `pandas.plotting` module has been added that holds plotting functionality that was previously in either `pandas.tools.plotting` or in the top-level namespace. See the deprecations sections for more details.

**Other development changes**

- Building pandas for development now requires `cython >= 0.23` (GH14831)
- Require at least 0.23 version of cython to avoid problems with character encodings (GH14699)
- Switched the test framework to use `pytest` (GH13097)
- Reorganization of tests directroy layout (GH14854, GH15707).
Deprecations

Deprecate `.ix`

The `.ix` indexer is deprecated, in favor of the more strict `.loc` and `.iloc` indexers. `.ix` offers a lot of magic on the inference of what the user wants to do. To wit, `.ix` can decide to index *positionally* OR via *labels*, depending on the data type of the index. This has caused quite a bit of user confusion over the years. The full indexing documentation is here. (GH14218)

The recommended methods of indexing are:

- `.loc` if you want to *label* index
- `.iloc` if you want to *positionally* index.

Using `.ix` will now show a DeprecationWarning with a link to some examples of how to convert code here.

```
In [122]: df = pd.DataFrame({'A': [1, 2, 3],
        ...:               'B': [4, 5, 6],
        ...:               index=list('abc'))

In [123]: df ix[[0, 2], 'A']
Out[123]:
   a 1
   c 3
Name: A, dtype: int64
```

Previous behavior, where you wish to get the 0th and the 2nd elements from the index in the ‘A’ column.

```
In [3]: df ix[[0, 2], 'A']
Out[3]:
   a 1
   c 3
Name: A, dtype: int64
```

Using `.loc`. Here we will select the appropriate indexes from the index, then use *label* indexing.

```
In [124]: df loc[df.index[[0, 2]], 'A']
Out[124]:
   a 1
   c 3
Name: A, Length: 2, dtype: int64
```

Using `.iloc`. Here we will get the location of the ‘A’ column, then use *positional* indexing to select things.

```
In [125]: df.iloc[[0, 2], df.columns.get_loc('A')]
Out[125]:
   a 1
   c 3
Name: A, Length: 2, dtype: int64
```
Deprecate Panel

Panel is deprecated and will be removed in a future version. The recommended way to represent 3-D data are with a MultiIndex on a DataFrame via the to_frame() or with the xarray package. pandas provides a to_xarray() method to automate this conversion (GH13563).

Convert to a MultiIndex DataFrame

```
In [136]: p.to_frame()
```

```
ItemA  ItemB  ItemC
major  minor
2000-01-03 A  0.628776 -1.409432  0.209395
       B  -0.988138 -1.347533  0.896581
       C  -0.938153  1.272395 -0.161137
       D  -0.223019 -0.591863 -1.051539
2000-01-04 A  0.186494  1.422986 -0.592886
       B  -0.072608  0.363565  1.104352
       C  -1.239072 -1.449567  0.889157
       D  2.123692 -0.414505 -0.319561

       B  -0.550603 -0.014752 -0.431550
       C  0.139683 -1.195524  0.288377
       D  0.122273 -1.425795 -0.619993
[12 rows x 3 columns]
```

Convert to an xarray DataArray

```
In [137]: p.to_xarray()
```

```
xarray.DataArray (items: 3, major_axis: 3, minor_axis: 4)
array([[[ 0.628776,  0.988138, -0.938153, -0.223019],
       [ 0.186494, -0.072608, -1.239072,  2.123692],
       [ 0.952478, -0.550603,  0.139683,  0.122273]],
      [[-1.409432, -1.347533,  1.272395, -0.591863],
       [ 1.422986,  0.363565, -1.449567, -0.414505],
       [-2.147855, -0.014752, -1.195524, -1.425795]],
      [[ 0.209395, -0.896581, -0.161137, -1.051539],
       [-0.592886,  1.104352,  0.889157, -0.319561],
       [-1.473116, -0.431550,  0.288377, -0.619993]])
```

Coordinates:
* items (items) object 'ItemA' 'ItemB' 'ItemC'
Deprecate groupby.agg() with a dictionary when renaming

The .groupby(..).agg(..).rolling(..).agg(..).and .resample(..).agg(..) syntax can accept a variable of inputs, including scalars, list, and a dict of column names to scalars or lists. This provides a useful syntax for constructing multiple (potentially different) aggregations.

However, .agg(..) can also accept a dict that allows ‘renaming’ of the result columns. This is a complicated and confusing syntax, as well as not consistent between Series and DataFrame. We are deprecating this ‘renaming’ functionality.

- We are deprecating passing a dict to a grouped/rolled/resampled Series. This allowed one to rename the resulting aggregation, but this had a completely different meaning than passing a dictionary to a grouped DataFrame, which accepts column-to-aggregations.
- We are deprecating passing a dict-of-dicts to a grouped/rolled/resampled DataFrame in a similar manner.

This is an illustrative example:

```python
In [126]: df = pd.DataFrame({'A': [1, 1, 1, 2, 2],
                   'B': range(5),
                   'C': range(5))

In [127]: df.groupby('A').agg({'B': 'sum', 'C': 'min'})
```

Here is a typical useful syntax for computing different aggregations for different columns. This is a natural, and useful syntax. We aggregate from the dict-to-list by taking the specified columns and applying the list of functions. This returns a MultiIndex for the columns (this is not deprecated).

```python
In [128]: df.groupby('A').agg({'B': 'sum', 'C': 'min'})
```

Here’s an example of the first deprecation, passing a dict to a grouped Series. This is a combination aggregation & renaming:

```python
In [6]: df.groupby('A').B.agg({'foo': 'count'})
```

(continues on next page)
is deprecated and will be removed in a future version

\begin{verbatim}
In [129]: df.groupby('A').B.agg({'count':}).rename(columns={'count': 'foo'})
Out[129]:
     foo
A
1   3
2   2

[2 rows x 1 columns]
\end{verbatim}

You can accomplish the same operation, more idiomatically by:

\begin{verbatim}
In [129]: df.groupby('A').B.agg({'foo': 'sum'}, 'bar': 'min')
Out[129]:
     B   C
foo
A
1   3   0
2   7   3

[2 rows x 2 columns]
\end{verbatim}

Here’s an example of the second deprecation, passing a dict-of-dict to a grouped DataFrame:

\begin{verbatim}
In [23]: (df.groupby('A')
    ...: .agg({'B': {'foo': 'sum'}, 'C': {'bar': 'min'}})
    ...: )

FutureWarning: using a dict with renaming is deprecated and will be removed in a future version

Out[23]:
     B   C
foo
A
1   3   0
2   7   3

[2 rows x 2 columns]
\end{verbatim}

You can accomplish nearly the same by:

\begin{verbatim}
In [130]: (df.groupby('A')
    ...: .agg({'B': 'sum', 'C': 'min'})
    ...: .rename(columns={'B': 'foo', 'C': 'bar'})
    ...: )

Out[130]:
     foo   bar
A
1   3   0
2   7   3

[2 rows x 2 columns]
\end{verbatim}
Deprecate .plotting

The `pandas.tools.plotting` module has been deprecated, in favor of the top level `pandas.plotting` module. All the public plotting functions are now available from `pandas.plotting` (GH12548).

Furthermore, the top-level `pandas.scatter_matrix` and `pandas.plot_params` are deprecated. Users can import these from `pandas.plotting` as well.

Previous script:
```
pd.tools.plotting.scatter_matrix(df)
pd.scatter_matrix(df)
```

Should be changed to:
```
pd.plotting.scatter_matrix(df)
```

Other deprecations

- `SparseArray.to_dense()` has deprecated the `fill` parameter, as that parameter was not being respected (GH14647)
- `SparseSeries.to_dense()` has deprecated the `sparse_only` parameter (GH14647)
- `Series.repeat()` has deprecated the `reps` parameter in favor of `repeats` (GH12662)
- The `Series` constructor and `.astype` method have deprecated accepting timestamp dtypes without a frequency (e.g. `np.datetime64`) for the `dtype` parameter (GH15524)
- `Index.repeat()` and `MultiIndex.repeat()` have deprecated the `n` parameter in favor of `repeats` (GH12662)
- `Categorical.searchsorted()` and `Series.searchsorted()` have deprecated the `v` parameter in favor of `value` (GH12662)
- `TimedeltaIndex.searchsorted()`, `DatetimeIndex.searchsorted()`, and `PeriodIndex.searchsorted()` have deprecated the `key` parameter in favor of `value` (GH12662)
- `DataFrame.astype()` has deprecated the `raise_on_error` parameter in favor of `errors` (GH14878)
- `Series.sortlevel` and `DataFrame.sortlevel` have been deprecated in favor of `Series.sort_index` and `DataFrame.sort_index` (GH15099)
- importing `concat` from `pandas.tools.merge` has been deprecated in favor of imports from the `pandas` namespace. This should only affect explicit imports (GH15358)
- `Series/DataFrame/Panel.consolidate()` been deprecated as a public method. (GH15483)
- The `as_indexer` keyword of `Series.str.match()` has been deprecated (ignored keyword) (GH15257).
- The following top-level pandas functions have been deprecated and will be removed in a future version (GH13790, GH15940)
  - `pd.pnow()`, replaced by `Period.now()`
  - `pd.Term`, is removed, as it is not applicable to user code. Instead use in-line string expressions in the where clause when searching in HDFStore
  - `pd.Expr`, is removed, as it is not applicable to user code.
  - `pd.match()`, is removed.
pandas: powerful Python data analysis toolkit, Release 1.2.2

- `pd.groupby()`, replaced by using the `.groupby()` method directly on a Series/DataFrame
- `pd.get_store()`, replaced by a direct call to `pd.HDFStore(...)`

- `is_any_int_dtype`, `is_floating_dtype`, and `is_sequence` are deprecated from pandas.api.types (GH16042)

Removal of prior version deprecations/changes

- The `pandas.rpy` module is removed. Similar functionality can be accessed through the rpy2 project. See the R interfacing docs for more details.

- The `pandas.io.ga` module with a google-analytics interface is removed (GH11308). Similar functionality can be found in the Google2Pandas package.

- `pd.to_datetime` and `pd.to_timedelta` have dropped the `coerce` parameter in favor of `errors` (GH13602)

- `pandas.stats.fama_macbeth`, `pandas.stats.ols`, `pandas.stats.plm` and `pandas.stats.var`, as well as the top-level `pandas.fama_macbeth` and `pandas.ols` routines are removed. Similar functionality can be found in the statsmodels package. (GH11898)

- The `TimeSeries` and `SparseTimeSeries` classes, aliases of `Series` and `SparseSeries`, are removed (GH10890, GH15098).

- `Series.is_time_series` is dropped in favor of `Series.index.is_all_dates` (GH15098)

- The deprecated `irow`, `icol`, `iget` and `iget_value` methods are removed in favor of `iloc` and `iat` as explained here (GH10711).

- The deprecated `DataFrame.iterkv()` has been removed in favor of `DataFrame.iteritems()` (GH10711)

- The `Categorical` constructor has dropped the `name` parameter (GH10632)

- `Categorical` has dropped support for NaN categories (GH10748)

- The `take_last` parameter has been dropped from `duplicated()`, `drop_duplicates()`, `nlargest()`, and `nsmallest()` methods (GH10236, GH10792, GH10920)

- `Series`, `Index`, and `DataFrame` have dropped the `sort` and `order` methods (GH10726)

- Where clauses in `pytables` are only accepted as strings and expressions types and not other data-types (GH12027)

- `DataFrame` has dropped the `combineAdd` and `combineMult` methods in favor of `add` and `mul` respectively (GH10735)

Performance improvements

- Improved performance of `pd.wide_to_long()` (GH14779)

- Improved performance of `pd.factorize()` by releasing the GIL with `object` dtype when inferred as strings (GH14859, GH16057)

- Improved performance of timeseries plotting with an irregular DatetimeIndex (or with `compat_x=True`) (GH15073).

- Improved performance of `groupby().cummin()` and `groupby().cummax()` (GH15048, GH15109, GH15561, GH15635)

- Improved performance and reduced memory when indexing with a MultiIndex (GH15245)
• When reading buffer object in `read_sas()` method without specified format, filepath string is inferred rather than buffer object. (GH14947)

• Improved performance of `.rank()` for categorical data (GH15498)

• Improved performance when using `.unstack()` (GH15503)

• Improved performance of merge/join on category columns (GH10409)

• Improved performance of `drop_duplicates()` on bool columns (GH12963)

• Improved performance of `pd.core.groupby.GroupBy.apply` when the applied function used the `.name` attribute of the group DataFrame (GH15062).

• Improved performance of `iloc` indexing with a list or array (GH15504).

• Improved performance of `Series.sort_index()` with a monotonic index (GH15694)

• Improved performance in `pd.read_csv()` on some platforms with buffered reads (GH16039)

**Bug fixes**

**Conversion**

• Bug in `Timestamp.replace` now raises `TypeError` when incorrect argument names are given; previously this raised `ValueError` (GH15240)

• Bug in `Timestamp.replace` with compat for passing long integers (GH15030)

• Bug in `Timestamp` returning UTC based time/date attributes when a timezone was provided (GH13303, GH6538)

• Bug in `Timestamp` incorrectly localizing timezones during construction (GH11481, GH15777)

• Bug in `TimedeltaIndex` addition where overflow was being allowed without error (GH14816)

• Bug in `TimedeltaIndex` raising a `ValueError` when boolean indexing with `loc` (GH14946)

• Bug in catching an overflow in `Timestamp + Timedelta/Offset` operations (GH15126)

• Bug in `Datet imeIndex.round()` and `Timestamp.round()` floating point accuracy when rounding by milliseconds or less (GH14440, GH15578)

• Bug in `astype()` where `inf` values were incorrectly converted to integers. Now raises error now with `astype()` for Series and DataFrames (GH14265)

• Bug in `DataFrame(...).apply(to_numeric)` when values are of type `decimal.Decimal`. (GH14827)

• Bug in `describe()` when passing a numpy array which does not contain the median to the `percentiles` keyword argument (GH14908)

• Cleaned up `PeriodIndex` constructor, including raising on floats more consistently (GH13277)

• Bug in using `__deepcopy__` on empty NDFrame objects (GH15370)

• Bug in `.replace()` may result in incorrect dtypes. (GH12747, GH15765)

• Bug in `Series.replace` and `DataFrame.replace` which failed on empty replacement dicts (GH15289)

• Bug in `Series.replace` which replaced a numeric by string (GH15743)

• Bug in `Index` construction with `NaN` elements and integer dtype specified (GH15187)

• Bug in `Series` construction with a datetimetz (GH14928)

• Bug in `Series.dt.round()` inconsistent behaviour on `NaT`’s with different arguments (GH14940)
• Bug in Series constructor when both copy=True and dtype arguments are provided (GH15125)
• Incorrect dtyped Series was returned by comparison methods (e.g., lt, gt, ...) against a constant for an empty DataFrame (GH15077)
• Bug in Series.ffill() with mixed dtypes containing tz-aware datetimes. (GH14956)
• Bug in DataFrame.fillna() where the argument downcast was ignored when fillna value was of type dict (GH15277)
• Bug in .asfreq(), where frequency was not set for empty Series (GH14320)
• Bug in DataFrame construction with nulls and datetimes in a list-like (GH15869)
• Bug in DataFrame.fillna() with tz-aware datetimes (GH15855)
• Bug in is_string_dtype, is_timedelta64_ns_dtype, and is_string_like_dtype in which an error was raised when None was passed in (GH15941)
• Bug in the return type of pd.unique on a Categorical, which was returning an ndarray and not a Categorical (GH15903)
• Bug in Index.to_series() where the index was not copied (and so mutating later would change the original), (GH15949)
• Bug in indexing with partial string indexing with a len-1 DataFrame (GH16071)
• Bug in Series construction where passing invalid dtype didn’t raise an error. (GH15520)

Indexing

• Bug in Index power operations with reversed operands (GH14973)
• Bug in DataFrame.sort_values() when sorting by multiple columns where one column is of type int64 and contains NaT (GH14922)
• Bug in DataFrame.reindex() in which method was ignored when passing columns (GH14992)
• Bug in DataFrame.loc with indexing a MultiIndex with a Series indexer (GH14730, GH15424)
• Bug in DataFrame.loc with indexing a MultiIndex with a numpy array (GH15434)
• Bug in Series.asof which raised if the series contained all np.nan (GH15713)
• Bug in .at when selecting from a tz-aware column (GH15822)
• Bug in Series.where() and DataFrame.where() where array-like conditionals were being rejected (GH15414)
• Bug in Series.where() where TZ-aware data was converted to float representation (GH15701)
• Bug in .loc that would not return the correct dtype for scalar access for a DataFrame (GH11617)
• Bug in output formatting of a MultiIndex when names are integers (GH12223, GH15262)
• Bug in Categorical.searchsorted() where alphabetical instead of the provided categorical order was used (GH14522)
• Bug in Series.iloc where a Categorical object for list-like indexes input was returned, where a Series was expected. (GH14580)
• Bug in DataFrame.isin comparing datetimelike to empty frame (GH15473)
• Bug in .reset_index() when an all NaN level of a MultiIndex would fail (GH6322)
- Bug in `.reset_index()` when raising error for index name already present in MultiIndex columns (GH16120)
- Bug in creating a MultiIndex with tuples and not passing a list of names; this will now raise ValueError (GH15110)
- Bug in the HTML display with a MultiIndex and truncation (GH14882)
- Bug in the display of `.info()` where a qualifier (+) would always be displayed with a MultiIndex that contains only non-strings (GH15245)
- Bug in `pd.concat()` where the names of MultiIndex of resulting DataFrame are not handled correctly when None is presented in the names of MultiIndex of input DataFrame (GH15787)
- Bug in `DataFrame.sort_index()` and `Series.sort_index()` where na_position doesn’t work with a MultiIndex (GH14784, GH16604)
- Bug in `pd.concat()` when combining objects with a CategoricalIndex (GH16111)
- Bug in indexing with a scalar and a CategoricalIndex (GH16123)

IO

- Bug in `pd.to_numeric()` in which float and unsigned integer elements were being improperly casted (GH14941, GH15005)
- Bug in `pd.read_fwf()` where the skiprows parameter was not being respected during column width inference (GH11256)
- Bug in `pd.read_csv()` in which the dialect parameter was not being verified before processing (GH14898)
- Bug in `pd.read_csv()` in which missing data was being improperly handled with usecols (GH6710)
- Bug in `pd.read_csv()` in which a file containing a row with many columns followed by rows with fewer columns would cause a crash (GH14125)
- Bug in `pd.read_csv()` for the C engine where usecols were being indexed incorrectly with parse_dates (GH14792)
- Bug in `pd.read_csv()` with parse_dates when multi-line headers are specified (GH15376)
- Bug in `pd.read_csv()` with float_precision='round_trip' which caused a segfault when a text entry is parsed (GH15140)
- Bug in `pd.read_csv()` when an index was specified and no values were specified as null values (GH15835)
- Bug in `pd.read_csv()` in which certain invalid file objects caused the Python interpreter to crash (GH15337)
- Bug in `pd.read_csv()` in which invalid values for nrows and chunksize were allowed (GH15767)
- Bug in `pd.read_csv()` for the Python engine in which unhelpful error messages were being raised when parsing errors occurred (GH15910)
- Bug in `pd.read_csv()` in which the skipfooter parameter was not being properly validated (GH15925)
- Bug in `pd.to_csv()` in which there was numeric overflow when a timestamp index was being written (GH15982)
- Bug in `pd.util.hashing.hash_pandas_object()` in which hashing of categoricals depended on the ordering of categories, instead of just their values. (GH15143)
- Bug in `.to_json()` where lines=True and contents (keys or values) contain escaped characters (GH15096)
• Bug in `.to_json()` causing single byte ascii characters to be expanded to four byte unicode (GH15344)
• Bug in `.to_json()` for the C engine where rollover was not correctly handled for case where frac is odd and
diff is exactly 0.5 (GH15716, GH15864)
• Bug in `pd.read_json()` for Python 2 where `lines=True` and contents contain non-ascii unicode characters (GH15132)
• Bug in `pd.read_msgpack()` in which `Series` categoricals were being improperly processed (GH14901)
• Bug in `pd.read_msgpack()` which did not allow loading of a dataframe with an index of type `CategoricalIndex` (GH15487)
• Bug in `pd.read_msgpack()` when deserializing a `CategoricalIndex` (GH15487)
• Bug in `DataFrame.to_records()` with converting a `DatetimeIndex` with a timezone (GH13937)
• Bug in `DataFrame.to_records()` which failed with unicode characters in column names (GH11879)
• Bug in `.to_sql()` when writing a `DataFrame` with numeric index names (GH15404).
• Bug in `DataFrame.to_html()` with `index=False` and `max_rows` raising in `IndexError` (GH14998)
• Bug in `pd.read_hdf()` passing a `Timestamp` to the `where` parameter with a non date column (GH15492)
• Bug in `DataFrame.to_stata()` and `StataWriter` which produces incorrectly formatted files to be
produced for some locales (GH13856)
• Bug in `StataReader` and `StataWriter` which allows invalid encodings (GH15723)
• Bug in the `Series` repr not showing the length when the output was truncated (GH15962).

### Plotting

• Bug in `DataFrame.hist` where `plt.tight_layout` caused an `AttributeError` (use `matplotlib
>= 2.0.1`) (GH9351)
• Bug in `DataFrame.boxplot` where `fontsize` was not applied to the tick labels on both axes (GH15108)
• Bug in the date and time converters pandas registers with `matplotlib` not handling multiple dimensions
(GH16026)
• Bug in `pd.scatter_matrix()` which could accept either `color` or `c`, but not both (GH14855)

### GroupBy/resample/rolling

• Bug in `.groupby(...).resample()` when passed the `on=` kwarg. (GH15021)
• Properly set `__name__` and `__qualname__` for `Groupby.*` functions (GH14620)
• Bug in `GroupBy.get_group()` failing with a categorical grouper (GH15155)
• Bug in `.groupby(...).rolling(...)` when `on` is specified and using a `DatetimeIndex` (GH15130,
GH13966)
• Bug in groupby operations with `timedelta64` when passing `numeric_only=False` (GH5724)
• Bug in `groupby.apply()` coercing object dtypes to numeric types, when not all values were numeric
(GH14423, GH15421, GH15670)
• Bug in `resample`, where a non-string `loffset` argument would not be applied when resampling a timeseries
(GH13218)
- **Bug in** `DataFrame.groupby().describe()` when grouping on `Index` containing tuples (GH14848)
- **Bug in** `groupby().nunique()` with a datetimelike-grouper where bins counts were incorrect (GH13453)
- **Bug in** `groupby.transform()` that would coerce the resultant dtypes back to the original (GH10972, GH11444)
- **Bug in** `groupby.agg()` incorrectly localizing timezone on `datetime` (GH15426, GH10668, GH13046)
- **Bug in** `.rolling/expanding()` functions where `count()` was not counting `np.Inf`, nor handling object dtypes (GH12541)
- **Bug in** `.rolling()` where `pd.Timedelta` or `datetime.timedelta` was not accepted as a window argument (GH15440)
- **Bug in** `Rolling.quantile` function that caused a segmentation fault when called with a quantile value outside of the range [0, 1] (GH15463)
- **Bug in** `DataFrame.resample().median()` if duplicate column names are present (GH14233)

**Sparse**

- **Bug in** `SparseSeries.reindex` on single level with list of length 1 (GH15447)
- **Bug in** repr-formattting a `SparseDataFrame` after a value was set on (a copy of) one of its series (GH15488)
- **Bug in** `SparseDataFrame` construction with lists not coercing to dtype (GH15682)
- **Bug in** sparse array indexing in which indices were not being validated (GH15863)

**Reshaping**

- **Bug in** `pd.merge_asof()` where `left_index` or `right_index` caused a failure when multiple `by` was specified (GH15676)
- **Bug in** `pd.merge_asof()` where `left_index/right_index` together caused a failure when `tolerance` was specified (GH15135)
- **Bug in** `DataFrame.pivot_table()` where `dropna=True` would not drop all-NaN columns when the columns was a `category` dtype (GH15193)
- **Bug in** `pd.melt()` where passing a tuple value for `value_vars` caused a `TypeError` (GH15348)
- **Bug in** `pd.pivot_table()` where no error was raised when values argument was not in the columns (GH14938)
- **Bug in** `pd.concat()` in which concatenating with an empty dataframe with `join='inner'` was being improperly handled (GH15328)
- **Bug with** `sort=True` in `DataFrame.join` and `pd.merge` when joining on indexes (GH15582)
- **Bug in** `DataFrame.nsmallest` and `DataFrame.nlargest` where identical values resulted in duplicated rows (GH15297)
- **Bug in** `pandas.pivot_table()` incorrectly raising `UnicodeError` when passing unicode input for `margins` keyword (GH13292)
Numeric

• Bug in \texttt{.rank()} which incorrectly ranks ordered categories (GH15420)
• Bug in \texttt{.corr()} and \texttt{.cov()} where the column and index were the same object (GH14617)
• Bug in \texttt{.mode()} where \texttt{mode} was not returned if it was only a single value (GH15714)
• Bug in \texttt{pd.cut()} with a single bin on an all 0s array (GH15428)
• Bug in \texttt{pd.qcut()} with a single quantile and an array with identical values (GH15431)
• Bug in \texttt{pandas.tools.utils.cartesian_product()} with large input can cause overflow on windows (GH15265)
• Bug in \texttt{.eval()} which caused multi-line evals to fail with local variables not on the first line (GH15342)

Other

• Compat with SciPy 0.19.0 for testing on \texttt{.interpolate()} (GH15662)
• Compat for 32-bit platforms for \texttt{.qcut/cut}; bins will now be \texttt{int64} dtype (GH14866)
• Bug in interactions with Qt when a \texttt{QtApplication} already exists (GH14372)
• Avoid use of \texttt{np.finfo()} during import \texttt{pandas} removed to mitigate deadlock on Python GIL misuse (GH14641)

5.10 Version 0.19

5.10.1 Version 0.19.2 (December 24, 2016)

This is a minor bug-fix release in the 0.19.x series and includes some small regression fixes, bug fixes and performance improvements. We recommend that all users upgrade to this version.

Highlights include:

• Compatibility with Python 3.6
• Added a Pandas Cheat Sheet. (GH13202).

What’s new in v0.19.2

• Enhancements
• Performance improvements
• Bug fixes
• Contributors

Enhancements

The pd.merge_asof(), added in 0.19.0, gained some improvements:

• pd.merge_asof() gained left_index/right_index and left_by/right_by arguments (GH14253)
• pd.merge_asof() can take multiple columns in by parameter and has specialized dtypes for better performance (GH13936)
Performance improvements

- Performance regression with PeriodIndex (GH14822)
- Performance regression in indexing with getitem (GH14930)
- Improved performance of .replace() (GH12745)
- Improved performance Series creation with a datetime index and dictionary data (GH14894)

Bug fixes

- Compat with python 3.6 for pickling of some offsets (GH14685)
- Compat with python 3.6 for some indexing exception types (GH14684, GH14689)
- Compat with python 3.6 for deprecation warnings in the test suite (GH14681)
- Compat with python 3.6 for Timestamp pickles (GH14689)
- Compat with dateutil==2.6.0; segfault reported in the testing suite (GH14621)
- Allow nanosecond in Timestamp.replace as a kwarg (GH14621)
- Bug in pd.read_csv in which aliasing was being done for na_values when passed in as a dictionary (GH14203)
- Bug in pd.read_csv in which column indices for a dict-like na_values were not being respected (GH14203)
- Bug in pd.read_csv where reading files fails, if the number of headers is equal to the number of lines in the file (GH14515)
- Bug in pd.read_csv for the Python engine in which an unhelpful error message was being raised when multi-char delimiters were not being respected with quotes (GH14582)
- Fix bugs (GH14734, GH13654) in pd.read_sas and pandas.io.sas.sas7bdat.SAS7BDATReader that caused problems when reading a SAS file incrementally.
- Bug in pd.read_csv for the Python engine in which an unhelpful error message was being raised when skipfooter was not being respected by Python’s CSV library (GH13879)
- Bug in .fillna() in which timezone aware datetime64 values were incorrectly rounded (GH14872)
- Bug in .groupby(...) sort=True) of a non-lexsorted MultiIndex when grouping with multiple levels (GH14776)
- Bug in pd.cut with negative values and a single bin (GH14652)
- Bug in pd.to_numeric where a 0 was not unsigned on a downcast='unsigned' argument (GH14401)
- Bug in plotting regular and irregular timeseries using shared axes (sharex=True or ax.twinx()) (GH13341, GH14322).
- Bug in not propagating exceptions in parsing invalid datetimes, noted in python 3.6 (GH14561)
- Bug in resampling a DatetimeIndex in local TZ, covering a DST change, which would raise AmbiguousTimeError (GH14682)
- Bug in indexing that transformed RecursionError into KeyError or IndexError (GH14554)
- Bug in HDFStore when writing a MultiIndex when using data_columns=True (GH14435)
- Bug in HDFStore.append() when writing a Series and passing a min_itemsize argument containing a value for the index (GH1412)
• Bug when writing to a HDFStore in table format with a min_itemsize value for the index and without asking to append (GH10381)

• Bug in Series.groupby.nunique() raising an IndexError for an empty Series (GH12553)

• Bug in DataFrame.nlargest and DataFrame.nsmallest when the index had duplicate values (GH13412)

• Bug in clipboard functions on linux with python2 with unicode and separators (GH13747)

• Bug in clipboard functions on Windows 10 and python 3 (GH14362, GH12807)

• Bug in .to_clipboard() and Excel compat (GH12529)

• Bug in DataFrame.combine_first() for integer columns (GH14687).

• Bug in pd.read_csv() in which the dtype parameter was not being respected for empty data (GH14712)

• Bug in pd.read_csv() in which the nrows parameter was not being respected for large input when using the C engine for parsing (GH7626)

• Bug in pd.merge_asof() could not handle timezone-aware DatetimeIndex when a tolerance was specified (GH14844)

• Explicit check in to_stata and StataWriter for out-of-range values when writing doubles (GH14618)

• Bug in .plot(kind='kde') which did not drop missing values to generate the KDE Plot, instead generating an empty plot. (GH14821)

• Bug in unstack() if called with a list of column(s) as an argument, regardless of the dtypes of all columns, they get coerced to object (GH11847)

5.10.2 Version 0.19.1 (November 3, 2016)

This is a minor bug-fix release from 0.19.0 and includes some small regression fixes, bug fixes and performance improvements. We recommend that all users upgrade to this version.

What’s new in v0.19.1

- Performance improvements
- Bug fixes
- Contributors

Performance improvements

- Fixed performance regression in factorization of Period data (GH14338)
- Fixed performance regression in Series.asof(where) when where is a scalar (GH14461)
- Improved performance in DataFrame.asof(where) when where is a scalar (GH14461)
- Improved performance in .to_json() when lines=True (GH14408)
- Improved performance in certain types of loc indexing with a MultiIndex (GH1451).
Bug fixes

- Source installs from PyPI will now again work without cython installed, as in previous versions (GH14204)
- Compats with Cython 0.25 for building (GH14496)
- Fixed regression where user-provided file handles were closed in read_csv (c engine) (GH14418).
- Fixed regression in DataFrame.quantile when missing values were present in some columns (GH14357).
- Fixed regression in Index.difference where the freq of a DatetimeIndex was incorrectly set (GH14323)
- Added back pandas.core.common.array_equivalent with a deprecation warning (GH14555).
- Bug in pd.read_csv for the C engine in which quotation marks were improperly parsed in skipped rows (GH14459)
- Bug in pd.read_csv for Python 2.x in which Unicode quote characters were no longer being respected (GH14477)
- Fixed regression in Index.append when categorical indices were appended (GH14545).
- Fixed regression in pd.DataFrame where constructor fails when given dict with None value (GH14381)
- Fixed regression in DatetimeIndex._maybe_cast_slice_bound when index is empty (GH14354).
- Bug in localizing an ambiguous timezone when a boolean is passed (GH14402)
- Bug in TimedeltaIndex addition with a Datetime-like object where addition overflow in the negative direction was not being caught (GH14068, GH14453)
- Bug in string indexing against data with object index may raise AttributeError (GH14424)
- Correctly raise ValueError on empty input to pd.eval() and df.query() (GH13139)
- Bug in RangeIndex.intersection when result is an empty set (GH14364).
- Bug in groupby-transform broadcasting that could cause incorrect dtype coercion (GH14457)
- Bug in Series.__setitem__ which allowed mutating read-only arrays (GH14359).
- Bug in DataFrame.insert where multiple calls with duplicate columns can fail (GH14291)
- pd.merge() will raise ValueError with non-boolean parameters in passed boolean type arguments (GH1434)
- Bug in Timestamp where dates very near the minimum (1677-09) could underflow on creation (GH14415)
- Bug in pd.concat where names of the keys were not propagated to the resulting MultiIndex (GH14252)
- Bug in pd.concat where axis cannot take string parameters 'rows' or 'columns' (GH14369)
- Bug in pd.concat with dataframes heterogeneous in length and tuple keys (GH14438)
- Bug in MultiIndex.set_levels where illegal level values were still set after raising an error (GH13754)
- Bug in DataFrame.to_json where lines=True and a value contained a } character (GH14391)
- Bug in df.groupby causing an AttributeError when grouping a single index frame by a column and the index level (GH14327)
- Bug in df.groupby where TypeError raised when pd.Grouper(key=...) is passed in a list (GH14334)
- Bug in pd.pivot_table may raise TypeError or ValueError when index or columns is not scalar and values is not specified (GH14380)

5.10.3 Version 0.19.0 (October 2, 2016)

This is a major release from 0.18.1 and includes number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

Highlights include:

- `merge_asof()` for asof-style time-series joining, see [here](#).
- `.rolling()` is now time-series aware, see [here](#).
- `read_csv()` now supports parsing Categorical data, see [here](#).
- A function `union_categorical()` has been added for combining categoricals, see [here](#).
- `PeriodIndex` now has its own `period` dtype, and changed to be more consistent with other `Index` classes. See [here](#).
- Sparse data structures gained enhanced support of `int` and `bool` dtypes, see [here](#).
- Comparison operations with `Series` no longer ignores the index, see [here](#) for an overview of the API changes.
- Introduction of a pandas development API for utility functions, see [here](#).
- Deprecation of `Panel4D` and `PanelND`. We recommend to represent these types of n-dimensional data with the `xarray` package.
- Removal of the previously deprecated modules `pandas.io.data`, `pandas.io.wb`, `pandas.tools.rplot`.

**Warning:** pandas >= 0.19.0 will no longer silence numpy ufunc warnings upon import, see [here](#).

### What’s new in v0.19.0

- **New features**
  - Function `merge_asof` for asof-style time-series joining
  - Method `.rolling()` is now time-series aware
  - Method `read_csv` has improved support for duplicate column names
  - Method `read_csv` supports parsing Categorical directly
  - Categorical concatenation
  - Semi-month offsets
  - New Index methods
  - Google BigQuery enhancements
  - Fine-grained NumPy errstate
  - Method `get_dummies` now returns integer dtypes
  - Downcast values to smallest possible dtype in `to_numeric`
  - pandas development API
  - Other enhancements

### API changes
Series.tolist() will now return Python types

Series operators for different indexes

* Arithmetic operators
* Comparison operators
* Logical operators
* Flexible comparison methods

Series type promotion on assignment

Function .to_datetime() changes

Merging changes

Method .describe() changes

Period changes

* The PeriodIndex now has period dtype
* Period('NaT') now returns pd.NaT
* PeriodIndex.values now returns array of Period object

Index + / – no longer used for set operations

Index.difference and .symmetric_difference changes

Index.unique consistently returns Index

MultiIndex constructors, groupby and set_index preserve categorical dtypes

Function read_csv will progressively enumerate chunks

Sparse changes

* Types int64 and bool support enhancements
* Operators now preserve dtypes
* Other sparse fixes

Indexer dtype changes

Other API changes

• Deprecations
* Removal of prior version deprecations/changes
* Performance improvements
* Bug fixes
* Contributors
New features

Function `merge_asof` for asof-style time-series joining

A long-time requested feature has been added through the `merge_asof()` function, to support asof style joining of time-series (GH1870, GH13695, GH13709, GH13902). Full documentation is [here](#).

The `merge_asof()` performs an asof merge, which is similar to a left-join except that we match on nearest key rather than equal keys.

```python
In [1]: left = pd.DataFrame({"a": [1, 5, 10], "left_val": ["a", "b", "c"]})
In [2]: right = pd.DataFrame({"a": [1, 2, 3, 6, 7], "right_val": [1, 2, 3, 6, 7]})
In [3]: left
Out[3]:
a  left_val
0  1     a
1  5     b
2 10     c
[3 rows x 2 columns]
In [4]: right
Out[4]:
a  right_val
0  1     1
1  2     2
2  3     3
3  6     6
4  7     7
[5 rows x 2 columns]
```

We typically want to match exactly when possible, and use the most recent value otherwise.

```python
In [5]: pd.merge_asof(left, right, on="a")
Out[5]:
a  left_val   right_val
0  1     a     1
1  5     b     3
2 10     c     7
[3 rows x 3 columns]
```

We can also match rows ONLY with prior data, and not an exact match.

```python
In [6]: pd.merge_asof(left, right, on="a", allow_exact_matches=False)
Out[6]:
a  left_val   right_val
0  1     a    NaN
1  5     b   3.0
2 10     c   7.0
[3 rows x 3 columns]
```

In a typical time-series example, we have trades and quotes and we want to asof-join them. This also illustrates using the `by` parameter to group data before merging.
In [7]: trades = pd.DataFrame(
    ...:     {
    ...:         "time": pd.to_datetime(
    ...:             ["20160525 13:30:00.023",
    ...:             "20160525 13:30:00.038",
    ...:             "20160525 13:30:00.048",
    ...:             "20160525 13:30:00.048",
    ...:             "20160525 13:30:00.048",
    ...:             "20160525 13:30:00.048",
    ...:         ]
    ...:     ),
    ...:     "ticker": ["MSFT", "MSFT", "GOOG", "GOOG", "AAPL"],
    ...:     "price": [51.95, 51.95, 720.77, 720.92, 98.00],
    ...:     "quantity": [75, 155, 100, 100, 100],
    ...:     },
    ...:     columns=["time", "ticker", "price", "quantity"],
    ...: )

In [8]: quotes = pd.DataFrame(
    ...:     {
    ...:         "time": pd.to_datetime(
    ...:             ["20160525 13:30:00.023",
    ...:             "20160525 13:30:00.023",
    ...:             "20160525 13:30:00.030",
    ...:             "20160525 13:30:00.041",
    ...:             "20160525 13:30:00.048",
    ...:             "20160525 13:30:00.049",
    ...:             "20160525 13:30:00.072",
    ...:             "20160525 13:30:00.075",
    ...:             "20160525 13:30:00.076",
    ...:         ]
    ...:     ),
    ...:     "ticker": ["GOOG", "MSFT", "MSFT", "MSFT", "GOOG", "AAPL", "GOOG",
    ...:             "MSFT"],
    ...:     "bid": [720.50, 51.95, 51.97, 51.99, 720.50, 97.99, 720.50, 52.01],
    ...:     "ask": [720.93, 51.96, 51.98, 52.00, 720.93, 98.01, 720.88, 52.03],
    ...:     },
    ...:     columns=["time", "ticker", "bid", "ask"],
    ...: )

In [9]: trades
Out[9]:
    time  ticker  price  quantity
0 05-25  13:30:00.023 MSFT  51.95    75
1 05-25  13:30:00.038 MSFT  51.95   155
2 05-25  13:30:00.048 GOOG  720.77   100
3 05-25  13:30:00.048 GOOG  720.92   100
4 05-25  13:30:00.048 AAPL  98.00   100

[5 rows x 4 columns]

In [10]: quotes
Out[10]:
    time  ticker  bid  ask
0 05-25  13:30:00.023 GOOG  720.50  720.93
An asof merge joins on the `on`, typically a datetimelike field, which is ordered, and in this case we are using a grouper in the `by` field. This is like a left-outer join, except that forward filling happens automatically taking the most recent non-NaN value.

```py
In [11]: pd.merge_asof(trades, quotes, on="time", by="ticker")
```

```
Out[11]:
       time  ticker  price  quantity  bid  ask
0 2016-05-25 13:30:00.023  MSFT  51.95       75  51.95  51.96
1 2016-05-25 13:30:00.038  MSFT  51.95      155  51.97  51.98
2 2016-05-25 13:30:00.048  GOOG  720.77     100  720.50  720.93
3 2016-05-25 13:30:00.048  GOOG  720.92     100  720.50  720.93
4 2016-05-25 13:30:00.048  AAPL  98.00     100    NaN   NaN
```

This returns a merged DataFrame with the entries in the same order as the original left passed DataFrame (`trades` in this case), with the fields of the `quotes` merged.

**Method `.rolling()` is now time-series aware**

`.rolling()` objects are now time-series aware and can accept a time-series offset (or convertible) for the `window` argument (GH13327, GH12995). See the full documentation [here](#).  

```py
In [12]: dft = pd.DataFrame(
        ...
        {"B": [0, 1, 2, np.nan, 4]},
        ...
        index=pd.date_range("20130101 09:00:00", periods=5, freq="s"),
        ...
    )
```

```py
In [13]: dft
```

```
Out[13]:
     B
2013-01-01 09:00:00  0.0
2013-01-01 09:00:01  1.0
2013-01-01 09:00:02  2.0
2013-01-01 09:00:03  NaN
2013-01-01 09:00:04  4.0
```

This is a regular frequency index. Using an integer window parameter works to roll along the window frequency.

```py
In [14]: dft.rolling(2).sum()
```

```
Out[14]:
     B
2013-01-01 09:00:00  0.0
2013-01-01 09:00:01  1.0
2013-01-01 09:00:02  3.0
2013-01-01 09:00:03  NaN
2013-01-01 09:00:04  4.0
```
Specifying an offset allows a more intuitive specification of the rolling frequency.

```
In [16]: dft.rolling("2s").sum()
Out[16]:
   B
2013-01-01 09:00:00  0.0
2013-01-01 09:00:01  1.0
2013-01-01 09:00:02  3.0
2013-01-01 09:00:03  2.0
2013-01-01 09:00:04  4.0
```

Using a non-regular, but still monotonic index, rolling with an integer window does not impart any special calculation.

```
In [17]: dft = pd.DataFrame(
   ...:     {"B": [0, 1, 2, np.nan, 4]},
   ...:     index=pd.Index(
   ...:         [pd.Timestamp("20130101 09:00:00"),
   ...:          pd.Timestamp("20130101 09:00:02"),
   ...:          pd.Timestamp("20130101 09:00:03"),
   ...:          pd.Timestamp("20130101 09:00:05"),
   ...:          pd.Timestamp("20130101 09:00:06"),
   ...:        ],
   ...:     name="foo",
   ...:     ),
   ...: )
   ...

In [18]: dft
Out[18]:
   B
foo
2013-01-01 09:00:00  0.0
2013-01-01 09:00:02  1.0
2013-01-01 09:00:03  2.0
2013-01-01 09:00:05  NaN
```
Using the time-specification generates variable windows for this sparse data.

```python
In [20]: dft.rolling("2s").sum()
Out[20]:
   foo
0 2013-01-01 09:00:00     0.0
  2013-01-01 09:00:02     1.0
  2013-01-01 09:00:03     3.0
  2013-01-01 09:00:05  NaN
  2013-01-01 09:00:06     4.0
[5 rows x 1 columns]
```

Furthermore, we now allow an optional `on` parameter to specify a column (rather than the default of the index) in a DataFrame.

```python
In [21]: dft = dft.reset_index()

In [22]: dft
Out[22]:
   foo  B
0 2013-01-01 09:00:00  0.0
1 2013-01-01 09:00:02  1.0
2 2013-01-01 09:00:03  2.0
3 2013-01-01 09:00:05  NaN
4 2013-01-01 09:00:06  4.0
[5 rows x 2 columns]

In [23]: dft.rolling("2s", on="foo").sum()
Out[23]:
   foo  B
0 2013-01-01 09:00:00  0.0
1 2013-01-01 09:00:02  1.0
2 2013-01-01 09:00:03  3.0
3 2013-01-01 09:00:05  NaN
4 2013-01-01 09:00:06  4.0
[5 rows x 2 columns]
```
Method `read_csv` has improved support for duplicate column names

Duplicate column names are now supported in `read_csv()` whether they are in the file or passed in as the `names` parameter (GH7160, GH9424)

```python
In [24]: data = "0,1,2\n3,4,5"
In [25]: names = ["a", "b", "a"]
```

Previous behavior:

```python
In [2]: pd.read_csv(StringIO(data), names=names)
Out[2]:
a b a
  0 2 1 2
  1 5 4 5
```
The first `a` column contained the same data as the second `a` column, when it should have contained the values `[0, 3]`.

New behavior:

```python
In [26]: pd.read_csv(StringIO(data), names=names)
---------------------------------------------------------------------------
ValueError                                 Traceback (most recent call last)
<ipython-input-26-a095135d9435> in <module>
----> 1 pd.read_csv(StringIO(data), names=names)
/pandas/pandas/io/parsers.py in read_csv(filepath_or_buffer, sep, delimiter, header, ...
    608     kwds.update(kwds Defaults)
    609     return _read(filepath_or_buffer, kwds)
--> 610     return _read(filepath_or_buffer, kwds)
/pandas/pandas/io/parsers.py in _read(filepath_or_buffer, kwds)
    457 # Check for duplicates in names.
---> 459     _validate_names(kwds.get("names", None))
    460     # Create the parser.
    461     # Create the parser.
/pandas/pandas/io/parsers.py in _validate_names(names)
    438     if names is not None:
    439         if len(names) != len(set(names)):
---> 440             raise ValueError("Duplicate names are not allowed.")
    441         if not (is_list_like(names, allow_sets=False) or isinstance(names, abc.
    442     # KeysView)
```

(continues on next page)
ValueError: Duplicate names are not allowed.

**Method read_csv supports parsing Categorical directly**

The `read_csv()` function now supports parsing a `Categorical` column when specified as a dtype (GH10153). Depending on the structure of the data, this can result in a faster parse time and lower memory usage compared to converting to `Categorical` after parsing. See the io docs here.

In [27]: data = ""
       ....: col1,col2,col3
       ....: a,b,1
       ....: a,b,2
       ....: c,d,3
       ....: ***
       ....:

In [28]: pd.read_csv(StringIO(data))
Out[28]:
       col1  col2  col3
       0    a    b    1
       1    a    b    2
       2    c    d    3
[3 rows x 3 columns]

In [29]: pd.read_csv(StringIO(data)).dtypes
Out[29]:
       col1   object
       col2   object
       col3   int64
       Length: 3, dtype: object

In [30]: pd.read_csv(StringIO(data), dtype="category").dtypes
Out[30]:
       col1   category
       col2   object
       col3   category
       Length: 3, dtype: object

Individual columns can be parsed as a `Categorical` using a dict specification

In [31]: pd.read_csv(StringIO(data), dtype="category").dtypes
Out[31]:
       col1   category
       col2   object
       col3   int64
       Length: 3, dtype: object

Note: The resulting categories will always be parsed as strings (object dtype). If the categories are numeric they can be converted using the `to_numeric()` function, or as appropriate, another converter such as `to_datetime()`.

In [32]: df = pd.read_csv(StringIO(data), dtype="category")
Categorical concatenation

```python
In [37]: from pandas.api.types import union_categoricals

In [38]: a = pd.Categorical(['b', 'c'])

In [39]: b = pd.Categorical(['a', 'b'])

In [40]: union_categoricals([a, b])
Out[40]:
['b', 'c', 'a', 'b']
Categories (3, object): ['b', 'c', 'a']
```

- `concat` and `append` now can concat category dtypes with different categories as `object` dtype (GH13524)

```python
In [41]: s1 = pd.Series(['a', 'b'], dtype='category')

In [42]: s2 = pd.Series(['b', 'c'], dtype='category')
```

Previous behavior:

```python
In [1]: pd.concat([s1, s2])
ValueError: incompatible categories in categorical concat
```

New behavior:
In [43]: pd.concat([s1, s2])
Out[43]:
       0  a
       1  b
       0  b
       1  c
Length: 4, dtype: object

Semi-month offsets

pandas has gained new frequency offsets, SemiMonthEnd (‘SM’) and SemiMonthBegin (‘SMS’). These provide date offsets anchored (by default) to the 15th and end of month, and 15th and 1st of month respectively. (GH1543)

In [44]: from pandas.tseries.offsets import SemiMonthEnd, SemiMonthBegin
SemiMonthEnd:

In [45]: pd.Timestamp("2016-01-01") + SemiMonthEnd()
Out[45]: Timestamp('2016-01-15 00:00:00')
In [46]: pd.date_range("2015-01-01", freq="SM", periods=4)
     dtype='datetime64[ns]', freq='SM-15')

SemiMonthBegin:

In [47]: pd.Timestamp("2016-01-01") + SemiMonthBegin()
Out[47]: Timestamp('2016-01-15 00:00:00')
In [48]: pd.date_range("2015-01-01", freq="SMS", periods=4)
     dtype='datetime64[ns]', freq='SMS-15')

Using the anchoring suffix, you can also specify the day of month to use instead of the 15th.

In [49]: pd.date_range("2015-01-01", freq="SMS-16", periods=4)
Out[49]: DatetimeIndex(['2015-01-01', '2015-01-16', '2015-02-01', '2015-02-16'],
     dtype='datetime64[ns]', freq='SMS-16')
In [50]: pd.date_range("2015-01-01", freq="SM-14", periods=4)
     dtype='datetime64[ns]', freq='SM-14')

New Index methods

The following methods and options are added to Index, to be more consistent with the Series and DataFrame API.

Index now supports the .where() function for same shape indexing (GH13170)

In [51]: idx = pd.Index(['a', 'b', 'c'])
In [52]: idx.where([True, False, True])
Out[52]: Index(['a', 'nan', 'c'], dtype='object')
Index now supports `.dropna()` to exclude missing values (GH6194)

```python
In [53]: idx = pd.Index([1, 2, np.nan, 4])
In [54]: idx.dropna()
Out[54]: Float64Index([1.0, 2.0, 4.0], dtype='float64')
```

For MultiIndex, values are dropped if any level is missing by default. Specifying `how='all'` only drops values where all levels are missing.

```python
In [55]: midx = pd.MultiIndex.from_arrays([[1, 2, np.nan, 4], [1, 2, np.nan, np.nan]])
In [56]: midx
Out[56]: MultiIndex([(1.0, 1.0),
                    (2.0, 2.0),
                    (nan, nan),
                    (4.0, nan)],
                   )
In [57]: midx.dropna()
Out[57]: MultiIndex([(1, 1),
                    (2, 2)],
                   )
In [58]: midx.dropna(how="all")
Out[58]: MultiIndex([(1, 1.0),
                    (2, 2.0),
                    (4, nan)],
                   )
```

Index now supports `.str.extractall()` which returns a DataFrame, see the docs here (GH10008, GH13156)

```python
In [59]: idx = pd.Index(["a1a2", "b1", "c1"])
In [60]: idx.str.extractall(r"[ab]?P<digit>\d")
Out[60]:
    digit
0   0
1   2
1   1
[3 rows x 1 columns]
```

Index.astype() now accepts an optional boolean argument `copy`, which allows optional copying if the requirements on `dtype` are satisfied (GH13209)
Google BigQuery enhancements

- The `read_gbq()` method has gained the `dialect` argument to allow users to specify whether to use BigQuery’s legacy SQL or BigQuery’s standard SQL. See the docs for more details (GH13615).
- The `to_gbq()` method now allows the DataFrame column order to differ from the destination table schema (GH11359).

Fine-grained NumPy errstate

Previous versions of pandas would permanently silence numpy’s `ufunc` error handling when `pandas` was imported. pandas did this in order to silence the warnings that would arise from using numpy `ufuncs` on missing data, which are usually represented as `NaN`s. Unfortunately, this silenced legitimate warnings arising in non-pandas code in the application. Starting with 0.19.0, pandas will use the `numpy.errstate` context manager to silence these warnings in a more fine-grained manner, only around where these operations are actually used in the pandas code base. (GH13109, GH13145)

After upgrading pandas, you may see new `RuntimeWarnings` being issued from your code. These are likely legitimate, and the underlying cause likely existed in the code when using previous versions of pandas that simply silenced the warning. Use `numpy.errstate` around the source of the `RuntimeWarning` to control how these conditions are handled.

Method `get_dummies` now returns integer dtypes

The `pd.get_dummies` function now returns dummy-encoded columns as small integers, rather than floats (GH8725). This should provide an improved memory footprint.

Previous behavior:

```python
In [1]: pd.get_dummies(['a', 'b', 'a', 'c']).dtypes
Out[1]:
a   float64
b   float64
c   float64
dtype: object
```

New behavior:

```python
In [61]: pd.get_dummies(['a', 'b', 'a', 'c']).dtypes
Out[61]:
a   uint8
b   uint8
c   uint8
Length: 3, dtype: object
```
**Downcast values to smallest possible dtype in to_numeric**

`pd.to_numeric()` now accepts a `downcast` parameter, which will downcast the data if possible to smallest specified numerical dtype (GH13352)

```python
In [62]: s = ["1", 2, 3]
In [63]: pd.to_numeric(s, downcast="unsigned")
Out[63]: array([1, 2, 3], dtype=uint8)
In [64]: pd.to_numeric(s, downcast="integer")
Out[64]: array([1, 2, 3], dtype=int8)
```

**pandas development API**

As part of making pandas API more uniform and accessible in the future, we have created a standard sub-package of pandas, `pandas.api` to hold public API’s. We are starting by exposing type introspection functions in `pandas.api.types`. More sub-packages and officially sanctioned API’s will be published in future versions of pandas (GH13147, GH13634)

The following are now part of this API:

```python
In [65]: import pprint
In [66]: from pandas.api import types
In [67]: funcs = [f for f in dir(types) if not f.startswith("_")]
In [68]: pprint.pprint(funcs)
['CategoricalDtype', 'DatetimeTZDtype', 'IntervalDtype', 'PeriodDtype', 'infer_dtype', 'is_array_like', 'is_bool', 'is_bool_dtype', 'is_categorical', 'is_categorical_dtype', 'is_complex', 'is_complex_dtype', 'is_datetime64_any_dtype', 'is_datetime64_dtype', 'is_datetime64_ns_dtype', 'is_datetime64tz_dtype', 'is_dict_like', 'is_dtype_equal', 'is_extension_array_dtype', 'is_extension_type', 'is_file_like', 'is_float', 'is_float_dtype', 'is_hashable', 'is_int64_dtype', 'is_integer', 'is_integer_dtype',
```

(continues on next page)
Note: Calling these functions from the internal module pandas.core.common will now show a DeprecationWarning (GH13990)

Other enhancements

- Timestamp can now accept positional and keyword parameters similar to datetime.datetime() (GH10758, GH11630)

```python
In [69]: pd.Timestamp(2012, 1, 1)
Out [69]: Timestamp('2012-01-01 00:00:00')

In [70]: pd.Timestamp(year=2012, month=1, day=1, hour=8, minute=30)
Out [70]: Timestamp('2012-01-01 08:30:00')
```

- The .resample() function now accepts a on= or level= parameter for resampling on a datetimelike column or MultiIndex level (GH13500)

```python
In [71]: df = pd.DataFrame(
        ...:     {"date": pd.date_range("2015-01-01", freq="W", periods=5), "a": np.
        ...:         arange(5)},
        ...:     index=pd.MultiIndex.from_arrays(
        ...:         [[1, 2, 3, 4, 5], pd.date_range("2015-01-01", freq="W",
        ...:         periods=5)],
        ...:         names=["v", "d"],
        ...:         ),
        ...:     )

In [72]: df
Out [72]:
    date   a
    v  d
```

(continues on next page)
In [73]: df.resample("M", on="date").sum()
Out[73]:
a
date
2015-01-31  6
2015-02-28  4

[2 rows x 1 columns]

In [74]: df.resample("M", level="d").sum()
Out[74]:
a
d
2015-01-31  6
2015-02-28  4

[2 rows x 1 columns]

- The `.get_credentials()` method of GbqConnector can now first try to fetch the application default credentials. See the docs for more details (GH13577).

- The `.tz_localize()` method of DatetimeIndex and Timestamp has gained the errors keyword, so you can potentially coerce nonexistent timestamps to NaT. The default behavior remains to raising a NonExistentTimeError (GH13057)

- `.to_hdf/read_hdf()` now accept path objects (e.g. `pathlib.Path`, `py.path.local`) for the file path (GH11773)

- The `pd.read_csv()` with engine='python' has gained support for the decimal (GH12933), na_filter (GH13321) and the memory_map option (GH13381).

- Consistent with the Python API, `pd.read_csv()` will now interpret +inf as positive infinity (GH13274)

- The `pd.read_html()` has gained support for the na_values, converters, keep_default_na options (GH13461)

- Categorical.astype() now accepts an optional boolean argument copy, effective when dtype is categorical (GH13209)

- DataFrame has gained the .asof() method to return the last non-NaN values according to the selected subset (GH13358)

- The DataFrame constructor will now respect key ordering if a list of OrderedDict objects are passed in (GH13304)

- `pd.read_html()` has gained support for the decimal option (GH12907)

- Series has gained the properties .is_monotonic, .is_monotonic_increasing, .is_monotonic_decreasing, similar to Index (GH13336)

- DataFrame.to_sql() now allows a single value as the SQL type for all columns (GH11886).

- Series.append now supports the ignore_index option (GH13677)
**.to_stata()** and **StataWriter** can now write variable labels to Stata dta files using a dictionary to make column names to labels (GH13535, GH13536)

**.to_stata()** and **StataWriter** will automatically convert **datetime64[ns]** columns to Stata format %tc, rather than raising a **ValueError** (GH12259)

**read_stata()** and **StataReader** raise with a more explicit error message when reading Stata files with repeated value labels when **convert_categoricals=True** (GH13923)

**DataFrame.style** will now render sparsified MultiIndexes (GH11655)

**DataFrame.style** will now show column level names (e.g. **DataFrame.columns.names**) (GH13775)

**DataFrame** has gained support to re-order the columns based on the values in a row using **df.sort_values(by='...', axis=1)** (GH10806)

```python
In [75]: df = pd.DataFrame({"A": [2, 7], "B": [3, 5], "C": [4, 8]}, index=["row1", "row2"])
In [76]: df
Out[76]:
   A  B  C
row1 2  3  4
row2 7  5  8
[2 rows x 3 columns]
In [77]: df.sort_values(by="row2", axis=1)
Out[77]:
   B  A  C
row1 3  2  4
row2 5  7  8
[2 rows x 3 columns]
```

**Added documentation to I/O** regarding the perils of reading in columns with mixed dtypes and how to handle it (GH13746)

**to_html()** now has a **border** argument to control the value in the opening **<table>** tag. The default is the value of the **html.border** option, which defaults to 1. This also affects the notebook HTML repr, but since Jupyter’s CSS includes a border-width attribute, the visual effect is the same. (GH11563).

**Raise ImportError** in the sql functions when **sqlalchemy** is not installed and a connection string is used (GH11920).

**Compatibility with matplotlib 2.0.** Older versions of pandas should also work with matplotlib 2.0 (GH13333)

**Timestamp, Period, DatetimeIndex, PeriodIndex** and **.dt** accessor have gained a .is_leap_year property to check whether the date belongs to a leap year. (GH13727)

**astype()** will now accept a dict of column name to data types mapping as the **dtype** argument. (GH12086)

**The pd.read_json and DataFrame.to_json** has gained support for reading and writing json lines with **lines** option see **Line delimited json** (GH9180)

**read_excel()** now supports the **true_values** and **false_values** keyword arguments (GH13347)

**groupby()** will now accept a scalar and a single-element list for specifying **level** on a non-MultiIndex grouper. (GH13907)

**Non-convertible dates in an excel date column will be returned without conversion and the column will be object dtype, rather than raising an exception (GH10001).**
• `pd.Timedelta(None)` is now accepted and will return `NaT`, mirroring `pd.Timestamp` (GH13687)

• `pd.read_stata()` can now handle some format 111 files, which are produced by SAS when generating Stata `.dta` files (GH11526)

• `Series` and `Index` now support `divmod` which will return a tuple of series or indices. This behaves like a standard binary operator with regards to broadcasting rules (GH14208).

**API changes**

**Series.tolist() will now return Python types**

`Series.tolist()` will now return Python types in the output, mimicking NumPy `.tolist()` behavior (GH10904)

```
In [78]: s = pd.Series([1, 2, 3])
```

Previous behavior:

```
In [7]: type(s.tolist()[0])
Out[7]:
<class 'numpy.int64'>
```

New behavior:

```
In [79]: type(s.tolist()[0])
Out[79]: int
```

**Series operators for different indexes**

Following `Series` operators have been changed to make all operators consistent, including `DataFrame` (GH1134, GH4581, GH13538)

• `Series` comparison operators now raise `ValueError` when `index` are different.

• `Series` logical operators align both `index` of left and right hand side.

**Warning:** Until 0.18.1, comparing `Series` with the same length, would succeed even if the `.index` are different (the result ignores `.index`). As of 0.19.0, this will raises `ValueError` to be more strict. This section also describes how to keep previous behavior or align different indexes, using the flexible comparison methods like `.eq`.

As a result, `Series` and `DataFrame` operators behave as below:
Arithmetic operators

Arithmetic operators align both index (no changes).

```python
In [80]: s1 = pd.Series([1, 2, 3], index=list("ABC"))
In [81]: s2 = pd.Series([2, 2, 2], index=list("ABD"))
In [82]: s1 + s2
Out[82]:
A   3.0
B   4.0
C  NaN
D  NaN
Length: 4, dtype: float64
```

```python
In [83]: df1 = pd.DataFrame([1, 2, 3], index=list("ABC"))
In [84]: df2 = pd.DataFrame([2, 2, 2], index=list("ABD"))
In [85]: df1 + df2
Out[85]:
      0
A   3.0
B   4.0
C  NaN
D  NaN
[4 rows x 1 columns]
```

Comparison operators

Comparison operators raise `ValueError` when `.index` are different.

**Previous behavior** (Series):
Series compared values ignoring the `.index` as long as both had the same length:

```python
In [1]: s1 == s2
Out[1]:
A   False
B    True
C   False
dtype: bool
```

**New behavior** (Series):

```python
In [2]: s1 == s2
Out[2]:
ValueError: Can only compare identically-labeled Series objects
```

**Note:** To achieve the same result as previous versions (compare values based on locations ignoring `.index`), compare both `.values`.

```python
In [86]: s1.values == s2.values
Out[86]: array([False,  True, False])
```
If you want to compare Series aligning its `.index`, see flexible comparison methods section below:

<table>
<thead>
<tr>
<th>In [87]:</th>
<th>s1.eq(s2)</th>
</tr>
</thead>
</table>
| Out[87]: | A False 
|          | B True    
|          | C False   
|          | D False   

Length: 4, dtype: bool

**Current behavior** (DataFrame, no change):

<table>
<thead>
<tr>
<th>In [3]:</th>
<th>df1 == df2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Out[3]:</td>
<td>ValueError: Can only compare identically-labeled DataFrame objects</td>
</tr>
</tbody>
</table>

**Logical operators**

Logical operators align both `.index` of left and right hand side.

**Previous behavior** (Series), only left hand side `index` was kept:

<table>
<thead>
<tr>
<th>In [4]:</th>
<th>s1 = pd.Series([True, False, True], index=list('ABC'))</th>
</tr>
</thead>
<tbody>
<tr>
<td>In [5]:</td>
<td>s2 = pd.Series([True, True, True], index=list('ABD'))</td>
</tr>
<tr>
<td>In [6]:</td>
<td>s1 &amp; s2</td>
</tr>
</tbody>
</table>
| Out[6]: | A True 
|         | B False 
|         | C False 
|         | dtype: bool |

**New behavior** (Series):

<table>
<thead>
<tr>
<th>In [88]:</th>
<th>s1 = pd.Series([True, False, True], index=list('ABC'))</th>
</tr>
</thead>
<tbody>
<tr>
<td>In [89]:</td>
<td>s2 = pd.Series([True, True, True], index=list('ABD'))</td>
</tr>
<tr>
<td>In [90]:</td>
<td>s1 &amp; s2</td>
</tr>
</tbody>
</table>
| Out[90]: | A True 
|         | B False 
|         | C False 
|         | D False 
|         | Length: 4, dtype: bool |

**Note:** Series logical operators fill a NaN result with `False`.

**Note:** To achieve the same result as previous versions (compare values based on only left hand side index), you can use `reindex_like`:

<table>
<thead>
<tr>
<th>In [91]:</th>
<th>s1 &amp; s2.reindex_like(s1)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Out[91]:</td>
<td>(continues on next page)</td>
</tr>
</tbody>
</table>
A    True
B    False
C    False
Length: 3, dtype: bool

**Current behavior** (DataFrame, no change):

```
In [92]: df1 = pd.DataFrame([True, False, True], index=list("ABC"))
In [93]: df2 = pd.DataFrame([True, True, True], index=list("ABD"))
In [94]: df1 & df2
Out[94]:
   0
A   True
B   False
C   False
D   False
[4 rows x 1 columns]
```

**Flexible comparison methods**

Series flexible comparison methods like `eq`, `ne`, `le`, `lt`, `ge` and `gt` now align both `index`. Use these operators if you want to compare two `Series` which has the different `index`.

```
In [95]: s1 = pd.Series([1, 2, 3], index=["a", "b", "c"])
In [96]: s2 = pd.Series([2, 2, 2], index=["b", "c", "d"])
In [97]: s1.eq(s2)
Out[97]:
   a  False
   b   True
   c  False
d   False
Length: 4, dtype: bool

In [98]: s1.ge(s2)
Out[98]:
   a  False
   b   True
   c   True
d  False
Length: 4, dtype: bool
```

Previously, this worked the same as comparison operators (see above).
Series type promotion on assignment

A Series will now correctly promote its dtype for assignment with incompat values to the current dtype (GH13234)

```python
In [99]: s = pd.Series()
```

**Previous behavior:**

```python
In [2]: s["a"] = pd.Timestamp("2016-01-01")
In [3]: s["b"] = 3.0
TypeError: invalid type promotion
```

**New behavior:**

```python
In [100]: s["a"] = pd.Timestamp("2016-01-01")
In [101]: s["b"] = 3.0
In [102]: s
Out[102]:
a 2016-01-01 00:00:00
b 3.0
Length: 2, dtype: object
```

**Function .to_datetime() changes**

Previously if .to_datetime() encountered mixed integers/floats and strings, but no datetimes with errors='coerce' it would convert all to NaT.

**Previous behavior:**

```python
In [2]: pd.to_datetime([1, 'foo'], errors='coerce')
Out[2]: DatetimeIndex(['NaT', 'NaT'], dtype='datetime64[ns]', freq=None)
```

**Current behavior:**

This will now convert integers/floats with the default unit of ns.

```python
In [104]: pd.to_datetime([1, "foo"], errors="coerce")
Out[104]: DatetimeIndex(['1970-01-01 00:00:00.000000001', 'NaT'], dtype='datetime64[ns]', freq=None)
```

Bug fixes related to .to_datetime():

- Bug in pd.to_datetime() when passing integers or floats, and no unit and errors='coerce' (GH13180).
- Bug in pd.to_datetime() when passing invalid data types (e.g. bool); will now respect the errors keyword (GH13176)
- Bug in pd.to_datetime() which overflowed on int8, and int16 dtypes (GH13451)
- Bug in pd.to_datetime() raise AttributeError with NaN and the other string is not valid when errors='ignore' (GH12424)
• Bug in `pd.to_datetime()` did not cast floats correctly when `unit` was specified, resulting in truncated datetime (GH13834)

Merging changes

Merging will now preserve the dtype of the join keys (GH8596)

```
In [105]: df1 = pd.DataFrame({"key": [1], "v1": [10]})

In [106]: df1
Out[106]:
key  v1
0   1  10
[1 rows x 2 columns]

In [107]: df2 = pd.DataFrame({"key": [1, 2], "v1": [20, 30]})

In [108]: df2
Out[108]:
key  v1
0   1  20
1   2  30
[2 rows x 2 columns]
```

Previous behavior:

```
In [5]: pd.merge(df1, df2, how='outer')
Out[5]:
   key  v1
0 1.0 10.0
1 1.0 20.0
2 2.0 30.0

In [6]: pd.merge(df1, df2, how='outer').dtypes
Out[6]:
key  float64
v1   float64
dtype: object
```

New behavior:

We are able to preserve the join keys

```
In [109]: pd.merge(df1, df2, how="outer")
Out[109]:
   key  v1
0   1   10
1   1   20
2   2   30
[3 rows x 2 columns]

In [110]: pd.merge(df1, df2, how="outer").dtypes
Out[110]:
   key  int64
```

(continues on next page)
Of course if you have missing values that are introduced, then the resulting dtype will be upcast, which is unchanged from previous.

```python
In [111]: pd.merge(df1, df2, how="outer", on="key")
Out[111]:
   key  v1_x  v1_y
0    1   10.0  20
1    2    NaN  30
[2 rows x 3 columns]
```

```python
In [112]: pd.merge(df1, df2, how="outer", on="key").dtypes
Out[112]:
    key  int64
    v1_x float64
    v1_y  int64
Length: 3, dtype: object
```

### Method `.describe()` changes

Percentile identifiers in the index of a `.describe()` output will now be rounded to the least precision that keeps them distinct (GH13104)

```python
In [113]: s = pd.Series([0, 1, 2, 3, 4])
In [114]: df = pd.DataFrame([0, 1, 2, 3, 4])

Previous behavior:
The percentiles were rounded to at most one decimal place, which could raise `ValueError` for a data frame if the percentiles were duplicated.

```python
In [3]: s.describe(percentiles=[0.0001, 0.0005, 0.001, 0.999, 0.9995, 0.9999])
Out[3]:
count   5.000000
mean    2.000000
std     1.581139
min     0.000000
0.0%    0.000400
0.1%    0.002000
0.1%    0.004000
50%     2.000000
99.9%    3.996000
100.0%   3.998000
100.0%   3.999600
max     4.000000
dtype: float64
```

```python
In [4]: df.describe(percentiles=[0.0001, 0.0005, 0.001, 0.999, 0.9995, 0.9999])
Out[4]:
...
ValueError: cannot reindex from a duplicate axis
```
New behavior:

```python
In [115]: s.describe(percentiles=[0.0001, 0.0005, 0.001, 0.999, 0.9995, 0.9999])
Out[115]:
count   5.000000
mean    2.000000
std     1.581139
min     0.000000
0.01%   0.000400
0.05%   0.002000
0.1%    0.004000
50%     2.000000
99.9%   3.996000
99.95%  3.998000
99.99%  3.999600
max     4.000000
Length: 12, dtype: float64
```

```python
In [116]: df.describe(percentiles=[0.0001, 0.0005, 0.001, 0.999, 0.9995, 0.9999])
Out[116]:
  0
    count  5.000000
    mean  2.000000
    std   1.581139
    min   0.000000
   0.01%  0.000400
   0.05%  0.002000
   0.1%   0.004000
   50%    2.000000
  99.9%   3.996000
  99.95%  3.998000
  99.99%  3.999600
    max   4.000000
[12 rows x 1 columns]
```

Furthermore:

- Passing duplicated percentiles will now raise a `ValueError`.
- Bug in `describe()` on a DataFrame with a mixed-dtype column index, which would previously raise a `TypeError` (GH13288)

**Period changes**

The `PeriodIndex` now has period dtype

PeriodIndex now has its own period dtype. The period dtype is a pandas extension dtype like category or the `timezone aware dtype` (`datetime64[ns, tz]`) (GH13941). As a consequence of this change, `PeriodIndex` no longer has an integer dtype:

**Previous behavior:**

```python
In [1]: pi = pd.PeriodIndex(['2016-08-01'], freq='D')
In [2]: pi
Out[2]: PeriodIndex(['2016-08-01'], dtype='int64', freq='D')
```
In [3]: pd.api.types.is_integer_dtype(pi)
Out[3]: True

In [4]: pi.dtype
Out[4]: dtype('int64')

New behavior:

In [117]: pi = pd.PeriodIndex(['2016-08-01'], freq='D')
In [118]: pi
Out[118]: PeriodIndex(['2016-08-01'], dtype='period[D]', freq='D')

In [119]: pd.api.types.is_integer_dtype(pi)
Out[119]: False

In [120]: pd.api.types.is_period_dtype(pi)
Out[120]: True

In [121]: pi.dtype
Out[121]: period[D]

In [122]: type(pi.dtype)
Out[122]: pandas.core.dtypes.dtypes.PeriodDtype

`Period('NaT')` now returns `pd.NaT`

Previously, `Period` has its own `Period('NaT')` representation different from `pd.NaT`. Now `Period('NaT')` has been changed to return `pd.NaT`. (GH12759, GH13582)

Previous behavior:

In [5]: pd.Period('NaT', freq='D')
Out[5]: Period('NaT', 'D')

New behavior:

These result in `pd.NaT` without providing `freq` option.

In [123]: pd.Period("NaT")
Out[123]: NaT

In [124]: pd.Period(None)
Out[124]: NaT

To be compatible with `Period` addition and subtraction, `pd.NaT` now supports addition and subtraction with `int`. Previously it raised `ValueError`.

Previous behavior:

In [5]: pd.NaT + 1
... 
ValueError: Cannot add integral value to Timestamp without freq.

New behavior:
```python
In [125]: pd.NaT + 1
Out[125]: NaT

In [126]: pd.NaT - 1
Out[126]: NaT
```

**PeriodIndex.values now returns array of Period object**

`.values` is changed to return an array of `Period` objects, rather than an array of integers (GH13988).

**Previous behavior:**

```python
In [6]: pi = pd.PeriodIndex(['2011-01', '2011-02'], freq='M')
In [7]: pi.values
Out[7]: array([492, 493])
```

**New behavior:**

```python
In [127]: pi = pd.PeriodIndex(['2011-01', '2011-02'], freq='M')
In [128]: pi.values
Out[128]: array([Period('2011-01', 'M'), Period('2011-02', 'M')], dtype=object)
```

**Index + / – no longer used for set operations**

Addition and subtraction of the base Index type and of DatetimeIndex (not the numeric index types) previously performed set operations (set union and difference). This behavior was already deprecated since 0.15.0 (in favor using the specific `.union()` and `.difference()` methods), and is now disabled. When possible, + and – are now used for element-wise operations, for example for concatenating strings or subtracting datetimes (GH8227, GH14127).

**Previous behavior:**

```python
In [1]: pd.Index(['a', 'b']) + pd.Index(['a', 'c'])
FutureWarning: using '+' to provide set union with Indexes is deprecated, use '|' or .
               +union()
Out[1]: Index(['a', 'b', 'c'], dtype='object')
```

**New behavior:** the same operation will now perform element-wise addition:

```python
In [129]: pd.Index(['a', 'b']) + pd.Index(['a', 'c'])
Out[129]: Index(['aa', 'bc'], dtype='object')
```

Note that numeric Index objects already performed element-wise operations. For example, the behavior of adding two integer Indexes is unchanged. The base `Index` is now made consistent with this behavior.

```python
In [130]: pd.Index([1, 2, 3]) + pd.Index([2, 3, 4])
Out[130]: Int64Index([3, 5, 7], dtype='int64')
```

Further, because of this change, it is now possible to subtract two DatetimeIndex objects resulting in a TimedeltaIndex:

**Previous behavior:**
In [1]: (pd.DatetimeIndex(["2016-01-01", '2016-01-02']))
    ...: - pd.DatetimeIndex(['2016-01-02', '2016-01-03']))
FutureWarning: using '-' to provide set differences with datetimelike Indexes is deprecated, use .difference()
Out[1]: DatetimeIndex(['2016-01-01'], dtype='datetime64[ns]', freq=None)

New behavior:
In [131]: (  
    .....:     pd.DatetimeIndex(["2016-01-01", "2016-01-02"])  
    .....:     - pd.DatetimeIndex(["2016-01-02", "2016-01-03"])  
    .....: )  
    .....: Out[131]: TimedeltaIndex(['-1 days', '-1 days'], dtype='timedelta64[ns]', freq=None)

Index.difference and .symmetric_difference changes

Index.difference and Index.symmetric_difference will now, more consistently, treat NaN values as any other values. (GH13514)

In [132]: idx1 = pd.Index([1, 2, 3, np.nan])
In [133]: idx2 = pd.Index([0, 1, np.nan])

Previous behavior:
In [3]: idx1.difference(idx2)
Out[3]: Float64Index([nan, 2.0, 3.0], dtype='float64')
In [4]: idx1.symmetric_difference(idx2)
Out[4]: Float64Index([0.0, nan, 2.0, 3.0], dtype='float64')

New behavior:
In [134]: idx1.difference(idx2)
Out[134]: Float64Index([2.0, 3.0], dtype='float64')
In [135]: idx1.symmetric_difference(idx2)
Out[135]: Float64Index([0.0, 2.0, 3.0], dtype='float64')

Index.unique consistently returns Index

Index.unique() now returns unique values as an Index of the appropriate dtype. (GH13395). Previously, most Index classes returned np.ndarray, and DatetimeIndex, TimedeltaIndex and PeriodIndex returned Index to keep metadata like timezone.

Previous behavior:
In [1]: pd.Index([1, 2, 3]).unique()
Out[1]: array([1, 2, 3])
In [2]: pd.DatetimeIndex(['2011-01-01', '2011-01-02',  
    ...:          '2011-01-03'], tz='Asia/Tokyo').unique()
Out[2]:
(continues on next page)
DatetimeIndex(['2011-01-01 00:00:00+09:00', '2011-01-02 00:00:00+09:00',
    '2011-01-03 00:00:00+09:00'],
dtype='datetime64[ns, Asia/Tokyo]', freq=None)

New behavior:

```
In [136]: pd.Index([1, 2, 3]).unique()
Out[136]: Int64Index([1, 2, 3], dtype='int64')

In [137]: pd.DatetimeIndex(
    .....: ['2011-01-01', '2011-01-02', '2011-01-03'], tz='Asia/Tokyo'
    .....: ).unique()
    .....:
Out[137]: DatetimeIndex(['2011-01-01 00:00:00+09:00', '2011-01-02 00:00:00+09:00',
    '2011-01-03 00:00:00+09:00'],
dtype='datetime64[ns, Asia/Tokyo]', freq=None)
```

**MultiIndex constructors, groupby and set_index preserve categorical dtypes**

MultiIndex.from_arrays and MultiIndex.from_product will now preserve categorical dtype in MultiIndex levels (GH13743, GH13854).

```
In [138]: cat = pd.Categorical(['a', 'b'], categories=list('bac'))
In [139]: lvl1 = ['foo', 'bar']
In [140]: midx = pd.MultiIndex.from_arrays([cat, lvl1])
In [141]: midx
Out[141]: MultiIndex([('a', 'foo'),
                     ('b', 'bar')],
                    )

Previous behavior:

```
In [4]: midx.levels[0]
Out[4]: Index(['b', 'a', 'c'], dtype='object')
In [5]: midx.get_level_values[0]
Out[5]: Index(['a', 'b'], dtype='object')
```

New behavior: the single level is now a CategoricalIndex:

```
In [142]: midx.levels[0]
Out[142]: CategoricalIndex(['b', 'a', 'c'], categories=['b', 'a', 'c'], ordered=False,
                                           dtype='category')
In [143]: midx.get_level_values[0]
Out[143]: CategoricalIndex(['a', 'b'], categories=['b', 'a', 'c'], ordered=False,
                                           dtype='category')
```

An analogous change has been made to MultiIndex.from_product. As a consequence, groupby and set_index also preserve categorical dtypes in indexes
In [144]: df = pd.DataFrame({'A': [0, 1], 'B': [10, 11], 'C': cat})

In [145]: df_grouped = df.groupby(by=['A', 'C']).first()

In [146]: df_set_idx = df.set_index(['A', 'C'])

Previous behavior:

In [11]: df_grouped.index.levels[1]
Out[11]: Index(['b', 'a', 'c'], dtype='object', name='C')
In [12]: df_grouped.reset_index().dtypes
Out[12]:
   A  int64
   C  object
    B  float64
   dtype: object

In [13]: df_set_idx.index.levels[1]
Out[13]: Index(['b', 'a', 'c'], dtype='object', name='C')
In [14]: df_set_idx.reset_index().dtypes
Out[14]:
   A  int64
   C  object
    B  int64
   dtype: object

New behavior:

In [147]: df_grouped.index.levels[1]
Out[147]: CategoricalIndex(['b', 'a', 'c'], categories=['b', 'a', 'c'], ordered=False, name='C', dtype='category')

In [148]: df_grouped.reset_index().dtypes
Out[148]:
   A  int64
   C  category
    B  float64
Length: 3, dtype: object

In [149]: df_set_idx.index.levels[1]
Out[149]: CategoricalIndex(['b', 'a', 'c'], categories=['b', 'a', 'c'], ordered=False, name='C', dtype='category')

In [150]: df_set_idx.reset_index().dtypes
Out[150]:
   A  int64
   C  category
    B  int64
Length: 3, dtype: object
Function `read_csv` will progressively enumerate chunks

When `read_csv()` is called with chunksize=n and without specifying an index, each chunk used to have an independently generated index from 0 to n-1. They are now given instead a progressive index, starting from 0 for the first chunk, from n for the second, and so on, so that, when concatenated, they are identical to the result of calling `read_csv()` without the chunksize= argument (GH12185).

```python
In [151]: data = "A,B\n0,1\n2,3\n4,5\n6,7"

Previous behavior:

```python
In [2]: pd.concat(pd.read_csv(StringIO(data), chunksize=2))
Out[2]:
    A  B
0  0  1
1  2  3
0  4  5
1  6  7
```

New behavior:

```python
In [152]: pd.concat(pd.read_csv(StringIO(data), chunksize=2))
Out[152]:
    A  B
0  0  1
1  2  3
2  4  5
3  6  7
[4 rows x 2 columns]
```

Sparse changes

These changes allow pandas to handle sparse data with more dtypes, and for work to make a smoother experience with data handling.

Types `int64` and `bool` support enhancements

Sparse data structures now gained enhanced support of `int64` and `bool` dtype (GH667, GH13849).

Previously, sparse data were float64 dtype by default, even if all inputs were of int or bool dtype. You had to specify dtype explicitly to create sparse data with int64 dtype. Also, fill_value had to be specified explicitly because the default was np.nan which doesn’t appear in int64 or bool data.

```python
In [1]: pd.SparseArray([1, 2, 0, 0])
Out[1]:
[1.0, 2.0, 0.0, 0.0]
Fill: nan
IntIndex
Indices: array([0, 1, 2, 3], dtype=int32)

# specifying int64 dtype, but all values are stored in sp_values because
# fill_value default is np.nan
In [2]: pd.SparseArray([1, 2, 0, 0], dtype=np.int64)
```

(continues on next page)
As of v0.19.0, sparse data keeps the input dtype, and uses more appropriate fill_value defaults (0 for int64 dtype, False for bool dtype).

```
In [153]: pd.SparseArray([1, 2, 0, 0], dtype=np.int64)
Out[153]:
[1, 2, 0, 0]
Fill: 0
IntIndex
Indices: array([0, 1], dtype=int32)
```

```
In [154]: pd.SparseArray([True, False, False, False])
Out[154]:
[True, False, False, False]
Fill: False
IntIndex
Indices: array([0], dtype=int32)
```

See the docs for more details.

**Operators now preserve dtypes**

- Sparse data structure now can preserve dtype after arithmetic ops (GH13848)

```
s = pd.SparseSeries([0, 2, 0, 1], fill_value=0, dtype=np.int64)
s.dtype
s + 1
```

- Sparse data structure now support astype to convert internal dtype (GH13900)

```
s = pd.SparseSeries([1.0, 0.0, 2.0, 0.0], fill_value=0)
s.s.astype(np.int64)
```

astype fails if data contains values which cannot be converted to specified dtype. Note that the limitation is applied to fill_value which default is np.nan.

```
In [7]: pd.SparseSeries([1., np.nan, 2., np.nan], fill_value=np.nan).astype(np.int64)
Out[7]:
ValueError: unable to coerce current fill_value nan to int64 dtype
```
Other sparse fixes

- Subclassed `SparseDataFrame` and `SparseSeries` now preserve class types when slicing or transposing. *(GH13787)*
- `SparseArray` with `bool` dtype now supports logical (bool) operators *(GH14000)*
- Bug in `SparseSeries` with MultiIndex [] indexing may raise `IndexError` *(GH13144)*
- Bug in `SparseSeries` with MultiIndex [] indexing result may have normal `Index` *(GH13144)*
- Bug in `SparseDataFrame` in which `axis=None` did not default to `axis=0` *(GH13048)*
- Bug in `SparseSeries` and `SparseDataFrame` creation with object dtype may raise `TypeError` *(GH11633)*
- Bug in `SparseDataFrame` doesn’t respect passed `SparseArray` or `SparseSeries` ‘s dtype and `fill_value` *(GH13866)*
- Bug in `SparseArray` and `SparseSeries` don’t apply ufunc to `fill_value` *(GH13853)*
- Bug in `SparseSeries.abs` incorrectly keeps negative `fill_value` *(GH13853)*
- Bug in single row slicing on multi-type `SparseDataFrame` s, types were previously forced to float *(GH13917)*
- Bug in `SparseSeries` slicing changes integer dtype to float *(GH8292)*
- Bug in `SparseDataFrame` comparison ops may raise `TypeError` *(GH13001)*
- Bug in `SparseDataFrame.isnull` raises `ValueError` *(GH8276)*
- Bug in `SparseSeries` representation with `bool` dtype may raise `IndexError` *(GH13110)*
- Bug in `SparseSeries` and `SparseDataFrame` of `bool` or `int64` dtype may display its values like `float64` dtype *(GH13110)*
- Bug in sparse indexing using `SparseArray` with `bool` dtype may return incorrect result *(GH13985)*
- Bug in `SparseArray` created from `SparseSeries` may lose dtype *(GH13999)*
- Bug in `SparseSeries` comparison with dense returns normal `Series` rather than `SparseSeries` *(GH13999)*

Indexer dtype changes

**Note:** This change only affects 64 bit python running on Windows, and only affects relatively advanced indexing operations

Methods such as `Index.get_indexer` that return an indexer array, coerce that array to a “platform int”, so that it can be directly used in 3rd party library operations like `numpy.take`. Previously, a platform int was defined as `np.int_` which corresponds to a C integer, but the correct type, and what is being used now, is `np.intp` which corresponds to the C integer size that can hold a pointer *(GH3033, GH13972)*.

These types are the same on many platform, but for 64 bit python on Windows, `np.int_` is 32 bits, and `np.intp` is 64 bits. Changing this behavior improves performance for many operations on that platform.

**Previous behavior:**
In [1]: i = pd.Index(['a', 'b', 'c'])

In [2]: i.get_indexer(['b', 'b', 'c']).dtype

Out[2]: dtype('int32')

New behavior:

In [1]: i = pd.Index(['a', 'b', 'c'])

In [2]: i.get_indexer(['b', 'b', 'c']).dtype

Out[2]: dtype('int64')

Other API changes

• Timestamp.to_pydatetime will issue a UserWarning when warn=True, and the instance has a non-zero number of nanoseconds, previously this would print a message to stdout (GH14101).
• Series.unique() with datetime and timezone now returns return array of Timestamp with timezone (GH13565).
• Panel.to_sparse() will raise a NotImplementedError exception when called (GH13778).
• Index.reshape() will raise a NotImplementedError exception when called (GH12882).
• .filter() enforces mutual exclusion of the keyword arguments (GH12399).
• eval’s upcasting rules for float32 types have been updated to be more consistent with NumPy’s rules. New behavior will not upcast to float64 if you multiply a pandas float32 object by a scalar float64 (GH12388).
• An UnsupportedFunctionCall error is now raised if NumPy ufuncs like np.mean are called on groupby or resample objects (GH12811).
• __setitem__ will no longer apply a callable rhs as a function instead of storing it. Call where directly to get the previous behavior (GH13299).
• Calls to .sample() will respect the random seed set via numpy.random.seed(n) (GH13161)
• Styler.apply is now more strict about the outputs your function must return. For axis=0 or axis=1, the output shape must be identical. For axis=None, the output must be a DataFrame with identical columns and index labels (GH13222).
• Float64Index.astype(int) will now raise ValueError if Float64Index contains NaN values (GH13149)
• TimedeltaIndex.astype(int) and DatetimeIndex.astype(int) will now return Int64Index instead of np.array (GH13209)
• Passing Period with multiple frequencies to normal Index now returns Index with object dtype (GH13664)
• PeriodIndex.fillna with Period has different freq now coerces to object dtype (GH13664)
• Faceted boxplots from DataFrame.boxplot(by=col) now return a Series when return_type is not None. Previously these returned an OrderedDict. Note that when return_type=None, the default, these still return a 2-D NumPy array (GH12216, GH7096).
• pd.read_hdf will now raise a ValueError instead of KeyError, if a mode other than r, r+ and a is supplied. (GH13623)
• `pd.read_csv()`, `pd.read_table()`, and `pd.read_hdf()` raise the built-in `FileNotFoundError` exception for Python 3.x when called on a nonexistent file; this is back-ported as `IOError` in Python 2.x (GH14086)

• More informative exceptions are passed through the csv parser. The exception type would now be the original exception type instead of `CParserError` (GH13652).

• `pd.read_csv()` in the C engine will now issue a `ParserWarning` or raise a `ValueError` when `sep` encoded is more than one character long (GH14065)

• `DataFrame.values` will now return `float64` with a `DataFrame` of mixed `int64` and `uint64` dtypes, conforming to `np.find_common_type` (GH10364, GH13917)

• `.groupby.groups` will now return a dictionary of `Index` objects, rather than a dictionary of `np.ndarray` or `lists` (GH14293)

### Deprecations

• `Series.reshape` and `Categorical.reshape` have been deprecated and will be removed in a subsequent release (GH12882, GH12882)

• `PeriodIndex.to_datetime` has been deprecated in favor of `PeriodIndex.to_timestamp` (GH8254)

• `Timestamp.to_datetime` has been deprecated in favor of `Timestamp.to_pydatetime` (GH8254)

• `Index.to_datetime` and `DatetimeIndex.to_datetime` have been deprecated in favor of `pd.to_datetime` (GH8254)

• `pandas.core.datetools` module has been deprecated and will be removed in a subsequent release (GH14094)

• `SparseList` has been deprecated and will be removed in a future version (GH13784)

• `Dataframe.to_html()` and `Dataframe.to_latex()` have dropped the `colSpace` parameter in favor of `col_space` (GH13857)

• `DataFrame.to_sql()` has deprecated the `flavor` parameter, as it is superfluous when SQLAlchemy is not installed (GH13611)

• Deprecated `read_csv` keywords:
  - `compact_ints` and `use_unsigned` have been deprecated and will be removed in a future version (GH13320)
  - `buffer_lines` has been deprecated and will be removed in a future version (GH13360)
  - `as_recarray` has been deprecated and will be removed in a future version (GH13373)
  - `skip_footer` has been deprecated in favor of `skipfooter` and will be removed in a future version (GH13349)

• `top-level pd.ordered_merge()` has been renamed to `pd.merge_ordered()` and the original name will be removed in a future version (GH13358)

• `Timestamp.offset` property (and named arg in the constructor), has been deprecated in favor of `freq` (GH12160)

• `pd.tseries.util.pivot_annual` is deprecated. Use `pivot_table` as alternative, an example is here (GH736)

• `pd.tseries.util.isleapyear` has been deprecated and will be removed in a subsequent release. Datetime-likes now have a `.is_leap_year` property (GH13727)
• Panel4D and PanelND constructors are deprecated and will be removed in a future version. The recommended way to represent these types of n-dimensional data are with the xarray package. pandas provides a to_xarray() method to automate this conversion (GH13564).

• pandas.tseries.frequencies.get_standard_freq is deprecated. Use pandas.tseries.frequencies.to_offset(freq).rule_code instead (GH13874)

• pandas.tseries.frequencies.to_offset's freqstr keyword is deprecated in favor of freq (GH13874)

• Categorical.from_array has been deprecated and will be removed in a future version (GH13854)

Removal of prior version deprecations/changes

• The SparsePanel class has been removed (GH13778)

• The pd.sandbox module has been removed in favor of the external library pandas-qt (GH13670)

• The pandas.io.data and pandas.io.wb modules are removed in favor of the pandas-datareader package (GH13724).

• The pandas.tools.rplot module has been removed in favor of the seaborn package (GH13855)

• DataFrame.to_csv() has dropped the engine parameter, as was deprecated in 0.17.1 (GH11274, GH13419)

• DataFrame.to_dict() has dropped the outtype parameter in favor of orient (GH13627, GH8486)

• pd.Categorical has dropped setting of the ordered attribute directly in favor of the set_ordered method (GH13671)

• pd.Categorical has dropped the levels attribute in favor of categories (GH8376)

• DataFrame.to_sql() has dropped the mysql option for the flavor parameter (GH13611)

• Panel.shift() has dropped the lags parameter in favor of periods (GH14041)

• pd.Index has dropped the diff method in favor of difference (GH13669)

• pd.DataFrame has dropped the to_wide method in favor of to_panel (GH14039)

• Series.to_csv has dropped the nanRep parameter in favor of na_rep (GH13804)

• Series.xs, DataFrame.xs, Panel.xs, Panel.major_xs, and Panel.minor_xs have dropped the copy parameter (GH13781)

• str.split has dropped the return_type parameter in favor of expand (GH13701)

• Removal of the legacy time rules (offset aliases), deprecated since 0.17.0 (this has been alias since 0.8.0) (GH13590, GH13868). Now legacy time rules raises ValueError. For the list of currently supported offsets, see here.

• The default value for the return_type parameter for DataFrame.plot.box and DataFrame.boxplot changed from None to "axes". These methods will now return a matplotlib axes by default instead of a dictionary of artists. See here (GH6581).

• The tquery and uquery functions in the pandas.io.sql module are removed (GH5950).
Performance improvements

- Improved performance of sparse `IntIndex.intersect` (GH13082)
- Improved performance of sparse arithmetic with `BlockIndex` when the number of blocks are large, though recommended to use `IntIndex` in such cases (GH13082)
- Improved performance of `DataFrame.quantile()` as it now operates per-block (GH11623)
- Improved performance of float64 hash table operations, fixing some very slow indexing and groupby operations in python 3 (GH13166, GH13334)
- Improved performance of `Index` and `Series.duplicated` (GH10235)
- Improved performance of `Index.difference` (GH12044)
- Improved performance of `Index.is_monotonic_increasing` and `is_monotonic_decreasing` (GH13749)
- Improved performance of datetime string parsing in `DatetimeIndex` (GH13692)
- Improved performance of hashing `Period` (GH12817)
- Improved performance of factorize of datetime with timezone (GH13750)
- Improved performance of by lazily creating indexing hashtables on larger Indexes (GH14266)
- Improved performance of `groupby.transform` (GH12737)
- Improved performance of `groupby.groups` (GH14293)
- Unnecessary materializing of a MultiIndex when introspecting for memory usage (GH14308)

Bug fixes

- Bug in `groupby().shift()`, which could cause a segfault or corruption in rare circumstances when grouping by columns with missing values (GH13813)
- Bug in `groupby().cumsum()` calculating cumprod when axis=1. (GH13994)
- Bug in `pd.to_timedelta()` in which the errors parameter was not being respected (GH13613)
- Bug in `io.json.json_normalize()`, where non-ascii keys raised an exception (GH13213)
- Bug when passing a not-default-indexed `Series` as `xerr` or `yerr` in `.plot()` (GH11858)
- Bug in area plot draws legend incorrectly if subplot is enabled or legend is moved after plot (matplotlib 1.5.0 is required to draw area plot legend properly) (GH9161, GH13544)
- Bug in `DataFrame` assignment with an object-dtyped `Index` where the resultant column is mutable to the original object. (GH13522)
- Bug in `matplotlib.AutoDataFormatter; this restores the second scaled formatting and re-adds micro-second scaled formatting (GH13131)
- Bug in selection from a `HDFStore` with a fixed format and `start` and/or `stop` specified will now return the selected range (GH8287)
- Bug in `Categorical.from_codes()` where an unhelpful error was raised when an invalid `ordered` parameter was passed in (GH14058)
- Bug in `Series` construction from a tuple of integers on windows not returning default dtype (int64) (GH13646)
- Bug in `TimedeltaIndex` addition with a Datetime-like object where addition overflow was not being caught (GH14068)
• Bug in `.groupby(..).resample(..)` when the same object is called multiple times (GH13174)
• Bug in `.to_records()` when index name is a unicode string (GH13172)
• Bug in calling `.memory_usage()` on object which doesn’t implement (GH12924)
• Regression in `Series.quantile` with nans (also shows up in `.median()` and `.describe()`); furthermore now names the Series with the quantile (GH13098, GH13146)
• Bug in `SeriesGroupBy.transform` with datetime values and missing groups (GH13191)
• Bug where empty `Series` were incorrectly coerced in datetime-like numeric operations (GH13844)
• Bug in `Categorical` constructor when passed a `Categorical` containing datetimes with timezones (GH14190)
• Bug in `Series.str.extractall()` with `str` index raises `ValueError` (GH13156)
• Bug in `Series.str.extractall()` with single group and quantifier (GH13382)
• Bug in `DatetimeIndex` and `Period` subtraction raises `ValueError` or `AttributeError` rather than `TypeError` (GH13078)
• Bug in `Index` and `Series` created with `NaN` and `NaT` mixed data may not have `datetime64` dtype (GH13324)
• Bug in `Index` and `Series` may ignore `np.datetime64('nat')` and `np.timedelta64('nat')` to infer dtype (GH13324)
• Bug in `PeriodIndex` and `Period` subtraction raises `AttributeError` (GH13071)
• Bug in `PeriodIndex` construction returning a `float64` index in some circumstances (GH13067)
• Bug in `.resample(..)` with a `PeriodIndex` not changing its freq appropriately when empty (GH13067)
• Bug in `.resample(..)` with a `PeriodIndex` not retaining its type or name with an empty `DataFrame` appropriately when empty (GH13212)
• Bug in groupby(..).apply(..) when the passed function returns scalar values per group (GH13468).
• Bug in groupby(..).resample(..) where passing some keywords would raise an exception (GH13235)
• Bug in `.tz_convert` on a tz-aware `DateTimeIndex` that relied on index being sorted for correct results (GH13306)
• Bug in `.tz_localize` with `dateutil.tz.tzlocal` may return incorrect result (GH13583)
• Bug in `DatetimeTZDtype` dtype with `dateutil.tz.tzlocal` cannot be regarded as valid dtype (GH13583)
• Bug in `pd.read_hdf()` where attempting to load an HDF file with a single dataset, that had one or more categorical columns, failed unless the key argument was set to the name of the dataset. (GH13231)
• Bug in `.rolling()` that allowed a negative integer window in construction of the `Rolling()` object, but would later fail on aggregation (GH13383)
• Bug in `Series` indexing with tuple-valued data and a numeric index (GH13509)
• Bug in printing `pd.DataFrame` where unusual elements with the `object` dtype were causing segfaults (GH13717)
• Bug in ranking `Series` which could result in segfaults (GH13445)
• Bug in various index types, which did not propagate the name of passed index (GH12309)
• Bug in `DatetimeIndex`, which did not honour the `copy=True` (GH13205)
- Bug in `DatetimeIndex.is_normalized` returns incorrectly for normalized date_range in case of local timezones (GH13459)
- Bug in `pd.concat` and `.append` may coerce `datetime64` and `timedelta` to `object` dtype containing python built-in `datetime` or `timedelta` rather than `Timestamp` or `Timedelta` (GH13626)
- Bug in `PeriodIndex.append` may raise `AttributeError` when the result is object dtype (GH13221)
- Bug in `CategoricalIndex.append` may accept normal list (GH13626)
- Bug in `pd.concat` and `.append` with the same timezone get reset to UTC (GH7795)
- Bug in `Series` and `DataFrame` `.append` raises `AmbiguousTimeError` if data contains datetime near DST boundary (GH13626)
- Bug in `DataFrame.to_csv()` in which float values were being quoted even though quotations were specified for non-numeric values only (GH12922, GH13259)
- Bug in `DataFrame.describe()` raising `ValueError` with only boolean columns (GH13898)
- Bug in `MultiIndex` slicing where extra elements were returned when level is non-unique (GH12896)
- Bug in `.str.replace` does not raise `TypeError` for invalid replacement (GH13438)
- Bug in `MultiIndex.from_arrays` which didn’t check for input array lengths matching (GH13599)
- Bug in `cartesian_product` and `MultiIndex.from_product` which may raise with empty input arrays (GH12258)
- Bug in `pd.read_csv()` which may cause a segfault or corruption when iterating in large chunks over a stream/file under rare circumstances (GH13703)
- Bug in `pd.read_csv()` which caused errors to be raised when a dictionary containing scalars is passed in for `na_values` (GH12224)
- Bug in `pd.read_csv()` which caused BOM files to be incorrectly parsed by not ignoring the BOM (GH4793)
- Bug in `pd.read_csv()` with engine='python' which raised errors when a numpy array was passed in for `usecols` (GH12546)
- Bug in `pd.read_csv()` where the index columns were being incorrectly parsed when parsed as dates with a `thousands` parameter (GH14066)
- Bug in `pd.read_csv()` with engine='python' in which NaN values weren’t being detected after data was converted to numeric values (GH13314)
- Bug in `pd.read_csv()` in which the `nrows` argument was not properly validated for both engines (GH10476)
- Bug in `pd.read_csv()` with engine='python' in which infinities of mixed-case forms were not being interpreted properly (GH13274)
- Bug in `pd.read_csv()` with engine='python' in which trailing NaN values were not being parsed (GH13320)
- Bug in `pd.read_csv()` with engine='python' when reading from a `tempfile.TemporaryFile` on Windows with Python 3 (GH13398)
- Bug in `pd.read_csv()` that prevents `usecols` kwarg from accepting single-byte unicode strings (GH13219)
- Bug in `pd.read_csv()` that prevents `usecols` from being an empty set (GH13402)
- Bug in `pd.read_csv()` in the C engine where the NULL character was not being parsed as NULL (GH14012)
Bug in `pd.read_csv()` with engine='c' in which NULL quotechar was not accepted even though quoting was specified as None (GH13411)

Bug in `pd.read_csv()` with engine='c' in which fields were not properly cast to float when quoting was specified as non-numeric (GH13411)

Bug in `pd.read_csv()` in Python 2.x with non-UTF8 encoded, multi-character separated data (GH3404)

Bug in `pd.read_csv()`, where aliases for utf-xx (e.g. UTF-xx, UTF_xx, utf_xx) raised UnicodeDecodeError (GH13549)

Bug in `pd.read_csv`, `pd.read_table`, `pd.read_fwf`, `pd.read_stata` and `pd.read_sas` where files were opened by parsers but not closed if both chunksize and iterator were None. (GH13940)

Bug in StataReader, StataWriter, XportReader and SAS7BDATReader where a file was not properly closed when an error was raised. (GH13940)

Bug in `pd.pivot_table()` where margins_name is ignored when aggfunc is a list (GH13354)

Bug in `pd.Series.str.zfill`, `center`, `ljust`, `rjust`, and `pad` when passing non-integers, did not raise TypeError (GH13598)

Bug in checking for any null objects in a TimedeltaIndex, which always returned True (GH13603)

Bug in Series arithmetic raises TypeError if it contains datetime-like as object dtype (GH13043)

Bug in `Series.isnull()` and `Series.notnull()` ignore Period('NaT') (GH13737)

Bug in `Series.fillna()` and `Series.dropna()` don’t affect to Period('NaT') (GH13737)

Bug in `.fillna(value=np.nan)` incorrectly raises KeyError on a category dtype (GH14021)

Bug in extension dtype creation where the created types were not is/identical (GH13285)

Bug in `.resample(..)` where incorrect warnings were triggered by IPython introspection (GH13618)

Bug in `NaT`-Period raises AttributeError (GH13071)

Bug in Series comparison may output incorrect result if rhs contains NaT (GH9005)

Bug in Series and Index comparison may output incorrect result if it contains NaT with object dtype (GH13592)

Bug in Period addition raises TypeError if Period is on right hand side (GH13069)

Bug in Period and Series or Index comparison raises TypeError (GH13200)

Bug in `pd.set_eng_float_format()` that would prevent NaN and Inf from formatting (GH11981)

Bug in `.unstack` with Categorical dtype resets .ordered to True (GH13249)

Clean some compile time warnings in datetime parsing (GH13607)

Bug in `factorize` raises AmbiguousTimeError if data contains datetime near DST boundary (GH13750)

Bug in `.set_index` raises AmbiguousTimeError if new index contains DST boundary and multi levels (GH12920)

Bug in `.shift` raises AmbiguousTimeError if data contains datetime near DST boundary (GH13926)

Bug in `pd.read_hdf()` returns incorrect result when a DataFrame with a categorical column and a query which doesn’t match any values (GH13792)

Bug in `.iloc` when indexing with a non lexsorted MultiIndex (GH13797)

Bug in `.loc` when indexing with date strings in a reverse sorted DatetimeIndex (GH14316)
• Bug in Series comparison operators when dealing with zero dim NumPy arrays (GH13006)
• Bug in .combine_first may return incorrect dtype (GH7630, GH10567)
• Bug in groupby where apply returns different result depending on whether first result is None or not (GH12824)
• Bug in groupby(..).nth() where the group key is included inconsistently if called after .head()/tail() (GH12839)
• Bug in .to_html, .to_latex and .to_string silently ignore custom datetime formatter passed through the formatters key word (GH10690)
• Bug in DataFrame.iterrows(), not yielding a Series subclass if defined (GH13977)
• Bug in pd.to_numeric when errors='coerce' and input contains non-hashable objects (GH13324)
• Bug in invalid Timedelta arithmetic and comparison may raise ValueError rather than TypeError (GH13624)
• Bug in invalid datetime parsing in to_datetime and DatetimeIndex may raise TypeError rather than ValueError (GH11169, GH11287)
• Bug in Index created with tz-aware Timestamp and mismatched tz option incorrectly coerces timezone (GH13692)
• Bug in DatetimeIndex with nanosecond frequency does not include timestamp specified with end (GH13672)
• Bug in `Series when setting a slice with a np.timedelta64 (GH14155)
• Bug in Index raises OutOfBoundsDatetime if datetime exceeds datetime64[ns] bounds, rather than coercing to object dtype (GH13663)
• Bug in Index may ignore specified datetime64 or timedelta64 passed as dtype (GH13981)
• Bug in RangeIndex can be created without no arguments rather than raises TypeError (GH13793)
• Bug in .value_counts() raises OutOfBoundsDatetime if data exceeds datetime64[ns] bounds (GH13663)
• Bug in DatetimeIndex may raise OutOfBoundsDatetime if input np.datetime64 has other unit than ns (GH9114)
• Bug in Series creation with np.datetime64 which has other unit than ns as object dtype results in incorrect values (GH13876)
• Bug in resample with timedelta data where data was casted to float (GH13119).
• Bug in pd.isnull() pd.notnull() raise TypeError if input datetime-like has other unit than ns (GH13389)
• Bug in pd.merge() may raise TypeError if input datetime-like has other unit than ns (GH13389)
• Bug in HDFStore/read_hdf() discarded DatetimeIndex.name if tz was set (GH13884)
• Bug in Categorical.remove_unused_categories() changes .codes dtype to platform int (GH13261)
• Bug in groupby with as_index=False returns all NaN’s when grouping on multiple columns including a categorical one (GH13204)
• Bug in df.groupby(...)[...] where getitem with Int64Index raised an error (GH13731)
• Bug in the CSS classes assigned to DataFrame.style for index names. Previously they were assigned "col_heading level<n> col<c>" where n was the number of levels + 1. Now they are assigned "index_name level<n>", where n is the correct level for that MultiIndex.

• Bug where pd.read_gbq() could throw ImportError: No module named discovery as a result of a naming conflict with another python package called apiclient (GH13454)

• Bug in Index.union returns an incorrect result with a named empty index (GH13432)

• Bugs in Index.difference and DataFrame.join raise in Python3 when using mixed-integer indexes (GH13432, GH12814)

• Bug in subtract tz-aware datetime.datetime from tz-aware datetime64 series (GH14088)

• Bug in .to_excel() when DataFrame contains a MultiIndex which contains a label with a NaN value (GH13511)

• Bug in invalid frequency offset string like “D1”, “-2-3H” may not raise ValueError (GH13930)

• Bug in concat and groupby for hierarchical frames with RangeIndex levels (GH13542).

• Bug in Series.str.contains() for Series containing only NaN values of object dtype (GH14171)

• Bug in agg() function on groupby dataframe changes dtype of datetime64[ns] column to float64 (GH12821)

• Bug in using NumPy ufunc with PeriodIndex to add or subtract integer raise IncompatibleFrequency. Note that using standard operator like + or - is recommended, because standard operators use more efficient path (GH13980)

• Bug in operations on NaT returning float instead of datetime64[ns] (GH12941)

• Bug in Series flexible arithmetic methods (like .add()) raises ValueError when axis=None (GH13894)

• Bug in DataFrame.to_csv() with MultiIndex columns in which a stray empty line was added (GH6618)

• Bug in DatetimeIndex, TimedeltaIndex and PeriodIndex.equals() may return True when input isn’t Index but contains the same values (GH13107)

• Bug in assignment against datetime with timezone may not work if it contains datetime near DST boundary (GH13822)

• Bug in pd.eval() and HDFStore query truncating long float literals with python 2 (GH14241)

• Bug in Index raises KeyError displaying incorrect column when column is not in the df and columns contains duplicate values (GH13822)

• Bug in Period and PeriodIndex creating wrong dates when frequency has combined offset aliases (GH13874)

• Bug in .to_string() when called with an integer line_width and index=False raises an UnboundLocalError exception because idx referenced before assignment.

• Bug in eval() where the resolvers argument would not accept a list (GH14095)

• Bugs in stack, get_dummies, make_axis_dummies which don’t preserve categorical dtypes in (multi)indexes (GH13854)

• PeriodIndex can now accept list and array which contains pd.NaT (GH13430)

• Bug in df.groupby where .median() returns arbitrary values if grouped dataframe contains empty bins (GH13629)

• Bug in Index.copy() where name parameter was ignored (GH14302)

5.11 Version 0.18

5.11.1 Version 0.18.1 (May 3, 2016)

This is a minor bug-fix release from 0.18.0 and includes a large number of bug fixes along with several new features, enhancements, and performance improvements. We recommend that all users upgrade to this version.

Highlights include:

• `.groupby(...)` has been enhanced to provide convenient syntax when working with `.rolling(..)`, `.expanding(..)` and `.resample(..)` per group, see here

• `pd.to_datetime()` has gained the ability to assemble dates from a `DataFrame`, see here

• Method chaining improvements, see here.

• Custom business hour offset, see here.

• Many bug fixes in the handling of `sparse`, see here

• Expanded the `Tutorials section` with a feature on modern pandas, courtesy of @TomAugsburger. (GH13045).

What’s new in v0.18.1

• New features
  – Custom business hour
  – Method `.groupby(..)` syntax with window and resample operations
  – Method chaining improvements
    * Methods `.where()` and `.mask()`
    * Methods `.loc[]`, `.iloc[]`, `.ix[]`
    * Indexing with ```[```
  – Partial string indexing on `DatetimeIndex` when part of a `MultiIndex`
New features

Custom business hour

The CustomBusinessHour is a mixture of BusinessHour and CustomBusinessDay which allows you to specify arbitrary holidays. For details, see Custom Business Hour (GH11514)

```python
In [1]: from pandas.tseries.offsets import CustomBusinessHour
In [2]: from pandas.tseries.holiday import USFederalHolidayCalendar
In [3]: bhour_us = CustomBusinessHour(calendar=USFederalHolidayCalendar())
```

Friday before MLK Day

```python
In [4]: import datetime
In [5]: dt = datetime.datetime(2014, 1, 17, 15)
In [6]: dt + bhour_us
Out[6]: Timestamp('2014-01-17 16:00:00')
```

Tuesday after MLK Day (Monday is skipped because it's a holiday)

```python
In [7]: dt + bhour_us * 2
Out[7]: Timestamp('2014-01-20 09:00:00')
```
Method `.groupby()` syntax with window and resample operations

`.groupby(...)` has been enhanced to provide convenient syntax when working with `.rolling(...)`, `.expanding(...)`, and `.resample(...) per group`, see (GH12486, GH12738).

You can now use `.rolling(...)` and `.expanding(...)` as methods on groupbys. These return another deferred object (similar to what `.rolling()` and `.expanding()` do on ungrouped pandas objects). You can then operate on these `RollingGroupby` objects in a similar manner.

Previously you would have to do this to get a rolling window mean per-group:

```python
In [9]: df
Out[9]:
   A  B
0  1  0
1  1  1
2  1  2
3  1  3
4  1  4
   ... ...
35 3  35
36 3  36
37 3  37
38 3  38
39 3  39
[40 rows x 2 columns]
```

```python
In [10]: df.groupby("A").apply(lambda x: x.rolling(4).B.mean())
Out[10]:
   A
0  0  NaN
1  1  NaN
2  2  NaN
3  1.5
   ... ...
3  35  33.5
36  34.5
37  35.5
38  36.5
39  37.5
Name: B, Length: 40, dtype: float64
```

Now you can do:

```python
In [11]: df.groupby("A").rolling(4).B.mean()
Out[11]:
   A
0  0  NaN
1  1  NaN
2  2  NaN
3  1.5
   ... ...
3  35  33.5
```

(continues on next page)
For `.resample(..)` type of operations, previously you would have to:

```
In [12]: df = pd.DataFrame(
    ...:     {
    ...:         "date": pd.date_range(start="2016-01-01", periods=4, freq="W"),
    ...:         "group": [1, 1, 2, 2],
    ...:         "val": [5, 6, 7, 8],
    ...:     }
    ...: ).set_index("date")

In [13]: df
Out[13]:
     group  val
  date       
2016-01-03  1   5
2016-01-10  1   6
2016-01-17  2   7
2016-01-24  2   8

[4 rows x 2 columns]
```

```
In [14]: df.groupby("group").apply(lambda x: x.resample("1D").ffill())
Out[14]:
     group  val
  group date       
   1  2016-01-03  1   5
       2016-01-04  1   5
       2016-01-05  1   5
       2016-01-06  1   5
       2016-01-07  1   5
       ... ... ...
   2  2016-01-20  2   7
       2016-01-21  2   7
       2016-01-22  2   7
       2016-01-23  2   7
       2016-01-24  2   8

[16 rows x 2 columns]
```

Now you can do:

```
In [15]: df.groupby("group").resample("1D").ffill()
Out[15]:
     group  val
  group date       
   1  2016-01-03  1   5
       2016-01-04  1   5
       2016-01-05  1   5
       2016-01-06  1   5
```

(continues on next page)
Method chaining improvements

The following methods/indexers now accept a callable. It is intended to make these more useful in method chains, see the documentation. (GH11485, GH12533)

- `.where()` and `.mask()`
- `.loc[]`, `.iloc[]` and `.ix[]`
- `[]` indexing

**Methods `.where()` and `.mask()`**

These can accept a callable for the condition and other arguments.

```
In [16]: df = pd.DataFrame({"A": [1, 2, 3], "B": [4, 5, 6], "C": [7, 8, 9]})

In [17]: df.where(lambda x: x > 4, lambda x: x + 10)
Out[17]:
   A  B  C
0  11 14  7
1  12  5  8
2  13  6  9
```

```
In [18]: df.loc[lambda x: x.A >= 2, lambda x: x.sum() > 10]
Out[18]:
   B  C
0  11 14
1  12  8
2  13  9
```

**Methods `.loc[]`, `.iloc[]`, `.ix[]`**

These can accept a callable, and a tuple of callable as a slicer. The callable can return a valid boolean indexer or anything which is valid for these indexer’s input.

```
# callable returns bool indexer
In [18]: df.loc[lambda x: x.A >= 2, lambda x: x.sum() > 10]
Out[18]:
   B  C
0  11 14
1  12  8
2  13  9
```

```
# callable returns list of labels
In [19]: df.loc[lambda x: [1, 2], lambda x: ["A", "B"]]
```
Indexing with `[]`

Finally, you can use a callable in `[]` indexing of Series, DataFrame and Panel. The callable must return a valid input for `[]` indexing depending on its class and index type.

```python
In [20]: df[lambda x: "A"]
Out[20]:
   0  1
0  1  
1  2
2  3
Name: A, Length: 3, dtype: int64
```

Using these methods / indexers, you can chain data selection operations without using temporary variable.

```python
In [21]: bb = pd.read_csv("data/baseball.csv", index_col="id")
In [22]: (bb.groupby(['year', 'team']).sum().loc[lambda df: df.r > 100])
Out[22]:
   stint  g   ab   r  h  X2b  X3b  hr  rbi  sb  cs  bb  so  ibb  hbp  sh  sf gidp

```
Partial string indexing on `DatetimeIndex` when part of a `MultiIndex`

Partial string indexing now matches on `DateTimeIndex` when part of a `MultiIndex` (GH10331)

```
In [23]: dft2 = pd.DataFrame(
       ....:     np.random.randn(20, 1),
       ....:     columns=["A"],
       ....:     index=pd.MultiIndex.from_product(
       ....:         [pd.date_range("20130101", periods=10, freq="12H"), ["a", "b"]]
       ....:     ),
       ....: )

In [24]: dft2
Out[24]:
   A
2013-01-01 00:00:00 a  0.469112

[4 rows x 1 columns]

Assembling datetimes

pd.to_datetime() has gained the ability to assemble datetimes from a passed in DataFrame or a dict. (GH8158).

```
In [30]: df = pd.DataFrame(
   ....:     {"year": [2015, 2016], "month": [2, 3], "day": [4, 5], "hour": [2, 3]}
   ....: )
   ....:

In [31]: df
Out[31]:
   year  month  day  hour
 0  2015     2    4     2
 1  2016     3    5     3

[2 rows x 4 columns]
```

Assembling using the passed frame.

```
In [32]: pd.to_datetime(df)
Out[32]:
0  2015-02-04 02:00:00
1  2016-03-05 03:00:00
Length: 2, dtype: datetime64[ns]
```

You can pass only the columns that you need to assemble.

```
In [33]: pd.to_datetime(df[["year", "month", "day"]])
Out[33]:
0  2015-02-04
1  2016-03-05
Length: 2, dtype: datetime64[ns]
```
Other enhancements

- `pd.read_csv()` now supports `delim_whitespace=True` for the Python engine (GH12958)
- `pd.read_csv()` now supports opening ZIP files that contains a single CSV, via extension inference or explicit `compression='zip'` (GH12175)
- `pd.read_csv()` now supports opening files using xz compression, via extension inference or explicit `compression='xz'` is specified; xz compressions is also supported by `DataFrame.to_csv` in the same way (GH11852)
- `pd.read_msgpack()` now always gives writeable ndarrays even when compression is used (GH12359).
- `pd.read_msgpack()` now supports serializing and de-serializing categoricals with msgpack (GH12573)
- `.to_json()` now supports NDFrames that contain categorical and sparse data (GH10778)
- `interpolate()` now supports method='akima' (GH7588).
- `pd.read_excel()` now accepts path objects (e.g. `pathlib.Path`, `py.path.local`) for the file path, in line with other `read_*` functions (GH12655)
- Added `.weekday_name` property as a component to DatetimeIndex and the `.dt` accessor. (GH11128)

```python
In [34]: idx = pd.Index([1.0, 2.0, 3.0, 4.0], dtype="float")

# default, allow_fill=True, fill_value=None
In [35]: idx.take([2, -1])
Out[35]: Float64Index([3.0, 4.0], dtype='float64')

In [36]: idx.take([2, -1], fill_value=False)
Out[36]: Float64Index([3.0, nan], dtype='float64')
```

- `Index` now supports `.str.get_dummies()` which returns `MultiIndex`, see Creating Indicator Variables (GH10008, GH10103)

```python
In [37]: idx = pd.Index(['a|b', 'a|c', 'b|c'])

In [38]: idx.str.get_dummies("|")
Out[38]: MultiIndex(((1, 1, 0),
                 (1, 0, 1),
                 (0, 1, 1)),
                 names=['a', 'b', 'c'])
```

- `pd.crosstab()` has gained a `normalize` argument for normalizing frequency tables (GH12569). Examples in the updated docs here.
- `.resample(..).interpolate()` is now supported (GH12925)
- `.isin()` now accepts passed sets (GH12988)
Sparse changes

These changes conform sparse handling to return the correct types and work to make a smoother experience with indexing.

`SparseArray.take` now returns a scalar for scalar input, `SparseArray` for others. Furthermore, it handles a negative indexer with the same rule as `Index` (GH10560, GH12796)

```python
s = pd.SparseArray([np.nan, np.nan, 1, 2, 3, np.nan, 4, 5, np.nan, 6])
s.take(0)
s.take([1, 2, 3])
```

- **Bug in `SparseSeries[]` indexing with Ellipsis raises `KeyError` (GH9467)
- **Bug in `SparseArray[]` indexing with tuples are not handled properly (GH12966)
- **Bug in `SparseSeries.loc[]` with list-like input raises `TypeError` (GH10560)
- **Bug in `SparseSeries.iloc[]` with scalar input may raise `IndexError` (GH10560)
- **Bug in `SparseSeries.loc[]`, `.iloc[]` with slice returns `SparseArray`, rather than `SparseSeries` (GH10560)
- **Bug in `SparseDataFrame.loc[]`, `.iloc[]` may results in dense `Series`, rather than `SparseSeries` (GH12787)
- **Bug in `SparseArray` addition ignores `fill_value` of right hand side (GH12910)
- **Bug in `SparseArray` mod raises `AttributeError` (GH12910)
- **Bug in `SparseArray` pow calculates `1 ** np.nan` as `np.nan` which must be `1` (GH12910)
- **Bug in `SparseArray` comparison output may incorrect result or raise `ValueError` (GH12971)
- **Bug in `SparseSeries.__repr__` raises `TypeError` when it is longer than `max_rows` (GH10560)
- **Bug in `SparseSeries.shape` ignores `fill_value` (GH10452)
- **Bug in `SparseSeries` and `SparseArray` may have different `dtype` from its dense values (GH12908)
- **Bug in `SparseSeries.reindex` incorrectly handle `fill_value` (GH12797)
- **Bug in `SparseArray.to_frame()` results in `DataFrame`, rather than `SparseDataFrame` (GH9850)
- **Bug in `SparseSeries.value_counts()` does not count `fill_value` (GH6749)
- **Bug in `SparseArray.to_dense()` does not preserve `dtype` (GH10648)
- **Bug in `SparseArray.to_dense()` incorrectly handle `fill_value` (GH12797)
- **Bug in `pd.concat()` of `SparseSeries` results in dense (GH10536)
- **Bug in `pd.concat()` of `SparseDataFrame` incorrectly handle `fill_value` (GH9765)
- **Bug in `pd.concat()` of `SparseDataFrame` may raise `AttributeError` (GH12174)
- **Bug in `SparseArray.shift()` may raise `NameError` or `TypeError` (GH12908)
API changes

**Method `.groupby(..).nth()` changes**

The index in `.groupby(..).nth()` output is now more consistent when the `as_index` argument is passed (GH11039):

```python
In [39]: df = pd.DataFrame({"A": ["a", "b", "a"], "B": [1, 2, 3]})
In [40]: df
Out[40]:
   A  B
0  a  1
1  b  2
2  a  3
[3 rows x 2 columns]
```

**Previous behavior:**

```python
In [3]: df.groupby('A', as_index=True)['B'].nth(0)
Out[3]:
   0  1
Name: B, dtype: int64

In [4]: df.groupby('A', as_index=False)['B'].nth(0)
Out[4]:
   0  1
   1  2
Name: B, dtype: int64
```

**New behavior:**

```python
In [41]: df.groupby("A", as_index=True)["B"].nth(0)
Out[41]:
  A
a  1
b  2
Name: B, Length: 2, dtype: int64

In [42]: df.groupby("A", as_index=False)["B"].nth(0)
Out[42]:
   0  1
   1  2
Name: B, Length: 2, dtype: int64
```

Furthermore, previously, a `.groupby` would always sort, regardless if `sort=False` was passed with `.nth()`.

```python
In [43]: np.random.seed(1234)
In [44]: df = pd.DataFrame(np.random.randn(100, 2), columns=["a", "b"])
In [45]: df["c"] = np.random.randint(0, 4, 100)
```

**Previous behavior:**
In [4]: df.groupby('c', sort=True).nth(1)
Out[4]:
     a   b
  c
0 -0.334077 0.002118
1  0.036142 -2.074978
2 -0.720589 0.887163
3  0.859588 -0.636524

In [5]: df.groupby('c', sort=False).nth(1)
Out[5]:
     a   b
  c
0 -0.334077 0.002118
1  0.036142 -2.074978
2 -0.720589 0.887163
3  0.859588 -0.636524

New behavior:

In [46]: df.groupby("c", sort=True).nth(1)
Out[46]:
     a   b
  c
0 -0.334077 0.002118
1  0.036142 -2.074978
2 -0.720589 0.887163
3  0.859588 -0.636524

[4 rows x 2 columns]

In [47]: df.groupby("c", sort=False).nth(1)
Out[47]:
     a   b
  c
2 -0.720589 0.887163
3  0.859588 -0.636524
0 -0.334077 0.002118
1  0.036142 -2.074978

[4 rows x 2 columns]

**NumPy function compatibility**

Compatibility between pandas array-like methods (e.g. `sum` and `take`) and their `numpy` counterparts has been greatly increased by augmenting the signatures of the pandas methods so as to accept arguments that can be passed in from `numpy`, even if they are not necessarily used in the pandas implementation (GH12644, GH12638, GH12687)

- `.searchsorted()` for `Index` and `TimedeltaIndex` now accept a `sorter` argument to maintain compatibility with `numpy`'s `searchsorted` function (GH12238)
- Bug in `numpy` compatibility of `np.round()` on a `Series` (GH12600)

An example of this signature augmentation is illustrated below:
Previous behaviour:

```
In [2]: np.cumsum(sp, axis=0)
...:
TypeError: cumsum() takes at most 2 arguments (4 given)
```

New behaviour:

```
np.cumsum(sp, axis=0)
```

Using `.apply` on `GroupBy` resampling

Using `apply` on resampling groupby operations (using a `pd.TimeGrouper`) now has the same output types as similar `apply` calls on other groupby operations. (GH11742).

```
In [48]: df = pd.DataFrame(...:
               "date": pd.to_datetime(["10/10/2000", "11/10/2000"]), "value": [10, 13]).
               ....:
               ....:
In [49]: df
Out[49]:
       date  value
0  2000-10-10   10
1  2000-11-10   13
[2 rows x 2 columns]
```

Previous behavior:

```
In [1]: df.groupby(pd.TimeGrouper(key='date',
                   ...: freq='M')).apply(lambda x: x.value.sum())
Out[1]:
...:
TypeError: cannot concatenate a non-NDFrame object
# Output is a Series
In [2]: df.groupby(pd.TimeGrouper(key='date',
                   ...: freq='M')).apply(lambda x: x['value'].sum())
Out[2]:
     date  value
2000-10-31   10
2000-11-30   13
dtype: int64
```

New behavior:

```
# Output is a Series
In [55]: df.groupby(pd.TimeGrouper(key='date',
                   ...: freq='M')).apply(lambda x: x.value.sum())
Out[55]:
     date  value
2000-10-31   10
2000-11-30   13
Freq: M, dtype: int64
```
Changes in read_csv exceptions

In order to standardize the read_csv API for both the c and python engines, both will now raise an EmptyDataError, a subclass of ValueError, in response to empty columns or header (GH12493, GH12506)

Previous behaviour:

New behaviour:

In addition to this error change, several others have been made as well:

- CParserError now sub-classes ValueError instead of just a Exception (GH12551)
- A CParserError is now raised instead of a generic Exception in read_csv when the c engine cannot parse a column (GH12506)
- A ValueError is now raised instead of a generic Exception in read_csv when the c engine encounters a NaN value in an integer column (GH12506)
- A ValueError is now raised instead of a generic Exception in read_csv when true_values is specified, and the c engine encounters an element in a column containing unencodable bytes (GH12506)
- pandas.parser.OverflowError exception has been removed and has been replaced with Python’s built-in OverflowError exception (GH12506)
- pd.read_csv() no longer allows a combination of strings and integers for the usecols parameter (GH12678)
Method to_datetime error changes

Bugs in pd.to_datetime() when passing a unit with convertible entries and errors='coerce' or non-convertible with errors='ignore'. Furthermore, an OutOfBoundsDateTime exception will be raised when an out-of-range value is encountered for that unit when errors='raise'. (GH11758, GH13052, GH13059)

Previous behaviour:

```python
In [27]: pd.to_datetime(1420043460, unit='s', errors='coerce')
Out[27]: NaT

In [28]: pd.to_datetime(11111111, unit='D', errors='ignore')
OverflowError: Python int too large to convert to C long

In [29]: pd.to_datetime(11111111, unit='D', errors='raise')
OverflowError: Python int too large to convert to C long
```

New behaviour:

```python
In [2]: pd.to_datetime(1420043460, unit='s', errors='coerce')
Out[2]: Timestamp('2014-12-31 16:31:00')

In [3]: pd.to_datetime(11111111, unit='D', errors='ignore')
Out[3]: 11111111

In [4]: pd.to_datetime(11111111, unit='D', errors='raise')
OutOfBoundsDatetime: cannot convert input with unit 'D'
```

Other API changes

- `.swaplevel()` for Series, DataFrame, Panel, and MultiIndex now features defaults for its first two parameters `i` and `j` that swap the two innermost levels of the index. (GH12934)
- `.searchsorted()` for Index and TimedeltaIndex now accept a sorter argument to maintain compatibility with numpy's searchsorted function (GH12238)
- `Period` and `PeriodIndex` now raise IncompatibleFrequency error which inherits ValueError rather than raw ValueError (GH12615)
- `Series.apply` for category dtype now applies the passed function to each of the `.categories` (and not the `.codes`), and returns a category dtype if possible (GH12473)
- `read_csv` will now raise a TypeError if parse_dates is neither a boolean, list, or dictionary (matches the doc-string) (GH5636)
- The default for `.query()/.eval()` is now engine=None, which will use numexpr if it's installed; otherwise it will fallback to the python engine. This mimics the pre-0.18.1 behavior if numexpr is installed (and which, previously, if numexpr was not installed, .query()/.eval() would raise). (GH12749)
- `pd.concat(ignore_index=True)` now uses `RangeIndex` as default (GH12695)
- `pd.merge()` and DataFrame.join() will show a UserWarning when merging/joining a single- with a multi-leveled dataframe (GH9455, GH12219)
• Compat with scipy > 0.17 for deprecated piecewise_polynomial interpolation method; support for the replacement from_derivatives method (GH12887)

Deprecations

• The method name Index.sym_diff() is deprecated and can be replaced by Index.symmetric_difference() (GH12591)
• The method name Categorical.sort() is deprecated in favor of Categorical.sort_values() (GH12882)

Performance improvements

• Improved speed of SAS reader (GH12656, GH12961)
• Performance improvements in .groupby().cumcount() (GH11039)
• Improved memory usage in pd.read_csv() when using skiprows=an_integer (GH13005)
• Improved performance of DataFrame.to_sql when checking case sensitivity for tables. Now only checks if table has been created correctly when table name is not lower case. (GH12876)
• Improved performance of Period construction and time series plotting (GH12903, GH11831).
• Improved performance of .str.encode() and .str.decode() methods (GH13008)
• Improved performance of to_numeric if input is numeric dtype (GH12777)
• Improved performance of sparse arithmetic with IntIndex (GH13036)

Bug fixes

• usecols parameter in pd.read_csv is now respected even when the lines of a CSV file are not even (GH12203)
• Bug in groupby.transform(...) when axis=1 is specified with a non-monotonic ordered index (GH12713)
• Bug in Period and PeriodIndex creation raises KeyError if freq="Minute" is specified. Note that “Minute” freq is deprecated in v0.17.0, and recommended to use freq="T" instead (GH11854)
• Bug in .resample(...).count() with a PeriodIndex always raising a TypeError (GH12774)
• Bug in .resample(...) with a PeriodIndex casting to a DatetimeIndex when empty (GH12868)
• Bug in .resample(...) with a PeriodIndex when resampling to an existing frequency (GH12770)
• Bug in printing data which contains Period with different freq raises ValueError (GH12615)
• Bug in Series construction with Categorical and dtype='category' is specified (GH12574)
• Bugs in concatenation with a coercible dtype was too aggressive, resulting in different dtypes in output formatting when an object was longer than display.max_rows (GH12411, GH12045, GH11594, GH10571, GH12211)
• Bug in float_format option with option not being validated as a callable. (GH12706)
• Bug in GroupBy.filter when dropna=False and no groups fulfilled the criteria (GH12768)
• Bug in .name of .cum* functions (GH12021)
• Bug in .astype() of a Float64Inde/Int64Index to an Int64Index (GH12881)
- Bug in round tripping an integer based index in `.to_json()`/.read_json() when `orient='index'` (the default) (GH12866)
- Bug in plotting Categorical dtypes cause error when attempting stacked bar plot (GH13019)
- Compat with >= numpy 1.11 for NaT comparisons (GH12969)
- Bug in `.drop()` with a non-unique MultiIndex. (GH12701)
- Bug in `.concat` of datetime tz-aware and naive DataFrames (GH12467)
- Bug in correctly raising a `ValueError` in `.resample(..).fillna(..)` when passing a non-string (GH12952)
- Bug fixes in various encoding and header processing issues in `pd.read_sas()` (GH12659, GH12654, GH12647, GH12809)
- Bug in `pd.crosstab()` where would silently ignore `aggfunc if values=None` (GH12569).
- Potential segfault in `DataFrame.to_json` when serialising `datetime.time` (GH11473).
- Potential segfault in `DataFrame.to_json` when attempting to serialise 0d array (GH11299).
- Segfault in `to_json` when attempting to serialise a DataFrame or Series with non-ndarray values; now supports serialization of category, sparse, and `datetime64[ns, tz]` dtypes (GH10778).
- Bug in `DataFrame.to_json` with unsupported dtype not passed to default handler (GH12554).
- Bug in `.align not returning the sub-class (GH12983)
- Bug in aligning a Series with a DataFrame (GH13037)
- Bug in ABCPanel in which Panel4D was not being considered as a valid instance of this generic type (GH12810)
- Bug in consistency of `.name` on `.groupby(..).apply(..)` cases (GH12363)
- Bug in `Timestamp.__repr__` that caused `pprint` to fail in nested structures (GH12622)
- Bug in `Timedelta.min` and `Timedelta.max`, the properties now report the true minimum/maximum `timedeltas` as recognized by pandas. See the documentation. (GH12727)
- Bug in `.quantile()` with interpolation may coerce to float unexpectedly (GH12772)
- Bug in `.quantile()` with empty Series may return scalar rather than empty Series (GH12772)
- Bug in `.loc with out-of-bounds in a large indexer would raise `IndexError` rather than `KeyError` (GH12527)
- Bug in resampling when using a `TimedeltaIndex` and `.asfreq()`, would previously not include the final fencepost (GH12926)
- Bug in equality testing with a `Categorical` in a `DataFrame` (GH12564)
- Bug in `GroupBy.first()`, `.last()` returns incorrect row when `TimeGrouper` is used (GH7453)
- Bug in `pd.read_csv()` with the `c` engine when specifying `skiprows` with newlines in quoted items (GH10911, GH12775)
- Bug in `DataFrame timezone lost when assigning tz-aware datetime Series with alignment` (GH12981)
- Bug in `.value_counts()` when `normalize=True` and `dropna=True` where nulls still contributed to the normalized count (GH12558)
- Bug in `Series.value_counts()` loses name if its dtype is category (GH12835)
- Bug in `Series.value_counts()` loses timezone info (GH12835)
- Bug in `Series.value_counts(normalize=True)` with Categorical raises UnboundLocalError (GH12835)
- Bug in `Panel.fillna()` ignoring `inplace=True` (GH12633)
- Bug in pd.read_csv() when specifying `names`, `usecols`, and `parse_dates` simultaneously with the c engine (GH9755)
- Bug in pd.read_csv() when specifying `delim_whitespace=True` and `lineterminator` simultaneously with the c engine (GH12912)
- Bug in `Series.rename`, `DataFrame.rename` and `DataFrame.rename_axis` not treating Series as mappings to relabel (GH12623).
- Clean in `.rolling.min` and `.rolling.max` to enhance dtype handling (GH12373)
- Bug in `groupby` where complex types are coerced to float (GH12902)
- Bug in `Series.map` raises `TypeError` if its dtype is category or tz-aware datetime (GH12473)
- Bugs on 32bit platforms for some test comparisons (GH12972)
- Bug in index coercion when falling back from `RangeIndex` construction (GH12893)
- Better error message in window functions when invalid argument (e.g. a float window) is passed (GH12669)
- Bug in slicing subclassed `DataFrame` defined to return subclassed `Series` may return normal `Series` (GH11559)
- Bug in `.str` accessor methods may raise `ValueError` if input has name and the result is `DataFrame` or `MultiIndex` (GH12617)
- Bug in `DataFrame.last_valid_index()` and `DataFrame.first_valid_index()` on empty frames (GH12800)
- Bug in `CategoricalIndex.get_loc` returns different result from regular `Index` (GH12531)
- Bug in `PeriodIndex.resample` where name not propagated (GH12576)
- Bug in `date_range` closed keyword and timezones (GH12684).
- Bug in pd.concat raises `AttributeError` when input data contains tz-aware datetime and timedelta (GH12620)
- Bug in pd.concat did not handle empty `Series` properly (GH11082)
- Bug in `.plot.bar` alignment when width is specified with `int` (GH12979)
- Bug in `fill_value` is ignored if the argument to a binary operator is a constant (GH12723)
- Bug in pd.read_html() when using bs4 flavor and parsing table with a header and only one column (GH9178)
- Bug in `.pivot_table` when `margins=True` and `dropna=True` where nulls still contributed to margin count (GH12577)
- Bug in `.pivot_table` when `dropna=False` where table index/column names disappear (GH12133)
- Bug in pd.crosstab() when `margins=True` and `dropna=False` which raised (GH12642)
- Bug in `Series.name` when name attribute can be a hashable type (GH12610)
- Bug in `.describe()` resets categorical columns information (GH11558)
- Bug where `loffset` argument was not applied when calling `resample().count()` on a timeseries (GH12725)
- `pd.read_excel()` now accepts column names associated with keyword argument `names` (GH12870)
• Bug in `pd.to_numeric()` with `Index` returns `np.ndarray`, rather than `Index` (GH12777)
• Bug in `pd.to_numeric()` with `datetime-like` may raise `TypeError` (GH12777)
• Bug in `pd.to_numeric()` with scalar raises `ValueError` (GH12777)

5.11.2 Version 0.18.0 (March 13, 2016)

This is a major release from 0.17.1 and includes a small number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

**Warning:** pandas >= 0.18.0 no longer supports compatibility with Python version 2.6 and 3.3 (GH7718, GH11273)

**Warning:** numexpr version 2.4.4 will now show a warning and not be used as a computation back-end for pandas because of some buggy behavior. This does not affect other versions (>= 2.1 and >= 2.4.6). (GH12489)

Highlights include:

- Moving and expanding window functions are now methods on Series and DataFrame, similar to `.groupby`, see [here](#).
- Adding support for a `RangeIndex` as a specialized form of the `Int64Index` for memory savings, see [here](#).
- API breaking change to the `.resample` method to make it more `.groupby` like, see [here](#).
- Removal of support for positional indexing with floats, which was deprecated since 0.14.0. This will now raise a `TypeError`, see [here](#).
- The `.to_xarray()` function has been added for compatibility with the `xarray` package, see [here](#).
- The `read_sas` function has been enhanced to read `sas7bdat` files, see [here](#).
- Addition of the `.str.extractall()` method, and API changes to the `.str.extract()` method and `.str.cat()` method.
- `pd.test()` top-level nose test runner is available (GH4327).

Check the [API Changes](#) and [deprecations](#) before updating.

What’s new in v0.18.0

- **New features**
  - Window functions are now methods
  - Changes to rename
  - Range Index
  - Changes to `str.extract`
  - Addition of `str.extractall`
  - Changes to `str.cat`
  - Datetimelike rounding
  - Formatting of integers in `FloatIndex`
  - Changes to `dtype` assignment behaviors
  - Method to `xarray`
  - Latex representation
pd.read_sas() changes

Other enhancements

• Backwards incompatible API changes
  – NaT andTimedelta operations
  – Changes to msgpack
  – Signature change for .rank
  – Bug in QuarterBegin with n=0
  – Resample API
    • Downsampling
    • Upsampling
      • Previous API will work but with deprecations
  – Changes to eval
  – Other API changes
  – Deprecations
    – Removal of deprecated float indexers
    – Removal of prior version deprecations/changes

• Performance improvements

• Bug fixes

• Contributors

New features

Window functions are now methods

Window functions have been refactored to be methods on Series/DataFrame objects, rather than top-level functions, which are now deprecated. This allows these window-type functions, to have a similar API to that of .groupby. See the full documentation here (GH11603, GH12373)

In [1]: np.random.seed(1234)

In [2]: df = pd.DataFrame({'A': range(10), 'B': np.random.randn(10)})

In [3]: df
Out[3]:
     A      B
0  0.0  0.471435
1  1.0 -1.190976
2  2.0  1.432707
3  3.0 -0.312652
4  4.0 -0.720589
5  5.0  0.887163
6  6.0  0.859588
7  7.0 -0.636524
8  8.0  0.015696

(continues on next page)
Previous behavior:

```python
In [8]: pd.rolling_mean(df, window=3)
FutureWarning: pd.rolling_mean is deprecated for DataFrame and will be removed in a future version, replace with DataFrame.rolling(window=3,center=False).mean()
```

```python
Out[8]:
   A     B
0 NaN   NaN
1 NaN   NaN
2  1  0.237722
3  3  0.331667
4  5  0.342054
5  7  0.370076
6  9  0.079587
7 11  0.954504
```

New behavior:

```python
In [4]: r = df.rolling(window=3)
```

These show a descriptive repr

```python
In [5]: r
Out[5]: Rolling [window=3,center=False,axis=0]
```

with tab-completion of available methods and properties.

```python
In [9]: r.<TAB> # noqa E225, E999
   r.A   r.agg   r.apply   r.count   r.exclusions r.max   r.
   r.median   r.name   r.skew   r.sum
   r.B   r.aggregate r.corr   r.cov   r.kurt   r.mean   r.
   r.min   r.quantile r.std   r.var
```

The methods operate on the `Rolling` object itself

```python
In [6]: r.mean()
```

```python
Out[6]:
   A     B
0 NaN   NaN
1 NaN   NaN
2  1.0  0.237722
3  3.0 -0.023640
4  5.0  0.133155
5  7.0 -0.048693
6  9.0  0.342054
7 11.0  0.370076
8 13.0  0.079587
9 15.0 -0.954504
```

[10 rows x 2 columns]
They provide getitem accessors

```python
In [7]: r['A'].mean()
Out[7]:
   0   NaN
   1   NaN
   2   1.0
   3   2.0
   4   3.0
   5   4.0
   6   5.0
   7   6.0
   8   7.0
   9   8.0
Name: A, Length: 10, dtype: float64
```

And multiple aggregations

```python
In [8]: r.agg({'A': ['mean', 'std'],
       ...:     'B': ['mean', 'std']})
```

```python
Out[8]:
     A         B
    mean  std     mean  std
   0  NaN   NaN  NaN   NaN
   1      1.0  0.237722  1.327364
   2      2.0  0.023640  1.335505
   3      3.0  0.133155  1.143778
   4      4.0 -0.048693  1.335505
   5      5.0  0.342054  0.920379
   6      6.0  0.370076  0.871850
   7      7.0  0.795870  0.750099
   8      8.0 -0.954504  1.162285
[10 rows x 4 columns]
```

Changes to rename

Series.rename and NDFrame.rename_axis can now take a scalar or list-like argument for altering the Series or axis name, in addition to their old behaviors of altering labels. (GH9494, GH11965)

```python
In [9]: s = pd.Series(np.random.randn(5))
In [10]: s.rename('newname')
Out[10]:
   0   1.150036
   1   0.991946
   2   0.953324
   3  -2.021255
   4  -0.334077
Name: newname, Length: 5, dtype: float64
```

```python
In [11]: df = pd.DataFrame(np.random.randn(5, 2))
In [12]: (df.rename_axis("indexname")
```

(continues on next page)
The new functionality works well in method chains. Previously these methods only accepted functions or dicts mapping a \textit{label} to a new label. This continues to work as before for function or dict-like values.

**Range Index**

A \texttt{RangeIndex} has been added to the \texttt{Int64Index} sub-classes to support a memory saving alternative for common use cases. This has a similar implementation to the python range object (\texttt{xrange} in python 2), in that it only stores the start, stop, and step values for the index. It will transparently interact with the user API, converting to \texttt{Int64Index} if needed.

This will now be the default constructed index for \texttt{NDFrame} objects, rather than previous an \texttt{Int64Index}. (GH939, GH12070, GH12071, GH12109, GH12888)

Previous behavior:

```python
In [3]: s = pd.Series(range(1000))
In [4]: s.index
Out[4]:
Int64Index([0, 1, 2, 3, 4, 5, 6, 7, 8, 9, ...
         990, 991, 992, 993, 994, 995, 996, 997, 998, 999], dtype='int64',
         length=1000)
In [6]: s.index.nbytes
Out[6]: 8000
```

New behavior:

```python
In [13]: s = pd.Series(range(1000))
In [14]: s.index
Out[14]: RangeIndex(start=0, stop=1000, step=1)
In [15]: s.index.nbytes
Out[15]: 128
```
Changes to \texttt{str.extract}

The \texttt{.str.extract} method takes a regular expression with capture groups, finds the first match in each subject string, and returns the contents of the capture groups (GH11386).

In v0.18.0, the \texttt{expand} argument was added to \texttt{extract}.

- \texttt{expand=False}: it returns a Series, Index, or DataFrame, depending on the subject and regular expression pattern (same behavior as pre-0.18.0).
- \texttt{expand=True}: it always returns a DataFrame, which is more consistent and less confusing from the perspective of a user.

Currently the default is \texttt{expand=None} which gives a \texttt{FutureWarning} and uses \texttt{expand=False}. To avoid this warning, please explicitly specify \texttt{expand}.

```
In [1]: pd.Series(['a1', 'b2', 'c3']).str.extract(r'\[ab\](\d)', expand=None)
FutureWarning: currently extract(expand=None) means expand=False (return Index/Series/DataFrame)
but in a future version of pandas this will be changed to expand=True (return DataFrame)

Out[1]:
      0
   1   1
   2   2
Name: A, dtype: object
```

Extracting a regular expression with one group returns a Series if \texttt{expand=False}.

```
In [16]: pd.Series(['a1', 'b2', 'c3']).str.extract(r'\[ab\](\d)', expand=False)
Out[16]:
   0   1
   1   2
   2  NaN
Length: 3, dtype: object
```

It returns a DataFrame with one column if \texttt{expand=True}.

```
In [17]: pd.Series(['a1', 'b2', 'c3']).str.extract(r'\[ab\](\d)', expand=True)
Out[17]:
   0
   0   1
   1   2
   2  NaN
[3 rows x 1 columns]
```

Calling on an Index with a regex with exactly one capture group returns an Index if \texttt{expand=False}.

```
In [18]: s = pd.Series(['a1', 'b2', 'c3'], ['A11', 'B22', 'C33'])
In [19]: s.index
Out[19]: Index(['A11', 'B22', 'C33'], dtype='object')
In [20]: s.index.str.extract("(?P<letter>[a-zA-Z])", expand=False)
Out[20]: Index(['A', 'B', 'C'], dtype='object', name='letter')
```

It returns a DataFrame with one column if \texttt{expand=True}.
In [21]: s.index.str.extract("(?P<letter>[a-zA-Z])", expand=True)
Out[21]:
   letter
0   A
1   B
2   C
[3 rows x 1 columns]

Calling on an Index with a regex with more than one capture group raises ValueError if expand=False.

>>> s.index.str.extract("(?P<letter>[a-zA-Z])\([0-9]+\)", expand=False)
ValueError: only one regex group is supported with Index

It returns a DataFrame if expand=True.

In [22]: s.index.str.extract("(?P<letter>[a-zA-Z])\([0-9]+\)", expand=True)
Out[22]:
   letter  1
0      A  11
1      B  22
2      C  33
[3 rows x 2 columns]

In summary, extract(expand=True) always returns a DataFrame with a row for every subject string, and a column for every capture group.

Addition of str.extractall

The .str.extractall method was added (GH11386). Unlike extract, which returns only the first match.

In [23]: s = pd.Series(['a1a2', 'b1', 'c1'], ['A', 'B', 'C'])
In [24]: s
Out[24]:
   A   a1a2
   B    b1
   C    c1
Length: 3, dtype: object
In [25]: s.str.extractall(r"(?P<letter>[ab])(?P<digit>\d)\", expand=False)
Out[25]:
   letter digit
A   a   1
B   b   1
C  NaN  NaN
[3 rows x 2 columns]

The extractall method returns all matches.

In [26]: s.str.extractall(r"(?P<letter>[ab])(?P<digit>\d)\")
Out[26]:
   letterdigit
match
(continues on next page)
Changes to `str.cat`

The method `.str.cat()` concatenates the members of a Series. Before, if NaN values were present in the Series, calling `.str.cat()` on it would return NaN, unlike the rest of the Series.str.* API. This behavior has been amended to ignore NaN values by default. (GH11435).

A new, friendlier ValueError is added to protect against the mistake of supplying the `sep` as an arg, rather than as a kwarg. (GH11334).

In [27]: pd.Series(['a', 'b', np.nan, 'c']).str.cat(sep=' ')
Out[27]: 'a b c'

In [28]: pd.Series(['a', 'b', np.nan, 'c']).str.cat(sep=' ', na_rep='?')
Out[28]: 'a b ? c'

Datetimelike rounding

DatetimeIndex, Timestamp, TimedeltaIndex, Timedelta have gained the .round(), .floor() and .ceil() method for datetimelike rounding, flooring and ceiling. (GH4314, GH11963)

Naive datetimes

In [29]: dr = pd.date_range('20130101 09:12:56.1234', periods=3)
In [30]: dr
Out[30]: DatetimeIndex(['2013-01-01 09:12:56.123400', '2013-01-02 09:12:56.123400',
 '2013-01-03 09:12:56.123400'],
 dtype='datetime64[ns]', freq='D')

In [31]: dr.round('s')
Out[31]: DatetimeIndex(['2013-01-01 09:12:56', '2013-01-02 09:12:56',
 '2013-01-03 09:12:56'],
 dtype='datetime64[ns]', freq=None)

# Timestamp scalar
In [32]: dr[0]
Out[32]: Timestamp('2013-01-01 09:12:56.123400', freq='D')

In [33]: dr[0].round('10s')
Out[33]: Timestamp('2013-01-01 09:13:00')

Tz-aware are rounded, floored and ceiled in local times
In [34]: dr = dr.tz_localize('US/Eastern')

In [35]: dr
Out[35]:
DatetimeIndex(["2013-01-01 09:12:56.123400-05:00",
   '2013-01-02 09:12:56.123400-05:00",
   '2013-01-03 09:12:56.123400-05:00'],
dtype='datetime64[ns, US/Eastern]', freq=None)

In [36]: dr.round('s')
Out[36]:
DatetimeIndex(["2013-01-01 09:12:56-05:00", '2013-01-02 09:12:56-05:00',
   '2013-01-03 09:12:56-05:00'],
dtype='datetime64[ns, US/Eastern]', freq=None)

Timedeltas

In [37]: t = pd.timedelta_range('1 days 2 hr 13 min 45 us', periods=3, freq='d')

In [38]: t
Out[38]:
TimedeltaIndex(["1 days 02:13:00.000045", '2 days 02:13:00.000045',
   '3 days 02:13:00.000045'],
dtype='timedelta64[ns]', freq='D')

In [39]: t.round('10min')
Out[39]: TimedeltaIndex(["1 days 02:10:00", '2 days 02:10:00', '3 days 02:10:00'],
dtype='timedelta64[ns]', freq=None)

In addition, .round(), .floor() and .ceil() will be available through the .dt accessor of Series.

In [40]: t[0]
Out[40]: Timedelta('1 days 02:13:00.000045')

In [41]: t[0].round('2h')
Out[41]: Timedelta('1 days 02:00:00')

In [42]: s = pd.Series(dr)

In [43]: s
Out[43]:
0   2013-01-01 09:12:56.123400-05:00
1   2013-01-02 09:12:56.123400-05:00
2   2013-01-03 09:12:56.123400-05:00
Length: 3, dtype: datetime64[ns, US/Eastern]

In [44]: s.dt.round('D')
Out[44]:
0   2013-01-01 00:00:00-05:00
1   2013-01-02 00:00:00-05:00
2   2013-01-03 00:00:00-05:00
Length: 3, dtype: datetime64[ns, US/Eastern]
Formatting of integers in FloatIndex

Integers in FloatIndex, e.g. 1., are now formatted with a decimal point and a 0 digit, e.g. 1.0 (GH11713) This change not only affects the display to the console, but also the output of IO methods like .to_csv or .to_html.

Previous behavior:

```python
In [2]: s = pd.Series([1, 2, 3], index=np.arange(3.))
In [3]: s
Out[3]:
0   1
1   2
2   3
dtype: int64
In [4]: s.index
Out[4]: Float64Index([0.0, 1.0, 2.0], dtype='float64')
In [5]: print(s.to_csv(path=None))
0,1
1,2
2,3
```

New behavior:

```python
In [45]: s = pd.Series([1, 2, 3], index=np.arange(3.))
In [46]: s
Out[46]:
0.0  1
1.0  2
2.0  3
Length: 3, dtype: int64
In [47]: s.index
Out[47]: Float64Index([0.0, 1.0, 2.0], dtype='float64')
In [48]: print(s.to_csv(path_or_buf=None, header=False))
0.0,1
1.0,2
2.0,3
```

Changes to dtype assignment behaviors

When a DataFrame’s slice is updated with a new slice of the same dtype, the dtype of the DataFrame will now remain the same. (GH10503)

Previous behavior:

```python
In [5]: df = pd.DataFrame({'a': [0, 1, 1],
                       'b': pd.Series([100, 200, 300], dtype='uint32')})
In [7]: df.dtypes
Out[7]:
a    int64
b    uint32
```

(continues on next page)
### New behavior:

```
In [49]: df = pd.DataFrame({'a': [0, 1, 1],
                        'b': pd.Series([100, 200, 300], dtype='uint32')})

In [50]: df.dtypes
Out[50]:
a    int64
b    uint32
Length: 2, dtype: object

In [51]: ix = df['a'] == 1

In [52]: df.loc[ix, 'b'] = df.loc[ix, 'b']

In [53]: df.dtypes
Out[53]:
a    int64
b    uint32
Length: 2, dtype: object
```

When a DataFrame’s integer slice is partially updated with a new slice of floats that could potentially be down-casted to integer without losing precision, the dtype of the slice will be set to float instead of integer.

### Previous behavior:

```
In [4]: df = pd.DataFrame(np.array(range(1,10)).reshape(3,3),
                      columns=list('abc'),
                      index=[[4,4,8], [8,10,12]])

In [5]: df
Out[5]:
    a  b  c
4  8  1  2  3
10 4  5  6
8 12  7  8  9

In [7]: df.ix[4, 'c'] = np.array([0., 1.])

In [8]: df
Out[8]:
    a  b  c
4  8  1  2  0
```

(continues on next page)
New behavior:

```
In [54]: df = pd.DataFrame(np.array(range(1,10)).reshape(3,3),
    ....:    columns=list('abc'),
    ....:    index=[[4,4,8], [8,10,12]])
```

```
In [55]: df
Out[55]:
   a  b  c
4  8  1  2  3
10 4  5  6
  8 12  7  8  9
[3 rows x 3 columns]
```

```
In [56]: df.loc[4, 'c'] = np.array([0., 1.])
In [57]: df
Out[57]:
   a  b  c
4  8  1  2  0.0
10 4  5  1.0
  8 12  7  8  9.0
[3 rows x 3 columns]
```

**Method to_xarray**

In a future version of pandas, we will be deprecating `Panel` and other > 2 ndim objects. In order to provide for continuity, all `NDFrame` objects have gained the `.to_xarray()` method in order to convert to `xarray` objects, which has a pandas-like interface for > 2 ndim. (GH11972)

See the `xarray` full-documentation here.

```
In [1]: p = Panel(np.arange(2*3*4).reshape(2,3,4))
In [2]: p.to_xarray()
Out[2]:
<xarray.DataArray (items: 2, major_axis: 3, minor_axis: 4)>
array([[ 0,  1,  2,  3],
        [ 4,  5,  6,  7],
        [ 8,  9, 10, 11]],
       [[12, 13, 14, 15],
        [16, 17, 18, 19],
        [20, 21, 22, 23]])
Coordinates:
* items    (items) int64  0  1
* major_axis (major_axis) int64 0 1 2
* minor_axis (minor_axis) int64 0 1 2 3
```
Latex representation

Dataframe has gained a \_repr\_latex\_() method in order to allow for conversion to latex in a ipython/jupyter notebook using nbconvert. (GH11778)

Note that this must be activated by setting the option pd.display.latex.repr=True (GH12182)

For example, if you have a jupyter notebook you plan to convert to latex using nbconvert, place the statement pd.display.latex.repr=True in the first cell to have the contained DataFrame output also stored as latex.

The options display.latex.escape and display.latex.longtable have also been added to the configuration and are used automatically by the to_latex method. See the available options docs for more info.

pd.read_sas() changes

read_sas has gained the ability to read SAS7BDAT files, including compressed files. The files can be read in entirety, or incrementally. For full details see here. (GH4052)

Other enhancements

- Handle truncated floats in SAS xport files (GH11713)
- Added option to hide index in Series.to_string (GH11729)
- read_excel now supports s3 urls of the format s3://bucketname/filename (GH11447)
- add support for AWS_S3_HOST env variable when reading from s3 (GH12198)
- A simple version of Panel.round() is now implemented (GH11763)
- For Python 3.x, round(DataFrame), round(Series), round(Panel) will work (GH11763)
- sys.getsizeof(obj) returns the memory usage of a pandas object, including the values it contains (GH11597)
- Series gained an is_unique attribute (GH11946)
- DataFrame.quantile and Series.quantile now accept interpolation keyword (GH10174).
- Added DataFrame.style.format for more flexible formatting of cell values (GH11692)
- DataFrame.select_dtypes now allows the np.float16 type code (GH11990)
- pivot_table() now accepts most iterables for the values parameter (GH12017)
- Added Google BigQuery service account authentication support, which enables authentication on remote servers. (GH11881, GH12572). For further details see here
- HDFStore is now iterable: for k in store is equivalent to for k in store.keys() (GH12221).
- Add missing methods/fields to .dt for Period (GH8848)
- The entire code base has been PEP-ified (GH12096)
Backwards incompatible API changes

- the leading white spaces have been removed from the output of `to_string(index=False)` method (GH11833)
- the `out` parameter has been removed from the `Series.round()` method. (GH11763)
- `DataFrame.round()` leaves non-numeric columns unchanged in its return, rather than raises. (GH11885)
- `DataFrame.head(0)` and `DataFrame.tail(0)` return empty frames, rather than `self`. (GH11937)
- `Series.head(0)` and `Series.tail(0)` return empty series, rather than `self`. (GH11937)
- `to_msgpack` and `read_msgpack` encoding now defaults to 'utf-8'. (GH12170)
- the order of keyword arguments to text file parsing functions (`.read_csv()`, `.read_table()`, `.read_fwf()`) changed to group related arguments. (GH11555)
- `NaTType.isoformat` now returns the string 'NaT to allow the result to be passed to the constructor of Timestamp. (GH12300)

NaT and Timedelta operations

NaT and Timedelta have expanded arithmetic operations, which are extended to Series arithmetic where applicable. Operations defined for `datetime64[ns]` or `timedelta64[ns]` are now also defined for NaT (GH11564).

NaT now supports arithmetic operations with integers and floats.

```python
In [58]: pd.NaT * 1
Out[58]: NaT

In [59]: pd.NaT * 1.5
Out[59]: NaT

In [60]: pd.NaT / 2
Out[60]: NaT

In [61]: pd.NaT * np.nan
Out[61]: NaT
```

NaT defines more arithmetic operations with `datetime64[ns]` and `timedelta64[ns]`.

```python
In [62]: pd.NaT / pd.NaT
Out[62]: nan

In [63]: pd.Timedelta('1s') / pd.NaT
Out[63]: nan
```

NaT may represent either a `datetime64[ns]` null or a `timedelta64[ns]` null. Given the ambiguity, it is treated as a `timedelta64[ns]`, which allows more operations to succeed.

```python
In [64]: pd.NaT + pd.NaT
Out[64]: NaT

# same as
In [65]: pd.Timedelta('1s') + pd.Timedelta('1s')
Out[65]: Timedelta('0 days 00:00:02')
```

as opposed to
In [3]: pd.Timestamp('19900315') + pd.Timestamp('19900315')
TypeError: unsupported operand type(s) for +: 'Timestamp' and 'Timestamp'

However, when wrapped in a `Series` whose `dtype` is `datetime64[ns]` or `timedelta64[ns]`, the `dtype` information is respected.

In [1]: pd.Series([pd.NaT], dtype='<M8[ns]') + pd.Series([pd.NaT], dtype='<M8[ns]')
TypeError: can only operate on a datetimes for subtraction, but the operator `__add__` was passed

Out[66]:
0    NaT
Length: 1, dtype: timedelta64[ns]

Timedelta division by floats now works.

In [67]: pd.Timedelta('1s') / 2.0
Out[67]: Timedelta('0 days 00:00:00.500000')

Subtraction by Timedelta in a `Series` by a `Timestamp` works (GH11925)

In [68]: ser = pd.Series(pd.timedelta_range('1 day', periods=3))
In [69]: ser
Out[69]:
0   1 days
1   2 days
2   3 days
Length: 3, dtype: timedelta64[ns]

In [70]: pd.Timestamp('2012-01-01') - ser
Out[70]:
0   2011-12-31
1   2011-12-30
2   2011-12-29
Length: 3, dtype: datetime64[ns]

`NaT.isoformat()` now returns 'NaT'. This change allows `pd.Timestamp` to rehydrate any timestamp like object from its isoformat (GH12300).

**Changes to msgpack**

Forward incompatible changes in msgpack writing format were made over 0.17.0 and 0.18.0; older versions of pandas cannot read files packed by newer versions (GH12129, GH10527)

Bugs in `to_msgpack` and `read_msgpack` introduced in 0.17.0 and fixed in 0.18.0, caused files packed in Python 2 unreadable by Python 3 (GH12142). The following table describes the backward and forward compat of msgpacks.

<table>
<thead>
<tr>
<th>Packed with</th>
<th>Can be unpacked with</th>
</tr>
</thead>
<tbody>
<tr>
<td>pre-0.17 / Python 2</td>
<td>any</td>
</tr>
<tr>
<td>pre-0.17 / Python 3</td>
<td>any</td>
</tr>
<tr>
<td>0.17 / Python 2</td>
<td>• ==0.17 / Python 2</td>
</tr>
<tr>
<td></td>
<td>• &gt;=0.18 / any Python</td>
</tr>
<tr>
<td>0.17 / Python 3</td>
<td>&gt;=0.18 / any Python</td>
</tr>
<tr>
<td>0.18</td>
<td>&gt;= 0.18</td>
</tr>
</tbody>
</table>
0.18.0 is backward-compatible for reading files packed by older versions, except for files packed with 0.17 in Python 2, in which case only they can only be unpacked in Python 2.

**Signature change for .rank**

Series.rank and DataFrame.rank now have the same signature (GH11759)

Previous signature

```
In [3]: pd.Series([0,1]).rank(method='average', na_option='keep',
                ascending=True, pct=False)
Out[3]:
       0    1
      1    2
      dtype: float64

In [4]: pd.DataFrame([[0,1]], axis=0, numeric_only=None,
                   method='average', na_option='keep',
                   ascending=True, pct=False)
Out[4]:
   0  1  2
   0  1
   1  2
```

New signature

```
In [71]: pd.Series([0,1]).rank(axis=0, method='average', numeric_only=None,
                           na_option='keep', ascending=True, pct=False)
     ....:
     ....:
Out[71]:
       0    1.0
      1    2.0
      Length: 2, dtype: float64

In [72]: pd.DataFrame([[0,1]], axis=0, method='average', numeric_only=None,
                   na_option='keep', ascending=True, pct=False)
     ....:
     ....:
Out[72]:
   0  1.0
   1  2.0
   [2 rows x 1 columns]
```

**Bug in QuarterBegin with n=0**

In previous versions, the behavior of the QuarterBegin offset was inconsistent depending on the date when the \( n \) parameter was 0. (GH11406)

The general semantics of anchored offsets for \( n=0 \) is to not move the date when it is an anchor point (e.g., a quarter start date), and otherwise roll forward to the next anchor point.
In [73]: d = pd.Timestamp('2014-02-01')

In [74]: d
Out[74]: Timestamp('2014-02-01 00:00:00')

In [75]: d + pd.offsets.QuarterBegin(n=0, startingMonth=2)
Out[75]: Timestamp('2014-02-01 00:00:00')

In [76]: d + pd.offsets.QuarterBegin(n=0, startingMonth=1)
Out[76]: Timestamp('2014-04-01 00:00:00')

For the QuarterBegin offset in previous versions, the date would be rolled *backwards* if date was in the same month as the quarter start date.

In [3]: d = pd.Timestamp('2014-02-15')

In [4]: d + pd.offsets.QuarterBegin(n=0, startingMonth=2)
Out[4]: Timestamp('2014-02-01 00:00:00')

This behavior has been corrected in version 0.18.0, which is consistent with other anchored offsets like MonthBegin and YearBegin.

In [77]: d = pd.Timestamp('2014-02-15')

In [78]: d + pd.offsets.QuarterBegin(n=0, startingMonth=2)
Out[78]: Timestamp('2014-05-01 00:00:00')

**Resample API**

Like the change in the window functions API *above*, .resample(...) is changing to have a more groupby-like API. (GH11732, GH12702, GH12202, GH12332, GH12334, GH12348, GH12448).

In [79]: np.random.seed(1234)

In [80]: df = pd.DataFrame(np.random.rand(10, 4),
                   columns=list('ABCD'),
                   index=pd.date_range('2010-01-01 09:00:00',
                                       periods=10, freq='s'))

In [81]: df
Out[81]:
   A     B     C     D
0  0.19152  0.62211  0.43773  0.78536
1  0.77998  0.27259  0.27646  0.80187
2  0.95814  0.87593  0.35782  0.50099
3  0.68347  0.87593  0.35782  0.50099
4  0.93314  0.65138  0.39720  0.78873
5  0.36489  0.56809  0.86913  0.43617
6  0.80215  0.14377  0.70426  0.70458
7  0.21879  0.92487  0.44214  0.90931
8  0.15897  0.35077  0.17533  0.20616
9  0.74161  0.57142  0.74167  0.57142

[10 rows x 4 columns]
Previous API:

You would write a resampling operation that immediately evaluates. If a `how` parameter was not provided, it would default to `how='mean'`.

```python
In [6]: df.resample('2s')
Out [6]:
   A     B     C     D
2010-01-01 09:00:00  0.485748 0.447351 0.357096 0.793615
2010-01-01 09:00:02  0.820801 0.794317 0.364034 0.531096
2010-01-01 09:00:04  0.433985 0.314582 0.424104 0.625733
2010-01-01 09:00:06  0.624988 0.609738 0.633165 0.612452
2010-01-01 09:00:08  0.510470 0.534317 0.573201 0.806949
```

You could also specify a `how` directly.

```python
In [7]: df.resample('2s', how='sum')
Out[7]:
   A     B     C     D
2010-01-01 09:00:00  0.971495 0.894701 0.714192 1.587231
2010-01-01 09:00:02  1.641602 1.588635 0.728068 1.062191
2010-01-01 09:00:04  0.867969 0.629165 0.848208 1.251465
2010-01-01 09:00:06  1.249976 1.219477 1.266330 1.224904
2010-01-01 09:00:08  1.020940 1.068634 1.146402 1.613897
```

New API:

Now, you can write `.resample(..)` as a 2-stage operation like `.groupby(...)`, which yields a `Resampler`.

```python
In [82]: r = df.resample('2s')
In [83]: r
Out[83]: <pandas.core.resample.DatetimeIndexResampler object at 0x7f708c0d5a00>
```

Downsampling

You can then use this object to perform operations. These are downsampling operations (going from a higher frequency to a lower one).

```python
In [84]: r.mean()
Out[84]:
   A     B     C     D
2010-01-01 09:00:00  0.485748 0.447351 0.357096 0.793615
2010-01-01 09:00:02  0.820801 0.794317 0.364034 0.531096
2010-01-01 09:00:04  0.433985 0.314582 0.424104 0.625733
2010-01-01 09:00:06  0.624988 0.609738 0.633165 0.612452
2010-01-01 09:00:08  0.510470 0.534317 0.573201 0.806949
[5 rows x 4 columns]
```

```python
In [85]: r.sum()
Out[85]:
   A     B     C     D
2010-01-01 09:00:00  0.971495 0.894701 0.714192 1.587231
2010-01-01 09:00:02  1.641602 1.588635 0.728068 1.062191
2010-01-01 09:00:04  0.867969 0.629165 0.848208 1.251465
2010-01-01 09:00:06  1.249976 1.219477 1.266330 1.224904
2010-01-01 09:00:08  1.020940 1.068634 1.146402 1.613897
```

(continues on next page)
Furthermore, resample now supports \texttt{getitem} operations to perform the resample on specific columns.

\begin{verbatim}
In [86]: r[['A','C']].mean()
Out[86]:
        A    C
2010-01-01 09:00:00 0.485748 0.357096
2010-01-01 09:00:02 0.820801 0.364034
2010-01-01 09:00:04 0.433985 0.424104
2010-01-01 09:00:06 0.624988 0.633165
2010-01-01 09:00:08 0.510470 0.573201

[5 rows x 2 columns]
\end{verbatim}

and \texttt{aggregate} type operations.

\begin{verbatim}
In [87]: r.agg({'A' : 'mean', 'B' : 'sum'})
Out[87]:

        A    B
2010-01-01 09:00:00 0.485748 0.894701
2010-01-01 09:00:02 0.820801 1.588635
2010-01-01 09:00:04 0.433985 0.629165
2010-01-01 09:00:06 0.624988 1.219477
2010-01-01 09:00:08 0.510470 1.068634

[5 rows x 2 columns]
\end{verbatim}

These accessors can of course, be combined

\begin{verbatim}
In [88]: r[['A','B']].agg(['mean','sum'])
Out[88]:

          A     B
     mean  sum     mean  sum
2010-01-01 09:00:00 0.485748 0.971495 0.447351 0.894701
2010-01-01 09:00:02 0.820801 1.641602 0.794317 1.588635
2010-01-01 09:00:04 0.433985 0.867969 0.314582 0.629165
2010-01-01 09:00:06 0.624988 1.249976 0.609738 1.219477
2010-01-01 09:00:08 0.510470 1.020940 0.534317 1.068634

[5 rows x 4 columns]
\end{verbatim}

\section*{Upsampling}

Upsampling operations take you from a lower frequency to a higher frequency. These are now performed with the \texttt{Resampler} objects with \texttt{backfill()}, \texttt{ffill()}, \texttt{fillna()} and \texttt{asfreq()} methods.

\begin{verbatim}
In [89]: s = pd.Series(np.arange(5, dtype='int64'),
                 index=pd.date_range('2010-01-01', periods=5, freq='Q'))

In [90]: s
\end{verbatim}
Previously

```python
In [6]: s.resample('M', fill_method='ffill')
Out[6]:
2010-03-31  0
2010-04-30  0
2010-05-31  0
2010-06-30  1
2010-07-31  1
2010-08-31  1
2010-09-30  2
2010-10-31  2
2010-11-30  2
2010-12-31  3
2011-01-31  3
2011-02-28  3
2011-03-31  4
Freq: M, dtype: int64
```

New API

```python
In [91]: s.resample('M').ffill()
Out[91]:
2010-03-31  0
2010-04-30  0
2010-05-31  0
2010-06-30  1
2010-07-31  1
2010-08-31  1
2010-09-30  2
2010-10-31  2
2010-11-30  2
2010-12-31  3
2011-01-31  3
2011-02-28  3
2011-03-31  4
Freq: M, Length: 13, dtype: int64
```

**Note:** In the new API, you can either downsample OR upsample. The prior implementation would allow you to pass an aggregator function (like `mean`) even though you were upsampling, providing a bit of confusion.
**Warning:** This new API for resample includes some internal changes for the prior-to-0.18.0 API, to work with a deprecation warning in most cases, as the resample operation returns a deferred object. We can intercept operations and just do what the (pre 0.18.0) API did (with a warning). Here is a typical use case:

```python
In [4]: r = df.resample('2s')

In [6]: r*10
```

```
pandas/tseries/resample.py:80: FutureWarning: .resample() is now a deferred operation
use .resample(...).mean() instead of .resample(...)
```

```
Out[6]:
       A     B     C     D
2010-01-01 09:00:00  4.86  4.47  3.57  7.94
2010-01-01 09:00:02  8.21  7.94  3.64  5.31
2010-01-01 09:00:04  4.34  3.15  4.24  6.25
2010-01-01 09:00:06  6.25  6.00  6.33  6.12
2010-01-01 09:00:08  5.10  5.34  5.73  8.07
```

However, getting and assignment operations directly on a Resampler will raise a `ValueError`:

```python
In [7]: r.iloc[0] = 5
```

```
ValueError: .resample() is now a deferred operation
use .resample(...).mean() instead of .resample(...)
```

There is a situation where the new API can not perform all the operations when using original code. This code is intending to resample every 2s, take the mean AND then take the min of those results.

```python
In [4]: df.resample('2s').min()
```

```
Out[4]:
       A     B     C     D
2010-01-01 09:00:00  0.19  0.27  0.28  0.78
2010-01-01 09:00:02  0.68  0.71  0.36  0.50
2010-01-01 09:00:04  0.36  0.01  0.07  0.36
2010-01-01 09:00:06  0.32  0.56  0.39  0.43
2010-01-01 09:00:08  0.22  0.14  0.44  0.70
```

The new API will:

```python
In [92]: df.resample('2s').min()
```

```
Out[92]:
       A     B     C     D
2010-01-01 09:00:00  0.19  0.27  0.28  0.78
2010-01-01 09:00:02  0.68  0.71  0.36  0.50
2010-01-01 09:00:04  0.36  0.01  0.07  0.36
2010-01-01 09:00:06  0.32  0.56  0.39  0.43
2010-01-01 09:00:08  0.22  0.14  0.44  0.70
```

The good news is the return dimensions will differ between the new API and the old API, so this should loudly raise an exception.

To replicate the original operation:

```python
In [93]: df.resample('2s').mean().min()
```

```
Out[93]:
       A     B     C     D
0  0.43  0.31  0.36  0.50
1  0.43  0.31  0.36  0.50
2  0.43  0.31  0.36  0.50
3  0.43  0.31  0.36  0.50
4  0.43  0.31  0.36  0.50
```

Length: 4, dtype: float64
Changes to eval

In prior versions, new columns assignments in an eval expression resulted in an inplace change to the DataFrame. (GH9297, GH8664, GH10486)

In [94]: df = pd.DataFrame({'a': np.linspace(0, 10, 5), 'b': range(5)})
In [95]: df
Out[95]:
   a  b
0  0  0
1  2.5 1
2  5.0 2
3  7.5 3
4  10.0 4

[5 rows x 2 columns]

In [12]: df.eval('c = a + b')
FutureWarning: eval expressions containing an assignment currently default to operating inplace. This will change in a future version of pandas, use inplace=True to avoid this warning.
In [13]: df
Out[13]:
   a  b  c
0  0  0  0.0
1  2.5 1  3.5
2  5.0 2  7.0
3  7.5 3 10.5
4 10.0 4 14.0

In version 0.18.0, a new inplace keyword was added to choose whether the assignment should be done inplace or return a copy.

In [96]: df
Out[96]:
   a  b  c
0  0  0  0.0
1  2.5 1  3.5
2  5.0 2  7.0
3  7.5 3 10.5
4 10.0 4 14.0

[5 rows x 3 columns]

In [97]: df.eval('d = c - b', inplace=False)
Out[97]:
   a  b  c  d
0  0  0  0.0  0.0
1  2.5 1  3.5  2.5
2  5.0 2  7.0  5.0

(continues on next page)
3  7.5  3  10.5  7.5  
4  10.0  4  14.0  10.0

[5 rows x 4 columns]

In [98]: df
Out[98]:
   a   b   c
0  0.0  0.0
1  2.5  1.0
2  5.0  2.0
3  7.5  3.0
4 10.0  4.0

[5 rows x 3 columns]

In [99]: df.eval('d = c - b', inplace=True)

In [100]: df
Out[100]:
   a   b   c   d
0  0.0  0.0  0.0
1  2.5  1.0  2.5
2  5.0  2.0  5.0
3  7.5  3.0  7.5
4 10.0  4.0 10.0

[5 rows x 4 columns]

Warning: For backwards compatibility, inplace defaults to True if not specified. This will change in a future version of pandas. If your code depends on an inplace assignment you should update to explicitly set inplace=True

The inplace keyword parameter was also added the query method.

In [101]: df.query('a > 5')
Out[101]:
   a   b   c   d
3  7.5  3.0  7.5
4 10.0  4.0 10.0

[2 rows x 4 columns]

In [102]: df.query('a > 5', inplace=True)

In [103]: df
Out[103]:
   a   b   c   d
3  7.5  3.0  7.5
4 10.0  4.0 10.0

[2 rows x 4 columns]
Warning: Note that the default value for inplace in a query is False, which is consistent with prior versions.

eval has also been updated to allow multi-line expressions for multiple assignments. These expressions will be evaluated one at a time in order. Only assignments are valid for multi-line expressions.

```
In [104]: df
Out[104]:
   a  b  c  d
3  7.5 3 10.5  7.5
4 10.0 4 14.0 10.0
[2 rows x 4 columns]
In [105]: df.eval(""'
.....: e = d + a
.....: f = e - 22
.....: g = f / 2.0"'", inplace=True)
.....:
In [106]: df
Out[106]:
   a  b  c  d  e  f  g
3  7.5 3 10.5 15.0 -7.0 -3.5
4 10.0 4 14.0 20.0 -2.0 -1.0
[2 rows x 7 columns]
```

Other API changes

- `DataFrame.between_time` and `Series.between_time` now only parse a fixed set of time strings. Parsing of date strings is no longer supported and raises a `ValueError`. (GH11818)

```
In [107]: s = pd.Series(range(10), pd.date_range('2015-01-01', freq='H', periods=10))
In [108]: s.between_time("7:00am", "9:00am")
Out[108]:
2015-01-01 07:00:00    7
2015-01-01 08:00:00    8
2015-01-01 09:00:00    9
Freq: H, Length: 3, dtype: int64
```

This will now raise.

```
In [2]: s.between_time('20150101 07:00:00','20150101 09:00:00')
ValueError: Cannot convert arg ['20150101 07:00:00'] to a time.
```

- `.memory_usage()` now includes values in the index, as does `memory_usage` in `.info()` (GH11597)
- `DataFrame.to_latex()` now supports non-ascii encodings (eg utf-8) in Python 2 with the parameter `encoding` (GH7061)
- `pandas.merge()` and `DataFrame.merge()` will show a specific error message when trying to merge with an object that is not of type `DataFrame` or a subclass (GH12081)
DataFrame.unstack and Series.unstack now take fill_value keyword to allow direct replacement of missing values when an unstack results in missing values in the resulting DataFrame. As an added benefit, specifying fill_value will preserve the data type of the original stacked data. (GH9746)

As part of the new API for window functions and resampling, aggregation functions have been clarified, raising more informative error messages on invalid aggregations. (GH9052). A full set of examples are presented in groupby.

Statistical functions for NDFrame objects (like sum(), mean(), min()) will now raise if non-numpy-compatible arguments are passed in for **kwargs (GH12301)

.to_latex and .to_html gain a decimal parameter like .to_csv; the default is '.' (GH12031)

More helpful error message when constructing a DataFrame with empty data but with indices (GH8020)

.describe() will now properly handle bool dtype as a categorical (GH6625)

More helpful error message with an invalid .transform with user defined input (GH10165)

Exponentially weighted functions now allow specifying alpha directly (GH10789) and raise ValueError if parameters violate $0 < \alpha \leq 1$ (GH12492)

### Deprecations

- The functions pd.rolling_*, pd.expanding_*, and pd.ewm* are deprecated and replaced by the corresponding method call. Note that the new suggested syntax includes all of the arguments (even if default) (GH11603)

```python
In [1]: s = pd.Series(range(3))

In [2]: pd.rolling_mean(s,window=2,min_periods=1)
   FutureWarning: pd.rolling_mean is deprecated for Series and will be removed in a future version, replace with Series.rolling(min_periods=1,window=2,center=False).mean()

Out[2]:
   0    0.0
   1    0.5
   2    1.5
dtype: float64

In [3]: pd.rolling_cov(s, s, window=2)
   FutureWarning: pd.rolling_cov is deprecated for Series and will be removed in a future version, replace with Series.rolling(window=2).cov(other=<Series>)

Out[3]:
   0   NaN
   1    0.5
   2    0.5
dtype: float64
```

- The freq and how arguments to the .rolling, .expanding, and .ewm (new) functions are deprecated, and will be removed in a future version. You can simply resample the input prior to creating a window function. (GH11603).

For example, instead of s.rolling(window=5,freq='D').max() to get the max value on a rolling 5 Day window, one could use s.resample('D').mean().rolling(window=5).max(), which first resamples the data to daily data, then provides a rolling 5 day window.
• `pd.tseries.frequencies.get_offset_name` function is deprecated. Use offset’s `.freqstr` property as alternative (GH11192)

• `pandas.stats.fama_macbeth` routines are deprecated and will be removed in a future version (GH6077)

• `pandas.stats.ols`, `pandas.stats.plm` and `pandas.stats.var` routines are deprecated and will be removed in a future version (GH6077)

• show a `FutureWarning` rather than a `DeprecationWarning` on using long-time deprecated syntax in `HDFStore.select`, where the `where` clause is not a string-like (GH12027)

• The `pandas.options.display.mpl_style` configuration has been deprecated and will be removed in a future version of pandas. This functionality is better handled by matplotlib’s style sheets (GH11783).

Removal of deprecated float indexers

In GH4892 indexing with floating point numbers on a non-`Float64Index` was deprecated (in version 0.14.0). In 0.18.0, this deprecation warning is removed and these will now raise a `TypeError`. (GH12165, GH12333)

```python
In [109]: s = pd.Series([1, 2, 3], index=[4, 5, 6])
In [110]: s
Out[110]:
4 1
5 2
6 3
Length: 3, dtype: int64
In [111]: s2 = pd.Series([1, 2, 3], index=list('abc'))
In [112]: s2
Out[112]:
a 1
b 2
c 3
Length: 3, dtype: int64
```

Previous behavior:

```python
# this is label indexing
In [2]: s[5.0]
FutureWarning: scalar indexers for index type Int64Index should be integers and not floating point
Out[2]: 2

# this is positional indexing
In [3]: s.iloc[1.0]
FutureWarning: scalar indexers for index type Int64Index should be integers and not floating point
Out[3]: 2

# this is label indexing
In [4]: s.loc[5.0]
FutureWarning: scalar indexers for index type Int64Index should be integers and not floating point
Out[4]: 2

# .ix would coerce 1.0 to the positional 1, and index
```
In [5]: s2.ix[1.0] = 10
FutureWarning: scalar indexers for index type Index should be integers and not floating point

In [6]: s2
Out[6]:
   a  1
   b 10
   c  3
dtype: int64

New behavior:
For iloc, getting & setting via a float scalar will always raise.

In [3]: s.iloc[2.0]
TypeError: cannot do label indexing on <class 'pandas.indexes.numeric.Int64Index'>
with these indexers [2.0] of <type 'float'>

Other indexers will coerce to a like integer for both getting and setting. The FutureWarning has been dropped for .loc, .ix and [].

In [113]: s[5.0]
Out[113]: 2
In [114]: s.loc[5.0]
Out[114]: 2

and setting

In [115]: _copy = s.copy()
In [116]: _copy[5.0] = 10
In [117]: _copy
Out[117]:
   4   1
   5  10
   6   3
Length: 3, dtype: int64
In [118]: _copy = s.copy()
In [119]: _copy.loc[5.0] = 10
In [120]: _copy
Out[120]:
   4   1
   5  10
   6   3
Length: 3, dtype: int64

Positional setting with .ix and a float indexer will ADD this value to the index, rather than previously setting the value by position.

In [3]: s2.ix[1.0] = 10
In [4]: s2
Slicing will also coerce integer-like floats to integers for a non-Float64Index.

```
In [121]: s.loc[5.0:6]
Out[121]:
   5  2
   6  3
Length: 2, dtype: int64
```

Note that for floats that are NOT coercible to ints, the label based bounds will be excluded.

```
In [122]: s.loc[5.1:6]
Out[122]:
   6  3
Length: 1, dtype: int64
```

Float indexing on a Float64Index is unchanged.

```
In [123]: s = pd.Series([1, 2, 3], index=np.arange(3.))
In [124]: s[1.0]
Out[124]:
1.0	2
In [125]: s[1.0:2.5]
Out[125]:
1.0  2
2.0  3
Length: 2, dtype: int64
```

**Removal of prior version deprecations/changes**

- Removal of `rolling_corr_pairwise` in favor of `.rolling().corr(pairwise=True)` (GH4950)
- Removal of `expanding_corr_pairwise` in favor of `.expanding().corr(pairwise=True)` (GH4950)
- Removal of `DataMatrix` module. This was not imported into the pandas namespace in any event (GH12111)
- Removal of `cols` keyword in favor of `subset` in `DataFrame.duplicated()` and `DataFrame.drop_duplicates()` (GH6680)
- Removal of the `read_frame` and `frame_query` (both aliases for `pd.read_sql`) and `write_frame` (alias of `to_sql`) functions in the `pd.io.sql` namespace, deprecated since 0.14.0 (GH6292).
- Removal of the `order` keyword from `.factorize()` (GH6930)
Performance improvements

- Improved performance of andrews_curves (GH11534)
- Improved huge DatetimeIndex, PeriodIndex and TimedeltaIndex's ops performance including NaT (GH10277)
- Improved performance of pandas.concat (GH11958)
- Improved performance of StataReader (GH11591)
- Improved performance in construction of Categoricals with Series of datetimes containing NaT (GH12077)
- Improved performance of ISO 8601 date parsing for dates without separators (GH11899), leading zeros (GH11871) and with white space preceding the time zone (GH9714)

Bug fixes

- Bug in GroupBy.size when data-frame is empty. (GH11699)
- Bug in Period.end_time when a multiple of time period is requested (GH11738)
- Regression in .clip with tz-aware datetimes (GH11838)
- Bug in date_range when the boundaries fell on the frequency (GH11804, GH12409)
- Bug in consistency of passing nested dicts to .groupby(...).agg(...) (GH9052)
- Accept unicode in Timedelta constructor (GH11995)
- Bug in value label reading for StataReader when reading incrementally (GH12014)
- Bug in vectorized DateOffset when n parameter is 0 (GH11370)
- Compat for numpy 1.11 w.r.t. NaT comparison changes (GH12049)
- Bug in read_csv when reading from a StringIO in threads (GH11790)
- Bug in not treating NaT as a missing value in datetimelikes when factorizing & with Categoricals (GH12077)
- Bug in getitem when the values of a Series were tz-aware (GH12089)
- Bug in Series.str.get_dummies when one of the variables was 'name' (GH12180)
- Bug in pd.concat while concatenating tz-aware NaT series. (GH11693, GH11755, GH12217)
- Bug in pd.read_stata with version <= 108 files (GH12232)
- Bug in Series.resample using a frequency of Nano when the index is a DatetimeIndex and contains non-zero nanosecond parts (GH12037)
- Bug in resampling with .nunique and a sparse index (GH12352)
- Removed some compiler warnings (GH12471)
- Work around compat issues with boto in python 3.5 (GH11915)
- Bug in NaT subtraction from Timestamp or DatetimeIndex with timezones (GH11718)
- Bug in subtraction of Series of a single tz-aware Timestamp (GH12290)
- Use compat iterators in PY2 to support .next () (GH12299)
- Bug in Timedelta.round with negative values (GH11690)
• Bug in .loc against CategoricalIndex may result in normal Index (GH11586)
• Bug in DataFrame.info when duplicated column names exist (GH11761)
• Bug in .copy of datetime tz-aware objects (GH11794)
• Bug in Series.apply and Series.map where timedelta64 was not boxed (GH11349)
• Bug in DataFrame.set_index() with tz-aware Series (GH12358)
• Bug in subclasses of DataFrame where AttributeError did not propagate (GH11808)
• Bug in groupby on tz-aware data where selection not returning Timestamp (GH11616)
• Bug in pd.read_clipboard and pd.to_clipboard functions not supporting Unicode; upgrade included pyperclip to v1.5.15 (GH9263)
• Bug in DataFrame.query containing an assignment (GH8664)
• Bug in from_msgpack where __contains__() fails for columns of the unpacked DataFrame, if the DataFrame has object columns. (GH11880)
• Bug in .resample on categorical data with TimedeltaIndex (GH12169)
• Bug in timezone info lost when broadcasting scalar datetime to DataFrame (GH11682)
• Bug in Index creation from Timestamp with mixed tz coerces to UTC (GH11488)
• Bug in to_numeric where it does not raise if input is more than one dimension (GH11776)
• Bug in parsing timezone offset strings with non-zero minutes (GH11708)
• Bug in df.plot using incorrect colors for bar plots under matplotlib 1.5+ (GH11614)
• Bug in the groupby plot method when using keyword arguments (GH11805).
• Bug in DataFrame.duplicated and drop_duplicates causing spurious matches when setting keep=False (GH11864)
• Bug in .loc result with duplicated key may have Index with incorrect dtype (GH11497)
• Bug in pd.rolling_median where memory allocation failed even with sufficient memory (GH11696)
• Bug in DataFrame.style with spurious zeros (GH12134)
• Bug in DataFrame.style with integer columns not starting at 0 (GH12125)
• Bug in .style.bar may not rendered properly using specific browser (GH11678)
• Bug in rich comparison of Timedelta with a numpy.array of Timedelta that caused an infinite recursion (GH11835)
• Bug in DataFrame.round dropping column index name (GH11986)
• Bug in df.replace while replacing value in mixed dtype DataFrame (GH11698)
• Bug in Index prevents copying name of passed Index, when a new name is not provided (GH1193)
• Bug in read_excel failing to read any non-empty sheets when empty sheets exist and sheetname=None (GH11711)
• Bug in read_excel failing to raise NotImplemented error when keywords parse_dates and date_parser are provided (GH11544)
• Bug in read_sql with pymysql connections failing to return chunked data (GH11522)
• Bug in .to_csv ignoring formatting parameters decimal, na_rep, float_format for float indexes (GH11553)
- Bug in `Int64Index` and `Float64Index` preventing the use of the modulo operator (GH9244)
- Bug in `MultiIndex.drop` for not lexsorted MultiIndexes (GH12078)
- Bug in `DataFrame` when masking an empty `DataFrame` (GH11859)
- Bug in `.plot` potentially modifying the `colors` input when the number of columns didn’t match the number of series provided (GH12039).
- Bug in `Series.plot` failing when index has a `CustomBusinessDay` frequency (GH7222).
- Bug in `.to_sql` for `datetime.time` values with sqlite fallback (GH8341)
- Bug in `read_excel` failing to read data with one column when `squeeze=True` (GH12157)
- Bug in `read_excel` failing to read one empty column (GH12292, GH9002)
- Bug in `.groupby` where a `KeyError` was not raised for a wrong column if there was only one row in the dataframe (GH11741)
- Bug in `.read_csv` with dtype specified on empty data producing an error (GH12048)
- Bug in `.read_csv` where strings like `'2E'` are treated as valid floats (GH12237)
- Bug in building `pandas` with debugging symbols (GH12123)
- Removed `millisecond` property of `DatetimeIndex`. This would always raise a `ValueError` (GH12019).
- Bug in `Series` constructor with read-only data (GH11502)
- Removed `pandas._testing.choice()`. Should use `np.random.choice()`, instead. (GH12386)
- Bug in `.loc` setitem indexer preventing the use of a TZ-aware DatetimeIndex (GH12050)
- Bug in `.style` indexes and MultiIndexes not appearing (GH11655)
- Bug in `to_msgpack` and `from_msgpack` which did not correctly serialize or deserialize `NaT` (GH12307).
- Bug in `.skew` and `.kurt` due to roundoff error for highly similar values (GH11974)
- Bug in `Timestamp` constructor where microsecond resolution was lost if HHMMSS were not separated with `:` (GH10041)
- Bug in `buffer_rd_bytes src->buffer` could be freed more than once if reading failed, causing a segfault (GH12098)
- Bug in `crosstab` where arguments with non-overlapping indexes would return a `KeyError` (GH10291)
- Bug in `DataFrame.apply` in which reduction was not being prevented for cases in which `dtype` was not a `numpy` `dtype` (GH12244)
- Bug when initializing categorical series with a scalar value. (GH12336)
- Bug when specifying a UTC `DatetimeIndex` by setting `utc=True` in `.to_datetime` (GH11934)
- Bug when increasing the buffer size of CSV reader in `read_csv` (GH12494)
- Bug when setting columns of a `DataFrame` with duplicate column names (GH12344)

5.12 Version 0.17

5.12.1 Version 0.17.1 (November 21, 2015)

Note: We are proud to announce that pandas has become a sponsored project of the (NumFOCUS organization). This will help ensure the success of development of pandas as a world-class open-source project.

This is a minor bug-fix release from 0.17.0 and includes a large number of bug fixes along several new features, enhancements, and performance improvements. We recommend that all users upgrade to this version.

Highlights include:

• Support for Conditional HTML Formatting, see here
• Releasing the GIL on the csv reader & other ops, see here
• Fixed regression in DataFrame.drop_duplicates from 0.16.2, causing incorrect results on integer values (GH11376)

What’s new in v0.17.1

• New features
  – Conditional HTML formatting
• Enhancements
• API changes
  – Deprecations
• Performance improvements
• Bug fixes
• Contributors

New features

Conditional HTML formatting

Warning: This is a new feature and is under active development. We’ll be adding features an possibly making breaking changes in future releases. Feedback is welcome.

We’ve added experimental support for conditional HTML formatting: the visual styling of a DataFrame based on the data. The styling is accomplished with HTML and CSS. Accesses the styler class with the pandas.DataFrame.style, attribute, an instance of Styler with your data attached.

Here’s a quick example:

```
In [1]: np.random.seed(123)
In [2]: df = pd.DataFrame(np.random.randn(10, 5), columns=list("abcde"))
```
In [3]: html = df.style.background_gradient(cmap="viridis", low=0.5)

We can render the HTML to get the following table.
Styler interacts nicely with the Jupyter Notebook. See the documentation for more.

Enhancements

• DatetimeIndex now supports conversion to strings with astype(str) (GH10442)
• Support for compression (gzip/bz2) in pandas.DataFrame.to_csv() (GH7615)
• pd.read_* functions can now also accept pathlib.Path, or py._path.local.LocalPath objects for the filepath_or_buffer argument. (GH11033) - The DataFrame and Series functions .to_csv(), .to_html() and .to_latex() can now handle paths beginning with tildes (e.g. ~/Documents/)(GH11438)
• DataFrame now uses the fields of a namedtuple as columns, if columns are not supplied (GH11181)
• DataFrame.itertuples() now returns namedtuple objects, when possible. (GH11269, GH11625)
• Added axvlines_kwds to parallel coordinates plot (GH10709)
• Option to .info() and .memory_usage() to provide for deep introspection of memory consumption. Note that this can be expensive to compute and therefore is an optional parameter. (GH11595)

In [4]: df = pd.DataFrame({"A": ["foo"] * 1000})  # noqa: F821

In [5]: df["B"] = df["A"]:astype("category")

# shows the '+' as we have object dtypes
In [6]: df.info()
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 1000 entries, 0 to 999
Data columns (total 2 columns):
  # Column Non-Null Count Dtype
  --- ------ -------------- -----  
   0 A 1000 non-null object
   1 B 1000 non-null category
dtypes: category(1), object(1)
memory usage: 9.0+ KB

# we have an accurate memory assessment (but can be expensive to compute this)
In [7]: df.info(memory_usage="deep")
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 1000 entries, 0 to 999
Data columns (total 2 columns):
  # Column Non-Null Count Dtype
  --- ------ -------------- -----  
   0 A 1000 non-null object
   1 B 1000 non-null category
dtypes: category(1), object(1)
memory usage: 59.9 KB

• Index now has a fillna method (GH10089)
• **Series of type category** now make `.str.<...>` and `.dt.<...>` accessor methods / properties available, if the categories are of that type. (GH10661)

```python
In [9]: s = pd.Series(list("aabb")).astype("category")
Out[9]:
0  a
1  a
2  b
3  b
Length: 4, dtype: category
Categories (2, object): ['a', 'b']
```

```python
In [10]: s.str.contains("a")
Out[10]:
0   True
1   True
2  False
3  False
Length: 4, dtype: bool
```

```python
In [11]: date = pd.Series(pd.date_range("1/1/2015", periods=5)).astype("category")
Out[11]:
0  2015-01-01
1  2015-01-02
2  2015-01-03
3  2015-01-04
4  2015-01-05
Length: 5, dtype: category
Categories (5, datetime64[ns]): [2015-01-01, 2015-01-02, 2015-01-03, 2015-01-04, ...
→2015-01-05]
```

```python
In [12]: date.dt.day
Out[12]:
0    1
1    2
2    3
3    4
4    5
Length: 5, dtype: int64
```

• **pivot_table** now has a `margins_name` argument so you can use something other than the default of ‘All’ (GH3335)

• Implement export of `datetime64[ns, tz]` dtypes with a fixed HDF5 store (GH11411)

• Pretty printing sets (e.g. in DataFrame cells) now uses set literal syntax `{x, y}` instead of Legacy Python syntax `set([x, y])` (GH11215)

• Improve the error message in `pandas.io.gbq.to_gbq()` when a streaming insert fails (GH11285) and when the DataFrame does not match the schema of the destination table (GH11359)
API changes

- `raise NotImplementedError` in `Index.shift` for non-supported index types (GH8038)
- `min` and `max` reductions on `datetime64` and `timedelta64` dtyped series now result in `NaT` and not `nan` (GH11245).
- Indexing with a null key will raise a `TypeError`, instead of a `ValueError` (GH11356)
- `Series.ptp` will now ignore missing values by default (GH1163)

Deprecations

- The `pandas.io.ga` module which implements `google-analytics` support is deprecated and will be removed in a future version (GH11308)
- Deprecate the `engine` keyword in `.to_csv()`, which will be removed in a future version (GH11274)

Performance improvements

- Checking monotonic-ness before sorting on an index (GH11080)
- `Series.dropna` performance improvement when its dtype can’t contain `NaN` (GH11159)
- Release the GIL on most datetime field operations (e.g. `DatetimeIndex.year`, `Series.dt.year`), normalization, and conversion to and from `Period`, `DatetimeIndex.to_period` and `PeriodIndex.to_timestamp` (GH11263)
- Release the GIL on some rolling algos: `rolling_median`, `rolling_mean`, `rolling_max`, `rolling_min`, `rolling_var`, `rolling_kurt`, `rolling_skew` (GH11450)
- Release the GIL when reading and parsing text files in `.read_csv`, `.read_table` (GH11272)
- Improved performance of `rolling_median` (GH11450)
- Improved performance of `to_excel` (GH11352)
- Performance bug in repr of `Categorical` categories, which was rendering the strings before chopping them for display (GH11305)
- Performance improvement in `Categorical.remove_unused_categories`, (GH11643).
- Improved performance of `Series` constructor with no data and `DatetimeIndex` (GH11433)
- Improved performance of `shift`, `cumprod`, and `cumsum` with groupby (GH4095)

Bug fixes

- `SparseArray.__iter__()` now does not cause `PendingDeprecationWarning` in Python 3.5 (GH11622)
- Regression from 0.16.2 for output formatting of long floats/nan, restored in (GH11302)
- `Series.sort_index()` now correctly handles the `inplace` option (GH11402)
- Incorrectly distributed .c file in the build on PyPi when reading a csv of floats and passing `na_values=<a scalar>` would show an exception (GH11374)
- Bug in `.to_latex()` output broken when the index has a name (GH10660)
pandas: powerful Python data analysis toolkit, Release 1.2.2

• Bug in `HDFStore.append` with strings whose encoded length exceeded the max unencoded length (GH11234)
• Bug in merging `datetime64[ns, tz]` dtypes (GH11405)
• Bug in `HDFStore.select` when comparing with a numpy scalar in a where clause (GH11283)
• Bug in using `DataFrame.ix` with a MultiIndex indexer (GH11372)
• Bug in `date_range` with ambiguous endpoints (GH11626)
• Prevent adding new attributes to the accessors `.str`, `.dt` and `.cat`. Retrieving such a value was not possible, so error out on setting it. (GH10673)
• Bug in `tz-conversions` with an ambiguous time and `.dt` accessors (GH11295)
• Bug in output formatting when using an index of ambiguous times (GH11619)
• Bug in comparisons of `Series` vs list-likes (GH11339)
• Bug in `DataFrame.replace` with a `datetime64[ns, tz]` and a non-compat to_replace (GH11326, GH11153)
• Bug in `isnull` where `numpy.datetime64('NaT')` in a `numpy.array` was not determined to be null (GH11206)
• Bug in list-like indexing with a mixed-integer Index (GH11320)
• Bug in `pivot_table` with margins=True when indexes are of Categorical dtype (GH10993)
• Bug in `DataFrame.plot` cannot use hex strings colors (GH10299)
• Regression in `DataFrame.drop_duplicates` from 0.16.2, causing incorrect results on integer values (GH11376)
• Bug in `pd.eval` where unary ops in a list error (GH11235)
• Bug in `squeeze()` with zero length arrays (GH11230, GH8999)
• Bug in `describe()` dropping column names for hierarchical indexes (GH11517)
• Bug in `DataFrame.pct_change()` not propagating axis keyword on `.fillna` method (GH11550)
• Bug in `.to_csv()` when a mix of integer and string column names are passed as the `columns` parameter (GH11637)
• Bug in indexing with a `range`, (GH11652)
• Bug in inference of numpy scalars and preserving dtype when setting columns (GH11638)
• Bug in `to_sql` using unicode column names giving UnicodeEncodeError with (GH11431).
• Fix regression in setting of `xticks` in `plot` (GH11529).
• Bug in `holiday.dates` where observance rules could not be applied to holiday and doc enhancement (GH11477, GH11533)
• Fix plotting issues when having plain `Axes` instances instead of `SubplotAxes` (GH11520, GH11556).
• Bug in `DataFrame.to_latex()` produces an extra rule when `header=False` (GH7124)
• Bug in `df.groupby(...).apply(func)` when a func returns a `Series` containing a new datetimelike column (GH11324)
• Bug in `pandas.json` when file to load is big (GH11344)
• Bugs in `to_excel` with duplicate columns (GH11007, GH10982, GH10970)
• Fixed a bug that prevented the construction of an empty series of dtype `datetime64[ns, tz]` (GH11245).

5.12. Version 0.17
• Bug in `read_excel` with MultiIndex containing integers (GH11317)
• Bug in `to_excel` with openpyxl 2.2+ and merging (GH11408)
• Bug in `DataFrame.to_dict()` produces a `np.datetime64` object instead of `Timestamp` when only datetime is present in data (GH11327)
• Bug in `DataFrame.corr()` raises exception when computes Kendall correlation for DataFrames with boolean and not boolean columns (GH11560)
• Bug in the link-time error caused by C `inline` functions on FreeBSD 10+ (with `clang`) (GH10510)
• Bug in `DataFrame.to_csv` in passing through arguments for formatting MultiIndexes, including `date_format` (GH7791)
• Bug in `DataFrame.join()` with `how='right'` producing a `TypeError` (GH11519)
• Bug in `Series.quantile` with empty list results has `Index` with `object` dtype (GH11588)
• Bug in `pd.merge` results in empty `Int64Index` rather than `Index(dtype=object)` when the merge result is empty (GH11588)
• Bug in `Categorical.remove_unused_categories` when having NaN values (GH11599)
• Bug in `DataFrame.to_sparse()` loses column names for MultiIndexes (GH11600)
• Bug in `DataFrame.round()` with non-unique column index producing a Fatal Python error (GH11611)
• Bug in `DataFrame.round()` with `decimals` being a non-unique indexed Series producing extra columns (GH11618)

5.12.2 Version 0.17.0 (October 9, 2015)

This is a major release from 0.16.2 and includes a small number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

**Warning:** pandas >= 0.17.0 will no longer support compatibility with Python version 3.2 (GH9118)

**Warning:** The pandas.io.data package is deprecated and will be replaced by the pandas-datareader package. This will allow the data modules to be independently updated to your pandas installation. The API for pandas-datareader v0.1.1 is exactly the same as in pandas v0.17.0 (GH8961, GH10861).

After installing pandas-datareader, you can easily change your imports:

```python
from pandas.io import data, wb
```

becomes

```python
from pandas_datareader import data, wb
```

Highlights include:

- Release the Global Interpreter Lock (GIL) on some cython operations, see [here](#)
- Plotting methods are now available as attributes of the .plot accessor, see [here](#)
- The sorting API has been revamped to remove some long-time inconsistencies, see [here](#)
- Support for a datetime64[ns] with timezones as a first-class dtype, see [here](#)
- The default for to_datetime will now be to raise when presented with unparsable formats, previously this would return the original input. Also, date parse functions now return consistent results. See [here](#)
- The default for dropna in HDFStore has changed to False, to store by default all rows even if they are all NaN, see [here](#)
- Datetime accessor (dt) now supports Series.dt.strftime to generate formatted strings for datetime-likes, and Series.dt.total_seconds to generate each duration of the timedelta in seconds. See [here](#)
• *Period* and *PeriodIndex* can handle multiplied freq like 3D, which corresponding to 3 days span. See [here](#)

• Development installed versions of pandas will now have PEP440 compliant version strings (GH9518)

• Development support for benchmarking with the *Air Speed Velocity* library (GH8361)

• Support for reading SAS xport files, see [here](#)

• Documentation comparing SAS to *pandas*, see [here](#)

• Removal of the automatic TimeSeries broadcasting, deprecated since 0.8.0, see [here](#)

• Display format with plain text can optionally align with Unicode East Asian Width, see [here](#)

• Compatibility with Python 3.5 (GH11097)

• Compatibility with matplotlib 1.5.0 (GH11111)

Check the *API Changes* and *deprecations* before updating.

---

**What’s new in v0.17.0**

• *New features*
  
  – Datetime with TZ
  
  – Releasing the GIL
  
  – Plot submethods
  
  – Additional methods for *dt* accessor
    
    * Series.*dt.strftime
    
    * Series.*dt.total_seconds
  
  – Period frequency enhancement
  
  – Support for SAS XPORT files
  
  – Support for math functions in *eval()*
  
  – Changes to Excel with MultiIndex
  
  – Google BigQuery enhancements
  
  – Display alignment with Unicode East Asian width
  
  – Other enhancements

• *Backwards incompatible API changes*
  
  – Changes to sorting API
  
  – Changes to to_datetime and to_timedelta
    
    * Error handling
    
    * Consistent parsing
  
  – Changes to Index comparisons
  
  – Changes to boolean comparisons vs. None
  
  – HDFStore dropna behavior
  
  – Changes to *display.precision* option
  
  – Changes to *Categorical.unique*
New features

Datetime with TZ

We are adding an implementation that natively supports datetime with timezones. A Series or a DataFrame column previously could be assigned a datetime with timezones, and would work as an object dtype. This had performance issues with a large number rows. See the docs for more details. (GH8260, GH10763, GH11034).

The new implementation allows for having a single-timezone across all rows, with operations in a performant manner.

```python
In [1]: df = pd.DataFrame({
    ...:     "A": pd.date_range("20130101", periods=3),
    ...:     "B": pd.date_range("20130101", periods=3, tz="US/Eastern"),
    ...:     "C": pd.date_range("20130101", periods=3, tz="CET"),
    ...:     })

In [2]: df
Out[2]:
    A    B    C
0 2013-01-01 2013-01-01 00:00:00-05:00 2013-01-01 00:00:00+01:00
1 2013-01-02 2013-01-02 00:00:00-05:00 2013-01-02 00:00:00+01:00
2 2013-01-03 2013-01-03 00:00:00-05:00 2013-01-03 00:00:00+01:00
[3 rows x 3 columns]

In [3]: df.dtypes
Out[3]:
    A          datetime64[ns]
    B    datetime64[ns, US/Eastern]
    C          datetime64[ns, CET]
Length: 3, dtype: object

In [4]: df.B
Out[4]:
0 2013-01-01 00:00:00-05:00
1 2013-01-02 00:00:00-05:00
2 2013-01-03 00:00:00-05:00
Name: B, Length: 3, dtype: datetime64[ns, US/Eastern]

In [5]: df.B.dt.tz_localize(None)
```

(continues on next page)
This uses a new-dtype representation as well, that is very similar in look-and-feel to its numpy cousin `datetime64[ns]`

```python
In [6]: df["B"].dtype
Out[6]: datetime64[ns, US/Eastern]
```

```
In [7]: type(df["B"].dtype)
Out[7]: pandas.core.dtypes.dtypes.DatetimeTZDtype
```

**Note:** There is a slightly different string repr for the underlying `DatetimeIndex` as a result of the dtype changes, but functionally these are the same.

Previous behavior:

```python
In [1]: pd.date_range('20130101', periods=3, tz='US/Eastern')
Out[1]: DatetimeIndex(['2013-01-01 00:00:00-05:00', '2013-01-02 00:00:00-05:00',
                    '2013-01-03 00:00:00-05:00'],
                   dtype='datetime64[ns]', freq='D', tz='US/Eastern')
```

```
In [2]: pd.date_range('20130101', periods=3, tz='US/Eastern').dtype
Out[2]: dtype('<M8[ns]')
```

New behavior:

```python
In [8]: pd.date_range("20130101", periods=3, tz="US/Eastern")
Out[8]: DatetimeIndex(['2013-01-01 00:00:00-05:00', '2013-01-02 00:00:00-05:00',
                    '2013-01-03 00:00:00-05:00'],
                   dtype='datetime64[ns, US/Eastern]', freq='D')
```

```python
In [9]: pd.date_range("20130101", periods=3, tz="US/Eastern").dtype
Out[9]: datetime64[ns, US/Eastern]
```

### Releasing the GIL

We are releasing the global-interpreter-lock (GIL) on some cython operations. This will allow other threads to run simultaneously during computation, potentially allowing performance improvements from multi-threading. Notably `groupby`, `nsmallest`, `value_counts` and some indexing operations benefit from this. (GH8882)

For example the `groupby` expression in the following code will have the GIL released during the factorization step, e.g. `df.groupby('key')` as well as the `.sum()` operation.

```python
N = 1000000
ngroups = 10
df = DataFrame(
    {"key": np.random.randint(0, ngroups, size=N), "data": np.random.randn(N)}
)```
df.groupby("key")["data"].sum()

Releasing of the GIL could benefit an application that uses threads for user interactions (e.g. QT), or performing multi-threaded computations. A nice example of a library that can handle these types of computation-in-parallel is the dask library.

### Plot submethods

The Series and DataFrame `.plot()` method allows for customizing plot types by supplying the kind keyword arguments. Unfortunately, many of these kinds of plots use different required and optional keyword arguments, which makes it difficult to discover what any given plot kind uses out of the dozens of possible arguments.

To alleviate this issue, we have added a new, optional plotting interface, which exposes each kind of plot as a method of the `.plot` attribute. Instead of writing `series.plot(kind=<kind>, ...), you can now also use `series.plot.<kind>(...)`:

```python
In [10]: df = pd.DataFrame(np.random.rand(10, 2), columns=["a", "b"])
In [11]: df.plot.bar()
```

![](image)

As a result of this change, these methods are now all discoverable via tab-completion:

```python
In [12]: df.plot.<TAB> # noqa: E225, E999
df.plot.area   df.plot.barh   df.plot.density df.plot.hist df.plot.line df.plot.scatter
  df.plot.bar   df.plot.box   df.plot.hexbin df.plot.kde df.plot.pie
```

Each method signature only includes relevant arguments. Currently, these are limited to required arguments, but in the future these will include optional arguments, as well. For an overview, see the new Plotting API documentation.
Additional methods for `dt` accessor

**Series.dt.strftime**

We are now supporting a `Series.dt.strftime` method for datetime-likes to generate a formatted string (GH10110). Examples:

```python
# DatetimeIndex
In [13]: s = pd.Series(pd.date_range("20130101", periods=4))

In [14]: s
def
Out[14]:
0  2013-01-01
1  2013-01-02
2  2013-01-03
3  2013-01-04
Length: 4, dtype: datetime64[ns]

In [15]: s.dt.strftime("%Y/%m/%d")
Out[15]:
0  2013/01/01
1  2013/01/02
2  2013/01/03
3  2013/01/04
Length: 4, dtype: object

# PeriodIndex
In [16]: s = pd.Series(pd.period_range("20130101", periods=4))

In [17]: s
Out[17]:
0  2013-01-01
1  2013-01-02
2  2013-01-03
3  2013-01-04
Length: 4, dtype: period[D]

In [18]: s.dt.strftime("%Y/%m/%d")
Out[18]:
0  2013/01/01
1  2013/01/02
2  2013/01/03
3  2013/01/04
Length: 4, dtype: object
```

The string format is as the python standard library and details can be found [here](#).
Series.dt.total_seconds

`pd.Series` of type `timedelta64` has new method `.dt.total_seconds()` returning the duration of the `timedelta` in seconds (GH10817)

```
# TimedeltaIndex
In [19]: s = pd.Series(pd.timedelta_range("1 minutes", periods=4))
In [20]: s
Out[20]:
0  0 days 00:01:00
1  1 days 00:01:00
2  2 days 00:01:00
3  3 days 00:01:00
Length: 4, dtype: timedelta64[ns]
In [21]: s.dt.total_seconds()
Out[21]:
0    60.0
1  86460.0
2 172860.0
3 259260.0
Length: 4, dtype: float64
```

Period frequency enhancement

Period, `PeriodIndex` and `period_range` can now accept multiplied freq. Also, `Period.freq` and `PeriodIndex.freq` are now stored as a `DateOffset` instance like `DatetimeIndex`, and not as `str` (GH7811)

A multiplied freq represents a span of corresponding length. The example below creates a period of 3 days. Addition and subtraction will shift the period by its span.

```
In [22]: p = pd.Period("2015-08-01", freq="3D")
In [23]: p
Out[23]: Period('2015-08-01', '3D')
In [24]: p + 1
Out[24]: Period('2015-08-04', '3D')
In [25]: p - 2
Out[25]: Period('2015-07-26', '3D')
In [26]: p.to_timestamp()
Out[26]: Timestamp('2015-08-01 00:00:00')
In [27]: p.to_timestamp(how="E")
Out[27]: Timestamp('2015-08-03 23:59:59.999999999')
```

You can use the multiplied freq in `PeriodIndex` and `period_range`.

```
In [28]: idx = pd.period_range("2015-08-01", periods=4, freq="2D")
In [29]: idx
Out[29]: PeriodIndex(['2015-08-01', '2015-08-03', '2015-08-05', '2015-08-07'], dtype=period['2D'], freq='2D')
```

(continues on next page)
Support for SAS XPORT files

read_sas() provides support for reading SAS XPORT format files. (GH4052).

```python
df = pd.read_sas("sas_xport.xpt")
```

It is also possible to obtain an iterator and read an XPORT file incrementally.

```python
for df in pd.read_sas("sas_xport.xpt", chunksize=10000):
do_something(df)
```

See the docs for more details.

Support for math functions in .eval()

eval() now supports calling math functions (GH4893)

```python
df = pd.DataFrame({"a": np.random.randn(10)})
df.eval("b = sin(a)")
```

The support math functions are sin, cos, exp, log, expm1, log1p, sqrt, sinh, cosh, tanh, arcsin, arccos, arctan, arccosh, arccsinh, arctanh, abs and arctan2.

These functions map to the intrinsics for the NumExpr engine. For the Python engine, they are mapped to NumPy calls.

Changes to Excel with MultiIndex

In version 0.16.2 a DataFrame with MultiIndex columns could not be written to Excel via to_excel. That functionality has been added (GH10564), along with updating read_excel so that the data can be read back with, no loss of information, by specifying which columns/rows make up the MultiIndex in the header and index_col parameters (GH4679)

See the documentation for more details.

```python
In [31]: df = pd.DataFrame(
    ...:                  [[1, 2, 3, 4], [5, 6, 7, 8]],
    ...:                  columns=pd.MultiIndex.from_product(
    ...:                      ["foo", "bar"], ["a", "b"], names="coll", "col2"
    ...:                      ),
    ...:                  index=pd.MultiIndex.from_product(["j", ["l", "k"], names="il", "i2"
    ...:                      ->"])
    ...:                  )
    
In [32]: df
Out[32]:
```
Previously, it was necessary to specify the `has_index_names` argument in `read_excel`, if the serialized data had index names. For version 0.17.0 the output format of `to_excel` has been changed to make this keyword unnecessary - the change is shown below.

</table>

[2 rows x 4 columns]
pandas: powerful Python data analysis toolkit, Release 1.2.2

Warning: Excel files saved in version 0.16.2 or prior that had index names will still able to be read in, but the has_index_names argument must specified to True.

Google BigQuery enhancements

- Added ability to automatically create a table/dataset using the pandas.io.gbq.to_gbq() function if the destination table/dataset does not exist. (GH8325, GH11121).
- Added ability to replace an existing table and schema when calling the pandas.io.gbq.to_gbq() function via the if_exists argument. See the docs for more details (GH8325).
- InvalidColumnOrder and InvalidPageToken in the gbq module will raise ValueError instead of IOError.
- The generate_bq_schema() function is now deprecated and will be removed in a future version (GH11121)
- The gbq module will now support Python 3 (GH11094).

Display alignment with Unicode East Asian width

Warning: Enabling this option will affect the performance for printing of DataFrame and Series (about 2 times slower). Use only when it is actually required.

Some East Asian countries use Unicode characters its width is corresponding to 2 alphabets. If a DataFrame or Series contains these characters, the default output cannot be aligned properly. The following options are added to enable precise handling for these characters.

- display.unicode.east_asian_width: Whether to use the Unicode East Asian Width to calculate the display text width. (GH2612)
- display.unicode.ambiguous_as_wide: Whether to handle Unicode characters belong to Ambiguous as Wide. (GH11102)

In [36]: df = pd.DataFrame({"UK": ["UK", ""], "": ["Alice", ""]})

In [37]: df;
Other enhancements

- Support for openpyxl >= 2.2. The API for style support is now stable (GH10125)
- merge now accepts the argument indicator which adds a Categorical-type column (by default called _merge) to the output object that takes on the values (GH8790)

<table>
<thead>
<tr>
<th>Observation Origin</th>
<th>_merge value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Merge key only in 'left' frame</td>
<td>left_only</td>
</tr>
<tr>
<td>Merge key only in 'right' frame</td>
<td>right_only</td>
</tr>
<tr>
<td>Merge key in both frames</td>
<td>both</td>
</tr>
</tbody>
</table>

For more, see the updated docs

- pd.to_numeric is a new function to coerce strings to numbers (possibly with coercion) (GH11133)
- pd.merge will now allow duplicate column names if they are not merged upon (GH10639).
- pd.pivot will now allow passing index as None (GH3962).
- pd.concat will now use existing Series names if provided (GH10698).

(continues on next page)
In [45]: baz = pd.Series([4, 5])

Previous behavior:

In [1]: pd.concat([foo, bar, baz], 1)
Out[1]:
0 1 2
  0 1 1 4
  1 2 2 5

New behavior:

In [46]: pd.concat([foo, bar, baz], 1)
Out[46]:
   foo  0  1
      0 1 1 4
      1 2 2 5
[2 rows x 3 columns]

- **DataFrame** has gained the `nlargest` and `nsmallest` methods (GH10393)
- Add a `limit_direction` keyword argument that works with `limit` to enable `interpolate` to fill NaN values forward, backward, or both (GH9218, GH10420, GH11115)

In [47]: ser = pd.Series([np.nan, np.nan, 5, np.nan, np.nan, np.nan, 13])

In [48]: ser.interpolate(limit=1, limit_direction="both")
Out[48]:
    0   NaN
    1   5.0
    2   5.0
    3   7.0
    4   NaN
    5  11.0
    6  13.0
Length: 7, dtype: float64

- Added a `DataFrame.round` method to round the values to a variable number of decimal places (GH10568).

In [49]: df = pd.DataFrame(
               ....:     np.random.random([3, 3]),
               ....:     columns=["A", "B", "C"],
               ....:     index=["first", "second", "third"],
               ....:     )

In [50]: df
Out[50]:
   A      B      C
first  0.126970  0.966718  0.260476
second 0.897237  0.376750  0.336222
third  0.451376  0.840255  0.123102

[3 rows x 3 columns]
In [51]: df.round(2)
Out[51]:
   A     B     C
first  0.13  0.97  0.26
second  0.90  0.38  0.34
third  0.45  0.84  0.12

[3 rows x 3 columns]

In [52]: df.round({"A": 0, "C": 2})
Out[52]:
   A     B     C
first 0.0  0.967  0.26
second 1.0  0.377  0.34
third 0.0  0.840  0.12

[3 rows x 3 columns]

• drop_duplicates and duplicated now accept a keep keyword to target first, last, and all duplicates. The take_last keyword is deprecated, see here (GH6511, GH8505)

In [54]: s.drop_duplicates()
Out[54]:
   0  A
   1  B
   2  C
   5  D
Length: 4, dtype: object

In [55]: s.drop_duplicates(keep="last")
Out[55]:
   2  C
   3  A
   4  B
   5  D
Length: 4, dtype: object

In [56]: s.drop_duplicates(keep=False)
Out[56]:
   2  C
   5  D
Length: 2, dtype: object

• Reindex now has a tolerance argument that allows for finer control of Limits on filling while reindexing (GH10411):

In [57]: df = pd.DataFrame({"x": range(5), "t": pd.date_range("2000-01-01", periods=5)})

In [58]: df.reindex([0.1, 1.9, 3.5], method="nearest", tolerance=0.2)
Out[58]:
   x    t
0.1  0.0 2000-01-01
1.9  2.0 2000-01-03

(continues on next page)
When used on a DatetimeIndex, TimedeltaIndex or PeriodIndex, tolerance will coerced into a Timedelta if possible. This allows you to specify tolerance with a string:

```
In [59]: df = df.set_index("t")
In [60]: df.reindex(pd.to_datetime(["1999-12-31"]), method="nearest", tolerance="1 day")
Out[60]:
   x
0 1999-12-31
```

tolerance is also exposed by the lower level Index.get_indexer and Index.get_loc methods.

- Added functionality to use the base argument when resampling a TimeDeltaIndex (GH10530)
- DatetimeIndex can be instantiated using strings contains NaT (GH7599)
- to_datetime can now accept the yearfirst keyword (GH7599)
- pandas.tseries.offsets larger than the Day offset can now be used with a Series for addition/subtraction (GH10699). See the docs for more details.
- pd.Timedelta.total_seconds() now returns Timedelta duration to ns precision (previously microsecond precision) (GH10939)
- PeriodIndex now supports arithmetic with np.ndarray (GH10638)
- Support pickling of Period objects (GH10439)
- .as_blocks will now take a copy optional argument to return a copy of the data, default is to copy (no change in behavior from prior versions), (GH9607)
- regex argument to DataFrame.filter now handles numeric column names instead of raising ValueError (GH10384).
- Enable reading gzip compressed files via URL, either by explicitly setting the compression parameter or by inferring from the presence of the HTTP Content-Encoding header in the response (GH8685)
- Enable writing Excel files in memory using StringIO/BytesIO (GH7074)
- Enable serialization of lists and dicts to strings in ExcelWriter (GH8188)
- SQL io functions now accept a SQLAlchemy connectable. (GH7877)
- pd.read_sql and to_sql can accept database URI as con parameter (GH10214)
- read_sql_table will now allow reading from views (GH10750).
- Enable writing complex values to HDFStores when using the table format (GH10447)
- Enable pd.read_hdf to be used without specifying a key when the HDF file contains a single dataset (GH10443)
- pd.read_stata will now read Stata 118 type files. (GH9882)
- msgpack submodule has been updated to 0.4.6 with backward compatibility (GH10581)
- DataFrame.to_dict now accepts orient='index' keyword argument (GH10844).
pandas: powerful Python data analysis toolkit, Release 1.2.2

- **DataFrame.apply** will return a Series of dicts if the passed function returns a dict and `reduce=True` (GH8735).
- Allow passing **kwargs to the interpolation methods** (GH10378).
- Improved error message when concatenating an empty iterable of Dataframe objects (GH9157)
- `pd.read_csv` can now read bz2-compressed files incrementally, and the C parser can read bz2-compressed files from AWS S3 (GH11070, GH11072).
- In `pd.read_csv`, recognize `s3n://` and `s3a://` URLs as designating S3 file storage (GH11070, GH11071).
- Read CSV files from AWS S3 incrementally, instead of first downloading the entire file. (Full file download still required for compressed files in Python 2.) (GH11070, GH11073)
- `pd.read_csv` is now able to infer compression type for files read from AWS S3 storage (GH11070, GH11074).

**Backwards incompatible API changes**

**Changes to sorting API**

The sorting API has had some longtime inconsistencies. (GH9816, GH8239).

Here is a summary of the API PRIOR to 0.17.0:

- **Series.sort** is **INPLACE** while **DataFrame.sort** returns a new object.
- **Series.order** returns a new object
- It was possible to use **Series/DataFrame.sort_index** to sort by **values** by passing the `by` keyword.
- **Series/DataFrame.sortlevel** worked only on a MultiIndex for sorting by index.

To address these issues, we have revamped the API:

- We have introduced a new method, **DataFrame.sort_values()**, which is the merger of **DataFrame.sort()**, **Series.sort()**, and **Series.order()**, to handle sorting of **values**.
- The existing methods **Series.sort()**, **Series.order()**, and **DataFrame.sort()** have been deprecated and will be removed in a future version.
- The `by` argument of **DataFrame.sort_index()** has been deprecated and will be removed in a future version.
- The existing method **.sort_index()** will gain the `level` keyword to enable level sorting.

We now have two distinct and non-overlapping methods of sorting. A * marks items that will show a FutureWarning.

To sort by the **values**:

<table>
<thead>
<tr>
<th>Previous</th>
<th>Replacement</th>
</tr>
</thead>
<tbody>
<tr>
<td>* Series.order()</td>
<td>Series.sort_values()</td>
</tr>
<tr>
<td>* Series.sort()</td>
<td>Series.sort_values(inplace=True)</td>
</tr>
<tr>
<td>* DataFrame.sort(columns=...)</td>
<td>DataFrame.sort_values(by=...)</td>
</tr>
</tbody>
</table>

To sort by the **index**:
We have also deprecated and changed similar methods in two Series-like classes, Index and Categorical.

<table>
<thead>
<tr>
<th>Previous</th>
<th>Replacement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Series.sort_index()</td>
<td>Series.sort_index()</td>
</tr>
<tr>
<td>Series.sortlevel(level=...)</td>
<td>Series.sort_index(level=...)</td>
</tr>
<tr>
<td>DataFrame.sort_index()</td>
<td>DataFrame.sort_index()</td>
</tr>
<tr>
<td>DataFrame.sortlevel(level=...)</td>
<td>DataFrame.sort_index(level=...)</td>
</tr>
<tr>
<td>*DataFrame.sort()</td>
<td>DataFrame.sort_index()</td>
</tr>
</tbody>
</table>

Changes to `to_datetime` and `to_timedelta`

**Error handling**

The default for `pd.to_datetime` error handling has changed to `errors='raise'`. In prior versions it was `errors='ignore'`. Furthermore, the `coerce` argument has been deprecated in favor of `errors='coerce'`. This means that invalid parsing will raise rather that return the original input as in previous versions. (GH10636)

Previous behavior:

```python
In [2]: pd.to_datetime(['2009-07-31', 'asd'])
Out[2]: array(['2009-07-31', 'asd'], dtype=object)
```

New behavior:

```python
In [3]: pd.to_datetime(['2009-07-31', 'asd'])
ValueError: Unknown string format
```

Of course you can coerce this as well.

```python
In [61]: pd.to_datetime(['2009-07-31', 'asd'], errors='coerce')
Out[61]: DatetimeIndex(['2009-07-31', 'NaT'], dtype='datetime64[ns]', freq=None)
```

To keep the previous behavior, you can use `errors='ignore'`:

```python
In [62]: pd.to_datetime(['2009-07-31', 'asd'], errors='ignore')
Out[62]: Index(['2009-07-31', 'asd'], dtype='object')
```

Furthermore, `pd.to_timedelta` has gained a similar API, of `errors='raise' | 'ignore' | 'coerce'`, and the `coerce` keyword has been deprecated in favor of `errors='coerce'`. 

5.12. Version 0.17

3053
Consistent parsing

The string parsing of `to_datetime`, `Timestamp` and `DatetimeIndex` has been made consistent. (GH7599)

Prior to v0.17.0, `Timestamp` and `to_datetime` may parse year-only datetime-string incorrectly using today’s date, otherwise `DatetimeIndex` uses the beginning of the year. `Timestamp` and `to_datetime` may raise `ValueError` in some types of datetime-string which `DatetimeIndex` can parse, such as a quarterly string.

Previous behavior:

```python
In [1]: pd.Timestamp('2012Q2')
Traceback...
ValueError: Unable to parse 2012Q2
# Results in today's date.
In [2]: pd.Timestamp('2014')
Out [2]: 2014-08-12 00:00:00
```

v0.17.0 can parse them as below. It works on `DatetimeIndex` also.

New behavior:

```python
In [63]: pd.Timestamp("2012Q2")
Out[63]: Timestamp('2012-04-01 00:00:00')
In [64]: pd.Timestamp("2014")
Out[64]: Timestamp('2014-01-01 00:00:00')
In [65]: pd.DatetimeIndex(["2012Q2", "2014")
Out[65]: DatetimeIndex(["2012-04-01", '2014-01-01'], dtype='datetime64[ns]',
               →freq=None)
```

Note: If you want to perform calculations based on today’s date, use `Timestamp.now()` and `pandas.tseries.offsets`.

```python
In [66]: import pandas.tseries.offsets as offsets
In [67]: pd.Timestamp.now()
Out[67]: Timestamp('2021-02-09 11:34:45.455167')
In [68]: pd.Timestamp.now() + offsets.DateOffset(years=1)
Out[68]: Timestamp('2022-02-09 11:34:45.455798')
```

Changes to Index comparisons

Operator equal on `Index` should behave similarly to `Series` (GH9947, GH10637)

Starting in v0.17.0, comparing `Index` objects of different lengths will raise a `ValueError`. This is to be consistent with the behavior of `Series`.

Previous behavior:

```python
In [2]: pd.Index([1, 2, 3]) == pd.Index([1, 4, 5])
Out[2]: array([ True, False, False], dtype=bool)
```
New behavior:

$$\text{In [8]}: \text{pd.Index([}1, 2, 3\text{])} == \text{pd.Index([}1, 4, 5\text{])}$$
$$\text{Out[8]}: \text{array([True, False, False], dtype=bool)}$$

$$\text{In [9]}: \text{pd.Index([}1, 2, 3\text{])} == \text{pd.Index([}2\text{])}$$
ValueError: Lengths must match to compare

$$\text{In [10]}: \text{pd.Index([}1, 2, 3\text{])} == \text{pd.Index([}1, 2\text{])}$$
ValueError: Lengths must match to compare

Note that this is different from the numpy behavior where a comparison can be broadcast:

$$\text{In [69]}: \text{np.array([}1, 2, 3\text{])} == \text{np.array([}1\text{])}$$
$$\text{Out[69]}: \text{array([True, False, False])}$$

or it can return False if broadcasting cannot be done:

$$\text{In [70]}: \text{np.array([}1, 2, 3\text{])} == \text{np.array([}1, 2\text{])}$$
$$\text{Out[70]}: \text{False}$$

**Changes to boolean comparisons vs. None**

Boolean comparisons of a Series vs None will now be equivalent to comparing with np.nan, rather than raise TypeError. (GH1079).

$$\text{In [71]}: s = \text{pd.Series(range(3))}$$

$$\text{In [72]}: s.iiloc[1] = \text{None}$$

$$\text{In [73]}: s$$
$$\text{Out[73]}:$$

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0.0</td>
</tr>
<tr>
<td>1</td>
<td>NaN</td>
</tr>
<tr>
<td>2</td>
<td>2.0</td>
</tr>
</tbody>
</table>

Length: 3, dtype: float64

Previous behavior:

$$\text{In [5]}: s == \text{None}$$
TypeError: Could not compare <type 'NoneType'> type with Series

New behavior:

$$\text{In [74]}: s == \text{None}$$
$$\text{Out[74]}:$$

<p>| |</p>
<table>
<thead>
<tr>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
</tr>
</tbody>
</table>

(continues on next page)
Usually you simply want to know which values are null.

```
In [75]: s.isnull()
Out[75]:
0  False
1   True
2  False
Length: 3, dtype: bool
```

**Warning:** You generally will want to use `isnull/notnull` for these types of comparisons, as `isnull/notnull` tells you which elements are null. One has to be mindful that `np.nan` don’t compare equal, but `None`'s do. Note that pandas/numpy uses the fact that `np.nan != np.nan`, and treats `None` like `np.nan`.

```
In [76]: None == None
Out[76]: True

In [77]: np.nan == np.nan
Out[77]: False
```

### HDFStore dropna behavior

The default behavior for HDFStore write functions with `format='table'` is now to keep rows that are all missing. Previously, the behavior was to drop rows that were all missing save the index. The previous behavior can be replicated using the `dropna=True` option. (GH9382)

**Previous behavior:**

```
In [78]: df_with_missing = pd.DataFrame(
       ....:   {"col1": [0, np.nan, 2], "col2": [1, np.nan, np.nan]}
       ....: )
       ....:

In [79]: df_with_missing
Out[79]:
   col1  col2
0   0.0   1.0
1   NaN   NaN
2   2.0   NaN
[3 rows x 2 columns]
```

```
In [27]:
df_with_missing.to_hdf('file.h5','df_with_missing',
    'df_with_missing',
    format='table',
    mode='w')
```

```
In [28]: pd.read_hdf('file.h5', 'df_with_missing')
```
Out [28]:
    col1  col2
  0   0    1
  2   2   NaN

New behavior:

In [80]: df_with_missing.to_hdf("file.h5", "df_with_missing", format="table", mode="w 
˓→")

In [81]: pd.read_hdf("file.h5", "df_with_missing")
Out[81]:
    col1  col2
  0   0.0   1.0
  1   NaN   NaN
  2   2.0   NaN

[3 rows x 2 columns]

See the docs for more details.

Changes to display.precision option

The display.precision option has been clarified to refer to decimal places (GH10451).

Earlier versions of pandas would format floating point numbers to have one less decimal place than the value in display.precision.

In [1]: pd.set_option('display.precision', 2)

In [2]: pd.DataFrame({'x': [123.456789]})
Out[2]:
   x
0  123.5

If interpreting precision as “significant figures” this did work for scientific notation but that same interpretation did not work for values with standard formatting. It was also out of step with how numpy handles formatting.

Going forward the value of display.precision will directly control the number of places after the decimal, for regular formatting as well as scientific notation, similar to how numpy’s precision print option works.

In [82]: pd.set_option("display.precision", 2)

In [83]: pd.DataFrame({"x": [123.456789]})
Out[83]:
   x
0  123.46

[1 rows x 1 columns]

To preserve output behavior with prior versions the default value of display.precision has been reduced to 6 from 7.
Changes to `Categorical.unique`

`Categorical.unique` now returns new `Categoricals` with categories and codes that are unique, rather than returning `np.array` (GH10508)

- unordered category: values and categories are sorted by appearance order.
- ordered category: values are sorted by appearance order, categories keep existing order.

```python
In [84]: cat = pd.Categorical(['C', 'A', 'B', 'C'], categories=['A', 'B', 'C'], ordered=True)

In [85]: cat
Out[85]:
['C', 'A', 'B', 'C']
Categories (3, object): ['A' < 'B' < 'C']

In [86]: cat.unique()
Out[86]:
['C', 'A', 'B']
Categories (3, object): ['A' < 'B' < 'C']

In [87]: cat = pd.Categorical(['C', 'A', 'B', 'C'], categories=['A', 'B', 'C'])

In [88]: cat
Out[88]:
['C', 'A', 'B', 'C']
Categories (3, object): ['A', 'B', 'C']

In [89]: cat.unique()
Out[89]:
['C', 'A', 'B']
Categories (3, object): ['C', 'A', 'B']
```

Changes to `bool` passed as `header` in parsers

In earlier versions of pandas, if a bool was passed the `header` argument of `read_csv`, `read_excel`, or `read_html` it was implicitly converted to an integer, resulting in `header=0` for `False` and `header=1` for `True` (GH6113)

A `bool` input to `header` will now raise a `TypeError`

```python
In [29]: df = pd.read_csv('data.csv', header=False)
TypeError: Passing a bool to header is invalid. Use header=None for no header or header=int or list-like of ints to specify the row(s) making up the column names
```
Other API changes

- Line and kde plot with subplots=True now uses default colors, not all black. Specify color='k' to draw all lines in black (GH9894).
- Calling the .value_counts() method on a Series with a categorical dtype now returns a Series with a CategoricalIndex (GH10704).
- The metadata properties of subclasses of pandas objects will now be serialized (GH10553).
- groupby using Categorical follows the same rule as Categorical.unique described above (GH10508).
- When constructing DataFrame with an array of complex64 dtype previously meant the corresponding column was automatically promoted to the complex128 dtype. pandas will now preserve the itemsize of the input for complex data (GH10952).
- some numeric reduction operators would return ValueError, rather than TypeError on object types that includes strings and numbers (GH11131).
- Passing currently unsupported chunksize argument to read_excel or ExcelFile.parse will now raise NotImplementedError (GH8011).
- Allow an ExcelFile object to be passed into read_excel (GH11198).
- DatetimeIndex.union does not infer freq if self and the input have None as freq (GH11086).
- NaT's methods now either raise ValueError, or return np.nan or NaT (GH9513).

<table>
<thead>
<tr>
<th>Behavior</th>
<th>Methods</th>
</tr>
</thead>
<tbody>
<tr>
<td>return np.nan</td>
<td>weekday, isoweekday</td>
</tr>
<tr>
<td>return NaT</td>
<td>date, now, replace, to_datetime, today</td>
</tr>
<tr>
<td>return np.datetime64('NaT')</td>
<td>to_datetime64 (unchanged)</td>
</tr>
<tr>
<td>raise ValueError</td>
<td>All other public methods (names not beginning with underscores)</td>
</tr>
</tbody>
</table>

Deprecations

- For Series the following indexing functions are deprecated (GH10177).

<table>
<thead>
<tr>
<th>Deprecated Function</th>
<th>Replacement</th>
</tr>
</thead>
<tbody>
<tr>
<td>.irow(i)</td>
<td>.iloc[i] or .iat[i]</td>
</tr>
<tr>
<td>.iget(i)</td>
<td>.iloc[i] or .iat[i]</td>
</tr>
<tr>
<td>.iget_value(i)</td>
<td>.iloc[i] or .iat[i]</td>
</tr>
</tbody>
</table>

- For DataFrame the following indexing functions are deprecated (GH10177).

<table>
<thead>
<tr>
<th>Deprecated Function</th>
<th>Replacement</th>
</tr>
</thead>
<tbody>
<tr>
<td>.irow(i)</td>
<td>.iloc[i]</td>
</tr>
<tr>
<td>.iget_value(i, j)</td>
<td>.iloc[i, j] or .iat[i, j]</td>
</tr>
<tr>
<td>.icol(j)</td>
<td>.iloc[:, j]</td>
</tr>
</tbody>
</table>

**Note:** These indexing function have been deprecated in the documentation since 0.11.0.
Categorical.name was deprecated to make Categorical more numpy.ndarray like. Use Series(cat, name="whatever") instead (GH10482).

• Setting missing values (NaN) in a Categorical's categories will issue a warning (GH10748). You can still have missing values in the values.

• drop_duplicates and duplicated's take_last keyword was deprecated in favor of keep. (GH6511, GH8505)

• Series.nsmallest and nlargest's take_last keyword was deprecated in favor of keep. (GH10792)

• DataFrame.combineAdd and DataFrame.combineMult are deprecated. They can easily be replaced by using the add and mul methods: DataFrame.add(other, fill_value=0) and DataFrame.mul(other, fill_value=1.) (GH10735).

• TimeSeries deprecated in favor of Series (note that this has been an alias since 0.13.0), (GH10890)

• SparsePanel deprecated and will be removed in a future version (GH11157).

• Series.is_time_series deprecated in favor of Series.index.is_all_dates (GH11135)

• Legacy offsets (like 'A@JAN') are deprecated (note that this has been alias since 0.8.0) (GH10878)

• WidePanel deprecated in favor of Panel, LongPanel in favor of DataFrame (note these have been aliases since < 0.11.0), (GH10892)

• DataFrame.convert_objects has been deprecated in favor of type-specific functions pd.to_datetime, pd.to_timestamp and pd.to_numeric (new in 0.17.0) (GH11133).

Removal of prior version deprecations/changes

• Removal of na_last parameters from Series.order() and Series.sort(), in favor of na_position. (GH5231)

• Remove of percentile_width from .describe(), in favor of percentiles. (GH7088)

• Removal of colSpace parameter from DataFrame.to_string(), in favor of col_space, circa 0.8.0 version.

• Removal of automatic time-series broadcasting (GH2304)

```

- Remove `table` keyword in HDFStore.put/append, in favor of using `format=` (GH4645)
- Remove `kind` in read_excel/ExcelFile as its unused (GH4712)
- Remove `infer_type` keyword from pd.read_html as its unused (GH4770, GH7032)
- Remove offset and timeRule keywords from Series.tshift/shift, in favor of freq (GH4853, GH4864)
- Remove pd.load/pd.save aliases in favor of pd.to_pickle/pd.read_pickle (GH3787)

Performance improvements

- Development support for benchmarking with the Air Speed Velocity library (GH8361)
- Added vbench benchmarks for alternative ExcelWriter engines and reading Excel files (GH7171)
- Performance improvements in Categorical.value_counts (GH10804)
- Performance improvements in SeriesGroupBy.nunique and SeriesGroupBy.value_counts and SeriesGroupby.transform (GH10820, GH11077)
- Performance improvements in DataFrame.drop_duplicates with integer dtypes (GH10917)
- Performance improvements in DataFrame duplicated with wide frames. (GH10161, GH11180)
- 4x improvement in timedelta string parsing (GH6755, GH10426)
- 8x improvement in timedelta64 and datetime64 ops (GH6755)
- Significantly improved performance of indexing MultiIndex with slicers (GH10287)
- 8x improvement in `iloc` using list-like input (GH10791)
- Improved performance of `Series.isin` for datetimelike/integer Series (GH10287)
- 20x improvement in `concat` of Categoricals when categories are identical (GH10587)
- Improved performance of `to_datetime` when specified format string is ISO8601 (GH10178)
- 2x improvement of `Series.value_counts` for float dtype (GH10821)
- Enable `infer_datetime_format` in `to_datetime` when date components do not have 0 padding (GH11142)
- Regression from 0.16.1 in constructing `DataFrame` from nested dictionary (GH11084)
- Performance improvements in addition/subtraction operations for `DateOffset` with `Series` or `DatetimeIndex` (GH10744, GH11205)

**Bug fixes**

- Bug in incorrect computation of `.mean()` on `timedelta64[ns]` because of overflow (GH9442)
- Bug in `.isin` on older numpies (GH11232)
- Bug in `DataFrame.to_html` (index=False) renders unnecessary name row (GH10344)
- Bug in `DataFrame.to_latex()` the `column_format` argument could not be passed (GH9402)
- Bug in `DatetimeIndex` when localizing with `NaT` (GH10477)
- Bug in `Series.dt` ops in preserving meta-data (GH10477)
- Bug in preserving `NaT` when passed in an otherwise invalid `to_datetime` construction (GH10477)
- Bug in `DataFrame.apply` when function returns categorical series. (GH9573)
- Bug in `to_datetime` with invalid dates and formats supplied (GH10154)
- Bug in `Index.drop_duplicates` dropping name(s) (GH10115)
- Bug in `Series.quantile` dropping name (GH10881)
- Bug in `pd.Series` when setting a value on an empty `Series` whose index has a frequency. (GH10193)
- Bug in `pd.Series.interpolate` with invalid order keyword values. (GH10633)
- Bug in `DataFrame.plot` raises `ValueError` when color name is specified by multiple characters (GH10387)
- Bug in `Index` construction with a mixed list of tuples (GH10697)
- Bug in `DataFrame.reset_index` when index contains `NaT`. (GH10388)
- Bug in `ExcelReader` when worksheet is empty (GH6403)
- Bug in `BinGrouper.group_info` where returned values are not compatible with base class (GH10914)
- Bug in clearing the cache on `DataFrame.pop` and a subsequent inplace op (GH10912)
- Bug in indexing with a mixed-integer `Index` causing an `ImportError` (GH10610)
- Bug in `Series.count` when index has nulls (GH10946)
- Bug in pickling of a non-regular freq `DatetimeIndex` (GH11002)
- Bug causing `DataFrame.where` to not respect the `axis` parameter when the frame has a symmetric shape. (GH9736)
- Bug in `Table.select_column` where name is not preserved (GH10392)
• Bug in `offsets.generate_range` where `start` and `end` have finer precision than `offset` (GH9907)
• Bug in `pd.rolling_*` where `Series.name` would be lost in the output (GH10565)
• Bug in `stack` when index or columns are not unique. (GH10417)
• Bug in setting a `Panel` when an axis has a `MultiIndex` (GH10360)
• Bug in `USFederalHolidayCalendar` where `USMemorialDay` and `USMartinLutherKingJr` were incorrect (GH10278 and GH9760)
• Bug in `.sample()` where returned object, if set, gives unnecessary `SettingWithCopyWarning` (GH10738)
• Bug in `.sample()` where weights passed as `Series` were not aligned along axis before being treated positionally, potentially causing problems if weight indices were not aligned with sampled object. (GH10738)
• Regression fixed in (GH9311, GH6620, GH9345), where `groupby` with a datetime-like converting to float with certain aggregators (GH10979)
• Bug in `DataFrame.interpolate` with `axis=1` and `inplace=True` (GH10395)
• Bug in `io.sql.get_schema` when specifying multiple columns as primary key (GH10385).
• Bug in `groupby(sort=False)` with datetime-like `Categorical` raises `ValueError` (GH10505)
• Bug in `groupby(axis=1)` with `filter()` throws `IndexError` (GH11041)
• Bug in `test_categorical` on big-endian builds (GH10425)
• Bug in `Series.shift` and `DataFrame.shift` not supporting categorical data (GH9416)
• Bug in `Series.map` using categorical `Series` raises `AttributeError` (GH10324)
• Bug in `MultiIndex.get_level_values` including `Categorical` raises `AttributeError` (GH10460)
• Bug in `pd.get_dummies` with `sparse=True` not returning `SparseDataFrame` (GH10531)
• Bug in `Index` subtypes (such as `PeriodIndex`) not returning their own type for `.drop` and `.insert` methods (GH10620)
• Bug in `algos.outer_join_indexer` when right array is empty (GH10618)
• Bug in `filter` (regression from 0.16.0) and `transform` when grouping on multiple keys, one of which is datetime-like (GH10114)
• Bug in `to_datetime` and `to_timedelta` causing `Index` name to be lost (GH10875)
• Bug in `len(DataFrame.groupby)` causing `IndexError` when there’s a column containing only NaNs (GH11016)
• Bug that caused segfault when resampling an empty `Series` (GH10228)
• Bug in `DatetimeIndex` and `PeriodIndex.value_counts` resets name from its result, but retains in result’s `Index`. (GH10150)
• Bug in `pd.eval` using `numexpr` engine coerces 1 element numpy array to scalar (GH10546)
• Bug in `pd.concat` with `axis=0` when column is of `dtype` `category` (GH10177)
• Bug in `read_msgpack` where input type is not always checked (GH10369, GH10630)
• Bug in `pd.read_csv` with `kwargs` `index_col=False`, `index_col=['a', 'b']` or `dtype` (GH10413, GH10467, GH10577)
• Bug in `Series.from_csv` with `header` kwarg not setting the `Series.name` or the `Series.index.name` (GH10483)
• Bug in `groupby.var` which caused variance to be inaccurate for small float values (GH10448)
• Bug in `Series.plot(kind='hist')` Y Label not informative (GH10485)
• Bug in `read_csv` when using a converter which generates a `uint8` type (GH9266)
• Bug causes memory leak in time-series line and area plot (GH9003)
• Bug when setting a `Panel` sliced along the major or minor axes when the right-hand side is a `DataFrame` (GH11014)
• Bug that returns `None` and does not raise `NotImplementedError` when operator functions (e.g. `.add`) of `Panel` are not implemented (GH7692)
• Bug in line and kde plot cannot accept multiple colors when `subplots=True` (GH9894)
• Bug in `DataFrame.plot` raises `ValueError` when color name is specified by multiple characters (GH10387)
• Bug in left and right align of `Series` with `MultiIndex` may be inverted (GH10665)
• Bug in left and right join of with `MultiIndex` may be inverted (GH10741)
• Bug in `read_stata` when reading a file with a different order set in columns (GH10757)
• Bug in `Categorical` may not representing properly when category contains `tz` or `Period` (GH10713)
• Bug in `Categorical.__iter__` may not returning correct `datetime` and `Period` (GH10713)
• Bug in indexing with a `PeriodIndex` on an object with a `PeriodIndex` (GH10791)
• Bug in `read_csv` with `engine='c'`: EOF preceded by a comment, blank line, etc. was not handled correctly (GH10528, GH10548)
• Reading “famafrench” data via `DataReader` results in HTTP 404 error because of the website url is changed (GH10591).
• Bug in `read_msgpack` where DataFrame to decode has duplicate column names (GH9618)
• Bug in `io.common.get_filepath_or_buffer` which caused reading of valid S3 files to fail if the bucket also contained keys for which the user does not have read permission (GH10604)
• Bug in vectorised setting of timestamp columns with python `datetime.date` and numpy `datetime64` (GH10408, GH10412)
• Bug in `Index.take` may add unnecessary freq attribute (GH10791)
• Bug in `merge` with empty `DataFrame` may raise `IndexError` (GH10824)
• Bug in `to_latex` where unexpected keyword argument for some documented arguments (GH10888)
• Bug in indexing of large `DataFrame` where `IndexError` is uncaught (GH10645 and GH10692)
• Bug in `read_csv` when using the `nrows` or `chunksize` parameters if file contains only a header line (GH9535)
• Bug in serialization of category types in HDF5 in presence of alternate encodings. (GH10366)
• Bug in `pd.DataFrame` when constructing an empty `DataFrame` with a string dtype (GH9428)
• Bug in `pd.DataFrame.diff` when `DataFrame` is not consolidated (GH10907)
• Bug in `pd.unique` for arrays with the `datetime64` or `timedelta64` dtype that meant an array with object dtype was returned instead the original dtype (GH9431)
• Bug in `Timedelta` raising error when slicing from 0s (GH10583)
• Bug in `DatetimeIndex.take` and `TimedeltaIndex.take` may not raise `IndexError` against invalid index (GH10295)

• Bug in `Series([np.nan]).astype('M8[ms]')`, which now returns `Series([pd.NaT])` (GH10747)

• Bug in `PeriodIndex.order reset freq` (GH10295)

• Bug in `date_range` when `freq` divides end as nanos (GH10885)

• Bug in `iloc` allowing memory outside bounds of a Series to be accessed with negative integers (GH10779)

• Bug in `read_msgpack` where encoding is not respected (GH10581)

• Bug preventing access to the first index when using `iloc` with a list containing the appropriate negative integer (GH10547, GH10779)

• Bug in `TimedeltaIndex` formatter causing error while trying to save DataFrame with TimedeltaIndex using to_csv (GH10833)

• Bug in `DataFrame.where` when handling Series slicing (GH10218, GH9558)

• Bug where `pd.read_gbq` throws `ValueError` when Bigquery returns zero rows (GH10273)

• Bug in `to_json` which was causing segmentation fault when serializing 0-rank ndarray (GH9576)

• Bug in plotting functions may raise `IndexError` when plotted on `GridSpec` (GH10819)

• Bug in plot result may show unnecessary minor ticklabels (GH10657)

• Bug in `groupby` incorrect computation for aggregation on DataFrame with `NaT` (E.g first, last, min). (GH10590, GH11010)

• Bug when constructing DataFrame where passing a dictionary with only scalar values and specifying columns did not raise an error (GH10856)

• Bug in `.var()` causing roundoff errors for highly similar values (GH10242)

• Bug in `DataFrame.plot(subplots=True)` with duplicated columns outputs incorrect result (GH10962)

• Bug in `Index` arithmetic may result in incorrect class (GH10638)

• Bug in `date_range` results in empty if `freq` is negative annually, quarterly and monthly (GH11018)

• Bug in `DateTimeIndex` cannot infer negative freq (GH11018)

• Remove use of some deprecated numpy comparison operations, mainly in tests. (GH10569)

• Bug in `Index` dtype may not applied properly (GH11017)

• Bug in `io.gbq` when testing for minimum google api client version (GH10652)

• Bug in `DataFrame` construction from nested dict with timedelta keys (GH11129)

• Bug in `.fillna` against may raise `TypeError` when data contains datetime dtype (GH7095, GH11153)

• Bug in `.groupby` when number of keys to group by is same as length of index (GH11185)

• Bug in `convert_objects` where converted values might not be returned if all null and `coerce` (GH9589)

• Bug in `convert_objects` where `copy` keyword was not respected (GH9589)

5.13 Version 0.16

5.13.1 Version 0.16.2 (June 12, 2015)

This is a minor bug-fix release from 0.16.1 and includes a large number of bug fixes along some new features (pipe() method), enhancements, and performance improvements.

We recommend that all users upgrade to this version.

Highlights include:

- A new pipe method, see here
- Documentation on how to use numba with pandas, see here

What’s new in v0.16.2

- **New features**
  - Pipe
  - Other enhancements
- **API changes**
- **Performance improvements**
- **Bug fixes**
- **Contributors**

### New features

**Pipe**

We’ve introduced a new method DataFrame.pipe(). As suggested by the name, pipe should be used to pipe data through a chain of function calls. The goal is to avoid confusing nested function calls like

```python
# df is a DataFrame
# f, g, and h are functions that take and return DataFrames
f(g(h(df), arg1=1), arg2=2, arg3=3)  # noqa F821
```

The logic flows from inside out, and function names are separated from their keyword arguments. This can be rewritten as

```python
# df is a DataFrame
# f, g, and h are functions that take and return DataFrames
f(h(g(df), arg1=1), arg2=2, arg3=3)  # noqa F821
```
Now both the code and the logic flow from top to bottom. Keyword arguments are next to their functions. Overall the code is much more readable.

In the example above, the functions \( f \), \( g \), and \( h \) each expected the DataFrame as the first positional argument. When the function you wish to apply takes its data anywhere other than the first argument, pass a tuple of \((\text{function}, \text{keyword})\) indicating where the DataFrame should flow. For example:

```python
In [1]: import statsmodels.formula.api as sm
In [2]: bb = pd.read_csv("data/baseball.csv", index_col="id")
# sm.ols takes (formula, data)
In [3]: (
    ...:     bb.query("h > 0")
    ...:     .assign(ln_h=lambda df: np.log(df.h))
    ...:     .pipe((sm.ols, "data"), "hr ~ ln_h + year + g + C(lg)")
    ...:     .fit()
    ...:     .summary()
    ...: )
Out[3]:
<class 'statsmodels.iolib.summary.Summary'>
```
The condition number is large, 1.49e+07. This might indicate that there are strong multicollinearity or other numerical problems.

The pipe method is inspired by unix pipes, which stream text through processes. More recently dplyr and magrittr have introduced the popular (%>%) pipe operator for R.

See the documentation for more. (GH10129)

Other enhancements

• Added rsplit to Index/Series StringMethods (GH10303)
• Removed the hard-coded size limits on the DataFrame HTML representation in the IPython notebook, and leave this to IPython itself (only for IPython v3.0 or greater). This eliminates the duplicate scroll bars that appeared in the notebook with large frames (GH10231).

Note that the notebook has a toggle output scrolling feature to limit the display of very large frames (by clicking left of the output). You can also configure the way DataFrames are displayed using the pandas options, see here.

• axis parameter of DataFrame.quantile now accepts also index and column. (GH9543)

API changes

• Holiday now raises NotImplementedError if both offset and observance are used in the constructor instead of returning an incorrect result (GH10217).

Performance improvements

• Improved Series.resample performance with dtype=datetime64[ns] (GH7754)
• Increase performance of str.split when expand=True (GH10081)

Bug fixes

• Bug in Series.hist raises an error when a one row Series was given (GH10214)
• Bug where HDFStore.select modifies the passed columns list (GH7212)
• Bug in Categorical repr with display.width of None in Python 3 (GH10087)
• Bug in to_json with certain orients and a CategoricalIndex would segfault (GH10317)
• Bug where some of the nan functions do not have consistent return dtypes (GH10251)
• Bug in DataFrame.quantile on checking that a valid axis was passed (GH9543)
• Bug in groupby.apply aggregation for Categorical not preserving categories (GH10138)
• Bug in to_csv where date_format is ignored if the datetime is fractional (GH10209)
• Bug in DataFrame.to_json with mixed data types (GH10289)
• Bug in cache updating when consolidating (GH10264)
• Bug in mean() where integer dtypes can overflow (GH10172)
• Bug where `Panel.from_dict` does not set dtype when specified (GH10058)
• Bug in `Index.union` raises `AttributeError` when passing array-likes. (GH10149)
• Bug in `Timestamp`'s' microsecond, quarter, dayofyear, week and daysinmonth properties return np.int type, not built-in int. (GH10050)
• Bug in `NaT` raises `AttributeError` when accessing to daysinmonth, dayofweek properties. (GH10096)
• Bug in `Index` repr when using the `max_seq_items=None` setting (GH10182).
• Bug in getting timezone data with `dateutil` on various platforms (GH9059, GH8639, GH9663, GH10121)
• Bug in displaying datetimes with mixed frequencies; display 'ms' datetimes to the proper precision. (GH10170)
• Bug in `setitem` where type promotion is applied to the entire block (GH10280)
• Bug in `Series` arithmetic methods may incorrectly hold names (GH10068)
• Bug in `GroupBy.get_group` when grouping on multiple keys, one of which is categorical. (GH10132)
• Bug in `DatetimeIndex` and `TimedeltaIndex` names are lost after timedelta arithmetic (GH9926)
• Bug in `DataFrame` construction from nested dict with datetime64 (GH10160)
• Bug in `Series` construction from dict with datetime64 keys (GH9456)
• Bug in `Series.plot` (label="LABEL") not correctly setting the label (GH10119)
• Bug in plot not defaulting to `matplotlib` axes.grid setting (GH9792)
• Bug causing strings containing an exponent, but no decimal to be parsed as int instead of float in engine='python' for the read_csv parser (GH9565)
• Bug in `Series.align` resets name when `fill_value` is specified (GH10067)
• Bug in `read_csv` causing index name not to be set on an empty DataFrame (GH10184)
• Bug in `SparseSeries.abs` resets name (GH10241)
• Bug in `TimedeltaIndex` slicing may reset freq (GH10292)
• Bug in `GroupBy.get_group` raises `ValueError` when group key contains `NaT` (GH6992)
• Bug in `SparseSeries` constructor ignores input data name (GH10258)
• Bug in `Categorical.remove_categories` causing a `ValueError` when removing the NaN category if underlying dtype is floating-point (GH10156)
• Bug where `infer_freq` infers time rule (WOM-5XXX) unsupported by `to_offset` (GH9425)
• Bug in `DataFrame.to_hdf()` where table format would raise a seemingly unrelated error for invalid (non-string) column names. This is now explicitly forbidden. (GH9057)
• Bug to handle masking empty `DataFrame` (GH10126).
• Bug where MySQL interface could not handle numeric table/column names (GH10255)
• Bug in `read_csv` with a `date_parser` that returned a datetime64 array of other time resolution than [ns] (GH10245)
• Bug in `Panel.apply` when the result has ndim=0 (GH10332)
• Bug in `read_hdf` where `auto_close` could not be passed (GH9327).
• Bug in `read_hdf` where `open stores` could not be used (GH10330).
• Bug in adding empty DataFrame, now results in a DataFrame that .equals an empty DataFrame (GH10181).
• Bug in to_hdf and HDFStore which did not check that complib choices were valid (GH4582, GH8874).

5.13.2 Version 0.16.1 (May 11, 2015)

This is a minor bug-fix release from 0.16.0 and includes a large number of bug fixes along several new features, enhancements, and performance improvements. We recommend that all users upgrade to this version.

Highlights include:

- Support for a `CategoricalIndex`, a category based index, see [here](#)
- New section on how-to-contribute to `pandas`, see [here](#)
- Revised “Merge, join, and concatenate” documentation, including graphical examples to make it easier to understand each operations, see [here](#)
- New method `sample` for drawing random samples from Series, DataFrames and Panels. See [here](#)
- The default `Index` printing has changed to a more uniform format, see [here](#)
- `BusinessHour` datetime-offset is now supported, see [here](#)
- Further enhancement to the `.str` accessor to make string operations easier, see [here](#)

### What’s new in v0.16.1

- **Enhancements**
  - `CategoricalIndex`
  - `Sample`
  - `String methods enhancements`
  - `Other enhancements`
- **API changes**
  - `Deprecations`
- **Index representation**
- **Performance improvements**
- **Bug fixes**
- **Contributors**

**Warning:** In pandas 0.17.0, the sub-package `pandas.io.data` will be removed in favor of a separately installable package (GH8961).
Enhancements

CategoricalIndex

We introduce a CategoricalIndex, a new type of index object that is useful for supporting indexing with duplicates. This is a container around a Categorical (introduced in v0.15.0) and allows efficient indexing and storage of an index with a large number of duplicated elements. Prior to 0.16.1, setting the index of a DataFrame/Series with a category dtype would convert this to regular object-based Index.

```
In [1]: df = pd.DataFrame({'A': np.arange(6),
                       'B': pd.Series(list('aabbca'))
                       .astype('category', categories=list('cab'))
                       })

In [2]: df
Out[2]:
   A  B
0  0  a
1  1  a
2  2  b
3  3  b
4  4  c
5  5  a

In [3]: df.dtypes
Out[3]:
   A  int64
   B  category
   dtype: object

In [4]: df.B.cat.categories
Out[4]: Index(['c', 'a', 'b'], dtype='object')

setting the index, will create a CategoricalIndex

```
```
In [5]: df2 = df.set_index('B')

In [6]: df2.index
Out[6]: CategoricalIndex([a, a, b, b, c, a], categories=[c, a, b], ordered=False, name='B', dtype='category')
```

indexing with __getitem__/.iloc/.loc/.ix works similarly to an Index with duplicates. The indexers MUST be in the category or the operation will raise.

```
In [7]: df2.loc['a']
Out[7]:
   A
B
a  0
b  1
a  5
```

and preserves the CategoricalIndex

```
In [8]: df2.loc['a'].index
Out[8]: CategoricalIndex([a, a, a], categories=[c, a, b], ordered=False,)  

(continues on next page)
sorting will order by the order of the categories

```
In [9]: df2.sort_index()
Out[9]:
    A
    B
    c  4
    a  0
    a  1
    a  5
    b  2
    b  3
```

groupby operations on the index will preserve the index nature as well

```
In [10]: df2.groupby(level=0).sum()
Out[10]:
    A
    B
    c  4
    a  6
    b  5
```

reindexing operations, will return a resulting index based on the type of the passed indexer, meaning that passing a list will return a plain-old-Index; indexing with a Categorical will return a CategoricalIndex, indexed according to the categories of the PASSED Categorical dtype. This allows one to arbitrarily index these even with values NOT in the categories, similarly to how you can reindex ANY pandas index.

```
In [12]: df2.reindex(['a', 'e'])
Out[12]:
    A
    B
    a  0.0
    a  1.0
    a  5.0
    e   NaN
```

```
In [13]: df2.reindex(['a', 'e']).index
Out[13]: pd.Index(['a', 'a', 'a', 'e'], dtype='object', name='B')
```

```
In [14]: df2.reindex(pd.Categorical(['a', 'e'], categories=list('abcde')))  
In [15]: df2.reindex(pd.Categorical(['a', 'e'], categories=list('abcde'))).index
Out[15]: pd.CategoricalIndex(['a', 'a', 'a', 'e'], categories=['a', 'a', 'a', 'e'], ordered=False, name='B', dtype='category')
```
See the documentation for more. (GH7629, GH10038, GH10039)

Sample

Series, DataFrames, and Panels now have a new method: `sample()`. The method accepts a specific number of rows or columns to return, or a fraction of the total number of rows or columns. It also has options for sampling with or without replacement, for passing in a column for weights for non-uniform sampling, and for setting seed values to facilitate replication. (GH2419)

```
In [1]: example_series = pd.Series([0, 1, 2, 3, 4, 5])

# When no arguments are passed, returns 1
In [2]: example_series.sample()
Out[2]:
3 3
Length: 1, dtype: int64

# One may specify either a number of rows:
In [3]: example_series.sample(n=3)
Out[3]:
2 2
1 1
0 0
Length: 3, dtype: int64

# Or a fraction of the rows:
In [4]: example_series.sample(frac=0.5)
Out[4]:
1 1
5 5
3 3
Length: 3, dtype: int64

# weights are accepted.
In [5]: example_weights = [0, 0, 0.2, 0.2, 0.2, 0.4]

In [6]: example_series.sample(n=3, weights=example_weights)
Out[6]:
2 2
4 4
3 3
Length: 3, dtype: int64

# weights will also be normalized if they do not sum to one,
# and missing values will be treated as zeros.
In [7]: example_weights2 = [0.5, 0, 0, 0, None, np.nan]

In [8]: example_series.sample(n=1, weights=example_weights2)
Out[8]:
0 0
Length: 1, dtype: int64
```
When applied to a DataFrame, one may pass the name of a column to specify sampling weights when sampling from rows.

```python
In [9]: df = pd.DataFrame({"col1": [9, 8, 7, 6], "weight_column": [0.5, 0.4, 0.1, 0]})
In [10]: df.sample(n=3, weights="weight_column")
Out[10]:
       col1  weight_column
0      9          0.5
1      8          0.4
2      7          0.1
[3 rows x 2 columns]
```

### String methods enhancements

*Continuing from v0.16.0,* the following enhancements make string operations easier and more consistent with standard python string operations.

- **Added** `StringMethods (.str accessor) to Index (GH9068)**

  The `.str` accessor is now available for both `Series` and `Index`.

```python
In [11]: idx = pd.Index([" jack", "jill ", " jesse ", "frank"])
In [12]: idx.str.strip()
Out[12]: Index(['jack', 'jill', 'jesse', 'frank'], dtype='object')
```

One special case for the `.str` accessor on `Index` is that if a string method returns `bool`, the `.str` accessor will return a `np.array` instead of a boolean `Index (GH8875)`. This enables the following expression to work naturally:

```python
In [13]: idx = pd.Index(["a1", "a2", "b1", "b2"])
In [14]: s = pd.Series(range(4), index=idx)
In [15]: s
Out[15]:
a1    0
a2    1
b1    2
b2    3
Length: 4, dtype: int64
In [16]: idx.str.startswith("a")
Out[16]: array([ True,  True, False, False])
In [17]: s[s.index.str.startswith("a")]
Out[17]:
a1    0
a2    1
Length: 2, dtype: int64
```

- The following new methods are accessible via `.str` accessor to apply the function to each values. *(GH9766, GH9773, GH10031, GH10045, GH10052)*

---

3078 Chapter 5. Release notes
split now takes expand keyword to specify whether to expand dimensionality. return_type is deprecated. (GH9847)

```
In [18]: s = pd.Series(['a,b', 'a,c', 'b,c'])

# return Series
In [19]: s.str.split(',')
Out [19]:
0 [a, b]
1 [a, c]
2 [b, c]
Length: 3, dtype: object

# return DataFrame
In [20]: s.str.split(', ', expand=True)
Out [20]:
    0  1
  0 a b
  1 a c
  2 b c

[3 rows x 2 columns]

In [21]: idx = pd.Index(['a,b', 'a,c', 'b,c'])

# return Index
In [22]: idx.str.split(', ')
Out [22]: Index([['a', 'b'], ['a', 'c'], ['b', 'c']], dtype='object')

# return MultiIndex
In [23]: idx.str.split(', ', expand=True)
Out [23]:
MultiIndex([('a', 'b'),
            ('a', 'c'),
            ('b', 'c')])
```

Improved extract and get_dummies methods for Index.str (GH9980)

Other enhancements

- BusinessHour offset is now supported, which represents business hours starting from 09:00 - 17:00 on BusinessDay by default. See Here for details. (GH7905)

```
In [24]: pd.Timestamp('2014-08-01 09:00') + pd.tseries.offsets.BusinessHour()
Out [24]: Timestamp('2014-08-01 10:00:00')

In [25]: pd.Timestamp('2014-08-01 07:00') + pd.tseries.offsets.BusinessHour()
Out [25]: Timestamp('2014-08-01 10:00:00')
```
### DataFrame.diff
Now takes an axis parameter that determines the direction of differencing (GH9727)

- Allow clip, clip_lower, and clip_upper to accept array-like arguments as thresholds (This is a regression from 0.11.0). These methods now have an axis parameter which determines how the Series or DataFrame will be aligned with the threshold(s). (GH6966)

- DataFrame.mask() and Series.mask() now support same keywords as where (GH8801)

- drop function can now accept errors keyword to suppress ValueError raised when any of label does not exist in the target data. (GH6736)

```python
In [27]: df = pd.DataFrame(np.random.randn(3, 3), columns=['A', 'B', 'C'])
In [28]: df.drop(['A', 'X'], axis=1, errors='ignore')
Out[28]:
         B   C
0 -0.706771 -1.039575
1 -0.424972  0.567020
2 -1.087401 -0.673690
[3 rows x 2 columns]
```

- Add support for separating years and quarters using dashes, for example 2014-Q1. (GH9688)

- Allow conversion of values with dtype datetime64 or timedelta64 to strings using astype(str) (GH9757)

- get_dummies function now accepts sparse keyword. If set to True, the return DataFrame is sparse, e.g. SparseDataFrame. (GH8823)

- Period now accepts datetime64 as value input. (GH9054)

- Allow timedelta string conversion when leading zero is missing from time definition, ie 0:00:00 vs 00:00:00. (GH9570)

- Allow Panel.shift with axis='items' (GH9890)

- Trying to write an excel file now raises NotImplementedError if the DataFrame has a MultiIndex instead of writing a broken Excel file. (GH9794)

- Allow Categorical.add_categories to accept Series or np.array. (GH9927)

- Add/delete str/dt/cat accessors dynamically from __dir__. (GH9910)

- Add normalize as a dt accessor method. (GH10047)

- DataFrame and Series now have _constructor_expanddim property as overridable constructor for one higher dimensionality data. This should be used only when it is really needed, see here

- pd.lib.infer_dtype now returns 'bytes' in Python 3 where appropriate. (GH10032)
API changes

- When passing in an ax to df.plot(..., ax=ax), the sharex kwarg will now default to False. The result is that the visibility of xlabels and xticklabels will not anymore be changed. You have to do that by yourself for the right axes in your figure or set sharex=True explicitly (but this changes the visible for all axes in the figure, not only the one which is passed in!). If pandas creates the subplots itself (e.g. no passed in ax kwarg), then the default is still sharex=True and the visibility changes are applied.

- `assign()` now inserts new columns in alphabetical order. Previously the order was arbitrary. (GH9777)

- By default, `read_csv` and `read_table` will now try to infer the compression type based on the file extension. Set compression=None to restore the previous behavior (no decompression). (GH9770)

Deprecations

- `Series.str.split`'s return_type keyword was removed in favor of expand (GH9847)

Index representation

The string representation of `Index` and its sub-classes have now been unified. These will show a single-line display if there are few values; a wrapped multi-line display for a lot of values (but less than display.max_seq_items; if lots of items (> display.max_seq_items) will show a truncated display (the head and tail of the data). The formatting for `MultiIndex` is unchanged (a multi-line wrapped display). The display width responds to the option display.max_seq_items, which is defaulted to 100. (GH6482)

Previous behavior

```python
In [2]: pd.Index(range(4), name='foo')
Out[2]: Int64Index([0, 1, 2, 3], dtype='int64')

In [3]: pd.Index(range(104), name='foo')
Out[3]: Int64Index([0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99, ...], dtype='int64')

In [4]: pd.date_range('20130101', periods=4, name='foo', tz='US/Eastern')
Out[4]: <class 'pandas.tseries.index.DatetimeIndex'>
[2013-01-01 00:00:00-05:00, ..., 2013-01-04 00:00:00-05:00]
Length: 4, Freq: D, Timezone: US/Eastern

In [5]: pd.date_range('20130101', periods=104, name='foo', tz='US/Eastern')
Out[5]: <class 'pandas.tseries.index.DatetimeIndex'>
[2013-01-01 00:00:00-05:00, ..., 2013-04-14 00:00:00-04:00]
Length: 104, Freq: D, Timezone: US/Eastern
```

New behavior

```python
In [29]: pd.set_option("display.width", 80)
In [30]: pd.Index(range(4), name='foo')
```
Out[30]: RangeIndex(start=0, stop=4, step=1, name='foo')

In [31]: pd.Index(range(30), name="foo")
Out[31]: RangeIndex(start=0, stop=30, step=1, name='foo')

In [32]: pd.Index(range(104), name="foo")
Out[32]: RangeIndex(start=0, stop=104, step=1, name='foo')

In [33]: pd.CategoricalIndex(['a', 'bb', 'ccc', 'dddd'], ordered=True, name='foobar')
Out[33]: CategoricalIndex(['a', 'bb', 'ccc', 'dddd'], categories=['a', 'bb', 'ccc', 'dddd'], ordered=True, name='foobar', dtype='category')

In [34]: pd.CategoricalIndex(['a', 'bb', 'ccc', 'dddd'] * 10, ordered=True, name='foobar')
Out[34]: CategoricalIndex(['a', 'bb', 'ccc', 'dddd', 'a', 'bb', 'ccc', 'dddd', 'a', 'bb', 'ccc', 'dddd', 'a', 'bb', 'ccc', 'dddd', 'a', 'bb', 'ccc', 'dddd', 'a', 'bb', 'ccc', 'dddd'], categories=['a', 'bb', 'ccc', 'dddd'], ordered=True, name='foobar', dtype='category')

In [35]: pd.CategoricalIndex(['a', 'bb', 'ccc', 'dddd'] * 100, ordered=True, name='foobar')
Out[35]: CategoricalIndex(['a', 'bb', 'ccc', 'dddd', 'a', 'bb', 'ccc', 'dddd', 'a', 'bb', 'ccc', 'dddd', 'a', 'bb', 'ccc', 'dddd', 'a', 'bb', 'ccc', 'dddd', 'a', 'bb', 'ccc', 'dddd'], categories=['a', 'bb', 'ccc', 'dddd'], ordered=True, name='foobar', dtype='category', length=400)

In [36]: pd.date_range("20130101", periods=4, name="foo", tz="US/Eastern")
Out[36]: DatetimeIndex(['2013-01-01 00:00:00-05:00', '2013-01-02 00:00:00-05:00', '2013-01-03 00:00:00-05:00', '2013-01-04 00:00:00-05:00'], dtype='datetime64[ns, US/Eastern]', name='foo', freq='D')

In [37]: pd.date_range("20130101", periods=25, freq="D")

In [38]: pd.date_range("20130101", periods=104, name="foo", tz="US/Eastern")
Out[38]: DatetimeIndex(['2013-01-01 00:00:00-05:00', '2013-01-02 00:00:00-05:00', '2013-01-03 00:00:00-05:00', '2013-01-04 00:00:00-05:00', '2013-01-05 00:00:00-05:00', '2013-01-06 00:00:00-05:00', '2013-01-07 00:00:00-05:00', '2013-01-08 00:00:00-05:00', '2013-01-09 00:00:00-05:00', '2013-01-10 00:00:00-05:00', '2013-01-11 00:00:00-05:00', '2013-01-12 00:00:00-05:00', '2013-01-13 00:00:00-05:00', '2013-01-14 00:00:00-05:00', '2013-01-15 00:00:00-05:00', '2013-01-16 00:00:00-05:00', '2013-01-17 00:00:00-05:00', '2013-01-18 00:00:00-05:00', '2013-01-19 00:00:00-05:00', '2013-01-20 00:00:00-05:00', '2013-01-21 00:00:00-05:00', '2013-01-22 00:00:00-05:00', '2013-01-23 00:00:00-05:00', '2013-01-24 00:00:00-05:00', '2013-01-25 00:00:00-05:00', '2013-01-26 00:00:00-05:00', '2013-01-27 00:00:00-05:00', '2013-01-28 00:00:00-05:00', '2013-01-29 00:00:00-05:00', '2013-01-30 00:00:00-05:00'])
Performance improvements

- Improved csv write performance with mixed dtypes, including datetimes by up to 5x (GH9940)
- Improved csv write performance generally by 2x (GH9940)
- Improved the performance of pd.lib.max_len_string_array by 5-7x (GH10024)

Bug fixes

- Bug where labels did not appear properly in the legend of DataFrame.plot(), passing label= arguments works, and Series indices are no longer mutated. (GH9542)
- Bug in json serialization causing a segfault when a frame had zero length. (GH9805)
- Bug in read_csv where missing trailing delimiters would cause segfault. (GH5664)
- Bug in retaining index name on appending (GH9862)
- Bug in scatter_matrix draws unexpected axis ticklabels (GH5662)
- Fixed bug in StataWriter resulting in changes to input DataFrame upon save (GH9795).
- Bug in transform causing length mismatch when null entries were present and a fast aggregator was being used (GH9697)
- Bug in equals causing false negatives when block order differed (GH9330)
- Bug in grouping with multiple pd.Grouper where one is non-time based (GH10063)
- Bug in read_sql_table error when reading postgres table with timezone (GH7139)
- Bug in DataFrame slicing may not retain metadata (GH9776)
- Bug where TimedeltaIndex were not properly serialized in fixed HDFStore (GH9635)
- Bug with TimedeltaIndex constructor ignoring name when given another TimedeltaIndex as data (GH10025).
- Bug in DataFrameFormatter._get_formated_index with not applying max_colwidth to the DataFrame index (GH7856)
- Bug in .loc with a read-only ndarray data source (GH10043)
- Bug in groupby.apply() that would raise if a passed user defined function either returned only None (for all input). (GH9685)
- Always use temporary files in pytables tests (GH9992)
- Bug in plotting continuously using secondary_y may not show legend properly. (GH9610, GH9779)
• Bug in `DataFrame.plot(kind="hist")` results in `TypeError` when `DataFrame` contains non-numeric columns (GH9853)
• Bug where repeated plotting of `DataFrame` with a `DatetimeIndex` may raise `TypeError` (GH9852)
• Bug in `setup.py` that would allow an incompat cython version to build (GH9827)
• Bug in plotting `secondary_y` incorrectly attaches `right_ax` property to secondary axes specifying itself recursively. (GH9861)
• Bug in `Series.quantile` on empty `Series` of type `Datetime` or `Timedelta` (GH9675)
• Bug in `where` causing incorrect results when upcasting was required (GH9731)
• Bug in `FloatArrayFormatter` where decision boundary for displaying “small” floats in decimal format is off by one order of magnitude for a given display.precision (GH9764)
• Fixed bug where `DataFrame.plot()` raised an error when both `color` and `style` keywords were passed and there was no color symbol in the style strings (GH9671)
• Not showing a `DeprecationWarning` on combining list-likes with an `Index` (GH10083)
• Bug in `read_csv` and `read_table` when using `skip_rows` parameter if blank lines are present. (GH9832)
• Bug in `read_csv()` interprets `index_col=True` as 1 (GH9798)
• Bug in index equality comparisons using `==` failing on `Index/MultiIndex` type incompatibility (GH9785)
• Bug in which `SparseDataFrame` could not take `nan` as a column name (GH8822)
• Bug in `to_msgpack` and `read_msgpack` zlib and blosc compression support (GH9783)
• Bug `GroupBy.size` doesn’t attach index name properly if grouped by `TimeGrouper` (GH9925)
• Bug causing an exception in slice assignments because `length_of_indexer` returns wrong results (GH9995)
• Bug in csv parser causing lines with initial white space plus one non-space character to be skipped. (GH9710)
• Bug in C csv parser causing spurious NaNs when data started with newline followed by white space. (GH10022)
• Bug causing elements with a null group to spill into the final group when grouping by a `Categorical` (GH9603)
• Bug where `.iloc` and `.loc` behavior is not consistent on empty dataframes (GH9964)
• Bug in invalid attribute access on a `TimedeltaIndex` incorrectly raised `ValueError` instead of `AttributeError` (GH9680)
• Bug in unequal comparisons between categorical data and a scalar, which was not in the categories (e.g. `Series(Categorical(list("abc"), ordered=True)) > "d"`). This returned `False` for all elements, but now raises a `TypeError`. Equality comparisons also now return `False` for `==` and `True` for `!=`. (GH9848)
• Bug in `DataFrame__setitem__` when right hand side is a dictionary (GH9874)
• Bug in `where` when `dtype` is `datetime64/timedelta64`, but `dtype` of other is not (GH9804)
• Bug in `MultiIndex.sortlevel()` results in unicode level name breaks (GH9856)
• Bug in which `groupby.transform` incorrectly enforced output dtypes to match input dtypes. (GH9807)
• Bug in `DataFrame constructor` when `columns` parameter is set, and `data` is an empty list (GH9939)
• Bug in bar plot with `log=True` raises `TypeError` if all values are less than 1 (GH9905)
• Bug in horizontal bar plot ignores `log=True` (GH9905)
• Bug in PyTables queries that did not return proper results using the index (GH8265, GH9676)
• Bug where dividing a dataframe containing values of type Decimal by another Decimal would raise. (GH9787)
• Bug where using DataFrames asfreq would remove the name of the index. (GH9885)
• Bug causing extra index point when resample BM/BQ (GH9756)
• Changed caching in AbstractHolidayCalendar to be at the instance level rather than at the class level as the latter can result in unexpected behaviour. (GH9552)
• Fixed latex output for MultiIndexed dataframes (GH9778)
• Bug causing an exception when setting an empty range using DataFrame.loc (GH9596)
• Bug in hiding ticklabels with subplots and shared axes when adding a new plot to an existing grid of axes (GH9158)
• Bug in transform and filter when grouping on a categorical variable (GH9921)
• Bug in transform when groups are equal in number and dtype to the input index (GH9700)
• Google BigQuery connector now imports dependencies on a per-method basis. (GH9713)
• Updated BigQuery connector to no longer use deprecated oauth2client.tools.run() (GH8327)
• Bug in subclassed DataFrame. It may not return the correct class, when slicing or subsetting it. (GH9632)
• Bug in .median() where non-float null values are not handled correctly (GH10040)
• Bug in Series.fillna() where it raises if a numerically convertible string is given (GH10092)

5.13.3 Version 0.16.0 (March 22, 2015)

This is a major release from 0.15.2 and includes a small number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

Highlights include:

- DataFrame.assign method, see here
- Series.to_coo/from_coo methods to interact with scipy.sparse, see here
- Backwards incompatible change to Timedelta to conform the .seconds attribute with datetime.timedelta, see here
- Changes to the .loc slicing API to conform with the behavior of .ix see here
- Changes to the default for ordering in the Categorical constructor, see here
- Enhancement to the .str accessor to make string operations easier, see here
- The pandas.tools.rplot, pandas.sandbox.qtpandas and pandas.rpy modules are deprecated. We refer users to external packages like seaborn, pandas-qt and rpy2 for similar or equivalent functionality, see here

Check the API Changes and deprecations before updating.

### What’s new in v0.16.0

- **New features**
  - DataFrame assign
  - Interaction with scipy.sparse
  - String methods enhancements
  - Other enhancements
- **Backwards incompatible API changes**
  - Changes in timedelta
  - Indexing changes
  - Categorical changes
  - Other API changes
  - Deprecations
New features

**Dataframe assign**

Inspired by dplyr's `mutate` verb, Dataframe has a new `assign()` method. The function signature for `assign` is simply `**kwargs`. The keys are the column names for the new fields, and the values are either a value to be inserted (for example, a Series or NumPy array), or a function of one argument to be called on the DataFrame. The new values are inserted, and the entire DataFrame (with all original and new columns) is returned.

```python
In [1]: iris = pd.read_csv('data/iris.data')
In [2]: iris.head()
Out[2]:
   SepalLength  SepalWidth  PetalLength  PetalWidth       Name
0         5.1       3.5         1.4       0.2   Iris-setosa
1         4.9       3.0         1.4       0.2   Iris-setosa
2         4.7       3.2         1.3       0.2   Iris-setosa
3         4.6       3.1         1.5       0.2   Iris-setosa
4         5.0       3.6         1.4       0.2   Iris-setosa
[5 rows x 5 columns]
```

```python
In [3]: iris.assign(sepal_ratio=iris['SepalWidth'] / iris['SepalLength']).head()
Out[3]:
   SepalLength  SepalWidth  PetalLength  PetalWidth     Name sepal_ratio
0         5.1       3.5         1.4       0.2   Iris-setosa  0.686275
1         4.9       3.0         1.4       0.2   Iris-setosa  0.612245
2         4.7       3.2         1.3       0.2   Iris-setosa  0.680851
3         4.6       3.1         1.5       0.2   Iris-setosa  0.673913
4         5.0       3.6         1.4       0.2   Iris-setosa  0.720000
[5 rows x 6 columns]
```

Above was an example of inserting a precomputed value. We can also pass in a function to be evaluated.

```python
In [4]: iris.assign(sepal_ratio=lambda x: (x['SepalWidth'] / x['SepalLength'])).head()
Out[4]:
   SepalLength  SepalWidth  PetalLength  PetalWidth     Name   sepal_ratio
0         5.1       3.5         1.4       0.2   Iris-setosa  0.686275
1         4.9       3.0         1.4       0.2   Iris-setosa  0.612245
2         4.7       3.2         1.3       0.2   Iris-setosa  0.680851
3         4.6       3.1         1.5       0.2   Iris-setosa  0.673913
4         5.0       3.6         1.4       0.2   Iris-setosa  0.720000
[5 rows x 6 columns]
```
The power of `assign` comes when used in chains of operations. For example, we can limit the DataFrame to just those with a Sepal Length greater than 5, calculate the ratio, and plot.

```
In [5]: iris = pd.read_csv('data/iris.data')
In [6]: (iris.query('SepalLength > 5')
    ...: .assign(SepalRatio=lambda x: x.SepalWidth / x.SepalLength,
    ...:          PetalRatio=lambda x: x.PetalWidth / x.PetalLength)
    ...: .plot(kind='scatter', x='SepalRatio', y='PetalRatio'))
```

```
Out[6]: <AxesSubplot:xlabel='SepalRatio', ylabel='PetalRatio'>
```

See the documentation for more. (GH9229)

### Interaction with scipy.sparse

Added `SparseSeries.to_coo()` and `SparseSeries.from_coo()` methods (GH8048) for converting to and from `scipy.sparse.coo_matrix` instances (see here). For example, given a SparseSeries with MultiIndex we can convert to a `scipy.sparse.coo_matrix` by specifying the row and column labels as index levels:

```
s = pd.Series([3.0, np.nan, 1.0, 3.0, np.nan, np.nan])
s.index = pd.MultiIndex.from_tuples([(1, 2, 'a', 0),
    (1, 2, 'a', 1),
    (1, 1, 'b', 0),
    (1, 1, 'b', 1),
    (2, 1, 'b', 0),
    (2, 1, 'b', 1)],
    names=['A', 'B', 'C', 'D'])

s
# SparseSeries
ss = s.to_sparse()
ss

A, rows, columns = ss.to_coo(row_levels=['A', 'B'],
    column_levels=['C', 'D'],
    sort_labels=False)

A
A.todense()
rows
columns
```
The from_coo method is a convenience method for creating a SparseSeries from a scipy.sparse.coo_matrix:

```python
from scipy import sparse
A = sparse.coo_matrix(((3.0, 1.0, 2.0), ([1, 0, 0], [0, 2, 3])),
    shape=(3, 4))
A
A.todense()
ss = pd.SparseSeries.from_coo(A)
ss
```

**String methods enhancements**

- Following new methods are accessible via .str accessor to apply the function to each values. This is intended to make it more consistent with standard methods on strings. (GH9282, GH9352, GH9386, GH9387, GH9439)

<table>
<thead>
<tr>
<th>Methods</th>
<th>isalnum()</th>
<th>isalpha()</th>
<th>isdigit()</th>
<th>isspace()</th>
</tr>
</thead>
<tbody>
<tr>
<td>islower()</td>
<td>isupper()</td>
<td>isdecimal()</td>
<td></td>
<td></td>
</tr>
<tr>
<td>find()</td>
<td>rfind()</td>
<td>ljust()</td>
<td>rjust()</td>
<td>zfill()</td>
</tr>
</tbody>
</table>

```python
In [7]: s = pd.Series(['abcd', '3456', 'EFGH'])

In [8]: s.str.isalpha()
Out[8]:
0   True
1  False
2   True
Length: 3, dtype: bool

In [9]: s.str.find('ab')
Out[9]:
0   0
1  -1
2  -1
Length: 3, dtype: int64
```

- `Series.str.pad()` and `Series.str.center()` now accept fillchar option to specify filling character (GH9352)

```python
In [10]: s = pd.Series(['12', '300', '25'])

In [11]: s.str.pad(5, fillchar='_')
Out[11]:
0   ___12
1   __300
2   ___25
Length: 3, dtype: object
```

- Added `Series.str.slice_replace()`, which previously raised `NotImplementedError` (GH8888)

```python
In [12]: s = pd.Series(['ABCD', 'EFGH', 'IJK'])
```

(continues on next page)
In [13]: s.str.slice_replace(1, 3, 'X')
Out[13]:
0  AXD
1  EXH
2   IX
Length: 3, dtype: object

# replaced with empty char
In [14]: s.str.slice_replace(0, 1)
Out[14]:
0  BCD
1  FGH
2   JK
Length: 3, dtype: object

Other enhancements

• Reindex now supports method='nearest' for frames or series with a monotonic increasing or decreasing index (GH9258):

```python
In [15]: df = pd.DataFrame({'x': range(5)})
In [16]: df.reindex([0.2, 1.8, 3.5], method='nearest')
Out[16]:
x
0.2  0
1.8  2
3.5  4
[3 rows x 1 columns]
```

This method is also exposed by the lower level Index.get_indexer and Index.get_loc methods.

• The read_excel() function’s sheetname argument now accepts a list and None, to get multiple or all sheets respectively. If more than one sheet is specified, a dictionary is returned. (GH9450)

```python
# Returns the 1st and 4th sheet, as a dictionary of DataFrames.
pd.read_excel('path_to_file.xls', sheetname=['Sheet1', 3])
```

• Allow Stata files to be read incrementally with an iterator; support for long strings in Stata files. See the docs here (GH9493).

• Paths beginning with ~ will now be expanded to begin with the user’s home directory (GH9066)

• Added time interval selection in get_data_yahoo (GH9071)

• Added Timestamp.to_datetime64() to complement Timedelta.to_timedelta64() (GH9255)

• tseries.frequencies.to_offset() now accepts Timedelta as input (GH9064)

• Lag parameter was added to the autocorrelation method of Series, defaults to lag-1 autocorrelation (GH9192)

• Timedelta will now accept nanoseconds keyword in constructor (GH9273)

• SQL code now safely escapes table and column names (GH8986)

• Added auto-complete for Series.str.<tab>, Series.dt.<tab> and Series.cat.<tab> (GH9322)
- 
  Index.get_indexer now supports method='pad' and method='backfill' even for any target array, not just monotonic targets. These methods also work for monotonic decreasing as well as monotonic increasing indexes (GH9258).

- Index.asof now works on all index types (GH9258).

- A verbose argument has been augmented in io.read_excel(), defaults to False. Set to True to print sheet names as they are parsed. (GH9450)

- Added days_in_month (compatibility alias daysinmonth) property to Timestamp, DatetimeIndex, Period, PeriodIndex, and Series.dt (GH9572)

- Added decimal option in to_csv to provide formatting for non-`.` decimal separators (GH781)

- Added normalize option for Timestamp to normalized to midnight (GH8794)

- Added example for DataFrame import to R using HDF5 file and rhdf5 library. See the documentation for more (GH9636).

Backwards incompatible API changes

Changes in timedelta

In v0.15.0 a new scalar type Timedelta was introduced, that is a sub-class of datetime.timedelta. Mentioned here was a notice of an API change w.r.t. the .seconds accessor. The intent was to provide a user-friendly set of accessors that give the 'natural' value for that unit, e.g. if you had a Timedelta('1 day, 10:11:12'), then .seconds would return 12. However, this is at odds with the definition of datetime.timedelta, which defines .seconds as 10 * 3600 + 11 * 60 + 12 == 36672.

So in v0.16.0, we are restoring the API to match that of datetime.timedelta. Further, the component values are still available through the .components accessor. This affects the .seconds and .microseconds accessors, and removes the .hours, .minutes, .milliseconds accessors. These changes affect TimedeltaIndex and the Series .dt accessor as well. (GH9185, GH9139)

Previous behavior

```
In [2]: t = pd.Timedelta('1 day, 10:11:12.100123')

In [3]: t.days
Out[3]: 1

In [4]: t.seconds
Out[4]: 12

In [5]: t.microseconds
Out[5]: 123
```

New behavior

```
In [17]: t = pd.Timedelta('1 day, 10:11:12.100123')

In [18]: t.days
Out[18]: 1

In [19]: t.seconds
Out[19]: 36672

In [20]: t.microseconds
Out[20]: 100123
```
Using `.components` allows the full component access

```python
In [21]: t.components
Out[21]: Components(days=1, hours=10, minutes=11, seconds=12, milliseconds=100,
  microseconds=123, nanoseconds=0)
In [22]: t.components.seconds
Out[22]: 12
```

### Indexing changes

The behavior of a small sub-set of edge cases for using `.loc` have changed (GH8613). Furthermore we have improved the content of the error messages that are raised:

- Slicing with `.loc` where the start and/or stop bound is not found in the index is now allowed; this previously would raise a `KeyError`. This makes the behavior the same as `.ix` in this case. This change is only for slicing, not when indexing with a single label.

```python
In [23]: df = pd.DataFrame(np.random.randn(5, 4),
   ....:   columns=list('ABCD'),
   ....:   index=pd.date_range('20130101', periods=5))
   ....:  
   In [24]: df
Out[24]:
   A   B   C   D
2013-01-01 0.469112 -0.282863 -1.509059 -1.135632
2013-01-02 1.212112 -0.173215  0.119209 -1.044236
2013-01-03 -0.861849 -2.104569 -0.494929  1.071804
2013-01-04  0.721555 -0.706771 -1.039575  0.271860
2013-01-05 -0.424972  0.567020  0.276232 -1.087401
   [5 rows x 4 columns]
In [25]: s = pd.Series(range(5), [-2, -1, 1, 2, 3])
In [26]: s
Out[26]:
   -2  0
   -1  1
    1  2
    2  3
    3  4
Length: 5, dtype: int64
```

Previous behavior

```python
In [4]: df.loc['2013-01-02':'2013-01-10']
KeyError: 'stop bound [2013-01-10] is not in the [index]'
```

```python
In [6]: s.loc[-10:3]
KeyError: 'start bound [-10] is not the [index]'
```

New behavior
In [27]: df.loc['2013-01-02':'2013-01-10']
Out[27]:
   A         B         C         D
2013-01-02  1.212112 -0.173215  0.119209 -1.044236
2013-01-03 -0.861849 -2.104569 -0.494929  1.071804
2013-01-04  0.721555 -0.706771 -1.039575  0.271860
2013-01-05 -0.424972  0.567020  0.276232 -1.087401
[4 rows x 4 columns]

In [28]: s.loc[-10:3]
Out[28]:
-2  0
-1  1
  2
  3
Length: 5, dtype: int64

• Allow slicing with float-like values on an integer index for .ix. Previously this was only enabled for .loc:

Previous behavior

In [8]: s.ix[-1.0:2]
TypeError: the slice start value [-1.0] is not a proper indexer for this index
   →type (Int64Index)

New behavior

In [2]: s.ix[-1.0:2]
Out[2]:
-1  1
  1
  2
  3
dtype: int64

• Provide a useful exception for indexing with an invalid type for that index when using .loc. For example
  trying to use .loc on an index of type DatetimeIndex or PeriodIndex or TimedeltaIndex, with an
  integer (or a float).

Previous behavior

In [4]: df.loc[2:3]
KeyError: 'start bound [2] is not the [index]'

New behavior

In [4]: df.loc[2:3]
TypeError: Cannot do slice indexing on <class 'pandas.tseries.index.DatetimeIndex'> with <type 'int'> keys
Categorical changes

In prior versions, Categoricals that had an unspecified ordering (meaning no ordered keyword was passed) were defaulted as ordered Categoricals. Going forward, the ordered keyword in the Categorical constructor will default to False. Ordering must now be explicit.

Furthermore, previously you could change the ordered attribute of a Categorical by just setting the attribute, e.g. `cat.ordered=True`; This is now deprecated and you should use `cat.as_ordered()` or `cat.as_unordered()`. These will by default return a new object and not modify the existing object. (GH9347, GH9190)

Previous behavior

```python
In [3]: s = pd.Series([0, 1, 2], dtype='category')
In [4]: s
Out[4]:
0 0
1 1
2 2
dtype: category
Categories (3, int64): [0 < 1 < 2]
In [5]: s.cat.ordered
Out[5]: True
In [6]: s.cat.ordered = False
In [7]: s
Out[7]:
0 0
1 1
2 2
dtype: category
Categories (3, int64): [0, 1, 2]
```

New behavior

```python
In [29]: s = pd.Series([0, 1, 2], dtype='category')
In [30]: s
Out[30]:
0 0
1 1
2 2
Length: 3, dtype: category
Categories (3, int64): [0, 1, 2]
In [31]: s.cat.ordered
Out[31]: False
In [32]: s = s.cat.as_ordered()
In [33]: s
Out[33]:
0 0
1 1
2 2
```

(continues on next page)
Length: 3, dtype: category
Categories (3, int64): [0 < 1 < 2]

In [34]: s.cat.ordered
Out[34]: True

# you can set in the constructor of the Categorical
In [35]: s = pd.Series(pd.Categorical([0, 1, 2], ordered=True))

In [36]: s
Out[36]:
0 0
1 1
2 2
Length: 3, dtype: category
Categories (3, int64): [0 < 1 < 2]

In [37]: s.cat.ordered
Out[37]: True

For ease of creation of series of categorical data, we have added the ability to pass keywords when calling .
astype(). These are passed directly to the constructor.

In [54]: s = pd.Series(['a', 'b', 'c', 'a']).astype('category', ordered=True)

In [55]: s
Out[55]:
0  a
1  b
2  c
3  a
dtype: category
Categories (3, object): [a < b < c]

In [56]: s = (pd.Series(['a', 'b', 'c', 'a']))
     ....: .astype('category', categories=list('abcdef'), ordered=False))

In [57]: s
Out[57]:
0  a
1  b
2  c
3  a
dtype: category
Categories (6, object): [a, b, c, d, e, f]
Other API changes

- **Index.duplicated** now returns `np.array(dtype=bool)` rather than `Index(dtype=object)` containing bool values. (GH8875)

- **DataFrame.to_json** now returns accurate type serialisation for each column for frames of mixed dtype (GH9037)

  Previously data was coerced to a common dtype before serialisation, which for example resulted in integers being serialised to floats:

  ```
  In [2]: pd.DataFrame({'i': [1, 2], 'f': [3.0, 4.2]}).to_json()
  Out[2]: '{"f":{"0":3.0,"1":4.2},"i":{"0":1.0,"1":2.0}}'
  ```

  Now each column is serialised using its correct dtype:

  ```
  In [2]: pd.DataFrame({'i': [1, 2], 'f': [3.0, 4.2]}).to_json()
  Out[2]: '{"f":{"0":3.0,"1":4.2},"i":{"0":1,"1":2}}'
  ```

- **DatetimeIndex**, **PeriodIndex** and **TimedeltaIndex.summary** now output the same format. (GH9116)

- **TimedeltaIndex.freqstr** now output the same string format as **DatetimeIndex**. (GH9116)

- **Bar** and **horizontal bar plots** no longer add a dashed line along the info axis. The prior style can be achieved with matplotlib's `axhline` or `axvline` methods (GH9088).

- **Series** accessors `.dt`, `.cat` and `.str` now raise `AttributeError` instead of `TypeError` if the series does not contain the appropriate type of data (GH9617). This follows Python's built-in exception hierarchy more closely and ensures that tests like `hasattr(s, 'cat')` are consistent on both Python 2 and 3.

- **Series** now supports bitwise operation for integral types (GH9016). Previously even if the input dtypes were integral, the output dtype was coerced to bool.

  Previous behavior

  ```
  In [2]: pd.Series([0, 1, 2, 3], list('abcd')) | pd.Series([4, 4, 4, 4], list('abcd →'))
  Out[2]:
  a    True
  b    True
  c    True
  d    True
dtype: bool
  ```

  New behavior. If the input dtypes are integral, the output dtype is also integral and the output values are the result of the bitwise operation.

  ```
  In [2]: pd.Series([0, 1, 2, 3], list('abcd')) | pd.Series([4, 4, 4, 4], list('abcd →'))
  Out[2]:
  a     4
  b     5
  c     6
  d     7
dtype: int64
  ```

- **During division involving a Series or DataFrame, 0/0 and 0//0 now give np.nan instead of np.inf.** (GH9144, GH8445)
Previous behavior

```
In [2]: p = pd.Series([0, 1])
In [3]: p / 0
Out[3]:
0   inf
1   inf
dtype: float64
In [4]: p // 0
Out[4]:
0   inf
1   inf
dtype: float64
```

New behavior

```
In [38]: p = pd.Series([0, 1])
In [39]: p / 0
Out[39]:
0   NaN
1   inf
Length: 2, dtype: float64
In [40]: p // 0
Out[40]:
0   NaN
1   inf
Length: 2, dtype: float64
```

- `Series.values_counts` and `Series.describe` for categorical data will now put NaN entries at the end. (GH9443)
- `Series.describe` for categorical data will now give counts and frequencies of 0, not NaN, for unused categories (GH9443)
- Due to a bug fix, looking up a partial string label with `DatetimeIndex.asof` now includes values that match the string, even if they are after the start of the partial string label (GH9258).

Old behavior:

```
In [4]: pd.to_datetime(['2000-01-31', '2000-02-28']).asof('2000-02')
Out[4]: Timestamp('2000-01-31 00:00:00')
```

Fixed behavior:

```
In [41]: pd.to_datetime(['2000-01-31', '2000-02-28']).asof('2000-02')
Out[41]: Timestamp('2000-02-28 00:00:00')
```

To reproduce the old behavior, simply add more precision to the label (e.g., use 2000-02-01 instead of 2000-02).
Deprecations

- The rplot trellis plotting interface is deprecated and will be removed in a future version. We refer to external packages like seaborn for similar but more refined functionality (GH3445). The documentation includes some examples how to convert your existing code from rplot to seaborn here.
- The pandas.sandbox.qtpandas interface is deprecated and will be removed in a future version. We refer users to the external package pandas-qt. (GH9615)
- The pandas.rpy interface is deprecated and will be removed in a future version. Similar functionality can be accessed through the rpy2 project (GH9602)
- Adding DatetimeIndex/PeriodIndex to another DatetimeIndex/PeriodIndex is being deprecated as a set-operation. This will be changed to a TypeError in a future version. .union() should be used for the union set operation. (GH9094)
- Subtracting DatetimeIndex/PeriodIndex from another DatetimeIndex/PeriodIndex is being deprecated as a set-operation. This will be changed to an actual numeric subtraction yielding a TimedeltaIndex in a future version. .difference() should be used for the differencing set operation. (GH9094)

Removal of prior version deprecations/changes

- DataFrame.pivot_table and crosstab's rows and cols keyword arguments were removed in favor of index and columns (GH6581)
- DataFrame.to_excel and DataFrame.to_csv cols keyword argument was removed in favor of columns (GH6581)
- Removed convert_dummies in favor of get_dummies (GH6581)
- Removed value_range in favor of describe (GH6581)

Performance improvements

- Fixed a performance regression for .loc indexing with an array or list-like (GH9126:).
- DataFrame.to_json 30x performance improvement for mixed dtype frames. (GH9037)
- Performance improvements in MultiIndex.duplicated by working with labels instead of values (GH9125)
- Improved the speed of nunique by calling unique instead of value_counts (GH9129, GH7771)
- Performance improvement of up to 10x in DataFrame.count and DataFrame.dropna by taking advantage of homogeneous/heterogeneous dtypes appropriately (GH9136)
- Performance improvement of up to 20x in DataFrame.count when using a MultiIndex and the level keyword argument (GH9163)
- Performance and memory usage improvements in merge when key space exceeds int64 bounds (GH9151)
- Performance improvements in multi-key groupby (GH9429)
- Performance improvements in MultiIndex.sortlevel (GH9445)
- Performance and memory usage improvements in DataFrame.duplicated (GH9398)
- Cythonized Period (GH9440)
- Decreased memory usage on to_hdf (GH9648)
Bug fixes

- Changed `.to_html` to remove leading/trailing spaces in table body (GH4987)
- Fixed issue using `read_csv` on s3 with Python 3 (GH9452)
- Fixed compatibility issue in `DatetimeIndex` affecting architectures where `numpy.int_` defaults to `numpy.int32` (GH8943)
- Bug in Panel indexing with an object-like (GH9140)
- Bug in the returned `Series.dt.components` index was reset to the default index (GH9247)
- Bug in `Categorical.__getitem__/__setitem__` with listlike input getting incorrect results from indexer coercion (GH9469)
- Bug in partial setting with a `DatetimeIndex` (GH9478)
- Bug in `groupby` for integer and datetime64 columns when applying an aggregator that caused the value to be changed when the number was sufficiently large (GH9311, GH6620)
- Fixed bug in `to_sql` when mapping a `Timestamp` object column (datetime column with timezone info) to the appropriate `sqlalchemy` type (GH9085).
- Fixed bug in `to_sql` dtype argument not accepting an instantiated `SQLAlchemy` type (GH9083).
- Bug in `.loc` partial setting with a `np.datetime64` (GH9516)
- Incorrect dtypes inferred on datetimelike looking `Series` & on `.xs` slices (GH9477)
- Items in `Categorical.unique()` (and `s.unique()` if `s` is of dtype `category`) now appear in the order in which they are originally found, not in sorted order (GH9331). This is now consistent with the behavior for other dtypes in pandas.
- Fixed bug on big endian platforms which produced incorrect results in StataReader (GH8688).
- Bug in `MultiIndex.has_duplicates` when having many levels causes an indexer overflow (GH9075, GH5873)
- Bug in `pivot` and `unstack` where `nan` values would break index alignment (GH4862, GH7401, GH7403, GH7405, GH7466, GH9497)
- Bug in `left` `join` on `MultiIndex` with `sort=True` or `null` values (GH9210).
- Bug in `MultiIndex` where inserting new keys would fail (GH9250).
- Bug in `groupby` when key space exceeds `int64` bounds (GH9096).
- Bug in `unstack` with `TimedeltaIndex` or `DatetimeIndex` and `nulls` (GH9491).
- Bug in `rank` where comparing floats with tolerance will cause inconsistent behaviour (GH8365).
- Fixed character encoding bug in `read_stata` and StataReader when loading data from a URL (GH9231).
- Bug in `adding offsets.Nano` to other offsets raises `TypeError` (GH9284)
- Bug in `DatetimeIndex` iteration, related to (GH8890), fixed in (GH9100)
- Bugs in `resample` around DST transitions. This required fixing offset classes so they behave correctly on DST transitions. (GH5172, GH8744, GH8653, GH9173, GH9468).
- Bug in binary operator method (eg `.mul()`) alignment with integer levels (GH9463).
- Bug in `boxplot`, `scatter` and `hexbin` plot may show an unnecessary warning (GH8877)
- Bug in `subplot` with `layout` kw may show unnecessary warning (GH9464)
• Bug in using grouper functions that need passed through arguments (e.g. axis), when using wrapped function (e.g. fillna), (GH9221)
• DataFrame now properly supports simultaneous copy and dtype arguments in constructor (GH9099)
• Bug in read_csv when using skiprows on a file with CR line endings with the c engine. (GH9079)
• isnull now detects NaT in PeriodIndex (GH9129)
• Bug in groupby .nth() with a multiple column groupby (GH8979)
• Bug in DataFrame.where and Series.where coerce numerics to string incorrectly (GH9280)
• Bug in DataFrame.where and Series.where raise ValueError when string list-like is passed. (GH9280)
• Accessing Series.str methods on with non-string values now raises TypeError instead of producing incorrect results (GH9184)
• Bug in DatetimeIndex.__contains__ when index has duplicates and is not monotonic increasing (GH9512)
• Fixed division by zero error for Series.kurt() when all values are equal (GH9197)
• Fixed issue in the xlsxwriter engine where it added a default ‘General’ format to cells if no other format was applied. This prevented other row or column formatting being applied. (GH9167)
• Fixes issue with index_col=False when usecols is also specified in read_csv. (GH9082)
• Bug where wide_to_long would modify the input stub names list (GH9204)
• Bug in to_sql not storing float64 values using double precision. (GH9009)
• SparseSeries and SparsePanel now accept zero argument constructors (same as their non-sparse counterparts) (GH9272).
• Regression in merging Categorical and object dtypes (GH9426)
• Bug in read_csv with buffer overflows with certain malformed input files (GH9205)
• Bug in groupby MultiIndex with missing pair (GH9049, GH9344)
• Fixed bug in Series.groupby where grouping on MultiIndex levels would ignore the sort argument (GH9444)
• Fix bug in DataFrame.Groupby where sort=False is ignored in the case of Categorical columns. (GH8868)
• Fixed bug with reading CSV files from Amazon S3 on python 3 raising a TypeError (GH9452)
• Bug in the Google BigQuery reader where the ‘jobComplete’ key may be present but False in the query results (GH8728)
• Bug in Series.values_counts with excluding NaN for categorical type Series with dropna=True (GH9443)
• Fixed missing numeric_only option for DataFrame.std/var/sem (GH9201)
• Support constructing Panel or Panel4D with scalar data (GH8285)
• Series text representation disconnected from max_rows/max_columns (GH7508).
• Series number formatting inconsistent when truncated (GH8532).

Previous behavior
In [2]: pd.options.display.max_rows = 10
In [3]: s = pd.Series([1,1,1,1,1,1,1,1,1,1,0.9999,1,1]*10)
In [4]: s
Out[4]:
   0    1
   1    1
   2    1
...  
127  0.9999
128  1.0000
129  1.0000
Length: 130, dtype: float64

New behavior

   0  1.0000
   1  1.0000
   2  1.0000
   3  1.0000
   4  1.0000
...  
125  1.0000
126  1.0000
127  0.9999
128  1.0000
129  1.0000
dtype: float64

• A Spurious SettingWithCopy Warning was generated when setting a new item in a frame in some cases (GH8730)

The following would previously report a SettingWithCopy Warning.

In [42]: df1 = pd.DataFrame({'x': pd.Series(['a', 'b', 'c'])},
                            'y': pd.Series(['d', 'e', 'f']))
In [43]: df2 = df1[['x']]
In [44]: df2['y'] = ['g', 'h', 'i']

5.14 Version 0.15

5.14.1 Version 0.15.2 (December 12, 2014)

This is a minor release from 0.15.1 and includes a large number of bug fixes along with several new features, enhancements, and performance improvements. A small number of API changes were necessary to fix existing bugs. We recommend that all users upgrade to this version.

- Enhancements
- API Changes
- Performance Improvements
- Bug Fixes

API changes

- Indexing in MultiIndex beyond lex-sort depth is now supported, though a lexically sorted index will have a better performance. (GH2646)

```python
In [1]: df = pd.DataFrame({'jim':[0, 0, 1, 1],
                      ...:                     'joe':['x', 'x', 'z', 'y'],
                      ...:                     'jolie':np.random.rand(4)).set_index(['jim', 'joe'])
                      ...:
In [2]: df
```

(continues on next page)
Out[2]:
     jolie
jim joe
0  x  0.126970
   x  0.966718
1  z  0.260476
   y  0.897237
[4 rows x 1 columns]

In [3]: df.index.lexsort_depth
Out[3]: 1

# in prior versions this would raise a KeyError
# will now show a PerformanceWarning
In [4]: df.loc[(1, 'z')]
Out[4]:
     jolie
jim joe
1  z  0.260476
[1 rows x 1 columns]

# lexically sorting
In [5]: df2 = df.sort_index()

In [6]: df2
Out[6]:
     jolie
jim joe
0  x  0.126970
   x  0.966718
1  y  0.897237
   z  0.260476
[4 rows x 1 columns]

In [7]: df2.index.lexsort_depth
Out[7]: 2

In [8]: df2.loc[(1,'z')]
Out[8]:
     jolie
jim joe
1  z  0.260476
[1 rows x 1 columns]

- Bug in unique of Series with category dtype, which returned all categories regardless whether they were “used” or not (see GH8559 for the discussion). Previous behaviour was to return all categories:

In [3]: cat = pd.Categorical(['a', 'b', 'a'], categories=['a', 'b', 'c'])

In [4]: cat
Out[4]:
['a', 'b', 'a']
Categories (3, object): [a < b < c]

In [5]: cat.unique()
Out[5]: array(['a', 'b', 'c'], dtype=object)

Now, only the categories that do effectively occur in the array are returned:

In [9]: cat = pd.Categorical(['a', 'b', 'a'], categories=['a', 'b', 'c'])
In [10]: cat.unique()
Out[10]:
['a', 'b']
Categories (2, object): ['a', 'b']

• Series.all and Series.any now support the level and skipna parameters. Series.all, Series.any, Index.all, and Index.any no longer support the out and keepdims parameters, which existed for compatibility with ndarray. Various index types no longer support the all and any aggregation functions and will now raise TypeError. (GH8302).

• Allow equality comparisons of Series with a categorical dtype and object dtype; previously these would raise TypeError. (GH8938)

• Bug in NDFrame: conflicting attribute/column names now behave consistently between getting and setting. Previously, when both a column and attribute named y existed, data.y would return the attribute, while data.y = z would update the column (GH8994)

In [11]: data = pd.DataFrame({'x': [1, 2, 3]})
In [12]: data.y = 2
In [13]: data['y'] = [2, 4, 6]
In [14]: data
Out[14]:
   x  y
0  1  2
1  2  4
2  3  6
[3 rows x 2 columns]

# this assignment was inconsistent
In [15]: data.y = 5

Old behavior:

In [6]: data.y
Out[6]: 2
In [7]: data['y'].values
Out[7]: array([5, 5, 5])

New behavior:

In [16]: data.y
Out[16]: 5
• Timestamp('now') is now equivalent to Timestamp.now() in that it returns the local time rather than UTC. Also, Timestamp('today') is now equivalent to Timestamp.today() and both have tz as a possible argument. (GH9000)

• Fix negative step support for label-based slices (GH8753)

Old behavior:

```
In [1]: s = pd.Series(np.arange(3), ['a', 'b', 'c'])
Out[1]:
       a     0
       b     1
       c     2
       dtype: int64

In [2]: s.loc['c':'a':-1]
Out[2]:
       c     2
       dtype: int64
```

New behavior:

```
In [18]: s = pd.Series(np.arange(3), ['a', 'b', 'c'])
In [19]: s.loc['c':'a':-1]
Out[19]:
       c     2
       b     1
       a     0
Length: 3, dtype: int64
```

Enhancements

Categorical enhancements:

• Added ability to export Categorical data to Stata (GH8633). See here for limitations of categorical variables exported to Stata data files.

• Added flag order_categoricals to StataReader and read_stata to select whether to order imported categorical data (GH8836). See here for more information on importing categorical variables from Stata data files.

• Added ability to export Categorical data to/from HDF5 (GH7621). Queries work the same as if it was an object array. However, the category dtyped data is stored in a more efficient manner. See here for an example and caveats w.r.t. prior versions of pandas.

• Added support for searchsorted() on Categorical class (GH8420).

Other enhancements:

• Added the ability to specify the SQL type of columns when writing a DataFrame to a database (GH8778). For example, specifying to use the sqlalchemy String type instead of the default Text type for string columns:

```
from sqlalchemy.types import String
data.to_sql('data_dtype', engine, dtype={'Col_1': String}) # noqa F821
```
- Series.all and Series.any now support the level and skipna parameters (GH8302):

```python
In [20]: s = pd.Series([False, True, False], index=[0, 0, 1])
In [21]: s.any(level=0)
Out[21]:
0   True
1   False
Length: 2, dtype: bool
```

- Panel now supports the all and any aggregation functions. (GH8302):

```python
>>> p = pd.Panel(np.random.rand(2, 5, 4) > 0.1)
>>> p.all()
0 1 2 3
0 True True True True
1 True False True True
2 True True True True
3 False True False True
4 True True True True
```

- Added support for `utcfromtimestamp()`, `fromtimestamp()`, and `combine()` on Timestamp class (GH5351).
- Added Google Analytics (`pandas.io.ga`) basic documentation (GH8835). See here.
- Timedelta arithmetic returns `NotImplemented` in unknown cases, allowing extensions by custom classes (GH8813).
- Timedelta now supports arithmetic with `numpy.ndarray` objects of the appropriate dtype (numpy 1.8 or newer only) (GH8884).
- Added `Timedelta.to_timedelta64()` method to the public API (GH8884).
- Added `gbq.generate_bq_schema()` function to the `gbq` module (GH8325).
- Series now works with map objects the same way as generators (GH8909).
- Added context manager to `HDFStore` for automatic closing (GH8791).
- `to_datetime` gains an exact keyword to allow for a format to not require an exact match for a provided format string (if its False), exact defaults to True (meaning that exact matching is still the default) (GH8904).
- Added `axvlines` boolean option to `parallel_coordinates` plot function, determines whether vertical lines will be printed, default is True.
- Added ability to read table footers to `read_html` (GH8552).
- `to_sql` now infers data types of non-NA values for columns that contain NA values and have dtype `object` (GH8778).
Performance

- Reduce memory usage when skiprows is an integer in read_csv (GH8681)
- Performance boost for to_datetime conversions with a passed format=, and the exact=False (GH8904)

Bug fixes

- Bug in concat of Series with category dtype which were coercing to object. (GH8641)
- Bug in Timestamp-Timestamp not returning a Timedelta type and datelike-datelike ops with timezones (GH8865)
- Made consistent a timezone mismatch exception (either tz operated with None or incompatible timezone), will now return TypeError rather than ValueError (a couple of edge cases only), (GH8865)
- Bug in using a pd.Grouper(key=...) with no level/axis or level only (GH8795, GH8866)
- Report a TypeError when invalid/no parameters are passed in a groupby (GH8015)
- Bug in packaging pandas with py2app/cx_Freeze (GH8602, GH8831)
- Bug in groupby signatures that didn’t include *args or **kwargs (GH8733).
- io.data.Options now raises RemoteDataError when no expiry dates are available from Yahoo and when it receives no data from Yahoo (GH8761), (GH8783).
- Unclear error message in csv parsing when passing dtype and names and the parsed data is a different data type (GH8833)
- Bug in slicing a MultiIndex with an empty list and at least one boolean indexer (GH8781)
- io.data.Options now raises RemoteDataError when no expiry dates are available from Yahoo (GH8761).
- Timedelta kwars may now be numpy ints and floats (GH8757).
- Fixed several outstanding bugs for Timedelta arithmetic and comparisons (GH8813, GH5963, GH5436).
- sql_schema now generates dialect appropriate CREATE TABLE statements (GH8697)
- slice string method now takes step into account (GH8754)
- Bug in BlockManager where setting values with different type would break block integrity (GH8850)
- Bug in DatetimeIndex when using time object as key (GH8667)
- Bug in merge where how='left' and sort=False would not preserve left frame order (GH7331)
- Bug in MultiIndex.reindex where reindexing at level would not reorder labels (GH4088)
- Bug in certain operations with dateutil timezones, manifesting with dateutil 2.3 (GH8639)
- Regression in DatetimeIndex iteration with a Fixed/Local offset timezone (GH8890)
- Bug in to_datetime when parsing a nanoseconds using the %f format (GH8989)
- io.data.Options now raises RemoteDataError when no expiry dates are available from Yahoo and when it receives no data from Yahoo (GH8761), (GH8783).
- Fix: The font size was only set on x axis if vertical or the y axis if horizontal. (GH8765)
- Fixed division by 0 when reading big csv files in python 3 (GH8621)
- Bug in outputting a MultiIndex with to_html, index=False which would add an extra column (GH8452)
• Imported categorical variables from Stata files retain the ordinal information in the underlying data (GH8836).
• Defined .size attribute across NDFrame objects to provide compat with numpy >= 1.9.1; buggy with np. array_split (GH8846)
• Skip testing of histogram plots for matplotlib <= 1.2 (GH8648).
• Bug where get_data_google returned object dtypes (GH3995)
• Bug in DataFrame.stack(..., dropna=False) when the DataFrame's columns is a MultiIndex whose labels do not reference all its levels. (GH8844)
• Bug in that Option context applied on __enter__ (GH8514)
• Bug in resample that causes a ValueError when resampling across multiple days and the last offset is not calculated from the start of the range (GH8683)
• Bug where DataFrame.plot(kind='scatter') fails when checking if an np.array is in the DataFrame (GH8852)
• Bug in pd.infer_freq/DataFrame.inferred_freq that prevented proper sub-daily frequency inference when the index contained DST days (GH8772).
• Bug where index name was still used when plotting a series with use_index=False (GH8558).
• Bugs when trying to stack multiple columns, when some (or all) of the level names are numbers (GH8584).
• Bug in MultiIndex where __contains__ returns wrong result if index is not lexically sorted or unique (GH7724)
• BUG CSV: fix problem with trailing white space in skipped rows, (GH8679), (GH8661), (GH8983)
• Regression in Timestamp does not parse ‘Z’ zone designator for UTC (GH8771)
• Bug in StataWriter the produces writes strings with 244 characters irrespective of actual size (GH8969)
• Fixed ValueError raised by cummin/cummax when datetime64 Series contains NaT. (GH8965)
• Bug in DataReader returns object dtype if there are missing values (GH8980)
• Bug in plotting if sharex was enabled and index was a timeseries, would show labels on multiple axes (GH3964).
• Bug where passing a unit to the TimedeltaIndex constructor applied the to nano-second conversion twice. (GH9011).
• Bug in plotting of a period-like array (GH9012)

5.14.2 Version 0.15.1 (November 9, 2014)

This is a minor bug-fix release from 0.15.0 and includes a small number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

- **Enhancements**
- **API Changes**
- **Bug Fixes**

**API changes**

- `s.dt.hour` and other `.dt` accessors will now return `np.nan` for missing values (rather than previously `-1`), (GH8689)

```python
In [1]: s = pd.Series(pd.date_range("20130101", periods=5, freq="D"))
In [2]: s.iloc[2] = np.nan
In [3]: s
Out[3]:
0 2013-01-01
1 2013-01-02
2 NaT
3 2013-01-04
4 2013-01-05
Length: 5, dtype: datetime64[ns]
previous behavior:
```
```python
In [6]: s.dt.hour
Out[6]:
0 0
1 0
2 -1
3 0
4 0
dtype: int64
```

current behavior:

```python
In [4]: s.dt.hour
Out[4]:
0 0.0
1 0.0
2 NaN
```
pandas: powerful Python data analysis toolkit, Release 1.2.2

(continued from previous page)

3
0.0
4
0.0
Length: 5, dtype: float64

• groupby with as_index=False will not add erroneous extra columns to result (GH8582):
In [5]: np.random.seed(2718281)
In [6]: df = pd.DataFrame(np.random.randint(0, 100, (10, 2)), columns=["jim", "joe
˓→"])
In [7]: df.head()
Out[7]:
jim joe
0
61
81
1
96
49
2
55
65
3
72
51
4
77
12
[5 rows x 2 columns]
In [8]: ts = pd.Series(5 * np.random.randint(0, 3, 10))

previous behavior:
In [4]: df.groupby(ts, as_index=False).max()
Out[4]:
NaN jim joe
0
0
72
83
1
5
77
84
2
10
96
65

current behavior:
In [9]: df.groupby(ts, as_index=False).max()
Out[9]:
jim joe
0
72
83
1
77
84
2
96
65
[3 rows x 2 columns]

• groupby will not erroneously exclude columns if the column name conflicts with the grouper name (GH8112):
In [10]: df = pd.DataFrame({"jim": range(5), "joe": range(5, 10)})
In [11]: df
Out[11]:
jim joe
0
0
5
1
1
6
2
2
7
3
3
8
4
4
9
(continues on next page)

5.14. Version 0.15

3113


previous behavior (excludes 1st column from output):

```python
In [4]: gr.apply(sum)
Out[4]:
   jim  joe
jim  24   11
False  9  24
True   1  11
```

current behavior:

```python
In [13]: gr.apply(sum)
Out[13]:
   jim  joe
   False  9  24
   True   1  11
```

• Support for slicing with monotonic decreasing indexes, even if `start` or `stop` is not found in the index (GH7860):

```python
In [14]: s = pd.Series(['a', 'b', 'c', 'd'], [4, 3, 2, 1])
In [15]: s
Out[15]:
4   a
3   b
2   c
1   d
Length: 4, dtype: object
```

previous behavior:

```python
In [8]: s.loc[3.5:1.5]
KeyError: 3.5
```

current behavior:

```python
In [16]: s.loc[3.5:1.5]
Out[16]:
3   b
2   c
Length: 2, dtype: object
```

• `io.data.Options` has been fixed for a change in the format of the Yahoo Options page (GH8612), (GH8741)

Note: As a result of a change in Yahoo’s option page layout, when an expiry date is given, `Options` methods
now return data for a single expiry date. Previously, methods returned all data for the selected month.

The `month` and `year` parameters have been undeprecated and can be used to get all options data for a given month.

If an expiry date that is not valid is given, data for the next expiry after the given date is returned.

Option data frames are now saved on the instance as `callsYYMMDD` or `putsYYMMDD`. Previously they were saved as `callsMMYY` and `putsMMYY`. The next expiry is saved as `calls` and `puts`.

New features:
- The expiry parameter can now be a single date or a list-like object containing dates.
- A new property `expiry_dates` was added, which returns all available expiry dates.

Current behavior:

```python
In [17]: from pandas.io.data import Options
In [18]: aapl = Options('aapl', 'yahoo')
In [19]: aapl.get_call_data().iloc[0:5, 0:1]
Out[19]:
Last  Strike Expiry Type Symbol
     80 2014-11-14 call AAPL141114C00080000 29.05
     84 2014-11-14 call AAPL141114C00084000 24.80
     85 2014-11-14 call AAPL141114C00085000 24.05
     86 2014-11-14 call AAPL141114C00086000 22.76
     87 2014-11-14 call AAPL141114C00087000 21.74

In [20]: aapl.expiry_dates
Out[20]:
[datetime.date(2014, 11, 14),
  datetime.date(2014, 11, 22),
  datetime.date(2014, 11, 28),
  datetime.date(2014, 12, 5),
  datetime.date(2014, 12, 12),
  datetime.date(2014, 12, 20),
  datetime.date(2015, 1, 17),
  datetime.date(2015, 2, 20),
  datetime.date(2015, 4, 17),
  datetime.date(2015, 7, 17),
  datetime.date(2016, 1, 15),
  datetime.date(2017, 1, 20)]
```

```python
In [21]: aapl.get_near_stock_price(expiry=aapl.expiry_dates[0:3]).iloc[0:5, 0:1]
Out[21]:
Last  Strike Expiry Type Symbol
     109 2014-11-22 call AAPL141122C00109000 1.48
     110 2014-11-28 call AAPL141128C00109000 1.79
     109 2014-11-22 call AAPL141122C00110000 0.55
     110 2014-11-22 call AAPL141122C00110000 1.02
     109 2014-11-28 call AAPL141128C00110000 1.32
```

- pandas now also registers the `datetime64` dtype in matplotlib's units registry to plot such values as datetimes. This is activated once pandas is imported. In previous versions, plotting an array of `datetime64` values will
have resulted in plotted integer values. To keep the previous behaviour, you can do `del matplotlib.units.registry[np.datetime64]` (GH8614).

Enhancements

• `concat` permits a wider variety of iterables of pandas objects to be passed as the first parameter (GH8645):

```python
In [17]: from collections import deque
In [18]: df1 = pd.DataFrame([1, 2, 3])
In [19]: df2 = pd.DataFrame([4, 5, 6])

previous behavior:

In [7]: pd.concat(deque((df1, df2)))
TypeError: first argument must be a list-like of pandas objects, you passed an
→object of type "deque"

current behavior:

In [20]: pd.concat(deque((df1, df2)))
Out[20]:
   0  1
  1  2
  2  3
  0  4
  1  5
  2  6
[6 rows x 1 columns]
```

• Represent `MultiIndex` labels with a `dtype` that utilizes memory based on the level size. In prior versions, the memory usage was a constant 8 bytes per element in each level. In addition, in prior versions, the reported memory usage was incorrect as it didn’t show the usage for the memory occupied by the underling data array. (GH8456)

```python
In [21]: dfi = pd.DataFrame(
    ....:     1, index=pd.MultiIndex.from_product(["a", range(1000)], columns=[
    ....:         "A"],
    ....:     )
    ....: )

previous behavior:

# this was underreported in prior versions
In [1]: dfi.memory_usage(index=True)
Out[1]:
   Index     8000 # took about 24008 bytes in < 0.15.1
   A         8000
dtype: int64

current behavior:
In [22]: dfi.memory_usage(index=True)
Out[22]:
<table>
<thead>
<tr>
<th>Index</th>
<th>44212</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>8000</td>
</tr>
<tr>
<td>Length: 2, dtype: int64</td>
<td></td>
</tr>
</tbody>
</table>

- Added Index properties `is_monotonic_increasing` and `is_monotonic_decreasing` (GH8680).
- Added option to select columns when importing Stata files (GH7935).
- Qualify memory usage in `DataFrame.info()` by adding `+` if it is a lower bound (GH8578).
- Raise errors in certain aggregation cases where an argument such as `numeric_only` is not handled (GH8592).
- Added support for 3-character ISO and non-standard country codes in `io.wb.download()` (GH8482).
- World Bank data requests now will warn/raise based on an `errors` argument, as well as a list of hard-coded country codes and the World Bank’s JSON response. In prior versions, the error messages didn’t look at the World Bank’s JSON response. Problem-inducing input were simply dropped prior to the request. The issue was that many good countries were cropped in the hard-coded approach. All countries will work now, but some bad countries will raise exceptions because some edge cases break the entire response. (GH8482)
- Added option to `Series.str.split()` to return a `DataFrame` rather than a `Series` (GH8428).
- Added option to `df.info(null_counts=None|True|False)` to override the default display options and force showing of the null-counts (GH8701).

**Bug fixes**

- Bug in unpickling of a `CustomBusinessDay` object (GH8591).
- Bug in coercing `Categorical` to a records array, e.g. `df.to_records()` (GH8626).
- Bug in `Categorical` not created properly with `Series.to_frame()` (GH8626).
- Bug in coercing in `astype` of a `Categorical` of a passed `pd.Categorical` (this now raises `TypeError` correctly), (GH8626).
- Bug in `cut/qcut` when using `Series` and `retbins=True` (GH8589).
- Bug in writing `Categorical` columns to an SQL database with `to_sql` (GH8624).
- Bug in comparing `Categorical` of datetime raising when being compared to a scalar datetime (GH8687).
- Bug in selecting from a `Categorical` with `.iloc` (GH8623).
- Bug in `groupby-transform` with a `Categorical` (GH8623).
- Bug in `duplicated/drop_duplicates` with a `Categorical` (GH8623).
- Bug in `Categorical` reflected comparison operator raising if the first argument was a numpy array scalar (e.g. `np.int64`) (GH8658).
- Bug in Panel indexing with a list-like (GH8710).
- Compat issue is `DataFrame.dtypes` when `options.mode.use_inf_as_null` is True (GH8722).
- Bug in `read_csv`, `dialect` parameter would not take a string (GH8703).
- Bug in slicing a `MultiIndex` level with an empty-list (GH8737).
- Bug in numeric index operations of add/sub with Float/Index Index with numpy arrays (GH8608).
- Bug in `setitem` with empty indexer and unwanted coercion of dtypes (GH8669).
• Bug in ix/loc block splitting on setitem (manifests with integer-like dtypes, e.g. datetime64) (GH8607)
• Bug when doing label based indexing with integers not found in the index for non-unique but monotonic indexes (GH8680).
• Bug when indexing a Float64Index with np.nan on numpy 1.7 (GH8980).
• Fix shape attribute for MultiIndex (GH8609)
• Bug in GroupBy where a name conflict between the grouper and columns would break groupby operations (GH7115, GH8112)
• Fixed a bug where plotting a column y and specifying a label would mutate the index name of the original DataFrame (GH8494)
• Fix regression in plotting of a DatetimeIndex directly with matplotlib (GH8614).
• Bug in date_range where partially-specified dates would incorporate current date (GH6961)
• Bug in Setting by indexer to a scalar value with a mixed-dtype Panel4d was failing (GH8702)
• Bug where DataReader’s would fail if one of the symbols passed was invalid. Now returns data for valid symbols and np.nan for invalid (GH8494)
• Bug in get_quote_yahoo that wouldn’t allow non-float return values (GH5229).

5.14.3 Version 0.15.0 (October 18, 2014)

This is a major release from 0.14.1 and includes a small number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

**Warning:** pandas >= 0.15.0 will no longer support compatibility with NumPy versions < 1.7.0. If you want to use the latest versions of pandas, please upgrade to NumPy >= 1.7.0 (GH7711)

• Highlights include:
  – The `Categorical` type was integrated as a first-class pandas type, see [here](#)
  – New scalar type `Timedelta`, and a new index type `TimedeltaIndex`, see [here](#)
  – New datetimelike properties accessor `.dt` for Series, see [Datetimelike Properties](#)
  – New DataFrame default display for `df.info()` to include memory usage, see [Memory Usage](#)
  – `read_csv` will now by default ignore blank lines when parsing, see [here](#)
  – API change in using Indexes in set operations, see [here](#)
  – Enhancements in the handling of timezones, see [here](#)
  – A lot of improvements to the rolling and expanding moment functions, see [here](#)
  – Internal refactoring of the `Index` class to no longer sub-class `ndarray`, see [Internal Refactoring](#)
  – dropping support for PyTables less than version 3.0.0, and numexpr less than version 2.1 (GH7990)
  – Split indexing documentation into `Indexing and Selecting Data` and `MultiIndex / Advanced Indexing`
  – Split out string methods documentation into `Working with Text Data`

• Check the **API Changes** and **deprecations** before updating

• **Other Enhancements**

• **Performance Improvements**

• **Bug Fixes**

**Warning:** In 0.15.0 `Index` has internally been refactored to no longer sub-class `ndarray` but instead subclass `PandasObject`, similarly to the rest of the pandas objects. This change allows very easy sub-classing and creation of new index types. This should be a transparent change with only very limited API implications (See the [Internal Refactoring](#))
Warning: The refactoring in `Categorical` changed the two argument constructor from “codes/labels and levels” to “values and levels (now called ‘categories’)”. This can lead to subtle bugs. If you use `Categorical` directly, please audit your code before updating to this pandas version and change it to use the `from_codes()` constructor. See more on `Categorical` here.

New features

Categoricals in Series/DataFrame

`Categorical` can now be included in `Series` and `DataFrames` and gained new methods to manipulate. Thanks to Jan Schulz for much of this API/implementation. (GH3943, GH5313, GH5314, GH7444, GH7839, GH7848, GH7864, GH7914, GH7768, GH8006, GH8075, GH8076, GH8143, GH8453, GH8518).

For full docs, see the [categorical introduction](https://pandas.pydata.org/pandas-docs/stable/user_guide/categorical.html) and the [API documentation](https://pandas.pydata.org/pandas-docs/stable/reference/api/pandas.Categorical.html).

```python
In [1]: df = pd.DataFrame({"id": [1, 2, 3, 4, 5, 6],
   ...:     "raw_grade": ['a', 'b', 'b', 'a', 'a', 'e']})
   ...

In [2]: df["grade"] = df["raw_grade"]=astype("category")

In [3]: df["grade"]
Out[3]:
   0     a
   1     b
   2     b
   3     a
   4     a
   5     e
Name: grade, Length: 6, dtype: category
Categories (3, object): ['a', 'b', 'e']

# Rename the categories
In [4]: df["grade"]=cat.categories = ['very good', "good", "very bad"]

# Reorder the categories and simultaneously add the missing categories
In [5]: df["grade"] = df["grade"]=set_categories(['very bad', "bad", "medium", "good", "very good"])
   ...

In [6]: df["grade"]
Out[6]:
   0  very good
   1     good
   2     good
   3  very good
   4  very good
   5  very bad
Name: grade, Length: 6, dtype: category
Categories (5, object): ['very bad', 'bad', 'medium', 'good', 'very good']

In [7]: df.sort_values("grade")
Out[7]:
   id  raw_grade  grade
   5   6      e  very bad
(continues on next page)
In [8]: df.groupby("grade").size()
Out[8]:
grade
very bad 1
bad 0
medium 0
good 2
very good 3
Length: 5, dtype: int64

- `pandas.core.group_agg` and `pandas.core.factor_agg` were removed. As an alternative, construct a dataframe and use `df.groupby(<group>).agg(<func>)`.
- Supplying “codes/labels and levels” to the `Categorical` constructor is not supported anymore. Supplying two arguments to the constructor is now interpreted as “values and levels (now called ‘categories’)”. Please change your code to use the `from_codes()` constructor.
- The `Categorical.labels` attribute was renamed to `Categorical.codes` and is read only. If you want to manipulate codes, please use one of the API methods on Categoricals.
- The `Categorical.levels` attribute is renamed to `Categorical.categories`.

### TimedeltaIndex/Scalar

We introduce a new scalar type `Timedelta`, which is a subclass of `datetime.timedelta`, and behaves in a similar manner, but allows compatibility with `np.timedelta64` types as well as a host of custom representation, parsing, and attributes. This type is very similar to how `Timestamp` works for `datetimes`. It is a nice-API box for the type. See the docs. (GH3009, GH4533, GH8209, GH8187, GH8190, GH7869, GH7661, GH8345, GH8471)

**Warning:** `Timedelta` scalars (and `TimedeltaIndex`) component fields are *not the same* as the component fields on a `datetime.timedelta` object. For example, `.seconds` on a `datetime.timedelta` object returns the total number of seconds combined between hours, minutes and seconds. In contrast, the pandas `Timedelta` breaks out hours, minutes, microseconds and nanoseconds separately.

```python
# Timedelta accessor
In [9]: tds = pd.Timedelta('31 days 5 min 3 sec')

In [10]: tds.minutes
Out[10]: 5L

In [11]: tds.seconds
Out[11]: 3L

# datetime.timedelta accessor
# this is 5 minutes * 60 + 3 seconds
In [12]: tds.to_pytimedelta().seconds
Out[12]: 303
```
Construct a scalar

```
In [9]: pd.Timedelta('1 days 06:05:01.00003')
Out[9]: Timedelta('1 days 06:05:01.000030')

In [10]: pd.Timedelta('15.5us')
Out[10]: Timedelta('0 days 00:00:00.000015500')

In [11]: pd.Timedelta('1 hour 15.5us')
Out[11]: Timedelta('0 days 01:00:00.000015500')

# negative Timedeltas have this string repr
# to be more consistent with datetime.timedelta conventions
In [12]: pd.Timedelta('-1us')
Out[12]: Timedelta('-1 days +23:59:59.999999')

# a NaT
In [13]: pd.Timedelta('nan')
Out[13]: NaT
```

Access fields for a Timedelta

```
In [14]: td = pd.Timedelta('1 hour 3m 15.5us')

In [15]: td.seconds
Out[15]: 3780

In [16]: td.microseconds
Out[16]: 15

In [17]: td.nanoseconds
Out[17]: 500
```

Construct a TimedeltaIndex

```
In [18]: pd.TimedeltaIndex(['1 days', '1 days, 00:00:05',
                   '1 hour and 15.5us', np.timedelta64(2, 'D'),
                   datetime.timedelta(days=2, seconds=2))
Out[18]: TimedeltaIndex(['1 days 00:00:00', '1 days 00:00:05', '2 days 00:00:00',
                   '2 days 00:00:02'],
                   dtype='timedelta64[ns]', freq=None)
```

Constructing a TimedeltaIndex with a regular range
In [19]: pd.timedelta_range('1 days', periods=5, freq='D')
Out[19]: TimedeltaIndex(['1 days', '2 days', '3 days', '4 days', '5 days'], dtype=
→'timedelta64[ns]', freq='D')

In [20]: pd.timedelta_range(start='1 days', end='2 days', freq='30T')
Out[20]: TimedeltaIndex(['1 days 00:00:00', '1 days 00:30:00', '1 days 01:00:00',
→'1 days 01:30:00', '1 days 02:00:00', '1 days 02:30:00',
→'1 days 03:00:00', '1 days 03:30:00', '1 days 04:00:00',
→'1 days 04:30:00', '1 days 05:00:00', '1 days 05:30:00',
→'1 days 06:00:00', '1 days 06:30:00', '1 days 07:00:00',
→'1 days 07:30:00', '1 days 08:00:00', '1 days 08:30:00',
→'1 days 09:00:00', '1 days 09:30:00', '1 days 10:00:00',
→'1 days 10:30:00', '1 days 11:00:00', '1 days 11:30:00',
→'1 days 12:00:00', '1 days 12:30:00', '1 days 13:00:00',
→'1 days 13:30:00', '1 days 14:00:00', '1 days 14:30:00',
→'1 days 15:00:00', '1 days 15:30:00', '1 days 16:00:00',
→'1 days 16:30:00', '1 days 17:00:00', '1 days 17:30:00',
→'1 days 18:00:00', '1 days 18:30:00', '1 days 19:00:00',
→'1 days 19:30:00', '1 days 20:00:00', '1 days 20:30:00',
→'1 days 21:00:00', '1 days 21:30:00', '1 days 22:00:00',
→'1 days 22:30:00', '1 days 23:00:00', '1 days 23:30:00',
→'2 days 00:00:00'],
dtypes='timedelta64[ns]', freq='30T')

You can now use a TimedeltaIndex as the index of a pandas object

In [21]: s = pd.Series(np.arange(5),
→    index=pd.timedelta_range('1 days', periods=5, freq='s'))

In [22]: s
Out[22]:
      1 days 00:00:00  0
      1 days 00:00:01  1
      1 days 00:00:02  2
      1 days 00:00:03  3
      1 days 00:00:04  4
Freq: S, Length: 5, dtype: int64

You can select with partial string selections

In [23]: s['1 day 00:00:02']
Out[23]: 2

In [24]: s['1 day':'1 day 00:00:02']
Out[24]:
      1 days 00:00:00  0
      1 days 00:00:01  1
      1 days 00:00:02  2
Freq: S, Length: 3, dtype: int64

Finally, the combination of TimedeltaIndex with DatetimeIndex allow certain combination operations that are NaT preserving:

In [25]: tdi = pd.TimedeltaIndex(['1 days', pd.NaT, '2 days'])
(continues on next page)
In [26]: tdi.tolist()
Out[26]: [Timedelta('1 days 00:00:00'), NaT, Timedelta('2 days 00:00:00')]

In [27]: dti = pd.date_range('20130101', periods=3)

In [28]: dti.tolist()
Out[28]: [Timestamp('2013-01-01 00:00:00', freq='D'),
    Timestamp('2013-01-02 00:00:00', freq='D'),
    Timestamp('2013-01-03 00:00:00', freq='D')]

In [29]: (dti + tdi).tolist()
Out[29]: [Timestamp('2013-01-02 00:00:00'), NaT, Timestamp('2013-01-05 00:00:00')]

In [30]: (dti - tdi).tolist()
Out[30]: [Timestamp('2012-12-31 00:00:00'), NaT, Timestamp('2013-01-01 00:00:00')]

- iteration of a Series e.g. list(Series(...)) of timedelta64[ns] would prior to v0.15.0 return np.timedelta64 for each element. These will now be wrapped in Timedelta.

Memory usage

Implemented methods to find memory usage of a DataFrame. See the FAQ for more. (GH6852).

A new display option display.memory_usage (see Options and settings) sets the default behavior of the memory_usage argument in the df.info() method. By default display.memory_usage is True.

In [31]: dtypes = ['int64', 'float64', 'datetime64[ns]', 'timedelta64[ns]',
    ....: 'complex128', 'object', 'bool']
    ....:

In [32]: n = 5000

In [33]: data = {t: np.random.randint(100, size=n).astype(t) for t in dtypes}

In [34]: df = pd.DataFrame(data)

In [35]: df['categorical'] = df['object'].astype('category')

In [36]: df.info()
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 5000 entries, 0 to 4999
Data columns (total 8 columns):
   # Column   Non-Null Count  Dtype
   --- ----- -------------- -----  
      0 int64  5000 non-null  int64
      1 float64  5000 non-null float64
      2 datetime64[ns]  5000 non-null datetime64[ns]
      3 timedelta64[ns]  5000 non-null timedelta64[ns]
      4 complex128  5000 non-null complex128
      5 object  5000 non-null object
      6 bool  5000 non-null bool
      7 categorical  5000 non-null category
dtypes: bool(1), category(1), complex128(1), datetime64[ns](1), float64(1), int64(1),
       object(1), timedelta64[ns](1)
memory usage: 288.2+ KB
Additionally `memory_usage()` is an available method for a dataframe object which returns the memory usage of each column.

```python
In [37]: df.memory_usage(index=True)
Out[37]:
Index          128
int64         40000
float64      40000
datetime64[ns] 40000
timedelta64[ns] 40000
complex128 80000
object       40000
bool         5000
categorical  9968
Length: 9, dtype: int64
```

### Series.dt accessor

Series has gained an accessor to succinctly return datetime like properties for the `values` of the Series, if its a datetime/period like Series. (GH7207) This will return a Series, indexed like the existing Series. See the docs.

```python
# datetime
In [38]: s = pd.Series(pd.date_range('20130101 09:10:12', periods=4))

In [39]: s
Out[39]:
0  2013-01-01 09:10:12
1  2013-01-02 09:10:12
2  2013-01-03 09:10:12
3  2013-01-04 09:10:12
Length: 4, dtype: datetime64[ns]

In [40]: s.dt.hour
Out[40]:
0    9
1    9
2    9
3    9
Length: 4, dtype: int64

In [41]: s.dt.second
Out[41]:
0    12
1    12
2    12
3    12
Length: 4, dtype: int64

In [42]: s.dt.day
Out[42]:
0    1
1    2
2    3
3    4
Length: 4, dtype: int64
```

(continues on next page)
This enables nice expressions like this:

```
In [44]: s[s.dt.day == 2]
Out[44]:
1 2013-01-02 09:10:12
Length: 1, dtype: datetime64[ns]
```

You can easily produce tz aware transformations:

```
In [45]: stz = s.dt.tz_localize('US/Eastern')
In [46]: stz
Out[46]:
0 2013-01-01 09:10:12-05:00
1 2013-01-02 09:10:12-05:00
2 2013-01-03 09:10:12-05:00
3 2013-01-04 09:10:12-05:00
Length: 4, dtype: datetime64[ns, US/Eastern]
```

You can also chain these types of operations:

```
In [48]: s.dt.tz_localize('UTC').dt.tz_convert('US/Eastern')
Out[48]:
0 2013-01-01 04:10:12-05:00
1 2013-01-02 04:10:12-05:00
2 2013-01-03 04:10:12-05:00
3 2013-01-04 04:10:12-05:00
Length: 4, dtype: datetime64[ns, US/Eastern]
```

The .dt accessor works for period and timedelta dtypes.

```
# period
In [49]: s = pd.Series(pd.period_range('20130101', periods=4, freq='D'))
In [50]: s
dt
Out[50]:
0 2013-01-01
1 2013-01-02
2 2013-01-03
3 2013-01-04
Length: 4, dtype: period[D]
```

```
In [51]: s.dt.year
dt
Out[51]:
0 2013
1 2013
2 2013
3 2013
Length: 4, dtype: int64
```
In [52]: s.dt.day
Out[52]:
0  1
1  2
2  3
3  4
Length: 4, dtype: int64

# timedelta
In [53]: s = pd.Series(pd.timedelta_range('1 day 00:00:05', periods=4, freq='s'))
In [54]: s
Out[54]:
0  1 days 00:00:05
1  1 days 00:00:06
2  1 days 00:00:07
3  1 days 00:00:08
Length: 4, dtype: timedelta64[ns]
In [55]: s.dt.days
Out[55]:
0  1
1  1
2  1
3  1
Length: 4, dtype: int64
In [56]: s.dt.seconds
Out[56]:
0   5
1   6
2   7
3   8
Length: 4, dtype: int64
In [57]: s.dt.components
Out[57]:
   days  hours  minutes  seconds  milliseconds  microseconds  nanoseconds
0    1       0         0       5            0            0          0
1    1       0         0       6            0            0          0
2    1       0         0       7            0            0          0
3    1       0         0       8            0            0          0
[4 rows x 7 columns]

Timezone handling improvements

- `tz_localize(None)` for tz-aware Timestamp and DatetimeIndex now removes timezone holding local time, previously this resulted in Exception or TypeError (GH7812)

In [58]: ts = pd.Timestamp('2014-08-01 09:00', tz='US/Eastern')
In [59]: ts
Out[59]: Timestamp('2014-08-01 09:00:00-0400', tz='US/Eastern')
tz_localize now accepts the ambiguous keyword which allows for passing an array of bools indicating whether the date belongs in DST or not, ‘NaT’ for setting transition times to NaT, ‘infer’ for inferring DST/non-DST, and ‘raise’ (default) for an AmbiguousTimeError to be raised. See the docs for more details (GH7943)

DataFrame.tz_localize and DataFrame.tz_convert now accepts an optional level argument for localizing a specific level of a MultiIndex (GH7846)

Timestamp.tz_localize and Timestamp.tz_convert now raise TypeError in error cases, rather than Exception (GH8025)

a timeseries/index localized to UTC when inserted into a Series/DataFrame will preserve the UTC timezone (rather than being a naive datetime64[ns]) as object dtype (GH8411)

Timestamp.__repr__ displays dateutil.tz.tzoffset info (GH7907)

**Rolling/expanding moments improvements**

- rolling_min(), rolling_max(), rolling_cov(), and rolling_corr() now return objects with all NaN when len(arg) < min_periods <= window rather than raising. (This makes all rolling functions consistent in this behavior) (GH7766)

Prior to 0.15.0

```
In [64]: s = pd.Series([10, 11, 12, 13])
```

```
In [15]: pd.rolling_min(s, window=10, min_periods=5)
ValueError: min_periods (5) must be <= window (4)
```

New behavior
In [4]: pd.rolling_min(s, window=10, min_periods=5)
Out[4]:
0  NaN
1  NaN
2  NaN
3  NaN
dtype: float64

• rolling_max(), rolling_min(), rolling_sum(), rolling_mean(), rolling_median(), rolling_std(), rolling_var(), rolling_skew(), rolling_kurt(), rolling_quantile(), rolling_cov(), rolling_corr(), rolling_corr_pairwise(), rolling_window(), and rolling_apply() with center=True previously would return a result of the same structure as the input arg with NaN in the final (window-1)/2 entries.

Now the final (window-1)/2 entries of the result are calculated as if the input arg were followed by (window-1)/2 NaN values (or with shrinking windows, in the case of rolling_apply()). (GH7925, GH8269)

Prior behavior (note final value is NaN):

In [7]: pd.rolling_sum(Series(range(4)), window=3, min_periods=0, center=True)
Out[7]:
0  1
1  3
2  6
3  NaN
dtype: float64

New behavior (note final value is 5 = sum([2, 3, NaN])):

In [7]: pd.rolling_sum(pd.Series(range(4)), window=3, ....: min_periods=0, center=True)
Out[7]:
0  1
1  3
2  6
3  5
dtype: float64

• rolling_window() now normalizes the weights properly in rolling mean mode (mean=True) so that the calculated weighted means (e.g. 'triang', 'gaussian') are distributed about the same means as those calculated without weighting (i.e. ‘boxcar’). See the note on normalization for further details. (GH7618)

In [65]: s = pd.Series([10.5, 8.8, 11.4, 9.7, 9.3])

Behavior prior to 0.15.0:

In [39]: pd.rolling_window(s, window=3, win_type='triang', center=True)
Out[39]:
0  NaN
1  6.583333
2  6.883333
3  6.683333
4  NaN
dtype: float64

New behavior
In [10]: pd.rolling_window(s, window=3, win_type='triang', center=True)

Out[10]:
   0   NaN
   1  9.875
   2 10.325
   3 10.025
   4   NaN
dtype: float64

• Removed `center` argument from all `expanding_*` functions (see list), as the results produced when center=True did not make much sense. (GH7925)

• Added optional `ddof` argument to `expanding_cov()` and `rolling_cov()`. The default value of 1 is backwards-compatible. (GH8279)

• Documented the `ddof` argument to `expanding_var()`, `expanding_std()`, `rolling_var()`, and `rolling_std()`. These functions’ support of a `ddof` argument (with a default value of 1) was previously undocumented. (GH8064)

• `ewma()`, `ewmstd()`, `ewmvol()`, `ewmvar()`, `ewmcov()`, and `ewmcorr()` now interpret `min_periods` in the same manner that the `rolling_*()` and `expanding_*()` functions do: a given result entry will be NaN if the (expanding, in this case) window does not contain at least `min_periods` values. The previous behavior was to set to NaN the `min_periods` entries starting with the first non-NaN value. (GH7977)

Prior behavior (note values start at index 2, which is `min_periods` after index 0 (the index of the first non-empty value)):

In [66]: s = pd.Series([1, None, None, None, 2, 3])

In [51]: ewma(s, com=3., min_periods=2)

Out[51]:
   0   NaN
   1   NaN
   2 1.000000
   3 1.000000
   4 1.571429
   5 2.189189
dtype: float64

New behavior (note values start at index 4, the location of the 2nd (since `min_periods=2`) non-empty value):

In [2]: pd.ewma(s, com=3., min_periods=2)

Out[2]:
   0   NaN
   1   NaN
   2   NaN
   3   NaN
   4 1.759644
   5 2.383784
dtype: float64

• `ewmstd()`, `ewmvol()`, `ewmvar()`, `ewmcov()`, and `ewmcorr()` now have an optional `adjust` argument, just like `ewma()` does, affecting how the weights are calculated. The default value of `adjust` is `True`, which is backwards-compatible. See Exponentially weighted moment functions for details. (GH7911)

• `ewma()`, `ewmstd()`, `ewmvol()`, `ewmvar()`, `ewmcov()`, and `ewmcorr()` now have an optional `ignore_na` argument. When `ignore_na=False` (the default), missing values are taken into account in
the weights calculation. When ignore_na=True (which reproduces the pre-0.15.0 behavior), missing values are ignored in the weights calculation. (GH7543)

```
In [7]: pd.ewma(pd.Series([None, 1., 8.]), com=2.)
Out[7]:
0   NaN
1   1.0
2   5.2
dtype: float64

In [8]: pd.ewma(pd.Series([1., None, 8.]), com=2.,
       ....: ignore_na=True) # pre-0.15.0 behavior
Out[8]:
0   1.0
1   1.0
2   5.2
dtype: float64

In [9]: pd.ewma(pd.Series([1., None, 8.]), com=2.,
       ....: ignore_na=False) # new default
Out[9]:
0  1.000000
1  1.000000
2  5.846154
dtype: float64
```

**Warning:** By default (ignore_na=False) the ewm*() functions’ weights calculation in the presence of missing values is different than in pre-0.15.0 versions. To reproduce the pre-0.15.0 calculation of weights in the presence of missing values one must specify explicitly ignore_na=True.

- **Bug in** expanding_cov(), expanding_corr(), rolling_cov(), rolling_cor(), ewmcov(), and ewmcorr() returning results with columns sorted by name and producing an error for non-unique columns; now handles non-unique columns and returns columns in original order (except for the case of two DataFrames with pairwise=False, where behavior is unchanged) (GH7542)
- **Bug in** rolling_count() and expanding_*() functions unnecessarily producing error message for zero-length data (GH8056)
- **Bug in** rolling_apply() and expanding_apply() interpreting min_periods=0 as min_periods=1 (GH8080)
- **Bug in** expanding_std() and expanding_var() for a single value producing a confusing error message (GH7900)
- **Bug in** rolling_std() and rolling_var() for a single value producing 0 rather than NaN (GH7900)
- **Bug in** ewmstd(), ewmvol(), ewmvar(), and ewmcov() calculation of de-biasing factors when bias=False (the default). Previously an incorrect constant factor was used, based on adjust=True, ignore_na=True, and an infinite number of observations. Now a different factor is used for each entry, based on the actual weights (analogous to the usual N/ (N-1) factor). In particular, for a single point a value of NaN is returned when bias=False, whereas previously a value of (approximately) 0 was returned.

For example, consider the following pre-0.15.0 results for ewmvar(..., bias=False), and the corresponding debiasing factors:

```
In [67]: s = pd.Series([1., 2., 0., 4.])
```
In [89]: ewmvar(s, com=2., bias=False)
Out[89]:
0   -2.775558e-16
1    3.000000e-01
2    9.556787e-01
3    3.585799e+00
dtype: float64

In [90]: ewmvar(s, com=2., bias=False) / ewmvar(s, com=2., bias=True)
Out[90]:
0    1.25
1    1.25
2    1.25
3    1.25
dtype: float64

Note that entry 0 is approximately 0, and the debiasing factors are a constant 1.25. By comparison, the following 0.15.0 results have a NaN for entry 0, and the debiasing factors are decreasing (towards 1.25):

In [14]: pd.ewmvar(s, com=2., bias=False)
Out[14]:
0     NaN
1  0.500000
2  1.210526
3  4.089069
dtype: float64

In [15]: pd.ewmvar(s, com=2., bias=False) / pd.ewmvar(s, com=2., bias=True)
Out[15]:
0     NaN
1  2.083333
2  1.583333
3  1.425439
dtype: float64

See *Exponentially weighted moment functions* for details. (GH7912)

**Improvements in the SQL IO module**

- Added support for a chunksize parameter to `to_sql` function. This allows DataFrame to be written in chunks and avoid packet-size overflow errors (GH8062).
- Added support for a chunksize parameter to `read_sql` function. Specifying this argument will return an iterator through chunks of the query result (GH2908).
- Added support for writing `datetime.date` and `datetime.time` object columns with `to_sql` (GH6932).
- Added support for specifying a `schema` to read from/write to with `read_sql_table` and `to_sql` (GH7441, GH7952). For example:

```python
df.to_sql('table', engine, schema='other_schema')  # no ga F821
pd.read_sql_table('table', engine, schema='other_schema')  # no ga F821
```

- Added support for writing NaN values with `to_sql` (GH2754).
- Added support for writing datetime64 columns with `to_sql` for all database flavors (GH7103).
# Backwards incompatible API changes

## Breaking changes

API changes related to Categorical (see [here](#) for more details):

- The `Categorical` constructor with two arguments changed from “codes/labels and levels” to “values and levels (now called ‘categories’)”. This can lead to subtle bugs. If you use `Categorical` directly, please audit your code by changing it to use the `from_codes()` constructor.

An old function call like (prior to 0.15.0):

```python
pd.Categorical([0,1,0,2,1], levels=['a', 'b', 'c'])
```

will have to adapted to the following to keep the same behaviour:

```python
pd.Categorical.from_codes([0,1,0,2,1], categories=['a', 'b', 'c'])
```

API changes related to the introduction of the Timedelta scalar (see [above](#) for more details):

- Prior to 0.15.0 `to_timedelta()` would return a Series for list-like/Series input, and a np.timedelta64 for scalar input. It will now return a TimedeltaIndex for list-like input, Series for Series input, and Timedelta for scalar input.

For API changes related to the rolling and expanding functions, see detailed overview [above](#).

Other notable API changes:

- Consistency when indexing with `.loc` and a list-like indexer when no values are found.

In prior versions there was a difference in these two constructs:

- `df.loc[[3]]` would return a frame reindexed by 3 (with all np.nan values)
- `df.loc[[3],:]` would raise `KeyError`.

Both will now raise a `KeyError`. The rule is that at least 1 indexer must be found when using a list-like and `.loc` ([GH7999](#))

Furthermore in prior versions these were also different:

- `df.loc[[1,3]]` would return a frame reindexed by [1,3]
- `df.loc[[1,3],:]` would raise `KeyError`.

Both will now return a frame reindexed by [1,3]. E.g.
In [3]: df.loc[[1, 3]]
Out[3]:
   0  a
   3  NaN

In [4]: df.loc[[1, 3], :]
Out[4]:
   0  a
   3  NaN

This can also be seen in multi-axis indexing with a Panel.

```python
>>> p = pd.Panel(np.arange(2 * 3 * 4).reshape(2, 3, 4),
                items=['ItemA', 'ItemB'],
                major_axis=[1, 2, 3],
                minor_axis=['A', 'B', 'C', 'D'])
>>> p
<class 'pandas.core.panel.Panel'>
Dimensions: 2 (items) x 3 (major_axis) x 4 (minor_axis)
Items axis: ItemA to ItemB
Major_axis axis: 1 to 3
Minor_axis axis: A to D
```

The following would raise `KeyError` prior to 0.15.0:

```python
In [5]:
Out[5]:
    ItemA ItemD
   1   3  NaN
   2   7  NaN
   3  11  NaN
```

Furthermore, `.loc` will raise `KeyError` if no values are found in a MultiIndex with a list-like indexer:

```python
In [70]: s = pd.Series(np.arange(3, dtype='int64'),
                 index=pd.MultiIndex.from_product([['A'], ['foo', 'bar', 'baz']],
                                                names=['one', 'two'])).sort_index()
In [71]: s
Out[71]:
   one two
   A   1 NaN
   bar 7 NaN
   baz 2 NaN
   foo 0 NaN
Length: 3, dtype: int64
In [72]: try:
   ....:   s.loc[['D']]
   ....: except KeyError as e:
   ....:     print("KeyError: " + str(e))
   ....: KeyError: "['D'] not in index"
```
• Assigning values to `None` now considers the dtype when choosing an ‘empty’ value (GH7941).

Previously, assigning to `None` in numeric containers changed the dtype to object (or errored, depending on the call). It now uses `NaN`:

```python
In [73]: s = pd.Series([1, 2, 3])
In [74]: s.loc[0] = None
In [75]: s
Out[75]:
    0   NaN
    1   2.0
    2   3.0
Length: 3, dtype: float64
```

`NaT` is now used similarly for datetime containers.

For object containers, we now preserve `None` values (previously these were converted to `NaN` values).

```python
In [76]: s = pd.Series(['a', 'b', 'c'])
In [77]: s.loc[0] = None
In [78]: s
Out[78]:
    0   None
    1   b
    2   c
Length: 3, dtype: object
```

To insert a `NaN`, you must explicitly use `np.nan`. See the `docs`.

• In prior versions, updating a pandas object in-place would not reflect in other python references to this object. (GH8511, GH5104)

```python
In [79]: s = pd.Series([1, 2, 3])
In [80]: s2 = s
In [81]: s += 1.5
```

Behavior prior to v0.15.0

```python
# the original object
In [5]: s
Out[5]:
    0   2.5   
    1   3.5   
    2   4.5   
    dtype: float64

# a reference to the original object
In [7]: s2
Out[7]:
    0   1   
    1   2   
```
This is now the correct behavior

```python
# the original object
In [82]: s
Out[82]:
0  2.5
1  3.5
2  4.5
Length: 3, dtype: float64

# a reference to the original object
In [83]: s2
Out[83]:
0  2.5
1  3.5
2  4.5
Length: 3, dtype: float64
```

- Made both the C-based and Python engines for `read_csv` and `read_table` ignore empty lines in input as well as white space-filled lines, as long as `sep` is not white space. This is an API change that can be controlled by the keyword parameter `skip_blank_lines`. See the docs (GH4466)
- A timeseries/index localized to UTC when inserted into a Series/DataFrame will preserve the UTC timezone and inserted as `object` dtype rather than being converted to a naive `datetime64[ns]` (GH8411).
- Bug in passing a `DatetimeIndex` with a timezone that was not being retained in DataFrame construction from a dict (GH7822)

In prior versions this would drop the timezone, now it retains the timezone, but gives a column of `object` dtype:

```python
In [84]: i = pd.date_range('1/1/2011', periods=3, freq='10s', tz='US/Eastern')

In [85]: i
Out[85]: DatetimeIndex(['2011-01-01 00:00:00-05:00', '2011-01-01 00:00:10-05:00', '2011-01-01 00:00:20-05:00'],
            dtype='datetime64[ns, US/Eastern]', freq='10S')

In [86]: df = pd.DataFrame({'a': i})

In [87]: df
Out[87]:
     a
0 2011-01-01 00:00:00-05:00
1 2011-01-01 00:00:10-05:00
2 2011-01-01 00:00:20-05:00

[3 rows x 1 columns]

In [88]: df.dtypes
Out[88]:
da  datetime64[ns, US/Eastern]
Length: 1, dtype: object
Previously this would have yielded a column of datetime64 dtype, but without timezone info.

The behaviour of assigning a column to an existing dataframe as `df['a'] = i` remains unchanged (this already returned an object column with a timezone).

- When passing multiple levels to `stack()`, it will now raise a `ValueError` when the levels aren’t all level names or all level numbers (GH7660). See Reshaping by stacking and unstacking.

- Raise a `ValueError` in `df.to_hdf` with ‘fixed’ format, if `df` has non-unique columns as the resulting file will be broken (GH7761).

- SettingWithCopy raise/warnings (according to the option `mode.chained_assignment`) will now be issued when setting a value on a sliced mixed-dtype DataFrame using chained-assignment. (GH7845, GH7950)

```python
In [1]: df = pd.DataFrame(np.arange(0, 9), columns=['count'])
In [2]: df['group'] = 'b'
In [3]: df.iloc[0:5]['group'] = 'a'
/home/local/bin/ipython:1: SettingWithCopyWarning:
A value is trying to be set on a copy of a slice from a DataFrame.
Try using .loc[row_indexer,col_indexer] = value instead
See the caveats in the documentation: https://pandas.pydata.org/pandas-docs/˓
stable/indexing.html#indexing-view-versus-copy
```

- `merge`, `DataFrame.merge`, and `ordered_merge` now return the same type as the left argument (GH737).

- Previously an enlargement with a mixed-dtype frame would act unlike `.append` which will preserve dtypes (related GH2578, GH8176):

```python
In [89]: df = pd.DataFrame([[True, 1], [False, 2]], columns=['female', 'fitness'])
In [90]: df.dtypes
Out[90]:
female   bool
fitness  int64
Length: 2, dtype: object
# dtypes are now preserved
In [93]: df
Out[93]:
   female  fitness
0    True     1
1   False     2
2   False     2
```

(continues on next page)
Series.to_csv() now returns a string when path=None, matching the behaviour of DataFrame.to_csv() (GH8215).

read_hdf now raises IOError when a file that doesn’t exist is passed in. Previously, a new, empty file was created, and a KeyError raised (GH7715).
DataFrame.info() now ends its output with a newline character (GH8114)
Concatenating no objects will now raise a ValueError rather than a bare Exception.
Merge errors will now be sub-classes of ValueError rather than raw Exception (GH8501)
DataFrame.plot and Series.plot keywords are now have consistent orders (GH8037)

Internal refactoring

In 0.15.0 Index has internally been refactored to no longer sub-class ndarray but instead subclass PandasObject, similarly to the rest of the pandas objects. This change allows very easy sub-classing and creation of new index types. This should be a transparent change with only very limited API implications (GH5080, GH7439, GH7796, GH8024, GH8367, GH7997, GH8522):

• you may need to unpickle pandas version < 0.15.0 pickles using pd.read_pickle rather than pickle.load. See pickle docs
• when plotting with a PeriodIndex, the matplotlib internal axes will now be arrays of Period rather than a PeriodIndex (this is similar to how a DatetimeIndex passes arrays of datetimes now)
• MultiIndexes will now raise similarly to other pandas objects w.r.t. truth testing, see here (GH7897).
• When plotting a DatetimeIndex directly with matplotlib’s plot function, the axis labels will no longer be formatted as dates but as integers (the internal representation of a datetime64). UPDATE This is fixed in 0.15.1, see here.

Deprecations

• The attributes Categorical labels and levels attributes are deprecated and renamed to codes and categories.
• The outtype argument to pd.DataFrame.to_dict has been deprecated in favor of orient. (GH7840)
• The convert_dummies method has been deprecated in favor of get_dummies (GH8140)
• The infer_dst argument in tz_localize will be deprecated in favor of ambiguous to allow for more flexibility in dealing with DST transitions. Replace infer_dst=True with ambiguous='infer' for the same behavior (GH7943). See the docs for more details.
• The top-level pd.value_range has been deprecated and can be replaced by .describe() (GH8481)
The Index set operations + and - were deprecated in order to provide these for numeric type operations on certain index types. + can be replaced by .union() or |, and - by .difference(). Further the method name Index.diff() is deprecated and can be replaced by Index.difference() (GH8226)

```python
# +
pd.Index(['a', 'b', 'c']) + pd.Index(['b', 'c', 'd'])
# should be replaced by
pd.Index(['a', 'b', 'c']).union(pd.Index(['b', 'c', 'd']))

# -
pd.Index(['a', 'b', 'c']) - pd.Index(['b', 'c', 'd'])
# should be replaced by
pd.Index(['a', 'b', 'c']).difference(pd.Index(['b', 'c', 'd']))
```

The infer_types argument to read_html() now has no effect and is deprecated (GH7762, GH7032).

Removal of prior version deprecations/changes

- Remove DataFrame.delevel method in favor of DataFrame.reset_index

Enhancements

Enhancements in the importing/exporting of Stata files:

- Added support for bool, uint8, uint16 and uint32 data types in to_stata (GH7097, GH7365)
- Added conversion option when importing Stata files (GH8527)
- DataFrame.to_stata and StataWriter check string length for compatibility with limitations imposed in dta files where fixed-width strings must contain 244 or fewer characters. Attempting to write Stata dta files with strings longer than 244 characters raises a ValueError. (GH7858)
- read_stata and StataReader can import missing data information into a DataFrame by setting the argument convert_missing to True. When using this options, missing values are returned as StataMissingValue objects and columns containing missing values have object data type. (GH8045)

Enhancements in the plotting functions:

- Added layout keyword to DataFrame.plot. You can pass a tuple of (rows, columns), one of which can be -1 to automatically infer (GH6667, GH8071).
- Allow to pass multiple axes to DataFrame.plot.hist and boxplot (GH5353, GH6970, GH7069)
- Added support for c, colormap and colorbar arguments for DataFrame.plot with kind='scatter' (GH7780)
- Histogram from DataFrame.plot with kind='hist' (GH7809), See the docs.
- Boxplot from DataFrame.plot with kind='box' (GH7998), See the docs.

Other:

- read_csv now has a keyword parameter float_precision which specifies which floating-point converter the C engine should use during parsing, see here (GH8002, GH8044)
- Added searchsorted method to Series objects (GH7447)
• `describe()` on mixed-types DataFrames is more flexible. Type-based column filtering is now possible via the `include/exclude` arguments. See the docs (GH8164).

```
In [95]: df = pd.DataFrame({'catA': ['foo', 'foo', 'bar'] * 8,
    ....:     'catB': ['a', 'b', 'c', 'd'] * 6,
    ....:     'numC': np.arange(24),
    ....:     'numD': np.arange(24.) + .5})

In [96]: df.describe(include=['object'])
Out[96]:
   catA  catB
count  24   24
unique  2   4
top   foo   d
freq  16   6

[4 rows x 2 columns]

In [97]: df.describe(include=['number', 'object'], exclude=['float'])
Out[97]:
   catA  catB  numC
count  24   24  24.000000
unique  2   4    NaN
top   foo   d    NaN
freq  16   6    NaN
mean   NaN   NaN   11.500000
std    NaN   NaN   7.071068
min    NaN   NaN   0.000000
25%    NaN   NaN   5.750000
50%    NaN   NaN   11.500000
75%    NaN   NaN   17.250000
max    NaN   NaN   23.000000

[11 rows x 3 columns]
```

Requesting all columns is possible with the shorthand ‘all’

```
In [98]: df.describe(include='all')
Out[98]:
   catA  catB  numC  numD
count  24  24.000000  24.000000
unique  2   NaN    NaN
top   foo   NaN    NaN
freq  16   NaN    NaN
mean   NaN   NaN    11.500000
std    NaN   NaN    7.071068
min    NaN   NaN    0.000000
25%    NaN   NaN    5.750000
50%    NaN   NaN    11.500000
75%    NaN   NaN    17.250000
max    NaN   NaN    23.000000

[11 rows x 4 columns]
```

Without those arguments, `describe` will behave as before, including only numerical columns or, if none are, only categorical columns. See also the docs.

• Added `split` as an option to the `orient` argument in `pd.DataFrame.to_dict` (GH7840)
• The `get_dummies` method can now be used on DataFrames. By default only categorical columns are encoded as 0’s and 1’s, while other columns are left untouched.

```python
In [99]: df = pd.DataFrame({'A': ['a', 'b', 'a'], 'B': ['c', 'c', 'b'],
                      'C': [1, 2, 3]})

In [100]: pd.get_dummies(df)  
Out[100]:  
   C  A_a  A_b  B_b  B_c  
0  1    1    0    0    1  
1  2    0    1    0    1  
2  3    1    0    1    0  
```

• `PeriodIndex` supports resolution as the same as `DatetimeIndex` (GH7708)

• `pandas.tseries.holiday` has added support for additional holidays and ways to observe holidays (GH7070)

• `pandas.tseries.holiday.Holiday` now supports a list of offsets in Python3 (GH7070)

• `pandas.tseries.holiday.Holiday` now supports a `days_of_week` parameter (GH7070)

• `GroupBy.nth()` now supports selecting multiple nth values (GH7910)

```python
In [101]: business_dates = pd.date_range(start='4/1/2014', end='6/30/2014', freq='B')

In [102]: df = pd.DataFrame(1, index=business_dates, columns=['a', 'b'])

# get the first, 4th, and last date index for each month
In [103]: df.groupby([df.index.year, df.index.month]).nth([0, 3, -1])

Out[103]:  
          a  b  
2014 4  1  1  
   4  1  1  
   5  1  1  
   5  1  1  
   6  1  1  
   6  1  1  
   6  1  1  
```

• `Period` and `PeriodIndex` supports addition/subtraction with `timedelta`-likes (GH7966)

If `Period freq` is D, H, T, S, L, U, N, `Timedelta`-like can be added if the result can have same freq. Otherwise, only the same offsets can be added.

```python
In [104]: idx = pd.period_range('2014-07-01 09:00', periods=5, freq='H')

In [105]: idx
Out[105]: PeriodIndex(['2014-07-01 09:00', '2014-07-01 10:00', '2014-07-01 11:00',
   '2014-07-01 12:00', '2014-07-01 13:00'],
   freq='H')
```
Added experimental compatibility with openpyxl for versions >= 2.0. The DataFrame.to_excel method engine keyword now recognizes openpyxl1 and openpyxl2 which will explicitly require openpyxl v1 and v2 respectively, failing if the requested version is not available. The openpyxl engine is a now a meta-engine that automatically uses whichever version of openpyxl is installed. (GH7177)

- DataFrame.fillna can now accept a DataFrame as a fill value (GH8377)
- Passing multiple levels to stack() will now work when multiple level numbers are passed (GH7660). See Reshaping by stacking and unstacking.
- set_names(), set_labels(), and set_levels() methods now take an optional level keyword argument to all modification of specific level(s) of a MultiIndex. Additionally set_names() now accepts a scalar string value when operating on an Index or on a specific level of a MultiIndex (GH7792)

In [111]: idx = pd.MultiIndex.from_product([[a], range(3), list("pqr")], names=['foo', 'bar', 'baz'])
       .....:
       .....:

In [112]: idx.set_names('qux', level=0)
Out[112]: MultiIndex([('a', 0, 'p'),
            ('a', 0, 'q'),
            ('a', 0, 'r'),
            ('a', 1, 'p'),
            ('a', 1, 'q'),
            ('a', 1, 'r'),
            ('a', 2, 'p'),
            ('a', 2, 'q'),
            ('a', 2, 'r')],
            names=['qux', 'bar', 'baz'])
In [114]: idx.set_levels(['a', 'b', 'c'], level='bar')
Out[114]:
MultiIndex([('a', 'a', 'p'),
             ('a', 'a', 'q'),
             ('a', 'a', 'r'),
             ('a', 'b', 'p'),
             ('a', 'b', 'q'),
             ('a', 'b', 'r'),
             ('a', 'c', 'p'),
             ('a', 'c', 'q'),
             ('a', 'c', 'r')],
           names=['foo', 'bar', 'baz'])

In [115]: idx.set_levels([['a', 'b', 'c'], [1, 2, 3]], level=[1, 2])
Out[115]:
MultiIndex([('a', 'a', 1),
             ('a', 'a', 2),
             ('a', 'a', 3),
             ('a', 'b', 1),
             ('a', 'b', 2),
             ('a', 'b', 3),
             ('a', 'c', 1),
             ('a', 'c', 2),
             ('a', 'c', 3)],
           names=['foo', 'bar', 'baz'])

- **Index.isin** now supports a level argument to specify which index level to use for membership tests (GH7892, GH7890)

    In [1]: idx = pd.MultiIndex.from_product([[0, 1], ['a', 'b', 'c']])

    In [2]: idx.values
Out[2]: array([(0, 'a'), (0, 'b'), (0, 'c'), (1, 'a'), (1, 'b'), (1, 'c')],
             dtype=object)

    In [3]: idx.isin(['a', 'c', 'e'], level=1)
Out[3]: array([ True, False, True, True, False, True], dtype=bool)

- **Index** now supports duplicated and drop_duplicates. (GH4060)

    In [116]: idx = pd.Index([1, 2, 3, 4, 1, 2])

    In [117]: idx
Out[117]: Int64Index([1, 2, 3, 4, 1, 2], dtype='int64')
In [118]: idx.duplicated()
Out[118]: array([False, False, False, False, True, True])

In [119]: idx.drop_duplicates()
Out[119]: Int64Index([1, 2, 3, 4], dtype='int64')

• add copy=True argument to pd.concat to enable pass through of complete blocks (GH8252)
• Added support for numpy 1.8+ data types (bool_, int_, float_, string_) for conversion to R dataframe (GH8400)

Performance

• Performance improvements in DatetimeIndex.__iter__ to allow faster iteration (GH7683)
• Performance improvements in Period creation (and PeriodIndex setitem) (GH5155)
• Improvements in Series.transform for significant performance gains (revised) (GH6496)
• Performance improvements in StataReader when reading large files (GH8040, GH8073)
• Performance improvements in StataWriter when writing large files (GH8079)
• Performance and memory usage improvements in multi-key groupby (GH8128)
• Performance improvements in groupby .agg and .apply where builtins max/min were not mapped to numpy/cythonized versions (GH7722)
• Performance improvement in writing to sql (to_sql) of up to 50% (GH8208).
• Performance benchmarking of groupby for large value of ngroups (GH6787)
• Performance improvement in CustomBusinessDay, CustomBusinessMonth (GH8236)
• Performance improvement for MultiIndex.values for multi-level indexes containing datetimes (GH8543)

Bug fixes

• Bug in pivot_table, when using margins and a dict aggfunc (GH8349)
• Bug in read_csv where squeeze=True would return a view (GH8217)
• Bug in checking of table name in read_sql in certain cases (GH7826).
• Bug in DataFrame.groupby where Grouper does not recognize level when frequency is specified (GH7885)
• Bug in multiindexes dtypes getting mixed up when DataFrame is saved to SQL table (GH8021)
• Bug in Series 0-division with a float and integer operand dtypes (GH7785)
• Bug in Series.astype("unicode") not calling unicode on the values correctly (GH7758)
• Bug in DataFrame.as_matrix() with mixed datetime64[ns] and timedelta64[ns] dtypes (GH7778)
• Bug in HDFStore.select_column() not preserving UTC timezone info when selecting a DatetimeIndex (GH7777)
• Bug in to_datetime when format='%Y%m%d' and coerce=True are specified, where previously an object array was returned (rather than a coerced time-series with NaT), (GH7930)
- Bug in `DatetimeIndex` and `PeriodIndex` in-place addition and subtraction cause different result from normal one (GH6527)
- Bug in adding and subtracting `PeriodIndex` with `PeriodIndex` raise `TypeError` (GH7741)
- Bug in `combine_first` with `PeriodIndex` data raises `TypeError` (GH3367)
- Bug in MultiIndex slicing with missing indexers (GH7866)
- Bug in MultiIndex slicing with various edge cases (GH8132)
- Regression in MultiIndex indexing with a non-scalar type object (GH7914)
- Bug in `Timestamp` comparisons with `==` and `int64` dtype (GH8058)
- Bug in pickles contains `DateOffset` may raise `AttributeError` when normalize attribute is referred internally (GH7748)
- Bug in `Panel` when using `major_xs` and `copy=False` is passed (deprecation warning fails because of missing warnings) (GH8152).
- Bug in pickle deserialization that failed for pre-0.14.1 containers with dup items trying to avoid ambiguity when matching block and manager items, when there’s only one block there’s no ambiguity (GH7794)
- Bug in putting a `PeriodIndex` into a `Series` would convert to `int64` dtype, rather than object of `Periods` (GH7932)
- Bug in `HDFStore` iteration when passing a where (GH8014)
- Bug in `DataFrameGroupby.transform` when transforming with a passed non-sorted key (GH8046, GH8430)
- Bug in repeated timeseries line and area plot may result in `ValueError` or incorrect kind (GH7733)
- Bug in inference in a MultiIndex with `datetime.date` inputs (GH7788)
- Bug in `get` where an `IndexError` would not cause the default value to be returned (GH7725)
- Bug in offsets.apply, rollforward and rollback may reset nanosecond (GH7697)
- Bug in offsets.apply, rollforward and rollback may raise `AttributeError` if `Timestamp` has `dateutil tzinfo` (GH7697)
- Bug in sorting a MultiIndex frame with a `Float64Index` (GH8017)
- Bug in inconsistent panel setitem with a rhs of a `DataFrame` for alignment (GH7763)
- Bug in `is_superperiod` and `is_subperiod` cannot handle higher frequencies than `S` (GH7760, GH7772, GH7803)
- Bug in 32-bit platforms with `Series.shift` (GH8129)
- Bug in `PeriodIndex.unique` returns `int64 np.ndarray` (GH7540)
- Bug in `groupby.apply` with a non-affecting mutation in the function (GH8467)
- Bug in `DataFrame.reset_index` which has MultiIndex contains `PeriodIndex` or `DatetimeIndex` with tz raises `ValueError` (GH7746, GH7793)
- Bug in `DataFrame.plot` with subplots=True may draw unnecessary minor xticks and yticks (GH7801)
- Bug in `StataReader` which did not read variable labels in 117 files due to difference between Stata documentation and implementation (GH7816)
- Bug in `StataReader` where strings were always converted to 244 characters-fixed width irrespective of underlying string size (GH7858)
- Bug in `DataFrame.plot` and `Series.plot` may ignore `rot` and `fontsize` keywords (GH7844)
• Bug in `DatetimeIndex.value_counts` doesn’t preserve tz (GH7735)
• Bug in `PeriodIndex.value_counts` results in `Int64Index` (GH7735)
• Bug in `DataFrame.join` when doing left join on index and there are multiple matches (GH5391)
• Bug in `GroupBy.transform()` where int groups with a transform that didn’t preserve the index were incorrectly truncated (GH7972).
• Bug in `groupby` where callable objects without name attributes would take the wrong path, and produce a `DataFrame` instead of a `Series` (GH7929)
• Bug in `groupby` error message when a DataFrame grouping column is duplicated (GH7511)
• Bug in `read_html` where the `infer_types` argument forced coercion of date-likes incorrectly (GH7762, GH7032).
• Bug in `Series.str.cat` with an index which was filtered as to not include the first item (GH7857)
• Bug in `Timestamp` cannot parse nanosecond from string (GH7878)
• Bug in `Timestamp` with string offset and tz results incorrect (GH7833)
• Bug in `tslib.tz_convert` and `tslib.tz_convert_single` may return different results (GH7798)
• Bug in `DatetimeIndex.intersection` of non-overlapping timestamps with tz raises `IndexError` (GH7880)
• Bug in alignment with TimeOps and non-unique indexes (GH8363)
• Bug in `GroupBy.filter()` where fast path vs. slow path made the filter return a non scalar value that appeared valid but wasn’t (GH7870).
• Bug in `date_range()`/`DatetimeIndex()` when the timezone was inferred from input dates yet incorrect times were returned when crossing DST boundaries (GH7835, GH7901).
• Bug in `to_excel()` where a negative sign was being prepended to positive infinity and was absent for negative infinity (GH7949)
• Bug in area plot draws legend with incorrect alpha when stacked=True (GH8027)
• `Period` and `PeriodIndex` addition/subtraction with `np.timedelta64` results in incorrect internal representations (GH7740)
• Bug in `Holiday` with no offset or observance (GH7987)
• Bug in `DataFrame.to_latex` formatting when columns or index is a MultiIndex (GH7982).
• Bug in `DateOffset` around Daylight Savings Time produces unexpected results (GH5175).
• Bug in `DataFrame.shift` where empty columns would throw `ZeroDivisionError` on numpy 1.7 (GH8019)
• Bug in installation where `html_encoding/*.html` wasn’t installed and therefore some tests were not running correctly (GH7927).
• Bug in `read_html` where bytes objects were not tested for in `_read` (GH7927).
• Bug in `DataFrame.stack()` when one of the column levels was a datelike (GH8039)
• Bug in broadcasting numpy scalars with `DataFrame` (GH8116)
• Bug in `pivot_table` performed with nameless index and columns raises `KeyError` (GH8103)
• Bug in `DataFrame.plot(kind='scatter')` draws points and errorbars with different colors when the color is specified by c keyword (GH8081)
• Bug in `Float64Index` where iat and at were not testing and were failing (GH8092).
• Bug in DataFrame.boxplot() where y-limits were not set correctly when producing multiple axes (GH7528, GH5517).

• Bug in read_csv where line comments were not handled correctly given a custom line terminator or delim_whitespace=True (GH8122).

• Bug in read_html where empty tables caused a StopIteration (GH7575)

• Bug in casting when setting a column in a same-dtype block (GH7704)

• Bug in accessing groups from a GroupBy when the original grouper was a tuple (GH8121).

• Bug in .at that would accept integer indexers on a non-integer index and do fallback (GH7814)

• Bug with kde plot and NaNs (GH8182)

• Bug in GroupBy.count with float32 data type were nan values were not excluded (GH8169).

• Bug with stacked barplots and NaNs (GH8175).

• Bug in resample with non evenly divisible offsets (e.g. ‘7s’) (GH8371)

• Bug in interpolation methods with the limit keyword when no values needed interpolating (GH7173).

• Bug where col_space was ignored in DataFrame.to_string() when header=False (GH8230).

• Bug with DatetimeIndex.asof incorrectly matching partial strings and returning the wrong date (GH8245).

• Bug in plotting methods modifying the global matplotlib rcParams (GH8242).

• Bug in DataFrame.__setitem__ that caused errors when setting a dataframe column to a sparse array (GH8131)

• Bug where DataFrame.boxplot() failed when entire column was empty (GH8181).

• Bug with messed variables in radviz visualization (GH8199).

• Bug in interpolation methods with the limit keyword when no values needed interpolating (GH7173).

• Bug where col_space was ignored in DataFrame.to_string() when header=False (GH8230).

• Bug in to_clipboard that would clip long column data (GH8305)

• Bug in DataFrame terminal display: Setting max_column/max_rows to zero did not trigger auto-resizing of dfs to fit terminal width/height (GH7180).

• Bug in OLS where running with “cluster” and “nw_lags” parameters did not work correctly, but also did not throw an error (GH8584).

• Bug in DataFrame.dropna that interpreted non-existent columns in the subset argument as the ‘last column’ (GH8303)

• Bug in Index.intersection on non-monotonic non-unique indexes (GH8362).

• Bug in masked series assignment where mismatching types would break alignment (GH8387)

• Bug in NDFrame.equals gives false negatives with dtype=object (GH8437)

• Bug in assignment with indexer where type diversity would break alignment (GH8258)

• Bug in NDFrame.loc indexing when row/column names were lost when target was a list/ndarray (GH6552)

• Regression in NDFrame.loc indexing when rows/columns were converted to Float64Index if target was an empty list/ndarray (GH7774)

• Bug in Series that allows it to be indexed by a DataFrame which has unexpected results. Such indexing is no longer permitted (GH8444)
pandas: powerful Python data analysis toolkit, Release 1.2.2

- Bug in item assignment of a DataFrame with MultiIndex columns where right-hand-side columns were not aligned (GH7655)
- Suppress FutureWarning generated by NumPy when comparing object arrays containing NaN for equality (GH7065)
- Bug in DataFrame.eval() where the dtype of the not operator (~) was not correctly inferred as bool.

5.15 Version 0.14

5.15.1 Version 0.14.1 (July 11, 2014)

This is a minor release from 0.14.0 and includes a small number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

• Highlights include:
  – New methods select_dtypes() to select columns based on the dtype and sem() to calculate the standard error of the mean.
  – Support for dateutil timezones (see docs).
  – Support for ignoring full line comments in the read_csv() text parser.
  – New documentation section on Options and Settings.
  – Lots of bug fixes.

• Enhancements
• API Changes
• Performance Improvements
• Experimental Changes
• Bug Fixes
API changes

- Openpyxl now raises a ValueError on construction of the openpyxl writer instead of warning on pandas import (GH7284).

- For `StringMethods.extract`, when no match is found, the result - only containing NaN values - now also has `dtype=object` instead of `float` (GH7242).

- Period objects no longer raise a TypeError when compared using `==` with another object that isn’t a Period. Instead when comparing a Period with another object using `==` if the other object isn’t a Period False is returned. (GH7376)

- Previously, the behaviour on resetting the time or not in `offsets.apply`, `rollforward` and `rollback` operations differed between offsets. With the support of the `normalize` keyword for all offsets(see below) with a default value of False (preserve time), the behaviour changed for certain offsets (BusinessMonthBegin, MonthEnd, BusinessMonthEnd, CustomBusinessMonthEnd, BusinessYearBegin, LastWeekOfMonth, FY5253Quarter, LastWeekOfMonth, Easter):

```
In [6]: from pandas.tseries import offsets

In [7]: d = pd.Timestamp('2014-01-01 09:00')

# old behaviour < 0.14.1
In [8]: d + offsets.MonthEnd()
Out[8]: pd.Timestamp('2014-01-31 00:00:00')

Starting from 0.14.1 all offsets preserve time by default. The old behaviour can be obtained with
normalize=True

# new behaviour
In [1]: d + offsets.MonthEnd()
Out[1]: Timestamp('2014-01-31 09:00:00')

In [2]: d + offsets.MonthEnd(normalize=True)
Out[2]: Timestamp('2014-01-31 00:00:00')
```

Note that for the other offsets the default behaviour did not change.

- Add back `#N/A N/A` as a default NA value in text parsing. (regression from 0.12) (GH5521)

- Raise a TypeError on inplace-setting with a `.where` and a non np.nan value as this is inconsistent with a
set-item expression like `df[mask] = None` (GH7656)

Enhancements

- Add `dropna` argument to `value_counts` and `nunique` (GH5569).

- Add `select_dtypes()` method to allow selection of columns based on dtype (GH7316). See the docs.

- All offsets supports the `normalize` keyword to specify whether `offsets.apply`, `rollforward` and `rollback` resets the time (hour, minute, etc) or not (default False, preserves time) (GH7156):

```
import pandas.tseries.offsets as offsets

day = offsets.Day()
day.apply(pd.Timestamp("2014-01-01 09:00"))

day = offsets.Day(normalize=True)
day.apply(pd.Timestamp("2014-01-01 09:00"))
```
• PeriodIndex is represented as the same format as DatetimeIndex (GH7601)
• StringMethods now work on empty Series (GH7242)
• The file parsers read_csv and read_table now ignore line comments provided by the parameter comment, which accepts only a single character for the C reader. In particular, they allow for comments before file data begins (GH2685)
• Add NotImplementedError for simultaneous use of chunksize and nrows for read_csv() (GH6774).
• Tests for basic reading of public S3 buckets now exist (GH7281).
• read_html now sports an encoding argument that is passed to the underlying parser library. You can use this to read non-ascii encoded web pages (GH7323).
• read_excel now supports reading from URLs in the same way that read_csv does. (GH6809)
• Support for dateutil timezones, which can now be used in the same way as pytz timezones across pandas. (GH4688)

```
In [3]: rng = pd.date_range("3/6/2012 00:00", periods=10, freq="D", tz="dateutil/Europe/London")
In [4]: rng.tz
Out[4]: tzfile('/usr/share/zoneinfo/Europe/London')
```

See the docs.
• Implemented sem (standard error of the mean) operation for Series, DataFrame, Panel, and Groupby (GH6897)
• Add nlargest and nsmallest to the Series groupby allowlist, which means you can now use these methods on a SeriesGroupBy object (GH7053).
• All offsets apply, rollforward and rollback can now handle np.datetime64, previously results in ApplyTypeError (GH7452)
• Period and PeriodIndex can contain NaT in its values (GH7485)
• Support pickling Series, DataFrame and Panel objects with non-unique labels along item axis (index, columns and items respectively) (GH7370).
• Improved inference of datetime/timedelta with mixed null objects. Regression from 0.13.1 in interpretation of an object Index with all null elements (GH7431)

Performance

• Improvements in dtypes inference for numeric operations involving yielding performance gains for dtypes: int64, timedelta64, datetime64 (GH7223)
• Improvements in Series.transform for significant performance gains (GH6496)
• Improvements in DataFrame.transform with ufuncs and built-in grouper functions for significant performance gains (GH7383)
• Regression in groupby aggregation of datetime64 dtypes (GH7555)
• Improvements in MultiIndex.from_product for large iterables (GH7627)
Experimental

- pandas.io.data.Options has a new method, get_all_data method, and now consistently returns a MultiIndex DataFrame (GH5602)
- io.gbq.read_gbq and io.gbq.to_gbq were refactored to remove the dependency on the Google bq.py command line client. This submodule now uses httplib2 and the Google apiclient and oauth2client API client libraries which should be more stable and, therefore, reliable than bq.py. See the docs. (GH6937).

Bug fixes

- Bug in DataFrame.where with a symmetric shaped frame and a passed other of a DataFrame (GH7506)
- Bug in Panel indexing with a MultiIndex axis (GH7516)
- Regression in datetime-like slice indexing with a duplicated index and non-exact end-points (GH7523)
- Bug in setitem with list-of-lists and single vs mixed types (GH7551)
- Bug in time ops with non-aligned Series (GH7500)
- Bug in timedelta inference when assigning an incomplete Series (GH7592)
- Bug in groupby .nth with a Series and integer-like column name (GH7559)
- Bug in Series.set with a boolean accessor (GH7407)
- Bug in value_counts where NaT did not qualify as missing (NaN) (GH7423)
- Bug in to_timedelta that accepted invalid units and misinterpreted ‘m/h’ (GH7611, GH6423)
- Bug in line plot doesn’t set correct xlim if secondary_y=True (GH7459)
- Bug in grouped hist and scatter plots use old figsize default (GH7394)
- Bug in plotting subplots with DataFrame.plot, hist clears passed ax even if the number of subplots is one (GH7391).
- Bug in plotting subplots with DataFrame.boxplot with by kw raises ValueError if the number of subplots exceeds 1 (GH7391).
- Bug in subplots displays ticklabels and labels in different rule (GH5897)
- Bug in Panel.apply with a MultiIndex as an axis (GH7469)
- Bug in DatetimeIndex.insert doesn’t preserve name and tz (GH7299)
- Bug in DatetimeIndex.asobject doesn’t preserve name (GH7299)
- Bug in MultiIndex slicing with datetime-like ranges (strings and Timestamps), (GH7429)
- Bug in Index.min and max doesn’t handle nan and NaT properly (GH7261)
- Bug in PeriodIndex.min/max results in int (GH7609)
- Bug in resample where fill_method was ignored if you passed how (GH2073)
- Bug in TimeGrouper doesn’t exclude column specified by key (GH7227)
- Bug in DataFrame and Series bar and barh plot raises TypeError when bottom and left keyword is specified (GH7226)
- Bug in DataFrame.hist raises TypeError when it contains non numeric column (GH7277)
- Bug in Index.delete does not preserve name and freq attributes (GH7302)
• Bug in `DataFrame.query()` where local string variables with the @ sign were being treated as temporaries attempting to be deleted (GH7300).
• Bug in `Float64Index` which didn’t allow duplicates (GH7149).
• Bug in `DataFrame.replace()` where truthy values were being replaced (GH7140).
• Bug in `StringMethods.extract()` where a single match group Series would use the matcher’s name instead of the group name (GH7313).
• Bug in `isnull()` when mode.use_inf_as_null == True where isnull wouldn’t test True when it encountered an inf/-inf (GH7315).
• Bug in inferred_freq results in None for eastern hemisphere timezones (GH7310)
• Bug in `Easter` returns incorrect date when offset is negative (GH7195)
• Bug in broadcasting with .div, integer dtypes and divide-by-zero (GH7325)
• Bug in `CustomBusinessDay.apply` raises NameError when np.datetime64 object is passed (GH7196)
• Bug in `MultiIndex.append, concat and pivot_table` don’t preserve timezone (GH6606)
• Bug in `.loc` with a list of indexers on a single-multi index level (that is not nested) (GH7349)
• Bug in `Series.map` when mapping a dict with tuple keys of different lengths (GH7333)
• Bug all `StringMethods` now work on empty Series (GH7242)
• Fix delegation of `read_sql` to `read_sql_query` when query does not contain `select` (GH7324).
• Bug where a string column name assignment to a `DataFrame` with a `Float64Index` raised a TypeError during a call to np.isnan (GH7366).
• Bug where `NDFrame.replace()` didn’t correctly replace objects with `Period` values (GH7379).
• Bug in `.ix` getitem should always return a Series (GH7150)
• Bug in `MultiIndex` slicing with incomplete indexers (GH7399)
• Bug in `MultiIndex` slicing with a step in a sliced level (GH7400)
• Bug where negative indexers in `DatetimeIndex` were not correctly sliced (GH7408)
• Bug where `NaT` wasn’t repr’d correctly in a `MultiIndex` (GH7406, GH7409).
• Bug where bool objects were converted to `nan` in `convert_objects` (GH7416).
• Bug in `quantile` ignoring the axis keyword argument (GH7306)
• Bug where `nanops._maybe_null_out` doesn’t work with complex numbers (GH7353)
• Bug in several `nanops` functions when axis==0 for 1-dimensional `nan` arrays (GH7354)
• Bug where `nanops.nanmedian` doesn’t work when axis==None (GH7352)
• Bug where `nanops._has_infs` doesn’t work with many dtypes (GH7357)
• Bug in `StataReader.data` where reading a 0-observation dta failed (GH7369)
• Bug in `StataReader` when reading Stata 13 (117) files containing fixed width strings (GH7360)
• Bug in `StataWriter` where encoding was ignored (GH7286)
• Bug in `DatetimeIndex` comparison doesn’t handle NaT properly (GH7529)
• Bug in passing input with tzinfo to some offsets apply, rollforward or rollback resets tzinfo or raises ValueError (GH7465)
• Bug in `DatetimeIndex.to_period`, `PeriodIndex.asobject`, `PeriodIndex.to_timestamp` doesn’t preserve name (GH7485)
• Bug in `DatetimeIndex.to_period` and `PeriodIndex.to_timestamp` handle NaT incorrectly (GH7228)
• Bug in `offsets.apply`, `rollforward` and `rollback` may return normal datetime (GH7502)
• Bug in `resample` raises `ValueError` when target contains NaT (GH7227)
• Bug in `Timestamp.tz_localize` resets nanosecond info (GH7534)
• Bug in `DatetimeIndex.asobject` raises `ValueError` when it contains NaT (GH7539)
• Bug in `Timestamp.__new__` doesn’t preserve nanosecond properly (GH7610)
• Bug in `Index.astype(float)` where it would return an object dtype Index (GH7464).
• Bug in `DataFrame.reset_index` loses tz (GH3950)
• Bug in `DatetimeIndex.freqstr` raises `AttributeError` when freq is None (GH7606)
• Bug in `GroupBy.size` created by `TimeGrouper` raises `AttributeError` (GH7453)
• Bug in single column bar plot is misaligned (GH7498).
• Bug in area plot with tz-aware time series raises `ValueError` (GH7471)
• Bug in non-monotonic `Index.union` may preserve name incorrectly (GH7458)
• Bug in `DatetimeIndex.intersection` doesn’t preserve timezone (GH4690)
• Bug in `rolling_var` where a window larger than the array would raise an error (GH7297)
• Bug with last plotted timeseries dictating `xlim` (GH2960)
• Bug with `secondary_y` axis not being considered for timeseries `xlim` (GH3490)
• Bug in `Float64Index` assignment with a non scalar indexer (GH7586)
• Bug in `pandas.core.strings.str_contains` does not properly match in a case insensitive fashion when `regex=False` and `case=False` (GH7505)
• Bug in `expanding_cov`, `expanding_corr`, `rolling_cov`, and `rolling_corr` for two arguments with mismatched index (GH7512)
• Bug in `to_sql` taking the boolean column as text column (GH7678)
• Bug in grouped `hist` doesn’t handle `rot` kw and `sharex` kw properly (GH7234)
• Bug in `.loc` performing fallback integer indexing with object dtype indices (GH7496)
• Bug (regression) in `PeriodIndex` constructor when passed `Series` objects (GH7701).

5.15.2 Version 0.14.0 (May 31, 2014)

This is a major release from 0.13.1 and includes a small number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

• Highlights include:
  – Officially support Python 3.4
  – SQL interfaces updated to use sqlalchemy, See Here.
  – Display interface changes, See Here
  – MultiIndexing Using Slicers, See Here.
  – Ability to join a singly-indexed DataFrame with a MultiIndexed DataFrame, see Here
  – More consistency in groupby results and more flexible groupby specifications, See Here
  – Holiday calendars are now supported in CustomBusinessDay, see Here
  – Several improvements in plotting functions, including: hexbin, area and pie plots, see Here.
  – Performance doc section on I/O operations, See Here

• Other Enhancements

• API Changes

• Text Parsing API Changes

• Groupby API Changes

• Performance Improvements

• Prior Deprecations

• Deprecations

• Known Issues

• Bug Fixes

Warning: In 0.14.0 all NDFrame based containers have undergone significant internal refactoring. Before that each block of homogeneous data had its own labels and extra care was necessary to keep those in sync with the parent container’s labels. This should not have any visible user/API behavior changes (GH6745)
API changes

- `read_excel` uses 0 as the default sheet (GH6573)

- `iloc` will now accept out-of-bounds indexers for slices, e.g. a value that exceeds the length of the object being indexed. These will be excluded. This will make pandas conform more with python/numpy indexing of out-of-bounds values. A single indexer that is out-of-bounds and drops the dimensions of the object will still raise `IndexError` (GH6296, GH6299). This could result in an empty axis (e.g. an empty DataFrame being returned)

```python
In [1]: dfl = pd.DataFrame(np.random.randn(5, 2), columns=list('AB'))
In [2]: dfl
Out[2]:
   A     B
0  0.469112 -0.282863
1 -1.509059 -1.135632
2  1.212112 -0.173215
3  0.119209 -1.044236
4 -0.861849 -2.104569
[5 rows x 2 columns]
In [3]: dfl.iloc[:, 2:3]
Out[3]:
Empty DataFrame
Columns: []
Index: [0, 1, 2, 3, 4]
[5 rows x 0 columns]
In [4]: dfl.iloc[:, 1:3]
Out[4]:
    B
0 -0.282863
1 -1.135632
2 -0.173215
3 -1.044236
4 -2.104569
[5 rows x 1 columns]
In [5]: dfl.iloc[4:6]
Out[5]:
   A     B
4 -0.861849 -2.104569
[1 rows x 2 columns]
```

These are out-of-bounds selections

```
>>> dfl.iloc[[4, 5, 6]]
IndexError: positional indexers are out-of-bounds

>>> dfl.iloc[:, 4]
IndexError: single positional indexer is out-of-bounds
```

- Slicing with negative start, stop & step values handles corner cases better (GH6531):
- df.iloc[:-len(df)] is now empty
- df.iloc[len(df)::] now enumerates all elements in reverse

- The DataFrame.interpolate() keyword downcast default has been changed from infer to None. This is to preserve the original dtype unless explicitly requested otherwise (GH6290).

- When converting a dataframe to HTML it used to return Empty DataFrame. This special case has been removed, instead a header with the column names is returned (GH6062).

- Series and Index now internally share more common operations, e.g. factorize(), nunique(), value_counts() are now supported on Index types as well. The Series.weekday property from is removed from Series for API consistency. Using a DatetimeIndex/PeriodIndex method on a Series will now raise a TypeError. (GH4551, GH4056, GH5519, GH6380, GH7206).

- Add is_month_start, is_month_end, is_quarter_start, is_quarter_end, is_year_start, is_year_end accessors for DateTimeIndex / Timestamp which return a boolean array of whether the timestamp(s) are at the start/end of the month/quarter/year defined by the frequency of the DateTimeIndex / Timestamp (GH4565, GH6998)

- Local variable usage has changed in pandas.eval()/DataFrame.eval()/DataFrame.query() (GH5987). For the DataFrame methods, two things have changed
  - Column names are now given precedence over locals
  - Local variables must be referred to explicitly. This means that even if you have a local variable that is not a column you must still refer to it with the '@' prefix.
  - You can have an expression like df.query('@a < a') with no complaints from pandas about ambiguity of the name a.
  - The top-level pandas.eval() function does not allow you use the '@' prefix and provides you with an error message telling you so.
  - NameResolutionError was removed because it isn't necessary anymore.

- Define and document the order of column vs index names in query/eval (GH6676)

- concat will now concatenate mixed Series and DataFrames using the Series name or numbering columns as needed (GH2385). See the docs

- Slicing and advanced/boolean indexing operations on Index classes as well as Index.delete() and Index.drop() methods will no longer change the type of the resulting index (GH6440, GH7040)

```python
In [6]: i = pd.Index([1, 2, 3, 'a', 'b', 'c'])
In [7]: i[[0, 1, 2]]
Out[7]: Index([1, 2, 3], dtype='object')
In [8]: i.drop(['a', 'b', 'c'])
Out[8]: Index([1, 2, 3], dtype='object')
```

Previously, the above operation would return Int64Index. If you’d like to do this manually, use Index.astype() (GH6459):

```python
In [9]: i[[0, 1, 2]].astype(np.int)
Out[9]: Int64Index([1, 2, 3], dtype='int64')
```

- set_index no longer converts MultiIndexes to an Index of tuples. For example, the old behavior returned an Index in this case (GH6459):
# Old behavior, casted MultiIndex to an Index
In [10]: tuple_ind
Out[10]: Index([('a', 'c'), ('a', 'd'), ('b', 'c'), ('b', 'd')], dtype='object')

In [11]: df_multi.set_index(tuple_ind)
Out[11]:
0   1

• pairwise keyword was added to the statistical moment functions rolling_cov, rolling_corr,
ewmcov, ewmcorr, expanding_cov, expanding_corr to allow the calculation of moving window covariance and correlation matrices (GH4950). See *Computing rolling pairwise covariances and correlations* in the docs.

```
In [1]: df = pd.DataFrame(np.random.randn(10, 4), columns=list('ABCD'))

In [4]: covs = pd.rolling_cov(df[['A', 'B', 'C']],
                       df[['B', 'C', 'D']],
                       5,
                       pairwise=True)

In [5]: covs[df.index[-1]]
Out [5]:
       B     C    D
A 0.035310 0.326593 -0.505430
B 0.137748 -0.006888 -0.005383
C -0.006888 0.861040 0.020762
```

- *Series.iteritems()* is now lazy (returns an iterator rather than a list). This was the documented behavior prior to 0.14. (GH6760)
- Added *nunique* and *value_counts* functions to *Index* for counting unique elements. (GH6734)
- *stack* and *unstack* now raise a *ValueError* when the *level* keyword refers to a non-unique item in the *Index* (previously raised a *KeyError*). (GH6738)
- *drop unused order argument from Series.sort; args now are in the same order as Series.order; add na_position arg to conform to Series.order* (GH6847)
- *default sorting algorithm for Series.order is now quicksort, to conform with Series.sort (and numpy defaults)*
- *add inplace keyword to Series.order/sort to make them inverses* (GH6859)
- *DataFrame.sort now places NaNs at the beginning or end of the sort according to the na_position parameter.* (GH3917)
- *accept TextFileReader in concat, which was affecting a common user idiom (GH6583), this was a regression from 0.13.1*
- *Added factorize functions to Index and Series to get indexer and unique values (GH7090)*
- *describe on a DataFrame with a mix of Timestamp and string like objects returns a different Index (GH7088). Previously the index was unintentionally sorted.*
- *Arithmetic operations with only bool dtypes now give a warning indicating that they are evaluated in Python space for +, −, and * operations and raise for all others (GH7011, GH6762, GH7015, GH7210)*

```python
>>> x = pd.Series(np.random.rand(10) > 0.5)
>>> y = True
>>> x + y  # warning generated: should do x | y instead
UserWarning: evaluating in Python space because the '+' operator is not supported by numexpr for the bool dtype, use '|' instead
>>> x / y  # this raises because it doesn't make sense
NotImplementedError: operator '/' not implemented for bool dtypes
```

- *In HDFStore, select_as_multiple will always raise a KeyError, when a key or the selector is not found (GH6177)*
- *df['col'] = value and df.loc[:, 'col'] = value are now completely equivalent; previously the .loc would not necessarily coerce the dtype of the resultant series (GH6149)*
• dtypes and ftypes now return a series with dtype=object on empty containers (GH5740)
• df.to_csv will now return a string of the CSV data if neither a target path nor a buffer is provided (GH6061)
• pd.infer_freq() will now raise a TypeError if given an invalid Series/Index type (GH6407, GH6463)
• A tuple passed to DataFrame.sort_index will be interpreted as the levels of the index, rather than requiring a list of tuple (GH4370)
• all offset operations now return Timestamp types (rather than datetime), Business/Week frequencies were incorrect (GH4069)
• to_excel now converts np.inf into a string representation, customizable by the inf_rep keyword argument (Excel has no native inf representation) (GH6782)
• Replace pandas.compat.scipy.scoreatpercentile with numpy.percentile (GH6810)
• .quantile on a datetime[ns] series now returns Timestamp instead of np.datetime64 objects (GH6810)
• change AssertionError to TypeError for invalid types passed to concat (GH6583)
• Raise a TypeError when DataFrame is passed an iterator as the data argument (GH5357)

Display changes
• The default way of printing large DataFrames has changed. DataFrames exceeding max_rows and/or max_columns are now displayed in a centrally truncated view, consistent with the printing of a pandas.Series (GH5603).

In previous versions, a DataFrame was truncated once the dimension constraints were reached and an ellipse (...) signaled that part of the data was cut off.

```python
In [1]: import pandas as pd
In [2]: import numpy as np
In [3]: pd.options.display.max_rows = 6
In [4]: pd.options.display.max_columns = 6
In [5]: index = pd.DatetimeIndex(start='2001-01-01', freq='D', periods=10)
In [6]: pd.DataFrame(np.arange(10*10).reshape((10,10)), index=index)
Out[6]:
          0  1  2  3  4  5
2001-01-01 0  1  2  3  4  5 ...
2001-01-02 10 11 12 13 14 15 ...
2001-01-03 20 21 22 23 24 25 ...
2001-01-04 30 31 32 33 34 35 ...
2001-01-05 40 41 42 43 44 45 ...
2001-01-06 50 51 52 53 54 55 ...
...   ...   ...   ...   ...   ...
[10 rows x 10 columns]
```
In the current version, large DataFrames are centrally truncated, showing a preview of head and tail in both dimensions.

```python
In [24]: pd.DataFrame(np.arange(10*10).reshape((10,10)),index=index)
Out[24]:
     0  1  2 ...  7  8  9
2001-01-01 0  1  2 ...  7  8  9
2001-01-02 10 11 12 ... 17 18 19
2001-01-03 20 21 22 ... 27 28 29
...   ... ... ...   ... ... ...
2001-01-08 70 71 72 ... 77 78 79
2001-01-09 80 81 82 ... 87 88 89
2001-01-10 90 91 92 ... 97 98 99
```
[10 rows x 10 columns]

- allow option 'truncate' for `display.show_dimensions` to only show the dimensions if the frame is truncated (GH6547).

The default for `display.show_dimensions` will now be `truncate`. This is consistent with how Series display length.

```python
In [16]: dfd = pd.DataFrame(np.arange(25).reshape(-1, 5),
                      index=[0, 1, 2, 3, 4],
                      columns=[0, 1, 2, 3, 4])

# show dimensions since this is truncated
In [17]: with pd.option_context('display.max_rows', 2, 'display.max_columns', 2, 'display.show_dimensions', 'truncate'):
     ...:     print(dfd)
     ...:
0  ...  4
0  1  ...  4
4 20  ... 24

[5 rows x 5 columns]

# will not show dimensions since it is not truncated
In [18]: with pd.option_context('display.max_rows', 10, 'display.max_columns', 40, 'display.show_dimensions', 'truncate'):
     ...:     print(dfd)
     ...:
0  1  2  3  4
0  1  2  3  4
1  5  6  7  8  9
2 10  11  12  13  14
3 15  16  17  18  19
4 20  21  22  23  24
```

- Regression in the display of a MultiIndexed Series with `display.max_rows` is less than the length of the series (GH7101)

- Fixed a bug in the HTML repr of a truncated Series or DataFrame not showing the class name with the `large_repr` set to ‘info’ (GH7105)
• The `verbose` keyword in `DataFrame.info()`, which controls whether to shorten the `info` representation, is now `None` by default. This will follow the global setting in `display.max_info_columns`. The global setting can be overridden with `verbose=True` or `verbose=False`.

• Fixed a bug with the `info` repr not honoring the `display.max_info_columns` setting (GH6939)

• Offset/freq info now in Timestamp __repr__ (GH4553)

Text parsing API changes

`read_csv()/read_table()` will now be noisier w.r.t invalid options rather than falling back to the PythonParser.

• Raise `ValueError` when `sep` specified with `delim_whitespace=True` in `read_csv()/read_table()` (GH6607)

• Raise `ValueError` when `engine='c'` specified with unsupported options in `read_csv()/read_table()` (GH6607)

• Raise `ValueError` when fallback to python parser causes options to be ignored (GH6607)

• Produce `ParserWarning` on fallback to python parser when no options are ignored (GH6607)

• Translate `sep='\s+'` to `delim_whitespace=True` in `read_csv()/read_table()` if no other C-unsupported options specified (GH6607)

GroupBy API changes

More consistent behavior for some groupby methods:

• groupby `head` and `tail` now act more like `filter` rather than an aggregation:

```
In [19]: df = pd.DataFrame([[1, 2], [1, 4], [5, 6]], columns=['A', 'B'])
In [20]: g = df.groupby('A')
In [21]: g.head(1)  # filters DataFrame
Out[21]:
   A  B
0  1  2
2  5  6
[2 rows x 2 columns]
In [22]: g.apply(lambda x: x.head(1))  # used to simply fall-through
Out[22]:
   A  B
A  0  1  2
   5  2  5  6
[2 rows x 2 columns]
```

• groupby head and tail respect column selection:

```
In [23]: g[['B']].head(1)
Out[23]:
   B
0  2
```

(continues on next page)
• `groupby` `n`th now reduces by default; filtering can be achieved by passing `as_index=False`. With an optional `dropna` argument to ignore NaN. See the docs.

Reducing

```python
In [24]: df = pd.DataFrame([[1, np.nan], [1, 4], [5, 6]], columns=['A', 'B'])
In [25]: g = df.groupby('A')
In [26]: g.nth(0)
Out[26]:
    B
   A
1  NaN
5  6.0
[2 rows x 1 columns]
```

# this is equivalent to `g.first()`

```python
In [27]: g.nth(0, dropna='any')
Out[27]:
    B
   A
1  4.0
5  6.0
[2 rows x 1 columns]
```

# this is equivalent to `g.last()`

```python
In [28]: g.nth(-1, dropna='any')
Out[28]:
    B
   A
1  4.0
5  6.0
[2 rows x 1 columns]
```

Filtering

```python
In [29]: gf = df.groupby('A', as_index=False)
In [30]: gf.nth(0)
Out[30]:
   A  B
0  1 NaN
2  5  6.0
[2 rows x 2 columns]
```

```python
In [31]: gf.nth(0, dropna='any')
Out[31]:
   A  B
0  1 NaN
2  5  6.0
[2 rows x 2 columns]
```
pandas: powerful Python data analysis toolkit, Release 1.2.2

(continued from previous page)

<table>
<thead>
<tr>
<th>A</th>
<th>B</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>4.0</td>
</tr>
<tr>
<td>5</td>
<td>6.0</td>
</tr>
</tbody>
</table>

[2 rows x 2 columns]

- `groupby` will now not return the grouped column for non-cython functions (GH5610, GH5614, GH6732), as its already the index

In [32]: df = pd.DataFrame([[1, np.nan], [1, 4], [5, 6], [5, 8]], columns=['A', 'B'])

In [33]: g = df.groupby('A')

In [34]: g.count()
Out[34]:

<table>
<thead>
<tr>
<th>B</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
</tr>
<tr>
<td>1 1</td>
</tr>
<tr>
<td>5 2</td>
</tr>
</tbody>
</table>

[2 rows x 1 columns]

In [35]: g.describe()
Out[35]:

<table>
<thead>
<tr>
<th>B</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
</tr>
<tr>
<td>1 1.0 4.0 NaN 4.0 4.0 4.0 4.0</td>
</tr>
<tr>
<td>5 2.0 7.0 1.414214 6.0 6.5 7.0 7.5 8.0</td>
</tr>
</tbody>
</table>

[2 rows x 8 columns]

- passing `as_index` will leave the grouped column in-place (this is not change in 0.14.0)

In [36]: df = pd.DataFrame([[1, np.nan], [1, 4], [5, 6], [5, 8]], columns=['A', 'B'])

In [37]: g = df.groupby('A', as_index=False)

In [38]: g.count()
Out[38]:

<table>
<thead>
<tr>
<th>A</th>
<th>B</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 1 1</td>
<td></td>
</tr>
<tr>
<td>1 5 2</td>
<td></td>
</tr>
</tbody>
</table>

[2 rows x 2 columns]

In [39]: g.describe()
Out[39]:

Count mean std min 25% 50% 75% max
A
0 2.0 1.0 0.0 1.0 1.0 1.0 1.0 4.0
1 NaN 4.0 4.0 4.0 4.0

(continues on next page)
• Allow specification of a more complex groupby via `pd.Grouper`, such as grouping by a Time and a string field simultaneously. See the docs (GH3794).

• Better propagation/preservation of Series names when performing groupby operations:
  
  – `SeriesGroupBy.agg` will ensure that the name attribute of the original series is propagated to the result (GH6265).
  
  – If the function provided to `GroupBy.apply` returns a named series, the name of the series will be kept as the name of the column index of the DataFrame returned by `GroupBy.apply` (GH6124). This facilitates `DataFrame.stack` operations where the name of the column index is used as the name of the inserted column containing the pivoted data.

### SQL

The SQL reading and writing functions now support more database flavors through SQLAlchemy (GH2717, GH4163, GH5950, GH6292). All databases supported by SQLAlchemy can be used, such as PostgreSQL, MySQL, Oracle, Microsoft SQL server (see documentation of SQLAlchemy on included dialects).

The functionality of providing DBAPI connection objects will only be supported for sqlite3 in the future. The 'mysql' flavor is deprecated.

The new functions `read_sql_query()` and `read_sql_table()` are introduced. The function `read_sql()` is kept as a convenience wrapper around the other two and will delegate to specific function depending on the provided input (database table name or sql query).

In practice, you have to provide a SQLAlchemy `engine` to the sql functions. To connect with SQLAlchemy you use the `create_engine()` function to create an engine object from database URI. You only need to create the engine once per database you are connecting to. For an in-memory sqlite database:

\[40\]: from sqlalchemy import create_engine

# Create your connection.
\[41\]: engine = create_engine('sqlite:///:memory:)

This engine can then be used to write or read data to/from this database:

\[42\]: df = pd.DataFrame({'A': [1, 2, 3], 'B': ['a', 'b', 'c']})
\[43\]: df.to_sql('db_table', engine, index=False)

You can read data from a database by specifying the table name:

\[44\]: pd.read_sql_table('db_table', engine)

\[44\]:

<table>
<thead>
<tr>
<th>A</th>
<th>B</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>a</td>
</tr>
<tr>
<td>1</td>
<td>b</td>
</tr>
<tr>
<td>2</td>
<td>c</td>
</tr>
</tbody>
</table>

[3 rows x 2 columns]
or by specifying a SQL query:

```python
In [45]: pd.read_sql_query('SELECT * FROM db_table', engine)
Out[45]:
   A  B
0  1  a
1  2  b
2  3  c
[3 rows x 2 columns]
```

Some other enhancements to the SQL functions include:

- support for writing the index. This can be controlled with the `index` keyword (default is True).
- specify the column label to use when writing the index with `index_label`.
- specify string columns to parse as datetimes with the `parse_dates` keyword in `read_sql_query()` and `read_sql_table()`.

**Warning:** Some of the existing functions or function aliases have been deprecated and will be removed in future versions. This includes: `tquery`, `uquery`, `read_frame`, `frame_query`, `write_frame`.

**Warning:** The support for the ‘mysql’ flavor when using DBAPI connection objects has been deprecated. MySQL will be further supported with SQLAlchemy engines (GH6900).

### Multi-indexing using slicers

In 0.14.0 we added a new way to slice MultiIndexed objects. You can slice a MultiIndex by providing multiple indexers.

You can provide any of the selectors as if you are indexing by label, see *Selection by Label*, including slices, lists of labels, labels, and boolean indexers.

You can use `slice(None)` to select all the contents of that level. You do not need to specify all the deeper levels, they will be implied as `slice(None)`.

As usual, **both sides** of the slicers are included as this is label indexing.

See *the docs* See also issues (GH6134, GH4036, GH3057, GH2598, GH5641, GH7106)

**Warning:**

You should specify all axes in the `.loc` specifier, meaning the indexer for the `index` and for the `columns`. There are some ambiguous cases where the passed indexer could be mis-interpreted as indexing *both* axes, rather than into say the MultiIndex for the rows.

You should do this:

```python
>>> df.loc[([slice('A1', 'A3'), ...], :], ]  # noqa: E901
```

rather than this:

```python
>>> df.loc[[slice('A1', 'A3'), ...]]  # noqa: E901
```
Warning: You will need to make sure that the selection axes are fully lexsorted!

In [46]: def mklbl(prefix, n):
       ....:     return ["%s%s" % (prefix, i) for i in range(n)]

In [47]: index = pd.MultiIndex.from_product([mklbl('A', 4),
                                             mklbl('B', 2),
                                             mklbl('C', 4),
                                             mklbl('D', 2)])

In [48]: columns = pd.MultiIndex.from_tuples([('a', 'foo'), ('a', 'bar'),
                                             ('b', 'foo'), ('b', 'bah')],
                                             names=['lvl0', 'lvl1'])

In [49]: df = pd.DataFrame(np.arange(len(index) * len(columns)).reshape((len(index),
                                             len(columns))),
                                            index=index,
                                            columns=columns).sort_index().sort_index(axis=1)

In [50]: df
Out[50]:
lvl0  a  b
lvl1
A0 B0 C0 D0  1  0  3  2
     D1  5  4  7  6
     C1 D0  9  8 11 10
     D1 13 12 15 14
     C2 D0 17 16 19 18
     ...       ...       ...       ...
A3 B1 C1 D1 237 236 239 238
     C2 D0 241 240 243 242
     D1 245 244 247 246
     C3 D0 249 248 251 250
     D1 253 252 255 254
[64 rows x 4 columns]

Basic MultiIndex slicing using slices, lists, and labels.

In [51]: df.loc[(slice('A1', 'A3'), slice(None), ['C1', 'C3'])), :]
Out[51]:
lvl0  a  b
lvl1
A1 B0 C1 D0 73 72 75 74
     D1 77 76 79 78
     C3 D0 89 88 91 90
     D1 93 92 95 94
     B1 C1 D0 105 104 107 106
     ...       ...       ...       ...
A3 B0 C3 D1 221 220 223 222
     B1 C1 D0 233 232 235 234
     D1 237 236 239 238
(continues on next page)
You can use a `pd.IndexSlice` to shortcut the creation of these slices:

```python
In [52]: idx = pd.IndexSlice

In [53]: df.loc[idx[:, :, ['C1', 'C3']], idx[:, 'foo']]
Out[53]:
 lvl0  a  b
     lvl1    foo  foo
     A0  B0  C1  D0  8 10
     D1  12  14
     C3  D0  24  26
     D1  28  30
     B1  C1  D0  40  42
     ...
     ...
     ...
     A3  B0  C3  D1  220 222
     B1  C1  D0  232 234
     D1  236 238
     C3  D0  248 250
     D1  252 254
[32 rows x 2 columns]
```

It is possible to perform quite complicated selections using this method on multiple axes at the same time.

```python
In [54]: df.loc['A1', (slice(None), 'foo')]
Out[54]:
 lvl0  a  b
     lvl1    foo  foo
     B0  C0  D0  64  66
     D1  68  70
     C1  D0  72  74
     D1  76  78
     C2  D0  80  82
     ...
     ...
     ...
     B1  C1  D1  108 110
     C2  D0  112 114
     D1  116 118
     C3  D0  120 122
     D1  124 126
[16 rows x 2 columns]
```

```python
In [55]: df.loc[idx[:, :, ['C1', 'C3']], idx[:, 'foo']]
Out[55]:
 lvl0  a  b
     lvl1    foo  foo
     A0  B0  C1  D0  8 10
     D1  12  14
     C3  D0  24  26
     D1  28  30
     B1  C1  D0  40  42
     ...
     ...
     ...
```
Using a boolean indexer you can provide selection related to the values.

```python
In [56]: mask = df[('a', 'foo')] > 200
In [57]: df.loc[idx[mask, :, ['C1', 'C3']], idx[:, 'foo']]
Out[57]:
         a      b
    lvl0  lvl1
    A3   B0  C1  D1  204  206
    B1   C1  D0  232  234
              D1  236  238
    C3   D0  248  250
              D1  252  254
[7 rows x 2 columns]
```

You can also specify the axis argument to .loc to interpret the passed slicers on a single axis.

```python
In [58]: df.loc(axis=0)[; :, ['C1', 'C3']]
Out[58]:
    a      b
    lvl0    lvl1
    A0   B0  C0  D0  9   0  11   2
              A1   13  12  15  14
    B1   C1  D0  233  232  235  234
              D1  237  236  239  238
    C3   D0  249  248  251  250
              D1  253  252  255  254
[32 rows x 4 columns]
```

Furthermore you can set the values using these methods.

```python
In [59]: df2 = df.copy()
In [60]: df2.loc(axis=0)[; :, ['C1', 'C3']] = -10
In [61]: df2
Out[61]:
         a      b
    lvl0    lvl1
    A0   B0  C0  D0  1   0  3   2
    A1   13  12  15  14
    B1   C1  D0  233  232  235  234
              D1  237  236  239  238
    C3   D0  249  248  251  250
              D1  253  252  255  254
[32 rows x 4 columns]
```
You can use a right-hand-side of an alignable object as well.

```python
In [62]: df2 = df.copy()

In [63]: df2.loc[:, :, ['C1', 'C3']], : = df2 * 1000

In [64]: df2
Out[64]:
     lvl0   lvl1     a   b   c   d
    lvl1
  A0 B0 C0 D0     1   0   3   2
  D1   5   4   7   6
  C1 D0  9000  8000 11000 10000
  D1  13000 12000 15000 14000
  C2 D0   17   16   19   18
... ... ... ... ...
  A3 B1 C1 D1 237000 236000 239000 238000
  C2 D0  241  240  243  242
  D1  245  244  247  246
  C3 D0  249000 248000 251000 250000
  D1  253000 252000 255000 254000
[64 rows x 4 columns]
```

### Plotting

- Hexagonal bin plots from `DataFrame.plot` with `kind='hexbin'` (GH5478), See the docs.
- `DataFrame.plot` and `Series.plot` now supports area plot with specifying `kind='area'` (GH6656), See the docs.
- Pie plots from `Series.plot` and `DataFrame.plot` with `kind='pie'` (GH6976), See the docs.
- Plotting with Error Bars is now supported in the `.plot` method of `DataFrame` and `Series` objects (GH3796, GH6834), See the docs.
- `DataFrame.plot` and `Series.plot` now support a `table` keyword for plotting `matplotlib.Table`, See the docs. The `table` keyword can receive the following values.
  - `False`: Do nothing (default).
  - `True`: Draw a table using the `DataFrame` or `Series` called `plot` method. Data will be transposed to meet `matplotlib`’s default layout.
- DataFrame or Series: Draw matplotlib.table using the passed data. The data will be drawn as displayed in print method (not transposed automatically). Also, helper function pandas.tools.plotting.table is added to create a table from DataFrame and Series, and add it to an matplotlib.Axes.

- plot(legend='reverse') will now reverse the order of legend labels for most plot kinds. (GH6014)
- Line plot and area plot can be stacked by stacked=True (GH6656)
- Following keywords are now acceptable for DataFrame.plot() with kind='bar' and kind='barh':
  - width: Specify the bar width. In previous versions, static value 0.5 was passed to matplotlib and it cannot be overwritten. (GH6604)
  - align: Specify the bar alignment. Default is center (different from matplotlib). In previous versions, pandas passes align='edge' to matplotlib and adjust the location to center by itself, and it results align keyword is not applied as expected. (GH4525)
  - position: Specify relative alignments for bar plot layout. From 0 (left/bottom-end) to 1(right/top-end). Default is 0.5 (center). (GH6604)

Because of the default align value changes, coordinates of bar plots are now located on integer values (0.0, 1.0, 2.0...). This is intended to make bar plot be located on the same coordinates as line plot. However, bar plot may differs unexpectedly when you manually adjust the bar location or drawing area, such as using set_xlim, set_ylim, etc. In this cases, please modify your script to meet with new coordinates.

- The parallel_coordinates() function now takes argument color instead of colors. A FutureWarning is raised to alert that the old colors argument will not be supported in a future release. (GH6956)

- The parallel_coordinates() and andrews_curves() functions now take positional argument frame instead of data. A FutureWarning is raised if the old data argument is used by name. (GH6956)

- DataFrame.boxplot() now supports layout keyword (GH769)

- DataFrame.boxplot() has a new keyword argument, return_type. It accepts 'dict', 'axes', or 'both', in which case a namedtuple with the matplotlib axes and a dict of matplotlib Lines is returned.

Prior version deprecations/changes

There are prior version deprecations that are taking effect as of 0.14.0.

- Remove DateRange in favor of DatetimeIndex (GH6816)
- Remove column keyword from DataFrame.sort (GH4370)
- Remove precision keyword from set_eng_float_format() (GH395)
- Remove force_unicode keyword from DataFrame.to_string(), DataFrame.to_latex(), and DataFrame.to_html(); these function encode in unicode by default (GH2224, GH2225)
- Remove nanRep keyword from DataFrame.to_csv() and DataFrame.to_string() (GH275)
- Remove unique keyword from HDFStore.select_column() (GH3256)
- Remove inferTimeRule keyword from Timestamp.offset() (GH391)
- Remove name keyword from get_data_yahoo() and get_data_google() (commit b921d1a)
- Remove offset keyword from DatetimeIndex constructor (commit 3136390)
- Remove time_rule from several rolling-moment statistical functions, such as rolling_sum() (GH1042)
• Removed `neg` – boolean operations on numpy arrays in favor of `inv ~`, as this is going to be deprecated in numpy 1.9 (GH6960)

Deprecations

• The `pivot_table()/Dataframe.pivot_table()` and `crosstab()` functions now take arguments `index` and `columns` instead of `rows` and `cols`. A `FutureWarning` is raised to alert that the old `rows` and `cols` arguments will not be supported in a future release (GH5505)

• The `Dataframe.drop_duplicates()` and `Dataframe.duplicated()` methods now take argument `subset` instead of `cols` to better align with `Dataframe.dropna()`. A `FutureWarning` is raised to alert that the old `cols` arguments will not be supported in a future release (GH6680)

• The `Dataframe.to_csv()` and `Dataframe.to_excel()` functions now takes argument `columns` instead of `cols`. A `FutureWarning` is raised to alert that the old `cols` arguments will not be supported in a future release (GH6645)

• Indexers will warn `FutureWarning` when used with a scalar indexer and a non-floating point Index (GH4892, GH6960)

```python
# non-floating point indexes can only be indexed by integers / labels
In [1]: pd.Series(1, np.arange(5))[3.0]
pandas/core/index.py:469: FutureWarning: scalar indexers for index type Int64Index should be integers and not floating point
Out[1]: 1

In [2]: pd.Series(1, np.arange(5)).iloc[3.0]
pandas/core/index.py:469: FutureWarning: scalar indexers for index type Int64Index should be integers and not floating point
Out[2]: 1

In [3]: pd.Series(1, np.arange(5)).iloc[3.0:4]
pandas/core/index.py:527: FutureWarning: slice indexers when using iloc should be integers and not floating point
Out[3]:
   3
   1
   dtype: int64

# these are Float64Indexes, so integer or floating point is acceptable
In [4]: pd.Series(1, np.arange(5.))[3]
Out[4]: 1

In [5]: pd.Series(1, np.arange(5.))[3.0]
Out[6]: 1
```

• Numpy 1.9 compat w.r.t. deprecation warnings (GH6960)

• `Panel.shift()` now has a function signature that matches `DataFrame.shift()`. The old positional argument `lags` has been changed to a keyword argument `periods` with a default value of 1. A `FutureWarning` is raised if the old argument `lags` is used by name. (GH6910)

• The `order` keyword argument of `factorize()` will be removed. (GH6926)

• Remove the `copy` keyword from `Dataframe.xs()`, `Panel.major_xs()`, `Panel.minor_xs()`. A view will be returned if possible, otherwise a copy will be made. Previously the user could think that `copy=False` would ALWAYS return a view. (GH6894)

• The `parallel_coordinates()` function now takes argument `color` instead of `colors`. A `FutureWarning` is raised to alert that the old `colors` argument will not be supported in a future release.
• The `parallel_coordinates()` and `andrews_curves()` functions now take positional argument `frame` instead of `data`. A `FutureWarning` is raised if the old `data` argument is used by name. (GH6956)

• The support for the ‘mysql’ flavor when using DBAPI connection objects has been deprecated. MySQL will be further supported with SQLAlchemy engines (GH6900).

• The following `io.sql` functions have been deprecated: `tquery`, `uquery`, `read_frame`, `frame_query`, `write_frame`.

• The `percentile_width` keyword argument in `describe()` has been deprecated. Use the `percentiles` keyword instead, which takes a list of percentiles to display. The default output is unchanged.

• The default return type of `boxplot()` will change from a dict to a matplotlib Axes in a future release. You can use the future behavior now by passing `return_type='axes'` to boxplot.

Known issues

• OpenPyXL 2.0.0 breaks backwards compatibility (GH7169)

Enhancements

• DataFrame and Series will create a MultiIndex object if passed a tuples dict, See the docs (GH3323)

| In [65]: | pd.Series({('a', 'b'): 1, ('a', 'a'): 0, |
| ...: | ('a', 'c'): 2, ('b', 'a'): 3, ('b', 'b'): 4}) |
| Out [65]: | a b 1 |
| ...: | a 0 |
| ...: | c 2 |
| ...: | b a 3 |
| ...: | b 4 |
| Length: 5, dtype: int64 |

| In [66]: | pd.DataFrame({('a', 'b'): {('A', 'B'): 1, ('A', 'C'): 2}, |
| ...: | ('a', 'a'): {('A', 'C'): 3, ('A', 'B'): 4}, |
| ...: | ('b', 'a'): {('A', 'C'): 5, ('A', 'B'): 6}, |
| ...: | ('b', 'b'): {('A', 'D'): 7, ('A', 'B'): 8}}) |
| Out [66]: | a b |
| ...: | b a c a b |
| A B 1.0 4.0 5.0 8.0 10.0 |
| C 2.0 3.0 6.0 7.0 NaN |
| D NaN NaN NaN NaN 9.0 |
| [3 rows x 5 columns] |

• Added the `sym_diff` method to Index (GH5543)

• `DataFrame.to_latex` now takes a `longtable` keyword, which if `True` will return a table in a `longtable` environment. (GH6617)

• Add option to turn off escaping in `DataFrame.to_latex` (GH6472)
• `pd.read_clipboard` will, if the keyword `sep` is unspecified, try to detect data copied from a spreadsheet and parse accordingly. (GH6223)

• Joining a singly-indexed DataFrame with a MultiIndexed DataFrame (GH3662)

See the docs. Joining MultiIndex DataFrames on both the left and right is not yet supported ATM.

```python
In [67]: household = pd.DataFrame({'household_id': [1, 2, 3],
                              'male': [0, 1, 0],
                              'wealth': [196087.3, 316478.7, 294750]},
                             columns=['household_id', 'male', 'wealth']).set_index('household_id')

In [68]: household
Out[68]:

         male   wealth
household_id
1       0     196087.3
2       1     316478.7
3       0     294750.0

[3 rows x 2 columns]

In [69]: portfolio = pd.DataFrame({'household_id': [1, 2, 2, 3, 3, 3, 4],
                              'asset_id': ['nl0000301109',
                                          'nl0000289783',
                                          'gb00b03mlx29',
                                          'gb00b03mlx29',
                                          'lu0197800237',
                                          'nl0000289965',
                                          np.nan],
                              'name': ['ABN Amro',
                                       'Robeco',
                                       'Royal Dutch Shell',
                                       'Royal Dutch Shell',
                                       'AAB Eastern Europe Equity Fund',
                                       'Postbank BioTech Fonds',
                                       np.nan],
                              'share': [1.0, 0.4, 0.6, 0.15, 0.6, 0.25, 1.0]},
                             columns=['household_id', 'asset_id', 'name', 'share']).set_index(['household_id', 'asset_id'])

In [70]: portfolio
Out[70]:

          name    share
household_id  asset_id
1  nl0000301109     ABN Amro  1.00

- `quotechar`, `doublequote`, and `escapechar` can now be specified when using `DataFrame.to_csv` (GH5414, GH4528)
- Partially sort by only the specified levels of a MultiIndex with the `sort_remaining` boolean kwarg. (GH3984)
- Added `to_julian_date` to `TimeStamp` and `DatetimeIndex`. The Julian Date is used primarily in astronomy and represents the number of days from noon, January 1, 4713 BC. Because nanoseconds are used to define the time in pandas the actual range of dates that you can use is 1678 AD to 2262 AD. (GH4041)
- `DataFrame.to_stata` will now check data for compatibility with Stata data types and will upcast when needed. When it is not possible to losslessly upcast, a warning is issued (GH6327)
- `DataFrame.to_stata` and `StataWriter` will accept keyword arguments `time_stamp` and `data_label` which allow the time stamp and dataset label to be set when creating a file. (GH6545)
- `pandas.io.gbq` now handles reading unicode strings properly. (GH5940)
- `Holidays Calendars` are now available and can be used with the `CustomBusinessDay` offset (GH6719)
- `Float64Index` is now backed by a `float64` dtype ndarray instead of an `object` dtype array (GH6471).
- Implemented `Panel.pct_change` (GH6904)
- Added how option to rolling-moment functions to dictate how to handle resampling: `rolling_max()` defaults to max, `rolling_min()` defaults to min, and all others default to mean (GH6297)
- `CustomBusinessMonthBegin` and `CustomBusinessMonthEnd` are now available (GH6866)
- `Series.quantile()` and `DataFrame.quantile()` now accept an array of quantiles.
- `describe()` now accepts an array of percentiles to include in the summary statistics (GH4196)
- `pivot_table` can now accept `Grouper` by `index` and `columns` keywords (GH6913)

- Arrays of strings can be wrapped to a specified width (`str.wrap`) (GH6999)
- Add `nsmallest()` and `Series.nlargest()` methods to `Series`. See the docs (GH3960)
- `PeriodIndex` fully supports partial string indexing like `DatetimeIndex` (GH7043)
• read_excel can now read milliseconds in Excel dates and times with xlrd >= 0.9.3. (GH5945)
• pd.stats.moments.rolling_var now uses Welford’s method for increased numerical stability (GH6817)
• pd.expanding_apply and pd.rolling_apply now take args and kwargs that are passed on to the func (GH6289)
• DataFrame.rank() now has a percentage rank option (GH5971)
• Series.rank() now has a percentage rank option (GH5971)
• Series.rank() and DataFrame.rank() now accept method='dense' for ranks without gaps (GH6514)
• Support passing encoding with xlwt (GH3710)
• Refactor Block classes removing Block.items attributes to avoid duplication in item handling (GH6745, GH6988).
• Testing statements updated to use specialized asserts (GH6175)

Performance

• Performance improvement when converting DatetimeIndex to floating ordinals using DatetimeConverter (GH6636)
• Performance improvement for DataFrame.shift (GH5609)
• Performance improvement in indexing into a MultiIndexed Series (GH5567)
• Performance improvements in single-dtyped indexing (GH6484)
• Improve performance of DataFrame construction with certain offsets, by removing faulty caching (e.g. MonthEnd, BusinessMonthEnd), (GH6479)
• Improve performance of CustomBusinessDay (GH6584)
• Improve performance of slice indexing on Series with string keys (GH6341, GH6372)
• Performance improvement for DataFrame.from_records when reading a specified number of rows from an iterable (GH6700)
• Performance improvements in timedelta conversions for integer dtypes (GH6754)
• Improved performance of compatible pickles (GH6899)
• Improve performance in certain reindexing operations by optimizing take_2d (GH6749)
• GroupBy.count() is now implemented in Cython and is much faster for large numbers of groups (GH7016).

Experimental

There are no experimental changes in 0.14.0

Bug fixes

• Bug in Series ValueError when index doesn’t match data (GH6532)
• Prevent segfault due to MultiIndex not being supported in HDFStore table format (GH1848)
• Bug in pd.DataFrame.sort_index where mergesort wasn’t stable when ascending=False (GH6399)
• Bug in pd.tseries.frequencies.to_offset when argument has leading zeros (GH6391)
• Bug in version string gen. for dev versions with shallow clones / install from tarball (GH6127)
• Inconsistent tz parsing Timestamp / to_datetime for current year (GH5958)
• Indexing bugs with reordered indexes (GH6252, GH6254)
• Bug in .xs with a Series multiindex (GH6258, GH5684)
• Bug in conversion of a string types to a DatetimeIndex with a specified frequency (GH6273, GH6274)
• Bug in eval where type-promotion failed for large expressions (GH6205)
• Bug in interpolate with inplace=True (GH6281)
• HDFStore.remove now handles start and stop (GH6177)
• HDFStore.select_as_multiple handles start and stop the same way as select (GH6177)
• HDFStore.select_as_coordinates and select_column works with a where clause that results in filters (GH6177)
• Regression in join of non_unique_indexes (GH6329)
• Issue with groupby agg with a single function and a mixed-type frame (GH6337)
• Bug in DataFrame.replace() when passing a non-bool to_replace argument (GH6332)
• Raise when trying to align on different levels of a MultiIndex assignment (GH3738)
• Bug in setting complex dtypes via boolean indexing (GH6345)
• Bug in TimeGrouper/resample when presented with a non-monotonic DatetimeIndex that would return invalid results. (GH4161)
• Bug in index name propagation in TimeGrouper/resample (GH4161)
• TimeGrouper has a more compatible API to the rest of the groupers (e.g. groups was missing) (GH3881)
• Bug in multiple grouping with a TimeGrouper depending on target column order (GH6764)
• Bug in pd.eval when parsing strings with possible tokens like ‘&’ (GH6351)
• Bug correctly handle placements of -inf in Panels when dividing by integer 0 (GH6178)
• DataFrame.shift with axis=1 was raising (GH6371)
• Disabled clipboard tests until release time (run locally with nosetests -A disabled) (GH6048).
• Bug in DataFrame.replace() when passing a nested dict that contained keys not in the values to be replaced (GH6342).
• str.match ignored the na flag (GH6609).
• Bug in take with duplicate columns that were not consolidated (GH6240).
• Bug in interpolate changing dtypes (GH6290).
• Bug in Series.get, was using a buggy access method (GH6383).
• Bug in hdstore queries of the form where=\[('date', '\textgreater', \text{datetime}(2013,1,1)), ('date', '\textless', \text{datetime}(2014,1,1))\] (GH6313).
• Bug in DataFrame.dropna with duplicate indices (GH6355).
• Regression in chained getitem indexing with embedded list-like from 0.12 (GH6394).
• Float64Index with nans not comparing correctly (GH6401).
• eval/query expressions with strings containing the @ character will now work (GH6366).
• Bug in Series.reindex when specifying a method with some nan values was inconsistent (noted on a resample) (GH6418).
• Bug in DataFrame.replace() where nested dicts were erroneously depending on the order of dictionary keys and values (GH5338).
• Performance issue in concatenating with empty objects (GH3259).
• Clarify sorting of sym_diff on Index objects with NaN values (GH6444).
• Regression in MultiIndex.from_product with a DatetimeIndex as input (GH6439).
• Bug in str.extract when passed a non-default index (GH6348).
• Bug in str.split when passed pat=None and n=1 (GH6466).
• Bug in io.data.DataReader when passed "F-F\_Momentum\_Factor" and data_source= "famafrench" (GH6460).
• Bug in sum of a timedelta64[ns] series (GH6462).
• Bug in resample with a timezone and certain offsets (GH6397).
• Bug iniat/iloc with duplicate indices on a Series (GH6493).
• Bug in read_html where nan’s were incorrectly being used to indicate missing values in text. Should use the empty string for consistency with the rest of pandas (GH5129).
• Bug in read_html tests where redirected invalid URLs would make one test fail (GH6445).
• Bug in multi-axis indexing using .loc on non-unique indices (GH6504).
• Bug that caused _ref_locs corruption when slice indexing across columns axis of a DataFrame (GH6525).
• Regression from 0.13 in the treatment of numpy datetime64 non-ns dtypes in Series creation (GH6529).
• .names attribute of MultiIndexes passed to set_index are now preserved (GH6459).
• Bug in setitem with a duplicate index and an alignable rhs (GH6541).
• Bug in setitem with .loc on mixed integer Indexes (GH6546).
• Bug in pd.read_stata which would use the wrong data types and missing values (GH6327).
- Bug in DataFrame.to_stata that lead to data loss in certain cases, and could be exported using the wrong data types and missing values (GH6335)
- StataWriter replaces missing values in string columns by empty string (GH6802)
- Inconsistent types in Timestamp addition/subtraction (GH6543)
- Bug in preserving frequency across Timestamp addition/subtraction (GH4547)
- Bug in empty list lookup caused IndexError exceptions (GH6536, GH6551)
- Series.quantile raising on an object dtype (GH6555)
- Bug in .xs with a nan in level when dropped (GH6574)
- Bug in fillna with method='bfill/ffill' and datetime64[ns] dtype (GH6587)
- Bug in sql writing with mixed dtypes possibly leading to data loss (GH6509)
- Bug in Series.pop (GH6600)
- Bug in iloc indexing when positional indexer matched Int64Index of the corresponding axis and no reordering happened (GH6612)
- Bug in fillna with limit and value specified
- Bug in DataFrame.to_stata when columns have non-string names (GH4558)
- Bug in compat with np.compress, surfaced in (GH6658)
- Bug in binary operations with a rhs of a Series not aligning (GH6681)
- Bug in DataFrame.to_stata which incorrectly handles nan values and ignores with_index keyword argument (GH6685)
- Bug in resample with extra bins when using an evenly divisible frequency (GH4076)
- Bug in consistency of groupby aggregation when passing a custom function (GH6715)
- Bug in resample when how=None resample freq is the same as the axis frequency (GH5955)
- Bug in downcasting inference with empty arrays (GH6733)
- Bug in obj.blocks on sparse containers dropping all but the last items of same for dtype (GH6748)
- Bug in unpickling NaT (NaTType) (GH4606)
- Bug in DataFrame.replace() where regex meta characters were being treated as regex even when regex=False (GH6777)
- Bug in timedelta ops on 32-bit platforms (GH6808)
- Bug in setting a tz-aware index directly via .index (GH6785)
- Bug in expressions.py where numexpr would try to evaluate arithmetic ops (GH6762).
- Bug in Makefile where it didn’t remove Cython generated C files with make clean (GH6768)
- Bug with numpy < 1.7.2 when reading long strings from HDFStore (GH6166)
- Bug in DataFrame._reduce where non bool-like (0/1) integers were being converted into bools. (GH6806)
- Regression from 0.13 with fillna and a Series on datetime-like (GH6344)
- Bug in adding np.timedelta64 to DatetimeIndex with timezone outputs incorrect results (GH6818)
- Bug in DataFrame.replace() where changing a dtype through replacement would only replace the first occurrence of a value (GH6689)
- Better error message when passing a frequency of ‘MS’ in Period construction (GH5332)
• Bug in `Series.__unicode__` when `max_rows=None` and the Series has more than 1000 rows. (GH6863)
• Bug in `groupby.get_group` where a datelike wasn’t always accepted (GH5267)
• Bug in `groupBy.get_group` created by `TimeGrouper` raises `AttributeError` (GH6914)
• Bug in `DatetimeIndex.tz_localize` and `DatetimeIndex.tz_convert` converting NaT incorrectly (GH5546)
• Bug in arithmetic operations affecting NaT (GH6873)
• Bug in `Series.str.extract` where the resulting `Series` from a single group match wasn’t renamed to the group name
• Bug in `DataFrame.to_csv` where setting `index=False` ignored the header kwarg (GH6186)
• Bug in `DataFrame.plot` and `Series.plot`, where the legend behave inconsistently when plotting to the same axes repeatedly (GH6678)
• Internal tests for patching `__finalize__` / bug in merge not finalizing (GH6923, GH6927)
• accept `TextFileReader` in `concat`, which was affecting a common user idiom (GH6583)
• Bug in C parser with leading white space (GH3374)
• Bug in C parser with `delim_whitespace=True` and \r-delimited lines
• Bug in python parser with explicit MultiIndex in row following column header (GH6893)
• Bug in `Series.rank` and `DataFrame.rank` that caused small floats (<1e-13) to all receive the same rank (GH6886)
• Bug in `DataFrame.apply` with functions that used `*args` or `**kwargs` and returned an empty result (GH6952)
• Bug in `sum/mean` on 32-bit platforms on overflows (GH6915)
• Moved `Panel.shift` to `NDFrame.slice_shift` and fixed to respect multiple dtypes. (GH6959)
• Bug in enabling `subplots=True` in `DataFrame.plot` only has single column raises `TypeError`, and `Series.plot` raises `AttributeError` (GH6951)
• Bug in `DataFrame.plot` draws unnecessary axes when enabling `subplots` and `kind=scatter` (GH6951)
• Bug in `read_csv` from a filesystem with non-utf-8 encoding (GH6807)
• Bug in `iloc` when setting / aligning (GH6766)
• Bug causing `UnicodeEncodeError` when get_dummies called with unicode values and a prefix (GH6885)
• Bug in timeseries-with-frequency plot cursor display (GH5453)
• Bug surfaced in `groupby.plot` when using a `Float64Index` (GH7025)
• Stopped tests from failing if options data isn’t able to be downloaded from Yahoo (GH7034)
• Bug in `parallel_coordinates` and `radviz` where reordering of class column caused possible color/class mismatch (GH6956)
• Bug in `radviz` and `andrews_curves` where multiple values of ‘color’ were being passed to plotting method (GH6956)
• Bug in `Float64Index.isin()` where containing `nans` would make indices claim that they contained all the things (GH7066).
• Bug in `DataFrame.boxplot` where it failed to use the axis passed as the `ax` argument (GH3578)
• Bug in the XlsxWriter and XlwtWriter implementations that resulted in datetime columns being formatted without the time (GH7075) were being passed to plotting method

• read_fwf() treats None in colspec like regular python slices. It now reads from the beginning or until the end of the line when colspec contains a None (previously raised a TypeError)

• Bug in cache coherence with chained indexing and slicing; add _is_view property to NDFrame to correctly predict views; mark is_copy on xs only if its an actual copy (and not a view) (GH7084)

• Bug in DatetimeIndex creation from string ndarray with dayfirst=True (GH5917)

• Bug in MultiIndex.from_arrays created from DatetimeIndex doesn’t preserve freq and tz (GH7090)

• Bug in unstack raises ValueError when MultiIndex contains PeriodIndex (GH4342)

• Bug in boxplot and hist draws unnecessary axes (GH6769)

• Regression in groupby.nth() for out-of-bounds indexers (GH6621)

• Bug in quantile with datetime values (GH6965)

• Bug in Dataframe.set_index, reindex and pivot don’t preserve DatetimeIndex and PeriodIndex attributes (GH3950, GH5878, GH6631)

• Bug in MultiIndex.get_level_values doesn’t preserve DatetimeIndex and PeriodIndex attributes (GH7092)

• Bug in Groupby doesn’t preserve tz (GH3950)

• Bug in PeriodIndex partial string slicing (GH6716)

• Bug in the HTML repr of a truncated Series or DataFrame not showing the class name with the large_repr set to ‘info’ (GH7105)

• Bug in DatetimeIndex specifying freq raises ValueError when passed value is too short (GH7098)

• Fixed a bug with the info repr not honoring the display.max_info_columns setting (GH6939)

• Bug PeriodIndex string slicing with out of bounds values (GH5407)

• Fixed a memory error in the hashtable implementation/factorizer on resizing of large tables (GH7157)

• Bug in isnull when applied to 0-dimensional object arrays (GH7176)

• Bug in query/eval where global constants were not looked up correctly (GH7178)

• Bug in recognizing out-of-bounds positional list indexers with iloc and a multi-axis tuple indexer (GH7189)

• Bug in setitem with a single value, MultiIndex and integer indices (GH7190, GH7218)

• Bug in expressions evaluation with reversed ops, showing in series-dataframe ops (GH7198, GH7192)

• Bug in multi-axis indexing with > 2 ndim and a MultiIndex (GH7199)

• Fix a bug where invalid eval/query operations would blow the stack (GH5198)

5.16 Version 0.13

5.16.1 Version 0.13.1 (February 3, 2014)

This is a minor release from 0.13.0 and includes a small number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

Highlights include:

• Added `infer_datetime_format` keyword to `read_csv/to_datetime` to allow speedups for homogeneously formatted datetimes.
• Will intelligently limit display precision for datetime/timedelta formats.
• Enhanced Panel `apply()` method.
• Suggested tutorials in new Tutorials section.
• Our pandas ecosystem is growing. We now feature related projects in a new Pandas Ecosystem section.
• Much work has been taking place on improving the docs, and a new Contributing section has been added.
• Even though it may only be of interest to devs, we <3 our new CI status page: ScatterCI.

Warning: 0.13.1 fixes a bug that was caused by a combination of having numpy < 1.8, and doing chained assignment on a string-like array. Please review the docs, chained indexing can have unexpected results and should generally be avoided.

This would previously segfault:

```
In [1]: df = pd.DataFrame({"A": np.array(["foo", "bar", "bah", "foo", "bar"])})
In [2]: df["A"].iloc[0] = np.nan
In [3]: df
Out[3]:
    A
  0 NaN
  1 bar
  2 bah
  3 foo
  4 bar
```

The recommended way to do this type of assignment is:

```
In [4]: df = pd.DataFrame({"A": np.array(["foo", "bar", "bah", "foo", "bar"])})
In [5]: df.loc[0, "A"] = np.nan
In [6]: df
Out[6]:
    A
  0 NaN
  1 bar
  2 bah
  3 foo
  4 bar
```

Output formatting enhancements

• df.info() view now display dtype info per column (GH5682)
• df.info() now honors the option max_info_rows, to disable null counts for large frames (GH5974)

```
In [7]: max_info_rows = pd.get_option("max_info_rows")
In [8]: df = pd.DataFrame(
    ...:     {  
    ...:         "A": np.random.randn(10),
    ...:         "B": np.random.randn(10),
    ...:         "C": pd.date_range("20130101", periods=10),
    ...:     }
    ...: )
```

(continues on next page)
...:
In [9]: df.iloc[3:6, [0, 2]] = np.nan

# set to not display the null counts
In [10]: pd.set_option("max_info_rows", 0)

In [11]: df.info()
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 10 entries, 0 to 9
Data columns (total 3 columns):
# Column Dtype
--- ------ -----
0 A float64
1 B float64
2 C datetime64[ns]
dtypes: datetime64[ns](1), float64(2)
memory usage: 368.0 bytes

# this is the default (same as in 0.13.0)
In [12]: pd.set_option("max_info_rows", max_info_rows)

In [13]: df.info()
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 10 entries, 0 to 9
Data columns (total 3 columns):
# Column Non-Null Count Dtype
--- ------ -------------- -----
0 A 7 non-null float64
1 B 10 non-null float64
2 C 7 non-null datetime64[ns]
dtypes: datetime64[ns](1), float64(2)
memory usage: 368.0 bytes

• Add show_dimensions display option for the new DataFrame repr to control whether the dimensions print.

In [14]: df = pd.DataFrame([[1, 2], [3, 4]])

In [15]: pd.set_option("show_dimensions", False)

In [16]: df
Out[16]:
   0  1
0  1  2
1  3  4

In [17]: pd.set_option("show_dimensions", True)

In [18]: df
Out[18]:
   0  1  2  3  4
0   1   2   3   4
[2 rows x 2 columns]

• The ArrayFormatter for datetime and timedelta64 now intelligently limit precision based on the
values in the array (GH3401)

Previously output might look like:

<table>
<thead>
<tr>
<th></th>
<th>today</th>
<th>diff</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>2001-01-01 00:00:00</td>
<td>2013-04-19 00:00:00</td>
</tr>
<tr>
<td>1</td>
<td>2004-06-01 00:00:00</td>
<td>2013-04-19 00:00:00</td>
</tr>
</tbody>
</table>

Now the output looks like:

```
In [19]: df = pd.DataFrame(  
.....:     [pd.Timestamp("20010101"), pd.Timestamp("20040601")], columns=["age"]  
.....: )  
.....:
In [20]: df["today"] = pd.Timestamp("20130419")
In [21]: df["diff"] = df["today"] - df["age"]
In [22]: df
Out[22]:  
<table>
<thead>
<tr>
<th>age</th>
<th>today</th>
<th>diff</th>
</tr>
</thead>
<tbody>
<tr>
<td>2001-01-01</td>
<td>2013-04-19 00:00:00</td>
<td>4491 days, 00:00:00</td>
</tr>
<tr>
<td>2004-06-01</td>
<td>2013-04-19 00:00:00</td>
<td>3244 days, 00:00:00</td>
</tr>
</tbody>
</table>
```

API changes

- Add -NaN and -nan to the default set of NA values (GH5952). See NA Values.
- Added `Series.str.get_dummies` vectorized string method (GH6021), to extract dummy/indicator variables for separated string columns:

```
In [23]: s = pd.Series(["a", "a|b", np.nan, "a|c"])
In [24]: s.str.get_dummies(sep="|")
Out[24]:
<table>
<thead>
<tr>
<th>a</th>
<th>b</th>
<th>c</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>2</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>3</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>
```
- Added the `NDFrame.equals()` method to compare if two NDFrames are equal have equal axes, dtypes, and values. Added the `array_equivalent` function to compare if two ndarrays are equal. NaNs in identical locations are treated as equal. (GH5283) See also the docs for a motivating example.

```
df = pd.DataFrame({"col": ["foo", 0, np.nan]})
df2 = pd.DataFrame({"col": [np.nan, 0, "foo"]}, index=[2, 1, 0])
df.equals(df2)
df.equals(df2.sort_index())
```
- `DataFrame.apply` will use the reduce argument to determine whether a Series or a DataFrame should be returned when the DataFrame is empty (GH6007).
Previously, calling `DataFrame.apply` an empty `DataFrame` would return either a `DataFrame` if there were no columns, or the function being applied would be called with an empty `Series` to guess whether a `Series` or `DataFrame` should be returned:

```python
In [32]: def applied_func(col):
   ....:     print("Apply function being called with: ", col)
   ....:     return col.sum()
   ....:

In [33]: empty = DataFrame(columns=['a', 'b'])

In [34]: empty.apply(applied_func)
Apply function being called with: Series([], Length: 0, dtype: float64)
Out[34]:
   a  NaN
   b  NaN
Length: 2, dtype: float64
```

Now, when `apply` is called on an empty `DataFrame`: if the `reduce` argument is `True` a `Series` will returned, if it is `False` a `DataFrame` will be returned, and if it is `None` (the default) the function being applied will be called with an empty series to try and guess the return type.

```python
In [35]: empty.apply(applied_func, reduce=True)
Out[35]:
   a  NaN
   b  NaN
Length: 2, dtype: float64

In [36]: empty.apply(applied_func, reduce=False)
Out[36]:
Empty DataFrame
Columns: [a, b]
Index: []
[0 rows x 2 columns]
```

**Prior version deprecations/changes**

There are no announced changes in 0.13 or prior that are taking effect as of 0.13.1

**Deprecations**

There are no deprecations of prior behavior in 0.13.1

**Enhancements**

- `pd.read_csv` and `pd.to_datetime` learned a new `infer_datetime_format` keyword which greatly improves parsing perf in many cases. Thanks to @lexual for suggesting and @danbirken for rapidly implementing. (GH5490, GH6021)

If `parse_dates` is enabled and this flag is set, pandas will attempt to infer the format of the datetime strings in the columns, and if it can be inferred, switch to a faster method of parsing them. In some cases this can increase the parsing speed by ~5-10x.
# Try to infer the format for the index column

def = pd.read_csv(
    "foo.csv", index_col=0, parse_dates=True, infer_datetime_format=True
)

• `date_format` and `datetime_format` keywords can now be specified when writing to excel files (GH4133)

• `MultiIndex.from_product` convenience function for creating a MultiIndex from the cartesian product of a set of iterables (GH6055):

```python
In [25]: shades = ["light", "dark"]

In [26]: colors = ["red", "green", "blue"]

In [27]: pd.MultiIndex.from_product([shades, colors], names=["shade", "color"])

Out[27]:
MultiIndex([( 'light',  'red'),
            ( 'light',  'green'),
            ( 'light',  'blue'),
            ( 'dark',   'red'),
            ( 'dark',   'green'),
            ( 'dark',   'blue')],
           names=[ 'shade',  'color'])
```

• `Panel apply()` will work on non-ufuncs. See the docs.

```python
In [28]: import pandas._testing as tm

In [29]: panel = tm.makePanel(5)

In [30]: panel
Out[30]:
<class 'pandas.core.panel.Panel'>
Dimensions: 3 (items) x 5 (major_axis) x 4 (minor_axis)
Items axis: ItemA to ItemC
Major_axis axis: 2000-01-03 00:00:00 to 2000-01-07 00:00:00
Minor_axis axis: A to D

In [31]: panel['ItemA']
Out[31]:

<table>
<thead>
<tr>
<th></th>
<th>A</th>
<th>B</th>
<th>C</th>
<th>D</th>
</tr>
</thead>
<tbody>
<tr>
<td>2000-01-03</td>
<td>-0.673690</td>
<td>0.577046</td>
<td>-1.344312</td>
<td>-1.469388</td>
</tr>
<tr>
<td>2000-01-04</td>
<td>0.113648</td>
<td>-1.715002</td>
<td>0.844885</td>
<td>0.357021</td>
</tr>
<tr>

```

Specifying an apply that operates on a Series (to return a single element)

```python
In [32]: panel.apply(lambda x: x.dtype, axis='items')
Out[32]:

<table>
<thead>
<tr>
<th></th>
<th>A</th>
<th>B</th>
<th>C</th>
<th>D</th>
</tr>
</thead>
<tbody>
<tr>
<td>2000-01-03</td>
<td>float64</td>
<td>float64</td>
<td>float64</td>
<td>float64</td>
</tr>
<tr>
<td>2000-01-04</td>
<td>float64</td>
<td>float64</td>
<td>float64</td>
<td>float64</td>
</tr>
</tbody>
</table>
```

(continues on next page)
A similar reduction type operation

```
In [33]: panel.apply(lambda x: x.sum(), axis='major_axis')
```

```
Out[33]:
      ItemA  ItemB  ItemC
A -1.108775 -1.090118 -2.984435
B -3.705764  0.409204  1.866240
C  2.110856  2.960500 -0.974967
D -4.532785  0.303202 -3.685193
```

This is equivalent to

```
In [34]: panel.sum('major_axis')
```

```
Out[34]:
      ItemA  ItemB  ItemC
A -1.108775 -1.090118 -2.984435
B -3.705764  0.409204  1.866240
C  2.110856  2.960500 -0.974967
D -4.532785  0.303202 -3.685193
```

A transformation operation that returns a Panel, but is computing the z-score across the major_axis

```
In [35]: result = panel.apply(
                           lambda x: (x - x.mean()) / x.std(),
                           axis='major_axis')
```

```
In [36]: result
```

```
<class 'pandas.core.panel.Panel'>
Dimensions: 3 (items) x 5 (major_axis) x 4 (minor_axis)
Items axis: ItemA to ItemC
Major_axis axis: 2000-01-03 00:00:00 to 2000-01-07 00:00:00
Minor_axis axis: A to D
```

```
In [37]: result['ItemA']  # noqa E999
```

```

Performance

Performance improvements for 0.13.1

- Series datetime/timedelta binary operations (GH5801)
- DataFrame count/dropna for axis=1
- Series.str.contains now has a regex=False keyword which can be faster for plain (non-regex) string patterns. (GH5879)
- Series.str.extract (GH5944)
- dtypes/ftypes methods (GH5968)
- indexing with object dtypes (GH5968)
- DataFrame.apply (GH6013)
- Regression in JSON IO (GH5765)
- Index construction from Series (GH6150)

Experimental

There are no experimental changes in 0.13.1

Bug fixes

- Bug in io.wb.get_countries not including all countries (GH6008)
- Bug in Series replace with timestamp dict (GH5797)
- read_csv/read_table now respects the prefix kwarg (GH5732).
- Bug in selection with missing values via .ix from a duplicate indexed DataFrame failing (GH5835)
- Fix issue of boolean comparison on empty DataFrames (GH5808)
- Bug in isnull handling NaT in an object array (GH5443)
- Bug into_datetime when passed a np.nan or integer datelike and a format string (GH5863)
- Bug in groupby dtype conversion with datetimelike (GH5869)
- Regression in handling of empty Series as indexers to Series (GH5877)
- Bug in internal caching, related to (GH5727)
- Testing bug in reading JSON/msgpack from a non-filepath on windows under py3 (GH5874)
- Bug when assigning to .ix[tuple(...)] (GH5896)
- Bug in fully reindexing a Panel (GH5905)
- Bug in idxmin/max with object dtypes (GH5914)
- Bug in BusinessDay when adding n days to a date not on offset when n>5 and n%5==0 (GH5890)
- Bug in assigning to chained series with a series via ix (GH5928)
- Bug in creating an empty DataFrame, copying, then assigning (GH5932)
- Bug in DataFrame.tail with empty frame (GH5846)
- Bug in propagating metadata on resample (GH5862)
• Fixed string-representation of NaT to be “NaT” (GH5708)
• Fixed string-representation for Timestamp to show nanoseconds if present (GH5912)
• pd.match not returning passed sentinel
• Panel.to_frame() no longer fails when major_axis is a MultiIndex (GH5402).
• Bug in pd.read_msgpack with inferring a DateTimeIndex frequency incorrectly (GH5947)
• Fixed to_datetime for array with both Tz-aware datetimes and NaT’s (GH5961)
• Bug in rolling skew/kurtosis when passed a Series with bad data (GH5749)
• Bug in scipy interpolate methods with a datetime index (GH5975)
• Bug in NaT comparison if a mixed datetime/np.datetime64 with NaT were passed (GH5968)
• Fixed bug with pd.concat losing dtype information if all inputs are empty (GH5742)
• Recent changes in IPython cause warnings to be emitted when using previous versions of pandas in QTConsole, now fixed. If you’re using an older version and need to suppress the warnings, see (GH5922).
• Bug in merging timedelta dtypes (GH5695)
• Bug in plotting.scatter_matrix function. Wrong alignment among diagonal and off-diagonal plots, see (GH5497).
• Regression in Series with a MultiIndex via ix (GH6018)
• Bug in Series.xs with a MultiIndex (GH6018)
• Bug in Series construction of mixed type with datelike and an integer (which should result in object type and not automatic conversion) (GH6028)
• Possible segfault when chained indexing with an object array under NumPy 1.7.1 (GH6026, GH6056)
• Bug in setting using fancy indexing a single element with a non-scalar (e.g. a list), (GH6043)
• to_sql did not respect if_exists (GH4110 GH4304)
• Regression in .get (None) indexing from 0.12 (GH5652)
• Subtle iloc indexing bug, surfaced in (GH6059)
• Bug with insert of strings into DatetimeIndex (GH5818)
• Fixed unicode bug in to_html/HTML repr (GH6098)
• Fixed missing arg validation in get_options_data (GH6105)
• Bug in assignment with duplicate columns in a frame where the locations are a slice (e.g. next to each other) (GH6120)
• Bug in propagating _ref_locs during construction of a DataFrame with dups index/columns (GH6121)
• Bug in DataFrame.apply when using mixed datelike reductions (GH6125)
• Bug in DataFrame.append when appending a row with different columns (GH6129)
• Bug in DataFrame construction with recarray and non-ns datetime dtype (GH6140)
• Bug in .loc setitem indexing with a dataframe on rhs, multiple item setting, and a datetimelike (GH6152)
• Fixed a bug in query/eval during lexicographic string comparisons (GH6155).
• Fixed a bug in query where the index of a single-element Series was being thrown away (GH6148).
• Bug in HDFStore on appending a dataframe with MultiIndexed columns to an existing table (GH6167)
• Consistency with dtypes in setting an empty DataFrame (GH6171)
• Bug in selecting on a MultiIndex HDFStore even in the presence of under specified column spec (GH6169)
• Bug in nanops.var with ddof=1 and 1 elements would sometimes return inf rather than nan on some platforms (GH6136)
• Bug in Series and DataFrame bar plots ignoring the use_index keyword (GH6209)
• Bug in groupby with mixed str/int under python3 fixed; argsort was failing (GH6212)

5.16.2 Version 0.13.0 (January 3, 2014)

This is a major release from 0.12.0 and includes a number of API changes, several new features and enhancements along with a large number of bug fixes.

Highlights include:
• support for a new index type `Float64Index`, and other Indexing enhancements
• `HDFStore` has a new string based syntax for query specification
• support for new methods of interpolation
• updated `timedelta` operations
• a new string manipulation method `extract`
• Nanosecond support for Offsets
• **isin** for DataFrames

Several experimental features are added, including:

• new **eval/query** methods for expression evaluation
• support for msgpack serialization
• an i/o interface to Google’s BigQuery

Their are several new or updated docs sections including:

• **Comparison with SQL**, which should be useful for those familiar with SQL but still learning pandas.
• **Comparison with R**, idiom translations from R to pandas.
• **Enhancing Performance**, ways to enhance pandas performance with eval/query.

---

**Warning:** In 0.13.0 Series has internally been refactored to no longer sub-class ndarray but instead subclass NDFrame, similar to the rest of the pandas containers. This should be a transparent change with only very limited API implications. See **Internal Refactoring**

---

**API changes**

• **read_excel** now supports an integer in its sheetname argument giving the index of the sheet to read in (GH4301).

• Text parser now treats anything that reads like inf (“inf”, “Inf”, “-Inf”, “iNf”, etc.) as infinity. (GH4220, GH4219), affecting read_table, read_csv, etc.

• **pandas** now is Python 2/3 compatible without the need for 2to3 thanks to @jtratner. As a result, pandas now uses iterators more extensively. This also led to the introduction of substantive parts of the Benjamin Peterson’s six library into compat. (GH4384, GH4375, GH4372)

• pandas.util.compat and pandas.util.py3compat have been merged into pandas.compat. pandas.compat now includes many functions allowing 2/3 compatibility. It contains both list and iterator versions of range, filter, map and zip, plus other necessary elements for Python 3 compatibility. lmap, lzip, lrange and lfilter all produce lists instead of iterators, for compatibility with numpy, subscripting and pandas constructors.(GH4384, GH4375, GH4372)

• **Series.get** with negative indexers now returns the same as [] (GH4390)

• Changes to how **Index** and **MultiIndex** handle metadata (levels, labels, and names) (GH4039):

```python
# previously, you would have set levels or labels directly
>>> pd.index.levels = [[1, 2, 3, 4], [1, 2, 4, 4]]

# now, you use the set_levels or set_labels methods
>>> index = pd.index.set_levels([[1, 2, 3, 4], [1, 2, 4, 4]])

# similarly, for names, you can rename the object
# but setting names is not deprecated
>>> index = pd.index.set_names(["bob", "cranberry"])

# and all methods take an inplace kwarg - but return None
>>> pd.index.set_names(["bob", "cranberry"], inplace=True)
```

• All division with **NDFrame** objects is now **truedivision**, regardless of the future import. This means that operating on pandas objects will by default use **floating point** division, and return a floating point dtype. You can use // and floordiv to do integer division.
Integer division

```
In [3]: arr = np.array([1, 2, 3, 4])
In [4]: arr2 = np.array([5, 3, 2, 1])
In [5]: arr / arr2
Out[5]: array([0, 0, 1, 4])
In [6]: pd.Series(arr) // pd.Series(arr2)
Out[6]:
   0    0
   1    0
   2    1
   3    4
   dtype: int64
```

True Division

```
In [7]: pd.Series(arr) / pd.Series(arr2)  # no future import required
Out[7]:
   0   0.200000
   1 0.666667
   2 1.500000
   3  4.000000
   dtype: float64
```

- Infer and downcast dtype if `downcast='infer'` is passed to `fillna/ffill/bfill` (GH4604)
- `__nonzero__` for all NDFrame objects, will now raise a `ValueError`, this reverts back to (GH1073, GH4633) behavior. See `gotchas` for a more detailed discussion.

This prevents doing boolean comparison on `entire` pandas objects, which is inherently ambiguous. These all will raise a `ValueError`.

```python
>>> df = pd.DataFrame({'A': np.random.randn(10),
...                    'B': np.random.randn(10),
...                    'C': pd.date_range('20130101', periods=10)}
...)
>>> if df:
...    pass
...Traceback (most recent call last):
...  ValueError: The truth value of a DataFrame is ambiguous. Use a.empty, a.bool(), a.item(), a.any() or a.all().
```

```python
>>> df1 = df
>>> df2 = df
>>> df1 and df2
Traceback (most recent call last):
...  ValueError: The truth value of a DataFrame is ambiguous. Use a.empty, a.bool(), a.item(), a.any() or a.all().
>>> d = [1, 2, 3]
>>> s1 = pd.Series(d)
>>> s2 = pd.Series(d)
```
Added the `.bool()` method to NDFrame objects to facilitate evaluating of single-element boolean Series:

```python
In [1]: pd.Series([True]).bool()
Out[1]: True

In [2]: pd.Series([False]).bool()
Out[2]: False

In [3]: pd.DataFrame([[True]]).bool()
Out[3]: True

In [4]: pd.DataFrame([[False]]).bool()
Out[4]: False
```

- All non-Index NDFrames (Series, DataFrame, Panel, Panel4D, SparsePanel, etc.), now support the entire set of arithmetic operators and arithmetic flex methods (add, sub, mul, etc.). SparsePanel does not support pow or mod with non-scalars. (GH3765)

- Series and DataFrame now have a `mode()` method to calculate the statistical mode(s) by axis/Series. (GH5367)

- Chained assignment will now by default warn if the user is assigning to a copy. This can be changed with the option `mode.chained_assignment`, allowed options are raise/warn/None. See the docs.

```python
In [5]: dfc = pd.DataFrame({'A': ['aaa', 'bbb', 'ccc'], 'B': [1, 2, 3]})
In [6]: pd.set_option('chained_assignment', 'warn')

The following warning / exception will show if this is attempted.

```python
In [7]: dfc.loc[0]['A'] = 1111
```

```
Traceback (most recent call last):
 ... 
SettingWithCopyWarning:
 A value is trying to be set on a copy of a slice from a DataFrame. 
Try using .loc[row_index,col_indexer] = value instead
```

Here is the correct method of assignment.

```python
In [8]: dfc.loc[0, 'A'] = 11
```

```python
In [9]: dfc
Out[9]:
   A   B
0  11  1
1  bbb 2
2  ccc 3
```

- `Panel.reindex` has the following call signature `Panel.reindex(items=None, major_axis=None, minor_axis=None, **kwargs)` to conform with other NDFrame objects. See Internal Refactoring for more information.
• Series.argmin and Series.argmax are now aliased to Series.idxmin and Series.idxmax. These return the index of the min or max element respectively. Prior to 0.13.0 these would return the position of the min / max element. (GH6214)

Prior version deprecations/changes

These were announced changes in 0.12 or prior that are taking effect as of 0.13.0

• Remove deprecated Factor (GH3650)
• Remove deprecated set_printoptions/reset_printoptions (GH3046)
• Remove deprecated _verbose_info (GH3215)
• Remove deprecated read_clipboard/to_clipboard/ExcelFile/ExcelWriter from pandas. io.parsers (GH3717) These are available as functions in the main pandas namespace (e.g. pd. read_clipboard)
• default for tupleize_cols is now False for both to_csv and read_csv. Fair warning in 0.12 (GH3604)
• default for display.max_seq_len is now 100 rather than None. This activates truncated display (“…”) of long sequences in various places. (GH3391)

Deprecations

Deprecated in 0.13.0

• deprecated iterkv, which will be removed in a future release (this was an alias of iteritems used to bypass 2to3’s changes). (GH4384, GH4375, GH4372)

• deprecated the string method match, whose role is now performed more idiomatically by extract. In a future release, the default behavior of match will change to become analogous to contains, which returns a boolean indexer. (Their distinction is strictness: match relies on re.match while contains relies on re.search.) In this release, the deprecated behavior is the default, but the new behavior is available through the keyword argument as_indexer=True.

Indexing API changes

Prior to 0.13, it was impossible to use a label indexer (.loc/.ix) to set a value that was not contained in the index of a particular axis. (GH2578). See the docs

In the Series case this is effectively an appending operation

<table>
<thead>
<tr>
<th>In [10]:</th>
<th>s = pd.Series([1, 2, 3])</th>
</tr>
</thead>
<tbody>
<tr>
<td>In [11]:</td>
<td>s</td>
</tr>
<tr>
<td>Out[11]:</td>
<td>0 1 1 2 2 3 dtype: int64</td>
</tr>
<tr>
<td>In [13]:</td>
<td>s</td>
</tr>
<tr>
<td>Out[13]:</td>
<td>(continues on next page)</td>
</tr>
</tbody>
</table>
pandas: powerful Python data analysis toolkit, Release 1.2.2

In [14]: dfi = pd.DataFrame(np.arange(6).reshape(3, 2),
   ....:         columns=['A', 'B'])
   ....:

In [15]: dfi
Out[15]:
     A  B
0   0  1
1   2  3
2   4  5

This would previously KeyError

In [16]: dfi.loc[:, 'C'] = dfi.loc[:, 'A']

In [17]: dfi
Out[17]:
     A  B  C
0   0  1  0
1   2  3  2
2   4  5  4

This is like an append operation.

In [18]: dfi.loc[3] = 5

In [19]: dfi
Out[19]:
     A  B  C
0   0  1  0
1   2  3  2
2   4  5  4
3   5  5  5

A Panel setting operation on an arbitrary axis aligns the input to the Panel

In [20]: p = pd.Panel(np.arange(16).reshape(2, 4, 2),
   ....:     items=['Item1', 'Item2'],
   ....:     major_axis=pd.date_range('2001/1/12', periods=4),
   ....:     minor_axis=['A', 'B'], dtype='float64')
   ....:

In [21]: p
Out[21]:
<class 'pandas.core.panel.Panel'>
Dimensions: 2 (items) x 4 (major_axis) x 2 (minor_axis)
Items axis: Item1 to Item2
Major_axis axis: 2001-01-12 00:00:00 to 2001-01-15 00:00:00
Minor_axis axis: A to B

(continues on next page)
In [22]: p.loc[:, :, 'C'] = pd.Series([30, 32], index=p.items)

In [23]: p
Out[23]:
<class 'pandas.core.panel.Panel'>
Dimensions: 2 (items) x 4 (major_axis) x 3 (minor_axis)
Items axis: Item1 to Item2
Major_axis axis: 2001-01-12 00:00:00 to 2001-01-15 00:00:00
Minor_axis axis: A to C

In [24]: p.loc[:, :, 'C']
Out[24]:
Item1  Item2
2001-01-12 30.0  32.0
2001-01-13 30.0  32.0
2001-01-14 30.0  32.0
2001-01-15 30.0  32.0

Float64Index API change

- Added a new index type, Float64Index. This will be automatically created when passing floating values in index creation. This enables a pure label-based slicing paradigm that makes [], .ix, .loc for scalar indexing and slicing work exactly the same. See the docs, (GH263)

Construction is by default for floating type values.

In [20]: index = pd.Index([1.5, 2, 3, 4.5, 5])

In [21]: index
Out[21]: Float64Index([1.5, 2.0, 3.0, 4.5, 5.0], dtype='float64')

In [22]: s = pd.Series(range(5), index=index)

In [23]: s
Out[23]:
1.5   0
2.0   1
3.0   2
4.5   3
5.0   4
dtype: int64

Scalar selection for [], .ix, .loc will always be label based. An integer will match an equal float index (e.g. 3 is equivalent to 3.0)

In [24]: s[3]
Out[24]: 2

In [25]: s.loc[3]
Out[25]: 2

The only positional indexing is via iloc

In [26]: s.iloc[3]
Out[26]: 3
A scalar index that is not found will raise `KeyError`.

Slicing is ALWAYS on the values of the index, for [], `ix`, `loc` and ALWAYS positional with `iloc`.

```python
In [27]: s[2:4]
Out[27]:
2.0  1
3.0  2
dtype: int64

In [28]: s.loc[2:4]
Out[28]:
2.0  1
3.0  2
dtype: int64

In [29]: s.iloc[2:4]
Out[29]:
3.0  2
4.5  3
dtype: int64
```

In float indexes, slicing using floats are allowed.

```python
In [30]: s[2.1:4.6]
Out[30]:
3.0  2
4.5  3
dtype: int64

In [31]: s.loc[2.1:4.6]
Out[31]:
3.0  2
4.5  3
dtype: int64
```

- Indexing on other index types are preserved (and positional fallback for [], `ix`), with the exception, that floating point slicing on indexes on non-`Float64Index` will now raise a `TypeError`.

```python
In [1]: pd.Series(range(5))[3.5]
TypeError: the label [3.5] is not a proper indexer for this index type
      →(Int64Index)

In [1]: pd.Series(range(5))[3.5:4.5]
TypeError: the slice start [3.5] is not a proper indexer for this index type
      →(Int64Index)
```

Using a scalar float indexer will be deprecated in a future version, but is allowed for now.

```python
In [3]: pd.Series(range(5))[3.0]
Out[3]: 3
```
HDFStore API changes

- Query Format Changes. A much more string-like query format is now supported. See the docs.

```python
In [32]: path = 'test.h5'

In [33]: dfq = pd.DataFrame(np.random.randn(10, 4),
....:                     columns=list('ABCD'),
....:                     index=pd.date_range('20130101', periods=10))

In [34]: dfq.to_hdf(path, 'dfq', format='table', data_columns=True)

Use boolean expressions, with in-line function evaluation.

```python
In [35]: pd.read_hdf(path, 'dfq',
....:                where='index>Timestamp('20130104') & columns=['A', 'B'])

```python
Out[35]:
   A   B
0  2013-01-05  -0.424972  0.567020
1  2013-01-06  -0.67369   0.113648
2  2013-01-07   0.404705  0.577046
3  2013-01-08  -0.370647  1.157892
4  2013-01-09  1.07577   -0.10905
5  2013-01-10  0.357021  0.67460

Use an inline column reference

```python
In [36]: pd.read_hdf(path, 'dfq',
....:                where='A>0 or C>0')

```python
Out[36]:
   A   B   C   D
0  2013-01-01  0.469112 -0.282863 -1.509059 -1.135632
1  2013-01-02  1.212112  0.173215  0.119209 -1.044236
2  2013-01-04  0.721555 -0.706771 -1.039575  0.27186
3  2013-01-05 -0.424972  0.567020  0.276232 -1.087401
4  2013-01-07  0.404705  0.577046 -1.715002 -1.039268
5  2013-01-09  1.07577  -0.10905  1.643563 -1.46938
6  2013-01-10  0.357021 -0.67460  -1.776904 -0.968914

- the format keyword now replaces the table keyword; allowed values are fixed(f) or table(t) the same defaults as prior < 0.13.0 remain, e.g. put implies fixed format and append implies table format. This default format can be set as an option by setting io.hdf.default_format.

```python
In [37]: path = 'test.h5'

In [38]: df = pd.DataFrame(np.random.randn(10, 2))

In [39]: df.to_hdf(path, 'df_table', format='table')

In [40]: df.to_hdf(path, 'df_table2', append=True)

In [41]: df.to_hdf(path, 'df_fixed')

In [42]: with pd.HDFStore(path) as store:
....:     print(store)
```
• Significant table writing performance improvements
• handle a passed Series in table format (GH4330)
• can now serialize a timedelta64[ns] dtype in a table (GH3577), See the docs.
• added an is_open property to indicate if the underlying file handle is_open; a closed store will now report 'CLOSED' when viewing the store (rather than raising an error) (GH4409)
• a close of a HDFStore now will close that instance of the HDFStore but will only close the actual file if the ref count (by PyTables) w.r.t. all of the open handles are 0. Essentially you have a local instance of HDFStore referenced by a variable. Once you close it, it will report closed. Other references (to the same file) will continue to operate until they themselves are closed. Performing an action on a closed file will raise ClosedFileError

In [43]: path = 'test.h5'
In [44]: df = pd.DataFrame(np.random.randn(10, 2))
In [45]: store1 = pd.HDFStore(path)
In [46]: store2 = pd.HDFStore(path)
In [47]: store1.append('df', df)
In [48]: store2.append('df2', df)
In [49]: store1
Out [49]:
<class 'pandas.io.pytables.HDFStore'>
File path: test.h5
In [50]: store2
Out [50]:
<class 'pandas.io.pytables.HDFStore'>
File path: test.h5
In [51]: store1.close()
In [52]: store2
Out [52]:
<class 'pandas.io.pytables.HDFStore'>
File path: test.h5
In [53]: store2.close()
In [54]: store2
Out [54]:
<class 'pandas.io.pytables.HDFStore'>
File path: test.h5

• removed the _quiet attribute, replace by a DuplicateWarning if retrieving duplicate rows from a table (GH4367)
• removed the `warn` argument from `open`. Instead a `PossibleDataLossError` exception will be raised if you try to use `mode='w'` with an `OPEN` file handle (GH4367)
• allow a passed locations array or mask as a `where` condition (GH4467). See the docs for an example.
• add the keyword `dropna=True` to `append` to change whether ALL nan rows are not written to the store (default is `True`, ALL nan rows are NOT written), also settable via the option `io.hdf.dropna_table` (GH4625)
• pass through store creation arguments; can be used to support in-memory stores

**DataFrame repr changes**

The HTML and plain text representations of `DataFrame` now show a truncated view of the table once it exceeds a certain size, rather than switching to the short info view (GH4886, GH5550). This makes the representation more consistent as small DataFrames get larger.

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>2010-03-30</td>
<td>13.55</td>
<td>13.64</td>
<td>13.18</td>
<td>13.28</td>
<td>142055200</td>
<td>12.70</td>
</tr>
<tr>
<td>...</td>
<td>...</td>
<td>...</td>
<td>...</td>
<td>...</td>
<td>...</td>
<td>...</td>
</tr>
</tbody>
</table>

771 rows × 6 columns

To get the info view, call `DataFrame.info()`. If you prefer the info view as the repr for large DataFrames, you can set this by running `set_option('display.large_repr', 'info')`.

**Enhancements**

• `df.to_clipboard()` learned a new `excel` keyword that let’s you paste df data directly into excel (enabled by default). (GH5070).
• `read_html` now raises a `URLError` instead of catching and raising a `ValueError` (GH4303, GH4305)
• Added a test for `read_clipboard()` and `to_clipboard()` (GH4282)
• Clipboard functionality now works with PySide (GH4282)
• Added a more informative error message when plot arguments contain overlapping color and style arguments (GH4402)
• `to_dict` now takes `records` as a possible out type. Returns an array of column-keyed dictionaries. (GH4936)
• NaN handing in `get_dummies` (GH4446) with `dummy_na`
In [56]: pd.get_dummies([1, 2, np.nan], dummy_na=True)
Out[56]:
    1.0  2.0  NaN  
0   1   0   0   
1   0   1   0   
2   0   0   1   

• timedelta64[ns] operations. See the docs.

Warning: Most of these operations require numpy >= 1.7

Using the new top-level to_timedelta, you can convert a scalar or array from the standard timedelta format (produced by to_csv) into a timedelta type (np.timedelta64 in nanoseconds).

In [57]: pd.to_timedelta('1 days 06:05:01.00003')
Out[57]: Timedelta('1 days 06:05:01.000030')

In [58]: pd.to_timedelta('15.5us')
Out[58]: Timedelta('0 days 00:00:00.000015500')

In [59]: pd.to_timedelta(['1 days 06:05:01.00003', '15.5us', 'nan'])
Out[59]: TimedeltaIndex(['1 days 06:05:01.000030', '0 days 00:00:00.000015500', 
                        NaT], dtype='timedelta64[ns]', freq=None)

In [60]: pd.to_timedelta(np.arange(5), unit='s')
Out[60]: TimedeltaIndex(['0 days 00:00:00', '0 days 00:00:01', '0 days 00:00:02', 
                        '0 days 00:00:03', '0 days 00:00:04'], 
                        dtype='timedelta64[ns]', freq=None)

In [61]: pd.to_timedelta(np.arange(5), unit='d')
Out[61]: TimedeltaIndex(['0 days', '1 days', '2 days', '3 days', '4 days'], dtype=
                        'timedelta64[ns]', freq=None)

A Series of dtype timedelta64[ns] can now be divided by another timedelta64[ns] object, or astyped to yield a float64 dtype Series. This is frequency conversion. See the docs for the docs.

In [62]: import datetime

In [63]: td = pd.Series(pd.date_range('20130101', periods=4)) - 
   pd.Series(pd.date_range('20121201', periods=4))

In [64]: td[2] += np.timedelta64(datetime.timedelta(minutes=5, seconds=3))

In [65]: td[3] = np.nan

In [66]: td
Out[66]:
0   31 days 00:00:00
1   31 days 00:00:00
2   31 days 00:05:03
3       NaT

dtype: timedelta64[ns]
Dividing or multiplying a `timedelta64[ns]` Series by an integer or integer Series

```python
In [71]: td * -1
Out[71]:
0   -31 days 00:00:00
1   -31 days 00:00:00
2   -32 days 23:54:57
3       NaT
dtype: timedelta64[ns]
```

```python
In [72]: td * pd.Series([1, 2, 3, 4])
Out[72]:
0   31 days 00:00:00
1   62 days 00:00:00
2   93 days 00:15:09
3       NaT
dtype: timedelta64[ns]
```

**Absolute** `DateOffset` objects can act equivalently to `timedeltas`

```python
In [73]: from pandas import offsets

In [74]: td + offsets.Minute(5) + offsets.Milli(5)
```

(continues on next page)
Fillna is now supported for timedeltas

```python
In [75]: td.fillna(pd.Timedelta(0))
Out[75]:
0   31 days 00:00:00
1   31 days 00:00:00
2   31 days 00:05:03
3    0 days 00:00:00
dtype: timedelta64[ns]
```

```python
In [76]: td.fillna(datetime.timedelta(days=1, seconds=5))
Out[76]:
0   31 days 00:00:00
1   31 days 00:00:00
2   31 days 00:05:03
3   1 days 00:00:05
```

You can do numeric reduction operations on timedeltas.

```python
In [77]: td.mean()
Out[77]: Timedelta('31 days 00:01:41')
```

```python
In [78]: td.quantile(.1)
Out[78]: Timedelta('31 days 00:00:00')
```

- `plot(kind='kde')` now accepts the optional parameters `bw_method` and `ind`, passed to `scipy.stats.gaussian_kde()` (for scipy >= 0.11.0) to set the bandwidth, and to `gkde.evaluate()` to specify the indices at which it is evaluated, respectively. See scipy docs. (GH4298)

- DataFrame constructor now accepts a numpy masked record array (GH3478)

- The new vectorized string method `extract` return regular expression matches more conveniently.

```python
In [79]: pd.Series(['a1', 'b2', 'c3']).str.extract('[ab](\d)')
Out[79]:
0    1
1    2
2  NaN
```

Elements that do not match return NaN. Extracting a regular expression with more than one group returns a DataFrame with one column per group.

```python
In [80]: pd.Series(['a1', 'b2', 'c3']).str.extract('[\[ab\]\d]')
Out[80]:
0    a 1
1    b 2
2  NaN NaN
```
Elements that do not match return a row of NaN. Thus, a Series of messy strings can be converted into a like-indexed Series or DataFrame of cleaned-up or more useful strings, without necessitating get() to access tuples or re.match objects.

Named groups like

```
In [81]: pd.Series(['a1', 'b2', 'c3']).str.extract(  
....:   '(?P<letter>[ab])(?P<digit>\d)')
....:
Out[81]:
   letter digit
0     a    1
1     b    2
2  NaN  NaN
```

and optional groups can also be used.

```
In [82]: pd.Series(['a1', 'b2', '3']).str.extract(  
....:   '(?P<letter>[ab])?(?P<digit>\d)')
....:
Out[82]:
   letter digit
0     a    1
1     b    2
2  NaN    3
```

- `read_stata` now accepts Stata 13 format (GH4291)
- `read_fwf` now infers the column specifications from the first 100 rows of the file if the data has correctly separated and properly aligned columns using the delimiter provided to the function (GH4488).
- support for nanosecond times as an offset

**Warning:** These operations require numpy >= 1.7

Period conversions in the range of seconds and below were reworked and extended up to nanoseconds. Periods in the nanosecond range are now available.

```
In [83]: pd.date_range('2013-01-01', periods=5, freq='5N')
Out[83]:
DatetimeIndex(
[ '2013-01-01 00:00:00',  
  '2013-01-01 00:00:00.000000005',  
  '2013-01-01 00:00:00.000000010',  
  '2013-01-01 00:00:00.000000015',  
  '2013-01-01 00:00:00.000000020'],  
dtype='datetime64[ns]', freq='5N')
```

or with frequency as offset

```
In [84]: pd.date_range('2013-01-01', periods=5, freq=pd.offsets.Nano(5))
Out[84]:
DatetimeIndex(
[ '2013-01-01 00:00:00',  
  '2013-01-01 00:00:00.000000005',  
  '2013-01-01 00:00:00.000000010',  
  '2013-01-01 00:00:00.000000015',  
  '2013-01-01 00:00:00.000000020'],  
dtype='datetime64[ns]', freq='5N')
```
Timestamps can be modified in the nanosecond range

```
In [85]: t = pd.Timestamp('20130101 09:01:02')
In [86]: t + pd.tseries.offsets.Nano(123)
Out[86]: Timestamp('2013-01-01 09:01:02.000000123')
```

- A new method, `isin` for DataFrames, which plays nicely with boolean indexing. The argument to `isin`, what we’re comparing the DataFrame to, can be a DataFrame, Series, dict, or array of values. See the docs for more.

To get the rows where any of the conditions are met:

```
In [87]: dfi = pd.DataFrame({'A': [1, 2, 3, 4], 'B': ['a', 'b', 'f', 'n']})
In [88]: dfi
Out[88]:
   A  B
0  1  a
1  2  b
2  3  f
3  4  n
In [89]: other = pd.DataFrame({'A': [1, 3, 3, 7], 'B': ['e', 'f', 'f', 'e']})
In [90]: mask = dfi.isin(other)
In [91]: mask
Out[91]:
   A  B
0  True False
1  False False
2  True  True
3  False  False
In [92]: dfi[mask.any(1)]
Out[92]:
   A  B
0  1  a
2  3  f
```

- Series now supports a `to_frame` method to convert it to a single-column DataFrame (GH5164)
- All R datasets listed here http://stat.ethz.ch/R-manual/R-devel/library/datasets/html/00Index.html can now be loaded into pandas objects

```
# note that pandas.rpy was deprecated in v0.16.0
import pandas_rpy.common as com
com.load_data('Titanic')
```

- `tz_localize` can infer a fall daylight savings transition based on the structure of the unlocalized data (GH4230), see the docs
- `DatetimeIndex` is now in the API documentation, see the docs
- `json_normalize()` is a new method to allow you to create a flat table from semi-structured JSON data. See the docs (GH1067)
- Added PySide support for the qtpandas DataFrameModel and DataFrameWidget.
- Python csv parser now supports usecols (GH4335)
- Frequencies gained several new offsets:
  - LastWeekOfMonth (GH4637)
  - FY5253, and FY5253Quarter (GH4511)
- DataFrame has a new `interpolate` method, similar to Series (GH4434, GH1892)

```python
In [93]: df = pd.DataFrame({'A': [1, 2.1, np.nan, 4.7, 5.6, 6.8],  
                        'B': [.25, np.nan, np.nan, 4, 12.2, 14.4]})
In [94]: df.interpolate()
Out[94]:
   A    B
0  1.0  0.25
1  2.1  1.50
2  3.4  2.75
3  4.7  4.00
4  5.6  12.20
5  6.8  14.40
```

Additionally, the `method` argument to `interpolate` has been expanded to include 'nearest', 'zero', 'slinear', 'quadratic', 'cubic', 'barycentric', 'krogh', 'piecewise_polynomial', 'pchip', 'polynomial', 'spline'. The new methods require `scipy`. Consult the Scipy reference guide and documentation for more information about when the various methods are appropriate. See the docs.

Interpolate now also accepts a `limit` keyword argument. This works similar to `fillna`’s limit:

```python
In [95]: ser = pd.Series([1, 3, np.nan, np.nan, np.nan, 11])
In [96]: ser.interpolate(limit=2)
Out[96]:
   0  1.0
   1  3.0
   2  5.0
   3  7.0
   4  NaN
   5 11.0
dtype: float64
```

- Added `wide_to_long` panel data convenience function. See the docs.

```python
In [97]: np.random.seed(123)
In [98]: df = pd.DataFrame({"A1970" : {0 : "a", 1 : "b", 2 : "c"},  
                        "A1980" : {0 : "d", 1 : "e", 2 : "f"},  
                        "B1970" : {0 : 2.5, 1 : 1.2, 2 : .7},  
                        "B1980" : {0 : 3.2, 1 : 1.3, 2 : .1},  
                        "X" : dict(zip(range(3), np.random.randn(3)))})
In [99]: df["id"] = df.index
In [100]: df
Out[100]:
0       a      d  2.500  3.200  NaN
1       b      e  1.200  1.300  NaN
2       c      f  0.700  0.100  NaN
```

(continues on next page)
pandas: powerful Python data analysis toolkit, Release 1.2.2

(continued from previous page)

```
In [101]: pd.wide_to_long(df, ["A", "B"], i="id", j="year")
Out[101]:
   X  A  B
id       year
0 1970 -1.085631 a 2.5
1 1970  0.997345 b 1.2
2 1970  0.282978 c 0.7
0 1980 -1.085631 d 3.2
1 1980  0.997345 e 1.3
2 1980  0.282978 f 0.1
```

- `to_csv` now takes a `date_format` keyword argument that specifies how output datetime objects should be formatted. Datetimes encountered in the index, columns, and values will all have this formatting applied. (GH4313)

- `DataFrame.plot` will scatter plot \( x \) versus \( y \) by passing `kind='scatter'` (GH2215)

- Added support for Google Analytics v3 API segment IDs that also supports v2 IDs. (GH5271)

**Experimental**

- The new `eval()` function implements expression evaluation using `numexpr` behind the scenes. This results in large speedups for complicated expressions involving large DataFrames/Series. For example,

```
In [102]: nrows, ncols = 20000, 100
In [103]: df1, df2, df3, df4 = [pd.DataFrame(np.random.randn(nrows, ncols))
.....:     for _ in range(4)]
   .....:
# eval with NumExpr backend
In [104]: %timeit pd.eval('df1 + df2 + df3 + df4')
5.31 ms +- 45.9 us per loop (mean +- std. dev. of 7 runs, 100 loops each)

# pure Python evaluation
In [105]: %timeit df1 + df2 + df3 + df4
6.03 ms +- 344 us per loop (mean +- std. dev. of 7 runs, 100 loops each)
```

For more details, see the *the docs*

- Similar to `pandas.eval`, `DataFrame` has a new `DataFrame.eval` method that evaluates an expression in the context of the `DataFrame`. For example,

```
In [106]: df = pd.DataFrame(np.random.randn(10, 2), columns=['a', 'b'])
In [107]: df.eval('a + b')
Out[107]:
   0  -0.685204
   1   1.589745
   2   0.325441
   3  -1.784153
```

(continues on next page)
• `query()` method has been added that allows you to select elements of a DataFrame using a natural query syntax nearly identical to Python syntax. For example,

```python
In [108]: n = 20
In [109]: df = pd.DataFrame(np.random.randint(n, size=(n, 3)), columns=['a', 'b', 'c'])
In [110]: df.query('a < b < c')
Out[110]:
   a  b  c
11 1  5  8
15 8 16 19
```

selects all the rows of `df` where `a < b < c` evaluates to `True`. For more details see the `docs`.

• `pd.read_msgpack()` and `pd.to_msgpack()` are now a supported method of serialization of arbitrary pandas (and python objects) in a lightweight portable binary format. See `docs`.

**Warning:** Since this is an EXPERIMENTAL LIBRARY, the storage format may not be stable until a future release.

```python
def = pd.DataFrame(np.random.rand(5, 2), columns=list('AB'))
df.to_msgpack('foo/msg')
pd.read_msgpack('foo/msg')

s = pd.Series(np.random.rand(5), index=pd.date_range('20130101', periods=5))
pd.to_msgpack('foo/msg', df, s)
pd.read_msgpack('foo/msg')
```

You can pass `iterator=True` to iterator over the unpacked results

```python
for o in pd.read_msgpack('foo/msg', iterator=True):
    print(o)
```

• `pandas.io.gbq` provides a simple way to extract from, and load data into, Google’s BigQuery Data Sets by way of pandas DataFrames. BigQuery is a high performance SQL-like database service, useful for performing ad-hoc queries against extremely large datasets. See `docs`.

```python
from pandas.io import gbq

# A query to select the average monthly temperatures in the
# in the year 2000 across the USA. The dataset,
# publicata:samples.gsod, is available on all BigQuery accounts,
# and is based on NOAA gsod data.
```
query = """SELECT station_number as STATION, 
month as MONTH, AVG(mean_temp) as MEAN_TEMP 
FROM publicdata:samples.gsod 
WHERE YEAR = 2000 
GROUP BY STATION, MONTH 
ORDER BY STATION, MONTH ASC"""

# Fetch the result set for this query

# Your Google BigQuery Project ID
# To find this, see your dashboard: 
# https://console.developers.google.com/iam-admin/projects?authuser=0
projectid = 'xxxxxxxxx'
df = gbq.read_gbq(query, project_id=projectid)

# Use pandas to process and reshape the dataset

df2 = df.pivot(index='STATION', columns='MONTH', values='MEAN_TEMP')
df3 = pd.concat([df2.min(), df2.mean(), df2.max()],
                axis=1, keys=['Min Temp', 'Mean Temp', 'Max Temp'])

The resulting DataFrame is:

<table>
<thead>
<tr>
<th>MONTH</th>
<th>Min Temp</th>
<th>Mean Temp</th>
<th>Max Temp</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>-53.336667</td>
<td>39.827892</td>
<td>89.770968</td>
</tr>
<tr>
<td>2</td>
<td>-49.837500</td>
<td>43.685219</td>
<td>93.437932</td>
</tr>
<tr>
<td>3</td>
<td>-77.926087</td>
<td>48.708355</td>
<td>96.099998</td>

</tr>
</tbody>
</table>

**Warning:** To use this module, you will need a BigQuery account. See <https://cloud.google.com/products/big-query> for details.

As of 10/10/13, there is a bug in Google’s API preventing result sets from being larger than 100,000 rows. A patch is scheduled for the week of 10/14/13.
Internal refactoring

In 0.13.0 there is a major refactor primarily to subclass \textit{Series} from \textit{NDFrame}, which is the base class currently for \textit{DataFrame} and \textit{Panel}, to unify methods and behaviors. Series formerly subclassed directly from \textit{ndarray}. (GH4080, GH3862, GH816)

\begin{center}
\textbf{Warning:} There are two potential incompatibilities from < 0.13.0
\end{center}

- Using certain numpy functions would previously return a \textit{Series} if passed a \textit{Series} as an argument. This seems only to affect \textit{np.ones_like}, \textit{np.empty_like}, \textit{np.diff} and \textit{np.where}. These now return \textit{ndarrays}.

  \begin{Verbatim}
  In [111]: s = pd.Series([1, 2, 3, 4])
  
  Numpy Usage
  In [112]: np.ones_like(s)
  Out[112]: array([1, 1, 1, 1])
  
  In [113]: np.diff(s)
  Out[113]: array([1, 1, 1])
  
  In [114]: np.where(s > 1, s, np.nan)
  Out[114]: array([nan, 2., 3., 4.])
  
  Pandas Usage
  In [115]: pd.Series(1, index=s.index)
  Out[115]:
  0   1
  1   1
  2   1
  3   1
  dtype: int64
  
  In [116]: s.diff()
  Out[116]:
  0  NaN
  1  1.0
  2  1.0
  3  1.0
  dtype: float64
  
  In [117]: s.where(s > 1)
  Out[117]:
  0  NaN
  1  2.0
  2  3.0
  3  4.0
  dtype: float64
  
- Passing a \textit{Series} directly to a cython function expecting an \textit{ndarray} type will no longer work directly, you must pass \textit{Series.values}, \textit{See Enhancing Performance}

- \textit{Series(0.5)} would previously return the scalar 0.5, instead this will return a 1-element \textit{Series}

- This change breaks rpy2<=2.3.8. An Issue has been opened against rpy2 and a workaround is detailed in \textit{GH5698}. Thanks @JanSchulz.

- Pickle compatibility is preserved for pickles created prior to 0.13. These must be unpickled with \textit{pd.}
• Refactor of series.py/frame.py/panel.py to move common code to generic.py
  – added _setup_axes to created generic NDFrame structures
  – moved methods
    * from_axes, _wrap_array, axes, ix, loc, iloc, shape, empty, swapaxes, transpose, pop
    * __iter__, keys, __contains__, __len__, __neg__, __invert__
    * convert_objects, as_blocks, as_matrix, values
    * __getstate__, __setstate__ (compat remains in frame/panel)
    * __getattr__, __setattr__
    * _indexed_same, reindex_like, align, where, mask
    * fillna, replace (Series replace is now consistent with DataFrame)
    * filter (also added axis argument to selectively filter on a different axis)
    * reindex, reindex_axis, take
    * truncate (moved to become part of NDFrame)
  • These are API changes which make Panel more consistent with DataFrame
    – swapaxes on a Panel with the same axes specified now return a copy
    – support attribute access for setting
    – filter supports the same API as the original DataFrame filter
  • Reindex called with no arguments will now return a copy of the input object
  • TimeSeries is now an alias for Series. the property is_time_series can be used to distinguish (if desired)
  • Refactor of Sparse objects to use BlockManager
    – Created a new block type in internals, SparseBlock, which can hold multi-dtypes and is non-consolidatable. SparseSeries and SparseDataFrame now inherit more methods from there hierarchy (Series/DataFrame), and no longer inherit from SparseArray (which instead is the object of the SparseBlock)
    – Sparse suite now supports integration with non-sparse data. Non-float sparse data is supportable (partially implemented)
    – Operations on sparse structures within DataFrames should preserve sparseness, merging type operations will convert to dense (and back to sparse), so might be somewhat inefficient
    – enable setitem on SparseSeries for boolean/integer/slices
    – SparsePanels implementation is unchanged (e.g. not using BlockManager, needs work)
  • added ftypes method to Series/DataFrame, similar to dtypes, but indicates if the underlying is sparse/dense (as well as the dttype)
  • All NDFrame objects can now use __finalize__() to specify various values to propagate to new objects from an existing one (e.g. name in Series will follow more automatically now)
  • Internal type checking is now done via a suite of generated classes, allowing isinstance(value, klass) without having to directly import the klass, courtesy of @jtratner
Bug fixes

- **HDFStore**
  - raising an invalid `TypeError` rather than `ValueError` when appending with a different block ordering (GH4096)
  - `read_hdf` was not respecting as passed `mode` (GH4504)
  - appending a 0-len table will work correctly (GH4273)
  - `to_hdf` was raising when passing both arguments `append` and `table` (GH4584)
  - reading from a store with duplicate columns across dtypes would raise (GH4767)
  - Fixed a bug where `ValueError` wasn’t correctly raised when column names weren’t strings (GH4956)
  - A zero length series written in Fixed format not deserializing properly. (GH4708)
  - Fixed decoding perf issue on py3 (GH5441)
  - Validate levels in a MultiIndex before storing (GH5527)
  - Correctly handle `data_columns` with a Panel (GH5717)

- Fixed bug in `tslib.tz_convert(vals, tz1, tz2)`: it could raise `IndexError` exception while trying to access `trans[pos + 1]` (GH4496)

- The `by` argument now works correctly with the `layout` argument (GH4102, GH4014) in `.*.hist` plotting methods
- Fixed bug in `PeriodIndex.map` where using `str` would return the str representation of the index (GH4136)
- Fixed test failure `test_time_series_plot_color_with_empty_kwargs` when using custom matplotlib default colors (GH4345)
- Fix running of stata IO tests. Now uses temporary files to write (GH4353)
- Fixed an issue where `DataFrame.sum` was slower than `DataFrame.mean` for integer valued frames (GH4365)
- `read_html` tests now work with Python 2.6 (GH4351)
- Fixed bug where network testing was throwing `NameError` because a local variable was undefined (GH4381)
- In `to_json`, raise if a passed `orient` would cause loss of data because of a duplicate index (GH4359)
- In `to_json`, fix date handling so milliseconds are the default timestamp as the docstring says (GH4362).
- `as_index` is no longer ignored when doing groupby apply (GH4648, GH3417)
- JSON NaT handling fixed, NaTs are now serialized to `null` (GH4948)
- Fixed JSON handling of escapable characters in JSON object keys (GH4593)
- Fixed passing `keep_default_na=False` when `na_values=None` (GH4318)
- Fixed bug with `values` raising an error on a DataFrame with duplicate columns and mixed dtypes, surfaced in (GH4377)
- Fixed bug with duplicate columns and type conversion in `read_json` when `orient='split'` (GH4377)
- Fixed JSON bug where locales with decimal separators other than ’.’ threw exceptions when encoding / decoding certain values. (GH4918)
- Fix `.iat` indexing with a `PeriodIndex` (GH4390)
- Fixed an issue where `PeriodIndex` joining with self was returning a new instance rather than the same instance (GH4379); also adds a test for this for the other index types
- Fixed a bug with all the dtypes being converted to object when using the CSV cpars with the usecols parameter (GH3192)
- Fix an issue in merging blocks where the resulting DataFrame had partially set _ref_locs (GH4403)
- Fixed an issue where hist subplots were being overwritten when they were called using the top level matplotlib API (GH4408)
- Fixed a bug where calling `Series.astype(str)` would truncate the string (GH4405, GH4437)
- Fixed a py3 compait issue where bytes were being repr'd as tuples (GH4455)
- Fixed Panel attribute naming conflict if item is named ‘a’ (GH3440)
- Fixed an issue where duplicate indexes were raising when plotting (GH4486)
- Fixed an issue where cumsum and cumprod didn’t work with bool dtypes (GH4170, GH4440)
- Fixed Panel slicing issued in `xs` that was returning an incorrect dimmed object (GH4016)
- Fix resampling bug where custom reduce function not used if only one group (GH3849, GH4494)
- Fixed Panel assignment with a transposed frame (GH3830)
- Raise on set indexing with a Panel and a Panel as a value which needs alignment (GH3777)
- frozenset objects now raise in the `Series` constructor (GH4482, GH4480)
- Fixed issue with sorting a duplicate MultiIndex that has multiple dtypes (GH4516)
- Fixed bug in `DataFrame.set_values` which was causing name attributes to be lost when expanding the index. (GH3742, GH4039)
- Fixed issue where individual names, levels and labels could be set on `MultiIndex` without validation (GH3714, GH4039)
- Fixed (GH3334) in `pivot_table`. Margins did not compute if values is the index.
- Fix bug in having a rhs of `np.timedelta64` or `np.offsets.DateOffset` when operating with date-times (GH4532)
- Fix arithmetic with series/datetimeindex and `np.timedelta64` not working the same (GH4134) and buggy timedelta in NumPy 1.6 (GH4135)
- Fix bug in `pd.read_clipboard` on windows with PY3 (GH4561); not decoding properly
- `tslib.get_period_field()` and `tslib.get_period_field_arr()` now raise if code argument out of range (GH4519, GH4520)
- Fix boolean indexing on an empty series loses index names (GH4235), `infer_dtype` works with empty arrays.
- Fix reindexing with multiple axes; if an axes match was not replacing the current axes, leading to a possible lazy frequency inference issue (GH3317)
- Fixed issue where `DataFrame.apply` was reraising exceptions incorrectly (causing the original stack trace to be truncated).
- Fix selection with `ix/loc` and non_unique selectors (GH4619)
- Fix assignment with `iloc/loc` involving a dtype change in an existing column (GH4312, GH5702) have internal `setitem_with_indexer` in core/indexing to use Block.setitem
- Fixed bug where thousands operator was not handled correctly for floating point numbers in `csv_import` (GH4322)
- Fix an issue with `CacheableOffset` not properly being used by many DateOffset; this prevented the DateOffset from being cached (GH4609)
- Fix boolean comparison with a `DataFrame` on the lhs, and a list/tuple on the rhs (GH4576)
- Fix error/dtype conversion with `setitem` of `None` on `Series/DataFrame` (GH4667)
- Fix decoding based on a passed in non-default encoding in `pd.read_stata` (GH4626)
- Fix `DataFrame.from_records` with a plain-vanilla `ndarray`. (GH4727)
- Fix some inconsistencies with `Index.rename` and `MultiIndex.rename`, etc. (GH4718, GH4628)
- Bug in using `iloc/loc` with a cross-sectional and duplicate indices (GH4726)
- Bug with using `QUOTE_NONE` with `to_csv` causing `Exception`. (GH4328)
- Bug with Series indexing not raising an error when the right-hand-side has an incorrect length (GH2702)
- Bug in `MultiIndexing` with a partial string selection as one part of a `MultiIndex` (GH4758)
- Bug with reindexing on the index with a non-unique index will now raise `ValueError` (GH4746)
- Bug in setting with `loc/ix` a single indexer with a `MultiIndex` axis and a NumPy array, related to (GH3777)
- Bug in concatenation with duplicate columns across dtypes not merging with axis=0 (GH4771, GH4975)
- Bug in `iloc` with a slice index failing (GH4771)
- Incorrect error message with no colspecs or width in `read_fwf`. (GH4774)
- Fix bugs in indexing in a `Series` with a duplicate index (GH4548, GH4550)
• Fixed bug with reading compressed files with `read_fwf` in Python 3. (GH3963)
• Fixed an issue with a duplicate index and assignment with a dtype change (GH4686)
• Fixed an issue related to ticklocs/ticklabels with log scale bar plots across different versions of matplotlib (GH4789)
• Suppressed DeprecationWarning associated with internal calls issued by repr() (GH4391)
• Fixed an issue with a duplicate index and duplicate selector with `.loc` (GH4825)
• Fixed an issue with `DataFrame.sort_index` where, when sorting by a single column and passing a list for `ascending`, the argument for `ascending` was being interpreted as `True` (GH4839, GH4846)
• Fixed `Panel.tshift` not working. Added `freq` support to `Panel.shift` (GH4853)
• Fix an issue in `TextFileReader` w/ Python engine (i.e. `PythonParser`) with thousands != "," (GH4596)
• Bug in `getitem` with a duplicate index when using where (GH4879)
• Fix Type inference code coerces float column into datetime (GH4601)
• Fixed `_ensure_numeric` does not check for complex numbers (GH4902)
• Fixed a bug in `Series.hist` where two figures were being created when the `by` argument was passed (GH4112, GH4113).
• Fixed a bug in `convert_objects` for > 2 ndims (GH4937)
• Fixed a bug in `DataFrame/Panel` cache insertion and subsequent indexing (GH4939, GH5424)
• Fixed string methods for `FrozenNDArray` and `FrozenList` (GH4929)
• Fixed a bug with setting invalid or out-of-range values in indexing enlargement scenarios (GH4940)
• Tests for `fillna` on empty Series (GH4346), thanks @immerr
• Fixed `copy()` to shallow copy axes/indices as well and thereby keep separate metadata. (GH4202, GH4830)
• Fixed `skiprows` option in Python parser for `read_csv` (GH4382)
• Fixed bug preventing `cut` from working with `np.inf` levels without explicitly passing labels (GH3415)
• Fixed wrong check for overlapping in `DatetimeIndex.union` (GH4564)
• Fixed conflict between thousands separator and date parser in `csv_parser` (GH4678)
• Fix appending when dtypes are not the same (error showing mixing float/np.datetime64) (GH4993)
• Fix `repr` for `DateOffset`. No longer show duplicate entries in `kwds`. Removed unused offset fields. (GH4638)
• Fixed wrong index name during `read_csv` if using `usecols`. Applies to `c` parser only. (GH4201)
• `Timestamp` objects can now appear in the left hand side of a comparison operation with a `Series` or `DataFrame` object (GH4982).
• Fix a bug when indexing with `np.nan` via `iloc/loc` (GH5016)
• Fixed a bug where low memory `c` parser could create different types in different chunks of the same file. Now coerces to numerical type or raises warning. (GH3866)
• Fix a bug where reshaping a `Series` to its own shape raised `TypeError` (GH4554) and other reshaping issues.
• Bug in setting with `ix/loc` and a mixed int/string index (GH4544)
• Make sure series-series boolean comparisons are label based (GH4947)
• Bug in multi-level indexing with a Timestamp partial indexer (GH4294)
• Tests/fix for MultiIndex construction of an all-nan frame (GH4078)
• Fixed a bug where `read_html()` wasn’t correctly inferring values of tables with commas (GH5029)
• Fixed a bug where `read_html()` wasn’t providing a stable ordering of returned tables (GH4770, GH5029).
• Fixed a bug where `read_html()` was incorrectly parsing when passed `index_col=0` (GH5066).
• Fixed a bug where `read_html()` was incorrectly inferring the type of headers (GH5048).
• Fixed a bug where `DatetimeIndex` joins with `PeriodIndex` caused a stack overflow (GH3899).
• Fixed a bug where `groupby` objects didn’t allow plots (GH5102).
• Fixed a bug where `groupby` objects weren’t tab-completing column names (GH5102).
• Fixed a bug where `groupby.plot()` and friends were duplicating figures multiple times (GH5102).
• Provide automatic conversion of `object` dtypes on `fillna`, related (GH5103)
• Fixed a bug where default options were being overwritten in the option parser cleaning (GH5121).
• Treat a list/ndarray identically for `iloc` indexing with list-like (GH5006)
• Fix `MultiIndex.get_level_values()` with missing values (GH5074)
• Fix bound checking for `Timestamp()` with datetime64 input (GH4065)
• Fix a bug where `TestReadHtml` wasn’t calling the correct `read_html()` function (GH5150).
• Fix a bug with `NDFrame.replace()` which made replacement appear as though it was (incorrectly) using regular expressions (GH5143).
• Fix better error message for `to_datetime` (GH4928)
• Made sure different locales are tested on travis-ci (GH4918). Also adds a couple of utilities for getting locales and setting locales with a context manager.
• Fixed segfault on `isnull(MultiIndex)` (now raises an error instead) (GH5123, GH5125)
• Allow duplicate indices when performing operations that align (GH5185, GH5639)
• Compound dtypes in a constructor raise `NotImplementedError` (GH5191)
• Bug in comparing duplicate frames (GH4421) related
• Bug in `describe` on duplicate frames
• Bug in `to_datetime` with a format and `coerce=True` not raising (GH5195)
• Bug in `loc` setting with multiple indexers and a rhs of a Series that needs broadcasting (GH5206)
• Fixed bug where inplace setting of levels or labels on `MultiIndex` would not clear cached `values` property and therefore return wrong values. (GH5215)
• Fixed bug where filtering a grouped DataFrame or Series did not maintain the original ordering (GH4621).
• Fixed `Period` with a business date freq to always roll-forward if on a non-business date. (GH5203)
• Fixed bug in Excel writers where frames with duplicate column names weren’t written correctly. (GH5235)
• Fixed issue with `drop` and a non-unique index on Series (GH5248)
• Fixed segfault in C parser caused by passing more names than columns in the file. (GH5156)
• Fix `Series.isin` with date/time-like dtypes (GH5021)
• C and Python Parser can now handle the more common MultiIndex column format which doesn’t have a row for index names (GH4702)
• Bug when trying to use an out-of-bounds date as an object dtype (GH5312)
• Bug when trying to display an embedded PandasObject (GH5324)
• Allows operating of Timestamps to return a datetime if the result is out-of-bounds related (GH5312)
• Fix return value/type signature of initObjToJSON() to be compatible with numpy’s import_array() (GH5334, GH5326)
• Bug when renaming then set_index on a DataFrame (GH5344)
• Test suite no longer leaves around temporary files when testing graphics. (GH5347) (thanks for catching this @yarikoptic!)
• Fixed html tests on win32. (GH4580)
• Make sure that head/tail are iloc based, (GH5370)
• Fixed bug for PeriodIndex string representation if there are 1 or 2 elements. (GH5372)
• The GroupBy methods transform and filter can be used on Series and DataFrames that have repeated (non-unique) indices. (GH4620)
• Fix empty series not printing name in repr (GH4651)
• Make tests create temp files in temp directory by default. (GH5419)
• pd.to_timedelta of a scalar returns a scalar (GH5410)
• pd.to_timedelta accepts NaN and NaT, returning NaT instead of raising (GH5437)
• performance improvements in isnull on larger size pandas objects
• Fixed various setitem with 1d ndarray that does not have a matching length to the indexer (GH5508)
• Bug in getitem with a MultiIndex and iloc (GH5528)
• Bug in delitem on a Series (GH5542)
• Bug fix in apply when using custom function and objects are not mutated (GH5545)
• Bug in selecting from a non-unique index with loc (GH5553)
• Bug in groupby returning non-consistent types when user function returns a None, (GH5592)
• Work around regression in numpy 1.7.0 which erroneously raises IndexError from ndarray.item(GH5666)
• Bug in repeated indexing of object with resultant non-unique index (GH5678)
• Bug in fillna with Series and a passed series/dict (GH5703)
• Bug in groupby transform with a datetime-like grouper (GH5712)
• Bug in MultiIndex selection in PY3 when using certain keys (GH5725)
• Row-wise concat of differing dtypes failing in certain cases (GH5754)

5.17 Version 0.12

5.17.1 Version 0.12.0 (July 24, 2013)

This is a major release from 0.11.0 and includes several new features and enhancements along with a large number of bug fixes.

Highlights include a consistent I/O API naming scheme, routines to read html, write MultiIndexes to csv files, read & write STATA data files, read & write JSON format files, Python 3 support for HDFStore, filtering of groupby expressions via filter, and a revamped replace routine that accepts regular expressions.

API changes

- The I/O API is now much more consistent with a set of top level reader functions accessed like pd.
  read_csv() that generally return a pandas object.
  - read_csv
  - read_excel
  - read_hdf
  - read_sql
  - read_json
  - read_html
  - read_stata
  - read_clipboard

The corresponding writer functions are object methods that are accessed like df.to_csv()
  - to_csv
  - to_excel
  - to_hdf
  - to_sql
  - to_json
  - to_html
  - to_stata
• Fix modulo and integer division on Series, DataFrames to act similarly to float dtypes to return \( \text{np.nan} \) or \( \text{np.inf} \) as appropriate (GH3590). This correct a numpy bug that treats integer and float dtypes differently.

```
In [1]: p = pd.DataFrame({"first": [4, 5, 8], "second": [0, 0, 3]})

In [2]: p % 0
Out[2]:
  first  second
0   NaN    NaN
1   NaN    NaN
2   NaN    NaN

In [3]: p % p
Out[3]:
  first  second
0    0.0    NaN
1    0.0    NaN
2    0.0    0.0

In [4]: p / p
Out[4]:
  first  second
0    1.0    NaN
1    1.0    NaN
2    1.0    1.0

In [5]: p / 0
Out[5]:
  first  second
0    inf    NaN
1    inf    NaN
2    inf    inf
```

• Add `squeeze` keyword to `groupby` to allow reduction from DataFrame -> Series if groups are unique. This is a Regression from 0.10.1. We are reverting back to the prior behavior. This means groupby will return the same shaped objects whether the groups are unique or not. Revert this issue (GH2893) with (GH3596).

```
In [2]: df2 = pd.DataFrame(
            ...:     {"val1": 1, "val2": 20},
            ...:     {"val1": 1, "val2": 19},
            ...:     {"val1": 1, "val2": 27},
            ...:     {"val1": 1, "val2": 12})

In [3]: def func(dataf):
            ...:     return dataf["val2"] - dataf["val2"].mean()
            ...:

In [4]: # squeezing the result frame to a series (because we have unique groups)
            ...:     df2.groupby("val1", squeeze=True).apply(func)
Out[4]:
       0   0.5
   1   -0.5
   2    7.5
   3   -7.5
Name: 1, dtype: float64
```
In [5]: # no squeezing (the default, and behavior in 0.10.1)
    ...: df2.groupby("val1").apply(func)
Out[5]:
   val2  0  1  2  3
val1   
   1  0.5 -0.5  7.5 -7.5

• Raise on iloc when boolean indexing with a label based indexer mask e.g. a boolean Series, even with integer labels, will raise. Since iloc is purely positional based, the labels on the Series are not alignable (GH3631)

This case is rarely used, and there are plenty of alternatives. This preserves the iloc API to be purely positional based.

In [6]: df = pd.DataFrame(range(5), index=list("ABCDE"), columns=["a"])
In [7]: mask = df.a % 2 == 0
In [8]: mask
Out[8]:
       a
A   True
B   False
C   True
D   False
E   True
Name: a, dtype: bool

# this is what you should use
In [9]: df.loc[mask]
Out[9]:
a
   A  0  
   C  2  
   E  4  

# this will work as well
In [10]: df.iloc[mask.values]
Out[10]:
a
   A  0
   C  2
   E  4

df.iloc[mask] will raise a ValueError

• The raise_on_error argument to plotting functions is removed. Instead, plotting functions raise a TypeError when the dtype of the object is object to remind you to avoid object arrays whenever possible and thus you should cast to an appropriate numeric dtype if you need to plot something.

• Add colormap keyword to DataFrame plotting methods. Accepts either a matplotlib colormap object (ie, matplotlib.cm.jet) or a string name of such an object (ie, 'jet'). The colormap is sampled to select the color for each column. Please see Colormaps for more information. (GH3860)

• DataFrame.interpolate() is now deprecated. Please use DataFrame.fillna() and DataFrame.replace() instead. (GH3582, GH3675, GH3676)

• the method and axis arguments of DataFrame.replace() are deprecated

• DataFrame.replace 's infer_types parameter is removed and now performs conversion by default. (GH3907)
• Add the keyword *allow_duplicates* to *DataFrame.insert* to allow a duplicate column to be inserted if True, default is False (same as prior to 0.12) (GH3679)

• Implement **nonzero** for NDFrame objects (GH3691, GH3696)

• IO api
  – added top-level function *read_excel* to replace the following. The original API is deprecated and will be removed in a future version

```python
from pandas.io.parsers import ExcelFile
xls = ExcelFile("path_to_file.xls")
xls.parse("Sheet1", index_col=None, na_values=["NA"])
```

With

```python
import pandas as pd
pd.read_excel("path_to_file.xls", "Sheet1", index_col=None, na_values=["NA"])
```

– added top-level function *read_sql* that is equivalent to the following

```python
from pandas.io.sql import read_frame
read_frame(...)
```

• *DataFrame.to_html* and *DataFrame.to_latex* now accept a path for their first argument (GH3702)

• Do not allow astypes on datetime64[ns] except to object, and timedelta64[ns] to object/int (GH3425)

• The behavior of datetime64 dtypes has changed with respect to certain so-called reduction operations (GH3726). The following operations now raise a TypeError when performed on a Series and return an empty Series when performed on a DataFrame similar to performing these operations on, for example, a DataFrame of slice objects:
  – sum, prod, mean, std, var, skew, kurt, corr, and cov

• *read_html* now defaults to None when reading, and falls back on bs4 + html5lib when lxml fails to parse. a list of parsers to try until success is also valid

• The internal pandas class hierarchy has changed (slightly). The previous PandasObject now is called PandasContainer and a new PandasObject has become the base class for PandasContainer as well as Index, Categorical, GroupBy, SparseList, and SparseArray (+ their base classes). Currently, PandasObject provides string methods (from StringMixin). (GH4090, GH4092)

• New StringMixin that, given a **unicode** method, gets python 2 and python 3 compatible string methods (**str**., **bytes**., and **repr**.). Plus string safety throughout. Now employed in many places throughout the pandas library. (GH4090, GH4092)
IO enhancements

- `pd.read_html()` can now parse HTML strings, files or urls and return DataFrames, courtesy of @cpcloud. (GH3477, GH3605, GH3606, GH3616). It works with a single parser backend: BeautifulSoup4 + html5lib See the docs

You can use `pd.read_html()` to read the output from `DataFrame.to_html()` like so

\[
\begin{array}{l}
\text{In [11]: } df = \text{pd.DataFrame({"a": range(3), "b": list("abc")})} \\
\text{In [12]: } \text{print(df)} \\
\quad a \quad b \\
\quad 0 \quad 0 \quad a \\
\quad 1 \quad 1 \quad b \\
\quad 2 \quad 2 \quad c \\
\text{In [13]: } html = df.to_html() \\
\text{In [14]: } \text{alist = pd.read_html(html, index_col=0)} \\
\text{In [15]: } \text{print(df == alist[0])} \\
\quad a \quad b \\
\quad 0 \quad True \quad True \\
\quad 1 \quad True \quad True \\
\quad 2 \quad True \quad True
\end{array}
\]

Note that `alist` here is a Python list so `pd.read_html()` and `DataFrame.to_html()` are not inverses.

- `pd.read_html()` no longer performs hard conversion of date strings (GH3656).

**Warning:** You may have to install an older version of BeautifulSoup4, See the installation docs

- Added module for reading and writing Stata files: `pandas.io.stata` (GH1512) accessible via `read_stata` top-level function for reading, and `to_stata` DataFrame method for writing, See the docs

- Added module for reading and writing json format files: `pandas.io.json` accessible via `read_json` top-level function for reading, and `to_json` DataFrame method for writing, See the docs various issues (GH1226, GH3804, GH3876, GH3867, GH1305)

- MultiIndex column support for reading and writing csv format files
  - The header option in `read_csv` now accepts a list of the rows from which to read the index.
  - The option, `tupleize_cols` can now be specified in both `to_csv` and `read_csv`, to provide compatibility for the pre 0.12 behavior of writing and reading MultiIndex columns via a list of tuples. The default in 0.12 is to write lists of tuples and not interpret list of tuples as a MultiIndex column.

Note: The default behavior in 0.12 remains unchanged from prior versions, but starting with 0.13, the default to write and read MultiIndex columns will be in the new format. (GH3571, GH1651, GH3141)

- If an `index_col` is not specified (e.g. you don’t have an index, or wrote it with `df.to_csv(..., index=False), then any names on the columns index will be lost.

\[
\begin{array}{l}
\text{In [16]: } \text{from pandas._testing import makeCustomDataframe as mkdf} \\
\text{In [17]: } df = \text{mkdf(5, 3, r_idx_nlevels=2, c_idx_nlevels=4)}
\end{array}
\]

(continues on next page)
In [18]: df.to_csv("mi.csv")
In [19]: print(open("mi.csv").read())
C0,,C_l0_g0,C_l0_g1,C_l0_g2

</table>

• Support for HDFStore (via PyTables 3.0.0) on Python3
• Iterator support via read_hdf that automatically opens and closes the store when iteration is finished. This is only for tables

In [25]: path = 'store_iterator.h5'
In [26]: pd.DataFrame(np.random.randn(10, 2)).to_hdf(path, 'df', table=True)
In [27]: for df in pd.read_hdf(path, 'df', chunksize=3):
     ....:    print(df)
     ....:
     0 1
  0 0.713216 -0.778461
  1 -0.661062 0.862877
  2 0.344342 0.149565
     0 1
  3 -0.626968 -0.875772
  4 -0.930687 -0.218983
  5 0.949965 -0.442354
     0 1
  6 -0.402985 1.111358

  8 0.049355 0.632633
     0 1
  9 -1.502767 -1.225492

• read_csv will now throw a more informative error message when a file contains no columns, e.g., all newline characters
Other enhancements

- DataFrame.replace() now allows regular expressions on contained Series with object dtype. See the examples section in the regular docs _Replacing via String Expression_

  For example you can do

  ```
  In [21]: df = pd.DataFrame({'a': list('ab..'), 'b': [1, 2, 3, 4]})
  In [22]: df.replace(regexp=r'\s*\.\s*', value=np.nan)
  Out[22]:
          a  b
    0   a  1
    1   b  2
    2  NaN  3
    3  NaN  4
  ```

  to replace all occurrences of the string '. ' with zero or more instances of surrounding white space with NaN.

  Regular string replacement still works as expected. For example, you can do

  ```
  In [23]: df.replace('.', np.nan)
  Out[23]:
          a  b
    0   a  1
    1   b  2
    2  NaN  3
    3  NaN  4
  ```

  to replace all occurrences of the string '.' with NaN.

- pd.melt() now accepts the optional parameters var_name and value_name to specify custom column names of the returned DataFrame.

- pd.set_option() now allows N option, value pairs (GH3667).

  Let's say that we had an option 'a.b' and another option 'b.c'. We can set them at the same time:

  ```
  In [31]: pd.get_option('a.b')
  Out[31]: 2
  In [32]: pd.get_option('b.c')
  Out[32]: 3
  In [33]: pd.set_option('a.b', 1, 'b.c', 4)
  In [34]: pd.get_option('a.b')
  Out[34]: 1
  In [35]: pd.get_option('b.c')
  Out[35]: 4
  ```

- The filter method for group objects returns a subset of the original object. Suppose we want to take only elements that belong to groups with a group sum greater than 2.

  ```
  In [24]: sf = pd.Series([1, 1, 2, 3, 3, 3])
  In [25]: sf.groupby(sf).filter(lambda x: x.sum() > 2)
  Out[25]:
  ```
The argument of `filter` must a function that, applied to the group as a whole, returns `True` or `False`. Another useful operation is filtering out elements that belong to groups with only a couple members.

```
In [26]: dff = pd.DataFrame({"A": np.arange(8), "B": list("aabbbbcc")})
In [27]: dff.groupby("B").filter(lambda x: len(x) > 2)
Out[27]:
   A  B
  2  2 b
  3  3 b
  4  4 b
  5  5 b
```

Alternatively, instead of dropping the offending groups, we can return a like-indexed objects where the groups that do not pass the filter are filled with NaNs.

```
In [28]: dff.groupby("B").filter(lambda x: len(x) > 2, dropna=False)
Out[28]:
   A  B
  0  NaN NaN
  1  NaN NaN
  2  2.0 b
  3  3.0 b
  4  4.0 b
  5  5.0 b
  6  NaN NaN
  7  NaN NaN
```

- Series and DataFrame hist methods now take a `figsize` argument (GH3834)
- DatetimeIndexes no longer try to convert mixed-integer indexes during join operations (GH3877)
- Timestamp.min and Timestamp.max now represent valid Timestamp instances instead of the default date-time.min and datetime.max (respectively), thanks @SleepingPills
- `read_html` now raises when no tables are found and BeautifulSoup==4.2.0 is detected (GH4214)

**Experimental features**

- Added experimental `CustomBusinessDay` class to support `DateOffsets` with custom holiday calendars and custom weekmasks. (GH2301)

**Note:** This uses the `numpy.busdaycalendar` API introduced in Numpy 1.7 and therefore requires Numpy 1.7.0 or newer.

```
In [29]: from pandas.tseries.offsets import CustomBusinessDay
In [30]: from datetime import datetime
```

(continues on next page)
As an interesting example, let's look at Egypt where a Friday-Saturday weekend is observed.

```python
In [31]: weekmask_egypt = "Sun Mon Tue Wed Thu"

# They also observe International Workers' Day so let's add that for a couple of years
In [32]: holidays = ["2012-05-01", datetime(2013, 5, 1), np.datetime64("2014-05-01")]

In [33]: bday_egypt = CustomBusinessDay(holidays=holidays, weekmask=weekmask_egypt)

In [34]: dt = datetime(2013, 4, 30)

In [35]: print(dt + 2 * bday_egypt)
2013-05-05 00:00:00

In [36]: dts = pd.date_range(dt, periods=5, freq=bday_egypt)

In [37]: print(pd.Series(dts.weekday, dts).map(pd.Series("Mon Tue Wed Thu Fri Sat Sun".split())))
```

**Bug fixes**

- Plotting functions now raise a `TypeError` before trying to plot anything if the associated objects have a dtype of `object` (GH1818, GH3572, GH3911, GH3912), but they will try to convert object arrays to numeric arrays if possible so that you can still plot, for example, an object array with floats. This happens before any drawing takes place which eliminates any spurious plots from showing up.
- `fillna` methods now raise a `TypeError` if the `value` parameter is a list or tuple.
- `Series.str` now supports iteration (GH3638). You can iterate over the individual elements of each string in the `Series`. Each iteration yields a `Series` with either a single character at each index of the original `Series` or `NaN`. For example,

```python
In [38]: strs = "go", "bow", "joe", "slow"

In [39]: ds = pd.Series(strs)

In [40]: for s in ds.str:
   ....:     print(s)
   ....:
0  g
1  b
2  j
3  s
dtype: object
```

(continues on next page)
The last element yielded by the iterator will be a `Series` containing the last element of the longest string in the `Series` with all other elements being NaN. Here since 'slow' is the longest string and there are no other strings with the same length 'w' is the only non-null string in the yielded `Series`.

- **HDFStore**
  - will retain index attributes (freq,tz,name) on recreation (GH3499)
  - will warn with an `AttributeConflictWarning` if you are attempting to append an index with a different frequency than the existing, or attempting to append an index with a different name than the existing
  - support datelike columns with a timezone as `data_columns` (GH2852)

- Non-unique index support clarified (GH3468).
  - Fix assigning a new index to a duplicate index in a DataFrame would fail (GH3468)
  - Fix construction of a DataFrame with a duplicate index
  - `ref_locs` support to allow duplicative indices across dtypes, allows `iGet` support to always find the index (even across dtypes) (GH2194)
  - `applymap` on a DataFrame with a non-unique index now works (removed warning) (GH2786), and fix (GH3230)
  - `to_csv` to handle non-unique columns (GH3495)
  - Duplicate indexes with `getitem` will return items in the correct order (GH3455, GH3457) and handle missing elements like unique indices (GH3561)
  - Duplicate indexes with and empty DataFrame.from_records will return a correct frame (GH3562)
  - `Concat` to produce a non-unique columns when duplicates are across dtypes is fixed (GH3602)
  - Allow insert/delete to non-unique columns (GH3679)
pandas: powerful Python data analysis toolkit, Release 1.2.2

- Non-unique indexing with a slice via `loc` and friends fixed (GH3659)
- Allow insert/delete to non-unique columns (GH3679)
- Extend `reindex` to correctly deal with non-unique indices (GH3679)
- `DataFrame.iterrows()` now works with frames with duplicate column names (GH3873)
- Bug in non-unique indexing via `iloc` (GH4017); added takeable argument to `reindex` for location-based taking
- Allow non-unique indexing in series via `.ix/loc` and `__getitem__` (GH4246)
- Fixed non-unique indexing memory allocation issue with `.ix/loc` (GH4280)
  - `DataFrame.from_records` did not accept empty recarrays (GH3682)
  - `read_html` now correctly skips tests (GH3741)
  - Fixed a bug where `DataFrame.replace` with a compiled regular expression in the `to_replace` argument wasn’t working (GH3907)
  - Improved network test decorator to catch IOError (and therefore URLError as well). Added `with_connectivity_check` decorator to allow explicitly checking a website as a proxy for seeing if there is network connectivity. Plus, new `optional_args` decorator factory for decorators. (GH3910, GH3914)
  - Fixed testing issue where too many sockets where open thus leading to a connection reset issue (GH3982, GH3985, GH4028, GH4054)
  - Fixed failing tests in test_yahoo, test_google where symbols were not retrieved but were being accessed (GH3982, GH3985, GH4028, GH4054)
  - `Series.hist` will now take the figure from the current environment if one is not passed
  - Fixed bug where a 1xN DataFrame would barf on a 1xN mask (GH4071)
  - Fixed running of `tox` under python3 where the pickle import was getting rewritten in an incompatible way (GH4062, GH4063)
  - Fixed bug where sharex and sharey were not being passed to grouped_hist (GH4089)
  - Fixed bug in `DataFrame.replace` where a nested dict wasn’t being iterated over when `regex=False` (GH4115)
  - Fixed bug in the parsing of microseconds when using the `format` argument in `to_datetime` (GH4152)
  - Fixed bug in `PandasAutoDateLocator` where `invert_xaxis` triggered incorrectly (GH3990)
  - Fixed bug in plotting that wasn’t raising on invalid colormap for matplotlib 1.1.1 (GH4215)
  - Fixed the legend displaying in `DataFrame.plot(kind='kde')` (GH4216)
  - Fixed bug where `Index` slices weren’t carrying the name attribute (GH4226)
  - Fixed bug in initializing `DateTimeIndex` with an array of strings in a certain time zone (GH4229)
  - Fixed bug where `html5lib` wasn’t being properly skipped (GH4265)
  - Fixed bug where `get_data_famafrench` wasn’t using the correct file edges (GH4281)

See the full release notes or issue tracker on GitHub for a complete list.

5.18 Version 0.11

5.18.1 Version 0.11.0 (April 22, 2013)

This is a major release from 0.10.1 and includes many new features and enhancements along with a large number of bug fixes. The methods of Selecting Data have had quite a number of additions, and Dtype support is now full-fledged. There are also a number of important API changes that long-time pandas users should pay close attention to.

There is a new section in the documentation, *10 Minutes to Pandas*, primarily geared to new users.

There is a new section in the documentation, *Cookbook*, a collection of useful recipes in pandas (and that we want contributions!).

There are several libraries that are now *Recommended Dependencies*

Selection choices

Starting in 0.11.0, object selection has had a number of user-requested additions in order to support more explicit location based indexing. pandas now supports three types of multi-axis indexing.

- `.loc` is strictly label based, will raise *KeyError* when the items are not found, allowed inputs are:
  - A single label, e.g. 5 or 'a', (note that 5 is interpreted as a *label* of the index. This use is **not** an integer position along the index)
  - A list or array of labels ['a', 'b', 'c']
  - A slice object with labels 'a':'f', (note that contrary to usual python slices, **both** the start and the stop are included!)
– A boolean array

See more at Selection by Label

• .iloc is strictly integer position based (from 0 to length-1 of the axis), will raise IndexError when the requested indices are out of bounds. Allowed inputs are:
  – An integer e.g. 5
  – A list or array of integers [4, 3, 0]
  – A slice object with ints 1:7
  – A boolean array

See more at Selection by Position

• .ix supports mixed integer and label based access. It is primarily label based, but will fallback to integer positional access. .ix is the most general and will support any of the inputs to .loc and .iloc, as well as support for floating point label schemes. .ix is especially useful when dealing with mixed positional and label based hierarchical indexes.

  As using integer slices with .ix have different behavior depending on whether the slice is interpreted as position based or label based, it’s usually better to be explicit and use .iloc or .loc.

  See more at Advanced Indexing and Advanced Hierarchical.

Selection deprecations

Starting in version 0.11.0, these methods may be deprecated in future versions.

• irow
• icol
• iget_value

See the section Selection by Position for substitutes.

Dtypes

Numeric dtypes will propagate and can coexist in DataFrames. If a dtype is passed (either directly via the dtype keyword, a passed ndarray, or a passed Series), then it will be preserved in DataFrame operations. Furthermore, different numeric dtypes will NOT be combined. The following example will give you a taste.

```
In [1]: df1 = pd.DataFrame(np.random.randn(8, 1), columns=['A'], dtype='float32')
In [2]: df1
Out[2]:
   A
0  0.469112
1 -0.282863
2 -1.509058
3 -1.135632
4  1.212112
5 -0.173215
6  0.119209
7 -1.044236
```

In [3]: df1.dtypes

(continues on next page)
Out[3]:
A   float32
dtype: object

In [4]: df2 = pd.DataFrame({'A': pd.Series(np.random.randn(8), dtype='float16'),
                         'B': pd.Series(np.random.randn(8)),
                         'C': pd.Series(range(8), dtype='uint8')})

In [5]: df2
Out[5]:
     A         B        C
0 -0.861816 -0.424972   0
1 -2.105469  0.567020   1
2 -0.494873  0.276232   2
3  1.072266 -1.087401   3
4  0.721680 -0.673690   4
5 -0.706543  0.113648   5
6 -1.040039 -1.478427   6
7  0.271973  0.524988   7

In [6]: df2.dtypes
Out[6]:
A  float16  
B  float64  
C   uint8  
dtype: object

# here you get some upcasting
In [7]: df3 = df1.reindex_like(df2).fillna(value=0.0) + df2

In [8]: df3
Out[8]:
     A         B        C
0 -0.392704 -0.424972  0.0
1 -2.388332  0.567020  1.0
2 -2.003932  0.276232  2.0
3 -0.063367 -1.087401  3.0
4  1.933792 -0.673690  4.0
5 -0.879758  0.113648  5.0
6 -0.920830 -1.478427  6.0
7 -0.772263  0.524988  7.0

In [9]: df3.dtypes
Out[9]:
A  float32  
B  float64  
C  float64  
dtype: object
Dtype conversion

This is lower-common-denominator upcasting, meaning you get the dtype which can accommodate all of the types

```
In [10]: df3.values.dtype
Out[10]: dtype('float64')
```

Conversion

```
In [11]: df3.astype('float32').dtypes
Out[11]:
          A    B    C
dtype: object
```

Mixed conversion

```
In [12]: df3['D'] = '1.'
In [13]: df3['E'] = '1'

In [14]: df3.convert_objects(convert_numeric=True).dtypes
Out[14]:
          A    B    C
dtype: object
```

# same, but specific dtype conversion
```
In [15]: df3['D'] = df3['D'].astype('float16')
In [16]: df3['E'] = df3['E'].astype('int32')
```

```
In [17]: df3.dtypes
Out[17]:
          A    B    C    D    E
dtype: object
```

Forcing date coercion (and setting NaT when not datelike)

```
In [18]: import datetime
In [19]: s = pd.Series([datetime.datetime(2001, 1, 1, 0, 0), 'foo', 1.0, 1, pd.Timestamp('20010104'), '20010105'], dtype='O')

In [20]: s.convert_objects(convert_dates='coerce')
Out[20]:
   0  2001-01-01
   1    NaT
   2    NaT
```

(continues on next page)
Dtype gotchas

Platform gotchas

Starting in 0.11.0, construction of DataFrame/Series will use default dtypes of int64 and float64, regardless of platform. This is not an apparent change from earlier versions of pandas. If you specify dtypes, they WILL be respected, however (GH2837)

The following will all result in int64 dtypes

```
In [21]: pd.DataFrame([1, 2], columns=['a']).dtypes
Out[21]:
 a  int64
 dtype: object

In [22]: pd.DataFrame({'a': [1, 2]}).dtypes
Out[22]:
 a  int64
 dtype: object

In [23]: pd.DataFrame({'a': 1}, index=range(2)).dtypes
Out[23]:
 a  int64
 dtype: object
```

Keep in mind that DataFrame(np.array([1, 2])) WILL result in int32 on 32-bit platforms!

Upcasting gotchas

Performing indexing operations on integer type data can easily upcast the data. The dtype of the input data will be preserved in cases where nans are not introduced.

```
In [24]: dfi = df3.astype('int32')

In [25]: dfi['D'] = dfi['D'].astype('int64')

In [26]: dfi
Out[26]:
     A  B  C  D  E
0   0  0  0  1  1
1  -2  0  1  1  1
2  -2  0  2  1  1
3   0 -1  3  1  1
4   1  0  4  1  1
5   0  0  5  1  1
6  -1  6  1  1
7   0  0  7  1  1

In [27]: dfi.dtypes
Out[27]:
A    int32
dtype: int32
```
In [28]: casted = dfi[dfi > 0]

In [29]: casted

Out[29]:
   A   B     C      D  E
0  NaN  NaN   NaN 1.0  1
1  NaN  NaN  2.0  1.0  1
2  NaN  NaN  3.0  1.0  1
3  NaN  NaN  4.0  1.0  1
4  NaN  NaN  5.0  1.0  1
5  NaN  NaN  6.0  1.0  1
6  NaN  NaN  7.0  1.0  1

In [30]: casted.dtypes

Out[30]:
   A   B   C   D  E
dtype: object

While float dtypes are unchanged.

In [31]: df4 = df3.copy()

In [32]: df4['A'] = df4['A'].astype('float32')

In [33]: df4.dtypes

Out[33]:
   A   B   C   D  E
dtype: object

In [34]: casted = df4[df4 > 0]

In [35]: casted

Out[35]:
   A     B     C     D  E
0  NaN  NaN  NaN  1.0  1
1  NaN  0.56702  1.0  1.0  1
2  NaN  0.27623  2.0  1.0  1
3  NaN  1.93379  3.0  1.0  1
4  NaN  0.11364  4.0  1.0  1
5  NaN  0.52498  5.0  1.0  1
6  NaN  0.52498  6.0  1.0  1
7  NaN  0.52498  7.0  1.0  1

(continues on next page)
Datetimes conversion

Datetim64[ns] columns in a DataFrame (or a Series) allow the use of np.nan to indicate a nan value, in addition to the traditional NaT, or not-a-time. This allows convenient nan setting in a generic way. Furthermore datetim64[ns] columns are created by default, when passed datetimelike objects (this change was introduced in 0.10.1) (GH2809, GH2810)

```python
In [12]: df = pd.DataFrame(np.random.randn(6, 2), pd.date_range('20010102', periods=6),
...:       columns=["A", "B"])
...:
In [13]: df['timestamp'] = pd.Timestamp('20010103')
```

```python
In [14]: df
Out[14]:
       A       B       timestamp
2001-01-02  0.404705  0.577046  2001-01-03
2001-01-03 -1.715002 -1.039268  2001-01-03
2001-01-04 -0.370647 -1.157892  2001-01-03
2001-01-05 -1.344312  0.844885  2001-01-03
2001-01-06  1.075770 -0.109050 2001-01-03
2001-01-07  1.643563 -1.469388  2001-01-03
```

Astype conversion on datetim64[ns] to object, implicitly converts NaT to np.nan

```python
In [15]: df.dtypes.value_counts()
Out[15]:
float64       2
datetime64[ns]  1
dtype: int64
```

```python
In [16]: df.loc[df.index[2:4], ['A', 'timestamp']] = np.nan
```

```python
In [17]: df
Out[17]:
       A       B       timestamp
2001-01-02  0.404705  0.577046  2001-01-03
2001-01-03 -1.715002 -1.039268  2001-01-03
2001-01-04  NaN       NaN         NaN
2001-01-05  NaN       NaN         NaN
2001-01-06  1.075770 -0.109050 2001-01-03
2001-01-07  1.643563 -1.469388  2001-01-03
```
In [18]: s = pd.Series([datetime.datetime(2001, 1, 2, 0, 0) for i in range(3)])

In [19]: s.dtype
Out[19]: dtype('M8[ns]')

In [20]: s[1] = np.nan

In [21]: s
Out[21]:
[ 2001-01-02  
  NaT  
  2001-01-02  
]
dtype: datetime64[ns]

In [22]: s.dtype
Out[22]: dtype('M8[ns]')

In [23]: s = s.astype('O')

In [24]: s
Out[24]:
[ 2001-01-02 00:00:00  
  NaT  
  2001-01-02 00:00:00  
]
dtype: object

In [25]: s.dtype
Out[25]: dtype('O')

API changes

- Added to_series() method to indices, to facilitate the creation of indexers (GH3275)

  • HDFStore
    - added the method select_column to select a single column from a table as a Series.
    - deprecated the unique method, can be replicated by select_column(key, column).unique()
    - min_itemsize parameter to append will now automatically create data_columns for passed keys

Enhancements

- Improved performance of df.to_csv() by up to 10x in some cases. (GH3059)
- Numexpr is now a Recommended Dependencies, to accelerate certain types of numerical and boolean operations
- Bottleneck is now a Recommended Dependencies, to accelerate certain types of nan operations
- HDFStore
  - support read_hdf/to_hdf API similar to read_csv/to_csv

In [26]: df = pd.DataFrame({'A': range(5), 'B': range(5)})

In [27]: df.to_hdf('store.h5', 'table', append=True)

In [28]: pd.read_hdf('store.h5', 'table', where=['index > 2'])
– provide dotted attribute access to get from stores, e.g. store.df == store['df']
– new keywords iterator=boolean, and chunksize=number_in_a_chunk are provided to support iteration on select and select_as_multiple (GH3076)

• You can now select timestamps from an unordered timeseries similarly to an ordered timeseries (GH2437)
• You can now select with a string from a DataFrame with a datelike index, in a similar way to a Series (GH3070)

```
In [29]: idx = pd.date_range("2001-10-1", periods=5, freq='M')
In [30]: ts = pd.Series(np.random.randn(len(idx)), index=idx)
In [31]: ts['2001']
Out[31]:
2001-10-31  0.117967
2001-11-30  0.702184
2001-12-31  0.414034
Freq: M, dtype: float64
In [32]: df = pd.DataFrame({'A': ts})
In [33]: df['2001']
Out[33]:
   A
2001-10-31  0.117967
2001-11-30  0.702184
2001-12-31  0.414034
```

• Squeeze to possibly remove length 1 dimensions from an object.

```
>>> p = pd.Panel(np.random.randn(3, 4, 4), items=['ItemA', 'ItemB', 'ItemC'],
               major_axis=pd.date_range('20010102', periods=4),
               minor_axis=['A', 'B', 'C', 'D'])
>>> p
<class 'pandas.core.panel.Panel'>
Dimensions: 3 (items) x 4 (major_axis) x 4 (minor_axis)
Items axis: ItemA to ItemC
Major_axis axis: 2001-01-02 00:00:00 to 2001-01-05 00:00:00
Minor_axis: A to D

>>> p.reindex(items=['ItemA']).squeeze()
   A   B   C   D
2001-01-02  0.926089 -2.026458  0.501277 -0.204683
2001-01-03  0.076524  1.081161  1.141361  0.479243
2001-01-04  0.641817 -0.185352  1.824568  0.809152
2001-01-05  0.575237  0.669934  1.398014 -0.399338

>>> p.reindex(items=['ItemA'], minor=['B']).squeeze()
   A   B
2001-01-02 -2.026458
2001-01-03  1.081161
2001-01-04 -0.185352
```

(continues on next page)
In `pd.io.data.Options`,

- Fix bug when trying to fetch data for the current month when already past expiry.
- Now using lxml to scrape html instead of BeautifulSoup (lxml was faster).
- New instance variables for calls and puts are automatically created when a method that creates them is called. This works for current month where the instance variables are simply `calls` and `puts`. Also works for future expiry months and save the instance variable as `callsMMYY` or `putsMMYY`, where `MMYY` are, respectively, the month and year of the option’s expiry.
- `Options.get_near_stock_price` now allows the user to specify the month for which to get relevant options data.
- `Options.get_forward_data` now has optional kwargs `near` and `above_below`. This allows the user to specify if they would like to only return forward looking data for options near the current stock price. This just obtains the data from `Options.get_near_stock_price` instead of `Options.get_xxx_data()` (GH2758).

- Cursor coordinate information is now displayed in time-series plots.
- added option `display.max_seq_items` to control the number of elements printed per sequence pprinting it. (GH2979)
- added option `display.chop_threshold` to control display of small numerical values. (GH2739)
- added option `display.max_info_rows` to prevent verbose info from being calculated for frames above 1M rows (configurable). (GH2807, GH2918)
- `value_counts()` now accepts a “normalize” argument, for normalized histograms. (GH2710).
- DataFrame.from_records now accepts not only dicts but any instance of the collections.Mapping ABC.
- added option `display.mpl_style` providing a sleeker visual style for plots. Based on https://gist.github.com/huyng/816622 (GH3075).
- Treat boolean values as integers (values 1 and 0) for numeric operations. (GH2641)
- `to_html()` now accepts an optional “escape” argument to control reserved HTML character escaping (enabled by default) and escapes &, in addition to < and >. (GH2919)

See the full release notes or issue tracker on GitHub for a complete list.

5.19 Version 0.10

5.19.1 Version 0.10.1 (January 22, 2013)

This is a minor release from 0.10.0 and includes new features, enhancements, and bug fixes. In particular, there is substantial new HDFStore functionality contributed by Jeff Reback.

An undesired API breakage with functions taking the \texttt{inplace} option has been reverted and deprecation warnings added.

API changes

- Functions taking an \texttt{inplace} option return the calling object as before. A deprecation message has been added
- Groupby aggregations \texttt{Max/Min} no longer exclude non-numeric data (GH2700)
- Resampling an empty DataFrame now returns an empty DataFrame instead of raising an exception (GH2640)
- The file reader will now raise an exception when NA values are found in an explicitly specified integer column instead of converting the column to float (GH2631)
- DatetimeIndex.unique now returns a DatetimeIndex with the same name and timezone instead of an array (GH2563)

New features

- MySQL support for database (contribution from Dan Allan)

HDFStore

You may need to upgrade your existing data files. Please visit the \texttt{compatibility} section in the main docs.

You can designate (and index) certain columns that you want to be able to perform queries on a table, by passing a list to \texttt{data\_columns}

\begin{verbatim}
In [1]: store = pd.HDFStore("store.h5")
In [2]: df = pd.DataFrame(
      ...:     np.random.randn(8, 3),
      ...:     index=pd.date_range("1/1/2000", periods=8),

(continues on next page)
In [3]: df["string"] = "foo"
In [4]: df.loc[df.index[4:6], "string"] = np.nan
In [5]: df.loc[df.index[7:9], "string"] = "bar"
In [6]: df["string2"] = "cool"

In [7]: df
Out[7]:
   A     B     C     string  string2
0 2000-01-01 0.469112 -0.282863 -1.509059 foo    cool
1 2000-01-02 -1.135632 1.212112 -0.173215 foo    cool
2 2000-01-03 0.119209 -1.044236 -0.861849 foo    cool
3 2000-01-04 -2.104569 -0.494929 1.071804 foo    cool
4 2000-01-05 0.721555 -0.706771 -1.039575 NaN    cool
5 2000-01-06 0.271860 -0.424972 0.567020 NaN    cool
6 2000-01-07 0.276232 -1.087401 -0.673690 foo    cool
7 2000-01-08 0.113648 -1.478427 0.524988 bar    cool

# on-disk operations
In [8]: store.append("df", df, data_columns=["B", "C", "string", "string2"])  
In [9]: store.select("df", "B>0 and string=='foo'")
Out[9]:
   A     B     C     string  string2
0 2000-01-02 -1.135632 1.212112 -0.173215 foo    cool

# this is in-memory version of this type of selection
In [10]: df[(df.B > 0) & (df.string == "foo")]
Out[10]:
   A     B     C     string  string2
0 2000-01-02 -1.135632 1.212112 -0.173215 foo    cool

Retrieving unique values in an indexable or data column.

# note that this is deprecated as of 0.14.0
# can be replicated by: store.select_column('df', 'index').unique()
store.unique("df", "index")
store.unique("df", "string")

You can now store datetime64 in data columns

In [11]: df_mixed = df.copy()
In [12]: df_mixed["datetime64"] = pd.Timestamp("20010102")
In [13]: df_mixed.loc[df_mixed.index[3:4], ["A", "B"]]] = np.nan
In [14]: store.append("df_mixed", df_mixed)
In [15]: df_mixed1 = store.select("df_mixed")

(continues on next page)
In [16]: df_mixed1
Out[16]:
A       B       C     string  string2       datetime64
2000-01-01  0.469112 -1.509059 foo    cool  2001-01-02
2000-01-02  1.135632 -0.173215 foo    cool  2001-01-02

HDFStore now serializes MultiIndex dataframes when appending tables.

In [19]: index = pd.MultiIndex(levels=[['foo', 'bar', 'baz', 'qux'],
                          ['one', 'two', 'three']],
                         labels=[[0, 0, 0, 1, 1, 2, 2, 3, 3, 3],
                                 [0, 1, 2, 0, 1, 1, 2, 0, 1, 2]],
                         names=['foo', 'bar'])

In [20]: df = pd.DataFrame(np.random.randn(10, 3), index=index,
                       columns=['A', 'B', 'C'])

In [21]: df
Out[21]:
foo  bar
foo one  -0.116619  0.295575 -1.047704

</table>

Multi-table creation via `append_to_multiple` and selection via `select_as_multiple` can create/select from multiple tables and return a combined result, by using `where` on a selector table.
Enhancements

- **HDFStore** now can read native PyTables table format tables
  - You can pass `nan_rep = 'my_nan_rep'` to append, to change the default nan representation on disk (which converts to/from np.nan), this defaults to `nan`.

- You can pass `index` to `append`. This defaults to `True`. This will automatically create indices on the indexables and data columns of the table

- You can pass `chunksize=an integer` to `append`, to change the writing chunksize (default is 50000). This will significantly lower your memory usage on writing.

- You can pass `expectedrows=an integer` to the first `append`, to set the TOTAL number of expected rows that PyTables will expected. This will optimize read/write performance.

- **Select** now supports passing `start` and `stop` to provide selection space limiting in selection.

- Greatly improved ISO8601 (e.g., yyyy-mm-dd) date parsing for file parsers (GH2698)

- Allow `DataFrame.merge` to handle combinatorial sizes too large for 64-bit integer (GH2690)

- Series now has unary negation (-series) and inversion (~series) operators (GH2686)

- `DataFrame.plot` now includes a `logx` parameter to change the x-axis to log scale (GH2327)

- Series arithmetic operators can now handle constant and ndarray input (GH2574)
• ExcelFile now takes a kind argument to specify the file type (GH2613)
• A faster implementation for Series.str methods (GH2602)

**Bug Fixes**

• HDFStore tables can now store float32 types correctly (cannot be mixed with float64 however)
• Fixed Google Analytics prefix when specifying request segment (GH2713).
• Function to reset Google Analytics token store so users can recover from improperly setup client secrets (GH2687).
• Fixed groupby bug resulting in segfault when passing in MultiIndex (GH2706)
• Fixed bug where passing a Series with datetime64 values into to_datetime results in bogus output values (GH2699)
• Fixed bug in pattern in HDFStore expressions when pattern is not a valid regex (GH2694)
• Fixed performance issues while aggregating boolean data (GH2692)
• When given a boolean mask key and a Series of new values, Series __setitem__ will now align the incoming values with the original Series (GH2686)
• Fixed MemoryError caused by performing counting sort on sorting MultiIndex levels with a very large number of combinatorial values (GH2684)
• Fixed bug that causes plotting to fail when the index is a DatetimeIndex with a fixed-offset timezone (GH2683)
• Corrected business day subtraction logic when the offset is more than 5 bdays and the starting date is on a weekend (GH2680)
• Fixed C file parser behavior when the file has more columns than data (GH2668)
• Fixed file reader bug that misaligned columns with data in the presence of an implicit column and a specified usecols value
• DataFrames with numerical or datetime indices are now sorted prior to plotting (GH2609)
• Fixed DataFrame.from_records error when passed columns, index, but empty records (GH2633)
• Several bug fixed for Series operations when dtype is datetime64 (GH2689, GH2629, GH2626)

See the [full release notes](https://github.com/pandas-dev/pandas/releases) or issue tracker on GitHub for a complete list.

**Contributors**

A total of 17 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

File parsing new features

The delimited file parsing engine (the guts of `read_csv` and `read_table`) has been rewritten from the ground up and now uses a fraction the amount of memory while parsing, while being 40% or more faster in most use cases (in some cases much faster).

There are also many new features:

- Much-improved Unicode handling via the `encoding` option.
- Column filtering (`usecols`)
- Dtype specification (`dtype` argument)
- Ability to specify strings to be recognized as True/False
- Ability to yield NumPy record arrays (`as_recarray`)
- High performance `delim_whitespace` option
- Decimal format (e.g. European format) specification
- Easier CSV dialect options: `escapechar`, `lineterminator`, `quotechar`, etc.
- More robust handling of many exceptional kinds of files observed in the wild

API changes

Deprecated DataFrame BINOP TimeSeries special case behavior

The default behavior of binary operations between a DataFrame and a Series has always been to align on the DataFrame’s columns and broadcast down the rows, except in the special case that the DataFrame contains time series. Since there are now method for each binary operator enabling you to specify how you want to broadcast, we are phasing out this special case (Zen of Python: Special cases aren’t special enough to break the rules). Here’s what I’m talking about:
In [1]: import pandas as pd

In [2]: df = pd.DataFrame(np.random.randn(6, 4), index=pd.date_range("1/1/2000", periods=6))

In [3]: df

You will get a deprecation warning in the 0.10.x series, and the deprecated functionality will be removed in 0.11 or later.

Altered resample default behavior

The default time series resample binning behavior of daily D and higher frequencies has been changed to closed='left', label='left'. Lower nfrequencies are unaffected. The prior defaults were causing a great deal of confusion for users, especially resampling data to daily frequency (which labeled the aggregated group with the end of the interval: the next day).

In [1]: dates = pd.date_range('1/1/2000', '1/5/2000', freq='4h') (continues on next page)
In [2]: series = pd.Series(np.arange(len(dates)), index=dates)

          2000-01-05  129
Freq: D, dtype: int64

- Infinity and negative infinity are no longer treated as NA by isnull and notnull. That they ever were was a relic of early pandas. This behavior can be re-enabled globally by the mode.use_inf_as_null option:

```python
In [6]: s = pd.Series([1.5, np.inf, 3.4, -np.inf])
In [7]: pd.isnull(s)
```

(continues on next page)
Out[7]:
0  False
1  False
2  False
3  False
Length: 4, dtype: bool

In [8]: s.fillna(0)
Out[8]:
0  1.500000
1   inf
2  3.400000
3  -inf
Length: 4, dtype: float64

In [9]: pd.set_option('use_inf_as_null', True)

In [10]: pd.isnull(s)
Out[10]:
0  False
1   True
2  False
3   True
Length: 4, dtype: bool

In [11]: s.fillna(0)
Out[11]:
0  1.5
1  0.0
2  3.4
3  0.0
Length: 4, dtype: float64

In [12]: pd.reset_option('use_inf_as_null')

• Methods with the inplace option now all return None instead of the calling object. E.g. code written like
df = df.fillna(0, inplace=True) may stop working. To fix, simply delete the unnecessary variable assignment.

• pandas.merge no longer sorts the group keys (sort=False) by default. This was done for performance reasons: the group-key sorting is often one of the more expensive parts of the computation and is often unnecessary.

• The default column names for a file with no header have been changed to the integers 0 through N - 1. This is to create consistency with the DataFrame constructor with no columns specified. The v0.9.0 behavior (names X0, X1, ...) can be reproduced by specifying prefix='X':

In [6]: import io

In [7]: data = ""
   ...: a,b,c
   ...: 1,Yes,2
   ...: 3,No,4
   ...: ***
   ...

In [8]: print(data)

(continues on next page)
Values like 'Yes' and 'No' are not interpreted as boolean by default, though this can be controlled by new `true_values` and `false_values` arguments:

```
In [11]: print(data)

a,b,c
1,Yes,2
3,No,4
```

```
In [12]: pd.read_csv(io.StringIO(data))
Out[12]:
   a    b    c
0  1  Yes  2
1  3   No  4
```

```
In [13]: pd.read_csv(io.StringIO(data), true_values=["Yes"], false_values=["No"])
Out[13]:
   a     b     c
0  1  True   2
1  3  False   4
```

The file parsers will not recognize non-string values arising from a converter function as NA if passed in the `na_values` argument. It’s better to do post-processing using the `replace` function instead.

Calling `fillna` on Series or DataFrame with no arguments is no longer valid code. You must either specify a fill value or an interpolation method:

```
In [14]: s = pd.Series([np.nan, 1.0, 2.0, np.nan, 4])
```

```
In [15]: s
Out[15]:
0  NaN
1  1.0
2  2.0
3  NaN
4  4.0
```
dtype: float64

In [16]: s.fillna(0)
Out[16]:
0  0.0  
1  1.0  
2  2.0  
3  0.0  
4  4.0  
dtype: float64

In [17]: s.fillna(method="pad")
Out[17]:
0  NaN  
1  1.0  
2  2.0  
3  2.0  
4  4.0  
dtype: float64

Convenience methods **ffill** and **bfill** have been added:

In [18]: s.ffill()
Out[18]:
0  NaN  
1  1.0  
2  2.0  
3  2.0  
4  4.0  
dtype: float64

- **Series.apply** will now operate on a returned value from the applied function, that is itself a series, and possibly upcast the result to a DataFrame

In [19]: def f(x):
   ....:    return pd.Series([x, x ** 2], index=['x', "x^2"])
   ....:

In [20]: s = pd.Series(np.random.rand(5))

In [21]: s
Out[21]:
0  0.340445  
1  0.984729  
2  0.919540  
3  0.037772  
4  0.861549  
dtype: float64

In [22]: s.apply(f)
Out[22]:
 x  x^2
0  0.340445  0.115903
1  0.984729  0.969691
2  0.919540  0.845555
3  0.037772  0.001427
4  0.861549  0.742267
• New API functions for working with pandas options (GH2097):
  - get_option / set_option - get/set the value of an option. Partial names are accepted.
  - reset_option - reset one or more options to their default value. Partial names are accepted.
  - describe_option - print a description of one or more options. When called with no arguments, print all registered options.

Note: set_printoptions/ reset_printoptions are now deprecated (but functioning), the print options now live under “display.XYZ”. For example:

```
In [23]: pd.get_option("display.max_rows")
Out[23]: 15
```

• to_string() methods now always return unicode strings (GH2224).

New features

Wide DataFrame printing

Instead of printing the summary information, pandas now splits the string representation across multiple rows by default:

```
In [24]: wide_frame = pd.DataFrame(np.random.randn(5, 16))

In [25]: wide_frame
Out[25]:
     0     1     2     3     4     5      ...
-11 0.548702 1.467327 -1.015962 -0.483075 1.637550 -1.217659 ...
 12 0.266046 -0.709661 1.669052 1.037882 -1.705775 ... -0.176000 0.
 14 1.956030 0.017587 -0.016692 ...
 15 0.339355 0.593616 0.884345 1.591431 ...

     6     7     8     9    10    11    12    13    14    15
0 -0.291519 -1.745505 0.991460 -0.919069 0.266046 -0.709661 1.669052 1.037882 -1.705775 ...
1 0.268520 0.024580 1.627081 -0.016692 ...
2 1.591431 ...
3 -0.089329 0.337863 -0.945867 -0.932132 1.956030 0.017587 -0.016692 ...
4 0.337863 -0.945867 -0.932132 1.956030 0.017587 -0.016692 ...

[5 rows x 16 columns]
```

The old behavior of printing out summary information can be achieved via the ‘expand_frame_repr’ print option:

```
In [26]: pd.set_option("expand_frame_repr", False)

In [27]: wide_frame
Out[27]:
     0     1     2     3     4     5     6     7     8     9    10    11    12    13    14    15
-11 -0.548702 1.467327 -1.015962 -0.483075 1.637550 -1.217659 -0.291519 -1.745505 0.991460 -0.709661 1.669052 1.037882 -1.705775 ...
 12 0.266046 -0.709661 1.669052 1.037882 -1.705775 ...
 14 1.956030 0.017587 -0.016692 ...
 15 0.339355 0.593616 0.884345 1.591431 ...
     6     7     8     9    10    11    12    13    14    15
0 -0.291519 -1.745505 0.991460 -0.919069 0.266046 -0.709661 1.669052 1.037882 -1.705775 ...
1 0.268520 0.024580 1.627081 -0.016692 ...

(continues on next page)
```
The width of each line can be changed via ‘line_width’ (80 by default):

```python
pd.set_option("line_width", 40)
```

### Updated PyTables support

Docs for PyTables Table format & several enhancements to the api. Here is a taste of what to expect.

```python
In [41]: store = pd.HDFStore('store.h5')

In [42]: df = pd.DataFrame(np.random.randn(8, 3),
                     index=pd.date_range('1/1/2000', periods=8),
                     columns=['A', 'B', 'C'])

In [43]: df
Out[43]:
   A        B          C
2000-01-01 2.036047  0.898872  0.449644
2000-01-02 2.036047  0.898872  0.449644
2000-01-03 2.036047  0.898872  0.449644
2000-01-04 2.036047  0.898872  0.449644
2000-01-05 2.036047  0.898872  0.449644
2000-01-06 2.036047  0.898872  0.449644

Minor_axis axis: A to D

# storing a panel
In [52]: store.append('wp', wp)

# selecting via A QUERY
In [53]: store.select('wp', [pd.Term('major_axis>20000102'),
                       ....:   pd.Term('minor_axis', '=', ['A', 'B'])])
Out[53]:
<class 'pandas.core.panel.Panel'>
Dimensions: 2 (items) x 3 (major_axis) x 2 (minor_axis)
Items axis: Item1 to Item2
Major_axis axis: 2000-01-03 00:00:00 to 2000-01-05 00:00:00
Minor_axis axis: A to B

# removing data from tables
In [54]: store.remove('wp', pd.Term('major_axis>20000103'))
Out[54]: 8

In [55]: store.select('wp')
Out[55]:
<class 'pandas.core.panel.Panel'>
Dimensions: 2 (items) x 3 (major_axis) x 4 (minor_axis)
Items axis: Item1 to Item2
Major_axis axis: 2000-01-01 00:00:00 to 2000-01-03 00:00:00
Minor_axis axis: A to D

# deleting a store
In [56]: del store['df']

In [57]: store
Out[57]:
<class 'pandas.io.pytables.HDFStore'>
File path: store.h5
/wp wide_table (typ->appendable,nrows->12,ncols->2,indexers->[major_axis, 
                minor_axis])

Enhancements

5.19. Version 0.10
• added ability to hierarchical keys

```python
In [58]: store.put('foo/bar/bah', df)
In [59]: store.append('food/orange', df)
In [60]: store.append('food/apple', df)
In [61]: store
Out[61]: <class 'pandas.io.pytables.HDFStore'>
File path: store.h5
/foo/bar/bah frame (shape->[8,3])
/food/apple frame_table (typ->appendable,nrows->8,nrows->3,
→indexers->[index])
/food/orange frame_table (typ->appendable,nrows->8,nrows->3,
→indexers->[index])
/wp wide_table (typ->appendable,nrows->12,nrows->2,
→indexers->[major_axis,minor_axis])
```

# remove all nodes under this level
```
In [62]: store.remove('food')
In [63]: store
Out[63]: <class 'pandas.io.pytables.HDFStore'>
File path: store.h5
/foo/bar/bah frame (shape->[8,3])
/wp wide_table (typ->appendable,nrows->12,nrows->2,
→indexers->[major_axis,minor_axis])
```

• added mixed-dtype support!

```python
In [64]: df['string'] = 'string'
In [65]: df['int'] = 1
In [66]: store.append('df', df)
In [67]: df1 = store.select('df')
```

```python
In [68]: df1
Out[68]:
   A     B     C  string  int
0 2000-01-01  -2.036047  0.000830  -0.955697 string    1
1 2000-01-02   -0.898872  -0.725411   0.059904 string    1
2 2000-01-03   -0.449644   1.082900  -1.221265 string    1
3 2000-01-04    0.361078   1.330704   0.855932 string    1
4 2000-01-05  -1.216718   1.488887   0.018993 string    1
5 2000-01-06   -0.877046   0.045976   0.437274 string    1
6 2000-01-07  -0.567182  -0.888657  -0.556383 string    1
7 2000-01-08    0.655457   1.117949  -2.782376 string    1

[8 rows x 5 columns]
```

```python
In [69]: df1.get_dtype_counts()
Out[69]:
float64  3
```

(continues on next page)
int64    1
object  1
dtype: int64

- performance improvements on table writing
- support for arbitrarily indexed dimensions
- SparseSeries now has a density property (GH2384)
- enable Series.str.strip/lstrip/rstrip methods to take an input argument to strip arbitrary characters (GH2411)
- implement value_vars in melt to limit values to certain columns and add melt to pandas namespace (GH2412)

Bug Fixes
- added Term method of specifying where conditions (GH1996).
- del store['df'] now call store.remove('df') for store deletion
- deleting of consecutive rows is much faster than before
- min_itemsize parameter can be specified in table creation to force a minimum size for indexing columns (the previous implementation would set the column size based on the first append)
- indexing support via create_table_index (requires PyTables >= 2.3) (GH698).
- appending on a store would fail if the table was not first created via put
- fixed issue with missing attributes after loading a pickled dataframe (GH2431)
- minor change to select and remove: require a table ONLY if where is also provided (and not None)

Compatibility
0.10 of HDFStore is backwards compatible for reading tables created in a prior version of pandas, however, query terms using the prior (undocumented) methodology are unsupported. You must read in the entire file and write it out using the new format to take advantage of the updates.

N dimensional panels (experimental)

Adding experimental support for Panel4D and factory functions to create n-dimensional named panels. Here is a taste of what to expect.

```
In [58]: p4d = Panel4D(np.random.randn(2, 2, 5, 4),
                   labels=['Label1','Label2'],
                   items=['Item1', 'Item2'],
                   major_axis=date_range('1/1/2000', periods=5),
                   minor_axis=['A', 'B', 'C', 'D'])

In [59]: p4d
Out[59]:
<class 'pandas.core.panelnd.Panel4D'>
Dimensions: 2 (labels) x 2 (items) x 5 (major_axis) x 4 (minor_axis)
Labels axis: Label1 to Label2
Items axis: Item1 to Item2
Major_axis axis: 2000-01-01 00:00:00 to 2000-01-05 00:00:00
Minor_axis axis: A to D
```

5.20 Version 0.9

5.20.1 Version 0.9.1 (November 14, 2012)

This is a bug fix release from 0.9.0 and includes several new features and enhancements along with a large number of bug fixes. The new features include by-column sort order for DataFrame and Series, improved NA handling for the rank method, masking functions for DataFrame, and intraday time-series filtering for DataFrame.

New features

• Series.sort, DataFrame.sort, and DataFrame.sort_index can now be specified in a per-column manner to support multiple sort orders (GH928)

```python
In [2]: df = pd.DataFrame(np.random.randint(0, 2, (6, 3)),
   ...:     columns=['A', 'B', 'C'])
In [3]: df.sort(['A', 'B'], ascending=[1, 0])
Out[3]:
     A  B  C
0  0  1  1
1  0  1  1
2  0  0  1
3  1  0  0
4  1  0  0
5  1  0  0
```

• DataFrame.rank now supports additional argument values for the na_option parameter so missing values can be assigned either the largest or the smallest rank (GH1508, GH2159)

```python
In [1]: df = pd.DataFrame(np.random.randn(6, 3), columns=['A', 'B', 'C'])
In [3]: df.rank()
Out[3]:
     A  B  C
0  3.0 2.0 1.0
1  1.0 3.0 2.0
2  NaN NaN NaN
3  NaN NaN NaN
4  NaN NaN NaN
5  2.0 1.0 3.0
[6 rows x 3 columns]
In [4]: df.rank(na_option='top')
Out[4]:
     A  B  C
0  6.0 5.0 4.0
1  4.0 6.0 5.0
2  2.0 2.0 2.0
3  2.0 2.0 2.0
4  2.0 2.0 2.0
5  5.0 4.0 6.0
```

(continues on next page)
In [5]: df.rank(na_option='bottom')
Out[5]:
       A   B   C
0  3.0  2.0  1.0
1  1.0  3.0  2.0
2  5.0  5.0  5.0
3  5.0  5.0  5.0
4  5.0  5.0  5.0
5  2.0  1.0  3.0

• DataFrame has new `where` and `mask` methods to select values according to a given boolean mask (GH2109, GH2151)

DataFrame currently supports slicing via a boolean vector the same length as the DataFrame (inside the []). The returned DataFrame has the same number of columns as the original, but is sliced on its index.

In [6]: df = DataFrame(np.random.randn(5, 3), columns = ['A','B','C'])
In [7]: df
Out[7]:
     A          B          C
0  0.276232  -1.087401  -0.673690
1  0.113648  -1.478427   0.524988
2  0.404705   0.577046  -1.715002
3 -1.039268  -0.370647  -1.157892
4 -1.344312   0.844885   1.075770

In [8]: df[df['A'] > 0]
Out[8]:
     A          B          C
0  0.276232  -1.087401  -0.673690
1  0.113648  -1.478427   0.524988
2  0.404705   0.577046  -1.715002

If a DataFrame is sliced with a DataFrame based boolean condition (with the same size as the original DataFrame), then a DataFrame the same size (index and columns) as the original is returned, with elements that do not meet the boolean condition as NaN. This is accomplished via the new method `DataFrame.where`. In addition, `where` takes an optional `other` argument for replacement.

In [9]: df[df>0]
Out[9]:
     A          B          C
0  0.276232    NaN       NaN
1  0.113648    NaN   0.524988
2  0.404705  0.577046    NaN
Furthermore, `where` now aligns the input boolean condition (ndarray or DataFrame), such that partial selection with setting is possible. This is analogous to partial setting via `.ix` (but on the contents rather than the axis labels).

In [12]: df2 = df.copy()

In [13]: df2[ df2[1:4] > 0 ] = 3

In [14]: df2

Out[14]:

<table>
<thead>
<tr>
<th></th>
<th>A</th>
<th>B</th>
<th>C</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0.276232</td>
<td>NaN</td>
<td>NaN</td>
</tr>
<tr>
<td>1</td>
<td>0.113648</td>
<td>NaN</td>
<td>0.524988</td>
</tr>
<tr>
<td>2</td>
<td>0.404705</td>
<td>0.577046</td>
<td>NaN</td>
</tr>

</tr>
<tr>
<td>4</td>
<td>NaN</td>
<td>0.844885</td>
<td>1.075770</td>
</tr>
</tbody>
</table>

[5 rows x 3 columns]
• Enable referencing of Excel columns by their column names (GH1936)

```python
In [16]: xl = pd.ExcelFile('data/test.xls')

In [17]: xl.parse('Sheet1', index_col=0, parse_dates=True,
.....:     parse_cols='A:D')
.....:
Out[17]:
A   B   C   D
2000-01-03 0.980269 3.685731 -0.364217 -1.159738
2000-01-04 1.047916 -0.041232 -0.161812 0.212549
2000-01-05 0.498581 0.731168 -0.537677 1.346270
2000-01-06 1.120202 1.567621 0.003641 0.675253
2000-01-07 -0.487094 0.571455 -1.611639 0.103469
2000-01-10 0.836649 0.246462 0.588543 1.062782
2000-01-11 -0.157161 1.340307 1.195778 -1.097007
```

[7 rows x 4 columns]

• Added option to disable pandas-style tick locators and formatters using `series.plot(x_compat=True)` or `pandas.plot_params['x_compat'] = True` (GH2205)

• Existing TimeSeries methods `at_time` and `between_time` were added to DataFrame (GH2149)

• DataFrame.dot can now accept ndarrays (GH2042)

• DataFrame.drop now supports non-unique indexes (GH2101)

• Panel.shift now supports negative periods (GH2164)

• DataFrame now support unary ~ operator (GH2110)

**API changes**

• Upsampling data with a PeriodIndex will result in a higher frequency TimeSeries that spans the original time window

```python
In [1]: prng = pd.period_range('2012Q1', periods=2, freq='Q')

In [2]: s = pd.Series(np.random.randn(len(prng)), prng)

In [4]: s.resample('M')
Out[4]:
2012-01 -1.471992
2012-02 NaN
2012-03 NaN
2012-04 -0.493593
2012-05 NaN
2012-06 NaN
Freq: M, dtype: float64
```

• Period.end_time now returns the last nanosecond in the time interval (GH2124, GH2125, GH1764)
In [18]: p = pd.Period('2012')

In [19]: p.end_time
Out[19]: Timestamp('2012-12-31 23:59:59.999999999')

- File parsers no longer coerce to float or bool for columns that have custom converters specified (GH2184)

In [20]: import io

In [21]: data = ('A,B,C
   ....: ', '00001,001,5
   ....: ', '00002,002,6')

In [22]: pd.read_csv(io.StringIO(data), converters={'A': lambda x: x.strip()})
Out[22]:
   A  B  C
0  00001  1  5
1  00002  2  6
[2 rows x 3 columns]

See the full release notes or issue tracker on GitHub for a complete list.

5.20.2 Version 0.9.0 (October 7, 2012)

This is a major release from 0.8.1 and includes several new features and enhancements along with a large number of bug fixes. New features include vectorized unicode encoding/decoding for Series.str, to_latex method to DataFrame, more flexible parsing of boolean values, and enabling the download of options data from Yahoo! Finance.

**New features**

- Add `encode` and `decode` for unicode handling to vectorized string processing methods in Series.str (GH1706)
- Add `DataFrame.to_latex` method (GH1735)
- Add convenient expanding window equivalents of all rolling_* ops (GH1785)
- Add Options class to pandas.io.data for fetching options data from Yahoo! Finance (GH1748, GH1739)
- More flexible parsing of boolean values (Yes, No, TRUE, FALSE, etc) (GH1691, GH1295)
- Add `level` parameter to Series.reset_index
- TimeSeries.between_time can now select times across midnight (GH1871)
- Series constructor can now handle generator as input (GH1679)
- DataFrame.dropna can now take multiple axes (tuple/list) as input (GH924)
- Enable `skip_footer` parameter in ExcelFile.parse (GH1843)

**API changes**

- The default column names when `header=None` and no columns names passed to functions like read_csv has changed to be more Pythonic and amenable to attribute access:

  ```python
  In [1]: import io
  In [2]: data = ""
     ...: 0,0,1
     ...: 1,1,0
     ...: 0,1,0
     ...: ***
     ...

  In [3]: df = pd.read_csv(io.StringIO(data), header=None)

  In [4]: df
  Out[4]:
  0 1 2
  0 0 1
  1 1 0
  2 0 1
  [3 rows x 3 columns]
  ```

- Creating a Series from another Series, passing an index, will cause reindexing to happen inside rather than treating the Series like an ndarray. Technically improper usages like `Series(df[col1], index=df[col2])` that worked before “by accident” (this was never intended) will lead to all NA Series in some cases. To be perfectly clear:
In [5]: s1 = pd.Series([1, 2, 3])

In [6]: s1
Out[6]:
          0    1
         1    2
         2    3
Length: 3, dtype: int64

In [7]: s2 = pd.Series(s1, index=["foo", "bar", "baz"])

In [8]: s2
Out[8]:
              foo   NaN
              bar   NaN
              baz   NaN
Length: 3, dtype: float64

• Deprecated day_of_year API removed from PeriodIndex, use dayofyear (GH1723)
• Don’t modify NumPy suppress printoption to True at import time
• The internal HDF5 data arrangement for DataFrames has been transposed. Legacy files will still be readable by HDFStore (GH1834, GH1824)
• Legacy cruft removed: pandas.stats.misc.quantileTS
• Use ISO8601 format for Period repr: monthly, daily, and on down (GH1776)
• Empty DataFrame columns are now created as object dtype. This will prevent a class of TypeErrors that was occurring in code where the dtype of a column would depend on the presence of data or not (e.g. a SQL query having results) (GH1783)
• Setting parts of DataFrame/Panel using ix now aligns input Series/DataFrame (GH1630)
• first and last methods in GroupBy no longer drop non-numeric columns (GH1809)
• Resolved inconsistencies in specifying custom NA values in text parser. na_values of type dict no longer override default NAs unless keep_default_na is set to false explicitly (GH1657)
• DataFrame.dot will not do data alignment, and also work with Series (GH1915)

See the full release notes or issue tracker on GitHub for a complete list.

5.21 Version 0.8

5.21.1 Version 0.8.1 (July 22, 2012)

This release includes a few new features, performance enhancements, and over 30 bug fixes from 0.8.0. New features include notably NA friendly string processing functionality and a series of new plot types and options.

New features

- Add vectorized string processing methods accessible via Series.str (GH620)
- Add option to disable adjustment in EWMA (GH1584)
- Radviz plot (GH1566)
- Parallel coordinates plot
- Bootstrap plot
- Per column styles and secondary y-axis plotting (GH1559)
- New datetime converters millisecond plotting (GH1599)
- Add option to disable “sparse” display of hierarchical indexes (GH1538)
- Series/DataFrame’s set_index method can append levels to an existing Index/MultiIndex (GH1569, GH1577)
**Performance improvements**

- Improved implementation of rolling min and max (thanks to Bottleneck !)
- Add accelerated 'median' GroupBy option (GH1358)
- Significantly improve the performance of parsing ISO8601-format date strings with DatetimeIndex or to_datetime (GH1571)
- Improve the performance of GroupBy on single-key aggregations and use with Categorical types
- Significant datetime parsing performance improvements

**Contributors**

A total of 5 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

- Chang She
- Skipper Seabold
- Todd DeLuca +
- Vytautas Jancauskas
- Wes McKinney

**5.21.2 Version 0.8.0 (June 29, 2012)**

This is a major release from 0.7.3 and includes extensive work on the time series handling and processing infrastructure as well as a great deal of new functionality throughout the library. It includes over 700 commits from more than 20 distinct authors. Most pandas 0.7.3 and earlier users should not experience any issues upgrading, but due to the migration to the NumPy datetime64 dtype, there may be a number of bugs and incompatibilities lurking. Lingering incompatibilities will be fixed ASAP in a 0.8.1 release if necessary. See the full release notes or issue tracker on GitHub for a complete list.

**Support for non-unique indexes**

All objects can now work with non-unique indexes. Data alignment / join operations work according to SQL join semantics (including, if application, index duplication in many-to-many joins)

**NumPy datetime64 dtype and 1.6 dependency**

Time series data are now represented using NumPy’s datetime64 dtype; thus, pandas 0.8.0 now requires at least NumPy 1.6. It has been tested and verified to work with the development version (1.7+) of NumPy as well which includes some significant user-facing API changes. NumPy 1.6 also has a number of bugs having to do with nanosecond resolution data, so I recommend that you steer clear of NumPy 1.6’s datetime64 API functions (though limited as they are) and only interact with this data using the interface that pandas provides.

See the end of the 0.8.0 section for a “porting” guide listing potential issues for users migrating legacy code bases from pandas 0.7 or earlier to 0.8.0.

Bug fixes to the 0.7.x series for legacy NumPy < 1.6 users will be provided as they arise. There will be no more further development in 0.7.x beyond bug fixes.
**Time Series changes and improvements**

**Note:** With this release, legacy scikits.timeseries users should be able to port their code to use pandas.

**Note:** See documentation for overview of pandas timeseries API.

- New datetime64 representation **speeds up join operations and data alignment**, **reduces memory usage**, and improve serialization / deserialization performance significantly over datetime.datetime

- High performance and flexible **resample** method for converting from high-to-low and low-to-high frequency. Supports interpolation, user-defined aggregation functions, and control over how the intervals and result labeling are defined. A suite of high performance Cython/C-based resampling functions (including Open-High-Low-Close) have also been implemented.

- Revamp of **frequency aliases** and support for **frequency shortcuts** like ‘15min’, or ‘1h30min’

- New **DatetimeIndex class** supports both fixed frequency and irregular time series. Replaces now deprecated DateRange class

- New **PeriodIndex** and **Period** classes for representing **time spans** and performing **calendar logic**, including the 12 fiscal quarterly frequencies <timeseries.quarterly>. This is a partial port of, and a substantial enhancement to, elements of the scikits.timeseries code base. Support for conversion between PeriodIndex and DatetimeIndex

- New **Timestamp data type subclasses** datetime.datetime, providing the same interface while enabling working with nanosecond-resolution data. Also provides easy **time zone conversions**.

- Enhanced support for **time zones**. Add tz_convert and tz_localize methods to TimeSeries and DataFrame. All timestamps are stored as UTC; Timestamps from DatetimeIndex objects with time zone set will be localized to local time. Time zone conversions are therefore essentially free. User needs to know very little about pytz library now; only time zone names as strings are required. Time zone-aware timestamps are equal if and only if their UTC timestamps match. Operations between time zone-aware time series with different time zones will result in a UTC-indexed time series.

- Time series **string indexing conveniences** / shortcuts: slice years, year and month, and index values with strings

- Enhanced time series **plotting**: adaptation of scikits.timeseries matplotlib-based plotting code

- New **date_range**, bdate_range, and **period_range** factory functions

- Robust **frequency inference** function infer_freq and inferred_freq property of DatetimeIndex, with option to infer frequency on construction of DatetimeIndex

- **to_datetime** function efficiently parses array of strings to DatetimeIndex. DatetimeIndex will parse array or list of strings to datetime64

- **Optimized** support for datetime64-dtype data in Series and DataFrame columns

- New NaT (Not-a-Time) type to represent NA in timestamp arrays

- Optimize Series.asof for looking up “as of” values for arrays of timestamps

- Milli, Micro, Nano date offset objects

- Can index time series with datetime.time objects to select all data at particular **time of day** (TimeSeries.at_time) or **between two times** (TimeSeries.between_time)

- Add **tshift** method for leading/lagging using the frequency (if any) of the index, as opposed to a naive lead/lag using shift
Other new features

- New `cut` and `qcut` functions (like R’s `cut` function) for computing a categorical variable from a continuous variable by binning values either into value-based (`cut`) or quantile-based (`qcut`) bins
- Rename `Factor` to `Categorical` and add a number of usability features
- Add `limit` argument to `fillna/reindex`
- More flexible multiple function application in `GroupBy`, and can pass list (name, function) tuples to get result in particular order with given names
- Add flexible `replace` method for efficiently substituting values
- Enhanced `read_csv/read_table` for reading time series data and converting multiple columns to dates
- Add `comments` option to parser functions: `read_csv`, etc.
- Add `dayfirst` option to parser functions for parsing international DD/MM/YYYY dates
- Allow the user to specify the CSV reader `dialect` to control quoting etc.
- Handling `thousands` separators in `read_csv` to improve integer parsing.
- Enable unstacking of multiple levels in one shot. Alleviate `pivot_table` bugs (empty columns being introduced)
- Move to klib-based hash tables for indexing; better performance and less memory usage than Python’s dict
- Add first, last, min, max, and prod optimized `GroupBy` functions
- New `ordered_merge` function
- Add flexible `comparison` instance methods `eq`, `ne`, `lt`, `gt`, etc. to `DataFrame`, `Series`
- Improve `scatter_matrix` plotting function and add histogram or kernel density estimates to diagonal
- Add `kde` plot option for density plots
- Support for converting `DataFrame` to R `data.frame` through rpy2
- Improved support for complex numbers in `Series` and `DataFrame`
- Add `pct_change` method to all data structures
- Add `max_colwidth` configuration option for `DataFrame` console output
- `Interpolate` `Series` values using index values
- Can select multiple columns from `GroupBy`
- Add `update` methods to `Series/DataFrame` for updating values in place
- Add `any` and `all` method to `DataFrame`

New plotting methods

```python
import pandas as pd

fx = pd.read_pickle("data/fx_prices")
import matplotlib.pyplot as plt

Series.plot now supports a `secondary_y` option:
```
plt.figure()

fx['FR'].plot(style="g")

fx['IT'].plot(style="k--", secondary_y=True)

Vytautas Jancauskas, the 2012 GSOC participant, has added many new plot types. For example, 'kde' is a new option:

```
In [1]: s = pd.Series(
                   ...:   np.concatenate((np.random.randn(1000), np.random.randn(1000) * 0.5 + 3))
                   ...:)
                   ...

In [2]: plt.figure()
Out[2]: <Figure size 640x480 with 0 Axes>

In [3]: s.hist(density=True, alpha=0.2)
Out[3]: <AxesSubplot:>

In [4]: s.plot(kind="kde")
Out[4]: <AxesSubplot:ylabel='Density'>
```

See the plotting page for much more.

**Other API changes**

- Deprecation of `offset`, `time_rule`, and `timeRule` arguments names in time series functions. Warnings will be printed until pandas 0.9 or 1.0.

**Potential porting issues for pandas <= 0.7.3 users**

The major change that may affect you in pandas 0.8.0 is that time series indexes use NumPy’s `datetime64` data type instead of `dtype=object` arrays of Python’s built-in `datetime.datetime` objects. `DateRange` has been replaced by `DatetimeIndex` but otherwise behaved identically. But, if you have code that converts `DateRange` or `Index` objects that used to contain `datetime.datetime` values to plain NumPy arrays, you may have bugs lurking with code using scalar values because you are handing control over to NumPy:

```
In [5]: import datetime

In [6]: rng = pd.date_range("1/1/2000", periods=10)

In [7]: rng[5]
Out[7]: Timestamp('2000-01-06 00:00:00', freq='D')

In [8]: isinstance(rng[5], datetime.datetime)
Out[8]: True

In [9]: rng_asarray = np.asarray(rng)

In [10]: scalar_val = rng_asarray[5]

In [11]: type(scalar_val)
Out[11]: numpy.datetime64
```
pandas's Timestamp object is a subclass of datetime.datetime that has nanosecond support (the nanosecond field store the nanosecond value between 0 and 999). It should substitute directly into any code that used datetime.datetime values before. Thus, I recommend not casting DatetimeIndex to regular NumPy arrays.

If you have code that requires an array of datetime.datetime objects, you have a couple of options. First, the astype(object) method of DatetimeIndex produces an array of Timestamp objects:

```python
In [12]: stamp_array = rng.astype(object)
In [13]: stamp_array
Out[13]:
Index([2000-01-01 00:00:00, 2000-01-02 00:00:00, 2000-01-03 00:00:00,
      2000-01-04 00:00:00, 2000-01-05 00:00:00, 2000-01-06 00:00:00,
      2000-01-07 00:00:00, 2000-01-08 00:00:00, 2000-01-09 00:00:00,
      2000-01-10 00:00:00],
dtype='object')
```

To get an array of proper datetime.datetime objects, use the to_pydatetime method:

```python
In [15]: dt_array = rng.to_pydatetime()
In [16]: dt_array
Out[16]:
array([datetime.datetime(2000, 1, 1, 0, 0),
      datetime.datetime(2000, 1, 2, 0, 0),
      datetime.datetime(2000, 1, 3, 0, 0),
      datetime.datetime(2000, 1, 4, 0, 0),
      datetime.datetime(2000, 1, 5, 0, 0),
      datetime.datetime(2000, 1, 6, 0, 0),
      datetime.datetime(2000, 1, 7, 0, 0),
      datetime.datetime(2000, 1, 8, 0, 0),
      datetime.datetime(2000, 1, 9, 0, 0),
      datetime.datetime(2000, 1, 10, 0, 0)], dtype=object)
```

matplotlib knows how to handle datetime.datetime but not Timestamp objects. While I recommend that you plot time series using TimeSeries.plot, you can either use to_pydatetime or register a converter for the Timestamp type. See matplotlib documentation for more on this.

```
Warning: There are bugs in the user-facing API with the nanosecond datetime64 unit in NumPy 1.6. In particular, the string version of the array shows garbage values, and conversion to dtype=object is similarly broken.
In [18]: rng = pd.date_range("1/1/2000", periods=10)
In [19]: rng
Out[19]:
      '2000-01-09', '2000-01-10'],
dtype='datetime64[ns]', freq='D')
```

In [20]: np.asarray(rng)
Out[20]:
array(['2000-01-01T00:00:00.000000000', '2000-01-02T00:00:00.000000000',
       '2000-01-03T00:00:00.000000000', '2000-01-04T00:00:00.000000000',
       '2000-01-05T00:00:00.000000000', '2000-01-06T00:00:00.000000000',
       '2000-01-07T00:00:00.000000000', '2000-01-08T00:00:00.000000000',
       '2000-01-09T00:00:00.000000000', '2000-01-10T00:00:00.000000000'],
      dtype='datetime64[ns]')

In [21]: converted = np.asarray(rng, dtype=object)

In [22]: converted[5]
Out[22]: Timestamp('2000-01-06 00:00:00', freq='D')

Trust me: don’t panic. If you are using NumPy 1.6 and restrict your interaction with datetime64 values to pandas’s API you will be just fine. There is nothing wrong with the data-type (a 64-bit integer internally); all of the important data processing happens in pandas and is heavily tested. I strongly recommend that you **do not work directly with datetime64 arrays in NumPy 1.6** and only use the pandas API.

Support for non-unique indexes: In the latter case, you may have code inside a try:... catch: block that failed due to the index not being unique. In many cases it will no longer fail (some method like append still check for uniqueness unless disabled). However, all is not lost: you can inspect index.is_unique and raise an exception explicitly if it is False or go to a different code branch.

5.22 Version 0.7

5.22.1 Version 0.7.3 (April 12, 2012)

This is a minor release from 0.7.2 and fixes many minor bugs and adds a number of nice new features. There are also a couple of API changes to note; these should not affect very many users, and we are inclined to call them “bug fixes” even though they do constitute a change in behavior. See the full release notes or issue tracker on GitHub for a complete list.

New features

• New fixed width file reader, read_fwf
• New scatter_matrix function for making a scatter plot matrix

```python
from pandas.tools.plotting import scatter_matrix
scatter_matrix(df, alpha=0.2)  # noqa F821
```

• Add stacked argument to Series and DataFrame’s plot method for stacked bar plots.

```python
df.plot(kind='bar', stacked=True)  # noqa F821

df.plot(kind='barh', stacked=True)  # noqa F821
```

• Add log x and y scaling options to DataFrame.plot and Series.plot
• Add kurt methods to Series and DataFrame for computing kurtosis
**NA boolean comparison API change**

Reverted some changes to how NA values (represented typically as NaN or None) are handled in non-numeric Series:

```python
In [1]: series = pd.Series(["Steve", np.nan, "Joe"])

In [2]: series == "Steve"
Out[2]:
0   True
1   False
2   False
Length: 3, dtype: bool

In [3]: series != "Steve"
Out[3]:
0   False
1   True
2   True
Length: 3, dtype: bool
```

In comparisons, NA / NaN will always come through as False except with != which is True. *Be very careful* with boolean arithmetic, especially negation, in the presence of NA data. You may wish to add an explicit NA filter into boolean array operations if you are worried about this:

```python
In [4]: mask = series == "Steve"

In [5]: series[mask & series.notnull()]
Out[5]:
0   Steve
Length: 1, dtype: object
```

While propagating NA in comparisons may seem like the right behavior to some users (and you could argue on purely technical grounds that this is the right thing to do), the evaluation was made that propagating NA everywhere, including in numerical arrays, would cause a large amount of problems for users. Thus, a “practicality beats purity” approach was taken. This issue may be revisited at some point in the future.

**Other API changes**

When calling apply on a grouped Series, the return value will also be a Series, to be more consistent with the groupby behavior with DataFrame:

```python
In [6]: df = pd.DataFrame(
   ...:     {"A": ["foo", "bar", "foo", "bar", "foo", "foo", "foo", "foo"],
   ...:      "B": ["one", "one", "two", "three", "two", "two", "one", "three"],
   ...:      "C": np.random.randn(8),
   ...:      "D": np.random.randn(8),
   ...:     }
   ...
)

In [7]: df
Out[7]:
   A   B          C         D
0  foo  one  0.469112 -0.861849
1  bar  one  0.282863  2.104569
```

5.22. Version 0.7
pandas: powerful Python data analysis toolkit, Release 1.2.2

- lgautier +

5.22.2 Version 0.7.2 (March 16, 2012)

This release targets bugs in 0.7.1, and adds a few minor features.

New features

- Add additional tie-breaking methods in DataFrame.rank (GH874)
- Add ascending parameter to rank in Series, DataFrame (GH875)
- Add coerce_float option to DataFrame.from_records (GH893)
- Add sort_columns parameter to allow unsorted plots (GH918)
- Enable column access via attributes on GroupBy (GH882)
- Can pass dict of values to DataFrame.fillna (GH661)
- Can select multiple hierarchical groups by passing list of values in .ix (GH134)
- Add axis option to DataFrame.fillna (GH174)
- Add level keyword to drop for dropping values from a level (GH159)

Performance improvements

- Use khash for Series.value_counts, add raw function to algorithms.py (GH861)
- Intercept __builtin__.sum in groupby (GH885)

Contributors

A total of 12 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

5.22.3 Version 0.7.1 (February 29, 2012)

This release includes a few new features and addresses over a dozen bugs in 0.7.0.

New features

- Add `to_clipboard` function to pandas namespace for writing objects to the system clipboard (GH774)
- Add `itertuples` method to DataFrame for iterating through the rows of a dataframe as tuples (GH818)
- Add ability to pass `fill_value` and method to DataFrame and Series align method (GH806, GH807)
- Add `fill_value` option to reindex, align methods (GH784)
- Enable `concat` to produce DataFrame from Series (GH787)
- Add `between` method to Series (GH802)
- Add HTML representation hook to DataFrame for the IPython HTML notebook (GH773)
- Support for reading Excel 2007 XML documents using openpyxl

Performance improvements

- Improve performance and memory usage of `fillna` on DataFrame
- Can concatenate a list of Series along axis=1 to obtain a DataFrame (GH787)

Contributors

A total of 9 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

5.22.4 Version 0.7.0 (February 9, 2012)

New features

- New unified **merge function** for efficiently performing full gamut of database / relational-algebra operations. Refactored existing join methods to use the new infrastructure, resulting in substantial performance gains (GH220, GH249, GH267)

- New **unified concatenation function** for concatenating Series, DataFrame or Panel objects along an axis. Can form union or intersection of the other axes. Improves performance of Series.append and DataFrame.append (GH468, GH479, GH273)

- **Can** pass multiple DataFrames to DataFrame.append to concatenate (stack) and multiple Series to Series.append too

- **Can** pass list of dicts (e.g., a list of JSON objects) to DataFrame constructor (GH526)

- You can now set multiple columns in a DataFrame via __getitem__, useful for transformation (GH342)

- Handle differently-indexed output values in DataFrame.apply (GH498)

```
In [1]: df = pd.DataFrame(np.random.randn(10, 4))
In [2]: df.apply(lambda x: x.describe())
Out[2]:

```

```
• Add reorder_levels method to Series and DataFrame (GH534)
• Add dict-like get function to DataFrame and Panel (GH521)
• Add DataFrame.iterrows method for efficiently iterating through the rows of a DataFrame
• Add DataFrame.to_panel with code adapted from LongPanel.to_long
• Add reindex_axis method added to DataFrame
• Add level option to binary arithmetic functions on DataFrame and Series
• Add level option to the reindex and align methods on Series and DataFrame for broadcasting values across a level (GH542, GH552, others)
• Add attribute-based item access to Panel and add IPython completion (GH563)
• Add logy option to Series.plot for log-scaling on the Y axis
• Add index and header options to DataFrame.to_string
• Can pass multiple DataFrames to DataFrame.join to join on index (GH115)
• Can pass multiple Panels to Panel.join (GH115)
• Added justify argument to DataFrame.to_string to allow different alignment of column headers
```
pandas: powerful Python data analysis toolkit, Release 1.2.2

- Add `sort` option to GroupBy to allow disabling sorting of the group keys for potential speedups (GH595)
- Can pass MaskedArray to Series constructor (GH563)
- Add Panel item access via attributes and IPython completion (GH554)
- Implement `DataFrame.lookup`, fancy-indexing analogue for retrieving values given a sequence of row and column labels (GH338)
- Can pass a list of functions to aggregate with groupby on a DataFrame, yielding an aggregated result with hierarchical columns (GH166)
- Can call `cummin` and `cummax` on Series and DataFrame to get cumulative minimum and maximum, respectively (GH647)
- `value_range` added as utility function to get min and max of a dataframe (GH288)
- Added encoding argument to `read_csv`, `read_table`, `to_csv` and `from_csv` for non-ascii text (GH717)
- Added `abs` method to pandas objects
- Added `crosstab` function for easily computing frequency tables
- Added `isin` method to index objects
- Added `level` argument to `xs` method of DataFrame.

### API changes to integer indexing

One of the potentially riskiest API changes in 0.7.0, but also one of the most important, was a complete review of how integer indexes are handled with regard to label-based indexing. Here is an example:

```
In [3]: s = pd.Series(np.random.randn(10), index=range(0, 20, 2))

In [4]: s
Out[4]:
    0  -1.294524
    2   0.413738
    4   0.276662
    6  -0.472035
    8  -0.013960
   10  -0.362543
   12  -0.006154
   14  -0.923061
   16   0.895717
   18   0.805244
Length: 10, dtype: float64

In [5]: s[0]
Out[5]: -1.2945235902555294

In [6]: s[2]
Out[6]: 0.41373810535784006

In [7]: s[4]
Out[7]: 0.2766617129497566
```

This is all exactly identical to the behavior before. However, if you ask for a key not contained in the Series, in versions 0.6.1 and prior, Series would fall back on a location-based lookup. This now raises a `KeyError`:  

```
KeyError: 12
```
This change also has the same impact on DataFrame:

```
In [3]: df = pd.DataFrame(np.random.randn(8, 4), index=range(0, 16, 2))
In [4]: df
```

<table>
<thead>
<tr>
<th></th>
<th>1</th>
<th>2</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0.88427</td>
<td>0.3363</td>
<td>-0.1787</td>
</tr>
<tr>
<td>2</td>
<td>0.14451</td>
<td>-0.1415</td>
<td>0.2504</td>
</tr>
<tr>
<td>4</td>
<td>-1.44779</td>
<td>-0.9186</td>
<td>-1.4996</td>
</tr>
<tr>
<td>6</td>
<td>-0.26598</td>
<td>-2.4184</td>
<td>-0.2658</td>
</tr>
<tr>
<td>8</td>
<td>-0.58776</td>
<td>0.3144</td>
<td>-0.8566</td>
</tr>
<tr>
<td>10</td>
<td>0.10940</td>
<td>-0.7175</td>
<td>-1.0108</td>
</tr>
<tr>
<td>12</td>
<td>-1.16919</td>
<td>-0.3087</td>
<td>-0.6049</td>
</tr>
<tr>
<td>14</td>
<td>-0.07337</td>
<td>0.3410</td>
<td>0.0424</td>
</tr>
</tbody>
</table>

```
In [5]: df.ix[3]
```

KeyError: 3

In order to support purely integer-based indexing, the following methods have been added:

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Series.iget_value(i)</td>
<td>Retrieve value stored at location i</td>
</tr>
<tr>
<td>Series.iget(i)</td>
<td>Alias for iget_value</td>
</tr>
<tr>
<td>DataFrame.irow(i)</td>
<td>Retrieve the i-th row</td>
</tr>
<tr>
<td>DataFrame.icol(j)</td>
<td>Retrieve the j-th column</td>
</tr>
<tr>
<td>DataFrame.iget_value(i, j)</td>
<td>Retrieve the value at row i and column j</td>
</tr>
</tbody>
</table>

**API tweaks regarding label-based slicing**

Label-based slicing using `ix` now requires that the index be sorted (monotonic) unless both the start and endpoint are contained in the index:

```
In [1]: s = pd.Series(np.random.randn(6), index=list('gmkaec'))
In [2]: s
```

```
Out[2]:
g -1.182230
m -0.276183
k -0.243550
a 1.628992
e 0.073308
c -0.539890
dtype: float64
```

Then this is OK:

```
In [3]: s.ix['k':'e']
```

```
Out[3]:
k -0.243550
a 1.628992
e 0.073308
dtype: float64
```
But this is not:

```python
In [12]: s.ix['b':'h']
KeyError 'b'
```

If the index had been sorted, the “range selection” would have been possible:

```python
In [4]: s2 = s.sort_index()
In [5]: s2
Out[5]:
a   1.628992
b   1.206412
c  -0.539890
e    0.073308
g  -1.182230
k  -0.243550
m  -0.276183
dtype: float64

In [6]: s2.ix['b':'h']
Out[6]:
c  -0.539890
e    0.073308
g  -1.182230
dtype: float64
```

### Changes to Series [] operator

As as notational convenience, you can pass a sequence of labels or a label slice to a Series when getting and setting values via [] (i.e. the `__getitem__` and `__setitem__` methods). The behavior will be the same as passing similar input to `ix` except in the case of integer indexing:

```python
In [8]: s = pd.Series(np.random.randn(6), index=list('acegkm'))
In [9]: s
Out[9]:
a  -1.206412
b  2.565646
c  1.431256
de  1.340309
g  -1.170299
k  -0.226169
m  -0.226169
Length: 6, dtype: float64

In [10]: s[['m', 'a', 'c', 'e']]
Out[10]:
m  -0.226169
a  -1.206412
c  2.565646
de  1.431256
Length: 4, dtype: float64

In [11]: s[['b':'l']]
Out[11]:
c  2.565646
e  1.431256
```
In the case of integer indexes, the behavior will be exactly as before (shadowing ndarray):

```python
In [13]: s = pd.Series(np.random.randn(6), index=range(0, 12, 2))
In [14]: s[4, 0, 2]
Out[14]:
4  0.132003
0  0.410835
2  0.813850
Length: 3, dtype: float64
In [15]: s[1:5]
Out[15]:
2  0.813850
4  0.132003
6  -0.827317
Length: 4, dtype: float64
```

If you wish to do indexing with sequences and slicing on an integer index with label semantics, use `ix`.

**Other API changes**

- The deprecated `LongPanel` class has been completely removed
- If `Series.sort` is called on a column of a DataFrame, an exception will now be raised. Before it was possible to accidentally mutate a DataFrame’s column by doing `df[col].sort()` instead of the side-effect free method `df[col].order()` (GH316)
- Miscellaneous renames and deprecations which will (harmlessly) raise `FutureWarning`
- `drop` added as an optional parameter to `DataFrame.reset_index` (GH699)

**Performance improvements**

- `Cythonized GroupBy aggregations` no longer presort the data, thus achieving a significant speedup (GH93). GroupBy aggregations with Python functions significantly sped up by clever manipulation of the ndarray data type in Cython (GH496).
- Better error message in DataFrame constructor when passed column labels don’t match data (GH497)
- Substantially improve performance of multi-GroupBy aggregation when a Python function is passed, reuse ndarray object in Cython (GH496)
- Can store objects indexed by tuples and floats in HDFStore (GH492)
• Don’t print length by default in Series.to_string, add length option (GH489)
• Improve Cython code for multi-groupby to aggregate without having to sort the data (GH93)
• Improve MultiIndex reindexing speed by storing tuples in the MultiIndex, test for backwards unpickling compatibility
• Improve column reindexing performance by using specialized Cython take function
• Further performance tweaking of Series.__getitem__ for standard use cases
• Avoid Index dict creation in some cases (i.e. when getting slices, etc.), regression from prior versions
• Friendlier error message in setup.py if NumPy not installed
• Use common set of NA-handling operations (sum, mean, etc.) in Panel class also (GH536)
• Default name assignment when calling reset_index on DataFrame with a regular (non-hierarchical) index (GH476)
• Use Cythonized groupers when possible in Series/DataFrame stat ops with level parameter passed (GH545)
• Ported skiplist data structure to C to speed up rolling_median by about 5-10x in most typical use cases (GH374)

5.23 Version 0.6

5.23.1 Version 0.6.1 (December 13, 2011)

New features

- Can append single rows (as Series) to a DataFrame
- Add Spearman and Kendall rank correlation options to Series.corr and DataFrame.corr (GH428)
- Added get_value and set_value methods to Series, DataFrame, and Panel for very low-overhead access (>2x faster in many cases) to scalar elements (GH437, GH438). set_value is capable of producing an enlarged object.
- Add PyQt table widget to sandbox (GH435)
- DataFrame.align can accept Series arguments and an axis option (GH461)
- Implement new SparseArray and SparseList data structures. SparseSeries now derives from SparseArray (GH463)
- Better console printing options (GH453)
- Implement fast data ranking for Series and DataFrame, fast versions of scipy.stats.rankdata (GH428)
- Implement DataFrame.from_items alternate constructor (GH444)
- DataFrame.convert_objects method for inferring better dtypes for object columns (GH302)
- Add rolling_corr_pairwise function for computing Panel of correlation matrices (GH189)
- Add margins option to pivot_table for computing subgroup aggregates (GH114)
- Add Series.from_csv function (GH482)
- Can pass DataFrame/DataFrame and DataFrame/Series to rolling_corr/rolling_cov (GH #462)
- MultiIndex.get_level_values can accept the level name

Performance improvements

- Improve memory usage of DataFrame.describe (do not copy data unnecessarily) (PR #425)
- Optimize scalar value lookups in the general case by 25% or more in Series and DataFrame
- Fix performance regression in cross-sectional count in DataFrame, affecting DataFrame.dropna speed
- Column deletion in DataFrame copies no data (computes views on blocks) (GH #158)

Contributors

A total of 7 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

- Dieter Vandenbussche
- Fernando Perez +
- Jev Kuznetsov +
- Joon Ro
5.23.2 Version 0.6.0 (November 25, 2011)

New features

- Added melt function to pandas.core.reshape
- Added level parameter to group by level in Series and DataFrame descriptive statistics (GH313)
- Added head and tail methods to Series, analogous to DataFrame (GH296)
- Added Series.isin function which checks if each value is contained in a passed sequence (GH289)
- Added float_format option to Series.to_string
- Added skip_footer (GH291) and converters (GH343) options to read_csv and read_table
- Added drop_duplicates and duplicated functions for removing duplicate DataFrame rows and checking for duplicate rows, respectively (GH319)
- Implemented operators `&`, `|`, `^`, `-` on DataFrame (GH347)
- Added Series.mad, mean absolute deviation
- Added QuarterEnd DateOffset (GH321)
- Added dot to DataFrame (GH65)
- Added orient option to Panel.from_dict (GH359, GH301)
- Added orient option to DataFrame.from_dict
- Added passing list of tuples or list of lists to DataFrame.from_records (GH357)
- Added multiple levels to groupby (GH103)
- Allow multiple columns in by argument of DataFrame.sort_index (GH92, GH362)
- Added fast get_value and put_value methods to DataFrame (GH360)
- Added cov instance methods to Series and DataFrame (GH194, GH362)
- Added kind='bar' option to DataFrame.plot (GH348)
- Added idxmin and idxmax to Series and DataFrame (GH286)
- Added read_clipboard function to parse DataFrame from clipboard (GH300)
- Added nunique function to Series for counting unique elements (GH297)
- Made DataFrame constructor use Series name if no columns passed (GH373)
- Support regular expressions in read_table/read_csv (GH364)
- Added DataFrame.to_html for writing DataFrame to HTML (GH387)
- Added support for MaskedArray data in DataFrame, masked values converted to NaN (GH396)
- Added DataFrame.boxplot function (GH368)
- Can pass extra args, kwds to DataFrame.apply (GH376)
- Implement DataFrame.join with vector on argument (GH312)
• Added legend boolean flag to DataFrame.plot (GH324)
• Can pass multiple levels to stack and unstack (GH370)
• Can pass multiple values columns to pivot_table (GH381)
• Use Series name in GroupBy for result index (GH363)
• Added raw option to DataFrame.apply for performance if only need ndarray (GH309)
• Added proper, tested weighted least squares to standard and panel OLS (GH303)

Performance enhancements

• VBENCH Cythonized cache_readonly, resulting in substantial micro-performance enhancements throughout the code base (GH361)
• VBENCH Special Cython matrix iterator for applying arbitrary reduction operations with 3-5x better performance than np.apply_along_axis (GH309)
• VBENCH Improved performance of MultiIndex.from_tuples
• VBENCH Special Cython matrix iterator for applying arbitrary reduction operations
• VBENCH + DOCUMENT Add raw option to DataFrame.apply for getting better performance when
• VBENCH Faster cythonized count by level in Series and DataFrame (GH341)
• VBENCH? Significant GroupBy performance enhancement with multiple keys with many “empty” combinations
• VBENCH New Cython vectorized function map_infer speeds up Series.apply and Series.map significantly when passed elementwise Python function, motivated by (GH355)
• VBENCH Significantly improved performance of Series.order, which also makes np.unique called on a Series faster (GH327)
• VBENCH Vastly improved performance of GroupBy on axes with a MultiIndex (GH299)

5.24 Version 0.5

5.24.1 Version 0.5.0 (October 24, 2011)

New features

- Added DataFrame.align method with standard join options
- Added parse_dates option to read_csv and read_table methods to optionally try to parse dates in the index columns
- Added nrows, chunksize, and iterator arguments to read_csv and read_table. The last two return a new TextParser class capable of lazily iterating through chunks of a flat file (GH242)
- Added ability to join on multiple columns in DataFrame.join (GH214)
- Added private _get_duplicates function to Index for identifying duplicate values more easily (ENH5c)
- Added column attribute access to DataFrame.
- Added Python tab completion hook for DataFrame columns. (GH233, GH230)
- Implemented Series.describe for Series containing objects (GH241)
- Added inner join option to DataFrame.join when joining on key(s) (GH248)
- Implemented selecting DataFrame columns by passing a list to __getitem__ (GH253)
- Implemented & and | to intersect / union Index objects, respectively (GH261)
- Added pivot_table convenience function to pandas namespace (GH234)
- Implemented Panel.rename_axis function (GH243)
- DataFrame will show index level names in console output (GH334)
- Implemented Panel.take
- Added set_eng_float_format for alternate DataFrame floating point string formatting (ENH61)
- Added convenience set_index function for creating a DataFrame index from its existing columns
- Implemented groupby hierarchical index level name (GH223)
- Added support for different delimiters in DataFrame.to_csv (GH244)
- TODO: DOCS ABOUT TAKE METHODS

Performance enhancements

- VBENCH Major performance improvements in file parsing functions read_csv and read_table
- VBENCH Added Cython function for converting tuples to ndarray very fast. Speeds up many MultiIndex-related operations
- VBENCH Refactored merging / joining code into a tidy class and disabled unnecessary computations in the float/object case, thus getting about 10% better performance (GH211)
- VBENCH Improved speed of DataFrame.xs on mixed-type DataFrame objects by about 5x, regression from 0.3.0 (GH215)
- VBENCH With new DataFrame.align method, speeding up binary operations between differently-indexed DataFrame objects by 10-25%.
• VBENCH Significantly sped up conversion of nested dict into DataFrame (GH212)
• VBENCH Significantly speed up DataFrame __repr__ and count on large mixed-type DataFrame objects

Contributors

A total of 9 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

5.25 Version 0.4

5.25.1 Versions 0.4.1 through 0.4.3 (September 25 - October 9, 2011)

New features

• Added Python 3 support using 2to3 (GH200)
• *Added* name attribute to Series, now prints as part of Series.__repr__
• *Added* instance methods isnull and notnull to Series (GH209, GH203)
• *Added* Series.align method for aligning two series with choice of join method (ENH56)
• *Added* method get_level_values to MultiIndex (GH188)
• Set values in mixed-type DataFrame objects via .ix indexing attribute (GH135)
• *Added* new DataFrame methods get_dtype_counts and property dtypes (ENHdc)
• *Added* ignore_index option to DataFrame.append to stack DataFrames (ENH1b)
• read_csv tries to sniff delimiters using csv.Sniffer (GH146)
• read_csv can read multiple columns into a MultiIndex; DataFrame’s to_csv method writes out a corresponding MultiIndex (GH151)
• DataFrame.rename has a new copy parameter to rename a DataFrame in place (ENHed)
• Enable unstacking by name (GH142)
• *Enable* sortlevel to work by level (GH141)
Performance enhancements

- Altered binary operations on differently-indexed SparseSeries objects to use the integer-based (dense) alignment logic which is faster with a larger number of blocks (GH205)
- Wrote faster Cython data alignment / merging routines resulting in substantial speed increases
- Improved performance of isnull and notnull, a regression from v0.3.0 (GH187)
- Refactored code related to DataFrame.join so that intermediate aligned copies of the data in each DataFrame argument do not need to be created. Substantial performance increases result (GH176)
- Substantially improved performance of generic Index.intersection and Index.union
- Implemented BlockManager.take resulting in significantly faster take performance on mixed-type DataFrame objects (GH104)
- Improved performance of Series.sort_index
- Significant groupby performance enhancement: removed unnecessary integrity checks in DataFrame internals that were slowing down slicing operations to retrieve groups
- Optimized _ensure_index function resulting in performance savings in type-checking Index objects
- Wrote fast time series merging / joining methods in Cython. Will be integrated later into DataFrame.join and related functions
