One particularly important item is the `type` property. This should be the class that is the scalar type for your data. For example, if you were writing an extension array for IP Address data, this might be `ipaddress.IPv4Address`.

See the extension dtype source for interface definition.

`pandas.api.extension.ExtensionDtype` can be registered to pandas to allow creation via a string dtype name. This allows one to instantiate `Series` and `.astype()` with a registered string name, for example `category` is a registered string accessor for the `CategoricalDtype`.

See the extension dtype dtypes for more on how to register dtypes.

**ExtensionArray**

This class provides all the array-like functionality. ExtensionArrays are limited to 1 dimension. An ExtensionArray is linked to an ExtensionDtype via the `dtype` attribute.

`pandas` makes no restrictions on how an extension array is created via its `__new__` or `__init__`, and puts no restrictions on how you store your data. We do require that your array be convertible to a NumPy array, even if this is relatively expensive (as it is for `Categorical`).

They may be backed by none, one, or many NumPy arrays. For example, `pandas.Categorical` is an extension array backed by two arrays, one for codes and one for categories. An array of IPv6 addresses may be backed by a NumPy structured array with two fields, one for the lower 64 bits and one for the upper 64 bits. Or they may be backed by some other storage type, like Python lists.

See the extension array source for the interface definition. The docstrings and comments contain guidance for properly implementing the interface.

**ExtensionArray operator support**

By default, there are no operators defined for the class `ExtensionArray`. There are two approaches for providing operator support for your ExtensionArray:

1. Define each of the operators on your `ExtensionArray` subclass.
2. Use an operator implementation from `pandas` that depends on operators that are already defined on the underlying elements (scalars) of the ExtensionArray.

**Note:** Regardless of the approach, you may want to set `__array_priority__` if you want your implementation to be called when involved in binary operations with NumPy arrays.

For the first approach, you define selected operators, e.g., `__add__`, `__le__`, etc. that you want your `ExtensionArray` subclass to support.

The second approach assumes that the underlying elements (i.e., scalar type) of the `ExtensionArray` have the individual operators already defined. In other words, if your `ExtensionArray` named `MyExtensionArray` is implemented so that each element is an instance of the class `MyExtensionElement`, then if the operators are defined for `MyExtensionElement`, the second approach will automatically define the operators for `MyExtensionArray`.

A mixin class, `ExtensionScalarOpsMixin` supports this second approach. If developing an `ExtensionArray` subclass, for example `MyExtensionArray`, can simply include `ExtensionScalarOpsMixin` as a parent class of...
MyExtensionArray, and then call the methods _add_arithmetic_ops() and/or _add_comparison_ops() to hook the operators into your MyExtensionArray class, as follows:

```python
from pandas.api.extensions import ExtensionArray, ExtensionScalarOpsMixin

class MyExtensionArray(ExtensionArray, ExtensionScalarOpsMixin):
    pass

MyExtensionArray._add_arithmetic_ops()
MyExtensionArray._add_comparison_ops()
```

Note: Since pandas automatically calls the underlying operator on each element one-by-one, this might not be as performant as implementing your own version of the associated operators directly on the ExtensionArray.

For arithmetic operations, this implementation will try to reconstruct a new ExtensionArray with the result of the element-wise operation. Whether or not that succeeds depends on whether the operation returns a result that’s valid for the ExtensionArray. If an ExtensionArray cannot be reconstructed, an ndarray containing the scalars returned instead.

For ease of implementation and consistency with operations between pandas and NumPy ndarrays, we recommend not handling Series and Indexes in your binary ops. Instead, you should detect these cases and return NotImplemented. When pandas encounters an operation like op(Series, ExtensionArray), pandas will

1. unbox the array from the Series (Series.array)
2. call result = op(values, ExtensionArray)
3. re-box the result in a Series

**NumPy universal functions**

`Series` implements `__array_ufunc__`. As part of the implementation, pandas unboxes the ExtensionArray from the Series, applies the ufunc, and re-boxes it if necessary.

If applicable, we highly recommend that you implement `__array_ufunc__` in your extension array to avoid coercion to an ndarray. See the NumPy documentation for an example.

As part of your implementation, we require that you defer to pandas when a pandas container (Series, DataFrame, Index) is detected in inputs. If any of those is present, you should return NotImplemented. pandas will take care of unboxing the array from the container and re-calling the ufunc with the unwrapped input.

**Testing extension arrays**

We provide a test suite for ensuring that your extension arrays satisfy the expected behavior. To use the test suite, you must provide several pytest fixtures and inherit from the base test class. The required fixtures are found in https://github.com/pandas-dev/pandas/blob/master/pandas/tests/extension/conftest.py.

To use a test, subclass it:

```python
from pandas.tests.extension import base
```

(continues on next page)
class TestConstructors(base.BaseConstructorsTests):
    pass

See https://github.com/pandas-dev/pandas/blob/master/pandas/tests/extension/base/__init__.py for a list of all the
tests available.

Compatibility with Apache Arrow

An ExtensionArray can support conversion to / from pyarrow arrays (and thus support for example seri-
alization to the Parquet file format) by implementing two methods: ExtensionArray.__arrow_array__ and
ExtensionDtype.__from_arrow__.

The ExtensionArray.__arrow_array__ ensures that pyarrow knows how to convert the specific extension array
into a pyarrow.Array (also when included as a column in a pandas DataFrame):

```python
class MyExtensionArray(ExtensionArray):
    ...

    def __arrow_array__(self, type=None):
        # convert the underlying array values to a pyarrow Array
        import pyarrow

        return pyarrow.array(..., type=type)
```

The ExtensionDtype.__from_arrow__ method then controls the conversion back from pyarrow to a pandas Exten-
sionArray. This method receives a pyarrow Array or ChunkedArray as only argument and is expected to return the
appropriate pandas ExtensionArray for this dtype and the passed values:

```python
class ExtensionDtype:
    ...

    def __from_arrow__(self, array: pyarrow.Array/ChunkedArray) -> ExtensionArray:
        ...
```

See more in the Arrow documentation.

Those methods have been implemented for the nullable integer and string extension dtypes included in pandas, and
ensure roundtrip to pyarrow and the Parquet file format.

4.10.3 Subclassing pandas data structures

**Warning:** There are some easier alternatives before considering subclassing pandas data structures.

1. Extensible method chains with `pipe`
2. Use `composition`. See here.
3. Extending by `registering an accessor`
4. Extending by `extension type`

This section describes how to subclass pandas data structures to meet more specific needs. There are two points that
need attention:
Override constructor properties

Each data structure has several *constructor properties* for returning a new data structure as the result of an operation. By overriding these properties, you can retain subclasses through pandas data manipulations.

There are 3 possible constructor properties to be defined on a subclass:

- **DataFrame/Series._constructor**: Used when a manipulation result has the same dimension as the original.
- **DataFrame._constructor_sliced**: Used when a DataFrame (sub-)class manipulation result should be a Series (sub-)class.
- **Series._constructor_expanddim**: Used when a Series (sub-)class manipulation result should be a DataFrame (sub-)class, e.g. Series.to_frame().

Below example shows how to define SubclassedSeries and SubclassedDataFrame overriding constructor properties.

```python
class SubclassedSeries(pd.Series):
    @property
    def _constructor(self):
        return SubclassedSeries

    @property
    def _constructor_expanddim(self):
        return SubclassedDataFrame

class SubclassedDataFrame(pd.DataFrame):
    @property
    def _constructor(self):
        return SubclassedDataFrame

    @property
    def _constructor_sliced(self):
        return SubclassedSeries
```

```python
>>> s = SubclassedSeries([1, 2, 3])
>>> type(s)
<class '__main__.SubclassedSeries'>

>>> to_framed = s.to_frame()
>>> type(to_framed)
<class '__main__.SubclassedDataFrame'>

>>> df = SubclassedDataFrame({'A': [1, 2, 3], 'B': [4, 5, 6], 'C': [7, 8, 9]})
>>> df
  A  B  C
```

(continues on next page)
Define original properties

To let original data structures have additional properties, you should let pandas know what properties are added. pandas maps unknown properties to data names overriding __getattribute__. Defining original properties can be done in one of 2 ways:

1. Define _internal_names and _internal_names_set for temporary properties which WILL NOT be passed to manipulation results.
2. Define _metadata for normal properties which will be passed to manipulation results.

Below is an example to define two original properties, “internal_cache” as a temporary property and “added_property” as a normal property.

```python
class SubclassedDataFrame2(pd.DataFrame):
    # temporary properties
    _internal_names = pd.DataFrame._internal_names + ['internal_cache']
    _internal_names_set = set(_internal_names)

    # normal properties
    _metadata = ['added_property']

def _constructor(self):
    return SubclassedDataFrame2
```

4.10. Extending pandas
```python
>>> df = SubclassedDataFrame2({'A': [1, 2, 3], 'B': [4, 5, 6], 'C': [7, 8, 9]})
>>> df
    A  B  C
0  1  4  7
1  2  5  8
2  3  6  9

>>> df.internal_cache = "cached"
>>> df.added_property = "property"

>>> df.internal_cache
cached
>>> df.added_property
property

# properties defined in _internal_names is reset after manipulation
>>> df["A", "B"].internal_cache
AttributeError: 'SubclassedDataFrame2' object has no attribute 'internal_cache'

# properties defined in _metadata are retained
>>> df["A", "B"].added_property
property
```

### 4.10.4 Plotting backends

Starting in 0.25 pandas can be extended with third-party plotting backends. The main idea is letting users select a plotting backend different than the provided one based on Matplotlib. For example:

```python
>>> pd.set_option("plotting.backend", "backend.module")
>>> pd.Series([1, 2, 3]).plot()
```

This would be more or less equivalent to:

```python
>>> import backend.module
>>> backend.module.plot(pd.Series([1, 2, 3]))
```

The backend module can then use other visualization tools (Bokeh, Altair, ...) to generate the plots.

Libraries implementing the plotting backend should use entry points to make their backend discoverable to pandas. The key is "pandas_plotting_backends". For example, pandas registers the default “matplotlib” backend as follows.

```python
# in setup.py
setup(  # noqa: F821
    ...,  
    entry_points={
        "pandas_plotting_backends": [
            "matplotlib = pandas:plotting._matplotlib",
        ],
    },
)
```

More information on how to implement a third-party plotting backend can be found at https://github.com/pandas-dev/pandas/blob/master/pandas/plotting/__init__.py#L1.
4.11 Developer

This section will focus on downstream applications of pandas.

4.11.1 Storing pandas DataFrame objects in Apache Parquet format

The Apache Parquet format provides key-value metadata at the file and column level, stored in the footer of the Parquet file:

```python
5: optional list<KeyValue> key_value_metadata
```

where `KeyValue` is

```python
struct KeyValue {
  1: required string key
  2: optional string value
}
```

So that a `pandas.DataFrame` can be faithfully reconstructed, we store a `pandas` metadata key in the `FileMetaData` with the value stored as:

```python
{
  'index_columns': [<descr0>, <descr1>, ...],
  'column_indexes': [<ci0>, <ci1>, ..., <cIN>],
  'columns': [<c0>, <c1>, ...],
  'pandas_version': $VERSION,
  'creator': {
    'library': $LIBRARY,
    'version': $LIBRARY_VERSION
  }
}
```

The “descriptor” values `<descr>` in the 'index_columns' field are strings (referring to a column) or dictionaries with values as described below.

The `<c0>/<ci0>` and so forth are dictionaries containing the metadata for each column, including the index columns. This has JSON form:

```json
{
  'name': column_name,
  'field_name': parquet_column_name,
  'pandas_type': pandas_type,
  'numpy_type': numpy_type,
  'metadata': metadata
}
```

See below for the detailed specification for these.
Index metadata descriptors

RangeIndex can be stored as metadata only, not requiring serialization. The descriptor format for these as is follows:

```python
index = pd.RangeIndex(0, 10, 2)
{
    "kind": "range",
    "name": index.name,
    "start": index.start,
    "stop": index.stop,
    "step": index.step,
}
```

Other index types must be serialized as data columns along with the other DataFrame columns. The metadata for these is a string indicating the name of the field in the data columns, for example '__index_level_0__'.

If an index has a non-None name attribute, and there is no other column with a name matching that value, then the index.name value can be used as the descriptor. Otherwise (for unnamed indexes and ones with names colliding with other column names) a disambiguating name with pattern matching __index_level_d__ should be used. In cases of named indexes as data columns, name attribute is always stored in the column descriptors as above.

Column metadata

pandas_type is the logical type of the column, and is one of:

- Boolean: 'bool'
- Integers: 'int8', 'int16', 'int32', 'int64', 'uint8', 'uint16', 'uint32', 'uint64'
- Floats: 'float16', 'float32', 'float64'
- Date and Time Types: 'datetime', 'datetimetz', 'timedelta'
- String: 'unicode', 'bytes'
- Categorical: 'categorical'
- Other Python objects: 'object'

The numpy_type is the physical storage type of the column, which is the result of str(dtype) for the underlying NumPy array that holds the data. So for datetimetz this is datetime64[ns] and for categorical, it may be any of the supported integer categorical types.

The metadata field is None except for:

- datetimetz: {'timezone': zone, 'unit': 'ns'}, e.g. {'timezone', 'America/New_York', 'unit': 'ns'}. The 'unit' is optional, and if omitted it is assumed to be nanoseconds.
- categorical: {'num_categories': K, 'ordered': is_ordered, 'type': $TYPE}
  - Here 'type' is optional, and can be a nested pandas type specification here (but not categorical)
- unicode: {'encoding': encoding}
  - The encoding is optional, and if not present is UTF-8
- object: {'encoding': encoding}. Objects can be serialized and stored in BYTE_ARRAY Parquet columns. The encoding can be one of:
  - 'pickle'
  - 'bson'
- 'json'

- `timedelta`: {'unit': 'ns'}. The 'unit' is optional, and if omitted it is assumed to be nanoseconds. This metadata is optional altogether.

For types other than these, the 'metadata' key can be omitted. Implementations can assume None if the key is not present.

As an example of fully-formed metadata:

```json
{
  'index_columns': ['__index_level_0__'],
  'column_indexes': [
    {'name': None,
     'field_name': 'None',
     'pandas_type': 'unicode',
     'numpy_type': 'object',
     'metadata': {'encoding': 'UTF-8'}},
    {'name': 'c0',
     'field_name': 'c0',
     'pandas_type': 'int8',
     'numpy_type': 'int8',
     'metadata': None},
    {'name': 'c1',
     'field_name': 'c1',
     'pandas_type': 'bytes',
     'numpy_type': 'object',
     'metadata': None},
    {'name': 'c2',
     'field_name': 'c2',
     'pandas_type': 'categorical',
     'numpy_type': 'int16',
     'metadata': {'num_categories': 1000, 'ordered': False}},
    {'name': 'c3',
     'field_name': 'c3',
     'pandas_type': 'datetimetz',
     'numpy_type': 'datetime64[ns]',
     'metadata': {'timezone': 'America/Los_Angeles'}},
    {'name': 'c4',
     'field_name': 'c4',
     'pandas_type': 'object',
     'numpy_type': 'object',
     'metadata': {'encoding': 'pickle'}},
    {'name': None,
     'field_name': '__index_level_0__',
     'pandas_type': 'int64',
     'numpy_type': 'int64',
     'metadata': None}
  ],
  'pandas_version': '0.20.0',
  'creator': {
    'library': 'pyarrow',
    'version': '0.13.0'
  }
}
```
4.12 Policies

4.12.1 Version policy

Changed in version 1.0.0.

pandas uses a loose variant of semantic versioning (SemVer) to govern deprecations, API compatibility, and version numbering.

A pandas release number is made up of MAJOR.MINOR.PATCH.

API breaking changes should only occur in major releases. These changes will be documented, with clear guidance on what is changing, why it’s changing, and how to migrate existing code to the new behavior.

Whenever possible, a deprecation path will be provided rather than an outright breaking change.

pandas will introduce deprecations in minor releases. These deprecations will preserve the existing behavior while emitting a warning that provide guidance on:

- How to achieve similar behavior if an alternative is available
- The pandas version in which the deprecation will be enforced.

We will not introduce new deprecations in patch releases.

Deprecations will only be enforced in major releases. For example, if a behavior is deprecated in pandas 1.2.0, it will continue to work, with a warning, for all releases in the 1.x series. The behavior will change and the deprecation removed in the next major release (2.0.0).

Note: pandas will sometimes make behavior changing bug fixes, as part of minor or patch releases. Whether or not a change is a bug fix or an API-breaking change is a judgement call. We’ll do our best, and we invite you to participate in development discussion on the issue tracker or mailing list.

These policies do not apply to features marked as experimental in the documentation. pandas may change the behavior of experimental features at any time.

4.12.2 Python support

pandas will only drop support for specific Python versions (e.g. 3.6.x, 3.7.x) in pandas major or minor releases.

4.13 Roadmap

This page provides an overview of the major themes in pandas’ development. Each of these items requires a relatively large amount of effort to implement. These may be achieved more quickly with dedicated funding or interest from contributors.

An item being on the roadmap does not mean that it will necessarily happen, even with unlimited funding. During the implementation period we may discover issues preventing the adoption of the feature.

Additionally, an item not being on the roadmap does not exclude it from inclusion in pandas. The roadmap is intended for larger, fundamental changes to the project that are likely to take months or years of developer time. Smaller-scoped items will continue to be tracked on our issue tracker.

See Roadmap evolution for proposing changes to this document.
4.13.1 Extensibility

Pandas extension types allow for extending NumPy types with custom data types and array storage. Pandas uses extension types internally, and provides an interface for 3rd-party libraries to define their own custom data types.

Many parts of pandas still unintentionally convert data to a NumPy array. These problems are especially pronounced for nested data.

We'd like to improve the handling of extension arrays throughout the library, making their behavior more consistent with the handling of NumPy arrays. We'll do this by cleaning up pandas' internals and adding new methods to the extension array interface.

4.13.2 String data type

Currently, pandas stores text data in an object-dtype NumPy array. The current implementation has two primary drawbacks: First, object-dtype is not specific to strings: any Python object can be stored in an object-dtype array, not just strings. Second: this is not efficient. The NumPy memory model isn't especially well-suited to variable width text data.

To solve the first issue, we propose a new extension type for string data. This will initially be opt-in, with users explicitly requesting dtype="string". The array backing this string dtype may initially be the current implementation: an object-dtype NumPy array of Python strings.

To solve the second issue (performance), we'll explore alternative in-memory array libraries (for example, Apache Arrow). As part of the work, we may need to implement certain operations expected by pandas users (for example the algorithm used in Series.str.upper). That work may be done outside of pandas.

4.13.3 Consistent missing value handling

Currently, pandas handles missing data differently for different data types. We use different types to indicate that a value is missing (np.nan for floating-point data, np.nan or None for object-dtype data – typically strings or booleans – with missing values, and pd.NaT for datetimelike data). Integer data cannot store missing data or are cast to float. In addition, pandas 1.0 introduced a new missing value sentinel, pd.NA, which is being used for the experimental nullable integer, boolean, and string data types.

These different missing values have different behaviors in user-facing operations. Specifically, we introduced different semantics for the nullable data types for certain operations (e.g. propagating in comparison operations instead of comparing as False).

Long term, we want to introduce consistent missing data handling for all data types. This includes consistent behavior in all operations (indexing, arithmetic operations, comparisons, etc.). There has been discussion of eventually making the new semantics the default.

This has been discussed at github #28095 (and linked issues), and described in more detail in this design doc.

4.13.4 Apache Arrow interoperability

Apache Arrow is a cross-language development platform for in-memory data. The Arrow logical types are closely aligned with typical pandas use cases.

We’d like to provide better-integrated support for Arrow memory and data types within pandas. This will let us take advantage of its I/O capabilities and provide for better interoperability with other languages and libraries using Arrow.
4.13.5 Block manager rewrite

We'd like to replace pandas current internal data structures (a collection of 1 or 2-D arrays) with a simpler collection of 1-D arrays.

pandas internal data model is quite complex. A DataFrame is made up of one or more 2-dimensional “blocks”, with one or more blocks per dtype. This collection of 2-D arrays is managed by the BlockManager.

The primary benefit of the BlockManager is improved performance on certain operations (construction from a 2D array, binary operations, reductions across the columns), especially for wide DataFrames. However, the BlockManager substantially increases the complexity and maintenance burden of pandas.

By replacing the BlockManager we hope to achieve

- Substantially simpler code
- Easier extensibility with new logical types
- Better user control over memory use and layout
- Improved micro-performance
- Option to provide a C / Cython API to pandas’ internals

See these design documents for more.

4.13.6 Decoupling of indexing and internals

The code for getting and setting values in pandas’ data structures needs refactoring. In particular, we must clearly separate code that converts keys (e.g., the argument to DataFrame.loc) to positions from code that uses these positions to get or set values. This is related to the proposed BlockManager rewrite. Currently, the BlockManager sometimes uses label-based, rather than position-based, indexing. We propose that it should only work with positional indexing, and the translation of keys to positions should be entirely done at a higher level.

Indexing is a complicated API with many subtleties. This refactor will require care and attention. More details are discussed at https://github.com/pandas-dev/pandas/wiki/(Tentative)-rules-for-restructuring-indexing-code

4.13.7 Numba-accelerated operations

Numba is a JIT compiler for Python code. We’d like to provide ways for users to apply their own Numba-jitted functions where pandas accepts user-defined functions (for example, Series.apply(), DataFrame.apply(), DataFrame.applymap(), and in groupby and window contexts). This will improve the performance of user-defined-functions in these operations by staying within compiled code.

4.13.8 Performance monitoring

pandas uses airspeed velocity to monitor for performance regressions. ASV itself is a fabulous tool, but requires some additional work to be integrated into an open source project’s workflow.

The asv-runner organization, currently made up of pandas maintainers, provides tools built on top of ASV. We have a physical machine for running a number of project’s benchmarks, and tools managing the benchmark runs and reporting on results.

We’d like to fund improvements and maintenance of these tools to

- Be more stable. Currently, they’re maintained on the nights and weekends when a maintainer has free time.
• Tune the system for benchmarks to improve stability, following https://pyperf.readthedocs.io/en/latest/system.html
• Build a GitHub bot to request ASV runs before a PR is merged. Currently, the benchmarks are only run nightly.

4.13.9 Roadmap evolution

pandas continues to evolve. The direction is primarily determined by community interest. Everyone is welcome to review existing items on the roadmap and to propose a new item.

Each item on the roadmap should be a short summary of a larger design proposal. The proposal should include

1. Short summary of the changes, which would be appropriate for inclusion in the roadmap if accepted.
2. Motivation for the changes.
3. An explanation of why the change is in scope for pandas.
4. Detailed design: Preferably with example-usage (even if not implemented yet) and API documentation
5. API Change: Any API changes that may result from the proposal.

That proposal may then be submitted as a GitHub issue, where the pandas maintainers can review and comment on the design. The pandas mailing list should be notified of the proposal.

When there’s agreement that an implementation would be welcome, the roadmap should be updated to include the summary and a link to the discussion issue.

4.13.10 Completed items

This section records now completed items from the pandas roadmap.

Documentation improvements

We improved the pandas documentation

• The pandas community worked with others to build the pydata-sphinx-theme, which is now used for https://pandas.pydata.org/docs/ (GH15556).

• Getting started contains a number of resources intended for new pandas users coming from a variety of backgrounds (GH26831).

4.14 Developer meetings

We hold regular developer meetings on the second Wednesday of each month at 18:00 UTC. These meetings and their minutes are open to the public. All are welcome to join.
4.14.1 Minutes

The minutes of past meetings are available in this Google Document.

4.14.2 Calendar

This calendar shows all the developer meetings.

You can subscribe to this calendar with the following links:

- iCal
- Google calendar

Additionally, we’ll sometimes have one-off meetings on specific topics. These will be published on the same calendar.
CHAPTER
FIVE

RELEASE NOTES

This is the list of changes to pandas between each release. For full details, see the commit logs. For install and upgrade instructions, see Installation.

5.1 Version 1.3

5.1.1 What's new in 1.3.5 (December 12, 2021)

These are the changes in pandas 1.3.5. See Release notes for a full changelog including other versions of pandas.

Fixed regressions

- Fixed regression in `Series.equals()` when comparing floats with dtype object to None (GH44190)
- Fixed regression in `merge_asof()` raising error when array was supplied as join key (GH42844)
- Fixed regression when resampling `DataFrame` with `DateTimeIndex` with empty groups and `uint8`, `uint16` or `uint32` columns incorrectly raising `RuntimeError` (GH43329)
- Fixed regression in creating a `DataFrame` from a timezone-aware `Timestamp` scalar near a Daylight Savings Time transition (GH42505)
- Fixed performance regression in `read_csv()` (GH44106)
- Fixed regression in `Series.duplicated()` and `Series.drop_duplicates()` when Series has Categorical dtype with boolean categories (GH44351)
- Fixed regression in `GroupBy.sum()` with timedelta64[ns] dtype containing NaT failing to treat that value as NA (GH42659)
- Fixed regression in `RollingGroupby.cov()` and `RollingGroupby.corr()` when other had the same shape as each group would incorrectly return superfluous groups in the result (GH42915)
Contributors

A total of 10 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

- Ali McMaster
- Matthew Roeschke
- Matthew Zeitlin
- MeeseeksMachine
- Pandas Development Team
- Patrick Hoefler
- Simon Hawkins
- Thomas Li
- Tobias Pitters
- jbrockmendel

5.1.2 What’s new in 1.3.4 (October 17, 2021)

These are the changes in pandas 1.3.4. See Release notes for a full changelog including other versions of pandas.

Fixed regressions

- Fixed regression in DataFrame.convert_dtypes() incorrectly converts byte strings to strings (GH43183)
- Fixed regression in GroupBy.agg() where it was failing silently with mixed data types along axis=1 and MultiIndex (GH43209)
- Fixed regression in merge() with integer and NaN keys failing with outer merge (GH43550)
- Fixed regression in DataFrame.corr() raising ValueError with method="spearman" on 32-bit platforms (GH43588)
- Fixed performance regression in MultiIndex.equals() (GH43549)
- Fixed performance regression in GroupBy.first() and GroupBy.last() with StringDtype (GH41596)
- Fixed regression in Series.cat.reorder_categories() failing to update the categories on the Series (GH43232)
- Fixed regression in Series.cat.categories() setter failing to update the categories on the Series (GH43334)
- Fixed regression in read_csv() raising UnicodeDecodeError exception when memory_map=True (GH43540)
- Fixed regression in DataFrame.explode() raising AssertionError when column is any scalar which is not a string (GH43314)
- Fixed regression in Series.aggregate() attempting to pass args and kwargs multiple times to the user supplied func in certain cases (GH43357)
- Fixed regression when iterating over a DataFrame.groupby.rolling object causing the resulting DataFrames to have an incorrect index if the input groupings were not sorted (GH43386)
• Fixed regression in `DataFrame.groupby.rolling.cov()` and `DataFrame.groupby.rolling.corr()` computing incorrect results if the input groupings were not sorted (GH43386)

Bug fixes

• Fixed bug in `pandas.DataFrame.groupby.rolling()` and `pandas.api.indexers.FixedForwardWindowIndexer` leading to segfaults and window endpoints being mixed across groups (GH43267)

• Fixed bug in `GroupBy.mean()` with datetimelike values including NaT values returning incorrect results (GH43132)

• Fixed bug in `Series.aggregate()` not passing the first `args` to the user supplied `func` in certain cases (GH43357)

• Fixed memory leaks in `Series.rolling.quantile()` and `Series.rolling.median()` (GH43339)

Other

• The minimum version of Cython needed to compile pandas is now 0.29.24 (GH43729)

5.1.3 What’s new in 1.3.3 (September 12, 2021)

These are the changes in pandas 1.3.3. See Release notes for a full changelog including other versions of pandas.

Fixed regressions

- Fixed regression in DataFrame constructor failing to broadcast for defined Index and len one list of Timestamp (GH42810)
- Fixed regression in GroupBy.agg() incorrectly raising in some cases (GH42390)
- Fixed regression in GroupBy.apply() where nan values were dropped even with dropna=False (GH43205)
- Fixed regression in GroupBy.quantile() which was failing with pandas.NA (GH42849)
- Fixed regression in merge() where on columns with ExtensionDtype or bool data types were cast to object in right and outer merge (GH40073)
- Fixed regression in RangeIndex.where() and RangeIndex.putmask() raising AssertionError when result did not represent a RangeIndex (GH43240)
- Fixed regression in read_parquet() where the fastparquet engine would not work properly with fastparquet 0.7.0 (GH43075)
- Fixed regression in DataFrame.loc.__setitem__() raising ValueError when setting array as cell value (GH43422)
- Fixed regression in is_list_like() where objects with __iter__ set to None would be identified as iterable (GH43373)
- Fixed regression in DataFrame.__getitem__() raising error for slice of DatetimeIndex when index is non monotonic (GH43223)
- Fixed regression in Resampler.aggregate() when used after column selection would raise if func is a list of aggregation functions (GH42905)
- Fixed regression in DataFrame.corr() where Kendall correlation would produce incorrect results for columns with repeated values (GH43401)
- Fixed regression in DataFrame.groupby() where aggregation on columns with object types dropped results on those columns (GH42395, GH43108)
- Fixed regression in Series.fillna() raising TypeError when filling float Series with list-like fill value having a dtype which couldn’t cast losslessly (like float32 filled with float64) (GH43424)
- Fixed regression in read_csv() raising AttributeError when the file handle is an tempfile.SpooledTemporaryFile object (GH43439)
- Fixed performance regression in core.window.ewm.ExponentialMovingWindow.mean() (GH42333)

Performance improvements

- Performance improvement for DataFrame.__setitem__() when the key or value is not a DataFrame, or key is not list-like (GH43274)
Bug fixes

- Fixed bug in DataFrameGroupBy.agg() and DataFrameGroupBy.transform() with engine="numba" where index data was not being correctly passed into func (GH43133)

Contributors

A total of 18 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

5.1.4 What's new in 1.3.2 (August 15, 2021)

These are the changes in pandas 1.3.2. See Release notes for a full changelog including other versions of pandas.

Fixed regressions

- Performance regression in DataFrame.isin() and Series.isin() for nullable data types (GH42714)
- Regression in updating values of Series using boolean index, created by using DataFrame.pop() (GH42530)
- Regression in DataFrame.from_records() with empty records (GH42456)
- Fixed regression in DataFrame.shift() where TypeError occurred when shifting DataFrame created by concatenation of slices and fills with values (GH42719)
- Regression in DataFrame.agg() when the func argument returned lists and axis=1 (GH42727)
• Regression in `DataFrame.drop()` does nothing if `MultiIndex` has duplicates and indexer is a tuple or list of tuples (GH42771)

• Fixed regression where `read_csv()` raised a `ValueError` when parameters `names` and `prefix` were both set to `None` (GH42387)

• Fixed regression in comparisons between `Timestamp` object and `datetime64` objects outside the implementation bounds for nanosecond `datetime64` (GH42794)

• Fixed regression in `Styler.highlight_min()` and `Styler.highlight_max()` where `pandas.NA` was not successfully ignored (GH42650)

• Fixed regression in `concat()` where `copy=False` was not honored in `axis=1` Series concatenation (GH42501)

• Regression in `Series.nlargest()` and `Series.nsmallest()` with nullable integer or float dtype (GH42816)

• Fixed regression in `Series.quantile()` with `Int64Dtype` (GH42626)

• Fixed regression in `Series.groupby()` and `DataFrame.groupby()` where supplying the by argument with a Series named with a tuple would incorrectly raise (GH42731)

**Bug fixes**

• Bug in `read_excel()` modifies the dtypes dictionary when reading a file with duplicate columns (GH42462)

• 1D slices over extension types turn into N-dimensional slices over ExtensionArrays (GH42430)

• Fixed bug in `Series.rolling()` and `DataFrame.rolling()` not calculating window bounds correctly for the first row when `center=True` and `window` is an offset that covers all the rows (GH42753)

• `Styler.hide_columns()` now hides the index name header row as well as column headers (GH42101)

• `Styler.set_sticky()` has amended CSS to control the column/index names and ensure the correct sticky positions (GH42537)

• Bug in de-serializing datetime indexes in PYTHONOPTIMIZED mode (GH42866)

**Contributors**

A total of 16 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

5.1.5 What’s new in 1.3.1 (July 25, 2021)

These are the changes in pandas 1.3.1. See Release notes for a full changelog including other versions of pandas.

Fixed regressions

- Pandas could not be built on PyPy (GH42355)
- DataFrame constructed with an older version of pandas could not be unpickled (GH42345)
- Performance regression in constructing a DataFrame from a dictionary of dictionaries (GH42248)
- Fixed regression in DataFrame.agg() dropping values when the DataFrame had an Extension Array dtype, a duplicate index, and axis=1 (GH42380)
- Fixed regression in DataFrame.astype() changing the order of noncontiguous data (GH42396)
- Performance regression in DataFrame in reduction operations requiring casting such as DataFrame.mean() on integer data (GH38592)
- Performance regression in DataFrame.to_dict() and Series.to_dict() when orient argument one of “records”, “dict”, or “split” (GH42352)
- Fixed regression in indexing with a list subclass incorrectly raising TypeError (GH42433, GH42461)
- Fixed regression in DataFrame.isin() and Series.isin() raising TypeError with nullable data containing at least one missing value (GH42405)
- Regression in concat() between objects with bool dtype and integer dtype casting to object instead of to integer (GH42092)
- Bug in Series constructor not accepting a dask.Array (GH38645)
- Fixed regression for SettingWithCopyWarning displaying incorrect stacklevel (GH42570)
- Fixed regression for merge_asof() raising KeyError when one of the by columns is in the index (GH34488)
- Fixed regression in to_datetime() returning pd.NaT for inputs that produce duplicated values, when cache=True (GH42259)
- Fixed regression in SeriesGroupBy.value_counts() that resulted in an IndexError when called on a Series with one row (GH42618)
Bug fixes

- Fixed bug in `DataFrame.transpose()` dropping values when the DataFrame had an Extension Array dtype and a duplicate index (GH42380)
- Fixed bug in `DataFrame.to_xml()` raising `KeyError` when called with `index=False` and an offset index (GH42458)
- Fixed bug in `Styler.set_sticky()` not handling index names correctly for single index columns case (GH42537)
- Fixed bug in `DataFrame.copy()` failing to consolidate blocks in the result (GH42579)

5.1.6 What’s new in 1.3.0 (July 2, 2021)

These are the changes in pandas 1.3.0. See Release notes for a full changelog including other versions of pandas.

Warning: When reading new Excel 2007+ (.xlsx) files, the default argument `engine=None` to `read_excel()` will now result in using the `openpyxl` engine in all cases when the option `io.excel.xlsx.reader` is set to "auto". Previously, some cases would use the `xlrd` engine instead. See What's new 1.2.0 for background on this change.
Enhancements

Custom HTTP(s) headers when reading csv or json files

When reading from a remote URL that is not handled by fsspec (e.g. HTTP and HTTPS) the dictionary passed to storage_options will be used to create the headers included in the request. This can be used to control the User-Agent header or send other custom headers (GH36688). For example:

```python
In [1]: headers = {"User-Agent": "pandas"}

In [2]: df = pd.read_csv("https://download.bls.gov/pub/time.series/cu/cu.item", sep="\t", storage_options=headers)
```

Read and write XML documents

We added I/O support to read and render shallow versions of XML documents with read_xml() and DataFrame.to_xml(). Using lxml as parser, both XPath 1.0 and XSLT 1.0 are available. (GH27554)

```python
In [1]: xml = """"<?xml version='1.0' encoding='utf-8'?>
    ...: <data>
    ...:   <row>
    ...:     <shape>square</shape>
    ...:     <degrees>360</degrees>
    ...:     <sides>4.0</sides>
    ...:   </row>
    ...:   <row>
    ...:     <shape>circle</shape>
    ...:     <degrees>360</degrees>
    ...:     <sides/>
    ...:   </row>
    ...:   <row>
    ...:     <shape>triangle</shape>
    ...:     <degrees>180</degrees>
    ...:     <sides>3.0</sides>
    ...:   </row>
    ...: </data>"

In [2]: df = pd.read_xml(xml)
In [3]: df
Out[3]:
   shape   degrees  sides
0  square    360    4.0
1   circle    360   NaN
2  triangle   180    3.0
```

```python
In [4]: df.to_xml()
Out[4]:
<?xml version='1.0' encoding='utf-8'?>
(continues on next page)
```
For more, see Writing XML in the user guide on IO tools.

**Styler enhancements**

We provided some focused development on Styler. See also the Styler documentation which has been revised and improved (GH39720, GH39317, GH40493).

- The method Styler.set_table_styles() can now accept more natural CSS language for arguments, such as 'color:red;' instead of [('color', 'red')] (GH39563)
- The methods Styler.highlight_null(), Styler.highlight_min(), and Styler.highlight_max() now allow custom CSS highlighting instead of the default background coloring (GH40242)
- Styler.apply() now accepts functions that return an ndarray when axis=None, making it now consistent with the axis=0 and axis=1 behavior (GH39359)
- When incorrectly formatted CSS is given via Styler.apply() or Styler.applymap(), an error is now raised upon rendering (GH39660)
- Styler.format() now accepts the keyword argument escape for optional HTML and LaTeX escaping (GH40388, GH41619)
- Styler.background_gradient() has gained the argument gmap to supply a specific gradient map for shading (GH22727)
- Styler.clear() now clears Styler.hidden_index and Styler.hidden_columns as well (GH40484)
- Added the method Styler.highlight_between() (GH39821)
- Added the method Styler.highlight_quantile() (GH40926)
- Added the method Styler.text_gradient() (GH41098)
- Added the method Styler.set_tooltips() to allow hover tooltips; this can be used enhance interactive displays (GH21266, GH40284)
• Added the parameter `precision` to the method `Styler.format()` to control the display of floating point numbers (GH40134)

• `Styler` rendered HTML output now follows the w3 HTML Style Guide (GH39626)

• Many features of the `Styler` class are now either partially or fully usable on a DataFrame with a non-unique indexes or columns (GH41143)

• One has greater control of the display through separate sparsification of the index or columns using the new `styler options`, which are also usable via `option_context()` (GH41142)

• Added the option `styler.render.max_elements` to avoid browser overload when styling large DataFrames (GH40712)

• Added the method `Styler.to_latex()` (GH21673, GH42320), which also allows some limited CSS conversion (GH40731)

• Added the method `Styler.to_html()` (GH13379)

• Added the method `Styler.set_sticky()` to make index and column headers permanently visible in scrolling HTML frames (GH29072)

**DataFrame constructor honors copy=False with dict**

When passing a dictionary to `DataFrame` with `copy=False`, a copy will no longer be made (GH32960).

```
In [3]: arr = np.array([1, 2, 3])
In [4]: df = pd.DataFrame({"A": arr, "B": arr.copy()}, copy=False)
In [5]: df
Out[5]:
   A  B
0  1  1
1  2  2
2  3  3
```

`df["A"]` remains a view on `arr`:

```
In [6]: arr[0] = 0
In [7]: assert df.iloc[0, 0] == 0
```

The default behavior when not passing `copy` will remain unchanged, i.e. a copy will be made.

**PyArrow backed string data type**

We've enhanced the `StringDtype`, an extension type dedicated to string data. (GH39908)

It is now possible to specify a `storage` keyword option to `StringDtype`. Use pandas options or specify the dtype using `dtype='string[pyarrow]'` to allow the StringArray to be backed by a PyArrow array instead of a NumPy array of Python objects.

The PyArrow backed StringArray requires pyarrow 1.0.0 or greater to be installed.
**Warning:** `string[pyarrow]` is currently considered experimental. The implementation and parts of the API may change without warning.

```python
In [8]: pd.Series(['abc', None, 'def'], dtype=pd.StringDtype(storage='pyarrow'))
Out[8]:
0   abc
1   <NA>
2   def
dtype: string
```

You can use the alias "string[pyarrow]" as well.

```python
In [9]: s = pd.Series(['abc', None, 'def'], dtype='string[pyarrow]')
In [10]: s
Out[10]:
0   abc
1   <NA>
2   def
dtype: string
```

You can also create a PyArrow backed string array using pandas options.

```python
In [11]: with pd.option_context("string_storage", "pyarrow"):
....:     s = pd.Series(['abc', None, 'def'], dtype="string")
....:
In [12]: s
Out[12]:
0   abc
1   <NA>
2   def
dtype: string
```

The usual string accessor methods work. Where appropriate, the return type of the Series or columns of a DataFrame will also have string dtype.

```python
In [13]: s.str.upper()
Out[13]:
0   ABC
1   <NA>
2   DEF
dtype: string
In [14]: s.str.split('b', expand=True).dtypes
Out[14]:
0   string
1   string
dtype: object
```

String accessor methods returning integers will return a value with `Int64Dtype`
In [15]: s.str.count("a")
Out[15]:
0    1
1  <NA>
2    0
dtype: Int64

Centered datetime-like rolling windows

When performing rolling calculations on DataFrame and Series objects with a datetime-like index, a centered datetime-like window can now be used (GH38780). For example:

In [16]: df = pd.DataFrame(
    .....:   {"A": [0, 1, 2, 3, 4]}, index=pd.date_range("2020", periods=5, freq="1D")
    .....: )
    .....:
In [17]: df
Out[17]:
      A
2020-01-01  0
2020-01-02  1
2020-01-03  2
2020-01-04  3
2020-01-05  4

In [18]: df.rolling("2D", center=True).mean()
Out[18]:
      A
2020-01-01  0.5
2020-01-02  1.5
2020-01-03  2.5
2020-01-04  3.5
2020-01-05  4.0

Other enhancements

- `DataFrame.rolling()`, `Series.rolling()`, `DataFrame.expanding()`, and `Series.expanding()` now support a method argument with a 'table' option that performs the windowing operation over an entire DataFrame. See Window Overview for performance and functional benefits (GH15095, GH38995)
- ExponentialMovingWindow now support a online method that can perform mean calculations in an online fashion. See Window Overview (GH41673)
- Added `MultiIndex.dtypes()` (GH37062)
- Added end and end_day options for the origin argument in `DataFrame.resample()` (GH37804)
- Improved error message when usecols and names do not match for `read_csv()` and `engine="c"` (GH29042)
- Improved consistency of error messages when passing an invalid win_type argument in Window methods (GH15969)
- `read_sql_query()` now accepts a `dtype` argument to cast the columnar data from the SQL database based on user input (GH10285)
- `read_csv()` now raising `ParserWarning` if length of header or given names does not match length of data when `usecols` is not specified (GH21768)
- Improved integer type mapping from pandas to SQLAlchemy when using `DataFrame.to_sql()` (GH35076)
- `to_numeric()` now supports downcasting of nullable `ExtensionDtype` objects (GH33013)
- Added support for dict-like names in `MultiIndex.set_names` and `MultiIndex.rename` (GH20421)
- `read_excel()` can now auto-detect `.xlsb` files and older `.xls` files (GH35416, GH41225)
- `ExcelWriter` now accepts an `if_sheet_exists` parameter to control the behavior of append mode when writing to existing sheets (GH40230)
- `Rolling.sum()`, `Expanding.sum()`, `Rolling.mean()`, `Expanding.mean()`, `ExponentialMovingWindow.mean()`, `Rolling.median()`, `Expanding.median()`, `Rolling.max()`, `Expanding.max()`, `Rolling.min()`, and `Expanding.min()` now support Numba execution with the `engine` keyword (GH38895, GH41267)
- `DataFrame.apply()` can now accept NumPy unary operators as strings, e.g. `df.apply("sqrt")`, which was already the case for `Series.apply()` (GH39116)
- `DataFrame.apply()` can now accept non-callable DataFrame properties as strings, e.g. `df.apply("size")`, which was already the case for `Series.apply()` (GH39116)
- `DataFrame.applymap()` can now accept kwargs to pass on to the user-provided `func` (GH39987)
- Passing a `DataFrame` indexer to `iloc` is now disallowed for `Series.__getitem__()` and `DataFrame.__getitem__()` (GH39004)
- `Series.apply()` can now accept list-like or dictionary-like arguments that aren’t lists or dictionaries, e.g. `ser.apply(np.array(['sum', 'mean']))`, which was already the case for `DataFrame.apply()` (GH39140)
- `DataFrame.plot.scatter()` can now accept a categorical column for the argument `c` (GH12380, GH31357)
- `Series.loc()` now raises a helpful error message when the Series has a `MultiIndex` and the indexer has too many dimensions (GH35349)
- `read_stata()` now supports reading data from compressed files (GH26599)
- Added support for parsing ISO 8601-like timestamps with negative signs to `Timedelta` (GH37172)
- Added support for unary operators in `FloatingArray` (GH38749)
- `RangeIndex` can now be constructed by passing a `range` object directly e.g. `pd.RangeIndex(range(3))` (GH12067)
- `Series.round()` and `DataFrame.round()` now work with nullable integer and floating dtypes (GH38844)
- `read_csv()` and `read_json()` expose the argument `encoding_errors` to control how encoding errors are handled (GH39450)
- `GroupBy.any()` and `GroupBy.all()` use Kleene logic with nullable data types (GH37506)
- `GroupBy.any()` and `GroupBy.all()` return a `BooleanDtype` for columns with nullable data types (GH33449)
- `GroupBy.any()` and `GroupBy.all()` raising with object data containing pd.NA even when `skipna=True` (GH37501)
- `GroupBy.rank()` now supports object-dtype data (GH38278)
• Constructing a `DataFrame` or `Series` with the `data` argument being a Python iterable that is not a NumPy `ndarray` consisting of NumPy scalars will now result in a dtype with a precision the maximum of the NumPy scalars; this was already the case when `data` is a NumPy `ndarray` (GH40908)

• Add keyword `sort` to `pivot_table()` to allow non-sorting of the result (GH39143)

• Add keyword `dropna` to `DataFrame.value_counts()` to allow counting rows that include NA values (GH41325)

• `Series.replace()` will now cast results to `PeriodDtype` where possible instead of object dtype (GH41526)

• Improved error message in `corr` and `cov` methods on `Rolling`, `Expanding`, and `ExponentialMovingWindow` when `other` is not a `DataFrame` or `Series` (GH41741)

• `Series.between()` can now accept `left` or `right` as arguments to inclusive to include only the left or right boundary (GH40245)

• `DataFrame.explode()` now supports exploding multiple columns. Its `column` argument now also accepts a list of str or tuples for exploding on multiple columns at the same time (GH39240)

• `DataFrame.sample()` now accepts the `ignore_index` argument to reset the index after sampling, similar to `DataFrame.drop_duplicates()` and `DataFrame.sort_values()` (GH38581)

**Notable bug fixes**

These are bug fixes that might have notable behavior changes.

**Categorical.unique now always maintains same dtype as original**

Previously, when calling `Categorical.unique()` with categorical data, unused categories in the new array would be removed, making the dtype of the new array different than the original (GH18291)

As an example of this, given:

```python
In [19]: dtype = pd.CategoricalDtype(['bad', 'neutral', 'good'], ordered=True)
In [20]: cat = pd.Categorical(['good', 'good', 'bad', 'bad'], dtype=dtype)
In [21]: original = pd.Series(cat)
In [22]: unique = original.unique()
```

**Previous behavior:**

```python
In [1]: unique
['good', 'bad']
Categories (2, object): ['bad' < 'good']
In [2]: original.dtype == unique.dtype
False
```

**New behavior:**

```python
In [23]: unique
['good', 'bad']
Categories (3, object): ['bad' < 'neutral' < 'good']
```

(continues on next page)
Preserve dtypes in DataFrame.combine_first()

`DataFrame.combine_first()` will now preserve dtypes (GH7509)

In [25]: df1 = pd.DataFrame({'A': [1, 2, 3], 'B': [1, 2, 3]}, index=[0, 1, 2])

In [26]: df1
Out[26]:
   A  B
0  1  1
1  2  2
2  3  3

In [27]: df2 = pd.DataFrame({'B': [4, 5, 6], 'C': [1, 2, 3]}, index=[2, 3, 4])

In [28]: df2
Out[28]:
   B  C
2  4  1
3  5  2
4  6  3

In [29]: combined = df1.combine_first(df2)

Previous behavior:

In [1]: combined.dtypes
Out[2]:
   A float64    
   B float64    
   C float64    
 dtype: object

New behavior:

In [30]: combined.dtypes
Out[30]:
   A float64
   B int64
   C float64
 dtype: object
Groupby methods agg and transform no longer changes return dtype for callables

Previously the methods `DataFrameGroupBy.aggregate()`, `SeriesGroupBy.aggregate()`, `DataFrameGroupBy.transform()`, and `SeriesGroupBy.transform()` might cast the result dtype when the argument `func` is callable, possibly leading to undesirable results (GH21240). The cast would occur if the result is numeric and casting back to the input dtype does not change any values as measured by `np.allclose`. Now no such casting occurs.

```
In [31]: df = pd.DataFrame({'key': [1, 1], 'a': [True, False], 'b': [True, True]})

In [32]: df
Out[32]:
   key a b
0   1 True True
1   1 False True
```

Previous behavior:

```
In [5]: df.groupby('key').agg(lambda x: x.sum())
Out[5]:
   a   b
key
1  1   2
```

New behavior:

```
In [33]: df.groupby('key').agg(lambda x: x.sum())
Out[33]:
   a   b
key
1   1   2
```

Float result for `GroupBy.mean()`, `GroupBy.median()`, and `GroupBy.var()`

Previously, these methods could result in different dtypes depending on the input values. Now, these methods will always return a float dtype. (GH41137)

```
In [34]: df = pd.DataFrame({'a': [True], 'b': [1], 'c': [1.0]})

Previous behavior:

```
In [5]: df.groupby(df.index).mean()
Out[5]:
   a   b
0  True  1.0
```

New behavior:

```
In [35]: df.groupby(df.index).mean()
Out[35]:
   a   b   c
0  1.0  1.0  1.0
```
Try operating inplace when setting values with \texttt{loc} and \texttt{iloc}

When setting an entire column using \texttt{loc} or \texttt{iloc}, pandas will try to insert the values into the existing data rather than create an entirely new array.

```python
In [36]: df = pd.DataFrame(range(3), columns=["A"], dtype="float64")
In [37]: values = df.values
In [38]: new = np.array([5, 6, 7], dtype="int64")
In [39]: df.loc[[0, 1, 2], "A"] = new

In both the new and old behavior, the data in \texttt{values} is overwritten, but in the old behavior the dtype of \texttt{df["A"]} changed to \texttt{int64}.

Previous behavior:

```python
In [1]: df.dtypes
Out[1]:
    A  int64
dtype: object
In [2]: np.shares_memory(df["A"].values, new)
Out[2]: False
In [3]: np.shares_memory(df["A"].values, values)
Out[3]: False
```

In pandas 1.3.0, \texttt{df} continues to share data with \texttt{values}

New behavior:

```python
In [40]: df.dtypes
Out[40]:
    A  float64
dtype: object
In [41]: np.shares_memory(df["A"], new)
Out[41]: False
In [42]: np.shares_memory(df["A"], values)
Out[42]: True
```

Never operate inplace when setting \texttt{frame[keys] = values}

When setting multiple columns using \texttt{frame[keys] = values} new arrays will replace pre-existing arrays for these keys, which will not be over-written (GH39510). As a result, the columns will retain the dtype(s) of \texttt{values}, never casting to the dtypes of the existing arrays.

```python
In [43]: df = pd.DataFrame(range(3), columns=["A"], dtype="float64")
In [44]: df["A"] = 5

In the old behavior, 5 was cast to \texttt{float64} and inserted into the existing array backing \texttt{df}:

Previous behavior:

```python
In [45]: df["A"]
Out[45]:
    0    5
    1
    2
dtype: int64
```

```python
In [46]: df.dtypes
Out[46]:
    A  int64
dtype: object
In [47]: np.shares_memory(df["A"], new)
Out[47]: False
In [48]: np.shares_memory(df["A"], values)
Out[48]: True
```

In the new behavior, 5 was cast to \texttt{float64} and inserted into the existing array backing \texttt{df}:

```python
In [49]: df["A"]
Out[49]:
    0    5
    1
    2
dtype: float64
In [50]: np.shares_memory(df["A"], new)
Out[50]: False
In [51]: np.shares_memory(df["A"], values)
Out[51]: True
```
In [1]: df.dtypes
Out[1]:
A    float64

In the new behavior, we get a new array, and retain an integer-dtyped 5:

New behavior:

In [45]: df.dtypes
Out[45]:
A    int64
dtype: object

Consistent casting with setting into Boolean Series

Setting non-boolean values into a Series with dtype=BOOL now consistently casts to dtype=object (GH38709)

In [46]: orig = pd.Series([True, False])
In [47]: ser = orig.copy()
In [48]: ser.iloc[1] = np.nan
In [49]: ser2 = orig.copy()
In [50]: ser2.iloc[1] = 2.0

Previous behavior:

In [1]: ser
Out [1]:
0   1.0
1  NaN
dtype: float64

In [2]:ser2
Out [2]:
0   True
1   2.0
dtype: object

New behavior:

In [51]: ser
Out[51]:
0   True
1   NaN
dtype: object

In [52]: ser2
Out[52]:
0   True
(continues on next page)
**pandas: powerful Python data analysis toolkit, Release 1.3.5**

---

**GroupBy.rolling no longer returns grouped-by column in values**

The group-by column will now be dropped from the result of a `groupby.rolling` operation (GH32262)

```python
In [53]: df = pd.DataFrame({"A": [1, 1, 2, 3], "B": [0, 1, 2, 3]})

In [54]: df
Out[54]:
   A  B
0  1  0
1  1  1
2  2  2
3  3  3
```

*Previous behavior:*

```python
In [1]: df.groupby("A").rolling(2).sum()
Out[1]:
   A   B
A 0 NaN NaN
  1 2.0 1.0
  2 NaN NaN
  3 NaN NaN
```

*New behavior:*

```python
In [55]: df.groupby("A").rolling(2).sum()
Out[55]:
   B
A
  0 NaN
  1 1.0
  2 NaN
  3 NaN
```

**Removed artificial truncation in rolling variance and standard deviation**

`Rolling.std()` and `Rolling.var()` will no longer artificially truncate results that are less than ~1e-8 and ~1e-15 respectively to zero (GH37051, GH40448, GH39872).

However, floating point artifacts may now exist in the results when rolling over larger values.

```python
In [56]: s = pd.Series([7, 5, 5, 5])

In [57]: s.rolling(3).var()
Out[57]:
```

(continues on next page)
GroupBy.rolling with MultiIndex no longer drops levels in the result

GroupBy.rolling() will no longer drop levels of a DataFrame with a MultiIndex in the result. This can lead to a perceived duplication of levels in the resulting MultiIndex, but this change restores the behavior that was present in version 1.1.3 (GH38787, GH38523).

```
In [58]: index = pd.MultiIndex.from_tuples([("idx1", "idx2")], names=["label1", "label2"])
In [59]: df = pd.DataFrame({"a": [1], "b": [2]}, index=index)
In [60]: df
Out[60]:
   a  b
label1 label2
idx1  idx2 1  2
```

Previous behavior:

```
In [1]: df.groupby("label1").rolling(1).sum()
Out[1]:
   a  b
label1
idx1  1.0  2.0
```

New behavior:

```
In [61]: df.groupby("label1").rolling(1).sum()
Out[61]:
   a  b
label1 label1 label2
idx1  idx1  idx2  1.0  2.0
```

Backwards incompatible API changes

Increased minimum versions for dependencies

Some minimum supported versions of dependencies were updated. If installed, we now require:
For **optional libraries** the general recommendation is to use the latest version. The following table lists the lowest version per library that is currently being tested throughout the development of pandas. Optional libraries below the lowest tested version may still work, but are not considered supported.

<table>
<thead>
<tr>
<th>Package</th>
<th>Minimum Version</th>

See Dependencies and Optional dependencies for more.

**Other API changes**

- Partially initialized `CategoricalDtype` objects (i.e. those with categories=None) will no longer compare as equal to fully initialized dtypes (GH38516)
- Accessing `_constructor_expanddim` on a `DataFrame` and `_constructor_sliced` on a `Series` now raise an AttributeError. Previously a `NotImplementedError` was raised (GH38782)
- Added new `engine` and `**engine_kwargs` parameters to `DataFrame.to_sql()` to support other future “SQL engines”. Currently we still only use SQLAlchemy under the hood, but more engines are planned to be supported such as turbodbc (GH36893)
- Removed redundant `freq` from `PeriodIndex` string representation (GH41653)
• **ExtensionDtype.construct_array_type()** is now a required method instead of an optional one for ExtensionDtype subclasses (GH24860)

• Calling `hash` on non-hashable pandas objects will now raise `TypeError` with the built-in error message (e.g. `unhashable type: 'Series'`). Previously it would raise a custom message such as 'Series' objects are mutable, thus they cannot be hashed. Furthermore, `isinstance(<Series>, abc.collections.Hashable)` will now return `False` (GH40013)

• **Styler.from_custom_template()** now has two new arguments for template names, and removed the old name, due to template inheritance having been introducing for better parsing (GH42053). Subclassing modifications to Styler attributes are also needed.

**Build**

• Documentation in `.pptx` and `.pdf` formats are no longer included in wheels or source distributions. (GH30741)

**Deprecations**

**Deprecated dropping nuisance columns in DataFrame reductions and DataFrameGroupBy operations**

Calling a reduction (e.g. `.min`, `.max`, `.sum`) on a `DataFrame` with `numeric_only=None` (the default), columns where the reduction raises a `TypeError` are silently ignored and dropped from the result.

This behavior is deprecated. In a future version, the `TypeError` will be raised, and users will need to select only valid columns before calling the function.

For example:

```python
In [62]: df = pd.DataFrame({"A": [1, 2, 3, 4], "B": pd.date_range("2016-01-01", periods=4)})

In [63]: df
Out[63]:
   A      B
0  1  2016-01-01
1  2  2016-01-02
2  3  2016-01-03
3  4  2016-01-04

Old behavior:

In [3]: df.prod()
Out[3]:
   A
0  24
dtype: int64

Future behavior:

In [4]: df.prod()
...  
TypeError: 'DatetimeArray' does not implement reduction 'prod'
```

(continues on next page)
In [5]: df["A"].prod()
Out[5]:
A  24
dtype: int64

Similarly, when applying a function to DataFrameGroupBy, columns on which the function raises TypeError are currently silently ignored and dropped from the result.

This behavior is deprecated. In a future version, the TypeError will be raised, and users will need to select only valid columns before calling the function.

For example:

In [64]: df = pd.DataFrame({"A": [1, 2, 3, 4], "B": pd.date_range("2016-01-01", periods=4)})
In [65]: gb = df.groupby([1, 1, 2, 2])

Old behavior:

In [4]: gb.prod(numeric_only=False)
Out[4]:
A
1  2
2  12

Future behavior:

In [5]: gb.prod(numeric_only=False)
...  TypeError: datetime64 type does not support prod operations
In [6]: gb["A"].prod(numeric_only=False)
Out[6]:
A
1  2
2  12

Other Deprecations

- Deprecated allowing scalars to be passed to the Categorical constructor (GH38433)
- Deprecated constructing CategoricalIndex without passing list-like data (GH38944)
- Deprecated allowing subclass-specific keyword arguments in the Index constructor, use the specific subclass directly instead (GH14093, GH21315, GH22315, GH26974)
- Deprecated the astype() method of datetimelike (timedelta64[ns], datetime64[ns], Datetime64TZDtype, PeriodDtype) to convert to integer dtypes, use values.view(...) instead (GH38544)
- Deprecated MultiIndex.is_lexsorted() and MultiIndex.lexsort_depth(), use MultiIndex.is_monotonic_increasing() instead (GH32259)
- Deprecated keyword try_cast in Series.where(), Series.mask(), DataFrame.where(), DataFrame.mask(); cast results manually if desired (GH38836)
• Deprecated comparison of `Timestamp` objects with `datetime.date` objects. Instead of e.g. `ts <= mydate` use `ts <= pd.Timestamp(mydate)` or `ts.date() <= mydate` (GH36131)

• Deprecated `Rolling.win_type` returning "freq" (GH38963)

• Deprecated `Rolling.is_datetimelike` (GH38963)

• Deprecated `DataFrame` indexer for `Series.__setitem__()` and `DataFrame.__setitem__()` (GH39004)

• Deprecated `ExponentialMovingWindow.vol()` (GH39220)

• Using `.astype` to convert between `datetime64[ns]` dtype and `DatetimeTZDtype` is deprecated and will raise in a future version, use `obj.tz_localize` or `obj.dt.tz_localize` instead (GH38622)

• Deprecated casting `datetime.date` objects to `datetime64` when used as fill_value in `DataFrame.unstack()`, `DataFrame.shift()`, `Series.shift()`, and `DataFrame.reindex()`, pass `pd.Timestamp(dateobj)` instead (GH39767)

• Deprecated `Styler.set_na_rep()` and `Styler.set_precision()` in favor of `Styler.format()` with `na_rep` and `precision` as existing and new input arguments respectively (GH40134, GH40425)

• Deprecated `Styler.where()` in favor of using an alternative formulation with `Styler.applymap()` (GH40821)

• Deprecated allowing partial failure in `Series.transform()` and `DataFrame.transform()` when `func` is list-like or dict-like and raises anything but `TypeError`; `func` raising anything but a `TypeError` will raise in a future version (GH40211)

• Deprecated arguments `error_bad_lines` and `warn_bad_lines` in `read_csv()` and `read_table()` in favor of argument `on_bad_lines` (GH15122)

• Deprecated support for `np.ma.mrecords.MaskedRecords` in the `DataFrame` constructor, pass `{name: data[name] for name in data.dtype.names}` instead (GH40363)

• Deprecated using `merge()`, `DataFrame.merge()`, and `DataFrame.join()` on a different number of levels (GH34862)

• Deprecated the use of `**kwargs` in `ExcelWriter`; use the keyword argument `engine_kwargs` instead (GH40430)

• Deprecated the `level` keyword for `DataFrame` and `Series` aggregations; use `groupby` instead (GH39983)

• Deprecated the `inplace` parameter of `Categorical.remove_categories()`, `Categorical.add_categories()`, `Categorical.reorder_categories()`, `Categorical.rename_categories()`, `Categorical.set_categories()` and will be removed in a future version (GH37643)

• Deprecated `merge()` producing duplicated columns through the `suffixes` keyword and already existing columns (GH22818)

• Deprecated setting `Categorical._codes`, create a new `Categorical` with the desired codes instead (GH40606)

• Deprecated the `convert_float` optional argument in `read_excel()` and `ExcelFile.parse()` (GH41127)

• Deprecated behavior of `DatetimeIndex.union()` with mixed timezones; in a future version both will be cast to UTC instead of object dtype (GH39328)

• Deprecated using `usecols` with out of bounds indices for `read_csv()` with `engine="c"` (GH25623)

• Deprecated special treatment of lists with first element a `Categorical` in the `DataFrame` constructor; pass as `pd.DataFrame({col: categorical, ...})` instead (GH38845)

• Deprecated behavior of `DataFrame` constructor when a `dtype` is passed and the data cannot be cast to that `dtype`. In a future version, this will raise instead of being silently ignored (GH24435)
• Deprecated the `Timestamp.freq` attribute. For the properties that use it (`is_month_start`, `is_month_end`, `is_quarter_start`, `is_quarter_end`, `is_year_start`, `is_year_end`), when you have a `freq`, use e.g. `freq.is_month_start(ts)` (GH15146)

• Deprecated construction of `Series` or `DataFrame` with `DatetimeTZDtype` data and `datetime64[ns]` dtype. Use `Series(data).dt.tz_localize(None)` instead (GH41555, GH33401)

• Deprecated behavior of `Series` construction with large integer values and small integer dtype silently overflowing; use `Series(data).astype(dtype)` instead (GH41734)

• Deprecated behavior of `DataFrame` construction with floating data and integer dtype casting even when lossy; in a future version this will remain floating, matching `Series` behavior (GH41770)

• Deprecated inference of `timedelta64[ns]`, `datetime64[ns]`, or `DatetimeTZDtype` dtypes in `Series` construction when data containing strings is passed and no dtype is passed (GH33558)

• In a future version, constructing `Series` or `DataFrame` with `datetime64[ns]` data and `DatetimeTZDtype` will treat the data as wall-times instead of as UTC times (matching DatetimeIndex behavior). To treat the data as UTC times, use `pd.Series(data).dt.tz_localize("UTC").dt.tz_convert(dtype.tz)` or `pd.Series(data.view("int64"), dtype=dtype)` (GH33401)

• Deprecated passing lists as key to `DataFrame.xs()` and `Series.xs()` (GH41760)

• Deprecated boolean arguments of `inclusive` in `Series.between()` to have `{"left", "right", "neither", "both"}` as standard argument values (GH40628)

• Deprecated passing arguments as positional for all of the following, with exceptions noted (GH41485):
  - `concat()` (other than `objs`)
  - `read_csv()` (other than `filepath_or_buffer`)
  - `read_table()` (other than `filepath_or_buffer`)
  - `DataFrame.clip()` and `Series.clip()` (other than `upper` and `lower`)
  - `DataFrame.drop_duplicates()` (except for `subset`), `Series.drop_duplicates()`, `Index.drop_duplicates()` and `MultiIndex.drop_duplicates()`
  - `DataFrame.drop()` (other than `labels`) and `Series.drop()`
  - `DataFrame.droplevel()` and `Series.droplevel()`
  - `DataFrame.ffmpeg(), Series.ffmpeg(), DataFrame.bfill(), and Series.bfill()`
  - `DataFrame.fillna()` and `Series.fillna()` (apart from `value`)
  - `DataFrame.interpolate()` and `Series.interpolate()` (other than `method`)
  - `DataFrame.mask()` and `Series.mask()` (other than `cond` and `other`)
  - `DataFrame.reset_index()` (other than `level`) and `Series.reset_index()`
  - `DataFrame.set_axis()` and `Series.set_axis()` (other than `labels`)
  - `DataFrame.set_index()` (other than `keys`)
  - `DataFrame.sort_index()` and `Series.sort_index()`
  - `DataFrame.sort_values()` (other than `by`) and `Series.sort_values()`
  - `DataFrame.where()` and `Series.where()` (other than `cond` and `other`)
  - `Index.set_names()` and `MultiIndex.set_names()` (except for `names`)
  - `MultiIndex.codes()` (except for `codes`)
  - `MultiIndex.set_levels()` (except for `levels`)

2788 Chapter 5. Release notes
Performance improvements

- Performance improvement in `IntervalIndex.isin()` (GH38353)
- Performance improvement in `Series.mean()` for nullable data types (GH34814)
- Performance improvement in `Series.isin()` for nullable data types (GH38340)
- Performance improvement in `DataFrame.fillna()` with method="pad" or method="backfill" for nullable floating and nullable integer dtypes (GH39953)
- Performance improvement in `DataFrame.corr()` for method=kendall (GH28329)
- Performance improvement in `DataFrame.corr()` for method=spearman (GH40956, GH41885)
- Performance improvement in `Rolling.corr()` and `Rolling.cov()` (GH39388)
- Performance improvement in `RollingGroupby.corr()`, `ExpandingGroupby.corr()`, `ExpandingGroupby.corr()` and `ExpandingGroupby.cov()` (GH39591)
- Performance improvement in `unique()` for object data type (GH37615)
- Performance improvement in `json_normalize()` for basic cases (including separators) (GH40035 GH15621)
- Performance improvement in `ExpandingGroupby` aggregation methods (GH39664)
- Performance improvement in `Styler` where render times are more than 50% reduced and now matches `DataFrame.to_html()` (GH39972 GH39952, GH40425)
- The method `Styler.set_td_classes()` is now as performant as `Styler.apply()` and `Styler.applymap()`, and even more so in some cases (GH40453)
- Performance improvement in `ExponentialMovingWindow.mean()` with times (GH39784)
- Performance improvement in `GroupBy.apply()` when requiring the Python fallback implementation (GH40176)
- Performance improvement in the conversion of a PyArrow Boolean array to a pandas nullable Boolean array (GH41051)
- Performance improvement for concatenation of data with type `CategoricalDtype` (GH40193)
- Performance improvement in `GroupBy.cummin()` and `GroupBy.cummax()` with nullable data types (GH37493)
- Performance improvement in `Series.nunique()` with nan values (GH40865)
- Performance improvement in `DataFrame.transpose()`, `Series.unstack()` with `DatetimeTZDtype` (GH40149)
- Performance improvement in `Series.plot()` and `DataFrame.plot()` with entry point lazy loading (GH41492)
Bug fixes

Categorical

- Bug in `CategoricalIndex` incorrectly failing to raise `TypeError` when scalar data is passed (GH38614)
- Bug in `CategoricalIndex.reindex` failed when the `Index` passed was not categorical but whose values were all labels in the category (GH28690)
- Bug where constructing a `Categorical` from an object-dtype array of `date` objects did not round-trip correctly with `astype` (GH38552)
- Bug in constructing a `DataFrame` from an `ndarray` and a `CategoricalDtype` (GH38857)
- Bug in setting categorical values into an object-dtype column in a `DataFrame` (GH39136)
- Bug in `DataFrame.reindex()` was raising an `IndexError` when the new index contained duplicates and the old index was a `CategoricalIndex` (GH38906)
- Bug in `Categorical.fillna()` with a tuple-like category raising `NotImplementedError` instead of `ValueError` when filling with a non-category tuple (GH41914)

Datetimelike

- Bug in `DataFrame` and `Series` constructors sometimes dropping nanoseconds from `Timestamp` (resp. `Timedelta`) data, with `dtype=timedelta64[ns]` (resp. `timedelta64[ns]`) (GH38032)
- Bug in `DataFrame.first()` and `Series.first()` with an offset of one month returning an incorrect result when the first day is the last day of a month (GH29623)
- Bug in constructing a `DataFrame` or `Series` with mismatched `datetime64` data and `timedelta64` `dtype`, or vice-versa, failing to raise a `TypeError` (GH38575, GH38764, GH38792)
- Bug in constructing a `Series` or `DataFrame` with a `datetime` object out of bounds for `datetime64[ns]` `dtype` or a `timedelta` object out of bounds for `timedelta64[ns]` `dtype` (GH38792, GH38965)
- Bug in `DatetimeIndex.intersection()`, `DatetimeIndex.symmetric_difference()`, `PeriodIndex.intersection()`, `PeriodIndex.symmetric_difference()` always returning object-dtype when operating with `CategoricalIndex` (GH38741)
- Bug in `DatetimeIndex.intersection()` giving incorrect results with non-Tick frequencies with `n` != 1 (GH42104)
- Bug in `Series.where()` incorrectly casting `datetime64` values to `int64` (GH37682)
- Bug in `Categorical` incorrectly typecasting `datetime` object to `Timestamp` (GH38878)
- Bug in comparisons between `Timestamp` object and `datetime64` objects just outside the implementation bounds for nanosecond `datetime64` (GH39221)
- Bug in `Timestamp.round()`, `Timestamp.floor()`, `Timestamp.ceil()` for values near the implementation bounds of `Timestamp` (GH39244)
- Bug in `Timedelta.round()`, `Timedelta.floor()`, `Timedelta.ceil()` for values near the implementation bounds of `Timedelta` (GH38964)
- Bug in `date_range()` incorrectly creating `DatetimeIndex` containing `NaT` instead of raising `OutOfBoundsDatetime` in corner cases (GH24124)
- Bug in `infer_freq()` incorrectly fails to infer ‘H’ frequency of `DatetimeIndex` if the latter has a timezone and crosses DST boundaries (GH39556)
• Bug in `Series` backed by `DatetimeArray` or `TimedeltaArray` sometimes failing to set the array's `freq` to `None` (GH41425)

**Timedelta**

• Bug in constructing `Timedelta` from `np.timedelta64` objects with non-nanosecond units that are out of bounds for `timedelta64[ns]` (GH38965)
• Bug in constructing a `TimedeltaIndex` incorrectly accepting `np.datetime64("NaT")` objects (GH39462)
• Bug in constructing `Timedelta` from an input string with only symbols and no digits failed to raise an error (GH39710)
• Bug in `TimedeltaIndex` and `to_timedelta()` failing to raise when passed non-nanosecond `timedelta64` arrays that overflow when converting to `timedelta64[ns]` (GH40008)

**Timezones**

• Bug in different `tzinfo` objects representing UTC not being treated as equivalent (GH39216)
• Bug in `dateutil.tz.gettz("UTC")` not being recognized as equivalent to other UTC-representing `tzinfo`s (GH39276)

**Numeric**

• Bug in `DataFrame.quantile()`, `DataFrame.sort_values()` causing incorrect subsequent indexing behavior (GH38351)
• Bug in `DataFrame.sort_values()` raising an `IndexError` for empty by (GH40258)
• Bug in `DataFrame.select_dtypes()` with include=`np.number` would drop numeric `ExtensionDtype` columns (GH35340)
• Bug in `DataFrame.mode()` and `Series.mode()` not keeping consistent integer `Index` for empty input (GH33321)
• Bug in `DataFrame.rank()` when the DataFrame contained `np.inf` (GH32593)
• Bug in `DataFrame.rank()` with axis=`0` and columns holding incomparable types raising an `IndexError` (GH38932)
• Bug in `Series.rank()`, `DataFrame.rank()`, and `GroupBy.rank()` treating the most negative `int64` value as missing (GH32859)
• Bug in `DataFrame.select_dtypes()` different behavior between Windows and Linux with include="int" (GH36596)
• Bug in `DataFrame.apply()` and `DataFrame.agg()` when passed the argument `func="size"` would operate on the entire `DataFrame` instead of rows or columns (GH39934)
• Bug in `DataFrame.transform()` would raise a `SpecificationError` when passed a dictionary and columns were missing; will now raise a `KeyError` instead (GH40004)
• Bug in `GroupBy.rank()` giving incorrect results with `pct=True` and equal values between consecutive groups (GH40518)
• Bug in `Series.count()` would result in an `int32` result on 32-bit platforms when argument `level=None` (GH40908)
pandas: powerful Python data analysis toolkit, Release 1.3.5

- Bug in `Series` and `DataFrame` reductions with methods `any` and `all` not returning Boolean results for object data (GH12863, GH35450, GH27709)
- Bug in `Series.clip()` would fail if the Series contains NA values and has nullable int or float as a data type (GH40851)
- Bug in `UInt64Index.where()` and `UInt64Index.putmask()` with an np.int64 dtype other incorrectly raising `TypeError` (GH41974)
- Bug in `DataFrame.agg()` not sorting the aggregated axis in the order of the provided aggregation functions when one or more aggregation function fails to produce results (GH33634)
- Bug in `DataFrame.clip()` not interpreting missing values as no threshold (GH40420)

**Conversion**

- Bug in `Series.to_dict()` with `orient='records'` now returns Python native types (GH25969)
- Bug in `Series.view()` and `Index.view()` when converting between datetime-like (datetime64[ns], datetime64[ns, tz], timedelta64, period) dtypes (GH39788)
- Bug in creating a `DataFrame` from an empty `np.recarray` not retaining the original dtypes (GH40121)
- Bug in `DataFrame` failing to raise a `TypeError` when constructing from a `frozenset` (GH40163)
- Bug in `Index` construction silently ignoring a passed dtype when the data cannot be cast to that dtype (GH21311)
- Bug in `StringArray.astype()` falling back to NumPy and raising when converting to dtype='categorical' (GH40450)
- Bug in `factorize()` where, when given an array with a numeric NumPy dtype lower than int64, uint64 and float64, the unique values did not keep their original dtype (GH41132)
- Bug in `DataFrame` construction with a dictionary containing an array-like with `ExtensionDtype` and `copy=True` failing to make a copy (GH38939)
- Bug in `qcut()` raising error when taking `Float64DType` as input (GH40730)
- Bug in `DataFrame` and `Series` construction with `datetime64[ns]` data and dtype=object resulting in `datetime` objects instead of `Timestamp` objects (GH41599)
- Bug in `DataFrame` and `Series` construction with `timedelta64[ns]` data and dtype=object resulting in `np.timedelta64` objects instead of `Timedelta` objects (GH41599)
- Bug in `DataFrame` construction when given a two-dimensional object-dtype `np.ndarray` of `Period` or `Interval` objects failing to cast to `PeriodDtype` or `IntervalDtype`, respectively (GH41812)
- Bug in constructing a `Series` from a list and a `PandasDtype` (GH39357)
- Bug in creating a `Series` from a `range` object that does not fit in the bounds of int64 dtype (GH30173)
- Bug in creating a `Series` from a dict with all-tuple keys and an `Index` that requires reindexing (GH1707)
- Bug in `infer_dtype()` not recognizing Series, Index, or array with a Period dtype (GH23553)
- Bug in `infer_dtype()` raising an error for general `ExtensionArray` objects. It will now return "unknown-array" instead of raising (GH37367)
- Bug in `DataFrame.convert_dtypes()` incorrectly raised a `ValueError` when called on an empty DataFrame (GH40393)
Strings

- Bug in the conversion from `pyarrow.ChunkedArray` to `StringArray` when the original had zero chunks (GH41040)
- Bug in `Series.replace()` and `DataFrame.replace()` ignoring replacements with `regex=True` for `StringDType` data (GH41333, GH35977)
- Bug in `Series.str.extract()` with `StringArray` returning object dtype for an empty `DataFrame` (GH41441)
- Bug in `Series.str.replace()` where the `case` argument was ignored when `regex=False` (GH41602)

Interval

- Bug in `IntervalIndex.intersection()` and `IntervalIndex.symmetric_difference()` always returning object-dtype when operating with `CategoricalIndex` (GH38653, GH38741)
- Bug in `IntervalIndex.intersection()` returning duplicates when at least one of the `Index` objects have duplicates which are present in the other (GH38743)
- `IntervalIndex.union()`, `IntervalIndex.intersection()`, `IntervalIndex.difference()`, and `IntervalIndex.symmetric_difference()` now cast to the appropriate dtype instead of raising a `TypeError` when operating with another `IntervalIndex` with incompatible dtype (GH39267)
- `PeriodIndex.union()`, `PeriodIndex.intersection()`, `PeriodIndex.symmetric_difference()`, `PeriodIndex.difference()` now cast to object dtype instead of raising `IncompatibleFrequency` when operating with another `PeriodIndex` with incompatible dtype (GH39306)
- Bug in `IntervalIndex.is_monotonic()`, `IntervalIndex.get_loc()`, `IntervalIndex.get_indexer_for()`, and `IntervalIndex.__contains__()` when NA values are present (GH41831)

Indexing

- Bug in `Index.union()` and `MultiIndex.union()` dropping duplicate `Index` values when `Index` was not monotonic or `sort` was set to `False` (GH36289, GH31326, GH40862)
- Bug in `CategoricalIndex.get_indexer()` failing to raise `InvalidIndexError` when non-unique (GH38372)
- Bug in `IntervalIndex.get_indexer()` when `target` has `CategoricalDtype` and both the index and the target contain NA values (GH41934)
- Bug in `Series.loc()` raising a `ValueError` when input was filtered with a Boolean list and values to set were a list with lower dimension (GH38380)
- Bug in inserting many new columns into a `DataFrame` causing incorrect subsequent indexing behavior (GH20438)
- Bug in `DataFrame.__setitem__()` raising a `ValueError` when setting multiple values to duplicate columns (GH15695)
- Bug in `DataFrame.loc()`, `Series.loc()`, `DataFrame.__getitem__()` and `Series.__getitem__()` returning incorrect elements for non-monotonic `DatetimeIndex` for string slices (GH33146)
- Bug in `DataFrame.reindex()` and `Series.reindex()` with timezone aware indexes raising a `TypeError` for `method="ffill"` and `method="bfill"` and specified tolerance (GH38566)
• Bug in `DataFrame.reindex()` with `datetime64[ns]` or `timedelta64[ns]` incorrectly casting to integers when the fill_value requires casting to object dtype (GH39755)

• Bug in `DataFrame.__setitem__()` raising a `ValueError` when setting on an empty `DataFrame` using specified columns and a nonempty `DataFrame` value (GH38831)

• Bug in `DataFrame.loc.__setitem__()` raising a `ValueError` when operating on a unique column when the `DataFrame` has duplicate columns (GH38521)

• Bug in `DataFrame.iloc.__setitem__()` and `DataFrame.loc.__setitem__()` with mixed dtypes when setting with a dictionary value (GH38335)

• Bug in `Series.loc.__setitem__()` and `DataFrame.loc.__setitem__()` raising `KeyError` when provided a Boolean generator (GH39614)

• Bug in `Series.iloc()` and `DataFrame.iloc()` raising a `KeyError` when provided a generator (GH39614)

• Bug in `DataFrame.__setitem__()` not raising a `ValueError` when the right hand side is a `DataFrame` with wrong number of columns (GH38604)

• Bug in `Series.__setitem__()` raising a `ValueError` when setting a `Series` with a scalar indexer (GH38303)

• Bug in `DataFrame.loc()` dropping levels of a `MultiIndex` when the `DataFrame` used as input has only one row (GH10521)

• Bug in `DataFrame.__getitem__()` and `Series.__getitem__()` always raising `KeyError` when slicing with existing strings where the `Index` has milliseconds (GH33589)

• Bug in setting `timedelta64` or `datetime64` values into numeric `Series` failing to cast to object dtype (GH39086, GH39619)

• Bug in setting `Interval` values into a `Series` or `DataFrame` with mismatched `IntervalDtype` incorrectly casting the new values to the existing dtype (GH39120)

• Bug in setting `datetime64` values into a `Series` with integer-dtype incorrectly casting the `datetime64` values to integers (GH39266)

• Bug in setting `np.datetime64("NaT")` into a `Series` with `Datetime64TZDtype` incorrectly treating the timezone-naive value as timezone-aware (GH39769)

• Bug in `Index.get_loc()` not raising `KeyError` when key=NaN and method is specified but NaN is not in the `Index` (GH39382)

• Bug in `DatetimeIndex.insert()` when inserting `np.datetime64("NaT")` into a time-zone-aware index incorrectly treating the time-zone-naive value as time-zone-aware (GH39769)

• Bug in incorrectly raising in `Index.insert()`, when setting a new column that cannot be held in the existing frame.columns, or in `Series.reset_index()` or `DataFrame.reset_index()` instead of casting to a compatible dtype (GH39068)

• Bug in `RangeIndex.append()` where a single object of length 1 was concatenated incorrectly (GH39401)

• Bug in `RangeIndex.astype()` where when converting to `CategoricalIndex`, the categories became a `Int64Index` instead of a `RangeIndex` (GH41263)

• Bug in setting `numpy.timedelta64` values into an object-dtype `Series` using a Boolean indexer (GH39488)

• Bug in setting numeric values into a into a boolean-dtypes `Series` using at or iat failing to cast to object-dtype (GH39582)

• Bug in `DataFrame.__setitem__()` and `DataFrame.iloc.__setitem__()` raising `ValueError` when trying to index with a row-slice and setting a list as values (GH40440)

• Bug in `DataFrame.loc()` not raising `KeyError` when the key was not found in `MultiIndex` and the levels were not fully specified (GH41170)
• Bug in DataFrame.loc.__setitem__() when setting-with-expansion incorrectly raising when the index in the expanding axis contained duplicates (GH40096)

• Bug in DataFrame.loc.__getitem__() with MultiIndex casting to float when at least one index column has float dtype and we retrieve a scalar (GH41369)

• Bug in DataFrame.loc() incorrectly matching non-Boolean index elements (GH20432)

• Bug in indexing with np.nan on a Series or DataFrame with a CategoricalIndex incorrectly raising KeyError when np.nan keys are present (GH41933)

• Bug in Series.__delitem__() with ExtensionDtype incorrectly casting to ndarray (GH40386)

• Bug in DataFrame.at() with a CategoricalIndex returning incorrect results when passed integer keys (GH41846)

• Bug in DataFrame.loc() returning a MultiIndex in the wrong order if an indexer has duplicates (GH40978)

• Bug in DataFrame.loc() incorrectly raising a TypeError when using a str subclass as the column name with a DatetimeIndex (GH37366)

• Bug in PeriodIndex.get_loc() failing to raise a KeyError when given a Period with a mismatched freq (GH41670)

• Bug .loc.__getitem__ with a UInt64Index and negative-integer keys raising OverflowError instead of KeyError in some cases, wrapping around to positive integers in others (GH41777)

• Bug in Index.get_indexer() failing to raise ValueError in some cases with invalid method, limit, or tolerance arguments (GH41918)

• Bug when slicing a Series or DataFrame with a TimedeltaIndex when passing an invalid string raising ValueError instead of a TypeError (GH41821)

• Bug in Index constructor sometimes silently ignoring a specified dtype (GH38879)

• Index.where() behavior now mirrors Index.putmask() behavior, i.e. index.where(mask, other) matches index.putmask(~mask, other) (GH39412)

**Missing**

• Bug in Grouper did not correctly propagate the dropna argument: DataFrameGroupBy.transform() now correctly handles missing values for dropna=True (GH35612)

• Bug in isna(), Series.isna(), Index.isna(), DataFrame.isna(), and the corresponding notna functions not recognizing Decimal("NaN") objects (GH39409)

• Bug in DataFrame.fillna() not accepting a dictionary for the downcast keyword (GH40809)

• Bug in isna() not returning a copy of the mask for nullable types, causing any subsequent mask modification to change the original array (GH40935)

• Bug in DataFrame construction with float data containing NaN and an integer dtype casting instead of retaining the NaN (GH26919)

• Bug in Series.isin() and MultiIndex.isin() didn’t treat all nans as equivalent if they were in tuples (GH41836)
pandas: powerful Python data analysis toolkit, Release 1.3.5

MultiIndex

- Bug in DataFrame.drop() raising a TypeError when the MultiIndex is non-unique and level is not provided (GH36293)
- Bug in MultiIndex.intersection() duplicating NaN in the result (GH38623)
- Bug in MultiIndex.equals() incorrectly returning True when the MultiIndex contained NaN even when they are differently ordered (GH38439)
- Bug in MultiIndex.intersection() always returning an empty result when intersecting with CategoricalIndex (GH38653)
- Bug in MultiIndex.intersection() incorrectly raising TypeError when indexes contain non-sortable entries (GH41915)
- Bug in MultiIndex.reindex() raising a ValueError when used on an empty MultiIndex and indexing only a specific level (GH41170)
- Bug in MultiIndex.reindex() raising TypeError when reindexing against a flat Index (GH41707)

I/O

- Bug in Index.__repr__() when display.max_seq_items=1 (GH38415)
- Bug in read_csv() not recognizing scientific notation if the argument decimal is set and engine="python" (GH31920)
- Bug in read_csv() interpreting NA value as comment, when NA does contain the comment string fixed for engine="python" (GH34002)
- Bug in read_csv() raising an IndexError with multiple header columns and index_col is specified when the file has no data rows (GH38292)
- Bug in read_csv() not accepting usecols with a different length than names for engine="python" (GH16469)
- Bug in read_csv() returning object dtype when delimiter="," with usecols and parse_dates specified for engine="python" (GH35873)
- Bug in read_csv() raising a TypeError when names and parse_dates is specified for engine="c" (GH33699)
- Bug in read_clipboard() and DataFrame.to_clipboard() not working in WSL (GH38527)
- Allow custom error values for the parse_dates argument of read_sql(), read_sql_query() and read_sql_table() (GH35185)
- Bug in DataFrame.to_hdf() and Series.to_hdf() raising a KeyError when trying to apply for subclasses of DataFrame or Series (GH33748)
- Bug in HDFStore.put() raising a wrong TypeError when saving a DataFrame with non-string dtype (GH34274)
- Bug in json_normalize() resulting in the first element of a generator object not being included in the returned DataFrame (GH35923)
- Bug in read_csv() applying the thousands separator to date columns when the column should be parsed for dates and usecols is specified for engine="python" (GH39365)
- Bug in read_excel() forward filling MultiIndex names when multiple header and index columns are specified (GH34673)
• Bug in `read_excel()` not respecting `set_option()` (GH34252)
• Bug in `read_csv()` not switching `true_values` and `false_values` for nullable Boolean dtype (GH34655)
• Bug in `read_json()` when `orient="split"` not maintaining a numeric string index (GH28556)
• `read_sql()` returned an empty generator if `chunksize` was non-zero and the query returned no results. Now returns a generator with a single empty DataFrame (GH34411)
• Bug in `read_hdf()` returning unexpected records when filtering on categorical string columns using the `where` parameter (GH39189)
• Bug in `read_sas()` raising a `ValueError` when datetimes were null (GH39725)
• Bug in `read_excel()` dropping empty values from single-column spreadsheets (GH39808)
• Bug in `read_excel()` loading trailing empty rows/columns for some filetypes (GH41167)
• Bug in `read_excel()` raising an `AttributeError` when the excel file had a `MultiIndex` header followed by two empty rows and no index (GH40442)
• Bug in `read_excel()`, `read_csv()`, `read_table()`, `read_fwf()`, and `read_clipboard()` where one blank row after a `MultiIndex` header with no index would be dropped (GH40442)
• Bug in `DataFrame.to_string()` misplacing the truncation column when `index=False` (GH40904)
• Bug in `DataFrame.to_string()` adding an extra dot and misaligning the truncation row when `index=False` (GH40904)
• Bug in `read_orc()` always raising an `AttributeError` (GH40918)
• Bug in `read_csv()` and `read_table()` silently ignoring `prefix` if `names` and `prefix` are defined, now raising a `ValueError` (GH39123)
• Bug in `read_csv()` and `read_excel()` not respecting the dtype for a duplicated column name when `mangle_dupe_cols` is set to True (GH35211)
• Bug in `read_csv()` silently ignoring `sep` if `delimiter` and `sep` are defined, now raising a `ValueError` (GH39823)
• Bug in `read_csv()` and `read_table()` misinterpreting arguments when `sys.setprofile` had been previously called (GH41069)
• Bug in the conversion from PyArrow to pandas (e.g. for reading Parquet) with nullable dtypes and a PyArrow array whose data buffer size is not a multiple of the dtype size (GH40896)
• Bug in `read_excel()` would raise an error when pandas could not determine the file type even though the user specified the `engine` argument (GH41225)
• Bug in `read_clipboard()` copying from an excel file shifts values into the wrong column if there are null values in first column (GH41108)
• Bug in `DataFrame.to_hdf()` and `Series.to_hdf()` raising a `TypeError` when trying to append a string column to an incompatible column (GH41897)
Period

- Comparisons of `Period` objects or `Index`, `Series`, or `DataFrame` with mismatched `PeriodDtype` now behave like other mismatched-type comparisons, returning `False` for equals, `True` for not-equal, and raising `TypeError` for inequality checks (GH39274)

Plotting

- Bug in `plotting.scatter_matrix()` raising when 2d `ax` argument passed (GH16253)
- Prevent warnings when Matplotlib's `constrained_layout` is enabled (GH25261)
- Bug in `DataFrame.plot()` was showing the wrong colors in the legend if the function was called repeatedly and some calls used `yerr` while others didn't (GH39522)
- Bug in `DataFrame.plot()` was showing the wrong colors in the legend if the function was called repeatedly and some calls used `secondary_y` and others use `legend=False` (GH40044)
- Bug in `DataFrame.plot.box()` when `dark_background` theme was selected, caps or min/max markers for the plot were not visible (GH40769)

Groupby/resample/rolling

- Bug in `GroupBy.agg()` with `PeriodDtype` columns incorrectly casting results too aggressively (GH38254)
- Bug in `SeriesGroupBy.value_counts()` where unobserved categories in a grouped categorical Series were not tallied (GH38672)
- Bug in `SeriesGroupBy.value_counts()` where an error was raised on an empty Series (GH39172)
- Bug in `GroupBy.indices()` would contain non-existent indices when null values were present in the groupby keys (GH9304)
- Fixed bug in `GroupBy.sum()` causing a loss of precision by now using Kahan summation (GH38778)
- Fixed bug in `GroupBy.cumsum()` and `GroupBy.mean()` causing loss of precision through using Kahan summation (GH38934)
- Bug in `Resampler.aggregate()` and `DataFrame.transform()` raising a `TypeError` instead of `SpecificationError` when missing keys had mixed dtypes (GH39025)
- Bug in `DataFrameGroupBy.idxmin()` and `DataFrameGroupBy.idxmax()` with `ExtensionDtype` columns (GH38733)
- Bug in `Series.resample()` would raise when the index was a `PeriodIndex` consisting of `NaT` (GH39227)
- Bug in `RollingGroupby.corr()` and `ExpandingGroupby.corr()` where the groupby column would return 0 instead of `np.nan` when providing `other` that was longer than each group (GH39591)
- Bug in `ExpandingGroupby.corr()` and `ExpandingGroupby.cov()` where 1 would be returned instead of `np.nan` when providing `other` that was longer than each group (GH39591)
- Bug in `GroupBy.mean()`, `GroupBy.median()` and `DataFrame.pivot_table()` not propagating metadata (GH28283)
- Bug in `Series.rolling()` and `DataFrame.rolling()` not calculating window bounds correctly when window is an offset and dates are in descending order (GH40002)
• Bug in `Series.groupby()` and `DataFrame.groupby()` on an empty Series or DataFrame would lose index, columns, and/or data types when directly using the methods `idxmax`, `idxmin`, `mad`, `min`, `max`, `sum`, `prod`, and `skew` or using them through `apply`, `aggregate`, or `resample` (GH26411)

• Bug in `GroupBy.apply()` where a `MultiIndex` would be created instead of an `Index` when used on a `RollingGroupby` object (GH39732)

• Bug in `DataFrameGroupBy.sample()` where an error was raised when `weights` was specified and the index was an `Int64Index` (GH39927)

• Bug in `DataFrameGroupBy.aggregate()` and `Resampler.aggregate()` would sometimes raise a `SpecificationError` when passed a dictionary and columns were missing; will now always raise a `KeyError` instead (GH40004)

• Bug in `DataFrameGroupBy.sample()` where column selection was not applied before computing the result (GH39928)

• Bug in `ExponentialMovingWindow` when calling `__getitem__` would incorrectly raise a `ValueError` when providing `times` (GH40164)

• Bug in `ExponentialMovingWindow` when calling `__getitem__` would not retain `com`, `span`, `alpha` or `halflife` attributes (GH40164)

• `ExponentialMovingWindow` now raises a `NotImplementedError` when specifying `times` with `adjust=False` due to an incorrect calculation (GH40098)

• Bug in `ExponentialMovingWindowGroupby.mean()` where the `times` argument was ignored when `engine='numba'` (GH40951)

• Bug in `ExponentialMovingWindowGroupby.mean()` where the wrong `times` were used in the case of multiple groups (GH40951)

• Bug in `ExponentialMovingWindowGroupby` where the `times` vector and values became out of sync for non-trivial groups (GH40951)

• Bug in `Series.asfreq()` and `DataFrame.asfreq()` dropping rows when the index was not sorted (GH39805)

• Bug in aggregation functions for `DataFrame` not respecting `numeric_only` argument when `level` keyword was given (GH40660)

• Bug in `SeriesGroupBy.aggregate()` where using a user-defined function to aggregate a Series with an object-typed `Index` causes an incorrect `Index` shape (GH40014)

• Bug in `RollingGroupby` where `as_index=False` argument in `groupby` was ignored (GH39433)

• Bug in `GroupBy.any()` and `GroupBy.all()` raising a `ValueError` when using with nullable type columns holding `NA` even with `skipna=True` (GH40585)

• Bug in `GroupBy.cummin()` and `GroupBy.cummax()` incorrectly rounding integer values near the `int64` implementations bounds (GH40767)

• Bug in `GroupBy.rank()` with nullable dtypes incorrectly raising a `TypeError` (GH41010)

• Bug in `GroupBy.cummin()` and `GroupBy.cummax()` computing wrong result with nullable data types too large to roundtrip when casting to float (GH37493)

• Bug in `DataFrame.rolling()` returning mean zero for all NaN window with `min_periods=0` if calculation is not numerical stable (GH41053)

• Bug in `DataFrame.rolling()` returning sum not zero for all NaN window with `min_periods=0` if calculation is not numerical stable (GH41053)

• Bug in `SeriesGroupBy.agg()` failing to retain ordered `CategoricalDtype` on order-preserving aggregations (GH41147)
• Bug in `GroupBy.min()` and `GroupBy.max()` with multiple object-dtype columns and `numeric_only=False` incorrectly raising a `ValueError` (GH41111)

• Bug in `DataFrameGroupBy.rank()` with the GroupBy object's `axis=0` and the `rank` method's keyword `axis=1` (GH41320)

• Bug in `DataFrameGroupBy.__getitem__()` with non-unique columns incorrectly returning a malformed `SeriesGroupBy` instead of `DataFrameGroupBy` (GH41427)

• Bug in `DataFrameGroupBy.transform()` with non-unique columns incorrectly raising an `AttributeError` (GH41427)

• Bug in `Resampler.apply()` with non-unique columns incorrectly dropping duplicated columns (GH41445)

• Bug in `Series.groupby()` aggregations incorrectly returning empty `Series` instead of raising `TypeError` on aggregations that are invalid for its dtype, e.g. `.prod` with `datetime64[ns]` dtype (GH41342)

• Bug in `DataFrameGroupBy` aggregations incorrectly failing to drop columns with invalid dtypes for that aggregation when there are no valid columns (GH41291)

• Bug in `DataFrame.rolling.__iter__()` where `on` was not assigned to the index of the resulting objects (GH40373)

• Bug in `DataFrameGroupBy.transform()` and `DataFrameGroupBy.agg()` with `engine="numba"` where `*args` were being cached with the user passed function (GH41647)

• Bug in `DataFrameGroupBy` methods `agg`, `transform`, `sum`, `bfill`, `ffill`, `pad`, `pct_change`, `shift`, `ohlc` dropping `.columns.names` (GH41497)

Reshaping

• Bug in `merge()` raising error when performing an inner join with partial index and `right_index=True` when there was no overlap between indices (GH33814)

• Bug in `DataFrame.unstack()` with missing levels led to incorrect index names (GH37510)

• Bug in `merge_asof()` propagating the right Index with `left_index=True` and `right_on` specification instead of left Index (GH33463)

• Bug in `DataFrame.join()` on a DataFrame with a `MultiIndex` returned the wrong result when one of both indexes had only one level (GH36909)

• `merge_asof()` now raises a `ValueError` instead of a cryptic `TypeError` in case of non-numerical merge columns (GH29130)

• Bug in `DataFrame.join()` not assigning values correctly when the DataFrame had a `MultiIndex` where at least one dimension had dtype `Categorical` with non-alphabetically sorted categories (GH38502)

• `Series.value_counts()` and `Series.mode()` now return consistent keys in original order (GH12679, GH11227 and GH39007)

• Bug in `DataFrame.stack()` not handling `NaN` in `MultiIndex` columns correctly (GH39481)

• Bug in `DataFrame.apply()` would give incorrect results when the argument `func` was a string, `axis=1`, and the axis argument was not supported; now raises a `ValueError` instead (GH39211)

• Bug in `DataFrame.sort_values()` not reshaping the index correctly after sorting on columns when `ignore_index=True` (GH39464)

• Bug in `DataFrame.append()` returning incorrect dtypes with combinations of `ExtensionDtype` dtypes (GH39454)
• Bug in `DataFrame.append()` returning incorrect dtypes when used with combinations of `datetime64` and `timedelta64` dtypes (GH39574)

• Bug in `DataFrame.append()` with a `DataFrame` with a `MultiIndex` and appending a `Series` whose `Index` is not a `MultiIndex` (GH41707)

• Bug in `DataFrame.pivot_table()` returning a `MultiIndex` for a single value when operating on an empty `DataFrame` (GH13483)

• `Index` can now be passed to the `numpy.all()` function (GH40180)

• Bug in `DataFrame.stack()` not preserving `CategoricalDtype` in a `MultiIndex` (GH36991)

• Bug in `to_datetime()` raising an error when the input sequence contained unhashable items (GH39756)

• Bug in `Series.explode()` preserving the index when `ignore_index` was `True` and values were scalars (GH40487)

• Bug in `to_datetime()` raising a `ValueError` when `Series` contains `None` and `NaT` and has more than 50 elements (GH39882)

• Bug in `Series.unstack()` and `DataFrame.unstack()` with object-dtype values containing timezone-aware datetime objects incorrectly raising `TypeError` (GH41875)

• Bug in `DataFrame.melt()` raising `InvalidIndexError` when `DataFrame` has duplicate columns used as `value_vars` (GH41951)

Sparse

• Bug in `DataFrame.sparse.to_coo()` raising a `KeyError` with columns that are a numeric `Index` without a 0 (GH18414)

• Bug in `SparseArray.astype()` with `copy=False` producing incorrect results when going from integer dtype to floating dtype (GH34456)

• Bug in `SparseArray.max()` and `SparseArray.min()` would always return an empty result (GH40921)

ExtensionArray

• Bug in `DataFrame.where()` when `other` is a Series with an `ExtensionDtype` (GH38729)

• Fixed bug where `Series.idxmax()`, `Series.idxmin()`, `Series.argmax()`, and `Series.argmin()` would fail when the underlying data is an `ExtensionArray` (GH32749, GH33719, GH36566)

• Fixed bug where some properties of subclasses of `PandasExtensionDtype` where improperly cached (GH40329)

• Bug in `DataFrame.mask()` where masking a DataFrame with an `ExtensionDtype` raises a `ValueError` (GH40941)
Styler

- Bug in Styler where the subset argument in methods raised an error for some valid MultiIndex slices (GH33562)
- Styler rendered HTML output has seen minor alterations to support w3 good code standards (GH39626)
- Bug in Styler where rendered HTML was missing a column class identifier for certain header cells (GH39716)
- Bug in Styler.background_gradient() where text-color was not determined correctly (GH39888)
- Bug in Styler.set_table_styles() where multiple elements in CSS-selectors of the table_styles argument were not correctly added (GH34061)
- Bug in Styler where copying from Jupyter dropped the top left cell and misaligned headers (GH12147)
- Bug in Styler.where where kwargs were not passed to the applicable callable (GH40845)
- Bug in Styler causing CSS to duplicate on multiple renders (GH39395, GH40334)

Other

- inspect.getmembers(Series) no longer raises an AbstractMethodError (GH38782)
- Bug in Series.where() with numeric dtype and other=None not casting to nan (GH39761)
- Bug in assert_series_equal(), assert_frame_equal(), assert_index_equal() and assert_extension_array_equal() incorrectly raising when an attribute has an unrecognized NA type (GH39461)
- Bug in assert_index_equal() with exact=True not raising when comparing CategoricalIndex instances with Int64Index and RangeIndex categories (GH41263)
- Bug in DataFrame.equals(), Series.equals(), and Index.equals() with object-dtype containing np. datetime64("NaT") or np.timedelta64("NaT") (GH39650)
- Bug in show_versions() where console JSON output was not proper JSON (GH39701)
- pandas can now compile on z/OS when using xlc (GH35826)
- Bug in pandas.util.hash_pandas_object() not recognizing hash_key, encoding and categorize when the input object type is a DataFrame (GH41404)

5.2 Version 1.2

5.2.1 What’s new in 1.2.5 (June 22, 2021)

These are the changes in pandas 1.2.5. See Release notes for a full changelog including other versions of pandas.
Fixed regressions

- Fixed regression in `concat()` between two `DataFrame` where one has an `Index` that is all-None and the other is `DatetimeIndex` incorrectly raising (GH40841)
- Fixed regression in `DataFrame.sum()` and `DataFrame.prod()` when `min_count` and `numeric_only` are both given (GH41074)
- Fixed regression in `read_csv()` when using `memory_map=True` with a non-UTF8 encoding (GH40986)
- Fixed regression in `DataFrame.replace()` and `Series.replace()` when the values to replace is a NumPy float array (GH40371)
- Fixed regression in `ExcelFile()` when a corrupt file is opened but not closed (GH41778)
- Fixed regression in `DataFrame.astype()` with `dtype=str` failing to convert NaN in categorical columns (GH41797)

Contributors

5.2.2 What’s new in 1.2.4 (April 12, 2021)

These are the changes in pandas 1.2.4. See Release notes for a full changelog including other versions of pandas.
Fixed regressions

- Fixed regression in DataFrame.sum() when min_count greater than the DataFrame shape was passed resulted in a ValueError (GH39738)
- Fixed regression in DataFrame.to_json() raising AttributeError when run on PyPy (GH39837)
- Fixed regression in (in)equality comparison of pd.NaT with a non-datetimelike numpy array returning a scalar instead of an array (GH40722)
- Fixed regression in DataFrame.where() not returning a copy in the case of an all True condition (GH39595)
- Fixed regression in DataFrame.replace() raising IndexError when regex was a multi-key dictionary (GH39338)
- Fixed regression in repr of floats in an object column not respecting float_format when printed in the console or outputted through DataFrame.to_string(), DataFrame.to_html(), and DataFrame.to_latex() (GH40024)
- Fixed regression in NumPy ufuncs such as np.add not passing through all arguments for DataFrame (GH40662)

Contributors

A total of 9 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

- Patrick

5.2.3 What’s new in 1.2.3 (March 02, 2021)

These are the changes in pandas 1.2.3. See Release notes for a full changelog including other versions of pandas.

Fixed regressions

- Fixed regression in to_excel() raising KeyError when giving duplicate columns with columns attribute (GH39695)
- Fixed regression in nullable integer unary ops propagating mask on assignment (GH39943)
- Fixed regression in DataFrame.__setitem__() not aligning DataFrame on right-hand side for boolean indexer (GH39931)
- Fixed regression in to_json() failing to use compression with URL-like paths that are internally opened in binary mode or with user-provided file objects that are opened in binary mode (GH39985)
• Fixed regression in `Series.sort_index()` and `DataFrame.sort_index()`, which exited with an ungraceful error when having kwarg `ascending=None` passed. Passing `ascending=None` is still considered invalid, and the improved error message suggests a proper usage (`ascending` must be a boolean or a list-like of boolean) (GH39434)

• Fixed regression in `DataFrame.transform()` and `Series.transform()` giving incorrect column labels when passed a dictionary with a mix of list and non-list values (GH40018)

**5.2.4 What’s new in 1.2.2 (February 09, 2021)**

These are the changes in pandas 1.2.2. See Release notes for a full changelog including other versions of pandas.

**Fixed regressions**

- Fixed regression in `read_excel()` that caused it to raise `AttributeError` when checking version of older xld versions (GH38955)
- Fixed regression in `DataFrame` constructor reordering element when construction from datetime ndarray with dtype not "datetime64[ns]" (GH39422)
- Fixed regression in `DataFrame.astype()` and `Series.astype()` not casting to bytes dtype (GH39474)
- Fixed regression in `to_pickle()` failing to create bz2/xz compressed pickle files with protocol=5 (GH39002)
- Fixed regression in `pandas.testing.assert_series_equal()` and `pandas.testing.assert_frame_equal()` always raising `AssertionError` when comparing extension dtypes (GH39410)
- Fixed regression in `to_csv()` opening codecs.StreamWriter in binary mode instead of in text mode and ignoring user-provided mode (GH39247)
• Fixed regression in `Categorical.astype()` casting to incorrect dtype when np.int32 is passed to dtype argument (GH39402)
• Fixed regression in `to_excel()` creating corrupt files when appending (mode="a") to an existing file (GH39576)
• Fixed regression in `DataFrame.transform()` failing in case of an empty DataFrame or Series (GH39636)
• Fixed regression in `groupby()` or `resample()` when aggregating an all-NaN or numeric object dtype column (GH39329)
• Fixed regression in `Rolling.count()` where the `min_periods` argument would be set to 0 after the operation (GH39554)
• Fixed regression in `read_excel()` that incorrectly raised when the argument `io` was a non-path and non-buffer and the `engine` argument was specified (GH39528)

**Bug fixes**

• `pandas.read_excel()` error message when a specified `sheetname` does not exist is now uniform across engines (GH39250)
• Fixed bug in `pandas.read_excel()` producing incorrect results when the engine `openpyxl` is used and the excel file is missing or has incorrect dimension information; the fix requires `openpyxl` >= 3.0.0, prior versions may still fail (GH38956, GH39001)
• Fixed bug in `pandas.read_excel()` sometimes producing a DataFrame with trailing rows of `np.nan` when the engine `openpyxl` is used (GH39181)

5.2.5 What’s new in 1.2.1 (January 20, 2021)

These are the changes in pandas 1.2.1. See Release notes for a full changelog including other versions of pandas.

**Fixed regressions**

- Fixed regression in `to_csv()` that created corrupted zip files when there were more rows than `chunksize` (GH38714)
- Fixed regression in `to_csv()` opening `codecs.StreamReaderWriter` in binary mode instead of in text mode (GH39247)
- Fixed regression in `read_csv()` and other read functions were the encoding error policy (`errors`) did not default to "replace" when no encoding was specified (GH38989)
- Fixed regression in `read_excel()` with non-rawbyte file handles (GH38788)
- Fixed regression in `DataFrame.to_stata()` not removing the created file when an error occurred (GH39202)
- Fixed regression in `DataFrame.__setitem__` raising `ValueError` when expanding `DataFrame` and new column is from type "0 - name" (GH39010)
- Fixed regression in setting with `DataFrame.loc()` raising `ValueError` when `DataFrame` has unsorted `MultiIndex` columns and indexer is a scalar (GH38601)
- Fixed regression in setting with `DataFrame.loc()` raising `KeyError` with `MultiIndex` and list-like columns indexer enlarging `DataFrame` (GH38642)
- Fixed regression in `groupby()` with `Categorical` grouping column not showing unused categories for `grouped.indices` (GH38774)
- Fixed regression in `GroupBy.sem()` where the presence of non-numeric columns would cause an error instead of being dropped (GH38774)
- Fixed regression in `DataFrameGroupBy.diff()` raising for int8 and int16 columns (GH39050)
- Fixed regression in `DataFrame.groupby()` when aggregating an `ExtensionDType` that could fail for non-numeric values (GH38980)
- Fixed regression in `Rolling.skew()` and `Rolling.kurt()` modifying the object inplace (GH38908)
- Fixed regression in `DataFrame.any()` and `DataFrame.all()` not returning a result for tz-aware `datetime64` columns (GH38723)
- Fixed regression in `DataFrame.apply()` with `axis=1` using `str` accessor in apply function (GH38979)
- Fixed regression in `DataFrame.replace()` raising `ValueError` when `DataFrame` has dtype `bytes` (GH38900)
- Fixed regression in `Series.fillna()` that raised `RecursionError` with `datetime64[ns, UTC]` dtype (GH38851)
- Fixed regression in comparisons between `NaT` and `datetime.date` objects incorrectly returning `True` (GH39151)
- Fixed regression in calling NumPy `accumulate()` ufuncs on DataFrames, e.g. `np.maximum.accumulate(df)` (GH39259)
- Fixed regression in repr of float-like strings of an `object` dtype having trailing 0's truncated after the decimal (GH38708)
- Fixed regression that raised `AttributeError` with PyArrow versions [0.16.0, 1.0.0) (GH38801)
• Fixed regression in pandas.testing.assert_frame_equal() raising TypeError with check_like=True when Index or columns have mixed dtype (GH39168)

We have reverted a commit that resulted in several plotting related regressions in pandas 1.2.0 (GH38969, GH38736, GH38865, GH38947 and GH39126). As a result, bugs reported as fixed in pandas 1.2.0 related to inconsistent tick labeling in bar plots are again present (GH26186 and GH11465)

**Calling NumPy ufuncs on non-aligned DataFrames**

Before pandas 1.2.0, calling a NumPy ufunc on non-aligned DataFrames (or DataFrame / Series combination) would ignore the indices, only match the inputs by shape, and use the index/columns of the first DataFrame for the result:

```python
In [1]: df1 = pd.DataFrame({"a": [1, 2], "b": [3, 4], index=[0, 1])
In [2]: df2 = pd.DataFrame({"a": [1, 2], "b": [3, 4], index=[1, 2])
In [3]: df1
Out[3]:
a b
0 1 3
1 2 4
In [4]: df2
Out[4]:
a b
1 1 3
2 2 4
In [5]: np.add(df1, df2)
Out[5]:
a b
0 NaN NaN
1 3.0 7.0
2 NaN NaN
```

This contrasts with how other pandas operations work, which first align the inputs:

```python
In [6]: df1 + df2
Out[6]:
a b
0 NaN NaN
1 3.0 7.0
2 NaN NaN
```

In pandas 1.2.0, we refactored how NumPy ufuncs are called on DataFrames, and this started to align the inputs first (GH39184), as happens in other pandas operations and as it happens for ufuncs called on Series objects.

For pandas 1.2.1, we restored the previous behaviour to avoid a breaking change, but the above example of np.add(df1, df2) with non-aligned inputs will now to raise a warning, and a future pandas 2.0 release will start aligning the inputs first (GH39184). Calling a NumPy ufunc on Series objects (eg np.add(s1, s2)) already aligns and continues to do so.

To avoid the warning and keep the current behaviour of ignoring the indices, convert one of the arguments to a NumPy array:

```python
In [7]: np.add(df1, np.asarray(df2))
Out[7]:
a b
0 2 6
1 4 8
```

(continues on next page)
To obtain the future behaviour and silence the warning, you can align manually before passing the arguments to the ufunc:

```python
In [8]: df1, df2 = df1.align(df2)
In [9]: np.add(df1, df2)
Out[9]:
   a  b
0  NaN NaN
1  3.0  7.0
2  NaN NaN
```

### Bug fixes

- Bug in `read_csv()` with `float_precision="high"` caused segfault or wrong parsing of long exponent strings. This resulted in a regression in some cases as the default for `float_precision` was changed in pandas 1.2.0 (GH38753)
- Bug in `read_csv()` not closing an opened file handle when a `csv.Error` or `UnicodeDecodeError` occurred while initializing (GH39024)
- Bug in `pandas.testing.assert_index_equal()` raising `TypeError` with `check_order=False` when `Index` has mixed dtype (GH39168)

### Other

- The deprecated attributes `_AXIS_NAMES` and `_AXIS_NUMBERS` of `DataFrame` and `Series` will no longer show up in `dir` or `inspect.getmembers` calls (GH38740)
- Bumped minimum fastparquet version to 0.4.0 to avoid `AttributeError` from numba (GH38344)
- Bumped minimum pymysql version to 0.8.1 to avoid test failures (GH38344)
- Fixed build failure on MacOS 11 in Python 3.9.1 (GH38766)
- Added reference to backwards incompatible `check_freq` arg of `testing.assert_frame_equal()` and `testing.assert_series_equal()` in `pandas 1.1.0 what's new` (GH34050)

### Contributors

A total of 20 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

- Matthew Roeschke
5.2.6 What’s new in 1.2.0 (December 26, 2020)

These are the changes in pandas 1.2.0. See Release notes for a full changelog including other versions of pandas.

Warning: The xlwt package for writing old-style .xls excel files is no longer maintained. The xlrd package is now only for reading old-style .xls files.

Previously, the default argument engine=None to read_excel() would result in using the xlrd engine in many cases, including new Excel 2007+ (.xlsx) files. If openpyxl is installed, many of these cases will now default to using the openpyxl engine. See the read_excel() documentation for more details.

Thus, it is strongly encouraged to install openpyxl to read Excel 2007+ (.xlsx) files. Please do not report issues when using `xlrd` to read `.xlsx` files. This is no longer supported, switch to using openpyxl instead.

Attempting to use the xlwt engine will raise a FutureWarning unless the option io.excel.xls.writer is set to "xlwt". While this option is now deprecated and will also raise a FutureWarning, it can be globally set and the warning suppressed. Users are recommended to write .xlsx files using the openpyxl engine instead.

Enhancements

Optionally disallow duplicate labels

Series and DataFrame can now be created with allows_duplicate_labels=False flag to control whether the index or columns can contain duplicate labels (GH28394). This can be used to prevent accidental introduction of duplicate labels, which can affect downstream operations.

By default, duplicates continue to be allowed.
In [1]: pd.Series([1, 2], index=['a', 'a'])
Out[1]:
a   1
a   2
Length: 2, dtype: int64

In [2]: pd.Series([1, 2], index=['a', 'a']).set_flags(allow_duplicates_labels=False)
...: DuplicateLabelError: Index has duplicates.
  positions
label
a   [0, 1]

pandas will propagate the allows_duplicate_labels property through many operations.

In [3]: a = (
   ...:     pd.Series([1, 2], index=['a', 'b'])
   ...:     .set_flags(allow_duplicates_labels=False)
   ...: )

In [4]: a
Out[4]:
a   1
b   2
Length: 2, dtype: int64

# An operation introducing duplicates
In [5]: a.reindex(['a', 'b', 'a'])
...: DuplicateLabelError: Index has duplicates.
  positions
label
a   [0, 2]

[1 rows x 1 columns]

**Warning:** This is an experimental feature. Currently, many methods fail to propagate the allows_duplicate_labels value. In future versions it is expected that every method taking or returning one or more DataFrame or Series objects will propagate allows_duplicate_labels.

See *Duplicate Labels* for more.

The allows_duplicate_labels flag is stored in the new *DataFrame.flags* attribute. This stores global attributes that apply to the *pandas object*. This differs from *DataFrame.attrs*, which stores information that applies to the dataset.
Passing arguments to fsspec backends

Many read/write functions have acquired the `storage_options` optional argument, to pass a dictionary of parameters to the storage backend. This allows, for example, for passing credentials to S3 and GCS storage. The details of what parameters can be passed to which backends can be found in the documentation of the individual storage backends (detailed from the fsspec docs for builtin implementations and linked to external ones). See Section Reading/writing remote files.

GH35655 added fsspec support (including storage_options) for reading excel files.

Support for binary file handles in `to_csv`

to_csv() supports file handles in binary mode (GH19827 and GH35058) with encoding (GH13068 and GH23854) and compression (GH22555). If pandas does not automatically detect whether the file handle is opened in binary or text mode, it is necessary to provide mode="wb".

For example:

```
In [1]: import io
In [2]: data = pd.DataFrame([0, 1, 2])
In [3]: buffer = io.BytesIO()
In [4]: data.to_csv(buffer, encoding="utf-8", compression="gzip")
```

Support for short caption and table position in `to_latex`

`DataFrame.to_latex()` now allows one to specify a floating table position (GH35281) and a short caption (GH36267).

The keyword position has been added to set the position.

```
In [5]: data = pd.DataFrame({'a': [1, 2], 'b': [3, 4]})
In [6]: table = data.to_latex(position='ht')
In [7]: print(table)
\begin{table}[ht]
\centering
\begin{tabular}{lrr}
\toprule
{} & a & b \\
\midrule
0 & 1 & 3 \\
1 & 2 & 4 \\
\bottomrule
\end{tabular}
\end{table}
```

Usage of the keyword caption has been extended. Besides taking a single string as an argument, one can optionally provide a tuple (full_caption, short_caption) to add a short caption macro.
In [8]: data = pd.DataFrame({'a': [1, 2], 'b': [3, 4]})

In [9]: table = data.to_latex(caption=('the full long caption', 'short caption'))

In [10]: print(table)
\begin{table}
\centering
\caption[short caption]{the full long caption}
\begin{tabular}{lrr}
\toprule
{} & a & b \\
\midrule
0 & 1 & 3 \\
1 & 2 & 4 \\
\bottomrule
\end{tabular}
\end{table}

Change in default floating precision for read_csv and read_table

For the C parsing engine, the methods read_csv() and read_table() previously defaulted to a parser that could read floating point numbers slightly incorrectly with respect to the last bit in precision. The option floating_precision=“high” has always been available to avoid this issue. Beginning with this version, the default is now to use the more accurate parser by making floating_precision=None correspond to the high precision parser, and the new option floating_precision="legacy" to use the legacy parser. The change to using the higher precision parser by default should have no impact on performance. (GH17154)

Experimental nullable data types for float data

We’ve added Float32Dtype / Float64Dtype and FloatingArray. These are extension data types dedicated to floating point data that can hold the pd.NA missing value indicator (GH32265, GH34307).

While the default float data type already supports missing values using np.nan, these new data types use pd.NA (and its corresponding behavior) as the missing value indicator, in line with the already existing nullable integer and boolean data types.

One example where the behavior of np.nan and pd.NA is different is comparison operations:

```python
# the default NumPy float64 dtype
In [11]: s1 = pd.Series([1.5, None])

In [12]: s1
Out[12]:
0   1.5
1   NaN
dtype: float64

In [13]: s1 > 1
Out[13]:
0   True
1  False
dtype: bool
```
# the new nullable float64 dtype
In [14]: s2 = pd.Series([1.5, None], dtype="Float64")

In [15]: s2
Out[15]:
0   1.5
1   <NA>
dtype: Float64

In [16]: s2 > 1
Out[16]:
0   True
1   <NA>
dtype: boolean

See the *Experimental NA scalar to denote missing values* doc section for more details on the behavior when using the pd.NA missing value indicator.

As shown above, the dtype can be specified using the “Float64” or “Float32” string (capitalized to distinguish it from the default “float64” data type). Alternatively, you can also use the dtype object:

In [17]: pd.Series([1.5, None], dtype=pd.Float32Dtype())
Out[17]:
0   1.5
1   <NA>
dtype: Float32

Operations with the existing integer or boolean nullable data types that give float results will now also use the nullable floating data types (GH38178).

**Warning**: Experimental: the new floating data types are currently experimental, and their behavior or API may still change without warning. Especially the behavior regarding NaN (distinct from NA missing values) is subject to change.

**Index/column name preservation when aggregating**

When aggregating using *concat()* or the *DataFrame* constructor, pandas will now attempt to preserve index and column names whenever possible (GH35847). In the case where all inputs share a common name, this name will be assigned to the result. When the input names do not all agree, the result will be unnamed. Here is an example where the index name is preserved:

In [18]: idx = pd.Index(range(5), name='abc')
In [19]: ser = pd.Series(range(5, 10), index=idx)
In [20]: pd.concat({'x': ser[1:], 'y': ser[:-1]}, axis=1)
Out[20]:
     x  y
abc  NaN  5.0
     6.0  6.0

(continues on next page)
The same is true for `MultiIndex`, but the logic is applied separately on a level-by-level basis.

**GroupBy supports EWM operations directly**

DataFrameGroupBy now supports exponentially weighted window operations directly (GH16037).

```python
In [21]: df = pd.DataFrame({'A': ['a', 'b', 'a', 'b'], 'B': range(4)})

In [22]: df
Out[22]:
   A  B
0  a  0
1  b  1
2  a  2
3  b  3

In [23]: df.groupby('A').ewm(com=1.0).mean()
Out[23]:
   B
   A
  a  0  0.000000
      2  1.333333
  b  1  1.000000
      3  2.333333
```

Additionally, `mean` supports execution via Numba with the `engine` and `engine_kwargs` arguments. Numba must be installed as an optional dependency to use this feature.

**Other enhancements**

- Added `day_of_week` (compatibility alias dayofweek) property to `Timestamp, DatetimeIndex, Period, PeriodIndex` (GH9605)
- Added `day_of_year` (compatibility alias dayofyear) property to `Timestamp, DatetimeIndex, Period, PeriodIndex` (GH9605)
- Added `set_flags()` for setting table-wide flags on a Series or DataFrame (GH28394)
- `DataFrame.applymap()` now supports `na_action` (GH23803)
- `Index` with object dtype supports division and multiplication (GH34160)
- `io.sql.get_schema()` now supports a `schema` keyword argument that will add a schema into the create table statement (GH28486)
- `DataFrame.explode()` and `Series.explode()` now support exploding of sets (GH35614)
- `DataFrame.hist()` now supports time series (datetime) data (GH32590)
- `Styler.set_table_styles()` now allows the direct styling of rows and columns and can be chained (GH35607)
• **Styler** now allows direct CSS class name addition to individual data cells (GH36159)

• *Rolling.mean()* and *Rolling.sum()* use Kahan summation to calculate the mean to avoid numerical problems (GH10319, GH11645, GH13254, GH23761, GH36031)

• *DatetimeIndex.searchsorted(), TimedeltaIndex.searchsorted(), PeriodIndex.searchsorted(),* and *Series.searchsorted()* with datetime-like dtypes will now try to cast string arguments (list-like and scalar) to the matching datetime-like type (GH36346)

• Added methods IntegerArray.prod(), IntegerArray.min(), and IntegerArray.max() (GH33790)

• Calling a NumPy ufunc on a *DataFrame* with extension types now preserves the extension types when possible (GH23743)

• Calling a binary-input NumPy ufunc on multiple DataFrame objects now aligns, matching the behavior of binary operations and ufuncs on Series (GH23743). This change has been reverted in pandas 1.2.1, and the behaviour to not align DataFrames is deprecated instead, see the [1.2.1 release notes](https://pandas.pydata.org/pandas-docs/stable/releases/1.2.1.html).

• Where possible RangeIndex.difference() and RangeIndex.symmetric_difference() will return RangeIndex instead of Int64Index (GH36564)

• *DataFrame.to_parquet()* now supports MultiIndex for columns in parquet format (GH34777)

• *read_parquet()* gained a use_nullable_dtypes=True option to use nullable dtypes that use pd.NA as missing value indicator where possible for the resulting DataFrame (default is False, and only applicable for engine= "pyarrow") (GH31242)

• Added *Rolling.sem()* and *Expanding.sem()* to compute the standard error of the mean (GH26476)

• *Rolling.var()* and *Rolling.std()* use Kahan summation and Welford’s Method to avoid numerical issues (GH37051)

• *DataFrame.corr()* and *DataFrame.cov()* use Welford’s Method to avoid numerical issues (GH37448)

• *DataFrame.plot()* now recognizes xlabel and ylabel arguments for plots of type scatter and hexbin (GH37001)

• *DataFrame* now supports the divmod operation (GH37165)

• *DataFrame.to_parquet()* now returns a bytes object when no path argument is passed (GH37105)

• Rolling now supports the closed argument for fixed windows (GH34315)

• *DatetimeIndex* and *Series* with datetime64 or datetime64tz dtypes now support std (GH37436)

• Window now supports all Scipy window types in win_type with flexible keyword argument support (GH34556)

• *testing.assert_index_equal()* now has a check_order parameter that allows indexes to be checked in an order-insensitive manner (GH37478)

• *read_csv()* supports memory-mapping for compressed files (GH37621)

• Add support for min_count keyword for *DataFrame.groupby()* and *DataFrame.resample()* for functions min, max, first and last (GH38721, GH37768)

• Improve error reporting for *DataFrame.merge()* when invalid merge column definitions were given (GH16228)

• Improve numerical stability for *Rolling.skew(), Rolling.kurt(), Expanding.skew()* and *Expanding.kurt()* through implementation of Kahan summation (GH6929)

• Improved error reporting for subsetting columns of a DataFrameGroupBy with axis=1 (GH37725)

• Implement method cross for *DataFrame.merge()* and *DataFrame.join()* (GH5401)

• When *read_csv(), read_sas()* and *read_json()* are called with chunksize/iterator they can be used in a with statement as they return context-managers (GH38225)
Augmented the list of named colors available for styling Excel exports, enabling all of CSS4 colors (GH38247)

Notable bug fixes

These are bug fixes that might have notable behavior changes.

Consistency of DataFrame Reductions

*DataFrame.any()* and *DataFrame.all()* with *bool_only=True* now determines whether to exclude object-dtype columns on a column-by-column basis, instead of checking if *all* object-dtype columns can be considered boolean.

This prevents pathological behavior where applying the reduction on a subset of columns could result in a larger Series result. See (GH37799).

```
In [24]: df = pd.DataFrame({"A": ["foo", "bar"], "B": [True, False]}, dtype=object)
In [25]: df["C"] = pd.Series([True, True])
Previous behavior:
In [5]: df.all(bool_only=True)
Out[5]:
C   True
   dtype: bool
In [6]: df[['B', 'C']].all(bool_only=True)
Out[6]:
B   False
C   True
   dtype: bool
New behavior:
In [26]: In [5]: df.all(bool_only=True)
Out[26]:
B   False
C   True
   dtype: bool
In [27]: In [6]: df[['B', 'C']].all(bool_only=True)
Out[27]:
B   False
C   True
   dtype: bool
```

Other DataFrame reductions with *numeric_only=None* will also avoid this pathological behavior (GH37827):

```
In [28]: df = pd.DataFrame({"A": [0, 1, 2], "B": ["a", "b", "c"], dtype=object)
Previous behavior:
In [3]: df.mean()
Out[3]: Series([], dtype: float64)
```
In [4]: df["A"].mean()
Out[4]:
A  1.0
dtype: float64

New behavior:

In [29]: df.mean()
Out[29]:
A  1.0
dtype: float64

In [30]: df["A"].mean()
Out[30]:
A  1.0
dtype: float64

Moreover, DataFrame reductions with numeric_only=None will now be consistent with their Series counterparts. In particular, for reductions where the Series method raises TypeError, the DataFrame reduction will now consider that column non-numeric instead of casting to a NumPy array which may have different semantics (GH36076, GH28949, GH21020).

In [31]: ser = pd.Series([0, 1], dtype="category", name="A")
In [32]: df = ser.to_frame()

Previous behavior:

In [5]: df.any()
Out[5]:
A  True
dtype: bool

New behavior:

In [33]: df.any()
Out[33]: Series([], dtype: bool)
Increased minimum version for Python

pandas 1.2.0 supports Python 3.7.1 and higher (GH35214).

Increased minimum versions for dependencies

Some minimum supported versions of dependencies were updated (GH35214). If installed, we now require:

<table>
<thead>
<tr>
<th>Package</th>
<th>Minimum Version</th>
<th>Required</th>
<th>Changed</th>
</tr>
</thead>
<tbody>
<tr>
<td>numpy</td>
<td>1.16.5</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>pytz</td>
<td>2017.3</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>python-dateutil</td>
<td>2.7.3</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>bottleneck</td>
<td>1.2.1</td>
<td></td>
<td></td>
</tr>
<tr>
<td>numexpr</td>
<td>2.6.8</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>pytest (dev)</td>
<td>5.0.1</td>
<td></td>
<td></td>
</tr>
<tr>
<td>mypy (dev)</td>
<td>0.782</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

For optional libraries the general recommendation is to use the latest version. The following table lists the lowest version per library that is currently being tested throughout the development of pandas. Optional libraries below the lowest tested version may still work, but are not considered supported.

<table>
<thead>
<tr>
<th>Package</th>
<th>Minimum Version</th>
<th>Changed</th>
</tr>
</thead>
<tbody>
<tr>
<td>beautifulsoup4</td>
<td>4.6.0</td>
<td></td>
</tr>
<tr>

<td>pandas-gbq</td>
<td>0.12.0</td>
<td></td>
</tr>
</tbody>
</table>

See Dependencies and Optional dependencies for more.
Other API changes

- Sorting in descending order is now stable for `Series.sort_values()` and `Index.sort_values()` for Datetime-like `Index` subclasses. This will affect sort order when sorting a DataFrame on multiple columns, sorting with a key function that produces duplicates, or requesting the sorting index when using `Index.sort_values()`. When using `Series.value_counts()`, the count of missing values is no longer necessarily last in the list of duplicate counts. Instead, its position corresponds to the position in the original Series. When using `Index.sort_values()` for Datetime-like `Index` subclasses, NaTs ignored the `na_position` argument and were sorted to the beginning. Now they respect `na_position`, the default being last, same as other `Index` subclasses (GH35992)

- Passing an invalid `fill_value` to `Categorical.take()`, `DatetimeArray.take()`, `TimedeltaArray.take()`, or `PeriodArray.take()` now raises a `TypeError` instead of a `ValueError` (GH37733)

- Passing an invalid `fill_value` to `Series.shift()` with a `CategoricalDtype` now raises a `TypeError` instead of a `ValueError` (GH37733)

- Passing an invalid value to `IntervalIndex.insert()` or `CategoricalIndex.insert()` now raises a `TypeError` instead of a `ValueError` (GH37733)

- Attempting to reindex a Series with a `CategoricalIndex` with an invalid `fill_value` now raises a `TypeError` instead of a `ValueError` (GH37733)

- `CategoricalIndex.append()` with an index that contains non-category values will now cast instead of raising `TypeError` (GH38098)

Deprecations

- Deprecated parameter `inplace` in `MultiIndex.set_codes()` and `MultiIndex.set_levels()` (GH35626)

- Deprecated parameter `dtype` of method `copy()` for all `Index` subclasses. Use the `astype()` method instead for changing `dtype` (GH35853)

- Deprecated parameters `levels` and `codes` in `MultiIndex.copy()`. Use the `set_levels()` and `set_codes()` methods instead (GH36685)

- Date parser functions `parse_date_time()`, `parse_date_fields()`, `parse_all_fields()` and `generic_parser()` from `pandas.io.date_converters` are deprecated and will be removed in a future version; use `to_datetime()` instead (GH35741)

- `DataFrame.lookup()` is deprecated and will be removed in a future version, use `DataFrame.melt()` and `DataFrame.loc()` instead (GH35224)

- The method `Index.to_native_types()` is deprecated. Use `.astype(str)` instead (GH28867)

- Deprecated indexing `DataFrame` rows with a single datetime-like string as `df[string]` (given the ambiguity whether it is indexing the rows or selecting a column), use `df.loc[string]` instead (GH36179)

- Deprecated `Index.is_all_dates()` (GH27744)

- The default value of `regex` for `Series.str.replace()` will change from `True` to `False` in a future release. In addition, single character regular expressions will *not* be treated as literal strings when `regex=True` is set (GH24804)

- Deprecated automatic alignment on comparison operations between `DataFrame` and `Series`, do `frame, ser = frame.align(ser, axis=1, copy=False)` before e.g. `frame == ser` (GH28759)

- `Rolling.count()` with `min_periods=None` will default to the size of the window in a future version (GH31302)
pandas: powerful Python data analysis toolkit, Release 1.3.5

- Using “outer” ufuncs on DataFrames to return 4d ndarray is now deprecated. Convert to an ndarray first (GH23743)

- Deprecated slice-indexing on tz-aware `DatetimeIndex` with naive `datetime` objects, to match scalar indexing behavior (GH36148)

- `Index.ravel()` returning a `np.ndarray` is deprecated, in the future this will return a view on the same index (GH19956)

- Deprecate use of strings denoting units with ‘M’, ‘Y’ or ‘y’ in `to_timedelta()` (GH36666)

- `Index` methods &, |, and ^ behaving as the set operations `Index.intersection()`, `Index.union()`, and `Index.symmetric_difference()`, respectively, are deprecated and in the future will behave as pointwise boolean operations matching `Series` behavior. Use the named set methods instead (GH36758)

- `Categorical.is_dtype_equal()` and `CategoricalIndex.is_dtype_equal()` are deprecated, will be removed in a future version (GH37545)

- `Series.slice_shift()` and `DataFrame.slice_shift()` are deprecated, use `Series.shift()` or `DataFrame.shift()` instead (GH37601)

- Partial slicing on unordered `DatetimeIndex` objects with keys that are not in the index is deprecated and will be removed in a future version (GH18531)

- The `how` keyword in `PeriodIndex.astype()` is deprecated and will be removed in a future version, use `index.to_timestamp(how=how)` instead (GH37982)

- Deprecated `Index asi8()` for `Index` subclasses other than `DatetimeIndex`, `TimedeltaIndex`, and `PeriodIndex` (GH37877)

- The `inplace` parameter of `Categorical.remove_unused_categories()` is deprecated and will be removed in a future version (GH37643)

- The `null_counts` parameter of `DataFrame.info()` is deprecated and replaced by `show_counts`. It will be removed in a future version (GH37999)

Calling NumPy ufuncs on non-aligned DataFrames

Calling NumPy ufuncs on non-aligned DataFrames changed behaviour in pandas 1.2.0 (to align the inputs before calling the ufunc), but this change is reverted in pandas 1.2.1. The behaviour to not align is now deprecated instead, see the 1.2.1 release notes for more details.

Performance improvements

- Performance improvements when creating DataFrame or Series with dtype `str` or `StringDtype` from array with many string elements (GH36304, GH36317, GH36325, GH36432, GH37371)

- Performance improvement in `GroupBy.agg()` with the numba engine (GH35759)

- Performance improvements when creating `Series.map()` from a huge dictionary (GH34717)

- Performance improvement in `GroupBy.transform()` with the numba engine (GH36240)

- `Styler` uuid method altered to compress data transmission over web whilst maintaining reasonably low table collision probability (GH36345)

- Performance improvement in `to_datetime()` with non-ns time unit for `float` dtype columns (GH20445)

- Performance improvement in setting values on an `IntervalArray` (GH36310)

- The internal index method `_shallow_copy()` now makes the new index and original index share cached attributes, avoiding creating these again, if created on either. This can speed up operations that depend on creating copies of existing indexes (GH36840)
• Performance improvement in `RollingGroupby.count()` (GH35625)
• Small performance decrease to `Rolling.min()` and `Rolling.max()` for fixed windows (GH36567)
• Reduced peak memory usage in `DataFrame.to_pickle()` when using protocol=5 in python 3.8+ (GH34244)
• Faster dir calls when the object has many index labels, e.g. `dir(ser)` (GH37450)
• Performance improvement in `ExpandingGroupby` (GH37064)
• Performance improvement in `Series.astype()` and `DataFrame.astype()` for `Categorical` (GH8628)
• Performance improvement in `pd.isin()` for inputs with more than 1e6 elements (GH36611)
• Performance improvement for `DataFrame.__setitem__()` with list-like indexers (GH37954)
• `read_json()` now avoids reading entire file into memory when chunksize is specified (GH34548)

**Bug fixes**

**Categorical**

• `Categorical.fillna()` will always return a copy, validate a passed fill value regardless of whether there are any NAs to fill, and disallow an `NaT` as a fill value for numeric categories (GH36530)
• Bug in `Categorical.__setitem__()` that incorrectly raised when trying to set a tuple value (GH20439)
• Bug in `CategoricalIndex.equals()` incorrectly casting non-category entries to `np.nan` (GH37667)
• Bug in `CategoricalIndex.where()` incorrectly setting non-category entries to `np.nan` instead of raising `TypeError` (GH37977)
• Bug in `Categorical.to_numpy()` and `np.array(categorical)` with tz-aware datetime64 categories incorrectly dropping the time zone information instead of casting to object dtype (GH38136)

**Datetime-like**

• Bug in `DataFrame.combine_first()` that would convert datetime-like column on other `DataFrame` to integer when the column is not present in original `DataFrame` (GH28481)
• Bug in `DatetimeArray.date` where a `ValueError` would be raised with a read-only backing array (GH33530)
• Bug in `NaT` comparisons failing to raise `TypeError` on invalid inequality comparisons (GH35046)
• Bug in `DateOffset` where attributes reconstructed from pickle files differ from original objects when input values exceed normal ranges (e.g. months=12) (GH34511)
• Bug in `DatetimeIndex.get_slice_bound()` where `datetime.date` objects were not accepted or naive `Timestamp` with a tz-aware `DatetimeIndex` (GH35690)
• Bug in `DatetimeIndex.slice_locs()` where `datetime.date` objects were not accepted (GH34077)
• Bug in `DatetimeIndex.searchsorted()`, `TimedeltaIndex.searchsorted()`, `PeriodIndex.searchsorted()`, and `Series.searchsorted()` with datetime64, timedelta64 or `Period` dtype placement of `NaT` values being inconsistent with NumPy (GH36176, GH36254)
• Inconsistency in `DatetimeArray`, `TimedeltaArray`, and `PeriodArray` method `__setitem__` casting arrays of strings to datetime-like scalars but not scalar strings (GH36261)
• Bug in DatetimeArray.take() incorrectly allowing fill_value with a mismatched time zone (GH37356)
• Bug in DatetimeIndex.shift incorrectly raising when shifting empty indexes (GH14811)
  • Timestamp and DatetimeIndex comparisons between tz-aware and tz-naive objects now follow the standard library datetime behavior, returning True/False for !/=/== and raising for inequality comparisons (GH28507)
• Bug in DatetimeIndex.equals() and TimedeltaIndex.equals() incorrectly considering int64 indexes as equal (GH36744)
  • Series.to_json(), DataFrame.to_json(), and read_json() now implement time zone parsing when orient structure is table (GH35973)
  • astype() now attempts to convert to datetime64[ns, tz] directly from object with inferred time zone from string (GH35973)
• Bug in TimedeltaIndex.sum() and Series.sum() with timedelta64 dtype on an empty index or series returning NaT instead of Timedelta(0) (GH31751)
• Bug in DatetimeArray.shift() incorrectly allowing fill_value with a mismatched time zone (GH37299)
• Bug in adding a BusinessDay with nonzero offset to a non-scalar other (GH37457)
• Bug in to_datetime() with a read-only array incorrectly raising (GH34857)
• Bug in Series.isin() with datetime64[ns] dtype and DatetimeIndex.isin() incorrectly casting integers to datetimes (GH36621)
• Bug in Series.isin() with datetime64[ns] dtype and DatetimeIndex.isin() failing to consider tz-aware and tz-naive datetimes as always different (GH35728)
• Bug in Series.isin() with PeriodDtype dtype and PeriodIndex.isin() failing to consider arguments with different PeriodDtype as always different (GH37528)
• Bug in Period constructor now correctly handles nanoseconds in the value argument (GH34621 and GH17053)

Timedelta

• Bug in TimedeltaIndex, Series, and DataFrame floor-division with timedelta64 dtypes and NaT in the denominator (GH35529)
• Bug in parsing of ISO 8601 durations in Timedelta and to_datetime() (GH29773, GH36204)
• Bug in to_timedelta() with a read-only array incorrectly raising (GH34857)
• Bug in Timedelta incorrectly truncating to sub-second portion of a string input when it has precision higher than nanoseconds (GH36738)

Timezones

• Bug in date_range() was raising AmbiguousTimeError for valid input with ambiguous=False (GH35297)
• Bug in Timestamp.replace() was losing fold information (GH37610)
Numeric

- Bug in `to_numeric()` where float precision was incorrect (GH31364)
- Bug in `DataFrame.any()` with axis=1 and bool_only=True ignoring the bool_only keyword (GH32432)
- Bug in `Series.equals()` where a ValueError was raised when NumPy arrays were compared to scalars (GH35267)
- Bug in `Series` where two Series each have a `DatetimeIndex` with different time zones having those indexes incorrectly changed when performing arithmetic operations (GH33671)
- Bug in pandas.testing module functions when used with check_exact=False on complex numeric types (GH28235)
- Bug in `DataFrame.__rmatmul__()` error handling reporting transposed shapes (GH21581)
- Bug in `Series` flex arithmetic methods where the result when operating with a list, tuple or np.ndarray would have an incorrect name (GH36760)
- Bug in `IntegerArray` multiplication with timedelta and np.timedelta64 objects (GH36870)
- Bug in `MultiIndex` comparison with tuple incorrectly treating tuple as array-like (GH21517)
- Bug in `DataFrame.diff()` with datetime64 dtypes including NaT values failing to fill NaT results correctly (GH32441)
- Bug in `DataFrame` arithmetic ops incorrectly accepting keyword arguments (GH36843)
- Bug in `IntervalArray` comparisons with `Series` not returning Series (GH36908)
- Bug in `DataFrame` allowing arithmetic operations with list of array-likes with undefined results. Behavior changed to raising `ValueError` (GH36702)
- Bug in `DataFrame.std()` with timedelta64 dtype and skipna=False (GH37392)
- Bug in `DataFrame.min()` and `DataFrame.max()` with datetime64 dtype and skipna=False (GH36907)
- Bug in `DataFrame.idxmax()` and `DataFrame.idxmin()` with mixed dtypes incorrectly raising TypeError (GH38195)

Conversion

- Bug in `DataFrame.to_dict()` with orient='records' now returns python native datetime objects for datetime-like columns (GH21256)
- Bug in `Series.astype()` conversion from string to float raised in presence of pd.NA values (GH37626)

Strings

- Bug in `Series.to_string()`, `DataFrame.to_string()`, and `DataFrame.to_latex()` adding a leading space when index=False (GH24980)
- Bug in `to_numeric()` raising a TypeError when attempting to convert a string dtype Series containing only numeric strings and NA (GH37262)
Interval

- Bug in `DataFrame.replace()` and `Series.replace()` where `Interval` dtypes would be converted to object dtypes (GH34871)
- Bug in `IntervalIndex.take()` with negative indices and `fill_value=None` (GH37330)
- Bug in `IntervalIndex.putmask()` with datetime-like dtype incorrectly casting to object dtype (GH37968)
- Bug in `IntervalArray.astype()` incorrectly dropping dtype information with a `CategoricalDtype` object (GH37984)

Indexing

- Bug in `PeriodIndex.get_loc()` incorrectly raising `ValueError` on non-datelike strings instead of `KeyError`, causing similar errors in `Series.__getitem__()`, `Series.__contains__()`, and `Series.loc.__getitem__()` (GH34240)
- Bug in `Index.sort_values()` where, when empty values were passed, the method would break by trying to compare missing values instead of pushing them to the end of the sort order (GH35584)
- Bug in `Index.get_indexer()` and `Index.get_indexer_non_unique()` where int64 arrays are returned instead of intp (GH36359)
- Bug in `DataFrame.sort_index()` where parameter `ascending` passed as a list on a single level index gives wrong result (GH32334)
- Bug in `DataFrame.reset_index()` was incorrectly raising a `ValueError` for input with a `MultiIndex` with missing values in a level with Categorical dtype (GH24206)
- Bug in indexing with boolean masks on datetime-like values sometimes returning a view instead of a copy (GH36210)
- Bug in `DataFrame.__getitem__()` and `DataFrame.loc.__getitem__()` with `IntervalIndex` columns and a numeric indexer (GH26490)
- Bug in `Series.loc.__getitem__()` with a non-unique `MultiIndex` and an empty-list indexer (GH13691)
- Bug in indexing on a `Series` or `DataFrame` with a `MultiIndex` and a level named "0" (GH37194)
- Bug in `Series.__getitem__()` when using an unsigned integer array as an indexer giving incorrect results or segfaulting instead of raising `KeyError` (GH37218)
- Bug in `Index.where()` incorrectly casting numeric values to strings (GH37591)
- Bug in `DataFrame.loc()` returning empty result when indexer is a slice with negative step size (GH38071)
- Bug in `Series.loc()` and `DataFrame.loc()` raises when the index was of object dtype and the given numeric label was in the index (GH26491)
- Bug in `DataFrame.loc()` returned requested key plus missing values when `loc` was applied to single level from a `MultiIndex` (GH27104)
- Bug in indexing on a `Series` or `DataFrame` with a `CategoricalIndex` using a list-like indexer containing NA values (GH37722)
- Bug in `DataFrame.loc.__setitem__()` expanding an empty `DataFrame` with mixed dtypes (GH37932)
- Bug in `DataFrame.xs()` ignored `droplevel=False` for columns (GH19056)
- Bug in `DataFrame.reindex()` raising `IndexingError` wrongly for empty `DataFrame` with tolerance not None or method="nearest" (GH27315)
• Bug in indexing on a Series or DataFrame with a CategoricalIndex using list-like indexer that contains elements that are in the index’s categories but not in the index itself failing to raise KeyError (GH37901)

• Bug on inserting a boolean label into a DataFrame with a numeric Index columns incorrectly casting to integer (GH36319)

• Bug in DataFrame.iloc() and Series.iloc() aligning objects in __setitem__ (GH22046)

• Bug in MultiIndex.drop() does not raise if labels are partially found (GH37820)

• Bug in DataFrame.loc() did not raise KeyError when missing combination was given with slice(None) for remaining levels (GH19556)

• Bug in DataFrame.loc() raising TypeError when non-integer slice was given to select values from MultiIndex (GH25165, GH24263)

• Bug in Series.at() returning Series with one element instead of scalar when index is a MultiIndex with one level (GH38053)

• Bug in DataFrame.loc() returning and assigning elements in wrong order when indexer is differently ordered than the MultiIndex to filter (GH31330, GH34603)

• Bug in DataFrame.loc() and DataFrame.__getitem__() raising KeyError when columns were MultiIndex with only one level (GH29749)

• Bug in Series.__getitem__() and DataFrame.__getitem__() raising blank KeyError without missing keys for IntervalIndex (GH27365)

• Bug in setting a new label on a DataFrame or Series with a CategoricalIndex incorrectly raising TypeError when the new label is not among the index’s categories (GH38098)

• Bug in Series.loc() and Series.iloc() raising ValueError when inserting a list-like np.array, list or tuple in an object Series of equal length (GH37748, GH37486)

• Bug in Series.loc() and Series.iloc() setting all the values of an object Series with those of a list-like ExtensionArray instead of inserting it (GH38271)

**Missing**

• Bug in SeriesGroupBy.transform() now correctly handles missing values for dropna=False (GH35014)

• Bug in Series.nunique() with dropna=True was returning incorrect results when both NA and None missing values were present (GH37566)

• Bug in Series.interpolate() where kwarg limit_area and limit_direction had no effect when using methods pad and backfill (GH31048)

**MultiIndex**

• Bug in DataFrame.xs() when used with IndexSlice raises TypeError with message "Expected label or tuple of labels" (GH35301)

• Bug in DataFrame.reset_index() with NaT values in index raises ValueError with message "cannot convert float NaN to integer" (GH36541)

• Bug in DataFrame.combine_first() when used with MultiIndex containing string and NaN values raises TypeError (GH36562)

• Bug in MultiIndex.drop() dropped NaN values when non existing key was given as input (GH18853)
Bug in `MultiIndex.drop()` dropping more values than expected when index has duplicates and is not sorted (GH33494)

I/O

- `read_sas()` no longer leaks resources on failure (GH35566)
- Bug in `DataFrame.to_csv()` and `Series.to_csv()` caused a `ValueError` when it was called with a filename in combination with `mode` containing a `b` (GH35058)
- Bug in `read_csv()` with `float_precision='round_trip'` did not handle decimal and thousands parameters (GH35365)
- `to_pickle()` and `read_pickle()` were closing user-provided file objects (GH35679)
- `to_csv()` passes compression arguments for 'gzip' always to `gzip.GzipFile` (GH28103)
- `to_csv()` did not support zip compression for binary file object not having a filename (GH35058)
- `to_csv()` and `read_csv()` did not honor compression and encoding for path-like objects that are internally converted to file-like objects (GH35677, GH26124, GH32392)
- `DataFrame.to_pickle()`, `Series.to_pickle()`, and `read_pickle()` did not support compression for file-objects (GH26237, GH29054, GH29570)
- Bug in `LongTableBuilder.middle_separator()` was duplicating LaTeX longtable entries in the List of Tables of a LaTeX document (GH34360)
- Bug in `read_csv()` with `engine='python'` truncating data if multiple items present in first row and first element started with BOM (GH36343)
- Removed `private_key` and `verbose` from `read_gbq()` as they are no longer supported in pandas-gbq (GH34654, GH30200)
- Bumped minimum pytables version to 3.5.1 to avoid a `ValueError` in `read_hdf()` (GH24839)
- Bug in `read_table()` and `read_csv()` when `delim_whitespace=True` and `sep=default` (GH36583)
- Bug in `DataFrame.to_json()` and `Series.to_json()` when used with `lines=True` and `orient='records'` the last line of the record is not appended with 'new line character' (GH36888)
- Bug in `read_parquet()` with fixed offset time zones. String representation of time zones was not recognized (GH35997, GH36004)
- Bug in `DataFrame.to_html()`, `DataFrame.to_string()`, and `DataFrame.to_latex()` ignoring the na_rep argument when `float_format` was also specified (GH9046, GH13828)
- Bug in output rendering of complex numbers showing too many trailing zeros (GH36799)
- Bug in HDFStore threw a `TypeError` when exporting an empty DataFrame with `datetime64[ns, tz]` dtypes with a fixed HDF5 store (GH20594)
- Bug in HDFStore was dropping time zone information when exporting a Series with `datetime64[ns, tz]` dtypes with a fixed HDF5 store (GH20594)
- `read_csv()` was closing user-provided binary file handles when `engine="c"` and an `encoding` was requested (GH36980)
- Bug in `DataFrame.to_hdf()` was not dropping missing rows with `dropna=True` (GH35719)
- Bug in `read_html()` was raising a `TypeError` when supplying a `pathlib.Path` argument to the `io` parameter (GH37705)
- `DataFrame.to_excel()`, `Series.to_excel()`, `DataFrame.to_markdown()`, and `Series.to_markdown()` now support writing to fsspec URLs such as S3 and Google Cloud Storage (GH33987)
- Bug in `read_fwf()` with `skip_blank_lines=True` was not skipping blank lines (GH37758)
- Parse missing values using `read_json()` with `dtype=False` to `NaN` instead of `None` (GH28501)
- `read_fwf()` was inferring compression with `compression=None` which was not consistent with the other `read_*` functions (GH37909)
- `DataFrame.to_html()` was ignoring `formatters` argument for `ExtensionDtype` columns (GH36525)
- Bumped minimum xarray version to 0.12.3 to avoid reference to the removed Panel class (GH27101, GH37983)
- `DataFrame.to_csv()` was re-opening file-like handles that also implement `os.PathLike` (GH38125)
- Bug in the conversion of a sliced `pyarrow.Table` with missing values to a DataFrame (GH38525)
- Bug in `read_sql_table()` raising a `sqlalchemy.exc.OperationalError` when column names contained a percentage sign (GH37517)

### Period

- Bug in `DataFrame.replace()` and `Series.replace()` where `Period` dtypes would be converted to object dtypes (GH34871)

### Plotting

- Bug in `DataFrame.plot()` was rotating xticklabels when `subplots=True`, even if the x-axis wasn’t an irregular time series (GH29460)
- Bug in `DataFrame.plot()` where a marker letter in the `style` keyword sometimes caused a `ValueError` (GH21003)
- Bug in `DataFrame.plot.bar()` and `Series.plot.bar()` where ticks positions were assigned by value order instead of using the actual value for numeric or a smart ordering for string (GH26186, GH11465). This fix has been reverted in pandas 1.2.1, see What’s new in 1.2.1 (January 20, 2021)
- Twinned axes were losing their tick labels which should only happen to all but the last row or column of ‘externally’ shared axes (GH33819)
- Bug in `Series.plot()` and `DataFrame.plot()` was throwing a `ValueError` when the Series or DataFrame was indexed by a `TimedeltaIndex` with a fixed frequency and the x-axis lower limit was greater than the upper limit (GH37454)
- Bug in `DataFrameGroupBy.boxplot()` when `subplots=False` would raise a `KeyError` (GH16748)
- Bug in `DataFrame.plot()` and `Series.plot()` was overwriting matplotlib’s shared y axes behavior when no `sharey` parameter was passed (GH37942)
- Bug in `DataFrame.plot()` was raising a `TypeError` with `ExtensionDtype` columns (GH32073)
pandas: powerful Python data analysis toolkit, Release 1.3.5

Styler

- Bug in `Styler.render()` HTML was generated incorrectly because of formatting error in `rowspan` attribute, it now matches with w3 syntax (GH38234)

Groupby/resample/rolling

- Bug in `DataFrameGroupBy.count()` and `SeriesGroupBy.sum()` returning NaN for missing categories when grouped on multiple Categoricals. Now returning 0 (GH35028)
- Bug in `DataFrameGroupBy.apply()` that would sometimes throw an erroneous `ValueError` if the grouping axis had duplicate entries (GH16646)
- Bug in `DataFrame.resample()` that would throw a `ValueError` when resampling from "D" to "24H" over a transition into daylight savings time (DST) (GH35219)
- Bug when combining methods `DataFrame.groupby()` with `DataFrame.resample()` and `DataFrame.interpolate()` raising a `TypeError` (GH35325)
- Bug in `DataFrameGroupBy.apply()` where a non-nuisance grouping column would be dropped from the output columns if another groupby method was called before `apply` (GH34656)
- Bug when subsetting columns on a `DataFrameGroupBy` (e.g. `df.groupby('a')['b']`) would reset the attributes `axis`, `dropna`, `group_keys`, `level`, `mutated`, `sort`, and `squeeze` to their default values (GH9959)
- Bug in `DataFrameGroupBy.tshift()` failing to raise `ValueError` when a frequency cannot be inferred for the index of a group (GH35937)
- Bug in `DataFrame.groupby()` does not always maintain column index name for any, all, `bfill`, `ffill`, `shift` (GH29764)
- Bug in `DataFrameGroupBy.apply()` raising error with `np.nan` group(s) when `dropna=False` (GH35889)
- Bug in `Rolling.sum()` returned wrong values when dtypes where mixed between float and integer and `axis=1` (GH20649, GH35596)
- Bug in `Rolling.count()` returned `np.nan` with `FixedForwardWindowIndexer` as window, `min_periods=0` and only missing values in the window (GH35579)
- Bug where `pandas.core.window.Rolling` produces incorrect window sizes when using a `PeriodIndex` (GH34225)
- Bug in `DataFrameGroupBy.ffill()` and `DataFrameGroupBy.bfill()` where a NaN group would return filled values instead of NaN when `dropna=True` (GH34725)
- Bug in `RollingGroupby.count()` where a `ValueError` was raised when specifying the closed parameter (GH35869)
- Bug in `DataFrameGroupBy.rolling()` returning wrong values with partial centered window (GH36040)
- Bug in `DataFrameGroupBy.rolling()` returned wrong values with time aware window containing NaN. Raises `ValueError` because windows are not monotonic now (GH34617)
- Bug in `Rolling.__iter__()` where a `ValueError` was not raised when `min_periods` was larger than window (GH37156)
- Using `Rolling.var()` instead of `Rolling.std()` avoids numerical issues for `Rolling.corr()` when `Rolling.var()` is still within floating point precision while `Rolling.std()` is not (GH31286)
- Bug in `DataFrameGroupBy.quantile()` and `Resampler.quantile()` raised `TypeError` when values were of type Timedelta (GH29485)
• Bug in `Rolling.median()` and `Rolling.quantile()` returned wrong values for `BaseIndexer` subclasses with non-monotonic starting or ending points for windows (GH37153)

• Bug in `DataFrame.groupby()` dropped `nan` groups from result with `dropna=False` when grouping over a single column (GH35646, GH35542)

• Bug in `DataFrameGroupBy.head()`, `DataFrameGroupBy.tail()`, `SeriesGroupBy.head()`, and `SeriesGroupBy.tail()` would raise when used with `axis=1` (GH9772)

• Bug in `DataFrameGroupBy.transform()` would raise when used with `axis=1` and a transformation kernel (e.g. 'shift') (GH36308)

• Bug in `DataFrameGroupBy.resample()` using `.agg` with sum produced different result than just calling `.sum` (GH35458)

• Bug in `DataFrameGroupBy.apply()` dropped values on `nan` group when returning the same axes with the original frame (GH38227)

• Bug in `DataFrameGroupBy.quantile()` couldn't handle with arraylike `q` when grouping by columns (GH33795)

• Bug in `DataFrameGroupBy.rank()` with `datetime64tz` or period dtype incorrectly casting results to those dtypes instead of returning `float64` dtype (GH38187)

**Reshaping**

• Bug in `DataFrame.crosstab()` was returning incorrect results on inputs with duplicate row names, duplicate column names or duplicate names between row and column labels (GH22529)

• Bug in `DataFrame.pivot_table()` with `aggfunc='count'` or `aggfunc='sum'` returning `NaN` for missing categories when pivoted on a `Categorical`. Now returning `0` (GH31422)

• Bug in `concat()` and `DataFrame` constructor where input index names are not preserved in some cases (GH13475)

• Bug in `func crosstab()` when using multiple columns with `margins=True` and `normalize=True` (GH35144)

• Bug in `DataFrame.stack()` where an empty DataFrame.stack would raise an error (GH36113). Now returning an empty Series with empty MultiIndex.

• Bug in `Series.unstack()`. Now a Series with single level of Index trying to unstack would raise a `ValueError` (GH36113)

• Bug in `DataFrame.agg()` with `func={ 'name':<FUNC> }` incorrectly raising `TypeError` when DataFrame.columns==['Name'] (GH36212)

• Bug in `Series.transform()` would give incorrect results or raise when the argument `func` was a dictionary (GH35811)

• Bug in `DataFrame.pivot()` did not preserve `MultiIndex` level names for columns when rows and columns are both multiindexed (GH36360)

• Bug in `DataFrame.pivot()` modified index argument when columns was passed but values was not (GH37635)

• Bug in `DataFrame.join()` returned a non deterministic level-order for the resulting `MultiIndex` (GH36910)

• Bug in `DataFrame.combine_first()` caused wrong alignment with dtype string and one level of `MultiIndex` containing only `NA` (GH37591)

• Fixed regression in `merge()` on merging `DatetimeIndex` with empty DataFrame (GH36895)

• Bug in `DataFrame.apply()` not setting index of return value when func return type is `dict` (GH37544)
• Bug in `DataFrame.merge()` and `pandas.merge()` returning inconsistent ordering in result for `how=right` and `how=left` (GH35382)
• Bug in `merge_ordered()` couldn't handle list-like `left_by` or `right_by` (GH35269)
• Bug in `merge_ordered()` returned wrong join result when length of `left_by` or `right_by` equals to the rows of `left` or `right` (GH38166)
• Bug in `merge_ordered()` didn't raise when elements in `left_by` or `right_by` not exist in `left` columns or `right` columns (GH38167)
• Bug in `DataFrame.drop_duplicates()` not validating bool dtype for `ignore_index` keyword (GH38274)

**ExtensionArray**

• Fixed bug where `DataFrame` column set to scalar extension type via a dict instantiation was considered an object type rather than the extension type (GH35965)
• Fixed bug where `astype()` with equal dtype and `copy=False` would return a new object (GH28488)
• Fixed bug when applying a NumPy ufunc with multiple outputs to an `IntegerArray` returning `None` (GH36913)
• Fixed an inconsistency in `PeriodArray`'s `__init__` signature to those of `DatetimeArray` and `TimedeltaArray` (GH37289)
• Reductions for `BooleanArray`, `Categorical`, `DatetimeArray`, `FloatingArray`, `IntegerArray`, `PeriodArray`, `TimedeltaArray`, and `PandasArray` are now keyword-only methods (GH37541)
• Fixed a bug where a `TypeError` was wrongly raised if a membership check was made on an `ExtensionArray` containing nan-like values (GH37867)

**Other**

• Bug in `DataFrame.replace()` and `Series.replace()` incorrectly raising an `AssertionError` instead of a `ValueError` when invalid parameter combinations are passed (GH36045)
• Bug in `DataFrame.replace()` and `Series.replace()` with numeric values and string `to_replace` (GH34871)
• Fixed metadata propagation in `Series.abs()` and ufuncs called on Series and DataFrames (GH28283)
• Bug in `DataFrame.replace()` and `Series.replace()` incorrectly casting from `PeriodDtype` to object dtype (GH34871)
• Fixed bug in metadata propagation incorrectly copying DataFrame columns as metadata when the column name overlaps with the metadata name (GH37037)
• Fixed metadata propagation in the `Series.dt`, `Series.str` accessors, `DataFrame.duplicated`, `DataFrame.stack`, `DataFrame.unstack`, `DataFrame.pivot`, `DataFrame.append`, `DataFrame.diff`, `DataFrame.applymap` and `DataFrame.update` methods (GH28283, GH37381)
• Fixed metadata propagation when selecting columns with `DataFrame.__getitem__` (GH28283)
• Bug in `Index.intersection()` with non-`Index` failing to set the correct name on the returned `Index` (GH38111)
• Bug in `RangeIndex.intersection()` failing to set the correct name on the returned `Index` in some corner cases (GH38197)
• Bug in `Index.difference()` failing to set the correct name on the returned `Index` in some corner cases (GH38268)
• Bug in `Index.union()` behaving differently depending on whether operand is an `Index` or other list-like (GH36384)
• Bug in `Index.intersection()` with non-matching numeric dtypes casting to `object` dtype instead of minimal common dtype (GH38122)
• Bug in `IntervalIndex.union()` returning an incorrectly-typed `Index` when empty (GH38282)
• Passing an array with 2 or more dimensions to the `Series` constructor now raises the more specific `ValueError` rather than a bare `Exception` (GH35744)
• Bug in `dir` where `dir(obj)` wouldn’t show attributes defined on the instance for pandas objects (GH37173)
• Bug in `Index.drop()` raising `InvalidIndexError` when index has duplicates (GH38051)
• Bug in `RangeIndex.difference()` returning `Int64Index` in some cases where it should return `RangeIndex` (GH38028)
• Fixed bug in `assert_series_equal()` when comparing a datetime-like array with an equivalent non extension dtype array (GH37609)
• Bug in `is_bool_dtype()` would raise when passed a valid string such as "boolean" (GH38386)
• Fixed regression in logical operators raising `ValueError` when columns of `DataFrame` are a `CategoricalIndex` with unused categories (GH38367)

5.3 Version 1.1

5.3.1 What’s new in 1.1.5 (December 07, 2020)

These are the changes in pandas 1.1.5. See Release notes for a full changelog including other versions of pandas.

Fixed regressions

- Fixed regression in addition of a timedelta-like scalar to a DatetimeIndex raising incorrectly (GH37295)
- Fixed regression in Series.groupby() raising when the Index of the Series had a tuple as its name (GH37755)
- Fixed regression in DataFrame.loc() and Series.loc() for __setitem__ when one-dimensional tuple was given to select from MultiIndex (GH37711)
- Fixed regression in inplace operations on Series with ExtensionDtype with NumPy dtyped operand (GH37910)
• Fixed regression in metadata propagation for groupby iterator (GH37343)
• Fixed regression in MultiIndex constructed from a DatetimeIndex not retaining frequency (GH35563)
• Fixed regression in Index constructor raising an AttributeError when passed a SparseArray with datetime64 values (GH35843)
• Fixed regression in DataFrame.unstack() with columns with integer dtype (GH37115)
• Fixed regression in indexing on a Series with CategoricalDtype after unpickling (GH37631)
• Fixed regression in DataFrame.groupby() aggregation with out-of-bounds datetime objects in an object-dtype column (GH36003)
• Fixed regression in df.groupby(..).rolling(..) with the resulting MultiIndex when grouping by a label that is in the index (GH37641)
• Fixed regression in DataFrame.fillna() not filling NaN after other operations such as DataFrame.pivot() (GH36495).
• Fixed performance regression in df.groupby(..).rolling(..) (GH38038)
• Fixed regression in MultiIndex.intersection() returning duplicates when at least one of the indexes had duplicates (GH36915)
• Fixed regression in GroupBy.first() and GroupBy.last() where None was considered a non-NA value (GH38286)

Bug fixes

• Bug in pytables methods in python 3.9 (GH38041)

Other

• Only set -Werror as a compiler flag in the CI jobs (GH33315, GH33314)

5.3.2 What's new in 1.1.4 (October 30, 2020)

These are the changes in pandas 1.1.4. See Release notes for a full changelog including other versions of pandas.

Fixed regressions

- Fixed regression in `read_csv()` raising a `ValueError` when `names` was of type `dict_keys` (GH36928)
- Fixed regression in `read_csv()` with more than 1M rows and specifying an `index_col` argument (GH37094)
- Fixed regression where attempting to mutate a `DateOffset` object would no longer raise an `AttributeError` (GH36940)
- Fixed regression where `DataFrame.agg()` would fail with `TypeError` when passed positional arguments to be passed on to the aggregation function (GH36948).
- Fixed regression in `RollingGroupby` with `sort=False` not being respected (GH36889)
- Fixed regression in `Series.astype()` converting `None` to "nan" when casting to string (GH36904)
- Fixed regression in `Series.rank()` method failing for read-only data (GH37290)
- Fixed regression in `RollingGroupby` causing a segmentation fault with Index of dtype object (GH36727)
- Fixed regression in `DataFrame.resample(...)`.apply(...)() raised `AttributeError` when input was a `DataFrame` and only a `Series` was evaluated (GH36951)
- Fixed regression in `DataFrame.groupby(...)`.std() with nullable integer dtype (GH37415)
- Fixed regression in `PeriodDtype` comparing both equal and unequal to its string representation (GH37265)
- Fixed regression where slicing `DatetimeIndex` raised `AssertionError` on irregular time series with `pd.NaT` or on unsorted indices (GH36953 and GH35509)
- Fixed regression in certain offsets (`pd.offsets.Day()` and below) no longer being hashable (GH37267)
- Fixed regression in `StataReader` which required `chunksize` to be manually set when using an iterator to read a dataset (GH37280)
- Fixed regression in `setitem` with `DataFrame.iloc()` which raised error when trying to set a value while filtering with a boolean list (GH36741)
- Fixed regression in `setitem` with a Series getting aligned before setting the values (GH37427)
- Fixed regression in `MultiIndex.is_monotonic_increasing` returning wrong results with `NaN` in at least one of the levels (GH37220)
- Fixed regression in inplace arithmetic operation on a Series not updating the parent `DataFrame` (GH36373)
Bug fixes

- Bug causing `groupby(...).sum()` and similar to not preserve metadata (GH29442)
- Bug in `Series.isin()` and `DataFrame.isin()` raising a `ValueError` when the target was read-only (GH37174)
- Bug in `GroupBy.fillna()` that introduced a performance regression after 1.0.5 (GH36757)
- Bug in `DataFrame.info()` was raising a `KeyError` when the DataFrame has integer column names (GH37245)
- Bug in `DataFrameGroupby.apply()` would drop a `CategoricalIndex` when grouped on (GH35792)

5.3.3 What’s new in 1.1.3 (October 5, 2020)

These are the changes in pandas 1.1.3. See Release notes for a full changelog including other versions of pandas.

Enhancements

Added support for new Python version

pandas 1.1.3 now supports Python 3.9 (GH36296).

Development Changes

- The minimum version of Cython is now the most recent bug-fix version (0.29.21) (GH36296).

Fixed regressions

- Fixed regression in `DataFrame.agg()`, `DataFrame.apply()`, `Series.agg()`, and `Series.apply()` where internal suffix is exposed to the users when no relabelling is applied (GH36189)
- Fixed regression in `IntegerArray` unary plus and minus operations raising a TypeError (GH36063)
- Fixed regression when adding a `timedelta_range()` to a `Timestamp` raised a ValueError (GH35897)
- Fixed regression in `Series.__getitem__()` incorrectly raising when the input was a tuple (GH35354)
- Fixed regression in `Series.__getitem__()` incorrectly raising when the input was a frozenset (GH35747)
- Fixed regression in modulo of `Index`, `Series` and `DataFrame` using `numexpr` using C not Python semantics (GH36047, GH36526)
- Fixed regression in `read_excel()` with `engine="odf"` caused `UnboundLocalError` in some cases where cells had nested child nodes (GH36122, GH35802)
- Fixed regression in `DataFrame.replace()` inconsistent replace when using a float in the replace method (GH35376)
- Fixed regression in `Series.loc()` on a `Series` with a `MultiIndex` containing `Timestamp` raising `InvalidIndexError` (GH35858)
- Fixed regression in `DataFrame` and `Series` comparisons between numeric arrays and strings (GH35700, GH3677)
- Fixed regression in `DataFrame.apply()` with `raw=True` and user-function returning string (GH35940)
- Fixed regression when setting empty `DataFrame` column to a `Series` in preserving name of index in frame (GH36527)
- Fixed regression in `Period` incorrect value for ordinal over the maximum timestamp (GH36430)
- Fixed regression in `read_table()` raised ValueError when `delim_whitespace` was set to True (GH35958)
- Fixed regression in `Series.dt.normalize()` when normalizing pre-epoch dates the result was shifted one day (GH36294)
Bug fixes

- Bug in `read_spss()` where passing a `pathlib.Path` as `path` would raise a `TypeError` (GH33666)
- Bug in `Series.str.startswith()` and `Series.str.endswith()` with `category` dtype not propagating `na` parameter (GH36241)
- Bug in `Series` constructor where integer overflow would occur for sufficiently large scalar inputs when an index was provided (GH36291)
- Bug in `DataFrame.sort_values()` raising an `AttributeError` when sorting on a key that casts column to categorical dtype (GH36383)
- Bug in `DataFrame.stack()` raising a `ValueError` when stacking `MultiIndex` columns based on position when the levels had duplicate names (GH36353)
- Bug in `Series.astype()` showing too much precision when casting from `np.float32` to string dtype (GH36451)
- Bug in `Series.isin()` and `DataFrame.isin()` when using NaN and a row length above 1,000,000 (GH22205)
- Bug in `cut()` raising a `ValueError` when passed a `Series` of labels with `ordered=False` (GH36603)

Other

- Reverted enhancement added in pandas-1.1.0 where `timedelta_range()` infers a frequency when passed `start`, `stop`, and `periods` (GH32377)

5.3.4 What’s new in 1.1.2 (September 8, 2020)

These are the changes in pandas 1.1.2. See Release notes for a full changelog including other versions of pandas.

Fixed regressions

- Regression in `DatetimeIndex.intersection()` incorrectly raising `AssertionError` when intersecting against a list (GH35876)
- Fix regression in updating a column inplace (e.g. using `df['col'].fillna(., inplace=True)`) (GH35731)
- Fix regression in `DataFrame.append()` mixing tz-aware and tz-naive datetime columns (GH35460)
- Performance regression for `RangeIndex.format()` (GH35712)
- Regression where `MultiIndex.get_loc()` would return a slice spanning the full index when passed an empty list (GH35878)
- Fix regression in invalid cache after an indexing operation; this can manifest when setting which does not update the data (GH35521)
- Regression in `DataFrame.replace()` where a `TypeError` would be raised when attempting to replace elements of type `Interval` (GH35931)
- Fix regression in pickle roundtrip of the closed attribute of `IntervalIndex` (GH35658)
- Fixed regression in `DataFrameGroupBy.agg()` where a `ValueError: buffer source array is read-only` would be raised when the underlying array is read-only (GH36014)
- Fixed regression in `Series.groupby.rolling()` number of levels of `MultiIndex` in input was compressed to one (GH36018)
- Fixed regression in `DataFrameGroupBy` on an empty `DataFrame` (GH36197)

Bug fixes

- Bug in `DataFrame.eval()` with object dtype column binary operations (GH35794)
- Bug in `Series` constructor raising a `TypeError` when constructing sparse datetime64 dtypes (GH35762)
- Bug in `DataFrame.apply()` with result_type="reduce" returning with incorrect index (GH35683)
- Bug in `Series.astype()` and `DataFrame.astype()` not respecting the errors argument when set to "ignore" for extension dtypes (GH35471)
- Bug in `DateTimeIndex.format()` and `PeriodIndex.format()` with name=True setting the first item to "None" where it should be "" (GH35712)
- Bug in `Float64Index.__contains__()` incorrectly raising `TypeError` instead of returning `False` (GH35788)
- Bug in `Series` constructor incorrectly raising a `TypeError` when passed an ordered set (GH36044)
- Bug in `Series.dt.isocalendar()` and `DatetimeIndex.isocalendar()` that returned incorrect year for certain dates (GH36032)
- Bug in `DataFrame` indexing returning an incorrect `Series` in some cases when the series has been altered and a cache not invalidated (GH33675)
- Bug in `DataFrame.corr()` causing subsequent indexing lookups to be incorrect (GH35882)
• Bug in `import_optional_dependency()` returning incorrect package names in cases where package name is different from import name (GH35948)

• Bug when setting empty DataFrame column to a Series in preserving name of index in frame (GH31368)

Other

• `factorize()` now supports `na_sentinel=None` to include NaN in the uniques of the values and remove dropna keyword which was unintentionally exposed to public facing API in 1.1 version from `factorize()` (GH35667)

• `DataFrame.plot()` and `Series.plot()` raise UserWarning about usage of FixedFormatter and FixedLocator (GH35684 and GH35945)

5.3.5 What’s new in 1.1.1 (August 20, 2020)

These are the changes in pandas 1.1.1. See Release notes for a full changelog including other versions of pandas.

Fixed regressions

- Fixed regression in CategoricalIndex.format() where, when stringified scalars had different lengths, the shorter string would be right-filled with spaces, so it had the same length as the longest string (GH35439)
- Fixed regression in Series.truncate() when trying to truncate a single-element series (GH35544)
- Fixed regression where DataFrame.to_numpy() would raise a TypeError for mixed dtypes when converting to str (GH35545)
- Fixed regression where read_csv() would raise a ValueError when pandas.options.mode.use_inf_as_na was set to True (GH35493)
- Fixed regression where pandas.testing.assert_series_equal() would raise an error when non-numeric dtypes were passed with check_exact=True (GH35446)
- Fixed regression in .groupby(..).rolling(..) where row selection was ignored (GH35486)
- Fixed regression where DataFrame.interpolate() would raise a TypeError when the DataFrame was empty (GH35598)
- Fixed regression in DataFrame.shift() with axis=1 and heterogeneous dtypes (GH35488)
- Fixed regression in DataFrame.diff() with read-only data (GH35559)
- Fixed regression in .groupby(..).rolling(..) where a segfault would occur with center=True and an odd number of values (GH35552)
- Fixed regression in DataFrame.apply() where functions that altered the input in-place only operated on a single row (GH35462)
- Fixed regression in DataFrame.reset_index() would raise a ValueError on empty DataFrame with a MultiIndex with a datetime64 dtype level (GH35606, GH35657)
- Fixed regression where pandas.merge_asof() would raise a UnboundLocalError when left_index, right_index and tolerance were set (GH35558)
- Fixed regression in .groupby(..).rolling(..) where a custom BaseIndexer would be ignored (GH35557)
- Fixed regression in DataFrame.replace() and Series.replace() where compiled regular expressions would be ignored during replacement (GH35680)
- Fixed regression in aggregate() where a list of functions would produce the wrong results if at least one of the functions did not aggregate (GH35490)
- Fixed memory usage issue when instantiating large pandas.arrays.StringArray (GH35499)
Bug fixes

- Bug in *Styler* whereby *cell_ids* argument had no effect due to other recent changes (GH35588) (GH35663)
- Bug in *pandas.testing.assert_series_equal()* and *pandas.testing.assert_frame_equal()* where extension dtypes were not ignored when *check_dtypes* was set to *False* (GH35715)
- Bug in *to_timedelta()* fails when *arg* is a *Series* with *Int64* dtype containing null values (GH35574)
- Bug in *.groupby(..).rolling(..)* where passing *closed* with column selection would raise a *ValueError* (GH35549)
- Bug in *DataFrame* constructor failing to raise *ValueError* in some cases when *data* and *index* have mismatched lengths (GH33437)

5.3.6 What’s new in 1.1.0 (July 28, 2020)

These are the changes in pandas 1.1.0. See Release notes for a full changelog including other versions of pandas.

Enhancements

KeyErrors raised by loc specify missing labels

Previously, if labels were missing for a .loc call, a KeyError was raised stating that this was no longer supported. Now the error message also includes a list of the missing labels (max 10 items, display width 80 characters). See GH34272.

All dtypes can now be converted to StringDtype

Previously, declaring or converting to StringDtype was in general only possible if the data was already only str or nan-like (GH31204). StringDtype now works in all situations where astype(str) or dtype=str work:

For example, the below now works:

```
In [1]: ser = pd.Series([1, "abc", np.nan], dtype="string")

In [2]: ser
Out[2]:
   0     1
   1     abc
   2   <NA>
 dtype: string

In [3]: ser[0]
Out[3]: '1'

In [4]: pd.Series([1, 2, np.nan], dtype="Int64").astype("string")
Out[4]:
   0     1
   1     2
   2   <NA>
 dtype: string
```

Non-montonic PeriodIndex partial string slicing

PeriodIndex now supports partial string slicing for non-monotonic indexes, mirroring DatetimeIndex behavior (GH31096)

For example:

```
In [5]: dti = pd.date_range("2014-01-01", periods=30, freq="30D")

In [6]: pi = dti.to_period("D")

In [7]: ser_monotonic = pd.Series(np.arange(30), index=pi)
```

(continues on next page)
In [8]: shuffler = list(range(0, 30, 2)) + list(range(1, 31, 2))

In [9]: ser = ser_monotonic[shuffler]

In [10]: ser

Out[10]:
2014-01-01    0
2014-03-02    2
2014-05-01    4
2014-06-30    6
2014-08-29    8
   ..
2015-09-23   21
2015-11-22   23
2016-01-21   25
2016-03-21   27
2016-05-20   29
Freq: D, Length: 30, dtype: int64

In [11]: ser["2014"]

Out[11]:
2014-01-01    0
2014-03-02    2
2014-05-01    4
2014-06-30    6
2014-08-29    8

Freq: D, dtype: int64
Comparing two DataFrame or two Series and summarizing the differences

We've added DataFrame.compare() and Series.compare() for comparing two DataFrame or two Series (GH30429)

In [13]: df = pd.DataFrame(  
    ...:     {
    ...:         "col1": ["a", "a", "b", "b", "a"],  
    ...:         "col2": [1.0, 2.0, 3.0, np.nan, 5.0],  
    ...:         "col3": [1.0, 2.0, 3.0, 4.0, 5.0]  
    ...:     },  
    ...:     columns=["col1", "col2", "col3"],  
    ...:     )

In [14]: df
Out[14]:
       col1  col2  col3
0      a    1.0   1.0
1      a    2.0   2.0
2      b    3.0   3.0
3      b   NaN   4.0
4      a    5.0   5.0

In [15]: df2 = df.copy()

In [16]: df2.loc[0, 'col1'] = 'c'

In [17]: df2.loc[2, 'col3'] = 4.0

In [18]: df2
Out[18]:
       col1  col2  col3
0      c    1.0   1.0
1      a    2.0   2.0
2      b    3.0   4.0
3      b   NaN   4.0
4      a    5.0   5.0

In [19]: df.compare(df2)
Out[19]:
     col1  col3
      self  other  self  other
0    a    NaN  NaN  NaN
2   NaN  NaN    3.0  4.0

See User Guide for more details.
Allow NA in groupby key

With `groupby`, we’ve added a `dropna` keyword to `DataFrame.groupby()` and `Series.groupby()` in order to allow NA values in group keys. Users can define `dropna` to `False` if they want to include NA values in groupby keys. The default is set to `True` for `dropna` to keep backwards compatibility (GH3729).

```python
In [20]: df_list = [[1, 2, 3], [1, None, 4], [2, 1, 3], [1, 2, 2]]
In [21]: df_dropna = pd.DataFrame(df_list, columns=['a', 'b', 'c'])
In [22]: df_dropna
Out[22]:
     a  b  c
0   1  2.0 3
1   1  NaN 4
2   2  1.0 3
3   1  2.0 2
```

By default, `dropna` is set to `True`, which will exclude NaNs in keys.

```python
In [23]: df_dropna.groupby(by=['b'], dropna=True).sum()
Out[23]:
     a  c
  b
1.0  2  3
2.0  2  5
```

# In order to allow NaN in keys, set `dropna` to `False`

```python
In [24]: df_dropna.groupby(by=['b'], dropna=False).sum()
Out[24]:
     a  c
  b
1.0  2  3
2.0  2  5
  NaN 1  4
```

The default setting of `dropna` argument is `True` which means NA are not included in group keys.

### Sorting with keys

We’ve added a key argument to the `DataFrame` and `Series` sorting methods, including `DataFrame.sort_values()`, `DataFrame.sort_index()`, `Series.sort_values()`, and `Series.sort_index()`. The key can be any callable function which is applied column-by-column to each column used for sorting, before sorting is performed (GH27237). See `sort_values with keys` and `sort_index with keys` for more information.

```python
In [25]: s = pd.Series(['C', 'a', 'B'])
In [26]: s
Out[26]:
0   C
1   a
2   B
dtype: object
```
In [27]: s.sort_values()
Out[27]:
2   B
0   C
1   a
dtype: object

Note how this is sorted with capital letters first. If we apply the `Series.str.lower()` method, we get

In [28]: s.sort_values(key=lambda x: x.str.lower())
Out[28]:
1   a
2   B
0   C
dtype: object

When applied to a DataFrame, they key is applied per-column to all columns or a subset if by is specified, e.g.

In [29]: df = pd.DataFrame({'a': ['C', 'C', 'a', 'a', 'B', 'B'],
                     'b': [1, 2, 3, 4, 5, 6]})

In [30]: df
Out[30]:
a     b
0   C   1
1   C   2
2   a   3
3   a   4
4   B   5
5   B   6

In [31]: df.sort_values(by=['a'], key=lambda col: col.str.lower())
Out[31]:
a     b
2   a   3
3   a   4
4   B   5
5   B   6
0   C   1
1   C   2

For more details, see examples and documentation in `DataFrame.sort_values()`, `Series.sort_values()`, and `sort_index()`.
Fold argument support in Timestamp constructor

Timestamp: now supports the keyword-only fold argument according to PEP 495 similar to parent datetime. datetime class. It supports both accepting fold as an initialization argument and inferring fold from other constructor arguments (GH25057, GH31338). Support is limited to dateutil timezones as pytz doesn’t support fold.

For example:

```python
In [32]: ts = pd.Timestamp("2019-10-27 01:30:00+00:00")
In [33]: ts.fold
Out[33]: 0

In [34]: ts = pd.Timestamp(year=2019, month=10, day=27, hour=1, minute=30,
....:        tz="dateutil/Europe/London", fold=1)
....:
In [35]: ts
Out[35]: Timestamp('2019-10-27 01:30:00+0000', tz='dateutil//usr/share/zoneinfo/Europe/London')
```

For more on working with fold, see Fold subsection in the user guide.

Parsing timezone-aware format with different timezones in to_datetime

to_datetime() now supports parsing formats containing timezone names (%Z) and UTC offsets (%z) from different timezones then converting them to UTC by setting utc=True. This would return a DatetimeIndex with timezone at UTC as opposed to an Index with object dtype if utc=True is not set (GH32792).

For example:

```python
In [36]: tz_strs = ['2010-01-01 12:00:00 +0100', '2010-01-01 12:00:00 -0100',
....:           '2010-01-01 12:00:00 +0300', '2010-01-01 12:00:00 +0400']
....:
In [37]: pd.to_datetime(tz_strs, format='%Y-%m-%d %H:%M:%S %z', utc=True)
Out[37]: DatetimeIndex(['2010-01-01 11:00:00+00:00', '2010-01-01 13:00:00+00:00',
....:             '2010-01-01 09:00:00+00:00', '2010-01-01 08:00:00+00:00'],
               dtype='datetime64[ns, UTC]', freq=None)

In [38]: pd.to_datetime(tz_strs, format='%Y-%m-%d %H:%M:%S %z')
Out[38]: Index(['2010-01-01 12:00:00+01:00', '2010-01-01 12:00:00-01:00',
....:            '2010-01-01 12:00:00+03:00', '2010-01-01 12:00:00+04:00'],
               dtype='object')
```
Grouper and resample now supports the arguments origin and offset

Grouper and DataFrame.resample() now supports the arguments `origin` and `offset`. It let the user control the timestamp on which to adjust the grouping. (GH31809)

The bins of the grouping are adjusted based on the beginning of the day of the time series starting point. This works well with frequencies that are multiples of a day (like `30D`) or that divides a day (like `90s` or `1min`). But it can create inconsistencies with some frequencies that do not meet this criteria. To change this behavior you can now specify a fixed timestamp with the argument `origin`.

Two arguments are now deprecated (more information in the documentation of DataFrame.resample()):

- `base` should be replaced by `offset`.
- `loffset` should be replaced by directly adding an offset to the index DataFrame after being resampled.

Small example of the use of `origin`:

```
In [39]: start, end = '2000-10-01 23:30:00', '2000-10-02 00:30:00'
In [40]: middle = '2000-10-02 00:00:00'
In [41]: rng = pd.date_range(start, end, freq='7min')
In [42]: ts = pd.Series(np.arange(len(rng)) * 3, index=rng)
In [43]: ts
Out[43]:
2000-10-01 23:30:00    0
2000-10-01 23:37:00    3
2000-10-01 23:44:00    6
2000-10-01 23:51:00    9
2000-10-01 23:58:00   12
2000-10-02 00:05:00   15
2000-10-02 00:12:00   18
2000-10-02 00:19:00   21
2000-10-02 00:26:00   24
Freq: 7T, dtype: int64
```

Resample with the default behavior 'start_day' (origin is `2000-10-01 00:00:00`):

```
In [44]: ts.resample('17min').sum()
Out[44]:
2000-10-01 23:14:00    0
2000-10-01 23:31:00    9
2000-10-01 23:48:00   21
2000-10-02 00:05:00   54
2000-10-02 00:22:00   24
Freq: 17T, dtype: int64
```

```
In [45]: ts.resample('17min', origin='start_day').sum()
Out[45]:
2000-10-01 23:14:00    0
2000-10-01 23:31:00    9
2000-10-01 23:48:00   21
2000-10-02 00:05:00   54
```

(continues on next page)
Resample using a fixed origin:

```
In [46]: ts.resample('17min', origin='epoch').sum()
Out[46]:
2000-10-01 23:18:00    0
2000-10-01 23:35:00    18
2000-10-01 23:52:00    27
2000-10-02 00:09:00    39
2000-10-02 00:26:00    24
Freq: 17T, dtype: int64
```

```
In [47]: ts.resample('17min', origin='2000-01-01').sum()
Out[47]:
2000-10-01 23:24:00    3
2000-10-01 23:41:00    15
2000-10-01 23:58:00    45
2000-10-02 00:15:00    45
Freq: 17T, dtype: int64
```

If needed you can adjust the bins with the argument `offset` (a `Timedelta`) that would be added to the default `origin`. For a full example, see: *Use origin or offset to adjust the start of the bins.*

**fsspec now used for filesystem handling**

For reading and writing to filesystems other than local and reading from HTTP(S), the optional dependency `fsspec` will be used to dispatch operations (GH33452). This will give unchanged functionality for S3 and GCS storage, which were already supported, but also add support for several other storage implementations such as Azure Datalake and Blob, SSH, FTP, dropbox and github. For docs and capabilities, see the [fsspec docs](https://filesystem-spec.readthedocs.io/en/latest/).

The existing capability to interface with S3 and GCS will be unaffected by this change, as `fsspec` will still bring in the same packages as before.

**Other enhancements**

- Compatibility with matplotlib 3.3.0 (GH34850)
- `IntegerArray.astype()` now supports `datetime64` dtype (GH32538)
- `IntegerArray` now implements the `sum` operation (GH33172)
- Added `pandas.errors.InvalidIndexError` (GH34570).
- Added `DataFrame.value_counts()` (GH5377)
- Added a `pandas.api.indexers.FixedForwardWindowIndexer()` class to support forward-looking windows during rolling operations.
- Added a `pandas.api.indexers.VariableOffsetWindowIndexer()` class to support rolling operations with non-fixed offsets (GH34994)
• `describe()` now includes a `datetime_is_numeric` keyword to control how datetime columns are summarized (GH30164, GH34798)

• **Styler** may now render CSS more efficiently where multiple cells have the same styling (GH30876)

• `highlight_null()` now accepts `subset` argument (GH31345)

• When writing directly to a sqlite connection `DataFrame.to_sql()` now supports the `multi` method (GH29921)

• `pandas.errors.OptionError` is now exposed in `pandas.errors` (GH27553)

• Added `api.extensions.ExtensionArray.argmax()` and `api.extensions.ExtensionArray.argmin()` (GH24382)

• `timedelta_range()` will now infer a frequency when passed `start`, `stop`, and `periods` (GH32377)

• Positional slicing on a `IntervalIndex` now supports slices with step > 1 (GH31658)

• `Series.str` now has a `fullmatch` method that matches a regular expression against the entire string in each row of the `Series`, similar to `re.fullmatch` (GH32806).

• `DataFrame.sample()` will now also allow array-like and BitGenerator objects to be passed to `random_state` as seeds (GH32503)

• `Index.union()` will now raise `RuntimeWarning` for `MultiIndex` objects if the object inside are unsortable. Pass `sort=False` to suppress this warning (GH33015)

• Added `Series.dt.isocalendar()` and `DatetimeIndex.isocalendar()` that returns a `DataFrame` with `year`, `week`, and `day` calculated according to the ISO 8601 calendar (GH33206, GH34392).

• The `DataFrame.to_feather()` method now supports additional keyword arguments (e.g. to set the compression) that are added in pyarrow 0.17 (GH33422).

• The `cut()` will now accept parameter `ordered` with default `ordered=True`. If `ordered=False` and no labels are provided, an error will be raised (GH33141)

• `DataFrame.to_csv()`, `DataFrame.to_pickle()`, and `DataFrame.to_json()` now support passing a dict of compression arguments when using the `gzip` and `bz2` protocols. This can be used to set a custom compression level, e.g., `df.to_csv(path, compression={'method': 'gzip', 'compresslevel': 1})` (GH33196)

• `melt()` has gained an `ignore_index` (default `True`) argument that, if set to `False`, prevents the method from dropping the index (GH17440).

• `Series.update()` now accepts objects that can be coerced to a `Series`, such as dict and list, mirroring the behavior of `DataFrame.update()` (GH33215)

• `transform()` and `aggregate()` have gained engine and `engine_kwars` arguments that support executing functions with Numba (GH32854, GH33388)

• `interpolate()` now supports SciPy interpolation method `scipy.interpolate.CubicSpline` as method `cubicspline` (GH33670)

• `DataFrameGroupBy` and `SeriesGroupBy` now implement the `sample` method for doing random sampling within groups (GH31775)

• `DataFrame.to_numpy()` now supports the `na_value` keyword to control the NA sentinel in the output array (GH33820)

• Added `api.extension.ExtensionArray.equals` to the extension array interface, similar to `Series.equals()` (GH27081)

• The minimum supported dta version has increased to 105 in `read_stata()` and StataReader (GH26667).
to_stata() supports compression using the compression keyword argument. Compression can either be inferred or explicitly set using a string or a dictionary containing both the method and any additional arguments that are passed to the compression library. Compression was also added to the low-level Stata-file writers StataWriter, StataWriter117, and StataWriterUTF8 (GH26599).

HDFStore.put() now accepts a track_times parameter. This parameter is passed to the create_table method of PyTables (GH32682).

Series.plot() and DataFrame.plot() now accept xlabel and ylabel parameters to present labels on x and y axis (GH9093).

Made pandas.core.window.rolling.Rolling and pandas.core.window.expanding.Expanding iterable (GH11704)

Made option_context a contextlib.ContextDecorator, which allows it to be used as a decorator over an entire function (GH34253).

DataFrame.to_csv() and Series.to_csv() now accept an errors argument (GH22610)

transform() now allows func to be pad, backfill and cumcount (GH31269).

read_json() now accepts an nrows parameter. (GH33916).

DataFrame.hist(), Series.hist(), core.groupby.DataFrameGroupBy.hist(), and core.groupby.SeriesGroupBy.hist() have gained the legend argument. Set to True to show a legend in the histogram. (GH6279)

concat() and append() now preserve extension dtypes, for example combining a nullable integer column with a numpy integer column will no longer result in object dtype but preserve the integer dtype (GH33607, GH34339, GH34095).

read_gbq() now allows to disable progress bar (GH33360).

read_gbq() now supports the max_results kwarg from pandas-gbq (GH34639).

DataFrame.cov() and Series.cov() now support a new parameter ddof to support delta degrees of freedom as in the corresponding numpy methods (GH34611).

DataFrame.to_html() and DataFrame.to_string()’s col_space parameter now accepts a list or dict to change only some specific columns’ width (GH28917).

DataFrame.to_excel() can now also write OpenOffice spreadsheet (.ods) files (GH27222)

explode() now accepts ignore_index to reset the index, similar to pd.concat() or DataFrame.sort_values() (GH34932).

DataFrame.to_markdown() and Series.to_markdown() now accept index argument as an alias for tabulate’s showindex (GH32667)

read_csv() now accepts string values like “0”, “0.0”, “1”, “1.0” as convertible to the nullable Boolean dtype (GH34859)

pandas.core.window.ExponentialMovingWindow now supports a times argument that allows mean to be calculated with observations spaced by the timestamps in times (GH34839)

DataFrame.agg() and Series.agg() now accept named aggregation for renaming the output columns/indexes. (GH26513)

compute.use_numba now exists as a configuration option that utilizes the numba engine when available (GH33966, GH35374)

Series.plot() now supports asymmetric error bars. Previously, if Series.plot() received a “2xN” array with error values for yerr and/or xerr, the left/lower values (first row) were mirrored, while the right/upper
values (second row) were ignored. Now, the first row represents the left/lower error values and the second row the right/upper error values. (GH9536)

Notable bug fixes

These are bug fixes that might have notable behavior changes.

MultiIndex.get_indexer interprets method argument correctly

This restores the behavior of MultiIndex.get_indexer() with method='backfill' or method='pad' to the behavior before pandas 0.23.0. In particular, MultiIndexes are treated as a list of tuples and padding or backfilling is done with respect to the ordering of these lists of tuples (GH29896).

As an example of this, given:

```python
In [48]: df = pd.DataFrame({
    ....:     'a': [0, 0, 0, 0],
    ....:     'b': [0, 2, 3, 4],
    ....:     'c': ['A', 'B', 'C', 'D'],
    ....:     })
In [49]: mi_2 = pd.MultiIndex.from_product([[0], [-1, 0, 1, 3, 4, 5]])
```

The differences in reindexing df with mi_2 and using method='backfill' can be seen here:

```
pandas >= 0.23, < 1.1.0:
In [1]: df.reindex(mi_2, method='backfill')
Out[1]:
     c
0  -1  A
  0   A
  1   D
  3   A
  4   A
  5   C
```

```
pandas <0.23, >= 1.1.0
In [50]: df.reindex(mi_2, method='backfill')
Out[50]:
     c
0  -1  A
  0   A
  1   B
  3   C
  4   D
  5  NaN
```

And the differences in reindexing df with mi_2 and using method='pad' can be seen here:

```
pandas == 0.23, < 1.1.0
In [1]: df.reindex(mi_2, method='pad')
Out[1]:
     c
0  -1  A
  0   A
  1   D
  3   A
  4   A
  5   C
```

```
pandas >= 0.23, < 1.1.0
In [50]: df.reindex(mi_2, method='pad')
Out[50]:
     c
0  -1  A
  0   A
  1   B
  3   C
  4   D
  5  NaN
```

```
pandas <0.23, >= 1.1.0
In [50]: df.reindex(mi_2, method='pad')
Out[50]:
     c
0  -1  A
  0  NaN
  1   B
  3   C
  4  NaN
  5  NaN
```

```
pandas == 0.23, < 1.1.0
In [1]: df.reindex(mi_2, method='pad')
Out[1]:
     c
0  -1  A
  0  NaN
  1   B
  3   C
  4  NaN
  5  NaN
```
Failed label-based lookups always raise KeyError

Label lookups series[key], series.loc[key] and frame.loc[key] used to raise either KeyError or TypeError depending on the type of key and type of Index. These now consistently raise KeyError (GH31867)

Previous behavior:

In [3]: ser1[1.5]
   ...: TypeError: cannot do label indexing on Int64Index with these indexers [1.5] of type float
In [4]: ser1["foo"]
   ...: KeyError: 'foo'
In [5]: ser1.loc[1.5]
   ...: TypeError: cannot do label indexing on Int64Index with these indexers [1.5] of type float
In [6]: ser1.loc["foo"]
   ...: KeyError: 'foo'
In [7]: ser2.loc[1]
   ...: TypeError: cannot do label indexing on DatetimeIndex with these indexers [1] of type int
In [8]: ser2.loc[pd.Timestamp(0)]
...: KeyError: Timestamp('1970-01-01 00:00:00')

New behavior:

In [3]: ser1[1.5]
...: KeyError: 1.5
In [4] ser1["foo"]
...: KeyError: 'foo'
In [5]: ser1.loc[1.5]
...: KeyError: 1.5
In [6]: ser1.loc["foo"]
...: KeyError: 'foo'
In [7]: ser2.loc[1]
...: KeyError: 1
In [8]: ser2.loc[pd.Timestamp(0)]
...: KeyError: Timestamp('1970-01-01 00:00:00')

Similarly, DataFrame.at() and Series.at() will raise a TypeError instead of a ValueError if an incompatible key is passed, and KeyError if a missing key is passed, matching the behavior of .loc[] (GH31722)

Failed Integer Lookups on MultiIndex Raise KeyError

Indexing with integers with a MultiIndex that has an integer-dtype first level incorrectly failed to raise KeyError when one or more of those integer keys is not present in the first level of the index (GH33539)

In [54]: idx = pd.Index(range(4))
In [55]: dti = pd.date_range("2000-01-03", periods=3)
In [56]: mi = pd.MultiIndex.from_product([idx, dti])
In [57]: ser = pd.Series(range(len(mi)), index=mi)

Previous behavior:

In [5]: ser[[5]]
Out[5]: Series([], dtype: int64)
New behavior:

```python
In [5]: ser[[5]]
...
KeyError: '[5] not in index'
```

**DataFrame.merge() preserves right frame’s row order**

`DataFrame.merge()` now preserves the right frame’s row order when executing a right merge (GH27453)

```python
In [58]: left_df = pd.DataFrame({'animal': ['dog', 'pig'],
                           'max_speed': [40, 11]})

In [59]: right_df = pd.DataFrame({'animal': ['quetzal', 'pig'],
                            'max_speed': [80, 11]})

In [60]: left_df
Out[60]:
animal max_speed
0  dog   40
1  pig   11
```

**Previous behavior:**

```python
>>> left_df.merge(right_df, on=['animal', 'max_speed'], how="right")
animal max_speed
0  pig   11
1 quetzal  80
```

**New behavior:**

```python
In [62]: left_df.merge(right_df, on=['animal', 'max_speed'], how="right")
Out[62]:
    animal max_speed
0  quetzal   80
1   pig  11
```
Assignment to multiple columns of a DataFrame when some columns do not exist

Assignment to multiple columns of a DataFrame when some of the columns do not exist would previously assign the values to the last column. Now, new columns will be constructed with the right values. (GH13658)

```
In [63]: df = pd.DataFrame({"a": [0, 1, 2], "b": [3, 4, 5]})

In [64]: df
Out[64]:
   a  b
0  0  3
1  1  4
2  2  5
```

Previous behavior:

```
In [3]: df["a", "c"] = 1
In [4]: df
Out[4]:
   a  b
0  1  1
1  1  1
2  1  1
```

New behavior:

```
In [65]: df["a", "c"] = 1
In [66]: df
Out:  
   a  b  c
0  1  3  1
1  1  4  1
2  1  5  1
```

Consistency across groupby reductions

Using DataFrame.groupby() with as_index=True and the aggregation nunique would include the grouping column(s) in the columns of the result. Now the grouping column(s) only appear in the index, consistent with other reductions. (GH32579)

```
In [67]: df = pd.DataFrame({"a": ["x", "x", "y", "y"], "b": [1, 1, 2, 3]})

In [68]: df
Out[68]:
   a  b
0  x  1
1  x  1
2  y  2
3  y  3
```

Previous behavior:
In [3]: df.groupby("a", as_index=True).nunique()
Out[4]:
    a  b
  a  x 1
  y 1 2

New behavior:

In [69]: df.groupby("a", as_index=True).nunique()
Out[69]:
    b
  a  x 1
  y 2

Using `Dataframe.groupby()` with `as_index=False` and the function `idxmax, idxmin, mad, nunique, sem, skew, or std` would modify the grouping column. Now the grouping column remains unchanged, consistent with other reductions. (GH21090, GH10355)

Previous behavior:

In [3]: df.groupby("a", as_index=False).nunique()
Out[4]:
    a  b
  0  x 1
  1 y 2

New behavior:

In [70]: df.groupby("a", as_index=False).nunique()
Out[70]:
    a  b
  0 x 1
  1 y 2

The method `size()` would previously ignore `as_index=False`. Now the grouping columns are returned as columns, making the result a `DataFrame` instead of a `Series`. (GH32599)

Previous behavior:

In [3]: df.groupby("a", as_index=False).size()
Out[4]:
    a
  x  2
  y  2
dtype: int64

New behavior:

In [71]: df.groupby("a", as_index=False).size()
Out[71]:
    a size
  0 x 2
  1 y 2
**agg() lost results with as_index=False when relabeling columns**

Previously `agg()` lost the result columns, when the `as_index` option was set to `False` and the result columns were relabeled. In this case the result values were replaced with the previous index (GH32240).

```python
In [72]: df = pd.DataFrame(
    ....:    {"key": ["x", "y", "z", "x", "y", "z"],
    ....:     "val": [1.0, 0.8, 2.0, 3.0, 3.6, 0.75]})

In [73]: df
Out[73]:
key  val
0 x  1.00
1 y  0.80
2 z  2.00
3 x  3.00
4 y  3.60
5 z  0.75

Previous behavior:

```python
In [2]: grouped = df.groupby("key", as_index=False)
In [3]: result = grouped.agg(min_val=pd.NamedAgg(column="val", aggfunc="min"))
In [4]: result
```

```text
min_val
0  x
1  y
2  z
```

New behavior:

```python
In [74]: grouped = df.groupby("key", as_index=False)
In [75]: result = grouped.agg(min_val=pd.NamedAgg(column="val", aggfunc="min"))
In [76]: result
```

```text
key  min_val
0  x  1.00
1  y  0.80
2  z  0.75
```

**apply and applymap on DataFrame evaluates first row/column only once**

```python
In [77]: df = pd.DataFrame({'a': [1, 2], 'b': [3, 6]})
In [78]: def func(row):
    ....:     print(row)
    ....:     return row
    ....:
```

Previous behavior:
In [4]: df.apply(func, axis=1)
a 1
b 3
Name: 0, dtype: int64
a 1
b 3
Name: 0, dtype: int64
a 2
b 6
Name: 1, dtype: int64
Out[4]:
a b
0 1 3
1 2 6

New behavior:

In [79]: df.apply(func, axis=1)
a 1
b 3
Name: 0, dtype: int64
a 2
b 6
Name: 1, dtype: int64
Out[79]:
a b
0 1 3
1 2 6

Backwards incompatible API changes

Added check_freq argument to testing.assert_frame_equal and testing.assert_series_equal

The check_freq argument was added to testing.assert_frame_equal() and testing.assert_series_equal() in pandas 1.1.0 and defaults to True. testing.assert_frame_equal() and testing.assert_series_equal() now raise AssertionError if the indexes do not have the same frequency. Before pandas 1.1.0, the index frequency was not checked.

Increased minimum versions for dependencies

Some minimum supported versions of dependencies were updated (GH33718, GH29766, GH29723, pytables >= 3.4.3). If installed, we now require:

<table>
<thead>
<tr>
<th>Package</th>
<th>Minimum Version</th>
<th>Required</th>
<th>Changed</th>
</tr>
</thead>
<tbody>
<tr>
<td>numpy</td>
<td>1.15.4</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>pytz</td>
<td>2015.4</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>python-dateutil</td>
<td>2.7.3</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>bottleneck</td>
<td>1.2.1</td>
<td></td>
<td></td>
</tr>
<tr>
<td>numexpr</td>
<td>2.6.2</td>
<td></td>
<td></td>
</tr>
<tr>
<td>pytest (dev)</td>
<td>4.0.2</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
For **optional libraries** the general recommendation is to use the latest version. The following table lists the lowest version per library that is currently being tested throughout the development of pandas. Optional libraries below the lowest tested version may still work, but are not considered supported.

<table>
<thead>
<tr>
<th>Package</th>
<th>Minimum Version</th>
<th>Changed</th>
</tr>
</thead>

See [Dependencies](https://pandas.pydata.org/docs/user_guide/installation.html) and [Optional dependencies](https://pandas.pydata.org/docs/user_guide/optional.html) for more.

**Development changes**

- The minimum version of Cython is now the most recent bug-fix version (0.29.16) ([GH33334](https://github.com/pandas-dev/pandas/issues/33334)).

**Deprecations**

- Lookups on a `Series` with a single-item list containing a slice (e.g. `ser[[slice(0, 4)]]`) are deprecated and will raise in a future version. Either convert the list to a tuple, or pass the slice directly instead ([GH31333](https://github.com/pandas-dev/pandas/issues/31333)).
- `DataFrame.mean()` and `DataFrame.median()` with `numeric_only=None` will include `datetime64` and `datetime64[tz]` columns in a future version ([GH29941](https://github.com/pandas-dev/pandas/issues/29941)).
- Setting values with `.loc` using a positional slice is deprecated and will raise in a future version. Use `.loc` with labels or `.iloc` with positions instead ([GH31840](https://github.com/pandas-dev/pandas/issues/31840)).
- `DataFrame.to_dict()` has deprecated accepting short names for `orient` and will raise in a future version ([GH32515](https://github.com/pandas-dev/pandas/issues/32515)).
- `Categorical.to_dense()` is deprecated and will be removed in a future version, use `np.asarray(cat)` instead ([GH32639](https://github.com/pandas-dev/pandas/issues/32639)).
- The `fastpath` keyword in the `SingleBlockManager` constructor is deprecated and will be removed in a future version ([GH33092](https://github.com/pandas-dev/pandas/issues/33092)).
- Providing `suffixes` as a set in `pandas.merge()` is deprecated. Provide a tuple instead ([GH33740](https://github.com/pandas-dev/pandas/issues/33740), [GH34741](https://github.com/pandas-dev/pandas/issues/34741)).
- Indexing a `Series` with a multi-dimensional indexer like `[:, None]` to return an `ndarray` now raises a `FutureWarning`. Convert to a NumPy array before indexing instead ([GH27837](https://github.com/pandas-dev/pandas/issues/27837)).
• `Index.is_mixed()` is deprecated and will be removed in a future version, check `index.inferred_type` directly instead (GH32922)

• Passing any arguments but the first one to `read_html()` as positional arguments is deprecated. All other arguments should be given as keyword arguments (GH27573).

• Passing any arguments but `path_or_buf` (the first one) to `read_json()` as positional arguments is deprecated. All other arguments should be given as keyword arguments (GH27573).

• Passing any arguments but the first two to `read_excel()` as positional arguments is deprecated. All other arguments should be given as keyword arguments (GH27573).

• `pandas.api.types.is_categorical()` is deprecated and will be removed in a future version; use `pandas.api.types.is_categorical_dtype()` instead (GH33385)

• `Index.get_value()` is deprecated and will be removed in a future version (GH19728)

• `Series.dt.week()` and `Series.dt.weekofyear()` are deprecated and will be removed in a future version, use `Series.dt.isocalendar().week()` instead (GH33595)

• `DatetimeIndex.week()` and `DatetimeIndex.weekofyear` are deprecated and will be removed in a future version, use `DatetimeIndex.isocalendar().week` instead (GH33595)

• `DatetimeArray.week()` and `DatetimeArray.weekofyear` are deprecated and will be removed in a future version, use `DatetimeArray.isocalendar().week` instead (GH33595)

• `DateOffset.__call__()` is deprecated and will be removed in a future version, use `offset + other` instead (GH34171)

• `apply_index()` is deprecated and will be removed in a future version. Use `offset + other` instead (GH34580)

• `DataFrame.tshift()` and `Series.tshift()` are deprecated and will be removed in a future version, use `DataFrame.shift()` and `Series.shift()` instead (GH11631)

• Indexing an `Index` object with a float key is deprecated, and will raise an `IndexError` in the future. You can manually convert to an integer key instead (GH34191).

• The `squeeze` keyword in `groupby()` is deprecated and will be removed in a future version (GH32380)

• The `tz` keyword in `Period.to_timestamp()` is deprecated and will be removed in a future version; use `per.to_timestamp(...).tz_localize(tz)` instead (GH34522)

• `DatetimeIndex.to_perioddelta()` is deprecated and will be removed in a future version. Use `index - index.to_period(freq).to_timestamp()` instead (GH34853)

• `DataFrame.melt()` accepting a `value_name` that already exists is deprecated, and will be removed in a future version (GH34731)

• The `center` keyword in the `DataFrame.expanding()` function is deprecated and will be removed in a future version (GH20647)
Performance improvements

- Performance improvement in Timedelta constructor (GH30543)
- Performance improvement in Timestamp constructor (GH30543)
- Performance improvement in flex arithmetic ops between DataFrame and Series with axis=0 (GH31296)
- Performance improvement in arithmetic ops between DataFrame and Series with axis=1 (GH33600)
- The internal index method _shallow_copy() now copies cached attributes over to the new index, avoiding creating these again on the new index. This can speed up many operations that depend on creating copies of existing indexes (GH28584, GH32640, GH32669)
- Significant performance improvement when creating a DataFrame with sparse values from scipy.sparse matrices using the DataFrame.sparse.from_spmatrix() constructor (GH32821, GH32825, GH32826, GH32856, GH32858).
- Performance improvement for groupby methods first() and last() (GH34178)
- Performance improvement in factorize() for nullable (integer and Boolean) dtypes (GH33064).
- Performance improvement when constructing Categorical objects (GH33921)
- Fixed performance regression in pandas.qcut() and pandas.cut() (GH33921)
- Performance improvement in reductions (sum, prod, min, max) for nullable (integer and Boolean) dtypes (GH30982, GH33261, GH33442).
- Performance improvement in arithmetic operations between two DataFrame objects (GH32779)
- Performance improvement in pandas.core.groupby.RollingGroupby (GH34052)
- Performance improvement in arithmetic operations (sub, add, mul, div) for MultiIndex (GH34297)
- Performance improvement in DataFrame[bool_indexer] when bool_indexer is a list (GH33924)
- Significant performance improvement of io.formats.style.Styler.render() with styles added with various ways such as io.formats.style.Styler.apply(), io.formats.style.Styler.applymap() or io.formats.style.Styler.bar() (GH19917)

Bug fixes

Categorical

- Passing an invalid fill_value to Categorical.take() raises a ValueError instead of TypeError (GH33660)
- Combining a Categorical with integer categories and which contains missing values with a float dtype column in operations such as concat() or append() will now result in a float column instead of an object dtype column (GH33607)
- Bug where merge() was unable to join on non-unique categorical indices (GH28189)
- Bug when passing categorical data to Index constructor along with dtype=object incorrectly returning a CategoricalIndex instead of object-dtype Index (GH32167)
- Bug where Categorical comparison operator __ne__ would incorrectly evaluate to False when either element was missing (GH32276)
- Categorical.fillna() now accepts Categorical other argument (GH32420)
- Repr of Categorical was not distinguishing between int and str (GH33676)
Datetimelike

- Passing an integer dtype other than int64 to np.array(period_index, dtype=...) will now raise TypeError instead of incorrectly using int64 (GH32255)
- Series.to_timestamp() now raises a TypeError if the axis is not a PeriodIndex. Previously an AttributeError was raised (GH33327)
- Series.to_period() now raises a TypeError if the axis is not a DatetimeIndex. Previously an AttributeError was raised (GH33327)
- Period no longer accepts tuples for the freq argument (GH34658)
- Bug in Timestamp where constructing a Timestamp from ambiguous epoch time and calling constructor again changed the Timestamp.value() property (GH24329)
- DatetimeArray.searchsorted(), TimedeltaArray.searchsorted(), PeriodArray.searchsorted() not recognizing non-pandas scalars and incorrectly raising ValueError instead of TypeError (GH30950)
- Bug in Timestamp where constructing Timestamp with dateutil timezone less than 128 nanoseconds before daylight saving time switch from winter to summer would result in nonexistent time (GH31043)
- Bug in Period.to_timestamp(), Period.start_time() with microsecond frequency returning a timestamp one nanosecond earlier than the correct time (GH31475)
- Timestamp raised a confusing error message when year, month or day is missing (GH31200)
- Bug in DatetimeIndex constructor incorrectly accepting bool-dtype inputs (GH32668)
- Bug in DatetimeIndex.searchsorted() not accepting a list or Series as its argument (GH32762)
- Bug where PeriodIndex() raised when passed a Series of strings (GH26109)
- Bug in Timestamp arithmetic when adding or subtracting an np.ndarray with timedelta64 dtype (GH33296)
- Bug in DatetimeIndex.to_period() not inferring the frequency when called with no arguments (GH33358)
- Bug in DatetimeIndex.tz_localize() incorrectly retaining freq in some cases where the original freq is no longer valid (GH30511)
- Bug in DatetimeIndex.intersection() losing freq and timezone in some cases (GH33604)
- Bug in DatetimeIndex.get_indexer() where incorrect output would be returned for mixed datetime-like targets (GH33741)
- Bug in DatetimeIndex addition and subtraction with some types of DateOffset objects incorrectly retaining an invalid freq attribute (GH33779)
- Bug in DatetimeIndex where setting the freq attribute on an index could silently change the freq attribute on another index viewing the same data (GH33552)
- DataFrame.min() and DataFrame.max() were not returning consistent results with Series.min() and Series.max() when called on objects initialized with empty pd.to_datetime() (GH33904)
- Bug in DatetimeIndex.intersection() and TimedeltaIndex.intersection() with results not having the correct name attribute (GH33904)
- Bug in DatetimeArray.__setitem__(). TimedeltaArray.__setitem__(). PeriodArray.__setitem__() incorrectly allowing values with int64 dtype to be silently cast (GH33717)
- Bug in subtracting TimedeltaIndex from Period incorrectly raising TypeError in some cases where it should succeed and IncompatibleFrequency in some cases where it should raise TypeError (GH33883)
- Bug in constructing a Series or Index from a read-only NumPy array with non-ns resolution which converted to object dtype instead of coercing to datetime64[ns] dtype when within the timestamp bounds (GH34843).
• The freq keyword in `Period`, `date_range()`, `period_range()`, `pd.tseries.frequencies.to_offset()` no longer allows tuples, pass as string instead (GH34703)
• Bug in `DataFrame.append()` when appending a `Series` containing a scalar tz-aware `Timestamp` to an empty `DataFrame` resulted in an object column instead of `datetime64[ns, tz]` dtype (GH35038)
• `OutOfBoundsDatetime` issues an improved error message when timestamp is out of implementation bounds. (GH32967)
• Bug in `AbstractHolidayCalendar.holidays()` when no rules were defined (GH31415)
• Bug in `Tick` comparisons raising `TypeError` when comparing against timedelta-like objects (GH34088)
• Bug in `Tick` multiplication raising `TypeError` when multiplying by a float (GH34486)

**Timedelta**

• Bug in constructing a `Timedelta` with a high precision integer that would round the `Timedelta` components (GH31354)
• Bug in dividing `np.nan` or `None` by `Timedelta` incorrectly returning `NaT` (GH31869)
• `Timedelta` now understands µs as an identifier for microsecond (GH32899)
• `Timedelta` string representation now includes nanoseconds, when nanoseconds are non-zero (GH9309)
• Bug in comparing a `Timedelta` object against an `np.ndarray` with `timedelta64` dtype incorrectly viewing all entries as unequal (GH34441)
• Bug in `timedelta_range()` that produced an extra point on a edge case (GH30353, GH33498)
• Bug in `DataFrame.resample()` that produced an extra point on a edge case (GH30353, GH13022, GH33498)
• Bug in `DataFrame.resample()` that ignored the `loffset` argument when dealing with timedelta (GH7687, GH33498)
• Bug in `Timedelta` and `pandas.to_timedelta()` that ignored the `unit` argument for string input (GH12136)

**Timezones**

• Bug in `to_datetime()` with `infer_datetime_format=True` where timezone names (e.g. UTC) would not be parsed correctly (GH33133)

**Numeric**

• Bug in `DataFrame.floordiv()` with `axis=0` not treating division-by-zero like `Series.floordiv()` (GH31271)
• Bug in `to_numeric()` with string argument "uint64" and `errors="coerce"` silently fails (GH32394)
• Bug in `to_numeric()` with `downcast="unsigned"` fails for empty data (GH32493)
• Bug in `DataFrame.mean()` with `numeric_only=False` and either `datetime64` dtype or `PeriodDtype` column incorrectly raising `TypeError` (GH32426)
• Bug in `DataFrame.count()` with `level="foo"` and index level "foo" containing NaNs causes segmentation fault (GH21824)
• Bug in `DataFrame.diff()` with `axis=1` returning incorrect results with mixed dtypes (GH32995)
• Bug in `DataFrame.corr()` and `DataFrame.cov()` raising when handling nullable integer columns with `pandas.NA` (GH33803)

• Bug in arithmetic operations between `DataFrame` objects with non-overlapping columns with duplicate labels causing an infinite loop (GH35194)

• Bug in `DataFrame` and `Series` addition and subtraction between object-dtype objects and `datetime64` dtype objects (GH33824)

• Bug in `Index.difference()` giving incorrect results when comparing a `Float64Index` and object `Index` (GH35217)

• Bug in `DataFrame` reductions (e.g. `df.min()`, `df.max()`) with `ExtensionArray` dtypes (GH34520, GH32651)

• `Series.interpolate()` and `DataFrame.interpolate()` now raise a `ValueError` if `limit_direction` is 'forward' or 'both' and method is 'backfill' or 'bfill' or `limit_direction` is 'backward' or 'both' and method is 'pad' or 'ffill' (GH34746)

**Conversion**

• Bug in `Series` construction from NumPy array with big-endian `datetime64` dtype (GH29684)

• Bug in `Timedelta` construction with large nanoseconds keyword value (GH32402)

• Bug in `DataFrame` construction where sets would be duplicated rather than raising (GH32582)

• The `DataFrame` constructor no longer accepts a list of `DataFrame` objects. Because of changes to NumPy, `DataFrame` objects are now consistently treated as 2D objects, so a list of `DataFrame` objects is considered 3D, and no longer acceptable for the `DataFrame` constructor (GH32289).

• Bug in `DataFrame` when initiating a frame with lists and assign columns with nested list for `MultiIndex` (GH32173)

• Improved error message for invalid construction of list when creating a new index (GH35190)

**Strings**

• Bug in the `astype()` method when converting “string” dtype data to nullable integer dtype (GH32450).

• Fixed issue where taking `min` or `max` of a `StringArray` or `Series` with `StringDtype` type would raise. (GH31746)

• Bug in `Series.str.cat()` returning NaN output when other had `Index` type (GH33425)

• `pandas.api.dtypes.is_string_dtype()` no longer incorrectly identifies categorical series as string.

**Interval**

• Bug in `IntervalArray` incorrectly allowing the underlying data to be changed when setting values (GH32782)
Indexing

- `DataFrame.xs()` now raises a `TypeError` if a level keyword is supplied and the axis is not a `MultiIndex`. Previously an `AttributeError` was raised (GH33610)
- Bug in slicing on a `DatetimeIndex` with a partial-timestamp dropping high-resolution indices near the end of a year, quarter, or month (GH31064)
- Bug in `PeriodIndex.get_loc()` treating higher-resolution strings differently from `PeriodIndex.get_value()` (GH31172)
- Bug in `Series.at()` and `DataFrame.at()` not matching `.loc` behavior when looking up an integer in a `Float64Index` (GH31329)
- Bug in `PeriodIndex.is_monotonic()` incorrectly returning `True` when containing leading `NaT` entries (GH31437)
- Bug in `DatetimeIndex.get_loc()` raising `KeyError` with converted-integer key instead of the user-passed key (GH31425)
- Bug in `Series.xs()` incorrectly returning `Timestamp` instead of `datetime64` in some object-dtype cases (GH31630)
- Bug in `DataFrame.iat()` incorrectly returning `Timestamp` instead of `datetime` in some object-dtype cases (GH32809)
- Bug in `DataFrame.at()` when either columns or index is non-unique (GH33041)
- Bug in `Series.loc()` and `DataFrame.loc()` when indexing with an integer key on a object-dtype `Index` that is not all-integers (GH31905)
- Bug in `DataFrame.iloc.__setitem__()` on a `DataFrame` with duplicate columns incorrectly setting values for all matching columns (GH15686, GH2036)
- Bug in `DataFrame.loc()` and `Series.loc()` with a `DatetimeIndex`, `TimedeltaIndex`, or `PeriodIndex` incorrectly allowing lookups of non-matching datetime-like dtypes (GH32650)
- Bug in `Series.__getitem__()` indexing with non-standard scalars, e.g. `np.dtype` (GH32684)
- Bug in `Index` constructor where an unhelpful error message was raised for NumPy scalars (GH33017)
- Bug in `DataFrame.lookup()` incorrectly raising an `AttributeError` when `frame.index` or `frame.columns` is not unique; this will now raise a `ValueError` with a helpful error message (GH33041)
- Bug in `Interval` where a `Timedelta` could not be added or subtracted from a `Timestamp` interval (GH32023)
- Bug in `DataFrame.copy()` not invalidating `_item_cache` after copy caused post-copy value updates to not be reflected (GH31784)
- Fixed regression in `DataFrame.loc()` and `Series.loc()` throwing an error when a datetime64[ns, tz] value is provided (GH32959)
- Bug in `Series.__getitem__()` with an integer key and a `MultiIndex` with leading integer level failing to raise `KeyError` if the key is not present in the first level (GH33555)
- Bug in `DataFrame.iloc()` when slicing a single column `DataFrame` with `ExtensionDtype` (e.g. `df.iloc[:, :1]`) returning an invalid result (GH32957)
- Bug in `DatetimeIndex.insert()` and `TimedeltaIndex.insert()` causing index `freq` to be lost when setting an element into an empty `Series` (GH33573)
- Bug in `Series.__setitem__()` with an `IntervalIndex` and a list-like key of integers (GH33473)
- Bug in `Series.__getitem__()` allowing missing labels with `np.ndarray`, `Index`, `Series` indexers but not list, these now all raise `KeyError` (GH33646)
• Bug in `DataFrame.truncate()` and `Series.truncate()` where index was assumed to be monotone increasing (GH33756)

• Indexing with a list of strings representing datetimes failed on `DatetimeIndex` or `PeriodIndex` (GH11278)

• Bug in `Series.at()` when used with a `MultiIndex` would raise an exception on valid inputs (GH26989)

• Bug in `DataFrame.loc()` with dictionary of values changes columns with dtype of `int` to `float` (GH34573)

• Bug in `Series.loc()` when used with a `MultiIndex` would raise an `IndexingError` when accessing a `None` value (GH34318)

• Bug in `DataFrame.reset_index()` and `Series.reset_index()` would not preserve data types on an empty `DataFrame` or `Series` with a `MultiIndex` (GH19602)

• Bug in `Series` and `DataFrame` indexing with a `time` key on a `DatetimeIndex` with `NaT` entries (GH35114)

Missing

• Calling `fillna()` on an empty `Series` now correctly returns a shallow copied object. The behaviour is now consistent with `Index`, `DataFrame` and a non-empty `Series` (GH32543).

• Bug in `Series.replace()` when argument `to_replace` is of type dict/list and is used on a `Series` containing `<NA>` was raising a `TypeError`. The method now handles this by ignoring `<NA>` values when doing the comparison for the replacement (GH32621)

• Bug in `any()` and `all()` incorrectly returning `<NA>` for all False or all True values using the nullable Boolean dtype and with `skipna=False` (GH3253)

• Clarified documentation on interpolate with method=akima. The `der` parameter must be scalar or `None` (GH33426)

• `DataFrame.interpolate()` uses the correct axis convention now. Previously interpolating along columns lead to interpolation along indices and vice versa. Furthermore interpolating with methods pad, ffill, bfill and backfill are identical to using these methods with `DataFrame.fillna()` (GH12918, GH29146)

• Bug in `DataFrame.interpolate()` when called on a `DataFrame` with column names of string type was throwing a `ValueError`. The method is now independent of the type of the column names (GH33956)

• Passing NA into a format string using format specs will now work. For example `{:.1f}`.format(pd.NA) would previously raise a `ValueError`, but will now return the string "<NA>" (GH34740)

• Bug in `Series.map()` not raising on invalid `na_action` (GH32815)

MultiIndex

• `DataFrame.swaplevels()` now raises a `TypeError` if the axis is not a `MultiIndex`. Previously an `AttributeError` was raised (GH31126)

• Bug in `DataFrame.loc()` when used with a `MultiIndex`. The returned values were not in the same order as the given inputs (GH22797)

```python
In [80]: df = pd.DataFrame(np.arange(4),
    index=["a", "a", "b", "b"], [1, 2, 1, 2])

In [81]: df.loc[['b', 'a'], [2, 1], :]
```

(continues on next page)
Out[81]:

<table>
<thead>
<tr>
<th></th>
<th>b</th>
<th>2</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>b</td>
<td>2</td>
<td>3</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>2</td>
<td></td>

<td>0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- Bug in `MultiIndex.intersection()` was not guaranteed to preserve order when `sort=False`. (GH31325)
- Bug in `DataFrame.truncate()` was dropping `MultiIndex` names. (GH34564)

```python
In [82]: left = pd.MultiIndex.from_arrays([['b', 'a'], [2, 1]])
In [83]: right = pd.MultiIndex.from_arrays([['a', 'b', 'c'], [1, 2, 3]])

# Common elements are now guaranteed to be ordered by the left side
In [84]: left.intersection(right, sort=False)
```

Out[84]:
```
MultiIndex([('b', 2),
             ('a', 1)],
            names=['b', 'a'])
```

- Bug when joining two `MultiIndex` without specifying level with different columns. Return-indexers parameter was ignored. (GH34074)

**IO**

- Passing a set as names argument to `pandas.read_csv()`, `pandas.read_table()`, or `pandas.read_fwf()` will raise `ValueError`: Names should be an ordered collection. (GH34946)
- Bug in print-out when `display.precision` is zero. (GH20359)
- Bug in `read_json()` where integer overflow was occurring when json contains big number strings. (GH30320)
- `read_csv()` will now raise a `ValueError` when the arguments `header` and `prefix` both are not `None`. (GH27394)
- Bug in `DataFrame.to_json()` was raising `NotFoundError` when `path_or_buf` was an S3 URI (GH28375)
- Bug in `DataFrame.to_parquet()` overwriting pyarrow's default for `coerce_timestamps`; following pyarrow's default allows writing nanosecond timestamps with version="2.0" (GH31652).
- Bug in `read_json()` was raising `TypeError` when `sep=None` was used in combination with `comment` keyword (GH31396)
- Bug in HDFStore that caused it to set to int64 the dtype of a datetime64 column when reading a `DataFrame` in Python 3 from fixed format written in Python 2 (GH31750)
- `read_sas()` now handles dates and datetimes larger than `Timestamp.max` returning them as `datetime.datetime` objects (GH20927)
- Bug in `DataFrame.to_json()` where Timedelta objects would not be serialized correctly with `date_format="iso"` (GH28256)
- `read_csv()` will raise a `ValueError` when the column names passed in `parse_dates` are missing in the Dataframe (GH31251)
- Bug in `read_excel()` where a UTF-8 string with a high surrogate would cause a segmentation violation (GH23809)
- Bug in `read_csv()` was causing a file descriptor leak on an empty file (GH31488)
- Bug in `read_csv()` was causing a segfault when there were blank lines between the header and data rows (GH28071)
- Bug in `read_csv()` was raising a misleading exception on a permissions issue (GH23784)
- Bug in `read_csv()` was raising an `IndexError` when `header=None` and two extra data columns
- Bug in `read_sas()` was raising an `AttributeError` when reading files from Google Cloud Storage (GH33069)
- Bug in `DataFrame.to_sql()` where an `AttributeError` was raised when saving an out of bounds date (GH26761)
- Bug in `read_excel()` did not correctly handle multiple embedded spaces in OpenDocument text cells. (GH32207)
- Bug in `read_json()` was raising `TypeError` when reading a list of Booleans into a `Series`. (GH31464)
- Bug in `pandas.io.json.json_normalize()` where location specified by `record_path` doesn’t point to an array. (GH26284)
- `pandas.read_hdf()` has a more explicit error message when loading an unsupported HDF file (GH9539)
- Bug in `read_feather()` was raising an `ArrowIOError` when reading an s3 or http file path (GH29055)
- Bug in `to_excel()` could not handle the column name `render` and was raising an `KeyError` (GH34331)
- Bug in `execute()` was raising a `ProgrammingError` for some DB-API drivers when the SQL statement contained the `%` character and no parameters were present (GH34211)
- Bug in `StataReader()` which resulted in categorical variables with different dtypes when reading data using an iterator. (GH31544)
- `HDFStore.keys()` has now an optional `include` parameter that allows the retrieval of all native HDF5 table names (GH29916)
- `TypeError` exceptions raised by `read_csv()` and `read_table()` were showing as `parser_f` when an unexpected keyword argument was passed (GH25648)
- Bug in `read_excel()` for ODS files removes 0.0 values (GH27222)
- Bug in `ujson.encode()` was raising an `OverflowError` with numbers larger than `sys.maxsize` (GH34395)
- Bug in `HDFStore.append_to_multiple()` was raising a `ValueError` when the `min_itemsize` parameter is set (GH11238)
- Bug in `create_table()` now raises an error when column argument was not specified in `data_columns` on input (GH28156)
- `read_json()` now could read line-delimited json file from a file url while `lines` and `chunksize` are set.
- Bug in `DataFrame.to_sql()` when reading DataFrames with `-np.inf` entries with MySQL now has a more explicit `ValueError` (GH34431)
- Bug where capitalised files extensions were not decompressed by `read_*` functions (GH35164)
- Bug in `read_excel()` that was raising a `TypeError` when `header=None` and `index_col` is given as a list (GH31783)
- Bug in `read_excel()` where datetime values are used in the header in a `MultiIndex` (GH34748)
pandas: powerful Python data analysis toolkit, Release 1.3.5

- **read_excel()** no longer takes **kwds arguments. This means that passing in the keyword argument chunksize now raises a **TypeError** (previously raised a **NotImplementedError**), while passing in the keyword argument encoding now raises a **TypeError** (GH34464)

- Bug in DataFrame.to_records() was incorrectly losing timezone information in timezone-aware datetime64 columns (GH32535)

**Plotting**

- DataFrame.plot() for line/bar now accepts color by dictionary (GH8193).
- Bug in DataFrame.plot.hist() where weights are not working for multiple columns (GH33173)
- Bug in DataFrame.boxplot() and DataFrame.plot.boxplot() lost color attributes of medianprops, whiskerprops, capprops and boxprops (GH30346)
- Bug in DataFrame.hist() where the order of column argument was ignored (GH29235)
- Bug in DataFrame.plot.scatter() that when adding multiple plots with different cmap, colorbars always use the first cmap (GH33389)
- Bug in DataFrame.plot.scatter() was adding a colorbar to the plot even if the argument c was assigned to a column containing color names (GH34316)
- Bug in pandas.plotting.bootstrap_plot() was causing cluttered axes and overlapping labels (GH34905)
- Bug in DataFrame.plot.scatter() caused an error when plotting variable marker sizes (GH32904)

**GroupBy/resample/rolling**

- Using a pandas.api.indexers.BaseIndexer with count, min, max, median, skew, cov, corr will now return correct results for any monotonic pandas.api.indexers.BaseIndexer descendant (GH32865)
- DataFrameGroupBy.mean() and SeriesGroupBy.mean() (and similarly for median(), std() and var()) now raise a **TypeError** if a non-accepted keyword argument is passed into it. Previously an UnsupportedFunctionCall was raised (AssertionError if min_count passed into median()) (GH31485)
- Bug in GroupBy.apply() raises ValueError when the by axis is not sorted, has duplicates, and the applied func does not mutate passed in objects (GH30667)
- Bug in DataFrameGroupBy.transform() produces an incorrect result with transformation functions (GH30918)
- Bug in GroupBy.transform() was returning the wrong result when grouping by multiple keys of which some were categorical and others not (GH32494)
- Bug in GroupBy.count() causes segmentation fault when grouped-by columns contain NaNs (GH32841)
- Bug in DataFrame.groupby() and Series.groupby() produces inconsistent type when aggregating Boolean Series (GH32894)
- Bug in DataFrameGroupBy.sum() and SeriesGroupBy.sum() where a large negative number would be returned when the number of non-null values was below min_count for nullable integer dtypes (GH32861)
- Bug in SeriesGroupBy.quantile() was raising on nullable integers (GH33136)
- Bug in DataFrame.resample() where an **AmbiguousTimeError** would be raised when the resulting timezone aware DatetimeIndex had a DST transition at midnight (GH25758)
- Bug in DataFrame.groupby() where a **ValueError** would be raised when grouping by a categorical column with read-only categories and sort=False (GH33410)
- Bug in `GroupBy.agg()`, `GroupBy.transform()`, and `GroupBy.resample()` where subclasses are not preserved (GH28330)
- Bug in `SeriesGroupBy.agg()` where any column name was accepted in the named aggregation of `SeriesGroupBy` previously. The behaviour now allows only `str` and callables else would raise `TypeError` (GH34422)
- Bug in `DataFrame.groupby()` lost the name of the `Index` when one of the `agg` keys referenced an empty list (GH32580)
- Bug in `Rolling.apply()` where `center=True` was ignored when `engine='numba'` was specified (GH34784)
- Bug in `DataFrame.ewm.cov()` was throwing `AssertionError` for `MultiIndex` inputs (GH34440)
- Bug in `core.groupby.DataFrameGroupBy.quantile()` raised `TypeError` for non-numeric types rather than dropping the columns (GH27892)
- Bug in `core.groupby.DataFrameGroupBy.transform()` when `func='nunique'` and columns are of type `datetime64`, the result would also be of type `datetime64` instead of `int64` (GH35109)
- Bug in `DataFrame.groupby()` raising an `AttributeError` when selecting a column and aggregating with `as_index=False` (GH35246)
- Bug in `DataFrameGroupBy.first()` and `DataFrameGroupBy.last()` that would raise an unnecessary `ValueError` when grouping on multiple Categoricals (GH34951)

**Reshaping**

- Bug effecting all numeric and Boolean reduction methods not returning subclassed data type. (GH25596)
- Bug in `DataFrame.pivot_table()` when only `MultiIndexed` columns is set (GH17038)
- Bug in `DataFrame.unstack()` and `Series.unstack()` can take tuple names in `MultiIndexed` data (GH19966)
- Bug in `DataFrame.pivot_table()` when `margin` is `True` and only `column` is defined (GH31016)
- Fixed incorrect error message in `DataFrame.pivot()` when `columns` is set to `None`. (GH30924)
- Bug in `crosstab()` when inputs are two `Series` and have tuple names, the output will keep a dummy `MultiIndex` as columns. (GH18321)
- `DataFrame.pivot()` can now take lists for `index` and `columns` arguments (GH21425)
- Bug in `concat()` where the resulting indices are not copied when `copy=True` (GH29879)
- Bug in `SeriesGroupBy.aggregate()` was resulting in aggregations being overwritten when they shared the same name (GH30484)
- Bug where `Index.astype()` would lose the name attribute when converting from `Float64Index` to `Int64Index`, or when casting to an `ExtensionArray` dtype (GH32013)
- `Series.append()` will now raise a `TypeError` when passed a `DataFrame` or a sequence containing `DataFrame` (GH31413)
- `DataFrame.replace()` and `Series.replace()` will raise a `TypeError` if `to_replace` is not an expected type. Previously the `replace` would fail silently (GH18634)
- Bug on inplace operation of a `Series` that was adding a column to the `DataFrame` from where it was originally dropped from (using `inplace=True`) (GH30484)
- Bug in `DataFrame.apply()` where callback was called with `Series` parameter even though `raw=True` requested. (GH32423)
• Bug in `DataFrame.pivot_table()` losing timezone information when creating a `MultiIndex` level from a column with timezone-aware dtype (GH32558)

• Bug in `concat()` where when passing a non-dict mapping as `objs` would raise a `TypeError` (GH32863)

• `DataFrame.agg()` now provides more descriptive `SpecificationError` message when attempting to aggregate a non-existent column (GH32755)

• Bug in `DataFrame.unstack()` when `MultiIndex` columns and `MultiIndex` rows were used (GH32624, GH24729 and GH28306)

• Appending a dictionary to a `DataFrame` without passing `ignore_index=True` will raise `TypeError`: Can only append a dict if `ignore_index=True` or if the :class:`Series` has a name (GH30871)

• Bug in `DataFrame.corrwith()`, `DataFrame.memory_usage()`, `DataFrame.dot()`, `DataFrame.idxmin()`, `DataFrame.idxmax()`, `DataFrame.duplicated()`, `DataFrame.isin()`, `DataFrame.count()`, `Series.explode()`, `Series.asof()` and `DataFrame.asof()` not returning subclassed types. (GH31331)

• Bug in `concat()` was not allowing for concatenation of `DataFrame` and `Series` with duplicate keys (GH33654)

• Bug in `cut()` raised an error when the argument `labels` contains duplicates (GH33141)

• Ensure only named functions can be used in `eval` (GH32460)

• Bug in `Dataframe.aggregate()` and `Series.aggregate()` was causing a recursive loop in some cases (GH33244)

• Fixed bug in `melt()` where melting `MultiIndex` columns with `col_level > 0` would raise a `KeyError` on `id_vars` (GH34129)

• Bug in `Series.where()` with an empty `Series` and empty `cond` having non-bool dtype (GH34592)

• Fixed regression where `DataFrame.apply()` would raise `ValueError` for elements with `S` dtype (GH34529)

**Sparse**

• Creating a `SparseArray` from timezone-aware dtype will issue a warning before dropping timezone information, instead of doing so silently (GH32501)

• Bug in `arrays.SparseArray.from_spmatrix()` wrongly read scipy sparse matrix (GH31991)

• Bug in `Series.sum()` with `SparseArray` raised a `TypeError` (GH25777)

• Bug where `DataFrame` containing an all-sparse `SparseArray` filled with NaN when indexed by a list-like (GH27781, GH29563)

• The repr of `SparseDtype` now includes the repr of its `fill_value` attribute. Previously it used `fill_value`'s string representation (GH34352)

• Bug where empty `DataFrame` could not be cast to `SparseDtype` (GH33113)

• Bug in `arrays.SparseArray()` was returning the incorrect type when indexing a sparse dataframe with an iterable (GH34526, GH34540)
ExtensionArray

- Fixed bug where `Series.value_counts()` would raise on empty input of Int64 dtype (GH33317)
- Fixed bug in `concat()` when concatenating `DataFrame` objects with non-overlapping columns resulting in object-dtype columns rather than preserving the extension dtype (GH27692, GH33027)
- Fixed bug where `StringArray.isna()` would return False for NA values when `pandas.options.mode.use_inf_as_na` was set to True (GH33655)
- Fixed bug in `Series` construction with EA dtype and index but no data or scalar data fails (GH26469)
- Fixed bug that caused `Series.__repr__()` to crash for extension types whose elements are multidimensional arrays (GH33770).
- Fixed bug where `Series.update()` would raise a ValueError for ExtensionArray dtypes with missing values (GH33980)
- Fixed bug where `StringArray.memory_usage()` was not implemented (GH33963)
- Fixed bug where `DataFrameGroupBy()` would ignore the min_count argument for aggregations on nullable Boolean dtypes (GH34051)
- Fixed bug where the constructor of `DataFrame` with dtype='string' would fail (GH27953, GH33623)
- Bug where `DataFrame` column set to scalar extension type was considered an object type rather than the extension type (GH34832)
- Fixed bug in `IntegerArray.astype()` to correctly copy the mask as well (GH34931).

Other

- Set operations on an object-dtype `Index` now always return object-dtype results (GH31401)
- Fixed `pandas.testing.assert_series_equal()` to correctly raise if the left argument is a different subclass with check_series_type=True (GH32670).
- Getting a missing attribute in a `DataFrame.query()` or `DataFrame.eval()` string raises the correct AttributeError (GH32408)
- Fixed bug in `pandas.testing.assert_series_equal()` where dtypes were checked for Interval and ExtensionArray operands when check_dtype was False (GH32747)
- Bug in `DataFrame.__dir__()` caused a segfault when using unicode surrogates in a column name (GH25509)
- Bug in `DataFrame.equals()` and `Series.equals()` in allowing subclasses to be equal (GH34402).

5.4 Version 1.0

5.4.1 What’s new in 1.0.5 (June 17, 2020)

These are the changes in pandas 1.0.5. See Release notes for a full changelog including other versions of pandas.

Fixed regressions

- Fix regression in `read_parquet()` when reading from file-like objects (GH34467).
- Fix regression in reading from public S3 buckets (GH34626).

Note this disables the ability to read Parquet files from directories on S3 again (GH26388, GH34632), which was added in the 1.0.4 release, but is now targeted for pandas 1.1.0.

- Fixed regression in `replace()` raising an `AssertionError` when replacing values in an extension dtype with values of a different dtype (GH34530)

Bug fixes

- Fixed building from source with Python 3.8 fetching the wrong version of NumPy (GH34666)

Contributors

A total of 8 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

5.4.2 What’s new in 1.0.4 (May 28, 2020)

These are the changes in pandas 1.0.4. See Release notes for a full changelog including other versions of pandas.

Fixed regressions

• Fix regression where `Series.isna()` and `DataFrame.isna()` would raise for categorical dtype when `pandas.options.mode.use_inf_as_na` was set to True (GH33594)
• Fix regression in `GroupBy.first()` and `GroupBy.last()` where None is not preserved in object dtype (GH32800)
• Fix regression in DataFrame reductions using numeric_only=True and ExtensionArrays (GH33256).
• Fix performance regression in `memory_usage(deep=True)` for object dtype (GH33012)
• Fix regression where `Categorical.replace()` would replace with NaN whenever the new value and replacement value were equal (GH33288)
• Fix regression where an ordered `Categorical` containing only NaN values would raise rather than returning NaN when taking the minimum or maximum (GH33450)
• Fix regression in `DataFrameGroupBy.agg()` with dictionary input losing ExtensionArray dtypes (GH32194)
• Fix to preserve the ability to index with the “nearest” method with xarray’s CFTimeIndex, an `Index` subclass (pydata/xarray#3751, GH32905).
• Fix regression in `DataFrame.describe()` raising TypeError: unhashable type: 'dict' (GH32409)
• Fix regression in `DataFrame.replace()` casts columns to object dtype if items in `to_replace` not in values (GH32988)
• Fix regression in `Series.groupby()` would raise ValueError when grouping by `PeriodIndex` level (GH34010)
• Fix regression in `GroupBy.rolling.apply()` ignores args and kwargs parameters (GH33433)
• Fix regression in error message with `np.min` or `np.max` on unordered `Categorical` (GH33115)
• Fix regression in `DataFrame.loc()` and `Series.loc()` throwing an error when a datetime64[ns, tz] value is provided (GH32935)

Bug fixes

• Bug in `SeriesGroupBy.first()`, `SeriesGroupBy.last()`, `SeriesGroupBy.min()`, and `SeriesGroupBy.max()` returning floats when applied to nullable Booleans (GH33071)
• Bug in `Rolling.min()` and `Rolling.max()`: Growing memory usage after multiple calls when using a fixed window (GH30726)
• Bug in `to_parquet()` was not raising `PermissionError` when writing to a private s3 bucket with invalid creds. (GH27679)
• Bug in `to_csv()` was silently failing when writing to an invalid s3 bucket. (GH32486)
• Bug in `read_parquet()` was raising a `FileNotFoundException` when passed an s3 directory path. (GH26388)
• Bug in `to_parquet()` was throwing an `AttributeError` when writing a partitioned parquet file to s3 (GH27596)
• Bug in `GroupBy.quantile()` causes the quantiles to be shifted when the by axis contains NaN (GH33200, GH33569)

5.4. Version 1.0

5.4.3 What’s new in 1.0.3 (March 17, 2020)

These are the changes in pandas 1.0.3. See Release notes for a full changelog including other versions of pandas.

Fixed regressions

- Fixed regression in `resample.agg` when the underlying data is non-writeable (GH31710)
- Fixed regression in `DataFrame` exponentiation with reindexing (GH32685)

Bug fixes

Contributors

A total of 5 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

- MeeseeksMachine
- Pandas Development Team
- Tom Augspurger
5.4.4 What's new in 1.0.2 (March 12, 2020)

These are the changes in pandas 1.0.2. See Release notes for a full changelog including other versions of pandas.

Fixed regressions

**Groupby**

- Fixed regression in `groupby(..).agg()` which was failing on frames with `MultiIndex` columns and a custom function (GH31777)
- Fixed regression in `groupby(..).rolling(..).apply()` (RollingGroupby) where the `raw` parameter was ignored (GH31754)
- Fixed regression in `rolling(..).corr()` when using a time offset (GH31789)
- Fixed regression in `groupby(..).nunique()` which was modifying the original values if NaN values were present (GH31950)
- Fixed regression in `DataFrame.groupby` raising a `ValueError` from an internal operation (GH31802)
- Fixed regression in `groupby(..).agg()` calling a user-provided function an extra time on an empty input (GH31760)

**I/O**

- Fixed regression in `read_csv()` in which the `encoding` option was not recognized with certain file-like objects (GH31819)
- Fixed regression in `DataFrame.to_excel()` when the `columns` keyword argument is passed (GH31677)
- Fixed regression in `ExcelFile` where the stream passed into the function was closed by the destructor. (GH31467)
- Fixed regression where `read_pickle()` raised a `UnicodeDecodeError` when reading a py27 pickle with `MultiIndex` column (GH31988).

**Reindexing/alignment**

- Fixed regression in `Series.align()` when `other` is a `DataFrame` and `method` is not `None` (GH31785)
- Fixed regression in `DataFrame.reindex()` and `Series.reindex()` when reindexing with (tz-aware) index and `method=nearest` (GH26683)
- Fixed regression in `DataFrame.reindex_like()` on a `DataFrame` subclass raised an `AssertionError` (GH31925)
- Fixed regression in `DataFrame` arithmetic operations with mis-matched columns (GH31623)

**Other**

- Fixed regression in joining on `DatetimeIndex` or `TimedeltaIndex` to preserve `freq` in simple cases (GH32166)
- Fixed regression in `Series.shift()` with datetime64 dtype when passing an integer `fill_value` (GH32591)
- Fixed regression in the repr of an object-dtype `Index` with bools and missing values (GH32146)
Indexing with nullable boolean arrays

Previously indexing with a nullable Boolean array containing `NA` would raise a `ValueError`, however this is now permitted with `NA` being treated as `False`. (GH31503)

```python
In [1]: s = pd.Series([1, 2, 3, 4])
In [2]: mask = pd.array([True, True, False, None], dtype="boolean")
In [3]: s
Out[3]:
0 1
1 2
2 3
3 4
Length: 4, dtype: int64
In [4]: mask
Out[4]:
<BooleanArray>
[True, True, False, <NA>]
Length: 4, dtype: boolean
```

<table>
<thead>
<tr>
<th>pandas 1.0.0-1.0.1</th>
</tr>
</thead>
<tbody>
<tr>
<td>&gt;&gt;&gt; s[mask]</td>
</tr>
<tr>

</tr>
</tbody>
</table>

Bug fixes

Datetimelike

- Bug in `Series.astype()` not copying for tz-naive and tz-aware `datetime64` dtype (GH32490)
- Bug where `to_datetime()` would raise when passed `pd.NA` (GH32213)
- Improved error message when subtracting two `Timestamp` that result in an out-of-bounds `Timedelta` (GH31774)

Categorical

- Fixed bug where `Categorical.from_codes()` improperly raised a `ValueError` when passed nullable integer codes. (GH31779)
- Fixed bug where `Categorical()` constructor would raise a `TypeError` when given a numpy array containing `pd.NA`. (GH31927)
- Bug in `Categorical` that would ignore or crash when calling `Series.replace()` with a list-like `to_replace` (GH31720)

I/O

- Using `pd.NA` with `DataFrame.to_json()` now correctly outputs a null value instead of an empty object (GH31615)
- Bug in `pandas.json_normalize()` when value in meta path is not iterable (GH31507)
- Fixed pickling of `pandas.NA`. Previously a new object was returned, which broke computations relying on `NA` being a singleton (GH31847)
- Fixed bug in parquet roundtrip with nullable unsigned integer dtypes (GH31896)

Experimental dtypes

- Fixed bug in `DataFrame.convert_dtypes()` for columns that were already using the "string" dtype (GH31731).
- Fixed bug in `DataFrame.convert_dtypes()` for series with mix of integers and strings (GH32117)
- Fixed bug in `DataFrame.convert_dtypes()` where `BooleanDtype` columns were converted to `Int64` (GH32287)
- Fixed bug in setting values using a slice indexer with string dtype (GH31772)
- Fixed bug where `pandas.core.groupby.GroupBy.first()` and `pandas.core.groupby.GroupBy.last()` would raise a `TypeError` when groups contained `pd.NA` in a column of object dtype (GH32123)
- Fixed bug where `DataFrameGroupBy.mean()`, `DataFrameGroupBy.median()`, `DataFrameGroupBy.var()`, and `DataFrameGroupBy.std()` would raise a `TypeError` on `Int64` dtype columns (GH32219)

Strings

- Using `pd.NA` with `Series.str.repeat()` now correctly outputs a null value instead of raising error for vector inputs (GH31632)

Rolling

- Fixed rolling operations with variable window (defined by time duration) on decreasing time index (GH32385)

5.4.5 What’s new in 1.0.1 (February 5, 2020)

These are the changes in pandas 1.0.1. See Release notes for a full changelog including other versions of pandas.

Fixed regressions

• Fixed regression in DataFrame setting values with a slice (e.g. df[-4:] = 1) indexing by label instead of position (GH31469)
• Fixed regression when indexing a Series or DataFrame indexed by DatetimeIndex with a slice containing a datetime.date (GH31501)
• Fixed regression in DataFrame.__setitem__ raising an AttributeError with a MultiIndex and a non-monotonic indexer (GH31449)
• Fixed regression in Series multiplication when multiplying a numeric Series with >10000 elements with a timedelta-like scalar (GH31457)
• Fixed regression in .groupby().agg() raising an AssertionError for some reductions like min on object-dtype columns (GH31522)
• Fixed regression in .groupby() aggregations with categorical dtype using Cythonized reduction functions (e.g. first) (GH31450)
• Fixed regression in GroupBy.apply() if called with a function which returned a non-pandas non-scalar object (e.g. a list or numpy array) (GH31441)
• Fixed regression in DataFrame.groupby() whereby taking the minimum or maximum of a column with period dtype would raise a TypeError. (GH31471)
• Fixed regression in DataFrame.groupby() with an empty DataFrame grouping by a level of a MultiIndex (GH31670).
• Fixed regression in DataFrame.apply() with object dtype and non-reducing function (GH31505)
• Fixed regression in `to_datetime()` when parsing non-nanosecond resolution datetimes (GH31491)
• Fixed regression in `to_csv()` where specifying an `na_rep` might truncate the values written (GH31447)
• Fixed regression in `Categorical` construction with `numpy.str_` categories (GH31499)
• Fixed regression in `DataFrame.loc()` and `DataFrame.iloc()` when selecting a row containing a single `datetime64` or `timedelta64` column (GH31649)
• Fixed regression where setting `pd.options.display.max_colwidth` was not accepting negative integer. In addition, this behavior has been deprecated in favor of using `None` (GH31532)
• Fixed regression in `objTOJSON.c` fix return-type warning (GH31463)
• Fixed regression in `qcut()` when passed a nullable integer. (GH31389)
• Fixed regression in assigning to a `Series` using a nullable integer dtype (GH31446)
• Fixed performance regression when indexing a `DataFrame` or `Series` with a `MultiIndex` for the index using a list of labels (GH31648)
• Fixed regression in `read_csv()` used in file like object `RawIOBase` is not recognize `encoding` option (GH31575)

Deprecations

• Support for negative integer for `pd.options.display.max_colwidth` is deprecated in favor of using `None` (GH31532)

Bug fixes

Datetimelike

• Fixed bug in `to_datetime()` raising when `cache=True` and out-of-bound values are present (GH31491)

Numeric

• Bug in dtypes being lost in `DataFrame.__invert__` (~ operator) with mixed dtypes (GH31183) and for extension-array backed `Series` and `DataFrame` (GH23087)

Plotting

• Plotting tz-aware timeseries no longer gives UserWarning (GH31205)

Interval

• Bug in `Series.shift()` with `interval` dtype raising a `TypeError` when shifting an interval array of integers or datetimes (GH34195)

Contributors

A total of 15 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

• Daniel Saxton
• Guillaume Lemaitre
• Jeff Reback
• Joris Van den Bossche
5.4.6 What’s new in 1.0.0 (January 29, 2020)

These are the changes in pandas 1.0.0. See Release notes for a full changelog including other versions of pandas.

Note: The pandas 1.0 release removed a lot of functionality that was deprecated in previous releases (see below for an overview). It is recommended to first upgrade to pandas 0.25 and to ensure your code is working without warnings, before upgrading to pandas 1.0.

New deprecation policy

Starting with pandas 1.0.0, pandas will adopt a variant of SemVer to version releases. Briefly,

- Deprecations will be introduced in minor releases (e.g. 1.1.0, 1.2.0, 2.1.0, …)
- Deprecations will be enforced in major releases (e.g. 1.0.0, 2.0.0, 3.0.0, …)
- API-breaking changes will be made only in major releases (except for experimental features)

See Version policy for more.

Enhancements

Using Numba in rolling.apply and expanding.apply

We’ve added an engine keyword to apply() and apply() that allows the user to execute the routine using Numba instead of Cython. Using the Numba engine can yield significant performance gains if the apply function can operate on numpy arrays and the data set is larger (1 million rows or greater). For more details, see rolling apply documentation (GH28987, GH30936)
Defining custom windows for rolling operations

We’ve added a pandas.api.indexers.BaseIndexer() class that allows users to define how window bounds are created during rolling operations. Users can define their own get_window_bounds method on a pandas.api.indexers.BaseIndexer() subclass that will generate the start and end indices used for each window during the rolling aggregation. For more details and example usage, see the custom window rolling documentation.

Converting to markdown

We’ve added to_markdown() for creating a markdown table (GH11052)

```
In [1]: df = pd.DataFrame({'A': [1, 2, 3], 'B': [1, 2, 3], index=['a', 'a', 'b']})
In [2]: print(df.to_markdown())
<table>
<thead>
<tr>
<th align="left"></th>
<th align="right">A</th>
<th align="right">B</th>
</tr>
</thead>
<tbody>
<tr>
<td align="left">a</td>
<td align="right">1</td>
<td align="right">1</td>
</tr>
<tr>
<td align="left">a</td>
<td align="right">2</td>
<td align="right">2</td>
</tr>
<tr>
<td align="left">b</td>
<td align="right">3</td>
<td align="right">3</td>
</tr>
</tbody>
</table>
```

Experimental new features

Experimental NA scalar to denote missing values

A new pd.NA value (singleton) is introduced to represent scalar missing values. Up to now, pandas used several values to represent missing data: np.nan is used for this for float data, np.nan or None for object-dtype data and pd.NaT for datetime-like data. The goal of pd.NA is to provide a “missing” indicator that can be used consistently across data types. pd.NA is currently used by the nullable integer and boolean data types and the new string data type (GH28095).

**Warning:** Experimental: the behaviour of pd.NA can still change without warning.

For example, creating a Series using the nullable integer dtype:

```
In [3]: s = pd.Series([1, 2, None], dtype='Int64')
In [4]: s
Out[4]:
0      1
1      2
<NA>
Length: 3, dtype: Int64
In [5]: s[2]
Out[5]: <NA>
```

Compared to np.nan, pd.NA behaves differently in certain operations. In addition to arithmetic operations, pd.NA also propagates as “missing” or “unknown” in comparison operations:
In [6]: np.nan > 1
  Out[6]: False

In [7]: pd.NA > 1
  Out[7]: <NA>

For logical operations, `pd.NA` follows the rules of the three-valued logic (or Kleene logic). For example:

In [8]: pd.NA | True
  Out[8]: True

For more, see NA section in the user guide on missing data.

**Dedicated string data type**

We’ve added `StringDtype`, an extension type dedicated to string data. Previously, strings were typically stored in object-dtype NumPy arrays. (GH29975)

**Warning:** `StringDtype` is currently considered experimental. The implementation and parts of the API may change without warning.

The 'string' extension type solves several issues with object-dtype NumPy arrays:

1. You can accidentally store a mixture of strings and non-strings in an object dtype array. A `StringArray` can only store strings.

2. object dtype breaks dtype-specific operations like `DataFrame.select_dtypes()`. There isn’t a clear way to select just text while excluding non-text, but still object-dtype columns.

3. When reading code, the contents of an object dtype array is less clear than string.

In [9]: pd.Series(['abc', None, 'def'], dtype=pd.StringDtype())
  Out[9]:
  0    abc
  1   <NA>
  2    def
  Length: 3, dtype: string

You can use the alias "string" as well.

In [10]: s = pd.Series(['abc', None, 'def'], dtype="string")

In [11]: s
  Out[11]:
  0    abc
  1   <NA>
  2    def
  Length: 3, dtype: string

The usual string accessor methods work. Where appropriate, the return type of the Series or columns of a DataFrame will also have string dtype.
In [12]: s.str.upper()
Out[12]:
0   ABC
1   <NA>
2   DEF
Length: 3, dtype: string

In [13]: s.str.split('b', expand=True).dtypes
Out[13]:
0  string
1  string
Length: 2, dtype: object

String accessor methods returning integers will return a value with Int64Dtype

In [14]: s.str.count("a")
Out[14]:
0   1
1   <NA>
2   0
Length: 3, dtype: Int64

We recommend explicitly using the string data type when working with strings. See Text data types for more.

**Boolean data type with missing values support**

We’ve added BooleanDtype / BooleanArray, an extension type dedicated to boolean data that can hold missing values. The default bool data type based on a bool-dtype NumPy array, the column can only hold True or False, and not missing values. This new BooleanArray can store missing values as well by keeping track of this in a separate mask. (GH29555, GH30095, GH31131)

In [15]: pd.Series([True, False, None], dtype=pd.BooleanDtype())
Out[15]:
0  True
1  False
2  <NA>
Length: 3, dtype: boolean

You can use the alias "boolean" as well.

In [16]: s = pd.Series([True, False, None], dtype="boolean")

In [17]: s
Out[17]:
0  True
1  False
2  <NA>
Length: 3, dtype: boolean
Method `convert_dtypes` to ease use of supported extension dtypes

In order to encourage use of the extension dtypes `StringDtype`, `BooleanDtype`, `Int64Dtype`, `Int32Dtype`, etc., that support `pd.NA`, the methods `DataFrame.convert_dtypes()` and `Series.convert_dtypes()` have been introduced. (GH29752) (GH30929)

Example:

```
In [18]: df = pd.DataFrame({'x': ['abc', None, 'def'],
                     'y': [1, 2, np.nan],
                     'z': [True, False, True]})

In [19]: df
Out[19]:
    x    y     z
0  abc  1.0   True
1  NaN  2.0  False
2  def  NaN   True

In [20]: df.dtypes
Out[20]:
    x    object
    y    float64
    z     bool
Length: 3, dtype: object

In [21]: converted = df.convert_dtypes()

In [22]: converted
Out[22]:
    x    string
    y    Int64
    z    boolean

In [23]: converted.dtypes
Out[23]:
    x    string
    y    Int64
    z    boolean
Length: 3, dtype: object
```

This is especially useful after reading in data using readers such as `read_csv()` and `read_excel()`. See here for a description.
Other enhancements

- `Dataframe.to_string()` added the `max_colwidth` parameter to control when wide columns are truncated (GH9784)
- Added the `na_value` argument to `Series.to_numpy()`, `Index.to_numpy()` and `DataFrame.to_numpy()` to control the value used for missing data (GH30322)
- `MultiIndex.from_product()` infers level names from inputs if not explicitly provided (GH27292)
- `DataFrame.to_latex()` now accepts `caption` and `label` arguments (GH25436)
- DataFrames with `nullable integer`, the `new string dtype` and period data type can now be converted to pyarrow (>=0.15.0), which means that it is supported in writing to the Parquet file format when using the pyarrow engine (GH28368). Full roundtrip to parquet (writing and reading back in with `to_parquet()` / `read_parquet()`) is supported starting with pyarrow >= 0.16 (GH20612).
- `to_parquet()` now appropriately handles the schema argument for user defined schemas in the pyarrow engine (GH30270)
- `DataFrame.to_json()` now accepts an `indent` integer argument to enable pretty printing of JSON output (GH12004)
- `read_stata()` can read Stata 119 dta files. (GH28250)
- Implemented `pandas.core.window.Window.var()` and `pandas.core.window.Window.std()` functions (GH26597)
- Added encoding argument to `DataFrame.to_string()` for non-ascii text (GH28766)
- Added encoding argument to `DataFrame.to_html()` for non-ascii text (GH28663)
- `Styler.background_gradient()` now accepts `vmin` and `vmax` arguments (GH12145)
- `Styler.format()` added the `na_rep` parameter to help format the missing values (GH21527, GH28358)
- `read_excel()` now can read binary Excel (.xlsb) files by passing `engine='pyxlsb'`. For more details and example usage, see the Binary Excel files documentation. Closes GH8540.
- The `partition_cols` argument in `DataFrame.to_parquet()` now accepts a string (GH27117)
- `pandas.read_json()` now parses NaN, Infinity and -Infinity (GH12213)
- DataFrame constructor preserve `ExtensionArray` dtype with `ExtensionArray` (GH11363)
- `DataFrame.sort_values()` and `Series.sort_values()` have gained `ignore_index` keyword to be able to reset index after sorting (GH30114)
- `DataFrame.sort_index()` and `Series.sort_index()` have gained `ignore_index` keyword to reset index (GH30114)
- `DataFrame.drop_duplicates()` has gained `ignore_index` keyword to reset index (GH30114)
- Added new writer for exporting Stata dta files in versions 118 and 119, `StataWriterUTF8`. These files formats support exporting strings containing Unicode characters. Format 119 supports data sets with more than 32,767 variables (GH23573, GH30959)
- `Series.map()` now accepts `collections.abc.Mapping` subclasses as a mapper (GH29733)
- Added an experimental `attrs` for storing global metadata about a dataset (GH29062)
- `Timestamp.fromisocalendar()` is now compatible with python 3.8 and above (GH28115)
- `DataFrame.to_pickle()` and `read_pickle()` now accept URL (GH30163)
Backwards incompatible API changes

Avoid using names from `MultiIndex.levels`

As part of a larger refactor to `MultiIndex` the level names are now stored separately from the levels (GH27242). We recommend using `MultiIndex.names` to access the names, and `Index.set_names()` to update the names.

For backwards compatibility, you can still access the names via the levels.

```
In [24]: mi = pd.MultiIndex.from_product([[1, 2], ['a', 'b']], names=['x', 'y'])
In [25]: mi.levels[0].name
Out[25]: 'x'
```

However, it is no longer possible to update the names of the `MultiIndex` via the level.

```
In [26]: mi.levels[0].name = "new name"
   ^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
RuntimeError: Cannot set name on a level of a MultiIndex. Use 'MultiIndex.set_names' instead.
```

```
In [27]: mi.names
Out[27]: FrozenList(['x', 'y'])
```

To update, use `MultiIndex.set_names`, which returns a new `MultiIndex`.

```
In [28]: mi2 = mi.set_names("new name", level=0)
In [29]: mi2.names
Out[29]: FrozenList(['new name', 'y'])
```

New repr for `IntervalArray`

`pandas.arrays.IntervalArray` adopts a new `__repr__` in accordance with other array classes (GH25022)

```
In [1]: pd.arrays.IntervalArray.from_tuples([(0, 1), (2, 3)])
Out[2]: IntervalArray([(0, 1), (2, 3)],
                     closed='right',
                     dtype='interval[int64]')
```
Dataframe.rename now only accepts one positional argument

Dataframe.rename() would previously accept positional arguments that would lead to ambiguous or undefined behavior. From pandas 1.0, only the very first argument, which maps labels to their new names along the default axis, is allowed to be passed by position (GH29136).

pandas 0.25.x

In [1]: df = pd.DataFrame([[1]])
In [2]: df.rename({0: 1}, {0: 2})
Out[2]:
FutureWarning: ...Use named arguments to resolve ambiguity...
  2
  1 1

pandas 1.0.0

In [3]: df.rename({0: 1}, {0: 2})
Traceback (most recent call last):
...
TypeError: rename() takes from 1 to 2 positional arguments but 3 were given

Note that errors will now be raised when conflicting or potentially ambiguous arguments are provided.

pandas 0.25.x

In [4]: df.rename({0: 1}, index={0: 2})
Out[4]:
  0
  1 1
In [5]: df.rename(mapper={0: 1}, index={0: 2})
Out[5]:
  0
  2 1

pandas 1.0.0

In [6]: df.rename({0: 1}, index={0: 2})
Traceback (most recent call last):
...
TypeError: Cannot specify both 'mapper' and any of 'index' or 'columns'
In [7]: df.rename(mapper={0: 1}, index={0: 2})
Traceback (most recent call last):
(continues on next page)
...  

`TypeError: Cannot specify both 'mapper' and any of 'index' or 'columns'`

You can still change the axis along which the first positional argument is applied by supplying the `axis` keyword argument.

```
In [31]: df.rename({0: 1})
Out[31]:
    0  1
   ---
    1  1

[1 rows x 1 columns]
```

```
In [32]: df.rename({0: 1}, axis=1)
Out[32]:
    1
   ---
    0  1

[1 rows x 1 columns]
```

If you would like to update both the index and column labels, be sure to use the respective keywords.

```
In [33]: df.rename(index={0: 1}, columns={0: 2})
Out[33]:
    2
   ---
    1  1

[1 rows x 1 columns]
```

**Extended verbose info output for DataFrame**

`DataFrame.info()` now shows line numbers for the columns summary (GH17304)

`pandas 0.25.x`

```
In [1]: df = pd.DataFrame({'int_col': [1, 2, 3],
                      ...
                      'text_col': ['a', 'b', 'c'],
                      ...
                      'float_col': [0.0, 0.1, 0.2]})
```

```
In [2]: df.info(verbos=`True`)<class 'pandas.core.frame.DataFrame'>
RangeIndex: 3 entries, 0 to 2
Data columns (total 3 columns):
int_col    3 non-null int64
<BLANKLINE>
text_col   3 non-null object
<BLANKLINE>float_col  3 non-null float64
dtypes: float64(1), int64(1), object(1)
memory usage: 152.0+ bytes
```

`pandas 1.0.0`

```
In [34]: df = pd.DataFrame({'int_col': [1, 2, 3],
                      ...
                      'text_col': ['a', 'b', 'c'],
                      ...}
```

(continues on next page)
....:       "float_col": [0.0, 0.1, 0.2])
....:

In [35]: df.info(verbose=True)
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 3 entries, 0 to 2
Data columns (total 3 columns):
   # Column     Non-Null Count   Dtype
  --- -------- -------------- -----  
     0  int_col       3 non-null  int64  
     1  text_col      3 non-null object
     2  float_col      3 non-null float64
dtypes: float64(1), int64(1), object(1)
memory usage: 200.0+ bytes

**pandas.array() inference changes**

**pandas.array()** now infers pandas’ new extension types in several cases (GH29791):

1. String data (including missing values) now returns a *arrays.StringArray*.
2. Integer data (including missing values) now returns a *arrays.IntegerArray*.
3. Boolean data (including missing values) now returns the new *arrays.BooleanArray*

**pandas 0.25.x**

In [1]: pd.array(["a", None])
Out[1]:
<PandasArray>
["a", None]
Length: 2, dtype: object

In [2]: pd.array([1, None])
Out[2]:
<PandasArray>
[1, None]
Length: 2, dtype: object

**pandas 1.0.0**

In [36]: pd.array(["a", None])
Out[36]:
<StringArray>
["a", <NA>]
Length: 2, dtype: string

In [37]: pd.array([1, None])
Out[37]:
<IntegerArray>
[1, <NA>]
Length: 2, dtype: Int64

As a reminder, you can specify the dtype to disable all inference.
arrays.**IntegerArray** now uses **pandas.NA**

arrays.**IntegerArray** now uses **pandas.NA** rather than **numpy.nan** as its missing value marker (GH29964).

**pandas 0.25.x**

```python
In [1]: a = pd.array([1, 2, None], dtype="Int64")
In [2]: a
Out[2]: <IntegerArray>
[1, 2, NaN]
Length: 3, dtype: Int64
In [3]: a[2]
Out[3]: nan
```

**pandas 1.0.0**

```python
In [38]: a = pd.array([1, 2, None], dtype="Int64")
In [39]: a
Out[39]: <IntegerArray>
[1, 2, <NA>]
Length: 3, dtype: Int64
In [40]: a[2]
Out[40]: <NA>
```

This has a few API-breaking consequences.

**Converting to a NumPy ndarray**

When converting to a NumPy array missing values will be **pd.NA**, which cannot be converted to a float. So calling `np.asarray(integer_array, dtype="float")` will now raise.

**pandas 0.25.x**

```python
In [1]: np.asarray(a, dtype="float")
Out[1]: array([ 1., 2., nan])
```

**pandas 1.0.0**

```python
In [41]: np.asarray(a, dtype="float")
---------------------------------------------------------------------------
ValueError Traceback (most recent call last)
<ipython-input-41-4578f04da2b3> in <module>
----> 1 np.asarray(a, dtype="float")
/pandas/pandas/core/arrays/masked.py in __array__(self, dtype)
    333     raise ValueError("We return an object array here to preserve our scalar values")
    334     
--> 335     return self.to_numpy(dtype=dtype)
    336
```

(continues on next page)
337     def __arrow_array__(self, type=None):

/pandas/pandas/core/arrays/masked.py in to_numpy(self, dtype, copy, na_value)
    290         and na_value is libmissing.NA
    291     --> 292         raise ValueError(
    293             f"cannot convert to '{dtype}'-dtype NumPy array "
    294             "with missing values. Specify an appropriate 'na_value' ")

ValueError: cannot convert to 'float64'-dtype NumPy array with missing values. Specify an appropriate 'na_value' for this dtype.

Use arrays.IntegerArray.to_numpy() with an explicit na_value instead.

In [42]: a.to_numpy(dtype="float", na_value=np.nan)
Out[42]: array([ 1., 2., nan])

**Reductions can return `pd.NA`**

When performing a reduction such as a sum with `skipna=False`, the result will now be `pd.NA` instead of `np.nan` in presence of missing values (GH30958).

pandas 0.25.x

In [1]: pd.Series(a).sum(skipna=False)
Out[1]: nan

pandas 1.0.0

In [43]: pd.Series(a).sum(skipna=False)
Out[43]: <NA>

**value_counts returns a nullable integer dtype**

`Series.value_counts()` with a nullable integer dtype now returns a nullable integer dtype for the values.

pandas 0.25.x

In [1]: pd.Series([2, 1, 1, None], dtype="Int64").value_counts().dtype
Out[1]: dtype('Int64')

pandas 1.0.0

In [44]: pd.Series([2, 1, 1, None], dtype="Int64").value_counts().dtype
Out[44]: Int64Dtype()

See *Experimental NA scalar to denote missing values* for more on the differences between pandas.NA and numpy.nan.
arrays.IntegerArray comparisons return arrays.BooleanArray

Comparison operations on a arrays.IntegerArray now returns a arrays.BooleanArray rather than a NumPy array (GH29964).

**pandas 0.25.x**

```python
In [1]: a = pd.array([1, 2, None], dtype="Int64")
In [2]: a
Out[2]:
<IntegerArray>
[1, 2, NaN]
Length: 3, dtype: Int64

In [3]: a > 1
Out[3]:
array([False, True, False])
```

**pandas 1.0.0**

```python
In [45]: a = pd.array([1, 2, None], dtype="Int64")
In [46]: a > 1
Out[46]:
<BookBooleanArray>
[False, True, <NA>]
Length: 3, dtype: boolean
```

Note that missing values now propagate, rather than always comparing unequal like numpy.nan. See *Experimental NA scalar to denote missing values* for more.

**By default Categorical.min() now returns the minimum instead of np.nan**

When Categorical contains np.nan, Categorical.min() no longer return np.nan by default (skipna=True) (GH25303)

**pandas 0.25.x**

```python
In [1]: pd.Categorical([1, 2, np.nan], ordered=True).min()
Out[1]: nan
```

**pandas 1.0.0**

```python
In [47]: pd.Categorical([1, 2, np.nan], ordered=True).min()
Out[47]: 1
```
Default dtype of empty pandas.Series

Initialising an empty pandas.Series without specifying a dtype will raise a DeprecationWarning now (GH17261). The default dtype will change from float64 to object in future releases so that it is consistent with the behaviour of DataFrame and Index.

```
pandas 1.0.0
```

```
In [1]: pd.Series()
Out[2]:
DeprecationWarning: The default dtype for empty Series will be 'object' instead of 'float64' in a future version. Specify a dtype explicitly to silence this warning.
Series([], dtype: float64)
```

Result dtype inference changes for resample operations

The rules for the result dtype in DataFrame.resample() aggregations have changed for extension types (GH31359). Previously, pandas would attempt to convert the result back to the original dtype, falling back to the usual inference rules if that was not possible. Now, pandas will only return a result of the original dtype if the scalar values in the result are instances of the extension dtype’s scalar type.

```
pandas 0.25.x
```

```
In [1]> df.resample("2D").agg(lambda x: 'a').A.dtype
Out[1]:
CategoricalDtype(categories=['a', 'b'], ordered=False)
```

```
pandas 1.0.0
```

```
In [50]: df.resample("2D").agg(lambda x: 'a').A.dtype
Out[50]:
dtype('O')
```

This fixes an inconsistency between resample and groupby. This also fixes a potential bug, where the values of the result might change depending on how the results are cast back to the original dtype.

```
pandas 0.25.x
```

```
In [1] df.resample("2D").agg(lambda x: 'c')
Out[1]:
     A
0  NaN
```
pandas: powerful Python data analysis toolkit, Release 1.3.5

**pandas 1.0.0**

```python
In [51]: df.resample("2D").agg(lambda x: 'c')
Out[51]:
    A
2000-01-01  c
[1 rows x 1 columns]
```

**Increased minimum version for Python**

pandas 1.0.0 supports Python 3.6.1 and higher (GH29212).

**Increased minimum versions for dependencies**

Some minimum supported versions of dependencies were updated (GH29766, GH29723). If installed, we now require:

<table>
<thead>
<tr>
<th>Package</th>
<th>Minimum Version</th>
<th>Required</th>
<th>Changed</th>
</tr>
</thead>
<tbody>
<tr>
<td>numpy</td>
<td>1.13.3</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>pytz</td>
<td>2015.4</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>python-dateutil</td>
<td>2.6.1</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>bottleneck</td>
<td>1.2.1</td>
<td></td>
<td></td>
</tr>
<tr>
<td>numexpr</td>
<td>2.6.2</td>
<td></td>
<td></td>
</tr>
<tr>
<td>pytest (dev)</td>
<td>4.0.2</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

For **optional libraries** the general recommendation is to use the latest version. The following table lists the lowest version per library that is currently being tested throughout the development of pandas. Optional libraries below the lowest tested version may still work, but are not considered supported.

<table>
<thead>
<tr>
<th>Package</th>
<th>Minimum Version</th>
<th>Changed</th>
</tr>
</thead>
<tbody>
<tr>
<td>beautifulsoup4</td>
<td>4.6.0</td>
<td>X</td>
</tr>
<tr>
<td>fastparquet</td>
<td>0.3.2</td>
<td>X</td>
</tr>
<tr>
<td>gcsfs</td>
<td>0.2.2</td>
<td></td>
</tr>
<tr>
<td>lxml</td>
<td>3.8.0</td>
<td></td>
</tr>
<tr>
<td>matplotlib</td>
<td>2.2.2</td>
<td></td>
</tr>
<tr>
<td>numba</td>
<td>0.46.0</td>
<td>X</td>
</tr>
<tr>
<td>openpyxl</td>
<td>2.5.7</td>
<td>X</td>
</tr>
<tr>
<td>pyarrow</td>
<td>0.13.0</td>

<tr>
<td>scipy</td>
<td>0.19.0</td>
<td></td>
</tr>
<tr>
<td>sqlalchemy</td>
<td>1.1.4</td>
<td></td>
</tr>
<tr>
<td>xarray</td>
<td>0.8.2</td>
<td></td>
</tr>
<tr>
<td>xlrdr</td>
<td>1.1.0</td>
<td></td>
</tr>
<tr>
<td>xlsxwriter</td>
<td>0.9.8</td>
<td></td>
</tr>
<tr>
<td>xlwt</td>
<td>1.2.0</td>
<td></td>
</tr>
</tbody>
</table>

See **Dependencies** and **Optional dependencies** for more.
pandas: powerful Python data analysis toolkit, Release 1.3.5

Build changes

pandas has added a pyproject.toml file and will no longer include cythonized files in the source distribution uploaded to PyPI (GH28341, GH20775). If you’re installing a built distribution (wheel) or via conda, this shouldn’t have any effect on you. If you’re building pandas from source, you should no longer need to install Cython into your build environment before calling pip install pandas.

Other API changes

- core.groupby.GroupBy.transform now raises on invalid operation names (GH27489)
- pandas.api.types.infer_dtype() will now return “integer-na” for integer and np.nan mix (GH27283)
- MultiIndex.from_arrays() will no longer infer names from arrays if names=None is explicitly provided (GH27292)
- In order to improve tab-completion, pandas does not include most deprecated attributes when introspecting a pandas object using dir(e.g. dir(df)). To see which attributes are excluded, see an object’s _deprecations attribute, for example pd.DataFrame._deprecations (GH28805).
- The returned dtype of unique() now matches the input dtype. (GH27874)
- Changed the default configuration value for options.matplotlib.register_converters from True to "auto" (GH18720). Now, pandas custom formatters will only be applied to plots created by pandas, through plot(). Previously, pandas’ formatters would be applied to all plots created after a plot(). See units registration for more.
- Series.dropna() has dropped its **kwargs argument in favor of a single how parameter. Supplying anything else than how to **kwargs raised a TypeError previously (GH29388)
- When testing pandas, the new minimum required version of pytest is 5.0.1 (GH29664)
- Series.str.__iter__() was deprecated and will be removed in future releases (GH28277).
- Added <NA> to the list of default NA values for read_csv() (GH30821)

Documentation improvements

- Added new section on Scaling to large datasets (GH28315).
- Added sub-section on Query MultiIndex for HDF5 datasets (GH28791).

Deprecations

- Series.item() and Index.item() have been _undeprecated_ (GH29250)
- Index.set_value has been deprecated. For a given index idx, array arr, value in idx of idx_val and a new value of val, idx.set_value(arr, idx_val, val) is equivalent to arr[idx.get_loc(idx_val)] = val, which should be used instead (GH28621).
- is_extension_type() is deprecated, is_extension_array_dtype() should be used instead (GH29457)
- eval() keyword argument “truediv” is deprecated and will be removed in a future version (GH29812)
- DateOffset.isAnchored() and DatetOffset.onOffset() are deprecated and will be removed in a future version, use DateOffset.is_anchored() and DateOffset.is_on_offset() instead (GH30340)
pandas: powerful Python data analysis toolkit, Release 1.3.5

- pandas.tseries.frequencies.get_offset is deprecated and will be removed in a future version, use pandas.tseries.frequencies.to_offset instead (GH4205)
- Categorical.take_nd() and CategoricalIndex.take_nd() are deprecated, use Categorical.take() and CategoricalIndex.take() instead (GH27745)
- The parameter numeric_only of Categorical.min() and Categorical.max() is deprecated and replaced with skipna (GH25303)
- The parameter label in lreshape() has been deprecated and will be removed in a future version (GH29742)
- pandas.core.index has been deprecated and will be removed in a future version, the public classes are available in the top-level namespace (GH19711)
- pandas.json_normalize() is now exposed in the top-level namespace. Usage of json_normalize as pandas.io.json.json_normalize is now deprecated and it is recommended to use json_normalize as pandas.json_normalize() instead (GH27586).
- The numpy argument of pandas.read_json() is deprecated (GH28512).
- DataFrame.to_stata(), DataFrame.to_feather(), and DataFrame.to_parquet() argument “fname” is deprecated, use “path” instead (GH23574)
- The deprecated internal attributes _start, _stop and _step of RangeIndex now raise a FutureWarning instead of a DeprecationWarning (GH26581)
- The pandas.util.testing module has been deprecated. Use the public API in pandas.testing documented at Testing functions (GH16232).
- pandas.SparseArray has been deprecated. Use pandas.arrays.SparseArray (arrays.SparseArray) instead. (GH30642)
- The parameter is_copy of Series.take() and DataFrame.take() has been deprecated and will be removed in a future version. (GH27357)
- Support for multi-dimensional indexing (e.g. index[:, None]) on a Index is deprecated and will be removed in a future version, convert to a numpy array before indexing instead (GH30588)
- The pandas.np submodule is now deprecated. Import numpy directly instead (GH30296)
- The pandas.datetime class is now deprecated. Import from datetime instead (GH30610)
- diff will raise a TypeError rather than implicitly losing the dtype of extension types in the future. Convert to the correct dtype before calling diff instead (GH31025)

Selecting Columns from a Grouped DataFrame

When selecting columns from a DataFrameGroupBy object, passing individual keys (or a tuple of keys) inside single brackets is deprecated, a list of items should be used instead. (GH23566) For example:

```python
def = pd.DataFrame(
    {
        "A": ["foo", "bar", "foo", "bar", "foo", "bar", "foo"],
        "B": np.random.randn(8),
        "C": np.random.randn(8),
    }
)
g = df.groupby(\'A\')
# single key, returns SeriesGroupBy
g[\'B\']
# tuple of single key, returns SeriesGroupBy
g[[\'B\',]]
```
Removal of prior version deprecations/changes

Removed SparseSeries and SparseDataFrame

SparseSeries, SparseDataFrame and the DataFrame.to_sparse method have been removed (GH28425). We recommend using a Series or DataFrame with sparse values instead. See Migrating for help with migrating existing code.

Matplotlib unit registration

Previously, pandas would register converters with matplotlib as a side effect of importing pandas (GH18720). This changed the output of plots made via matplotlib plots after pandas was imported, even if you were using matplotlib directly rather than plot().

To use pandas formatters with a matplotlib plot, specify

```
In [1]: import pandas as pd
In [2]: pd.options.plotting.matplotlib.register_converters = True
```

Note that plots created by DataFrame.plot() and Series.plot() do register the converters automatically. The only behavior change is when plotting a date-like object via matplotlib.pyplot.plot or matplotlib.Axes.plot. See Custom formatters for timeseries plots for more.

Other removals

- Removed the previously deprecated keyword “index” from read_stata(), StataReader, and StataReader.read(), use “index_col” instead (GH17328)
- Removed StataReader.data method, use StataReader.read() instead (GH9493)
- Removed pandas.plotting._matplotlib.tsplot, use Series.plot() instead (GH19980)
- pandas.tseries.converter.register has been moved to pandas.plotting.register_matplotlib_converters(GH18307)
- Series.plot() no longer accepts positional arguments, pass keyword arguments instead (GH30003)
- DataFrame.hist() and Series.hist() no longer allows figsize=“default”, specify figure size by passing a tuple instead (GH30003)
- Floordiv of integer-dtyped array by Timedelta now raises TypeError (GH21036)
- TimedeltaIndex and DatetimeIndex no longer accept non-nanosecond dtype strings like “timedelta64” or “datetime64”, use “timedelta64[ns]” and “datetime64[ns]” instead (GH24806)
- Changed the default “skipna” argument in pandas.api.types.infer_dtype() from False to True (GH24050)
pandas: powerful Python data analysis toolkit, Release 1.3.5

- Removed Series.ix and DataFrame.ix (GH26438)
- Removed Index.summary (GH18217)
- Removed the previously deprecated keyword “fastpath” from the Index constructor (GH23110)
- Removed Series.get_value, Series.set_value, DataFrame.get_value, DataFrame.set_value (GH17739)
- Removed Series.compound and DataFrame.compound (GH26405)
- Changed the default “inplace” argument in DataFrame.set_index() and Series.set_axis() from None to False (GH27600)
- Removed Series.cat.categorical, Series.cat.index, Series.cat.name (GH24751)
- Removed the previously deprecated keyword “box” from to_datetime() and to_timedelta(); in addition these now always returns DatetimeIndex, TimedeltaIndex, Index, Series or DataFrame (GH24486)
- to_timedelta(), Timedelta, and TimedeltaIndex no longer allow “M”, “y”, or “Y” for the “unit” argument (GH23264)
- Removed the previously deprecated keyword “time_rule” from (non-public) offsets.generate_range, which has been moved to core.arrays._ranges.generate_range() (GH24157)
- DataFrame.loc() or Series.loc() with listlike indexers and missing labels will no longer reindex (GH17295)
- DataFrame.to_excel() and Series.to_excel() with non-existent columns will no longer reindex (GH17295)
- Removed the previously deprecated keyword “join_axes” from concat(); use reindex_like on the result instead (GH22318)
- Removed the previously deprecated keyword “by” from DataFrame.sort_index(), use DataFrame.sort_values() instead (GH10726)
- Removed support for nested renaming in DataFrame.aggregate(), Series.aggregate(), core.groupby, DataFrameGroupBy.aggregate(), core.groupby.SeriesGroupBy.aggregate(), core.window.rolling.Rolling.aggregate() (GH18529)
- Passing datetime64 data to TimedeltaIndex or timedelta64 data to DatetimeIndex now raises TypeError (GH23539, GH23937)
- Passing int64 values to DatetimeIndex and a timezone now interprets the values as nanosecond timestamps in UTC, not wall times in the given timezone (GH24559)
- A tuple passed to DataFrame.groupby() is now exclusively treated as a single key (GH18314)
- Removed Index.contains, use key in index instead (GH30103)
- Addition and subtraction of int or integer-arrays is no longer allowed in Timestamp, DatetimeIndex, TimedeltaIndex, use obj + n * obj.freq instead of obj + n (GH22535)
- Removed Series.ptp (GH21614)
- Removed Series.from_array (GH18258)
- Removed DataFrame.from_items (GH18458)
- Removed DataFrame.as_matrix, Series.as_matrix (GH18458)
- Removed Series.asobject (GH18477)
- Removed DataFrame.as_blocks, Series.as_blocks, DataFrame.blocks, Series.blocks (GH17656)
- pandas.Series.str.cat() now defaults to aligning others, using join='left' (GH27611)
**pandas.Series.str.cat()** does not accept list-likes within list-likes anymore (GH27611)

**Series.where()** with Categorical dtype (or DataFrame.where() with Categorical column) no longer allows setting new categories (GH24114)

Removed the previously deprecated keywords “start”, “end”, and “periods” from the DatetimeIndex, TimedeltaIndex, and PeriodIndex constructors; use date_range(), timedelta_range(), and period_range() instead (GH23919)

Removed the previously deprecated keyword “verify_integrity” from the DatetimeIndex and TimedeltaIndex constructors (GH23919)

Removed the previously deprecated keyword “fastpath” from pandas.core.internals.blocks.make_block (GH19265)

Removed the previously deprecated keyword “dtype” from Block.make_block_same_class() (GH19434)

Removed **ExtensionArray._formatting_values**. Use **ExtensionArray._formatter** instead. (GH23601)

Removed **MultiIndex.to_hierarchical** (GH21613)

Removed **MultiIndex.labels**, use **MultiIndex.codes** instead (GH23752)

Removed the previously deprecated keyword “labels” from the MultiIndex constructor, use “codes” instead (GH23752)

Removed **MultiIndex.set_labels**, use **MultiIndex.set_codes()** instead (GH23752)

Removed the previously deprecated keyword “labels” from **MultiIndex.set_codes(), MultiIndex.copy(), MultiIndex.drop()**, use “codes” instead (GH23752)

Removed support for legacy HDF5 formats (GH29787)

Passing a dtype alias (e.g. ‘datetime64[ns, UTC]’) to DatetimeTZDtype is no longer allowed, use DatetimeTZDtype.construct_from_string() instead (GH23990)

Removed the previously deprecated keyword “skip_footer” from read_excel(); use “skipfooter” instead (GH18836)

**read_excel()** no longer allows an integer value for the parameter usecols, instead pass a list of integers from 0 to usecols inclusive (GH23635)

Removed the previously deprecated keyword “convert_datetime64” from **DataFrame.to_records()** (GH18902)

Removed **IntervalIndex.from_intervals** in favor of the IntervalIndex constructor (GH19263)

Changed the default “keep_tz” argument in DatetimeIndex.to_series() from None to True (GH23739)

Removed api.types.is_period and api.types.is_datetimetz (GH23917)

Ability to read pickles containing Categorical instances created with pre-0.16 version of pandas has been removed (GH27538)

Removed pandas.tseries.plotting.tsplot (GH18627)

Removed the previously deprecated keywords “reduce” and “broadcast” from **DataFrame.apply()** (GH18577)

Removed the previously deprecated assert_raises_regex function in pandas._testing (GH29174)

Removed the previously deprecated FrozenNDArray class in pandas.core.indexes.frozen (GH29335)

Removed the previously deprecated keyword “nthreads” from **read_feather()**, use “use_threads” instead (GH23053)

Removed **Index.is_lexsorted_for_tuple** (GH29305)
• Removed support for nested renaming in `DataFrame.aggregate()`, `Series.aggregate()`, `core.groupby.DataFrameGroupBy.aggregate()`, `core.groupby.SeriesGroupBy.aggregate()`, `core.window.rolling.Rolling.aggregate()` (GH29608)

• Removed `Series.valid`; use `Series.dropna()` instead (GH18800)

• Removed `DataFrame.is_copy`, `Series.is_copy` (GH18812)

• Removed `DataFrame.get_ftype_counts`, `Series.get_ftype_counts` (GH18243)

• Removed `DataFrame.ftypes`, `Series.ftypes`, `Series.ftype` (GH26744)

• Removed `Index.get_duplicates`, use `idx[idx.duplicated()].unique()` instead (GH20239)

• Removed `Series.clip_upper`, `Series.clip_lower`, `DataFrame.clip_upper`, `DataFrame.clip_lower` (GH24203)

• Removed the ability to alter `DatetimeIndex.freq`, `TimedeltaIndex.freq`, or `PeriodIndex.freq` (GH20772)

• Removed `DatetimeIndex.offset` (GH20730)

• Removed `DatetimeIndex.asobject`, `TimedeltaIndex.asobject`, `PeriodIndex.asobject`, use `astype(object)` instead (GH29801)

• Removed the previously deprecated keyword “order” from `factorize()` (GH19751)

• Removed the previously deprecated keyword “encoding” from `read_stata()` and `DataFrame.to_stata()` (GH21400)

• Changed the default “sort” argument in `concat()` from `None` to `False` (GH20613)

• Removed the previously deprecated keyword “raise_conflict” from `DataFrame.update()`, use “errors” instead (GH23585)

• Removed the previously deprecated keyword “n” from `DatetimeIndex.shift()`, `TimedeltaIndex.shift()`, `PeriodIndex.shift()`, use “periods” instead (GH22458)

• Removed the previously deprecated keywords “how”, “fill_method”, and “limit” from `DataFrame.resample()` (GH30139)

• Passing an integer to `Series.fillna()` or `DataFrame.fillna()` with timedelta64[ns] dtype now raises `TypeError` (GH24694)

• Passing multiple axes to `DataFrame.dropna()` is no longer supported (GH20995)

• Removed `Series.nonzero`, use `to_numpy().nonzero()` instead (GH24048)

• Passing floating dtype codes to `Categorical.from_codes()` is no longer supported, pass `codes.astype(np.int64)` instead (GH21775)

• Removed the previously deprecated keyword “pat” from `Series.str.partition()` and `Series.str.rpartition()`, use “sep” instead (GH23767)

• Removed `Series.put` (GH27106)

• Removed `Series.real`, `Series.imag` (GH27106)

• Removed `Series.to_dense`, `DataFrame.to_dense` (GH26684)

• Removed `Index.dtype_str`, use `str(index.dtype)` instead (GH27106)

• `Categorical.ravel()` returns a `Categorical` instead of a `ndarray` (GH27199)

• The ‘outer’ method on Numpy ufuncs, e.g. `np.subtract.outer` operating on `Series` objects is no longer supported, and will raise `NotImplementedError` (GH27198)
pandas: powerful Python data analysis toolkit, Release 1.3.5

- Removed Series.get_dtype_counts and DataFrame.get_dtype_counts (GH27145)
- Changed the default “fill_value” argument in Categorical.take() from True to False (GH20841)
- Changed the default value for the raw argument in Series.rolling().apply().DataFrame.rolling().
  apply().Series.expanding().apply().DataFrame.expanding().apply() from None to False (GH20584)
- Removed deprecated behavior of Series.argmin() and Series.argmax(), use Series.idxmin() and
  Series.idxmax() for the old behavior (GH16955)
- Passing a tz-aware datetime.datetime or Timestamp into the Timestamp constructor with the tz argument
  now raises a ValueError (GH23621)
- Removed Series.base, Index.base, Categorical.base, Series.flags, Index.flags, PeriodArray.
  flags, Series.strides, Index.strides, Series.itemsize, Index.itemsize, Series.data, Index.
  data (GH20721)
- Changed Timedelta.resolution() to match the behavior of the standard library datetime.timedelta.
  resolution, for the old behavior, use Timedelta.resolution_string() (GH26839)
- Removed Timestamp.weekday_name, DatetimeIndex.weekday_name, and Series.dt.weekday_name
  (GH18164)
- Removed the previously deprecated keyword “errors” in Timestamp.tz_localize(), DatetimeIndex.
  tz_localize(), and Series.tz_localize() (GH22644)
- Changed the default “ordered” argument in CategoricalDtype from None to False (GH26336)
- Series.set_axis() and DataFrame.set_axis() now require “labels” as the first argument and “axis” as an
  optional named parameter (GH30089)
- Removed to_msgpack, read_msgpack, DataFrame.to_msgpack, Series.to_msgpack (GH27103)
- Removed Series.compress (GH21930)
- Removed the previously deprecated keyword “fill_value” from Categorical.fillna(), use “value” instead
  (GH19269)
- Removed the previously deprecated keyword “data” from andrews_curves(), use “frame” instead (GH6956)
- Removed the previously deprecated keyword “data” from parallel_coordinates(), use “frame” instead
  (GH6956)
- Removed the previously deprecated keyword “colors” from parallel_coordinates(), use “color” instead
  (GH6956)
- Removed the previously deprecated keywords “verbose” and “private_key” from read_gbq() (GH30200)
- Calling np.array and np.asarray on tz-aware Series and DatetimeIndex will now return an object array
  of tz-aware Timestamp (GH24596)

5.4. Version 1.0
Performance improvements

- Performance improvement in DataFrame arithmetic and comparison operations with scalars (GH24990, GH29853)
- Performance improvement in indexing with a non-unique IntervalIndex (GH27489)
- Performance improvement in MultiIndex.is_monotonic (GH27495)
- Performance improvement in cut() when bins is an IntervalIndex (GH27668)
- Performance improvement when initializing a DataFrame using a range (GH30171)
- Performance improvement in DataFrame.corr() when method is "spearman" (GH28139)
- Performance improvement in DataFrame.replace() when provided a list of values to replace (GH28099)
- Performance improvement in DataFrame.select_dtypes() by using vectorization instead of iterating over a loop (GH28317)
- Performance improvement in Categorical.searchsorted() and CategoricalIndex.searchsorted() (GH28795)
- Performance improvement when comparing a Categorical with a scalar and the scalar is not found in the categories (GH29750)
- Performance improvement when checking if values in a Categorical are equal, equal or larger or larger than a given scalar. The improvement is not present if checking if the Categorical is less than or less than or equal than the scalar (GH29820)
- Performance improvement in Index.equals() and MultiIndex.equals() (GH29134)
- Performance improvement in infer_dtypes() when skipna is True (GH28814)

Bug fixes

Categorical

- Added test to assert the fillna() raises the correct ValueError message when the value isn’t a value from categories (GH13628)
- Bug in Categorical.astype() where NaN values were handled incorrectly when casting to int (GH28406)
- DataFrame.reindex() with a CategoricalIndex would fail when the targets contained duplicates, and wouldn’t fail if the source contained duplicates (GH28107)
- Bug in Categorical.astype() not allowing for casting to extension dtypes (GH28668)
- Bug where merge() was unable to join on categorical and extension dtype columns (GH28668)
- Categorical.searchsorted() and CategoricalIndex.searchsorted() now work on unordered categoricals also (GH21667)
- Added test to assert roundtripping to parquet with DataFrame.to_parquet() or read_parquet() will preserve Categorical dtypes for string types (GH27955)
- Changed the error message in Categorical.remove_categories() to always show the invalid removals as a set (GH28669)
- Using date accessors on a categorical dtyped Series of datetimes was not returning an object of the same type as if one used the str() / dt() on a Series of that type. E.g. when accessing Series.dt.tz_localize() on a Categorical with duplicate entries, the accessor was skipping duplicates (GH27952)
• Bug in DataFrame.replace() and Series.replace() that would give incorrect results on categorical data (GH26988)

• Bug where calling Categorical.min() or Categorical.max() on an empty Categorical would raise a numpy exception (GH30227)

• The following methods now also correctly output values for unobserved categories when called through groupby(..., observed=False) (GH17605) * core.groupby.SeriesGroupBy.count() * core.groupby.SeriesGroupBy.size() * core.groupby.SeriesGroupBy.nunique() * core.groupby.SeriesGroupBy.nth()

Datetimelike

• Bug in Series.__setitem__() incorrectly casting np.timedelta64("NaT") to np.datetime64("NaT") when inserting into a Series with datetime64 dtype (GH27311)

• Bug in Series.dt() property lookups when the underlying data is read-only (GH27529)

• Bug in HDFStore.__getitem__ incorrectly reading tz attribute created in Python 2 (GH26443)

• Bug in to_datetime() where passing arrays of malformed str with errors="coerce" could incorrectly lead to raising ValueError (GH28299)

• Bug in core.groupby.SeriesGroupBy.nunique() where NaT values were interfering with the count of unique values (GH27951)

• Bug in Timestamp subtraction when subtracting a Timestamp from a np.datetime64 object incorrectly raising TypeError (GH28286)

• Addition and subtraction of integer or integer-dtype arrays with Timestamp will now raise NullFrequencyError instead of ValueError (GH28268)

• Bug in Series and DataFrame with integer dtype failing to raise TypeError when adding or subtracting a np.datetime64 object (GH28080)

• Bug in Series.astype(), Index.astype(), and DataFrame.astype() failing to handle NaT when casting to an integer dtype (GH28492)

• Bug in Week with weekday incorrectly raising AttributeError instead of TypeError when adding or subtracting an invalid type (GH28530)

• Bug in DataFrame arithmetic operations when operating with a Series with dtype 'timedelta64[ns]' (GH28049)

• Bug in core.groupby.generic.SeriesGroupBy.apply() raising ValueError when a column in the original DataFrame is a datetime and the column labels are not standard integers (GH28247)

• Bug in pandas._config.localization.get_locales() where the locales -a encodes the locales list as windows-1252 (GH23638, GH24760, GH27368)

• Bug in Series.var() failing to raise TypeError when called with timedelta64[ns] dtype (GH28289)

• Bug in DatetimeIndex.strftime() and Series.dt.strftime() where NaT was converted to the string 'NaT' instead of np.nan (GH29578)

• Bug in masking datetime-like arrays with a boolean mask of an incorrect length not raising an IndexError (GH30308)

• Bug in Timestamp.resolution being a property instead of a class attribute (GH29910)

• Bug in pandas.to_datetime() when called with None raising TypeError instead of returning NaT (GH30011)
• Bug in `pandas.to_datetime()` failing for deques when using `cache=True` (the default) (GH29403)

• Bug in `Series.item()` with `datetime64` or `timedelta64` dtype, `DatetimeIndex.item()`, and `TimedeltaIndex.item()` returning an integer instead of a `Timestamp` or `Timedelta` (GH30175)

• Bug in `DatetimeIndex` addition when adding a non-optimized `DateOffset` incorrectly dropping timezone information (GH30336)

• Bug in `DataFrame.drop()` where attempting to drop non-existent values from a DatetimeIndex would yield a confusing error message (GH30399)

• Bug in `DataFrame.append()` would remove the timezone-awareness of new data (GH30238)

• Bug in `Series.cummin()` and `Series.cummax()` with timezone-aware dtype incorrectly dropping its timezone (GH15553)

• Bug in `DatetimeArray, TimedeltaArray, and PeriodArray` where inplace addition and subtraction did not actually operate inplace (GH24115)

• Bug in `pandas.to_datetime()` when called with `Series` storing `IntegerArray` raising `TypeError` instead of returning `Series` (GH30050)

• Bug in `date_range()` with custom business hours as `freq` and given number of `periods` (GH30593)

• Bug in `PeriodIndex` comparisons with incorrectly casting integers to `Period` objects, inconsistent with the `Period` comparison behavior (GH30722)

• Bug in `DatetimeIndex.insert()` raising a `ValueError` instead of a `TypeError` when trying to insert a timezone-aware `Timestamp` into a timezone-naive `DatetimeIndex`, or vice-versa (GH30806)

### Timedelta

• Bug in subtracting a `TimedeltaIndex` or `TimedeltaArray` from a `np.datetime64` object (GH29558)

### Timezones

•

### Numeric

• Bug in `DataFrame.quantile()` with zero-column `DataFrame` incorrectly raising (GH23925)

• `DataFrame` flex inequality comparisons methods (`DataFrame.lt()`, `DataFrame.le()`, `DataFrame.gt()`, `DataFrame.ge()`) with object-dtype and complex entries failing to raise `TypeError` like their `Series` counterparts (GH28079)

• Bug in `DataFrame` logical operations (`&`, `|`, `^`) not matching `Series` behavior by filling NA values (GH28741)

• Bug in `DataFrame.interpolate()` where specifying axis by name references variable before it is assigned (GH29142)

• Bug in `Series.var()` not computing the right value with a nullable integer dtype series not passing through `ddof` argument (GH29128)

• Improved error message when using `frac > 1` and `replace = False` (GH27451)
• Bug in numeric indexes resulted in it being possible to instantiate an `Int64Index`, `UInt64Index`, or `Float64Index` with an invalid dtype (e.g. datetime-like) (GH29539)

• Bug in `UInt64Index` precision loss while constructing from a list with values in the np.uint64 range (GH29526)

• Bug in `NumericIndex` construction that caused indexing to fail when integers in the np.uint64 range were used (GH28023)

• Bug in `NumericIndex` construction that caused `UInt64Index` to be casted to `Float64Index` when integers in the np.uint64 range were used to index a `DataFrame` (GH28279)

• Bug in `Series.interpolate()` when using method='index' with an unsorted index, would previously return incorrect results. (GH21037)

• Bug in `DataFrame.round()` where a `DataFrame` with a `CategoricalIndex` of `IntervalIndex` columns would incorrectly raise a `TypeError` (GH30063)

• Bug in `Series.pct_change()` and `DataFrame.pct_change()` when there are duplicated indices (GH30463)

• Bug in `DataFrame` cumulative operations (e.g. cumsum, cummax) incorrect casting to object-dtype (GH19296)

• Bug in `diff` losing the dtype for extension types (GH30889)

• Bug in `DataFrame.diff` raising an `IndexError` when one of the columns was a nullable integer dtype (GH30967)

Conversion

•

Strings

• Calling `Series.str.isalnum()` (and other “ismethods”) on an empty `Series` would return an object dtype instead of bool (GH29624)

•

Interval

• Bug in `IntervalIndex.get_indexer()` where a `Categorical` or `CategoricalIndex` target would incorrectly raise a `TypeError` (GH30063)

• Bug in `pandas.core.dtypes.cast.infer_dtype_from_scalar` where passing pandas_dtype=True did not infer `IntervalDtype` (GH30337)

• Bug in `Series` constructor where constructing a `Series` from a list of `Interval` objects resulted in object dtype instead of `IntervalDtype` (GH23563)

• Bug in `IntervalDtype` where the kind attribute was incorrectly set as None instead of "O" (GH30568)

• Bug in `IntervalIndex`, `IntervalArray`, and `Series` with interval data where equality comparisons were incorrect (GH24112)
Indexing

- Bug in assignment using a reverse slicer (GH26939)
- Bug in DataFrame.explode() would duplicate frame in the presence of duplicates in the index (GH28010)
- Bug in reindexing a PeriodIndex() with another type of index that contained a Period (GH28323, GH28337)
- Fix assignment of column via .loc with numpy non-ns datatype type (GH27395)
- Bug in Float64Index.astype() where np.inf was not handled properly when casting to an integer dtype (GH28475)
- Index.union() could fail when the left contained duplicates (GH28257)
- Bug when indexing with .loc where the index was a CategoricalIndex with non-string categories didn't work (GH17569, GH30225)
- Index.get_indexer_non_unique() could fail with TypeError in some cases, such as when searching for ints in a string index (GH28257)
- Bug in Float64Index.get_loc() incorrectly raising TypeError instead of KeyError (GH29189)
- Bug in DataFrame.loc() with incorrect dtype when setting Categorical value in 1-row DataFrame (GH25495)
- MultiIndex.get_loc() can’t find missing values when input includes missing values (GH19132)
- Bug in Series.__setitem__() incorrectly assigning values with boolean indexer when the length of new data matches the number of True values and new data is not a Series or an np.array (GH30567)
- Bug in indexing with a PeriodIndex incorrectly accepting integers representing years, use e.g. ser.loc["2007"] instead of ser.loc[2007] (GH30763)

Missing

- 

MultiIndex

- Constructor for MultiIndex verifies that the given sortorder is compatible with the actual lexsort_depth if verify_integrity parameter is True (the default) (GH28735)
- Series and MultiIndex .drop with MultiIndex raise exception if labels not in given in level (GH8594)
- 

IO

- read_csv() now accepts binary mode file buffers when using the Python csv engine (GH23779)
- Bug in DataFrame.to_json() where using a Tuple as a column or index value and using orient="columns" or orient="index" would produce invalid JSON (GH20500)
- Improve infinity parsing. read_csv() now interprets Infinity, +Infinity, -Infinity as floating point values (GH10065)
- Bug in DataFrame.to_csv() where values were truncated when the length of na_rep was shorter than the text input data. (GH25099)
• Bug in `DataFrame.to_string()` where values were truncated using display options instead of outputting the full content (GH9784)
• Bug in `DataFrame.to_json()` where a datetime column label would not be written out in ISO format with `orient="table"` (GH28130)
• Bug in `DataFrame.to_parquet()` where writing to GCS would fail with `engine='fastparquet'` if the file did not already exist (GH28326)
• Bug in `read_hdf()` closing stores that it didn’t open when Exceptions are raised (GH28699)
• Bug in DataFrame.read_json() where using `orient="index"` would not maintain the order (GH28557)
• Bug in `DataFrame.to_html()` where the length of the `formatters` argument was not verified (GH28469)
• Bug in `DataFrame.to_parquet()` where writing to GCS would fail with `engine='fastparquet'` if the file did not already exist (GH28326)
• Bug in `read_hdf()` closing stores that it didn’t open when Exceptions are raised (GH28699)
• Bug in DataFrame.read_json() where using `orient="index"` would not maintain the order (GH28557)
• Bug in `DataFrame.to_html()` where the length of the `formatters` argument was not verified (GH28469)
• Bug in `DataFrame.read_hdf()` with `engine='fastparquet'` if the file did not already exist (GH28326)

Plotting

• Bug in `Series.plot()` not able to plot boolean values (GH23719)
• Bug in `DataFrame.plot()` not able to plot when no rows (GH27758)
• Bug in `DataFrame.plot()` producing incorrect legend markers when plotting multiple series on the same axis (GH18222)
• Bug in `DataFrame.plot()` when `kind='box'` and data contains datetime or timedelta data. These types are now automatically dropped (GH22799)
• Bug in `Dataframe.plot.line()` and `Dataframe.plot.area()` produce wrong xlim in x-axis (GH27686, GH25160, GH24784)
• Bug where `DataFrame.boxplot()` would not accept a `color` parameter like `DataFrame.plot.box()` (GH26214)
• Bug where `DataFrame.boxplot()` would not accept a `color` parameter like `DataFrame.plot.box()` (GH26214)
• Bug in the `xticks` argument being ignored for `DataFrame.plot.bar()` (GH14119)
• `set_option()` now validates that the plot backend provided to ‘plotting.backend‘ implements the backend when the option is set, rather than when a plot is created (GH28163)
pandas: powerful Python data analysis toolkit, Release 1.3.5

- DataFrame.plot() now allow a backend keyword argument to allow changing between backends in one session (GH28619).
- Bug in color validation incorrectly raising for non-color styles (GH29122).
- Allow DataFrame.plot.scatter() to plot objects and datetime type data (GH18755, GH30391).
- Bug in DataFrame.hist(), xrot=0 does not work with by and subplots (GH30288).

GroupBy/resample/rolling

- Bug in core.groupby.DataFrameGroupBy.apply() only showing output from a single group when function returns an Index (GH28652).
- Bug in DataFrame.groupby() with multiple groups where an IndexError would be raised if any group contained all NA values (GH20519).
- Bug in pandas.core.resample.Resampler.size() and pandas.core.resample.Resampler.count() returning wrong dtype when used with an empty Series or DataFrame (GH28427).
- Bug in DataFrame.rolling() not allowing for rolling over datetimes when axis=1 (GH28192).
- Bug in DataFrame.rolling() not allowing rolling over multi-index levels (GH15584).
- Bug in DataFrame.rolling() not allowing rolling on monotonic decreasing time indexes (GH19248).
- Bug in DataFrame.groupby() not offering selection by column name when axis=1 (GH27614).
- Bug in core.groupby.DataFrameGroupBy.agg() not able to use lambda function with named aggregation (GH27519).
- Bug in DataFrame.groupby() losing column name information when grouping by a categorical column (GH28787).
- Remove error raised due to duplicated input functions in named aggregation in DataFrame.groupby() and Series.groupby(). Previously error will be raised if the same function is applied on the same column and now it is allowed if new assigned names are different. (GH28426)
- core.groupby.SeriesGroupBy.value_counts() will be able to handle the case even when the Grouper makes empty groups (GH28479).
- Bug in core.window.rolling.Rolling.quantile() ignoring interpolation keyword argument when used within a groupby (GH28779).
- Bug in DataFrame.groupby() where any, all, nunique and transform functions would incorrectly handle duplicate column labels (GH21668).
- Bug in core.groupby.DataFrameGroupBy.agg() with timezone-aware datetime64 column incorrectly casting results to the original dtype (GH29641).
- Bug in DataFrame.groupby() when using axis=1 and having a single level columns index (GH30208).
- Bug in DataFrame.groupby() when using nunique on axis=1 (GH30253).
- Bug in GroupBy.quantile() with multiple list-like q value and integer column names (GH30289).
- Bug in GroupBy.pct_change() and core.groupby.SeriesGroupBy.pct_change() causes TypeError when fill_method is None (GH30463).
- Bug in Rolling.count() and Expanding.count() argument where min_periods was ignored (GH26996).
Reshaping

- Bug in `DataFrame.apply()` that caused incorrect output with empty `DataFrame` (GH28202, GH21959)
- Bug in `DataFrame.stack()` not handling non-unique indexes correctly when creating MultiIndex (GH28301)
- Bug in `pivot_table()` not returning correct type `float` when `margins=True` and `aggfunc='mean'` (GH24893)
- Bug `merge_asof()` could not use `datetime.timedelta` for `tolerance` kwarg (GH28098)
- Bug in `merge()`, did not append suffixes correctly with MultiIndex (GH28518)
- `qcut()` and `cut()` now handle boolean input (GH20303)
- Fix to ensure all dtypes can be used in `merge_asof()` when using a tolerance value. Previously every non-int64 type would raise an erroneous `MergeError` (GH28870).
- Better error message in `get_dummies()` when columns isn’t a list-like value (GH28383)
- Bug in `Index.join()` that caused infinite recursion error for mismatched MultiIndex name orders. (GH25760, GH28956)
- Bug `Series.pct_change()` where supplying an anchored frequency would throw a `ValueError` (GH28664)
- Bug where `DataFrame.equals()` returned True incorrectly in some cases when two DataFrames had the same columns in different orders (GH28839)
- Bug in `DataFrame.replace()` that caused non-numeric replacer’s dtype not respected (GH26632)
- Bug in `melt()` where supplying mixed strings and numeric values for id_vars or value_vars would incorrectly raise a `ValueError` (GH29718)
- Dtypes are now preserved when transposing a `DataFrame` where each column is the same extension dtype (GH30091)
- Bug in `merge_asof()` merging on a tz-aware `left_index` and `right_on` a tz-aware column (GH29864)
- Improved error message and docstring in `cut()` and `qcut()` when `labels=True` (GH13318)
- Bug in missing `fill_na` parameter to `DataFrame.unstack()` with list of levels (GH30740)

Sparse

- Bug in `SparseDataFrame` arithmetic operations incorrectly casting inputs to float (GH28107)
- Bug in `DataFrame.sparse` returning a `Series` when there was a column named `sparse` rather than the accessor (GH30758)
- Fixed `operator.xor()` with a boolean-dtype `SparseArray`. Now returns a sparse result, rather than object dtype (GH31025)
ExtensionArray

- Bug in `arrays.PandasArray` when setting a scalar string (GH28118, GH28150).
- Bug where nullable integers could not be compared to strings (GH28930)
- Bug where `DataFrame` constructor raised `ValueError` with list-like data and `dtype` specified (GH30280)

Other

- Trying to set the `display.precision`, `display.max_rows` or `display.max_columns` using `set_option()` to anything but a `None` or a positive int will raise a `ValueError` (GH23348)
- Using `DataFrame.replace()` with overlapping keys in a nested dictionary will no longer raise, now matching the behavior of a flat dictionary (GH27660)
- `DataFrame.to_csv()` and `Series.to_csv()` now support dicts as compression argument with key 'method' being the compression method and others as additional compression options when the compression method is 'zip'. (GH26023)
- Bug in `Series.diff()` where a boolean series would incorrectly raise a `TypeError` (GH17294)
- `Series.append()` will no longer raise a `TypeError` when passed a tuple of `Series` (GH28410)
- Fix corrupted error message when calling pandas.libs._json.encode() on a 0d array (GH18878)
- Backtick quoting in `DataFrame.query()` and `DataFrame.eval()` can now also be used to use invalid identifiers like names that start with a digit, are python keywords, or are using single character operators. (GH27017)
- Bug in `pd.core.util.hashing.hash_pandas_object` where arrays containing tuples were incorrectly treated as non-hashable (GH28969)
- Bug in `DataFrame.append()` that raised `IndexError` when appending with empty list (GH28769)
- Fix `AbstractHolidayCalendar` to return correct results for years after 2030 (now goes up to 2200) (GH27790)
- Fixed `IntegerArray` returning `inf` rather than `NaN` for operations dividing by 0 (GH27398)
- Fixed `pow` operations for `IntegerArray` when the other value is 0 or 1 (GH29997)
- Bug in `Series.count()` raises if use_inf_as_na is enabled (GH29478)
- Bug in `Index` where a non-hashable name could be set without raising `TypeError` (GH29069)
- Bug in `DataFrame` constructor when passing a 2D `ndarray` and an extension dtype (GH12513)
- Bug in `DataFrame.to_csv()` when supplied a series with a `dtype="string"` and a `na_rep`, the `na_rep` was being truncated to 2 characters. (GH29975)
- Bug where `DataFrame.itertuples()` would incorrectly determine whether or not namedtuples could be used for dataframes of 255 columns (GH28282)
- Handle nested NumPy object arrays in `testing.assert_series_equal()` for ExtensionArray implementations (GH30841)
- Bug in `Index` constructor incorrectly allowing 2-dimensional input arrays (GH13601, GH27125)

5.5 Version 0.25

5.5.1 What’s new in 0.25.3 (October 31, 2019)

These are the changes in pandas 0.25.3. See Release notes for a full changelog including other versions of pandas.

Bug fixes

**GroupBy/resample/rolling**

- Bug in DataFrameGroupBy.quantile() where NA values in the grouping could cause segfaults or incorrect results (GH28882)
Contributors

A total of 2 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

- Will Ayd
- William Ayd

5.5.2 What’s new in 0.25.2 (October 15, 2019)

These are the changes in pandas 0.25.2. See Release notes for a full changelog including other versions of pandas.

Note: pandas 0.25.2 adds compatibility for Python 3.8 (GH28147).

Bug fixes

Indexing

- Fix regression in DataFrame.reindex() not following the limit argument (GH28631).
- Fix regression in RangeIndex.get_indexer() for decreasing RangeIndex where target values may be improperly identified as missing/present (GH28678)

IO

- Fix regression in notebook display where <th> tags were missing for DataFrame.index values (GH28204).
- Regression in to_csv() where writing a Series or DataFrame indexed by an IntervalIndex would incorrectly raise a TypeError (GH28210)
- Fix to_csv() with ExtensionArray with list-like values (GH28840).

GroupBy/resample/rolling

- Bug incorrectly raising an IndexError when passing a list of quantiles to pandas.core.groupby.DataFrameGroupBy.quantile() (GH28113).
- Bug in pandas.core.groupby.GroupBy.shift(), pandas.core.groupby.GroupBy.bfill() and pandas.core.groupby.GroupBy.ffill() where timezone information would be dropped (GH19995, GH27992)
Other

- Compatibility with Python 3.8 in DataFrame.query() (GH27261)
- Fix to ensure that tab-completion in an IPython console does not raise warnings for deprecated attributes (GH27900).

Contributors

A total of 6 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

- Felix Divo +
- Jeremy Schendel
- Joris Van den Bossche
- MeeseeksMachine
- Tom Augspurger
- jbrockmendel

5.5.3 What’s new in 0.25.1 (August 21, 2019)

These are the changes in pandas 0.25.1. See Release notes for a full changelog including other versions of pandas.

IO and LZMA

Some users may unknowingly have an incomplete Python installation lacking the lzma module from the standard library. In this case, import pandas failed due to an ImportError (GH27575). pandas will now warn, rather than raising an ImportError if the lzma module is not present. Any subsequent attempt to use lzma methods will raise a RuntimeError. A possible fix for the lack of the lzma module is to ensure you have the necessary libraries and then re-install Python. For example, on MacOS installing Python with pyenv may lead to an incomplete Python installation due to unmet system dependencies at compilation time (like xz). Compilation will succeed, but Python might fail at run time. The issue can be solved by installing the necessary dependencies and then re-installing Python.

Bug fixes

Categorical

- Bug in Categorical.fillna() that would replace all values, not just those that are NaN (GH26215)
Datetimelike

- Bug in `to_datetime()` where passing a timezone-naive `DatetimeArray` or `DateTimeIndex` and `utc=True` would incorrectly return a timezone-naive result (GH27733)
- Bug in `Period.to_timestamp()` where a `Period` outside the `Timestamp` implementation bounds (roughly 1677-09-21 to 2262-04-11) would return an incorrect `Timestamp` instead of raising `OutOfBoundsDatetime` (GH19643)
- Bug in iterating over `DatetimeIndex` when the underlying data is read-only (GH28055)

Timezones

- Bug in `Index` where a numpy object array with a timezone aware `Timestamp` and `np.nan` would not return a `DatetimeIndex` (GH27011)

Numeric

- Bug in `Series.interpolate()` when using a timezone aware `DatetimeIndex` (GH27548)
- Bug when printing negative floating point complex numbers would raise an `IndexError` (GH27484)
- Bug where `DataFrame` arithmetic operators such as `DataFrame.mul()` with a `Series` with `axis=1` would raise an `AttributeError` on `DataFrame` larger than the minimum threshold to invoke `numexpr` (GH27636)
- Bug in `DataFrame` arithmetic where missing values in results were incorrectly masked with `NaN` instead of `Inf` (GH27464)

Conversion

- Improved the warnings for the deprecated methods `Series.real()` and `Series.imag()` (GH27610)

Interval

- Bug in `IntervalIndex` where `dir(obj)` would raise `ValueError` (GH27571)

Indexing

- Bug in partial-string indexing returning a NumPy array rather than a `Series` when indexing with a scalar like `.loc['2015']` (GH27516)
- Break reference cycle involving `Index` and other index classes to allow garbage collection of index objects without running the GC. (GH27585, GH27840)
- Fix regression in assigning values to a single column of a `DataFrame` with a `MultiIndex` columns (GH27841).
- Fix regression in `.ix` fallback with an `IntervalIndex` (GH27865).
Missing

- Bug in `pandas.isnull()` or `pandas.isna()` when the input is a type e.g. `type(pandas.Series())` (GH27482)

IO

- Avoid calling `S3File.s3` when reading parquet, as this was removed in s3fs version 0.3.0 (GH27756)
- Better error message when a negative header is passed in `pandas.read_csv()` (GH27779)
- Follow the `min_rows` display option (introduced in v0.25.0) correctly in the HTML repr in the notebook (GH27991).

Plotting

- Added a `pandas_plotting_backends` entrypoint group for registering plot backends. See Plotting backends for more (GH26747).
- Fixed the re-instatement of Matplotlib datetime converters after calling `pandas.plotting.deregister_matplotlib_converters()` (GH27481).
- Fix compatibility issue with matplotlib when passing a pandas `Index` to a plot call (GH27775).

GroupBy/resample/rolling

- Fixed regression in `pandas.core.groupby.DataFrameGroupBy.quantile()` raising when multiple quantiles are given (GH27526)
- Bug in `pandas.core.groupby.DataFrameGroupBy.transform()` where applying a timezone conversion lambda function would drop timezone information (GH27496)
- Bug in `pandas.core.groupby.GroupBy.nth()` where `observed=False` was being ignored for Categorical groupers (GH26385)
- Bug in windowing over read-only arrays (GH27766)
- Fixed segfault in `pandas.core.groupby.DataFrameGroupBy.quantile` when an invalid quantile was passed (GH27470)

Reshaping

- A `KeyError` is now raised if `.unstack()` is called on a `Series` or `DataFrame` with a flat `Index` passing a name which is not the correct one (GH18303)
- Bug `merge_asof()` could not merge `Timedelta` objects when passing `tolerance` kwarg (GH27642)
- Bug in `DataFrame.crosstab()` when `margins` set to `True` and `normalize` is not `False`, an error is raised. (GH27500)
- `DataFrame.join()` now suppresses the `FutureWarning` when the sort parameter is specified (GH21952)
- Bug in `DataFrame.join()` raising with readonly arrays (GH27943)
Sparse

- Bug in reductions for Series with Sparse dtypes (GH27080)

Other

- Bug in Series.replace() and DataFrame.replace() when replacing timezone-aware timestamps using a
dict-like replacer (GH27720)
- Bug in Series.rename() when using a custom type indexer. Now any value that isn’t callable or dict-like is
treated as a scalar. (GH27814)

Contributors

A total of 5 people contributed patches to this release. People with a “+” by their names contributed a patch for the
first time.

- Jeff Reback
- Joris Van den Bossche
- MeeseeksMachine +
- Tom Augspurger
- jbrockmendel

5.5.4 What’s new in 0.25.0 (July 18, 2019)

**Warning:** Starting with the 0.25.x series of releases, pandas only supports Python 3.5.3 and higher. See Dropping
Python 2.7 for more details.

**Warning:** The minimum supported Python version will be bumped to 3.6 in a future release.

**Warning:** Panel has been fully removed. For N-D labeled data structures, please use xarray

**Warning:** read_pickle() and read_msgpack() are only guaranteed backwards compatible back to pandas
version 0.20.3 (GH27082)

These are the changes in pandas 0.25.0. See Release notes for a full changelog including other versions of pandas.
Enhancements

GroupBy aggregation with relabeling

pandas has added special groupby behavior, known as “named aggregation”, for naming the output columns when applying multiple aggregation functions to specific columns (GH18366, GH26512).

```
In [1]: animals = pd.DataFrame({
    'kind': ['cat', 'dog', 'cat', 'dog'],
    'height': [9.1, 6.0, 9.5, 34.0],
    'weight': [7.9, 7.5, 9.9, 198.0]
})

In [2]: animals
Out[2]:
kind  height  weight
     0     cat     9.1     7.9
     1    dog      6.0     7.5
     2     cat     9.5     9.9
     3    dog    34.0    198.0
[4 rows x 3 columns]

In [3]: animals.groupby("kind").agg(
    min_height=pd.NamedAgg(column='height', aggfunc='min'),
    max_height=pd.NamedAgg(column='height', aggfunc='max'),
    average_weight=pd.NamedAgg(column='weight', aggfunc=np.mean),
)
Out[3]:
          min_height  max_height  average_weight
kind     kind
   cat     9.1      9.5          8.90
   dog     6.0     34.0        102.75
[2 rows x 3 columns]
```

Pass the desired columns names as the **kwargs to .agg. The values of **kwargs should be tuples where the first element is the column selection, and the second element is the aggregation function to apply. pandas provides the pandas.NamedAgg namedtupletomakeitclearerwhattheargumentstothefunctionare, but plain tuples are accepted as well.

```
In [4]: animals.groupby("kind").agg(
    min_height=('height', 'min'),
    max_height=('height', 'max'),
    average_weight=('weight', np.mean),
)
Out[4]:
         min_height  max_height  average_weight
kind     kind
   cat     9.1      9.5          8.90
   dog     6.0     34.0        102.75
```

(continues on next page)
Named aggregation is the recommended replacement for the deprecated “dict-of-dicts” approach to naming the output of column-specific aggregations (Deprecate groupby.agg() with a dictionary when renaming).

A similar approach is now available for Series groupby objects as well. Because there’s no need for column selection, the values can just be the functions to apply

```python
animals.groupby("kind").height.agg(
    ...
    min_height="min",
    ...
    max_height="max",
    ...
)
```

```bash
Out[5]:
  kind    min_height  max_height
      cat      9.1     9.5
     dog      6.0   34.0
```

This type of aggregation is the recommended alternative to the deprecated behavior when passing a dict to a Series groupby aggregation (Deprecate groupby.agg() with a dictionary when renaming).

See Named aggregation for more.

**GroupBy aggregation with multiple lambdas**

You can now provide multiple lambda functions to a list-like aggregation in `pandas.core.groupby.GroupBy.agg` (GH26430).

```python
In [6]: animals.groupby('kind').height.agg([  
    ...
    lambda x: x.iloc[0],  
    lambda x: x.iloc[-1]  
    ...
])
```

```bash
Out[6]:
  kind    <lambda_0>  <lambda_1>
      cat      9.1     9.5
     dog      6.0   34.0
```

```python
In [7]: animals.groupby('kind').agg([  
    ...
    lambda x: x.iloc[0] - x.iloc[1],  
    lambda x: x.iloc[0] + x.iloc[1]  
    ...
])
```

```bash
Out[7]:
  kind    height     weight
      cat  <lambda_0>  <lambda_1>
     dog  <lambda_0>  <lambda_1>
```
cat  -0.4   18.6   -2.0   17.8
dog  -28.0   40.0  -190.5  205.5

[2 rows x 4 columns]

Previously, these raised a `SpecificationError`.

**Better repr for MultiIndex**

Printing of `MultiIndex` instances now shows tuples of each row and ensures that the tuple items are vertically aligned, so it’s now easier to understand the structure of the `MultiIndex`. *(GH13480):*

The repr now looks like this:

```
In [8]: pd.MultiIndex.from_product([['a', 'abc'], range(500)])
Out[8]:
MultiIndex([( 'a', 0),
            ( 'a', 1),
            ( 'a', 2),
            ( 'a', 3),
            ( 'a', 4),
            ( 'a', 5),
            ( 'a', 6),
            ( 'a', 7),
            ( 'a', 8),
            ( 'a', 9),
            ...
            ('abc', 490),
            ('abc', 491),
            ('abc', 492),
            ('abc', 493),
            ('abc', 494),
            ('abc', 495),
            ('abc', 496),
            ('abc', 497),
            ('abc', 498),
            ('abc', 499)],
           length=1000)
```

Previously, outputting a `MultiIndex` printed all the levels and codes of the `MultiIndex`, which was visually unappealing and made the output more difficult to navigate. For example (limiting the range to 5):

```
In [1]: pd.MultiIndex.from_product([['a', 'abc'], range(5)])
Out[1]: MultiIndex(levels=[['a', 'abc'], [0, 1, 2, 3]],
                        codes=[[0, 0, 0, 0, 1, 1, 1, 1], [0, 1, 2, 3, 0, 1, 2, 3]])
```

In the new repr, all values will be shown, if the number of rows is smaller than `options.display.max_seq_items` (default: 100 items). Horizontally, the output will truncate, if it's wider than `options.display.width` (default: 80 characters).
Shorter truncated repr for Series and DataFrame

Currently, the default display options of pandas ensure that when a Series or DataFrame has more than 60 rows, its repr gets truncated to this maximum of 60 rows (the `display.max_rows` option). However, this still gives a repr that takes up a large part of the vertical screen estate. Therefore, a new option `display.min_rows` is introduced with a default of 10 which determines the number of rows showed in the truncated repr:

- For small Series or DataFrames, up to `max_rows` number of rows is shown (default: 60).
- For larger Series of DataFrames with a length above `max_rows`, only `min_rows` number of rows is shown (default: 10, i.e. the first and last 5 rows).

This dual option allows to still see the full content of relatively small objects (e.g. `df.head(20)` shows all 20 rows), while giving a brief repr for large objects.

To restore the previous behaviour of a single threshold, set `pd.options.display.min_rows = None`.

JSON normalize with max_level param support

`json_normalize()` normalizes the provided input dict to all nested levels. The new `max_level` parameter provides more control over which level to end normalization (GH23843):

The repr now looks like this:

```python
from pandas.io.json import json_normalize
data = [{
    'CreatedBy': {'Name': 'User001'},
    'Lookup': {'TextField': 'Some text',
               'UserField': {'Id': 'ID001', 'Name': 'Name001'}},
    'Image': {'a': 'b'}
}]
json_normalize(data, max_level=1)
```

Series.explode to split list-like values to rows

`Series` and `DataFrame` have gained the `DataFrame.explode()` methods to transform list-likes to individual rows. See section on Exploding list-like column in docs for more information (GH16538, GH10511)

Here is a typical usecase. You have comma separated string in a column.

```python
In [9]: df = pd.DataFrame([[{'var1': 'a,b,c', 'var2': 1},
                            {'var1': 'd,e,f', 'var2': 2}]])
...
```

```python
In [10]: df
Out[10]:
   var1  var2
0  a,b,c   1
1  d,e,f   2
[2 rows x 2 columns]
```

Creating a long form `DataFrame` is now straightforward using chained operations
In [11]: df.assign(var1=df.var1.str.split(',')) .explode('var1')
Out[11]:
        var1  var2
0       a   1
0       b   1
0       c   1
1       d   2
1       e   2
1       f   2
[6 rows x 2 columns]

Other enhancements

- `DataFrame.plot()` keywords `logy`, `logx` and `loglog` can now accept the value 'sym' for symlog scaling. (GH24867)
- Added support for ISO week year format ('%G-%V-%u') when parsing datetimes using `to_datetime()` (GH16607)
- Indexing of DataFrame and Series now accepts zerodim np.ndarray (GH24919)
- `Timestamp.replace()` now supports the `fold` argument to disambiguate DST transition times (GH25017)
- `DataFrame.at_time()` and `Series.at_time()` now support `datetime.time` objects with timezones (GH24043)
- `DataFrame.pivot_table()` now accepts an observed parameter which is passed to underlying calls to `DataFrame.groupby()` to speed up grouping categorical data. (GH24923)
- `Series.str` has gained `Series.str.casefold()` method to removes all case distinctions present in a string (GH25405)
- `DataFrame.set_index()` now works for instances of abc.Iterator, provided their output is of the same length as the calling frame (GH22484, GH24984)
- `DatetimeIndex.union()` now supports the `sort` argument. The behavior of the sort parameter matches that of `Index.union()` (GH24994)
- `RangeIndex.union()` now supports the sort argument. If sort=False an unsorted Int64Index is always returned. sort=None is the default and returns a monotonically increasing RangeIndex if possible or a sorted Int64Index if not (GH24471)
- `TimedeltaIndex.intersection()` now also supports the sort keyword (GH24471)
- `DataFrame.rename()` now supports the errors argument to raise errors when attempting to rename nonexistent keys (GH13473)
- Added Sparse accessor for working with a DataFrame whose values are sparse (GH25681)
- `RangeIndex` has gained `start`, `stop`, and `step` attributes (GH25710)
- `datetime.timezone` objects are now supported as arguments to timezone methods and constructors (GH25065)
- `DataFrame.query()` and `DataFrame.eval()` now supports quoting column names with backticks to refer to names with spaces (GH6508)
- `merge_asof()` now gives a more clear error message when merge keys are categoricals that are not equal (GH26136)
• pandas.core.window.Rolling() supports exponential (or Poisson) window type (GH21303)
• Error message for missing required imports now includes the original import error’s text (GH23868)
• DatetimeIndex and TimedeltaIndex now have a mean method (GH24757)
• DataFrame.describe() now formats integer percentiles without decimal point (GH26660)
• Added support for reading SPSS .sav files using read_spss() (GH26537)
• Added new option plotting.backend to be able to select a plotting backend different than the existing matplotlib one. Use pandas.set_option('plotting.backend', '<backend-module>') where <backend-module> is a library implementing the pandas plotting API (GH14130)
• pandas.offsets.BusinessHour supports multiple opening hours intervals (GH15481)
• read_excel() can now use openpyxl to read Excel files via the engine='openpyxl' argument. This will become the default in a future release (GH11499)
• pandas.io.excel.read_excel() supports reading OpenDocument tables. Specify engine='odf' to enable. Consult the IO User Guide for more details (GH9070)
• Interval, IntervalIndex, and IntervalArray have gained an is_empty attribute denoting if the given interval(s) are empty (GH27219)

Backwards incompatible API changes

Indexing with date strings with UTC offsets

Indexing a DataFrame or Series with a DatetimeIndex with a date string with a UTC offset would previously ignore the UTC offset. Now, the UTC offset is respected in indexing. (GH24076, GH16785)

```
In [12]: df = pd.DataFrame([0], index=pd.DatetimeIndex(['2019-01-01'], tz='US/Pacific'))
In [13]: df
Out[13]:
     0
2019-01-01 00:00:00-08:00  0
[1 rows x 1 columns]
```

Previous behavior:

```
In [3]: df['2019-01-01 00:00:00+04:00':'2019-01-01 01:00:00+04:00']
Out[3]:
     0
2019-01-01 00:00:00-08:00  0
```

New behavior:

```
In [14]: df['2019-01-01 12:00:00+04:00':'2019-01-01 13:00:00+04:00']
Out[14]:
     0
2019-01-01 00:00:00-08:00  0
[1 rows x 1 columns]
```
MultiIndex constructed from levels and codes

Constructing a `MultiIndex` with NaN levels or codes value < -1 was allowed previously. Now, construction with codes value < -1 is not allowed and NaN levels’ corresponding codes would be reassigned as -1. (GH19387)

Previous behavior:

```
In [1]: pd.MultiIndex(levels=[[np.nan, None, pd.NaT, 128, 2]],
                   codes=[[0, -1, 1, 2, 3, 4]])
Out[1]: MultiIndex(levels=[[nan, None, NaT, 128, 2]],
                   codes=[[0, -1, 1, 2, 3, 4]])
In [2]: pd.MultiIndex(levels=[[1, 2]], codes=[[0, -2]])
Out[2]: MultiIndex(levels=[[1, 2]],
                   codes=[[0, -2]])
```

New behavior:

```
In [15]: pd.MultiIndex(levels=[[np.nan, None, pd.NaT, 128, 2]],
                   codes=[[0, -1, 1, 2, 3, 4]])
Out[15]: MultiIndex(([nan,],
                   (nan,),
                   (nan,),
                   (nan,),
                   (128,),
                   ( 2,)],
                   dtype=object)
In [16]: pd.MultiIndex(levels=[[1, 2]], codes=[[0, -2]])
```

```

--> 410                 raise ValueError(f"On level {i}, code value ({level_codes.min()})
< -1")
    411             if not level.is_unique:
    412                 raise ValueError(

ValueError: On level 0, code value (-2) < -1
```
GroupBy.apply on DataFrame evaluates first group only once

The implementation of DataFrameGroupBy.apply() previously evaluated the supplied function consistently twice on the first group to infer if it is safe to use a fast code path. Particularly for functions with side effects, this was an undesired behavior and may have led to surprises. (GH2936, GH2656, GH7739, GH10519, GH12155, GH20084, GH21417)

Now every group is evaluated only a single time.

```python
In [17]: df = pd.DataFrame({"a": ["x", "y"], "b": [1, 2]})

In [18]: df
Out[18]:
   a  b
0  x  1
1  y  2
[2 rows x 2 columns]

In [19]: def func(group):
   ....:     print(group.name)
   ....:     return group
   ....:

Previous behavior:

In [3]: df.groupby('a').apply(func)
x   x
  y
Out[3]:
   a  b
0  x  1
1  y  2

New behavior:

In [20]: df.groupby("a").apply(func)
x   y
Out[20]:
   a  b
0  x  1
1  y  2
[2 rows x 2 columns]
```
Concatenating sparse values

When passed DataFrames whose values are sparse, `concat()` will now return a `Series` or `DataFrame` with sparse values, rather than a `SparseDataFrame` (GH25702).

```
In [21]: df = pd.DataFrame({"A": pd.SparseArray([0, 1])})
```

*Previous behavior:*

```
In [2]: type(pd.concat([df, df]))
pandas.core.sparse.frame.SparseDataFrame
```

*New behavior:*

```
In [22]: type(pd.concat([df, df]))
Out[22]: pandas.core.frame.DataFrame
```

This now matches the existing behavior of `concat` on `Series` with sparse values. `concat()` will continue to return a `SparseDataFrame` when all the values are instances of `SparseDataFrame`.

This change also affects routines using `concat()` internally, like `get_dummies()`, which now returns a `DataFrame` in all cases (previously a `SparseDataFrame` was returned if all the columns were dummy encoded, and a `DataFrame` otherwise).

Providing any `SparseSeries` or `SparseDataFrame` to `concat()` will cause a `SparseSeries` or `SparseDataFrame` to be returned, as before.

The `.str-accessor performs stricter type checks`

Due to the lack of more fine-grained dtypes, `Series.str` so far only checked whether the data was of `object` dtype. `Series.str` will now infer the dtype data within the Series; in particular, 'bytes'-only data will raise an exception (except for `Series.str.decode()`, `Series.str.get()`, `Series.str.len()`, `Series.str.slice()`), see GH23163, GH23011, GH23551.

*Previous behavior:*

```
In [1]: s = pd.Series(np.array(["a", "ba", "cba"], 'S'), dtype=object)
In [2]: s
Out[2]:
0  b'a'
1  b'ba'
2  b'cba'
dtype: object
In [3]: s.str.startswith(b'a')
Out[3]:
0   True
1   False
2   False
dtype: bool
```

*New behavior:*

```
In [1]: s = pd.Series(np.array(["a", "ba", "cba"], 'S'), dtype=object)
In [2]: s
Out[2]:
0  b'a'
1  b'ba'
2  b'cba'
dtype: object
In [3]: s.str.startswith(b'a')
Out[3]:
0   True
1   False
2   False
dtype: bool
```
In [23]: s = pd.Series(np.array(['a', 'ba', 'cba'], 'S'), dtype=object)

In [24]: s
Out[24]:
0  b'a'
1  b'ba'
2  b'cba'
Length: 3, dtype: object

In [25]: s.str.startswith(b'a')
---------------------------------------------------------------------------
TypeError Traceback (most recent call last)
<ipython-input-25-ac784692b361> in <module>()

    116 return func(self, *args, **kwargs)
    117
TypeError: Cannot use .str.startswith with values of inferred dtype 'bytes'.

Categorical dtypes are preserved during GroupBy

Previously, columns that were categorical, but not the groupby key(s) would be converted to object dtype during groupby operations. pandas now will preserve these dtypes. (GH18502)

In [26]: cat = pd.Categorical(['foo', 'bar', 'bar', 'qux'], ordered=True)

In [27]: df = pd.DataFrame({'payload': [-1, -2, -1, -2], 'col': cat})

In [28]: df
Out[28]:
    payload col  
0       -1   foo
1       -2   bar
2       -1   bar
3       -2   qux

[4 rows x 2 columns]

In [29]: df.dtypes
Out[29]:
payload    int64
col        category
Length: 2, dtype: object

Previous Behavior:
In [5]: df.groupby('payload').first().col.dtype
Out[5]: dtype('O')

New Behavior:

In [30]: df.groupby('payload').first().col.dtype
Out[30]: CategoricalDtype(categories=['bar', 'foo', 'qux'], ordered=True)

Incompatible Index type unions

When performing `Index.union()` operations between objects of incompatible dtypes, the result will be a base `Index` of dtype object. This behavior holds true for unions between `Index` objects that previously would have been prohibited. The dtype of empty `Index` objects will now be evaluated before performing union operations rather than simply returning the other `Index` object. `Index.union()` can now be considered commutative, such that \(A.\text{union}(B) = B.\text{union}(A)\) (GH23525).

Previous behavior:

In [1]: pd.period_range('19910905', periods=2).union(pd.Int64Index([1, 2, 3]))
...: ValueError: can only call with other PeriodIndex-ed objects

In [2]: pd.Index([], dtype=object).union(pd.Index([1, 2, 3]))
Out[2]: Int64Index([1, 2, 3], dtype='int64')

New behavior:

In [31]: pd.period_range('19910905', periods=2).union(pd.Int64Index([1, 2, 3]))
Out[31]: Index([1991-09-05, 1991-09-06, 1, 2, 3], dtype='object')

In [32]: pd.Index([], dtype=object).union(pd.Index([1, 2, 3]))
Out[32]: Index([1, 2, 3], dtype='object')

Note that integer- and floating-dtype indexes are considered “compatible”. The integer values are coerced to floating point, which may result in loss of precision. See `Set operations on Index objects` for more.

DataFrame GroupBy `ffill/bfill` no longer return group labels

The methods `ffill`, `bfill`, `pad` and `backfill` of DataFrameGroupBy previously included the group labels in the return value, which was inconsistent with other groupby transforms. Now only the filled values are returned. (GH21521)

In [33]: df = pd.DataFrame({'a': ['x', 'y'], 'b': [1, 2]})

In [34]: df
Out[34]:
   a  b
0  x  1
1  y  2
[2 rows x 2 columns]

Previous behavior:
In [3]: df.groupby("a").ffill()
Out[3]:
   a  b
0  x  1
1  y  2

New behavior:

In [35]: df.groupby("a").ffill()
Out[35]:
   b
0  1
1  2

DataFrame describe on an empty Categorical / object column will return top and freq

When calling DataFrame.describe() with an empty categorical / object column, the ‘top’ and ‘freq’ columns were previously omitted, which was inconsistent with the output for non-empty columns. Now the ‘top’ and ‘freq’ columns will always be included, with numpy.nan in the case of an empty DataFrame (GH26397)

In [36]: df = pd.DataFrame({"empty_col": pd.Categorical([])})

In [37]: df
Out[37]:
Empty DataFrame
Columns: [empty_col]
Index: []

[0 rows x 1 columns]

Previous behavior:

In [3]: df.describe()
Out[3]:
   empty_col
      count    0
      unique   0

New behavior:

In [38]: df.describe()
Out[38]:
   empty_col
      count    0
      unique   0
      top      NaN
      freq     NaN

[4 rows x 1 columns]
__str__ methods now call __repr__ rather than vice versa

pandas has until now mostly defined string representations in a pandas objects' __str__/__unicode__/__bytes__ methods, and called __str__ from the __repr__ method, if a specific __repr__ method is not found. This is not needed for Python3. In pandas 0.25, the string representations of pandas objects are now generally defined in __repr__, and calls to __str__ in general now pass the call on to the __repr__, if a specific __str__ method doesn't exist, as is standard for Python. This change is backward compatible for direct usage of pandas, but if you subclass pandas objects and give your subclasses specific __str__/__repr__ methods, you may have to adjust your __str__/__repr__ methods (GH26495).

Indexing an IntervalIndex with Interval objects

Indexing methods for IntervalIndex have been modified to require exact matches only for Interval queries. IntervalIndex methods previously matched on any overlapping Interval. Behavior with scalar points, e.g. querying with an integer, is unchanged (GH16316).

```
In [39]: ii = pd.IntervalIndex.from_tuples([(0, 4), (1, 5), (5, 8)])
In [40]: ii
Out[40]: IntervalIndex([(0, 4], (1, 5], (5, 8]], dtype='interval[int64, right]')

The in operator (__contains__) now only returns True for exact matches to Intervals in the IntervalIndex, whereas this would previously return True for any Interval overlapping an Interval in the IntervalIndex.

Previous behavior:

```
In [4]: pd.Interval(1, 2, closed='neither') in ii
Out[4]: True
In [5]: pd.Interval(-10, 10, closed='both') in ii
Out[5]: True
```

New behavior:

```
In [41]: pd.Interval(1, 2, closed='neither') in ii
Out[41]: False
In [42]: pd.Interval(-10, 10, closed='both') in ii
Out[42]: False
```

The get_loc() method now only returns locations for exact matches to Interval queries, as opposed to the previous behavior of returning locations for overlapping matches. A KeyError will be raised if an exact match is not found.

Previous behavior:

```
In [6]: ii.get_loc(pd.Interval(1, 5))
Out[6]: array([0, 1])
In [7]: ii.get_loc(pd.Interval(2, 6))
Out[7]: array([0, 1, 2])
```

New behavior:
In [6]: ii.get_loc(pd.Interval(1, 5))
Out[6]: 1

In [7]: ii.get_loc(pd.Interval(2, 6))
KeyError: Interval(2, 6, closed='right')

Likewise, get_indexer() and get_indexer_non_unique() will also only return locations for exact matches to Interval queries, with -1 denoting that an exact match was not found.

These indexing changes extend to querying a Series or DataFrame with an IntervalIndex index.

In [43]: s = pd.Series(list('abc'), index=ii)

In [44]: s
Out[44]:
(0, 4]  a
(1, 5]  b
(5, 8]  c
Length: 3, dtype: object

Selecting from a Series or DataFrame using [], __getitem__, or loc now only returns exact matches for Interval queries.

Previous behavior:

In [8]: s[pd.Interval(1, 5)]
Out[8]:
(0, 4]  a
(1, 5]  b
dtype: object

In [9]: s.loc[pd.Interval(1, 5)]
Out[9]:
(0, 4]  a
(1, 5]  b
dtype: object

New behavior:

In [45]: s[pd.Interval(1, 5)]
Out[45]: 'b'

In [46]: s.loc[pd.Interval(1, 5)]
Out[46]: 'b'

Similarly, a KeyError will be raised for non-exact matches instead of returning overlapping matches.

Previous behavior:

In [9]: s[pd.Interval(2, 3)]
Out[9]:
(0, 4]  a
(1, 5]  b
dtype: object

(continues on next page)
In [10]: s.loc[pd.Interval(2, 3)]
Out[10]:
(0, 4]   a
(1, 5]   b
dtype: object

New behavior:

In [6]: s[pd.Interval(2, 3)]
---------------------------------------------------------------------------
KeyError: Interval(2, 3, closed='right')

In [7]: s.loc[pd.Interval(2, 3)]
---------------------------------------------------------------------------
KeyError: Interval(2, 3, closed='right')

The `overlaps()` method can be used to create a boolean indexer that replicates the previous behavior of returning overlapping matches.

New behavior:

In [47]: idxr = s.index.overlaps(pd.Interval(2, 3))

In [48]: idxr
Out[48]: array([ True,  True, False])

In [49]: s[idxr]
Out[49]:
(0, 4]   a
(1, 5]   b
Length: 2, dtype: object

In [50]: s.loc[idxr]
Out[50]:
(0, 4]   a
(1, 5]   b
Length: 2, dtype: object

Binary ufuncs on Series now align

Applying a binary ufunc like `numpy.power()` now aligns the inputs when both are `Series` (GH23293).

In [51]: s1 = pd.Series([1, 2, 3], index=['a', 'b', 'c'])

In [52]: s2 = pd.Series([3, 4, 5], index=['d', 'c', 'b'])

In [53]: s1
Out[53]:
a    1
b    2
c    3
Length: 3, dtype: int64

In [54]: s2
Out[54]:
d  3
c  4
b  5
Length: 3, dtype: int64

Previous behavior

In [5]: np.power(s1, s2)
Out[5]:
a  1
b 16
c 243
dtype: int64

New behavior

In [55]: np.power(s1, s2)
Out[55]:
a  1.0
b 32.0
c 81.0
d  NaN
Length: 4, dtype: float64

This matches the behavior of other binary operations in pandas, like `Series.add()`. To retain the previous behavior, convert the other `Series` to an array before applying the ufunc.

In [56]: np.power(s1, s2.array)
Out[56]:
a  1
b 16
c 243
Length: 3, dtype: int64

Categorical.argsort now places missing values at the end

`Categorical.argsort()` now places missing values at the end of the array, making it consistent with NumPy and the rest of pandas (GH21801).

In [57]: cat = pd.Categorical(['b', None, 'a'], categories=['a', 'b'], ordered=True)

Previous behavior

In [2]: cat = pd.Categorical(['b', None, 'a'], categories=['a', 'b'], ordered=True)
In [3]: cat.argsort()
Out[3]: array([1, 2, 0])

**New behavior**

```
In [58]: cat.argsort()
Out[58]: array([2, 0, 1])

In [59]: cat[cat.argsort()]
Out[59]: ['a', 'b', NaN]
```

**Column order is preserved when passing a list of dicts to DataFrame**

Starting with Python 3.7 the key-order of `dict` is guaranteed. In practice, this has been true since Python 3.6. The `DataFrame` constructor now treats a list of dicts in the same way as it does a list of `OrderedDict`, i.e. preserving the order of the dict. This change applies only when pandas is running on Python>=3.6 (GH27309).

```
In [60]: data = [
  ....:     {'name': 'Joe', 'state': 'NY', 'age': 18},
  ....:     {'name': 'Jane', 'state': 'KY', 'age': 19, 'hobby': 'Minecraft'},
  ....:     {'name': 'Jean', 'state': 'OK', 'age': 20, 'finances': 'good'}
  ....: ]
```

**Previous Behavior:**

The columns were lexicographically sorted previously,

```
In [1]: pd.DataFrame(data)
Out[1]:
        age     finances hobby name state
   0     18           NaN  NaN   Joe   NY
   1     19  Minecraft  NaN  Jane   KY
   2     20       good  NaN  Jean   OK
```

**New Behavior:**

The column order now matches the insertion-order of the keys in the dict, considering all the records from top to bottom. As a consequence, the column order of the resulting DataFrame has changed compared to previous pandas versions.

```
In [61]: pd.DataFrame(data)
Out[61]:
       name state age     hobby finances
 0    Joe   NY  18           NaN  NaN
 1  Jane   KY  19  Minecraft  NaN
 2  Jean   OK  20           NaN  good
```

(continues on next page)
Increased minimum versions for dependencies

Due to dropping support for Python 2.7, a number of optional dependencies have updated minimum versions (GH25725, GH24942, GH25752). Independently, some minimum supported versions of dependencies were updated (GH23519, GH25554). If installed, we now require:

<table>
<thead>
<tr>
<th>Package</th>
<th>Minimum Version</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>numpy</td>
<td>1.13.3</td>
<td>X</td>
</tr>
<tr>
<td>pytz</td>
<td>2015.4</td>
<td>X</td>
</tr>
<tr>
<td>python-dateutil</td>
<td>2.6.1</td>
<td>X</td>
</tr>
<tr>
<td>bottleneck</td>
<td>1.2.1</td>
<td></td>
</tr>
<tr>
<td>numexpr</td>
<td>2.6.2</td>
<td></td>
</tr>
<tr>
<td>pytest (dev)</td>
<td>4.0.2</td>
<td></td>
</tr>
</tbody>
</table>

For optional libraries the general recommendation is to use the latest version. The following table lists the lowest version per library that is currently being tested throughout the development of pandas. Optional libraries below the lowest tested version may still work, but are not considered supported.

<table>
<thead>
<tr>
<th>Package</th>
<th>Minimum Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>beautifulsoup4</td>
<td>4.6.0</td>
</tr>
<tr>
<td>fastparquet</td>
<td>0.2.1</td>
</tr>
<tr>
<td>gcsfs</td>
<td>0.2.2</td>
</tr>
<tr>
<td>lxml</td>
<td>3.8.0</td>
</tr>
<tr>
<td>matplotlib</td>
<td>2.2.2</td>
</tr>
<tr>
<td>openpyxl</td>
<td>2.4.8</td>
</tr>
<tr>
<td>pyarrow</td>
<td>0.9.0</td>
</tr>
<tr>
<td>pymysql</td>
<td>0.7.1</td>
</tr>
<tr>
<td>pytables</td>
<td>3.4.2</td>
</tr>
<tr>
<td>scipy</td>
<td>0.19.0</td>
</tr>
<tr>
<td>sqlalchemay</td>
<td>1.1.4</td>
</tr>
<tr>
<td>xarray</td>
<td>0.8.2</td>
</tr>
<tr>
<td>xlrd</td>
<td>1.1.0</td>
</tr>
<tr>
<td>xlsxwriter</td>
<td>0.9.8</td>
</tr>
<tr>
<td>xlwt</td>
<td>1.2.0</td>
</tr>
</tbody>
</table>

See Dependencies and Optional dependencies for more.
Other API changes

- `DatetimeTZDtype` will now standardize pytz timezones to a common timezone instance (GH24713)
- `Timestamp` and `Timedelta` scalars now implement the `to_numpy()` method as aliases to `Timestamp.to_datetime64()` and `Timedelta.to_timedelta64()`, respectively. (GH24653)
- `Timestamp.strptime()` will now raise a `NotImplementedError` (GH25016)
- Comparing `Timestamp` with unsupported objects now returns `NotImplemented` instead of raising `TypeError`. This implies that unsupported rich comparisons are delegated to the other object, and are now consistent with Python 3 behavior for `datetime` objects (GH24011)
- Bug in `DatetimeIndex.snap()` which didn’t preserving the name of the input `Index` (GH25575)
- The `arg` argument in `pandas.core.groupby.DataFrameGroupBy.agg()` has been renamed to `func` (GH26089)
- The `arg` argument in `pandas.core.window._Window.aggregate()` has been renamed to `func` (GH26372)
- Most pandas classes had a `__bytes__` method, which was used for getting a python2-style bytestring representation of the object. This method has been removed as a part of dropping Python2 (GH26447)
- The `.str`-accessor has been disabled for 1-level `MultiIndex`, use `MultiIndex.to_flat_index()` if necessary (GH23679)
- Removed support of gtk package for clipboards (GH26563)
- Using an unsupported version of Beautiful Soup 4 will now raise an `ImportError` instead of a `ValueError` (GH27063)
- `Series.to_excel()` and `DataFrame.to_excel()` will now raise a `ValueError` when saving timezone aware data. (GH27008, GH7056)
- `ExtensionArray.argsort()` places NA values at the end of the sorted array. (GH21801)
- `DataFrame.to_hdf()` and `Series.to_hdf()` will now raise a `NotImplementedError` when saving a `MultiIndex` with extension data types for a fixed format. (GH7775)
- Passing duplicate names in `read_csv()` will now raise a `ValueError` (GH17346)

Deprecations

Sparse subclasses

The `SparseSeries` and `SparseDataFrame` subclasses are deprecated. Their functionality is better-provided by a `Series` or `DataFrame` with sparse values.

Previous way

```python
df = pd.SparseDataFrame({"A": [0, 0, 1, 2]})
df.dtypes
```

New way

```python
In [62]: df = pd.DataFrame({"A": pd.SparseArray([0, 0, 1, 2])})

In [63]: df.dtypes
Out[63]:
```
The memory usage of the two approaches is identical. See *Migrating* for more (GH19239).

**msgpack format**

The msgpack format is deprecated as of 0.25 and will be removed in a future version. It is recommended to use pyarrow for on-the-wire transmission of pandas objects. (GH27084)

**Other deprecations**

- The deprecated `.ix[]` indexer now raises a more visible `FutureWarning` instead of `DeprecationWarning` (GH26438).
- Deprecated the `units=M` (months) and `units=Y` (year) parameters for `units` of `pandas.to_timedelta()`, `pandas.Timedelta()` and `pandas.TimedeltaIndex()` (GH16344)
- `pandas.concat()` has deprecated the `join_axes`-keyword. Instead, use `DataFrame.reindex()` or `DataFrame.reindex_like()` on the result or on the inputs (GH21951)
- The `SparseArray.values` attribute is deprecated. You can use `np.asarray(...)` or the `SparseArray.to_dense()` method instead (GH26421).
- The functions `pandas.to_datetime()` and `pandas.to_timedelta()` have deprecated the `box` keyword. Instead, use `to_numpy()` or `Timedelta.to_timedelta64()` (GH24416)
- The `DataFrame.compound()` and `Series.compound()` methods are deprecated and will be removed in a future version (GH26405).
- The internal attributes `_start`, `_stop` and `_step` attributes of `RangeIndex` have been deprecated. Use the public attributes `start`, `stop` and `step` instead (GH26581).
- The `Series.ftype()`, `Series.ftypes()` and `DataFrame.ftypes()` methods are deprecated and will be removed in a future version. Instead, use `Series.dtype()` and `DataFrame.dtypes()` (GH26705).
- The `Series.get_values()`, `DataFrame.get_values()`, `Index.get_values()`, `SparseArray.get_values()` and `Categorical.get_values()` methods are deprecated. One of `np.asarray(...)` or `to_numpy()` can be used instead (GH19617).
- The `outer` method on NumPy ufuncs, e.g. `np.subtract.outer` has been deprecated on `Series` objects. Convert the input to an array with `Series.array` first (GH27186)
- `Timedelta.resolution()` is deprecated and replaced with `Timedelta.resolution_string()`. In a future version, `Timedelta.resolution()` will be changed to behave like the standard library `datetime.timedelta.resolution` (GH21344)
- `read_table()` has been undeprecated. (GH25220)
- `Index.dtype_str` is deprecated. (GH18262)
- `Series.imag` and `Series.real` are deprecated. (GH18262)
- `Series.put()` is deprecated. (GH18262)
- `Index.item()` and `Series.item()` is deprecated. (GH18262)
• The default value ordered=None in CategoricalDtype has been deprecated in favor of ordered=False. When converting between categorical types ordered=True must be explicitly passed in order to be preserved. (GH26336)

• Index.contains() is deprecated. Use key in index().__contains__() instead (GH17753).

• DataFrame.get_dtype_counts() is deprecated. (GH18262)

• Categorical.ravel() will return a Categorical instead of a np.ndarray (GH27199)

Removal of prior version deprecations/changes

• Removed Panel (GH25047, GH25191, GH25231)

• Removed the previously deprecated sheetname keyword in read_excel() (GH16442, GH20938)

• Removed the previously deprecated TimeGrouper (GH16942)

• Removed the previously deprecated parse_cols keyword in read_excel() (GH16488)

• Removed the previously deprecated pd.options.html.border (GH16970)

• Removed the previously deprecated convert_objects (GH11221)

• Removed the previously deprecated select method of DataFrame and Series (GH17633)

• Removed the previously deprecated behavior of DataFrame treated as list-like in rename_categories() (GH17982)

• Removed the previously deprecated DataFrame.reindex_axis and Series.reindex_axis (GH17842)

• Removed the previously deprecated behavior of altering column or index labels with Series.rename_axis() or DataFrame.rename_axis() (GH17842)

• Removed the previously deprecated tupleize_cols keyword argument in read_html(), read_csv(), and DataFrame.to_csv() (GH17877, GH17820)

• Removed the previously deprecated DataFrame.from_csv and Series.from_csv (GH17812)

• Removed the previously deprecated raise_on_error keyword argument in DataFrame.where() and DataFrame.mask() (GH17744)

• Removed the previously deprecated ordered and categories keyword arguments in astype (GH17742)

• Removed the previously deprecated cdate_range (GH17691)

• Removed the previously deprecated True option for the dropna keyword argument in SeriesGroupBy.nth() (GH17493)

• Removed the previously deprecated convert keyword argument in Series.take() and DataFrame.take() (GH17352)

• Removed the previously deprecated behavior of arithmetic operations with datetime.date objects (GH21152)
pandas: powerful Python data analysis toolkit, Release 1.3.5

Performance improvements

- Significant speedup in SparseArray initialization that benefits most operations, fixing performance regression introduced in v0.20.0 (GH24985)

- DataFrame.to_stata() is now faster when outputting data with any string or non-native endian columns (GH25045)

- Improved performance of Series.searchsorted(). The speedup is especially large when the dtype is int8/int16/int32 and the searched key is within the integer bounds for the dtype (GH22034)

- Improved performance of pandas.core.groupby.GroupBy.quantile() (GH20405)

- Improved performance of slicing and other selected operation on a RangeIndex (GH26565, GH26617, GH26722)

- RangeIndex now performs standard lookup without instantiating an actual hashtable, hence saving memory (GH16685)

- Improved performance of read_csv() by faster tokenizing and faster parsing of small float numbers (GH25784)

- Improved performance of read_csv() by faster parsing of N/A and boolean values (GH25804)

- Improved performance of IntervalIndex.is_monotonic, IntervalIndex.is_monotonic_increasing and IntervalIndex.is_monotonic_decreasing by removing conversion to MultiIndex (GH24813)

- Improved performance of dataframe.to_csv() when writing datetime dtypes (GH25708)

- Improved performance of read_csv() by much faster parsing of MM/YYYY and DD/MM/YYYY datetime formats (GH25922)

- Improved performance of nanops for dtypes that cannot store NaNs. Speedup is particularly prominent for Series.all() and Series.any() (GH25070)

- Improved performance of Series.map() for dictionary mappers on categorical series by mapping the categories instead of mapping all values (GH23785)

- Improved performance of IntervalIndex.intersection() (GH24813)

- Improved performance of read_csv() by faster concatenating date columns without extra conversion to string for integer/float zero and float NaN; by faster checking the string for the possibility of being a date (GH25754)

- Improved performance of IntervalIndex.is_unique by removing conversion to MultiIndex (GH24813)

- Restored performance of DatetimeIndex.__iter__() by re-enabling specialized code path (GH26702)

- Improved performance when building MultiIndex with at least one CategoricalIndex level (GH22044)

- Improved performance by removing the need for a garbage collect when checking for SettingWithCopyWarning (GH27031)

- For to_datetime() changed default value of cache parameter to True (GH26043)

- Improved performance of DatetimeIndex and PeriodIndex slicing given non-unique, monotonic data (GH27136).

- Improved performance of pd.read_json() for index-oriented data. (GH26773)

- Improved performance of MultiIndex.shape() (GH27384).
Bug fixes

Categorical

- Bug in `DataFrame.at()` and `Series.at()` that would raise exception if the index was a `CategoricalIndex` (GH20629)
- Fixed bug in comparison of ordered `Categorical` that contained missing values with a scalar which sometimes incorrectly resulted in `True` (GH26504)
- Bug in `DataFrame.dropna()` when the `DataFrame` has a `CategoricalIndex` containing `Interval` objects incorrectly raised a `TypeError` (GH25087)

Datetimelike

- Bug in `to_datetime()` which would raise an (incorrect) `ValueError` when called with a date far into the future and the `format` argument specified instead of raising `OutOfBoundsDatetime` (GH23830)
- Bug in `to_datetime()` which would raise `InvalidIndexError: Reindexing only valid with uniquely valued Index objects when called with cache=True, with arg including at least two different elements from the set {None, numpy.nan, pandas.NaT} (GH22305)
- Bug in `DataFrame` and `Series` where timezone aware data with `dtype='datetime64[ns]` was not cast to naive (GH25843)
- Improved `Timestamp` type checking in various datetime functions to prevent exceptions when using a subclassed `datetime` (GH25851)
- Bug in `Series` and `DataFrame` repr where `np.datetime64('NaT')` and `np.timedelta64('NaT')` with `dtype=object` would be represented as `NaN` (GH25445)
- Bug in `to_datetime()` which does not replace the invalid argument with `NaT` when error is set to `coerce` (GH26122)
- Bug in adding `DateOffset` with nonzero month to `DatetimeIndex` would raise `ValueError` (GH26258)
- Bug in `to_datetime()` which raises unhandled `OverflowError` when called with mix of invalid dates and `NaN` values with `format='%Y%m%d' and error='coerce'` (GH25512)
- Bug in `isin()` for datetimelike indexes, `DatetimeIndex, TimedeltaIndex` and `PeriodIndex` where the levels parameter was ignored. (GH26675)
- Bug in `to_datetime()` which raises `TypeError` for `format='%Y%m%d' when called for invalid integer dates with length >= 6 digits with errors='ignore'`
- Bug when comparing a `PeriodIndex` against a zero-dimensional numpy array (GH26689)
- Bug in constructing a `Series` or `DataFrame` from a numpy `datetime64` array with a non-ns unit and out-of-bound timestamps generating rubbish data, which will now correctly raise an `OutOfBoundsDatetime` error (GH26206).
- Bug in `date_range()` with unnecessary `OverflowError` being raised for very large or very small dates (GH26651)
- Bug where adding `Timestamp` to a `np.timedelta64` object would raise instead of returning a `Timestamp` (GH24775)
- Bug where comparing a zero-dimensional numpy array containing a `np.datetime64` object to a `Timestamp` would incorrect raise `TypeError` (GH26916)
**pandas: powerful Python data analysis toolkit, Release 1.3.5**

- Bug in `to_datetime()` which would raise `ValueError`: `Tz-aware datetime.datetime cannot be converted to datetime64 unless utc=True when called with cache=True, with arg including datetime strings with different offset (GH26097)`

Timedelta

- Bug in `TimedeltaIndex.intersection()` where for non-monotonic indices in some cases an empty `Index` was returned when in fact an intersection existed (GH25913)
- Bug with comparisons between `Timedelta` and `NaT` raising `TypeError` (GH26039)
- Bug when adding or subtracting a `BusinessDay` to a `Timestamp` with the resulting time landing in a following or prior day respectively (GH26381)
- Bug when comparing a `TimedeltaIndex` against a zero-dimensional numpy array (GH26689)

Timezones

- Bug in `DatetimeIndex.to_frame()` where timezone aware data would be converted to timezone naive data (GH25809)
- Bug in `to_datetime()` with utc=True and datetime strings that would apply previously parsed UTC offsets to subsequent arguments (GH24992)
- Bug in `Timestamp.tz_localize()` and `Timestamp.tz_convert()` does not propagate `freq` (GH25241)
- Bug in `Series.at()` where setting `Timestamp` with timezone raises `TypeError` (GH25506)
- Bug in `DataFrame.update()` when updating with timezone aware data would return timezone naive data (GH25807)
- Bug in `to_datetime()` where an uninformative `RuntimeError` was raised when passing a naive `Timestamp` with datetime strings with mixed UTC offsets (GH25978)
- Bug in `to_datetime()` with unit='ns' would drop timezone information from the parsed argument (GH26168)
- Bug in `DataFrame.join()` where joining a timezone aware index with a timezone aware column would result in a column of `NaN` (GH26335)
- Bug in `date_range()` where ambiguous or nonexistent start or end times were not handled by the ambiguous or nonexistent keywords respectively (GH27088)
- Bug in `DatetimeIndex.union()` when combining a timezone aware and timezone unaware `DatetimeIndex` (GH21671)
- Bug when applying a numpy reduction function (e.g. `numpy.minimum()`) to a timezone aware `Series` (GH15552)
Numeric

- Bug in `to_numeric()` in which large negative numbers were being improperly handled (GH24910)
- Bug in `to_numeric()` in which numbers were being coerced to float, even though errors was not coerce (GH24910)
- Bug in `to_numeric()` in which invalid values for errors were being allowed (GH26466)
- Bug in `format` in which floating point complex numbers were not being formatted to proper display precision and trimming (GH25514)
- Bug in error messages in `DataFrame.corr()` and `Series.corr()`. Added the possibility of using a callable. (GH25729)
- Bug in `Series.divmod()` and `Series.rdivmod()` which would raise an (incorrect) `ValueError` rather than return a pair of `Series` objects as result (GH25557)
- Raises a helpful exception when a non-numeric index is sent to `interpolate()` with methods which require numeric index. (GH21662)
- Bug in `eval()` when comparing floats with scalar operators, for example: `x < -0.1` (GH25928)
- Fixed bug where casting all-boolean array to integer extension array failed (GH25211)
- Bug in `divmod` with a `Series` object containing zeros incorrectly raising `AttributeError` (GH26987)
- Inconsistency in `Series` floor-division (`//`) and `divmod` filling positive//zero with NaN instead of Inf (GH27321)

Conversion

- Bug in `DataFrame.astype()` when passing a dict of columns and types the `errors` parameter was ignored. (GH25905)

Strings

- Bug in the `__name__` attribute of several methods of `Series.str`, which were set incorrectly (GH23551)
- Improved error message when passing `Series` of wrong dtype to `Series.str.cat()` (GH22722)

Interval

- Construction of `Interval` is restricted to numeric, `Timestamp` and `Timedelta` endpoints (GH23013)
- Fixed bug in `Series/DataFrame` not displaying NaN in `IntervalIndex` with missing values (GH25984)
- Bug in `IntervalIndex.get_loc()` where a `KeyError` would be incorrectly raised for a decreasing `IntervalIndex` (GH25860)
- Bug in `Index` constructor where passing mixed closed `Interval` objects would result in a `ValueError` instead of an object dtype `Index` (GH27172)
Indexing

- Improved exception message when calling `DataFrame.iloc()` with a list of non-numeric objects (GH25753).
- Improved exception message when calling `.iloc` or `.loc` with a boolean indexer with different length (GH26658).
- Bug in `KeyError` exception message when indexing a `MultiIndex` with a non-existent key not displaying the original key (GH27250).
- Bug in `.iloc` and `.loc` with a boolean indexer not raising an `IndexError` when too few items are passed (GH26658).
- Bug in `DataFrame.loc()` and `Series.loc()` where `KeyError` was not raised for a `MultiIndex` when the key was less than or equal to the number of levels in the `MultiIndex` (GH14885).
- Bug in which `DataFrame.append()` produced an erroneous warning indicating that a `KeyError` will be thrown in the future when the data to be appended contains new columns (GH22252).
- Bug in which `DataFrame.to_csv()` caused a segfault for a reindexed data frame, when the indices were single-level `MultiIndex` (GH26303).
- Fixed bug where assigning a `arrays.PandasArray` to a `pandas.core.frame.DataFrame` would raise error (GH26390)
- Allow keyword arguments for callable local reference used in the `DataFrame.query()` string (GH26426)
- Fixed a `KeyError` when indexing a `MultiIndex` level with a list containing exactly one label, which is missing (GH27148)
- Bug which produced `AttributeError` on partial matching `Timestamp` in a `MultiIndex` (GH26944)
- Bug in `Categorical` and `CategoricalIndex` with `Interval` values when using the in operator (`__contains__`) with objects that are not comparable to the values in the `Interval` (GH23705)
- Bug in `DataFrame.loc()` and `DataFrame.iloc()` on a `DataFrame` with a single timezone-aware datetime64[ns] column incorrectly returning a scalar instead of a `Series` (GH27110)
- Bug in `CategoricalIndex` and `Categorical` incorrectly raising `ValueError` instead of `TypeError` when a list is passed using the in operator (`__contains__`) (GH21729)
- Bug in setting a new value in a `Series` with a `Timedelta` object incorrectly casting the value to an integer (GH22717)
- Bug in `Series` setting a new key (`__setitem__`) with a timezone-aware datetime incorrectly raising `ValueError` (GH12862)
- Bug in `DataFrame.iloc()` when indexing with a read-only indexer (GH17192)
- Bug in `Series` setting an existing tuple key (`__setitem__`) with timezone-aware datetime values incorrectly raising `TypeError` (GH20441)
Missing

- Fixed misleading exception message in `Series.interpolate()` if argument `order` is required, but omitted (GH10633, GH24014).
- Fixed class type displayed in exception message in `DataFrame.dropna()` if invalid `axis` parameter passed (GH25555)
- A `ValueError` will now be thrown by `DataFrame.fillna()` when `limit` is not a positive integer (GH27042)

MultiIndex

- Bug in which incorrect exception raised by `Timedelta` when testing the membership of `MultiIndex` (GH24570)

IO

- Bug in `DataFrame.to_html()` where values were truncated using display options instead of outputting the full content (GH17004)
- Fixed bug in missing text when using `to_clipboard()` if copying utf-16 characters in Python 3 on Windows (GH25040)
- Bug in `read_json()` for `orient='table'` when it tries to infer dtypes by default, which is not applicable as dtypes are already defined in the JSON schema (GH21345)
- Bug in `read_json()` for `orient='table'` and float index, as it infers index dtype by default, which is not applicable because index dtype is already defined in the JSON schema (GH25433)
- Bug in `read_json()` for `orient='table'` and string of float column names, as it makes a column name type conversion to `Timestamp`, which is not applicable because column names are already defined in the JSON schema (GH25435)
- Bug in `json_normalize()` for `errors='ignore'` where missing values in the input data, were filled in resulting `DataFrame` with the string "nan" instead of `numpy.nan` (GH25468)
- `DataFrame.to_html()` now raises `TypeError` when using an invalid type for the `classes` parameter instead of `AssertionError` (GH25608)
- Bug in `DataFrame.to_string()` and `DataFrame.to_latex()` that would lead to incorrect output when the `header` keyword is used (GH16718)
- Bug in `read_csv()` not properly interpreting the UTF8 encoded filenames on Windows on Python 3.6+ (GH15086)
- Improved performance in `pandas.read_stata()` and `pandas.io.stata.StataReader` when converting columns that have missing values (GH25772)
- Bug in `DataFrame.to_html()` where header numbers would ignore display options when rounding (GH17280)
- Bug in `read_hdf()` where reading a table from an HDF5 file written directly with PyTables fails with a `ValueError` when using a sub-selection via the `start` or `stop` arguments (GH11188)
- Bug in `read_hdf()` not properly closing store after a `KeyError` is raised (GH25766)
- Improved the explanation for the failure when value labels are repeated in Stata dta files and suggested work-arounds (GH25772)
- Improved `pandas.read_stata()` and `pandas.io.stata.StataReader` to read incorrectly formatted 118 format files saved by Stata (GH25960)
- Improved the `col_space` parameter in `DataFrame.to_html()` to accept a string so CSS length values can be set correctly (GH25941)
- Fixed bug in loading objects from S3 that contain # characters in the URL (GH25945)
- Adds `use_bqstorage_api` parameter to `read_gbq()` to speed up downloads of large data frames. This feature requires version 0.10.0 of the pandas-gbq library as well as the google-cloud-bigquery-storage and fastavro libraries. (GH26104)
- Fixed memory leak in `DataFrame.to_json()` when dealing with numeric data (GH24889)
- Bug in `read_json()` where date strings with Z were not converted to a UTC timezone (GH26168)
- Added `cache_dates=True` parameter to `read_csv()`, which allows to cache unique dates when they are parsed (GH25990)
- `DataFrame.to_excel()` now raises a `ValueError` when the caller’s dimensions exceed the limitations of Excel (GH26051)
- Fixed bug in `pandas.read_csv()` where a BOM would result in incorrect parsing using engine='python' (GH26545)
- `read_excel()` now raises a `ValueError` when input is of type `pandas.io.excel.ExcelFile` and engine param is passed since `pandas.io.excel.ExcelFile` has an engine defined (GH26566)
- Bug while selecting from HDFStore with `where='` specified (GH26610).
- Fixed bug in `DataFrame.to_excel()` where custom objects (i.e. `PeriodIndex`) inside merged cells were not being converted into types safe for the Excel writer (GH27006)
- Bug in `read_hdf()` where reading a timezone aware `DatetimeIndex` would raise a `TypeError` (GH11926)
- Bug in `to_msgpack()` and `read_msgpack()` which would raise a `ValueError` rather than a `FileNotFoundError` for an invalid path (GH27160)
- Fixed bug in `DataFrame.to_parquet()` which would raise a `ValueError` when the dataframe had no columns (GH27339)
- Allow parsing of `PeriodDtype` columns when using `read_csv()` (GH26934)

Plotting

- Fixed bug where `api.extensions.ExtensionArray` could not be used in matplotlib plotting (GH25587)
- Bug in an error message in `DataFrame.plot()`. Improved the error message if non-numerics are passed to `DataFrame.plot()` (GH25481)
- Bug in incorrect ticklabel positions when plotting an index that are non-numeric / non-datetime (GH7612, GH15912, GH22334)
- Fixed bug causing plots of `PeriodIndex` timeseries to fail if the frequency is a multiple of the frequency rule code (GH14763)
- Fixed bug when plotting a `DatetimeIndex` with `datetime.timezone.utc` timezone (GH17173)
GroupBy/resample/rolling

- Bug in `pandas.core.resample.Resampler.agg()` with a timezone aware index where OverflowError would raise when passing a list of functions (GH22660)
- Bug in `pandas.core.groupby.DataFrameGroupBy.nunique()` in which the names of column levels were lost (GH23222)
- Bug in `pandas.core.groupby.GroupBy.agg()` when applying an aggregation function to timezone aware data (GH23683)
- Bug in `pandas.core.groupby.GroupBy.first()` and `pandas.core.groupby.GroupBy.last()` where timezone information would be dropped (GH21603)
- Bug in `pandas.core.groupby.GroupBy.size()` when grouping only NA values (GH23050)
- Bug in `Series.groupby()` where observed kwarg was previously ignored (GH24880)
- Bug in `Series.groupby()` where using groupby with a MultiIndex Series with a list of labels equal to the length of the series caused incorrect grouping (GH25704)
- Ensured that ordering of outputs in groupby aggregation functions is consistent across all versions of Python (GH25692)
- Ensured that result group order is correct when grouping on an ordered Categorical and specifying observed=True (GH25871, GH25167)
- Bug in `pandas.core.window.Rolling.min()` and `pandas.core.window.Rolling.max()` that caused a memory leak (GH25893)
- Bug in `pandas.core.window.Rolling.count()` and `pandas.core.window.Expanding.count` was previously ignoring the axis keyword (GH13503)
- Bug in `pandas.core.groupby.GroupBy.idmax()` and `pandas.core.groupby.GroupBy.idmin()` with datetime column would return incorrect dtye (GH25444, GH15306)
- Bug in `pandas.core.groupby.GroupBy.cumsum()`, `pandas.core.groupby.GroupBy.cumprod()`, `pandas.core.groupby.GroupBy.cummin()` and `pandas.core.groupby.GroupBy.cummax()` with categorical column having absent categories, would return incorrect result or segfault (GH16771)
- Bug in `pandas.core.groupby.GroupBy.nth()` where NA values in the grouping would return incorrect results (GH26011)
- Bug in `pandas.core.groupby.SeriesGroupBy.transform()` where transforming an empty group would raise a ValueError (GH26208)
- Bug in `pandas.core.frame.DataFrame.groupby()` where passing a `pandas.core.groupby.grouper.Grouper` would return incorrect groups when using the .groups accessor (GH26326)
- Bug in `pandas.core.groupby.GroupBy.agg()` where incorrect results are returned for uint64 columns. (GH26310)
- Bug in `pandas.core.window.Rolling.median()` and `pandas.core.window.Rolling.quantile()` where MemoryError is raised with empty window (GH26005)
- Bug in `pandas.core.window.Rolling.median()` and `pandas.core.window.Rolling.quantile()` where incorrect results are returned with closed='left' and closed='neither' (GH26005)
- Improved `pandas.core.window.Rolling`, `pandas.core.window.Window` and `pandas.core.window.ExponentialMovingWindow` functions to exclude nuisance columns from results instead of raising errors and raise a DataError only if all columns are nuisance (GH12537)
- Bug in `pandas.core.window.Rolling.max()` and `pandas.core.window.Rolling.min()` where incorrect results are returned with an empty variable window (GH26005)
• Raise a helpful exception when an unsupported weighted window function is used as an argument of pandas.core.window.Window.aggregate() (GH26597)

Reshaping

• Bug in pandas.merge() adds a string of None, if None is assigned in suffixes instead of remain the column name as-is (GH24782).
• Bug in merge() when merging by index name would sometimes result in an incorrectly numbered index (missing index values are now assigned NA) (GH24212, GH25009)
• to_records() now accepts dtypes to its column_dtypes parameter (GH24895)
• Bug in concat() where order of OrderedDict (and dict in Python 3.6+) is not respected, when passed in as objs argument (GH21510)
• Bug in pivot_table() where columns with NaN values are dropped even if dropna argument is False, when the aggfunc argument contains a list (GH22159)
• Bug in concat() where the resulting freq of two DatetimeIndex with the same freq would be dropped (GH3232).
• Bug in merge() where merging with equivalent Categorical dtypes was raising an error (GH22501)
• Bug in DataFrame instantiating with a dict of iterators or generators (e.g. pd.DataFrame({'A': reversed(range(3))})) raised an error (GH26349).
• Bug in DataFrame instantiating with a range (e.g. pd.DataFrame(range(3))) raised an error (GH26342).
• Bug in DataFrame constructor when passing non-empty tuples would cause a segmentation fault (GH25691)
• Bug in Series.apply() failed when the series is a timezone aware DatetimeIndex (GH25959)
• Bug in pandas.cut() where large bins could incorrectly raise an error due to an integer overflow (GH26045)
• Bug in DataFrame.sort_index() where an error is thrown when a multi-indexed DataFrame is sorted on all levels with the initial level sorted last (GH26053)
• Bug in Series.nlargest() treats True as smaller than False (GH26154)
• Bug in DataFrame.pivot_table() with a IntervalIndex as pivot index would raise TypeError (GH25814)
• Bug in which DataFrame.from_dict() ignored order of OrderedDict when orient='index' (GH8425).
• Bug in DataFrame.transpose() where transposing a DataFrame with a timezone-aware datetime column would incorrectly raise ValueError (GH26825)
• Bug in pivot_table() when pivoting a timezone aware column as the values would remove timezone information (GH14948)
• Bug in merge_asof() when specifying multiple by columns where one is datetime64[ns, tz] dtype (GH26649)
Sparse

- Significant speedup in `SparseArray` initialization that benefits most operations, fixing performance regression introduced in v0.20.0 (GH24985)
- Bug in `SparseFrame` constructor where passing `None` as the data would cause `default_fill_value` to be ignored (GH16807)
- Bug in `SparseDataFrame` when adding a column in which the length of values does not match length of index, `AssertionError` is raised instead of raising `ValueError` (GH25484)
- Introduce a better error message in `Series.sparse.from_coo()` so it returns a `TypeError` for inputs that are not coo matrices (GH26554)
- Bug in `numpy.modf()` on a `SparseArray`. Now a tuple of `SparseArray` is returned (GH26946).

Build changes

- Fix install error with PyPy on macOS (GH26536)

ExtensionArray

- Bug in `factorize()` when passing an `ExtensionArray` with a custom `na_sentinel` (GH25696).
- `Series.count()` miscounts NA values in ExtensionArrays (GH26835)
- Added `Series.__array_ufunc__` to better handle NumPy ufuncs applied to Series backed by extension arrays (GH23293).
- Keyword argument `deep` has been removed from `ExtensionArray.copy()` (GH27083)

Other

- Removed unused C functions from vendored UltraJSON implementation (GH26198)
- Allow `Index` and `RangeIndex` to be passed to `numpy min` and `max` functions (GH26125)
- Use actual class name in repr of empty objects of a `Series` subclass (GH27001).
- Bug in `DataFrame` where passing an object array of timezone-aware `datetime` objects would incorrectly raise `ValueError` (GH13287)

5.6 Version 0.24

5.6.1 What's new in 0.24.2 (March 12, 2019)

**Warning:** The 0.24.x series of releases will be the last to support Python 2. Future feature releases will support Python 3 only. See [Dropping Python 2.7](#) for more.

These are the changes in pandas 0.24.2. See [Release notes](#) for a full changelog including other versions of pandas.

**Fixed regressions**

- Fixed regression in `DataFrame.all()` and `DataFrame.any()` where `bool_only=True` was ignored (GH25101)
- Fixed issue in DataFrame construction with passing a mixed list of mixed types could segfault. (GH25075)
- Fixed regression in `DataFrame.apply()` causing `RecursionError` when dict-like classes were passed as argument. (GH25196)
- Fixed regression in `DataFrame.replace()` where `regex=True` was only replacing patterns matching the start of the string (GH25259)
- Fixed regression in `DataFrame.duplicated()`, where empty dataframe was not returning a boolean dtyped Series. (GH25184)
- Fixed regression in `Series.min()` and `Series.max()` where `numeric_only=True` was ignored when the `Series` contained Categorical data (GH25299)
- Fixed regression in subtraction between `Series` objects with `datetime64[ns]` dtype incorrectly raising `OverflowError` when the `Series` on the right contains null values (GH25317)
- Fixed regression in `TimedeltaIndex` where `np.sum(index)` incorrectly returned a zero-dimensional object instead of a scalar (GH25282)
- Fixed regression in `IntervalDtype` construction where passing an incorrect string with ‘Interval’ as a prefix could result in a `RecursionError`. (GH25338)
- Fixed regression in creating a period-dtype array from a read-only NumPy array of period objects. (GH25403)
• Fixed regression in `Categorical`, where constructing it from a categorical `Series` and an explicit `categories=` that differed from that in the `Series` created an invalid object which could trigger segfaults. (GH25318)

• Fixed regression in `to_timedelta()` losing precision when converting floating data to `Timedelta` data (GH25077).

• Fixed pip installing from source into an environment without NumPy (GH25193)

• Fixed regression in `DataFrame.replace()` where largest strings of numbers would be coerced into `int64`, causing an `OverflowError` (GH25616)

• Fixed regression in `factorize()` when passing a custom `na_sentinel` value with `sort=True` (GH25409).

• Fixed regression in `DataFrame.to_csv()` writing duplicate line endings with gzip compress (GH25311)

**Bug fixes**

**I/O**

• Better handling of terminal printing when the terminal dimensions are not known (GH25080)

• Bug in reading a HDF5 table-format `DataFrame` created in Python 2, in Python 3 (GH24925)

• Bug in reading a JSON with `orient='table'` generated by `DataFrame.to_json()` with `index=False` (GH25170)

• Bug where float indexes could have misaligned values when printing (GH25061)

**Categorical**

• Bug where calling `Series.replace()` on categorical data could return a `Series` with incorrect dimensions (GH24971)

•

**Reshaping**

• Bug in `transform()` where applying a function to a timezone aware column would return a timezone naive result (GH24198)

• Bug in `DataFrame.join()` when joining on a timezone aware `DatetimeIndex` (GH23931)

**Visualization**

• Bug in `Series.plot()` where a secondary y axis could not be set to log scale (GH25545)

**Other**

• Bug in `Series.is_unique()` where single occurrences of NaN were not considered unique (GH25180)

• Bug in `merge()` when merging an empty `DataFrame` with an `Int64` column or a non-empty `DataFrame` with an `Int64` column that is all NaN (GH25183)

• Bug in `IntervalTree` where a `RecursionError` occurs upon construction due to an overflow when adding endpoints, which also causes `IntervalIndex` to crash during indexing operations (GH25485)

• Bug in `Series.size` raising for some extension-array-backed `Series`, rather than returning the size (GH25580)

• Bug in resampling raising for nullable integer-dtype columns (GH25580)

5.6.2 What’s new in 0.24.1 (February 3, 2019)

**Warning:** The 0.24.x series of releases will be the last to support Python 2. Future feature releases will support Python 3 only. See Dropping Python 2.7 for more.

These are the changes in pandas 0.24.1. See Release notes for a full changelog including other versions of pandas. See What’s new in 0.24.0 (January 25, 2019) for the 0.24.0 changelog.

**API changes**

**Changing the sort parameter for Index set operations**

The default sort value for `Index.union()` has changed from `True` to `None` (GH24959). The default behavior, however, remains the same: the result is sorted, unless

1. `self` and `other` are identical
2. `self` or `other` is empty
3. `self` or `other` contain values that can not be compared (a `RuntimeWarning` is raised).

This change will allow `sort=True` to mean “always sort” in a future release.

The same change applies to `Index.difference()` and `Index.symmetric_difference()`, which would not sort the result when the values could not be compared.

The `sort` option for `Index.intersection()` has changed in three ways.

1. The default has changed from `True` to `False`, to restore the pandas 0.23.4 and earlier behavior of not sorting by default.
2. The behavior of `sort=True` can now be obtained with `sort=None`. This will sort the result only if the values in `self` and `other` are not identical.
3. The value `sort=True` is no longer allowed. A future version of pandas will properly support `sort=True` meaning “always sort”.

**Fixed regressions**

- Fixed regression in `DataFrame.to_dict()` with `records` orient raising an `AttributeError` when the `DataFrame` contained more than 255 columns, or wrongly converting column names that were not valid python identifiers (GH24939, GH24940).
- Fixed regression in `read_sql()` when passing certain queries with MySQL/pymysql (GH24988).
- Fixed regression in `Index.intersection` incorrectly sorting the values by default (GH24959).
- Fixed regression in `merge()` when merging an empty `DataFrame` with multiple timezone-aware columns on one of the timezone-aware columns (GH25014).
- Fixed regression in `Series.rename_axis()` and `DataFrame.rename_axis()` where passing `None` failed to remove the axis name (GH25034)
- Fixed regression in `to_timedelta()` with `box=False` incorrectly returning a `datetime64` object instead of a `timedelta64` object (GH24961)
- Fixed regression where custom hashable types could not be used as column keys in `DataFrame.set_index()` (GH24969)
**Bug fixes**

**Reshaping**
- Bug in `DataFrame.groupby()` with `Grouper` when there is a time change (DST) and grouping frequency is '1d' (GH24972)

**Visualization**
- Fixed the warning for implicitly registered matplotlib converters not showing. See [Restore Matplotlib datetime converter registration](https://github.com/pandas-dev/pandas/issues/24963) for more (GH24963).

**Other**
- Fixed AttributeError when printing a DataFrame’s HTML repr after accessing the IPython config object (GH25036)

**Contributors**

A total of 7 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

### 5.6.3 What’s new in 0.24.0 (January 25, 2019)

**Warning:** The 0.24.x series of releases will be the last to support Python 2. Future feature releases will support Python 3 only. See [Dropping Python 2.7](https://pandas.pydata.org/pandas-docs/stable/user_guide/versioning.html) for more details.

This is a major release from 0.23.4 and includes a number of API changes, new features, enhancements, and performance improvements along with a large number of bug fixes.

Highlights include:

- Optional Integer NA Support
- New APIs for accessing the array backing a Series or Index
- A new top-level method for creating arrays
- Store Interval and Period data in a Series or DataFrame
- Support for joining on two MultiIndexes

Check the [API Changes](https://pandas.pydata.org/pandas-docs/stable/user_guide/api_changes.html) and [deprecations](https://pandas.pydata.org/pandas-docs/stable/user_guide/deprecations.html) before updating.

These are the changes in pandas 0.24.0. See [Release notes](https://pandas.pydata.org/pandas-docs/stable/user_guide/whatsnew.html) for a full changelog including other versions of pandas.
Enhancements

Optional integer NA support

pandas has gained the ability to hold integer dtypes with missing values. This long requested feature is enabled through the use of extension types.

Note: IntegerArray is currently experimental. Its API or implementation may change without warning.

We can construct a Series with the specified dtype. The dtype string Int64 is a pandas ExtensionDtype. Specifying a list or array using the traditional missing value marker of np.nan will infer to integer dtype. The display of the Series will also use the NaN to indicate missing values in string outputs. (GH20700, GH20747, GH22441, GH21789, GH22346)

In [1]: s = pd.Series([1, 2, np.nan], dtype='Int64')

In [2]: s
Out[2]:
0   1
1   2
2  <NA>
Length: 3, dtype: Int64

Operations on these dtypes will propagate NaN as other pandas operations.

# arithmetic
In [3]: s + 1
Out[3]:
0   2
1   3
2  <NA>
Length: 3, dtype: Int64

# comparison
In [4]: s == 1
Out[4]:
0   True
1   False
2  <NA>
Length: 3, dtype: boolean

# indexing
In [5]: s.iloc[1:3]
Out[5]:
1   2
2  <NA>
Length: 2, dtype: Int64

# operate with other dtypes
In [6]: s + s.iloc[1:3].astype('Int8')
Out[6]:
0  <NA>
These dtypes can operate as part of a DataFrame.

```python
In [8]: df = pd.DataFrame({'A': s, 'B': [1, 1, 3], 'C': list('aab'))
```

```python
In [9]: df
Out[9]:
       A  B  C
0     1  1  a
1     2  1  a
2    <NA>  3  b
[3 rows x 3 columns]
```

```python
In [10]: df.dtypes
Out[10]:
       A    B     C
dtype: int64, int64, object
```

These dtypes can be merged, reshaped, and casted.

```python
In [11]: pd.concat([df[['A']], df[['B', 'C']]], axis=1).dtypes
Out[11]:
       A    B    C
dtype: int64, int64, object
```

```python
In [12]: df['A'].astype(float)
Out[12]:
0   1.0
1  2.0
2  NaN
Name: A, Length: 3, dtype: float64
```

Reduction and groupby operations such as `sum` work.

```python
In [13]: df.sum()
Out[13]:
A    3
```

B  5
C  aab
Length: 3, dtype: object

In [14]: df.groupby('B').A.sum()
Out[14]:
B
1  3
3  0
Name: A, Length: 2, dtype: Int64

**Warning:** The Integer NA support currently uses the capitalized dtype version, e.g. Int8 as compared to the traditional int8. This may be changed at a future date.

See [Nullable integer data type](https://pandas.pydata.org/pandas-docs/stable/user_guide/nullable.html) for more.

### Accessing the values in a Series or Index

`Series.array` and `Index.array` have been added for extracting the array backing a Series or Index. ([GH19954](https://github.com/pandas-dev/pandas/pull/19954), [GH23623](https://github.com/pandas-dev/pandas/pull/23623))

In [15]: idx = pd.period_range('2000', periods=4)

In [16]: idx.array
Out[16]:
<PeriodArray>
Length: 4, dtype: period[D]

In [17]: pd.Series(idx).array
Out[17]:
<PeriodArray>
Length: 4, dtype: period[D]

Historically, this would have been done with `series.values`, but with `.values` it was unclear whether the returned value would be the actual array, some transformation of it, or one of pandas custom arrays (like `Categorical`). For example, with `PeriodIndex`, `.values` generates a new ndarray of period objects each time.

In [18]: idx.values
Out[18]:
array([Period('2000-01-01', 'D'), Period('2000-01-02', 'D'),
       Period('2000-01-03', 'D'), Period('2000-01-04', 'D')], dtype=object)

In [19]: id(idx.values)
Out[19]: 139665006441552

In [20]: id(idx.values)
Out[20]: 139665007557008
If you need an actual NumPy array, use `Series.to_numpy()` or `Index.to_numpy()`.

```python
In [21]: idx.to_numpy()
Out[21]:
array([Period('2000-01-01', 'D'),
       Period('2000-01-02', 'D'),
       Period('2000-01-03', 'D'),
       Period('2000-01-04', 'D')], dtype=object)
```

```python
In [22]: pd.Series(idx).to_numpy()
Out[22]:
array([Period('2000-01-01', 'D'),
       Period('2000-01-02', 'D'),
       Period('2000-01-03', 'D'),
       Period('2000-01-04', 'D')], dtype=object)
```

For Series and Indexes backed by normal NumPy arrays, `Series.array` will return a new `arrays.PandasArray`, which is a thin (no-copy) wrapper around a `numpy.ndarray`. `PandasArray` isn’t especially useful on its own, but it does provide the same interface as any extension array defined in pandas or by a third-party library.

```python
In [23]: ser = pd.Series([1, 2, 3])
```

```python
In [24]: ser.array
Out[24]:
<PandasArray>
[1, 2, 3]
Length: 3, dtype: int64
```

```python
In [25]: ser.to_numpy()
Out[25]:
array([1, 2, 3])
```

We haven’t removed or deprecated `Series.values` or `DataFrame.values`, but we highly recommend and using `.array` or `.to_numpy()` instead.

See `Dtypes` and `Attributes and Underlying Data` for more.

**pandas.array: a new top-level method for creating arrays**

A new top-level method `array()` has been added for creating 1-dimensional arrays (GH22860). This can be used to create any extension array, including extension arrays registered by 3rd party libraries. See the `dtypes docs` for more on extension arrays.

```python
In [26]: pd.array([1, 2, np.nan], dtype='Int64')
Out[26]:
<IntegerArray>
[1, 2, <NA>]
Length: 3, dtype: Int64
```

```python
In [27]: pd.array(['a', 'b', 'c'], dtype='category')
Out[27]:
['a', 'b', 'c']
Categories (3, object): ['a', 'b', 'c']
```

Passing data for which there isn’t dedicated extension type (e.g. float, integer, etc.) will return a new `arrays.PandasArray`, which is just a thin (no-copy) wrapper around a `numpy.ndarray` that satisfies the pandas extension array interface.
On their own, a PandasArray isn’t a very useful object. But if you need write low-level code that works generically for any ExtensionArray, PandasArray satisfies that need.

Notice that by default, if no dtype is specified, the dtype of the returned array is inferred from the data. In particular, note that the first example of [1, 2, np.nan] would have returned a floating-point array, since NaN is a float.

Storing Interval and Period data in Series and DataFrame

Interval and Period data may now be stored in a Series or DataFrame, in addition to an IntervalIndex and PeriodIndex like previously (GH19453, GH22862).

For periods:

<table>
<thead>
<tr>
<th>In</th>
<th>Out</th>
</tr>
</thead>
<tbody>
<tr>
<td>In [33]: pd.Series(pd.period_range(&quot;2000&quot;, freq=&quot;D&quot;, periods=5))</td>
<td></td>
</tr>
<tr>
<td>In [34]: pser</td>
<td></td>
</tr>
<tr>
<td>0   2000-01-01</td>
<td></td>
</tr>
<tr>
<td>1   2000-01-02</td>
<td></td>
</tr>
<tr>
<td>2   2000-01-03</td>
<td></td>
</tr>
<tr>
<td>3   2000-01-04</td>
<td></td>
</tr>
<tr>
<td>4   2000-01-05</td>
<td></td>
</tr>
<tr>
<td>Length: 5, dtype: period[D]</td>
<td></td>
</tr>
</tbody>
</table>
Previously, these would be cast to a NumPy array with object dtype. In general, this should result in better performance when storing an array of intervals or periods in a `Series` or column of a `DataFrame`.

Use `Series.array` to extract the underlying array of intervals or periods from the `Series`:

```
In [36]: ser.array
Out[36]:
<IntervalArray>
[(0, 1], (1, 2], (2, 3], (3, 4], (4, 5]]
Length: 5, dtype: interval[int64, right]
```

```
In [37]: pser.array
Out[37]:
<PeriodArray>
Length: 5, dtype: period[D]
```

These return an instance of `arrays.IntervalArray` or `arrays.PeriodArray`, the new extension arrays that back interval and period data.

**Warning:** For backwards compatibility, `Series.values` continues to return a NumPy array of objects for Interval and Period data. We recommend using `Series.array` when you need the array of data stored in the `Series`, and `Series.to_numpy()` when you know you need a NumPy array.

See Dtypes and Attributes and Underlying Data for more.

### Joining with two multi-indexes

`DataFrame.merge()` and `DataFrame.join()` can now be used to join multi-indexed Dataframe instances on the overlapping index levels (GH6360)

See the Merge, join, and concatenate documentation section.

```
In [38]: index_left = pd.MultiIndex.from_tuples([(0, 1), (1, 2), (2, 3), (3, 4), (4, 5)],
                                           names=['key', 'X'])
   ....:
   ....:

In [39]: left = pd.DataFrame({'A': ['A0', 'A1', 'A2'],
                           'B': ['B0', 'B1', 'B2']}, index=index_left)
   ....:

In [40]: index_right = pd.MultiIndex.from_tuples([(0, 1), (1, 1), (2, 2), (3, 3)],
                                             names=['key', 'Y'])
   ....:

In [41]: right = pd.DataFrame({'C': ['C0', 'C1', 'C2', 'C3'],
                           'D': ['D0', 'D1', 'D2', 'D3']}, index=index_right)
   ....:

In [42]: left.join(right)
Out[42]:
```
(continues on next page)
For earlier versions this can be done using the following.

```python
In [43]: pd.merge(left.reset_index(), right.reset_index(),
               on=['key'], how='inner').set_index(['key', 'X', 'Y'])
```

```text
Out[43]:
```

Function `read_html` enhancements

`read_html()` previously ignored `colspan` and `rowspan` attributes. Now it understands them, treating them as sequences of cells with the same value. (GH17054)

```python
In [44]: result = pd.read_html("""
......: <table>
......:   <thead>
......:     <tr>
......:       <th>A</th><th>B</th><th>C</th>
......:     </tr>
......:   </thead>
......:   <tbody>
......:     <tr>
......:       <td colspan="2">1</td><td>2</td>
......:     </tr>
......:   </tbody>
......: </table>"")
```

Previous behavior:

```python
In [13]: result
Out [13]:
```

```
[[ A B C
  0 1 2 NaN]
```

New behavior:
New Styler.pipe() method

The Styler class has gained a pipe() method. This provides a convenient way to apply users’ predefined styling functions, and can help reduce “boilerplate” when using DataFrame styling functionality repeatedly within a notebook. (GH23229)

```python
In [46]: df = pd.DataFrame({'N': [1250, 1500, 1750], 'X': [0.25, 0.35, 0.50]})
```

```python
In [47]: def format_and_align(styler):
   ....:     return (styler.format({'N': '{:,}', 'X': '{:.1%}'}))
   ....:     .set_properties(**{'text-align': 'right'})
   ....:
```

```python
In [48]: df.style.pipe(format_and_align).set_caption('Summary of results.')
Out[48]: <pandas.io.formats.style.Styler at 0x7f064a90a190>
```

Similar methods already exist for other classes in pandas, including DataFrame.pipe(), GroupBy.pipe(), and Resampler.pipe().

Renaming names in a MultiIndex

DataFrame.rename_axis() now supports index and columns arguments and Series.rename_axis() supports index argument (GH19978).

This change allows a dictionary to be passed so that some of the names of a MultiIndex can be changed.

Example:

```python
In [49]: mi = pd.MultiIndex.from_product([list('AB'), list('CD'), list('EF')],
   ....:     names=['AB', 'CD', 'EF'])
   ....:
```

```python
In [50]: df = pd.DataFrame(list(range(len(mi))), index=mi, columns=['N'])
```

```python
In [51]: df
Out[51]:
   N
  AB CD EF
  A  C  E  0
  B  5
  D  E  2
  F  3
  E  4
  F  5
```

(continues on next page)
See the Advanced documentation on renaming for more details.

Other enhancements

- `merge()` now directly allows merge between objects of type DataFrame and named Series, without the need to convert the Series object into a DataFrame beforehand (GH21220)

- `ExcelWriter` now accepts `mode` as a keyword argument, enabling append to existing workbooks when using the openpyxl engine (GH3441)

- `FrozenList` has gained the `.union()` and `.difference()` methods. This functionality greatly simplifies groupby’s that rely on explicitly excluding certain columns. See Splitting an object into groups for more information (GH15475, GH15506).

- `DataFrame.to_parquet()` now accepts `index` as an argument, allowing the user to override the engine’s default behavior to include or omit the dataframe’s indexes from the resulting Parquet file. (GH20768)

- `read_feather()` now accepts `columns` as an argument, allowing the user to specify which columns should be read. (GH24025)

- `DataFrame.corr()` and `Series.corr()` now accept a callable for generic calculation methods of correlation, e.g. histogram intersection (GH22684)

- `DataFrame.to_string()` now accepts `decimal` as an argument, allowing the user to specify which decimal separator should be used in the output. (GH23614)

- `DataFrame.to_html()` now accepts `render_links` as an argument, allowing the user to generate HTML with links to any URLs that appear in the DataFrame. See the section on writing HTML in the IO docs for example usage. (GH2679)

- `pandas.read_csv()` now supports pandas extension types as an argument to `dtype`, allowing the user to use pandas extension types when reading CSVs. (GH23228)

- The `shift()` method now accepts `fill_value` as an argument, allowing the user to specify a value which will be used instead of NA/NaT in the empty periods. (GH15486)

- `to_datetime()` now supports the `%Z` and `%z` directive when passed into `format` (GH13486)
Series.mode() and DataFrame.mode() now support the dropna parameter which can be used to specify whether NaN/NaT values should be considered (GH17534)

DataFrame.to_csv() and Series.to_csv() now support the compression keyword when a file handle is passed. (GH21227)

Index.droplevel() is now implemented also for flat indexes, for compatibility with MultiIndex (GH21115)

Series.droplevel() and DataFrame.droplevel() are now implemented (GH20342)

Added support for reading from/writing to Google Cloud Storage via the gcsfs library (GH19454, GH23094)

DataFrame.to_gbq() and read_gbq() signature and documentation updated to reflect changes from the pandas-gbq library version 0.8.0. Adds a credentials argument, which enables the use of any kind of google-auth credentials. (GH21627, GH22557, GH23662)

New method HDFStore.walk() will recursively walk the group hierarchy of an HDF5 file (GH10932)

read_html() copies cell data across colspan and rowspan, and it treats all-th table rows as headers if header kwarg is not given and there is no thead (GH17054)

Series.nlargest(), Series.nsmallest(), DataFrame.nlargest(), and DataFrame.nsmallest() now accept the value "all" for the keep argument. This keeps all ties for the nth largest/smallest value (GH16818)

IntervalIndex has gained the set_closed() method to change the existing closed value (GH21670)

to_csv(), to_csv(), to_json(), and to_json() now support compression='infer' to infer compression based on filename extension (GH15008). The default compression for to_csv, to_json, and to_pickle methods has been updated to 'infer' (GH22004).

DataFrame.to_sql() now supports writing TIMESTAMP WITH TIME ZONE types for supported databases. For databases that don’t support timezones, datetime data will be stored as timezone unaware local timestamps. See the Datetime data types for implications (GH9086).

to_timedelta() now supports iso-formatted timedelta strings (GH21877)

Series and DataFrame now support Iterable objects in the constructor (GH2193)

DatetimeIndex has gained the DatetimeIndex.timetz attribute. This returns the local time with timezone information. (GH21358)

round(), ceil(), and floor() for DatetimeIndex and Timestamp now support an ambiguous argument for handling datetimes that are rounded to ambiguous times (GH18946) and a nonexistent argument for handling datetimes that are rounded to nonexistent times. See Nonexistent times when localizing (GH22647)

The result of resample() is now iterable similar to groupby() (GH15314).

Series.resample() and DataFrame.resample() have gained the pandas.core.resample.Resampler.quantile() (GH15023).

DataFrame.resample() and Series.resample() with a PeriodIndex will now respect the base argument in the same fashion as with a DatetimeIndex. (GH23882)

pandas.api.types.is_list_like() has gained a keyword allow_sets which is True by default; if False, all instances of set will not be considered “list-like” anymore (GH23061)

Index.to_frame() now supports overriding column name(s) (GH22580).

Categorical.from_codes() now can take a dtype parameter as an alternative to passing categories and ordered (GH24398).

New attribute __git_version__ will return git commit sha of current build (GH21295).

Compatibility with Matplotlib 3.0 (GH22790).
• Added `Interval.overlaps()`, `arrays.IntervalArray.overlaps()`, and `IntervalIndex.overlaps()` for determining overlaps between interval-like objects (GH21998)

• `read_fwf()` now accepts keyword `infer_nrows` (GH15138).

• `to_parquet()` now supports writing a `DataFrame` as a directory of parquet files partitioned by a subset of the columns when `engine = 'pyarrow'` (GH23283)

• `Timestamp.tz_localize()`, `DatetimeIndex.tz_localize()`, and `Series.tz_localize()` have gained the `nonexistent` argument for alternative handling of nonexistent times. See `Nonexistent times when localizing` (GH8917, GH24466)

• `Index.difference()`, `Index.intersection()`, `Index.union()`, and `Index.symmetric_difference()` now have an optional `sort` parameter to control whether the results should be sorted if possible (GH17839, GH24471)

• `read_excel()` now accepts `usecols` as a list of column names or callable (GH18273)

• `MultiIndex.to_flat_index()` has been added to flatten multiple levels into a single-level `Index` object.

• `DataFrame.to_stata()` and `pandas.io.stata.StataWriter117` can write mixed string columns to Stata `strl` format (GH23633)

• `DataFrame.between_time()` and `DataFrame.at_time()` have gained the `axis` parameter (GH8839)

• `DataFrame.to_records()` now accepts `index_dtypes` and `column_dtypes` parameters to allow different data types in stored column and index records (GH18146)

• `IntervalIndex` has gained the `is_overlapping` attribute to indicate if the `IntervalIndex` contains any overlapping intervals (GH23309)

• `pandas.DataFrame.to_sql()` has gained the `method` argument to control SQL insertion clause. See the `insertion method` section in the documentation. (GH8953)

• `DataFrame.corrwith()` now supports Spearman’s rank correlation, Kendall’s tau as well as callable correlation methods. (GH21925)

• `DataFrame.to_json()`, `DataFrame.to_csv()`, `DataFrame.to_pickle()`, and other export methods now support tilde(~) in path argument. (GH23473)

**Backwards incompatible API changes**

pandas 0.24.0 includes a number of API breaking changes.

**Increased minimum versions for dependencies**

We have updated our minimum supported versions of dependencies (GH21242, GH18742, GH23774, GH24767). If installed, we now require:

5.6. Version 0.24 3003
Additionally we no longer depend on feather-format for feather based storage and replaced it with references to pyarrow (GH21639 and GH23053).

**os.linesep is used for line_terminator of DataFrame.to_csv**

`DataFrame.to_csv()` now uses `os.linesep()` rather than ' \n ' for the default line terminator (GH20353). This change only affects when running on Windows, where ' \r\n ' was used for line terminator even when ' \n ' was passed in `line_terminator`.

**Previous behavior** on Windows:

```python
In [1]: data = pd.DataFrame({"string_with_lf": ["a\nbc"],
   ...
   "string_with_crlf": ["a\r\nbac"]})

In [2]: # When passing file PATH to to_csv,
   ...
   # line_terminator does not work, and csv is saved with \r\n'.
   ...
   # Also, this converts all \n's in the data to \r\n'.
   ...
   data.to_csv("test.csv", index=False, line_terminator='\n')

In [3]: with open("test.csv", mode='rb') as f:
   ...
   print(f.read())

Out[3]: b'string_with_lf,string_with_crlf\n\n"a\nbc","a\r\nbac"

In [4]: # When passing file OBJECT with newline option to
   ...
   # to_csv, line_terminator works.
   ...
   with open("test2.csv", mode='w', newline='\n') as f:
   ...
   data.to_csv(f, index=False, line_terminator='\n')

In [5]: with open("test2.csv", mode='rb') as f:
   ...
   print(f.read())

Out[5]: b'string_with_lf,string_with_crlf\n"a\nbc","a\r\nbac\n'
```

**New behavior** on Windows:

Passing `line_terminator` explicitly, set the line_terminator to that character.

```python
In [1]: data = pd.DataFrame({"string_with_lf": ["a\nbc"],
   ...
   "string_with_crlf": ["a\r\nbac"]})
```
In [2]: data.to_csv("test.csv", index=False, line_terminator=\'\n\')

In [3]: with open("test.csv", mode='rb') as f:
...:     print(f.read())
Out[3]: b'string_with_lf, string_with_crlf
\na\nb\nc', 'a\nr\nb\nc'\n
On Windows, the value of os.linesep is 'r\n', so if line_terminator is not set, 'r\n' is used for line terminator.

In [1]: data = pd.DataFrame({"string_with_lf": ["a\nb\nc"],
...:                      "string_with_crlf": ["a\nr\nb\nc"]})

In [2]: data.to_csv("test.csv", index=False)

In [3]: with open("test.csv", mode='rb') as f:
...:     print(f.read())
Out[3]: b'string_with_lf, string_with_crlf\na\nb\nc', 'a\nr\nb\nc\nr\n'

For file objects, specifying newline is not sufficient to set the line terminator. You must pass in the line_terminator explicitly, even in this case.

In [1]: data = pd.DataFrame({"string_with_lf": ["a\nb\nc"],
...:                      "string_with_crlf": ["a\nr\nb\nc"]})

In [2]: with open("test2.csv", mode='w', newline='\n') as f:
...:     data.to_csv(f, index=False)

In [3]: with open("test2.csv", mode='rb') as f:
...:     print(f.read())
Out[3]: b'string_with_lf, string_with_crlf\na\nb\nc', 'a\nr\nb\nc\nr\n'

Proper handling of np.NaN in a string data-typed column with the Python engine

There was bug in read_excel() and read_csv() with the Python engine, where missing values turned to 'nan' with dtype=str and na_filter=True. Now, these missing values are converted to the string missing indicator, np.nan. (GH20377)

Previous behavior:

In [5]: data = 'a,b,c\n1,,3\n4,5,6'
In [6]: df = pd.read_csv(StringIO(data), engine='python', dtype=str, na_filter=True)
In [7]: df.loc[0, 'b']
Out[7]: 'nan'

New behavior:

In [53]: data = 'a,b,c\n1,,3\n4,5,6'
In [54]: df = pd.read_csv(StringIO(data), engine='python', dtype=str, na_filter=True)
In [55]: df.loc[0, 'b']
Out[55]: nan

Notice how we now instead output np.nan itself instead of a stringified form of it.

Parsing datetime strings with timezone offsets

Previously, parsing datetime strings with UTC offsets with `to_datetime()` or `DatetimeIndex` would automatically convert the datetime to UTC without timezone localization. This is inconsistent from parsing the same datetime string with `Timestamp` which would preserve the UTC offset in the `tz` attribute. Now, `to_datetime()` preserves the UTC offset in the `tz` attribute when all the datetime strings have the same UTC offset (GH17697, GH11736, GH22457)

Previous behavior:

```python
In [2]: pd.to_datetime("2015-11-18 15:30:00+05:30")
Out[2]: Timestamp('2015-11-18 10:00:00')

In [3]: pd.Timestamp("2015-11-18 15:30:00+05:30")
Out[3]: Timestamp('2015-11-18 15:30:00+0530', tz='pytz.FixedOffset(330)')

# Different UTC offsets would automatically convert the datetimes to UTC (without a UTC
˓→timezone)
In [4]: pd.to_datetime(['"2015-11-18 15:30:00+05:30", "2015-11-18 16:30:00+06:30"'])
Out[4]: DatetimeIndex(['2015-11-18 10:00:00', '2015-11-18 10:00:00'], dtype=˓→'datetime64[ns]', freq=None)
```

New behavior:

```python
In [56]: pd.to_datetime("2015-11-18 15:30:00+05:30")
Out[56]: Timestamp('2015-11-18 15:30:00+0530', tz='pytz.FixedOffset(330)')

In [57]: pd.Timestamp("2015-11-18 15:30:00+05:30")
Out[57]: Timestamp('2015-11-18 15:30:00+0530', tz='pytz.FixedOffset(330)')
```

Parsing datetime strings with the same UTC offset will preserve the UTC offset in the `tz`

```python
In [58]: pd.to_datetime(['"2015-11-18 15:30:00+05:30"'] * 2)
Out[58]: DatetimeIndex(['2015-11-18 15:30:00+05:30', '2015-11-18 15:30:00+05:30'], dtype=˓→'datetime64[ns, pytz.FixedOffset(330)]', freq=None)
```

Parsing datetime strings with different UTC offsets will now create an Index of `datetime.datetime` objects with different UTC offsets

```python
In [59]: idx = pd.to_datetime(['"2015-11-18 15:30:00+05:30", ....: "2015-11-18 16:30:00+06:30"])
....:...

In [60]: idx
Out[60]: Index(['2015-11-18 15:30:00+05:30', 2015-11-18 16:30:00+06:30], dtype='object')

In [61]: idx[0]
Out[61]: datetime.datetime(2015, 11, 18, 15, 30, tzinfo=tzoffset(None, 19800))
```

(continues on next page)
In [62]: idx[1]
Out[62]: datetime.datetime(2015, 11, 18, 16, 30, tzinfo=tzoffset(None, 23400))

Passing utc=True will mimic the previous behavior but will correctly indicate that the dates have been converted to UTC.

In [63]: pd.to_datetime(['2015-11-18 15:30:00+05:30',
                         '2015-11-18 16:30:00+06:30'], utc=True)
Out[63]: DatetimeIndex(['2015-11-18 10:00:00+00:00', '2015-11-18 10:00:00+00:00'], dtype='datetime64[ns, UTC]', freq=None)

Parsing mixed-timezones with read_csv()

read_csv() no longer silently converts mixed-timezone columns to UTC (GH24987).

Previous behavior

```python
>>> import io
>>> content = ""
... a
... 2000-01-01T00:00:00+05:00
... 2000-01-01T00:00:00+06:00"
... df = pd.read_csv(io.StringIO(content), parse_dates=['a'])
>>> df.a
0 1999-12-31 19:00:00
1 1999-12-31 18:00:00
Name: a, dtype: datetime64[ns]
```

New behavior

```python
In [64]: import io
In [65]: content = ""
    ...: a
    ...: 2000-01-01T00:00:00+05:00
    ...: 2000-01-01T00:00:00+06:00"
    ...
In [66]: df = pd.read_csv(io.StringIO(content), parse_dates=['a'])
In [67]: df.a
Out[67]:
0 2000-01-01 00:00:00+05:00
1 2000-01-01 00:00:00+06:00
Name: a, Length: 2, dtype: object
```

As can be seen, the dtype is object; each value in the column is a string. To convert the strings to an array of datetimes, the date_parser argument
pandas: powerful Python data analysis toolkit, Release 1.3.5

```
In [68]: df = pd.read_csv(io.StringIO(content), parse_dates=['a'],
                      date_parser=lambda col: pd.to_datetime(col, utc=True))
....:
....:

In [69]: df.a
Out[69]:
0  1999-12-31 19:00:00+00:00
1  1999-12-31 18:00:00+00:00
Name: a, Length: 2, dtype: datetime64[ns, UTC]
```

See Parsing datetime strings with timezone offsets for more.

**Time values in dt.end_time and to_timestamp(how='end')**

The time values in `Period` and `PeriodIndex` objects are now set to ‘23:59:59.999999999’ when calling `Series.dt.end_time`, `Period.end_time`, `PeriodIndex.end_time`, `Period.to_timestamp()` with `how='end'`, or `PeriodIndex.to_timestamp()` with `how='end'` (GH17157)

*Previous behavior:*

```
In [2]: p = pd.Period('2017-01-01', 'D')
In [3]: pi = pd.PeriodIndex([p])

In [4]: pd.Series(pi).dt.end_time[0]
Out[4]: Timestamp(2017-01-01 00:00:00)

In [5]: p.end_time
```

*New behavior:*

Calling `Series.dt.end_time` will now result in a time of ‘23:59:59.999999999’ as is the case with `Period.end_time`, for example

```
In [70]: p = pd.Period('2017-01-01', 'D')

In [71]: pi = pd.PeriodIndex([p])

In [72]: pd.Series(pi).dt.end_time[0]
Out[72]: Timestamp('2017-01-01 23:59:59.999999999')

In [73]: p.end_time
Out[73]: Timestamp('2017-01-01 23:59:59.999999999')
```
Series.unique for timezone-aware data

The return type of `Series.unique()` for datetime with timezone values has changed from an `numpy.ndarray` of `Timestamp` objects to a `arrays.DatetimeArray` (GH24024).

```
In [74]: ser = pd.Series([pd.Timestamp('2000', tz='UTC'),
                      ....: pd.Timestamp('2000', tz='UTC')])

Previous behavior:
```
```
In [3]: ser.unique()
Out[3]: array([Timestamp('2000-01-01 00:00:00+0000', tz='UTC')], dtype=object)
```
```
New behavior:
```
```
In [75]: ser.unique()
Out[75]: <DatetimeArray>
['2000-01-01 00:00:00+00:00']
Length: 1, dtype: datetime64[ns, UTC]
```

Sparse data structure refactor

SparseArray, the array backing SparseSeries and the columns in a SparseDataFrame, is now an extension array (GH21978, GH19056, GH22835). To conform to this interface and for consistency with the rest of pandas, some API breaking changes were made:

- **SparseArray** is no longer a subclass of `numpy.ndarray`. To convert a `SparseArray` to a NumPy array, use `numpy.asarray()`.
- `SparseArray.dtype` and `SparseSeries.dtype` are now instances of `SparseDtype`, rather than `np.dtype`. Access the underlying dtype with `SparseDtypesubtype`.
- `numpy.asarray(sparse_array)` now returns a dense array with all the values, not just the non-fill-value values (GH14167)
- `SparseArray.take` now matches the API of `pandas.api.extensions.ExtensionArray.take()` (GH19506):
  - The default value of `allow_fill` has changed from False to True.
  - The `out` and `mode` parameters are now longer accepted (previously, this raised if they were specified).
  - Passing a scalar for `indices` is no longer allowed.
- The result of `concat()` with a mix of sparse and dense Series is a Series with sparse values, rather than a SparseSeries.
- `SparseDataFrame.combine` and `DataFrame.combine_first` no longer supports combining a sparse column with a dense column while preserving the sparse subtype. The result will be an object-dtype SparseArray.
- Setting `SparseArray.fill_value` to a fill value with a different dtype is now allowed.
- `DataFrame[column]` is now a `Series` with sparse values, rather than a SparseSeries, when slicing a single column with sparse values (GH23559).
- The result of `Series.where()` is now a `Series` with sparse values, like with other extension arrays (GH24077)
Some new warnings are issued for operations that require or are likely to materialize a large dense array:

- A `errors.PerformanceWarning` is issued when using `fillna` with a method, as a dense array is constructed to create the filled array. Filling with a value is the efficient way to fill a sparse array.
- A `errors.PerformanceWarning` is now issued when concatenating sparse Series with differing fill values. The fill value from the first sparse array continues to be used.

In addition to these API breaking changes, many Performance Improvements and Bug Fixes have been made.

Finally, a `Series.sparse` accessor was added to provide sparse-specific methods like `Series.sparse.from_coo()`.

In [76]: 
   s = pd.Series([0, 0, 1, 1, 1], dtype='Sparse[int]')

In [77]: s.sparse.density
Out[77]: 0.6

**get_dummies() always returns a DataFrame**

Previously, when `sparse=True` was passed to `get_dummies()`, the return value could be either a `DataFrame` or a `SparseDataFrame`, depending on whether all or a just a subset of the columns were dummy-encoded. Now, a `DataFrame` is always returned (GH24284).

**Previous behavior**

The first `get_dummies()` returns a `DataFrame` because the column `A` is not dummy encoded. When just ["B", "C"] are passed to `get_dummies`, then all the columns are dummy-encoded, and a `SparseDataFrame` was returned.

```{execution_options='start_hidden'}
In [2]: df = pd.DataFrame({'A': [1, 2], 'B': ['a', 'b'], 'C': ['a', 'a']})

In [3]: type(pd.get_dummies(df, sparse=True))
Out[3]: pandas.core.frame.DataFrame

In [4]: type(pd.get_dummies(df[['B', 'C']], sparse=True))
Out[4]: pandas.core.sparse.frame.SparseDataFrame
```

**New behavior**

Now, the return type is consistently a `DataFrame`.

```{execution_options='start_hidden'}
In [78]: type(pd.get_dummies(df, sparse=True))
Out[78]: pandas.core.frame.DataFrame

In [79]: type(pd.get_dummies(df[['B', 'C']], sparse=True))
Out[79]: pandas.core.frame.DataFrame
```

**Note:** There's no difference in memory usage between a `SparseDataFrame` and a `DataFrame` with sparse values. The memory usage will be the same as in the previous version of pandas.
Raise ValueError in DataFrame.to_dict(orient='index')

Bug in DataFrame.to_dict() raises ValueError when used with orient='index' and a non-unique index instead of losing data (GH22801)

```python
In [80]: df = pd.DataFrame({'a': [1, 2], 'b': [0.5, 0.75]}, index=['A', 'A'])

In [81]: df
Out[81]:
   a  b
A  1  0.50
A  2  0.75
[2 rows x 2 columns]

In [82]: df.to_dict(orient='index')
---------------------------------------------------------------------------
ValueError                       Traceback (most recent call last)
<ipython-input-82-f5309a7c6adb> in <module>
     1 df.to_dict(orient='index')
/pandas/pandas/core/frame.py in to_dict(self, orient, into)
 1826     elif orient == "index":
 1827         if not self.index.is_unique:
-> 1828             raise ValueError("DataFrame index must be unique for orient=
 1829             "index")."
 1830     return into_c(

ValueError: DataFrame index must be unique for orient='index'.
```

Tick DateOffset normalize restrictions

Creating a Tick object (Day, Hour, Minute, Second, Milli, Micro, Nano) with normalize=True is no longer supported. This prevents unexpected behavior where addition could fail to be monotone or associative. (GH21427)

Previous behavior:

```python
In [2]: ts = pd.Timestamp('2018-06-11 18:01:14')

In [3]: ts
Out[3]: Timestamp('2018-06-11 18:01:14')

In [4]: tic = pd.offsets.Hour(n=2, normalize=True)

In [5]: tic
Out[5]: <2 * Hours>

In [6]: ts + tic
Out[6]: Timestamp('2018-06-11 00:00:00')
```

(continues on next page)
In [7]: ts + tic + tic + tic == ts + (tic + tic + tic)
Out[7]: False

New behavior:

In [83]: ts = pd.Timestamp('2018-06-11 18:01:14')
In [84]: tic = pd.offsets.Hour(n=2)
In [85]: ts + tic + tic + tic == ts + (tic + tic + tic)
Out[85]: True

Period subtraction

Subtraction of a Period from another Period will give a DateOffset. instead of an integer (GH21314)

Previous behavior:

In [2]: june = pd.Period('June 2018')
In [3]: april = pd.Period('April 2018')
In [4]: june - april
Out [4]: 2

New behavior:

In [86]: june = pd.Period('June 2018')
In [87]: april = pd.Period('April 2018')
In [88]: june - april
Out[88]: <2 * MonthEnds>

Similarly, subtraction of a Period from a PeriodIndex will now return an Index of DateOffset objects instead of an Int64Index

Previous behavior:

In [2]: pi = pd.period_range('June 2018', freq='M', periods=3)
In [3]: pi - pi[0]
Out[3]: Int64Index([0, 1, 2], dtype='int64')

New behavior:

In [89]: pi = pd.period_range('June 2018', freq='M', periods=3)
In [90]: pi - pi[0]
Out[90]: Index([<0 * MonthEnds>, <MonthEnd>, <2 * MonthEnds>], dtype='object')
Addition/subtraction of NaN from DataFrame

Adding or subtracting NaN from a DataFrame column with timedelta64[ns] dtype will now raise a TypeError instead of returning all-NaT. This is for compatibility with TimedeltaIndex and Series behavior (GH22163)

```
In [91]: df = pd.DataFrame([pd.Timedelta(days=1)])

In [92]: df
Out[92]:
   0
0 1 days
[1 rows x 1 columns]
```

Previous behavior:

```
In [4]: df = pd.DataFrame([pd.Timedelta(days=1)])

In [5]: df - np.nan
Out[5]:
   0
0  NaT
```

New behavior:

```
In [2]: df - np.nan
...  TypeError: unsupported operand type(s) for -: 'TimedeltaIndex' and 'float'
```

DataFrame comparison operations broadcasting changes

Previously, the broadcasting behavior of DataFrame comparison operations (==, !=, ...) was inconsistent with the behavior of arithmetic operations (+, -, ...). The behavior of the comparison operations has been changed to match the arithmetic operations in these cases. (GH22880)

The affected cases are:

- operating against a 2-dimensional np.ndarray with either 1 row or 1 column will now broadcast the same way a np.ndarray would (GH23000).
- a list or tuple with length matching the number of rows in the DataFrame will now raise ValueError instead of operating column-by-column (GH22880).
- a list or tuple with length matching the number of columns in the DataFrame will now operate row-by-row instead of raising ValueError (GH22880).

```
In [93]: arr = np.arange(6).reshape(3, 2)

In [94]: df = pd.DataFrame(arr)

In [95]: df
Out[95]:
   0  1
0   0  1
```
**pandas: powerful Python data analysis toolkit, Release 1.3.5**

1 2 3  
2 4 5  
[3 rows x 2 columns]

**Previous behavior:**

```python
In [5]: df == arr[[0], :]
   ...: # comparison previously broadcast where arithmetic would raise
Out[5]:
     0  1
0 True True
1 False False
2 False False
In [6]: df + arr[[0], :]
   ...
ValueError: Unable to coerce to DataFrame, shape must be (3, 2): given (1, 2)
In [7]: df == (1, 2)
   ...: # length matches number of columns;
   ...: # comparison previously raised where arithmetic would broadcast
   ...
ValueError: Invalid broadcasting comparison [(1, 2)] with block values
In [8]: df + (1, 2)
Out[8]:
     0  1
0  1  3
1  3  5
2  5  7
In [9]: df == (1, 2, 3)
   ...: # length matches number of rows
   ...: # comparison previously broadcast where arithmetic would raise
Out[9]:
     0  1
0 False True
1 True False
2 False False
In [10]: df + (1, 2, 3)
   ...
ValueError: Unable to coerce to Series, length must be 2: given 3
```

**New behavior:**

```python
# Comparison operations and arithmetic operations both broadcast.
In [96]: df == arr[[0], :]
Out[96]:
     0  1
0 True True
1 False False
2 False False
```

(continues on next page)
In [97]: df + arr[:, :]
Out[97]:
   0 1
   0 0 2
   1 2 4
   2 4 6

# Comparison operations and arithmetic operations both broadcast.
In [98]: df == (1, 2)
Out[98]:
   0   1
   0  False False
   1  False False
   2  False False

In [99]: df + (1, 2)
Out[99]:
   0 1
   0 1 3
   1 3 5
   2 5 7

# Comparison operations and arithmetic operations both raise ValueError.
In [6]: df == (1, 2, 3)
   ...:
ValueError: Unable to coerce to Series, length must be 2: given 3
In [7]: df + (1, 2, 3)
   ...:
ValueError: Unable to coerce to Series, length must be 2: given 3

**DataFrame arithmetic operations broadcasting changes**

*DataFrame* arithmetic operations when operating with 2-dimensional *np.ndarray* objects now broadcast in the same way as *np.ndarray* broadcast. (*GH23000*)

In [100]: arr = np.arange(6).reshape(3, 2)
In [101]: df = pd.DataFrame(arr)
In [102]: df
Out[102]:
(continues on next page)
Previous behavior:

```python
In [5]: df + arr[[0], :]
   # 1 row, 2 columns
...  
ValueError: Unable to coerce to DataFrame, shape must be (3, 2): given (1, 2)
In [6]: df + arr[:, [1]]
   # 1 column, 3 rows
...  
ValueError: Unable to coerce to DataFrame, shape must be (3, 2): given (3, 1)
```

New behavior:

```python
In [103]: df + arr[[0], :]
   # 1 row, 2 columns
Out[103]:
    0 1
     0 0 2
     1 2 4
     2 4 6
[3 rows x 2 columns]
In [104]: df + arr[:, [1]]
   # 1 column, 3 rows
Out[104]:
    0 1
     0 1 2
     1 5 6
     2 9 10
[3 rows x 2 columns]
```

Series and Index data-dtype incompatibilities

Series and Index constructors now raise when the data is incompatible with a passed dtype=(GH15832)

Previous behavior:

```python
In [4]: pd.Series([-1], dtype="uint64")
Out [4]:
  0  18446744073709551615
dtype: uint64
```

New behavior:

```python
In [4]: pd.Series([-1], dtype="uint64")
Out [4]:
```

(continues on next page)
OverflowError: Trying to coerce negative values to unsigned integers

Concatenation changes

Calling `pandas.concat()` on a `Categorical` of ints with NA values now causes them to be processed as objects when concatenating with anything other than another `Categorical` of ints (GH19214)

```python
In [105]: s = pd.Series([0, 1, np.nan])
In [106]: c = pd.Series([0, 1, np.nan], dtype="category")
```

**Previous behavior**

```python
In [3]: pd.concat([s, c])
Out[3]:
0  0.0
1  1.0
2  NaN
0  0.0
1  1.0
2  NaN
dtype: float64
```

**New behavior**

```python
In [107]: pd.concat([s, c])
Out[107]:
0  0.0
1  1.0
2  NaN
0  0.0
1  1.0
2  NaN
Length: 6, dtype: float64
```

Datetimelike API changes

- For `DatetimeIndex` and `TimedeltaIndex` with non-None `freq` attribute, addition or subtraction of integer-dtyped array or `Index` will return an object of the same class (GH19959)
- `DateOffset` objects are now immutable. Attempting to alter one of these will now raise `AttributeError` (GH21341)
- `PeriodIndex` subtraction of another `PeriodIndex` will now return an object-dtype `Index` of `DateOffset` objects instead of raising a `TypeError` (GH20049)
- `cut()` and `qcut()` now returns a `DatetimeIndex` or `TimedeltaIndex` bins when the input is datetime or timedelta dtype respectively and `retbins=True` (GH19891)
- `DatetimeIndex.to_period()` and `Timestamp.to_period()` will issue a warning when timezone information will be lost (GH21333)
• PeriodIndex.tz_convert() and PeriodIndex.tz_localize() have been removed (GH21781)

Other API changes

• A newly constructed empty DataFrame with integer as the dtype will now only be cast to float64 if index is specified (GH22858)

• Series.str.cat() will now raise if others is a set (GH23009)

• Passing scalar values to DatetimeIndex or TimedeltaIndex will now raise TypeError instead of ValueError (GH23539)

• max_rows and max_cols parameters removed from HTMLFormatter since truncation is handled by DataFrameFormatter (GH23818)

• read_csv() will now raise a ValueError if a column with missing values is declared as having dtype bool (GH20591)

• The column order of the resultant DataFrame from MultiIndex.to_frame() is now guaranteed to match the MultiIndex.names order. (GH22420)

• Incorrectly passing a DatetimeIndex to MultiIndex.from_tuples(), rather than a sequence of tuples, now raises a TypeError rather than a ValueError (GH24024)

• pd.offsets.generate_range() argument time_rule has been removed; use offset instead (GH24157)

• In 0.23.x, pandas would raise a ValueError on a merge of a numeric column (e.g. int dtyped column) and an object dtyped column (GH9780). We have re-enabled the ability to merge object and other dtypes; pandas will still raise on a merge between a numeric and an object dtyped column that is composed only of strings (GH21681)

• Accessing a level of a MultiIndex with a duplicate name (e.g. in get_level_values()) now raises a ValueError instead of a KeyError (GH21678).

• Invalid construction of IntervalDtype will now always raise a TypeError rather than a ValueError if the subdtype is invalid (GH21185)

• Trying to reindex a DataFrame with a non unique MultiIndex now raises a ValueError instead of an Exception (GH21770)

• Index subtraction will attempt to operate element-wise instead of raising TypeError (GH19369)

• pandas.io.formats.style.Styler supports a number-format property when using to_excel() (GH22015)

• DataFrame.corr() and Series.corr() now raise a ValueError along with a helpful error message instead of a KeyError when supplied with an invalid method (GH22298)

• shift() will now always return a copy, instead of the previous behaviour of returning self when shifting by 0 (GH22397)

• DataFrame.set_index() now gives a better (and less frequent) KeyError, raises a ValueError for incorrect types, and will not fail on duplicate column names with drop=True. (GH22484)

• Slicing a single row of a DataFrame with multiple ExtensionArrays of the same type now preserves the dtype, rather than coercing to object (GH22784)

• DateOffset attribute _cacheable and method _should_cache have been removed (GH23118)

• Series.searchsorted(), when supplied a scalar value to search for, now returns a scalar instead of an array (GH23801).
• Categorical.searchsorted(), when supplied a scalar value to search for, now returns a scalar instead of an array (GH23466).

• Categorical.searchsorted() now raises a KeyError rather than a ValueError, if a searched for key is not found in its categories (GH23466).

• Index.hasnans() and Series.hasnans() now always return a python boolean. Previously, a python or a numpy boolean could be returned, depending on circumstances (GH23294).

• The order of the arguments of DataFrame.to_html() and DataFrame.to_string() is rearranged to be consistent with each other. (GH23614)

• CategoricalIndex.reindex() now raises a ValueError if the target index is non-unique and not equal to the current index. It previously only raised if the target index was not of a categorical dtype (GH23963).

• Series.to_list() and Index.to_list() are now aliases of Series.tolist respectively Index.tolist (GH8826)

• The result of SparseSeries.unstack is now a DataFrame with sparse values, rather than a SparseDataFrame (GH24372).

• DatetimeIndex and TimedeltaIndex no longer ignore the dtype precision. Passing a non-nanosecond resolution dtype will raise a ValueError (GH24753)

Extension type changes

Equality and hashability

pandas now requires that extension dtypes be hashable (i.e. the respective ExtensionDtype objects; hashability is not a requirement for the values of the corresponding ExtensionArray). The base class implements a default __eq__ and __hash__. If you have a parametrized dtype, you should update the ExtensionDtype._metadata tuple to match the signature of your __init__ method. See pandas.api.extensions.ExtensionDtype for more (GH22476).

New and changed methods

• dropna() has been added (GH21185)

• repeat() has been added (GH24349)

• The ExtensionArray constructor, _from_sequence now take the keyword arg copy=False (GH21185)

• pandas.api.extensions.ExtensionArray.shift() added as part of the basic ExtensionArray interface (GH22387).

• searchsorted() has been added (GH24350)

• Support for reduction operations such as sum, mean via opt-in base class method override (GH22762)

• ExtensionArray.isna() is allowed to return an ExtensionArray (GH22325).

Dtype changes

• ExtensionDtype has gained the ability to instantiate from string dtypes, e.g. decimal would instantiate a registered DecimalDtype; furthermore the ExtensionDtype has gained the method construct_array_type (GH21185)

• Added ExtensionDtype.__is_numeric for controlling whether an extension dtype is considered numeric (GH22290).

• Added pandas.api.types.register_extension_dtype() to register an extension type with pandas (GH22664)

• Updated the .type attribute for PeriodDtype, DatetimeTZDtype, and IntervalDtype to be instances of the dtype (Period, Timestamp, and Interval respectively) (GH22938)
Operator support

A Series based on an ExtensionArray now supports arithmetic and comparison operators (GH19577). There are two approaches for providing operator support for an ExtensionArray:

1. Define each of the operators on your ExtensionArray subclass.
2. Use an operator implementation from pandas that depends on operators that are already defined on the underlying elements (scalars) of the ExtensionArray.

See the ExtensionArray Operator Support documentation section for details on both ways of adding operator support.

Other changes

• A default repr for pandas.api.extensions.ExtensionArray is now provided (GH23601).
• ExtensionArray._formatting_values() is deprecated. Use ExtensionArray._formatter instead. (GH23601)
• An ExtensionArray with a boolean dtype now works correctly as a boolean indexer. pandas.api.types.is_bool_dtype() now properly considers them boolean (GH2326).

Bug fixes

• Bug in Series.get() for Series using ExtensionArray and integer index (GH21257)
• shift() now dispatches to ExtensionArray.shift() (GH22386)
• Series.combine() works correctly with ExtensionArray inside of Series (GH20825)
• Series.combine() with scalar argument now works for any function type (GH21248)
• Series.astype() and DataFrame.astype() now dispatch to ExtensionArray.astype() (GH21185).
• Slicing a single row of a DataFrame with multiple ExtensionArrays of the same type now preserves the dtype, rather than coercing to object (GH22784)
• Bug when concatenating multiple Series with different extension dtypes not casting to object dtype (GH22994)
• Series backed by an ExtensionArray now work with util.hash_pandas_object() (GH23066)
• DataFrame.stack() no longer converts to object dtype for DataFrames where each column has the same extension dtype. The output Series will have the same dtype as the columns (GH23077).
• Series.unstack() and DataFrame.unstack() no longer convert extension arrays to object-dtype ndarrays. Each column in the output DataFrame will now have the same dtype as the input (GH23077).
• Bug when grouping Dataframe.groupby() and aggregating on ExtensionArray it was not returning the actual ExtensionArray dtype (GH23227).
• Bug in pandas.merge() when merging on an extension array-backed column (GH23020).

Deprecations

• MultiIndex.labels has been deprecated and replaced by MultiIndex.codes. The functionality is unchanged. The new name better reflects the natures of these codes and makes the MultiIndex API more similar to the API for CategoricalIndex (GH13443). As a consequence, other uses of the name labels in MultiIndex have also been deprecated and replaced with codes:
  – You should initialize a MultiIndex instance using a parameter named codes rather than labels.
  – MultiIndex.set_labels has been deprecated in favor of MultiIndex.set_codes().
  – For method MultiIndex.copy(), the labels parameter has been deprecated and replaced by a codes parameter.
• *DataFrame.to_stata*, *read_stata*, StataReader and StataWriter have deprecated the encoding argument. The encoding of a Stata dta file is determined by the file type and cannot be changed (GH21244)
• MultiIndex.to_hierarchical() is deprecated and will be removed in a future version (GH21613)
• Series.ptp() is deprecated. Use numpy.ptp instead (GH21614)
• Series.compress() is deprecated. Use Series[condition] instead (GH18262)
• The signature of Series.to_csv() has been uniformed to that of DataFrame.to_csv(): the name of the first argument is now path_or_buf, the order of subsequent arguments has changed, the header argument now defaults to True. (GH19715)
• Categorical.from_codes() has deprecated providing float values for the codes argument. (GH21767)
• pandas.read_table() is deprecated. Instead, use read_csv() passing sep='\t' if necessary. This deprecation has been removed in 0.25.0. (GH21948)
• Series.str.cat() has deprecated using arbitrary list-likes within list-likes. A list-like container may still contain many Series, Index or 1-dimensional np.ndarray, or alternatively, only scalar values. (GH21950)
• FrozenNDArray.searchsorted() has deprecated the v parameter in favor of value (GH14645)
• DatetimeIndex.shift() and PeriodIndex.shift() now accept periods argument instead of n for consistency with Index.shift() and Series.shift(). Using n throws a deprecation warning (GH22458, GH22912)
• The fastpath keyword of the different Index constructors is deprecated (GH23110).
• Timestamp.tz_localize(), DatetimeIndex.tz_localize(), and Series.tz_localize() have deprecated the errors argument in favor of the nonexistent argument (GH8917)
• The class FrozenNDArray has been deprecated. When unpickling, FrozenNDArray will be unpickled to np.ndarray once this class is removed (GH9031)
• The methods DataFrame.update() and Panel.update() have deprecated the raise_conflict=False|True keyword in favor of errors='ignore'|'raise' (GH23585)
• The methods Series.str.partition() and Series.str.rpartition() have deprecated the pat keyword in favor of sep (GH22676)
• Deprecated the nthreads keyword of pandas.read_feather() in favor of use_threads to reflect the changes in pyarrow>=0.11.0. (GH23053)
• pandas.read_excel() has deprecated accepting usecols as an integer. Please pass in a list of ints from 0 to usecols inclusive instead (GH23527)
• Constructing a TimedeltaIndex from data with datetime64-dtyped data is deprecated, will raise TypeError in a future version (GH23539)
• Constructing a DatetimeIndex from data with timedelta64-dtyped data is deprecated, will raise TypeError in a future version (GH23675)
• The keep_tz=False option (the default) of the keep_tz keyword of DatetimeIndex.to_series() is deprecated (GH17832).
• Timezone converting a tz-aware datetime.datetime or Timestamp with Timestamp and the tz argument is now deprecated. Instead, use Timestamp.tz_convert() (GH23579)
• pandas.api.types.is_period() is deprecated in favor of pandas.api.types.is_period_dtype (GH23917)
• pandas.api.types.is_datetimetzet() is deprecated in favor of pandas.api.types.is_datetimetz (GH23917)
• Creating a TimedeltaIndex, DatetimeIndex, or PeriodIndex by passing range arguments start, end, and periods is deprecated in favor of timedelta_range(), date_range(), or period_range() (GH23919).

• Passing a string alias like 'datetime64[ns, UTC]' as the unit parameter to DatetimeTZDtype is deprecated. Use DatetimeTZDtype.construct_from_string instead (GH23990).

• The skipna parameter of infer_dtype() will switch to True by default in a future version of pandas (GH17066, GH24050).

• In Series.where() with Categorical data, providing an other that is not present in the categories is deprecated. Convert the categorical to a different dtype or add the other to the categories first (GH24077).

• Series.clip_lower(), Series.clip_upper(), DataFrame.clip_lower() and DataFrame.clip_upper() are deprecated and will be removed in a future version. Use Series.clip(lower=threshold), Series.clip(upper=threshold) and the equivalent DataFrame methods (GH24203).

• Series.nonzero() is deprecated and will be removed in a future version (GH18262).

• Passing an integer to Series.fillna() and DataFrame.fillna() with timedelta64[ns] dtypes is deprecated, will raise TypeError in a future version. Use obj.fillna(pd.Timedelta(...)) instead (GH24694).

• Series.cat.categorical, Series.cat.name and Series.cat.index have been deprecated. Use the attributes on Series.cat or Series directly. (GH24751).

• Passing a dtype without a precision like np.dtype('datetime64') or timedelta64 to Index, DatetimeIndex and TimedeltaIndex is now deprecated. Use the nanosecond-precision dtype instead (GH24753).

Integer addition/subtraction with datetimes and timedeltaas is deprecated

In the past, users could—in some cases—add or subtract integers or integer-dtype arrays from Timestamp, DatetimeIndex and TimedeltaIndex.

This usage is now deprecated. Instead add or subtract integer multiples of the object's freq attribute (GH21939, GH23878).

Previous behavior:

```
In [6]: ts + 2

In [7]: tdi = pd.timedelta_range('1D', periods=2)
In [8]: tdi - np.array([2, 1])
Out[8]: TimedeltaIndex(['-1 days', '1 days'], dtype='timedelta64[ns]', freq=None)

In [9]: dti = pd.date_range('2001-01-01', periods=2, freq='7D')
In [10]: dti + pd.Index([1, 2])
Out[10]: DatetimeIndex(['2001-01-08', '2001-01-22'], dtype='datetime64[ns]', freq=None)
```

New behavior:

```
In [109]: ts + 2 * ts.freq
```
In [110]: tdi = pd.timedelta_range('1D', periods=2)

In [111]: tdi - np.array([2 * tdi.freq, 1 * tdi.freq])
Out[111]: TimedeltaIndex(['-1 days', '1 days'], dtype='timedelta64[ns]', freq=None)

In [112]: dti = pd.date_range('2001-01-01', periods=2, freq='7D')

In [113]: dti + pd.Index([1 * dti.freq, 2 * dti.freq])
Out[113]: DatetimeIndex(['2001-01-08', '2001-01-22'], dtype='datetime64[ns]', freq=None)

### Passing integer data and a timezone to DatetimeIndex

The behavior of `DatetimeIndex` when passed integer data and a timezone is changing in a future version of pandas. Previously, these were interpreted as wall times in the desired timezone. In the future, these will be interpreted as wall times in UTC, which are then converted to the desired timezone (GH24559).

The default behavior remains the same, but issues a warning:

```
In [3]: pd.DatetimeIndex([946684800000000000], tz="US/Central")
/bin/ipython:1: FutureWarning:
  Passing integer-dtype data and a timezone to DatetimeIndex. Integer values
  will be interpreted differently in a future version of pandas. Previously,
  these were viewed as datetime64[ns] values representing the wall time
  *in the specified timezone*. In the future, these will be viewed as
  datetime64[ns] values representing the wall time *in UTC*. This is similar
  to a nanosecond-precision UNIX epoch. To accept the future behavior, use

  pd.to_datetime(integer_data, utc=True).tz_convert(tz)

  To keep the previous behavior, use

  pd.to_datetime(integer_data).tz_localize(tz)
```

As the warning message explains, opt in to the future behavior by specifying that the integer values are UTC, and then converting to the final timezone:

```
In [114]: pd.to_datetime([946684800000000000], utc=True).tz_convert('US/Central')
Out[114]: DatetimeIndex(['1999-12-31 18:00:00-06:00'], dtype='datetime64[ns, US/Central]',
  freq=None)
```

The old behavior can be retained with by localizing directly to the final timezone:

```
In [115]: pd.to_datetime([946684800000000000]).tz_localize('US/Central')
Out[115]: DatetimeIndex(['2000-01-01 00:00:00-06:00'], dtype='datetime64[ns, US/Central]',
  freq=None)
```
Converting timezone-aware Series and Index to NumPy arrays

The conversion from a `Series` or `Index` with timezone-aware datetime data will change to preserve timezones by default (GH23569).

NumPy doesn't have a dedicated dtype for timezone-aware datetimes. In the past, converting a `Series` or `DatetimeIndex` with timezone-aware datetimes would convert to a NumPy array by

1. converting the tz-aware data to UTC
2. dropping the timezone-info
3. returning a `numpy.ndarray` with `datetime64[ns]` dtype

Future versions of pandas will preserve the timezone information by returning an object-dtype NumPy array where each value is a `Timestamp` with the correct timezone attached

```
In [116]: ser = pd.Series(pd.date_range('2000', periods=2, tz='CET'))

In [117]: ser
```

```
Out[117]:
0 2000-01-01 00:00:00+01:00
1 2000-01-02 00:00:00+01:00
Length: 2, dtype: datetime64[ns, CET]
```

The default behavior remains the same, but issues a warning

```
In [8]: np.asarray(ser)

/bin/ipython:1: FutureWarning: Converting timezone-aware DatetimeArray to timezone-naive ndarray with 'datetime64[ns]' dtype. In the future, this will return an ndarray with 'object' dtype where each element is a 'pandas.Timestamp' with the correct 'tz _'.
To accept the future behavior, pass 'dtype=object'.
To keep the old behavior, pass 'dtype="datetime64[ns]"'.

#!/bin/python3
```

```
Out[8]:
array(['1999-12-31T23:00:00.000000000', '2000-01-01T23:00:00.000000000'],
dtype='datetime64[ns]')
```

The previous or future behavior can be obtained, without any warnings, by specifying the `dtype`

Previous behavior

```
In [118]: np.asarray(ser, dtype='datetime64[ns]')
```

```
Out[118]:
array(['1999-12-31T23:00:00.000000000', '2000-01-01T23:00:00.000000000'],
dtype='datetime64[ns]')
```

Future behavior

```
# New behavior
In [119]: np.asarray(ser, dtype=object)
```

```
Out[119]:
array([Timestamp('2000-01-01 00:00:00+0100', tz='CET'),
       Timestamp('2000-01-02 00:00:00+0100', tz='CET')], dtype=object)
```
Or by using `Series.to_numpy()`

```
In [120]: ser.to_numpy()
Out[120]:
array([Timestamp('2000-01-01 00:00:00+0100', tz='CET'),
       Timestamp('2000-01-02 00:00:00+0100', tz='CET')], dtype=object)
```

```
In [121]: ser.to_numpy(dtype="datetime64[ns]")
Out[121]:
array([1999-12-31T23:00:00.000000000,
      2000-01-01T23:00:00.000000000],
      dtype='datetime64[ns]')
```

All the above applies to a `DatetimeIndex` with tz-aware values as well.

### Removal of prior version deprecations/changes

- The `LongPanel` and `WidePanel` classes have been removed (GH10892)
- `Series.repeat()` has renamed the `reps` argument to `repeats` (GH14645)
- Several private functions were removed from the (non-public) module `pandas.core.common` (GH22001)
- Removal of the previously deprecated module `pandas.core.datetools` (GH14105, GH14094)
- Strings passed into `DataFrame.groupby()` that refer to both column and index levels will raise a `ValueError` (GH14432)
- `Index.repeat()` and `MultiIndex.repeat()` have renamed the `n` argument to `repeats` (GH14645)
- The `Series` constructor and `.astype` method will now raise a `ValueError` if timestamp dtypes are passed in without a unit (e.g. `np.datetime64`) for the `dtype` parameter (GH15987)
- Removal of the previously deprecated `as_indexer` keyword completely from `str.match()` (GH22356, GH6581)
- The modules `pandas.types`, `pandas.computation`, and `pandas.util.decorators` have been removed (GH16157, GH16250)
- Removed the `pandas.formats.style` shim for `pandas.io.formats.style.Styler` (GH16059)
- `pandas.pnow`, `pandas.match`, `pandas.groupby`, `pd.get_store`, `pd.Expr`, and `pd.Term` have been removed (GH15538, GH15940)
- `Categorical.searchsorted()` and `Series.searchsorted()` have renamed the `v` argument to `value` (GH14645)
- `pandas.parser`, `pandas.lib`, and `pandas.tslib` have been removed (GH15537)
- `Index.searchsorted()` have renamed the `key` argument to `value` (GH14645)
- `DataFrame.consolidate` and `Series.consolidate` have been removed (GH15501)
- Removal of the previously deprecated module `pandas.json` (GH19944)
- The module `pandas.tools` has been removed (GH15358, GH16005)
- `SparseArray.get_values()` and `SparseArray.to_dense()` have dropped the `fill` parameter (GH14686)
- `DataFrame.sortlevel` and `Series.sortlevel` have been removed (GH15099)
- `SparseSeries.to_dense()` has dropped the `sparse_only` parameter (GH14686)
• **DataFrame.astype()** and **Series.astype()** have renamed the **raise_on_error** argument to **errors** (GH14967)

• **is_sequence**, **is_any_int_dtype**, and **is_floating_dtype** have been removed from **pandas.api.types** (GH16163, GH16189)

### Performance improvements

• Slicing Series and DataFrames with a monotonically increasing **CategoricalIndex** is now very fast and has speed comparable to slicing with an **Int64Index**. The speed increase is both when indexing by label (using .loc) and position(.iloc) (GH20395) Slicing a monotonically increasing **CategoricalIndex** itself (i.e. ci[1000: 2000]) shows similar speed improvements as above (GH21659)

• Improved performance of **CategoricalIndex.equals()** when comparing to another **CategoricalIndex** (GH24023)

• Improved performance of **Series.describe()** in case of numeric dtpyes (GH21274)

• Improved performance of **pandas.core.groupby.GroupBy.rank()** when dealing with tied rankings (GH21237)

• Improved performance of **DataFrame.set_index()** with columns consisting of **Period** objects (GH21582, GH21606)

• Improved performance of **Series.at()** and **Index.get_value()** for Extension Arrays values (e.g. **Categorical**) (GH24204)

• Improved performance of membership checks in **Categorical** and **CategoricalIndex** (i.e. x in cat-style checks are much faster). **CategoricalIndex.contains()** is likewise much faster (GH21369, GH21508)

• Improved performance of **HDFStore.groups()** (and dependent functions like **HDFStore.keys()**. (i.e. x in store checks are much faster) (GH21372)

• Improved the performance of **pandas.get_dummies()** with **sparse=True** (GH21997)

• Improved performance of **IndexEngine.get_indexer_non_unique()** for sorted, non-unique indexes (GH9466)

• Improved performance of **PeriodIndex.unique()** (GH23083)

• Improved performance of **concat()** for **Series** objects (GH23404)

• Improved performance of **DatetimeIndex.normalize()** and **Timestamp.normalize()** for timezone naive or UTC datetimes (GH23634)

• Improved performance of **DatetimeIndex.tz_localize()** and various **DatetimeIndex** attributes with dateutil UTC timezone (GH23772)

• Fixed a performance regression on Windows with Python 3.7 of **read_csv()** (GH23516)

• Improved performance of **Categorical** constructor for **Series** objects (GH23814)

• Improved performance of **where()** for Categorical data (GH24077)

• Improved performance of iterating over a **Series**. Using **DataFrame.itertuples()** now creates iterators without internally allocating lists of all elements (GH20783)

• Improved performance of **Period** constructor, additionally benefitting **PeriodArray** and **PeriodIndex** creation (GH24084, GH24118)

• Improved performance of tz-aware **DatetimeArray** binary operations (GH24491)
Bug fixes

Categorical

- Bug in `Categorical.from_codes()` where NaN values in codes were silently converted to 0 (GH21767). In the future this will raise a `ValueError`. Also changes the behavior of `.from_codes([1.1, 2.0])`.

- Bug in `Categorical.sort_values()` where NaN values were always positioned in front regardless of `na_position` value. (GH22556).

- Bug when indexing with a boolean-valued `Categorical`. Now a boolean-valued `Categorical` is treated as a boolean mask (GH22665).

- Constructing a `CategoricalIndex` with empty values and boolean categories was raising a `ValueError` after a change to dtype coercion (GH22702).

- Bug in `Categorical.take()` with a user-provided `fill_value` not encoding the `fill_value`, which could result in a `ValueError`, incorrect results, or a segmentation fault (GH23296).

- In `Series.unstack()`, specifying a `fill_value` not present in the categories now raises a `TypeError` rather than ignoring the `fill_value` (GH23284)

- Bug when resampling `DataFrame.resample()` and aggregating on categorical data, the categorical dtype was getting lost. (GH23227)

- Bug in many methods of the `.str`-accessor, which always failed on calling the `CategoricalIndex.str` constructor (GH23555, GH23556)

- Bug in `Series.where()` losing the categorical dtype for categorical data (GH24077)

- Bug in `Categorical.apply()` where NaN values could be handled unpredictably. They now remain unchanged (GH24241)

- Bug in `Categorical` comparison methods incorrectly raising `ValueError` when operating against a `DataFrame` (GH24630)

- Bug in `Categorical.set_categories()` where setting fewer new categories with `rename=True` caused a segmentation fault (GH24675)

Datetimelike

- Fixed bug where two `DateOffset` objects with different `normalize` attributes could evaluate as equal (GH21404)

- Fixed bug where `Timestamp.resolution()` incorrectly returned 1-microsecond timedelta instead of 1-nanosecond `Timedelta` (GH21336, GH21365)

- Bug in `to_datetime()` that did not consistently return an `Index` when `box=True` was specified (GH21864)

- Bug in `DatetimeIndex` comparisons where string comparisons incorrectly raises `TypeError` (GH22074)

- Bug in `DatetimeIndex` comparisons when comparing against `timedelta64[ns]` dtyped arrays; in some cases `TypeError` was incorrectly raised, in others it incorrectly failed to raise (GH22074)

- Bug in `DatetimeIndex` comparisons when comparing against object-dtyped arrays (GH22074)

- Bug in `DataFrame` with `datetime64[ns]` dtype addition and subtraction with `Timedelta`-like objects (GH22005, GH22163)

- Bug in `DataFrame` with `datetime64[ns]` dtype addition and subtraction with `DateOffset` objects returning an object dtype instead of `datetime64[ns]` dtype (GH21610, GH22163)
• Bug in DataFrame with datetime64[ns] dtype comparing against NaT incorrectly (GH22242, GH22163)

• Bug in DataFrame with datetime64[ns] dtype subtracting Timestamp-like object incorrectly returned datetime64[ns] dtype instead of timedelta64[ns] dtype (GH8554, GH22163)

• Bug in DataFrame with datetime64[ns] dtype subtracting np.datetime64 object with non-nanosecond unit failing to convert to nanoseconds (GH18874, GH22163)

• Bug in DataFrame comparisons against Timestamp-like objects failing to raise TypeError for inequality checks with mismatched types (GH8932, GH22163)

• Bug in DataFrame with mixed dtypes including datetime64[ns] incorrectly raising TypeError on equality comparisons (GH13128, GH22163)

• Bug in DataFrame.values returning a DatetimeIndex for a single-column DataFrame with tz-aware datetime values. Now a 2-D numpy.ndarray of Timestamp objects is returned (GH24024)

• Bug in DataFrame.eq() comparison against NaT incorrectly returning True or NaN (GH15697, GH22163)

• Bug in DatetimeIndex subtraction that incorrectly failed to raise OverflowError (GH22492, GH22508)

• Bug in DatetimeIndex incorrectly allowing indexing with Timedelta object (GH20464)

• Bug in DatetimeIndex where frequency was being set if original frequency was None (GH22150)

• Bug in DatetimeIndex() and Timestamp() could give rise to loss of precision (GH22591)

• Bug in to_datetime() with an Index argument that would drop the name from the result (GH21697)

• Bug in PeriodIndex where adding or subtracting a timedelta or Tick object produced incorrect results (GH22988)

• Bug in the Series repr with period-dtype data missing a space before the data (GH23601)

• Bug in date_range() when decrementing a start date to a past end date by a negative frequency (GH23270)

• Bug in Series.min() which would return NaN instead of NaT when called on a series of NaT (GH23282)

• Bug in Series.combine_first() not properly aligning categoricals, so that missing values in self where not filled by valid values from other (GH24147)

• Bug in DataFrame.combine() with datetimelike values raising a TypeError (GH23079)

• Bug in date_range() with frequency of Day or higher where dates sufficiently far in the future could wrap around to the past instead of raising OutOfBoundsDatetime (GH14187)

• Bug in period_range() ignoring the frequency of start and end when those are provided as Period objects (GH20535)

• Bug in PeriodIndex with attribute freq.n greater than 1 where adding a DateOffset object would return incorrect results (GH23215)

• Bug in Series that interpreted string indices as lists of characters when setting datetimelike values (GH23451)

• Bug in DataFrame when creating a new column from an ndarray of Timestamp objects with timezones creating an object-dtype column, rather than datet ime with timezone (GH23932)

• Bug in Timestamp constructor which would drop the frequency of an input Timestamp (GH22311)

• Bug in DatetimeIndex where calling np.array(dtindex, dtype=object) would incorrectly return an array of long objects (GH23524)

• Bug in Index where passing a timezone-aware DatetimeIndex and dtype=object would incorrectly raise a ValueError (GH23524)
• Bug in Index where calling np.array(dtindex, dtype=object) on a timezone-naive DatetimeIndex would return an array of datetime objects instead of Timestamp objects, potentially losing nanosecond portions of the timestamps (GH23524)

• Bug in Categorical.__setitem__ not allowing setting with another Categorical when both are unordered and have the same categories, but in a different order (GH24142)

• Bug in date_range() where using dates with millisecond resolution or higher could return incorrect values or the wrong number of values in the index (GH24110)

• Bug in DatetimeIndex where constructing a DatetimeIndex from a Categorical or CategoricalIndex would incorrectly drop timezone information (GH18664)

• Bug in DatetimeIndex and TimedeltaIndex where indexing with Ellipsis would incorrectly lose the index’s freq attribute (GH21282)

• Clarified error message produced when passing an incorrect freq argument to DatetimeIndex with NaT as the first entry in the passed data (GH11587)

• Bug in to_datetime() where box and utc arguments were ignored when passing a DataFrame or dict of unit mappings (GH23760)

• Bug in Series.dt where the cache would not update properly after an in-place operation (GH24408)

• Bug in PeriodIndex where comparisons against an array-like object with length 1 failed to raise ValueError (GH23078)

• Bug in DatetimeIndex.astype(), PeriodIndex.astype() and TimedeltaIndex.astype() ignoring the sign of the dtype for unsigned integer dtypes (GH24405).

• Fixed bug in Series.max() with datetime64[ns]-dtype failing to return NaT when nulls are present and skipna=False is passed (GH24265)

• Bug in to_datetime() where arrays of datetime objects containing both timezone-aware and timezone-naive datetimes would fail to raise ValueError (GH24569)

• Bug in to_datetime() with invalid datetime format doesn’t coerce input to NaT even if errors='coerce' (GH24763)

Timedelta

• Bug in DataFrame with timedelta64[ns] dtype division by Timedelta-like scalar incorrectly returning timedelta64[ns] dtype instead of float64 dtype (GH20088, GH22163)

• Bug in adding a Index with object dtype to a Series with timedelta64[ns] dtype incorrectly raising (GH22390)

• Bug in multiplying a Series with numeric dtype against a timedelta object (GH22390)

• Bug in Series with numeric dtype when adding or subtracting an array or Series with timedelta64 dtype (GH22390)

• Bug in Index with numeric dtype when multiplying or dividing an array with dtype timedelta64 (GH22390)

• Bug in TimedeltaIndex incorrectly allowing indexing with Timestamp object (GH20464)

• Fixed bug where subtracting Timedelta from an object-dtyped array would raise TypeError (GH21980)

• Fixed bug in adding a DataFrame with all-timedelta64[ns] dtypes to a DataFrame with all-integer dtypes returning incorrect results instead of raising TypeError (GH22696)

• Bug in TimedeltaIndex where adding a timezone-aware datetime scalar incorrectly returned a timezone-naive DatetimeIndex (GH23215)
• Bug in `TimedeltaIndex` where adding `np.timedelta64('NaT')` incorrectly returned an all-NaT `DatetimeIndex` instead of an all-NaT `TimedeltaIndex` (GH23215)

• Bug in `Timedelta` and `to_timedelta()` have inconsistencies in supported unit string (GH21762)

• Bug in `TimedeltaIndex` division where dividing by another `TimedeltaIndex` raised `TypeError` instead of returning a `Float64Index` (GH23829, GH22631)

• Bug in `TimedeltaIndex` comparison operations where comparing against non-Timedelta-like objects would raise `TypeError` instead of returning all-False for `__eq__` and all-True for `__ne__` (GH24056)

• Bug in `Timedelta` comparisons when comparing with a `Tick` object incorrectly raising `TypeError` (GH24710)

Timezones

• Bug in `Index.shift()` where an `AssertionError` would raise when shifting across DST (GH8616)

• Bug in `Timestamp` constructor where passing an invalid timezone offset designator (Z) would not raise a `ValueError` (GH8910)

• Bug in `Timestamp.replace()` where replacing at a DST boundary would retain an incorrect offset (GH7825)

• Bug in `Series.replace()` with `datetime64[ns, tz]` data when replacing NaT (GH11792)

• Bug in `Timestamp` when passing different string date formats with a timezone offset would produce different timezone offsets (GH12064)

• Bug when comparing a tz-naive `Timestamp` to a tz-aware `DatetimeIndex` which would coerce the `DatetimeIndex` to tz-naive (GH12601)

• Bug in `Series.truncate()` with a tz-aware `DatetimeIndex` which would cause a core dump (GH9243)

• Bug in `Series` constructor which would coerce tz-aware and tz-naive `Timestamp` to tz-aware (GH13051)

• Bug in `Index` with `datetime64[ns, tz]` dtype that did not localize integer data correctly (GH20964)

• Fixed bug where `DataFrame.describe()` and `Series.describe()` on tz-aware datetimes did not show first and last result (GH21328)

• Bug in `DatetimeIndex` comparisons failing to raise `TypeError` when comparing timezone-aware `DatetimeIndex` against `np.datetime64` (GH22074)

• Bug in `DataFrame` assignment with a timezone-aware scalar (GH19843)

• Bug in `DataFrame.asof()` that raised a `TypeError` when attempting to compare tz-naive and tz-aware timestamps (GH21194)

• Bug when constructing a `DatetimeIndex` with `Timestamp` constructed with the `replace` method across DST (GH18785)

• Bug when setting a new value with `DataFrame.loc()` with a `DatetimeIndex` with a DST transition (GH18308, GH20724)

• Bug in `Index.unique()` that did not re-localize tz-aware dates correctly (GH21737)

• Bug when indexing a `Series` with a DST transition (GH21846)

• Bug in `DataFrame.resample()` and `Series.resample()` where an `AmbiguousTimeError` or `NonExistentTimeError` would raise if a timezone aware timeseries ended on a DST transition (GH19375, GH10117)
• Bug in DataFrame.drop() and Series.drop() when specifying a tz-aware Timestamp key to drop from a DatetimeIndex with a DST transition (GH21761)

• Bug in DatetimeIndex constructor where NaT and dateutil.tz.tzlocal would raise an OutOfBoundsDatetime error (GH23807)

• Bug in DatetimeIndex.tz_localize() and Timestamp.tz_localize() with dateutil.tz.tzlocal near a DST transition that would return an incorrectly localized datetime (GH23807)

• Bug in to_datetime() where utc=True was not respected when specifying a unit and errors='ignore' (GH23758)

• Bug in to_datetime() where utc=True was not respected when passing a Timestamp (GH24415)

• Bug in DataFrame.any() returns wrong value when axis=1 and the data is of datetimelike type (GH23070)

• Bug in DatetimeIndex.to_period() where a timezone aware index was converted to UTC first before creating PeriodIndex (GH22905)

• Bug in DataFrame.max() and DataFrame.min() with axis=1 where a Series with NaN would be returned when all columns contained the same timezone (GH10390)

Offsets

• Bug in FY5253 where date offsets could incorrectly raise an AssertionError in arithmetic operations (GH14774)

• Bug in DateOffset where keyword arguments week and milliseconds were accepted and ignored. Passing these will now raise ValueError (GH19398)

• Bug in adding DateOffset with DataFrame or PeriodIndex incorrectly raising TypeError (GH23215)

• Bug in comparing DateOffset objects with non-DateOffset objects, particularly strings, raising ValueError instead of returning False for equality checks and True for not-equal checks (GH23524)

Numeric

• Bug in Series __rmatmul__ doesn't support matrix vector multiplication (GH21530)

• Bug in factorize() fails with read-only array (GH12813)

• Fixed bug in unique() handled signed zeros inconsistently: for some inputs 0.0 and -0.0 were treated as equal and for some inputs as different. Now they are treated as equal for all inputs (GH21866)

• Bug in DataFrame.agg(), DataFrame.transform() and DataFrame.apply() where, when supplied with a list of functions and axis=1 (e.g. df.apply(['sum', 'mean'], axis=1)), a TypeError was wrongly raised. For all three methods such calculation are now done correctly. (GH16679).

• Bug in Series comparison against datetime-like scalars and arrays (GH22074)

• Bug in DataFrame multiplication between boolean dtype and integer returning object dtype instead of integer dtype (GH22047, GH22163)

• Bug in DataFrame.apply() where, when supplied with a string argument and additional positional or keyword arguments (e.g. df.apply('sum', min_count=1)), a TypeError was wrongly raised (GH22376)
Bug in `DataFrame.astype()` to extension dtype may raise `AttributeError` (GH22578)

Bug in `DataFrame` with `timedelta64[ns]` dtype arithmetic operations with `ndarray` with integer dtype incorrectly treating the array as `timedelta64[ns]` dtype (GH23114)

Bug in `Series.rpow()` with object dtype `NaN` for `1 ** NA` instead of `1` (GH22922).

`Series.agg()` can now handle numpy `NaN`-aware methods like `numpy.nansum()` (GH19629)

Bug in `Series.rank()` and `DataFrame.rank()` when `pct=True` and more than $2^{34}$ rows are present resulted in percentages greater than 1.0 (GH18271)

Calls such as `DataFrame.round()` with a non-unique `CategoricalIndex()` now return expected data. Previously, data would be improperly duplicated (GH21809).

Added `log10`, `floor` and `ceil` to the list of supported functions in `DataFrame.eval()` (GH24139, GH24353)

Logical operations `&`, `|`, `^` between `Series` and `Index` will no longer raise `ValueError` (GH22092)

Checking PEP 3141 numbers in `is_scalar()` function returns `True` (GH22903)

Reduction methods like `Series.sum()` now accept the default value of `keepdims=False` when called from a NumPy ufunc, rather than raising a `TypeError`. Full support for `keepdims` has not been implemented (GH24356).

Conversion

Bug in `DataFrame.combine_first()` in which column types were unexpectedly converted to float (GH20699)

Bug in `DataFrame.clip()` in which column types are not preserved and casted to float (GH24162)

Bug in `DataFrame.clip()` when order of columns of dataframes doesn’t match, result observed is wrong in numeric values (GH20911)

Bug in `DataFrame.astype()` where converting to an extension dtype when duplicate column names are present causes a `RecursionError` (GH24704)

Strings

Bug in `Index.str.partition()` was not nan-safe (GH23558).

Bug in `Index.str.split()` was not nan-safe (GH23677).

Bug `Series.str.contains()` not respecting the `na` argument for a Categorical dtype Series (GH22158)

Bug in `Index.str.cat()` when the result contained only `NaN` (GH24044)

Interval

Bug in the `IntervalIndex` constructor where the `closed` parameter did not always override the inferred `closed` (GH19370)

Bug in the `IntervalIndex` repr where a trailing comma was missing after the list of intervals (GH20611)

Bug in `Interval` where scalar arithmetic operations did not retain the `closed` value (GH22313)

Bug in `IntervalIndex` where indexing with datetime-like values raised a `KeyError` (GH20636)

Bug in `IntervalTree` where data containing `NaN` triggered a warning and resulted in incorrect indexing queries with `IntervalIndex` (GH23352)
Indexing

- Bug in `DataFrame.ne()` fails if columns contain column name “dtype” (GH22383)
- The traceback from a `KeyError` when asking `.loc` for a single missing label is now shorter and more clear (GH21557)
- `PeriodIndex` now emits a `KeyError` when a malformed string is looked up, which is consistent with the behavior of `DatetimeIndex` (GH22803)
- When `.ix` is asked for a missing integer label in a `MultiIndex` with a first level of integer type, it now raises a `KeyError`, consistently with the case of a flat `Int64Index`, rather than falling back to positional indexing (GH21593)
- Bug in `Index.reindex()` when reindexing a tz-naive and tz-aware `DatetimeIndex` (GH8306)
- Bug in `Series.reindex()` when reindexing an empty series with a datetime64[ns, tz] dtype (GH20869)
- Bug in `DataFrame` when setting values with `.loc` and a timezone aware `DatetimeIndex` (GH11365)
- `DataFrame.__getitem__` now accepts dictionaries and dictionary keys as list-likes of labels, consistently with `Series.__getitem__` (GH21294)
- Fixed `DataFrame[np.nan]` when columns are non-unique (GH21428)
- Bug when indexing `DatetimeIndex` with nanosecond resolution dates and timezones (GH11679)
- Bug where indexing with a Numpy array containing negative values would mutate the indexer (GH21867)
- Bug where mixed indexes wouldn’t allow integers for `.at` (GH19860)
- `Float64Index.get_loc` now raises `KeyError` when boolean key passed. (GH19087)
- Bug in `DataFrame.loc()` when indexing with an `IntervalIndex` (GH19977)
- `Index` no longer mangles `None`, `NaN` and `NaT`, i.e. they are treated as three different keys. However, for numeric `Index` all three are still coerced to a `NaN` (GH22332)
- Bug in `scalar` in `Index` if scalar is a float while the `Index` is of integer dtype (GH22085)
- Bug in `MultiIndex.set_levels()` when levels value is not subscriptable (GH23273)
- Bug where setting a timedelta column by `Index` causes it to be casted to double, and therefore lose precision (GH23511)
- Bug in `Index.union()` and `Index.intersection()` where name of the `Index` of the result was not computed correctly for certain cases (GH9943, GH9862)
- Bug in `Index` slicing with boolean `Index` may raise `TypeError` (GH22533)
- Bug in `PeriodArray.__setitem__` when accepting slice and list-like value (GH23978)
- Bug in `DatetimeIndex, TimedeltaIndex` where indexing with `Ellipsis` would lose their `freq` attribute (GH21282)
- Bug in `iat` where using it to assign an incompatible value would create a new column (GH23236)
Missing

- Bug in `DataFrame.fillna()` where a `ValueError` would raise when one column contained a `datetime64[ns, tz]` dtype (GH15522)
- Bug in `Series.hasnans()` that could be incorrectly cached and return incorrect answers if null elements are introduced after an initial call (GH19700)
- `Series.isin()` now treats all NaN-floats as equal also for `np.object_`-dtype. This behavior is consistent with the behavior for `float64` (GH22119)
- `unique()` no longer mangles NaN-floats and the `NaT-object` for `np.object_`-dtype, i.e. `NaT` is no longer coerced to a NaN-value and is treated as a different entity. (GH22295)
- `DataFrame` and `Series` now properly handle numpy masked arrays with hardened masks. Previously, constructing a `DataFrame` or `Series` from a masked array with a hard mask would create a pandas object containing the underlying value, rather than the expected NaN. (GH24574)
- Bug in `DataFrame` constructor where `dtype` argument was not honored when handling numpy masked record arrays. (GH24874)

MultiIndex

- Bug in `io.formats.style.Styler.applymap()` where `subset` with `MultiIndex` slice would reduce to `Series` (GH19861)
- Removed compatibility for `MultiIndex` pickles prior to version 0.8.0; compatibility with `MultiIndex` pickles from version 0.13 forward is maintained (GH21654)
- `MultiIndex.get_loc_level()` (and as a consequence, `.loc` on a `Series` or `DataFrame` with a `MultiIndex` index) will now raise a `KeyError`, rather than returning an empty slice, if asked a label which is present in the levels but is unused (GH22221)
- `MultiIndex` has gained the `MultiIndex.from_frame()`, it allows constructing a `MultiIndex` object from a `DataFrame` (GH22420)
- Fix `TypeError` in Python 3 when creating `MultiIndex` in which some levels have mixed types, e.g. when some labels are tuples (GH15457)

IO

- Bug in `read_csv()` in which a column specified with `CategoricalDtype` of boolean categories was not being correctly coerced from string values to booleans (GH20498)
- Bug in `read_csv()` in which unicode column names were not being properly recognized with Python 2.x (GH13253)
- Bug in `DataFrame.to_sql()` when writing timezone aware data (`datetime64[ns, tz]` dtype) would raise a `TypeError` (GH9086)
- Bug in `DataFrame.to_sql()` where a naive `DatetimeIndex` would be written as `TIMESTAMP WITH` `TIMEZONE` type in supported databases, e.g. PostgreSQL (GH23510)
- Bug in `read_excel()` when `parse_cols` is specified with an empty dataset (GH9208)
- `read_html()` no longer ignores all-whitespace `<tr>` within `<thead>` when considering the `skiprows` and `header` arguments. Previously, users had to decrease their `header` and `skiprows` values on such tables to work around the issue. (GH21641)
• *read_excel()* will correctly show the deprecation warning for previously deprecated *sheetname* (GH17994)

• *read_csv()* and *read_table()* will throw *UnicodeError* and not coredump on badly encoded strings (GH22748)

• *read_csv()* will correctly parse timezone-aware datetimes (GH22256)

• Bug in *read_csv()* in which memory management was prematurely optimized for the C engine when the data was being read in chunks (GH23509)

• Bug in *read_csv()* in unnamed columns were being improperly identified when extracting a multi-index (GH23687)

• *read_sas()* will parse numbers in sas7bdat-files that have width less than 8 bytes correctly. (GH21616)

• *read_sas()* will correctly parse sas7bdat files with many columns (GH22628)

• *read_sas()* will correctly parse sas7bdat files with data page types having also bit 7 set (so page type is 128 + 256 = 384) (GH16615)

• Bug in *read_sas()* in which an incorrect error was raised on an invalid file format. (GH24548)

• Bug in *detect_client_encoding()* where potential *IOError* goes unhandled when importing in a mod_wsgi process due to restricted access to stdin. (GH21552)

• Bug in *DataFrame.to_html()* with *index=False* misses truncation indicators (...) on truncated DataFrame (GH15019, GH22783)

• Bug in *DataFrame.to_html()* with *index=False* when both columns and row index are *MultiIndex* (GH22579)

• Bug in *DataFrame.to_html()* with *index_names=False* displaying index name (GH22747)

• Bug in *DataFrame.to_html()* with *header=False* not displaying row index names (GH23788)

• Bug in *DataFrame.to_html()* with *sparsify=False* that caused it to raise *TypeError* (GH22887)

• Bug in *DataFrame.to_string()* that broke column alignment when *index=False* and width of first column’s values is greater than the width of first column’s header (GH16839, GH13032)

• Bug in *DataFrame.to_string()* that caused representations of *DataFrame* to not take up the whole window (GH22984)

• Bug in *DataFrame.to_csv()* where a single level MultiIndex incorrectly wrote a tuple. Now just the value of the index is written (GH19589).

• *HDFStore* will raise *ValueError* when the *format* kwarg is passed to the constructor (GH13291)

• Bug in *HDFStore.append()* when appending a *DataFrame* with an empty string column and *min_itemsize* < 8 (GH12242)

• Bug in *read_csv()* in which memory leaks occurred in the C engine when parsing NaN values due to insufficient cleanup on completion or error (GH21353)

• Bug in *read_csv()* in which incorrect error messages were being raised when skipfooter was passed in along with *nrows*, *iterator*, or *chunksize* (GH23711)

• Bug in *read_csv()* in which *MultiIndex* index names were being improperly handled in the cases when they were not provided (GH23484)

• Bug in *read_csv()* in which unnecessary warnings were being raised when the dialect’s values conflicted with the default arguments (GH23761)

• Bug in *read_html()* in which the error message was not displaying the valid flavors when an invalid one was provided (GH23549)
• Bug in `read_excel()` in which extraneous header names were extracted, even though none were specified (GH11733)

• Bug in `read_excel()` in which column names were not being properly converted to string sometimes in Python 2.x (GH23874)

• Bug in `read_excel()` in which `index_col=None` was not being respected and parsing index columns anyway (GH18792, GH20480)

• Bug in `read_excel()` in which `usecols` was not being validated for proper column names when passed in as a string (GH20480)

• Bug in `DataFrame.to_dict()` when the resulting dict contains non-Python scalars in the case of numeric data (GH23753)

• `DataFrame.to_string()`, `DataFrame.to_html()`, `DataFrame.to_latex()` will correctly format output when a string is passed as the `float_format` argument (GH21625, GH22270)

• Bug in `read_csv()` that caused it to raise `OverflowError` when trying to use ‘inf’ as `na_value` with integer index column (GH17128)

• Bug in `read_csv()` that caused the C engine on Python 3.6+ on Windows to improperly read CSV filenames with accented or special characters (GH15086)

• Bug in `read_fwf()` in which the compression type of a file was not being properly inferred (GH22199)

• Bug in pandas.io.json.json_normalize() that caused it to raise `TypeError` when two consecutive elements of `record_path` are dicts (GH22706)

• Bug in `DataFrame.to_stata()`, `pandas.io.stata.StataWriter` and `pandas.io.stata.StataWriter117` where a exception would leave a partially written and invalid dta file (GH23573)

• Bug in `DataFrame.to_stata()` and `pandas.io.stata.StataWriter117` that produced invalid files when using strLs with non-ASCII characters (GH23573)

• Bug in HDFStore that caused it to raise `ValueError` when reading a Dataframe in Python 3 from fixed format written in Python 2 (GH24510)

• Bug in `DataFrame.to_string()` and more generally in the floating `repr` formatter. Zeros were not trimmed if `inf` was present in a columns while it was the case with NA values. Zeros are now trimmed as in the presence of NA (GH24861).

• Bug in the `repr` when truncating the number of columns and having a wide last column (GH24849).

Plotting

• Bug in `DataFrame.plot.scatter()` and `DataFrame.plot.hexbin()` caused x-axis label and ticklabels to disappear when colorbar was on in IPython inline backend (GH10611, GH10678, and GH20455)

• Bug in plotting a Series with datetimes using matplotlib.axes.Axes.scatter() (GH22039)

• Bug in `DataFrame.plot.bar()` caused bars to use multiple colors instead of a single one (GH20585)

• Bug in validating color parameter caused extra color to be appended to the given color array. This happened to multiple plotting functions using matplotlib. (GH20726)
GroupBy/resample/rolling

- Bug in `pandas.core.window.Rolling.min()` and `pandas.core.window.Rolling.max()` with closed='left', a datetime-like index and only one entry in the series leading to segfault (GH24718).
- Bug in `pandas.core.groupby.GroupBy.first()` and `pandas.core.groupby.GroupBy.last()` with as_index=False leading to the loss of timezone information (GH15884).
- Bug in `DataFrame.resample()` when downsampling across a DST boundary (GH8531).
- Bug in date anchoring for `DataFrame.resample()` with offset Day when n > 1 (GH24127).
- Bug where ValueError is wrongly raised when calling count() method of a SeriesGroupBy when the grouping variable only contains NaNs and numpy version < 1.13 (GH21956).
- Multiple bugs in `pandas.core.window.Rolling.min()` with closed='left' and a datetime-like index leading to incorrect results and also segfault. (GH21704)
- Bug in `pandas.core.resample.Resampler.apply()` when passing positional arguments to applied func (GH14615).
- Bug in `Series.resample()` when passing numpy.timedelta64 to loffset kwarg (GH7687).
- Bug in `pandas.core.resample.Resampler.asfreq()` when frequency of TimedeltaIndex is a subperiod of a new frequency (GH13022).
- Bug in `pandas.core.groupby.SeriesGroupBy.mean()` when values were integral but could not fit inside of int64, overflowing instead. (GH22487)
- Bugs in `pandas.core.groupby.RollingGroupby.agg()` and `pandas.core.groupby.ExpandingGroupby.agg()` now support multiple aggregation functions as parameters (GH15072).
- Bug in `DataFrame.resample()` and `Series.resample()` when resampling by a weekly offset ('W') across a DST transition (GH9119, GH21459).
- Bug in `DataFrame.expanding()` in which the axis argument was not being respected during aggregations (GH23372).
- Bug in `pandas.core.groupby.GroupBy.transform()` which caused missing values when the input function can accept a DataFrame but renames it (GH23455).
- Bug in `pandas.core.groupby.GroupBy.nth()` where column order was not always preserved (GH20760).
- Bug in `pandas.core.groupby.GroupBy.rank()` with method='dense' and pct=True when a group has only one member would raise a ZeroDivisionError (GH23666).
- Calling `pandas.core.groupby.GroupBy.rank()` with empty groups and pct=True was raising a ZeroDivisionError (GH22519).
- Bug in `DataFrame.resample()` when resampling NaT in TimeDeltaIndex (GH13223).
- Bug in `DataFrame.groupby()` did not respect the observed argument when selecting a column and instead always used observed=False (GH23970).
- Bug in `pandas.core.groupby.SeriesGroupBy.pct_change()` or `pandas.core.groupby.DataFrameGroupBy.pct_change()` would previously work across groups when calculating the percent change, where it now correctly works per group (GH21200, GH21235).
- Bug preventing hash table creation with very large number (2^32) of rows (GH22805).
- Bug in groupby when grouping on categorical causes ValueError and incorrect grouping if observed=True and nan is present in categorical column (GH24740, GH21151).
Reshaping

- Bug in `pandas.concat()` when joining resampled DataFrames with timezone aware index (GH13783)
- Bug in `pandas.concat()` when joining only Series the names argument of concat is no longer ignored (GH23490)
- Bug in `Series.combine_first()` with `datetime64[ns, tz]` dtype which would return tz-naive result (GH21469)
- Bug in `Series.where()` and `DataFrame.where()` with `datetime64[ns, tz]` dtype (GH21546)
- Bug in `DataFrame.where()` with an empty DataFrame and empty cond having non-bool dtype (GH21947)
- Bug in `Series.mask()` and `DataFrame.mask()` with list conditionals (GH21891)
- Bug in `DataFrame.replace()` raises `RecursionError` when converting OutOfBounds `datetime64[ns, tz]` (GH20380)
- `pandas.core.groupby.GroupBy.rank()` now raises a `ValueError` when an invalid value is passed for argument `na_option` (GH22124)
- Bug in `get_dummies()` with Unicode attributes in Python 2 (GH22084)
- Bug in `DataFrame.replace()` raises `RecursionError` when replacing empty lists (GH22083)
- Bug in `Series.replace()` and `DataFrame.replace()` when dict is used as the `to_replace` value and one key in the dict is another key’s value, the results were inconsistent between using integer key and using string key (GH20656)
- Bug in `DataFrame.drop_duplicates()` for empty DataFrame which incorrectly raises an error (GH20516)
- Bug in `pandas.wide_to_long()` when a string is passed to the stubnames argument and a column name is a substring of that stubname (GH22468)
- Bug in `merge()` when merging `datetime64[ns, tz]` data that contained a DST transition (GH18885)
- Bug in `merge_asof()` when merging on float values within defined tolerance (GH22981)
- Bug in `pandas.concat()` when concatenating a multicolumn DataFrame with tz-aware data against a DataFrame with a different number of columns (GH22796)
- Bug in `merge_asof()` where confusing error message raised when attempting to merge with missing values (GH23189)
- Bug in `DataFrame.nsmallest()` and `DataFrame.nlargest()` for dataframes that have a `MultiIndex` for columns (GH23033).
- Bug in `pandas.melt()` when passing column names that are not present in DataFrame (GH23575)
- Bug in `DataFrame.append()` with a `Series` with a dateutil timezone would raise a `TypeError` (GH23682)
- Bug in `Series` construction when passing no data and `dtype=str` (GH22477)
- Bug in `cut()` with bins as an overlapping `IntervalIndex` where multiple bins were returned per item instead of raising a `ValueError` (GH23980)
- Bug in `pandas.concat()` when joining Series datetimetz with Series category would lose timezone (GH23816)
- Bug in `DataFrame.join()` when joining on partial MultiIndex would drop names (GH20452).
- `DataFrame.nlargest()` and `DataFrame.nsmallest()` now returns the correct n values when keep != ‘all’ also when tied on the first columns (GH22752)
• Constructing a DataFrame with an index argument that wasn’t already an instance of Index was broken (GH22227).

• Bug in DataFrame prevented list subclasses to be used to construction (GH21226)

• Bug in DataFrame.unstack() and DataFrame.pivot_table() returning a misleading error message when the resulting DataFrame has more elements than int32 can handle. Now, the error message is improved, pointing towards the actual problem (GH20601)

• Bug in DataFrame.unstack() where a ValueError was raised when unstacking timezone aware values (GH18338)

• Bug in DataFrame.stack() where timezone aware values were converted to timezone naive values (GH19420)

• Bug in merge_asof() where a TypeError was raised when by_col were timezone aware values (GH21184)

• Bug showing an incorrect shape when throwing error during DataFrame construction. (GH20742)

Sparse

• Updating a boolean, datetime, or timedelta column to be Sparse now works (GH22367)

• Bug in Series.to_sparse() with Series already holding sparse data not constructing properly (GH22389)

• Providing a sparse_index to the SparseArray constructor no longer defaults the na-value to np.nan for all dtypes. The correct na_value for data.dtype is now used.

• Bug in SparseArray.nbytes under-reporting its memory usage by not including the size of its sparse index.

• Improved performance of Series.shift() for non-NA fill_value, as values are no longer converted to a dense array.

• Bug in DataFrame.groupby not including fill_value in the groups for non-NA fill_value when grouping by a sparse column (GH5078)

• Bug in unary inversion operator (~) on a SparseSeries with boolean values. The performance of this has also been improved (GH22835)

• Bug in SparseArray.unique() not returning the unique values (GH19595)

• Bug in SparseArray.nonzero() and SparseDataFrame.dropna() returning shifted/incorrect results (GH21172)

• Bug in DataFrame.apply() where dtypes would lose sparseness (GH23744)

• Bug in concat() when concatenating a list of Series with all-sparse values changing the fill_value and converting to a dense Series (GH24371)

Style

• background_gradient() now takes a text_color_threshold parameter to automatically lighten the text color based on the luminance of the background color. This improves readability with dark background colors without the need to limit the background colormap range. (GH21258)

• background_gradient() now also supports tablewise application (in addition to rowwise and columnwise) with axis=None (GH15204)

• bar() now also supports tablewise application (in addition to rowwise and columnwise) with axis=None and setting clipping range with vmin and vmax (GH21548 and GH21526). NaN values are also handled properly.
Build changes

- Building pandas for development now requires cython $\geq 0.28.2$ (GH21688)
- Testing pandas now requires hypothesis $\geq 3.58$. You can find the Hypothesis docs here, and a pandas-specific introduction in the contributing guide. (GH22280)
- Building pandas on macOS now targets minimum macOS 10.9 if run on macOS 10.9 or above (GH23424)

Other

- Bug where C variables were declared with external linkage causing import errors if certain other C libraries were imported before pandas. (GH24113)

5.7 Version 0.23

5.7.1 What’s new in 0.23.4 (August 3, 2018)

This is a minor bug-fix release in the 0.23.x series and includes some small regression fixes and bug fixes. We recommend that all users upgrade to this version.

Warning: Starting January 1, 2019, pandas feature releases will support Python 3 only. See Dropping Python 2.7 for more.
What’s new in v0.23.4

- Fixed regressions
- Bug fixes
- Contributors

Fixed regressions

- Python 3.7 with Windows gave all missing values for rolling variance calculations (GH21813)

Bug fixes

Groupby/resample/rolling

- Bug where calling DataFrameGroupBy.agg() with a list of functions including ohlc as the non-initial element would raise a ValueError (GH21716)
- Bug in roll_quantile caused a memory leak when calling .rolling(...) .quantile(q) with q in (0,1) (GH21965)

Missing

- Bug in Series.clip() and DataFrame.clip() cannot accept list-like threshold containing NaN (GH19992)

Contributors

A total of 6 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

- Jeff Reback

5.7.2 What’s new in 0.23.3 (July 7, 2018)

This release fixes a build issue with the sdist for Python 3.7 (GH21785) There are no other changes.
Contributors

A total of 2 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

- Tom Augspurger
- meeseeksdev[bot] +

5.7.3 What’s new in 0.23.2 (July 5, 2018)

This is a minor bug-fix release in the 0.23.x series and includes some small regression fixes and bug fixes. We recommend that all users upgrade to this version.

Note: pandas 0.23.2 is first pandas release that’s compatible with Python 3.7 (GH20552)

Warning: Starting January 1, 2019, pandas feature releases will support Python 3 only. See Dropping Python 2.7 for more.

What’s new in v0.23.2

- Logical reductions over entire DataFrame
- Fixed regressions
- Build changes
- Bug fixes
- Contributors

Logical reductions over entire DataFrame

`DataFrame.all()` and `DataFrame.any()` now accept `axis=None` to reduce over all axes to a scalar (GH19976)

```
In [1]: df = pd.DataFrame({"A": [1, 2], "B": [True, False]})
In [2]: df.all(axis=None)
Out[2]: False
```

This also provides compatibility with NumPy 1.15, which now dispatches to `DataFrame.all`. With NumPy 1.15 and pandas 0.23.1 or earlier, `numpy.all()` will no longer reduce over every axis:

```
>>> # NumPy 1.15, pandas 0.23.1
>>> np.any(pd.DataFrame({"A": [False], "B": [False]}))
A    False
B    False
dtype: bool
```

With pandas 0.23.2, that will correctly return False, as it did with NumPy < 1.5.
Fixed regressions

- Fixed regression in `to_csv()` when handling file-like object incorrectly (GH21471)
- Re-allowed duplicate level names of a MultiIndex. Accessing a level that has a duplicate name by name still raises an error (GH19029).
- Bug in both `DataFrame.first_valid_index()` and `Series.first_valid_index()` raised for a row index having duplicate values (GH21441)
- Fixed printing of DataFrames with hierarchical columns with long names (GH21180)
- Fixed regression in `reindex()` and `groupby()` with a MultiIndex or multiple keys that contains categorical datetime-like values (GH21390).
- Fixed regression in unary negative operations with object dtype (GH21380)
- Bug in `Timestamp.ceil()` and `Timestamp.floor()` when timestamp is a multiple of the rounding frequency (GH21262)
- Fixed regression in `to_clipboard()` that defaulted to copying dataframes with space delimited instead of tab delimited (GH21104)

Build changes

- The source and binary distributions no longer include test data files, resulting in smaller download sizes. Tests relying on these data files will be skipped when using `pandas.test()` (GH19320)

Bug fixes

Conversion

- Bug in constructing `Index` with an iterator or generator (GH21470)
- Bug in `Series.nlargest()` for signed and unsigned integer dtypes when the minimum value is present (GH21426)

Indexing

- Bug in `Index.get_indexer_non_unique()` with categorical key (GH21448)
- Bug in comparison operations for `MultiIndex` where error was raised on equality / inequality comparison involving a MultiIndex with nlevels == 1 (GH21149)
- Bug in `DataFrame.drop()` behaviour is not consistent for unique and non-unique indexes (GH21494)
- Bug in `DataFrame.duplicated()` with a large number of columns causing a 'maximum recursion depth exceeded' (GH21524)

I/O

- Bug in `read_csv()` that caused it to incorrectly raise an error when nrows=0, low_memory=True, and index_col was not None (GH21141)
- Bug in `json_normalize()` when formatting the record_prefix with integer columns (GH21536)

Categorical
• Bug in rendering `Series` with `Categorical` dtype in rare conditions under Python 2.7 (GH21002)

**Timezones**

• Bug in `Timestamp` and `DatetimeIndex` where passing a `Timestamp` localized after a DST transition would return a datetime before the DST transition (GH20854)

• Bug in comparing `DataFrame` with tz-aware `Datet imeIndex` columns with a DST transition that raised a `KeyError` (GH19970)

• Bug in `Datet imeIndex.shift()` where an `AssertionError` would raise when shifting across DST (GH8616)

• Bug in `Timestamp` constructor where passing an invalid timezone offset designator (Z) would not raise a `ValueError` (GH8910)

• Bug in `Timestamp.replace()` where replacing at a DST boundary would retain an incorrect offset (GH7825)

• Bug in `Datet imeIndex.reindex()` when reindexing a tz-naive and tz-aware `Datet imeIndex` (GH8306)

• Bug in `Datet imeIndex.resample()` when downsampling across a DST boundary (GH8531)

**Timedelta**

• Bug in `Timedelta` where non-zero timedeltas shorter than 1 microsecond were considered False (GH21484)

5.7.4 What’s new in 0.23.1 (June 12, 2018)

This is a minor bug-fix release in the 0.23.x series and includes some small regression fixes and bug fixes. We recommend that all users upgrade to this version.

Warning: Starting January 1, 2019, pandas feature releases will support Python 3 only. See Dropping Python 2.7 for more.

What’s new in v0.23.1

- Fixed regressions
- Performance improvements
- Bug fixes
- Contributors

Fixed regressions

Comparing Series with datetime.date

We’ve reverted a 0.23.0 change to comparing a Series holding datetimes and a datetime.date object (GH21152). In pandas 0.22 and earlier, comparing a Series holding datetimes and datetime.date objects would coerce the datetime.date to a datetime before comparing. This was inconsistent with Python, NumPy, and DatetimeIndex, which never consider a datetime and datetime.date equal.

In 0.23.0, we unified operations between DatetimeIndex and Series, and in the process changed comparisons between a Series of datetimes and datetime.date without warning.

We’ve temporarily restored the 0.22.0 behavior, so datetimes and dates may again compare equal, but restore the 0.23.0 behavior in a future release.

To summarize, here’s the behavior in 0.22.0, 0.23.0, 0.23.1:

```
# 0.22.0... Silently coerce the datetime.date
>>> import datetime
gg> pd.Series(pd.date_range('2017', periods=2)) == datetime.date(2017, 1, 1)
0   True
1   False
dtype: bool

# 0.23.0... Do not coerce the datetime.date
>>> pd.Series(pd.date_range('2017', periods=2)) == datetime.date(2017, 1, 1)
0   False
1   False
dtype: bool

# 0.23.1... Coerce the datetime.date with a warning
>>> pd.Series(pd.date_range('2017', periods=2)) == datetime.date(2017, 1, 1)
/bin/python:1: FutureWarning: Comparing Series of datetimes with 'datetime.date'. Currently, the 'datetime.date' is coerced to a datetime. In the future pandas will
```

(continues on next page)
not coerce, and the values not compare equal to the 'datetime.date'.
To retain the current behavior, convert the 'datetime.date' to a
datetime with 'pd.Timestamp'.

```python
#!/bin/python3
0     True
1    False
dtype: bool
```

In addition, ordering comparisons will raise a `TypeError` in the future.

**Other fixes**

- Reverted the ability of `to_sql()` to perform multivalue inserts as this caused regression in certain cases (GH21103). In the future this will be made configurable.
- Fixed regression in the `DatetimeIndex.date` and `DatetimeIndex.time` attributes in case of timezone-aware data: `DatetimeIndex.time` returned a tz-aware time instead of tz-naive (GH21267) and `DatetimeIndex.date` returned incorrect date when the input date has a non-UTC timezone (GH21230).
- Fixed regression in pandas.io.json.json_normalize() when called with `None` values in nested levels in JSON, and to not drop keys with value as `None` (GH21158, GH21356).
- Bug in `to_csv()` causes encoding error when compression and encoding are specified (GH21241, GH21118)
- Bug preventing pandas from being importable with -OO optimization (GH21071)
- Bug in `Categorical.fillna()` incorrectly raising a `TypeError` when `value` the individual categories are iterable and `value` is an iterable (GH21097, GH19788)
- Fixed regression in constructors coercing NA values like `None` to strings when passing `dtype=str` (GH21083)
- Regression in `pivot_table()` where an ordered `Categorical` with missing values for the pivot's index would give a mis-aligned result (GH21133)
- Fixed regression in merging on boolean index/columns (GH21119).

**Performance improvements**

- Improved performance of `CategoricalIndex.is_monotonic_increasing()`, `CategoricalIndex.is_monotonic_decreasing()` and `CategoricalIndex.is_monotonic()` (GH21025)
- Improved performance of `CategoricalIndex.is_unique()` (GH21107)

**Bug fixes**

**Groupby/resample/rolling**

- Bug in `DataFrame.agg()` where applying multiple aggregation functions to a `DataFrame` with duplicated column names would cause a stack overflow (GH21063)
- Bug in `pandas.core.groupby.GroupBy.ffill()` and `pandas.core.groupby.GroupBy.bfill()` where the fill within a grouping would not always be applied as intended due to the implementations' use of a non-stable sort (GH21207)
- Bug in `pandas.core.groupby.GroupBy.rank()` where results did not scale to 100% when specifying `method='dense'` and `pct=True`
- Bug in `pandas.DataFrame.rolling()` and `pandas.Series.rolling()` which incorrectly accepted a 0 window size rather than raising (GH21286)
Data-type specific

- Bug in `Series.str.replace()` where the method throws `TypeError` on Python 3.5.2 (GH21078)
- Bug in `Timedelta` where passing a float with a unit would prematurely round the float precision (GH14156)
- Bug in `pandas.testing.assert_index_equal()` which raised `AssertionError` incorrectly, when comparing two `CategoricalIndex` objects with param `check_categorical=False` (GH19776)

Sparse

- Bug in `SparseArray.shape` which previously only returned the shape `SparseArray.sp_values` (GH21126)

Indexing

- Bug in `Series.reset_index()` where appropriate error was not raised with an invalid level name (GH20925)
- Bug in `interval_range()` when `start/periods` or `end/periods` are specified with float `start` or `end` (GH21161)
- Bug in `MultiIndex.set_names()` where error raised for a `MultiIndex` with `nlevels == 1` (GH21149)
- Bug in `IntervalIndex` constructors where creating an `IntervalIndex` from categorical data was not fully supported (GH21243, GH21253)
- Bug in `MultiIndex.sort_index()` which was not guaranteed to sort correctly with `level=1`; this was also causing data misalignment in particular `DataFrame.stack()` operations (GH20994, GH20945, GH21052)

Plotting

- New keywords (sharex, sharey) to turn on/off sharing of x/y-axis by subplots generated with pandas.DataFrame().groupby().boxplot() (GH20968)

I/O

- Bug in IO methods specifying `compression='zip'` which produced uncompressed zip archives (GH17778, GH21144)
- Bug in `DataFrame.to_stata()` which prevented exporting DataFrames to buffers and most file-like objects (GH21041)
- Bug in `read_stata()` and StataReader which did not correctly decode utf-8 strings on Python 3 from Stata 14 files (dta version 118) (GH21244)
- Bug in IO JSON `read_json()` reading empty JSON schema with `orient='table'` back to DataFrame caused an error (GH21287)

Reshaping

- Bug in `concat()` where error was raised in concatenating `Series` with numpy scalar and tuple names (GH21015)
- Bug in `concat()` warning message providing the wrong guidance for future behavior (GH21101)

Other

- Tab completion on `Index` in IPython no longer outputs deprecation warnings (GH21125)
- Bug preventing pandas being used on Windows without C++ redistributable installed (GH21106)

5.7.5 What’s new in 0.23.0 (May 15, 2018)

This is a major release from 0.22.0 and includes a number of API changes, deprecations, new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

Highlights include:

- Round-trippable JSON format with ‘table’ orient.
- Instantiation from dicts respects order for Python 3.6+.
- Dependent column arguments for assign.
- Merging / sorting on a combination of columns and index levels.
- Extending pandas with custom types.
- Excluding unobserved categories from groupby.
- Changes to make output shape of DataFrame.apply consistent.

Check the API Changes and deprecations before updating.

Warning: Starting January 1, 2019, pandas feature releases will support Python 3 only. See Dropping Python 2.7 for more.

What’s new in v0.23.0

- New features
  - JSON read/write round-trippable with orient='table'
  - Method .assign() accepts dependent arguments
  - Merging on a combination of columns and index levels
  - Sorting by a combination of columns and index levels
  - Extending pandas with custom types (experimental)
  - New observed keyword for excluding unobserved categories in GroupBy
  - Rolling/Expanding.apply() accepts raw=False to pass a Series to the function
  - DataFrame.interpolate has gained the limit_area kwarg
  - Function get_dummies now supports dtype argument
  - Timedelta mod method
  - Method .rank() handles inf values when NaN are present
  - Series.str.cat has gained the join kwarg
  - DataFrame.astype performs column-wise conversion to Categorical
  - Other enhancements

- Backwards incompatible API changes
  - Dependencies have increased minimum versions
  - Instantiation from dicts preserves dict insertion order for Python 3.6+
- Deprecate Panel
- pandas.core.common removals
- Changes to make output of DataFrame.apply consistent
- Concatenation will no longer sort
- Build changes
- Index division by zero fills correctly
- Extraction of matching patterns from strings
- Default value for the ordered parameter of CategoricalDtype
- Better pretty-printing of DataFrames in a terminal
- Datetimelike API changes
- Other API changes

• Deprecations
• Removal of prior version deprecations/changes
• Performance improvements
• Documentation changes
• Bug fixes
  - Categorical
  - Datetimelike
  - Timedelta
  - Timezones
  - Offsets
  - Numeric
  - Strings
  - Indexing
  - MultiIndex
  - IO
  - Plotting
  - GroupBy/resample/rolling
  - Sparse
  - Reshaping
  - Other

New features

**JSON read/write round-trippable with orient='table'**

A DataFrame can now be written to and subsequently read back via JSON while preserving metadata through usage of the `orient='table'` argument (see GH18912 and GH9146). Previously, none of the available `orient` values guaranteed the preservation of dtypes and index names, amongst other metadata.

```python
In [1]: df = pd.DataFrame(
    ...:     {'foo': [1, 2, 3, 4],
    ...:       'bar': ['a', 'b', 'c', 'd'],
    ...:       'baz': pd.date_range('2018-01-01', freq='d', periods=4),
    ...:       'qux': pd.Categorical(['a', 'b', 'c', 'c'])),
    ...:     index=pd.Index(range(4), name='idx'))

In [2]: df
Out[2]:
       foo  bar      baz
    idx
0  1   a  2018-01-01 a
1  2   b  2018-01-02 b
2  3   c  2018-01-03 c
3  4   d  2018-01-04 c

[4 rows x 4 columns]

In [3]: df.dtypes
Out[3]:
       foo  bar             baz             qux
    dtype: int64  object  datetime64[ns]  category

In [4]: df.to_json('test.json', orient='table')

In [5]: new_df = pd.read_json('test.json', orient='table')

In [6]: new_df
Out[6]:
       foo  bar      baz
    idx
0  1   a  2018-01-01 a
1  2   b  2018-01-02 b
2  3   c  2018-01-03 c
3  4   d  2018-01-04 c

[4 rows x 4 columns]

In [7]: new_df.dtypes
Out[7]:
       foo  bar
    dtype: int64  object
```

(continues on next page)
Please note that the string index is not supported with the round trip format, as it is used by default in write_json to indicate a missing index name.

```python
In [8]: df.index.name = 'index'
In [9]: df.to_json('test.json', orient='table')
In [10]: new_df = pd.read_json('test.json', orient='table')
In [11]: new_df
```

```
foo  bar   baz  qux
0  1  a  2018-01-01  a
1  2  b  2018-01-02  b
2  3  c  2018-01-03  c
3  4  d  2018-01-04  c
```

```
In [12]: new_df.dtypes
```

```
foo  int64
bar  object
baz  datetime64[ns]
qux  category
```

**Method .assign() accepts dependent arguments**

The `DataFrame.assign()` now accepts dependent keyword arguments for python version later than 3.6 (see also PEP 468). Later keyword arguments may now refer to earlier ones if the argument is a callable. See the documentation here (GH14207)

```python
In [13]: df = pd.DataFrame({'A': [1, 2, 3]})
In [14]: df
```

```
   A
0  1
1  2
2  3
```

```python
In [15]: df.assign(B=df.A, C=lambda x: x['A'] + x['B'])
```

```
   A  B  C
0  1  1  a
1  2  3  c
2  3  5  c
```

0 1 1 2
1 2 2 4
2 3 3 6
[3 rows x 3 columns]

Warning: This may subtly change the behavior of your code when you’re using .assign() to update an existing column. Previously, callables referring to other variables being updated would get the “old” values

Previous behavior:

In [2]: df = pd.DataFrame({'A': [1, 2, 3]})
In [3]: df.assign(A=lambda df: df.A + 1, C=lambda df: df.A * -1)
Out[3]:
   A   C
0  2  -1
1  3  -2
2  4  -3

New behavior:

In [16]: df.assign(A=df.A + 1, C=lambda df: df.A * -1)
Out[16]:
   A   C
0  2  -2
1  3  -3
2  4  -4
[3 rows x 2 columns]

Merging on a combination of columns and index levels

Strings passed to DataFrame.merge() as the on, left_on, and right_on parameters may now refer to either column names or index level names. This enables merging DataFrame instances on a combination of index levels and columns without resetting indexes. See the Merge on columns and levels documentation section. (GH14355)
Strings passed to `DataFrame.sort_values()` as the by parameter may now refer to either column names or index level names. This enables sorting DataFrame instances by a combination of index levels and columns without resetting indexes. See the Sorting by Indexes and Values documentation section. (GH14353)
Extending pandas with custom types (experimental)

pandas now supports storing array-like objects that aren’t necessarily 1-D NumPy arrays as columns in a DataFrame or values in a Series. This allows third-party libraries to implement extensions to NumPy’s types, similar to how pandas implemented categoricals, datetimes with timezones, periods, and intervals.

As a demonstration, we’ll use cyberpandas, which provides an IPArray type for storing ip addresses.

```python
In [1]: from cyberpandas import IPArray

In [2]: values = IPArray([
    ...:     0,
    ...:     3232235777,
    ...:     42540766452641154071740215577757643572
    ...:     ])

IPArray isn’t a normal 1-D NumPy array, but because it’s a pandas ExtensionArray, it can be stored properly inside pandas’ containers.

In [3]: ser = pd.Series(values)

In [4]: ser
Out[4]:
    0     0.0.0.0
    1  192.168.1.1
    2 2001:db8:85a3::8a2e:370:7334
dtype: ip

Notice that the dtype is ip. The missing value semantics of the underlying array are respected:

In [5]: ser.isna()
Out[5]:
    0    True
    1   False
    2   False
dtype: bool
```

For more, see the extension types documentation. If you build an extension array, publicize it on our ecosystem page.
New observed keyword for excluding unobserved categories in GroupBy

Grouping by a categorical includes the unobserved categories in the output. When grouping by multiple categorical columns, this means you get the cartesian product of all the categories, including combinations where there are no observations, which can result in a large number of groups. We have added a keyword observed to control this behavior, it defaults to observed=False for backward-compatibility. (GH14942, GH8138, GH15217, GH17594, GH8669, GH20583, GH20902)

```
In [27]: cat1 = pd.Categorical(['a', 'a', 'b', 'b'],
                           categories=['a', 'b', 'z'], ordered=True)
   ....:    
In [28]: cat2 = pd.Categorical(['c', 'd', 'c', 'd'],
                           categories=['c', 'd', 'y'], ordered=True)
   ....:    
In [29]: df = pd.DataFrame({'A': cat1, 'B': cat2, 'values': [1, 2, 3, 4]})
In [30]: df['C'] = ['foo', 'bar'] * 2
In [31]: df
```
```
Out[31]:
     A B  values C
  0  a  c    1 foo
  1  a  d    2 bar
  2  b  c    3 foo
  3  b  d    4 bar
```

To show all values, the previous behavior:

```
In [32]: df.groupby(['A', 'B', 'C'], observed=False).count()
Out[32]:
        values
     A  B  C
 a c bar 0  
     foo 1
 d bar 1  
     foo 0
 y bar 0  
 ... ...
 z c foo 0  
 d bar 0  
     foo 0
 y bar 0  
     foo 0
```

To show only observed values:

```
In [33]: df.groupby(['A', 'B', 'C'], observed=True).count()
```

(continues on next page)
For pivoting operations, this behavior is already controlled by the dropna keyword:

```python
In [34]: cat1 = pd.Categorical(['a', 'a', 'b', 'b'],
                         categories=['a', 'b', 'z'], ordered=True)

In [35]: cat2 = pd.Categorical(['c', 'd', 'c', 'd'],
                         categories=['c', 'd', 'y'], ordered=True)

In [36]: df = pd.DataFrame({'A': cat1, 'B': cat2, 'values': [1, 2, 3, 4]})

In [37]: df
Out[37]:
   A   B  values
0  a   c     1
1  a   d     2
2  b   c     3
3  b   d     4
```

```python
In [38]: pd.pivot_table(df, values='values', index=['A', 'B'],
                dropna=True)

Out[38]:
   values
A  B
a   c     1
d     2
b   c     3
d     4
```

```python
In [39]: pd.pivot_table(df, values='values', index=['A', 'B'],
                dropna=False)

Out[39]:
   values
A  B
a   c   1.0
```
Rolling/Expanding.apply() accepts raw=False to pass a Series to the function

Series.rolling().apply(), DataFrame.rolling().apply(), Series.expanding().apply(), and DataFrame.expanding().apply() have gained a raw=None parameter. This is similar to DataFrame.apply(). This parameter, if True allows one to send a np.ndarray to the applied function. If False a Series will be passed. The default is None, which preserves backward compatibility, so this will default to True, sending an np.ndarray. In a future version the default will be changed to False, sending a Series. (GH5071, GH20584)

In [40]: s = pd.Series(np.arange(5), np.arange(5) + 1)

In [41]: s
Out[41]:
1 0
2 1
3 2
4 3
5 4
Length: 5, dtype: int64

Pass a Series:

In [42]: s.rolling(2, min_periods=1).apply(lambda x: x.iloc[-1], raw=False)
Out[42]:
1 0.0
2 1.0
3 2.0
4 3.0
5 4.0
Length: 5, dtype: float64

Mimic the original behavior of passing a ndarray:

In [43]: s.rolling(2, min_periods=1).apply(lambda x: x[-1], raw=True)
Out[43]:
1 0.0
2 1.0
3 2.0
4 3.0
5 4.0
Length: 5, dtype: float64
**DataFrame.interpolate** has gained the limit_area kwarg

*DataFrame.interpolate()* has gained a limit_area parameter to allow further control of which NaNs are replaced. Use limit_area='inside' to fill only NaNs surrounded by valid values or use limit_area='outside' to fill only NaNs outside the existing valid values while preserving those inside. (GH16284) See the full documentation here.

```
In [44]: ser = pd.Series([np.nan, np.nan, 5, np.nan, np.nan,  
                     ....:     np.nan, 13, np.nan, np.nan])  
      ....:

In [45]: ser
Out[45]:
0    NaN
1    NaN
2    5.0
3    NaN
4    NaN
5    NaN
6   13.0
7    NaN
8    NaN
Length: 9, dtype: float64

Fill one consecutive inside value in both directions

```
```
In [46]: ser.interpolate(limit_direction='both', limit_area='inside', limit=1)
Out[46]:
0    NaN
1    NaN
2    5.0
3    7.0
4    NaN
5   11.0
6   13.0
7    NaN
8    NaN
Length: 9, dtype: float64
```

Fill all consecutive outside values backward

```
In [47]: ser.interpolate(limit_direction='backward', limit_area='outside')
Out[47]:
0    5.0
1    5.0
2    5.0
3    NaN
4    NaN
5    NaN
6   13.0
7    NaN
8    NaN
Length: 9, dtype: float64
```

Fill all consecutive outside values in both directions
Function `get_dummies` now supports `dtype` argument

The `get_dummies()` now accepts a `dtype` argument, which specifies a dtype for the new columns. The default remains `uint8`. (GH18330)

```python
In [49]: df = pd.DataFrame({'a': [1, 2], 'b': [3, 4], 'c': [5, 6]})
In [50]: pd.get_dummies(df, columns=['c']).dtypes
Out[50]:
a       int64
b       int64
c_5      uint8
c_6      uint8
Length: 4, dtype: object
In [51]: pd.get_dummies(df, columns=['c'], dtype=bool).dtypes
Out[51]:
a       int64
b       int64
c_5     bool
c_6     bool
Length: 4, dtype: object
```

Timedelta mod method

`mod (%)` and `divmod` operations are now defined on `Timedelta` objects when operating with either timedelta-like or with numeric arguments. See the documentation here. (GH19365)

```python
In [52]: td = pd.Timedelta(hours=37)
In [53]: td % pd.Timedelta(minutes=45)
Out[53]: Timedelta('0 days 00:15:00')
```
Method `.rank()` handles `inf` values when `NaN` are present

In previous versions, `.rank()` would assign `inf` elements `NaN` as their ranks. Now ranks are calculated properly. (GH6945)

```python
In [54]: s = pd.Series([-np.inf, 0, 1, np.nan, np.inf])

In [55]: s
Out[55]:
0  -inf
1    0.0
2    1.0
3     NaN
4    inf
Length: 5, dtype: float64

Previous behavior:

In [11]: s.rank()
Out[11]:
0   1.0
1   2.0
2   3.0
3   NaN
4   NaN
dtype: float64

Current behavior:

In [56]: s.rank()
Out[56]:
0   1.0
1   2.0
2   3.0
3   NaN
4   4.0
Length: 5, dtype: float64

Furthermore, previously if you rank `inf` or `-inf` values together with `NaN` values, the calculation won’t distinguish `NaN` from infinity when using ‘top’ or ‘bottom’ argument.

In [57]: s = pd.Series([np.nan, np.nan, -np.inf, -np.inf])

In [58]: s
Out[58]:
0   NaN
1   NaN
2  -inf
3  -inf
Length: 4, dtype: float64

Previous behavior:
```python
In [15]: s.rank(na_option='top')
Out[15]:
    0   2.5
    1   2.5
    2   2.5
    3   2.5
dtype: float64
```

Current behavior:
```python
In [59]: s.rank(na_option='top')
Out[59]:
    0   1.5
    1   1.5
    2   3.5
    3   3.5
Length: 4, dtype: float64
```

These bugs were squashed:
- Bug in `DataFrame.rank()` and `Series.rank()` when `method='dense'` and `pct=True` in which percentile ranks were not being used with the number of distinct observations (GH15630)
- Bug in `Series.rank()` and `DataFrame.rank()` when `ascending='False'` failed to return correct ranks for infinity if NaN were present (GH19538)
- Bug in `DataFrameGroupBy.rank()` where ranks were incorrect when both infinity and NaN were present (GH20561)

**Series.str.cat has gained the join kwarg**

Previously, `Series.str.cat()` did not—in contrast to most of pandas—align `Series` on their index before concatenation (see GH18657). The method has now gained a keyword `join` to control the manner of alignment, see examples below and `here`.

In v.0.23 `join` will default to None (meaning no alignment), but this default will change to 'left' in a future version of pandas.

```python
In [60]: s = pd.Series(['a', 'b', 'c', 'd'])
In [61]: t = pd.Series(['b', 'd', 'e', 'c'], index=[1, 3, 4, 2])
In [62]: s.str.cat(t)
Out[62]:
    0   NaN
    1   bb
    2   cc
    3   dd
Length: 4, dtype: object
```

```python
In [63]: s.str.cat(t, join='left', na_rep='--')
Out[63]:
    0   a--
    1   bb
```

(continues on next page)
Furthermore, Series.str.cat() now works for CategoricalIndex as well (previously raised a ValueError; see GH20842).

**DataFrame.astype performs column-wise conversion to Categorical**

DataFrame.astype() can now perform column-wise conversion to Categorical by supplying the string 'category' or a CategoricalDtype. Previously, attempting this would raise a NotImplementedError. See the Object creation section of the documentation for more details and examples. (GH12860, GH18099)

Supplying the string 'category' performs column-wise conversion, with only labels appearing in a given column set as categories:

```
In [64]: df = pd.DataFrame({'A': list('abca'), 'B': list('bccd'))
In [65]: df = df.astype('category')
In [66]: df['A'].dtype
Out[66]: CategoricalDtype(categories=['a', 'b', 'c'], ordered=False)
In [67]: df['B'].dtype
Out[67]: CategoricalDtype(categories=['b', 'c', 'd'], ordered=False)
```

Supplying a CategoricalDtype will make the categories in each column consistent with the supplied dtype:

```
In [68]: from pandas.api.types import CategoricalDtype

In [69]: df = pd.DataFrame({'A': list('abca'), 'B': list('bccd'))
In [70]: cdt = CategoricalDtype(categories=list('abcd'), ordered=True)
In [71]: df = df.astype(cdt)
In [72]: df['A'].dtype
Out[72]: CategoricalDtype(categories=['a', 'b', 'c', 'd'], ordered=True)
In [73]: df['B'].dtype
Out[73]: CategoricalDtype(categories=['a', 'b', 'c', 'd'], ordered=True)
```
Other enhancements

- Unary + now permitted for Series and DataFrame as numeric operator (GH16073)
- Better support for to_excel() output with the xlsxwriter engine. (GH16149)
- pandas.tseries.frequencies.to_offset() now accepts leading ‘+’ signs e.g. ‘+1h’. (GH18171)
- MultiIndex.unique() now supports the level= argument, to get unique values from a specific index level (GH17896)
- pandas.io.formats.style.Styler now has method hide_index() to determine whether the index will be rendered in output (GH14194)
- pandas.io.formats.style.Styler now has method hide_columns() to determine whether columns will be hidden in output (GH14194)
- Improved wording of ValueError raised in to_datetime() when unit= is passed with a non-convertible value (GH14350)
- Series.fillna() now accepts a Series or a dict as a value for a categorical dtype (GH17033)
- pandas.read_clipboard() updated to use qtpy, falling back to PyQt5 and then PyQt4, adding compatibility with Python3 and multiple python-qt bindings (GH17722)
- Improved wording of ValueError raised in read_csv() when the usecols argument cannot match all columns. (GH17301)
- DataFrame.corrwith() now silently drops non-numeric columns when passed a Series. Before, an exception was raised (GH18570).
- IntervalIndex now supports time zone aware Interval objects (GH18537, GH18538)
- Series() / DataFrame() tab completion also returns identifiers in the first level of a MultiIndex(). (GH16326)
- read_excel() has gained the nrows parameter (GH16645)
- DataFrame.append() can now in more cases preserve the type of the calling dataframe's columns (e.g. if both are CategoricalIndex) (GH18359)
- DataFrame.to_json() and Series.to_json() now accept an index argument which allows the user to exclude the index from the JSON output (GH17394)
- IntervalIndex.to_tuples() has gained the na_tuple parameter to control whether NA is returned as a tuple of NA, or NA itself (GH18756)
- Categorical.rename_categories, CategoricalIndex.rename_categories and Series.cat.rename_categories can now take a callable as their argument (GH18862)
- Interval and IntervalIndex have gained a length attribute (GH18789)
- Resampler objects now have a functioning pipe method. Previously, calls to pipe were diverted to the mean method (GH17905).
- is_scalar() now returns True for DateOffset objects (GH18943).
- DataFrame.pivot() now accepts a list for the values= kwarg (GH18943).
- Added pandas.api.extensions.register_dataframe_accessor(), pandas.api.extensions.register_series_accessor(), and pandas.api.extensions.register_index_accessor(), accessor for libraries downstream of pandas to register custom accessors like .cat on pandas objects. See Registering Custom Accessors for more (GH14781).
• IntervalIndex.astype now supports conversions between subtypes when passed an IntervalDtype (GH19197)

• IntervalIndex and its associated constructor methods (from_arrays, from_breaks, from_tuples) have gained a dtype parameter (GH19262)

• Added pandas.core.groupby.SeriesGroupBy.is_monotonic_increasing() and pandas.core.groupby.SeriesGroupBy.is_monotonic_decreasing() (GH17015)

• For subclassed DataFrames, DataFrame.apply() will now preserve the Series subclass (if defined) when passing the data to the applied function (GH19822)

• DataFrame.from_dict() now accepts a columns argument that can be used to specify the column names when orient='index' is used (GH18529)

• Added option display.html.use_mathjax so MathJax can be disabled when rendering tables in Jupyter notebooks (GH19856, GH19824)

• DataFrame.replace() now supports the method parameter, which can be used to specify the replacement method when to_replace is a scalar, list or tuple and value is None (GH19632)

• Timestamp.month_name(), DatetimeIndex.month_name(), and Series.dt.month_name() are now available (GH12805)

• Timestamp.day_name() and DatetimeIndex.day_name() are now available to return day names with a specified locale (GH12806)

• DataFrame.to_sql() now performs a multi-value insert if the underlying connection supports itk rather than inserting row by row. SQLAlchemy dialects supporting multi-value inserts include: mysql, postgresql, sqlite and any dialect with supports_multivalues_insert. (GH14315, GH8953)

• read_html() now accepts a displayed_only keyword argument to controls whether or not hidden elements are parsed (True by default) (GH20027)

• read_html() now reads all <tbody> elements in a <table>, not just the first. (GH20690)

• quantile() and quantile() now accept the interpolation keyword, linear by default (GH20497)

• zip compression is supported via compression=zip in DataFrame.to_pickle(), Series.to_pickle(), DataFrame.to_csv(), Series.to_csv(), DataFrame.to_json(), Series.to_json(). (GH17778)

• WeekOfMonth constructor now supports n=0 (GH20517).

• DataFrame and Series now support matrix multiplication (@) operator (GH10259) for Python>=3.5

• Updated DataFrame.to_gbq() and pandas.read_gbq() signature and documentation to reflect changes from the pandas-gbq library version 0.4.0. Adds intersphinx mapping to pandas-gbq library. (GH20564)

• Added new writer for exporting Stata data files in version 117, StataWriter117. This format supports exporting strings with lengths up to 2,000,000 characters (GH16450)

• to_hdf() and read_hdf() now accept an errors keyword argument to control encoding error handling (GH20835)

• cut() has gained the duplicates='raise'|'drop' option to control whether to raise on duplicated edges (GH20947)

• date_range(), timedelta_range(), and interval_range() now return a linearly spaced index if start, stop, and periods are specified, but freq is not. (GH20808, GH20983, GH20976)
Backwards incompatible API changes

Dependencies have increased minimum versions

We have updated our minimum supported versions of dependencies (GH15184). If installed, we now require:

<table>
<thead>
<tr>
<th>Package</th>
<th>Minimum Version</th>
<th>Required</th>
<th>Issue</th>
</tr>
</thead>
<tbody>
<tr>
<td>python-dateutil</td>
<td>2.5.0</td>

</tbody>
</table>

Instantiation from dicts preserves dict insertion order for Python 3.6+

Until Python 3.6, dicts in Python had no formally defined ordering. For Python version 3.6 and later, dicts are ordered by insertion order, see PEP 468. pandas will use the dict's insertion order, when creating a Series or DataFrame from a dict and you’re using Python version 3.6 or higher. (GH19884)

Previous behavior (and current behavior if on Python < 3.6):

```
In [16]: pd.Series({'Income': 2000,
.....:     'Expenses': -1500,
.....:     'Taxes': -200,
.....:     'Net result': 300})
Out[16]:
Expenses   -1500
Income     2000
Taxes      -200
Net result 300
dtype: int64
```

Note the Series above is ordered alphabetically by the index values.

New behavior (for Python >= 3.6):

```
In [74]: pd.Series({'Income': 2000,
.....:     'Expenses': -1500,
.....:     'Taxes': -200,
.....:     'Net result': 300})
Out[74]:
Income     2000
Expenses   -1500
Taxes      -200
Net result 300
Length: 4, dtype: int64
```

Notice that the Series is now ordered by insertion order. This new behavior is used for all relevant pandas types (Series, DataFrame, SparseSeries and SparseDataFrame).

If you wish to retain the old behavior while using Python >= 3.6, you can use .sort_index():

```
```
In [75]: pd.Series({'Income': 2000, 'Expenses': -1500, 'Taxes': -200, 'Net result': 300}).sort_index()

Out[75]:
Expenses -1500
Income 2000
Net result 300
Taxes -200
Length: 4, dtype: int64

Deprecate Panel

Panel was deprecated in the 0.20.x release, showing as a DeprecationWarning. Using Panel will now show a FutureWarning. The recommended way to represent 3-D data are with a MultiIndex on a DataFrame via the to_frame() or with the xarray package. pandas provides a to_xarray() method to automate this conversion (GH13563, GH18324).

In [75]: import pandas._testing as tm

In [76]: p = tm.makePanel()

In [77]: p
Out[77]:
<class 'pandas.core.panel.Panel'>
Dimensions: 3 (items) x 3 (major_axis) x 4 (minor_axis)
Items axis: ItemA to ItemC
Major_axis axis: 2000-01-03 00:00:00 to 2000-01-05 00:00:00
Minor_axis axis: A to D

Convert to a MultiIndex DataFrame

In [78]: p.to_frame()
Out[78]:
   ItemA  ItemB  ItemC
major  minor
2000-01-03 A    0.469112  0.721555  0.404705
       B    -1.135632  0.271860  1.039268
       C     0.119209  0.276232 -1.344312
       D   -2.104569  0.113648 -0.109050
2000-01-04 A    0.282863 -0.706771  0.577046
       B     1.212112 -0.424972 -0.370647
       C    -1.044236 -1.087401  0.844885
       D   -0.494929 -1.478427  1.643563

      [[ 0.404705, -1.039268, -1.344312, -0.10905 ],
       [ 0.577046, -0.370647, 0.844885, 1.643563],
       [-1.715002, -1.157892, 1.07577 , -1.469388]])
Coordinates:
* items    (items) object 'ItemA' 'ItemB' 'ItemC'
* major_axis (major_axis) datetime64[ns] 2000-01-03 2000-01-04 2000-01-05
* minor_axis (minor_axis) object 'A' 'B' 'C' 'D'
```

**pandas.core.common removals**

The following error & warning messages are removed from `pandas.core.common` (GH13634, GH19769):

- `PerformanceWarning`
- `UnsupportedFunctionCall`
- `UnsortedIndexError`
- `AbstractMethodError`

These are available from import from `pandas.errors` (since 0.19.0).

**Changes to make output of DataFrame.apply consistent**

`DataFrame.apply()` was inconsistent when applying an arbitrary user-defined-function that returned a list-like with `axis=1`. Several bugs and inconsistencies are resolved. If the applied function returns a Series, then pandas will return a DataFrame; otherwise a Series will be returned, this includes the case where a list-like (e.g. `tuple` or `list` is returned) (GH16353, GH17437, GH17970, GH17348, GH17892, GH18573, GH17602, GH18775, GH18901, GH18919).

```
In [76]: df = pd.DataFrame(np.tile(np.arange(3), 6).reshape(6, -1) + 1,
                     columns=['A', 'B', 'C'])
```

```
In [77]: df
Out[77]:
   A  B  C
0  1  2  3
1  1  2  3
2  2  1  3
3  1  2  3
4  1  2  3
```
Previous behavior: if the returned shape happened to match the length of original columns, this would return a `DataFrame`. If the return shape did not match, a `Series` with lists was returned.

```python
In [3]: df.apply(lambda x: [1, 2, 3], axis=1)
Out[3]:
            A  B  C
 0        1  2  3
 1        1  2  3
 2        2  1  2
 3        3  1  2
 4        4  1  2
 5        5  1  2

In [4]: df.apply(lambda x: [1, 2], axis=1)
Out[4]:
   0  [1, 2]
   1  [1, 2]
   2  [1, 2]
   3  [1, 2]
   4  [1, 2]
   5  [1, 2]

```

New behavior: When the applied function returns a list-like, this will now always return a `Series`.

```python
In [78]: df.apply(lambda x: [1, 2, 3], axis=1)
Out[78]:
 0  [1, 2, 3]
 1  [1, 2, 3]
 2  [1, 2, 3]
 3  [1, 2, 3]
 4  [1, 2, 3]
 5  [1, 2, 3]
Length: 6, dtype: object

In [79]: df.apply(lambda x: [1, 2], axis=1)
Out[79]:
   0  [1, 2]
   1  [1, 2]
   2  [1, 2]
   3  [1, 2]
   4  [1, 2]
   5  [1, 2]
Length: 6, dtype: object
```

To have expanded columns, you can use `result_type='expand'`

```python
In [80]: df.apply(lambda x: [1, 2, 3], axis=1, result_type='expand')
Out[80]:
```

(continues on next page)
To broadcast the result across the original columns (the old behaviour for list-likes of the correct length), you can use `result_type='broadcast'`. The shape must match the original columns.

```python
In [81]: df.apply(lambda x: [1, 2, 3], axis=1, result_type='broadcast')
Out[81]:
        A     B     C
0  1.0  2.0  3.0
1  1.0  2.0  3.0
2  1.0  2.0  3.0
3  1.0  2.0  3.0
4  1.0  2.0  3.0
5  1.0  2.0  3.0
[6 rows x 3 columns]
```

Returning a `Series` allows one to control the exact return structure and column names:

```python
In [82]: df.apply(lambda x: pd.Series([1, 2, 3], index=['D', 'E', 'F']), axis=1)
Out[82]:
      D     E     F
0  1.0  2.0  3.0
1  1.0  2.0  3.0
2  1.0  2.0  3.0
3  1.0  2.0  3.0
4  1.0  2.0  3.0
5  1.0  2.0  3.0
[6 rows x 3 columns]
```

**Concatenation will no longer sort**

In a future version of pandas, pandas.concat() will no longer sort the non-concatenation axis when it is not already aligned. The current behavior is the same as the previous (sorting), but now a warning is issued when `sort` is not specified and the non-concatenation axis is not aligned (GH4588).

```python
In [83]: df1 = pd.DataFrame({'a': [1, 2], 'b': [1, 2]})
In [84]: df2 = pd.DataFrame({'a': [4, 5]})
In [85]: pd.concat([df1, df2])
Out[85]:
```

(continues on next page)
To keep the previous behavior (sorting) and silence the warning, pass `sort=True`

```
In [86]: pd.concat([df1, df2], sort=True)
Out[86]:
     a  b
0  1.0  1
1  2.0  2
0  NaN  4
1  NaN  5
[4 rows x 2 columns]
```

To accept the future behavior (no sorting), pass `sort=False`

Note that this change also applies to `DataFrame.append()`, which has also received a `sort` keyword for controlling this behavior.

**Build changes**

- Building pandas for development now requires `cython >= 0.24` (GH18613)
- Building from source now explicitly requires `setuptools` in `setup.py` (GH18113)
- Updated conda recipe to be in compliance with conda-build 3.0+ (GH18002)

**Index division by zero fills correctly**

Division operations on `Index` and subclasses will now fill division of positive numbers by zero with `np.inf`, division of negative numbers by zero with `-np.inf` and `0 / 0` with `np.nan`. This matches existing `Series` behavior. (GH19322, GH19347)

Previous behavior:

```
In [6]: index = pd.Int64Index([-1, 0, 1])
In [7]: index / 0
Out[7]: Int64Index([0, 0, 0], dtype='int64')
```

# Previous behavior yielded different results depending on the type of zero in the divisor

```
In [8]: index / 0.0
Out[8]: Float64Index([-inf, nan, inf], dtype='float64')
```

```
In [9]: index = pd.UInt64Index([0, 1])
```
In [10]: index / np.array([0, 0], dtype=np.uint64)
Out[10]: UInt64Index([0, 0], dtype='uint64')

In [11]: pd.RangeIndex(1, 5) / 0
ZeroDivisionError: integer division or modulo by zero

Current behavior:

In [87]: index = pd.Int64Index([-1, 0, 1])

# division by zero gives -infinity where negative, 
# +infinity where positive, and NaN for 0 / 0
In [88]: index / 0
Out[88]: Float64Index([-inf, nan, inf], dtype='float64')

# The result of division by zero should not depend on 
# whether the zero is int or float
In [89]: index / 0.0
Out[89]: Float64Index([-inf, nan, inf], dtype='float64')

In [90]: index = pd.UInt64Index([0, 1])
In [91]: index / np.array([0, 0], dtype=np.uint64)
Out[91]: Float64Index([nan, inf], dtype='float64')
In [92]: pd.RangeIndex(1, 5) / 0
Out[92]: Float64Index([inf, inf, inf, inf], dtype='float64')

**Extraction of matching patterns from strings**

By default, extracting matching patterns from strings with `str.extract()` used to return a `Series` if a single group was being extracted (a `DataFrame` if more than one group was extracted). As of pandas 0.23.0 `str.extract()` always returns a `DataFrame`, unless `expand` is set to `False`. Finally, `None` was an accepted value for the `expand` parameter (which was equivalent to `False`), but now raises a `ValueError`. (GH11386)

Previous behavior:

In [1]: s = pd.Series(['number 10', '12 eggs'])
In [2]: extracted = s.str.extract(r'.*(\d\d).*')
In [3]: extracted
Out [3]:
0  10
1  12
dtype: object
In [4]: type(extracted)
Out [4]: pandas.core.series.Series
New behavior:

```python
In [93]: s = pd.Series(['number 10', '12 eggs'])
In [94]: extracted = s.str.extract(r'.*(\d\d).*')
In [95]: extracted
Out[95]:
   0  10
 1  12
[2 rows x 1 columns]
In [96]: type(extracted)
Out[96]: pandas.core.frame.DataFrame
```

To restore previous behavior, simply set `expand` to `False`:

```python
In [97]: s = pd.Series(['number 10', '12 eggs'])
In [98]: extracted = s.str.extract(r'.*(\d\d).*', expand=False)
In [99]: extracted
Out[99]:
   0  10
 1  12
Length: 2, dtype: object
In [100]: type(extracted)
Out[100]: pandas.core.series.Series
```

### Default value for the ordered parameter of CategoricalDtype

The default value of the `ordered` parameter for `CategoricalDtype` has changed from `False` to `None` to allow updating of categories without impacting `ordered`. Behavior should remain consistent for downstream objects, such as `Categorical` (GH18790)

In previous versions, the default value for the `ordered` parameter was `False`. This could potentially lead to the ordered parameter unintentionally being changed from `True` to `False` when users attempt to update categories if `ordered` is not explicitly specified, as it would silently default to `False`. The new behavior for `ordered=None` is to retain the existing value of `ordered`.

New behavior:

```python
In [2]: from pandas.api.types import CategoricalDtype
In [3]: cat = pd.Categorical(list('abcaba'), ordered=True, categories=list('cba'))
In [4]: cat
Out[4]:
[a, b, c, a, b, a]
Categories (3, object): [c < b < a]
(continues on next page)```
In [5]: cdt = CategoricalDtype(categories=list('cbad'))

In [6]: cat.astype(cdt)
Out[6]:
[a, b, c, a, b, a]
Categories (4, object): [c < b < a < d]

Notice in the example above that the converted Categorical has retained ordered=True. Had the default value for ordered remained as False, the converted Categorical would have become unordered, despite ordered=False never being explicitly specified. To change the value of ordered, explicitly pass it to the new dtype, e.g. CategoricalDtype(categories=list('cbad'), ordered=False).

Note that the unintentional conversion of ordered discussed above did not arise in previous versions due to separate bugs that prevented astype from doing any type of category to category conversion (GH10696, GH18593). These bugs have been fixed in this release, and motivated changing the default value of ordered.

**Better pretty-printing of DataFrames in a terminal**

Previously, the default value for the maximum number of columns was pd.options.display.max_columns=20. This meant that relatively wide data frames would not fit within the terminal width, and pandas would introduce line breaks to display these 20 columns. This resulted in an output that was relatively difficult to read:
If Python runs in a terminal, the maximum number of columns is now determined automatically so that the printed data frame fits within the current terminal width (pd.options.display.max_columns=0) (GH17023). If Python runs as a Jupyter kernel (such as the Jupyter QtConsole or a Jupyter notebook, as well as in many IDEs), this value cannot be inferred automatically and is thus set to 20 as in previous versions. In a terminal, this results in a much nicer output:

Note that if you don’t like the new default, you can always set this option yourself. To revert to the old setting, you can run this line:

```python
pd.options.display.max_columns = 20
```

**Datetimelike API changes**

- The default Timedelta constructor now accepts an ISO 8601 Duration string as an argument (GH19040)
- Subtracting NaT from a Series with dtype='datetime64[ns]' returns a Series with dtype='timedelta64[ns]' instead of dtype='datetime64[ns]' (GH18808)
- Addition or subtraction of NaT from a TimedeltaIndex will return TimedeltaIndex instead of DatetimeIndex (GH19124)
- DatetimeIndex.shift() and TimedeltaIndex.shift() will now raise NullFrequencyError (which subclasses ValueError, which was raised in older versions) when the index object frequency is None (GH19147)
- Addition and subtraction of NaN from a Series with dtype='timedelta64[ns]' will raise a TypeError instead of treating the NaN as NaT (GH19274)
- NaT division with `datetime.timedelta` will now return `NaT` instead of raising (GH17876)
- Operations between a `Series` with dtype `datetime64[ns]` and a `PeriodIndex` will correctly raise `TypeError` (GH18850)
- Subtraction of `Series` with timezone-aware dtype `datetime64[ns]` with mismatched timezones will raise `TypeError` instead of `ValueError` (GH18817)
- `Timestamp` will no longer silently ignore unused or invalid tz or tzinfo keyword arguments (GH17690)
- `Timestamp` will no longer silently ignore invalid freq arguments (GH5168)
- CacheableOffset and `WeekDay` are no longer available in the `pandas.tseries.offsets` module (GH17830)
- `pandas.tseries.frequencies.get_freq_group()` and `pandas.tseries.frequencies.DAYS` are removed from the public API (GH18034)
- `Series.truncate()` and `DataFrame.truncate()` will raise a `ValueError` if the index is not sorted instead of an unhelpful `KeyError` (GH17935)
- `Series.first` and `DataFrame.first` will now raise a `TypeError` rather than `NotImplementedError` when index is not a `DatetimeIndex` (GH20725).
- `Series.last` and `DataFrame.last` will now raise a `TypeError` rather than `NotImplementedError` when index is not a `DatetimeIndex` (GH20725).
- Restricted `DateOffset` keyword arguments. Previously, `DateOffset` subclasses allowed arbitrary keyword arguments which could lead to unexpected behavior. Now, only valid arguments will be accepted. (GH17176, GH18226).
- `pandas.merge()` provides a more informative error message when trying to merge on timezone-aware and timezone-naive columns (GH15800)
- For `DatetimeIndex` and `TimedeltaIndex` with `freq=None`, addition or subtraction of integer-dtyped array or Index will raise `NullFrequencyError` instead of `TypeError` (GH19895)
- `Timestamp` constructor now accepts a nanosecond keyword or positional argument (GH18898)
- `DatetimeIndex` will now raise an `AttributeError` when the `tz` attribute is set after instantiation (GH3746)
- `DatetimeIndex` with a `pytz` timezone will now return a consistent `pytz` timezone (GH18595)

**Other API changes**

- `Series.astype()` and `Index.astype()` with an incompatible dtype will now raise a `TypeError` rather than a `ValueError` (GH18231)
- `Series` construction with an object dtypes tz-aware datetime and dtype=object specified, will now return an object dtypes Series, previously this would infer the datetime dtype (GH18231)
- A `Series` of dtype=category constructed from an empty dict will now have categories of dtype=object rather than dtype=float64, consistently with the case in which an empty list is passed (GH18515)
- All-NaN levels in a `MultiIndex` are now assigned float rather than object dtype, promoting consistency with Index (GH17929).
- Levels names of a `MultiIndex` (when not None) are now required to be unique: trying to create a `MultiIndex` with repeated names will raise a `ValueError` (GH18872)
- Both construction and renaming of `Index/MultiIndex` with non-hashable name/names will now raise `TypeError` (GH20527)
- `Index.map()` can now accept `Series` and dictionary input objects (GH12756, GH18482, GH18509).
• `DataFrame.unstack()` will now default to filling with `np.nan` for `object` columns. (GH12815)
• `IntervalIndex` constructor will raise if the `closed` parameter conflicts with how the input data is inferred to be closed (GH18421)
• Inserting missing values into indexes will work for all types of indexes and automatically insert the correct type of missing value (`NaN`, `NaT`, etc.) regardless of the type passed in (GH18295)
• When created with duplicate labels, `MultiIndex` now raises a `ValueError`. (GH17464)
• `Series.fillna()` now raises a `TypeError` instead of a `ValueError` when passed a list, tuple or DataFrame as a value (GH18293)
• `pandas.DataFrame.merge()` no longer casts a `float` column to `object` when merging on `int` and `float` columns (GH16572)
• `pandas.merge()` now raises a `ValueError` when trying to merge on incompatible data types (GH9780)
• The default NA value for `UInt64Index` has changed from 0 to `NaN`, which impacts methods that mask with NA, such as `UInt64Index.where()` (GH18398)
• Refactored `setup.py` to use `find_packages` instead of explicitly listing out all subpackages (GH18535)
• Rearranged the order of keyword arguments in `read_excel()` to align with `read_csv()` (GH16672)
• `wide_to_long()` previously kept numeric-like suffixes as `object` dtype. Now they are cast to numeric if possible (GH17627)
• In `read_excel()`, the `comment` argument is now exposed as a named parameter (GH18735)
• Rearranged the order of keyword arguments in `read_excel()` to align with `read_csv()` (GH16672)
• The options `html.border` and `mode.use_inf_as_null` were deprecated in prior versions, these will now show `FutureWarning` rather than a `DeprecationWarning` (GH19003)
• `IntervalIndex` and `IntervalDtype` no longer support categorical, object, and string subtypes (GH19016)
• `IntervalDtype` now returns `True` when compared against 'interval' regardless of subtype, and `IntervalDtype.name` now returns 'interval' regardless of subtype (GH18980)
• `KeyError` now raises instead of `ValueError` in `drop()`, `drop()`, `drop()`, `drop()` when dropping a non-existent element in an axis with duplicates (GH19186)
• `Series.to_csv()` now accepts a `compression` argument that works in the same way as the `compression` argument in `DataFrame.to_csv()` (GH18958)
• Set operations (union, difference...) on `IntervalIndex` with incompatible index types will now raise a `TypeError` rather than a `ValueError` (GH19329)
• `DateOffset` objects render more simply, e.g. `<DateOffset: days=1>` instead of `<DateOffset: kwd={‘days’: 1}>` (GH19403)
• `Categorical.fillna` now validates its value and method keyword arguments. It now raises when both or none are specified, matching the behavior of `Series.fillna()` (GH19682)
• `pd.to_datetime('today')` now returns a datetime, consistent with `pd.Timestamp('today')`; previously `pd.to_datetime('today')` returned a `.normalized()` datetime (GH19935)
• `Series.str.replace()` now takes an optional `regex` keyword which, when set to `False`, uses literal string replacement rather than regex replacement (GH16808)
• `DatetimeIndex.strftime()` and `PeriodIndex.strftime()` now return an `Index` instead of a numpy array to be consistent with similar accessors (GH20127)
• Constructing a Series from a list of length 1 no longer broadcasts this list when a longer index is specified (GH19714, GH20391).
DataFrame.to_dict() with orient='index' no longer casts int columns to float for a DataFrame with only int and float columns (GH18580)

A user-defined-function that is passed to Series.rolling().aggregate(), DataFrame.rolling().aggregate(), or its expanding cousins, will now always be passed a Series, rather than a np.array; .apply() only has the raw keyword, see here. This is consistent with the signatures of .aggregate() across pandas (GH20584)

Rolling and Expanding types raise NotImplementedError upon iteration (GH11704).

Deprecations

- Series.from_array and SparseSeries.from_array are deprecated. Use the normal constructor Series(.) and SparseSeries(.) instead (GH18213).
- DataFrame.as_matrix is deprecated. Use DataFrame.values instead (GH18458).
- Series.asobject, DatetimeIndex.asobject, PeriodIndex.asobject and TimeDeltaIndex.asobject have been deprecated. Use .astype(object) instead (GH18572)
- Grouping by a tuple of keys now emits a FutureWarning and is deprecated. In the future, a tuple passed to 'by' will always refer to a single key that is the actual tuple, instead of treating the tuple as multiple keys. To retain the previous behavior, use a list instead of a tuple (GH18314)
- Series.valid is deprecated. Use Series.dropna() instead (GH18800).
- read_excel() has deprecated the skip_footer parameter. Use skipfooter instead (GH18836)
- ExcelFile.parse() has deprecated sheetname in favor of sheet_name for consistency with read_excel() (GH20920).
- The is_copy attribute is deprecated and will be removed in a future version (GH18801).
- IntervalIndex.from_intervals is deprecated in favor of the IntervalIndex constructor (GH19263)
- DataFrame.from_items is deprecated. Use DataFrame.from_dict() instead, or DataFrame.from_dict(OrderedDict()) if you wish to preserve the key order (GH17320, GH17312)
- Indexing a MultiIndex or a FloatIndex with a list containing some missing keys will now show a FutureWarning, which is consistent with other types of indexes (GH17758).
- The broadcast parameter of .apply() is deprecated in favor of result_type='broadcast' (GH18577)
- The reduce parameter of .apply() is deprecated in favor of result_type='reduce' (GH18577)
- The order parameter of factorize() is deprecated and will be removed in a future release (GH19727)
- Timestamp.weekday_name, DatetimeIndex.weekday_name, and Series.dt.weekday_name are deprecated in favor of Timestamp.day_name(), DatetimeIndex.day_name(), and Series.dt.day_name() (GH12806)
- pandas.tseries.plotting.tsplot is deprecated. Use Series.plot() instead (GH18627)
- Index.summary() is deprecated and will be removed in a future version (GH18217)
- NDFrame.get_ftype_counts() is deprecated and will be removed in a future version (GH18243)
- The convert_datetime64 parameter in DataFrame.to_records() has been deprecated and will be removed in a future version. The NumPy bug motivating this parameter has been resolved. The default value for this parameter has also changed from True to None (GH18160).
- Series.rolling().apply(), DataFrame.rolling().apply(), Series.expanding().apply(), and DataFrame.expanding().apply() have deprecated passing an np.array by default. One will need to pass the new raw parameter to be explicit about what is passed (GH20584)
pandas: powerful Python data analysis toolkit, Release 1.3.5

- The data, base, strides, flags and itemsize properties of the Series and Index classes have been deprecated and will be removed in a future version (GH20419).
- `DateTimeIndex.offset` is deprecated. Use `DateTimeIndex.freq` instead (GH20716)
- Floor division between an integer ndarray and a `Timedelta` is deprecated. Divide by `Timedelta.value` instead (GH19761)
- Setting `PeriodIndex.freq` (which was not guaranteed to work correctly) is deprecated. Use `PeriodIndex.asfreq()` instead (GH20678)
- `Index.get_duplicates()` is deprecated and will be removed in a future version (GH20239)
- The previous default behavior of negative indices in `Categorical.take` is deprecated. In a future version it will change from meaning missing values to meaning positional indices from the right. The future behavior is consistent with `Series.take()` (GH20664).
- Passing multiple axes to the `axis` parameter in `DataFrame.dropna()` has been deprecated and will be removed in a future version (GH20987)

Removal of prior version deprecations/changes

- Warnings against the obsolete usage `Categorical(codes, categories)`, which were emitted for instance when the first two arguments to `Categorical()` had different dtypes, and recommended the use of `Categorical.from_codes`, have now been removed (GH8074)
- The `levels` and `labels` attributes of a `MultiIndex` can no longer be set directly (GH4039).
- `pd.tseries.util.pivot_annual` has been removed (deprecated since v0.19). Use `pivot_table` instead (GH18370)
- `pd.tseries.util.isleapyear` has been removed (deprecated since v0.19). Use `.is_leap_year` property in Datetime-likes instead (GH18370)
- `pd.ordered_merge` has been removed (deprecated since v0.19). Use `pd.merge_ordered` instead (GH18459)
- The `SparseList` class has been removed (GH14007)
- The `pandas.io.wb` and `pandas.io.data` stub modules have been removed (GH13735)
- `Categorical.from_array` has been removed (GH13854)
- The `freq` and `how` parameters have been removed from the `rolling/expanding/ewm` methods of DataFrame and Series (deprecated since v0.18). Instead, resample before calling the methods. (GH18601 & GH18668)
- `DateTimeIndex.to_datetime`, `Timestamp.to_datetime`, `PeriodIndex.to_datetime`, and `Index.to_datetime` have been removed (GH8254, GH14096, GH14113)
- `read_csv()` has dropped the `skip_footer` parameter (GH13386)
- `read_csv()` has dropped the `as_recarray` parameter (GH13373)
- `read_csv()` has dropped the `buffer_lines` parameter (GH13360)
- `read_csv()` has dropped the `compact_ints` and `use_unsigned` parameters (GH13323)
- The `Timestamp` class has dropped the `offset` attribute in favor of `freq` (GH13593)
- The `Series`, `Categorical`, and `Index` classes have dropped the `reshape` method (GH13012)
- `pandas.tseries.frequencies.get_standard_freq` has been removed in favor of `pandas.tseries.frequencies.to_offset(freq).rule_code` (GH13874)
- The `freqstr` keyword has been removed from `pandas.tseries.frequencies.to_offset` in favor of `freq` (GH13874)
• The `Panel4D` and `PanelND` classes have been removed (GH13776)

• The `Panel` class has dropped the `to_long` and `toLong` methods (GH19077)

• The options `display.line_with` and `display.height` are removed in favor of `display.width` and `display.max_rows` respectively (GH4391, GH19107)

• The `to_long` and `toLong` methods of the `Panel` class have been removed (GH19077)

• The `display.line_with` and `display.height` options are removed in favor of `display.width` and `display.max_rows` respectively (GH4391, GH19107)

• The `labels` attribute of the `Categorical` class has been removed in favor of `Categorical.codes` (GH7768)

• The `flavor` parameter have been removed from func:`to_sql` method (GH13611)

• The modules `pandas.tools.hashing` and `pandas.util.hashing` have been removed (GH16223)

• The top-level functions `pd.rolling_*`, `pd.expanding_*` and `pd.ewm` have been removed (Deprecated since v0.18). Instead, use the DataFrame/Series methods `rolling`, `expanding` and `ewm` (GH18723)

• The `infer_dst` keyword in `Series.tz_localize()`, `DatetimeIndex.tz_localize()` and `DatetimeIndex` have been removed. `infer_dst=True` is equivalent to `ambiguous='infer'`, and `infer_dst=False` to `ambiguous='raise'` (GH7963).

• When `.resample()` was changed from an eager to a lazy operation, like `.groupby()` in v0.18.0, we put in place compatibility (with a `FutureWarning`), so operations would continue to work. This is now fully removed, so a `Resampler` will no longer forward compat operations (GH20554)

• Remove long deprecated `axis=None` parameter from `.replace()` (GH20271)

Performance improvements

• Indexers on `Series` or `DataFrame` no longer create a reference cycle (GH17956)

• Added a keyword argument, `cache`, to `to_datetime()` that improved the performance of converting duplicate datetime arguments (GH11665)

• `DateOffset` arithmetic performance is improved (GH18218)

• Converting a `Series` of `Timedelta` objects to days, seconds, etc... sped up through vectorization of underlying methods (GH18092)

• Improved performance of `.map()` with a `Series/dict` input (GH15081)

• The overridden `Timedelta` properties of days, seconds and microseconds have been removed, leveraging their built-in Python versions instead (GH18242)

• `Series` construction will reduce the number of copies made of the input data in certain cases (GH17449)

• Improved performance of `Series.dt.date()` and `DatetimeIndex.date()` (GH18058)

• Improved performance of `Series.dt.time()` and `DatetimeIndex.time()` (GH18461)

• Improved performance of `IntervalIndex.symmetric_difference()` (GH18475)

• Improved performance of `DatetimeIndex` and `Series` arithmetic operations with Business-Month and Business-Quarter frequencies (GH18489)

• `Series() / DataFrame()` tab completion limits to 100 values, for better performance. (GH18587)

• Improved performance of `DataFrame.median()` with `axis=1` when bottleneck is not installed (GH16468)

• Improved performance of `MultiIndex.get_loc()` for large indexes, at the cost of a reduction in performance for small ones (GH18519)
**pandas: powerful Python data analysis toolkit, Release 1.3.5**

- Improved performance of `MultiIndex.remove_unused_levels()` when there are no unused levels, at the cost of a reduction in performance when there are (GH19289)

- Improved performance of `Index.get_loc()` for non-unique indexes (GH19478)

- Improved performance of pairwise `.rolling()` and `.expanding()` with `.cov()` and `.corr()` operations (GH17917)

- Improved performance of `pandas.core.groupby.GroupBy.rank()` (GH15779)

- Improved performance of variable `.rolling()` on `.min()` and `.max()` (GH19521)

- Improved performance of `pandas.core.groupby.GroupBy.ffill()` and `pandas.core.groupby.GroupBy.bfill()` (GH11296)

- Improved performance of `pandas.core.groupby.GroupBy.any()` and `pandas.core.groupby.GroupBy.all()` (GH15435)

- Improved performance of `pandas.core.groupby.GroupBy.pct_change()` (GH19165)

- Improved performance of `Series.isin()` in the case of categorical dtypes (GH20003)

- Improved performance of `getattr(Series, attr)` when the Series has certain index types. This manifested in slow printing of large Series with a `DatetimeIndex` (GH19764)

- Fixed a performance regression for `GroupBy.nth()` and `GroupBy.last()` with some object columns (GH19283)

- Improved performance of `pandas.core.arrays.Categorical.from_codes()` (GH18501)

**Documentation changes**

Thanks to all of the contributors who participated in the pandas Documentation Sprint, which took place on March 10th. We had about 500 participants from over 30 locations across the world. You should notice that many of the **API docstrings** have greatly improved.

There were too many simultaneous contributions to include a release note for each improvement, but this GitHub search should give you an idea of how many docstrings were improved.

Special thanks to Marc Garcia for organizing the sprint. For more information, read the NumFOCUS blogpost recapping the sprint.

- Changed spelling of “numpy” to “NumPy”, and “python” to “Python”. (GH19017)

- Consistency when introducing code samples, using either colon or period. Rewrote some sentences for greater clarity, added more dynamic references to functions, methods and classes. (GH18941, GH18948, GH18973, GH19017)

- Added a reference to `DataFrame.assign()` in the concatenate section of the merging documentation (GH18665)
Bug fixes

Categorical

**Warning:** A class of bugs were introduced in pandas 0.21 with CategoricalDtype that affects the correctness of operations like `merge`, `concat`, and indexing when comparing multiple unordered Categorical arrays that have the same categories, but in a different order. We highly recommend upgrading or manually aligning your categories before doing these operations.

- Bug in `Categorical.equals` returning the wrong result when comparing two unordered Categorical arrays with the same categories, but in a different order (GH16603)
- Bug in `pandas.api.types.union_categoricals()` returning the wrong result when for unordered categorical with the categories in a different order. This affected `pandas.concat()` with Categorical data (GH19096).
- Bug in `pandas.merge()` returning the wrong result when joining on an unordered Categorical that had the same categories but in a different order (GH19551)
- Bug in `CategoricalIndex.get_indexer()` returning the wrong result when target was an unordered Categorical that had the same categories as self but in a different order (GH19551)
- Bug in `Index.astype()` with a categorical dtype where the resultant index is not converted to a `CategoricalIndex` for all types of index (GH18630)
- Bug in `Series.astype()` and `Categorical.astype()` where an existing categorical data does not get updated (GH10696, GH18593)
- Bug in `Series.str.split()` with expand=True incorrectly raising an IndexError on empty strings (GH20002).
- Bug in `Index` constructor with dtype=CategoricalDtype(...) where categories and ordered are not maintained (GH19032)
- Bug in `Series` constructor with scalar and dtype=CategoricalDtype(...) where categories and ordered are not maintained (GH19565)
- Bug in `Categorical.__iter__` not converting to Python types (GH19909)
- Bug in `pandas.factorize()` returning the unique codes for the uniques. This now returns a Categorical with the same dtype as the input (GH19721)
- Bug in `pandas.factorize()` including an item for missing values in the uniques return value (GH19721)
- Bug in `Series.take()` with categorical data interpreting -1 in indices as missing value markers, rather than the last element of the Series (GH20664)

Datetimelike

- Bug in `Series.__sub__()` subtracting a non-nanosecond np.datetime64 object from a Series gave incorrect results (GH7996)
- Bug in `DatetimeIndex`, `TimedeltaIndex` addition and subtraction of zero-dimensional integer arrays gave incorrect results (GH19012)
- Bug in `DatetimeIndex` and `TimedeltaIndex` where adding or subtracting an array-like of DateOffset objects either raised (np.array, pd.Index) or broadcast incorrectly (pd.Series) (GH18849)
• Bug in Series.__add__() adding Series with dtype timedelta64[ns] to a timezone-aware DatetimeIndex incorrectly dropped timezone information (GH13905)

• Adding a Period object to a datetime or Timestamp object will now correctly raise a TypeError (GH17983)

• Bug in Timestamp where comparison with an array of Timestamp objects would result in a RecursionError (GH15183)

• Bug in Series floor-division where operating on a scalar timedelta raises an exception (GH18846)

• Bug in Series where comparison with an array of Timestamp objects would result in a RecursionError (GH15183)

• Bug in Series where comparison with an array of Timestamp objects would result in a RecursionError (GH15183)

• Bug in Series.floor() DatetimeIndex.floor() where time stamps far in the future and past were not rounded correctly (GH19206)

• Bug in Series.floor() DatetimeIndex.floor() where time stamps far in the future and past were not rounded correctly (GH19206)

• Bug in DatetimeIndex and TimedeltaIndex where division by a Series would return a TimedeltaIndex instead of a Series (GH19042)

Timedelta

• Bug in Timedelta.__mul__() where multiplying by NaT returned NaT instead of raising a TypeError (GH19819)

• Bug in Series with dtype='timedelta64[ns]' where addition or subtraction of TimedeltaIndex had results cast to dtype='int64' (GH17250)

• Bug in Series with dtype='timedelta64[ns]' where addition or subtraction of TimedeltaIndex could return a Series with an incorrect name (GH19043)

• Bug in Timedelta._floordiv__() and Timedelta._rfloordiv__() dividing by many incompatible numpy objects was incorrectly allowed (GH18846)

• Bug where dividing a scalar timedelta-like object with TimedeltaIndex performed the reciprocal operation (GH19125)

• Bug in TimedeltaIndex where division by a Series would return a TimedeltaIndex instead of a Series (GH19042)
- Bug in `Timedelta.__add__`, `Timedelta.__sub__` where adding or subtracting a `np.timedelta64` object would return another `np.timedelta64` instead of a `Timedelta` (GH19738)
- Bug in `Timedelta.__floordiv__`, `Timedelta.__rfloordiv__` where operating with a `Tick` object would raise a `TypeError` instead of returning a numeric value (GH19738)
- Bug in `Period.asfreq` where periods near `datetime(1, 1, 1)` could be converted incorrectly (GH19643, GH19834)
- Bug in `Timedelta.total_seconds()` causing precision errors, for example `Timedelta('30S').total_seconds()==30.000000000000004` (GH19458)
- Bug in `Timedelta.__rmod__` where operating with a `numpy.timedelta64` returned a `timedelta64` object instead of a `Timedelta` (GH19820)
- Multiplication of `TimedeltaIndex` by `TimedeltaIndex` will now raise `TypeError` instead of raising `ValueError` in cases of length mismatch (GH19333)
- Bug in indexing a `TimedeltaIndex` with a `np.timedelta64` object which was raising a `TypeError` (GH20393)

**Timezones**

- Bug in creating a `Series` from an array that contains both tz-naive and tz-aware values will result in a `Series` whose dtype is tz-aware instead of object (GH16406)
- Bug in comparison of timezone-aware `DatetimeIndex` against `NaT` incorrectly raising `TypeError` (GH19276)
- Bug in `DatetimeIndex.astype()` when converting between timezone aware dtypes, and converting from timezone aware to naive (GH18951)
- Bug in comparing `DatetimeIndex`, which failed to raise `TypeError` when attempting to compare timezone-aware and timezone-naive datetimelike objects (GH18162)
- Bug in localization of a naive, datetime string in a `Series` constructor with a `datetime64[ns, tz]` dtype (GH174151)
- `Timestamp.replace()` will now handle Daylight Savings transitions gracefully (GH18319)
- Bug in tz-aware `DatetimeIndex` where addition/subtraction with a `TimedeltaIndex` or array with dtype='timedelta64[ns]' was incorrect (GH17558)
- Bug in `DatetimeIndex.insert()` where inserting `NaT` into a timezone-aware index incorrectly raised (GH16357)
- Bug in `DataFrame` constructor, where tz-aware Datetimeindex and a given column name will result in an empty `DataFrame` (GH19157)
- Bug in `Timestamp.tz_localize()` where localizing a timestamp near the minimum or maximum valid values could overflow and return a timestamp with an incorrect nanosecond value (GH12677)
- Bug when iterating over `DatetimeIndex` that was localized with fixed timezone offset that rounded nanosecond precision to microseconds (GH19603)
- Bug in `DataFrame.diff()` that raised an `IndexError` with tz-aware values (GH19603)
- Bug in `melt()` that converted tz-aware dtypes to tz-naive (GH15785)
- Bug in `Dataframe.count()` that raised an `ValueError`, if `Dataframe.dropna()` was called for a single column with timezone-aware values. (GH13407)
Offsets

- Bug in `WeekOfMonth` and `Week` where addition and subtraction did not roll correctly (GH18510, GH18672, GH18864)
- Bug in `WeekOfMonth` and `LastWeekOfMonth` where default keyword arguments for constructor raised `ValueError` (GH19142)
- Bug in `FY5253Quarter`, `LastWeekOfMonth` where rollback and rollforward behavior was inconsistent with addition and subtraction behavior (GH18854)
- Bug in `FY5253` where datetime addition and subtraction incremented incorrectly for dates on the year-end but not normalized to midnight (GH18854)
- Bug in `FY5253` where date offsets could incorrectly raise an `AssertionError` in arithmetic operations (GH14774)

Numeric

- Bug in `Series` constructor with an int or float list where specifying `dtype=str`, `dtype='str'` or `dtype='U'` failed to convert the data elements to strings (GH16605)
- Bug in `Index` multiplication and division methods where operating with a `Series` would return an `Index` object instead of a `Series` object (GH19042)
- Bug in the `DataFrame` constructor in which data containing very large positive or very large negative numbers was causing `OverflowError` (GH18584)
- Bug in `Index` constructor with `dtype='uint64'` where int-like floats were not coerced to `UInt64Index` (GH18400)
- Bug in `DataFrame` flex arithmetic (e.g. `df.add(other, fill_value=foo)`) with a `fill_value` other than `None` failed to raise `NotImplementedError` in corner cases where either the frame or `other` has length zero (GH19522)
- Multiplication and division of numeric-dtyped `Index` objects with timedelta-like scalars returns `TimedeltaIndex` instead of raising `TypeError` (GH19333)
- Bug where `NaN` was returned instead of `0` by `Series.pct_change()` and `DataFrame.pct_change()` when `fill_method` is not `None` (GH19873)

Strings

- Bug in `Series.str.get()` with a dictionary in the values and the index not in the keys, raising `KeyError` (GH20671)

Indexing

- Bug in `Index` construction from list of mixed type tuples (GH18505)
- Bug in `Index.drop()` when passing a list of both tuples and non-tuples (GH18304)
- Bug in `DataFrame.drop()`, `Panel.drop()`, `Series.drop()`, `Index.drop()` where no `KeyError` is raised when dropping a non-existent element from an axis that contains duplicates (GH19186)
- Bug in indexing a datetimelike `Index` that raised `ValueError` instead of `IndexError` (GH18386).
- `Index.to_series()` now accepts `index` and `name` kwargs (GH18699)
• `DatetimeIndex.to_series()` now accepts `index` and `name` kwargs (GH18699)
• Bug in indexing non-scalar value from `Series` having non-unique `Index` will return value flattened (GH17610)
• Bug in indexing with iterator containing only missing keys, which raised no error (GH20748)
• Fixed inconsistency in `.ix` between list and scalar keys when the index has integer dtype and does not include the desired keys (GH20753)
• Bug in `__setitem__` when indexing a `DataFrame` with a 2-d boolean ndarray (GH18582)
• Bug in `str.extractall` when there were no matches empty `Index` was returned instead of appropriate `MultiIndex` (GH19034)
• Bug in `IntervalIndex` where empty and purely NA data was constructed inconsistently depending on the construction method (GH18421)
• Bug in `IntervalIndex.symmetric_difference()` where the symmetric difference with a non-`IntervalIndex` did not raise (GH18475)
• Bug in `IntervalIndex` where set operations that returned an empty `IntervalIndex` had the wrong dtype (GH19101)
• Bug in `DataFrame.drop_duplicates()` where no `KeyError` is raised when passing in columns that don’t exist on the `DataFrame` (GH19726)
• Bug in `Index` subclasses constructors that ignore unexpected keyword arguments (GH19348)
• Bug in `Index.difference()` when taking difference of an `Index` with itself (GH20040)
• Bug in `DataFrame.first_valid_index()` and `DataFrame.last_valid_index()` in presence of entire rows of NaNs in the middle of values (GH20499).
• Bug in `IntervalIndex` where some indexing operations were not supported for overlapping or non-monotonic `uint64` data (GH20636)
• Bug in `Series.is_unique` where extraneous output in stderr is shown if Series contains objects with `__ne__` defined (GH20661)
• Bug in `.loc` assignment with a single-element list-like incorrectly assigns as a list (GH19474)
• Bug in partial string indexing on a `Series/DataFrame` with a monotonic decreasing `DatetimeIndex` (GH19362)
• Bug in performing in-place operations on a `DataFrame` with a duplicate `Index` (GH17105)
• Bug in `IntervalIndex.get_loc()` and `IntervalIndex.get_indexer()` when used with an `IntervalIndex` containing a single interval (GH17284, GH20921)
• Bug in `.loc` with a `uint64` indexer (GH20722)

**MultiIndex**

• Bug in `MultiIndex.__contains__()` where non-tuple keys would return `True` even if they had been dropped (GH19027)
• Bug in `MultiIndex.set_labels()` which would cause casting (and potentially clipping) of the new labels if the `level` argument is not 0 or a list like `[0, 1, ...]` (GH19057)
• Bug in `MultiIndex.get_level_values()` which would return an invalid index on level of ints with missing values (GH17924)
• Bug in `MultiIndex.unique()` when called on empty `MultiIndex` (GH20568)
• Bug in `MultiIndex.unique()` which would not preserve level names (GH20570)
• Bug in `MultiIndex.remove_unused_levels()` which would fill nan values (GH18417)
• Bug in `MultiIndex.from_tuples()` which would fail to take zipped tuples in python3 (GH18434)
• Bug in `MultiIndex.get_loc()` which would fail to automatically cast values between float and int (GH18818, GH15994)
• Bug in `MultiIndex.get_loc()` which would cast boolean to integer labels (GH19086)
• Bug in `MultiIndex.get_loc()` which would fail to locate keys containing NaN (GH18485)
• Bug in `MultiIndex.get_loc()` in large `MultiIndex`, would fail when levels had different dtypes (GH18520)
• Bug in indexing where nested indexers having only numpy arrays are handled incorrectly (GH19686)

**IO**

• `read_html()` now rewinds seekable IO objects after parse failure, before attempting to parse with a new parser. If a parser errors and the object is non-peekable, an informative error is raised suggesting the use of a different parser (GH17975)
• `DataFrame.to_html()` now has an option to add an id to the leading `<table>` tag (GH8496)
• Bug in `read_msgpack()` with a non-existent file is passed in Python 2 (GH15296)
• Bug in `read_csv()` where a `MultiIndex` with duplicate columns was not being mangled appropriately (GH18062)
• Bug in `read_csv()` where missing values were not being handled properly when `keep_default_na=False` with dictionary `na_values` (GH19227)
• Bug in `read_csv()` causing heap corruption on 32-bit, big-endian architectures (GH20785)
• Bug in `read_sas()` where a file with 0 variables gave an `AttributeError` incorrectly. Now it gives an `EmptyDataError` (GH18184)
• Bug in `DataFrame.to_latex()` where pairs of braces meant to serve as invisible placeholders were escaped (GH18667)
• Bug in `DataFrame.to_latex()` where a NaN in a `MultiIndex` would cause an `IndexError` or incorrect output (GH14249)
• Bug in `DataFrame.to_latex()` where a non-string index-level name would result in an `AttributeError` (GH19981)
• Bug in `DataFrame.to_latex()` where the combination of an index name and the `index_names=False` option would result in incorrect output (GH18326)
• Bug in `DataFrame.to_latex()` where a `MultiIndex` with an empty string as its name would result in incorrect output (GH18669)
• Bug in `DataFrame.to_latex()` where missing space characters caused wrong escaping and produced non-valid latex in some cases (GH20859)
• Bug in `read_json()` where large numeric values were causing an `OverflowError` (GH18842)
• Bug in `DataFrame.to_parquet()` where an exception was raised if the write destination is S3 (GH19134)
• `Interval` now supported in `DataFrame.to_excel()` for all Excel file types (GH19242)
• `Timedelta` now supported in `DataFrame.to_excel()` for all Excel file types (GH19242, GH9155, GH19900)
• Bug in pandas.io.stata.StataReader.value_labels() raising an AttributeError when called on very old files. Now returns an empty dict (GH19417)
• Bug in read_pickle() when unpickling objects with TimedeltaIndex or Float64Index created with pandas prior to version 0.20 (GH19939)
• Bug in pandas.io.json.json_normalize() where sub-records are not properly normalized if any sub-records values are NoneType (GH20030)
• Bug in usecols parameter in read_csv() where error is not raised correctly when passing a string. (GH20529)
• Bug in HDFStore.keys() when reading a file with a soft link causes exception (GH20523)
• Bug in HDFStore.select_column() where a key which is not a valid store raised an AttributeError instead of a KeyError (GH17912)

Plotting

• Better error message when attempting to plot but matplotlib is not installed (GH19810).
• DataFrame.plot() now raises a ValueError when the x or y argument is improperly formed (GH18671)
• Bug in DataFrame.plot() when x and y arguments given as positions caused incorrect referenced columns for line, bar and area plots (GH20056)
• Bug in formatting tick labels with datetime.time() and fractional seconds (GH18478).
• Series.plot.kde() has exposed the args ind and bw_method in the docstring (GH18461). The argument ind may now also be an integer (number of sample points).
• DataFrame.plot() now supports multiple columns to the y argument (GH19699)

GroupBy/resample/rolling

• Bug when grouping by a single column and aggregating with a class like list or tuple (GH18079)
• Fixed regression in DataFrame.groupby() which would not emit an error when called with a tuple key not in the index (GH18798)
• Bug in DataFrame.resample() which silently ignored unsupported (or mistyped) options for label, closed and convention (GH19303)
• Bug in DataFrame.groupby() where tuples were interpreted as lists of keys rather than as keys (GH17979, GH18249)
• Bug in DataFrame.groupby() where aggregation by first/last/min/max was causing timestamps to lose precision (GH19526)
• Bug in DataFrame.transform() where particular aggregation functions were being incorrectly cast to match the dtype(s) of the grouped data (GH19200)
• Bug in DataFrame.groupby() passing the on= kwarg, and subsequently using .apply() (GH17813)
• Bug in DataFrame.resample().aggregate not raising a KeyError when aggregating a non-existent column (GH16766, GH19566)
• Bug in DataFrameGroupBy.cumsum() and DataFrameGroupBy.cumprod() when skipna was passed (GH19806)
• Bug in DataFrame.resample() that dropped timezone information (GH13238)
• Bug in `DataFrame.groupby()` where transformations using `np.all` and `np.any` were raising a `ValueError` (GH20653)
• Bug in `DataFrame.resample()` where `ffill`, `bfill`, `pad`, `backfill`, `fillna`, `interpolate`, and `asfreq` were ignoring `loffset`. (GH20744)
• Bug in `DataFrame.groupby()` when applying a function that has mixed data types and the user supplied function can fail on the grouping column (GH20949)
• Bug in `DataFrameGroupBy.rolling().apply()` where operations performed against the associated `DataFrameGroupBy` object could impact the inclusion of the grouped item(s) in the result (GH14013)

Sparse

• Bug in which creating a `SparseDataFrame` from a dense `Series` or an unsupported type raised an uncontrolled exception (GH19374)
• Bug in `SparseDataFrame.to_csv` causing exception (GH19384)
• Bug in `SparseSeries.memory_usage` which caused segfault by accessing non sparse elements (GH19368)
• Bug in constructing a `SparseArray`: if `data` is a scalar and `index` is defined it will coerce to `float64` regardless of scalar’s dtype. (GH19163)

Reshaping

• Bug in `DataFrame.merge()` where referencing a `CategoricalIndex` by name, where the by kwarg would raise a `KeyError` (GH20777)
• Bug in `DataFrame.stack()` which fails trying to sort mixed type levels under Python 3 (GH18310)
• Bug in `DataFrame.unstack()` which casts int to float if `columns` is a `MultiIndex` with unused levels (GH17845)
• Bug in `DataFrame.unstack()` which raises an error if `index` is a `MultiIndex` with unused labels on the unstacked level (GH18562)
• Fixed construction of a `Series` from a dict containing NaN as key (GH18480)
• Fixed construction of a `DataFrame` from a dict containing NaN as key (GH18455)
• Disabled construction of a `Series` where `len(index) > len(data) = 1`, which previously would broadcast the data item, and now raises a `ValueError` (GH18819)
• Suppressed error in the construction of a `DataFrame` from a dict containing scalar values when the corresponding keys are not included in the passed index (GH18600)
• Fixed (changed from object to float64) dtype of `DataFrame` initialized with axes, no data, and dtype=int (GH19646)
• Bug in `Series.rank()` where Series containing NaT modifies the Series inplace (GH18521)
• Bug in `cut()` which fails when using readonly arrays (GH18773)
• Bug in `DataFrame.pivot_table()` which fails when the `aggfunc` arg is of type string. The behavior is now consistent with other methods like `agg` and `apply` (GH18713)
• Bug in `DataFrame.merge()` in which merging using `Index` objects as vectors raised an `Exception` (GH19038)
• Bug in `DataFrame.stack()`, `DataFrame.unstack()`, `Series.unstack()` which were not returning subclasses (GH15563)
• Bug in timezone comparisons, manifesting as a conversion of the index to UTC in .concat() (GH18523)
• Bug in concat() when concatenating sparse and dense series it returns only a SparseDataFrame. Should be a DataFrame. (GH18914, GH18686, and GH16874)
• Improved error message for DataFrame.merge() when there is no common merge key (GH19427)
• Bug in DataFrame.join() which does an outer instead of a left join when being called with multiple DataFrames and some have non-unique indices (GH19624)
• Series.rename() now accepts axis as a kwarg (GH18589)
• Bug in rename() where an Index of same-length tuples was converted to a MultiIndex (GH19497)
• Comparisons between Series and Index would return a Series with an incorrect name, ignoring the Index’s name attribute (GH19582)
• Bug in qcut() where datetime and timedelta data with NaT present raised a ValueError (GH19768)
• Bug in DataFrame.iterrows(), which would infer strings not compliant to ISO8601 to datetimes (GH19671)
• Bug in Series constructor with Categorical where a ValueError is not raised when an index of different length is given (GH19342)
• Bug in DataFrame.astype() where column metadata is lost when converting to categorical or a dictionary of dtypes (GH19920)
• Bug in cut() and qcut() where timezone information was dropped (GH19872)
• Bug in Series constructor with a dtype=str, previously raised in some cases (GH19853)
• Bug in get_dummies(), and select_dtypes(), where duplicate column names caused incorrect behavior (GH20848)
• Bug in isna(), which cannot handle ambiguous typed lists (GH20675)
• Bug in concat() which raises an error when concatenating TZ-aware dataframes and all-NaT dataframes (GH12396)
• Bug in concat() which raises an error when concatenating empty TZ-aware series (GH18447)

Other

• Improved error message when attempting to use a Python keyword as an identifier in a numexpr backed query (GH18221)
• Bug in accessing a pandas.get_option(), which raised KeyError rather than OptionError when looking up a non-existent option key in some cases (GH19789)
• Bug in testing.assert_series_equal() and testing.assert_frame_equal() for Series or DataFrames with differing unicode data (GH20503)

5.8 Version 0.22

5.8.1 Version 0.22.0 (December 29, 2017)

This is a major release from 0.21.1 and includes a single, API-breaking change. We recommend that all users upgrade to this version after carefully reading the release note (singular!).

Backwards incompatible API changes

pandas 0.22.0 changes the handling of empty and all-NA sums and products. The summary is that

- The sum of an empty or all-NA Series is now 0
- The product of an empty or all-NA Series is now 1
- We’ve added a min_count parameter to .sum() and .prod() controlling the minimum number of valid values for the result to be valid. If fewer than min_count non-NA values are present, the result is NA. The default is 0. To return NaN, the 0.21 behavior, use min_count=1.

Some background: In pandas 0.21, we fixed a long-standing inconsistency in the return value of all-NA series depending on whether or not bottleneck was installed. See *Sum/prod of all-NaN or empty Series/DataFrames is now consistently NaN*. At the same time, we changed the sum and prod of an empty Series to also be NaN.

Based on feedback, we’ve partially reverted those changes.

Arithmetic operations

The default sum for empty or all-NA Series is now 0.

\[
\text{pandas 0.21.x}
\]

\[
\begin{align*}
\text{In [1]: } & \quad \text{pd.Series([]).sum()} \\
\text{Out[1]: } & \quad \text{nan} \\
\text{In [2]: } & \quad \text{pd.Series([np.nan]).sum()} \\
\text{Out[2]: } & \quad \text{nan}
\end{align*}
\]

\[
\text{pandas 0.22.0}
\]
The default behavior is the same as pandas 0.20.3 with bottleneck installed. It also matches the behavior of NumPy’s `np.nansum` on empty and all-NA arrays.

To have the sum of an empty series return `NaN` (the default behavior of pandas 0.20.3 without bottleneck, or pandas 0.21.x), use the `min_count` keyword.

Thanks to the `skipna` parameter, the `.sum` on an all-NA series is conceptually the same as the `.sum` of an empty one with `skipna=True` (the default).

The `min_count` parameter refers to the minimum number of non-null values required for a non-NA sum or product. `Series.prod()` has been updated to behave the same as `Series.sum()`, returning 1 instead.

These changes affect `DataFrame.sum()` and `DataFrame.prod()` as well. Finally, a few less obvious places in pandas are affected by this change.

**Grouping by a Categorical**

Grouping by a Categorical and summing now returns 0 instead of NaN for categories with no observations. The product now returns 1 instead of NaN.

```python
In [8]: grouper = pd.Categorical(['a', 'a'], categories=['a', 'b'])

In [9]: pd.Series([1, 2]).groupby(grouper).sum()
Out[9]:
   a     3.0
   b    NaN
dtype: float64
```

`pandas 0.21.x`

`pandas 0.22`
In [8]: grouper = pd.Categorical(['a', 'a'], categories=['a', 'b'])

In [9]: pd.Series([1, 2]).groupby(grouper).sum()
Out[9]:
   a  3
   b  0
Length: 2, dtype: int64

To restore the 0.21 behavior of returning NaN for unobserved groups, use min_count>=1.

In [10]: pd.Series([1, 2]).groupby(grouper).sum(min_count=1)
Out[10]:
   a  3.0
   b  NaN
Length: 2, dtype: float64

**Resample**

The sum and product of all-NA bins has changed from NaN to 0 for sum and 1 for product.

*pandas 0.21.x*

In [11]: s = pd.Series([1, 1, np.nan, np.nan], index=pd.date_range('2017', periods=4))

In [12]: s.resample('2d').sum()
Out[12]:
   2017-01-01  2.0
   2017-01-03  NaN
Freq: 2D, Length: 2, dtype: float64

*pandas 0.22.0*

In [11]: s = pd.Series([1, 1, np.nan, np.nan], index=pd.date_range('2017', periods=4))

In [12]: s.resample('2d').sum()
Out[12]:
   2017-01-01  2.0
   2017-01-03  0.0
Freq: 2D, Length: 2, dtype: float64

To restore the 0.21 behavior of returning NaN, use min_count>=1.

In [13]: s.resample('2d').sum(min_count=1)
Out[13]:
(continues on next page)
In particular, upsampling and taking the sum or product is affected, as upsampling introduces missing values even if the original series was entirely valid.

*pandas 0.21.x*

```python
In [14]: idx = pd.DatetimeIndex(['2017-01-01', '2017-01-02'])

In [15]: pd.Series([1, 2], index=idx).resample('12H').sum()
Out[15]:
2017-01-01 00:00:00    1.0
2017-01-01 12:00:00    NaN
2017-01-02 00:00:00    2.0
Freq: 12H, dtype: float64
```

*pandas 0.22.0*

```python
In [14]: idx = pd.DatetimeIndex(['2017-01-01', '2017-01-02'])

In [15]: pd.Series([1, 2], index=idx).resample('12H').sum()
Out[15]:
2017-01-01 00:00:00    1
2017-01-01 12:00:00    0
2017-01-02 00:00:00    2
Freq: 12H, Length: 3, dtype: int64
```

Once again, the `min_count` keyword is available to restore the 0.21 behavior.

```python
In [16]: pd.Series([1, 2], index=idx).resample('12H').sum(min_count=1)
Out[16]:
2017-01-01 00:00:00    1.0
2017-01-01 12:00:00    NaN
2017-01-02 00:00:00    2.0
Freq: 12H, Length: 3, dtype: float64
```

**Rolling and expanding**

Rolling and expanding already have a `min_periods` keyword that behaves similar to `min_count`. The only case that changes is when doing a rolling or expanding sum with `min_periods=0`. Previously this returned `NaN`, when fewer than `min_periods` non-NA values were in the window. Now it returns 0.

*pandas 0.21.1*

```python
In [17]: s = pd.Series([np.nan, np.nan])

In [18]: s.rolling(2, min_periods=0).sum()
Out[18]:
0    NaN
1    NaN
dtype: float64
```
pandas 0.22.0

```python
In [17]: s = pd.Series([np.nan, np.nan])
In [18]: s.rolling(2, min_periods=0).sum()
```

```
Out[18]:
0   0.0
1   0.0
Length: 2, dtype: float64
```

The default behavior of `min_periods=None`, implying that `min_periods` equals the window size, is unchanged.

**Compatibility**

If you maintain a library that should work across pandas versions, it may be easiest to exclude pandas 0.21 from your requirements. Otherwise, all your `sum()` calls would need to check if the `Series` is empty before summing.

With setuptools, in your `setup.py` use:

```python
install_requires=['pandas!=0.21.*', ...]
```

With conda, use

```python
requirements:
  run:
    - pandas !=0.21.0, !=0.21.1
```

Note that the inconsistency in the return value for all-NA series is still there for pandas 0.20.3 and earlier. Avoiding pandas 0.21 will only help with the empty case.

### 5.9 Version 0.21

#### 5.9.1 Version 0.21.1 (December 12, 2017)

This is a minor bug-fix release in the 0.21.x series and includes some small regression fixes, bug fixes and performance improvements. We recommend that all users upgrade to this version.

Highlights include:

- Temporarily restore matplotlib datetime plotting functionality. This should resolve issues for users who implicitly relied on pandas to plot datetimes with matplotlib. See [here](#).
- Improvements to the Parquet IO functions introduced in 0.21.0. See [here](#).
What’s new in v0.21.1

- Restore Matplotlib datetime converter registration
- New features
  - Improvements to the Parquet IO functionality
  - Other enhancements
- Deprecations
- Performance improvements
- Bug fixes
  - Conversion
  - Indexing
  - IO
  - Plotting
  - GroupBy/resample/rolling
  - Reshaping
  - Numeric
  - Categorical
  - String
- Contributors

**Restore Matplotlib datetime converter registration**

pandas implements some matplotlib converters for nicely formatting the axis labels on plots with datetime or Period values. Prior to pandas 0.21.0, these were implicitly registered with matplotlib, as a side effect of `import pandas`.

In pandas 0.21.0, we required users to explicitly register the converter. This caused problems for some users who relied on those converters being present for regular `matplotlib.pyplot` plotting methods, so we’re temporarily reverting that change; pandas 0.21.1 again registers the converters on import, just like before 0.21.0.

We’ve added a new option to control the converters: `pd.options.plotting.matplotlib.register_converters`. By default, they are registered. Toggling this to `False` removes pandas’ formatters and restore any converters we overwrote when registering them (GH18301).

We’re working with the matplotlib developers to make this easier. We’re trying to balance user convenience (automatically registering the converters) with import performance and best practices (importing pandas shouldn’t have the side effect of overwriting any custom converters you’ve already set). In the future we hope to have most of the datetime formatting functionality in matplotlib, with just the pandas-specific converters in pandas. We’ll then gracefully deprecate the automatic registration of converters in favor of users explicitly registering them when they want them.
New features

Improvements to the Parquet IO functionality

- `DataFrame.to_parquet()` will now write non-default indexes when the underlying engine supports it. The indexes will be preserved when reading back in with `read_parquet()` (GH18581).
- `read_parquet()` now allows to specify the columns to read from a parquet file (GH18154)
- `read_parquet()` now allows to specify kwargs which are passed to the respective engine (GH18216)

Other enhancements

- `Timestamp.timestamp()` is now available in Python 2.7. (GH17329)
- `Grouper` and `TimeGrouper` now have a friendly repr output (GH18203).

Deprecations

- `pandas.tseries.register` has been renamed to `pandas.plotting.register_matplotlib_converters()` (GH18301)

Performance improvements

- Improved performance of plotting large series/dataframes (GH18236).

Bug fixes

Conversion

- Bug in `TimedeltaIndex` subtraction could incorrectly overflow when NaT is present (GH17791)
- Bug in `DatetimeIndex` subtracting datetimelike from DatetimeIndex could fail to overflow (GH18020)
- Bug in `IntervalIndex.copy()` when copying and `IntervalIndex` with non-default closed (GH18339)
- Bug in `DataFrame.to_dict()` where columns of datetime that are tz-aware were not converted to required arrays when used with `orient='records'`, raising `TypeError` (GH18372)
- Bug in `DateTimeIndex` and `date_range()` where mismatching tz-aware start and end timezones would not raise an err if `end.tzinfo` is None (GH18431)
- Bug in `Series.fillna()` which raised when passed a long integer on Python 2 (GH18159).
Indexing

- Bug in a boolean comparison of a `datetime.datetime` and a `datetime64[ns]` dtype Series (GH17965)
- Bug where a MultiIndex with more than a million records was not raising `AttributeError` when trying to access a missing attribute (GH18165)
- Bug in `IntervalIndex` constructor when a list of intervals is passed with non-default `closed` (GH18334)
- Bug in `Index.putmask` when an invalid mask passed (GH18368)
- Bug in masked assignment of a `timedelta64[ns]` dtype Series, incorrectly coerced to float (GH18493)

IO

- Bug in class: `pandas.io.stata.StataReader` not converting date/time columns with display formatting addressed (GH17990). Previously columns with display formatting were normally left as ordinal numbers and not converted to datetime objects.
- Bug in `read_csv()` when reading a compressed UTF-16 encoded file (GH18071)
- Bug in `read_csv()` for handling null values in index columns when specifying `na_filter=False` (GH5239)
- Bug in `read_csv()` when reading numeric category fields with high cardinality (GH18186)
- Bug in `DataFrame.to_csv()` when the table had MultiIndex columns, and a list of strings was passed in for header (GH5539)
- Bug in parsing integer datetime-like columns with specified format in `read_sql` (GH17855).
- Bug in `DataFrame.to_msgpack()` when serializing data of the `numpy.bool_` datatype (GH18390)
- Bug in `read_json()` not decoding when reading line delimited JSON from S3 (GH17200)
- Bug in `pandas.io.json.json_normalize()` to avoid modification of meta (GH18610)
- Bug in `to_latex()` where repeated MultiIndex values were not printed even though a higher level index differed from the previous row (GH14484)
- Bug when reading NaN-only categorical columns in HDFStore (GH18413)
- Bug in `DataFrame.to_latex()` with `longtable=True` where a latex multicolumn always spanned over three columns (GH17959)

Plotting

- Bug in `DataFrame.plot()` and `Series.plot()` with `DatetimeIndex` where a figure generated by them is not pickleable in Python 3 (GH18439)
**GroupBy/resample/rolling**

- Bug in `DataFrame.resample(...).apply(...)` when there is a callable that returns different columns (GH15169)
- Bug in `DataFrame.resample(...)` when there is a time change (DST) and resampling frequency is 12h or higher (GH15549)
- Bug in `pd.DataFrameGroupBy.count()` when counting over a datetimelike column (GH13393)
- Bug in `rolling.var` where calculation is inaccurate with a zero-valued array (GH18430)

**Reshaping**

- Error message in `pd.merge_asof()` for key datatype mismatch now includes datatype of left and right key (GH18068)
- Bug in `pd.concat` when empty and non-empty DataFrames or Series are concatenated (GH18178 GH18187)
- Bug in `DataFrame.filter(...)` when unicode is passed as a condition in Python 2 (GH13101)
- Bug when merging empty DataFrames when `np.seterr(divide='raise')` is set (GH17776)

**Numeric**

- Bug in `pd.Series.rolling.skew()` and `rolling.kurt()` with all equal values has floating issue (GH18044)

**Categorical**

- Bug in `DataFrame.astype()` where casting to ‘category’ on an empty DataFrame causes a segmentation fault (GH18004)
- Error messages in the testing module have been improved when items have different `CategoricalDtype` (GH18069)
- `CategoricalIndex` can now correctly take a `pd.api.types.CategoricalDtype` as its dtype (GH18116)
- Bug in `Categorical.unique()` returning read-only codes array when all categories were NaN (GH18051)
- Bug in `DataFrame.groupby(axis=1)` with a `CategoricalIndex` (GH18432)

**String**

- `Series.str.split()` will now propagate NaN values across all expanded columns instead of None (GH18450)

5.9.2 Version 0.21.0 (October 27, 2017)

This is a major release from 0.20.3 and includes a number of API changes, deprecations, new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

Highlights include:

- Integration with Apache Parquet, including a new top-level `read_parquet()` function and `DataFrame.to_parquet()` method, see here.
- New user-facing `pandas.api.types.CategoricalDtype` for specifying categoricals independent of the data, see here.
- The behavior of `sum` and `prod` on all-NaN Series/DataFrames is now consistent and no longer depends on whether `bottleneck` is installed, and `sum` and `prod` on empty Series now return NaN instead of 0, see here.
- Compatibility fixes for pypy, see here.
- Additions to the `drop`, `reindex` and `rename` API to make them more consistent, see here.
- Addition of the new methods `DataFrame.infer_objects` (see here) and `GroupBy.pipe` (see here).
- Indexing with a list of labels, where one or more of the labels is missing, is deprecated and will raise a KeyError in a future version, see here.

Check the API Changes and deprecations before updating.

What's new in v0.21.0

- New features
  - Integration with Apache Parquet file format
  - Method `infer_objects` type conversion
  - Improved warnings when attempting to create columns

5.9. Version 0.21
- **Method** `drop` now also accepts index/columns keywords
- **Methods** `rename`, `reindex` now also accept `axis` keyword
- **CategoricalDtype** for specifying categoricals
- **GroupBy** objects now have a `pipe` method
- **Categorical**.`rename_categories` accepts a dict-like
- **Other enhancements**

• **Backwards incompatible API changes**
  - Dependencies have increased minimum versions
  - Sum/prod of all-NaN or empty Series/DataFrames is now consistently NaN
  - Indexing with a list with missing labels is deprecated
  - NA naming changes
  - Iteration of Series/Index will now return Python scalars
  - Indexing with a Boolean Index
  - **PeriodIndex** resampling
  - Improved error handling during item assignment in `pd.eval`
  - Dtype conversions
  - **MultiIndex** constructor with a single level
  - **UTC** localization with Series
  - Consistency of range functions
  - No automatic Matplotlib converters
  - **Other API changes**

• **Deprecations**
  - `Series.select` and `DataFrame.select`
  - `Series.argmax` and `Series.argmin`

• **Removal of prior version deprecations/changes**

• **Performance improvements**

• **Documentation changes**

• **Bug fixes**
  - **Conversion**
  - **Indexing**
  - **IO**
  - **Plotting**
  - **GroupBy/resample/rolling**
  - **Sparse**
  - **Reshaping**
New features

Integration with Apache Parquet file format

Integration with Apache Parquet, including a new top-level `read_parquet()` and `DataFrame.to_parquet()` method, see here (GH15838, GH17438).

Apache Parquet provides a cross-language, binary file format for reading and writing dataframes efficiently. Parquet is designed to faithfully serialize and de-serialize `DataFrame`s, supporting all of the pandas dtypes, including extension dtypes such as datetime with timezones.

This functionality depends on either the pyarrow or fastparquet library. For more details, see the IO docs on Parquet.

Method `infer_objects` type conversion

The `DataFrame.infer_objects()` and `Series.infer_objects()` methods have been added to perform dtype inference on object columns, replacing some of the functionality of the deprecated `convert_objects` method. See the documentation here for more details. (GH11221)

This method only performs soft conversions on object columns, converting Python objects to native types, but not any coercive conversions. For example:

```python
In [1]: df = pd.DataFrame({'A': [1, 2, 3],
...:                    'B': np.array([1, 2, 3], dtype='object'),
...:                    'C': ['1', '2', '3']})

In [2]: df.dtypes
Out[2]:
A   int64
B   object
C   object
Length: 3, dtype: object

In [3]: df.infer_objects().dtypes
Out[3]:
A   int64
B   int64
C   object
Length: 3, dtype: object
```

Note that column 'C' was not converted - only scalar numeric types will be converted to a new type. Other types of conversion should be accomplished using the `to_numeric()` function (or `to_datetime()`, `to_timedelta()`).
Improved warnings when attempting to create columns

New users are often puzzled by the relationship between column operations and attribute access on DataFrame instances (GH7175). One specific instance of this confusion is attempting to create a new column by setting an attribute on the DataFrame:

```
In [1]: df = pd.DataFrame({
          'one': [1., 2., 3.]
        })
In [2]: df.two = [4, 5, 6]
```

This does not raise any obvious exceptions, but also does not create a new column:

```
In [3]: df
Out[3]:
   one
0  1.0
1  2.0
2  3.0
```

Setting a list-like data structure into a new attribute now raises a `UserWarning` about the potential for unexpected behavior. See `Attribute Access`.

Method drop now also accepts index/columns keywords

The `drop()` method has gained index/columns keywords as an alternative to specifying the axis. This is similar to the behavior of `reindex` (GH12392).

For example:

```
In [7]: df = pd.DataFrame(np.arange(8).reshape(2, 4),
                        columns=['A', 'B', 'C', 'D'])
In [8]: df
Out[8]:
   A  B  C  D
0  0  1  2  3
1  4  5  6  7
```

(continues on next page)
In [9]: df.drop(['B', 'C'], axis=1)
Out[9]:
     A  D
0  0  3
1  4  7
[2 rows x 2 columns]

# the following is now equivalent
In [10]: df.drop(columns=['B', 'C'])
Out[10]:
     A  D
0  0  3
1  4  7
[2 rows x 2 columns]

Methods rename, reindex now also accept axis keyword

The `DataFrame.rename()` and `DataFrame.reindex()` methods have gained the `axis` keyword to specify the axis to target with the operation (GH12392).

Here's rename:

In [11]: df = pd.DataFrame({"A": [1, 2, 3], "B": [4, 5, 6]})

In [12]: df.rename(str.lower, axis='columns')
Out[12]:
       a  b
0     1  4
1     2  5
2     3  6
[3 rows x 2 columns]

In [13]: df.rename(id, axis='index')
Out[13]:
     A  B
0 94126208695520  1  4
1 94126208695552  2  5
2 94126208695584  3  6
[3 rows x 2 columns]

And reindex:

In [14]: df.reindex(['A', 'B', 'C'], axis='columns')
Out[14]:
     A  B  C
0     1  4  NaN
1     2  5  NaN
(continues on next page)
The “index, columns” style continues to work as before.

We *highly* encourage using named arguments to avoid confusion when using either style.

**CategoricalDtype for specifying categoricals**

`pandas.api.types.CategoricalDtype` has been added to the public API and expanded to include the categories and ordered attributes. A `CategoricalDtype` can be used to specify the set of categories and orderedness of an array, independent of the data. This can be useful for example, when converting string data to a `Categorical` (GH14711, GH15078, GH16015, GH17643):

```python
In [18]: from pandas.api.types import CategoricalDtype

In [19]: s = pd.Series(["a", "b", "c", "a"])  # strings

In [20]: dtype = CategoricalDtype(categoricals=["a", "b", "c", "d"], ordered=True)

In [21]: s.astype(dtype)
```

One place that deserves special mention is in `read_csv()`. Previously, with `dtype={'col': 'category'}`, the returned values and categories would always be strings.

```
In [22]: data = 'A,B
   ...: a,1
   ...: b,2
   ...: c,3'

In [23]: pd.read_csv(StringIO(data), dtype={'B': 'category'}).B.cat.categories
Out[23]: Index(['1', '2', '3'], dtype='object')
```

Notice the “object” dtype.

With a `CategoricalDtype` of all numerics, datetimes, or timedeltas, we can automatically convert to the correct type

```
In [24]: dtype = {'B': CategoricalDtype([1, 2, 3])}

In [25]: pd.read_csv(StringIO(data), dtype=dtype).B.cat.categories
Out[25]: Int64Index([1, 2, 3], dtype='int64')
```

The values have been correctly interpreted as integers.

The `.dtype` property of a `Categorical`, `CategoricalIndex` or a `Series` with categorical type will now return an instance of `CategoricalDtype`. While the repr has changed, `str(CategoricalDtype())` is still the string `'category'`. We’ll take this moment to remind users that the preferred way to detect categorical data is to use `pandas.api.types.is_categorical_dtype()`, and not `str(dtype) == 'category'`.

See the `CategoricalDtype docs` for more.

**GroupBy objects now have a pipe method**

GroupBy objects now have a pipe method, similar to the one on DataFrame and Series, that allow for functions that take a GroupBy to be composed in a clean, readable syntax. (GH17871)

For a concrete example on combining `.groupby` and `.pipe`, imagine having a DataFrame with columns for stores, products, revenue and sold quantity. We’d like to do a groupwise calculation of prices (i.e. revenue/quantity) per store and per product. We could do this in a multi-step operation, but expressing it in terms of piping can make the code more readable.

First we set the data:

```
In [26]: import numpy as np

In [27]: n = 1000

In [28]: df = pd.DataFrame({'Store': np.random.choice(['Store_1', 'Store_2'], n),
                      'Product': np.random.choice(['Product_1', 'Product_2', 'Product_3'], n),
                      'Revenue': (np.random.random(n) * 50 + 10).round(2),
                      ....: })
```

(continues on next page)
In [29]: df.head(2)
Out[29]:

<table>
<thead>
<tr>
<th>Store</th>
<th>Product</th>
<th>Revenue</th>
<th>Quantity</th>
</tr>
</thead>
<tbody>
<tr>
<td>Store_2</td>
<td>Product_2</td>
<td>32.09</td>
<td>7</td>
</tr>
<tr>
<td>Store_1</td>
<td>Product_3</td>
<td>14.20</td>
<td>1</td>
</tr>
</tbody>
</table>

[2 rows x 4 columns]

Now, to find prices per store/product, we can simply do:

In [30]: (df.groupby(['Store', 'Product'])
...: .pipe(lambda grp: grp.Revenue.sum() / grp.Quantity.sum())
...: .unstack().round(2))

Out[30]:

<table>
<thead>
<tr>
<th>Product</th>
<th>Product_1</th>
<th>Product_2</th>
<th>Product_3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Store</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Store_1</td>
<td>6.73</td>
<td>6.72</td>
<td>7.14</td>
</tr>
<tr>
<td>Store_2</td>
<td>7.59</td>
<td>6.98</td>
<td>7.23</td>
</tr>
</tbody>
</table>

[2 rows x 3 columns]

See the documentation for more.

**Categorical.rename_categories accepts a dict-like**

rename_categories() now accepts a dict-like argument for new_categories. The previous categories are looked up in the dictionary's keys and replaced if found. The behavior of missing and extra keys is the same as in DataFrame.rename().

In [31]: c = pd.Categorical(['a', 'a', 'b'])
In [32]: c.rename_categories({'a': "eh", 'b': "bee"})

Out[32]:

['eh', 'eh', 'bee']
Categories (2, object): ['eh', 'bee']

**Warning:** To assist with upgrading pandas, rename_categories treats Series as list-like. Typically, Series are considered to be dict-like (e.g. in .rename, .map). In a future version of pandas rename_categories will change to treat them as dict-like. Follow the warning message’s recommendations for writing future-proof code.

In [33]: c.rename_categories(pd.Series([0, 1], index=['a', 'c']))

FutureWarning: Treating Series 'new_categories' as a list-like and using the values. In a future version, 'rename_categories' will treat Series like a dictionary.
For dict-like, use 'new_categories.to_dict()'
For list-like, use 'new_categories.values'.

Out[33]:

[0, 0, 1]
Categories (2, int64): [0, 1]
Other enhancements

New functions or methods

- nearest() is added to support nearest-neighbor upsampling (GH17496).
- Index has added support for a to_frame method (GH15230).

New keywords

- Added a skipna parameter to infer_dtype() to support type inference in the presence of missing values (GH17059).
- Series.to_dict() and DataFrame.to_dict() now support an into keyword which allows you to specify the collections.Mapping subclass that you would like returned. The default is dict, which is backwards compatible. (GH16122)
- Series.set_axis() and DataFrame.set_axis() now support the inplace parameter. (GH14636)
- Series.to_pickle() and DataFrame.to_pickle() have gained a protocol parameter (GH16252). By default, this parameter is set to HIGHEST_PROTOCOL
- read_feather() has gained the nthreads parameter for multi-threaded operations (GH16359)
- DataFrame.clip() and Series.clip() have gained an inplace argument. (GH15388)
- crosstab() has gained a margins_name parameter to define the name of the row / column that will contain the totals when margins=True. (GH15972)
- read_json() now accepts a chunksize parameter that can be used when lines=True. If chunksize is passed, read_json now returns an iterator which reads in chunksize lines with each iteration. (GH17048)
- read_json() and to_json() now accept a compression argument which allows them to transparently handle compressed files. (GH17798)

Various enhancements

- Improved the import time of pandas by about 2.25x. (GH16764)
- Support for PEP 519 – Adding a file system path protocol on most readers (e.g. read_csv()) and writers (e.g. DataFrame.to_csv()) (GH13823).
- Added a __fspath__ method to pd.HDFStore, pd.ExcelFile, and pd.ExcelWriter to work properly with the file system path protocol (GH13823).
- The validate argument for merge() now checks whether a merge is one-to-one, one-to-many, many-to-one, or many-to-many. If a merge is found to not be an example of specified merge type, an exception of type MergeError will be raised. For more, see here (GH16270)
- Added support for PEP 518 (pyproject.toml) to the build system (GH16745)
- RangeIndex.append() now returns a RangeIndex object when possible (GH16212)
- Series.rename_axis() and DataFrame.rename_axis() now return a RangeIndex object when possible (GH15704)
• `api.types.infer_dtype()` now infers decimals. (GH15690)
• `DataFrame.select_dtypes()` now accepts scalar values for include/exclude as well as list-like. (GH16855)
• `date_range()` now accepts ‘YS’ in addition to ‘AS’ as an alias for start of year. (GH9313)
• `date_range()` now accepts ‘Y’ in addition to ‘A’ as an alias for end of year. (GH9313)
• `DataFrame.add_prefix()` and `DataFrame.add_suffix()` now accept strings containing the ‘%’ character. (GH17151)

Read/write methods that infer compression (`read_csv()`, `read_table()`, `read_pickle()`, and `to_pickle()`) can now infer from path-like objects, such as `pathlib.Path`. (GH17206)
• `read_sas()` now recognizes much more of the most frequently used date (datetime) formats in SAS7BDAT files. (GH15871)
• `DataFrame.items()` and `Series.items()` are now present in both Python 2 and 3 and is lazy in all cases. (GH13918, GH17213)
• `pandas.io.formats.style.Styler.where()` has been implemented as a convenience for `pandas.io.formats.style.Styler.applymap()`. (GH17474)
• `MultiIndex.is_monotonic_decreasing()` has been implemented. Previously returned False in all cases. (GH16554)
• `read_excel()` raises `ImportError` with a better message if `xlrd` is not installed. (GH17613)
• `DataFrame.assign()` will preserve the original order of `**kwargs` for Python 3.6+ users instead of sorting the column names. (GH14207)
• `Series.reindex()`, `DataFrame.reindex()`, `Index.get_indexer()` now support list-like argument for tolerance. (GH17367)

**Backwards incompatible API changes**

**Dependencies have increased minimum versions**

We have updated our minimum supported versions of dependencies (GH15206, GH15543, GH15214). If installed, we now require:

<table>
<thead>
<tr>
<th>Package</th>
<th>Minimum Version</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Numpy</td>
<td>1.9.0</td>
<td>X</td>
</tr>
<tr>
<td>Matplotlib</td>
<td>1.4.3</td>
<td></td>
</tr>
<tr>
<td>Scipy</td>
<td>0.14.0</td>
<td></td>
</tr>
<tr>
<td>Bottleneck</td>
<td>1.0.0</td>
<td></td>
</tr>
</tbody>
</table>

Additionally, support has been dropped for Python 3.4 (GH15251).
Sum/prod of all-NaN or empty Series/DataFrames is now consistently NaN

Note: The changes described here have been partially reverted. See the v0.22.0 Whatsnew for more.

The behavior of sum and prod on all-NaN Series/DataFrames no longer depends on whether bottleneck is installed, and return value of sum and prod on an empty Series has changed (GH9422, GH15507).

Calling sum or prod on an empty or all-NaN Series, or columns of a DataFrame, will result in NaN. See the docs.

```
In [33]: s = pd.Series([np.nan])
```

Previously WITHOUT bottleneck installed:

```
In [2]: s.sum()
Out[2]: np.nan
```

Previously WITH bottleneck:

```
In [2]: s.sum()
Out[2]: 0.0
```

New behavior, without regard to the bottleneck installation:

```
In [34]: s.sum()
Out[34]: 0.0
```

Note that this also changes the sum of an empty Series. Previously this always returned 0 regardless of a bottleneck installation:

```
In [1]: pd.Series([]).sum()
Out[1]: 0
```

but for consistency with the all-NaN case, this was changed to return NaN as well:

```
In [35]: pd.Series([]).sum()
Out[35]: 0.0
```

Indexing with a list with missing labels is deprecated

Previously, selecting with a list of labels, where one or more labels were missing would always succeed, returning NaN for missing labels. This will now show a FutureWarning. In the future this will raise a KeyError (GH15747). This warning will trigger on a DataFrame or a Series for using .loc[] or [[]] when passing a list-of-labels with at least 1 missing label. See the deprecation docs.

```
In [36]: s = pd.Series([1, 2, 3])
In [37]: s
Out[37]:
0   1
1   2
2   3
Length: 3, dtype: int64
```
Previous behavior

```
In [4]: s.loc[[1, 2, 3]]
Out[4]:
   1  2.0
   2  3.0
   3   NaN
```

dtype: float64

Current behavior

```
In [4]: s.loc[[1, 2, 3]]
Passing list-likes to .loc or [] with any missing label will raise
KeyError in the future, you can use .reindex() as an alternative.
```

See the documentation here:

```
Out[4]:
   1  2.0
   2  3.0
   3   NaN
```

dtype: float64

The idiomatic way to achieve selecting potentially not-found elements is via .reindex()

```
In [38]: s.reindex([1, 2, 3])
Out[38]:
   1  2.0
   2  3.0
   3   NaN
Length: 3, dtype: float64
```

Selection with all keys found is unchanged.

```
In [39]: s.loc[[1, 2]]
Out[39]:
   1  2
   2  3
Length: 2, dtype: int64
```

**NA naming changes**

In order to promote more consistency among the pandas API, we have added additional top-level functions `isna()` and `notna()` that are aliases for `isnull()` and `notnull()`. The naming scheme is now more consistent with methods like `.dropna()` and `.fillna()`. Furthermore in all cases where `.isnull()` and `.notnull()` methods are defined, these have additional methods named `.isna()` and `.notna()`, these are included for classes Categorical, Index, Series, and DataFrame. (GH15001).

The configuration option `pd.options.mode.use_inf_as_null` is deprecated, and `pd.options.mode.use_inf_as_na` is added as a replacement.
Iteration of Series/Index will now return Python scalars

Previously, when using certain iteration methods for a `Series` with `dtype int` or `float`, you would receive a `numpy` scalar, e.g. a `np.int64`, rather than a Python `int`. Issue (GH10904) corrected this for `Series.tolist()` and `list(Series)`. This change makes all iteration methods consistent, in particular, for `__iter__()` and `.map(); note that this only affects int/float dtypes. (GH13236, GH13258, GH14216).

```
In [40]: s = pd.Series([1, 2, 3])
```

```
In [41]: s
Out[41]:
0    1
1    2
2    3
Length: 3, dtype: int64
```

Previously:

```
In [2]: type(list(s)[0])
Out[2]: numpy.int64
```

New behavior:

```
In [42]: type(list(s)[0])
Out[42]: int
```

Furthermore this will now correctly box the results of iteration for `DataFrame.to_dict()` as well.

```
In [43]: d = {'a': [1], 'b': ['b']}
In [44]: df = pd.DataFrame(d)
```

Previously:

```
In [8]: type(df.to_dict()['a'][0])
Out[8]: numpy.int64
```

New behavior:

```
In [45]: type(df.to_dict()['a'][0])
Out[45]: int
```

Indexing with a Boolean Index

Previously when passing a boolean `Index` to `.loc`, if the index of the `Series/DataFrame` had boolean labels, you would get a label based selection, potentially duplicating result labels, rather than a boolean indexing selection (where `True` selects elements), this was inconsistent how a boolean `numpy` array indexed. The new behavior is to act like a boolean `numpy` array indexer. (GH17738)

Previous behavior:

```
In [46]: s = pd.Series([1, 2, 3], index=[False, True, False])
```

(continues on next page)
In [47]: s
Out[47]:
False  1
True   2
False  3
Length: 3, dtype: int64

In [59]: s.loc[pd.Index([True, False, True])]
Out[59]:
True   2
False  1
False  3
True   2
dtype: int64

Current behavior

In [48]: s.loc[pd.Index([True, False, True])]
Out[48]:
False  1
False  3
Length: 2, dtype: int64

Furthermore, previously if you had an index that was non-numeric (e.g. strings), then a boolean Index would raise a KeyError. This will now be treated as a boolean indexer.

Previously behavior:

In [49]: s = pd.Series([1, 2, 3], index=['a', 'b', 'c'])

In [50]: s
Out[50]:
a    1
b    2
c    3
Length: 3, dtype: int64

In [39]: s.loc[pd.Index([True, False, True])]
KeyError: "None of [Index([True, False, True], dtype='object')] are in the [index]"

Current behavior

In [51]: s.loc[pd.Index([True, False, True])]
Out[51]:
a    1
c    3
Length: 2, dtype: int64
**PeriodIndex resampling**

In previous versions of pandas, resampling a Series/DataFrame indexed by a PeriodIndex returned a DatetimeIndex in some cases (GH12884). Resampling to a multiplied frequency now returns a PeriodIndex (GH15944). As a minor enhancement, resampling a PeriodIndex can now handle NaT values (GH13224).

**Previous behavior:**

In [1]: pi = pd.period_range('2017-01', periods=12, freq='M')
In [2]: s = pd.Series(np.arange(12), index=pi)
In [3]: resampled = s.resample('2M').mean()
In [4]: resampled
Out[4]:
2017-03-31  1.0
2017-09-30  5.5
2018-03-31 10.0
Freq: 2Q-DEC, dtype: float64

In [5]: resampled.index
Out[5]: DatetimeIndex(['2017-03-31', '2017-09-30', '2018-03-31'], dtype='datetime64[ns]',
    → freq='2Q-DEC')

**New behavior:**

In [52]: pi = pd.period_range('2017-01', periods=12, freq='M')
In [53]: s = pd.Series(np.arange(12), index=pi)
In [54]: resampled = s.resample('2Q').mean()
In [55]: resampled
Out[55]:
2017Q1  2.5
2017Q3  8.5
Freq: 2Q-DEC, Length: 2, dtype: float64

In [56]: resampled.index
Out[56]: PeriodIndex(['2017Q1', '2017Q3'], dtype='period[2Q-DEC]')

Upsampling and calling `.ohlc()` previously returned a Series, basically identical to calling `.asfreq()`. OHLC upsampling now returns a DataFrame with columns open, high, low and close (GH13083). This is consistent with downsampling and DatetimeIndex behavior.

**Previous behavior:**

In [1]: pi = pd.period_range(start='2000-01-01', freq='D', periods=10)
In [2]: s = pd.Series(np.arange(10), index=pi)
In [3]: s.resample('H').ohlc()
Out[3]:

(continues on next page)
2000-01-01 00:00 0.0
...
2000-01-10 23:00 NaN
Freq: H, Length: 240, dtype: float64

In [4]: s.resample('M').ohlc()
Out[4]:
open  high  low  close
2000-01 0 9 0 9

New behavior:

In [57]: pi = pd.period_range(start='2000-01-01', freq='D', periods=10)
In [58]: s = pd.Series(np.arange(10), index=pi)
In [59]: s.resample('H').ohlc()
Out[59]:
open high low close
2000-01-01 00:00 0.0 0.0 0.0 0.0
2000-01-01 01:00 NaN NaN NaN NaN
2000-01-01 02:00 NaN NaN NaN NaN
2000-01-01 03:00 NaN NaN NaN NaN
2000-01-01 04:00 NaN NaN NaN NaN
... ... ... ... ...
2000-01-10 19:00 NaN NaN NaN NaN
2000-01-10 20:00 NaN NaN NaN NaN
2000-01-10 21:00 NaN NaN NaN NaN
2000-01-10 22:00 NaN NaN NaN NaN
2000-01-10 23:00 NaN NaN NaN NaN
[240 rows x 4 columns]

In [60]: s.resample('M').ohlc()
Out[60]:
open high low close
2000-01 0 9 0 9
[1 rows x 4 columns]

Improved error handling during item assignment in pd.eval

eval() will now raise a ValueError when item assignment malfunctions, or inplace operations are specified, but there is no item assignment in the expression (GH16732)

In [61]: arr = np.array([1, 2, 3])

Previously, if you attempted the following expression, you would get a not very helpful error message:

In [3]: pd.eval("a = 1 + 2", target=arr, inplace=True)
IndexError: only integers, slices (`:`), ellipsis (`...`), numpy.newaxis (`None`) and integer or boolean arrays are valid indices

This is a very long way of saying numpy arrays don’t support string-item indexing. With this change, the error message is now this:

```
In [3]: pd.eval("a = 1 + 2", target=arr, inplace=True)
...:
ValueError: Cannot assign expression output to target
```

It also used to be possible to evaluate expressions inplace, even if there was no item assignment:

```
In [4]: pd.eval("1 + 2", target=arr, inplace=True)
Out[4]:
```

However, this input does not make much sense because the output is not being assigned to the target. Now, a `ValueError` will be raised when such an input is passed in:

```
In [4]: pd.eval("1 + 2", target=arr, inplace=True)
...:
ValueError: Cannot operate inplace if there is no assignment
```

### Dtype conversions

Previously assignments, `.where()` and `.fillna()` with a bool assignment, would coerce to same the type (e.g. int / float), or raise for datetimelikes. These will now preserve the bools with `object` dtypes. (GH16821).

```
In [62]: s = pd.Series([1, 2, 3])
```

```
In [5]: s[1] = True
```

```
In [6]: s
Out[6]:
0   1
1   1
2   3
dtype: int64
```

New behavior

```
In [63]: s[1] = True
```

```
In [64]: s
Out[64]:
0   1
1   True
2   3
Length: 3, dtype: object
```

Previously, as assignment to a datetimelike with a non-datetimelike would coerce the non-datetime-like item being assigned (GH14145).
In [65]: s = pd.Series([pd.Timestamp('2011-01-01'), pd.Timestamp('2012-01-01')])

In [1]: s[1] = 1

In [2]: s
Out[2]:
0  2011-01-01 00:00:00.000000000
1  1970-01-01 00:00:00.000000001
dtype: datetime64[ns]

These now coerce to object dtype.

In [66]: s[1] = 1

In [67]: s
Out[67]:
0 2011-01-01 00:00:00
1 1
Length: 2, dtype: object

- Inconsistent behavior in `where()` with datetimelikes which would raise rather than coerce to `object` (GH16402)
- Bug in assignment against `int64` data with `np.ndarray` with `float64` dtype may keep `int64` dtype (GH14001)

**MultiIndex constructor with a single level**

The `MultiIndex` constructors no longer squeezes a `MultiIndex` with all length-one levels down to a regular `Index`. This affects all the `MultiIndex` constructors. (GH17178)

Previous behavior:

In [2]: pd.MultiIndex.from_tuples([('a',), ('b',)])
Out[2]: Index(['a', 'b'], dtype='object')

Length 1 levels are no longer special-cased. They behave exactly as if you had length 2+ levels, so a `MultiIndex` is always returned from all of the `MultiIndex` constructors:

In [68]: pd.MultiIndex.from_tuples([('a',), ('b',)])
Out[68]: MultiIndex([('a',),
                               ('b',)])
UTC localization with Series

Previously, `to_datetime()` did not localize datetime Series data when `utc=True` was passed. Now, `to_datetime()` will correctly localize Series with a datetime64[ns, UTC] dtype to be consistent with how list-like and Index data are handled. (GH6415).

**Previous behavior**

```
In [69]: s = pd.Series(['20130101 00:00:00'] * 3)
Out[69]:
0 2013-01-01
1 2013-01-01
2 2013-01-01
dtype: datetime64[ns]
```

```
In [12]: pd.to_datetime(s, utc=True)
Out[12]:
0 2013-01-01
1 2013-01-01
2 2013-01-01
dtype: datetime64[ns]
```

**New behavior**

```
In [70]: pd.to_datetime(s, utc=True)
Out[70]:
0 2013-01-01 00:00:00+00:00
1 2013-01-01 00:00:00+00:00
2 2013-01-01 00:00:00+00:00
Length: 3, dtype: datetime64[ns, UTC]
```

Additionally, DataFrames with datetime columns that were parsed by `read_sql_table()` and `read_sql_query()` will also be localized to UTC only if the original SQL columns were timezone aware datetime columns.

**Consistency of range functions**

In previous versions, there were some inconsistencies between the various range functions: `date_range()`, `bdate_range()`, `period_range()`, `timedelta_range()`, and `interval_range()`. (GH17471).

One of the inconsistent behaviors occurred when the `start`, `end` and `period` parameters were all specified, potentially leading to ambiguous ranges. When all three parameters were passed, `interval_range` ignored the `period` parameter, `period_range` ignored the `end` parameter, and the other range functions raised. To promote consistency among the range functions, and avoid potentially ambiguous ranges, `interval_range` and `period_range` will now raise when all three parameters are passed.

**Previous behavior**

```
In [2]: pd.interval_range(start=0, end=4, periods=6)
Out[2]:
IntervalIndex([(0, 1], (1, 2], (2, 3]],
    closed='right',
    dtype='interval[int64]')
```

```
In [3]: pd.period_range(start='2017Q1', end='2017Q4', periods=6, freq='Q')
Out[3]: PeriodIndex(['2017Q1', '2017Q2', '2017Q3', '2017Q4', '2018Q1', '2018Q2'],
                   freq='Q-DEC')
```

**New behavior**

```
In [2]: pd.interval_range(start=0, end=4, periods=6)
Out[2]:
IntervalIndex([(0, 1], (1, 2], (2, 3]],
               closed='right',
               dtype='interval[int64]')
```

```
In [3]: pd.period_range(start='2017Q1', end='2017Q4', periods=6, freq='Q')
Out[3]: PeriodIndex(['2017Q1', '2017Q2', '2017Q3', '2017Q4', '2018Q1', '2018Q2'],
                    freq='Q-DEC')
```
Additionally, the endpoint parameter end was not included in the intervals produced by `interval_range`. However, all other range functions include end in their output. To promote consistency among the range functions, `interval_range` will now include end as the right endpoint of the final interval, except if `freq` is specified in a way which skips end.

Previous behavior:

```python
In [4]: pd.interval_range(start=0, end=4)
Out[4]:
IntervalIndex([(0, 1], (1, 2], (2, 3]],
    closed='right',
    dtype='interval[int64]')
```

New behavior:

```python
In [71]: pd.interval_range(start=0, end=4)
Out[71]: IntervalIndex([(0, 1], (1, 2], (2, 3], (3, 4]], dtype='interval[int64, right]')
```

### No automatic Matplotlib converters

Pandas no longer registers our `date`, `time`, `datetime`, `datetime64`, and `Period` converters with matplotlib when pandas is imported. Matplotlib plot methods (plt.plot, ax.plot, ...), will not nicely format the x-axis for `DatetimeIndex` or `PeriodIndex` values. You must explicitly register these methods:

Pandas built-in `Series.plot` and `DataFrame.plot` will register these converters on first-use (GH17710).

**Note:** This change has been temporarily reverted in pandas 0.21.1, for more details see here.

### Other API changes

- The `Categorical` constructor no longer accepts a scalar for the `categories` keyword. (GH16022)
- Accessing a non-existent attribute on a closed `HDFStore` will now raise an `AttributeError` rather than a `ClosedFileError` (GH16301)
- `read_csv()` now issues a `UserWarning` if the `names` parameter contains duplicates (GH17095)
- `read_csv()` now treats `null` and `n/a` strings as missing values by default (GH16471, GH16078)
- pandas.HDFStore’s string representation is now faster and less detailed. For the previous behavior, use pandas.HDFStore.info(). (GH16503).
• Compression defaults in HDF stores now follow pytables standards. Default is no compression and if complib is missing and complevel $> 0$ zlib is used (GH15943)

• Index.get_indexer_non_unique() now returns a ndarray indexer rather than an Index; this is consistent with Index.get_indexer() (GH16819)

• Removed the @slow decorator from pandas._testing, which caused issues for some downstream packages' test suites. Use @pytest.mark.slow instead, which achieves the same thing (GH16850)

• Moved definition of MergeError to the pandas.errors module.

• The signature of Series.set_axis() and DataFrame.set_axis() has been changed from set_axis(axis, labels) to set_axis(labels, axis=0), for consistency with the rest of the API. The old signature is deprecated and will show a FutureWarning (GH14636)

• Series.argmin() and Series.argmax() will now raise a TypeError when used with object dtypes, instead of a ValueError (GH13595)

• Period is now immutable, and will now raise an AttributeError when a user tries to assign a new value to the ordinal or freq attributes (GH17116).

• to_datetime() when passed a tz-aware origin= kwarg will now raise a more informative ValueError rather than a TypeError (GH16842)

• to_datetime() now raises a ValueError when format includes %W or %U without also including day of the week and calendar year (GH16774)

• Renamed non-functional index to index_col in read_stata() to improve API consistency (GH16342)

• Bug in DataFrame.drop() caused boolean labels False and True to be treated as labels 0 and 1 respectively when dropping indices from a numeric index. This will now raise a ValueError (GH16877)

• Restricted DateOffset keyword arguments. Previously, DateOffset subclasses allowed arbitrary keyword arguments which could lead to unexpected behavior. Now, only valid arguments will be accepted. (GH17176).

**Deprecations**

• DataFrame.from_csv() and Series.from_csv() have been deprecated in favor of read_csv() (GH14191)

• read_excel() has deprecated sheetname in favor of sheet_name for consistency with .to_excel() (GH10559).

• read_excel() has deprecated parse_cols in favor of usecols for consistency with read_csv() (GH4988)

• read_csv() has deprecated the tupleize_cols argument. Column tuples will always be converted to a MultiIndex (GH17060)

• DataFrame.to_csv() has deprecated the tupleize_cols argument. MultiIndex columns will be always written as rows in the CSV file (GH17060)

• The convert parameter has been deprecated in the .take() method, as it was not being respected (GH16948)

• pd.options.html.border has been deprecated in favor of pd.options.display.html.border (GH15793).

• SeriesGroupBy.nth() has deprecated True in favor of 'all' for its kwarg dropna (GH11038).

• DataFrame.as_blocks() is deprecated, as this is exposing the internal implementation (GH17302)

• pd.TimeGrouper is deprecated in favor of pandas.Grouper (GH16747)

• cdate_range has been deprecated in favor of bdate_range(), which has gained weekmask and holidays parameters for building custom frequency date ranges. See the documentation for more details (GH17596)
• passing categories or ordered kwargs to `Series.astype()` is deprecated, in favor of passing a `CategoricalDtype` (GH17636).

• `.get_value` and `.set_value` on Series, DataFrame, Panel, SparseSeries, and SparseDataFrame are deprecated in favor of using `.iat[]` or `.at[]` accessors (GH15269).

• Passing a non-existent column in `.to_excel(..., columns=)` is deprecated and will raise a `KeyError` in the future (GH17295).

• `raise_on_error` parameter to `Series.where()`, `Series.mask()`, `DataFrame.where()`, `DataFrame.mask()` is deprecated, in favor of `errors=` (GH14968).

• Using `DataFrame.rename_axis()` and `Series.rename_axis()` to alter index or column labels is now deprecated in favor of using `.rename`. `rename_axis` may still be used to alter the name of the index or columns (GH17833).

• `reindex_axis()` has been deprecated in favor of `reindex(). See here for more (GH17833).

**Series.select and DataFrame.select**

The `Series.select()` and `DataFrame.select()` methods are deprecated in favor of using `df.loc[labels.map(crit)]` (GH12401).

```python
In [72]: df = pd.DataFrame({'A': [1, 2, 3], index=['foo', 'bar', 'baz']})

In [3]: df.select(lambda x: x in ['bar', 'baz'])
FutureWarning: select is deprecated and will be removed in a future release. You can use_.
..._.loc[crit] as a replacement

Out[3]:
    A
bar  2
baz  3

In [73]: df.loc[df.index.map(lambda x: x in ['bar', 'baz'])]
Out[73]:
    A
bar  2
baz  3
[2 rows x 1 columns]
```

**Series.argmax and Series.argmin**

The behavior of `Series.argmax()` and `Series.argmin()` have been deprecated in favor of `Series.idxmax()` and `Series.idxmin()`, respectively (GH16830).

For compatibility with NumPy arrays, `pd.Series` implements `argmax` and `argmin`. Since pandas 0.13.0, `argmax` has been an alias for `pandas.Series.idxmax()`, and `argmin` has been an alias for `pandas.Series.idxmin()`. They return the label of the maximum or minimum, rather than the position.

We’ve deprecated the current behavior of `Series.argmax` and `Series.argmin`. Using either of these will emit a `FutureWarning`. Use `Series.idxmax()` if you want the label of the maximum. Use `Series.values.argmax()` if you want the position of the maximum. Likewise for the minimum. In a future release `Series.argmax` and `Series.argmin` will return the position of the maximum or minimum.
Removal of prior version deprecation/changes

- `read_excel()` has dropped the `has_index_names` parameter (GH10967)
- The `pd.options.display.height` configuration has been dropped (GH3663)
- The `pd.options.display.line_width` configuration has been dropped (GH2881)
- The `pd.options.display.mpl_style` configuration has been dropped (GH12190)
- Index has dropped the `.sym_diff()` method in favor of `.symmetric_difference()` (GH12591)
- Categorical has dropped the `.order()` and `.sort()` methods in favor of `.sort_values()` (GH12882)
- `eval()` and `DataFrame.eval()` have changed the default of `inplace` from `None` to `False` (GH11149)
- The function `get_offset_name` has been dropped in favor of the `.freqstr` attribute for an offset (GH11834)
- pandas no longer tests for compatibility with hdf5-files created with pandas < 0.11 (GH17404).

Performance improvements

- Improved performance of instantiating `SparseDataFrame` (GH16773)
- `Series.dt` no longer performs frequency inference, yielding a large speedup when accessing the attribute (GH17210)
- Improved performance of `set_categories()` by not materializing the values (GH17508)
- `Timestamp.microsecond` no longer re-computes on attribute access (GH17331)
- Improved performance of the `CategoricalIndex` for data that is already categorical dtype (GH17513)
- Improved performance of `RangeIndex.min()` and `RangeIndex.max()` by using `RangeIndex` properties to perform the computations (GH17607)

Documentation changes

- Several NaT method docstrings (e.g. `NaT.ctime()`) were incorrect (GH17327)
- The documentation has had references to versions < v0.17 removed and cleaned up (GH17442, GH17442, GH17404 & GH17504)

Bug fixes

Conversion

- Bug in assignment against datetime-like data with int may incorrectly convert to datetime-like (GH14145)
- Bug in assignment against int64 data with np.ndarray with float64 dtype may keep int64 dtype (GH14001)
- Fixed the return type of `IntervalIndex.is_non_overlapping_monotonic` to be a Python bool for consistency with similar attributes/methods. Previously returned a numpy.bool_. (GH17237)
- Bug in `IntervalIndex.is_non_overlapping_monotonic` when intervals are closed on both sides and overlap at a point (GH16560)
- Bug in `Series.fillna()` returns frame when `inplace=True` and value is dict (GH16156)
- Bug in `Timestamp.weekday_name` returning a UTC-based weekday name when localized to a timezone (GH17354)
• Bug in Timestamp.replace when replacing tzinfo around DST changes (GH15683)
• Bug in Timedelta construction and arithmetic that would not propagate the Overflow exception (GH17367)
• Bug in astype() converting to object dtype when passed extension type classes (DatetimeTZDtype, CategoricalDtype) rather than instances. Now a TypeError is raised when a class is passed (GH17780).
• Bug in to_numeric() in which elements were not always being coerced to numeric when errors='coerce' (GH17007, GH17125)
• Bug in DataFrame and Series constructors where range objects are converted to int32 dtype on Windows instead of int64 (GH16804)

Indexing

• When called with a null slice (e.g. df.iloc[:]), the .iloc and .loc indexers return a shallow copy of the original object. Previously they returned the original object. (GH13873).
• When called on an unsorted MultiIndex, the loc indexer now will raise UnsortedIndexError only if proper slicing is used on non-sorted levels (GH16734).
• Fixes regression in 0.20.3 when indexing with a string on a TimedeltaIndex (GH16896).
• Fixed TimedeltaIndex.get_loc() handling of np.timedelta64 inputs (GH16909).
• Fix MultiIndex.sort_index() ordering when ascending argument is a list, but not all levels are specified, or are in a different order (GH16934).
• Fixes bug where indexing with np.inf caused an OverflowError to be raised (GH16957)
• Bug in reindexing on an empty CategoricalIndex (GH16770)
• Fixes DataFrame.loc for setting with alignment and tz-aware DatetimeIndex (GH16889)
• Avoids IndexError when passing an Index or Series to .iloc with older numpy (GH17193)
• Allow unicode empty strings as placeholders in multilevel columns in Python 2 (GH17099)
• Bug in .iloc when used with inplace addition or assignment and an int indexer on a MultiIndex causing the wrong indexes to be read from and written to (GH17148)
• Bug in .isin() in which checking membership in empty Series objects raised an error (GH16991)
• Bug in CategoricalIndex reindexing in which specified indices containing duplicates were not being respected (GH17323)
• Bug in intersection of RangeIndex with negative step (GH17296)
• Bug in IntervalIndex where performing a scalar lookup fails for included right endpoints of non-overlapping monotonic decreasing indexes (GH16417, GH17271)
• Bug in DataFrame.first_valid_index() and DataFrame.last_valid_index() when no valid entry (GH17400)
• Bug in Series.rename() when called with a callable, incorrectly alters the name of the Series, rather than the name of the Index. (GH17407)
• Bug in String.str_get() raises IndexError instead of inserting NaNs when using a negative index. (GH17704)
IO

- Bug in `read_hdf()` when reading a timezone aware index from fixed format HDFStore (GH17618)
- Bug in `read_csv()` in which columns were not being thoroughly de-duplicated (GH17060)
- Bug in `read_csv()` in which specified column names were not being thoroughly de-duplicated (GH17095)
- Bug in `read_csv()` in which non integer values for the header argument generated an unhelpful / unrelated error message (GH16338)
- Bug in `read_csv()` in which memory management issues in exception handling, under certain conditions, would cause the interpreter to segfault (GH14696, GH16798).
- Bug in `read_csv()` when called with `low_memory=False` in which a CSV with at least one column > 2GB in size would incorrectly raise a `MemoryError` (GH16798).
- Bug in `read_csv()` when called with a single-element list `header` would return a `DataFrame` of all NaN values (GH7757)
- Bug in `DataFrame.to_csv()` defaulting to ‘ascii’ encoding in Python 3, instead of ‘utf-8’ (GH17097)
- Bug in `read_stata()` where value labels could not be read when using an iterator (GH16923)
- Bug in `read_stata()` where the index was not set (GH16342)
- Bug in `read_html()` where import check fails when run in multiple threads (GH16928)
- Bug in `read_csv()` where automatic delimiter detection caused a `TypeError` to be thrown when a bad line was encountered rather than the correct error message (GH13374)
- Bug in `DataFrame.to_html()` with `notebook=True` where DataFrames with named indices or non-MultiIndex indices had undesired horizontal or vertical alignment for column or row labels, respectively (GH16792)
- Bug in `DataFrame.to_html()` in which there was no validation of the `justify` parameter (GH17527)
- Bug in `HDFStore.select()` when reading a contiguous mixed-data table featuring VLArray (GH17021)
- Bug in `to_json()` where several conditions (including objects with unprintable symbols, objects with deep recursion, overlapping labels) caused segfaults instead of raising the appropriate exception (GH14256)

Plotting

- Bug in plotting methods using `secondary_y` and `fontsize` not setting secondary axis font size (GH12565)
- Bug when plotting `timedelta` and `datetime` dtypes on y-axis (GH16953)
- Line plots no longer assume monotonic x data when calculating xlimits, they show the entire lines now even for unsorted x data. (GH11310, GH11471)
- With matplotlib 2.0.0 and above, calculation of x limits for line plots is left to matplotlib, so that its new default settings are applied. (GH15495)
- Bug in `Series.plot.bar` or `DataFrame.plot.bar` with y not respecting user-passed `color` (GH16822)
- Bug causing `plotting.parallel_coordinates` to reset the random seed when using random colors (GH17525)
GroupBy/resample/rolling

- Bug in DataFrame.resample(...) size() where an empty DataFrame did not return a Series (GH14962)
- Bug in infer_freq() causing indices with 2-day gaps during the working week to be wrongly inferred as business daily (GH16624)
- Bug in .rolling(...) .quantile() which incorrectly used different defaults than Series.quantile() and DataFrame.quantile() (GH9413, GH16211)
- Bug in groupby.transform() that would coerce boolean dtypes back to float (GH16875)
- Bug in Series.resample(...).apply() where an empty Series modified the source index and did not return the name of a Series (GH14313)
- Bug in .rolling(...).apply(...) with a DataFrame with a DatetimeIndex, a window of a timedelta-convertible and min_periods >= 1 (GH15305)
- Bug in DataFrame.groupby where index and column keys were not recognized correctly when the number of keys equaled the number of elements on the groupby axis (GH16859)
- Bug in groupby.nunique() with TimeGrouper which cannot handle NaT correctly (GH17575)
- Bug in DataFrame.groupby where a single level selection from a MultiIndex unexpectedly sorts (GH17537)
- Bug in DataFrame.groupby where spurious warning is raised when Grouper object is used to override ambiguous column name (GH17383)
- Bug in TimeGrouper differs when passes as a list and as a scalar (GH17530)

Sparse

- Bug in SparseSeries raises AttributeError when a dictionary is passed in as data (GH16905)
- Bug in SparseDataFrame.fillna() not filling all NaNs when frame was instantiated from SciPy sparse matrix (GH16112)
- Bug in SparseSeries.unstack() and SparseDataFrame.stack() (GH16614, GH15045)
- Bug in make_sparse() treating two numeric/boolean data, which have same bits, as same when array dtype is object (GH17574)
- SparseArray.all() and SparseArray.any() are now implemented to handle SparseArray, these were used but not implemented (GH17570)

Reshaping

- Joining/Merging with a non unique PeriodIndex raised a TypeError (GH16871)
- Bug in crosstab() where non-aligned series of integers were casted to float (GH17005)
- Bug in merging with categorical dtypes with datetimelikes incorrectly raised a TypeError (GH16900)
- Bug when using isin() on a large object series and large comparison array (GH16012)
- Fixes regression from 0.20, Series.aggregate() and DataFrame.aggregate() allow dictionaries as return values again (GH16741)
- Fixes dtype of result with integer dtype input, from pivot_table() when called with margins=True (GH17013)
- Bug in crosstab() where passing two Series with the same name raised a KeyError (GH13279)
• `Series.argmin()`, `Series.argmax()`, and their counterparts on DataFrame and groupby objects work correctly with floating point data that contains infinite values (GH13595).

• Bug in `unique()` where checking a tuple of strings raised a `TypeError` (GH17108)

• Bug in `concat()` where order of result index was unpredictable if it contained non-comparable elements (GH17344)

• Fixes regression when sorting by multiple columns on a `datetime64` dtype Series with NaT values (GH16836)

• Bug in `pivot_table()` where the result’s columns did not preserve the categorical dtype of columns when dropna was `False` (GH17836)

• Bug in `DataFrame.drop_duplicates` where dropping with non-unique column names raised a `ValueError` (GH17836)

• Bug in `unstack()` which, when called on a list of levels, would discard the `fillna` argument (GH13971)

• Bug in the alignment of `range` objects and other list-likes with `DataFrame` leading to operations being performed row-wise instead of column-wise (GH17901)

**Numeric**

• Bug in `.clip()` with `axis=1` and a list-like for `threshold` is passed; previously this raised `ValueError` (GH15390)

• `Series.clip()` and `DataFrame.clip()` now treat NA values for upper and lower arguments as `None` instead of raising `ValueError` (GH17276).

**Categorical**

• Bug in `Series.isin()` when called with a categorical (GH16639)

• Bug in the categorical constructor with empty values and categories causing the `.categories` to be an empty `Float64Index` rather than an empty `Index` with object dtype (GH17248)

• Bug in categorical operations with `Series.cat` not preserving the original Series’ name (GH17509)

• Bug in `DataFrame.merge()` failing for categorical columns with boolean/int data types (GH17187)

• Bug in constructing a Categorical/CategoricalDtype when the specified categories are of categorical type (GH17884).

**PyPy**

• Compatibility with PyPy in `read_csv()` with `usecols=[<unsorted ints>]` and `read_json()` (GH17351)

• Split tests into cases for CPython and PyPy where needed, which highlights the fragility of index matching with float(`'nan'`), np.nan and NAT (GH17351)

• Fix `DataFrame.memory_usage()` to support PyPy. Objects on PyPy do not have a fixed size, so an approximation is used instead (GH17228)
Other

- Bug where some inplace operators were not being wrapped and produced a copy when invoked (GH12962)
- Bug in `eval()` where the `inplace` parameter was being incorrectly handled (GH16732)

5.10 Version 0.20

5.10.1 Version 0.20.3 (July 7, 2017)

This is a minor bug-fix release in the 0.20.x series and includes some small regression fixes and bug fixes. We recommend that all users upgrade to this version.

What's new in v0.20.3

- **Bug fixes**
  - **Conversion**
  - **Indexing**
  - **IO**
  - **Plotting**
  - **Reshaping**
  - **Categorical**
- **Contributors**

**Bug fixes**

- Fixed a bug in failing to compute rolling computations of a column-MultiIndexed DataFrame (GH16789, GH16825)
- Fixed a pytest marker failing downstream packages' tests suites (GH16680)

**Conversion**

- Bug in pickle compat prior to the v0.20.x series, when UTC is a timezone in a Series/DataFrame/Index (GH16608)
- Bug in Series construction when passing a Series with dtype='category' (GH16524).
- Bug in `DataFrame.astype()` when passing a Series as the dtype kwarg. (GH16717).

**Indexing**

- Bug in Float64Index causing an empty array instead of None to be returned from `.get(np.nan)` on a Series whose index did not contain any NaNs (GH8569)
- Bug in MultiIndex.isin causing an error when passing an empty iterable (GH16777)
- Fixed a bug in a slicing DataFrame/Series that have a TimedeltaIndex (GH16637)
IO

- Bug in `read_csv()` in which files weren’t opened as binary files by the C engine on Windows, causing EOF characters mid-field, which would fail (GH16039, GH16559, GH16675)
- Bug in `read_hdf()` in which reading a Series saved to an HDF file in ‘fixed’ format fails when an explicit mode='r' argument is supplied (GH16583)
- Bug in `DataFrame.to_latex()` where `bold_rows` was wrongly specified to be True by default, whereas in reality row labels remained non-bold whatever parameter provided. (GH16707)
- Fixed an issue with `DataFrame.style()` where generated element ids were not unique (GH16780)
- Fixed loading a DataFrame with a PeriodIndex, from a format='fixed' HDFStore, in Python 3, that was written in Python 2 (GH16781)

Plotting

- Fixed regression that prevented RGB and RGBA tuples from being used as color arguments (GH16233)
- Fixed an issue with `DataFrame.plot.scatter()` that incorrectly raised a KeyError when categorical data is used for plotting (GH16199)

Reshaping

- `PeriodIndex / TimedeltaIndex.join` was missing the sort= kwarg (GH16541)
- Bug in joining on a MultiIndex with a category dtype for a level (GH16627).
- Bug in `merge()` when merging/joining with multiple categorical columns (GH16767)

Categorical

- Bug in `DataFrame.sort_values` not respecting the kind parameter with categorical data (GH16793)

5.10.2 Version 0.20.2 (June 4, 2017)

This is a minor bug-fix release in the 0.20.x series and includes some small regression fixes, bug fixes and performance improvements. We recommend that all users upgrade to this version.

What’s new in v0.20.2

• Enhancements
• Performance improvements
• Bug fixes
  – Conversion
  – Indexing
  – IO
  – Plotting
  – GroupBy/resample/rolling
  – Sparse
  – Reshaping
  – Numeric
  – Categorical
  – Other
• Contributors
Enhancements

• Series provides a \texttt{to\_latex} method (GH16180)
• A new groupby method \texttt{ngroup()}, parallel to the existing \texttt{cumcount()}, has been added to return the group order (GH11642); see \url{here}.

Performance improvements

• Performance regression fix when indexing with a list-like (GH16285)
• Performance regression fix for MultiIndexes (GH16319, GH16346)
• Improved performance of \texttt{.clip()} with scalar arguments (GH15400)
• Improved performance of groupby with categorical groupers (GH16413)
• Improved performance of \texttt{MultiIndex.remove\_unused\_levels()} (GH16556)

Bug fixes

• Silenced a warning on some Windows environments about “tput: terminal attributes: No such device or address” when detecting the terminal size. This fix only applies to python 3 (GH16496)
• Bug in using \texttt{pathlib.Path} or \texttt{py.path.local} objects with io functions (GH16291)
• Bug in \texttt{Index.symmetric\_difference()} on two equal MultiIndex’s, results in a \texttt{TypeError} (GH13490)
• Bug in \texttt{DataFrame.update()} with overwrite=False and NaN values (GH15593)
• Passing an invalid engine to \texttt{read\_csv()} now raises an informative \texttt{ValueError} rather than \texttt{UnboundLocalError}. (GH16511)
• Bug in \texttt{unique()} on an array of tuples (GH16519)
• Bug in \texttt{cut()} when labels are set, resulting in incorrect label ordering (GH16459)
• Fixed a compatibility issue with IPython 6.0’s tab completion showing deprecation warnings on \texttt{Categoricals} (GH16409)

Conversion

• Bug in \texttt{to\_numeric()} in which empty data inputs were causing a segfault of the interpreter (GH16302)
• Silence numpy warnings when broadcasting \texttt{DataFrame} to \texttt{Series} with comparison ops (GH16378, GH16306)
Indexing

- Bug in DataFrame.reset_index(level=) with single level index (GH16263)
- Bug in partial string indexing with a monotonic, but not strictly-monotonic, index incorrectly reversing the slice bounds (GH16515)
- Bug in MultiIndex.remove_unused_levels() that would not return a MultiIndex equal to the original. (GH16556)

IO

- Bug in read_csv() when comment is passed in a space delimited text file (GH16472)
- Bug in read_csv() not raising an exception with nonexistent columns in usecols when it had the correct length (GH14671)
- Bug that would force importing of the clipboard routines unnecessarily, potentially causing an import error on startup (GH16288)
- Bug that raised IndexError when HTML-rendering an empty DataFrame (GH15953)
- Bug in read_csv() in which tarfile object inputs were raising an error in Python 2.x for the C engine (GH16530)
- Bug where DataFrame.to_html() ignored the index_names parameter (GH16493)
- Bug where pd.read_hdf() returns numpy strings for index names (GH13492)
- Bug in HDFStore.select_as_multiple() where start/stop arguments were not respected (GH16209)

Plotting

- Bug in DataFrame.plot with a single column and a list-like color (GH3486)
- Bug in plot where NaT in DatetimeIndex results in Timestamp.min (GH12405)
- Bug in DataFrame.boxplot where figsize keyword was not respected for non-grouped boxplots (GH11959)

GroupBy/resample/rolling

- Bug in creating a time-based rolling window on an empty DataFrame (GH15819)
- Bug in rolling.cov() with offset window (GH16058)
- Bug in .resample() and .groupby() when aggregating on integers (GH16361)

Sparse

- Bug in construction of SparseDataFrame from scipy.sparse.dok_matrix (GH16179)
Reshaping

- Bug in `DataFrame.stack` with unsorted levels in `MultiIndex` columns (GH16323)
- Bug in `pd.wide_to_long()` where no error was raised when `i` was not a unique identifier (GH16382)
- Bug in `Series.isin(..)` with a list of tuples (GH16394)
- Bug in construction of a `DataFrame` with mixed dtypes including an all-NaT column. (GH16395)
- Bug in `DataFrame.agg()` and `Series.agg()` with aggregating on non-callable attributes (GH16405)

Numeric

- Bug in `.interpolate()`, where `limit_direction` was not respected when `limit=None` (default) was passed (GH16282)

Categorical

- Fixed comparison operations considering the order of the categories when both categoricals are unordered (GH16014)

Other

- Bug in `DataFrame.drop()` with an empty-list with non-unique indices (GH16270)

This is a major release from 0.19.2 and includes a number of API changes, deprecations, new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

Highlights include:

- New `.agg()` API for Series/DataFrame similar to the groupby-rolling-resample API’s, see here
- Integration with the feather-format, including a new top-level `pd.read_feather()` and DataFrame. `to_feather()` method, see here.
- The `.ix` indexer has been deprecated, see here
- Panel has been deprecated, see here
- Addition of an `IntervalIndex` and `Interval` scalar type, see here
- Improved user API when grouping by index levels in `groupby()`, see here
- Improved support for `UInt64` dtypes, see here
- A new orient for JSON serialization, `orient='table'`, that uses the Table Schema spec and that gives the possibility for a more interactive repr in the Jupyter Notebook, see here
- Experimental support for exporting styled DataFrames (`DataFrame.style`) to Excel, see here

5.10.3 Version 0.20.1 (May 5, 2017)
• Window binary corr/cov operations now return a MultiIndexed DataFrame rather than a Panel, as Panel is now deprecated, see here
• Support for S3 handling now uses s3fs, see here
• Google BigQuery support now uses the pandas-gbq library, see here

Warning: pandas has changed the internal structure and layout of the code base. This can affect imports that are not from the top-level pandas.* namespace, please see the changes here.

Check the API Changes and deprecations before updating.

Note: This is a combined release for 0.20.0 and 0.20.1. Version 0.20.1 contains one additional change for backwards-compatibility with downstream projects using pandas’ utils routines. (GH16250)

What’s new in v0.20.0

• New features
  – Method agg API for DataFrame/Series
  – Keyword argument dtype for data IO
  – Method .to_datetime() has gained an origin parameter
  – GroupBy enhancements
  – Better support for compressed URLs in read_csv
  – Pickle file IO now supports compression
  – UInt64 support improved
  – GroupBy on categoricals
  – Table schema output
  – SciPy sparse matrix from/to SparseDataFrame
  – Excel output for styled DataFrames
  – IntervalIndex
  – Other enhancements

• Backwards incompatible API changes
  – Possible incompatibility for HDF5 formats created with pandas < 0.13.0
  – Map on Index types now return other Index types
  – Accessing datetime fields of Index now return Index
  – pd.unique will now be consistent with extension types
  – S3 file handling
  – Partial string indexing changes
  – Concat of different float dtypes will not automatically upcast
  – pandas Google BigQuery support has moved
- Memory usage for Index is more accurate
- DataFrame.sort_index changes
- GroupBy describe formatting
- Window binary corr/cov operations return a MultiIndex DataFrame
- HDFStore where string comparison
- Index.intersection and inner join now preserve the order of the left Index
- Pivot table always returns a DataFrame
- Other API changes

• Reorganization of the library: privacy changes
  - Modules privacy has changed
  - pandas.errors
  - pandas.testing
  - pandas.plotting
  - Other development changes

• Deprecations
  - Deprecate .ix
  - Deprecate Panel
  - Deprecate groupby.agg() with a dictionary when renaming
  - Deprecate .plotting
  - Other deprecations

• Removal of prior version deprecations/changes

• Performance improvements

• Bug fixes
  - Conversion
  - Indexing
  - IO
  - Plotting
  - GroupBy/resample/rolling
  - Sparse
  - Reshaping
  - Numeric
  - Other

• Contributors
New features

Method agg API for DataFrame/Series

Series & DataFrame have been enhanced to support the aggregation API. This is a familiar API from groupby, window operations, and resampling. This allows aggregation operations in a concise way by using `agg()` and `transform()`. The full documentation is here (GH1623).

Here is a sample

```python
In [1]: df = pd.DataFrame(np.random.randn(10, 3), columns=['A', 'B', 'C'],
                      index=pd.date_range('1/1/2000', periods=10))
...:
...

In [2]: df.iloc[3:7] = np.nan

In [3]: df
Out[3]:
    A    B    C
0  0.469  0.283 -1.509
1 -1.136  1.212 -0.173
2  0.119 -1.044 -0.862
3   NaN   NaN   NaN
4   NaN   NaN   NaN
5   NaN   NaN   NaN
6   NaN   NaN   NaN
7  0.114 -1.478  0.525
8  0.405  0.577 -1.715
9 -1.039 -0.371 -1.158

[10 rows x 3 columns]
```

One can operate using string function names, callables, lists, or dictionaries of these.

Using a single function is equivalent to `.apply`.

```python
In [4]: df.agg('sum')
Out[4]:
   A   B   C
0 -1.068 -1.387 -4.892
Length: 3, dtype: float64
```

Multiple aggregations with a list of functions.

```python
In [5]: df.agg(['sum', 'min'])
Out[5]:
        A       B       C
sum -1.068226 -1.387015 -4.892029
min -1.135632 -1.478427 -1.715002
```

Using a dict provides the ability to apply specific aggregations per column. You will get a matrix-like output of all of the aggregators. The output has one column per unique function. Those functions applied to a particular column will
be NaN:

```
In [6]: df.agg({'A': ['sum', 'min'], 'B': ['min', 'max']})
```

```
Out[6]:
      A       B
     sum  1.068226  NaN
    min -1.135632 -1.478427
   max  1.212112
[3 rows x 2 columns]
```

The API also supports a `.transform()` function for broadcasting results.

```
In [7]: df.transform(['abs', lambda x: x - x.min()])
```

```
Out[7]:
     A       B         C
   abs <lambda> abs <lambda> abs <lambda>
2000-01-01  0.469112  1.604745  0.282863  1.195563  1.500059  0.205944
2000-01-02  1.135632  0.000000  1.212112  2.690539  0.173215  1.541787
2000-01-03  0.119209  1.254841  1.044236  0.434191  0.861849  0.853153
2000-01-04  NaN       NaN       NaN       NaN       NaN       NaN
2000-01-05  NaN       NaN       NaN       NaN       NaN       NaN
2000-01-06  NaN       NaN       NaN       NaN       NaN       NaN
2000-01-07  NaN       NaN       NaN       NaN       NaN       NaN
2000-01-08  0.113648  1.249281  1.478427  0.000000  0.524988  2.239990
2000-01-09  0.484705  1.540338  0.577046  2.055473  1.715002  0.000000
2000-01-10  1.039268  0.096364  0.370647  1.107780  1.157892  0.557110
[10 rows x 6 columns]
```

When presented with mixed dtypes that cannot be aggregated, `.agg()` will only take the valid aggregations. This is similar to how groupby `.agg()` works. (GH15015)

```
In [8]: df = pd.DataFrame({'A': [1, 2, 3],
                        'B': ['1', '2', '3'],
                        'C': ['foo', 'bar', 'baz'],
                        'D': pd.date_range('20130101', periods=3)})

In [9]: df.dtypes
```

```
Out[9]:
     A    B    C          D
int64  float64 object  datetime64[ns]
```

```
In [10]: df.agg(['min', 'sum'])
```

```
Out[10]:
     A  B   C    D
   min 1 1.0  bar 2013-01-01
  sum 6 6.0 foobarbaz  NaT
[2 rows x 4 columns]
```
Keyword argument `dtype` for data IO

The 'python' engine for `read_csv()`, as well as the `read_fwf()` function for parsing fixed-width text files and `read_excel()` for parsing Excel files, now accept the `dtype` keyword argument for specifying the types of specific columns (GH14295). See the `io docs` for more information.

```
In [11]: data = "a b\n1 2\n3 4"
In [12]: pd.read_fwf(StringIO(data)).dtypes
Out[12]:
a int64
b int64
Length: 2, dtype: object
In [13]: pd.read_fwf(StringIO(data), dtype={'a': 'float64', 'b': 'object'}).dtypes
Out[13]:
a float64
b object
Length: 2, dtype: object
```

Method `.to_datetime()` has gained an origin parameter

`.to_datetime()` has gained a new parameter, `origin`, to define a reference date from where to compute the resulting timestamps when parsing numerical values with a specific unit specified. (GH11276, GH11745)

For example, with 1960-01-01 as the starting date:

```
In [14]: pd.to_datetime([1, 2, 3], unit='D', origin=pd.Timestamp('1960-01-01'))
Out[14]:  DatetimeIndex(['1960-01-02', '1960-01-03', '1960-01-04'], dtype='datetime64[ns]', freq=None)
```

The default is set at `origin='unix'`, which defaults to `1970-01-01 00:00:00`, which is commonly called `unix epoch` or POSIX time. This was the previous default, so this is a backward compatible change.

```
In [15]: pd.to_datetime([1, 2, 3], unit='D')
Out[15]:  DatetimeIndex(['1970-01-02', '1970-01-03', '1970-01-04'], dtype='datetime64[ns]', freq=None)
```

GroupBy enhancements

Strings passed to `DataFrame.groupby()` as the by parameter may now reference either column names or index level names. Previously, only column names could be referenced. This allows to easily group by a column and index level at the same time. (GH5677)

```
In [16]: arrays = [[['bar', 'bar', 'baz', 'baz', 'foo', 'foo', 'qux', 'qux'], ['one', 'two', 'one', 'two', 'one', 'two', 'one', 'two']]
       ....
       ....
In [17]: index = pd.MultiIndex.from_arrays(arrays, names=['first', 'second'])
In [18]: df = pd.DataFrame({'A': [1, 1, 1, 2, 2, 3, 3]},
```

(continues on next page)
Better support for compressed URLs in `read_csv`

The compression code was refactored (GH12688). As a result, reading dataframes from URLs in `read_csv()` or `read_table()` now supports additional compression methods: xz, bz2, and zip (GH14570). Previously, only gzip compression was supported. By default, compression of URLs and paths are now inferred using their file extensions. Additionally, support for bz2 compression in the python 2 C-engine improved (GH14874).

```python
In [21]: url = ('https://github.com/{repo}/raw/{branch}/{path}'
       ....:     .format(repo='pandas-dev/pandas',
       ....:         branch='master',
       ....:         path='pandas/tests/io/parser/data/salaries.csv.bz2'))

# default, infer compression
In [22]: df = pd.read_csv(url, sep='\t', compression='infer')

# explicitly specify compression
In [23]: df = pd.read_csv(url, sep='\t', compression='bz2')
```
Pickle file IO now supports compression

`read_pickle()`, `DataFrame.to_pickle()` and `Series.to_pickle()` can now read from and write to compressed pickle files. Compression methods can be an explicit parameter or be inferred from the file extension. See the docs here.

```
In [25]: df = pd.DataFrame({'A': np.random.randn(1000),
                      'B': 'foo',
                      'C': pd.date_range('20130101', periods=1000, freq='s')})

In [26]: df.to_pickle("data.pkl.compress", compression="gzip")

In [27]: rt = pd.read_pickle("data.pkl.compress", compression="gzip")

In [28]: rt.head()
Out[28]:
   A   B        C
0 -1.344312 foo 2013-01-01 00:00:00
1  0.844885 foo 2013-01-01 00:00:01
2  1.075770 foo 2013-01-01 00:00:02
3 -0.109050 foo 2013-01-01 00:00:03
4  1.643563 foo 2013-01-01 00:00:04
```

The default is to infer the compression type from the extension (`compression='infer'`):

```
In [29]: df.to_pickle("data.pkl.gz")

In [30]: rt = pd.read_pickle("data.pkl.gz")

In [31]: rt.head()
Out[31]:
   A   B        C
0 -1.344312 foo 2013-01-01 00:00:00
1  0.844885 foo 2013-01-01 00:00:01
2  1.075770 foo 2013-01-01 00:00:02
3 -0.109050 foo 2013-01-01 00:00:03
4  1.643563 foo 2013-01-01 00:00:04
```
In [32]: df["A"].to_pickle("s1.pkl.bz2")

In [33]: rt = pd.read_pickle("s1.pkl.bz2")

In [34]: rt.head()
Out[34]:
0  -1.344312
1   0.844885
2    1.075770
3  -0.109050
4    1.643563
Name: A, Length: 5, dtype: float64

UInt64 support improved

pandas has significantly improved support for operations involving unsigned, or purely non-negative, integers. Previously, handling these integers would result in improper rounding or data-type casting, leading to incorrect results. Notably, a new numerical index, UInt64Index, has been created (GH14937)

In [35]: idx = pd.UInt64Index([1, 2, 3])

In [36]: df = pd.DataFrame({'A': ['a', 'b', 'c'], index=idx})

In [37]: df.index
Out[37]: UInt64Index([1, 2, 3], dtype='uint64')

• Bug in converting object elements of array-like objects to unsigned 64-bit integers (GH4471, GH14982)
• Bug in Series.unique() in which unsigned 64-bit integers were causing overflow (GH14721)
• Bug in DataFrame construction in which unsigned 64-bit integer elements were being converted to objects (GH14881)
• Bug in pd.read_csv() in which unsigned 64-bit integer elements were being improperly converted to the wrong data types (GH14983)
• Bug in pd.unique() in which unsigned 64-bit integers were causing overflow (GH14915)
• Bug in pd.value_counts() in which unsigned 64-bit integers were being erroneously truncated in the output (GH14934)

GroupBy on categoricals

In previous versions, .groupby(..., sort=False) would fail with a ValueError when grouping on a categorical series with some categories not appearing in the data. (GH13179)
In [40]: df
Out[40]:
    A   B   C chromosomes
0  87  22  81         4
1  87  22  81        13
2  87  22  81        22
3  87  22  81          2
4  87  22  81          6
...   ...   ...     ...
95  87  22  81          8
96  87  22  81         11
97  87  22  81         X
98  87  22  81          1
99  87  22  81         19

[100 rows x 4 columns]

Previous behavior:

In [3]: df[df.chromosomes != '1'].groupby('chromosomes', sort=False).sum()
---------------------------------------------------------------------------
ValueError: items in new_categories are not the same as in old categories

New behavior:

In [41]: df[df.chromosomes != '1'].groupby('chromosomes', sort=False).sum()
Out[41]:
    A   B   C
chromosomes
 2  348  88  324
 3  348  88  324
 4  348  88  324
 5  261  66  243
 6  174  44  162
...   ...   ...
22  348  88  324
X  348  88  324
Y  435 110  405
1   0    0    0
21   0    0    0

[24 rows x 3 columns]
Table schema output

The new orient 'table' for `DataFrame.to_json()` will generate a Table Schema compatible string representation of the data.

```python
In [42]: df = pd.DataFrame(
    ....:     { 'A': [1, 2, 3],
    ....:     'B': [ 'a', 'b', 'c' ],
    ....:     'C': pd.date_range('2016-01-01', freq='d', periods=3),
    ....:     index = pd.Index(range(3), name='idx'))

In [43]: df
Out[43]:
       A  B       C
0   1.0  a 2016-01-01
1   2.0  b 2016-01-02
2   3.0  c 2016-01-03

[3 rows x 3 columns]

In [44]: df.to_json(orient='table')
Out[44]:

"schema": {
    "fields": [
        { "name": "idx", "type": "integer" },
        { "name": "A", "type": "integer" },
        { "name": "B", "type": "string" },
        { "name": "C", "type": "datetime" }
    ],
    "primaryKey": [ "idx" ],
    "pandas_version": "0.20.0",
    "data": [
        { "idx": 0, "A": 1, "B": "a", "C": "2016-01-01T00:00:00.000Z" },
        { "idx": 1, "A": 2, "B": "b", "C": "2016-01-02T00:00:00.000Z" },
        { "idx": 2, "A": 3, "B": "c", "C": "2016-01-03T00:00:00.000Z" }
    ]
}
```

See [IO: Table Schema for more information.](https://pandas.pydata.org/pandas-docs/guide/ IO.html#table-schema)

Additionally, the repr for DataFrame and Series can now publish this JSON Table schema representation of the Series or DataFrame if you are using IPython (or another frontend like nteract using the Jupyter messaging protocol). This gives frontends like the Jupyter notebook and nteract more flexibility in how they display pandas objects, since they have more information about the data. You must enable this by setting the `display.html.table_schema` option to `True`.

### SciPy sparse matrix from/to SparseDataFrame

pandas now supports creating sparse dataframes directly from scipy.sparse.spmatrix instances. See the [documentation](https://pandas.pydata.org/pandas-docs/stable/reference/api/pandas.DataFrame.sparse.html) for more information. (GH4343)

All sparse formats are supported, but matrices that are not in **COOrdinate** format will be converted, copying data as needed.

```python
from scipy.sparse import csr_matrix
arr = np.random.random(size=(1000, 5))
arr[arr < .9] = 0
sp_arr = csr_matrix(arr)
sp_arr
sdf = pd.SparseDataFrame(sp_arr)
sdf
```

To convert a SparseDataFrame back to sparse SciPy matrix in COO format, you can use:
Excel output for styled DataFrames

Experimental support has been added to export DataFrame.style formats to Excel using the openpyxl engine. (GH15530)

For example, after running the following, styled.xlsx renders as below:

```python
In [45]: np.random.seed(24)

In [46]: df = pd.DataFrame({'A': np.linspace(1, 10, 10)})

In [47]: df = pd.concat([df, pd.DataFrame(np.random.RandomState(24).randn(10, 4), columns=list('BCDE'))], axis=1)

In [48]: df.iloc[0, 2] = np.nan

In [49]: df
Out[49]:
   A   B   C   D   E
0  1.0 1.329212 NaN -0.316280 -0.990810
1  2.0 -1.070816 -1.438713 0.564417 0.295722
2  3.0 -1.626404 0.219565 0.678805 1.889273
3  4.0  0.961538 0.104011 -0.481165 0.850229
4  5.0  1.453425 1.057737 0.165562 0.515018
5  6.0 -1.336936 0.562861 1.392855 -0.063328
6  7.0  0.121668 1.207603 -0.002040 1.627796
7  8.0  0.354493 1.037528 -0.385684 0.519818
8  9.0  1.686583 -1.325963 1.428984 -2.089354
9 10.0 -0.129820 0.631523 -0.586538 0.290720

[10 rows x 5 columns]

In [50]: styled = (df.style
   ....: .applymap(lambda val: 'color:red;' if val < 0 else 'color:black;')
   ....: .highlight_max())

In [51]: styled.to_excel('styled.xlsx', engine='openpyxl')
```
IntervalIndex

pandas has gained an IntervalIndex with its own dtype, interval as well as the Interval scalar type. These allow first-class support for interval notation, specifically as a return type for the categories in `cut()` and `qcut()`. The IntervalIndex allows some unique indexing, see the docs. (GH7640, GH8625)

**Warning:** These indexing behaviors of the IntervalIndex are provisional and may change in a future version of pandas. Feedback on usage is welcome.

Previous behavior:

The returned categories were strings, representing Intervals

```python
In [1]: c = pd.cut(range(4), bins=2)

In [2]: c
Out[2]:
[(-0.003, 1.5], (-0.003, 1.5], (1.5, 3], (1.5, 3]]
Categories (2, object): [(-0.003, 1.5] < (1.5, 3]]

In [3]: c.categories
Out[3]: Index(['(-0.003, 1.5]', '(1.5, 3]'], dtype='object')
```

New behavior:

```python
In [52]: c = pd.cut(range(4), bins=2)

In [53]: c
Out[53]:
[(-0.003, 1.5], (-0.003, 1.5], (1.5, 3.0], (1.5, 3.0]]
Categories (2, interval[float64, right]): [(-0.003, 1.5] < (1.5, 3.0]]

In [54]: c.categories
Out[54]: IntervalIndex([(-0.003, 1.5], (1.5, 3.0]], dtype='interval[float64, right]')
```
Furthermore, this allows one to bin other data with these same bins, with NaN representing a missing value similar to other dtypes.

```
In [55]: pd.cut([0, 3, 5, 1], bins=c.categories)
Out[55]:
[(-0.003, 1.5], (1.5, 3.0], NaN, (-0.003, 1.5]]
Categories (2, interval[float64, right]): [(-0.003, 1.5] < (1.5, 3.0]]
```

An `IntervalIndex` can also be used in `Series` and `DataFrame` as the index.

```
In [56]: df = pd.DataFrame({'A': range(4),
                        'B': pd.cut([0, 3, 1, 1], bins=c.categories)
}).set_index('B')

In [57]: df
Out[57]:
     A
B          
(-0.003, 1.5] 0
(1.5, 3.0]    1
(-0.003, 1.5] 2
(1.0, 1.5]    3

[4 rows x 1 columns]
```

Selecting via a specific interval:

```
In [58]: df.loc[pd.Interval(1.5, 3.0)]
Out[58]:
      A
Name: (1.5, 3.0], Length: 1, dtype: int64
```

Selecting via a scalar value that is contained in the intervals.

```
In [59]: df.loc[0]
Out[59]:
     A
B          
(-0.003, 1.5] 0
(-0.003, 1.5] 2
(-0.003, 1.5] 3

[3 rows x 1 columns]
```
Other enhancements

- `DataFrame.rolling()` now accepts the parameter `closed='right' | 'left' | 'both' | 'neither'` to choose the rolling window-endpoint closedness. See the documentation (GH13965).

- Integration with the `feather-format`, including a new top-level `pd.read_feather()` and `DataFrame.to_feather()` method, see here.

- `Series.str.replace()` now accepts a callable, as replacement, which is passed to `re.sub` (GH15055).

- `Series.str.replace()` now accepts a compiled regular expression as a pattern (GH15446).

- `Series.sort_index` accepts parameters `kind` and `na_position` (GH13589, GH14444).

- `DataFrame` and `DataFrame.groupby()` have gained a `nunique()` method to count the distinct values over an axis (GH14336, GH15197).

- `DataFrame` has gained a `melt()` method, equivalent to `pd.melt()`, for unpivoting from a wide to long format (GH12640).

- `pd.read_excel()` now preserves sheet order when using `sheetname=None` (GH9930).

- Multiple offset aliases with decimal points are now supported (e.g. `0.5min` is parsed as `30s`) (GH8419).

- `.isnull()` and `.notnull()` have been added to `Index` object to make them more consistent with the `Series` API (GH15300).

- New `UnsortedIndexError` (subclass of `KeyError`) raised when indexing/slicing into an unsorted MultiIndex (GH11897). This allows differentiation between errors due to lack of sorting or an incorrect key. See here.

- `MultiIndex` has gained a `.to_frame()` method to convert to a `DataFrame` (GH12397).

- `pd.cut` and `pd.qcut` now support `datetime64` and `timedelta64` dtypes (GH14714, GH14798).

- `pd.qcut` has gained the `duplicates='raise' | 'drop'` option to control whether to raise on duplicated edges (GH7751).

- `Series` provides a `to_excel` method to output Excel files (GH8825).

- The `usecols` argument in `pd.read_csv()` now accepts a callable function as a value (GH14154).

- The `skiprows` argument in `pd.read_csv()` now accepts a callable function as a value (GH10882).

- The `nrows` and `chunksize` arguments in `pd.read_csv()` are supported if both are passed (GH6774, GH15755).

- `DataFrame.plot` now prints a title above each subplot if `subplots=True` and `title` is a list of strings (GH14753).

- `DataFrame.plot` can pass the `matplotlib 2.0 default color cycle` as a single string as color parameter, see here. (GH15516).

- `Series.interpolate()` now supports `timedelta` as an index type with `method='time'` (GH6424).

- Addition of a `level` keyword to `DataFrame/Series.rename` to rename labels in the specified level of a `MultiIndex` (GH4160).

- `DataFrame.reset_index()` will now interpret a tuple `index.name` as a key spanning across levels of columns, if this is a `MultiIndex` (GH16164).

- `Timedelta.isoformat` method added for formatting `Timedeltas` as an ISO 8601 duration. See the `Timedelta docs` (GH15136).

- `.select_dtypes()` now allows the string `datetimetz` to generically select datetimes with tz (GH14910).

- The `.to_latex()` method will now accept `multicolumn` and `multirow` arguments to use the accompanying LaTeX enhancements.
• `pd.merge_asof()` gained the option `direction='backward' | 'forward' | 'nearest'` (GH14887)
• `Series/DataFrame.asfreq()` have gained a `fill_value` parameter, to fill missing values (GH3715).
• `Series/DataFrame.resample.asfreq` have gained a `fill_value` parameter, to fill missing values during resampling (GH3715).
• `pandas.util.hash_pandas_object()` has gained the ability to hash a `MultiIndex` (GH15224)
• `Series/DataFrame.squeeze()` have gained the `axis` parameter. (GH15339)
• `DataFrame.to_excel()` has a new `freeze_panes` parameter to turn on Freeze Panses when exporting to Excel (GH15160)
• `pd.read_html()` will parse multiple header rows, creating a `MultiIndex` header. (GH13434).
• HTML table output skips colspan or rowspan attribute if equal to 1. (GH15403)
• `pandas.io.formats.style.Styler` template now has blocks for easier extension, see the example notebook (GH15649)
• `Styler.render()` now accepts `**kwargs` to allow user-defined variables in the template (GH15649)
• Compatibility with Jupyter notebook 5.0; `MultiIndex` column labels are left-aligned and `MultiIndex` row-labels are top-aligned (GH15379)
• TimedeltaIndex now has a custom date-tick formatter specifically designed for nanosecond level precision (GH8711)
• `pd.api.types.union_categoricals` gained the `ignore_ordered` argument to allow ignoring the ordered attribute of unioned categoricals (GH13410). See the `categorical union docs` for more information.
• `DataFrame.to_latex()` and `DataFrame.to_string()` now allow optional header aliases. (GH15436)
• Re-enable the `parse_dates` keyword of `pd.read_excel()` to parse string columns as dates (GH14326)
• Added `.empty` property to subclasses of `Index`. (GH15270)
• Enabled floor division for Timedelta and TimedeltaIndex (GH15828)
• `pd.read_csv()` will now raise a `ParserError` error whenever any parsing error occurs (GH15913, GH15925)
• `pd.read_csv()` now supports the `error_bad_lines` and `warn_bad_lines` arguments for the Python parser (GH15925)
• The `display.show_dimensions` option can now also be used to specify whether the length of a `Series` should be shown in its repr (GH7117).
• `parallel_coordinates()` has gained a `sort_labels` keyword argument that sorts class labels and the colors assigned to them (GH15908)
• Options added to allow one to turn on/off using bottleneck and numexpr, see here (GH16157)
• `DataFrame.style.bar()` now accepts two more options to further customize the bar chart. Bar alignment is set with `align='left' | 'mid' | 'zero'`, the default is “left”, which is backward compatible; You can now pass a list of `color=[color_negative, color_positive]`. (GH14757)
Backwards incompatible API changes

Possible incompatibility for HDF5 formats created with pandas < 0.13.0

pd.TimeSeries was deprecated officially in 0.17.0, though has already been an alias since 0.13.0. It has been dropped in favor of pd.Series. (GH15098).

This may cause HDF5 files that were created in prior versions to become unreadable if pd.TimeSeries was used. This is most likely to be for pandas < 0.13.0. If you find yourself in this situation. You can use a recent prior version of pandas to read in your HDF5 files, then write them out again after applying the procedure below.

Map on Index types now return other Index types

map on an Index now returns an Index, not a numpy array (GH12766)
In [5]: idx.map(lambda x: x * 2)
Out[5]: array([2, 4])

In [6]: idx.map(lambda x: (x, x * 2))
Out[6]: array([(1, 2), (2, 4)], dtype=object)

In [7]: mi.map(lambda x: x)
Out[7]: array([(1, 2), (2, 4)], dtype=object)

In [8]: mi.map(lambda x: x[0])
Out[8]: array([1, 2])

New behavior:

In [64]: idx.map(lambda x: x * 2)
Out[64]: Int64Index([2, 4], dtype='int64')

In [65]: idx.map(lambda x: (x, x * 2))
Out[65]: MultiIndex([(1, 2),
                   (2, 4)],
                   )

In [66]: mi.map(lambda x: x)
Out[66]: MultiIndex([(1, 2),
                   (2, 4)],
                   )

In [67]: mi.map(lambda x: x[0])
Out[67]: Int64Index([1, 2], dtype='int64')

map on a Series with datetime64 values may return int64 dtypes rather than int32

In [68]: s = pd.Series(pd.date_range('2011-01-02T00:00', '2011-01-02T02:00', freq='H').tz_localize('Asia/Tokyo'))

In [69]: s
Out[69]:
0  2011-01-02 00:00:00+09:00
1  2011-01-02 01:00:00+09:00
2  2011-01-02 02:00:00+09:00
Length: 3, dtype: datetime64[ns, Asia/Tokyo]

Previous behavior:

In [9]: s.map(lambda x: x.hour)
Out[9]:
0  0
1  1
2  2
dtype: int32
New behavior:

```python
In [70]: s.map(lambda x: x.hour)
Out[70]:
0    0
1    1
2    2
Length: 3, dtype: int64
```

### Accessing datetime fields of Index now return Index

The datetime-related attributes (see here for an overview) of DatetimeIndex, PeriodIndex and TimedeltaIndex previously returned numpy arrays. They will now return a new Index object, except in the case of a boolean field, where the result will still be a boolean ndarray. (GH15022)

Previous behaviour:

```python
In [1]: idx = pd.date_range("2015-01-01", periods=5, freq='10H')
In [2]: idx.hour
Out[2]: array([ 0, 10, 20, 6, 16], dtype=int32)
```

New behavior:

```python
In [71]: idx = pd.date_range("2015-01-01", periods=5, freq='10H')
In [72]: idx.hour
Out[72]: Int64Index([0, 10, 20, 6, 16], dtype='int64')
```

This has the advantage that specific Index methods are still available on the result. On the other hand, this might have backward incompatibilities: e.g. compared to numpy arrays, Index objects are not mutable. To get the original ndarray, you can always convert explicitly using `np.asarray(idx.hour)`.

### `pd.unique` will now be consistent with extension types

In prior versions, using `Series.unique()` and `pandas.unique()` on Categorical and tz-aware data-types would yield different return types. These are now made consistent. (GH15903)

- Datetime tz-aware

  Previous behaviour:

  ```python
  # Series
  In [5]: pd.Series([pd.Timestamp('20160101', tz='US/Eastern'),
      ...:    pd.Timestamp('20160101', tz='US/Eastern')]).unique()
  Out[5]: array([Timestamp('2016-01-01 00:00:00-0500', tz='US/Eastern')],
               dtype=object)
  In [6]: pd.unique(pd.Series([pd.Timestamp('20160101', tz='US/Eastern'),
      ...:    pd.Timestamp('20160101', tz='US/Eastern')]))
  Out[6]: array(['2016-01-01T05:00:00.000000000'], dtype='datetime64[ns]')
  # Index
  ```
In [7]: pd.Index([pd.Timestamp('20160101', tz='US/Eastern'),
    ...:    pd.Timestamp('20160101', tz='US/Eastern')]).unique()

Out[7]: DatetimeIndex(['2016-01-01 00:00:00-05:00'],
                   dtype='datetime64[ns, US/Eastern]',
                   freq=None)

In [8]: pd.unique([pd.Timestamp('20160101', tz='US/Eastern'),
    ...:    pd.Timestamp('20160101', tz='US/Eastern')])

Out[8]: array([2016-01-01T05:00:00.000000000'],
             dtype='datetime64[ns]')

New behavior:

# Series, returns an array of Timestamp tz-aware
In [73]: pd.Series([pd.Timestamp('20160101', tz='US/Eastern'),
    ...:    pd.Timestamp('20160101', tz='US/Eastern')]).unique()

Out[73]:<DatetimeArray>
['2016-01-01 00:00:00-05:00']
Length: 1, dtype: datetime64[ns, US/Eastern]

In [74]: pd.unique(pd.Series([pd.Timestamp('20160101', tz='US/Eastern'),
    ...:    pd.Timestamp('20160101', tz='US/Eastern')]))

Out[74]:<DatetimeArray>
['2016-01-01 00:00:00-05:00']
Length: 1, dtype: datetime64[ns, US/Eastern]

# Index, returns a DatetimeIndex
In [75]: pd.Index([pd.Timestamp('20160101', tz='US/Eastern'),
    ...:    pd.Timestamp('20160101', tz='US/Eastern')]).unique()

Out[75]: DatetimeIndex(['2016-01-01 00:00:00-05:00'],
                      dtype='datetime64[ns, US/Eastern]',
                      freq=None)

In [76]: pd.unique(pd.Index([pd.Timestamp('20160101', tz='US/Eastern'),
    ...:    pd.Timestamp('20160101', tz='US/Eastern')]))

Out[76]: DatetimeIndex(['2016-01-01 00:00:00-05:00'],
                      dtype='datetime64[ns, US/Eastern]',
                      freq=None)

• Categoricals

Previous behaviour:

In [1]: pd.Series(list('baabc'), dtype='category').unique()
Out[1]:
[b, a, c]
Categories (3, object): [b, a, c]

In [2]: pd.unique(pd.Series(list('baabc'), dtype='category'))
Out[2]: array(['b', 'a', 'c'], dtype=object)

New behavior:
S3 file handling

pandas now uses s3fs for handling S3 connections. This shouldn’t break any code. However, since s3fs is not a required dependency, you will need to install it separately, like boto in prior versions of pandas. (GH11915).

Partial string indexing changes

DatetimeIndex Partial String Indexing now works as an exact match, provided that string resolution coincides with index resolution, including a case when both are seconds (GH14826). See Slice vs. Exact Match for details.

Previous behavior:

```python
In [4]: df['2011-12-31 23:59:59']
Out[4]:
2011-12-31 23:59:59 1
Name: a, dtype: int64
```

New behavior:

```python
In [4]: df['2011-12-31 23:59:59']
KeyError: '2011-12-31 23:59:59'

In [5]: df['a']['2011-12-31 23:59:59']
Out[5]: 1
```
Concat of different float dtypes will not automatically upcast

Previously, `concat` of multiple objects with different `float` dtypes would automatically upcast results to a dtype of `float64`. Now the smallest acceptable dtype will be used (GH13247)

```
In [80]: df1 = pd.DataFrame(np.array([1.0], dtype=np.float32, ndmin=2))
In [81]: df1.dtypes
Out[81]:
0  float32
Length: 1, dtype: object
In [82]: df2 = pd.DataFrame(np.array([np.nan], dtype=np.float32, ndmin=2))
In [83]: df2.dtypes
Out[83]:
0  float32
Length: 1, dtype: object
```

Previous behavior:

```
In [7]: pd.concat([df1, df2]).dtypes
Out[7]:
0  float64
dtype: object
```

New behavior:

```
In [84]: pd.concat([df1, df2]).dtypes
Out[84]:
0  float32
Length: 1, dtype: object
```

**pandas Google BigQuery support has moved**

`pandas` has split off Google BigQuery support into a separate package `pandas-gbq`. You can `conda install pandas-gbq -c conda-forge` or `pip install pandas-gbq` to get it. The functionality of `read_gbq()` and `DataFrame.to_gbq()` remain the same with the currently released version of `pandas-gbq=0.1.4`. Documentation is now hosted here (GH15347)

**Memory usage for Index is more accurate**

In previous versions, showing `.memory_usage()` on a pandas structure that has an index, would only include actual index values and not include structures that facilitated fast indexing. This will generally be different for `Index` and `MultiIndex` and less-so for other index types. (GH15237)

Previous behavior:

```
In [8]: index = pd.Index(['foo', 'bar', 'baz'])
In [9]: index.memory_usage(deep=True)
Out[9]: 180
```
In [10]: index.get_loc('foo')
Out[10]: 0

In [11]: index.memory_usage(deep=True)
Out[11]: 180

New behavior:

In [8]: index = pd.Index(['foo', 'bar', 'baz'])
In [9]: index.memory_usage(deep=True)
Out[9]: 180

In [10]: index.get_loc('foo')
Out[10]: 0

In [11]: index.memory_usage(deep=True)
Out[11]: 260

**DataFrame.sort_index changes**

In certain cases, calling `.sort_index()` on a MultiIndexed DataFrame would return the same DataFrame without seeming to sort. This would happen with a lexsorted, but non-monotonic levels. (GH15622, GH15687, GH14015, GH13431, GH15797)

This is unchanged from prior versions, but shown for illustration purposes:

In [85]: df = pd.DataFrame(np.arange(6), columns=['value'],
                          index=pd.MultiIndex.from_product([list('BA'), range(3)]))

In [86]: df
Out[86]:
          value
    B  0  0
    1  1
    2  2
    A  3
    1  4
    2  5

[6 rows x 1 columns]

In [87]: df.index.is_lexsorted()
Out[87]: False

In [88]: df.index.is_monotonic
Out[88]: False

Sorting works as expected
In [87]: df.sort_index()
Out[87]:
    value
   A  0  3
    1  4
     2  5
   B  0  0
    1  1
     2  2

[6 rows x 1 columns]

In [90]: df.sort_index().index.is_lexsorted()
Out[90]: True

In [91]: df.sort_index().index.is_monotonic
Out[91]: True

However, this example, which has a non-monotonic 2nd level, doesn’t behave as desired.

In [88]: df = pd.DataFrame({'value': [1, 2, 3, 4]},
                        index=pd.MultiIndex([['a', 'b'], ['bb', 'aa']],
                                             [[0, 0, 1, 1], [0, 1, 0, 1]]))

In [89]: df
Out[89]:
    value
   a bb  1
    aa  2
   b bb  3
    aa  4

[4 rows x 1 columns]

Previous behavior:

In [11]: df.sort_index()
Out[11]:
    value
   a bb  1
    aa  2
   b bb  3
    aa  4

In [14]: df.sort_index().index.is_lexsorted()
Out[14]: True

In [15]: df.sort_index().index.is_monotonic
Out[15]: False

New behavior:
GroupBy describe formatting

The output formatting of `groupby.describe()` now labels the `describe()` metrics in the columns instead of the index. This format is consistent with `groupby.agg()` when applying multiple functions at once. (GH4792)

Previous behavior:

```
In [1]: df = pd.DataFrame({'A': [1, 1, 2, 2], 'B': [1, 2, 3, 4]})

In [2]: df.groupby('A').describe()
Out[2]:

<table>
<thead>
<tr>
<th>A</th>
<th>count</th>
<th>mean</th>
<th>std</th>
<th>min</th>
<th>25%</th>
<th>50%</th>
<th>75%</th>
<th>max</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>2.000000</td>
<td>1.500000</td>
<td>0.707107</td>
<td>1.000000</td>
<td>1.250000</td>
<td>1.500000</td>
<td>1.750000</td>
<td>2.000000</td>
</tr>
<tr>
<td>2</td>
<td>2.000000</td>
<td>3.500000</td>
<td>0.707107</td>
<td>3.000000</td>
<td>3.250000</td>
<td>3.500000</td>
<td>3.750000</td>
<td>4.000000</td>
</tr>
</tbody>
</table>
```

```
In [3]: df.groupby('A').agg([np.mean, np.std, np.min, np.max])
Out[3]:

<table>
<thead>
<tr>
<th>A</th>
<th>mean</th>
<th>std</th>
<th>amin</th>
<th>amax</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1.500000</td>
<td>0.707107</td>
<td>1</td>
<td>2</td>
</tr>
</tbody>
</table>
```
New behavior:

In [90]: df = pd.DataFrame({'A': [1, 1, 2, 2], 'B': [1, 2, 3, 4]})

In [91]: df.groupby('A').describe()
Out[91]:
   B
--+
   count  mean std  min  25%  50%  75%  max
A
  1  2.0  1.5  0.707107  1.0  1.25  1.5  1.75  2.0
  2  2.0  3.5  0.707107  3.0  3.25  3.5  3.75  4.0
[2 rows x 8 columns]

In [92]: df.groupby('A').agg([np.mean, np.std, np.min, np.max])
Out[92]:
   B
--+
    mean std  amin amax
A
  1  1.5  0.707107  1  2
  2  3.5  0.707107  3  4
[2 rows x 4 columns]

Window binary corr/cov operations return a MultiIndex DataFrame

A binary window operation, like .corr() or .cov(), when operating on a .rolling(..), .expanding(..), or .ewm(..) object, will now return a 2-level MultiIndex DataFrame rather than a Panel, as Panel is now deprecated, see here. These are equivalent in function, but a MultiIndexed DataFrame enjoys more support in pandas. See the section on Windowed Binary Operations for more information. (GH15677)

In [93]: np.random.seed(1234)

In [94]: df = pd.DataFrame(np.random.rand(100, 2),
....:                   columns=pd.Index(['A', 'B'], name='bar'),
....:                   index=pd.date_range('20160101',
....:                               periods=100, freq='D', name='foo'))

In [95]: df.tail()
Out[95]:
   bar    A    B
foo
2016-04-05  0.640880  0.126205
2016-04-06  0.171465  0.737086
2016-04-07  0.127029  0.369650
2016-04-08  0.604334  0.103104
2016-04-09  0.802374  0.945553
Previous behavior:

```python
In [2]: df.rolling(12).corr()
Out[2]:
<class 'pandas.core.panel.Panel'>
Dimensions: 100 (items) x 2 (major_axis) x 2 (minor_axis)
Items axis: 2016-01-01 00:00:00 to 2016-04-09 00:00:00
Major_axis axis: A to B
Minor_axis axis: A to B
```

New behavior:

```python
In [96]: res = df.rolling(12).corr()
In [97]: res.tail()
Out[97]:
bar      A   B
foo      bar
2016-04-07 B   -0.132090 1.000000
2016-04-08 A   1.000000 -0.145775
    B   -0.145775 1.000000
2016-04-09 A   1.000000  0.119645
    B   0.119645  1.000000

[5 rows x 2 columns]
```

Retrieving a correlation matrix for a cross-section

```python
In [98]: df.rolling(12).corr().loc['2016-04-07']
Out[98]:
bar      A   B
foo      bar
2016-04-07 A   1.000000 -0.13209
    B   -0.13209  1.000000

[2 rows x 2 columns]
```

**HDFStore where string comparison**

In previous versions most types could be compared to string column in a HDFStore usually resulting in an invalid comparison, returning an empty result frame. These comparisons will now raise a TypeError (GH15492)

```python
In [99]: df = pd.DataFrame({'unparsed_date': ['2014-01-01', '2014-01-01']})
In [100]: df.to_hdf('store.h5', 'key', format='table', data_columns=True)
In [101]: df.dtypes
Out[101]:
unparsed_date    object
Length: 1, dtype: object
```
Previous behavior:

```
In [4]: pd.read_hdf('store.h5', 'key', where='unparsed_date > ts')
File "<string>", line 1
(unparsed_date > 1970-01-01 00:00:01.388552400)
^     
SyntaxError: invalid token
```

New behavior:

```
In [18]: ts = pd.Timestamp('2014-01-01')
In [19]: pd.read_hdf('store.h5', 'key', where='unparsed_date > ts')
```

```
TypeError: Cannot compare 2014-01-01 00:00:00 of type <class 'pandas.tslib.Timestamp'> to string column
```

**Index.intersection and inner join now preserve the order of the left Index**

`Index.intersection()` now preserves the order of the calling Index (left) instead of the other Index (right) (GH15582). This affects inner joins, `DataFrame.join()` and `merge()`, and the `.align` method.

- **Index.intersection**

  ```
  In [102]: left = pd.Index([2, 1, 0])
  In [103]: left
  Out[103]: Int64Index([2, 1, 0], dtype='int64')
  In [104]: right = pd.Index([1, 2, 3])
  In [105]: right
  Out[105]: Int64Index([1, 2, 3], dtype='int64')
  ```

  Previous behavior:

  ```
  In [4]: left.intersection(right)
  Out[4]: Int64Index([1, 2], dtype='int64')
  ```

  New behavior:

  ```
  In [106]: left.intersection(right)
  Out[106]: Int64Index([2, 1], dtype='int64')
  ```

- **DataFrame.join and pd.merge**

  ```
  In [107]: left = pd.DataFrame({'a': [20, 10, 0]}, index=[2, 1, 0])
  In [108]: left
  Out[108]:
    a
   2  20
   1  10
   0   0
  ```

  (continues on next page)
[3 rows x 1 columns]

In [109]: right = pd.DataFrame({'b': [100, 200, 300], index=[1, 2, 3])

In [110]: right
Out[110]:
   b
1 100
2 200
3 300
[3 rows x 1 columns]

Previous behavior:

In [4]: left.join(right, how='inner')
Out[4]:
   a   b
1 10 100
2 20 200

New behavior:

In [111]: left.join(right, how='inner')
Out[111]:
   a   b
1 10 100
2 20 200

Pivot table always returns a DataFrame

The documentation for pivot_table() states that a DataFrame is always returned. Here a bug is fixed that allowed this to return a Series under certain circumstance. (GH4386)

In [112]: df = pd.DataFrame({'col1': [3, 4, 5], 'col2': ['C', 'D', 'E'], 'col3': [1, 3, 9]})

In [113]: df
Out[113]:
   col1 col2 col3
0   3     C   1
1   4     D   3
2   5     E   9
[3 rows x 3 columns]

Previous behavior:
In [2]: df.pivot_table('col1', index=['col3', 'col2'], aggfunc=np.sum)
Out[2]:
      col2  col3
   1     C     3
   3     D     4
   9     E     5
Name: col1, dtype: int64

New behavior:

In [114]: df.pivot_table('col1', index=['col3', 'col2'], aggfunc=np.sum)
Out[114]:
   col1
  col3  col2
  1    C     3
  3    D     4
  9    E     5

[3 rows x 1 columns]

Other API changes

- numexpr version is now required to be >= 2.4.6 and it will not be used at all if this requisite is not fulfilled (GH15213).
- CParserError has been renamed to ParserError in pd.read_csv() and will be removed in the future (GH12665)
- SparseArray.cumsum() and SparseSeries.cumsum() will now always return SparseArray and SparseSeries respectively (GH12855)
- DataFrame.applymap() with an empty DataFrame will return a copy of the empty DataFrame instead of a Series (GH8222)
- Series.map() now respects default values of dictionary subclasses with a __missing__ method, such as collections.Counter (GH15999)
- .loc has compat with .ix for accepting iterators, and NamedTuples (GH15120)
- interpolate() and fillna() will raise a ValueError if the limit keyword argument is not greater than 0. (GH9217)
- pd.read_csv() will now issue a ParserWarning whenever there are conflicting values provided by the dialect parameter and the user (GH14898)
- pd.read_csv() will now raise a ValueError for the C engine if the quote character is larger than one byte (GH11592)
- inplace arguments now require a boolean value, else a ValueError is thrown (GH14189)
- pandas.api.types.is_datetime64_ns_dtype will now report True on a tz-aware dtype, similar to pandas.api.types.is_datetime64_any_dtype
- DataFrame.asof() will return a null filled Series instead the scalar NaN if a match is not found (GH15118)
- Specific support for copy.copy() and copy.deepcopy() functions on NDFrame objects (GH15444)
- Series.sort_values() accepts a one element list of bool for consistency with the behavior of DataFrame.sort_values() (GH15604)
• `.merge()` and `.join()` on category dtype columns will now preserve the category dtype when possible (GH10409)
• SparseDataFrame.default_fill_value will be 0, previously was nan in the return from pd.get_dummies(..., sparse=True) (GH15594)
• The default behaviour of Series.str.match has changed from extracting groups to matching the pattern. The extracting behaviour was deprecated since pandas version 0.13.0 and can be done with the Series.str.extract method (GH5224). As a consequence, the as_indexer keyword is ignored (no longer needed to specify the new behaviour) and is deprecated.
• NaT will now correctly report False for datetimelike boolean operations such as is_month_start (GH15781)
• NaT will now correctly return np.nan for Timedelta and Period accessors such as days and quarter (GH15782)
• NaT will now returns NaT for tz_localize and tz_convert methods (GH15830)
• DataFrame and Panel constructors with invalid input will now raise ValueError rather than PandasError, if called with scalar inputs and not axes (GH15541)
• DataFrame and Panel constructors with invalid input will now raise ValueError rather than pandas.core.common.PandasError, if called with scalar inputs and not axes; The exception PandasError is removed as well. (GH15541)
• The exception pandas.core.common.AmbiguousIndexError is removed as it is not referenced (GH15541)

Reorganization of the library: privacy changes

Modules privacy has changed

Some formerly public python/c/c++/cython extension modules have been moved and/or renamed. These are all removed from the public API. Furthermore, the pandas.core, pandas.compat, and pandas.util top-level modules are now considered to be PRIVATE. If indicated, a deprecation warning will be issued if you reference these modules. (GH12588)
### pandas.errors

We are adding a standard public module for all pandas exceptions & warnings pandas.errors. (GH14800). Previously these exceptions & warnings could be imported from pandas.core.common or pandas.io.common. These exceptions and warnings will be removed from the *.common locations in a future release. (GH15541)

The following are now part of this API:

```python
['DtypeWarning', 'EmptyDataError',
```

(continues on next page)
pandas: powerful Python data analysis toolkit, Release 1.3.5

`'OutOfBoundsDatetime',
'ParserError',
'ParserWarning',
'PerformanceWarning',
'UnsortedIndexError',
'UnsupportedFunctionCall']

pandas.testing

We are adding a standard module that exposes the public testing functions in pandas.testing (GH9895). Those functions can be used when writing tests for functionality using pandas objects.

The following testing functions are now part of this API:

- testing.assert_frame_equal()
- testing.assert_series_equal()
- testing.assert_index_equal()

pandas.plotting

A new public pandas.plotting module has been added that holds plotting functionality that was previously in either pandas.tools.plotting or in the top-level namespace. See the deprecations sections for more details.

Other development changes

- Building pandas for development now requires cython >= 0.23 (GH14831)
- Require at least 0.23 version of cython to avoid problems with character encodings (GH14699)
- Switched the test framework to use pytest (GH13097)
- Reorganization of tests directory layout (GH14854, GH15707).

Deprecations

Deprecate .ix

The .ix indexer is deprecated, in favor of the more strict .iloc and .loc indexers. .ix offers a lot of magic on the inference of what the user wants to do. More specifically, .ix can decide to index **positionally OR via labels**, depending on the data type of the index. This has caused a bit of user confusion over the years. The full indexing documentation is here. (GH14218)

The recommended methods of indexing are:

- .loc if you want to *label* index
- .iloc if you want to *positionally* index.

Using .ix will now show a DeprecationWarning with a link to some examples of how to convert code here.
In [115]: df = pd.DataFrame({'A': [1, 2, 3],
                      'B': [4, 5, 6],
                      index=list('abc'))

In [116]: df
Out[116]:
   A  B
a  1  4
b  2  5
c  3  6

Previous behavior, where you wish to get the 0th and the 2nd elements from the index in the ‘A’ column.

In [3]: df.ix[[0, 2], 'A']
Out[3]:
   A
a  1
b  3

Using .loc. Here we will select the appropriate indexes from the index, then use label indexing.

In [117]: df.loc[df.index[[0, 2]], 'A']
Out[117]:
   A
a  1
b  3

Using .iloc. Here we will get the location of the ‘A’ column, then use positional indexing to select things.

In [118]: df.iloc[[0, 2], df.columns.get_loc('A')]
Out[118]:
   A
a  1
b  3

Deprecate Panel

Panel is deprecated and will be removed in a future version. The recommended way to represent 3-D data are with a MultiIndex on a DataFrame via the to_frame() or with the xarray package. pandas provides a to_xarray() method to automate this conversion (GH13563).

In [133]: import pandas._testing as tm
In [134]: p = tm.makePanel()
In [135]: p
Out[135]:
<class 'pandas.core.panel.Panel'>
Dimensions: 3 (items) x 3 (major_axis) x 4 (minor_axis)

(continues on next page)
Convert to a MultiIndex DataFrame

In [136]: p.to_frame()
Out[136]:

<table>
<thead>

</table>

[12 rows x 3 columns]

Convert to an xarray DataArray

In [137]: p.to_xarray()
Out[137]:

<xarray.DataArray (items: 3, major_axis: 3, minor_axis: 4)>
array([[[ 0.628776,  0.988138, -0.938153, -0.223019],
        [ 0.186494, -0.072608, -1.239072,  2.123692],
        [ 0.952478, -0.550603,  0.139683,  0.122273]],
       [[-1.409432, -1.347533,  1.272395, -0.591863],
        [ 1.422986,  0.363565, -1.449567, -0.414505],
        [-2.147855, -0.014752, -1.195524, -1.425795]],
       [[ 0.293935, -0.896581, -0.161137, -1.051539],
        [-0.592886,  1.104352,  0.889157, -0.319561],
        [-1.473116, -0.431550,  0.288377, -0.619993]]])

Coordinates:
* items (items) object 'ItemA' 'ItemB' 'ItemC'
* major_axis (major_axis) datetime64[ns] 2000-01-03 2000-01-04 2000-01-05
* minor_axis (minor_axis) object 'A' 'B' 'C' 'D'
Deprecate groupby.agg() with a dictionary when renaming

The .groupby(..).agg(..).rolling(..).agg(..) and .resample(..).agg(..) syntax can accept a variable of inputs, including scalars, list, and a dict of column names to scalars or lists. This provides a useful syntax for constructing multiple (potentially different) aggregations.

However, .agg(..) can also accept a dict that allows ‘renaming’ of the result columns. This is a complicated and confusing syntax, as well as not consistent between Series and DataFrame. We are deprecating this ‘renaming’ functionality.

• We are deprecating passing a dict to a grouped/rolled/resampled Series. This allowed one to rename the resulting aggregation, but this had a completely different meaning than passing a dictionary to a grouped DataFrame, which accepts column-to-aggregations.

• We are deprecating passing a dict-of-dicts to a grouped/rolled/resampled DataFrame in a similar manner.

This is an illustrative example:

```
In [119]: df = pd.DataFrame({'A': [1, 1, 1, 2, 2],
                        'B': range(5),
                        'C': range(5)})

In [120]: df
Out[120]:
      A  B  C
0    1  0  0
1    1  1  1
2    2  2  2
3    3  3  3
4    4  4  4
[5 rows x 3 columns]
```

Here is a typical useful syntax for computing different aggregations for different columns. This is a natural, and useful syntax. We aggregate from the dict-to-list by taking the specified columns and applying the list of functions. This returns a MultiIndex for the columns (this is not deprecated).

```
In [121]: df.groupby('A').agg({'B': 'sum', 'C': 'min'})
Out[121]:
      B  C
A
1    3  0
2    7  3
[2 rows x 2 columns]
```

Here’s an example of the first deprecation, passing a dict to a grouped Series. This is a combination aggregation & renaming:

```
In [6]: df.groupby('A').B.agg({'foo': 'count'})
FutureWarning: using a dict on a Series for aggregation is deprecated and will be removed in a future version

Out[6]:
```

(continues on next page)
You can accomplish the same operation, more idiomatically by:

```python
In [122]: df.groupby('A').B.agg(['count']).rename(columns={'count': 'foo'})
Out[122]:
foo
A   
1   3
2   2
[2 rows x 1 columns]
```

Here's an example of the second deprecation, passing a dict-of-dict to a grouped DataFrame:

```python
In [23]: (df.groupby('A')
    ...:   .agg({'B': {'foo': 'sum', 'C': 'min'}})
    ...:   .rename(columns={'B': 'foo', 'C': 'bar'}))
```

```
FutureWarning: using a dict with renaming is deprecated and will be removed in a future version
```

```python
Out[23]:
   foo   bar
A
1  3   0
2  7   3
```

You can accomplish nearly the same by:

```python
In [123]: (df.groupby('A')
    ....:   .agg({'B': 'sum', 'C': 'min'})
    ....:   .rename(columns={'B': 'foo', 'C': 'bar'})
    ....:   )
```

```python
Out[123]:
   foo   bar
A
1  3   0
2  7   3
```

[2 rows x 2 columns]
Deprecate .plotting

The pandas.tools.plotting module has been deprecated, in favor of the top level pandas.plotting module. All the public plotting functions are now available from pandas.plotting (GH12548).

Furthermore, the top-level pandas.scatter_matrix and pandas.plot_params are deprecated. Users can import these from pandas.plotting as well.

Previous script:

```python
pd.tools.plotting.scatter_matrix(df)
pd.scatter_matrix(df)
```

Should be changed to:

```python
pd.plotting.scatter_matrix(df)
```

Other deprecations

- `SparseArray.to_dense()` has deprecated the fill parameter, as that parameter was not being respected (GH14647)
- `SparseSeries.to_dense()` has deprecated the sparse_only parameter (GH14647)
- `Series.repeat()` has deprecated the reps parameter in favor of repeats (GH12662)
- The Series constructor and .astype method have deprecated accepting timestamp dtypes without a frequency (e.g. np.datetime64) for the dtype parameter (GH15524)
- `Index.repeat()` and MultiIndex.repeat() have deprecated the n parameter in favor of repeats (GH12662)
- `Categorical.searchsorted()` and Series.searchsorted() have deprecated the v parameter in favor of value (GH12662)
- `TimedeltaIndex.searchsorted()`, `DatetimeIndex.searchsorted()`, and `PeriodIndex.searchsorted()` have deprecated the key parameter in favor of value (GH12662)
- `DataFrame.astype()` has deprecated the raise_on_error parameter in favor of errors (GH14878)
- `Series.sortlevel` and DataFrame.sortlevel have been deprecated in favor of Series.sort_index and DataFrame.sort_index (GH15099)
- importing concat from pandas.tools.merge has been deprecated in favor of imports from the pandas namespace. This should only affect explicit imports (GH15358)
- `Series/DataFrame/Panel.consolidate()` has been deprecated as a public method. (GH15483)
- The as_indexer keyword of Series.str.match() has been deprecated (ignored keyword) (GH15257).
- The following top-level pandas functions have been deprecated and will be removed in a future version (GH13790, GH15940)
  - `pd.pnow()`, replaced by `Period.now()`
  - `pd.Term`, is removed, as it is not applicable to user code. Instead use in-line string expressions in the where clause when searching in HDFStore
  - `pd.Expr`, is removed, as it is not applicable to user code.
  - `pd.match()`, is removed.
pandas: powerful Python data analysis toolkit, Release 1.3.5

- pd.groupby(), replaced by using the .groupby() method directly on a Series/DataFrame
- pd.get_store(), replaced by a direct call to pd.HDFStore(...)

• is_any_int_dtype, is_floating_dtype, and is_sequence are deprecated from pandas.api.types (GH16042)

Removal of prior version deprecations/changes

• The pandas.rpy module is removed. Similar functionality can be accessed through the rpy2 project. See the R interfacing docs for more details.

• The pandas.io.ga module with a google-analytics interface is removed (GH11308). Similar functionality can be found in the Google2Pandas package.

• pd.to_datetime and pd.to_timedelta have dropped the coerce parameter in favor of errors (GH13602)

• pandas.stats.fama_macbeth, pandas.stats.ols, pandas.stats.plm and pandas.stats.var, as well as the top-level pandas.fama_macbeth and pandas.ols routines are removed. Similar functionality can be found in the statsmodels package. (GH11898)

• The TimeSeries and SparseTimeSeries classes, aliases of Series and SparseSeries, are removed (GH10890, GH15098).

• Series.is_time_series is dropped in favor of Series.index.is_all_dates (GH15098)

• The deprecated irow, icol, iget and iget_value methods are removed in favor of iloc and iat as explained here (GH10711).

• The deprecated DataFrame.iterkv() has been removed in favor of DataFrame.iteritems() (GH10711)

• The Categorical constructor has dropped the name parameter (GH10632)

• Categorical has dropped support for NaN categories (GH10748)

• The take_last parameter has been dropped from duplicated(), drop_duplicates(), nlargest(), and nsmallest() methods (GH10236, GH10792, GH10920)

• Series, Index, and DataFrame have dropped the sort and order methods (GH10726)

• Where clauses in pytables are only accepted as strings and expressions types and not other data-types (GH12027)

• DataFrame has dropped the combineAdd and combineMult methods in favor of add and mul respectively (GH10735)

Performance improvements

• Improved performance of pd.wide_to_long() (GH14779)

• Improved performance of pd.factorize() by releasing the GIL with object dtype when inferred as strings (GH14859, GH16057)

• Improved performance of timeseries plotting with an irregular DatetimeIndex (or with compat_x=True) (GH15073).

• Improved performance of groupby().cummin() and groupby().cummax() (GH15048, GH15109, GH15561, GH15635)

• Improved performance and reduced memory when indexing with a MultiIndex (GH15245)

• When reading buffer object in read_sas() method without specified format, filepath string is inferred rather than buffer object. (GH14947)
• Improved performance of `.rank()` for categorical data (GH15498)
• Improved performance when using `.unstack()` (GH15503)
• Improved performance of merge/join on category columns (GH10409)
• Improved performance of `drop_duplicates()` on bool columns (GH12963)
• Improve performance of `pd.core.groupby.GroupBy.apply` when the applied function used the `.name` attribute of the group DataFrame (GH15062).
• Improved performance of `iloc` indexing with a list or array (GH15504).
• Improved performance of `Series.sort_index()` with a monotonic index (GH15694)
• Improved performance in `pd.read_csv()` on some platforms with buffered reads (GH16039)

**Bug fixes**

**Conversion**

• Bug in `Timestamp.replace` now raises `TypeError` when incorrect argument names are given; previously this raised `ValueError` (GH15240)
• Bug in `Timestamp.replace` with compat for passing long integers (GH15030)
• Bug in `Timestamp` returning UTC based time/date attributes when a timezone was provided (GH13303, GH6538)
• Bug in `Timestamp` incorrectly localizing timezones during construction (GH11481, GH15777)
• Bug in `TimedeltaIndex` addition where overflow was being allowed without error (GH14816)
• Bug in `TimedeltaIndex` raising a `ValueError` when boolean indexing with `loc` (GH14946)
• Bug in catching an overflow in `Timestamp` + `Timedelta/Offset` operations (GH15126)
• Bug in `DatetimeIndex.round()` and `Timestamp.round()` floating point accuracy when rounding by milliseconds or less (GH14440, GH15578)
• Bug in `astype()` where inf values were incorrectly converted to integers. Now raises error now with `astype()` for `Series` and `DataFrames` (GH14265)
• Bug in `DataFrame(...)`.apply(to_numeric) when values are of type decimal.Decimal. (GH14827)
• Bug in `describe()` when passing a numpy array which does not contain the median to the `percentiles` keyword argument (GH14908)
• Cleaned up `PeriodIndex` constructor, including raising on floats more consistently (GH13277)
• Bug in using `__deepcopy__` on empty `NDFrame` objects (GH15370)
• Bug in `.replace()` may result in incorrect dtypes. (GH12747, GH15765)
• Bug in `Series.replace` and `DataFrame.replace` which failed on empty replacement dicts (GH15289)
• Bug in `Series.replace` which replaced a numeric by string (GH15743)
• Bug in `Index` construction with NaN elements and integer dtype specified (GH15187)
• Bug in `Series` construction with a datetimetz (GH14928)
• Bug in `Series.dt.round()` inconsistent behaviour on NaT 's with different arguments (GH14940)
• Bug in `Series` constructor when both copy=True and dtype arguments are provided (GH15125)
• Incorrect dtyped Series was returned by comparison methods (e.g., lt, gt, ...) against a constant for an empty DataFrame (GH15077)
• Bug in Series.ffill() with mixed dtypes containing tz-aware datetimes. (GH14956)
• Bug in DataFrame.fillna() where the argument downcast was ignored when fillna value was of type dict (GH15277)
• Bug in .asfreq(), where frequency was not set for empty Series (GH14320)
• Bug in DataFrame construction with nulls and datetimes in a list-like (GH15869)
• Bug in DataFrame.fillna() with tz-aware datetimes (GH15855)
• Bug in is_string_dtype, is_timedelta64_ns_dtype, and is_string_like_dtype in which an error was raised when None was passed in (GH15941)
• Bug in the return type of pd.unique on a Categorical, which was returning an ndarray and not a Categorical (GH15903)
• Bug in Index.to_series() where the index was not copied (and so mutating later would change the original), (GH15949)
• Bug in indexing with partial string indexing with a len-1 DataFrame (GH16071)
• Bug in Series construction where passing invalid dtype didn’t raise an error. (GH15520)

Indexing

• Bug in Index power operations with reversed operands (GH14973)
• Bug in DataFrame.sort_values() when sorting by multiple columns where one column is of type int64 and contains NaT (GH14922)
• Bug in DataFrame.reindex() in which method was ignored when passing columns (GH14992)
• Bug in DataFrame.loc with indexing a MultiIndex with a Series indexer (GH14730, GH15424)
• Bug in DataFrame.loc with indexing a MultiIndex with a numpy array (GH15434)
• Bug in Series.asof which raised if the series contained all np.nan (GH15713)
• Bug in .at when selecting from a tz-aware column (GH15822)
• Bug in Series.where() and DataFrame.where() where array-like conditionals were being rejected (GH15414)
• Bug in Series.where() where TZ-aware data was converted to float representation (GH15701)
• Bug in .loc that would not return the correct dtype for scalar access for a DataFrame (GH11617)
• Bug in output formatting of a MultiIndex when names are integers (GH12223, GH15262)
• Bug in Categorical.searchsorted() where alphabetical instead of the provided categorical order was used (GH14522)
• Bug in Series.iloc where a Categorical object for list-like indexes input was returned, where a Series was expected. (GH14580)
• Bug in DataFrame.isin comparing datetimelike to empty frame (GH15473)
• Bug in .reset_index() when an all NaN level of a MultiIndex would fail (GH6322)
• Bug in .reset_index() when raising error for index name already present in MultiIndex columns (GH16120)
• Bug in creating a MultiIndex with tuples and not passing a list of names; this will now raise ValueError (GH15110)

• Bug in the HTML display with a MultiIndex and truncation (GH14882)

• Bug in the display of .info() where a qualifier (+) would always be displayed with a MultiIndex that contains only non-strings (GH15245)

• Bug in pd.concat() where the names of MultiIndex of resulting DataFrame are not handled correctly when None is presented in the names of MultiIndex of input DataFrame (GH15787)

• Bug in DataFrame.sort_index() and Series.sort_index() where na_position doesn’t work with a MultiIndex (GH14784, GH16604)

• Bug in pd.concat() when combining objects with a CategoricalIndex (GH16111)

• Bug in indexing with a scalar and a CategoricalIndex (GH16123)

IO

• Bug in pd.to_numeric() in which float and unsigned integer elements were being improperly casted (GH14941, GH15005)

• Bug in pd.read_fwf() where the skiprows parameter was not being respected during column width inference (GH11256)

• Bug in pd.read_csv() in which the dialect parameter was not being verified before processing (GH14898)

• Bug in pd.read_csv() in which missing data was being improperly handled with usecols (GH6710)

• Bug in pd.read_csv() in which a file containing a row with many columns followed by rows with fewer columns would cause a crash (GH14125)

• Bug in pd.read_csv() for the C engine where usecols were being indexed incorrectly with parse_dates (GH14792)

• Bug in pd.read_csv() with parse_dates when multi-line headers are specified (GH15376)

• Bug in pd.read_csv() with float_precision='round_trip' which caused a segfault when a text entry is parsed (GH15140)

• Bug in pd.read_csv() when an index was specified and no values were specified as null values (GH15835)

• Bug in pd.read_csv() in which certain invalid file objects caused the Python interpreter to crash (GH15337)

• Bug in pd.read_csv() in which invalid values for nrows and chunksize were allowed (GH15767)

• Bug in pd.read_csv() for the Python engine in which unhelpful error messages were being raised when parsing errors occurred (GH15910)

• Bug in pd.read_csv() in which the skipfooter parameter was not being properly validated (GH15925)

• Bug in pd.to_csv() in which there was numeric overflow when a timestamp index was being written (GH15982)

• Bug in pd.util.hashing.hash_pandas_object() in which hashing of categoricals depended on the ordering of categories, instead of just their values. (GH15143)

• Bug in .to_json() where lines=True and contents (keys or values) contain escaped characters (GH15096)

• Bug in .to_json() causing single byte ascii characters to be expanded to four byte unicode (GH15344)

• Bug in .to_json() for the C engine where rollover was not correctly handled for case where frac is odd and diff is exactly 0.5 (GH15716, GH15864)
• Bug in `pd.read_json()` for Python 2 where `lines=True` and contents contain non-ascii unicode characters (GH15132)
• Bug in `pd.read_msgpack()` in which `Series` categoricals were being improperly processed (GH14901)
• Bug in `pd.read_msgpack()` which did not allow loading of a dataframe with an index of type `CategoricalIndex` (GH15487)
• Bug in `pd.read_msgpack()` when deserializing a `CategoricalIndex` (GH15487)
• Bug in `DataFrame.to_records()` with converting a `DatetimeIndex` with a timezone (GH13937)
• Bug in `DataFrame.to_records()` which failed with unicode characters in column names (GH11879)
• Bug in `.to_sql()` when writing a DataFrame with numeric index names (GH15404).
• Bug in `DataFrame.to_html()` with `index=False` and `max_rows` raising in `IndexError` (GH14998)
• Bug in `pd.read_hdf()` passing a `Timestamp` to the `where` parameter with a non date column (GH15492)
• Bug in `DataFrame.to_stata()` and `StataWriter` which produces incorrectly formatted files to be produced for some locales (GH13856)
• Bug in `StataReader` and `StataWriter` which allows invalid encodings (GH15723)
• Bug in the Series repr not showing the length when the output was truncated (GH15962).

Plotting

• Bug in `DataFrame.hist` where `plt.tight_layout` caused an `AttributeError` (use `matplotlib >= 2.0.1`) (GH9351)
• Bug in `DataFrame.boxplot` where `fontsize` was not applied to the tick labels on both axes (GH15108)
• Bug in the date and time converters pandas registers with `matplotlib` not handling multiple dimensions (GH16026)
• Bug in `pd.scatter_matrix()` could accept either `color` or `c`, but not both (GH14855)

GroupBy/resample/rolling

• Bug in `.groupby(...).resample()` when passed the `on` kwarg. (GH15021)
• Properly set `__name__` and `__qualname__` for `Groupby.*` functions (GH14620)
• Bug in `GroupBy.get_group()` failing with a categorical grouper (GH15155)
• Bug in `.groupby(...).rolling(...)` when `on` is specified and using a `DatetimeIndex` (GH15130, GH13966)
• Bug in groupby operations with `timedelta64` when passing `numeric_only=False` (GH5724)
• Bug in groupby.apply() coercing object dtypes to numeric types, when not all values were numeric (GH14423, GH15421, GH15670)
• Bug in `resample`, where a non-string `offset` argument would not be applied when resampling a timeseries (GH13218)
• Bug in `DataFrame.groupby().describe()` when grouping on `Index` containing tuples (GH14848)
• Bug in `groupby().nunique()` with a datetimelike-grouper where bins counts were incorrect (GH13453)
• Bug in `groupby.transform()` that would coerce the resultant dtypes back to the original (GH10972, GH11444)
• Bug in `groupby.agg()` incorrectly localizing timezone on `datetime` (GH15426, GH10668, GH13046)
• Bug in `.rolling/expanding()` functions where `count()` was not counting `np.inf`, nor handling `object` dtypes (GH12541)
• Bug in rolling() where `pd.Timedelta` or `datetime.timedelta` was not accepted as a window argument (GH15440)
• Bug in `Rolling.quantile` function that caused a segmentation fault when called with a quantile value outside of the range [0, 1] (GH15463)
• Bug in DataFrame.resample().median() if duplicate column names are present (GH14233)

**Sparse**

• Bug in SparseSeries.reindex on single level with list of length 1 (GH15447)
• Bug in repr-formatting a SparseDataFrame after a value was set on (a copy of) one of its series (GH15488)
• Bug in SparseDataFrame construction with lists not coercing to dtype (GH15682)
• Bug in sparse array indexing in which indices were not being validated (GH15863)

**Reshaping**

• Bug in `pd.merge_asof()` where `left_index` or `right_index` caused a failure when multiple by was specified (GH15676)
• Bug in `pd.merge_asof()` where `left_index/right_index` together caused a failure when `tolerance` was specified (GH15135)
• Bug in DataFrame.pivot_table() where dropna=True would not drop all-NaN columns when the columns was a category dtype (GH15193)
• Bug in `pd.melt()` where passing a tuple value for `value_vars` caused a TypeError (GH15348)
• Bug in `pd.pivot_table()` where no error was raised when values argument was not in the columns (GH14938)
• Bug in `pd.concat()` in which concatenating with an empty dataframe with join='inner' was being improperly handled (GH15328)
• Bug with sort=True in DataFrame.join and `pd.merge` when joining on indexes (GH15582)
• Bug in DataFrame.nsmallest and DataFrame.nlargest where identical values resulted in duplicated rows (GH15297)
• Bug in `pandas.pivot_table()` incorrectly raising UnicodeError when passing unicode input for margins keyword (GH13292)
numeric

- bug in `.rank()` which incorrectly ranks ordered categories (GH15420)
- bug in `.corr()` and `.cov()` where the column and index were the same object (GH14617)
- bug in `.mode()` where `mode` was not returned if was only a single value (GH15714)
- bug in `pd.cut()` with a single bin on an all 0s array (GH15428)
- bug in `pd.qcut()` with a single quantile and an array with identical values (GH15431)
- bug in `pandas.tools.utils.cartesian_product()` with large input can cause overflow on windows (GH15265)
- bug in `.eval()` which caused multi-line evals to fail with local variables not on the first line (GH15342)

other

- compat with SciPy 0.19.0 for testing on `.interpolate()` (GH15662)
- compat for 32-bit platforms for `.qcut/cut`; bins will now be `int64` dtype (GH14866)
- bug in interactions with Qt when a `QtApplication` already exists (GH14372)
- avoid use of `np.finfo()` during import pandas removed to mitigate deadlock on Python GIL misuse (GH14641)

5.11 Version 0.19

5.11.1 Version 0.19.2 (December 24, 2016)

This is a minor bug-fix release in the 0.19.x series and includes some small regression fixes, bug fixes and performance improvements. We recommend that all users upgrade to this version.

Highlights include:

- Compatibility with Python 3.6
- Added a Pandas Cheat Sheet. (GH13202).

What’s new in v0.19.2

- Enhancements
- Performance improvements
- Bug fixes
- Contributors

Enhancements

The `pd.merge_asof()` added in 0.19.0, gained some improvements:

- `pd.merge_asof()` gained `left_index/right_index` and `left_by/right_by` arguments (GH14253)
- `pd.merge_asof()` can take multiple columns in by parameter and has specialized dtypes for better performance (GH13936)
Performance improvements

- Performance regression with PeriodIndex (GH14822)
- Performance regression in indexing with `getitem` (GH14930)
- Improved performance of `.replace()` (GH12745)
- Improved performance Series creation with a datetime index and dictionary data (GH14894)

Bug fixes

- Compat with python 3.6 for pickling of some offsets (GH14685)
- Compat with python 3.6 for some indexing exception types (GH14684, GH14689)
- Compat with python 3.6 for deprecation warnings in the test suite (GH14681)
- Compat with python 3.6 for Timestamp pickles (GH14689)
- Compat with `dateutil==2.6.0`; segfault reported in the testing suite (GH14621)
- Allow nanoseconds in `timestamp.replace` as a kwarg (GH14621)
- Bug in `pd.read_csv` in which aliasing was being done for `na_values` when passed in as a dictionary (GH14203)
- Bug in `pd.read_csv` in which column indices for a dict-like `na_values` were not being respected (GH14203)
- Bug in `pd.read_csv` where reading files fails, if the number of headers is equal to the number of lines in the file (GH14515)
- Bug in `pd.read_csv` for the Python engine in which an unhelpful error message was being raised when multi-char delimiters were not being respected with quotes (GH14582)
- Fix bugs (GH14734, GH13654) in `pd.read_sas` and `pandas.io.sas.sas7bdat.SAS7BDATReader` that caused problems when reading a SAS file incrementally.
- Bug in `pd.read_csv` for the Python engine in which an unhelpful error message was being raised when `skipfooter` was not being respected by Python’s CSV library (GH13879)
- Bug in `.fillna()` in which timezone aware datetime64 values were incorrectly rounded (GH14872)
- Bug in `.groupby(..., sort=True)` of a non-lexsorted MultiIndex when grouping with multiple levels (GH14776)
- Bug in `pd.cut` with negative values and a single bin (GH14652)
- Bug in `pd.to_numeric` where a 0 was not unsigned on a `downcast='unsigned'` argument (GH14401)
- Bug in plotting regular and irregular timeseries using shared axes (sharex=True or ax.twinx()) (GH13341, GH14322).
- Bug in not propagating exceptions in parsing invalid datetimes, noted in python 3.6 (GH14561)
- Bug in resampling a DatetimeIndex in local TZ, covering a DST change, which would raise `AmbiguousTimeError` (GH14682)
- Bug in indexing that transformed `RecursionError` into `KeyError` or `IndexingError` (GH14554)
- Bug in HDFStore when writing a MultiIndex when using `data_columns=True` (GH14435)
- Bug in HDFStore.append() when writing a Series and passing a `min_itemsize` argument containing a value for the index (GH11412)
pandas: powerful Python data analysis toolkit, Release 1.3.5

- Bug when writing to a HDFStore in table format with a min_itemsize value for the index and without asking to append (GH10381)
- Bug in Series.groupby.nunique() raising an IndexError for an empty Series (GH12553)
- Bug in DataFrame.nlargest and DataFrame.nsmallest when the index had duplicate values (GH13412)
- Bug in clipboard functions on linux with python2 with unicode and separators (GH13747)
- Bug in clipboard functions on Windows 10 and python 3 (GH14362, GH12807)
- Bug in .to_clipboard() and Excel compat (GH12529)
- Bug in DataFrame.combine_first() for integer columns (GH14687).
- Bug in pd.read_csv() in which the dtype parameter was not being respected for empty data (GH14712)
- Bug in pd.read_csv() in which the nrows parameter was not being respected for large input when using the C engine for parsing (GH17626)
- Bug in pd.merge_asof() could not handle timezone-aware DatetimeIndex when a tolerance was specified (GH14844)
- Explicit check in to_stata and StataWriter for out-of-range values when writing doubles (GH14618)
- Bug in .plot(kind='kde') which did not drop missing values to generate the KDE Plot, instead generating an empty plot. (GH14821)
- Bug in unstack() if called with a list of column(s) as an argument, regardless of the dtypes of all columns, they get coerced to object (GH11847)

5.11.2 Version 0.19.1 (November 3, 2016)

This is a minor bug-fix release from 0.19.0 and includes some small regression fixes, bug fixes and performance improvements. We recommend that all users upgrade to this version.

What’s new in v0.19.1

- **Performance improvements**
- **Bug fixes**
- **Contributors**

**Performance improvements**

- Fixed performance regression in factorization of Period data (GH14338)
- Fixed performance regression in Series.asof(where) when where is a scalar (GH14461)
- Improved performance in DataFrame.asof(where) when where is a scalar (GH14461)
- Improved performance in .to_json() when lines=True (GH14408)
- Improved performance in certain types of loc indexing with a MultiIndex (GH14551).
Bug fixes

- Source installs from PyPI will now again work without cython installed, as in previous versions (GH14204)
- Compat with Cython 0.25 for building (GH14496)
- Fixed regression where user-provided file handles were closed in read_csv (c engine) (GH14418).
- Fixed regression in DataFrame.quantile when missing values where present in some columns (GH14357).
- Fixed regression in Index.difference where the freq of a DatetimeIndex was incorrectly set (GH14323)
- Added back pandas.core.common.array_equivalent with a deprecation warning (GH14555).
- Bug in pd.read_csv for the C engine in which quotation marks were improperly parsed in skipped rows (GH14459)
- Bug in pd.read_csv for Python 2.x in which Unicode quote characters were no longer being respected (GH14477)
- Fixed regression in Index.append when categorical indices were appended (GH14545).
- Fixed regression in pd.DataFrame where constructor fails when given dict with None value (GH14381)
- Fixed regression in DatetimeIndex._maybe_cast_slice_bound when index is empty (GH14354).
- Bug in localizing an ambiguous timezone when a boolean is passed (GH14402)
- Bug in TimedeltaIndex addition with a Datetime-like object where addition overflow in the negative direction was not being caught (GH14068, GH14453)
- Bug in string indexing against data with object Index may raise AttributeError (GH14424)
- Correctly raise ValueError on empty input to pd.eval() and df.query() (GH13139)
- Bug in RangeIndex.intersection when result is a empty set (GH14364).
- Bug in groupby-transform broadcasting that could cause incorrect dtype coercion (GH14457)
- Bug in Series.__setitem__ which allowed mutating read-only arrays (GH14359).
- Bug in DataFrame.insert where multiple calls with duplicate columns can fail (GH14291)
- pd.merge() will raise ValueError with non-boolean parameters in passed boolean type arguments (GH14434)
- Bug in Timestamp where dates very near the minimum (1677-09) could underflow on creation (GH14415)
- Bug in pd.concat where names of the keys were not propagated to the resulting MultiIndex (GH14252)
- Bug in pd.concat where axis cannot take string parameters 'rows' or 'columns' (GH14369)
- Bug in pd.concat with dataframes heterogeneous in length and tuple keys (GH14438)
- Bug in MultiIndex.set_levels where illegal level values were still set after raising an error (GH13754)
- Bug in DataFrame.to_json where lines=True and a value contained a } character (GH14391)
- Bug in df.groupby causing an AttributeError when grouping a single index frame by a column and the index level (GH14327)
- Bug in df.groupby where TypeError raised when pd.Grouper(key=...) is passed in a list (GH14334)
- Bug in pd.pivot_table may raise TypeError or ValueError when index or columns is not scalar and values is not specified (GH14380)

5.11.3 Version 0.19.0 (October 2, 2016)

This is a major release from 0.18.1 and includes number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

Highlights include:

- **merge_asof()** for asof-style time-series joining, see [here](https://pandas.pydata.org/pandas-docs/stable/generated/pandas.merge_asof.html)
- `.rolling()` is now time-series aware, see [here](https://pandas.pydata.org/pandas-docs/stable/generated/pandas.core.window.Rolling.html)
- **read_csv()** now supports parsing Categorical data, see [here](https://pandas.pydata.org/pandas-docs/stable/generated/pandas.read_csv.html)
- A function `union_categorical()` has been added for combining categoricals, see [here](https://pandas.pydata.org/pandas-docs/stable/reference/indexing.html#union-categoricals)
- **PeriodIndex** now has its own period dtype, and changed to be more consistent with other Index classes. See [here](https://pandas.pydata.org/pandas-docs/stable/user_guide/periods_and_dates.html#indexing)
- Sparse data structures gained enhanced support of int and bool dtypes, see [here](https://pandas.pydata.org/pandas-docs/stable/reference/indexing.html#sparse-data-structures)
- Comparison operations with Series no longer ignores the index, see [here](https://pandas.pydata.org/pandas-docs/stable/reference/api/pandas.Series.html) for an overview of the API changes.
- Deprecation of Panel4D and PanelND. We recommend to represent these types of n-dimensional data with the xarray package.
- Removal of the previously deprecated modules pandas.io.data, pandas.io.wb, pandas.tools.rplot.

**Warning:** pandas >= 0.19.0 will no longer silence numpy ufunc warnings upon import, see [here](https://pandas.pydata.org/pandas-docs/stable/user_guide/errstate.html).

---

**What's new in v0.19.0**

- **New features**
  - Function **merge_asof** for asof-style time-series joining
  - Method `.rolling()` is now time-series aware
  - Method **read_csv()** has improved support for duplicate column names
  - Method **read_csv** supports parsing Categorical directly
  - **Categorical concatenation**
  - **Semi-month offsets**
  - **New Index methods**
  - **Google BigQuery enhancements**
  - **Fine-grained NumPy errstate**
  - Method **get_dummies** now returns integer dtypes
  - **Downcast values to smallest possible dtype in to_numeric**
  - pandas development API
  - **Other enhancements**

- **API changes**
Series.tolist() will now return Python types

Series operators for different indexes
* Arithmetic operators
* Comparison operators
* Logical operators
* Flexible comparison methods

Series type promotion on assignment
Function .to_datetime() changes
Merging changes
Method .describe() changes
Period changes
* The PeriodIndex now has period dtype
* Period('NaT') now returns pd.NaT
* PeriodIndex.values now returns array of Period object

Index +/- no longer used for set operations
Index.difference and .symmetric_difference changes
Index.unique consistently returns Index
MultiIndex constructors, groupby and set_index preserve categorical dtypes
Function read_csv will progressively enumerate chunks
Sparse changes
* Types int64 and bool support enhancements
* Operators now preserve dtypes
* Other sparse fixes
Indexer dtype changes
Other API changes

Deprecations
Removal of prior version deprecations/changes
Performance improvements
Bug fixes
Contributors
New features

Function merge_asof for asof-style time-series joining

A long-time requested feature has been added through the `merge_asof()` function, to support asof style joining of time-series (GH1870, GH13695, GH13709, GH13902). Full documentation is here.

The `merge_asof()` performs an asof merge, which is similar to a left-join except that we match on nearest key rather than equal keys.

```
In [1]: left = pd.DataFrame({'a': [1, 5, 10], 'left_val': ['a', 'b', 'c']})
In [2]: right = pd.DataFrame({'a': [1, 2, 3, 6, 7], 'right_val': [1, 2, 3, 6, 7]})
In [3]: left
Out[3]:
     a  left_val
0   1      a
1   5      b
2  10      c
[3 rows x 2 columns]
In [4]: right
Out[4]:
     a  right_val
0   1       1
1   2       2
2   3       3
3   6       6
4   7       7
[5 rows x 2 columns]
```

We typically want to match exactly when possible, and use the most recent value otherwise.

```
In [5]: pd.merge_asof(left, right, on="a")
Out[5]:
     a  left_val  right_val
0   1      a       1
1   5      b       3
2  10      c       7
[3 rows x 3 columns]
```

We can also match rows ONLY with prior data, and not an exact match.

```
In [6]: pd.merge_asof(left, right, on="a", allow_exact_matches=False)
Out[6]:
     a  left_val  right_val
0   1      a       NaN
1   5      b       3.0
2  10      c       7.0
```

(continues on next page)
In a typical time-series example, we have trades and quotes and we want to asof-join them. This also illustrates using the by parameter to group data before merging.

```python
In [7]: trades = pd.DataFrame(
    ...:     {
    ...:         "time": pd.to_datetime(
    ...:             ["20160525 13:30:00.023",
    ...:             "20160525 13:30:00.038",
    ...:             "20160525 13:30:00.048",
    ...:             "20160525 13:30:00.048",
    ...:             "20160525 13:30:00.048",
    ...:         ],
    ...:         "ticker": ["MSFT", "MSFT", "GOOG", "GOOG", "AAPL"],
    ...:         "price": [51.95, 51.95, 720.77, 720.92, 98.00],
    ...:         "quantity": [75, 155, 100, 100, 100],
    ...:     },
    ...:     columns=["time", "ticker", "price", "quantity"],
    ...: )
...

In [8]: quotes = pd.DataFrame(
    ...:     {
    ...:         "time": pd.to_datetime(
    ...:             ["20160525 13:30:00.023",
    ...:             "20160525 13:30:00.023",
    ...:             "20160525 13:30:00.030",
    ...:             "20160525 13:30:00.041",
    ...:             "20160525 13:30:00.048",
    ...:             "20160525 13:30:00.049",
    ...:             "20160525 13:30:00.072",
    ...:             "20160525 13:30:00.075",
    ...:         ],
    ...:         "ticker": ["GOOG", "MSFT", "MSFT", "MSFT", "GOOG", "AAPL", "GOOG", "MSFT"],
    ...:         "bid": [720.50, 51.95, 51.97, 51.99, 720.50, 97.99, 720.50, 52.01],
    ...:         "ask": [720.93, 51.96, 51.98, 52.00, 720.93, 98.01, 720.88, 52.03],
    ...:     },
    ...:     columns=["time", "ticker", "bid", "ask"],
    ...: )
...

In [9]: trades
Out[9]:
```
time ticker price quantity
0 2016-05-25 13:30:00.023 MSFT 51.95 75
```

(continues on next page)
pandas: powerful Python data analysis toolkit, Release 1.3.5

In [10]: quotes
Out[10]:

<table>

</tr>
</tbody>
</table>

[8 rows x 4 columns]

An asof merge joins on the on, typically a datetimelike field, which is ordered, and in this case we are using a grouper in the by field. This is like a left-outer join, except that forward filling happens automatically taking the most recent non-NaN value.

In [11]: pd.merge_asof(trades, quotes, on="time", by="ticker")
Out[11]:

<table>
<thead>
<tr>
<th>time</th>
<th>ticker</th>
<th>price</th>
<th>quantity</th>
<th>bid</th>

<td>NaN</td>
</tr>
</tbody>
</table>

[5 rows x 6 columns]

This returns a merged DataFrame with the entries in the same order as the original left passed DataFrame (trades in this case), with the fields of the quotes merged.

**Method .rolling() is now time-series aware**

.rolling() objects are now time-series aware and can accept a time-series offset (or convertible) for the window argument (GH13327, GH12995). See the full documentation here.

In [12]: dft = pd.DataFrame(
        ....:     {"B": [0, 1, 2, np.nan, 4]},
        ....:     index=pd.date_range("20130101 09:00:00", periods=5, freq="s"),
        ....:     )

In [13]: dft

(continues on next page)
Out[13]:

<table>
<thead>
<tr>

</tr>
<tr>
<td>2013-01-01 09:00:04</td>
<td>4.0</td>
</tr>
</tbody>
</table>

[5 rows x 1 columns]

This is a regular frequency index. Using an integer window parameter works to roll along the window frequency.

In [14]: dft.rolling(2).sum()
Out[14]:

<table>
<thead>
<tr>
<th></th>
<th>B</th>
</tr>
</thead>
<tbody>
<tr>
<td>2013-01-01 09:00:00</td>
<td>NaN</td>
</tr>
<tr>
<td>2013-01-01 09:00:01</td>
<td>1.0</td>
</tr>
<tr>
<td>2013-01-01 09:00:02</td>

<td>NaN</td>
</tr>
<tr>
<td>2013-01-01 09:00:04</td>
<td>NaN</td>
</tr>
</tbody>
</table>

[5 rows x 1 columns]

In [15]: dft.rolling(2, min_periods=1).sum()
Out[15]:

<table>
<thead>
<tr>
<th></th>
<th>B</th>
</tr>
</thead>
<tbody>
<tr>
<td>2013-01-01 09:00:00</td>
<td>0.0</td>
</tr>
<tr>
<td>2013-01-01 09:00:01</td>
<td>1.0</td>
</tr>
<tr>
<td>2013-01-01 09:00:02</td>
<td>3.0</td>
</tr>
<tr>
<td>2013-01-01 09:00:03</td>
<td>2.0</td>
</tr>
<tr>
<td>2013-01-01 09:00:04</td>
<td>4.0</td>
</tr>
</tbody>
</table>

[5 rows x 1 columns]

Specifying an offset allows a more intuitive specification of the rolling frequency.

In [16]: dft.rolling("2s").sum()
Out[16]:

<table>
<thead>
<tr>
<th></th>
<th>B</th>
</tr>
</thead>
<tbody>
<tr>
<td>2013-01-01 09:00:00</td>
<td>0.0</td>
</tr>
<tr>
<td>2013-01-01 09:00:01</td>
<td>1.0</td>
</tr>
<tr>
<td>2013-01-01 09:00:02</td>
<td>3.0</td>
</tr>
<tr>
<td>2013-01-01 09:00:03</td>
<td>2.0</td>
</tr>
<tr>
<td>2013-01-01 09:00:04</td>
<td>4.0</td>
</tr>
</tbody>
</table>

[5 rows x 1 columns]

Using a non-regular, but still monotonic index, rolling with an integer window does not impart any special calculation.
Using the time-specification generates variable windows for this sparse data.

Furthermore, we now allow an optional `on` parameter to specify a column (rather than the default of the index) in a `DataFrame`. 
In [21]: dft = dft.reset_index()

In [22]: dft
Out[22]:
       foo     B
0  2013-01-01 09:00:00  0.0
1  2013-01-01 09:00:02  1.0
2  2013-01-01 09:00:03  2.0
3  2013-01-01 09:00:05  NaN
4  2013-01-01 09:00:06  4.0

[5 rows x 2 columns]

In [23]: dft.rolling("2s", on="foo").sum()
Out[23]:
       foo     B
0  2013-01-01 09:00:00  0.0
1  2013-01-01 09:00:02  1.0
2  2013-01-01 09:00:03  3.0
3  2013-01-01 09:00:05  NaN
4  2013-01-01 09:00:06  4.0

[5 rows x 2 columns]

Method read_csv has improved support for duplicate column names

Duplicate column names are now supported in read_csv() whether they are in the file or passed in as the names parameter (GH7160, GH9424)

In [24]: data = "0,1,2

3,4,5"
In [25]: names = ["a", "b", "a"]

Previous behavior:

In [2]: pd.read_csv(StringIO(data), names=names)
Out[2]:
   a  b  a
   0  2  1  2
   1  5  4  5

The first a column contained the same data as the second a column, when it should have contained the values [0, 3].

New behavior:

In [26]: pd.read_csv(StringIO(data), names=names)
---------------------------------------------------------------------------
ValueError Traceback (most recent call last)
<ipython-input-26-a095135d9435> in <module>
----> 1 pd.read_csv(StringIO(data), names=names)

/pandas/pandas/util/_decorators.py in wrapper(*args, **kwargs)

(continues on next page)
Method read_csv supports parsing Categorical directly

The `read_csv()` function now supports parsing a Categorical column when specified as a dtype (GH10153). Depending on the structure of the data, this can result in a faster parse time and lower memory usage compared to converting to Categorical after parsing. See the io docs here.

In [27]:
    data = ""
    ....: col1,col2,col3
    ....: a,b,1
    ....: a,b,2
    ....: c,d,3
    ....: ""
    ....:

ValueError: Duplicate names are not allowed.
In [28]: pd.read_csv(StringIO(data))
Out[28]:
   col1 col2 col3
0    a   b   1
1    a   b   2
2    c   d   3

[3 rows x 3 columns]

In [29]: pd.read_csv(StringIO(data)).dtypes
Out[29]:
   col1     object
col2     object
col3    int64   
Length: 3, dtype: object

In [30]: pd.read_csv(StringIO(data), dtype="category").dtypes
Out[30]:
   col1    category
col2    category
col3    category
Length: 3, dtype: object

Individual columns can be parsed as a Categorical using a dict specification

In [31]: pd.read_csv(StringIO(data), dtype={"col1": "category"}).dtypes
Out[31]:
   col1    category
col2    category
col3    int64   
Length: 3, dtype: object

Note: The resulting categories will always be parsed as strings (object dtype). If the categories are numeric they can
be converted using the to_numeric() function, or as appropriate, another converter such as to_datetime().

In [32]: df = pd.read_csv(StringIO(data), dtype="category")

In [33]: df.dtypes
Out[33]:
   col1    category
col2    category
col3    category
Length: 3, dtype: object

In [34]: df["col3"]
Out[34]:
   0  1
   1  2
   2  3
Name: col3, Length: 3, dtype: category
Categories (3, object): ['1', '2', '3']

In [35]: df['col3'].cat.categories = pd.to_numeric(df['col3'].cat.categories)

In [36]: df['col3']
Out[36]:
0 1
1 2
2 3
Name: col3, Length: 3, dtype: category
Categories (3, int64): [1, 2, 3]

Categorical concatenation

• A function union_categoricals() has been added for combining categoricals, see Unioning Categoricals (GH13361, GH13763, GH13846, GH14173)

In [37]: from pandas.api.types import union_categoricals

In [38]: a = pd.Categorical(['b', 'c'])

In [39]: b = pd.Categorical(['a', 'b'])

In [40]: union_categoricals([a, b])
Out[40]:
['b', 'c', 'a', 'b']
Categories (3, object): ['b', 'c', 'a']

• concat and append now can concat category dtypes with different categories as object dtype (GH13524)

In [41]: s1 = pd.Series(['a', 'b'], dtype='category')

In [42]: s2 = pd.Series(['b', 'c'], dtype='category')

Previous behavior:

In [1]: pd.concat([s1, s2])
ValueError: incompatible categories in categorical concat

New behavior:

In [43]: pd.concat([s1, s2])
Out[43]:
0  a
1  b
0  b
1  c
Length: 4, dtype: object
Semi-month offsets

pandas has gained new frequency offsets, `SemiMonthEnd` (`SM`) and `SemiMonthBegin` (`SMS`). These provide date offsets anchored (by default) to the 15th and end of month, and 15th and 1st of month respectively. (GH1543)

```python
In [44]: from pandas.tseries.offsets import SemiMonthEnd, SemiMonthBegin
```

**SemiMonthEnd:**

```python
In [45]: pd.Timestamp("2016-01-01") + SemiMonthEnd()
Out[45]: Timestamp('2016-01-15 00:00:00')
```

```python
In [46]: pd.date_range("2015-01-01", freq="SM", periods=4)
```

**SemiMonthBegin:**

```python
In [47]: pd.Timestamp("2016-01-01") + SemiMonthBegin()
Out[47]: Timestamp('2016-01-15 00:00:00')
```

```python
In [48]: pd.date_range("2015-01-01", freq="SMS", periods=4)
```

Using the anchoring suffix, you can also specify the day of month to use instead of the 15th.

```python
In [49]: pd.date_range("2015-01-01", freq="SMS-16", periods=4)
Out[49]: DatetimeIndex(['2015-01-01', '2015-01-16', '2015-02-01', '2015-02-16'], dtype='datetime64[ns]', freq='SMS-16')
```

```python
In [50]: pd.date_range("2015-01-01", freq="SM-14", periods=4)
Out[50]: DatetimeIndex(['2015-01-14', '2015-01-31', '2015-02-14', '2015-02-28'], dtype='datetime64[ns]', freq='SM-14')
```

**New Index methods**

The following methods and options are added to `Index`, to be more consistent with the `Series` and `DataFrame` API.

Index now supports the `.where()` function for same shape indexing (GH13170)

```python
In [51]: idx = pd.Index(['a', 'b', 'c'])
```

```python
In [52]: idx.where([True, False, True])
Out[52]: Index(['a', nan, 'c'], dtype='object')
```

Index now supports `.dropna()` to exclude missing values (GH6194)

```python
In [53]: idx = pd.Index([1, 2, np.nan, 4])
```

```python
In [54]: idx.dropna()
Out[54]: Float64Index([1.0, 2.0, 4.0], dtype='float64')
```
For `MultiIndex`, values are dropped if any level is missing by default. Specifying `how='all'` only drops values where all levels are missing.

```python
In [55]: midx = pd.MultiIndex.from_arrays([[1, 2, np.nan, 4], [1, 2, np.nan, np.nan]])

In [56]: midx
Out[56]:
MultiIndex([(1.0, 1.0),
            (2.0, 2.0),
            (nan, nan),
            (4.0, nan)],
           )

In [57]: midx.dropna()
Out[57]:
MultiIndex([(1, 1),
            (2, 2)],
           )

In [58]: midx.dropna(how="all")
Out[58]:
MultiIndex([(1, 1.0),
            (2, 2.0),
            (4, nan)],
           )
```

Index now supports `.str.extractall()` which returns a DataFrame. See the docs here (GH10008, GH13156)

```python
In [59]: idx = pd.Index(["a1a2", "b1", "c1"])

In [60]: idx.str.extractall(r"[ab](?P<digit>[0-9])")
Out[60]:
   match
digit
0  0  1
1  1  2
1  0  1

[3 rows x 1 columns]
```

Index.astype() now accepts an optional boolean argument `copy`, which allows optional copying if the requirements on dtype are satisfied (GH13209)

### Google BigQuery enhancements

- The `read_gbq()` method has gained the `dialect` argument to allow users to specify whether to use BigQuery’s legacy SQL or BigQuery’s standard SQL. See the docs for more details (GH13615).
- The `to_gbq()` method now allows the DataFrame column order to differ from the destination table schema (GH11359).
Fine-grained NumPy errstate

Previous versions of pandas would permanently silence numpy's ufunc error handling when pandas was imported. pandas did this in order to silence the warnings that would arise from using numpy ufuns on missing data, which are usually represented as NaNs. Unfortunately, this silenced legitimate warnings arising in non-pandas code in the application. Starting with 0.19.0, pandas will use the numpy.errstate context manager to silence these warnings in a more fine-grained manner, only around where these operations are actually used in the pandas code base. (GH13109, GH13145)

After upgrading pandas, you may see new RuntimeWarnings being issued from your code. These are likely legitimate, and the underlying cause likely existed in the code when using previous versions of pandas that simply silenced the warning. Use numpy.errstate around the source of the RuntimeWarning to control how these conditions are handled.

Method get_dummies now returns integer dtypes

The pd.get_dummies function now returns dummy-encoded columns as small integers, rather than floats (GH8725). This should provide an improved memory footprint.

Previous behavior:

```python
In [1]: pd.get_dummies(["a", "b", "a", "c"]).dtypes
Out[1]:
a    float64
b    float64
c    float64
dtype: object
```

New behavior:

```python
In [61]: pd.get_dummies(["a", "b", "a", "c"]).dtypes
Out[61]:
a    uint8
b    uint8
c    uint8
Length: 3, dtype: object
```

Downcast values to smallest possible dtype in to_numeric

pd.to_numeric() now accepts a downcast parameter, which will downcast the data if possible to smallest specified numerical dtype (GH13352)

```python
In [62]: s = ["1", 2, 3]

In [63]: pd.to_numeric(s, downcast="unsigned")
Out[63]: array([1, 2, 3], dtype=uint8)

In [64]: pd.to_numeric(s, downcast="integer")
Out[64]: array([1, 2, 3], dtype=int8)
```
pandas development API

As part of making pandas API more uniform and accessible in the future, we have created a standard sub-package of pandas, pandas.api to hold public API's. We are starting by exposing type introspection functions in pandas.api.types. More sub-packages and officially sanctioned API's will be published in future versions of pandas (GH13147, GH13634)

The following are now part of this API:

In [65]: import pprint

In [66]: from pandas.api import types

In [67]: 

In [68]: pprint.pprint(funcs)

['CategoricalDtype',
'DatetimeTZDtype',
'IntervalDtype',
'PeriodDtype',
'infer_dtype',
'is_array_like',
'is_bool',
'is_bool_dtype',
'is_categorical',
'is_categorical_dtype',
'is_complex',
'is_complex_dtype',
'is_datetime64_any_dtype',
'is_datetime64_dtype',
'is_datetime64_ns_dtype',
'is_datetime64tz_dtype',
'is_dict_like',
'is_dtype_equal',
'is_extension_array_dtype',
'is_extension_type',
'is_file_like',
'is_float',
'is_float_dtype',
'is_hashable',
'is_int64_dtype',
'is_integer',
'is_integer_dtype',
'is_interval',
'is_interval_dtype',
'is_iterator',
'is_list_like',
'is_named_tuple',
'is_number',
'is_numeric_dtype',
'is_object_dtype',
'is_period_dtype',
'is_re',
'is_string',
'is_string_dtype',
'is_structured_dtype',
'is_string_like',
'is_time64_dtype',
'is_timedelta64_dtype',
'is_timedelta64_ns_dtype',
'is_timedelta64tz_dtype',
'is_unsigned_int',
'is_unsigned_int_dtype',
'is_unicode',
'is_unicode_dtype',
'is_unchangeable_index',
'is_unchangeable_index_dtype',
'is_arithmetic_dtype']

(continues on next page)
'is_re_compilable',
'is_scalar',
'is_signed_integer_dtype',
'is_sparse',
'is_string_dtype',
'is_timedelta64_dtype',
'is_timedelta64_ns_dtype',
'is_unsigned_integer_dtype',
'pandas_dtype',
'union_categoricals']

Note: Calling these functions from the internal module pandas.core.common will now show a DeprecationWarning (GH13990)

Other enhancements

• Timestamp can now accept positional and keyword parameters similar to datetime.datetime() (GH10758, GH11630)

```python
In [69]: pd.Timestamp(2012, 1, 1)
Out[69]: Timestamp('2012-01-01 00:00:00')
In [70]: pd.Timestamp(year=2012, month=1, day=1, hour=8, minute=30)
Out[70]: Timestamp('2012-01-01 08:30:00')
```

• The .resample() function now accepts a on= or level= parameter for resampling on a datetimelike column or MultiIndex level (GH13500)

```python
In [71]: df = pd.DataFrame(
       ....:     {"date": pd.date_range("2015-01-01", freq="W", periods=5), "a": np.
       ....:       arange(5)},
       ....:     index=pd.MultiIndex.from_arrays(  
       ....:         [[1, 2, 3, 4, 5], pd.date_range("2015-01-01", freq="W", periods=5)],
       ....:         names=["v", "d"],
       ....:     ),
       ....:     )
In [72]: df
Out[72]:
          date a
        v   d
1 2015-01-04 2015-01-04 0
2 2015-01-11 2015-01-11 1
3 2015-01-18 2015-01-18 2
4 2015-01-25 2015-01-25 3
5 2015-02-01 2015-02-01 4
```
In [73]: df.resample("M", on="date").sum()
Out[73]:
   date
2015-01-31 6
2015-02-28 4

[2 rows x 1 columns]

In [74]: df.resample("M", level="d").sum()
Out[74]:
   d
2015-01-31 6
2015-02-28 4

[2 rows x 1 columns]

• The .get_credentials() method of GbqConnector can now first try to fetch the application default credentials. See the docs for more details (GH13577).

• The .tz_localize() method of DatetimeIndex and Timestamp has gained the errors keyword, so you can potentially coerce nonexistent timestamps to NaT. The default behavior remains to raising a NonExistentTimeError (GH13057).

• to_hdf/read_hdf() now accept path objects (e.g. pathlib.Path, py.path.local) for the file path (GH11773).

• The pd.read_csv() with engine='python' has gained support for the decimal (GH12933), na_filter (GH13321) and the memory_map option (GH13381).

• Consistent with the Python API, pd.read_csv() will now interpret +inf as positive infinity (GH13274).

• The pd.read_html() has gained support for the na_values, converters, keep_default_na options (GH13461).

• Categorical.astype() now accepts an optional boolean argument copy, effective when dtype is categorical (GH13209).

• DataFrame has gained the .asof() method to return the last non-NaN values according to the selected subset (GH13358).

• The DataFrame constructor will now respect key ordering if a list of OrderedDict objects are passed in (GH13304).

• pd.read_html() has gained support for the decimal option (GH12907).

• Series has gained the properties .is_monotonic, .is_monotonic_increasing, .is_monotonic_decreasing, similar to Index (GH13336).

• DataFrame.to_sql() now allows a single value as the SQL type for all columns (GH11886).

• Series.append now supports the ignore_index option (GH13677).

• to_stata() and StataWriter can now write variable labels to Stata dta files using a dictionary to make column names to labels (GH13535, GH13536).
• `.to_stata()` and StataWriter will automatically convert datetime64[ns] columns to Stata format %tc, rather than raising a ValueError (GH12259)

• `read_stata()` and StataReader raise with a more explicit error message when reading Stata files with repeated value labels when `convert_categoricals=True` (GH13923)

• `DataFrame.style` will now render sparsified MultiIndexes (GH11655)

• `DataFrame.style` will now show column level names (e.g. `DataFrame.columns.names`) (GH13775)

• `DataFrame` has gained support to re-order the columns based on the values in a row using `df.sort_values(by='...', axis=1)` (GH10806)

```python
In [75]: df = pd.DataFrame({'A': [2, 7], 'B': [3, 5], 'C': [4, 8], index=['row1', 'row2'])

In [76]: df
Out[76]:
   A  B  C
row1 2  3  4
row2 7  5  8
[2 rows x 3 columns]

In [77]: df.sort_values(by="row2", axis=1)
Out[77]:
   B  A  C
row1 3  2  4
row2 5  7  8
[2 rows x 3 columns]
```

• Added documentation to I/O regarding the perils of reading in columns with mixed dtypes and how to handle it (GH13746)

• `to_html()` now has a `border` argument to control the value in the opening `<table>` tag. The default is the value of the `html.border` option, which defaults to 1. This also affects the notebook HTML repr, but since Jupyter's CSS includes a border-width attribute, the visual effect is the same. (GH11563).

• Raise `ImportError` in the sql functions when `sqlalchemy` is not installed and a connection string is used (GH11920).

• Compatibility with matplotlib 2.0. Older versions of pandas should also work with matplotlib 2.0 (GH13333)

• Timestamp, Period, DatetimeIndex, PeriodIndex and `.dt` accessor have gained a `is_leap_year` property to check whether the date belongs to a leap year. (GH13727)

• `astype()` will now accept a dict of column name to data types mapping as the `dtype` argument. (GH12086)

• The `pd.read_json` and `DataFrame.to_json` has gained support for reading and writing json lines with `lines` option see `Line delimited json` (GH9180)

• `read_excel()` now supports the `true_values` and `false_values` keyword arguments (GH13347)

• `groupby()` will now accept a scalar and a single-element list for specifying `level` on a non-MultiIndex grouper. (GH13907)

• Non-convertible dates in an excel date column will be returned without conversion and the column will be object dtype, rather than raising an exception (GH10001).

• `pd.Timedelta(None)` is now accepted and will return `NaT`, mirroring `pd.Timestamp` (GH13687)
• `pd.read_stata()` can now handle some format 111 files, which are produced by SAS when generating Stata `dta` files (GH11526)

• Series and Index now support `divmod` which will return a tuple of series or indices. This behaves like a standard binary operator with regards to broadcasting rules (GH14208).

**API changes**

**Series.tolist() will now return Python types**

Series.tolist() will now return Python types in the output, mimicking NumPy .tolist() behavior (GH10904)

```python
In [78]: s = pd.Series([1, 2, 3])
```

Previous behavior:

```python
In [7]: type(s.tolist()[0])
Out[7]: <class 'numpy.int64'>
```

New behavior:

```python
In [79]: type(s.tolist()[0])
Out[79]: int
```

**Series operators for different indexes**

Following Series operators have been changed to make all operators consistent, including DataFrame (GH1134, GH4581, GH3538)

• Series comparison operators now raise ValueError when index are different.

• Series logical operators align both index of left and right hand side.

**Warning:** Until 0.18.1, comparing Series with the same length, would succeed even if the .index are different (the result ignores .index). As of 0.19.0, this will raise ValueError to be more strict. This section also describes how to keep previous behavior or align different indexes, using the flexible comparison methods like .eq.

As a result, Series and DataFrame operators behave as below:

**Arithmetic operators**

Arithmetic operators align both index (no changes).

```python
In [80]: s1 = pd.Series([1, 2, 3], index=list("ABC"))
In [81]: s2 = pd.Series([2, 2, 2], index=list("ABD"))
In [82]: s1 + s2
Out[82]:
A  3.0
(continues on next page)```
Comparison operators

Comparison operators raise `ValueError` when `.index` are different.

**Previous behavior (Series):**

Series compared values ignoring the `.index` as long as both had the same length:

```python
In [83]: df1 = pd.DataFrame([1, 2, 3], index=list("ABC"))
In [84]: df2 = pd.DataFrame([2, 2, 2], index=list("ABD"))
In [85]: df1 + df2
Out[85]:
0   3.0
A  3.0
B  4.0
C   NaN
D   NaN
[4 rows x 1 columns]
```

**New behavior (Series):**

```python
In [82]: s1 == s2
Out[82]:
A   False
B    True
C   False
dtype: bool
```

**Note:** To achieve the same result as previous versions (compare values based on locations ignoring `.index`), compare both `.values`.

```python
In [86]: s1.values == s2.values
Out[86]: array([False, True, False])
```

If you want to compare `Series` aligning its `.index`, see flexible comparison methods section below:

```python
In [87]: s1.eq(s2)
Out[87]:
A   False
```

(continues on next page)
Current behavior (DataFrame, no change):  

```python
In [3]: df1 == df2
Out[3]:
ValueError: Can only compare identically-labeled DataFrame objects
```

**Logical operators**

Logical operators align both `.index` of left and right hand side.

**Previous behavior (Series), only left hand side index was kept:**

```python
In [4]: s1 = pd.Series([True, False, True], index=list('ABC'))
In [5]: s2 = pd.Series([True, True, True], index=list('ABD'))
In [6]: s1 & s2
Out[6]:
A   True  
B   False 
C   False 
D   False
Length: 4, dtype: bool
```

**New behavior (Series):**

```python
In [88]: s1 = pd.Series([True, False, True], index=list('ABC'))
In [89]: s2 = pd.Series([True, True, True], index=list('ABD'))
In [90]: s1 & s2
Out[90]:
A   True  
B   False 
C   False 
D   False
Length: 4, dtype: bool
```

**Note:** Series logical operators fill a NaN result with False.

**Note:** To achieve the same result as previous versions (compare values based on only left hand side index), you can use `reindex_like`:

```python
In [91]: s1 & s2.reindex_like(s1)
Out[91]:
A   True
```

(continues on next page)
Current behavior (DataFrame, no change):

```
In [92]: df1 = pd.DataFrame([True, False, True], index=list("ABC"))
In [93]: df2 = pd.DataFrame([True, True, True], index=list("ABD"))
In [94]: df1 & df2
Out[94]:
     0
A  True
B  False
C  False
D  False
[4 rows x 1 columns]
```

Flexible comparison methods

Series flexible comparison methods like `eq`, `ne`, `le`, `lt`, `ge` and `gt` now align both `index`. Use these operators if you want to compare two `Series` which has the different `index`.

```
In [95]: s1 = pd.Series([1, 2, 3], index=['a', 'b', 'c'])
In [96]: s2 = pd.Series([2, 2, 2], index=['b', 'c', 'd'])
In [97]: s1.eq(s2)
Out[97]:
a  False
b  True
c  False
d  False
Length: 4, dtype: bool
In [98]: s1.ge(s2)
Out[98]:
a  False
b  True
c  True
d  False
Length: 4, dtype: bool
```

Previously, this worked the same as comparison operators (see above).
Series type promotion on assignment

A Series will now correctly promote its dtype for assignment with incompat values to the current dtype (GH13234)

```
In [99]: s = pd.Series()
```

**Previous behavior:**

```
In [2]: s["a"] = pd.Timestamp("2016-01-01")
In [3]: s["b"] = 3.0
    TypeError: invalid type promotion
```

**New behavior:**

```
In [100]: s["a"] = pd.Timestamp("2016-01-01")
In [101]: s["b"] = 3.0
In [102]: s
Out[102]:
   a    2016-01-01 00:00:00
   b      3.0
Length: 2, dtype: object
```

**Function .to_datetime() changes**

Previously if .to_datetime() encountered mixed integers/floats and strings, but no datetimes with errors='coerce' it would convert all to NaT.

**Previous behavior:**

```
In [2]: pd.to_datetime([1, 'foo'], errors='coerce')
Out[2]: DatetimeIndex(['NaT', 'NaT'], dtype='datetime64[ns]', freq=None)
```

**Current behavior:**

This will now convert integers/floats with the default unit of ns.

```
In [104]: pd.to_datetime([1, "foo"], errors="coerce")
Out[104]: DatetimeIndex(['1970-01-01 00:00:00.000000001', 'NaT'], dtype='datetime64[ns]', freq=None)
```

Bug fixes related to .to_datetime():

- Bug in pd.to_datetime() when passing integers or floats, and no unit and errors='coerce' (GH13180).
- Bug in pd.to_datetime() when passing invalid data types (e.g. bool); will now respect the errors keyword (GH13176)
- Bug in pd.to_datetime() which overflowed on int8, and int16 dtypes (GH13451)
• Bug in `pd.to_datetime()` raise `AttributeError` with NaN and the other string is not valid when `errors='ignore'` (GH12424)

• Bug in `pd.to_datetime()` did not cast floats correctly when `unit` was specified, resulting in truncated datetime (GH13834)

Merging changes

Merging will now preserve the dtype of the join keys (GH8596)

```
In [105]: df1 = pd.DataFrame({"key": [1], "v1": [10]})

In [106]: df1
Out[106]:
     key  v1
0     1  10

[1 rows x 2 columns]
```

```
In [107]: df2 = pd.DataFrame({"key": [1, 2], "v1": [20, 30]})

In [108]: df2
Out[108]:
     key  v1
0     1  20
1     2  30

[2 rows x 2 columns]
```

Previous behavior:

```
In [5]: pd.merge(df1, df2, how='outer')
Out[5]:
     key  v1
0  1.0  10.0
1  1.0  20.0
2  2.0  30.0
```

```
In [6]: pd.merge(df1, df2, how='outer').dtypes
Out[6]:
key    float64
v1     float64
dtype: object
```

New behavior:

We are able to preserve the join keys

```
In [109]: pd.merge(df1, df2, how='outer')
Out[109]:
     key  v1
0     1  10
1     1  20
2     2  30
```

(continues on next page)
In [110]: pd.merge(df1, df2, how="outer").dtypes
Out[110]:
<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>key</td>
<td>int64</td>
</tr>
<tr>
<td>v1</td>
<td>int64</td>
</tr>
</tbody>
</table>
Length: 2, dtype: object

Of course if you have missing values that are introduced, then the resulting dtype will be upcast, which is unchanged from previous.

In [111]: pd.merge(df1, df2, how="outer", on="key")
Out[111]:
<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>

<td>int64</td>
<td></td>
</tr>
</tbody>
</table>
Length: 3, dtype: object

Method .describe() changes

Percentile identifiers in the index of a .describe() output will now be rounded to the least precision that keeps them distinct (GH13104)

In [113]: s = pd.Series([0, 1, 2, 3, 4])
In [114]: df = pd.DataFrame([0, 1, 2, 3, 4])

Previous behavior:
The percentiles were rounded to at most one decimal place, which could raise ValueError for a data frame if the percentiles were duplicated.

In [3]: s.describe(percentiles=[0.0001, 0.0005, 0.001, 0.999, 0.9995, 0.9999])
Out[3]:
<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>count</td>
<td>5.0000000</td>
</tr>
<tr>
<td>mean</td>
<td>2.0000000</td>
</tr>
<tr>
<td>std</td>
<td>1.581139</td>
</tr>
<tr>
<td>min</td>
<td>0.0000000</td>
</tr>
<tr>
<td>0.0%</td>
<td>0.0004000</td>
</tr>
<tr>
<td>0.1%</td>
<td>0.0020000</td>
</tr>
<tr>
<td>0.1%</td>
<td>0.0040000</td>
</tr>
<tr>
<td>50%</td>
<td>2.0000000</td>
</tr>
<tr>
<td>99.9%</td>
<td>3.9960000</td>
</tr>
</tbody>
</table>
In [4]: df.describe(percentiles=[0.0001, 0.0005, 0.001, 0.999, 0.9995, 0.9999])
Out[4]:

... ValueError: cannot reindex from a duplicate axis

New behavior:

In [115]: s.describe(percentiles=[0.0001, 0.0005, 0.001, 0.999, 0.9995, 0.9999])
Out[115]:

count 5.000000
mean 2.000000
std 1.581139
min 0.000000
0.01% 0.000400
0.05% 0.002000
0.1% 0.004000
50% 2.000000
99.9% 3.996000
99.95% 3.998000
99.99% 3.999600
max 4.000000
Length: 12, dtype: float64

In [116]: df.describe(percentiles=[0.0001, 0.0005, 0.001, 0.999, 0.9995, 0.9999])
Out[116]:

0
count 5.000000
mean 2.000000
std 1.581139
min 0.000000
0.01% 0.000400
0.05% 0.002000
0.1% 0.004000
50% 2.000000
99.9% 3.996000
99.95% 3.998000
99.99% 3.999600
max 4.000000

[12 rows x 1 columns]

Furthermore:

• Passing duplicated percentiles will now raise a ValueError.

• Bug in .describe() on a DataFrame with a mixed-dtype column index, which would previously raise a TypeError (GH13288)
**Period changes**

**The PeriodIndex now has period dtype**

PeriodIndex now has its own period dtype. The period dtype is a pandas extension dtype like category or the timezone aware dtype (datetime64[ns, tz]) (GH13941). As a consequence of this change, PeriodIndex no longer has an integer dtype:

**Previous behavior:**

```python
In [1]: pi = pd.PeriodIndex(['2016-08-01'], freq='D')
In [2]: pi
Out[2]: PeriodIndex(['2016-08-01'], dtype='int64', freq='D')
In [3]: pd.api.types.is_integer_dtype(pi)
Out[3]: True
In [4]: pi.dtype
Out[4]: dtype('int64')
```

**New behavior:**

```python
In [117]: pi = pd.PeriodIndex(['2016-08-01'], freq='D')
In [118]: pi
Out[118]: PeriodIndex(['2016-08-01'], dtype='period[D]')
In [119]: pd.api.types.is_integer_dtype(pi)
Out[119]: False
In [120]: pd.api.types.is_period_dtype(pi)
Out[120]: True
In [121]: pi.dtype
Out[121]: period[D]
In [122]: type(pi.dtype)
Out[122]: pandas.core.dtypes.dtypes.PeriodDtype
```

**Period('NaT') now returns pd.NaT**

Previously, Period('NaT') has its own Period('NaT') representation different from pd.NaT. Now Period('NaT') has been changed to return pd.NaT. (GH12759, GH13582)

**Previous behavior:**

```python
In [5]: pd.Period('NaT', freq='D')
Out[5]: Period('NaT', 'D')
```

**New behavior:**

These result in pd.NaT without providing freq option.
To be compatible with `Period` addition and subtraction, `pd.NaT` now supports addition and subtraction with `int`. Previously it raised `ValueError`.

**Previous behavior:**

```
In [5]: pd.NaT + 1
...: ValueError: Cannot add integral value to Timestamp without freq.
```

**New behavior:**

```
In [125]: pd.NaT + 1
Out[125]: NaT

In [126]: pd.NaT - 1
Out[126]: NaT
```

**PeriodIndex.values now returns array of Period object**

`.values` is changed to return an array of `Period` objects, rather than an array of integers (GH13988).

**Previous behavior:**

```
In [6]: pi = pd.PeriodIndex(['2011-01', '2011-02'], freq='M')
In [7]: pi.values
Out[7]: array([492, 493])
```

**New behavior:**

```
In [127]: pi = pd.PeriodIndex(['2011-01', '2011-02'], freq='M')

In [128]: pi.values
Out[128]: array([Period('2011-01', 'M'), Period('2011-02', 'M')], dtype=object)
```

**Index + / - no longer used for set operations**

Addition and subtraction of the base `Index` type and of DatetimeIndex (not the numeric index types) previously performed set operations (set union and difference). This behavior was already deprecated since 0.15.0 (in favor using the specific `.union()` and `.difference()` methods), and is now disabled. When possible, + and - are now used for element-wise operations, for example for concatenating strings or subtracting datetimes (GH8227, GH14127).

**Previous behavior:**

```
In [1]: pd.Index(['a', 'b']) + pd.Index(['a', 'c'])
FutureWarning: using '+' to provide set union with Indexes is deprecated, use '|' or .union()
Out[1]: Index(['a', 'b', 'c'], dtype='object')
```
**New behavior:** the same operation will now perform element-wise addition:

```python
In [129]: pd.Index(["a", "b"]) + pd.Index(["a", "c"])
Out[129]: Index(['aa', 'bc'], dtype='object')
```

Note that numeric Index objects already performed element-wise operations. For example, the behavior of adding two integer Indexes is unchanged. The base `Index` is now made consistent with this behavior.

```python
In [130]: pd.Index([1, 2, 3]) + pd.Index([2, 3, 4])
Out[130]: Int64Index([3, 5, 7], dtype='int64')
```

Further, because of this change, it is now possible to subtract two `DatetimeIndex` objects resulting in a `TimedeltaIndex`:

**Previous behavior:**

```python
In [1]: (pd.DatetimeIndex(['2016-01-01', '2016-01-02'])
       - pd.DatetimeIndex(['2016-01-02', '2016-01-03']))
FutureWarning: using '-' to provide set differences with datetimelike Indexes is...`n` deprecated, use `.difference()`
Out[1]: DatetimeIndex(['2016-01-01'], dtype='datetime64[ns]', freq=None)
```

**New behavior:**

```python
In [131]: (pd.DatetimeIndex(['2016-01-01', '2016-01-02'])
       - pd.DatetimeIndex(['2016-01-02', '2016-01-03']))
Out[131]: TimedeltaIndex([-1 days, -1 days], dtype='timedelta64[ns]', freq=None)
```

**Index.difference and .symmetric_difference changes**

`Index.difference` and `Index.symmetric_difference` will now, more consistently, treat NaN values as any other values. (GH13514)

```python
In [132]: idx1 = pd.Index([1, 2, 3, np.nan])
In [133]: idx2 = pd.Index([0, 1, np.nan])
```

**Previous behavior:**

```python
In [3]: idx1.difference(idx2)
Out[3]: Float64Index([nan, 2.0, 3.0], dtype='float64')
In [4]: idx1.symmetric_difference(idx2)
Out[4]: Float64Index([0.0, nan, 2.0, 3.0], dtype='float64')
```

**New behavior:**

```python
In [134]: idx1.difference(idx2)
Out[134]: Float64Index([2.0, 3.0], dtype='float64')
In [135]: idx1.symmetric_difference(idx2)
Out[135]: Float64Index([0.0, 2.0, 3.0], dtype='float64')
```
Index.unique consistently returns Index

Index.unique() now returns unique values as an Index of the appropriate dtype. (GH13395). Previously, most Index classes returned np.ndarray, and DatetimeIndex, TimedeltaIndex and PeriodIndex returned Index to keep metadata like timezone.

Previous behavior:

```python
In [1]: pd.Index([1, 2, 3]).unique()
Out[1]: array([1, 2, 3])
```

```python
In [2]: pd.DatetimeIndex(['2011-01-01', '2011-01-02', '2011-01-03'], tz='Asia/Tokyo').unique()
Out[2]: DatetimeIndex(['2011-01-01 00:00:00+09:00', '2011-01-02 00:00:00+09:00', '2011-01-03 00:00:00+09:00'],
 dtype='datetime64[ns, Asia/Tokyo]', freq=None)
```

New behavior:

```python
In [136]: pd.Index([1, 2, 3]).unique()
Out[136]: Int64Index([1, 2, 3], dtype='int64')
```

```python
In [137]: pd.DatetimeIndex(
    .....: ['2011-01-01', '2011-01-02', '2011-01-03'], tz='Asia/Tokyo'
    .....: ).unique()
Out[137]: DatetimeIndex(['2011-01-01 00:00:00+09:00', '2011-01-02 00:00:00+09:00',
 '2011-01-03 00:00:00+09:00'],
 dtype='datetime64[ns, Asia/Tokyo]', freq=None)
```

MultiIndex constructors, groupby and set_index preserve categorical dtypes

MultiIndex.from_arrays and MultiIndex.from_product will now preserve categorical dtype in MultiIndex levels (GH13743, GH13854).

```python
In [138]: cat = pd.Categorical(['a', 'b'], categories=list('bac'))
```

```python
In [139]: lvl1 = ['foo', 'bar']
```

```python
In [140]: midx = pd.MultiIndex.from_arrays([cat, lvl1])
```

```python
In [141]: midx
Out[141]: MultiIndex([('a', 'foo'), ('b', 'bar')],
)```

Previous behavior:

```python
In [4]: midx.levels[0]
Out[4]: Index(['b', 'a', 'c'], dtype='object')
```

(continues on next page)
In [5]: midx.get_level_values[0]
Out[5]: Index(['a', 'b'], dtype='object')

**New behavior:** the single level is now a CategoricalIndex:

In [142]: midx.levels[0]
Out[142]: CategoricalIndex(['b', 'a', 'c'], categories=['b', 'a', 'c'], ordered=False, dtype='category')

In [143]: midx.get_level_values(0)
Out[143]: CategoricalIndex(['a', 'b'], categories=['b', 'a', 'c'], ordered=False, dtype='category')

An analogous change has been made to `MultiIndex.from_product`. As a consequence, `groupby` and `set_index` also preserve categorical dtypes in indexes

In [144]: df = pd.DataFrame({"A" : [0, I], "B" : [10, 11], "C" : cat})
In [145]: df_grouped = df.groupby(by=['A', 'C']).first()
In [146]: df_set_idx = df.set_index(['A', 'C'])

**Previous behavior:**

In [11]: df_grouped.index.levels[1]
Out[11]: Index(['b', 'a', 'c'], dtype='object', name='C')
In [12]: df_grouped.reset_index().dtypes
Out[12]:
   A    int64
   C    object
   B    float64
type: object

In [13]: df_set_idx.index.levels[1]
Out[13]: Index(['b', 'a', 'c'], dtype='object', name='C')
In [14]: df_set_idx.reset_index().dtypes
Out[14]:
   A    int64
   C    object
   B    int64
type: object

**New behavior:**

In [147]: df_grouped.index.levels[1]
Out[147]: CategoricalIndex(['b', 'a', 'c'], categories=['b', 'a', 'c'], ordered=False, dtype='category', name='C')

In [148]: df_grouped.reset_index().dtypes
Out[148]:
   A    int64
   C    category

(continues on next page)
B  float64
Length: 3, dtype: object

**In [149]:** df_set_idx.index.levels[1]

**Out[149]:** CategoricalIndex(['b', 'a', 'c'], categories=['b', 'a', 'c'], ordered=False, dtypes='category', name='C')

**In [150]:** df_set_idx.reset_index().dtypes

**Out[150]:**
A  int64
C  category
B  int64
Length: 3, dtype: object

**Function read_csv will progressively enumerate chunks**

When `read_csv()` is called with `chunksize=n` and without specifying an index, each chunk used to have an independently generated index from 0 to n-1. They are now given instead a progressive index, starting from 0 for the first chunk, from n for the second, and so on, so that, when concatenated, they are identical to the result of calling `read_csv()` without the `chunksize` argument (GH12185).

**In [151]:** data = "A,B
0,1
2,3
4,5
6,7"

**Previous behavior:**

**In [2]:** pd.concat(pd.read_csv(StringIO(data), chunksize=2))

**Out[2]:**
A  B
0  0  1
1  2  3
0  4  5
1  6  7

**New behavior:**

**In [152]:** pd.concat(pd.read_csv(StringIO(data), chunksize=2))

**Out[152]:**
A  B
0  0  1
1  2  3
2  4  5
3  6  7

[4 rows x 2 columns]
Sparse changes

These changes allow pandas to handle sparse data with more dtypes, and for work to make a smoother experience with data handling.

Types int64 and bool support enhancements

Sparse data structures now gained enhanced support of int64 and bool dtype (GH667, GH13849).

Previously, sparse data were float64 dtype by default, even if all inputs were of int or bool dtype. You had to specify dtype explicitly to create sparse data with int64 dtype. Also, fill_value had to be specified explicitly because the default was np.nan which doesn’t appear in int64 or bool data.

```
In [1]: pd.SparseArray([1, 2, 0, 0])
Out[1]:
[1.0, 2.0, 0.0, 0.0]
Fill: nan
IntIndex
Indices: array([0, 1, 2, 3], dtype=int32)

# specifying int64 dtype, but all values are stored in sp_values because
# fill_value default is np.nan
In [2]: pd.SparseArray([1, 2, 0, 0], dtype=np.int64)
Out[2]:
[1, 2, 0, 0]
Fill: nan
IntIndex
Indices: array([0, 1, 2, 3], dtype=int32)

In [3]: pd.SparseArray([1, 2, 0, 0], dtype=np.int64, fill_value=0)
Out[3]:
[1, 2, 0, 0]
Fill: 0
IntIndex
Indices: array([0, 1], dtype=int32)
```

As of v0.19.0, sparse data keeps the input dtype, and uses more appropriate fill_value defaults (0 for int64 dtype, False for bool dtype).

```
In [153]: pd.SparseArray([1, 2, 0, 0], dtype=np.int64)
Out[153]:
[1, 2, 0, 0]
Fill: 0
IntIndex
Indices: array([0, 1], dtype=int32)

In [154]: pd.SparseArray([True, False, False, False])
Out[154]:
[True, False, False, False]
Fill: False
IntIndex
Indices: array([0], dtype=int32)
```

See the docs for more details.
Operators now preserve dtypes

- Sparse data structure now can preserve dtype after arithmetic ops (GH13848)

```python
s = pd.SparseSeries([0, 2, 0, 1], fill_value=0, dtype=np.int64)
s.dtype
s + 1
```

- Sparse data structure now support astype to convert internal dtype (GH13900)

```python
s = pd.SparseSeries([1.0, 0.0, 2.0, 0.0], fill_value=0)
s
s.astype(np.int64)
```

astype fails if data contains values which cannot be converted to specified dtype. Note that the limitation is applied to fill_value which default is np.nan.

```python
In [7]: pd.SparseSeries([1., np.nan, 2., np.nan]).astype(np.int64)
Out[7]:
ValueError: unable to coerce current fill_value nan to int64 dtype
```

Other sparse fixes

- Subclassed SparseDataFrame and SparseSeries now preserve class types when slicing or transposing. (GH13787)
- SparseArray with bool dtype now supports logical (bool) operators (GH14000)
- Bug in SparseSeries with MultiIndex [] indexing may raise IndexError (GH13144)
- Bug in SparseSeries with MultiIndex [] indexing result may have normal Index (GH13144)
- Bug in SparseDataFrame in which axis=None did not default to axis=0 (GH13048)
- Bug in SparseSeries and SparseDataFrame creation with object dtype may raise TypeError (GH11633)
- Bug in SparseDataFrame doesn’t respect passed SparseArray or SparseSeries ‘s dtype and fill_value (GH13866)
- Bug in SparseArray and SparseSeries don’t apply ufunc to fill_value (GH13853)
- Bug in SparseSeries.abs incorrectly keeps negative fill_value (GH13853)
- Bug in single row slicing on multi-type SparseDataFrame s, types were previously forced to float (GH13917)
- Bug in SparseSeries slicing changes integer dtype to float (GH8292)
- Bug in SparseDataFrame comparison ops may raise TypeError (GH13001)
- Bug in SparseDataFrame.isnull raises ValueError (GH8276)
- Bug in SparseDataFrame representation with bool dtype may raise IndexError (GH13110)
- Bug in SparseSeries and SparseDataFrame of bool or int64 dtype may display its values like float64 dtype (GH13110)
- Bug in sparse indexing using SparseArray with bool dtype may return incorrect result (GH13985)
- Bug in SparseArray created from SparseSeries may lose dtype (GH13999)
pandas: powerful Python data analysis toolkit, Release 1.3.5

- Bug in SparseSeries comparison with dense returns normal Series rather than SparseSeries (GH13999)

**Indexer dtype changes**

*Note:* This change only affects 64 bit python running on Windows, and only affects relatively advanced indexing operations

Methods such as `Index.get_indexer` that return an indexer array, coerce that array to a “platform int”, so that it can be directly used in 3rd party library operations like `numpy.take`. Previously, a platform int was defined as `np.int_` which corresponds to a C integer, but the correct type, and what is being used now, is `np.intp`, which corresponds to the C integer size that can hold a pointer (GH3033, GH13972).

These types are the same on many platform, but for 64 bit python on Windows, `np.int_` is 32 bits, and `np.intp` is 64 bits. Changing this behavior improves performance for many operations on that platform.

**Previous behavior:**

```python
In [1]: i = pd.Index(['a', 'b', 'c'])
In [2]: i.get_indexer(['b', 'b', 'c']).dtype
Out[2]: dtype('int32')
```

**New behavior:**

```python
In [1]: i = pd.Index(['a', 'b', 'c'])
In [2]: i.get_indexer(['b', 'b', 'c']).dtype
Out[2]: dtype('int64')
```

**Other API changes**

- `Timestamp.to_pydatetime` will issue a `UserWarning` when `warn=True`, and the instance has a non-zero number of nanoseconds, previously this would print a message to stdout (GH14101).
- `Series.unique()` with datetime and timezone now returns return array of `Timestamp` with timezone (GH13565).
- `Panel.to_sparse()` will raise a `NotImplementedError` exception when called (GH13778).
- `.filter()` enforces mutual exclusion of the keyword arguments (GH12399).
- `eval`'s upcasting rules for `float32` types have been updated to be more consistent with NumPy's rules. New behavior will not upcast to `float64` if you multiply a pandas `float32` object by a scalar `float64` (GH12388).
- An `UnsupportedFunctionCall` error is now raised if NumPy ufuncs like `np.mean` are called on groupby or resample objects (GH12811).
- `__setitem__` will no longer apply a callable rhs as a function instead of storing it. Call `where` directly to get the previous behavior (GH13299).
- Calls to `.sample()` will respect the random seed set via `numpy.random.seed(n)` (GH13161)
• **Styler.apply** is now more strict about the outputs your function must return. For `axis=0` or `axis=1`, the output shape must be identical. For `axis=None`, the output must be a DataFrame with identical columns and index labels (GH13222).

• Float64Index.astype(int) will now raise `ValueError` if Float64Index contains NaN values (GH13149).

• TimedeltaIndex.astype(int) and DatetimeIndex.astype(int) will now return Int64Index instead of np.array (GH13209).

• Passing Period with multiple frequencies to normal Index now returns Index with object dtype (GH13664).

• PeriodIndex.fillna with Period has different freq now coerces to object dtype (GH13664).

• Faceted boxplots from DataFrame.boxplot(by=col) now return a Series when return_type is not None. Previously these returned an OrderedDict. Note that when return_type=None, the default, these still return a 2-D NumPy array (GH12216, GH7096).

• pd.read_hdf will now raise a `ValueError` instead of KeyError, if a mode other than r, r+ and a is supplied. (GH13623)

• pd.read_csv(), pd.read_table(), and pd.read_hdf() raise the built-in `FileNotFoundError` exception for Python 3.x when called on a nonexistent file; this is back-ported as IOError in Python 2.x (GH14086).

• More informative exceptions are passed through the csv parser. The exception type would now be the original exception type instead of CParserError (GH13652).

• pd.read_csv() in the C engine will now issue a ParserWarning or raise a ValueError when sep encoded is more than one character long (GH14065).

• DataFrame.values will now return float64 with a DataFrame of mixed int64 and uint64 dtypes, conforming to np.find_common_type (GH10364, GH13917).

• GroupBy.groups will now return a dictionary of Index objects, rather than a dictionary of np.ndarray or lists (GH14293).

**Deprecations**

• Series.reshape and Categorical.reshape have been deprecated and will be removed in a subsequent release (GH12882, GH12882).

• PeriodIndex.to_datetime has been deprecated in favor of PeriodIndex.to_timestamp (GH8254).

• Timestamp.to_datetime has been deprecated in favor of Timestamp.to_pydatetime (GH8254).

• Index.to_datetime and DatetimeIndex.to_datetime have been deprecated in favor of pd.to_datetime (GH8254).

• pandas.core.datetools module has been deprecated and will be removed in a subsequent release (GH14094).

• SparseList has been deprecated and will be removed in a future version (GH13784)

• DataFrame.to_html() and DataFrame.to_latex() have dropped the colSpace parameter in favor of col_space (GH13857).

• DataFrame.to_sql() has deprecated the flavor parameter, as it is superfluous when SQLAlchemy is not installed (GH13611).

• Deprecated read_csv keywords:
  - compact_ints and use_unsigned have been deprecated and will be removed in a future version (GH13320)
  - buffer_lines has been deprecated and will be removed in a future version (GH13360)
pandas: powerful Python data analysis toolkit, Release 1.3.5

- `as_recarray` has been deprecated and will be removed in a future version (GH13373)
- `skip_footer` has been deprecated in favor of `skipfooter` and will be removed in a future version (GH13349)

- `top-level pd.ordered_merge()` has been renamed to `pd.merge_ordered()` and the original name will be removed in a future version (GH13358)
- `Timestamp.offset` property (and named arg in the constructor), has been deprecated in favor of `freq` (GH12160)
- `pd.tseries.util.pivot_annual` is deprecated. Use `pivot_table` as alternative, an example is here (GH736)
- `pd.tseries.util.isleapyear` has been deprecated and will be removed in a subsequent release. Datetime-likes now have a `.is_leap_year` property (GH13727)
- `Panel4D` and `PanelND` constructors are deprecated and will be removed in a future version. The recommended way to represent these types of n-dimensional data are with the `xarray` package. pandas provides a `to_xarray()` method to automate this conversion.
- `pandas.tseries.frequencies.get_standard_freq` is deprecated. Use `pandas.tseries.frequencies.to_offset(freq).rule_code` instead (GH13874)
- `pandas.tseries.frequencies.to_offset`’s `freqstr` keyword is deprecated in favor of `freq` (GH13874)
- `Categorical.from_array` has been deprecated and will be removed in a future version (GH13854)

Removal of prior version deprecations/changes

- The `SparsePanel` class has been removed (GH13778)
- The `pd.sandbox` module has been removed in favor of the external library `pandas-qt` (GH13670)
- The `pandas.io.data` and `pandas.io.wb` modules are removed in favor of the `pandas-datareader` package (GH13724).
- The `pd.DataFrame.rplot` module has been removed in favor of the `seaborn` package (GH13855)
- `DataFrame.to_csv()` has dropped the `engine` parameter, as was deprecated in 0.17.1 (GH11274, GH13419)
- `DataFrame.to_dict()` has dropped the `outtype` parameter in favor of `orient` (GH13627, GH8486)
- `pd.Categorical` has dropped setting of the `ordered` attribute directly in favor of the `set_ordered` method (GH13671)
- `pd.Categorical` has dropped the `levels` attribute in favor of `categories` (GH8376)
- `DataFrame.to_sql()` has dropped the `mysql` option for the `flavor` parameter (GH13611)
- `Panel.shift()` has dropped the `lags` parameter in favor of `periods` (GH14041)
- `pd.Index` has dropped the `diff` method in favor of `difference` (GH13669)
- `pd.DataFrame` has dropped the `to_wide` method in favor of `to_panel` (GH14039)
- `Series.to_csv` has dropped the `nanRep` parameter in favor of `na_rep` (GH13804)
- `Series.xs`, `DataFrame.xs`, `Panel.xs`, `Panel.major_xs`, and `Panel.minor_xs` have dropped the `copy` parameter (GH13781)
- `str.split` has dropped the `return_type` parameter in favor of `expand` (GH13701)
• Removal of the legacy time rules (offset aliases), deprecated since 0.17.0 (this has been alias since 0.8.0) (GH13590, GH13868). Now legacy time rules raises ValueError. For the list of currently supported offsets, see here.

• The default value for the return_type parameter for DataFrame.plot.box and DataFrame.boxplot changed from None to "axes". These methods will now return a matplotlib axes by default instead of a dictionary of artists. See here (GH6581).

• The tquery and uquery functions in the pandas.io.sql module are removed (GH5950).

Performance improvements

• Improved performance of sparse IntIndex.intersect (GH13082)
• Improved performance of sparse arithmetic with BlockIndex when the number of blocks are large, though recommended to use IntIndex in such cases (GH13082)
• Improved performance of DataFrame.quantile() as it now operates per-block (GH11623)
• Improved performance of float64 hash table operations, fixing some very slow indexing and groupby operations in python 3 (GH13166, GH13334)
• Improved performance of DataFrameGroupBy.transform (GH12737)
• Improved performance of Index and Series.duplicated (GH10235)
• Improved performance of Index.difference (GH12044)
• Improved performance of RangeIndex.is_monotonic_increasing and is_monotonic_decreasing (GH13749)
• Improved performance of DatetimeIndex (GH13692)
• Improved performance of hashing Period (GH12817)
• Improved performance of factorize of datetime with timezone (GH13750)
• Improved performance of by lazily creating indexing hashtables on larger Indexes (GH14266)
• Improved performance of groupby.groups (GH14293)
• Unnecessary materializing of a MultiIndex when introspecting for memory usage (GH14308)

Bug fixes

• Bug in groupby().shift(), which could cause a segfault or corruption in rare circumstances when grouping by columns with missing values (GH13813)
• Bug in groupby().cumsum() calculating cumprod when axis=1. (GH13994)
• Bug in pd.to_timedelta() in which the errors parameter was not being respected (GH13613)
• Bug in io.json.json_normalize(), where non-ascii keys raised an exception (GH13213)
• Bug when passing a not-default-indexed Series as xerr or yerr in .plot() (GH11858)
• Bug in area plot draws legend incorrectly if subplot is enabled or legend is moved after plot (matplotlib 1.5.0 is required to draw area plot legend properly) (GH9161, GH13544)
• Bug in DataFrame assignment with an object-dtyped Index where the resultant column is mutable to the original object. (GH13522)
• Bug in matplotlib AutoDataFormatter; this restores the second scaled formatting and re-adds micro-second scaled formatting (GH13131)
- Bug in selection from a HDFStore with a fixed format and start and/or stop specified will now return the selected range (GH8287)
- Bug in Categorical.from_codes() where an unhelpful error was raised when an invalid ordered parameter was passed in (GH14058)
- Bug in Series construction from a tuple of integers on windows not returning default dtype (int64) (GH13646)
- Bug in TimedeltaIndex addition with a Datetime-like object where addition overflow was not being caught (GH14068)
- Bug in .groupby(..).resample(..) when the same object is called multiple times (GH13174)
- Bug in .to_records() when index name is a unicode string (GH13172)
- Bug in calling .memory_usage() on object which doesn’t implement (GH12924)
- Regression in Series.quantile with nans (also shows up in .median() and .describe() ); furthermore now names the Series with the quantile (GH13098, GH13146)
- Bug in SeriesGroupBy.transform with datetime values and missing groups (GH13191)
- Bug where empty Series were incorrectly coerced in datetime-like numeric operations (GH13844)
- Bug in Categorical constructor when passed a Categorical containing datetimes with timezones (GH14190)
- Bug in Series.str.extractall() with str index raises ValueError (GH13156)
- Bug in Series.str.extractall() with single group and quantifier (GH13382)
- Bug in DatetimeIndex and Period subtraction raises ValueError or AttributeError rather than TypeError (GH13078)
- Bug in Index and Series created with NaN and NaT mixed data may not have datetime64 dtype (GH13324)
- Bug in Index and Series may ignore np.datetime64('nat') and np.timedelta64('nat') to infer dtype (GH13324)
- Bug in PeriodIndex and Period subtraction raises AttributeError (GH13071)
- Bug in PeriodIndex construction returning a float64 index in some circumstances (GH13067)
- Bug in .resample(..) with a PeriodIndex not changing its freq appropriately when empty (GH13067)
- Bug in .resample(..) with a PeriodIndex not retaining its type or name with an empty DataFrame appropriately when empty (GH13212)
- Bug in groupby(..).apply(..) when the passed function returns scalar values per group (GH13468).
- Bug in groupby(..).resample(..) where passing some keywords would raise an exception (GH13235)
- Bug in .tz_convert on a tz-aware DateTimeIndex that relied on index being sorted for correct results (GH13306)
- Bug in .tz_localize with dateutil.tz.tzlocal may return incorrect result (GH13583)
- Bug in DatetimeTZDtype dtype with dateutil.tz.tzlocal cannot be regarded as valid dtype (GH13583)
- Bug in pd.read_hdf() where attempting to load an HDF file with a single dataset, that had one or more categorical columns, failed unless the key argument was set to the name of the dataset. (GH13231)
- Bug in .rolling() that allowed a negative integer window in construction of the Rolling() object, but would later fail on aggregation (GH13383)
- Bug in Series indexing with tuple-valued data and a numeric index (GH13509)
- Bug in printing pd.DataFrame where unusual elements with the object dtype were causing segfaults (GH13717)
- Bug in ranking Series which could result in segfaults (GH13445)
- Bug in various index types, which did not propagate the name of passed index (GH12309)
- Bug in DatetimeIndex, which did not honour the copy=True (GH13205)
- Bug in DatetimeIndex.is_normalized returns incorrectly for normalized date_range in case of local timezones (GH13459)
- Bug in pd.concat and .append may coerce datetime64 and timedelta to object dtype containing python built-in datetime or timedelta rather than Timestamp or Timedelta (GH13626)
- Bug in PeriodIndex.append may raise AttributeError when the result is object dtype (GH13221)
- Bug in CategoricalIndex.append may accept normal list (GH13626)
- Bug in pd.concat and .append with the same timezone get reset to UTC (GH7795)
- Bug in Series and DataFrame .append raises AmbiguousTimeError if data contains datetime near DST boundary (GH13626)
- Bug in DataFrame.to_csv() in which float values were being quoted even though quotations were specified for non-numeric values only (GH12922, GH13259)
- Bug in DataFrame.describe() raising ValueError with only boolean columns (GH13898)
- Bug in MultiIndex slicing where extra elements were returned when level is non-unique (GH12896)
- Bug in .str.replace does not raise TypeError for invalid replacement (GH13438)
- Bug in MultiIndex.from_arrays which didn't check for input array lengths matching (GH13599)
- Bug in cartesian_product and MultiIndex.from_product which may raise with empty input arrays (GH12258)
- Bug in pd.read_csv() which may cause a segfault or corruption when iterating in large chunks over a stream/file under rare circumstances (GH13703)
- Bug in pd.read_csv() which caused errors to be raised when a dictionary containing scalars is passed in for na_values (GH12224)
- Bug in pd.read_csv() which caused BOM files to be incorrectly parsed by not ignoring the BOM (GH4793)
- Bug in pd.read_csv() with engine='python' which raised errors when a numpy array was passed in for usecols (GH12546)
- Bug in pd.read_csv() where the index columns were being incorrectly parsed when parsed as dates with a thousands parameter (GH14066)
- Bug in pd.read_csv() with engine='python' in which NaN values weren't being detected after data was converted to numeric values (GH13314)
- Bug in pd.read_csv() in which the nrows argument was not properly validated for both engines (GH10476)
- Bug in pd.read_csv() with engine='python' in which infinities of mixed-case forms were not being interpreted properly (GH13274)
- Bug in pd.read_csv() with engine='python' in which trailing NaN values were not being parsed (GH13320)
- Bug in pd.read_csv() with engine='python' when reading from a tempfile.TemporaryFile on Windows with Python 3 (GH13398)
- Bug in pd.read_csv() that prevents usecols kwarg from accepting single-byte unicode strings (GH13219)
- Bug in pd.read_csv() that prevents usecols from being an empty set (GH13402)
- Bug in pd.read_csv() in the C engine where the NULL character was not being parsed as NULL (GH14012)
• Bug in `pd.read_csv()` with engine='c' in which NULL quotechar was not accepted even though quoting was specified as None (GH13411)
• Bug in `pd.read_csv()` with engine='c' in which fields were not properly cast to float when quoting was specified as non-numeric (GH13411)
• Bug in `pd.read_csv()` in Python 2.x with non-UTF8 encoded, multi-character separated data (GH3404)
• Bug in `pd.read_csv()`, where aliases for utf-xx (e.g. UTF-xx, UTF_xx, utf_xx) raised UnicodeDecodeError (GH13549)
• Bug in `pd.read_csv`, `pd.read_table`, `pd.read_fwf`, `pd.read_stata` and `pd.read_sas` where files were opened by parsers but not closed if both chunksize and iterator were None. (GH13940)
• Bug in `StataReader`, `StataWriter`, `XportReader` and `SAS7BDATReader` where a file was not properly closed when an error was raised. (GH13940)
• Bug in `pd.pivot_table()` where margins_name is ignored when aggfunc is a list (GH13354)
• Bug in `pd.Series.str.zfill`, `center`, `ljust`, `rjust`, and `pad` when passing non-integers, did not raise TypeError (GH13598)
• Bug in checking for any null objects in a TimedeltaIndex, which always returned True (GH13603)
• Bug in Series arithmetic raises TypeError if it contains datetime-like as object dtype (GH13043)
• Bug in `Series.isnull()` and `Series.notnull()` ignore Period('NaT') (GH13737)
• Bug in `Series.fillna()` and `Series.dropna()` don't affect to Period('NaT') (GH13737)
• Bug in `Series` where prohibited values were matched by IPython introspection (GH13618)
• Bug in `Series` comparison may output incorrect result if it contains `NaT` (GH13592)
• Bug in `Series` comparison operators when dealing with zero dim NumPy arrays (GH13006)
• Bug in `.combine_first` may return incorrect dtype (GH7630, GH10567)
• Bug in `groupby` where `apply` returns different result depending on whether first result is `None` or not (GH12824)
• Bug in `groupby(...).nth()` where the group key is included inconsistently if called after `.head()`/.`tail()` (GH12839)
• Bug in `.to_html`, `.to_latex` and `.to_string` silently ignore custom datetime formatter passed through the `formatters` key word (GH10690)
• Bug in `DateTimeIndex` with nanosecond frequency does not include timestamp specified with `end` (GH13672)
• Bug in Index creation with tz-aware `Timestamp` and mismatched tz option incorrectly coerces timezone (GH13692)
• Bug in `pd.isnull()`pd.notnull() raise TypeError if input datetime-like has other unit than ns (GH13389)
• Bug in `pd.merge()` may raise TypeError if input datetime-like has other unit than ns (GH13389)
• Bug in `HDFStore/read_hdf()` discarded `DatetimeIndex.name` if tz was set (GH13884)
• Bug in `Categorical.remove_unused_categories()` changes `.codes` dtype to platform int (GH13261)
• Bug in groupby with `as_index=False` returns all NaN’s when grouping on multiple columns including a categorical one (GH13204)
• Bug in `df.groupby(...)[...]` where getitem with `Int64Index` raised an error (GH13731)
• Bug in the CSS classes assigned to `DataFrame.style` for index names. Previously they were assigned "col_heading level<n> col<c>" where n was the number of levels + 1. Now they are assigned "index_name level<n>", where n is the correct level for that MultiIndex.
• Bug where `pd.read_gbq()` could throw `ImportError: No module named discovery` as a result of a naming conflict with another python package called apiclient (GH13454)
• Bug in `Index.union` returns an incorrect result with a named empty index (GH13432)
- Bugs in `Index.difference` and `DataFrame.join` raise in Python3 when using mixed-integer indexes (GH13432, GH12814)
- Bug in subtract tz-aware `datetime.datetime` from tz-aware `datetime64` series (GH14088)
- Bug in `.to_excel()` when DataFrame contains a MultiIndex which contains a label with a NaN value (GH13511)
- Bug in invalid frequency offset string like “D1”, “-2-3H” may not raise `ValueError` (GH13930)
- Bug in `concat` and `groupby` for hierarchical frames with `RangeIndex` levels (GH13542).
- Bug in `Series.str.contains()` for Series containing only NaN values of object dtype (GH14171)
- Bug in invalid frequency offset string like “D1”, “-2-3H” may not raise `ValueError` (GH13930)
- Bug in `concat` and `groupby` for hierarchical frames with `RangeIndex` levels (GH13542).
- Bug in `Series.str.contains()` for Series containing only NaN values of object dtype (GH14171)
- Bug in `agg()` function on groupby dataframe changes dtype of `datetime64[ns]` column to `float64` (GH12821)
- Bug in using NumPy ufunc with `PeriodIndex` to add or subtract integer raise `IncompatibleFrequency`. Note that using standard operator like + or - is recommended, because standard operators use more efficient path (GH13980)
- Bug in operations on NaT returning `float` instead of `datetime64[ns]` (GH12941)
- Bug in `Series` flexible arithmetic methods (like `.add()`) raises `ValueError` when `axis=None` (GH13894)
- Bug in `DataFrame.to_csv()` with MultiIndex columns in which a stray empty line was added (GH6618)
- Bug in `DatetimeIndex`, `TimedeltaIndex` and `PeriodIndex.equals()` may return True when input isn't `Index` but contains the same values (GH13107)
- Bug in assignment against datetime with timezone may not work if it contains datetime near DST boundary (GH14146)
- Bug in `pd.eval()` and `HDFStore` query truncating long float literals with python 2 (GH14241)
- Bug in `Series` flexible arithmetic methods (like `.add()`) raises `ValueError` when `axis=None` (GH13894)
- Bug in `Index.copy()` where `name` parameter was ignored (GH14302)

5.12 Version 0.18

5.12.1 Version 0.18.1 (May 3, 2016)

This is a minor bug-fix release from 0.18.0 and includes a large number of bug fixes along with several new features, enhancements, and performance improvements. We recommend that all users upgrade to this version.

Highlights include:

- `.groupby(...)` has been enhanced to provide convenient syntax when working with `.rolling(..), .expanding(..) and `.resample(..)` per group, see [here](#).
- `pd.to_datetime()` has gained the ability to assemble dates from a DataFrame, see [here](#).
- Method chaining improvements, see [here](#).
- Custom business hour offset, see [here](#).
- Many bug fixes in the handling of `sparse`, see [here](#).
- Expanded the `Tutorials section` with a feature on modern pandas, courtesy of @TomAugsburger. (GH13045).

What’s new in v0.18.1

- **New features**
  - **Custom business hour**
  - Method `.groupby(..)` syntax with window and resample operations
  - Method chaining improvements
    * Methods `.where()` and `.mask()`
    * Methods `.loc[], .iloc[], .ix[]`
    * Indexing with ````
  - Partial string indexing on `DatetimeIndex` when part of a `MultiIndex`
- Assembling datetimes
- Other enhancements

  * Sparse changes
- API changes
  - Method .groupby(..).nth() changes
  - NumPy function compatibility
  - Using .apply on GroupBy resampling
  - Changes in read_csv exceptions
  - Method to_datetime error changes
  - Other API changes
  - Deprecations

- Performance improvements
- Bug fixes
- Contributors

New features

Custom business hour

The CustomBusinessHour is a mixture of BusinessHour and CustomBusinessDay which allows you to specify arbitrary holidays. For details, see Custom Business Hour (GH11514)

```
In [1]: from pandas.tseries.offsets import CustomBusinessHour
In [2]: from pandas.tseries.holiday import USFederalHolidayCalendar
In [3]: bhour_us = CustomBusinessHour(calendar=USFederalHolidayCalendar())
```

Friday before MLK Day

```
In [4]: import datetime
In [5]: dt = datetime.datetime(2014, 1, 17, 15)
In [6]: dt + bhour_us
Out[6]: Timestamp('2014-01-17 16:00:00')
```

Tuesday after MLK Day (Monday is skipped because it’s a holiday)

```
In [7]: dt + bhour_us * 2
Out[7]: Timestamp('2014-01-21 09:00:00')
```
**Method `.groupby()` syntax with window and resample operations**

`.groupby()` has been enhanced to provide convenient syntax when working with `.rolling()`, `.expanding()` and `.resample()` per group, see (GH12486, GH12738).

You can now use `.rolling()` and `.expanding()` as methods on groupbys. These return another deferred object (similar to what `.rolling()` and `.expanding()` do on ungrouped pandas objects). You can then operate on these `RollingGroupby` objects in a similar manner.

Previously you would have to do this to get a rolling window mean per-group:

```
In [8]: df = pd.DataFrame(  
              "B": np.arange(40))
In [9]: df
Out[9]:  
   A  B
0  1  0
1  1  1
2  1  2
3  1  3
4  1  4
...  ...  ...
35 3  35
36 3  36
37 3  37
38 3  38
39 3  39
[40 rows x 2 columns]
```

```
In [10]: df.groupby("A").apply(lambda x: x.rolling(4).B.mean())
Out[10]:  
      A
0   NaN
1   NaN
2   NaN
3  1.5
4  2.5
...  ...
35 33.5
36 34.5
37 35.5
38 36.5
39 37.5
Name: B, Length: 40, dtype: float64
```

Now you can do:

```
In [11]: df.groupby("A").rolling(4).B.mean()
Out[11]:  
      A
0   NaN
1   NaN
2   NaN
(continues on next page)
```
For `.resample(...)` type of operations, previously you would have to:

```
In [12]: df = pd.DataFrame(
    .....:   {  
    .....:     "date": pd.date_range(start="2016-01-01", periods=4, freq="W"),  
    .....:     "group": [1, 1, 2, 2],  
    .....:     "val": [5, 6, 7, 8],  
    .....:   }  
    .....: ).set_index("date")
    .....:
```

```
In [13]: df
Out[13]:
   group  val
  date
2016-01-03  1  5
2016-01-10  1  6
2016-01-17  2  7
2016-01-24  2  8
```

```
In [14]: df.groupby("group").apply(lambda x: x.resample("1D").ffill())
Out[14]:
   group  val
  date
1  2016-01-03  1  5
    2016-01-04  1  5
    2016-01-05  1  5
    2016-01-06  1  5
    2016-01-07  1  5
2  2016-01-20  2  7
    2016-01-21  2  7
    2016-01-22  2  7
    2016-01-23  2  7
    2016-01-24  2  8
```

Now you can do:
In [15]: df.groupby("group").resample("1D").ffill()

Out[15]:

<table>
<thead>
<tr>
<th>group</th>
<th>date</th>
<th>val</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>2016-01-03</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td>2016-01-04</td>
<td>1</td>

<td>2</td>
</tr>
<tr>
<td></td>
<td>2016-01-24</td>
<td>2</td>
</tr>
</tbody>
</table>

[16 rows x 2 columns]

Method chaining improvements

The following methods / indexers now accept a callable. It is intended to make these more useful in method chains, see the documentation. (GH11485, GH12533)

- `.where()` and `.mask()`
- `.loc[]`, `.iloc[]` and `.ix[]`
- `[]` indexing

Methods `.where()` and `.mask()`

These can accept a callable for the condition and other arguments.

In [16]: df = pd.DataFrame({"A": [1, 2, 3], "B": [4, 5, 6], "C": [7, 8, 9]})

In [17]: df.where(lambda x: x > 4, lambda x: x + 10)

Out[17]:

<table>
<thead>
<tr>
<th>A</th>
<th>B</th>
<th>C</th>
</tr>
</thead>
<tbody>
<tr>
<td>11</td>
<td>14</td>
<td>7</td>
</tr>
<tr>
<td>12</td>
<td>5</td>
<td>8</td>
</tr>
<tr>
<td>13</td>
<td>6</td>
<td>9</td>
</tr>
</tbody>
</table>

[3 rows x 3 columns]
Methods `.loc[]`, `.iloc[]`, `.ix[]`

These can accept a callable, and a tuple of callable as a slicer. The callable can return a valid boolean indexer or anything which is valid for these indexer's input.

```python
# callable returns bool indexer
In [18]: df.loc[lambda x: x.A >= 2, lambda x: x.sum() > 10]
Out[18]:
   B  C
0  5  8
1  6  9
[2 rows x 2 columns]

# callable returns list of labels
In [19]: df.loc[lambda x: [1, 2], lambda x: ["A", "B"]]
Out[19]:
   A  B
0  2  5
1  3  6
[2 rows x 2 columns]
```

Indexing with `[]`

Finally, you can use a callable in [] indexing of Series, DataFrame and Panel. The callable must return a valid input for [] indexing depending on its class and index type.

```python
In [20]: df[lambda x: "A"]
Out[20]:
  0  1
0  1
1  2
2  3
Name: A, Length: 3, dtype: int64
```

Using these methods / indexers, you can chain data selection operations without using temporary variable.

```python
In [21]: bb = pd.read_csv("data/baseball.csv", index_col="id")
In [22]: (bb.groupby(["year", "team"]).sum().loc[lambda df: df.r > 100])
Out[22]:
          stint  g  ab   r   h  X2b  X3b  hr  rbi  sb  cs  bb  so  ibb  →  hbp  sh  sf  gidp  →
year  team

(continues on next page)
```
Partial string indexing now matches on `DateTimeIndex` when part of a `MultiIndex` (GH10331)

```
In [23]: dft2 = pd.DataFrame(
    ....:     np.random.randn(20, 1),
    ....:     columns=["A"],
    ....:     index=pd.MultiIndex.from_product(
    ....:         [pd.date_range("20130101", periods=10, freq="12H"), ["a", "b"]
    ....:     ),
    ....:     )
    ....:

In [24]: dft2
Out[24]:
     A

Assembling datetimes

pd.to_datetime() has gained the ability to assemble datetimes from a passed in DataFrame or a dict. (GH8158).

In [30]: df = pd.DataFrame(
   ...:   {"year": [2015, 2016], "month": [2, 3], "day": [4, 5], "hour": [2, 3]}
   ...: )

In [31]: df
Out[31]:
   year  month  day  hour
0  2015      2   4    2
1  2016      3   5    3

[2 rows x 4 columns]

Assembling using the passed frame.
In [32]: pd.to_datetime(df)
Out[32]:
0  2015-02-04 02:00:00
1  2016-03-05 03:00:00
Length: 2, dtype: datetime64[ns]

You can pass only the columns that you need to assemble.

In [33]: pd.to_datetime(df["year", "month", "day"])  
Out[33]:
0  2015-04-02
1  2016-03-05
Length: 2, dtype: datetime64[ns]

Other enhancements

- `pd.read_csv()` now supports `delim_whitespace=True` for the Python engine (GH12958)
- `pd.read_csv()` now supports opening ZIP files that contains a single CSV, via extension inference or explicit `compression='zip'` (GH12175)
- `pd.read_csv()` now supports opening files using xz compression, via extension inference or explicit `compression='xz'` is specified; xz compressions is also supported by `DataFrame.to_csv` in the same way (GH11852)
- `pd.read_msgpack()` now always gives writeable ndarrays even when compression is used (GH12359).
- `pd.read_msgpack()` now supports serializing and de-serializing categoricals with msgpack (GH12573)
- `.to_json()` now supports `NDFrames` that contain categorical and sparse data (GH10778)
- `interpolate()` now supports method='akima' (GH7588).
- `pd.read_excel()` now accepts path objects (e.g. `pathlib.Path`, `py.path.local`) for the file path, in line with other `read_*` functions (GH12655)
- Added `.weekday_name` property as a component to `DatetimeIndex` and the `.dt` accessor. (GH11128)
- `Index.take` now handles `allow_fill` and `fill_value` consistently (GH12631)

In [34]: idx = pd.Index([1.0, 2.0, 3.0, 4.0], dtype="float")
# default, allow_fill=True, fill_value=None
In [35]: idx.take([2, -1])
Out[35]: Float64Index([3.0, 4.0], dtype='float64')
In [36]: idx.take([2, -1], fill_value=True)
Out[36]: Float64Index([3.0, nan], dtype='float64')

- `Index` now supports `.str.get_dummies()` which returns `MultiIndex`, see Creating Indicator Variables (GH10008, GH10103)

In [37]: idx = pd.Index(['a|b', 'a|c', 'b|c'])
In [38]: idx.str.get_dummies("|")
Out[38]:
(continues on next page)
MultiIndex([(1, 1, 0), 
(1, 0, 1), 
(0, 1, 1)],
    names=['a', 'b', 'c'])

• pd.crosstab() has gained a normalize argument for normalizing frequency tables (GH12569). Examples in the updated docs here.
• .resample(..).interpolate() is now supported (GH12925)
• .isin() now accepts passed sets (GH12988)

Sparse changes

These changes conform sparse handling to return the correct types and work to make a smoother experience with indexing.

SparseArray.take now returns a scalar for scalar input, SparseArray for others. Furthermore, it handles a negative indexer with the same rule as Index (GH10560, GH12796)

```python
s = pd.SparseArray([np.nan, np.nan, 1, 2, 3, np.nan, 4, 5, np.nan, 6])
s.take(0)
s.take([1, 2, 3])
```

• Bug in SparseSeries[] indexing with Ellipsis raises KeyError (GH9467)
• Bug in SparseArray[] indexing with tuples are not handled properly (GH12966)
• Bug in SparseSeries.loc[] with list-like input raises TypeError (GH10560)
• Bug in SparseSeries.iloc[] with scalar input may raise IndexError (GH10560)
• Bug in SparseSeries.loc[], .iloc[] with slice returns SparseArray, rather than SparseSeries (GH10560)
• Bug in SparseDataFrame.loc[], .iloc[] may results in dense Series, rather than SparseSeries (GH12787)
• Bug in SparseArray addition ignores fill_value of right hand side (GH12910)
• Bug in SparseArray mod raises AttributeError (GH12910)
• Bug in SparseArray pow calculates 1 ** np.nan as np.nan which must be 1 (GH12910)
• Bug in SparseArray comparison output may incorrect result or raise ValueError (GH12971)
• Bug in SparseSeries.__repr__ raises TypeError when it is longer than max_rows (GH10560)
• Bug in SparseSeries.shape ignores fill_value (GH10452)
• Bug in SparseSeries and SparseArray may have different dtype from its dense values (GH12908)
• Bug in SparseSeries.reindex incorrectly handle fill_value (GH12797)
• Bug in SparseArray.to_frame() results in DataFrame, rather than SparseDataFrame (GH9850)
• Bug in SparseSeries.value_counts() does not count fill_value (GH6749)
• Bug in SparseArray.to_dense() does not preserve dtype (GH10648)
• Bug in SparseArray.to_dense() incorrectly handle fill_value (GH12797)
• Bug in pd.concat() of SparseSeries results in dense (GH10536)
pandas: powerful Python data analysis toolkit, Release 1.3.5

- Bug in pd.concat() of SparseDataFrame incorrectly handle fill_value (GH9765)
- Bug in pd.concat() of SparseDataFrame may raise AttributeError (GH12174)
- Bug in SparseArray.shift() may raise NameError or TypeError (GH12908)

API changes

Method .groupby(..).nth() changes

The index in .groupby(..).nth() output is now more consistent when the as_index argument is passed (GH11039):

```
In [39]: df = pd.DataFrame({"A": ["a", "b", "a"], "B": [1, 2, 3]})

In [40]: df
Out[40]:
   A B
0  a 1
1  b 2
2  a 3
[3 rows x 2 columns]
```

Previous behavior:

```
In [3]: df.groupby('A', as_index=True)['B'].nth(0)
Out[3]:
     0
Name: B, dtype: int64

In [4]: df.groupby('A', as_index=False)['B'].nth(0)
Out[4]:
     0
Name: B, dtype: int64
```

New behavior:

```
In [41]: df.groupby("A", as_index=True)["B"].nth(0)
Out[41]:
     A
    a  1
   b  2
Name: B, Length: 2, dtype: int64

In [42]: df.groupby("A", as_index=False)["B"].nth(0)
Out[42]:
     0
Name: B, Length: 2, dtype: int64
```

Furthermore, previously, a .groupby would always sort, regardless if sort=False was passed with .nth().
In [43]: np.random.seed(1234)
In [44]: df = pd.DataFrame(np.random.randn(100, 2), columns=['a', 'b'])
In [45]: df['c'] = np.random.randint(0, 4, 100)

Previous behavior:

In [4]: df.groupby('c', sort=True).nth(1)
Out[4]:
       a    b
     c
   0 -0.334077  0.002118
   1  0.036142 -2.074978
   2 -0.720589  0.887163
   3  0.859588 -0.636524

In [5]: df.groupby('c', sort=False).nth(1)
Out[5]:
       a    b
     c
   0 -0.334077  0.002118
   1  0.036142 -2.074978
   2 -0.720589  0.887163
   3  0.859588 -0.636524

New behavior:

In [46]: df.groupby('c', sort=True).nth(1)
Out[46]:
       a    b
     c
   0 -0.334077  0.002118
   1  0.036142 -2.074978
   2 -0.720589  0.887163
   3  0.859588 -0.636524

[4 rows x 2 columns]

In [47]: df.groupby('c', sort=False).nth(1)
Out[47]:
       a    b
     c
   2 -0.720589  0.887163
   3  0.859588 -0.636524
   0 -0.334077  0.002118
   1  0.036142 -2.074978

[4 rows x 2 columns]
NumPy function compatibility

Compatibility between pandas array-like methods (e.g. `sum` and `take`) and their `numpy` counterparts has been greatly increased by augmenting the signatures of the pandas methods so as to accept arguments that can be passed in from `numpy`, even if they are not necessarily used in the pandas implementation (GH12644, GH12638, GH12687):

- `.searchsorted()` for `Index` and `TimedeltaIndex` now accept a `sorter` argument to maintain compatibility with `numpy`'s `.searchsorted` function (GH12238)
- Bug in `numpy` compatibility of `np.round()` on a `Series` (GH12600)

An example of this signature augmentation is illustrated below:

```python
sp = pd.SparseDataFrame([1, 2, 3])
sp
```

Previous behaviour:

```python
In [2]: np.cumsum(sp, axis=0)
...:
TypeError: cumsum() takes at most 2 arguments (4 given)
```

New behaviour:

```python
np.cumsum(sp, axis=0)
```

Using `.apply` on GroupBy resampling

Using `apply` on resampling groupby operations (using a `pd.TimeGrouper`) now has the same output types as similar `apply` calls on other groupby operations. (GH11742).

```python
In [48]: df = pd.DataFrame(
    .....:    {"date": pd.to_datetime(["10/10/2000", "11/10/2000"]), "value": [10, 13]}
    .....: )
    .....:
In [49]: df
Out[49]:
    date  value
0 2000-10-10  10
1 2000-11-10  13
[2 rows x 2 columns]
```

Previous behavior:

```python
In [1]: df.groupby(pd.TimeGrouper(key='date',
    .....:     freq='M')).apply(lambda x: x.value.sum())
Out[1]:
...:
TypeError: cannot concatenate a non-NDFrame object
# Output is a Series
In [2]: df.groupby(pd.TimeGrouper(key='date',
```
...
Out[2]:
date       
2000-10-31 10  
2000-11-30 13  
dtype: int64

New behavior:

# Output is a Series
In [55]: df.groupby(pd.TimeGrouper(key='date',
                    ...: freq='M')).apply(lambda x: x[['value']].sum())
Out[55]:
date       
2000-10-31 10  
2000-11-30 13  
Freq: M, dtype: int64

# Output is a DataFrame
In [56]: df.groupby(pd.TimeGrouper(key='date',
                    ...: freq='M')).apply(lambda x: x[['value']].sum())
Out[56]:
   value
date       
2000-10-31 10  
2000-11-30 13

Changes in read_csv exceptions

In order to standardize the read_csv API for both the c and python engines, both will now raise an EmptyDataError, a subclass of ValueError, in response to empty columns or header (GH12493, GH12506)

Previous behaviour:

In [1]: import io
In [2]: df = pd.read_csv(io.StringIO(''), engine='c')
...: ValueError: No columns to parse from file
In [3]: df = pd.read_csv(io.StringIO(''), engine='python')
...: StopIteration

New behaviour:

In [1]: df = pd.read_csv(io.StringIO(''), engine='c')
...: pandas.io.common.EmptyDataError: No columns to parse from file
In [2]: df = pd.read_csv(io.StringIO(''), engine='python')
In addition to this error change, several others have been made as well:

- CParserError now sub-classes ValueError instead of just a Exception (GH12551)
- A CParserError is now raised instead of a generic Exception in read_csv when the c engine cannot parse a column (GH12506)
- A ValueError is now raised instead of a generic Exception in read_csv when the c engine encounters a NaN value in an integer column (GH12506)
- A ValueError is now raised instead of a generic Exception in read_csv when true_values is specified, and the c engine encounters an element in a column containing unencodable bytes (GH12506)
- pandas.parser.OverflowError exception has been removed and has been replaced with Python’s built-in OverflowError exception (GH12506)
- pd.read_csv() no longer allows a combination of strings and integers for the usecols parameter (GH12678)

### Method to_datetime error changes

Bugs in pd.to_datetime() when passing a unit with convertible entries and errors='coerce' or non-convertible with errors='ignore'. Furthermore, an OutOfBoundsDateTime exception will be raised when an out-of-range value is encountered for that unit when errors='raise'. (GH11758, GH13052, GH13059)

Previous behaviour:

```
In [27]: pd.to_datetime(1420043460, unit='s', errors='coerce')
Out[27]: NaT
```

```
In [28]: pd.to_datetime(11111111, unit='D', errors='ignore')
OverflowError: Python int too large to convert to C long
```

```
In [29]: pd.to_datetime(11111111, unit='D', errors='raise')
OverflowError: Python int too large to convert to C long
```

New behaviour:

```
In [2]: pd.to_datetime(1420043460, unit='s', errors='coerce')
Out[2]: Timestamp('2014-12-31 16:31:00')
```

```
In [3]: pd.to_datetime(11111111, unit='D', errors='ignore')
Out[3]: 11111111
```

```
In [4]: pd.to_datetime(11111111, unit='D', errors='raise')
OutOfBoundsDatetime: cannot convert input with unit 'D'
```
Other API changes

- `.swaplevel()` for Series, DataFrame, Panel, and MultiIndex now features defaults for its first two parameters `i` and `j` that swap the two innermost levels of the index. (GH12934)
- `.searchsorted()` for Index and TimedeltaIndex now accept a `sorter` argument to maintain compatibility with numpys' `searchsorted` function (GH12238)
- Period and PeriodIndex now raises `IncompatibleFrequency` error which inherits `ValueError` rather than raw `ValueError` (GH12615)
- Series.apply for category dtype now applies the passed function to each of the `.categories` (and not the `.codes`), and returns a category dtype if possible (GH12473)
- `read_csv` will now raise a `TypeError` if `parse_dates` is neither a boolean, list, or dictionary (matches the doc-string) (GH5636)
- The default for `.query()/eval()` is now `engine=None`, which will use `numexpr` if it’s installed; otherwise it will fallback to the python engine. This mimics the pre-0.18.1 behavior if `numexpr` is installed (and which, previously, if numexpr was not installed, `.query()/eval()` would raise). (GH12749)
- `pd.show_versions()` now includes `pandas_datareader` version (GH12740)
- Provide a proper `__name__` and `__qualname__` attributes for generic functions (GH12021)
- `pd.concat(…)` now uses `RangeIndex` as default (GH12695)
- `pd.merge()` and DataFrame.join() will show a `UserWarning` when merging/joining a single- with a multi-leveled dataframe (GH9455, GH12219)
- Compat with scipy > 0.17 for deprecated `piecewise_polynominal` interpolation method; support for the replacement from_derivative method (GH12887)

Deprecations

- The method name `Index.sym_diff()` is deprecated and can be replaced by `Index.symmetric_difference()` (GH12591)
- The method name `Categorical.sort()` is deprecated in favor of `Categorical.sort_values()` (GH12882)

Performance improvements

- Improved speed of SAS reader (GH12656, GH12961)
- Performance improvements in `.groupby(…).cumcount()` (GH11039)
- Improved memory usage in `pd.read_csv()` when using `skiprows=an_integer` (GH13005)
- Improved performance of `DataFrame.to_sql` when checking case sensitivity for tables. Now only checks if table has been created correctly when table name is not lower case. (GH12876)
- Improved performance of Period construction and time series plotting (GH12903, GH11831).
- Improved performance of `.str.encode()` and `.str.decode()` methods (GH13008)
- Improved performance of `to_numeric` if input is numeric dtype (GH12777)
- Improved performance of sparse arithmetic with `IntIndex` (GH13036)
Bug fixes

- usecols parameter in `pd.read_csv` is now respected even when the lines of a CSV file are not even (GH12203)
- Bug in `groupby.transform(..)` when axis=1 is specified with a non-monotonic ordered index (GH12713)
- Bug in `Period` and `PeriodIndex` creation raises `KeyError` if `freq="Minute"` is specified. Note that “Minute” freq is deprecated in v0.17.0, and recommended to use `freq="T"` instead (GH11854)
- Bug in `.resample(...).count()` with a `PeriodIndex` always raising a `TypeError` (GH12774)
- Bug in `.resample(...)` with a `PeriodIndex` casting to a `DatetimeIndex` when empty (GH12868)
- Bug in `.resample(...)` with a `PeriodIndex` when resampling to an existing frequency (GH12770)
- Bug in printing data which contains `Period` with different `freq` raises `ValueError` (GH12615)
- Bug in `Series` construction with `Categorical` and `dtype='category'` is specified (GH12574)
- Bugs in concatenation with a coercible dtype was too aggressive, resulting in different dtypes in output formatting when an object was longer than `display.max_rows` (GH12411, GH12045, GH11594, GH10571, GH12211)
- Bug in `float_format` option with option not being validated as a callable. (GH12706)
- Bug in GroupBy.filter when dropna=False and no groups fulfilled the criteria (GH12768)
- Bug in __name__ of .cum* functions (GH12021)
- Bug in .astype() of a Float64Index/Int64Index to an Int64Index (GH12881)
- Bug in round tripping an integer based index in .to_json()/read_json() when orient='index' (the default) (GH12866)
- Bug in plotting Categorical dtypes cause error when attempting stacked bar plot (GH13019)
- Compat with >= numpy 1.11 for NaT comparisons (GH12969)
- Bug in .drop() with a non-unique MultiIndex. (GH12701)
- Bug in .concat() with a non-unique MultiIndex. (GH12467)
- Bug in correctly raising a `ValueError` in `.resample(..).fillna(..)` when passing a non-string (GH12952)
- Bug fixes in various encoding and header processing issues in `pd.read_sas()` (GH12659, GH12654, GH12647, GH12809)
- Bug in `pd.crosstab()` where would silently ignore aggfunc if values=None (GH12569).
- Potential segfault in DataFrame.to_json when serialising datetime.time (GH11473).
- Potential segfault in DataFrame.to_json when attempting to serialise 0d array (GH11299).
- Segfault in to_json when attempting to serialise a DataFrame or Series with non-ndarray values; now supports serialization of category, sparse, and datetime64[ns, tz] dtypes (GH10778).
- Bug in DataFrame.to_json with unsupported dtype not passed to default handler (GH12554).
- Bug in .align not returning the sub-class (GH12983)
- Bug in aligning a Series with a DataFrame (GH13037)
- Bug in ABCPanel in which Panel4D was not being considered as a valid instance of this generic type (GH12810)
- Bug in consistency of .name on .groupby(..).apply(..) cases (GH12363)
- Bug in Timestamp.__repr__ that caused pprint to fail in nested structures (GH12622)
- Bug in Timedelta.min and Timedelta.max, the properties now report the true minimum/maximum timedeltas as recognized by pandas. See the documentation. (GH12727)
• Bug in `.quantile()` with interpolation may coerce to float unexpectedly (GH12772)
• Bug in `.quantile()` with empty Series may return scalar rather than empty Series (GH12772)
• Bug in `.loc` with out-of-bounds in a large indexer would raise IndexError rather than KeyError (GH12527)
• Bug in resampling when using a TimedeltaIndex and `.asfreq()`, would previously not include the final fencepost (GH12926)
• Bug in equality testing with a Categorical in a DataFrame (GH12564)
• Bug in GroupBy.first(), .last() returns incorrect row when TimeGrouper is used (GH7453)
• Bug in pd.read_csv() with the c engine when specifying skiprows with newlines in quoted items (GH10911, GH12775)
• Bug in DataFrame timezone lost when assigning tz-aware datetime Series with alignment (GH12981)
• Bug in .value_counts() when normalize=True and dropna=True where nulls still contributed to the normalized count (GH12558)
• Bug in Series.value_counts() loses name if its dtype is category (GH12835)
• Bug in Series.value_counts() loses timezone info (GH12835)
• Bug in Series.value_counts(normalize=True) with Categorical raises UnboundLocalError (GH12835)
• Bug in Panel.fillna() ignoring inplace=True (GH12633)
• Bug in pd.read_csv() when specifying names, usecols, and parse_dates simultaneously with the c engine (GH9755)
• Bug in pd.read_csv() when specifying delim_whitespace=True and lineterminator simultaneously with the c engine (GH12912)
• Bug in Series.rename, DataFrame.rename and DataFrame.rename_axis not treating Series as mappings to relabel (GH12623).
• Clean in `.rolling.min` and `.rolling.max` to enhance dtype handling (GH12373)
• Bug in groupby where complex types are coerced to float (GH12902)
• Bug in Series.map raises TypeError if its dtype is category or tz-aware datetime (GH12473)
• Bugs on 32bit platforms for some test comparisons (GH12972)
• Bug in index coercion when falling back from RangeIndex construction (GH12893)
• Better error message in window functions when invalid argument (e.g. a float window) is passed (GH12669)
• Bug in slicing subclassed DataFrame defined to return subclassed Series may return normal Series (GH11559)
• Bug in `.str` accessor methods may raise ValueError if input has name and the result is DataFrame or MultiIndex (GH12617)
• Bug in DataFrame.last_valid_index() and DataFrame.first_valid_index() on empty frames (GH12800)
• Bug in CategoricalIndex.get_loc returns different result from regular Index (GH12531)
• Bug in PeriodIndex.resample where name not propagated (GH12769)
• Bug in date_range closed keyword and timezones (GH12684).
• Bug in pd.concat raises AttributeError when input data contains tz-aware datetime and timedelta (GH12620)
• Bug in `pd.concat` did not handle empty Series properly (GH11082)
• Bug in `.plot.bar` alignment when `width` is specified with `int` (GH12979)
• Bug in `fill_value` is ignored if the argument to a binary operator is a constant (GH12723)
• Bug in `pd.read_html()` when using bs4 flavor and parsing table with a header and only one column (GH9178)
• Bug in `.pivot_table` when `margins=True` and `dropna=True` where nulls still contributed to margin count (GH12577)
• Bug in `.pivot_table` when `dropna=False` where table index/column names disappear (GH12133)
• Bug in `pd.crosstab()` when `margins=True` and `dropna=False` which raised (GH12642)
• Bug in `Series.name` when `name` attribute can be a hashable type (GH12610)
• Bug in `.describe()` resets categorical columns information (GH11558)
• Bug where `loffset` argument was not applied when calling `resample().count()` on a timeseries (GH12725)
• `pd.read_excel()` now accepts column names associated with keyword argument names (GH12870)
• Bug in `pd.to_numeric()` with Index returns `np.ndarray`, rather than `Index` (GH12777)
• Bug in `pd.to_numeric()` with datetime-like may raise `TypeError` (GH12777)
• Bug in `pd.to_numeric()` with scalar raises `ValueError` (GH12777)

5.12.2 Version 0.18.0 (March 13, 2016)

This is a major release from 0.17.1 and includes a small number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

**Warning:** pandas >= 0.18.0 no longer supports compatibility with Python version 2.6 and 3.3 (GH7718, GH11273)

**Warning:** numexpr version 2.4.4 will now show a warning and not be used as a computation back-end for pandas because of some buggy behavior. This does not affect other versions (>= 2.1 and >= 2.4.6). (GH12489)

Highlights include:

- Moving and expanding window functions are now methods on Series and DataFrame, similar to .groupby, see here.
- Adding support for a RangeIndex as a specialized form of the Int64Index for memory savings, see here.
- API breaking change to the .resample method to make it more .groupby like, see here.
- Removal of support for positional indexing with floats, which was deprecated since 0.14.0. This will now raise a TypeError, see here.
- The .to_xarray() function has been added for compatibility with the xarray package, see here.
- The read_sas function has been enhanced to read sas7bdat files, see here.
- Addition of the .str.extractall() method, and API changes to the .str.extract() method and .str.cat() method.
- pd.test() top-level nose test runner is available (GH4327).

Check the API Changes and deprecations before updating.
- Changes to `str.cat`
- Datetimelike rounding
- Formatting of integers in `FloatIndex`
- Changes to dtype assignment behaviors
- Method to `_xarray`
- Latex representation
- `pd.read_sas()` changes
- Other enhancements

• Backwards incompatible API changes
  - NaT and Timedelta operations
  - Changes to msgpack
  - Signature change for `.rank`
  - Bug in QuarterBegin with n=0
  - Resample API
    * Downsampling
    * Upsampling
    * Previous API will work but with deprecations
  - Changes to eval
  - Other API changes
  - Deprecations
  - Removal of deprecated float indexers
  - Removal of prior version deprecations/changes

• Performance improvements
• Bug fixes
• Contributors

**New features**

**Window functions are now methods**

Window functions have been refactored to be methods on `Series/DataFrame` objects, rather than top-level functions, which are now deprecated. This allows these window-type functions, to have a similar API to that of `.groupby`. See the full documentation [here](GH11603, GH12373)

```
In [1]: np.random.seed(1234)

In [2]: df = pd.DataFrame({'A': range(10), 'B': np.random.randn(10)})

In [3]: df
```
Out[3]:
   A    B
0  0  0.471435
1  1 -1.190976
2  2  1.432707
3  3 -0.312652
4  4 -0.720589
5  5  0.887163
6  6  0.859588
7  7 -0.636524
8  8  0.015696
9  9 -2.242685
[10 rows x 2 columns]

Previous behavior:

In [8]: pd.rolling_mean(df, window=3)

FutureWarning: pd.rolling_mean is deprecated for DataFrame and will be removed in a future version, replace with
DataFrame.rolling(window=3,center=False).mean()

Out[8]:
   A    B
0  NaN  NaN
1  NaN  NaN
2  1  0.237722
3  2 -0.023640
4  3  0.133155
5  4 -0.048693
6  5  0.342054
7  6  0.370076
8  7  0.079587
9  8 -0.954504

New behavior:

In [4]: r = df.rolling(window=3)

These show a descriptive repr

In [5]: r
Out[5]: Rolling [window=3,center=False,axis=0,method=single]

with tab-completion of available methods and properties.

In [9]: r.<TAB>  # noqa E225, E999
r.A          r.agg          r.apply          r.count          r.exclusions          r.max          r.
            r.median        r.name          r.skew          r.sum
r.B          r.aggregate     r.corr          r.cov           r.kurt          r.mean          r.
            r.min          r.quantile     r.std           r.var

The methods operate on the Rolling object itself
In [6]: r.mean()
Out[6]:
   A   B
0  NaN  NaN
1  NaN  NaN
2  1.0  0.237722
3  2.0  0.023640
4  3.0  0.133155
5  4.0  0.048693
6  5.0  0.342054
7  6.0  0.370076
8  7.0  0.079587
9  8.0  0.954504
[10 rows x 2 columns]

They provide getitem accessors

In [7]: r['A'].mean()
Out[7]:
   A
0  NaN
1  NaN
2  1.0
3  2.0
4  3.0
5  4.0
6  5.0
7  6.0
8  7.0
9  8.0
Name: A, Length: 10, dtype: float64

And multiple aggregations

In [8]: r.agg({'A': ['mean', 'std'],
          'B': ['mean', 'std']})
Out[8]:
   A         B
   mean    std  mean    std
0  NaN     NaN  NaN     NaN
1  NaN     NaN  NaN     NaN
2  1.0     0.237722  0.023640
3  3.0     0.133155  0.048693
4  5.0     0.342054  0.079587
5  6.0     0.370076  0.0954504
[10 rows x 4 columns]
Changes to rename

Series.rename and NDFrame.rename_axis can now take a scalar or list-like argument for altering the Series or axis name, in addition to their old behaviors of altering labels. (GH9494, GH11965)

```
In [9]: s = pd.Series(np.random.randn(5))
In [10]: s.rename('newname')
Out[10]:
0  1.150036
1  0.991946
2  0.953324
3 -2.021255
4 -0.334077
Name: newname, Length: 5, dtype: float64
```

```
In [11]: df = pd.DataFrame(np.random.randn(5, 2))
In [12]: (df.rename_axis("indexname")
    ....: .rename_axis("columns_name", axis="columns"))
    ....:
Out[12]:
   columns_name  0  1
indexname
   0   0.002118  0.405453
   1  0.289092  1.321158
   2 -1.546906 -0.202646
   3 -0.655969  0.193421
   4  0.553439  1.318152
[5 rows x 2 columns]
```

The new functionality works well in method chains. Previously these methods only accepted functions or dicts mapping a label to a new label. This continues to work as before for function or dict-like values.

Range Index

A `RangeIndex` has been added to the `Int64Index` sub-classes to support a memory saving alternative for common use cases. This has a similar implementation to the python `range` object (`xrange` in python 2), in that it only stores the start, stop, and step values for the index. It will transparently interact with the user API, converting to `Int64Index` if needed.

This will now be the default constructed index for `NDFrame` objects, rather than previous a `Int64Index`. (GH939, GH12070, GH12071, GH12109, GH12888)

Previous behavior:

```
In [3]: s = pd.Series(range(1000))
In [4]: s.index
Out[4]:
Int64Index([ 0,  1,  2,  3,  4,  5,  6,  7,  8,  9, ...
```
In [6]: s.index nbytes
Out[6]: 8000

New behavior:

In [13]: s = pd.Series(range(1000))
In [14]: s.index
Out[14]: RangeIndex(start=0, stop=1000, step=1)
In [15]: s.index nbytes
Out[15]: 128

Changes to str.extract

The .str.extract method takes a regular expression with capture groups, finds the first match in each subject string, and returns the contents of the capture groups (GH11386).

In v0.18.0, the expand argument was added to extract.

- expand=False: it returns a Series, Index, or DataFrame, depending on the subject and regular expression pattern (same behavior as pre-0.18.0).
- expand=True: it always returns a DataFrame, which is more consistent and less confusing from the perspective of a user.

Currently the default is expand=None which gives a FutureWarning and uses expand=False. To avoid this warning, please explicitly specify expand.

Extracting a regular expression with one group returns a Series if expand=False.

In [16]: pd.Series(["a1", "b2", "c3"]).str.extract(r"[ab]\\d\", expand=False)
Out[16]:
          0
0       1
1       2
2    NaN
Length: 3, dtype: object

It returns a DataFrame with one column if expand=True.
Calling on an Index with a regex with exactly one capture group returns an Index if expand=False.

```
In [18]: s = pd.Series(['a1', 'b2', 'c3'], ['A11', 'B22', 'C33'])
In [19]: s.index
Out[19]: Index(['A11', 'B22', 'C33'], dtype='object')
In [20]: s.index.str.extract(r'(?P<letter>[a-zA-Z])', expand=False)
Out[20]: Index(['A', 'B', 'C'], dtype='object', name='letter')
```

It returns a DataFrame if expand=True.

```
In [21]: s.index.str.extract(r'(?P<letter>[a-zA-Z])([0-9]+)', expand=True)
Out[21]:
   letter 1
0    A  11
1    B  22
2    C  33
```

Calling on an Index with a regex with more than one capture group raises ValueError if expand=False.

```
>>> s.index.str.extract(r'(?P<letter>[a-zA-Z])([0-9]+)', expand=False)
ValueError: only one regex group is supported with Index
```

It returns a DataFrame if expand=True.

```
In [22]: s.index.str.extract(r'(?P<letter>[a-zA-Z])([0-9]+)', expand=True)
Out[22]:
   letter 1
0    A  11
1    B  22
2    C  33
```

In summary, extract(expand=True) always returns a DataFrame with a row for every subject string, and a column for every capture group.
Addition of \texttt{str.extractall}

The \texttt{str.extractall} method was added (GH11386). Unlike \texttt{extract}, which returns only the first match.

\begin{Verbatim}
\textbf{In [23]}: s = pd.Series(["a1a2", "b1", "c1"], ["A", "B", "C"])
\end{Verbatim}

\begin{Verbatim}
\textbf{In [24]}: s
\textbf{Out [24]}:  
A   a1a2
B    b1
C     c1
Length: 3, dtype: object
\end{Verbatim}

\begin{Verbatim}
\textbf{In [25]}: s.str.extract(r"(?P<letter>[ab])(?P<digit>\d)", expand=False)
\textbf{Out [25]}:  
letter digit
A    a   1
B    b   1
C   NaN  NaN
\end{Verbatim}

The \texttt{extractall} method returns all matches.

\begin{Verbatim}
\textbf{In [26]}: s.str.extractall(r"(?P<letter>[ab])(?P<digit>\d)")
\textbf{Out [26]}:  
letter digit
match
A  0    a   1
  1    a   2
B  0    b   1
\end{Verbatim}

Changes to \texttt{str.cat}

The method \texttt{str.cat()} concatenates the members of a Series. Before, if NaN values were present in the Series, calling \texttt{str.cat()} on it would return NaN, unlike the rest of the Series.\texttt{str.*} API. This behavior has been amended to ignore NaN values by default. (GH11435).

A new, friendlier \texttt{ValueError} is added to protect against the mistake of supplying the \texttt{sep} as an arg, rather than as a kwarg. (GH11334).

\begin{Verbatim}
\textbf{In [27]}: pd.Series(["a", "b", np.nan, "c"]).str.cat(sep=' ')
\textbf{Out [27]}: 'a b c'
\end{Verbatim}

\begin{Verbatim}
\textbf{In [28]}: pd.Series(["a", "b", np.nan, "c"]).str.cat(sep=' ', na_rep='? ')
\textbf{Out [28]}: 'a b ? c'
\end{Verbatim}

\begin{Verbatim}
\textbf{In [2]}: pd.Series(["a", "b", np.nan, "c"]).str.cat(' ')
ValueError: Did you mean to supply a `sep` keyword?
\end{Verbatim}
Datetimelike rounding

DatetimeIndex, Timestamp, TimedeltaIndex, Timedelta have gained the .round(), .floor() and .ceil() method for datetimelike rounding, flooring and ceiling. (GH4314, GH11963)

Naive datetimes

```
In [29]: dr = pd.date_range('20130101 09:12:56.1234', periods=3)
In [30]: dr
Out[30]: DatetimeIndex(['2013-01-01 09:12:56.123400', '2013-01-02 09:12:56.123400',
                      '2013-01-03 09:12:56.123400'],
                      dtype='datetime64[ns]', freq='D')
```

```
In [31]: dr.round('s')
Out[31]: DatetimeIndex(['2013-01-01 09:12:56', '2013-01-02 09:12:56',
                       '2013-01-03 09:12:56'],
                       dtype='datetime64[ns]', freq=None)
```

```
# Timestamp scalar
In [32]: dr[0]
Out[32]: Timestamp('2013-01-01 09:12:56.123400', freq='D')
```

```
In [33]: dr[0].round('10s')
Out[33]: Timestamp('2013-01-01 09:13:00')
```

Tz-aware are rounded, floored and ceiled in local times

```
In [34]: dr = dr.tz_localize('US/Eastern')
In [35]: dr
Out[35]: DatetimeIndex(['2013-01-01 09:12:56.123400-05:00',
                      '2013-01-02 09:12:56.123400-05:00',
                      '2013-01-03 09:12:56.123400-05:00'],
                      dtype='datetime64[ns, US/Eastern]', freq=None)
```

```
In [36]: dr.round('s')
Out[36]: DatetimeIndex(['2013-01-01 09:12:56-05:00', '2013-01-02 09:12:56-05:00',
                       '2013-01-03 09:12:56-05:00'],
                       dtype='datetime64[ns, US/Eastern]', freq=None)
```

Timedeltas

```
In [37]: t = pd.timedelta_range('1 days 2 hr 13 min 45 us', periods=3, freq='d')
In [38]: t
Out[38]: TimedeltaIndex(['1 days 02:13:00.000045', '2 days 02:13:00.000045',
                       '3 days 02:13:00.000045'],
                       dtype='timedelta64[ns]', freq='D')
```
In [39]: t.round('10min')
Out[39]: TimedeltaIndex(['1 days 02:10:00', '2 days 02:10:00', '3 days 02:10:00'], dtype='timedelta64[ns]', freq=None)

# Timedelta scalar
In [40]: t[0]
Out[40]: Timedelta('1 days 02:13:00.000045')

In [41]: t[0].round('2h')
Out[41]: Timedelta('1 days 02:00:00')

In addition, .round(), .floor() and .ceil() will be available through the .dt accessor of Series.

In [42]: s = pd.Series(dr)

In [43]: s
dtype: datetime64[ns, US/Eastern]

In [44]: s.dt.round('D')
Out[44]:
0 2013-01-01 00:00:00-05:00
1 2013-01-02 00:00:00-05:00
2 2013-01-03 00:00:00-05:00
Length: 3, dtype: datetime64[ns, US/Eastern]

Formatting of integers in FloatIndex

Integers in FloatIndex, e.g. 1., are now formatted with a decimal point and a 0 digit, e.g. 1.0 (GH11713) This change not only affects the display to the console, but also the output of IO methods like .to_csv or .to_html.

Previous behavior:

In [2]: s = pd.Series([1, 2, 3], index=np.arange(3.))

In [3]: s
dtype: int64

In [4]: s.index
dtype: int64

In [4]: s.index
Out[4]: Float64Index([0.0, 1.0, 2.0], dtype='float64')

In [5]: print(s.to_csv(path=None))
0,1
New behavior:

```python
In [45]: s = pd.Series([1, 2, 3], index=np.arange(3.))

In [46]: s
Out[46]:
0.0 1
1.0 2
2.0 3
Length: 3, dtype: int64

In [47]: s.index
Out[47]: Float64Index([0.0, 1.0, 2.0], dtype='float64')

In [48]: print(s.to_csv(path_or_buf=None, header=False))
0.0,1
1.0,2
2.0,3
```

**Changes to dtype assignment behaviors**

When a DataFrame’s slice is updated with a new slice of the same dtype, the dtype of the DataFrame will now remain the same. (GH10503)

Previous behavior:

```python
In [5]: df = pd.DataFrame(
   ....:     {'a': [0, 1, 1],
   ....:      'b': pd.Series([100, 200, 300], dtype='uint32')})

In [7]: df.dtypes
Out[7]:
   a    int64
   b  uint32
dtype: object

In [8]: ix = df['a'] == 1

In [9]: df.loc[ix, 'b'] = df.loc[ix, 'b']

In [11]: df.dtypes
Out[11]:
   a    int64
   b    int64
dtype: object
```

New behavior:

```python
In [49]: df = pd.DataFrame(
   ....:     {'a': [0, 1, 1],
   ....:      'b': pd.Series([100, 200, 300], dtype='uint32')})
```
When a DataFrame’s integer slice is partially updated with a new slice of floats that could potentially be down-casted to integer without losing precision, the dtype of the slice will be set to float instead of integer.

**Previous behavior:**

```python
In [4]: df = pd.DataFrame(np.array(range(1,10)).reshape(3,3),
                      columns=list('abc'),
                      index=[[4,4,8], [8,10,12]])

In [5]: df
Out[5]:
    a  b  c
   --- --- ---
4  8  1  2  3
10 4  5  6
8 12  7  8  9

In [7]: df.ix[4, 'c'] = np.array([0., 1.])

In [8]: df
Out[8]:
    a  b  c
   --- --- ---
4  8  1  2  0
10 4  5  1
8 12  7  8  9
```

**New behavior:**

```python
In [54]: df = pd.DataFrame(np.array(range(1,10)).reshape(3,3),
                      columns=list('abc'),
                      index=[[4,4,8], [8,10,12]])

In [55]: df
Out[55]:
    a  b  c
   --- --- ---
4  8  1  2
10 4  5  1
8 12  7  8
```
4 8 1 2 3
10 4 5 6
8 12 7 8 9

[3 rows x 3 columns]

In [56]: df.loc[4, 'c'] = np.array([0., 1.])

In [57]: df
Out[57]:
   a  b  c
4  8  1  2  0.0
10 4  5  1.0
8 12  7  8  9.0

[3 rows x 3 columns]

**Method to xarray**

In a future version of pandas, we will be deprecating Panel and other > 2 ndim objects. In order to provide for continuity, all NDFrame objects have gained the `.to_xarray()` method in order to convert to xarray objects, which has a pandas-like interface for > 2 ndim. (GH11972)

See the xarray full-documentation here.

In [1]: p = Panel(np.arange(2*3*4).reshape(2,3,4))

In [2]: p.to_xarray()
Out[2]:
<xarray.DataArray (items: 2, major_axis: 3, minor_axis: 4)>
array([[[ 0,  1,  2,  3],
          [ 4,  5,  6,  7],
          [ 8,  9, 10, 11]],
        [[12, 13, 14, 15],
          [16, 17, 18, 19],
          [20, 21, 22, 23]]])
Coordinates:
  * items (items) int64 0 1
  * major_axis (major_axis) int64 0 1 2
  * minor_axis (minor_axis) int64 0 1 2 3
Latex representation

DataFrame has gained a \_\_repr\_latex\_() method in order to allow for conversion to latex in a ipython/jupyter notebook using nbconvert. (GH11778)

Note that this must be activated by setting the option pd.display.latex.repr=True (GH12182)

For example, if you have a jupyter notebook you plan to convert to latex using nbconvert, place the statement pd. display.latex.repr=True in the first cell to have the contained DataFrame output also stored as latex.

The options display.latex.escape and display.latex.longtable have also been added to the configuration and are used automatically by the to_latex method. See the available options docs for more info.

pd.read_sas() changes

read_sas has gained the ability to read SAS?BDAT files, including compressed files. The files can be read in entirety, or incrementally. For full details see here. (GH4052)

Other enhancements

• Handle truncated floats in SAS xport files (GH11713)
• Added option to hide index in Series.to_string (GH11729)
• read_excel now supports s3 urls of the format s3://bucketname/filename (GH11447)
• add support for AWS_S3_HOST env variable when reading from s3 (GH12198)
• A simple version of Panel.round() is now implemented (GH11763)
• For Python 3.x, round(DataFrame), round(Series), round(Panel) will work (GH11763)
• sys.getsizeof(obj) returns the memory usage of a pandas object, including the values it contains (GH11597)
• Series gained an is_unique attribute (GH11946)
• DataFrame.quantile and Series.quantile now accept interpolation keyword (GH10174).
• Added DataFrame.style.format for more flexible formatting of cell values (GH11692)
• DataFrame.select_dtypes now allows the np.float16 type code (GH11990)
• pivot_table() now accepts most iterables for the values parameter (GH12017)
• Added Google BigQuery service account authentication support, which enables authentication on remote servers. (GH11881, GH12572). For further details see here
• HDFStore is now iterable: for k in store is equivalent to for k in store.keys() (GH12221).
• Add missing methods/fields to .dt for Period (GH8848)
• The entire code base has been PEP-ified (GH12096)
Backwards incompatible API changes

- the leading white spaces have been removed from the output of `.to_string(index=False)` method (GH11833)
- the out parameter has been removed from the `Series.round()` method. (GH11763)
- `DataFrame.round()` leaves non-numeric columns unchanged in its return, rather than raises. (GH11885)
- `DataFrame.head(0)` and `DataFrame.tail(0)` return empty frames, rather than `self`. (GH11937)
- `Series.head(0)` and `Series.tail(0)` return empty series, rather than `self`. (GH11937)
- `to_msgpack` and `read_msgpack` encoding now defaults to 'utf-8'. (GH12170)
- the order of keyword arguments to text file parsing functions (.read_csv(), .read_table(), .read_fwf()) changed to group related arguments. (GH11555)
- `NaTType.isoformat` now returns the string 'NaT' to allow the result to be passed to the constructor of `Timestamp`. (GH12300)

NaT and Timedelta operations

NaT and Timedelta have expanded arithmetic operations, which are extended to `Series` arithmetic where applicable. Operations defined for `datetime64[ns]` or `timedelta64[ns]` are now also defined for `NaT` (GH11564).

NaT now supports arithmetic operations with integers and floats.

```
In [58]: pd.NaT * 1
Out[58]: NaT

In [59]: pd.NaT * 1.5
Out[59]: NaT

In [60]: pd.NaT / 2
Out[60]: NaT

In [61]: pd.NaT * np.nan
Out[61]: NaT
```

NaT defines more arithmetic operations with `datetime64[ns]` and `timedelta64[ns]`.

```
In [62]: pd.NaT / pd.NaT
Out[62]: nan

In [63]: pd.Timedelta('1s') / pd.NaT
Out[63]: nan
```

NaT may represent either a `datetime64[ns]` null or a `timedelta64[ns]` null. Given the ambiguity, it is treated as a `timedelta64[ns]`, which allows more operations to succeed.

```
In [64]: pd.NaT + pd.NaT
Out[64]: NaT

# same as
In [65]: pd.Timedelta('1s') + pd.Timedelta('1s')
Out[65]: Timedelta('0 days 00:00:02')
```
as opposed to

```python
In [3]: pd.Timestamp('19900315') + pd.Timestamp('19900315')
TypeError: unsupported operand type(s) for +: 'Timestamp' and 'Timestamp'
```

However, when wrapped in a `Series` whose `dtype` is `datetime64[ns]` or `timedelta64[ns]`, the `dtype` information is respected.

```python
In [1]: pd.Series([pd.NaT], dtype='<M8[ns]') + pd.Series([pd.NaT], dtype='<M8[ns]')
TypeError: can only operate on a datetimes for subtraction, but the operator __add__ was passed
```

```python
In [66]: pd.Series([pd.NaT], dtype='<m8[ns]') + pd.Series([pd.NaT], dtype='<m8[ns]')
Out[66]:
NaT
Length: 1, dtype: timedelta64[ns]
```

Timedelta division by floats now works.

```python
In [67]: pd.Timedelta('1s') / 2.0
Out[67]: Timedelta('0 days 00:00:00.500000')
```

Subtraction by Timedelta in a Series by a Timestamp works (GH11925)

```python
In [68]: ser = pd.Series(pd.timedelta_range('1 day', periods=3))
In [69]: ser
Out[69]:
0 1 days
1 2 days
2 3 days
Length: 3, dtype: timedelta64[ns]
In [70]: pd.Timestamp('2012-01-01') - ser
Out[70]:
0 2011-12-31
1 2011-12-30
2 2011-12-29
Length: 3, dtype: datetime64[ns]
```

`NaT.isoformat()` now returns 'NaT'. This change allows `pd.Timestamp` to rehydrate any timestamp like object from its isoformat (GH12300).

### Changes to msgpack

Forward incompatible changes in msgpack writing format were made over 0.17.0 and 0.18.0; older versions of pandas cannot read files packed by newer versions (GH12129, GH10527)

Bugs in `to_msgpack` and `read_msgpack` introduced in 0.17.0 and fixed in 0.18.0, caused files packed in Python 2 unreadable by Python 3 (GH12142). The following table describes the backward and forward compat of msgpacks.

```markdown
**Warning:**
```
0.18.0 is backward-compatible for reading files packed by older versions, except for files packed with 0.17 in Python 2, in which case only they can only be unpacked in Python 2.

### Signature change for `.rank`

`Series.rank` and `DataFrame.rank` now have the same signature ([GH11759](https://github.com/pandas-dev/pandas/pull/11759))

Previous signature

```
In [3]: pd.Series([0,1]).rank(method='average', na_option='keep', ascending=True, pct=False)
Out[3]:
   0 1
0 1 2
dtype: float64
```

```
In [4]: pd.DataFrame([0,1]).rank(axis=0, numeric_only=None, method='average', na_option='keep', ascending=True, pct=False)
Out[4]:
    0
0  1
1  2
```

New signature

```
In [71]: pd.Series([0,1]).rank(axis=0, method='average', numeric_only=None, na_option='keep', ascending=True, pct=False)
       
       
Out[71]:
   0 1.0
0  1.0
1  2.0
Length: 2, dtype: float64
```

```
In [72]: pd.DataFrame([0,1]).rank(axis=0, method='average', numeric_only=None, na_option='keep', ascending=True, pct=False)
       
       
Out[72]:
    0
0  1.0
1  2.0
```
Bug in QuarterBegin with n=0

In previous versions, the behavior of the QuarterBegin offset was inconsistent depending on the date when the n parameter was 0. (GH11406)

The general semantics of anchored offsets for n=0 is to not move the date when it is an anchor point (e.g., a quarter start date), and otherwise roll forward to the next anchor point.

```
In [73]: d = pd.Timestamp('2014-02-01')
In [74]: d
Out[74]: Timestamp('2014-02-01 00:00:00')
In [75]: d + pd.offsets.QuarterBegin(n=0, startingMonth=2)
Out[75]: Timestamp('2014-02-01 00:00:00')
In [76]: d + pd.offsets.QuarterBegin(n=0, startingMonth=1)
Out[76]: Timestamp('2014-04-01 00:00:00')
```

For the QuarterBegin offset in previous versions, the date would be rolled backwards if date was in the same month as the quarter start date.

```
In [3]: d = pd.Timestamp('2014-02-15')
In [4]: d + pd.offsets.QuarterBegin(n=0, startingMonth=2)
Out[4]: Timestamp('2014-02-01 00:00:00')
```

This behavior has been corrected in version 0.18.0, which is consistent with other anchored offsets like MonthBegin and YearBegin.

```
In [77]: d = pd.Timestamp('2014-02-15')
In [78]: d + pd.offsets.QuarterBegin(n=0, startingMonth=2)
Out[78]: Timestamp('2014-05-01 00:00:00')
```

Resample API

Like the change in the window functions API above, .resample(...) is changing to have a more groupby-like API. (GH11732, GH12702, GH12202, GH12332, GH12334, GH12348, GH12448).

```
In [79]: np.random.seed(1234)
In [80]: df = pd.DataFrame(np.random.rand(10,4),
    ....:    columns=list('ABCD'),
    ....:    index=pd.date_range('2010-01-01 09:00:00',
    ....:    periods=10, freq='s'))
```
In [81]: df
Out[81]:

<table>
<thead>
<tr>
<th></th>
<th>A</th>

<td>0.909316</td>
</tr>
</tbody>
</table>

[10 rows x 4 columns]

Previous API:

You would write a resampling operation that immediately evaluates. If a how parameter was not provided, it would default to how='mean'.

In [6]: df.resample('2s')
Out[6]:

<table>
<thead>
<tr>
<th></th>
<th>A</th>
<th>B</th>
<th>C</th>
<th>D</th>
</tr>
</thead>
<tbody>
<tr>
<td>2010-01-01 09:00:00</td>
<td>0.485748</td>
<td>0.447351</td>
<td>0.357096</td>
<td>0.793615</td>
</tr>
<tr>
<td>2010-01-01 09:00:02</td>
<td>0.820801</td>
<td>0.794317</td>
<td>0.364034</td>
<td>0.531096</td>
</tr>
<tr>
<td>2010-01-01 09:00:04</td>
<td>0.433985</td>
<td>0.314582</td>
<td>0.424104</td>
<td>0.625733</td>
</tr>
<tr>
<td>2010-01-01 09:00:06</td>
<td>0.624988</td>
<td>0.609738</td>
<td>0.633165</td>
<td>0.612452</td>
</tr>
<tr>
<td>2010-01-01 09:00:08</td>
<td>0.510470</td>
<td>0.534317</td>
<td>0.573201</td>
<td>0.806949</td>
</tr>
</tbody>
</table>

You could also specify a how directly

In [7]: df.resample('2s', how='sum')
Out[7]:

<table>
<thead>
<tr>
<th></th>
<th>A</th>
<th>B</th>
<th>C</th>
<th>D</th>
</tr>
</thead>
<tbody>
<tr>
<td>2010-01-01 09:00:00</td>
<td>0.971495</td>
<td>0.894701</td>
<td>0.714192</td>
<td>1.587231</td>
</tr>
<tr>
<td>2010-01-01 09:00:02</td>
<td>1.641602</td>
<td>1.588635</td>
<td>0.728068</td>
<td>1.062191</td>
</tr>
<tr>
<td>2010-01-01 09:00:04</td>
<td>0.867969</td>
<td>0.629165</td>
<td>0.848208</td>
<td>1.251465</td>
</tr>
<tr>
<td>2010-01-01 09:00:06</td>
<td>1.249976</td>
<td>1.219477</td>
<td>1.266330</td>
<td>1.224904</td>
</tr>
<tr>
<td>2010-01-01 09:00:08</td>
<td>1.020940</td>
<td>1.068634</td>
<td>1.146402</td>
<td>1.613897</td>
</tr>
</tbody>
</table>

New API:

Now, you can write .resample(...) as a 2-stage operation like .groupby(...), which yields a Resampler.

In [82]: r = df.resample('2s')
In [83]: r
Out[83]: <pandas.core.resample.DatetimeIndexResampler object at 0x7f06588a6b80>
**Downsampling**

You can then use this object to perform operations. These are downsampling operations (going from a higher frequency to a lower one).

<table>
<thead>
<tr>
<th>In [84]: r.mean()</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Out[84]:</td>
<td></td>
</tr>
<tr>
<td>A     B     C     D</td>
<td></td>
</tr>
<tr>
<td>2010-01-01 09:00:00 0.485748 0.447351</td>
<td>0.357096 0.793615</td>
</tr>
<tr>
<td>2010-01-01 09:00:02 0.820801 0.794317</td>
<td>0.364034 0.531096</td>
</tr>
<tr>
<td>2010-01-01 09:00:04 0.433985 0.314582</td>
<td>0.424104 0.625733</td>
</tr>
<tr>
<td>2010-01-01 09:00:06 0.624988 0.609738</td>
<td>0.633165 0.612452</td>
</tr>
<tr>
<td>2010-01-01 09:00:08 0.510470 0.534317</td>
<td>0.573201 0.806949</td>
</tr>
<tr>
<td>[5 rows x 4 columns]</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>In [85]: r.sum()</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Out[85]:</td>
<td></td>
</tr>
<tr>
<td>A     B     C     D</td>
<td></td>
</tr>
<tr>
<td>2010-01-01 09:00:00 0.971495 0.894701</td>
<td>0.714192 1.587231</td>
</tr>
<tr>
<td>2010-01-01 09:00:02 1.641602 1.588635</td>
<td>0.728068 1.062191</td>
</tr>
<tr>
<td>2010-01-01 09:00:04 0.867969 0.629165</td>
<td>0.848208 1.251465</td>
</tr>
<tr>
<td>2010-01-01 09:00:06 1.249976 1.219477</td>
<td>1.266330 1.224904</td>
</tr>
<tr>
<td>2010-01-01 09:00:08 1.020940 1.068634</td>
<td>1.146402 1.613897</td>
</tr>
<tr>
<td>[5 rows x 4 columns]</td>
<td></td>
</tr>
</tbody>
</table>

Furthermore, resample now supports `getitem` operations to perform the resample on specific columns.

<table>
<thead>
<tr>
<th>In [86]: r[['A', 'C']].mean()</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Out[86]:</td>
<td></td>
</tr>
<tr>
<td>A     C</td>
<td></td>
</tr>
<tr>
<td>2010-01-01 09:00:00 0.485748 0.357096</td>
<td></td>
</tr>
<tr>
<td>2010-01-01 09:00:02 0.820801 0.364034</td>
<td></td>
</tr>
<tr>
<td>2010-01-01 09:00:04 0.433985 0.424104</td>
<td></td>
</tr>
<tr>
<td>2010-01-01 09:00:06 0.624988 0.633165</td>
<td></td>
</tr>
<tr>
<td>2010-01-01 09:00:08 0.510470 0.573201</td>
<td></td>
</tr>
<tr>
<td>[5 rows x 2 columns]</td>
<td></td>
</tr>
</tbody>
</table>

and `aggregate` type operations.

<table>
<thead>
<tr>
<th>In [87]: r.agg({'A': 'mean', 'B': 'sum'})</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Out[87]:</td>
<td></td>
</tr>
<tr>
<td>A     B</td>
<td></td>
</tr>
<tr>
<td>2010-01-01 09:00:00 0.485748 0.894701</td>
<td></td>
</tr>
<tr>
<td>2010-01-01 09:00:02 0.820801 1.588635</td>

</tr>
</tbody>
</table>

[5 rows x 4 columns]

**Upsampling**

Upsampling operations take you from a lower frequency to a higher frequency. These are now performed with the Resampler objects with backfill(), ffill(), fillna() and asfreq() methods.

In [89]: s = pd.Series(np.arange(5, dtype='int64'), index=pd.date_range('2010-01-01', periods=5, freq='Q'))

In [90]: s
Out[90]:

<p>| |</p>
<table>
<thead>
<tr>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>2010-03-31</td>
</tr>
<tr>
<td>2010-06-30</td>
</tr>
<tr>
<td>2010-09-30</td>
</tr>
<tr>
<td>2010-12-31</td>
</tr>
<tr>
<td>2011-03-31</td>
</tr>
</tbody>
</table>
Freq: Q-DEC, Length: 5, dtype: int64

Previously

In [6]: s.resample('M', fill_method='ffill')
Out[6]:

<p>| |</p>
<table>
<thead>
<tr>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>2010-03-31</td>
</tr>

Freq: M, dtype: int64

New API
In [91]: s.resample('M').ffill()
Out[91]:
2010-03-31  0
2010-04-30  0
2010-05-31  0
2010-06-30  1
2010-07-31  1
2010-08-31  1
2010-09-30  2
2010-10-31  2
2010-11-30  2
2010-12-31  3
2011-01-31  3
2011-02-28  3
2011-03-31  4
Freq: M, Length: 13, dtype: int64

Note: In the new API, you can either downsample OR upsample. The prior implementation would allow you to pass an aggregator function (like mean) even though you were upsampling, providing a bit of confusion.

Previous API will work but with deprecations

Warning: This new API for resample includes some internal changes for the prior-to-0.18.0 API, to work with a deprecation warning in most cases, as the resample operation returns a deferred object. We can intercept operations and just do what the (pre 0.18.0) API did (with a warning). Here is a typical use case:

In [4]: r = df.resample('2s')

In [6]: r*10
pandas/tseries/resample.py:80: FutureWarning: .resample() is now a deferred operation use .resample(...).mean() instead of .resample(...)  
Out[6]:

<table>
<thead>
<tr>
<th></th>
<th>A</th>
<th>B</th>
<th>C</th>
<th>D</th>
</tr>
</thead>
<tbody>
<tr>
<td>2010-01-01 09:00:00</td>
<td>4.857476</td>
<td>4.473507</td>
<td>3.570960</td>
<td>7.936154</td>
</tr>
<tr>
<td>2010-01-01 09:00:02</td>

</tr>
</tbody>
</table>

However, getting and assignment operations directly on a Resampler will raise a ValueError:

In [7]: r.iloc[0] = 5
ValueError: .resample() is now a deferred operation use .resample(...).mean() instead of .resample(...)  

There is a situation where the new API can not perform all the operations when using original code. This code is intending to resample every 2s, take the mean AND then take the min of those results.
The new API will:

```
In [92]: df.resample('2s').min()
Out[92]:
          A   B   C   D
2010-01-01 09:00:00 0.191519 0.272593 0.276464 0.785359
2010-01-01 09:00:02 0.683463 0.712702 0.357817 0.500995
2010-01-01 09:00:04 0.364886 0.013768 0.075381 0.368824
2010-01-01 09:00:06 0.316836 0.568099 0.397203 0.436173
2010-01-01 09:00:08 0.218792 0.143767 0.442141 0.704581
[5 rows x 4 columns]
```

The good news is the return dimensions will differ between the new API and the old API, so this should loudly raise an exception.

To replicate the original operation

```
In [93]: df.resample('2s').mean().min()
Out[93]:
          A   B   C   D
0  0.433985 0.314582 0.357096 0.531096
Length: 4, dtype: float64
```

**Changes to eval**

In prior versions, new columns assignments in an eval expression resulted in an inplace change to the DataFrame. (GH9297, GH8664, GH10486)

```
In [94]: df = pd.DataFrame({'a': np.linspace(0, 10, 5), 'b': range(5)})
In [95]: df
Out[95]:
   a   b
0  0.0  0
1  2.5  1
2  5.0  2
3  7.5  3
4 10.0  4
[5 rows x 2 columns]
```
In [12]: df.eval('c = a + b')
FutureWarning: eval expressions containing an assignment currently default to operating in-place.
This will change in a future version of pandas, use inplace=True to avoid this warning.

In [13]: df
Out[13]:
   a  b  c
0  0.0 0.0 0.0
1  2.5 1.0 3.5
2  5.0 2.0 7.0
3  7.5 3.0 10.5
4 10.0 4.0 14.0

In version 0.18.0, a new `inplace` keyword was added to choose whether the assignment should be done in-place or return a copy.

In [96]: df
Out[96]:
   a  b  c
0  0.0 0.0 0.0
1  2.5 1.0 3.5
2  5.0 2.0 7.0
3  7.5 3.0 10.5
4 10.0 4.0 14.0

[5 rows x 3 columns]

In [97]: df.eval('d = c - b', inplace=False)
Out[97]:
   a  b  c  d
0  0.0 0.0 0.0 0.0
1  2.5 1.0 3.5 2.5
2  5.0 2.0 7.0 5.0
3  7.5 3.0 10.5 7.5
4 10.0 4.0 14.0 10.0

[5 rows x 4 columns]

In [98]: df
Out[98]:
   a  b  c
0  0.0 0.0 0.0
1  2.5 1.0 3.5
2  5.0 2.0 7.0
3  7.5 3.0 10.5
4 10.0 4.0 14.0

[5 rows x 3 columns]

In [99]: df.eval('d = c - b', inplace=True)
Warning: For backwards compatibility, inplace defaults to True if not specified. This will change in a future version of pandas. If your code depends on an inplace assignment you should update to explicitly set inplace=True.

The inplace keyword parameter was also added the query method.

In [101]: df.query('a > 5')
Out[101]:
     a  b  c  d
0  2.5  1  3.5  2.5
1  5.0  2  7.0  5.0
2  7.5  3 10.5  7.5
3 10.0  4 14.0 10.0
[4 rows x 4 columns]

In [102]: df.query('a > 5', inplace=True)
In [103]: df
Out[103]:
     a  b  c  d
0  2.5  1  3.5  2.5
1  5.0  2  7.0  5.0
2  7.5  3 10.5  7.5
3 10.0  4 14.0 10.0
[4 rows x 4 columns]

Warning: Note that the default value for inplace in a query is False, which is consistent with prior versions.

eval has also been updated to allow multi-line expressions for multiple assignments. These expressions will be evaluated one at a time in order. Only assignments are valid for multi-line expressions.

In [104]: df
Out[104]:
     a  b  c  d
0  2.5  1  3.5  2.5
1  5.0  2  7.0  5.0
2  7.5  3 10.5  7.5
3 10.0  4 14.0 10.0
[4 rows x 4 columns]

In [105]: df.eval("e = d + a");
   ......: f = e - 22
Other API changes

- **DataFrame.between_time** and **Series.between_time** now only parse a fixed set of time strings. Parsing of date strings is no longer supported and raises a ValueError. (GH11818)

```python
In [107]: s = pd.Series(range(10), pd.date_range('2015-01-01', freq='H', periods=10))
In [108]: s.between_time("7:00am", "9:00am")
Out[108]:
2015-01-01 07:00:00 7
2015-01-01 08:00:00 8
2015-01-01 09:00:00 9
Freq: H, Length: 3, dtype: int64
```

This will now raise.

```python
In [2]: s.between_time('20150101 07:00:00','20150101 09:00:00')
ValueError: Cannot convert arg ['20150101 07:00:00'] to a time.
```

- **.memory_usage()** now includes values in the index, as does memory_usage in **.info()** (GH11597)
- **DataFrame.to_latex()** now supports non-ascii encodings (e.g. utf-8) in Python 2 with the parameter encoding (GH7061)
- **pandas.merge()** and **DataFrame.merge()** will show a specific error message when trying to merge with an object that is not of type DataFrame or a subclass (GH12081)
- **DataFrame.unstack** and **Series.unstack** now take **fill_value** keyword to allow direct replacement of missing values when an unstack results in missing values in the resulting DataFrame. As an added benefit, specifying **fill_value** will preserve the data type of the original stacked data. (GH9746)
- As part of the new API for **window functions** and **resampling**, aggregation functions have been clarified, raising more informative error messages on invalid aggregations. (GH9052). A full set of examples are presented in **groupby**.
- Statistical functions for **NDFrame** objects (like **sum()**, **mean()**, **min()**) will now raise if non-numpy-compatible arguments are passed in for **kwargs** (GH12301)
- **.to_latex** and **.to_html** gain a **decimal** parameter like **.to_csv**; the default is '. (GH12031)
- More helpful error message when constructing a **DataFrame** with empty data but with indices (GH8020)
- **.describe()** will now properly handle bool dtype as a categorical (GH6625)
• More helpful error message with an invalid `.transform` with user defined input (GH10165)
• Exponentially weighted functions now allow specifying alpha directly (GH10789) and raise `ValueError` if parameters violate $0 < \alpha \leq 1$ (GH12492)

Deprecations

• The functions `pd.rolling_*`, `pd.expanding_*`, and `pd.ewm*` are deprecated and replaced by the corresponding method call. Note that the new suggested syntax includes all of the arguments (even if default) (GH11603)

```python
In [1]: s = pd.Series(range(3))
In [2]: pd.rolling_mean(s, window=2, min_periods=1)
   ...: FutureWarning: pd.rolling_mean is deprecated for Series and will be removed in a future version, replace with Series.rolling(min_periods=1, window=2, center=False).mean()
Out[2]:
   0   0.0
   1   0.5
   2   1.5
   dtype: float64
In [3]: pd.rolling_cov(s, s, window=2)
   ...: FutureWarning: pd.rolling_cov is deprecated for Series and will be removed in a future version, replace with Series.rolling(window=2).cov(other=<Series>)
Out[3]:
   0   NaN
   1   0.5
   2   0.5
   dtype: float64
```

• The `freq` and `how` arguments to the `.rolling`, `.expanding`, and `.ewm` (new) functions are deprecated, and will be removed in a future version. You can simply resample the input prior to creating a window function. (GH11603)

For example, instead of `s.rolling(window=5, freq='D').max()` to get the max value on a rolling 5 Day window, one could use `s.resample('D').mean().rolling(window=5).max()`, which first resamples the data to daily data, then provides a rolling 5 day window.

• `pd.tseries.frequencies.get_offset_name` function is deprecated. Use offset's `.freqstr` property as alternative (GH11192)
• `pandas.stats.fama_macbeth` routines are deprecated and will be removed in a future version (GH6077)
• `pandas.stats.ols`, `pandas.stats.plm` and `pandas.stats.var` routines are deprecated and will be removed in a future version (GH6077)
• show a `FutureWarning` rather than a `DeprecationWarning` on using long-time deprecated syntax in `HDFStore.select`, where the `where` clause is not a string-like (GH12027)
• The `pandas.options.display.mpl_style` configuration has been deprecated and will be removed in a future version of pandas. This functionality is better handled by matplotlib’s `style sheets` (GH11783).
Removal of deprecated float indexers

In GH4892 indexing with floating point numbers on a non-Float64Index was deprecated (in version 0.14.0). In 0.18.0, this deprecation warning is removed and these will now raise a TypeError. (GH12165, GH12333)

```
In [109]: s = pd.Series([1, 2, 3], index=[4, 5, 6])

In [110]: s
Out[110]:
   4  1
   5  2
   6  3
Length: 3, dtype: int64

In [111]: s2 = pd.Series([1, 2, 3], index=list('abc'))

In [112]: s2
Out[112]:
a  1
b  2
c  3
Length: 3, dtype: int64

Previous behavior:

# this is label indexing
In [2]: s[5.0]
FutureWarning: scalar indexers for index type Int64Index should be integers and not floating point
Out[2]: 2

# this is positional indexing
In [3]: s.iloc[1.0]
FutureWarning: scalar indexers for index type Int64Index should be integers and not floating point
Out[3]: 2

# this is label indexing
In [4]: s.loc[5.0]
FutureWarning: scalar indexers for index type Int64Index should be integers and not floating point
Out[4]: 2

# .ix would coerce 1.0 to the positional 1, and index
In [5]: s2.ix[1.0] = 10
FutureWarning: scalar indexers for index type Index should be integers and not floating point

In [6]: s2
Out[6]:
a  1
b 10
c  3
dtype: int64
```
New behavior:

For `iloc`, getting & setting via a float scalar will always raise.

```python
In [3]: s.iloc[2.0]
TypeError: cannot do label indexing on <class 'pandas.indexes.numeric.Int64Index'> with
these indexers [2.0] of <type 'float'>
```

Other indexers will coerce to a like integer for both getting and setting. The `FutureWarning` has been dropped for `.loc`, `.ix` and `[]`.

```python
In [113]: s[5.0]
Out[113]: 2

In [114]: s.loc[5.0]
Out[114]: 2
```

and setting

```python
In [115]: s_copy = s.copy()
In [116]: s_copy[5.0] = 10
In [117]: s_copy
Out[117]:
   4  1
   5 10
   6  3
Length: 3, dtype: int64

In [118]: s_copy = s.copy()
In [119]: s_copy.loc[5.0] = 10
In [120]: s_copy
Out[120]:
   4  1
   5 10
   6  3
Length: 3, dtype: int64
```

Positional setting with `.ix` and a float indexer will ADD this value to the index, rather than previously setting the value by position.

```python
In [3]: s2.ix[1.0] = 10
In [4]: s2
Out[4]:
a    1
b    2
c    3
1.0 10
dtype: int64
```

Slicing will also coerce integer-like floats to integers for a non-`Float64Index`.
In [121]: s.loc[5.0:6]
Out[121]:
5  2
6  3
Length: 2, dtype: int64

Note that for floats that are NOT coercible to ints, the label based bounds will be excluded

In [122]: s.loc[5.1:6]
Out[122]:
6  3
Length: 1, dtype: int64

Float indexing on a Float64Index is unchanged.

In [123]: s = pd.Series([1, 2, 3], index=np.arange(3.))

In [124]: s[1.0]
Out[124]: 2

In [125]: s[1.0:2.5]
Out[125]:
1.0  2
2.0  3
Length: 2, dtype: int64

Removal of prior version deprecations/changes

- Removal of rolling_corr_pairwise in favor of .rolling().corr(pairwise=True) (GH4950)
- Removal of expanding_corr_pairwise in favor of .expanding().corr(pairwise=True) (GH4950)
- Removal of DataMatrix module. This was not imported into the pandas namespace in any event (GH12111)
- Removal of cols keyword in favor of subset in DataFrame.duplicated() and DataFrame.drop_duplicates() (GH6680)
- Removal of the read_frame and frame_query (both aliases for pd.read_sql) and write_frame (alias of to_sql) functions in the pd.io.sql namespace, deprecated since 0.14.0 (GH6292).
- Removal of the order keyword from .factorize() (GH6930)

Performance improvements

- Improved performance of andrews_curves (GH11534)
- Improved huge DatetimeIndex, PeriodIndex and TimedeltaIndex's ops performance including NaT (GH10277)
- Improved performance of pandas.concat (GH11958)
- Improved performance of StataReader (GH11591)
- Improved performance in construction of Categoricals with Series of datetimes containing NaT (GH12077)
- Improved performance of ISO 8601 date parsing for dates without separators (GH11899), leading zeros (GH11871) and with white space preceding the time zone (GH9714)
Bug fixes

- Bug in `GroupBy.size` when data-frame is empty. (GH11699)
- Bug in `Period.end_time` when a multiple of time period is requested (GH11738)
- Regression in `.clip` with tz-aware datetimes (GH11838)
- Bug in `date_range` when the boundaries fell on the frequency (GH11804, GH12409)
- Bug in consistency of passing nested dicts to `.groupby(...).agg(...)` (GH9052)
- Accept unicode in `Timedelta` constructor (GH11995)
- Bug in value label reading for `StataReader` when reading incrementally (GH12014)
- Bug in vectorized `DateOffset` when n parameter is 0 (GH11370)
- Compat for numpy 1.11 w.r.t. NaT comparison changes (GH12049)
- Bug in `read_csv` when reading from a `StringIO` in threads (GH11790)
- Bug in not treating NaT as a missing value in datetimelikes when factorizing & with `Categoricals` (GH12077)
- Bug in `getitem` when the values of a `Series` were tz-aware (GH12089)
- Bug in `Series.str.get_dummies` when one of the variables was 'name' (GH12180)
- Bug in `pd.concat` while concatenating tz-aware NaT series. (GH11693, GH11755, GH12217)
- Bug in `pd.read_stata` with version <= 108 files. (GH11693, GH11755, GH12217)
- Bug in `Series.resample` using a frequency of `Nano` when the index is a `datetimeIndex` and contains non-zero nanosecond parts (GH12037)
- Bug in resampling with `.nunique` and a sparse index (GH12352)
- Removed some compiler warnings (GH12471)
- Work around compat issues with `boto` in python 3.5 (GH11915)
- Bug in NaT subtraction from `Timestamp` or `datetimeIndex` with timezones (GH11718)
- Bug in subtraction of `Series` of a single tz-aware `Timestamp` (GH12290)
- Use compat iterators in PY2 to support `.next()` (GH12299)
- Bug in `Timedelta.round` with negative values (GH11690)
- Bug in `.loc` against `CategoricalIndex` may result in normal `Index` (GH11586)
- Bug in `DataFrame.info` when duplicated column names exist (GH11761)
- Bug in `.copy` of datetime tz-aware objects (GH11794)
- Bug in `Series.apply` and `Series.map` where `timedelta64` was not boxed (GH11349)
- Bug in `DataFrame.set_index()` with tz-aware `Series` (GH12358)
- Bug in subclasses of `DataFrame` where `AttributeError` did not propagate (GH11808)
- Bug groupby on tz-aware data where selection not returning `Timestamp` (GH11616)
- Bug in `pd.read_clipboard` and `pd.to_clipboard` functions not supporting Unicode; upgrade included `pyperclip` to v1.5.15 (GH9263)
- Bug in `DataFrame.query` containing an assignment (GH8664)
- Bug in `from_msgpack` where `__contains__()` fails for columns of the unpacked `DataFrame`, if the `DataFrame` has object columns. (GH11880)
• Bug in `resample` on categorical data with TimedeltaIndex (GH12169)
• Bug in timezone info lost when broadcasting scalar datetime to DataFrame (GH11682)
• Bug in Index creation from Timestamp with mixed tz coerces to UTC (GH11488)
• Bug in to_numeric where it does not raise if input is more than one dimension (GH11776)
• Bug in parsing timezone offset strings with non-zero minutes (GH11708)
• Bug in df.plot using incorrect colors for bar plots under matplotlib 1.5+ (GH11614)
• Bug in the groupby plot method when using keyword arguments (GH11805).
• Bug in DataFrame duplicated and drop_duplicates causing spurious matches when setting keep=False (GH11864)
• Bug in .loc result with duplicated key may have Index with incorrect dtype (GH11497)
• Bug in pd.rolling_median where memory allocation failed even with sufficient memory (GH11696)
• Bug in DataFrame.style with spurious zeros (GH12134)
• Bug in DataFrame.style with integer columns not starting at 0 (GH12125)
• Bug in .style.bar may not rendered properly using specific browser (GH11678)
• Bug in rich comparison of Timedelta with a numpy.array of Timedelta that caused an infinite recursion (GH11835)
• Bug in DataFrame.round dropping column index name (GH11986)
• Bug in df.replace while replacing value in mixed dtype Dataframe (GH11698)
• Bug in Index prevents copying name of passed Index, when a new name is not provided (GH11193)
• Bug in read_excel failing to read any non-empty sheets when empty sheets exist and sheetname=None (GH11711)
• Bug in read_excel failing to raise NotImplemented error when keywords parse_dates and date_parser are provided (GH11544)
• Bug in read_sql with pymysql connections failing to return chunked data (GH11522)
• Bug in .to_csv ignoring formatting parameters decimal, na_rep, float_format for float indexes (GH11553)
• Bug in Int64Index and Float64Index preventing the use of the modulo operator (GH9244)
• Bug in MultiIndex.drop for not lexsorted MultiIndexes (GH12078)
• Bug in DataFrame when masking an empty DataFrame (GH11859)
• Bug in .plot potentially modifying the colors input when the number of columns didn’t match the number of series provided (GH12039).
• Bug in Series.plot failing when index has a CustomBusinessDay frequency (GH7222).
• Bug in .to_sql for datetime.time values with sqlite fallback (GH8341)
• Bug in read_excel failing to read data with one column when squeeze=True (GH12157)
• Bug in read_excel failing to read one empty column (GH12292, GH9002)
• Bug in .groupby where a KeyError was not raised for a wrong column if there was only one row in the dataframe (GH11741)
• Bug in .read_csv with dtype specified on empty data producing an error (GH12048)
• Bug in .read_csv where strings like '2E' are treated as valid floats (GH12237)
• Bug in building *pandas* with debugging symbols (GH12123)
• Removed millisecond property of *DatetimeIndex*. This would always raise a `ValueError` (GH12019).
• Bug in *Series* constructor with read-only data (GH11502)
• Removed *pandas._testing.choice()*. Should use *np.random.choice()* instead. (GH12386)
• Bug in `.loc` setitem indexer preventing the use of a TZ-aware *DatetimeIndex* (GH12050)
• Bug in `.style` indexes and MultiIndexes not appearing (GH11655)
• Bug in `to_msgpack` and `from_msgpack` which did not correctly serialize or deserialize `NaT` (GH12307).
• Bug in `.skew` and `.kurt` due to roundoff error for highly similar values (GH11974)
• Bug in *Timestamp* constructor where microsecond resolution was lost if HHMMSS were not separated with ‘:’ (GH10041)
• Bug in `buffer_rd_bytes src->buffer` could be freed more than once if reading failed, causing a segfault (GH12098)
• Bug in `crosstab` where arguments with non-overlapping indexes would return a `KeyError` (GH10291)
• Bug in `DataFrame.apply` in which reduction was not being prevented for cases in which `dtype` was not a `numpy dtype` (GH12244)
• Bug when initializing categorical series with a scalar value. (GH12336)
• Bug when specifying a UTC *DatetimeIndex* by setting `utc=True` in `.to_datetime` (GH11934)
• Bug when increasing the buffer size of CSV reader in `read_csv` (GH12494)
• Bug when setting columns of a *DataFrame* with duplicate column names (GH12344)

5.13 Version 0.17

5.13.1 Version 0.17.1 (November 21, 2015)

Note: We are proud to announce that pandas has become a sponsored project of the (NumFOCUS organization). This will help ensure the success of development of pandas as a world-class open-source project.

This is a minor bug-fix release from 0.17.0 and includes a large number of bug fixes along several new features, enhancements, and performance improvements. We recommend that all users upgrade to this version.

Highlights include:

• Support for Conditional HTML Formatting, see here
• Releasing the GIL on the csv reader & other ops, see here
• Fixed regression in DataFrame.drop_duplicates from 0.16.2, causing incorrect results on integer values (GH11376)

What’s new in v0.17.1

• New features
  – Conditional HTML formatting
• Enhancements
• API changes
  – Deprecations
**New features**

### Conditional HTML formatting

**Warning:** This is a new feature and is under active development. We'll be adding features an possibly making breaking changes in future releases. Feedback is welcome.

We’ve added *experimental* support for conditional HTML formatting: the visual styling of a DataFrame based on the data. The styling is accomplished with HTML and CSS. Accesses the styler class with the `pandas.DataFrame.style` attribute, an instance of `Styler` with your data attached.

Here’s a quick example:

```python
In [1]: np.random.seed(123)
In [2]: df = pd.DataFrame(np.random.randn(10, 5), columns=list("abcde"))
In [3]: html = df.style.background_gradient(cmap="viridis", low=0.5)
```

We can render the HTML to get the following table.

**Styler** interacts nicely with the Jupyter Notebook. See the [documentation](#) for more.

### Enhancements

- DatetimeIndex now supports conversion to strings with `astype(str)` (GH10442)
- Support for compression (gzip/bz2) in `pandas.DataFrame.to_csv()` (GH7615)
- `pd.read_*` functions can now also accept `pathlib.Path`, or `py:py._path.local.LocalPath` objects for the `filepath_or_buffer` argument. (GH11033) - The DataFrame and Series functions `.to_csv()`, `.to_html()` and `.to_latex()` can now handle paths beginning with tildes (e.g. `~/Documents/`) (GH11438)
- DataFrame now uses the fields of a `namedtuple` as columns, if columns are not supplied (GH11181)
- DataFrame.iterrows() now returns namedtuple objects, when possible. (GH11269, GH11625)
- Added `axvlines_kwds` to parallel coordinates plot (GH10709)
- Option to `.info()` and `.memory_usage()` to provide for deep introspection of memory consumption. Note that this can be expensive to compute and therefore is an optional parameter. (GH11595)

```python
In [4]: df = pd.DataFrame({"A": ["foo"] * 1000})  # noqa: F821
In [5]: df["B"] = df["A"].astype("category")

# shows the '+' as we have object dtypes
In [6]: df.info()
```
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 1000 entries, 0 to 999
Data columns (total 2 columns):
  # Column Non-Null Count Dtype
  --- ------ -------------- -----
  0 A      1000 non-null  object
  1 B      1000 non-null category
dtypes: category(1), object(1)
memory usage: 9.0+ KB

# we have an accurate memory assessment (but can be expensive to compute this)
In [7]: df.info(memory_usage="deep")
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 1000 entries, 0 to 999
Data columns (total 2 columns):
  # Column Non-Null Count Dtype
  --- ------ -------------- -----
  0 A      1000 non-null  object
  1 B      1000 non-null category
dtypes: category(1), object(1)
memory usage: 59.9 KB

• Index now has afillna method (GH10089)

In [8]: pd.Index([1, np.nan, 3]).fillna(2)
Out[8]: Float64Index([1.0, 2.0, 3.0], dtype='float64')

• Series of type category now make .str.<...> and .dt.<...> accessor methods / properties available, if the categories are of that type. (GH10661)

In [9]: s = pd.Series(list("aabb")).astype("category")

In [10]: s
Out[10]:
0   a
1   a
2   b
3   b
Length: 4, dtype: category
Categories (2, object): ['a', 'b']

In [11]: s.str.contains("a")
Out[11]:
0   True
1   True
2   False
3   False
Length: 4, dtype: bool

In [12]: date = pd.Series(pd.date_range("1/1/2015", periods=5)).astype("category")
In [13]: date
Out[13]:
0  2015-01-01
1  2015-01-02
2  2015-01-03
3  2015-01-04
4  2015-01-05
Length: 5, dtype: category

In [14]: date.dt.day
Out[14]:
0     1
1     2
2     3
3     4
4     5
Length: 5, dtype: int64

• `pivot_table` now has a `margins_name` argument so you can use something other than the default of ‘All’ (GH3335)

• Implement export of `datetime64[ns, tz]` dtypes with a fixed HDF5 store (GH11411)

• Pretty printing sets (e.g. in DataFrame cells) now uses set literal syntax ({x, y}) instead of Legacy Python syntax (set([x, y])) (GH11215)

• Improve the error message in `pandas.io.gbq.to_gbq()` when a streaming insert fails (GH11285) and when the DataFrame does not match the schema of the destination table (GH11359)

API changes

• `raise NotImplementedError` in `Index.shift` for non-supported index types (GH8038)

• `min` and `max` reductions on `datetime64` and `timedelta64` dtyped series now result in `NaT` and not `nan` (GH11245).

• Indexing with a null key will raise a `TypeError`, instead of a `ValueError` (GH11356)

• `Series.ptp` will now ignore missing values by default (GH11163)

Deprecations

• The `pandas.io.ga` module which implements google-analytics support is deprecated and will be removed in a future version (GH11308)

• Deprecate the `engine` keyword in `.to_csv()`, which will be removed in a future version (GH11274)
Performance improvements

- Checking monotonic-ness before sorting on an index (GH11080)
- Series.dropna performance improvement when its dtype can’t contain NaN (GH11159)
- Release the GIL on most datetime field operations (e.g. DatetimeIndex.year, Series.dt.year), normalization, and conversion to and from Period, DatetimeIndex.to_period and PeriodIndex.to_timestamp (GH11263)
- Release the GIL on some rolling algos: rolling_median, rolling_mean, rolling_max, rolling_min, rolling_var, rolling_kurt, rolling_skew (GH11450)
- Release the GIL when reading and parsing text files in read_csv, read_table (GH11272)
- Improved performance of rolling_median (GH11450)
- Improved performance of to_excel (GH11352)
- Performance bug in repr of Categorical categories, which was rendering the strings before chopping them for display (GH11305)
- Performance improvement in Categorical.remove_unused_categories, (GH11643).
- Improved performance of Series constructor with no data and DatetimeIndex (GH11433)
- Improved performance of shift, cumprod, and cumsum with groupby (GH4095)

Bug fixes

- SparseArray.__iter__() now does not cause PendingDeprecationWarning in Python 3.5 (GH11622)
- Regression from 0.16.2 for output formatting of long floats/nan, restored in (GH11302)
- Series.sort_index() now correctly handles the inplace option (GH11402)
- Incorrectly distributed .c file in the build on PyPi when reading a csv of floats and passing na_values=<a scalar> would show an exception (GH11374)
- Bug in .to_latex() output broken when the index has a name (GH10660)
- Bug in HDFStore.append with strings whose encoded length exceeded the max unencoded length (GH11234)
- Bug in merging datetime64[ns, tz] dtypes (GH11405)
- Bug in HDFStore.select when comparing with a numpy scalar in a where clause (GH11283)
- Bug in using DataFrame.ix with a MultiIndex indexer (GH11372)
- Bug in date_range with ambiguous endpoints (GH11626)
- Prevent adding new attributes to the accessors .str, .dt and .cat. Retrieving such a value was not possible, so error out on setting it. (GH10673)
- Bug in tz-conversions with an ambiguous time and .dt accessors (GH11295)
- Bug in output formatting when using an index of ambiguous times (GH11619)
- Bug in comparisons of Series vs list-likes (GH11339)
- Bug in DataFrame.replace with a datetime64[ns, tz] and a non-compat to_replace (GH11326, GH11153)
- Bug in isnull where numpy.datetime64('NaT') in a numpy.array was not determined to be null(GH11206)
pandas: powerful Python data analysis toolkit, Release 1.3.5

- Bug in list-like indexing with a mixed-integer Index (GH11320)
- Bug in `pivot_table` with `margins=True` when indexes are of Categorical dtype (GH10993)
- Bug in `DataFrame.plot` cannot use hex strings colors (GH10299)
- Regression in `DataFrame.drop_duplicates` from 0.16.2, causing incorrect results on integer values (GH11376)
- Bug in `pd.eval` where unary ops in a list error (GH11235)
- Bug in `squeeze()` with zero length arrays (GH11230, GH8999)
- Bug in `describe()` dropping column names for hierarchical indexes (GH11517)
- Bug in `DataFrame.pct_change()` not propagating `axis` keyword on `.fillna` method (GH11150)
- Bug in `.to_csv()` when a mix of integer and string column names are passed as the `columns` parameter (GH11637)
- Bug in indexing with a `range`, (GH11652)
- Bug in inference of numpy scalars and preserving dtype when setting columns (GH11638)
- Bug in `to_sql` using unicode column names giving UnicodeEncodeError with (GH11431).
- Fix regression in setting of `xticks` in `plot` (GH11529).
- Bug in `holiday.dates` where observance rules could not be applied to holiday and doc enhancement (GH11477, GH11533)
- Fix plotting issues when having plain `Axes` instances instead of `SubplotAxes` (GH11520, GH11556).
- Bug in `DataFrame.to_latex()` produces an extra rule when `header=False` (GH11527)
- Bug in `DataFrame.to_dict()` produces a `np.datetime64` object instead of `Timestamp` when only datetime is present in data (GH11327)
- Bug in `DataFrame.corr()` raises exception when computes Kendall correlation for DataFrames with boolean and not boolean columns (GH11560)
- Bug in the link-time error caused by C inline functions on FreeBSD 10+ (with clang) (GH10510)
- Bug in `DataFrame.to_csv` in passing through arguments for formatting MultiIndexes, including `date_format` (GH11791)
- Bug in `DataFrame.join()` with `how='right'` producing a `TypeError` (GH11519)
- Bug in `Series.quantile` with empty list results has `Index` with `object` dtype (GH11588)
- Bug in `pd.merge` results in empty `Int64Index` rather than `Index(dtype=object)` when the merge result is empty (GH11588)
- Bug in `Categorical.remove_unused_categories` when having NaN values (GH11599)
- Bug in `DataFrame.to_sparse()` loses column names for MultiIndexes (GH11600)
• Bug in DataFrame.round() with non-unique column index producing a Fatal Python error (GH11611)
• Bug in DataFrame.round() with decimals being a non-unique indexed Series producing extra columns (GH11618)

5.13.2 Version 0.17.0 (October 9, 2015)

This is a major release from 0.16.2 and includes a small number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

**Warning:** pandas >= 0.17.0 will no longer support compatibility with Python version 3.2 (GH9118)

**Warning:** The pandas.io.data package is deprecated and will be replaced by the pandas-datareader package. This will allow the data modules to be independently updated to your pandas installation. The API for pandas-datareader v0.1.1 is exactly the same as in pandas v0.17.0 (GH8961, GH10861).

After installing pandas-datareader, you can easily change your imports:

```
from pandas.io import data, wb
```

becomes

```
from pandas_datareader import data, wb
```

Highlights include:

- Release the Global Interpreter Lock (GIL) on some cython operations, see [here](#)
- Plotting methods are now available as attributes of the `.plot` accessor, see [here](#)
- The sorting API has been revamped to remove some long-time inconsistencies, see [here](#)
- Support for a `datetime64[ns]` with timezones as a first-class dtype, see [here](#)
- The default for `to_datetime` will now be to raise when presented with unparsable formats, previously this would return the original input. Also, date parse functions now return consistent results. See [here](#)
- The default for dropna in HDFStore has changed to False, to store by default all rows even if they are all NaN, see [here](#)
- Datetime accessor (`dt`) now supports `Series.dt.strftime` to generate formatted strings for datetime-likes, and `Series.dt.total_seconds` to generate each duration of the timedelta in seconds. See [here](#)
- Period and PeriodIndex can handle multiplied freq like 3D, which corresponding to 3 days span. See [here](#)
- Development installed versions of pandas will now have PEP440 compliant version strings (GH9518)
- Development support for benchmarking with the Air Speed Velocity library (GH8361)
- Support for reading SAS xport files, see [here](#)
- Documentation comparing SAS to pandas, see [here](#)
- Removal of the automatic TimeSeries broadcasting, deprecated since 0.8.0, see [here](#)
- Display format with plain text can optionally align with Unicode East Asian Width, see [here](#)
- Compatibility with Python 3.5 (GH11097)
- Compatibility with matplotlib 1.5.0 (GH11111)

Check the [API Changes](#) and [deprecations](#) before updating.
What’s new in v0.17.0

• **New features**
  – Datetime with TZ
  – Releasing the GIL
  – Plot submethods
  – Additional methods for dt accessor
    * Series.dt.strftime
    * Series.dt.total_seconds
  – Period frequency enhancement
  – Support for SAS XPORT files
  – Support for math functions in .eval()
  – Changes to Excel with MultiIndex
  – Google BigQuery enhancements
  – Display alignment with Unicode East Asian width
  – Other enhancements

• **Backwards incompatible API changes**
  – Changes to sorting API
  – Changes to to_datetime and to_timedelta
    * Error handling
    * Consistent parsing
  – Changes to Index comparisons
  – Changes to boolean comparisons vs. None
  – HDFStore dropna behavior
  – Changes to display.precision option
  – Changes to Categorical.unique
  – Changes to bool passed as header in parsers
  – Other API changes
  – Deprecations
  – Removal of prior version deprecations/changes

• **Performance improvements**
• **Bug fixes**
• **Contributors**
New features

Datetime with TZ

We are adding an implementation that natively supports datetime with timezones. A Series or a DataFrame column previously could be assigned a datetime with timezones, and would work as an object dtype. This had performance issues with a large number rows. See the docs for more details. (GH8260, GH10763, GH11034).

The new implementation allows for having a single-timezone across all rows, with operations in a performant manner.

```python
In [1]: df = pd.DataFrame({
    ...:    "A": pd.date_range("20130101", periods=3),
    ...:    "B": pd.date_range("20130101", periods=3, tz="US/Eastern"),
    ...:    "C": pd.date_range("20130101", periods=3, tz="CET"),
    ...:  }
    ...
)

In [2]: df
Out[2]:
       A         B
0 2013-01-01 00:00:00-05:00 2013-01-01 00:00:00-05:00
1 2013-01-02 00:00:00-05:00 2013-01-02 00:00:00-05:00
2 2013-01-03 00:00:00-05:00 2013-01-03 00:00:00-05:00

[3 rows x 3 columns]

In [3]: df.dtypes
Out[3]:
       A       B       C
dtype: datetime64[ns]  datetime64[ns, US/Eastern]  datetime64[ns, CET]

In [4]: df.B
Out[4]:
0 2013-01-01 00:00:00-05:00
1 2013-01-02 00:00:00-05:00
2 2013-01-03 00:00:00-05:00
Name: B, Length: 3, dtype: datetime64[ns, US/Eastern]

In [5]: df.B.dt.tz_localize(None)
Out[5]:
0 2013-01-01
1 2013-01-02
2 2013-01-03
Name: B, Length: 3, dtype: datetime64[ns]

This uses a new-dtype representation as well, that is very similar in look-and-feel to its numpy cousin datetime64[ns]

In [6]: df["B").dtype
Out[6]: datetime64[ns, US/Eastern]
In 

```
In [7]: type(df['B'].dtype)
Out[7]: pandas.core.dtypes.dtypes.DatetimeTZDtype
```

**Note:** There is a slightly different string repr for the underlying `DatetimeIndex` as a result of the dtype changes, but functionally these are the same.

Previous behavior:

```
In [1]: pd.date_range('20130101', periods=3, tz='US/Eastern')
Out[1]: DatetimeIndex(['2013-01-01 00:00:00-05:00', '2013-01-02 00:00:00-05:00', '2013-01-03 00:00:00-05:00'],
                     dtype='datetime64[ns]', freq='D', tz='US/Eastern')
```

```
In [2]: pd.date_range('20130101', periods=3, tz='US/Eastern').dtype
Out[2]: dtype('<M8[ns]')
```

New behavior:

```
In [8]: pd.date_range("20130101", periods=3, tz="US/Eastern")
Out[8]: DatetimeIndex(['2013-01-01 00:00:00-05:00', '2013-01-02 00:00:00-05:00', '2013-01-03 00:00:00-05:00'],
                     dtype='datetime64[ns, US/Eastern]', freq='D')
```

```
In [9]: pd.date_range("20130101", periods=3, tz="US/Eastern").dtype
Out[9]: datetime64[ns, US/Eastern]
```

**Releasing the GIL**

We are releasing the global-interpreter-lock (GIL) on some cython operations. This will allow other threads to run simultaneously during computation, potentially allowing performance improvements from multi-threading. Notably `groupby`, `nsmallest`, `value_counts` and some indexing operations benefit from this. ([GH8882](https://github.com/pandas-dev/pandas/pull/8882))

For example the groupby expression in the following code will have the GIL released during the factorization step, e.g. `df.groupby('key').sum()` as well as the `.sum()` operation.

```python
N = 1000000
ngroups = 10
df = DataFrame(
    {"key": np.random.randint(0, ngroups, size=N), "data": np.random.randn(N)}
)
df.groupby("key")['data'].sum()
```

Releasing of the GIL could benefit an application that uses threads for user interactions (e.g. QT), or performing multi-threaded computations. A nice example of a library that can handle these types of computation-in-parallel is the [dask](https://dask.org) library.
Plot submethods

The Series and DataFrame `.plot()` method allows for customizing plot types by supplying the kind keyword arguments. Unfortunately, many of these kinds of plots use different required and optional keyword arguments, which makes it difficult to discover what any given plot kind uses out of the dozens of possible arguments.

To alleviate this issue, we have added a new, optional plotting interface, which exposes each kind of plot as a method of the `.plot` attribute. Instead of writing `series.plot(kind=<kind>, ...)`, you can now also use `series.plot.<kind>(...)`:

```python
In [10]: df = pd.DataFrame(np.random.rand(10, 2), columns=['a', 'b'])
In [11]: df.plot.bar()
```

As a result of this change, these methods are now all discoverable via tab-completion:

```python
In [12]: df.plot.<TAB> # noqa: E225, E999
df.plot.area df.plot.barh df.plot.density df.plot.hist df.plot.line df.plot.scatter
df.plot.bar df.plot.box df.plot.hexbin df.plot.kde df.plot.pie
```

Each method signature only includes relevant arguments. Currently, these are limited to required arguments, but in the future these will include optional arguments, as well. For an overview, see the new Plotting API documentation.

Additional methods for dt accessor

**Series.dt.strftime**

We are now supporting a `Series.dt.strftime` method for datetime-likes to generate a formatted string (GH10110). Examples:

```python
# DatetimeIndex
In [13]: s = pd.Series(pd.date_range("20130101", periods=4))
In [14]: s
Out[14]:
```

(continues on next page)
In [16]: s = pd.Series(pd.period_range("20130101", periods=4))

In [17]: s
Out[17]:
0  2013-01-01
1  2013-01-02
2  2013-01-03
3  2013-01-04
Length: 4, dtype: period[D]

In [18]: s.dt.strftime("%Y/%m/%d")
Out[18]:
0  2013/01/01
1  2013/01/02
2  2013/01/03
3  2013/01/04
Length: 4, dtype: object

The string format is as the python standard library and details can be found [here](#).

Series.dt.total_seconds

pd.Series of type timedelta64 has new method .dt.total_seconds() returning the duration of the timedelta in seconds (GH10817)

In [19]: s = pd.Series(pd.timedelta_range("1 minutes", periods=4))

In [20]: s
Out[20]:
0  0 days 00:01:00
1  1 days 00:01:00
2  2 days 00:01:00
3  3 days 00:01:00
Length: 4, dtype: timedelta64[ns]
In [21]: s.dt.total_seconds()
Out[21]:
0   60.0
1  86460.0
2  172860.0
3  259260.0
Length: 4, dtype: float64

Period frequency enhancement

Period, PeriodIndex and period_range can now accept multiplied freq. Also, Period.freq and PeriodIndex.freq are now stored as a DateOffset instance like DatetimeIndex, and not as str (GH7811)

A multiplied freq represents a span of corresponding length. The example below creates a period of 3 days. Addition and subtraction will shift the period by its span.

In [22]: p = pd.Period("2015-08-01", freq="3D")

In [23]: p
Out[23]: Period('2015-08-01', '3D')

In [24]: p + 1
Out[24]: Period('2015-08-04', '3D')

In [25]: p - 2
Out[25]: Period('2015-07-26', '3D')

In [26]: p.to_timestamp()
Out[26]: Timestamp('2015-08-01 00:00:00')

In [27]: p.to_timestamp(how="E")
Out[27]: Timestamp('2015-08-03 23:59:59.999999999')

You can use the multiplied freq in PeriodIndex and period_range.

In [28]: idx = pd.period_range("2015-08-01", periods=4, freq="2D")

In [29]: idx
Out[29]: PeriodIndex(['2015-08-01', '2015-08-03', '2015-08-05', '2015-08-07'], dtype='period[2D]')

In [30]: idx + 1
Out[30]: PeriodIndex(['2015-08-03', '2015-08-05', '2015-08-07', '2015-08-09'], dtype='period[2D]')
Support for SAS XPORT files

`read_sas()` provides support for reading SAS XPORT format files. (GH4052).

```python
df = pd.read_sas("sas_xport.xpt")
```

It is also possible to obtain an iterator and read an XPORT file incrementally.

```python
for df in pd.read_sas("sas_xport.xpt", chunksize=10000):
    do_something(df)
```

See the docs for more details.

Support for math functions in .eval()

`eval()` now supports calling math functions (GH4893)

```python
df = pd.DataFrame({"a": np.random.randn(10)})
df.eval("b = sin(a)"")
```

The support math functions are `sin`, `cos`, `exp`, `log`, `expm1`, `log1p`, `sqrt`, `sinh`, `cosh`, `tanh`, `arcsin`, `arccos`, `arctan`, `arccosh`, `arcsinh`, `arctanh`, `abs` and `arctan2`.

These functions map to the intrinsics for the NumExpr engine. For the Python engine, they are mapped to NumPy calls.

Changes to Excel with MultiIndex

In version 0.16.2a DataFrame with MultiIndex columns could not be written to Excel via `to_excel`. That functionality has been added (GH10564), along with updating `read_excel` so that the data can be read back with, no loss of information, by specifying which columns/rows make up the MultiIndex in the header and `index_col` parameters (GH4679)

See the documentation for more details.

```python
In [31]: df = pd.DataFrame(
       ....:     [[1, 2, 3, 4], [5, 6, 7, 8]],
       ....:     columns=pd.MultiIndex.from_product(
       ....:         ["foo", "bar"], ["a", "b"], names=["col1", "col2"]
       ....:     ),
       ....:     index=pd.MultiIndex.from_product(["j", ["1", "k"], names=["i1", "i2"]),
       ....:     )

In [32]: df
Out[32]:
                   col1 foo  bar
       col2   a   b   a   b
      i1   a   1   2   3   4
      i2   b   5   6   7   8
[2 rows x 4 columns]
```
In [33]: df.to_excel("test.xlsx")

In [34]: df = pd.read_excel("test.xlsx", header=[0, 1], index_col=[0, 1])

In [35]: df
Out[35]:
    col1  foo  bar
col2    a    b    a    b
i1   j1  1  2  3  4
     k5  6  7  8
[2 rows x 4 columns]

Previously, it was necessary to specify the `has_index_names` argument in `read_excel`, if the serialized data had index names. For version 0.17.0 the output format of `to_excel` has been changed to make this keyword unnecessary - the change is shown below.

Old

<table>
<thead>

</tr>
</tbody>
</table>

**Warning:** Excel files saved in version 0.16.2 or prior that had index names will still able to be read in, but the `has_index_names` argument must specified to True.
Google BigQuery enhancements

- Added ability to automatically create a table/dataset using the pandas.io.gbq.to_gbq() function if the destination table/dataset does not exist. (GH8325, GH11121).
- Added ability to replace an existing table and schema when calling the pandas.io.gbq.to_gbq() function via the if_exists argument. See the docs for more details (GH8325).
- InvalidColumnOrder and InvalidPageToken in the gbq module will raise ValueError instead of IOError.
- The generate_bq_schema() function is now deprecated and will be removed in a future version (GH11121).
- The gbq module will now support Python 3 (GH11094).

Display alignment with Unicode East Asian width

**Warning:** Enabling this option will affect the performance for printing of DataFrame and Series (about 2 times slower). Use only when it is actually required.

Some East Asian countries use Unicode characters its width is corresponding to 2 alphabets. If a DataFrame or Series contains these characters, the default output cannot be aligned properly. The following options are added to enable precise handling for these characters.

- `display.unicode.east_asian_width`: Whether to use the Unicode East Asian Width to calculate the display text width. (GH2612)
- `display.unicode.ambiguous_as_wide`: Whether to handle Unicode characters belong to Ambiguous as Wide. (GH11102)

```python
In [36]: df = pd.DataFrame({u'': ['UK', u''], u'': ['Alice', u'']})

In [37]: df;
```

```bash
0 Alice  UK
1  しのぶ 日本
```

```python
In [38]: pd.set_option("display.unicode.east_asian_width", True)

In [39]: df;
```

```bash
0 Alice  UK
1  しのぶ 日本
```

For further details, see [here](#)
Other enhancements

- Support for `openpyxl >= 2.2`. The API for style support is now stable (GH10125)
- `merge` now accepts the argument `indicator` which adds a Categorical-type column (by default called `_merge`) to the output object that takes on the values (GH8790)

<table>
<thead>
<tr>
<th>Observation Origin</th>
<th>_merge value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Merge key only in 'left' frame</td>
<td>left_only</td>
</tr>
<tr>
<td>Merge key only in 'right' frame</td>
<td>right_only</td>
</tr>
<tr>
<td>Merge key in both frames</td>
<td>both</td>
</tr>
</tbody>
</table>

```python
In [40]: df1 = pd.DataFrame({'col1': [0, 1], 'col_left': ['a', 'b']})
In [41]: df2 = pd.DataFrame({'col1': [1, 2, 2], 'col_right': [2, 2, 2]})
In [42]: pd.merge(df1, df2, on='col1', how='outer', indicator=True)
Out[42]:
   col1  col_left  col_right  _merge
0     0        a         NaN      left_only
1     1        b         2.0      both
2     2  NaN       2.0      right_only
3     2  NaN       2.0      right_only
[4 rows x 4 columns]
```

For more, see the updated docs

- `pd.to_numeric` is a new function to coerce strings to numbers (possibly with coercion) (GH11133)
- `pd.merge` will now allow duplicate column names if they are not merged upon (GH10639).
- `pd.pivot` will now allow passing index as `None` (GH3962).
- `pd.concat` will now use existing Series names if provided (GH10698).

```python
In [43]: foo = pd.Series([1, 2], name='foo')
In [44]: bar = pd.Series([1, 2])
In [45]: baz = pd.Series([4, 5])
```

Previous behavior:

```python
In [1]: pd.concat([foo, bar, baz], axis=1)
Out[1]:
   0  1  2
0  1  1  4
1  2  2  5
```

New behavior:

```python
In [46]: pd.concat([foo, bar, baz], axis=1)
Out[46]:
   foo  0  1
```
• **DataFrame** has gained the \texttt{nlargest} and \texttt{nsmallest} methods (GH10393)

• Add a \texttt{limit\_direction} keyword argument that works with \texttt{limit} to enable \texttt{interpolate} to fill NaN values forward, backward, or both (GH9218, GH10420, GH11115)

```
In [47]: ser = pd.Series([np.nan, np.nan, 5, np.nan, np.nan, np.nan, 13])

In [48]: ser.interpolate(limit=1, limit_direction="both")
```

```
Out[48]:
0  NaN
1  5.0
2  5.0
3  7.0
4  NaN
5  11.0
6  13.0
Length: 7, dtype: float64
```

• Added a \texttt{DataFrame.round} method to round the values to a variable number of decimal places (GH10568).

```
In [49]: df = pd.DataFrame(
   ....: np.random.random([3, 3]),
   ....: columns=["A", "B", "C"],
   ....: index=["first", "second", "third"],
   ....: )

In [50]: df
Out[50]:
     A      B      C
first  0.126970  0.966718  0.260476
second  0.897237  0.376750  0.336222
third  0.451376  0.840255  0.123102

[3 rows x 3 columns]
```

```
In [51]: df.round(2)
```

```
Out[51]:
     A      B      C
first  0.13  0.97  0.26
second  0.90  0.38  0.34
third  0.45  0.84  0.12

[3 rows x 3 columns]
```

```
In [52]: df.round({"A": 0, "C": 2})
```

```
Out[52]:
     A  B  C
first  0  0  2
second  0  0  2
third  0  0  2

[3 rows x 3 columns]
```
• drop_duplicates and duplicated now accept a keep keyword to target first, last, and all duplicates. The take_last keyword is deprecated, see here (GH6511, GH8505)

```
In [53]: s = pd.Series(['A', 'B', 'C', 'A', 'B', 'D'])
In [54]: s.drop_duplicates()
Out[54]:
0   A
1   B
2   C
5   D
Length: 4, dtype: object
In [55]: s.drop_duplicates(keep="last")
Out[55]:
2   C
3   A
4   B
5   D
Length: 4, dtype: object
In [56]: s.drop_duplicates(keep=False)
Out[56]:
2   C
5   D
Length: 2, dtype: object
```

• Reindex now has a tolerance argument that allows for finer control of Limits on filling while reindexing (GH10411):

```
In [57]: df = pd.DataFrame({'x': range(5), 't': pd.date_range('2000-01-01', periods=5)})
In [58]: df.reindex([0.1, 1.9, 3.5], method="nearest", tolerance=0.2)
Out[58]:
     x     t
0.1  0.0  2000-01-01
1.9  2.0  2000-01-03
3.5  NaN   NaT
```

When used on a DatetimeIndex, TimedeltaIndex or PeriodIndex, tolerance will coerced into a Timedelta if possible. This allows you to specify tolerance with a string:

```
In [59]: df = df.set_index("t")
```

(continues on next page)
In [60]: df.reindex(pd.to_datetime(['1999-12-31']), method="nearest", tolerance="1 day")
Out[60]:
    x
1999-12-31  0
[1 rows x 1 columns]

tolerance is also exposed by the lower level Index.get_indexer and Index.get_loc methods.

• Added functionality to use the base argument when resampling a TimeDeltaIndex (GH10530)
• DatetimeIndex can be instantiated using strings contains NaT (GH7599)
• to_datetime can now accept the yearfirst keyword (GH7599)
• pandas.tseries.offsets larger than the Day offset can now be used with a Series for addition/subtraction (GH10699). See the docs for more details.
• pd.Timedelta.total_seconds() now returns Timedelta duration to ns precision (previously microsecond precision) (GH10939)
• PeriodIndex now supports arithmetic with np.ndarray (GH10638)
• Support pickling of Period objects (GH10439)
• .as_blocks will now take a copy optional argument to return a copy of the data, default is to copy (no change in behavior from prior versions), (GH9607)
• regex argument to DataFrame.filter now handles numeric column names instead of raising ValueError (GH10384).
• Enable reading gzip compressed files via URL, either by explicitly setting the compression parameter or by inferring from the presence of the HTTP Content-Encoding header in the response (GH8685)
• Enable writing Excel files in memory using StringIO/BytesIO (GH7074)
• Enable serialization of lists and dicts to strings in ExcelWriter (GH8188)
• SQL io functions now accept a SQLAlchemy connectable. (GH7877)
• pd.read_sql and to_sql can accept database URI as con parameter (GH10214)
• read_sql_table will now allow reading from views (GH10750).
• Enable writing complex values to HDFStores when using the table format (GH10447)
• Enable pd.read_hdf to be used without specifying a key when the HDF file contains a single dataset (GH10443)
• pd.read_stata will now read Stata 118 type files. (GH9882)
• msgpack submodule has been updated to 0.4.6 with backward compatibility (GH10518)
• DataFrame.to_dict now accepts orient='index' keyword argument (GH10844).
• DataFrame.apply will return a Series of dicts if the passed function returns a dict and reduce=True (GH8735).
• Allow passing kwargs to the interpolation methods (GH10378).
• Improved error message when concatenating an empty iterable of DataFrame objects (GH9157)
• pd.read_csv can now read bz2-compressed files incrementally, and the C parser can read bz2-compressed files from AWS S3 (GH10170, GH11072).
• In pd.read_csv, recognize s3n:// and s3a:// URLs as designating S3 file storage (GH11070, GH11071).
• Read CSV files from AWS S3 incrementally, instead of first downloading the entire file. (Full file download still required for compressed files in Python 2.) (GH11070, GH11073)
• `pd.read_csv` is now able to infer compression type for files read from AWS S3 storage (GH11070, GH11074).

Backwards incompatible API changes

Changes to sorting API

The sorting API has had some longtime inconsistencies. (GH9816, GH8239).

Here is a summary of the API PRIOR to 0.17.0:

- `Series.sort` is **INPLACE** while `DataFrame.sort` returns a new object.
- `Series.order` returns a new object
- It was possible to use `Series/DataFrame.sort_index` to sort by **values** by passing the by keyword.
- `Series/DataFrame.sortlevel` worked only on a MultiIndex for sorting by index.

To address these issues, we have revamped the API:

- We have introduced a new method, `DataFrame.sort_values()`, which is the merger of `DataFrame.sort()`, `Series.sort()`, and `Series.order()`, to handle sorting of **values**.
- The existing methods `Series.sort()`, `Series.order()`, and `DataFrame.sort()` have been deprecated and will be removed in a future version.
- The by argument of `DataFrame.sort_index()` has been deprecated and will be removed in a future version.
- The existing method `.sort_index()` will gain the level keyword to enable level sorting.

We now have two distinct and non-overlapping methods of sorting. A * marks items that will show a FutureWarning.

To sort by the **values**:

<table>
<thead>
<tr>
<th>Previous</th>
<th>Replacement</th>
</tr>
</thead>
<tbody>
<tr>
<td>*Series.order()</td>
<td>Series.sort_values()</td>
</tr>
<tr>
<td>*Series.sort()</td>
<td>Series.sort_values(inplace=True)</td>
</tr>
<tr>
<td>* DataFrame.sort(columns=...)</td>
<td>DataFrame.sort_values(by=...)</td>
</tr>
</tbody>
</table>

To sort by the **index**:

<table>
<thead>
<tr>
<th>Previous</th>
<th>Replacement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Series.sort_index()</td>
<td>Series.sort_index()</td>
</tr>
<tr>
<td>Series.sortlevel(level=...)</td>
<td>Series.sort_index(level=...)</td>
</tr>
<tr>
<td>DataFrame.sort_index()</td>
<td>DataFrame.sort_index()</td>
</tr>
<tr>
<td>DataFrame.sortlevel(level=...)</td>
<td>DataFrame.sort_index(level=...)</td>
</tr>
<tr>
<td>* DataFrame.sort()</td>
<td>DataFrame.sort_index()</td>
</tr>
</tbody>
</table>

We have also deprecated and changed similar methods in two Series-like classes, Index and Categorical.

<table>
<thead>
<tr>
<th>Previous</th>
<th>Replacement</th>
</tr>
</thead>
<tbody>
<tr>
<td>* Index.order()</td>
<td>Index.sort_values()</td>
</tr>
<tr>
<td>* Categorical.order()</td>
<td>Categorical.sort_values()</td>
</tr>
</tbody>
</table>
Changes to to_datetime and to_timedelta

Error handling

The default for pd.to_datetime error handling has changed to errors='raise'. In prior versions it was errors='ignore'. Furthermore, the coerce argument has been deprecated in favor of errors='coerce'. This means that invalid parsing will raise rather that return the original input as in previous versions. (GH10636)

Previous behavior:

```
In [2]: pd.to_datetime(['2009-07-31', 'asd'])
Out[2]: array(['2009-07-31', 'asd'], dtype=object)
```

New behavior:

```
In [3]: pd.to_datetime(['2009-07-31', 'asd'])
ValueError: Unknown string format
```

Of course you can coerce this as well.

```
In [61]: pd.to_datetime(['2009-07-31', 'asd'], errors='coerce')
Out[61]: DatetimeIndex(['2009-07-31', NaT'], dtype='datetime64[ns]', freq=None)
```

To keep the previous behavior, you can use errors='ignore':

```
In [62]: pd.to_datetime(['2009-07-31', 'asd'], errors='ignore')
Out[62]: Index(['2009-07-31', 'asd'], dtype='object')
```

Furthermore, pd.to_timedelta has gained a similar API, of errors='raise'|'ignore'|'coerce', and the coerce keyword has been deprecated in favor of errors='coerce'.

Consistent parsing

The string parsing of to_datetime, Timestamp and DatetimeIndex has been made consistent. (GH7599)

Prior to v0.17.0, Timestamp and to_datetime may parse year-only datetime-string incorrectly using today's date, otherwise DatetimeIndex uses the beginning of the year. Timestamp and to_datetime may raise ValueError in some types of datetime-string which DatetimeIndex can parse, such as a quarterly string.

Previous behavior:

```
In [1]: pd.Timestamp('2012Q2')
Traceback
...
ValueError: Unable to parse 2012Q2

# Results in today's date.
In [2]: pd.Timestamp('2014')
Out [2]: 2014-08-12 00:00:00
```

v0.17.0 can parse them as below. It works on DatetimeIndex also.

New behavior:
In [63]: pd.Timestamp("2012Q2")
Out[63]: Timestamp('2012-04-01 00:00:00')

In [64]: pd.Timestamp("2014")
Out[64]: Timestamp('2014-01-01 00:00:00')

In [65]: pd.DatetimeIndex(["2012Q2", "2014"])
Out[65]: DatetimeIndex(['2012-04-01', '2014-01-01'], dtype='datetime64[ns]', freq=None)

Note: If you want to perform calculations based on today’s date, use Timestamp.now() and pandas.tseries.
offsets.

In [66]: import pandas.tseries.offsets as offsets

In [67]: pd.Timestamp.now()
Out[67]: Timestamp('2021-12-12 11:09:45.985560')

In [68]: pd.Timestamp.now() + offsets.DateOffset(years=1)
Out[68]: Timestamp('2022-12-12 11:09:45.986968')

Changes to Index comparisons

Operator equal on Index should behavior similarly to Series (GH9947, GH10637)
Starting in v0.17.0, comparing Index objects of different lengths will raise a ValueError. This is to be consistent with the behavior of Series.

Previous behavior:

In [2]: pd.Index([1, 2, 3]) == pd.Index([1, 4, 5])
Out[2]: array([ True, False, False], dtype=bool)

In [3]: pd.Index([1, 2, 3]) == pd.Index([2])
Out[3]: array([False, True, False], dtype=bool)

In [4]: pd.Index([1, 2, 3]) == pd.Index([1, 2])
Out[4]: False

New behavior:

In [8]: pd.Index([1, 2, 3]) == pd.Index([1, 4, 5])
Out[8]: array([ True, False, False], dtype=bool)

In [9]: pd.Index([1, 2, 3]) == pd.Index([2])
ValueError: Lengths must match to compare

In [10]: pd.Index([1, 2, 3]) == pd.Index([1, 2])
ValueError: Lengths must match to compare

Note that this is different from the numpy behavior where a comparison can be broadcast:
or it can return False if broadcasting can not be done:

```python
In [70]: np.array([1, 2, 3]) == np.array([1, 2])
Out[70]: False
```

### Changes to boolean comparisons vs. None

Boolean comparisons of a `Series` vs `None` will now be equivalent to comparing with `np.nan`, rather than raise `TypeError`. (GH1079).

```python
In [71]: s = pd.Series(range(3))

In [72]: s.iloc[1] = None

In [73]: s
Out[73]:
0  0.0
1  NaN
2  2.0
Length: 3, dtype: float64
```

Previous behavior:

```python
In [5]: s == None
TypeError: Could not compare <type 'NoneType'> type with Series
```

New behavior:

```python
In [74]: s == None
Out[74]:
0  False
1  False
2  False
Length: 3, dtype: bool
```

Usually you simply want to know which values are null.

```python
In [75]: s.isnull()
Out[75]:
0  False
1  True
2  False
Length: 3, dtype: bool
```

**Warning:** You generally will want to use `isnull/notnull` for these types of comparisons, as `isnull/notnull` tells you which elements are null. One has to be mindful that `nan`’s don’t compare equal, but `None`’s do. Note that pandas/numpy uses the fact that `np.nan != np.nan`, and treats `None` like `np.nan`. 
In [76]: None == None
Out[76]: True

In [77]: np.nan == np.nan
Out[77]: False

**HDFStore dropna behavior**

The default behavior for HDFStore write functions with format='table' is now to keep rows that are all missing. Previously, the behavior was to drop rows that were all missing save the index. The previous behavior can be replicated using the dropna=True option. (GH9382)

Previous behavior:

```python
In [78]: df_with_missing = pd.DataFrame(
   ....:   {"col1": [0, np.nan, 2], "col2": [1, np.nan, np.nan]}
   ....: )
   ....:
In [79]: df_with_missing
Out[79]:
   col1 col2
  0   0.0  1.0
  1   NaN  NaN
  2   2.0  NaN
[3 rows x 2 columns]
```

```python
In [27]:
df_with_missing.to_hdf('file.h5', 'df_with_missing', format='table', mode='w')
In [28]: pd.read_hdf('file.h5', 'df_with_missing')
Out [28]:
   col1  col2
  0.0   1.0
  NaN  NaN
```

New behavior:

```python
In [80]: df_with_missing.to_hdf("file.h5", "df_with_missing", format="table", mode="w")
In [81]: pd.read_hdf("file.h5", "df_with_missing")
Out[81]:
   col1  col2
  0   0.0  1.0
  NaN  NaN
  2   2.0  NaN
```

(continues on next page)
See the *docs* for more details.

**Changes to display.precision option**

The `display.precision` option has been clarified to refer to decimal places (GH10451).

Earlier versions of pandas would format floating point numbers to have one less decimal place than the value in `display.precision`.

```
In [1]: pd.set_option('display.precision', 2)
In [2]: pd.DataFrame({'x': [123.456789]})
Out[2]:
       x
0  123.5
```

If interpreting precision as “significant figures” this did work for scientific notation but that same interpretation did not work for values with standard formatting. It was also out of step with how numpy handles formatting.

Going forward the value of `display.precision` will directly control the number of places after the decimal, for regular formatting as well as scientific notation, similar to how numpy’s `precision` print option works.

```
In [82]: pd.set_option("display.precision", 2)
In [83]: pd.DataFrame({'x': [123.456789]})
Out[83]:
       x
0  123.46
```

To preserve output behavior with prior versions the default value of `display.precision` has been reduced to 6 from 7.

**Changes to Categorical.unique**

`Categorical.unique` now returns new `Categoricals` with categories and codes that are unique, rather than returning `np.array` (GH10508)

• unordered category: values and categories are sorted by appearance order.

• ordered category: values are sorted by appearance order, categories keep existing order.

```
In [84]: cat = pd.Categorical(['C', 'A', 'B', 'C'], categories=['A', 'B', 'C'], ordered=True)
In [85]: cat
Out[85]:
['C', 'A', 'B', 'C']
```

(continues on next page)
Categories (3, object): ['A' < 'B' < 'C']

In [86]: cat.unique()
Out[86]: ['C', 'A', 'B']
Categories (3, object): ['A' < 'B' < 'C']

In [87]: cat = pd.Categorical(['C', 'A', 'B', 'C'], categories=['A', 'B', 'C'])

In [88]: cat
Out[88]: ['C', 'A', 'B', 'C']
Categories (3, object): ['A', 'B', 'C']

In [89]: cat.unique()
Out[89]: ['C', 'A', 'B']
Categories (3, object): ['A', 'B', 'C']

Changes to bool passed as header in parsers

In earlier versions of pandas, if a bool was passed the header argument of `read_csv`, `read_excel`, or `read_html` it was implicitly converted to an integer, resulting in `header=0` for False and `header=1` for True (GH6113)

A bool input to `header` will now raise a TypeError

In [29]: df = pd.read_csv('data.csv', header=False)
TypeError: Passing a bool to header is invalid. Use header=None for no header or header=int or list-like of ints to specify the row(s) making up the column names

Other API changes

- Line and kde plot with `subplots=True` now uses default colors, not all black. Specify `color='k'` to draw all lines in black (GH9894)
- Calling the `.value_counts()` method on a Series with a categorical dtype now returns a Series with a CategoricalIndex (GH10704)
- The metadata properties of subclasses of pandas objects will now be serialized (GH10553).
- `groupby` using Categorical follows the same rule as Categorical.unique described above (GH10508)
- When constructing DataFrame with an array of complex64 dtype previously meant the corresponding column was automatically promoted to the complex128 dtype. pandas will now preserve the itemsize of the input for complex data (GH10952)
- some numeric reduction operators would return ValueError, rather than TypeError on object types that includes strings and numbers (GH11131)
- Passing currently unsupported chunksize argument to `read_excel` or ExcelFile.parse will now raise `NotImplementedError` (GH8011)
- Allow an ExcelFile object to be passed into `read_excel` (GH11198)
datetime_index.union does not infer freq if self and the input have None as freq (GH11086)

NaT’s methods now either raise ValueError, or return np.nan or NaT (GH9513)

<table>
<thead>
<tr>
<th>Behavior</th>
<th>Methods</th>
</tr>
</thead>
<tbody>
<tr>
<td>return np.nan</td>
<td>weekday, isoweekday</td>
</tr>
<tr>
<td>return NaT</td>
<td>date, now, replace, to_datetime, today</td>
</tr>
<tr>
<td>return np.datetime64('NaT')</td>
<td>to_datetime64 (unchanged)</td>
</tr>
<tr>
<td>raise ValueError</td>
<td>All other public methods (names not beginning with underscores)</td>
</tr>
</tbody>
</table>

**Deprecations**

- For Series the following indexing functions are deprecated (GH10177).

<table>
<thead>
<tr>
<th>Deprecated Function</th>
<th>Replacement</th>
</tr>
</thead>
<tbody>
<tr>
<td>.irow(i)</td>
<td>.iloc[i] or .iat[i]</td>
</tr>
<tr>
<td>.iget(i)</td>
<td>.iloc[i] or .iat[i]</td>
</tr>
<tr>
<td>.iget_value(i)</td>
<td>.iloc[i] or .iat[i]</td>
</tr>
</tbody>
</table>

- For DataFrame the following indexing functions are deprecated (GH10177).

<table>
<thead>
<tr>
<th>Deprecated Function</th>
<th>Replacement</th>
</tr>
</thead>
<tbody>
<tr>
<td>.irow(i)</td>
<td>.iloc[i]</td>
</tr>
<tr>
<td>.iget_value(i, j)</td>
<td>.iloc[i, j] or .iat[i, j]</td>
</tr>
<tr>
<td>.icol(j)</td>
<td>.iloc[:, j]</td>
</tr>
</tbody>
</table>

**Note:** These indexing functions have been deprecated in the documentation since 0.11.0.

- Categorical.name was deprecated to make Categorical more numpy.ndarray like. Use Series(cat, name="whatever") instead (GH10482).
- Setting missing values (NaN) in a Categorical’s categories will issue a warning (GH10748). You can still have missing values in the values.
- drop_duplicates and duplicated’s take_last keyword was deprecated in favor of keep. (GH6511, GH8505)
- Series.nsmallest and nlargest’s take_last keyword was deprecated in favor of keep. (GH10792)
- DataFrame.combineAdd and DataFrame.combineMult are deprecated. They can easily be replaced by using the add and mul methods: DataFrame.add(other, fill_value=0) and DataFrame.mul(other, fill_value=1.) (GH10735).
- TimeSeries deprecated in favor of Series (note that this has been an alias since 0.13.0), (GH10890)
- SparsePanel deprecated and will be removed in a future version (GH11157).
- Series.is_time_series deprecated in favor of Series.index.is_all_dates (GH11135)
- Legacy offsets (like 'A@JAN') are deprecated (note that this has been alias since 0.8.0) (GH10878)
- WidePanel deprecated in favor of Panel, LongPanel in favor of DataFrame (note these have been aliases since < 0.11.0), (GH10892)
- `DataFrame.convert_objects` has been deprecated in favor of type-specific functions `pd.to_datetime`, `pd.to_timestamp` and `pd.to_numeric` (new in 0.17.0) (GH11133).

**Removal of prior version deprecations/changes**

- Removal of `na_last` parameters from `Series.order()` and `Series.sort()`, in favor of `na_position` (GH5231)
- Remove of `percentile_width` from `.describe()`, in favor of `percentiles` (GH7088)
- Removal of `colSpace` parameter from `DataFrame.to_string()` in favor of `col_space`, circa 0.8.0 version.
- Removal of automatic time-series broadcasting (GH2304)

```python
In [90]: np.random.seed(1234)
In [91]: df = pd.DataFrame(
    ...:     np.random.randn(5, 2),
    ...:     columns=list("AB"),
    ...:     index=pd.date_range("2013-01-01", periods=5),
    ...:     )
    ...:
In [92]: df
Out[92]:
     A         B
2013-01-01  0.471435 -1.190976
2013-01-02  1.432707 -0.312652
2013-01-03 -0.720589  0.887163
2013-01-04  0.859588 -0.636524
2013-01-05  0.015696 -2.242685
[5 rows x 2 columns]
```

Previously

```python
In [3]: df + df.A
FutureWarning: TimeSeries broadcasting along DataFrame index by default is deprecated.
Please use DataFrame.<op> to explicitly broadcast arithmetic operations along the index

Out[3]:

[5 rows x 2 columns]

• Remove table keyword in HDFStore.put/append, in favor of using format= (GH4645)
• Remove kind in read_excel/ExcelFile as its unused (GH4712)
• Remove infer_type keyword from pd.read_html as its unused (GH4770, GH7032)
• Remove offset and timeRule keywords from Series.tshift/shift, in favor of freq (GH4853, GH4864)
• Remove pd.load/pd.save aliases in favor of pd.to_pickle/pd.read_pickle (GH3787)

Performance improvements

• Development support for benchmarking with the Air Speed Velocity library (GH8361)
• Added vbench benchmarks for alternative ExcelWriter engines and reading Excel files (GH7171)
• Performance improvements in Categorical.value_counts (GH10804)
• Performance improvements in SeriesGroupBy.nunique and SeriesGroupBy.value_counts and SeriesGroupby.transform (GH10820, GH11077)
• Performance improvements in DataFrame.drop_duplicates with integer dtypes (GH10917)
• Performance improvements in DataFrame.duplicated with wide frames. (GH10161, GH11180)
• 4x improvement in timedelta string parsing (GH6755, GH10426)
• 8x improvement in timedelta64 and datetime64 ops (GH6755)
• Significantly improved performance of indexing MultiIndex with slicers (GH10287)
• 8x improvement in iloc using list-like input (GH10791)
• Improved performance of Series.isin for datetimelike/integer Series (GH10287)
• 20x improvement in concat of Categoricals when categories are identical (GH10587)
• Improved performance of to_datetime when specified format string is ISO8601 (GH10178)
• 2x improvement of Series.value_counts for float dtype (GH10821)
• Enable infer_datetime_format in to_datetime when date components do not have 0 padding (GH11142)
• Regression from 0.16.1 in constructing DataFrame from nested dictionary (GH11084)
• Performance improvements in addition/subtraction operations for DateOffset with Series or DatetimeIndex (GH10744, GH11205)
Bug fixes

- Bug in incorrect computation of `.mean()` on timedelta64[ns] because of overflow (GH9442)
- Bug in `.isin` on older numpies (GH11232)
- Bug in DataFrame.to_html(index=False) renders unnecessary name row (GH10344)
- Bug in DataFrame.to_latex() the column_format argument could not be passed (GH9402)
- Bug in DatetimeIndex when localizing with NaT (GH10477)
- Bug in Series.dt ops in preserving meta-data (GH10477)
- Bug in preserving NaT when passed in an otherwise invalid to_datetime construction (GH10477)
- Bug in DataFrame.apply when function returns categorical series. (GH9573)
- Bug in to_datetime with invalid dates and formats supplied (GH10154)
- Bug in Index.drop_duplicates dropping name(s) (GH10115)
- Bug in Series.quantile dropping name (GH10881)
- Bug in pd.Series when setting a value on an otherwise empty Series whose index has a frequency. (GH10193)
- Bug in pd.Series.interpolate with invalid order keyword values. (GH10633)
- Bug in DataFrame.plot raises ValueError when color name is specified by multiple characters (GH10387)
- Bug in Index construction with a mixed list of tuples (GH10697)
- Bug in DataFrame.reset_index when index contains NaT. (GH10388)
- Bug in ExcelReader when worksheet is empty (GH6403)
- Bug in BinGrouper.group_info where returned values are not compatible with base class (GH10914)
- Bug in clearing the cache on DataFrame.pop and a subsequent inplace op (GH10912)
- Bug in indexing with a mixed-integer Index causing an ImportError (GH10610)
- Bug in Series.count when index has nulls (GH10946)
- Bug in pickling of a non-regular freq DatetimeIndex (GH11002)
- Bug causing DataFrame.where to not respect the axis parameter when the frame has a symmetric shape. (GH9736)
- Bug in Table.select_column where name is not preserved (GH10392)
- Bug in offsets.generate_range where start and end have finer precision than offset (GH9907)
- Bug in pd.rolling_* where Series.name would be lost in the output (GH10565)
- Bug in stack when index or columns are not unique. (GH10417)
- Bug in setting a Panel when an axis has a MultiIndex (GH10360)
- Bug in USFederalHolidayCalendar where USMemorialDay and USMartinLutherKingJr were incorrect (GH10278 and GH9760)
- Bug in `.sample()` where returned object, if set, gives unnecessary SettingWithCopyWarning (GH10738)
- Bug in `.sample()` where weights passed as Series were not aligned along axis before being treated positionally, potentially causing problems if weight indices were not aligned with sampled object. (GH10738)
- Regression fixed in (GH9311, GH6620, GH9345), where groupby with a datetime-like converting to float with certain aggregators (GH10979)
• Bug in DataFrame.interpolate with axis=1 and inplace=True (GH10395)
• Bug in io.sql.get_schema when specifying multiple columns as primary key (GH10385).
• Bug in groupby(sort=False) with datetime-like Categorical raises ValueError (GH10505)
• Bug in groupby(axis=1) with filter() throws IndexError (GH11041)
• Bug in test_categorical on big-endian builds (GH10425)
• Bug in Series.shift and DataFrame.shift not supporting categorical data (GH9416)
• Bug in Series.map using categorical Series raises AttributeError (GH10324)
• Bug in MultiIndex.get_level_values including Categorical raises AttributeError (GH10460)
• Bug in pd.get_dummies with sparse=True not returning SparseDataFrame (GH10531)
• Bug in pd.concat with axis=0 when column is of dtype category (GH10177)
• Bug in read_msgpack where input type is not always checked (GH10369, GH10630)
• Bug in pd.read_csv with kwargs index_col=False, index_col=['a', 'b'] or dtype (GH10413, GH10467, GH10577)
• Bug in Series.from_csv with header kwarg not setting the Series.name or the Series.index.name (GH10483)
• Bug in left and right align of Series with MultiIndex may be inverted (GH10665)
• Bug in left and right join of with MultiIndex may be inverted (GH10741)
- Bug in `read_stata` when reading a file with a different order set in columns (GH10757)
- Bug in `Categorical` may not representing properly when category contains `tz` or `Period` (GH10713)
- Bug in `Categorical.__iter__` may not returning correct `datetime` and `Period` (GH10713)
- Bug in indexing with a `PeriodIndex` on an object with a `PeriodIndex` (GH4125)
- Bug in `read_csv` with `engine='c'`: EOF preceded by a comment, blank line, etc. was not handled correctly (GH10728, GH10548)
- Reading “famafrench” data via `DataReader` results in HTTP 404 error because of the website url is changed (GH10591).
- Bug in `read_msgpack` where DataFrame to decode has duplicate column names (GH9618)
- Bug in `io.common.get_filepath_or_buffer` which caused reading of valid S3 files to fail if the bucket also contained keys for which the user does not have read permission (GH10604)
- Bug in vectorised setting of timestamp columns with python `datetime.date` and numpy `datetime64` (GH10408, GH10412)
- Bug in `Index.take` may add unnecessary `freq` attribute (GH10791)
- Bug in `merge` with empty DataFrame may raise `IndexError` (GH10824)
- Bug in `to_latex` where unexpected keyword argument for some documented arguments (GH10888)
- Bug in indexing of large DataFrame where `IndexError` is uncaught (GH10645 and GH10692)
- Bug in `read_csv` when using the `nrows` or `chunksize` parameters if file contains only a header line (GH9535)
- Bug in serialization of `category` types in HDF5 in presence of alternate encodings. (GH10366)
- Bug in `pd.DataFrame` when constructing an empty DataFrame with a string dtype (GH9428)
- Bug in `pd.DataFrame.diff` when DataFrame is not consolidated (GH10907)
- Bug in `pd.unique` for arrays with the `datetime64` or `timedelta64` dtype that meant an array with object dtype was returned instead the original dtype (GH9431)
- Bug in `Timedelta` raising error when slicing from 0s (GH10583)
- Bug in `DatetimeIndex.take` and `TimedeltaIndex.take` may not raise `IndexError` against invalid index (GH10295)
- Bug in `Series([np.nan]).astype('M8[ms]')`, which now returns `Series([pd.NaT])` (GH10747)
- Bug in `PeriodIndex.order` reset freq (GH10295)
- Bug in `date_range` when `freq` divides end as nanos (GH10885)
- Bug in `iloc` allowing memory outside bounds of a Series to be accessed with negative integers (GH10779)
- Bug in `read_msgpack` where encoding is not respected (GH10581)
- Bug preventing access to the first index when using `iloc` with a list containing the appropriate negative integer (GH10547, GH10779)
- Bug in `TimedeltaIndex` formatter causing error while trying to save DataFrame with `TimedeltaIndex` using `to_csv` (GH10833)
- Bug in `DataFrame.where` when handling Series slicing (GH10218, GH9558)
- Bug where `pd.read_gbq` throws `ValueError` when Bigquery returns zero rows (GH10273)
- Bug in `to_json` which was causing segmentation fault when serializing 0-rank ndarray (GH9576)
- Bug in plotting functions may raise `IndexError` when plotted on `GridSpec` (GH10819)
• Bug in plot result may show unnecessary minor ticklabels (GH10657)
• Bug in groupby incorrect computation for aggregation on DataFrame with NaT (E.g first, last, min). (GH10590, GH11010)
• Bug when constructing DataFrame where passing a dictionary with only scalar values and specifying columns did not raise an error (GH10856)
• Bug in .var() causing roundoff errors for highly similar values (GH10242)
• Bug in DataFrame.plot(subplots=True) with duplicated columns outputs incorrect result (GH10962)
• Bug in Index arithmetic may result in incorrect class (GH10638)
• Bug in date_range results in empty if freq is negative annually, quarterly and monthly (GH11018)
• Bug in DataFrame.plot(subplots=True) with duplicated columns outputs incorrect result (GH10962)
• Bug in Index arithmetic may result in incorrect class (GH10638)
• Bug in date_range results in empty if freq is negative annually, quarterly, and monthly (GH11018)
• Bug in .var() causing roundoff errors for highly similar values (GH10242)
• Bug in .var() causing roundoff errors for highly similar values (GH10242)
• Bug in .var() causing roundoff errors for highly similar values (GH10242)
• Remove use of some deprecated numpy comparison operations, mainly in tests. (GH10569)
• Bug in Index dtype may not be applied properly (GH11017)
• Bug in io.gbq when testing for minimum google api client version (GH10652)
• Bug in DataFrame construction from nested dict with timedelta keys (GH11129)
• Bug in .fillna against may raise TypeError when data contains datetime dtype (GH7095, GH11153)
• Bug in groupby when number of keys to group by is same as length of index (GH11185)
• Bug in convert_objects where converted values might not be returned if all null and coerce (GH9589)
• Bug in convert_objects where copy keyword was not respected (GH9589)

5.14 Version 0.16

5.14.1 Version 0.16.2 (June 12, 2015)

This is a minor bug-fix release from 0.16.1 and includes a large number of bug fixes along some new features (pipe() method), enhancements, and performance improvements.

We recommend that all users upgrade to this version.

Highlights include:

- A new pipe method, see here
- Documentation on how to use numba with pandas, see here
What’s new in v0.16.2

• New features
  – Pipe
  – Other enhancements
• API changes
• Performance improvements
• Bug fixes
• Contributors

New features

Pipe

We’ve introduced a new method `DataFrame.pipe()`. As suggested by the name, `pipe` should be used to pipe data through a chain of function calls. The goal is to avoid confusing nested function calls like

```python
# df is a DataFrame
# f, g, and h are functions that take and return DataFrames
f(g(h(df), arg1=1), arg2=2, arg3=3)  # noqa F821
```

The logic flows from inside out, and function names are separated from their keyword arguments. This can be rewritten as

```python
(df.pipe(h)  # noqa F821
.pipe(g, arg1=1)  # noqa F821
.pipe(f, arg2=2, arg3=3)  # noqa F821
)
```

Now both the code and the logic flow from top to bottom. Keyword arguments are next to their functions. Overall the code is much more readable.

In the example above, the functions `f`, `g`, and `h` each expected the DataFrame as the first positional argument. When the function you wish to apply takes its data anywhere other than the first argument, pass a tuple of `(function, keyword)` indicating where the DataFrame should flow. For example:

```python
In [1]: import statsmodels.formula.api as sm
In [2]: bb = pd.read_csv("data/baseball.csv", index_col="id")
# sm.ols takes (formula, data)
In [3]: (  
    ...:     bb.query("h > 0")  
    ...:     .assign(ln_h=lambda df: np.log(df.h))  
    ...:     .pipe((sm.ols, "data"), "hr ~ ln_h + year + g + C(lg)")  
    ...:     .fit()  
    ...:     .summary()
```

(continues on next page)
pandas: powerful Python data analysis toolkit, Release 1.3.5

Kurtosis:       5.225  Cond. No. 1.49e+07
```

Notes:
[1] Standard Errors assume that the covariance matrix of the errors is correctly specified.
[2] The condition number is large, 1.49e+07. This might indicate that there are strong multicollinearity or other numerical problems.

The pipe method is inspired by unix pipes, which stream text through processes. More recently dplyr and magrittr have introduced the popular (%>% pipe operator for R.

See the documentation for more. (GH10129)
Other enhancements

- Added rsplit to Index/Series StringMethods (GH10303)
- Removed the hard-coded size limits on the DataFrame HTML representation in the IPython notebook, and leave this to IPython itself (only for IPython v3.0 or greater). This eliminates the duplicate scroll bars that appeared in the notebook with large frames (GH10231).

  Note that the notebook has a toggle output scrolling feature to limit the display of very large frames (by clicking left of the output). You can also configure the way DataFrames are displayed using the pandas options, see here here.

- axis parameter of DataFrame.quantile now accepts also index and column. (GH9543)

API changes

- Holiday now raises NotImplementedError if both offset and observance are used in the constructor instead of returning an incorrect result (GH10217).

Performance improvements

- Improved Series.resample performance with dtype=datetime64[ns] (GH7754)
- Increase performance of str.split when expand=True (GH10081)

Bug fixes

- Bug in Series.hist raises an error when a one row Series was given (GH10214)
- Bug where HDFStore.select modifies the passed columns list (GH7212)
- Bug in Categorical repr with display.width of None in Python 3 (GH10087)
- Bug in to_json with certain orients and a CategoricalIndex would segfault (GH10317)
- Bug where some of the nan functions do not have consistent return dtypes (GH10251)
- Bug in DataFrame.quantile on checking that a valid axis was passed (GH9543)
- Bug in groupby.apply aggregation for Categorical not preserving categories (GH10138)
- Bug in to_csv where date_format is ignored if the datetime is fractional (GH10209)
- Bug in DataFrame.to_json with mixed data types (GH10289)
- Bug in cache updating when consolidating (GH10264)
- Bug in mean() where integer dtypes can overflow (GH10172)
- Bug where Panel.from_dict does not set dtype when specified (GH10058)
- Bug in Index.union raises AttributeError when passing array-likes. (GH10149)
- Bug in Timestamp’s’ microsecond, quarter, dayofyear, week and daysinmonth properties return np.int type, not built-in int. (GH10050)
- Bug in NaT raises AttributeError when accessing to daysinmonth, dayofweek properties. (GH10096)
- Bug in Index repr when using the max_seq_items=None setting (GH10182).
- Bug in getting timezone data with dateutil on various platforms (GH9059, GH8639, GH9663, GH10121)
• Bug in displaying datetimes with mixed frequencies; display ‘ms’ datetimes to the proper precision. (GH10170)
• Bug in `setitem` where type promotion is applied to the entire block (GH10280)
• Bug in `Series` arithmetic methods may incorrectly hold names (GH10068)
• Bug in `GroupBy.get_group` when grouping on multiple keys, one of which is categorical. (GH10132)
• Bug in `DatetimeIndex` and `TimedeltaIndex` names are lost after timedelta arithmetic (GH9926)
• Bug in `DataFrame` construction from nested `dict` with `datetime64` (GH10160)
• Bug in `Series` construction from `dict` with `datetime64` keys (GH9456)
• Bug in `Series.plot(label="LABEL")` not correctly setting the label (GH10119)
• Bug in `plot` not defaulting to matplotlib `axes.grid` setting (GH9792)
• Bug causing strings containing an exponent, but no decimal to be parsed as int instead of float in `engine='python'` for the `read_csv` parser (GH9565)
• Bug in `Series.align` resets name when `fill_value` is specified (GH10067)
• Bug in `read_csv` causing index name not to be set on an empty `DataFrame` (GH10184)
• Bug in `SparseSeries.abs` resets name (GH10241)
• Bug in `TimedeltaIndex` slicing may reset freq (GH10292)
• Bug in `GroupBy.get_group` raises `ValueError` when group key contains NaN (GH6992)
• Bug in `SparseSeries` constructor ignores input data name (GH10258)
• Bug in `Categorical.remove_categories` causing a `ValueError` when removing the NaN category if underlying dtype is floating-point (GH10156)
• Bug where infer_freq infers time rule (WOM-5XXX) unsupported by to_offset (GH9425)
• Bug in `DataFrame.to_hdf()` where table format would raise a seemingly unrelated error for invalid (non-string) column names. This is now explicitly forbidden. (GH9057)
• Bug to handle masking empty `DataFrame` (GH10126).
• Bug where MySQL interface could not handle numeric table/column names (GH10255)
• Bug in `read_csv` with a `date_parser` that returned a `datetime64` array of other time resolution than [ns] (GH10245)
• Bug in `Panel.apply` when the result has `ndim=0` (GH10332)
• Bug in `read_hdf` where `auto_close` could not be passed (GH9327).
• Bug in `read_hdf` where open stores could not be used (GH10330).
• Bug in adding empty `DataFrames`, now results in a `DataFrame` that `.equals` an empty `DataFrame` (GH10181).
• Bug in `to_hdf` and `HDFStore` which did not check that complib choices were valid (GH4582, GH8874).

5.14.2 Version 0.16.1 (May 11, 2015)

This is a minor bug-fix release from 0.16.0 and includes a large number of bug fixes along several new features, enhancements, and performance improvements. We recommend that all users upgrade to this version.

Highlights include:

• Support for a CategoricalIndex, a category based index, see here
• New section on how-to-contribute to pandas, see here
• Revised “Merge, join, and concatenate” documentation, including graphical examples to make it easier to understand each operations, see here
• New method sample for drawing random samples from Series, DataFrames and Panels. See here
• The default Index printing has changed to a more uniform format, see here
• BusinessHour datetime-offset is now supported, see here
• Further enhancement to the .str accessor to make string operations easier, see here

What's new in v0.16.1

• Enhancements
  – CategoricalIndex
  – Sample
  – String methods enhancements
  – Other enhancements
• API changes
  – Deprecations
• Index representation
• Performance improvements
• Bug fixes
• Contributors

Warning: In pandas 0.17.0, the sub-package pandas.io.data will be removed in favor of a separately installable package (GH8961).
Enhancements

CategoricalIndex

We introduce a CategoricalIndex, a new type of index object that is useful for supporting indexing with duplicates. This is a container around a Categorical (introduced in v0.15.0) and allows efficient indexing and storage of an index with a large number of duplicated elements. Prior to 0.16.1, setting the index of a DataFrame/Series with a category dtype would convert this to regular object-based Index.

```python
In [1]: df = pd.DataFrame({'A': np.arange(6),
    ...:    'B': pd.Series(list('aabbca'))
    ...:    .astype('category', categories=list('cab'))
    ...:    })

In [2]: df
Out[2]:
   A  B
0  0  a
1  1  a
2  2  b
3  3  b
4  4  c
5  5  a

In [3]: df.dtypes
Out[3]:
   A  int64
   B  category
dtype: object

In [4]: df.B.cat.categories
Out[4]: Index(['c', 'a', 'b'], dtype='object')

setting the index, will create a CategoricalIndex

```python
In [5]: df2 = df.set_index('B')

In [6]: df2.index
Out[6]: CategoricalIndex(['a', 'a', 'b', 'c', 'a'], categories=['c', 'a', 'b'], ordered=False, name='B', dtype='category')

indexing with __getitem__/.iloc/.loc/.ix works similarly to an Index with duplicates. The indexers MUST be in the category or the operation will raise.

```python
In [7]: df2.loc['a']
Out[7]:
   A  B
   a  0
   a  1
   a  5

and preserves the CategoricalIndex
In [8]: df2.loc['a'].index
Out[8]: CategoricalIndex(['a', 'a', 'a'], categories=['c', 'a', 'b'], ordered=False, name='B', dtype='category')

sorting will order by the order of the categories

In [9]: df2.sort_index()
Out[9]

<table>
<thead>
<tr>
<th></th>
<th>A</th>
<th>B</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>a</td>
<td>5</td>
<td></td>
</tr>
<tr>
<td>b</td>
<td>2</td>
<td>3</td>
</tr>
</tbody>
</table>

groupby operations on the index will preserve the index nature as well

In [10]: df2.groupby(level=0).sum()
Out[10]

<table>
<thead>
<tr>
<th></th>
<th>A</th>
<th>B</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>6</td>
<td></td>
</tr>
<tr>
<td>b</td>
<td>5</td>
<td></td>
</tr>
</tbody>
</table>

In [11]: df2.groupby(level=0).sum().index
Out[11]: CategoricalIndex(['c', 'a', 'b'], categories=['c', 'a', 'b'], ordered=False, name='B', dtype='category')

reindexing operations, will return a resulting index based on the type of the passed indexer, meaning that passing a list will return a plain-old-Index; indexing with a Categorical will return a CategoricalIndex, indexed according to the categories of the PASSED Categorical dtype. This allows one to arbitrarily index these even with values NOT in the categories, similarly to how you can reindex ANY pandas index.

In [12]: df2.reindex(['a', 'e'])
Out[12]:
   B
a 0.0
a 1.0
a 5.0
e NaN

In [13]: df2.reindex(['a', 'e']).index
Out[13]: pd.Index(['a', 'a', 'a', 'e'], dtype='object', name='B')

In [14]: df2.reindex(pd.Categorical(['a', 'e'], categories=list('abcde')))
Out[14]:
   B
a 0.0
(continues on next page)
See the documentation for more. (GH7629, GH10038, GH10039)

### Sample

Series, DataFrames, and Panels now have a new method: `sample()`. The method accepts a specific number of rows or columns to return, or a fraction of the total number of rows or columns. It also has options for sampling with or without replacement, for passing in a column for weights for non-uniform sampling, and for setting seed values to facilitate replication. (GH2419)

```python
In [1]: example_series = pd.Series([0, 1, 2, 3, 4, 5])

# When no arguments are passed, returns 1
In [2]: example_series.sample()
Out[2]:
3 3
Length: 1, dtype: int64

# One may specify either a number of rows:
In [3]: example_series.sample(n=3)
Out[3]:
2 2
1 1
0 0
Length: 3, dtype: int64

# Or a fraction of the rows:
In [4]: example_series.sample(frac=0.5)
Out[4]:
1 1
5 5
3 3
Length: 3, dtype: int64

# weights are accepted.
In [5]: example_weights = [0, 0, 0.2, 0.2, 0.2, 0.4]

In [6]: example_series.sample(n=3, weights=example_weights)
Out[6]:
2 2
4 4
3 3
(continues on next page)
```
Length: 3, dtype: int64

# weights will also be normalized if they do not sum to one,  
# and missing values will be treated as zeros.  
In [7]: example_weights2 = [0.5, 0, 0, None, np.nan]  

In [8]: example_series.sample(n=1, weights=example_weights2)  
Out[8]:  
   0  
Length: 1, dtype: int64  

When applied to a DataFrame, one may pass the name of a column to specify sampling weights when sampling from  
rows.  
In [9]: df = pd.DataFrame({"col1": [9, 8, 7, 6], "weight_column": [0.5, 0.4, 0.1, 0]})  
In [10]: df.sample(n=3, weights="weight_column")  
Out[10]:  
    col1  weight_column  
0       9            0.5  
1       8            0.4  
2       7            0.1  
[3 rows x 2 columns]

String methods enhancements

*Continuing from v0.16.0,* the following enhancements make string operations easier and more consistent with standard  
python string operations.  

- Added *StringMethods* (*.str accessor) to *Index* (GH9068)  
The *.str accessor is now available for both *Series* and *Index*.  
In [11]: idx = pd.Index(["jack", "jill", "jesse", "frank"])  
In [12]: idx.str.strip()  
Out[12]: Index(['jack', 'jill', 'jesse', 'frank'], dtype='object')  

One special case for the *.str accessor on *Index* is that if a string method returns bool, the *.str accessor  
will return a np.array instead of a boolean *Index* (GH8875). This enables the following expression to work  
naturally:  
In [13]: idx = pd.Index(["a1", "a2", "b1", "b2"])  
In [14]: s = pd.Series(range(4), index=idx)  
In [15]: s  
Out[15]:  
a1 0  
a2 1  
b1 2  

(continues on next page)
The following new methods are accessible via .str accessor to apply the function to each values. (GH9766, GH9773, GH10031, GH10045, GH10052)

- **capitalize()**
- **swapcase()**
- **normalize()**
- **partition()**
- **rpartition()**
- **index()**
- **rindex()**
- **translate()**

- **split** now takes expand keyword to specify whether to expand dimensionality. return_type is deprecated. (GH9847)

```
In [18]: s = pd.Series(
[a, b],
[a, c],
[b, c])

# return Series
In [19]: s.str.split(",")

Out[19]:
0 [a, b]
1 [a, c]
2 [b, c]
Length: 3, dtype: object

# return DataFrame
In [20]: s.str.split(",", expand=True)

Out[20]:
0 1
0 a b
1 a c
2 b c

[3 rows x 2 columns]

In [21]: idx = pd.Index(
[a, b],
[a, c],
[b, c])

# return Index
In [22]: idx.str.split(",")

Out[22]: Index([['a', 'b'], ['a', 'c'], ['b', 'c']], dtype='object')

# return MultiIndex
In [23]: idx.str.split(",", expand=True)

Out[23]:
MultiIndex([['a', 'b'],
['a', 'c'],
['b', 'c']])
```
• Improved `extract` and `get_dummies` methods for `Index.str` (GH9980)

Other enhancements

• `BusinessHour` offset is now supported, which represents business hours starting from 09:00 - 17:00 on `BusinessDay` by default. See `Here` for details. (GH7905)

```python
In [24]: pd.Timestamp("2014-08-01 09:00") + pd.tseries.offsets.BusinessHour()
Out[24]: Timestamp('2014-08-01 10:00:00')

In [25]: pd.Timestamp("2014-08-01 07:00") + pd.tseries.offsets.BusinessHour()
Out[25]: Timestamp('2014-08-01 10:00:00')

In [26]: pd.Timestamp("2014-08-01 16:30") + pd.tseries.offsets.BusinessHour()
Out[26]: Timestamp('2014-08-04 09:30:00')
```

• `DataFrame.diff` now takes an `axis` parameter that determines the direction of differencing (GH9727)

• Allow `clip`, `clip_lower`, and `clip_upper` to accept array-like arguments as thresholds (This is a regression from 0.11.0). These methods now have an `axis` parameter which determines how the Series or DataFrame will be aligned with the threshold(s). (GH6966)

• `DataFrame.mask()` and `Series.mask()` now support same keywords as `where` (GH8801)

• `drop` function can now accept `errors` keyword to suppress `ValueError` raised when any of label does not exist in the target data. (GH6736)

```python
In [27]: df = pd.DataFrame(np.random.randn(3, 3), columns=["A", "B", "C"])

In [28]: df.drop(['A', 'X'], axis=1, errors="ignore")
Out[28]:
     B  C
0 -0.706771 -1.039575
1 -0.424972  0.567020
2 -1.087401 -0.673690

[3 rows x 2 columns]
```

• Add support for separating years and quarters using dashes, for example 2014-Q1. (GH9688)

• Allow conversion of values with dtype `datetime64` or `timedelta64` to strings using `astype(str)` (GH9757)

• `get_dummies` function now accepts `sparse` keyword. If set to `True`, the return DataFrame is sparse, e.g. `SparseDataFrame`. (GH8823)

• `Period` now accepts `datetime64` as value input. (GH9054)

• Allow `timedelta` string conversion when leading zero is missing from time definition, i.e `0:00:00` vs `00:00:00`. (GH9570)

• Allow `Panel.shift` with `axis='items'` (GH9890)
• Trying to write an excel file now raises `NotImplementedError` if the DataFrame has a MultiIndex instead of writing a broken Excel file. (GH9794)

• Allow `Categorical.add_categories` to accept Series or np.array. (GH9927)

• Add/delete `str/dt/cat` accessors dynamically from `__dir__`. (GH9910)

• Add `normalize` as a `dt` accessor method. (GH10047)

• DataFrame and Series now have `_constructor_expanddim` property as overridable constructor for one higher dimensionality data. This should be used only when it is really needed, see here

• `pd.lib.infer_dtype` now returns 'bytes' in Python 3 where appropriate. (GH10032)

API changes

• When passing in an ax to `df.plot(..., ax=ax)`, the sharex kwarg will now default to False. The result is that the visibility of xlabels and xticklabels will not anymore be changed. You have to do that by yourself for the right axes in your figure or set sharex=True explicitly (but this changes the visible for all axes in the figure, not only the one which is passed in!). If pandas creates the subplots itself (e.g. no passed in ax kwarg), then the default is still sharex=True and the visibility changes are applied.

• `assign()` now inserts new columns in alphabetical order. Previously the order was arbitrary. (GH9777)

• By default, `read_csv` and `read_table` will now try to infer the compression type based on the file extension. Set compression=None to restore the previous behavior (no decompression). (GH9770)

Deprecations

• Series.str.split's `return_type` keyword was removed in favor of `expand` (GH9847)

Index representation

The string representation of `Index` and its sub-classes have now been unified. These will show a single-line display if there are few values; a wrapped multi-line display for a lot of values (but less than `display.max_seq_items`: if lots of items (> `display.max_seq_items`) will show a truncated display (the head and tail of the data). The formatting for MultiIndex is unchanged (a multi-line wrapped display). The display width responds to the option `display.max_seq_items`, which is defaulted to 100. (GH6482)

Previous behavior

```python
In [2]: pd.Index(range(4), name='foo')
Out[2]: Int64Index([0, 1, 2, 3], dtype='int64')

In [3]: pd.Index(range(104), name='foo')
Out[3]: Int64Index([0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, ...
    → 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40,
    → 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, ...
    → 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83,
    → 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99, ...], dtype='int64')

In [4]: pd.date_range('20130101', periods=4, name='foo', tz='US/Eastern')
Out[4]: <class 'pandas.tseries.index.DatetimeIndex'>
[2013-01-01 00:00:00-05:00, ..., 2013-01-04 00:00:00-05:00]
```
Length: 4, Freq: D, Timezone: US/Eastern

In [5]: pd.date_range('20130101', periods=104, name='foo', tz='US/Eastern')
Out[5]:
<class 'pandas.tseries.index.DatetimeIndex'>
[2013-01-01 00:00:00-05:00, ..., 2013-04-14 00:00:00-04:00]
Length: 104, Freq: D, Timezone: US/Eastern

New behavior

In [29]: pd.set_option("display.width", 80)
In [30]: pd.Index(range(4), name="foo")
Out[30]: RangeIndex(start=0, stop=4, step=1, name='foo')
In [31]: pd.Index(range(30), name="foo")
Out[31]: RangeIndex(start=0, stop=30, step=1, name='foo')
In [32]: pd.Index(range(104), name="foo")
Out[32]: RangeIndex(start=0, stop=104, step=1, name='foo')
In [33]: pd.CategoricalIndex(["a", "bb", "ccc", "dddd"], ordered=True, name='foobar')
Out[33]: CategoricalIndex(['a', 'bb', 'ccc', 'dddd'], categories=['a', 'bb', 'ccc', 'dddd'], ordered=True, dtype='category', name='foobar')
In [34]: pd.CategoricalIndex(["a", "bb", "ccc", "dddd"] * 10, ordered=True, name='foobar')
Out[34]: CategoricalIndex(['a', 'bb', 'ccc', 'dddd', 'a', 'bb', 'ccc', 'dddd', 'a', 'bb', 'ccc', 'dddd', 'a', 'bb', 'ccc', 'dddd', 'a', 'bb', 'ccc', 'dddd', 'a', 'bb', 'ccc', 'dddd', 'a', 'bb', 'ccc', 'dddd', 'a', 'bb', 'ccc', 'dddd'], categories=['a', 'bb', 'ccc', 'dddd'], ordered=True, dtype='category', name='foobar')
In [35]: pd.CategoricalIndex(["a", "bb", "ccc", "dddd"] * 100, ordered=True, name='foobar')

dtype='datetime64[ns, US/Eastern]', name='foo', length=104, freq='D')

Performance improvements

- Improved csv write performance with mixed dtypes, including datetimes by up to 5x (GH9940)
- Improved csv write performance generally by 2x (GH9940)
- Improved the performance of pd.lib.max_len_string_array by 5-7x (GH10024)

Bug fixes

- Bug where labels did not appear properly in the legend of DataFrame.plot(), passing label= arguments works, and Series indices are no longer mutated. (GH9542)
- Bug in json serialization causing a segfault when a frame had zero length. (GH9805)
- Bug in read_csv where missing trailing delimiters would cause segfault. (GH5664)
- Bug in retaining index name on appending (GH9862)
- Bug in scatter_matrix draws unexpected axis ticklabels (GH5662)
- Fixed bug in StataWriter resulting in changes to input DataFrame upon save (GH9795).
- Bug in transform causing length mismatch when null entries were present and a fast aggregator was being used (GH9697)
- Bug in equals causing false negatives when block order differed (GH9330)
- Bug in grouping with multiple pd.Grouper where one is non-time based (GH10063)
- Bug in `read_sql_table` error when reading postgres table with timezone (GH7139)
- Bug in DataFrame slicing may not retain metadata (GH9776)
- Bug where TimedeltaIndex were not properly serialized in fixed HDFStore (GH9635)
- Bug with TimedeltaIndex constructor ignoring name when given another TimedeltaIndex as data (GH10025).
- Bug in DataFrameFormatter._get_formatted_index with not applying max_colwidth to the DataFrame index (GH7856)
- Bug in .loc with a read-only ndarray data source (GH10043)
- Bug in groupby.apply() that would raise if a passed user defined function either returned only None (for all input). (GH9685)
- Always use temporary files in pytables tests (GH9992)
- Bug in plotting continuously using secondary_y may not show legend properly. (GH9610, GH9779)
- Bug in DataFrame.plot(kind="hist") results in TypeError when DataFrame contains non-numeric columns (GH9853)
- Bug where repeated plotting of DataFrame with a DatetimeIndex may raise TypeError (GH9852)
- Bug in setup.py that would allow an incompat cython version to build (GH9827)
- Bug in plotting secondary_y incorrectly attaches right_ax property to secondary axes specifying itself recursively. (GH9861)
- Bug in Series.quantile on empty Series of type Datetime or Timedelta (GH9675)
- Bug in where causing incorrect results when upcasting was required (GH9731)
- Bug in FloatArrayFormatter where decision boundary for displaying “small” floats in decimal format is off by one order of magnitude for a given display.precision (GH9764)
- Fixed bug where DataFrame.plot() raised an error when both color and style keywords were passed and there was no color symbol in the style strings (GH9671)
- Not showing a DeprecationWarning on combining list-likes with an Index (GH10083)
- Bug in read_csv and read_table when using skip_rows parameter if blank lines are present. (GH9832)
- Bug in read_csv() interprets index_col=True as 1 (GH9798)
- Bug in index equality comparisons using == failing on Index/MultiIndex type incompatibility (GH9785)
- Bug in which SparseDataFrame could not take nan as a column name (GH8822)
- Bug in to_msgpack and read_msgpack zlib and blosc compression support (GH9783)
- Bug GroupBy.size doesn’t attach index name properly if grouped by TimeGrouper (GH9925)
- Bug causing an exception in slice assignments because length_of_indexer returns wrong results (GH9995)
- Bug in csv parser causing lines with initial white space plus one non-space character to be skipped. (GH9710)
- Bug in C csv parser causing spurious NaNs when data started with newline followed by white space. (GH10022)
- Bug causing elements with a null group to spill into the final group when grouping by a Categorical (GH9603)
- Bug where .iloc and .loc behavior is not consistent on empty dataframes (GH9964)
- Bug in invalid attribute access on a TimedeltaIndex incorrectly raised ValueError instead of AttributeError (GH9680)
• Bug in unequal comparisons between categorical data and a scalar, which was not in the categories (e.g. Series(Categorical(list("abc"), ordered=True)) > "d"). This returned False for all elements, but now raises a TypeError. Equality comparisons also now return False for == and True for !=. (GH9848)

• Bug in DataFrame __setitem__ when right hand side is a dictionary (GH9874)

• Bug in where when dtype is datetime64/timedelta64, but dtype of other is not (GH9804)

• Bug in MultiIndex.sortlevel() results in unicode level name breaks (GH9856)

• Bug in which groupby.transform incorrectly enforced output dtypes to match input dtypes. (GH9807)

• Bug in DataFrame constructor when columns parameter is set, and data is an empty list (GH9939)

• Bug in bar plot with log=True raises TypeError if all values are less than 1 (GH9905)

• Bug in horizontal bar plot ignores log=True (GH9905)

• Bug in PyTables queries that did not return proper results using the index (GH8265, GH9676)

• Bug where dividing a dataframe containing values of type Decimal by another Decimal would raise. (GH9787)

• Bug where using DataFrames asfreq would remove the name of the index. (GH9885)

• Bug causing extra index point when resample BM/BQ (GH9756)

• Changed caching in AbstractHolidayCalendar to be at the instance level rather than at the class level as the latter can result in unexpected behaviour. (GH9552)

• Fixed latex output for MultiIndexed dataframes (GH9778)

• Bug causing an exception when setting an empty range using DataFrame.loc (GH9596)

• Bug in hiding ticklabels with subplots and shared axes when adding a new plot to an existing grid of axes (GH9158)

• Bug in transform and filter when grouping on a categorical variable (GH9921)

• Bug in transform when groups are equal in number and dtype to the input index (GH9700)

• Google BigQuery connector now imports dependencies on a per-method basis. (GH9713)

• Updated BigQuery connector to no longer use deprecated oauth2client.tools.run() (GH8327)

• Bug in subclassed DataFrame. It may not return the correct class, when slicing or subsetting it. (GH9632)

• Bug in .median() where non-float null values are not handled correctly (GH10040)

• Bug in Series.fillna() where it raises if a numerically convertible string is given (GH10092)

This is a major release from 0.15.2 and includes a small number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

Highlights include:

- DataFrame.assign method, see here
- Series.to_coo/from_coo methods to interact with scipy.sparse, see here
- Backwards incompatible change to Timedelta to conform the .seconds attribute with datetime.timedelta, see here
- Changes to the .loc slicing API to conform with the behavior of .ix see here
- Changes to the default for ordering in the Categorical constructor, see here
- Enhancement to the .str accessor to make string operations easier, see here
- The pandas.tools.rplot, pandas.sandbox.qtpandas and pandas.rpy modules are deprecated. We refer users to external packages like seaborn, pandas-qt and rpy2 for similar or equivalent functionality, see here

Check the API Changes and deprecations before updating.
New features

Dataframe assign

Inspired by dplyr's mutate verb, DataFrame has a new assign() method. The function signature for assign is simply **kwargs. The keys are the column names for the new fields, and the values are either a value to be inserted (for example, a Series or NumPy array), or a function of one argument to be called on the DataFrame. The new values are inserted, and the entire DataFrame (with all original and new columns) is returned.

```
In [1]: iris = pd.read_csv('data/iris.data')
In [2]: iris.head()
Out[2]:
   SepalLength  SepalWidth  PetalLength  PetalWidth     Name
0          5.1        3.5         1.4       0.2  Iris-setosa
1          4.9        3.0         1.4       0.2  Iris-setosa
2          4.7        3.2         1.3       0.2  Iris-setosa
3          4.6        3.1         1.5       0.2  Iris-setosa
4          5.0        3.6         1.4       0.2  Iris-setosa
[5 rows x 5 columns]
```

```
In [3]: iris.assign(sepal_ratio=iris['SepalWidth'] / iris['SepalLength']).head()
Out[3]:
   SepalLength  SepalWidth  PetalLength  PetalWidth     Name          sepal_ratio
0          5.1        3.5         1.4       0.2  Iris-setosa  0.686275
1          4.9        3.0         1.4       0.2  Iris-setosa  0.612245
2          4.7        3.2         1.3       0.2  Iris-setosa  0.680851
3          4.6        3.1         1.5       0.2  Iris-setosa  0.673913
4          5.0        3.6         1.4       0.2  Iris-setosa  0.720000
[5 rows x 6 columns]
```

Above was an example of inserting a precomputed value. We can also pass in a function to be evaluated.
The power of `assign` comes when used in chains of operations. For example, we can limit the DataFrame to just those with a Sepal Length greater than 5, calculate the ratio, and plot:

```python
In [5]: iris = pd.read_csv('data/iris.data')

In [6]: (iris.query('SepalLength > 5')
   ...:   .assign(SepalRatio=lambda x: x.SepalWidth / x.SepalLength,
   ...:            PetalRatio=lambda x: x.PetalWidth / x.PetalLength)
   ...:   .plot(kind='scatter', x='SepalRatio', y='PetalRatio'))
```

See the documentation for more. (GH9229)
s

# SparseSeries
ss = s.to_sparse()
ss

A, rows, columns = ss.to_coo(row_levels=['A', 'B'],
    column_levels=['C', 'D'],
    sort_labels=False)
A
A.todense()
rows
columns

The from_coo method is a convenience method for creating a SparseSeries from a scipy.sparse.coo_matrix:

from scipy import sparse
A = sparse.coo_matrix(([3.0, 1.0, 2.0], ([1, 0, 0], [0, 2, 3])),
    shape=(3, 4))
A
A.todense()
ss = pd.SparseSeries.from_coo(A)
ss

String methods enhancements

• Following new methods are accessible via .str accessor to apply the function to each values. This is intended to make it more consistent with standard methods on strings. (GH9282, GH9352, GH9386, GH9387, GH9439)

<table>
<thead>
<tr>
<th>Methods</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>isalnum()</td>
<td>isalpha()</td>
</tr>
<tr>
<td>islower()</td>
<td>isupper()</td>
</tr>
<tr>
<td>isdecimal()</td>
<td>isnumeric()</td>
</tr>
<tr>
<td>find()</td>
<td>rfind()</td>
</tr>
<tr>
<td>ljust()</td>
<td>rjust()</td>
</tr>
<tr>
<td>zfill()</td>
<td></td>
</tr>
</tbody>
</table>

In [7]: s = pd.Series(['abcd', '3456', 'EFGH'])

In [8]: s.str.isalpha()
Out[8]:
0   True
1   False
2   True
Length: 3, dtype: bool

In [9]: s.str.find('ab')
Out[9]:
0   0
Series.str.pad() and Series.str.center() now accept fillchar option to specify filling character (GH9352)

```python
In [10]: s = pd.Series(['12', '300', '25'])
In [11]: s.str.pad(5, fillchar='_')
Out[11]:
  0 ___12
  1 ___300
  2 ___25
Length: 3, dtype: object
```

• Added Series.str.slice_replace(), which previously raised NotImplementedError (GH8888)

```python
In [12]: s = pd.Series(['ABCD', 'EFGH', 'IJK'])
In [13]: s.str.slice_replace(1, 3, 'X')
Out[13]:
  0 AXD
  1 EXH
  2 IX
Length: 3, dtype: object
# replaced with empty char
In [14]: s.str.slice_replace(0, 1)
Out[14]:
  0 BCD
  1 FGH
  2 JK
Length: 3, dtype: object
```

Other enhancements

• Reindex now supports method=’nearest’ for frames or series with a monotonic increasing or decreasing index (GH9258):

```python
In [15]: df = pd.DataFrame({'x': range(5)})
In [16]: df.reindex([0.2, 1.8, 3.5], method='nearest')
Out[16]:
    x
0.2  0
1.8  2
3.5  4
[3 rows x 1 columns]
```

This method is also exposed by the lower level Index.get_indexer and Index.get_loc methods.
• The `read_excel()` function’s `sheetname` argument now accepts a list and `None`, to get multiple or all sheets respectively. If more than one sheet is specified, a dictionary is returned. (GH9450)

```
# Returns the 1st and 4th sheet, as a dictionary of DataFrames.
pd.read_excel('path_to_file.xls', sheetname=['Sheet1', 3])
```

• Allow Stata files to be read incrementally with an iterator; support for long strings in Stata files. See the docs [here](GH9493:).

• Paths beginning with `~` will now be expanded to begin with the user’s home directory (GH9066)

• Added time interval selection in `get_data_yahoo` (GH9071)

• Added `Timestamp.to_datetime64()` to complement `Timedelta.to_timedelta64()` (GH9255)

• `tseries.frequencies.to_offset()` now accepts `Timedelta` as input (GH9064)

• Lag parameter was added to the autocorrelation method of `Series`, defaults to lag-1 autocorrelation (GH9192)

• `Timedelta` will now accept `nanoseconds` keyword in constructor (GH9273)

• SQL code now safely escapes table and column names (GH8986)

• Added auto-complete for `Series.str.<tab>`, `Series.dt.<tab>` and `Series.cat.<tab>` (GH9322)

• `Index.get_indexer` now supports `method='pad'` and `method='backfill'` even for any target array, not just monotonic targets. These methods also work for monotonic decreasing as well as monotonic increasing indexes (GH9258).

• `Index.asof` now works on all index types (GH9258).

• A `verbose` argument has been augmented in `io.read_excel()`, defaults to False. Set to True to print sheet names as they are parsed. (GH9450)

• Added `days_in_month` (compatibility alias `daysinmonth`) property to `Timestamp, DatetimeIndex, Period, PeriodIndex, and Series.dt` (GH9572)

• Added decimal option in `to_csv` to provide formatting for non-`.` decimal separators (GH781)

• Added `normalize` option for `Timestamp` to normalized to midnight (GH8794)

• Added example for `DataFrame` import to R using HDF5 file and `rhdf5` library. See the documentation for more (GH9636).

**Backwards incompatible API changes**

**Changes in timedelta**

In v0.15.0 a new scalar type `Timedelta` was introduced, that is a sub-class of `datetime.timedelta`. Mentioned [here](https://pandas.pydata.org/pandas-docs/stable/user_guide/dataframe.html) was a notice of an API change w.r.t. the `.seconds` accessor. The intent was to provide a user-friendly set of accessors that give the ‘natural’ value for that unit, e.g. if you had a `Timedelta('1 day, 10:11:12')`, then `.seconds` would return 12. However, this is at odds with the definition of `datetime.timedelta`, which defines `.seconds` as 10 * 3600 + 11 * 60 + 12 == 36672.

So in v0.16.0, we are restoring the API to match that of `datetime.timedelta`. Further, the component values are still available through the `.components` accessor. This affects the `.seconds` and `.microseconds` accessors, and removes the `.hours`, `.minutes`, `.milliseconds` accessors. These changes affect `TimedeltaIndex` and the `Series .dt` accessor as well. (GH9185, GH9139)

Previous behavior
```python
In [2]: t = pd.Timedelta('1 day, 10:11:12.100123')

In [3]: t.days
Out[3]: 1

In [4]: t.seconds
Out[4]: 12

In [5]: t.microseconds
Out[5]: 123

New behavior

In [17]: t = pd.Timedelta('1 day, 10:11:12.100123')

In [18]: t.days
Out[18]: 1

In [19]: t.seconds
Out[19]: 36672

In [20]: t.microseconds
Out[20]: 100123

Using .components allows the full component access

In [21]: t.components
Out[21]: Components(days=1, hours=10, minutes=11, seconds=12, milliseconds=100,
                     microseconds=123, nanoseconds=0)

In [22]: t.components.seconds
Out[22]: 12

Indexing changes

The behavior of a small sub-set of edge cases for using .loc have changed (GH8613). Furthermore we have improved the content of the error messages that are raised:

- Slicing with .loc where the start and/or stop bound is not found in the index is now allowed; this previously would raise a KeyError. This makes the behavior the same as .ix in this case. This change is only for slicing, not when indexing with a single label.

In [23]: df = pd.DataFrame(np.random.randn(5, 4),
                columns=list('ABCD'),
                index=pd.date_range('20130101', periods=5))

In [24]: df
Out[24]:
       A         B         C            D
2013-01-01  0.469112 -0.282863 -1.509059 -1.135632
2013-01-02  1.212112 -0.173215  0.119209 -1.044236

(continues on next page)
In [25]: s = pd.Series(range(5), [-2, -1, 1, 2, 3])
In [26]: s
Out[26]:
-2 0
-1 1
 1 2
 2 3
 3 4
Length: 5, dtype: int64

Previous behavior
In [4]: df.loc['2013-01-02':'2013-01-10']
KeyError: 'stop bound [2013-01-10] is not in the [index]'
In [6]: s.loc[-10:3]
KeyError: 'start bound [-10] is not the [index]'

New behavior
In [27]: df.loc['2013-01-02':'2013-01-10']
Out[27]:
<table>
<thead>
<tr>
<th></th>
<th>A</th>
<th>B</th>
<th>C</th>
<th>D</th>
</tr>
</thead>
<tbody>
<tr>
<td>2013-01-02</td>
<td>1.212112</td>
<td>-0.173215</td>
<td>0.119209</td>
<td>-1.044236</td>
</tr>
<tr>
<td>2013-01-03</td>
<td>-0.861849</td>
<td>-2.104569</td>
<td>-0.494929</td>
<td>1.071804</td>
</tr>
<tr>
<td>2013-01-04</td>
<td>0.721555</td>
<td>-0.706771</td>
<td>-1.039575</td>
<td>0.271860</td>
</tr>
<tr>
<td>2013-01-05</td>
<td>-0.424972</td>
<td>0.567020</td>
<td>0.276232</td>
<td>-1.087401</td>
</tr>
</tbody>
</table>

[4 rows x 4 columns]
In [28]: s.loc[-10:3]
Out[28]:
-2 0
-1 1
 1 2
 2 3
 3 4
Length: 5, dtype: int64

- Allow slicing with float-like values on an integer index for .ix. Previously this was only enabled for .loc:

Previous behavior
In [8]: s.ix[-1.0:2]
TypeError: the slice start value [-1.0] is not a proper indexer for this index type (Int64Index)
New behavior

<table>
<thead>
<tr>
<th>In [2]: s.ix[-1.0:2]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Out[2]:</td>
</tr>
<tr>
<td>-1 1</td>
</tr>
<tr>
<td>1 2</td>
</tr>
<tr>
<td>2 3</td>
</tr>
<tr>
<td>dtype: int64</td>
</tr>
</tbody>
</table>

- Provide a useful exception for indexing with an invalid type for that index when using .loc. For example trying to use .loc on an index of type DatetimeIndex or PeriodIndex or TimedeltaIndex, with an integer (or a float).

Previous behavior

<table>
<thead>
<tr>
<th>In [4]: df.loc[2:3]</th>
</tr>
</thead>
<tbody>
<tr>
<td>KeyError: 'start bound [2] is not the [index]'</td>
</tr>
</tbody>
</table>

New behavior

<table>
<thead>
<tr>
<th>In [4]: df.loc[2:3]</th>
</tr>
</thead>
<tbody>
<tr>
<td>TypeError: Cannot do slice indexing on &lt;class 'pandas.tseries.index.DatetimeIndex'&gt; with &lt;type 'int'&gt; keys</td>
</tr>
</tbody>
</table>

Categorical changes

In prior versions, Categoricals that had an unspecified ordering (meaning no ordered keyword was passed) were defaulted as ordered Categoricals. Going forward, the ordered keyword in the Categorical constructor will default to False. Ordering must now be explicit.

Furthermore, previously you could change the ordered attribute of a Categorical by just setting the attribute, e.g. cat. ordered=True; This is now deprecated and you should use cat.as_ordered() or cat.as_unordered(). These will by default return a new object and not modify the existing object. (GH9347, GH9190)

Previous behavior

| In [3]: s = pd.Series([0, 1, 2], dtype='category') |
| In [4]: s |
| Out[4]: |
| 0 0 |
| 1 1 |
| 2 2 |
| dtype: category |
| Categories (3, int64): [0 < 1 < 2] |

| In [5]: s.cat.ordered |
| Out[5]: True |

| In [6]: s.cat.ordered = False |
| In [7]: s |
| Out[7]: |
| 0 0 |
New behavior

In [29]: s = pd.Series([0, 1, 2], dtype='category')

In [30]: s
Out[30]:
0 0
1 1
2 2
Length: 3, dtype: category
Categories (3, int64): [0, 1, 2]

In [31]: s.cat.ordered
Out[31]: False

In [32]: s = s.cat.as_ordered()

In [33]: s
Out[33]:
0 0
1 1
2 2
Length: 3, dtype: category
Categories (3, int64): [0 < 1 < 2]

In [34]: s.cat.ordered
Out[34]: True

# you can set in the constructor of the Categorical
In [35]: s = pd.Series(pd.Categorical([0, 1, 2], ordered=True))

In [36]: s
Out[36]:
0 0
1 1
2 2
Length: 3, dtype: category
Categories (3, int64): [0 < 1 < 2]

In [37]: s.cat.ordered
Out[37]: True

For ease of creation of series of categorical data, we have added the ability to pass keywords when calling .astype(). These are passed directly to the constructor.
In [55]: s
Out[55]:
0  a
1  b
2  c
3  a
dtype: category
Categories (3, object): [a < b < c]

In [56]: s = (pd.Series(["a", "b", "c", "a"])
       ....: .astype('category', categories=list('abcdef'), ordered=False))

In [57]: s
Out[57]:
0  a
1  b
2  c
3  a
dtype: category
Categories (6, object): [a, b, c, d, e, f]

Other API changes

- `Index.duplicated` now returns `np.array(dtype=bool)` rather than `Index(dtype=object)` containing bool values. (GH8875)

- `DataFrame.to_json` now returns accurate type serialisation for each column for frames of mixed dtype (GH9037)

  Previously data was coerced to a common dtype before serialisation, which for example resulted in integers being serialised to floats:

  ```python
  In [2]: pd.DataFrame({"i": [1,2], "f": [3.0, 4.2]}).to_json()
  Out[2]: {'f":{"0":3.0, "1":4.2}, "i":{"0":1.0, "1":2.0}}
  ```

  Now each column is serialised using its correct dtype:

  ```python
  In [2]: pd.DataFrame({"i": [1,2], "f": [3.0, 4.2]}).to_json()
  Out[2]: {'f":{"0":3.0, "1":4.2}, "i":{"0":1, "1":2}}
  ```

- `DatetimeIndex`, `PeriodIndex` and `TimedeltaIndex.summary` now output the same format. (GH9116)

- `TimedeltaIndex.freqstr` now output the same string format as `DatetimeIndex`. (GH9116)

- Bar and horizontal bar plots no longer add a dashed line along the info axis. The prior style can be achieved with matplotlib’s `axhline` or `axvline` methods (GH9088).

- Series accessors `.dt`, `.cat` and `.str` now raise `AttributeError` instead of `TypeError` if the series does not contain the appropriate type of data (GH9617). This follows Python’s built-in exception hierarchy more closely and ensures that tests like `hasattr(s, 'cat')` are consistent on both Python 2 and 3.

- Series now supports bitwise operation for integral types (GH9016). Previously even if the input dtypes were integral, the output dtype was coerced to `bool`.

  Previous behavior
In [2]: pd.Series([0, 1, 2, 3], list('abcd')) | pd.Series([4, 4, 4, 4], list('abcd →'))
Out[2]:
a   True
b   True
c   True
d   True
dtype: bool

New behavior. If the input dtypes are integral, the output dtype is also integral and the output values are the result of the bitwise operation.

In [2]: pd.Series([0, 1, 2, 3], list('abcd')) | pd.Series([4, 4, 4, 4], list('abcd →'))
Out[2]:
a    4
b    5
c    6
d    7
dtype: int64

• During division involving a Series or DataFrame, 0/0 and 0//0 now give np.nan instead of np.inf. (GH9144, GH8445)

Previous behavior

In [2]: p = pd.Series([0, 1])

In [3]: p / 0
Out[3]:
  0   inf
  1   inf
dtype: float64

In [4]: p // 0
Out[4]:
  0   inf
  1   inf
dtype: float64

New behavior

In [38]: p = pd.Series([0, 1])

In [39]: p / 0
Out[39]:
  0   NaN
  1   inf
Length: 2, dtype: float64

In [40]: p // 0
Out[40]:
  0   NaN
  1   inf
(continues on next page)
**Series.values_counts** and **Series.describe** for categorical data will now put NaN entries at the end. (GH9443)

**Series.describe** for categorical data will now give counts and frequencies of 0, not NaN, for unused categories (GH9443)

Due to a bug fix, looking up a partial string label with **DatetimeIndex.asof** now includes values that match the string, even if they are after the start of the partial string label (GH9258).

**Old behavior:**

```
In [4]: pd.to_datetime(['2000-01-31', '2000-02-28']).asof('2000-02')
Out[4]: Timestamp('2000-01-31 00:00:00')
```

**Fixed behavior:**

```
In [41]: pd.to_datetime(['2000-01-31', '2000-02-28']).asof('2000-02')
Out[41]: Timestamp('2000-02-28 00:00:00')
```

To reproduce the old behavior, simply add more precision to the label (e.g., use **2000-02-01** instead of **2000-02**).

**Deprecations**

- The **rplot** trellis plotting interface is deprecated and will be removed in a future version. We refer to external packages like **seaborn** for similar but more refined functionality (GH3445). The documentation includes some examples how to convert your existing code from rplot to seaborn here.

- The **pandas.sandbox.qtpandas** interface is deprecated and will be removed in a future version. We refer users to the external package pandas-qt. (GH9615)

- The **pandas.rpy** interface is deprecated and will be removed in a future version. Similar functionality can be accessed through the rpy2 project (GH9602)

- Adding **DatetimeIndex/PeriodIndex** to another **DatetimeIndex/PeriodIndex** is being deprecated as a set-operation. This will be changed to a **TypeError** in a future version. `.union()` should be used for the union set operation. (GH9094)

- Subtracting **DatetimeIndex/PeriodIndex** from another **DatetimeIndex/PeriodIndex** is being deprecated as a set-operation. This will be changed to an actual numeric subtraction yielding a **TimeDeltaIndex** in a future version. `.difference()` should be used for the differencing set operation. (GH9094)

**Removal of prior version deprecations/changes**

- **DataFrame.pivot_table** and crosstab’s `rows` and `cols` keyword arguments were removed in favor of `index` and `columns` (GH6581)

- **DataFrame.to_excel** and **DataFrame.to_csv** `cols` keyword argument was removed in favor of `columns` (GH6581)

- Removed **convert_dummies** in favor of **get_dummies** (GH6581)

- Removed **value_range** in favor of **describe** (GH6581)
Performance improvements

- Fixed a performance regression for `.loc` indexing with an array or list-like (GH9126).
- `.DataFrame.to_json` 30x performance improvement for mixed dtypes frames. (GH9037)
- Performance improvements in `.MultiIndex.duplicated` by working with labels instead of values (GH9125)
- Improved the speed of `uniques` by calling `unique` instead of `value_counts` (GH9129, GH7771)
- Performance improvement of up to 10x in `.DataFrame.count` and `.DataFrame.dropna` by taking advantage of homogeneous/heterogeneous dtypes appropriately (GH9136)
- Performance improvement of up to 20x in `.DataFrame.count` when using a `.MultiIndex` and the `level` keyword argument (GH9163)
- Performance and memory usage improvements in `merge` when key space exceeds `int64` bounds (GH9151)
- Performance improvements in multi-key `groupby` (GH9429)
- Performance improvements in `.MultiIndex.sortlevel` (GH9445)
- Performance and memory usage improvements in `.DataFrame.duplicated` (GH9398)
- Cythonized `Period` (GH9440)
- Decreased memory usage on `to_hdf` (GH9648)

Bug fixes

- Changed `.to_html` to remove leading/trailing spaces in table body (GH4987)
- Fixed issue using `read_csv` on s3 with Python 3 (GH9452)
- Fixed compatibility issue in `DatetimeIndex` affecting architectures where `numpy.int_` defaults to `numpy.int32` (GH8943)
- Bug in Panel indexing with an object-like (GH9140)
- Bug in the returned `Series.dt.components` index was reset to the default index (GH9247)
- Bug in `Categorical.__getitem__/__setitem__` with listlike input getting incorrect results from indexer coercion (GH9469)
- Bug in partial setting with a `DatetimeIndex` (GH9478)
- Bug in `groupby` for integer and datetime64 columns when applying an aggregator that caused the value to be changed when the number was sufficiently large (GH9311, GH6620)
- Fixed bug in `to_sql` when mapping a `Timestamp` object column (datetime column with timezone info) to the appropriate `sqlalchemy` type (GH9085).
- Fixed bug in `to_sql` dtypes argument not accepting an instantiated `SQLAlchemy` type (GH9083).
- Bug in `.loc` partial setting with a `np.datetime64` (GH9516)
- Incorrect dtypes inferred on datetimelike looking `Series` & on `.xs` slices (GH9477)
- Items in `Categorical.unique()` (and `s.unique()` if `s` is of dtype `category`) now appear in the order in which they are originally found, not in sorted order (GH9331). This is now consistent with the behavior for other dtypes in pandas.
- Fixed bug on big endian platforms which produced incorrect results in `StataReader` (GH8688).
- Bug in `.MultiIndex.has_duplicates` when having many levels causes an indexer overflow (GH9075, GH5873)
- Bug in `pivot` and `unstack` where `nan` values would break index alignment (GH4862, GH7401, GH7403, GH7405, GH7466, GH9497)
- Bug in `left join` on MultiIndex with `sort=True` or null values (GH9210).
- Bug in `groupby` where inserting new keys would fail (GH9250).
- Bug in `groupby` when key space exceeds int64 bounds (GH9096).
- Bug in `unstack` with `TimedeltaIndex` or `DatetimeIndex` and nulls (GH9491).
- Bug in `rank` where comparing floats with tolerance will cause inconsistent behaviour (GH8365).
- Fixed character encoding bug in `read_stata` and `StreamReader` when loading data from a URL (GH9231).
- Bug in adding `offsets.Nano` to other offsets raises `TypeError` (GH9284)
- Bug in `DatetimeIndex` iteration, related to (GH8890), fixed in (GH9100)
- Bugs in `resample` around DST transitions. This required fixing offset classes so they behave correctly on DST transitions. (GH5172, GH8744, GH8653, GH9173, GH9468).
- Bug in binary operator method (eg `.mul()`) alignment with integer levels (GH9463).
- Bug in `boxplot`, scatter and hexbin plot may show an unnecessary warning (GH8877)
- Bug in subplot with `layout kw` may show unnecessary warning (GH9464)
- Bug in using groupby functions that need passed through arguments (e.g. `axis`), when using wrapped function (e.g. `fillna`), (GH9221)
- `DataFrame` now properly supports simultaneous `copy` and `dtype` arguments in constructor (GH9099)
- Bug in `read_csv` when using skiprows on a file with CR line endings with the c engine. (GH9079)
- `isnull` now detects `NaT` in `PeriodIndex` (GH9129)
- Bug in `groupby .nth()` with a multiple column groupby (GH8979)
- Bug in `DataFrame.where` and `Series.where` coerce numerics to string incorrectly (GH9280)
- Bug in `DataFrame.where` and `Series.where` raise `ValueError` when string list-like is passed. (GH9280)
- Accessing `Series.str` methods on with non-string values now raises `TypeError` instead of producing incorrect results (GH9184)
- Bug in `DatetimeIndex.__contains__` when index has duplicates and is not monotonic increasing (GH9512)
- Fixed division by zero error for `Series.kurt()` when all values are equal (GH9197)
- Fixed issue in the `xlsxwriter` engine where it added a default ‘General’ format to cells if no other format was applied. This prevented other row or column formatting being applied. (GH9167)
- Fixes issue with `index_col=False` when `usecols` is also specified in `read_csv`. (GH9082)
- Bug where `wide_to_long` would modify the input stub names list (GH9204)
- Bug in `to_sql` not storing float64 values using double precision. (GH9009)
- `SparseSeries` and `SparsePanel` now accept zero argument constructors (same as their non-sparse counterparts) (GH9272).
- Regression in merging `Categorical` and `object` dtypes (GH9426)
- Bug in `read_csv` with buffer overflows with certain malformed input files (GH9205)
- Bug in `groupby MultIndex` with missing pair (GH9049, GH9344)
- Fixed bug in `Series.groupby` where grouping on `MultiIndex` levels would ignore the `sort` argument (GH9444)
• Fix bug in `DataFrame.Groupby` where `sort=False` is ignored in the case of Categorical columns. (GH8868)
• Fixed bug with reading CSV files from Amazon S3 on python 3 raising a TypeError (GH9452)
• Bug in the Google BigQuery reader where the ‘jobComplete’ key may be present but False in the query results (GH8728)
• Bug in `Series.values_counts` with excluding NaN for categorical type Series with `dropna=True` (GH9443)
• Fixed missing numeric_only option for `DataFrame.std/var/sem` (GH9201)
• Support constructing `Panel` or `Panel4D` with scalar data (GH8285)
• Series text representation disconnected from `max_rows/max_columns` (GH7508).

• Series number formatting inconsistent when truncated (GH8532).

Previous behavior

| In [2]: | pd.options.display.max_rows = 10 |
| In [3]: | s = pd.Series([1,1,1,1,1,1,1,1,1,1,0.9999,1,1]*10) |
| In [4]: | s |
| Out[4]: | 0 1 |
| 1 1 |
| 2 1 |
| ... |
| 127 0.9999 |
| 128 1.0000 |
| 129 1.0000 |
| Length: 130, dtype: float64 |

New behavior

| 0 1.0000 |
| 1 1.0000 |
| 2 1.0000 |
| 3 1.0000 |
| 4 1.0000 |
| ... |
| 125 1.0000 |
| 126 1.0000 |
| 127 0.9999 |
| 128 1.0000 |
| 129 1.0000 |
| dtype: float64 |

• A Spurious `SettingWithCopy` Warning was generated when setting a new item in a frame in some cases (GH8730)

The following would previously report a `SettingWithCopy` Warning.

| In [42]: | df1 = pd.DataFrame({'x': pd.Series([a, b, c]), |
| ....: | 'y': pd.Series([d, e, f])}) |
| ....: | |
| In [43]: | df2 = df1[['x']] |

5.15 Version 0.15

5.15.1 Version 0.15.2 (December 12, 2014)

This is a minor release from 0.15.1 and includes a large number of bug fixes along with several new features, enhancements, and performance improvements. A small number of API changes were necessary to fix existing bugs. We recommend that all users upgrade to this version.

- **Enhancements**
- **API Changes**
- **Performance Improvements**
- **Bug Fixes**

**API changes**

- Indexing in MultiIndex beyond lex-sort depth is now supported, though a lexically sorted index will have a better performance. (GH2646)

```
In [1]: df = pd.DataFrame({'jim':[0, 0, 1, 1],
                      'joe':['x', 'x', 'z', 'y'],
                      'jolie':np.random.rand(4)).set_index(['jim', 'joe'])

In [2]: df
Out[2]:
         jolie
    jim  joe
0     x  0.126970
     x  0.966718
1     z  0.260476
     y  0.897237

[4 rows x 1 columns]
```

```
In [3]: df.index.lexsort_depth
Out[3]: 1

# in prior versions this would raise a KeyError
# will now show a PerformanceWarning
In [4]: df.loc[(1, 'z')]
Out[4]:
         jolie
    jim  joe
1     z  0.260476

[1 rows x 1 columns]

# lexically sorting
In [5]: df2 = df.sort_index()

In [6]: df2
```
Out[6]:
    jolie
jim joe
0  x  0.126970
   x  0.966718
1  y  0.897237
   z  0.260476
[4 rows x 1 columns]

In [7]: df2.index.lexsort_depth
Out[7]: 2

In [8]: df2.loc[(1, 'z')]
Out[8]:
    jolie
jim joe
1  z  0.260476
[1 rows x 1 columns]

- Bug in unique of Series with category dtype, which returned all categories regardless whether they were “used” or not (see GH8559 for the discussion). Previous behaviour was to return all categories:

    In [3]: cat = pd.Categorical(['a', 'b', 'a'], categories=['a', 'b', 'c'])
    In [4]: cat
    Out[4]:
       [a, b, a]
    Categories (3, object): [a < b < c]
    In [5]: cat.unique()
    Out[5]: array(['a', 'b', 'c'], dtype=object)

    Now, only the categories that do effectively occur in the array are returned:

    In [9]: cat = pd.Categorical(['a', 'b', 'a'], categories=['a', 'b', 'c'])
    In [10]: cat.unique()
    Out[10]:
       ['a', 'b']
    Categories (3, object): ['a', 'b', 'c']

- Series.all and Series.any now support the level and skipna parameters. Series.all, Series.any, Index.all, and Index.any no longer support the out and keepdims parameters, which existed for compatibility with ndarray. Various index types no longer support the all and any aggregation functions and will now raise TypeError. (GH8302).

- Allow equality comparisons of Series with a categorical dtype and object dtype; previously these would raise TypeError (GH8938)

- Bug in NDFrame: conflicting attribute/column names now behave consistently between getting and setting. Previously, when both a column and attribute named y existed, data.y would return the attribute, while data.y = z would update the column (GH8994)
```
In [11]: data = pd.DataFrame({'x': [1, 2, 3]})
In [12]: data.y = 2
In [13]: data['y'] = [2, 4, 6]
In [14]: data
Out[14]:
   x  y
0  1  2
1  2  4
2  3  6
[3 rows x 2 columns]
# this assignment was inconsistent
In [15]: data.y = 5
```

Old behavior:
```
In [6]: data.y
Out[6]:
In [7]: data['y'].values
Out[7]: array([5, 5, 5])
```

New behavior:
```
In [16]: data.y
Out[16]:
In [17]: data['y'].values
Out[17]: array([2, 4, 6])
```

- `Timestamp('now')` is now equivalent to `Timestamp.now()` in that it returns the local time rather than UTC. Also, `Timestamp('today')` is now equivalent to `Timestamp.today()` and both have `tz` as a possible argument. (GH9000)

- Fix negative step support for label-based slices (GH8753)

Old behavior:
```
In [1]: s = pd.Series(np.arange(3), ['a', 'b', 'c'])
Out[1]:
a    0
b    1
c    2
dtype: int64
In [2]: s.loc['c':]  # a negative step
Out[2]:
c    2
dtype: int64
```

New behavior:
In [18]: s = pd.Series(np.arange(3), ['a', 'b', 'c'])

In [19]: s.loc['c':'a':-1]
Out[19]:
c 2
b 1
a 0
Length: 3, dtype: int64

Enhancements

Categorical enhancements:

- Added ability to export Categorical data to Stata (GH8633). See here for limitations of categorical variables exported to Stata data files.
- Added flag order_categoricals to StataReader and read_stata to select whether to order imported categorical data (GH8836). See here for more information on importing categorical variables from Stata data files.
- Added ability to export Categorical data to/from HDF5 (GH7621). Queries work the same as if it was an object array. However, the category dtyped data is stored in a more efficient manner. See here for an example and caveats w.r.t. prior versions of pandas.
- Added support for searchsorted() on Categorical class (GH8420).

Other enhancements:

- Added the ability to specify the SQL type of columns when writing a DataFrame to a database (GH8778). For example, specifying to use the sqlalchemy String type instead of the default Text type for string columns:

```python
from sqlalchemy.types import String
data.to_sql('data_dtype', engine, dtype={'Col_1': String})  # noqa F821
```

- Series.all and Series.any now support the level and skipna parameters (GH8302):

```python
In [20]: s = pd.Series([False, True, False], index=[0, 0, 1])
In [21]: s.any(level=0)
Out[21]:
0   True
1   False
Length: 2, dtype: bool
```

- Panel now supports the all and any aggregation functions. (GH8302):

```python
>>> p = pd.Panel(np.random.rand(2, 5, 4) > 0.1)
>>> p.all()
0   1  2  3
 0  True  True  True  True
 1  True  False  True  True
 2  True  True  True  True
 3  False  True  False  True
 4  True  True  True  True
```

- Added support for utcfromtimestamp(), fromtimestamp(), and combine() on Timestamp class (GH5351).
• Added Google Analytics (pandas.io.ga) basic documentation (GH8835). See here.

• Timedelta arithmetic returns NotImplemented in unknown cases, allowing extensions by custom classes (GH8813).

• Timedelta now supports arithmetic with numpy.ndarray objects of the appropriate dtype (numpy 1.8 or newer only) (GH8884).

• Added Timedelta.to_timedelta64() method to the public API (GH8884).

• Added gbq.generate_bq_schema() function to the gbq module (GH8325).

• Series now works with map objects the same way as generators (GH8909).

• Added context manager to HDFStore for automatic closing (GH8791).

• to_datetime gains an exact keyword to allow for a format to not require an exact match for a provided format string (if its False). exact defaults to True (meaning that exact matching is still the default) (GH8904)

• Added axvlines boolean option to parallel_coordinates plot function, determines whether vertical lines will be printed, default is True

• Added ability to read table footers to read_html (GH8552)

• to_sql now infers data types of non-NA values for columns that contain NA values and have dtype object (GH8778).

Performance

• Reduce memory usage when skiprows is an integer in read_csv (GH8681)

• Performance boost for to_datetime conversions with a passed format=, and the exact=False (GH8904)

Bug fixes

• Bug in concat of Series with category dtype which were coercing to object. (GH8641)

• Bug in Timestamp-Timestamp not returning a Timedelta type and datelike-datelike ops with timezones (GH8865)

• Made consistent a timezone mismatch exception (either tz operated with None or incompatible timezone), will now return TypeError rather than ValueError (a couple of edge cases only), (GH8865)

• Bug in using a pd.Grouper(key=...) with no level/axis or level only (GH8795, GH8866)

• Report a TypeError when invalid/no parameters are passed in a groupby (GH8015)

• Bug in packaging pandas with py2app/cx_Freeze (GH8602, GH8831)

• Bug in groupby signatures that didn’t include *args or **kwargs (GH8733).

• io.data.Options now raises RemoteDataError when no expiry dates are available from Yahoo and when it receives no data from Yahoo (GH8761), (GH8783).

• Unclear error message in csv parsing when passing dtype and names and the parsed data is a different data type (GH8833)

• Bug in slicing a MultiIndex with an empty list and at least one boolean indexer (GH8781)

• io.data.Options now raises RemoteDataError when no expiry dates are available from Yahoo (GH8761).

• Timedelta kwargs may now be numpy ints and floats (GH8757).

• Fixed several outstanding bugs for Timedelta arithmetic and comparisons (GH8813, GH5963, GH5436).

• sql_schema now generates dialect appropriate CREATE TABLE statements (GH8697)
• **slice** string method now takes step into account (GH8754)
• Bug in `BlockManager` where setting values with different type would break block integrity (GH8850)
• Bug in `DatetimeIndex` when using `time` object as key (GH8667)
• Bug in `merge` where `how='left'` and `sort=False` would not preserve left frame order (GH7331)
• Bug in `MultiIndex.reindex` where reindexing at level would not reorder labels (GH4088)
• Bug in certain operations with dateutil timezones, manifesting with dateutil 2.3 (GH8639)
• Regression in `DatetimeIndex` iteration with a Fixed/Local offset timezone (GH8890)
• Bug in `to_datetime` when parsing a nanoseconds using the '%f' format (GH8989)
• `io.data.Options` now raises `RemoteDataError` when no expiry dates are available from Yahoo and when it receives no data from Yahoo (GH8761), (GH8783).
• Fix: The font size was only set on x axis if vertical or the y axis if horizontal. (GH8765)
• Fixed division by 0 when reading big csv files in python 3 (GH8621)
• Bug in outputting a MultiIndex with `to_html`, `index=False` which would add an extra column (GH8452)
• Imported categorical variables from Stata files retain the ordinal information in the underlying data (GH8836).
• Defined `.size` attribute across `NDFrame` objects to provide compat with numpy >= 1.9.1; buggy with np. `array_split` (GH8846)
• Skip testing of histogram plots for matplotlib <= 1.2 (GH8648).
• Bug where `get_data_google` returned object dtypes (GH3995)
• Bug in `DataFrame.stack(..., dropna=False)` when the `DataFrame`'s columns is a `MultiIndex` whose labels do not reference all its levels. (GH8844)
• Bug in that Option context applied on `__enter__` (GH8514)
• Bug in resample that causes a `ValueError` when resampling across multiple days and the last offset is not calculated from the start of the range (GH8683)
• Bug where `DataFrame.plot(kind='scatter')` fails when checking if an np.array is in the `DataFrame` (GH8852)
• Bug in `pd.infer_freq/DataFrame.inferred_freq` that prevented proper sub-daily frequency inference when the index contained DST days (GH8772).
• Bug where index name was still used when plotting a series with `use_index=False` (GH8558).
• Bugs when trying to stack multiple columns, when some (or all) of the level names are numbers (GH8584).
• Bug in `MultiIndex` where `__contains__` returns wrong result if index is not lexically sorted or unique (GH7724)
• BUG CSV: fix problem with trailing white space in skipped rows, (GH8679), (GH8661), (GH8983)
• Regression in `Timestamp` does not parse ‘Z’ zone designator for UTC (GH8771)
• Bug in `StataWriter` the produces writes strings with 244 characters irrespective of actual size (GH8969)
• Fixed `ValueError` raised by `cummin/cummax` when `datetime64` Series contains NaT. (GH8965)
• Bug in `DataReader` returns object dtype if there are missing values (GH8980)
• Bug in plotting if `sharex` was enabled and index was a timeseries, would show labels on multiple axes (GH3964).
• Bug where passing a unit to the TimedeltaIndex constructor applied the to nano-second conversion twice. (GH9011).
• Bug in plotting of a period-like array (GH9012)

5.15.2 Version 0.15.1 (November 9, 2014)

This is a minor bug-fix release from 0.15.0 and includes a small number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

- **Enhancements**
- **API Changes**
- **Bug Fixes**

**API changes**

- `s.dt.hour` and other `.dt` accessors will now return `np.nan` for missing values (rather than previously -1), (GH8689)

```python
In [1]: s = pd.Series(pd.date_range("20130101", periods=5, freq="D"))
In [2]: s.iloc[2] = np.nan
In [3]: s
Out[3]:
      0  2013-01-01
      1  2013-01-02
      2    NaT
```

(continues on next page)
previous behavior:

```
In [6]: s.dt.hour
Out[6]:
0    0
1    0
2   -1
3    0
4    0
dtype: int64
```

current behavior:

```
In [4]: s.dt.hour
Out[4]:
0   0.0
1   0.0
2   NaN
3   0.0
4   0.0
Length: 5, dtype: float64
```

- `groupby` with `as_index=False` will not add erroneous extra columns to result (GH8582):

```
In [5]: np.random.seed(2718281)
In [6]: df = pd.DataFrame(np.random.randint(0, 100, (10, 2)), columns=['jim', 'joe'])
In [7]: df.head()
Out[7]:
   jim  joe
0   61   81
1   96   49
2   55   65
3   72   51
4   77   12
```

previous behavior:

```
In [4]: df.groupby(ts, as_index=False).max()
```

```
NaN Jim Joe
0 0 72 83
```
current behavior:

```python
In [9]: df.groupby(ts, as_index=False).max()
Out[9]:
    jim  joe
0   72   83
1   77   84
2   96   65
[3 rows x 2 columns]
```

- `groupby` will not erroneously exclude columns if the column name conflicts with the grouper name (GH8112):

```python
In [10]: df = pd.DataFrame({"jim": range(5), "joe": range(5, 10)})
In [11]: df
Out[11]:
    jim  joe
0 0 5
1 1 6
2 2 7
3 3 8
4 4 9
[5 rows x 2 columns]
In [12]: gr = df.groupby(df["jim"] < 2)
```

previous behavior (excludes 1st column from output):

```python
In [4]: gr.apply(sum)
Out[4]:
   joe
    jim  
   False 24
   True 11
```

current behavior:

```python
In [13]: gr.apply(sum)
Out[13]:
    joe
    jim
   False 9 24
   True 1 11
[2 rows x 2 columns]
```

- Support for slicing with monotonic decreasing indexes, even if `start` or `stop` is not found in the index (GH7860):
In [14]: s = pd.Series(["a", "b", "c", "d"], [4, 3, 2, 1])

In [15]: s
Out[15]:
4   a
3   b
2   c
1   d
Length: 4, dtype: object

previous behavior:

In [8]: s.loc[3.5:1.5]
KeyError: 3.5

current behavior:

In [16]: s.loc[3.5:1.5]
Out[16]:
3   b
2   c
Length: 2, dtype: object

• io.data.Options has been fixed for a change in the format of the Yahoo Options page (GH8612), (GH8741)

**Note:** As a result of a change in Yahoo’s option page layout, when an expiry date is given, Options methods now return data for a single expiry date. Previously, methods returned all data for the selected month.

The month and year parameters have been undeprecated and can be used to get all options data for a given month.

If an expiry date that is not valid is given, data for the next expiry after the given date is returned.

Option data frames are now saved on the instance as callsYYMDD or putsYYMDD. Previously they were saved as callsMMYY and putsMMYY. The next expiry is saved as calls and puts.

New features:

- The expiry parameter can now be a single date or a list-like object containing dates.
- A new property expiry_dates was added, which returns all available expiry dates.

Current behavior:

In [17]: from pandas.io.data import Options

In [18]: aapl = Options('aapl', 'yahoo')

In [19]: aapl.get_call_data().iloc[0:5, 0:1]
Out[19]:
Strike  Expiry  Type  Symbol
80  2014-11-14  call  AAPL141114C00080000  29.05
84  2014-11-14  call  AAPL141114C00084000  24.80
85  2014-11-14  call  AAPL141114C00085000  24.05

(continues on next page)
pandas: powerful Python data analysis toolkit, Release 1.3.5

86  2014-11-14 call AAPL141114C00086000  22.76
87  2014-11-14 call AAPL141114C00087000  21.74

**In [20]:** aapl.expiry_dates

**Out[20]:**

```
[datetime.date(2014, 11, 14),
  datetime.date(2014, 11, 22),
  datetime.date(2014, 11, 28),
  datetime.date(2014, 12, 5),
  datetime.date(2014, 12, 12),
  datetime.date(2014, 12, 20),
  datetime.date(2015, 1, 17),
  datetime.date(2015, 2, 20),
  datetime.date(2015, 4, 17),
  datetime.date(2015, 7, 17),
  datetime.date(2016, 1, 15),
  datetime.date(2017, 1, 20)]
```

**In [21]:** aapl.get_near_stock_price(expiry=aapl.expiry_dates[0:3]).iloc[0:5, 0:1]

**Out[21]:**

```
<table>
<thead>
<tr>
<th>Strike</th>
<th>Expiry</th>
<th>Type</th>
<th>Symbol</th>
<th>Last</th>
</tr>
</thead>
<tbody>
<tr>
<td>109</td>

<td>21.74</td>
</tr>
</tbody>
</table>
```

- pandas now also registers the `datetime64` dtype in matplotlib's units registry to plot such values as datetimes. This is activated once pandas is imported. In previous versions, plotting an array of `datetime64` values will have resulted in plotted integer values. To keep the previous behaviour, you can do `del matplotlib.units.registry[np.datetime64]` (GH8614).

**Enhancements**

- `concat` permits a wider variety of iterables of pandas objects to be passed as the first parameter (GH8645):

**In [17]:** `from collections import deque`

**In [18]:** `df1 = pd.DataFrame([1, 2, 3])`

**In [19]:** `df2 = pd.DataFrame([4, 5, 6])`

```
previous behavior:
In [7]: pd.concat(deque((df1, df2)))
TypeError: first argument must be a list-like of pandas objects, you passed an object of type "deque"
```

```
current behavior:
```
In [20]: pd.concat(deque((df1, df2)))
Out[20]:
0 1
1 2
2 3
0 4
1 5
2 6
[6 rows x 1 columns]

- Represent MultiIndex labels with a dtype that utilizes memory based on the level size. In prior versions, the memory usage was a constant 8 bytes per element in each level. In addition, in prior versions, the reported memory usage was incorrect as it didn't show the usage for the memory occupied by the underlying data array. (GH8456)

In [21]: dfi = pd.DataFrame(
    ...:   1, index=pd.MultiIndex.from_product(["a", range(1000)]), columns=["A →"
    ...:   )
    ...:

previous behavior:

# this was underreported in prior versions
In [1]: dfi.memory_usage(index=True)
Out[1]:
Index 8000 # took about 24008 bytes in < 0.15.1
A 8000
dtype: int64

current behavior:

In [22]: dfi.memory_usage(index=True)
Out[22]:
Index 44212
A 8000
Length: 2, dtype: int64

- Added Index properties is_monotonic_increasing and is_monotonic_decreasing (GH8680).
- Added option to select columns when importing Stata files (GH7935)
- Qualify memory usage in DataFrame.info() by adding + if it is a lower bound (GH8578)
- Raise errors in certain aggregation cases where an argument such as numeric_only is not handled (GH8592).
- Added support for 3-character ISO and non-standard country codes in io.wb.download() (GH8482)
- World Bank data requests now will warn/raise based on an errors argument, as well as a list of hard-coded country codes and the World Bank’s JSON response. In prior versions, the error messages didn’t look at the World Bank’s JSON response. Problem-inducing input were simply dropped prior to the request. The issue was that many good countries were cropped in the hard-coded approach. All countries will work now, but some bad countries will raise exceptions because some edge cases break the entire response. (GH8482)
- Added option to Series.str.split() to return a DataFrame rather than a Series (GH8428)
• Added option to `df.info(null_counts=None|True|False)` to override the default display options and force showing of the null-counts (GH8701)

**Bug fixes**

• Bug in unpickling of a `CustomBusinessDay` object (GH8591)
• Bug in coercing `Categorical` to a records array, e.g. `df.to_records()` (GH8626)
• Bug in `Categorical` not created properly with `Series.to_frame()` (GH8626)
• Bug in coercing in `astype` of a `Categorical` of a passed `pd.Categorical` (this now raises `TypeError` correctly), (GH8626)
• Bug in `cut/qcut` when using `Series` and `retbins=True` (GH8589)
• Bug in writing `Categorical` columns to an SQL database with `to_sql` (GH8624).
• Bug in comparing `Categorical` of datetime raising when being compared to a scalar datetime (GH8687)
• Bug in selecting from a `Categorical` with `.iloc` (GH8623)
• Bug in groupby-transform with a `Categorical` (GH8623)
• Bug in duplicated/drop_duplicates with a `Categorical` (GH8623)
• Bug in `Categorical` reflected comparison operator raising if the first argument was a numpy array scalar (e.g. `np.int64`) (GH8658)
• Bug in Panel indexing with a list-like (GH8710)
• Compat issue is `DataFrame.dtypes` when `options.mode.use_inf_as_null` is True (GH8722)
• Bug in `read_csv`, dialect parameter would not take a string (GH8703)
• Bug in slicing a `MultiIndex` level with an empty-list (GH8737)
• Bug in numeric index operations of add/sub with `Float/Index Index` with `numpy` arrays (GH8608)
• Bug in `setitem` with empty indexer and unwanted coercion of dtypes (GH8669)
• Bug in ix/loc block splitting on `setitem` (manifests with integer-like dtypes, e.g. `datetime64`) (GH8607)
• Bug when doing label based indexing with integers not found in the index for non-unique but monotonic indexes (GH8680).
• Bug when indexing a `Float64Index` with `np.nan` on `numpy` 1.7 (GH8980).
• Fix `shape` attribute for `MultiIndex` (GH8609)
• Bug in `GroupBy` where a name conflict between the grouper and columns would break `groupby` operations (GH7115, GH8112)
• Fixed a bug where plotting a column `y` and specifying a label would mutate the index name of the original `DataFrame` (GH8494)
• Fix regression in plotting of a `DatetimeIndex` directly with `matplotlib` (GH8614).
• Bug in `date_range` where partially-specified dates would incorporate current date (GH6961)
• Bug in `Setting` by indexer to a scalar value with a mixed-dtype `Panel4d` was failing (GH8702)
• Bug where `DataReader`'s would fail if one of the symbols passed was invalid. Now returns data for valid symbols and `np.nan` for invalid (GH8494)
• Bug in `get_quote_yahoo` that wouldn't allow non-float return values (GH5229).

5.15.3 Version 0.15.0 (October 18, 2014)

This is a major release from 0.14.1 and includes a small number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

Warning: pandas >= 0.15.0 will no longer support compatibility with NumPy versions < 1.7.0. If you want to use the latest versions of pandas, please upgrade to NumPy >= 1.7.0 (GH7711)

• Highlights include:
  – The Categorical type was integrated as a first-class pandas type, see here
  – New scalar type Timedelta, and a new index type TimedeltaIndex, see here
- New datetimelike properties accessor .dt for Series, see Datetimelike Properties
- New DataFrame default display for df.info() to include memory usage, see Memory Usage
- read_csv will now by default ignore blank lines when parsing, see here
- API change in using Indexes in set operations, see here
- Enhancements in the handling of timezones, see here
- A lot of improvements to the rolling and expanding moment functions, see here
- Internal refactoring of the Index class to no longer sub-class ndarray, see Internal Refactoring
- dropping support for PyTables less than version 3.0.0, and numexpr less than version 2.1 (GH7990)
- Split indexing documentation into Indexing and Selecting Data and MultiIndex / Advanced Indexing
- Split out string methods documentation into Working with Text Data

• Check the API Changes and deprecations before updating
• Other Enhancements
• Performance Improvements
• Bug Fixes

**Warning:** In 0.15.0 Index has internally been refactored to no longer sub-class ndarray but instead subclass PandasObject, similarly to the rest of the pandas objects. This change allows very easy sub-classing and creation of new index types. This should be a transparent change with only very limited API implications (See the Internal Refactoring)

**Warning:** The refactoring in Categorical changed the two argument constructor from “codes/labels and levels” to “values and levels (now called ‘categories’)”. This can lead to subtle bugs. If you use Categorical directly, please audit your code before updating to this pandas version and change it to use the from_codes() constructor. See more on Categorical here

**New features**

**Categoricals in Series/DataFrame**

*Categorical* can now be included in Series and DataFrames and gained new methods to manipulate. Thanks to Jan Schulz for much of this API/implementation. (GH3943, GH5313, GH5314, GH7444, GH7839, GH7848, GH7864, GH7914, GH7768, GH8006, GH3678, GH8075, GH8076, GH8143, GH8453, GH8518).

For full docs, see the categorical introduction and the API documentation.

```
In [1]: df = pd.DataFrame({"id": [1, 2, 3, 4, 5, 6],
                      "raw_grade": ['a', 'b', 'b', 'a', 'a', 'e']})
            ...
In [2]: df["grade"] = df["raw_grade"].astype("category")

In [3]: df["grade"]
Out[3]:
```
# Rename the categories

```python
In [4]: df["grade"].cat.categories = ["very good", "good", "very bad"]
```

# Reorder the categories and simultaneously add the missing categories

```python
In [5]: df["grade"] = df["grade"].cat.set_categories(["very bad", "bad", ...
   :        "medium", "good", "very good"])
   ...
```

```python
In [6]: df["grade"]
```

```
    0    very good
   1      good
   2    good
   3    very good
   4    very good
   5  very bad
Name: grade, Length: 6, dtype: category
Categories (5, object): ['very bad', 'bad', 'medium', 'good', 'very good']
```

```python
In [7]: df.sort_values("grade")
```

```
   id  raw_grade  grade
   5   e    very bad
   1   b      good
   2   3      good
   0   1    very good
   3   4    very good
   4   5    very good
```

```
[6 rows x 3 columns]
```

```python
In [8]: df.groupby("grade").size()
```

```
grade
very bad    1
bad         0
medium      0
good        2
very good   3
```

Length: 5, dtype: int64

- **pandas.core.group_agg** and **pandas.core.factor_agg** were removed. As an alternative, construct a dataframe and use `df.groupby(<group>).agg(<func>).`
Supplying “codes/labels and levels” to the `Categorical` constructor is not supported anymore. Supplying two arguments to the constructor is now interpreted as “values and levels (now called ‘categories’)”. Please change your code to use the `from_codes()` constructor.

The `Categorical.labels` attribute was renamed to `Categorical.codes` and is read only. If you want to manipulate codes, please use one of the `API methods on Categoricals`.

The `Categorical.levels` attribute is renamed to `Categorical.categories`.

**TimedeltaIndex/scalar**

We introduce a new scalar type `Timedelta`, which is a subclass of `datetime.timedelta`, and behaves in a similar manner, but allows compatibility with `np.timedelta64` types as well as a host of custom representation, parsing, and attributes. This type is very similar to how `Timestamp` works for `datetimes`. It is a nice-API box for the type. See the docs. (GH3009, GH4533, GH8209, GH8187, GH8190, GH7869, GH7661, GH8345, GH8471)

### Warning:

Timedelta scalars (and TimedeltaIndex) component fields are *not the same* as the component fields on a `datetime.timedelta` object. For example, `.seconds` on a `datetime.timedelta` object returns the total number of seconds combined between hours, minutes and seconds. In contrast, the pandas `Timedelta` breaks out hours, minutes, microseconds and nanoseconds separately.

```python
# Timedelta accessor
In [9]: tds = pd.Timedelta('31 days 5 min 3 sec')

In [10]: tds.minutes
Out[10]: 5L

In [11]: tds.seconds
Out[11]: 3L

# datetime.timedelta accessor
# this is 5 minutes * 60 + 3 seconds
In [12]: tds.to_pytimedelta().seconds
Out[12]: 303
```

**Note:** this is no longer true starting from v0.16.0, where full compatibility with `datetime.timedelta` is introduced. See the 0.16.0 `whatsnew` entry

### Warning:

Prior to 0.15.0 `pd.to_timedelta` would return a `Series` for list-like/Series input, and a `np.timedelta64` for scalar input. It will now return a `TimedeltaIndex` for list-like input, `Series` for Series input, and `Timedelta` for scalar input.

The arguments to `pd.to_timedelta` are now `(arg,unit='ns',box=True,coerce=False)`, previously were `(arg,box=True,unit='ns')` as these are more logical.

### Construct a scalar

```python
In [9]: pd.Timedelta('1 days 06:05:01.00003')
Out[9]: Timedelta('1 days 06:05:01.000030')

In [10]: pd.Timedelta('15.5us')
```
Out[10]: Timedelta('0 days 00:00:00.000015500')

In [11]: pd.Timedelta('1 hour 15.5us')
Out[11]: Timedelta('0 days 01:00:00.000015500')

# negative Timedeltas have this string repr
# to be more consistent with datetime.timedelta conventions
In [12]: pd.Timedelta('-1us')
Out[12]: Timedelta('0 days 01:00:00.000015500')

# a NaT
In [13]: pd.Timedelta('nan')
Out[13]: NaT

Access fields for a Timedelta

In [14]: td = pd.Timedelta('1 hour 3m 15.5us')

In [15]: td.seconds
Out[15]: 3780

In [16]: td.microseconds
Out[16]: 15

In [17]: td.nanoseconds
Out[17]: 500

Construct a TimedeltaIndex

In [18]: pd.TimedeltaIndex(['1 days', '1 days, 00:00:05',
                         '2 days 00:00:02'],
                         dtype='timedelta64[ns]', freq=None)

Constructing a TimedeltaIndex with a regular range

In [19]: pd.timedelta_range('1 days', periods=5, freq='D')
Out[19]: TimedeltaIndex(['1 days', '2 days', '3 days', '4 days', '5 days'],
                        dtype='timedelta64[ns]', freq='D')

In [20]: pd.timedelta_range(start='1 days', end='2 days', freq='30T')
Out[20]: TimedeltaIndex(['1 days 00:00:00', '1 days 00:30:00', '1 days 01:00:00',
                        '1 days 01:30:00', '1 days 02:00:00', '1 days 02:30:00',
                        '1 days 03:00:00', '1 days 03:30:00', '1 days 04:00:00',
                        '1 days 04:30:00', '1 days 05:00:00', '1 days 05:30:00',
                        '1 days 06:00:00', '1 days 06:30:00', '1 days 07:00:00',
                        '1 days 07:30:00', '1 days 08:00:00', '1 days 08:30:00',
                        '1 days 09:00:00', '1 days 09:30:00', '1 days 10:00:00'],
                        freq='30T')

(continues on next page)
You can now use a TimedeltaIndex as the index of a pandas object

```
In [21]: s = pd.Series(np.arange(5),
                   index=pd.timedelta_range('1 days', periods=5, freq='s'))
```

```
In [22]: s
Out[22]:
0    0 days 00:00:00
1    1 days 00:00:00
2    1 days 00:00:02
3    1 days 00:00:03
4    1 days 00:00:04
Freq: S, Length: 5, dtype: int64
```

You can select with partial string selections

```
In [23]: s['1 day 00:00:02']
Out[23]: 2
```

```
In [24]: s['1 day': '1 day 00:00:02']
Out[24]:
0    0 days 00:00:00
1    1 days 00:00:01
2    1 days 00:00:02
Freq: S, Length: 3, dtype: int64
```

Finally, the combination of TimedeltaIndex with DatetimeIndex allow certain combination operations that are NaT preserving:

```
In [25]: tdi = pd.TimedeltaIndex(['1 days', pd.NaT, '2 days'])
```

```
In [26]: tdi.tolist()  
Out[26]:  
[Timedelta('1 days 00:00:00'), NaT, Timedelta('2 days 00:00:00')]
```

```
In [27]: dti = pd.date_range('20130101', periods=3)
```

```
In [28]: dti.tolist()  
Out[28]:  
[Timestamp('2013-01-01 00:00:00', freq='D'),  
  Timestamp('2013-01-02 00:00:00', freq='D'),  
  Timestamp('2013-01-03 00:00:00', freq='D')]
```
```
Timestamp('2013-01-03 00:00:00', freq='D'))

In [29]: (dti + tdi).tolist()
Out[29]: [Timestamp('2013-01-02 00:00:00'), NaT, Timestamp('2013-01-05 00:00:00')]

In [30]: (dti - tdi).tolist()
Out[30]: [Timestamp('2012-12-31 00:00:00'), NaT, Timestamp('2013-01-01 00:00:00')]
```

- iteration of a Series e.g. `list(Series(...))` of `timedelta64[ns]` would prior to v0.15.0 return `np.timedelta64` for each element. These will now be wrapped in `Timedelta`.

**Memory usage**

Implemented methods to find memory usage of a DataFrame. See the FAQ for more. (GH6852).

A new display option `display.memory_usage` (see Options and settings) sets the default behavior of the `memory_usage` argument in the `df.info()` method. By default `display.memory_usage` is `True`.

```
In [31]: dtypes = ['int64', 'float64', 'datetime64[ns]', 'timedelta64[ns]',
            ....:   'complex128', 'object', 'bool']

In [32]: n = 5000

In [33]: data = {t: np.random.randint(100, size=n).astype(t) for t in dtypes}

In [34]: df = pd.DataFrame(data)

In [35]: df['categorical'] = df['object'].astype('category')

In [36]: df.info()
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 5000 entries, 0 to 4999
Data columns (total 8 columns):
# Column     Non-Null Count  Dtype
--- ------- -------------- -----  
0 int64     5000 non-null  int64  
1 float64   5000 non-null  float64  
2 datetime64[ns]  5000 non-null  datetime64[ns]  
3 timedelta64[ns]  5000 non-null  timedelta64[ns]  
4 complex128  5000 non-null  complex128  
5 object     5000 non-null  object  
6 bool       5000 non-null  bool  
7 categorical  5000 non-null category
dtypes: bool(1), category(1), complex128(1), datetime64[ns](1), float64(1), int64(1),
        object(1), timedelta64[ns](1)
memory usage: 288.2+ KB
```

Additionally `memory_usage()` is an available method for a dataframe object which returns the memory usage of each column.
In [37]: df.memory_usage(index=True)
Out[37]:
Index 128
int64 40000
float64 40000
datetime64[ns] 40000
timedelta64[ns] 40000
complex128 80000
object 40000
bool 5000
categorical 9968
Length: 9, dtype: int64

Series.dt accessor

Series has gained an accessor to succinctly return datetime like properties for the values of the Series, if its a datetime/period like Series. (GH7207) This will return a Series, indexed like the existing Series. See the docs

# datetime
In [38]: s = pd.Series(pd.date_range('20130101 09:10:12', periods=4))

In [39]: s
Out[39]:
0   2013-01-01 09:10:12
1   2013-01-02 09:10:12
2   2013-01-03 09:10:12
3   2013-01-04 09:10:12
Length: 4, dtype: datetime64[ns]

In [40]: s.dt.hour
Out[40]:
0    9
1    9
2    9
3    9
Length: 4, dtype: int64

In [41]: s.dt.second
Out[41]:
0   12
1   12
2   12
3   12
Length: 4, dtype: int64

In [42]: s.dt.day
Out[42]:
0    1
1    2
2    3
3    4
(continues on next page)
This enables nice expressions like this:

```
In [44]: s[s.dt.day == 2]
Out[44]:
1  2013-01-02 09:10:12
Length: 1, dtype: datetime64[ns]
```

You can easily produce tz aware transformations:

```
In [45]: stz = s.dt.tz_localize('US/Eastern')

In [46]: stz
Out[46]:
0  2013-01-01 09:10:12-05:00
1  2013-01-02 09:10:12-05:00
2  2013-01-03 09:10:12-05:00
3  2013-01-04 09:10:12-05:00
Length: 4, dtype: datetime64[ns, US/Eastern]
```

You can also chain these types of operations:

```
In [48]: s.dt.tz_localize('UTC').dt.tz_convert('US/Eastern')
Out[48]:
0  2013-01-01 04:10:12-05:00
1  2013-01-02 04:10:12-05:00
2  2013-01-03 04:10:12-05:00
3  2013-01-04 04:10:12-05:00
Length: 4, dtype: datetime64[ns, US/Eastern]
```

The `.dt` accessor works for period and timedelta dtypes.

```
# period
In [49]: s = pd.Series(pd.period_range('20130101', periods=4, freq='D'))

In [50]: s
Out[50]:
0  2013-01-01
1  2013-01-02
2  2013-01-03
3  2013-01-04
Length: 4, dtype: period[D]
```

```
In [52]: s.dt.day
Out[52]:
0  1
1  2
2  3
3  4
Length: 4, dtype: int64

# timedelta
In [53]: s = pd.Series(pd.timedelta_range('1 day 00:00:05', periods=4, freq='s'))

In [54]: s
Out[54]:
0   1 days 00:00:05
1   1 days 00:00:06
2   1 days 00:00:07
3   1 days 00:00:08
Length: 4, dtype: timedelta64[ns]

In [55]: s.dt.days
Out[55]:
0  1
1  1
2  1
3  1
Length: 4, dtype: int64

In [56]: s.dt.seconds
Out[56]:
0   5
1   6
2   7
3   8
Length: 4, dtype: int64

In [57]: s.dt.components
Out[57]:
       days  hours  minutes  seconds  milliseconds  microseconds nanoseconds
0 0 1 0 0 0 5 0 0 0
1 1 1 0 0 6 0 0 0
2 1 1 0 0 7 0 0 0
3 1 1 0 0 8 0 0 0
[4 rows x 7 columns]
Timezone handling improvements

- `tz_localize(None)` for tz-aware Timestamp and DatetimeIndex now removes timezone holding local time, previously this resulted in Exception or TypeError (GH7812)

```python
In [58]: ts = pd.Timestamp('2014-08-01 09:00', tz='US/Eastern')
In [59]: ts
Out[59]: Timestamp('2014-08-01 09:00:00-0400', tz='US/Eastern')
In [60]: ts.tz_localize(None)
Out[60]: Timestamp('2014-08-01 09:00:00')

In [61]: didx = pd.date_range(start='2014-08-01 09:00', freq='H', periods=10, tz='US/Eastern')
   ....:     .....:
   ....:     .....:
In [62]: didx
Out[62]: DatetimeIndex(['2014-08-01 09:00:00-04:00', '2014-08-01 10:00:00-04:00',
   '2014-08-01 11:00:00-04:00', '2014-08-01 12:00:00-04:00',
   '2014-08-01 13:00:00-04:00', '2014-08-01 14:00:00-04:00',
   '2014-08-01 15:00:00-04:00', '2014-08-01 16:00:00-04:00',
   '2014-08-01 17:00:00-04:00', '2014-08-01 18:00:00-04:00'],
   dtype='datetime64[ns, US/Eastern]', freq='H')
In [63]: didx.tz_localize(None)
Out[63]: DatetimeIndex(['2014-08-01 09:00:00', '2014-08-01 10:00:00',
   '2014-08-01 11:00:00', '2014-08-01 12:00:00',
   '2014-08-01 13:00:00', '2014-08-01 14:00:00',
   '2014-08-01 15:00:00', '2014-08-01 16:00:00',
   '2014-08-01 17:00:00', '2014-08-01 18:00:00'],
   dtype='datetime64[ns]', freq=None)
```

- `tz_localize` now accepts the ambiguous keyword which allows for passing an array of bools indicating whether the date belongs in DST or not, 'NaT' for setting transition times to NaT, ‘infer’ for inferring DST/non-DST, and ‘raise’ (default) for an AmbiguousTimeError to be raised. See the docs for more details (GH7943)

```python
In [58]: ts = pd.Timestamp('2014-08-01 09:00:00-04:00', tz='US/Eastern')
In [59]: ts
Out[59]: Timestamp('2014-08-01 09:00:00-0400', tz='US/Eastern')
In [60]: ts.tz_localize(None)
Out[60]: Timestamp('2014-08-01 09:00:00')

In [61]: didx = pd.date_range(start='2014-08-01 09:00', freq='H', periods=10, tz='US/Eastern')
   ....:     .....:
   ....:     .....:
In [62]: didx
Out[62]: DatetimeIndex(['2014-08-01 09:00:00-04:00', '2014-08-01 10:00:00-04:00',
   '2014-08-01 11:00:00-04:00', '2014-08-01 12:00:00-04:00',
   '2014-08-01 13:00:00-04:00', '2014-08-01 14:00:00-04:00',
   '2014-08-01 15:00:00-04:00', '2014-08-01 16:00:00-04:00',
   '2014-08-01 17:00:00-04:00', '2014-08-01 18:00:00-04:00'],
   dtype='datetime64[ns, US/Eastern]', freq='H')
In [63]: didx.tz_localize(None)
Out[63]: DatetimeIndex(['2014-08-01 09:00:00', '2014-08-01 10:00:00',
   '2014-08-01 11:00:00', '2014-08-01 12:00:00',
   '2014-08-01 13:00:00', '2014-08-01 14:00:00',
   '2014-08-01 15:00:00', '2014-08-01 16:00:00',
   '2014-08-01 17:00:00', '2014-08-01 18:00:00'],
   dtype='datetime64[ns]', freq=None)
```

- `tz_localize` now accepts the ambiguous keyword which allows for passing an array of bools indicating whether the date belongs in DST or not, 'NaT' for setting transition times to NaT, ‘infer’ for inferring DST/non-DST, and ‘raise’ (default) for an AmbiguousTimeError to be raised. See the docs for more details (GH7943)

- `DataFrame.tz_localize` and `DataFrame.tz_convert` now accepts an optional level argument for localizing a specific level of a MultiIndex (GH7846)

- `Timestamp.tz_localize` and `Timestamp.tz_convert` now raise TypeError in error cases, rather than Exception (GH8025)

- a timeseries/index localized to UTC when inserted into a Series/DataFrame will preserve the UTC timezone (rather than being a naive datetime64[ns]) as object dtype (GH8411)

- `Timestamp.__repr__` displays dateutil.tz.tzoffset info (GH7907)
Rolling/expanding moments improvements

- rolling_min(), rolling_max(), rolling_cov(), and rolling_corr() now return objects with all NaN when len(arg) < min_periods ≤ window rather than raising. (This makes all rolling functions consistent in this behavior). (GH7766)

Prior to 0.15.0

```
In [64]: s = pd.Series([10, 11, 12, 13])

In [15]: pd.rolling_min(s, window=10, min_periods=5)
ValueError: min_periods (5) must be <= window (4)
```

New behavior

```
In [4]: pd.rolling_min(s, window=10, min_periods=5)
Out[4]:
0   NaN
1   NaN
2   NaN
3   NaN
dtype: float64
```

- rolling_max(), rolling_min(), rolling_sum(), rolling_mean(), rolling_median(), rolling_std(), rolling_var(), rolling_skew(), rolling_kurt(), rolling_quantile(), rolling_cov(), rolling_corr(), rolling_corr_pairwise(), rolling_window(), and rolling_apply() with center=True previously would return a result of the same structure as the input arg with NaN in the final (window-1)/2 entries. Now the final (window-1)/2 entries of the result are calculated as if the input arg were followed by (window-1)/2 NaN values (or with shrinking windows, in the case of rolling_apply()). (GH7925, GH8269)

Prior behavior (note final value is NaN):

```
In [7]: pd.rolling_sum(Series(range(4)), window=3, min_periods=0, center=True)
Out[7]:
0   1
1   3
2   6
3   NaN
dtype: float64
```

New behavior (note final value is 5 = sum([2, 3, NaN])):

```
In [7]: pd.rolling_sum(pd.Series(range(4)), window=3, 
                      min_periods=0, center=True)
Out[7]:
0   1
1   3
2   6
3   5
dtype: float64
```

- rolling_window() now normalizes the weights properly in rolling mean mode (mean=True) so that the calculated weighted means (e.g. ‘triang’, ‘gaussian’) are distributed about the same means as those calculated without weighting (i.e. ‘boxcar’). See the note on normalization for further details. (GH7618)
In [65]: s = pd.Series([10.5, 8.8, 11.4, 9.7, 9.3])

Behavior prior to 0.15.0:

In [39]: pd.rolling_window(s, window=3, win_type='triang', center=True)
Out[39]:
0    NaN
1    6.583333
2    6.883333
3    6.683333
4    NaN
dtype: float64

New behavior

In [10]: pd.rolling_window(s, window=3, win_type='triang', center=True)
Out[10]:
0    NaN
1    9.875
2    10.325
3    10.025
4    NaN
dtype: float64

• Removed center argument from all expanding_* functions (see list), as the results produced when center=True did not make much sense. (GH7925)

• Added optional ddof argument to expanding_cov() and rolling_cov(). The default value of 1 is backwards-compatible. (GH8279)

• Documented the ddof argument to expanding_var(), expanding_std(), rolling_var(), and rolling_std(). These functions’ support of a ddof argument (with a default value of 1) was previously undocumented. (GH8064)

• ewma(), ewmstd(), ewmvol(), ewmvar(), ewmcov(), and ewmcorr() now interpret min_periods in the same manner that the rolling_*() and expanding_*() functions do: a given result entry will be NaN if the (expanding, in this case) window does not contain at least min_periods values. The previous behavior was to set to NaN the min_periods entries starting with the first non-NaN value. (GH7977)

Prior behavior (note values start at index 2, which is min_periods after index 0 (the index of the first non-empty value)):

In [66]: s = pd.Series([1, None, None, None, 2, 3])

In [51]: ewma(s, com=3., min_periods=2)
Out[51]:
0   NaN
1   NaN
2  1.000000
3  1.000000
4  1.571429
5  2.189189
dtype: float64

New behavior (note values start at index 4, the location of the 2nd (since min_periods=2) non-empty value):
In [2]: pd.ewma(s, com=3., min_periods=2)
Out[2]:
     0    NaN
     1    NaN
     2    NaN
     3  1.759644
     4  2.383784
     dtype: float64

• `ewmstd()`, `ewmvol()`, `ewmvar()`, `ewmcov()`, and `ewmcorr()` now have an optional `adjust` argument, just like `ewma()` does, affecting how the weights are calculated. The default value of `adjust` is `True`, which is backwards-compatible. See `Exponentially weighted moment functions` for details. (GH7911)

• `ewma()`, `ewmstd()`, `ewmvol()`, `ewmvar()`, `ewmcov()`, and `ewmcorr()` now have an optional `ignore_na` argument. When `ignore_na=False` (the default), missing values are taken into account in the weights calculation. When `ignore_na=True` (which reproduces the pre-0.15.0 behavior), missing values are ignored in the weights calculation. (GH7543)

In [7]: pd.ewma(pd.Series([None, 1., 8.]), com=2.)
Out[7]:
   0    NaN
   1    1.0
   2    5.2
   dtype: float64

In [8]: pd.ewma(pd.Series([1., None, 8.]), com=2.,
       ....: ignore_na=True) # pre-0.15.0 behavior
Out[8]:
   0    1.0
   1    1.0
   2    5.2
   dtype: float64

In [9]: pd.ewma(pd.Series([1., None, 8.]), com=2.,
       ....: ignore_na=False) # new default
Out[9]:
   0  1.000000
   1  1.000000
   2  5.846154
   dtype: float64

Warning: By default (`ignore_na=False`) the `ewm*()` functions' weights calculation in the presence of missing values is different than in pre-0.15.0 versions. To reproduce the pre-0.15.0 calculation of weights in the presence of missing values one must specify explicitly `ignore_na=True`.

• Bug in `expanding_cov()`, `expanding_corr()`, `rolling_cov()`, `rolling_cor()`, `ewmcov()`, and `ewmcorr()` returning results with columns sorted by name and producing an error for non-unique columns; now handles non-unique columns and returns columns in original order (except for the case of two DataFrames with `pairwise=False`, where behavior is unchanged) (GH7542)

• Bug in `rolling_count()` and `expanding_*()` functions unnecessarily producing error message for zero-length data (GH8056)
• Bug in `rolling_apply()` and `expanding_apply()` interpreting `min_periods=0` as `min_periods=1` (GH8080)

• Bug in `expanding_std()` and `expanding_var()` for a single value producing a confusing error message (GH7900)

• Bug in `rolling_std()` and `rolling_var()` for a single value producing 0 rather than NaN (GH7900)

• Bug in `ewmstd()`, `ewmvar()`, `ewmmvar()`, and `ewmcov()` calculation of de-biasing factors when `bias=False` (the default). Previously an incorrect constant factor was used, based on `adjust=True`, `ignore_na=True`, and an infinite number of observations. Now a different factor is used for each entry, based on the actual weights (analogous to the usual $N/(N-1)$ factor). In particular, for a single point a value of NaN is returned when `bias=False`, whereas previously a value of (approximately) 0 was returned.

For example, consider the following pre-0.15.0 results for `ewmvar(..., bias=False)`, and the corresponding debiasing factors:

```python
In [67]: s = pd.Series([1., 2., 0., 4.])

In [89]: ewmvar(s, com=2., bias=False)
Out[89]:
   0   -2.775558e-16
   1    3.000000e-01
   2    9.556787e-01
   3    3.585799e+00
   dtype: float64

In [90]: ewmvar(s, com=2., bias=False) / ewmvar(s, com=2., bias=True)
Out[90]:
   0     1.25
   1     1.25
   2     1.25
   3     1.25
   dtype: float64
```

Note that entry 0 is approximately 0, and the debiasing factors are a constant 1.25. By comparison, the following 0.15.0 results have a NaN for entry 0, and the debiasing factors are decreasing (towards 1.25):

```python
In [14]: pd.ewmvar(s, com=2., bias=False)
Out[14]:
   0       NaN
   1    0.500000
   2    1.210526
   3    4.089069
   dtype: float64

In [15]: pd.ewmvar(s, com=2., bias=False) / pd.ewmvar(s, com=2., bias=True)
Out[15]:
   0       NaN
   1    2.083333
   2    1.583333
   3    1.425439
   dtype: float64
```

See *Exponentially weighted moment functions* for details. (GH7912)
Improvements in the SQL IO module

- Added support for a chunksize parameter to to_sql function. This allows DataFrame to be written in chunks and avoid packet-size overflow errors (GH8062).
- Added support for a chunksize parameter to read_sql function. Specifying this argument will return an iterator through chunks of the query result (GH2908).
- Added support for writing datetime.date and datetime.time object columns with to_sql (GH6932).
- Added support for specifying a schema to read from/write to with read_sql_table and to_sql (GH7441, GH7952). For example:

  ```python
  df.to_sql('table', engine, schema='other_schema') # noqa F821
  pd.read_sql_table('table', engine, schema='other_schema') # noqa F821
  ```

- Added support for writing NaN values with to_sql (GH2754).
- Added support for writing datetime64 columns with to_sql for all database flavors (GH7103).

Backwards incompatible API changes

Breaking changes

API changes related to Categorical (see here for more details):

- The Categorical constructor with two arguments changed from “codes/labels and levels” to “values and levels (now called ‘categories’)”. This can lead to subtle bugs. If you use Categorical directly, please audit your code by changing it to use the from_codes() constructor.

  An old function call like (prior to 0.15.0):

  ```python
  pd.Categorical([0,1,0,2,1], levels=['a', 'b', 'c'])
  ```

  will have to adapted to the following to keep the same behaviour:

  ```python
  In [2]: pd.Categorical.from_codes([0,1,0,2,1], categories=['a', 'b', 'c'])
  Out[2]:
  [a, b, a, c, b]
  Categories (3, object): [a, b, c]
  ```

API changes related to the introduction of the Timedelta scalar (see above for more details):

- Prior to 0.15.0 to_timedelta() would return a Series for list-like/Series input, and a np.timedelta64 for scalar input. It will now return a TimedeltaIndex for list-like input, Series for Series input, and Timedelta for scalar input.

For API changes related to the rolling and expanding functions, see detailed overview above.

Other notable API changes:

- Consistency when indexing with .loc and a list-like indexer when no values are found.

  ```python
  In [68]: df = pd.DataFrame([['a'], ['b']], index=[1, 2])
  In [69]: df
  Out[69]:
  0
  ```

(continues on next page)
In prior versions there was a difference in these two constructs:
- `df.loc[[3]]` would return a frame reindexed by 3 (with all `np.nan` values)
- `df.loc[[3],:]` would raise `KeyError`.

Both will now raise a `KeyError`. The rule is that at least 1 indexer must be found when using a list-like and `.loc` (GH7999)

Furthermore in prior versions these were also different:
- `df.loc[[1,3]]` would return a frame reindexed by [1,3]
- `df.loc[[1,3],:]` would raise `KeyError`.

Both will now return a frame reindex by [1,3]. E.g.

```python
In [3]: df.loc[[1, 3]]
Out[3]:
   0
1   a
3  NaN

In [4]: df.loc[[1, 3], :]
Out[4]:
   0
1   a
3  NaN
```

This can also be seen in multi-axis indexing with a Panel.

```python
>>> p = pd.Panel(np.arange(2 * 3 * 4).reshape(2, 3, 4),
...                items=['ItemA', 'ItemB'],
...                major_axis=[1, 2, 3],
...                minor_axis=['A', 'B', 'C', 'D'])
>>> p
<class 'pandas.core.panel.Panel'>
Dimensions: 2 (items) x 3 (major_axis) x 4 (minor_axis)
Items axis: ItemA to ItemB
Major_axis axis: 1 to 3
Minor_axis axis: A to D
```

The following would raise `KeyError` prior to 0.15.0:

```python
In [5]:
Out[5]:
   ItemA  ItemD
1  3  NaN
2  7  NaN
3 11  NaN
```

Furthermore, `.loc` will raise if no values are found in a MultiIndex with a list-like indexer:
In [70]:
    s = pd.Series(np.arange(3, dtype='int64'),
        index=pd.MultiIndex.from_product([['A'], ['foo', 'bar', 'baz']], names=['one', 'two'])).sort_index()

In [71]:
    s

Out[71]:
    one  two
    A    bar 1
         baz 2
    foo 0
    Length: 3, dtype: int64

In [72]:
    try:
        s.loc[['D']]
    except KeyError as e:
        print("KeyError: " + str(e))

KeyError: "['D'] not in index"

- Assigning values to None now considers the dtype when choosing an ‘empty’ value (GH7941).

Previously, assigning to None in numeric containers changed the dtype to object (or errored, depending on the call). It now uses NaN:

In [73]:
    s = pd.Series([1, 2, 3])

In [74]:
    s.loc[0] = None

In [75]:
    s

Out[75]:
    0  NaN
    1  2.0
    2  3.0
    Length: 3, dtype: float64

NaT is now used similarly for datetime containers.

For object containers, we now preserve None values (previously these were converted to NaN values).

In [76]:
    s = pd.Series(['a', 'b', 'c'])

In [77]:
    s.loc[0] = None

In [78]:
    s

Out[78]:
    0  None
    1  b
    2  c
    Length: 3, dtype: object

To insert a NaN, you must explicitly use np.nan. See the docs.
• In prior versions, updating a pandas object inplace would not reflect in other python references to this object. (GH8511, GH5104)

```python
In [79]: s = pd.Series([1, 2, 3])
In [80]: s2 = s
In [81]: s += 1.5
```

Behavior prior to v0.15.0

```python
# the original object
In [5]: s
Out[5]:
0   2.5
1   3.5
2   4.5
dtype: float64

# a reference to the original object
In [7]: s2
Out[7]:
0   1
1   2
2   3
dtype: int64
```

This is now the correct behavior

```python
# the original object
In [82]: s
Out[82]:
0   2.5
1   3.5
2   4.5
Length: 3, dtype: float64

# a reference to the original object
In [83]: s2
Out[83]:
0   2.5
1   3.5
2   4.5
Length: 3, dtype: float64
```

• Made both the C-based and Python engines for read_csv and read_table ignore empty lines in input as well as white space-filled lines, as long as sep is not white space. This is an API change that can be controlled by the keyword parameter skip_blank_lines. See the docs (GH4466)

• A timeseries/index localized to UTC when inserted into a Series/DataFrame will preserve the UTC timezone and inserted as object dtype rather than being converted to a naive datetime64[ns] (GH8411).

• Bug in passing a DatetimeIndex with a timezone that was not being retained in DataFrame construction from a dict (GH7822)
In prior versions this would drop the timezone, now it retains the timezone, but gives a column of object dtype:

```python
In [84]: i = pd.date_range('1/1/2011', periods=3, freq='10s', tz='US/Eastern')

In [85]: i
Out[85]:
DatetimeIndex(['2011-01-01 00:00:00-05:00', '2011-01-01 00:00:10-05:00',
              '2011-01-01 00:00:20-05:00'],
dtype='datetime64[ns, US/Eastern]', freq='10S')

In [86]: df = pd.DataFrame({'a': i})

In [87]: df
Out[87]:
a
0 2011-01-01 00:00:00-05:00
1 2011-01-01 00:00:10-05:00
2 2011-01-01 00:00:20-05:00

[3 rows x 1 columns]

In [88]: df.dtypes
Out[88]:
a    datetime64[ns, US/Eastern]
Length: 1, dtype: object
```

Previously this would have yielded a column of datetime64 dtype, but without timezone info.

The behaviour of assigning a column to an existing dataframe as `df['a'] = i` remains unchanged (this already returned an object column with a timezone).

- When passing multiple levels to `stack()`, it will now raise a `ValueError` when the levels aren’t all level names or all level numbers (GH7660). See Reshaping by stacking and unstacking.
- Raise a `ValueError` in `df.to_hdf` with ‘fixed’ format, if `df` has non-unique columns as the resulting file will be broken (GH7761)
- SettingWithCopy raise/warnings (according to the option `mode.chained_assignment`) will now be issued when setting a value on a sliced mixed-dtype DataFrame using chained-assignment. (GH7845, GH7950)

```python
In [1]: df = pd.DataFrame(np.arange(0, 9), columns=['count'])

In [2]: df['group'] = 'b'

In [3]: df.iloc[0:5]['group'] = 'a'
/usr/local/bin/ipython:1: SettingWithCopyWarning:
A value is trying to be set on a copy of a slice from a DataFrame. Try using .loc[row_indexer,col_indexer] = value instead
See the caveats in the documentation: https://pandas.pydata.org/pandas-docs/stable/indexing.html#indexing-view-versus-copy
```

- `merge`, `DataFrame.merge`, and `ordered_merge` now return the same type as the `left` argument (GH7737).
- Previously an enlargement with a mixed-dtype frame would act unlike `.append` which will preserve dtypes (related GH2578, GH8176):
In [89]: df = pd.DataFrame([[True, 1], [False, 2]],
   ....:       columns=["female", "fitness"])

In [90]: df
Out[90]:
   female  fitness
0   True     1
1  False     2

[2 rows x 2 columns]

In [91]: df.dtypes
Out[91]:
   female  bool
   fitness int64
Length: 2, dtype: object

# dtypes are now preserved

In [93]: df
Out[93]:
   female  fitness
0   True     1
1  False     2
2  False     2

[3 rows x 2 columns]

In [94]: df.dtypes
Out[94]:
   female  bool
   fitness int64
Length: 2, dtype: object

- Series.to_csv() now returns a string when path=None, matching the behaviour of DataFrame.to_csv() (GH8215).
- read_hdf now raises IOError when a file that doesn't exist is passed in. Previously, a new, empty file was created, and a KeyError raised (GH7715).
- DataFrame.info() now ends its output with a newline character (GH8114)
- Concatenating no objects will now raise a ValueError rather than a bare Exception.
- Merge errors will now be sub-classes of ValueError rather than raw Exception (GH8501)
- DataFrame.plot and Series.plot keywords are now have consistent orders (GH8037)
Internal refactoring

In 0.15.0 Index has internally been refactored to no longer sub-class ndarray but instead subclass PandasObject, similarly to the rest of the pandas objects. This change allows very easy sub-classing and creation of new index types. This should be a transparent change with only very limited API implications (GH5080, GH7439, GH7796, GH8024, GH8367, GH7997, GH8522):

- you may need to unpickle pandas version < 0.15.0 pickles using pd.read_pickle rather than pickle.load. See pickle docs
- when plotting with a PeriodIndex, the matplotlib internal axes will now be arrays of Period rather than a PeriodIndex (this is similar to how a DatetimeIndex passes arrays of datetimes now)
- MultiIndexes will now raise similarly to other pandas objects w.r.t. truth testing, see here (GH7897).
- When plotting a DatetimeIndex directly with matplotlib’s plot function, the axis labels will no longer be formatted as dates but as integers (the internal representation of a datetime64). UPDATE This is fixed in 0.15.1, see here.

Deprecations

- The attributes Categorical labels and levels attributes are deprecated and renamed to codes and categories.
- The outtype argument to pd.DataFrame.to_dict has been deprecated in favor of orient. (GH7840)
- The convert_dummies method has been deprecated in favor of get_dummies (GH8140)
- The infer_dst argument in tz_localize will be deprecated in favor of ambiguous to allow for more flexibility in dealing with DST transitions. Replace infer_dst=True with ambiguous='infer' for the same behavior (GH7943). See the docs for more details.
- The top-level pd.value_range has been deprecated and can be replaced by .describe() (GH8481)
- The Index set operations + and - were deprecated in order to provide these for numeric type operations on certain index types. + can be replaced by .union() or |, and - by .difference(). Further the method name Index.diff() is deprecated and can be replaced by Index.difference() (GH8226)

```
# +
pd.Index(['a', 'b', 'c']) + pd.Index(['b', 'c', 'd'])
# should be replaced by
pd.Index(['a', 'b', 'c']).union(pd.Index(['b', 'c', 'd']))
```

```
# -
pd.Index(['a', 'b', 'c']) - pd.Index(['b', 'c', 'd'])
# should be replaced by
pd.Index(['a', 'b', 'c']).difference(pd.Index(['b', 'c', 'd']))
```

- The infer_types argument to read_html() now has no effect and is deprecated (GH7762, GH7032).
Removal of prior version deprecations/changes

- Remove DataFrame.delevel method in favor of DataFrame.reset_index

Enhancements

Enhancements in the importing/exporting of Stata files:

- Added support for bool, uint8, uint16 and uint32 data types in to_stata (GH7097, GH7365)
- Added conversion option when importing Stata files (GH8527)
- DataFrame.to_stata and StataWriter check string length for compatibility with limitations imposed in dta files where fixed-width strings must contain 244 or fewer characters. Attempting to write Stata dta files with strings longer than 244 characters raises a ValueError. (GH7858)
- read_stata and StataReader can import missing data information into a DataFrame by setting the argument convert_missing to True. When using this option, missing values are returned as StataMissingValue objects and columns containing missing values have object data type. (GH8045)

Enhancements in the plotting functions:

- Added layout keyword to DataFrame.plot. You can pass a tuple of (rows, columns), one of which can be -1 to automatically infer (GH6667, GH8071).
- Allow to pass multiple axes to DataFrame.plot.hist and boxplot (GH5353, GH6970, GH7069)
- Added support for c, colormap and colorbar arguments for DataFrame.plot with kind='scatter' (GH7780)
- Histogram from DataFrame.plot with kind='hist' (GH7809), See the docs.
- Boxplot from DataFrame.plot with kind='box' (GH7998), See the docs.

Other:

- read_csv now has a keyword parameter float_precision which specifies which floating-point converter the C engine should use during parsing, see here (GH8002, GH8044)
- Added searchsorted method to Series objects (GH7447)
- describe() on mixed-types DataFrames is more flexible. Type-based column filtering is now possible via the include/exclude arguments. See the docs (GH8164).

```
In [95]: df = pd.DataFrame({'catA': ['foo', 'foo', 'bar'] * 8,
                          'catB': ['a', 'b', 'c', 'd'] * 6,
                          'numC': np.arange(24),
                          'numD': np.arange(24.) + .5})

In [96]: df.describe(include=['object'])
Out[96]:
   catA  catB
  count  24   24
  unique  2   4
    top  foo   a
    freq 16    6
[4 rows x 2 columns]
```

(continues on next page)
In [97]: df.describe(include=['number', 'object'], exclude=['float'])
Out[97]:
       catA  catB  numC  
count  24    24  24.000000
unique  2    4   NaN   
top     foo   a   NaN   
freq   16    6   NaN   
mean   NaN  NaN  11.500000
std    NaN  NaN  7.071068
min    NaN  NaN  0.000000
25%    NaN  NaN  5.750000
50%    NaN  NaN  11.500000
75%    NaN  NaN  17.250000
max    NaN  NaN  23.000000
[11 rows x 3 columns]

Requesting all columns is possible with the shorthand ‘all’

In [98]: df.describe(include='all')
Out[98]:
       catA  catB  numC  numD  
count  24    24  24.000000  24.000000
unique  2    4   NaN   NaN   
top     foo   a   NaN   NaN   
freq   16    6   NaN   NaN   
mean   NaN  NaN  11.500000  12.000000
std    NaN  NaN  7.071068  7.071068
min    NaN  NaN  0.000000  0.500000
25%    NaN  NaN  5.750000  6.250000
50%    NaN  NaN  11.500000 12.000000
75%    NaN  NaN  17.250000 17.750000
max    NaN  NaN  23.000000 23.500000
[11 rows x 4 columns]

Without those arguments, describe will behave as before, including only numerical columns or, if none are, only categorical columns. See also the docs

• Added split as an option to the orient argument in pandas.DataFrame.to_dict. (GH7840)

• The get_dummies method can now be used on DataFrames. By default only categorical columns are encoded as 0’s and 1’s, while other columns are left untouched.

In [99]: df = pd.DataFrame({'A': ['a', 'b', 'a'], 'B': ['c', 'c', 'b'],
                        'C': [1, 2, 3]})

In [100]: pd.get_dummies(df)
Out[100]:
   C  A_a  A_b  B_b  B_c
0  1    1    0    0    1
PeriodIndex supports resolution as the same as DatetimeIndex (GH7708)

pandas.tseries.holiday has added support for additional holidays and ways to observe holidays (GH7070)

pandas.tseries.holiday.Holiday now supports a list of offsets in Python3 (GH7070)

pandas.tseries.holiday.Holiday now supports a days_of_week parameter (GH7070)

GroupBy.nth() now supports selecting multiple nth values (GH7910)

In [101]: business_dates = pd.date_range(start='4/1/2014', end='6/30/2014', freq='B →')

In [102]: df = pd.DataFrame(1, index=business_dates, columns=['a', 'b'])

# get the first, 4th, and last date index for each month
In [103]: df.groupby([df.index.year, df.index.month]).nth([0, 3, -1])
Out[103]:
    a  b
2014 4 1 1
    4 1 1
    5 1 1
    5 1 1
    6 1 1
    6 1 1

[9 rows x 2 columns]

Period and PeriodIndex supports addition/subtraction with timedelta-likes (GH7966)

If Period freq is D, H, T, L, U, N, Timedelta-like can be added if the result can have same freq. Otherwise, only the same offsets can be added.

In [104]: idx = pd.period_range('2014-07-01 09:00', periods=5, freq='H')

In [105]: idx
Out[105]:
PeriodIndex(['2014-07-01 09:00', '2014-07-01 10:00', '2014-07-01 11:00',
             '2014-07-01 12:00', '2014-07-01 13:00'],
            dtype='period[H]')

In [106]: idx + pd.offsets.Hour(2)
Out[106]:
PeriodIndex(['2014-07-01 11:00', '2014-07-01 12:00', '2014-07-01 13:00',
             '2014-07-01 14:00', '2014-07-01 15:00'],
            dtype='period[H]')
In [107]: idx + pd.Timedelta('120m')
Out[107]:
PeriodIndex(['2014-07-01 11:00', '2014-07-01 12:00', '2014-07-01 13:00',
             '2014-07-01 14:00', '2014-07-01 15:00'],
             dtype='period[H]')

In [108]: idx = pd.period_range('2014-07', periods=5, freq='M')
In [109]: idx
Out[109]:
             dtype='period[M]')

In [110]: idx + pd.offsets.MonthEnd(3)
Out[110]:
             dtype='period[M]')

• Added experimental compatibility with openpyxl for versions >= 2.0. The DataFrame.to_excel method engine keyword now recognizes openpyxl1 and openpyxl2 which will explicitly require openpyxl v1 and v2 respectively, failing if the requested version is not available. The openpyxl engine is a now a meta-engine that automatically uses whichever version of openpyxl is installed. (GH7177)

• DataFrame.fillna can now accept a DataFrame as a fill value (GH8377)

• Passing multiple levels to stack() will now work when multiple level numbers are passed (GH7660). See Reshaping by stacking and unstacking.

• set_names(), set_labels(), and set_levels() methods now take an optional level keyword argument to all modification of specific level(s) of a MultiIndex. Additionally set_names() now accepts a scalar string value when operating on an Index or on a specific level of a MultiIndex (GH7792)

In [111]: idx = pd.MultiIndex.from_product([['a'], range(3), list('pqr')],
                                      names=['foo', 'bar', 'baz'])

In [112]: idx.set_names('qux', level=0)
Out[112]:
MultiIndex([('a', 0, 'p'),
             ('a', 0, 'q'),
             ('a', 0, 'r'),
             ('a', 1, 'p'),
             ('a', 1, 'q'),
             ('a', 1, 'r'),
             ('a', 2, 'p'),
             ('a', 2, 'q'),
             ('a', 2, 'r')],
             names=['qux', 'bar', 'baz'])

In [113]: idx.set_names(['qux', 'corge'], level=[0, 1])
Out[113]:
MultiIndex([('a', 0, 'p'),
             ('a', 0, 'q'),
             ('a', 0, 'r'),
             ('a', 1, 'p'),
             ('a', 1, 'q'),
             ('a', 1, 'r'),...],
             names=['qux', 'corge'])
In [114]: idx.set_levels(['a', 'b', 'c'], level='bar')
Out[114]: MultiIndex([(a, a, 'p'),
                   (a, a, 'q'),
                   (a, 'b', 'p'),
                   (a, 'b', 'q'),
                   (a, 'b', 'r'),
                   (a, 'c', 'p'),
                   (a, 'c', 'q'),
                   (a, 'c', 'r')],
                   names=['qux', 'corge', 'baz'])

In [115]: idx.set_levels([[a, b, c], [1, 2, 3]], level=[1, 2])
Out[115]: MultiIndex([(a, a, 1),
                     (a, a, 2),
                     (a, a, 3),
                     (a, 'b', 1),
                     (a, 'b', 2),
                     (a, 'b', 3),
                     (a, 'c', 1),
                     (a, 'c', 2),
                     (a, 'c', 3)],
                     names=['foo', 'bar', 'baz'])

- Index.isin now supports a level argument to specify which index level to use for membership tests (GH7892, GH7890)

In [1]: idx = pd.MultiIndex.from_product([[], ['a', 'b', 'c']])
In [2]: idx.values
Out[2]: array([(0, 'a'), (0, 'b'), (0, 'c'), (1, 'a'), (1, 'b'), (1, 'c')],
               dtype=object)
In [3]: idx.isin(['a', 'c', 'e'], level=1)
Out[3]: array([ True, False, True, True, False, True], dtype=bool)

- Index now supports duplicated and drop_duplicates. (GH4060)

In [116]: idx = pd.Index([1, 2, 3, 4, 1, 2])
In [117]: idx
Out[117]: Int64Index([1, 2, 3, 4, 1, 2], dtype='int64')
In [118]: idx.duplicated()
Out[118]: array([False, False, False, False, True, True])
In [119]: idx.drop_duplicates()
Out[119]: Int64Index([1, 2, 3, 4], dtype='int64')

• add copy=True argument to pd.concat to enable pass through of complete blocks (GH8252)
• Added support for numpy 1.8+ data types (bool_, int_, float_, string_) for conversion to R dataframe (GH8400)

Performance

• Performance improvements in DatetimeIndex.__iter__ to allow faster iteration (GH7683)
• Performance improvements in Period creation (and PeriodIndex setitem) (GH5155)
• Improvements in Series.transform for significant performance gains (revised) (GH6496)
• Performance improvements in StataReader when reading large files (GH8040, GH8073)
• Performance improvements in StataWriter when writing large files (GH8079)
• Performance and memory usage improvements in multi-key groupby (GH8128)
• Performance improvements in groupby .agg and .apply where builtins max/min were not mapped to numpy/cythonized versions (GH7722)
• Performance improvement in writing to sql (to_sql) of up to 50% (GH8208).
• Performance benchmarking of groupby for large value of ngroups (GH6787)
• Performance improvement in CustomBusinessDay, CustomBusinessMonth (GH8236)
• Performance improvement for MultiIndex.values for multi-level indexes containing datetimes (GH8543)

Bug fixes

• Bug in pivot_table, when using margins and a dict aggfunc (GH8349)
• Bug in read_csv where squeeze=True would return a view (GH8217)
• Bug in checking of table name in read_sql in certain cases (GH7826).
• Bug in DataFrame.groupby where Grouper does not recognize level when frequency is specified (GH7885)
• Bug in multiindexes dtypes getting mixed up when DataFrame is saved to SQL table (GH8021)
• Bug in Series 0-division with a float and integer operand dtypes (GH7785)
• Bug in Series.astype("unicode") not calling unicode on the values correctly (GH7758)
• Bug in DataFrame.as_matrix() with mixed datetime64[ns] and timedelta64[ns] dtypes (GH7778)
• Bug in HDFStore.select_column() not preserving UTC timezone info when selecting a DatetimeIndex (GH7777)
• Bug in to_datetime when format=’%Y%m%d’ and coerce=True are specified, where previously an object array was returned (rather than a coerced time-series with NaT) (GH7930)
• Bug in DatetimeIndex and PeriodIndex in-place addition and subtraction cause different result from normal one (GH6527)
• Bug in adding and subtracting PeriodIndex with PeriodIndex raise TypeError (GH7741)
• Bug in combine_first with PeriodIndex data raises TypeError (GH3367)
• Bug in MultiIndex slicing with missing indexers (GH7866)
• Bug in MultiIndex slicing with various edge cases (GH8132)
• Regression in MultiIndex indexing with a non-scalar type object (GH7914)
• Bug in Timestamp comparisons with == and int64 dtype (GH8058)
• Bug in pickles contains DateOffset may raise AttributeError when normalize attribute is referred internally (GH7748)
• Bug in Panel when using major_xs and copy=False is passed (deprecation warning fails because of missing warnings) (GH8152).
• Bug in pickle deserialization that failed for pre-0.14.1 containers with dup items trying to avoid ambiguity when matching block and manager items, when there’s only one block there’s no ambiguity (GH7794)
• Bug in putting a PeriodIndex into a Series would convert to int64 dtype, rather than object of Periods (GH7932)
• Bug in HDFStore iteration when passing a where (GH8014)
• Bug in DataFrameGroupby.transform when transforming with a passed non-sorted key (GH8046, GH8430)
• Bug in repeated timeseries line and area plot may result in ValueError or incorrect kind (GH7733)
• Bug in inference in a MultiIndex with datetime.date inputs (GH7888)
• Bug in get where an IndexError would not cause the default value to be returned (GH7725)
• Bug in offsets.apply, rollforward and rollback may reset nanosecond (GH7697)
• Bug in offsets.apply, rollforward and rollback may raise AttributeError if Timestamp has dateutil.tzinfo (GH7697)
• Bug in sorting a MultiIndex frame with a Float64Index (GH8017)
• Bug in inconsistent panel setitem with a rhs of a DataFrame for alignment (GH7763)
• Bug in is_superperiod and is_subperiod cannot handle higher frequencies than S (GH7760, GH7772, GH7803)
• Bug in 32-bit platforms with Series.shift (GH8129)
• Bug in PeriodIndex.unique returns int64 np.ndarray (GH7540)
• Bug in groupby.apply with a non-affecting mutation in the function (GH8467)
• Bug in DataFrame.reset_index which has MultiIndex contains PeriodIndex or DatetimeIndex with tz raises ValueError (GH7746, GH7793)
• Bug in DataFrame.plot with subplots=True may draw unnecessary minor xticks and yticks (GH7801)
• Bug in StataReader which did not read variable labels in 117 files due to difference between Stata documentation and implementation (GH7816)
• Bug in StataReader where strings were always converted to 244 characters-fixed width irrespective of underlying string size (GH7858)
• Bug in DataFrame.plot and Series.plot may ignore rot and fontsize keywords (GH7844)
• Bug in DatetimeIndex.value_counts doesn't preserve tz (GH7735)
• Bug in PeriodIndex.value_counts results in Int64Index (GH7735)
• Bug in `DataFrame.join` when doing left join on index and there are multiple matches (GH5391)

• Bug in `GroupBy.transform()` where int groups with a transform that didn’t preserve the index were incorrectly truncated (GH7972).

• Bug in groupby where callable objects without name attributes would take the wrong path, and produce a `DataFrame` instead of a `Series` (GH7929)

• Bug in groupby error message when a DataFrame grouping column is duplicated (GH7511)

• Bug in `read_html` where the `infer_types` argument forced coercion of date-likes incorrectly (GH7762, GH7032).

• Bug in `Series.str.cat` with an index which was filtered as to not include the first item (GH7857)

• Bug in `Timestamp` cannot parse `nanosecond` from string (GH7878)

• Bug in `Timestamp` with string offset and `tz` results incorrect (GH7833)

• Bug in `tslib.tz_convert` and `tslib.tz_convert_single` may return different results (GH7798)

• Bug in `DatetimeIndex.intersection` of non-overlapping timestamps with `tz` raises `IndexError` (GH7880)

• Bug in alignment with `TimeOps` and non-unique indexes (GH8363)

• Bug in `GroupBy.filter()` where fast path vs. slow path made the filter return a non scalar value that appeared valid but wasn’t (GH7870).

• Bug in `date_range()/DatetimeIndex()` when the timezone was inferred from input dates yet incorrect times were returned when crossing DST boundaries (GH7835, GH7901).

• Bug in `to_excel()` where a negative sign was being prepended to positive infinity and was absent for negative infinity (GH7949)

• Bug in area plot draws legend with incorrect `alpha` when `stacked=True` (GH8027)

• Period and `PeriodIndex` addition/subtraction with `np.timedelta64` results in incorrect internal representations (GH7740)

• Bug in `Holiday` with no offset or observance (GH7987)

• Bug in `DataFrame.to_latex` formatting when columns or index is a `MultiIndex` (GH7982).

• Bug in `DateOffset` around Daylight Savings Time produces unexpected results (GH5175).

• Bug in `DataFrame.shift` where empty columns would throw `ZeroDivisionError` on numpy 1.7 (GH8019)

• Bug in installation where `html_encoding/*.html` wasn’t installed and therefore some tests were not running correctly (GH7927).

• Bug in `read_html` where bytes objects were not tested for in `_read` (GH7927).

• Bug in `DataFrame.stack()` when one of the column levels was a datelike (GH8039)

• Bug in broadcasting numpy scalars with `DataFrame` (GH8116)

• Bug in `pivot_table` performed with nameless `index` and `columns` raises `KeyError` (GH8103)

• Bug in `DataFrame.plot(kind='scatter')` draws points and errorbars with different colors when the color is specified by `c` keyword (GH8081)

• Bug in `Float64Index` where `iat` and `at` were not testing and were failing (GH8092).

• Bug in `DataFrame.boxplot()` where `y-limits` were not set correctly when producing multiple axes (GH7528, GH5517).

• Bug in `read_csv` where line comments were not handled correctly given a custom line terminator or `delim_whitespace=True` (GH8122).
• Bug in `read_html` where empty tables caused a `StopIteration` (GH7575)
• Bug in casting when setting a column in a same-dtype block (GH7704)
• Bug in accessing groups from a `GroupBy` when the original grouper was a tuple (GH8121).
• Bug in `.at` that would accept integer indexers on a non-integer index and do fallback (GH7814)
• Bug with kde plot and NaNs (GH8182)
• Bug in `GroupBy.count` with float32 data type were nan values were not excluded (GH8169).
• Bug with stacked barplots and NaNs (GH8175).
• Bug in resample with non evenly divisible offsets (e.g. ‘7s’) (GH8371)
• Bug in interpolation methods with the `limit` keyword when no values needed interpolating (GH7173).
• Bug where `col_space` was ignored in `DataFrame.to_string()` when `header=False` (GH8230).
• Bug with `DatetimeIndex.asof` incorrectly matching partial strings and returning the wrong date (GH8245).
• Bug in plotting methods modifying the global matplotlib `rcParams` (GH8242).
• Bug in `DataFrame.__setitem__` that caused errors when setting a dataframe column to a sparse array (GH8131)
• Bug where `DataFrame.boxplot()` failed when entire column was empty (GH8181).
• Bug with messed variables in `radviz` visualization (GH8199).
• Bug in interpolation methods with the `limit` keyword when no values needed interpolating (GH7173).
• Bug where `col_space` was ignored in `DataFrame.to_string()` when `header=False` (GH8230).
• Bug in `to_clipboard` that would clip long column data (GH8305)
• Bug in `DataFrame` terminal display: Setting `max_column/max_rows` to zero did not trigger auto-resizing of dfs to fit terminal width/height (GH7180).
• Bug in OLS where running with “cluster” and “nw_lags” parameters did not work correctly, but also did not throw an error (GH5884).
• Bug in `DataFrame.dropna` that interpreted non-existent columns in the subset argument as the ‘last column’ (GH8303)
• Bug in `Index.intersection` on non-monotonic non-unique indexes (GH8362).
• Bug in masked series assignment where mismatching types would break alignment (GH8387)
• Bug in `NDFrame.equals` gives false negatives with `dtype=object` (GH8437)
• Bug in assignment with indexer where type diversity would break alignment (GH8258)
• Bug in `NDFrame.loc` indexing when row/column names were lost when target was a list/ndarray (GH6552)
• Regression in `NDFrame.loc` indexing when rows/columns were converted to Float64Index if target was an empty list/ndarray (GH7774)
• Bug in `Series` that allows it to be indexed by a `DataFrame` which has unexpected results. Such indexing is no longer permitted (GH8444)
• Bug in item assignment of a `DataFrame` with MultiIndex columns where right-hand-side columns were not aligned (GH7655)
• Suppress FutureWarning generated by NumPy when comparing object arrays containing NaN for equality (GH7065)
• Bug in `DataFrame.eval()` where the dtype of the `not` operator (~) was not correctly inferred as `bool`.

5.16 Version 0.14

5.16.1 Version 0.14.1 (July 11, 2014)

This is a minor release from 0.14.0 and includes a small number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

• Highlights include:
  – New methods select_dtypes() to select columns based on the dtype and sem() to calculate the standard error of the mean.
  – Support for dateutil timezones (see docs).
  – Support for ignoring full line comments in the read_csv() text parser.
  – New documentation section on Options and Settings.
  – Lots of bug fixes.

• Enhancements
• API Changes
• Performance Improvements
• Experimental Changes
• Bug Fixes
API changes

- Openpyxl now raises a ValueError on construction of the openpyxl writer instead of warning on pandas import (GH7284).
- For StringMethods.extract, when no match is found, the result - only containing NaN values - now also has dtypes=object instead of float (GH7242).
- Period objects no longer raise a TypeError when compared using == with another object that isn’t a Period. Instead when comparing a Period with another object using == if the other object isn’t a Period False is returned. (GH7376)
- Previously, the behaviour on resetting the time or not in offsets.apply, rollforward and rollback operations differed between offsets. With the support of the normalize keyword for all offsets(see below) with a default value of False (preserve time), the behaviour changed for certain offsets (BusinessMonthBegin, MonthEnd, BusinessMonthEnd, CustomBusinessMonthEnd, BusinessYearBegin, LastWeekOfMonth, FY5253Quarter, LastWeekOfMonth, Easter):

```python
In [6]: from pandas.tseries import offsets
In [7]: d = pd.Timestamp('2014-01-01 09:00')
# old behaviour < 0.14.1
In [8]: d + offsets.MonthEnd()
Out[8]: pd.Timestamp('2014-01-31 00:00:00')
```

Starting from 0.14.1 all offsets preserve time by default. The old behaviour can be obtained with normalize=True

```python
# new behaviour
In [1]: d + offsets.MonthEnd()
Out[1]: Timestamp('2014-01-31 09:00:00')
In [2]: d + offsets.MonthEnd(normalize=True)
Out[2]: Timestamp('2014-01-31 00:00:00')
```

Note that for the other offsets the default behaviour did not change.
- Add back #N/A N/A as a default NA value in text parsing. (regression from 0.12) (GH5521)
- Raise a TypeError on inplace-setting with a .where and a non np.nan value as this is inconsistent with a set-item expression like df[mask] = None (GH7656)

Enhancements

- Add dropna argument to value_counts and nunique (GH5569).
- Add select_dtypes() method to allow selection of columns based on dtype (GH7316). See the docs.
- All offsets supports the normalize keyword to specify whether offsets.apply, rollforward and rollback resets the time (hour, minute, etc) or not (default False, preserves time) (GH7156):

```python
import pandas.tseries.offsets as offsets
day = offsets.Day()
day.apply(pd.Timestamp("2014-01-01 09:00"))
```

(continues on next page)
day = offsets.Day(normalize=True)
day.apply(pd.Timestamp("2014-01-01 09:00"))

- PeriodIndex is represented as the same format as DatetimeIndex (GH7601)
- StringMethods now work on empty Series (GH7242)
- The file parsers read_csv and read_table now ignore line comments provided by the parameter comment, which accepts only a single character for the C reader. In particular, they allow for comments before file data begins (GH2685)
- Add NotImplementedException for simultaneous use of chunksize and nrows for read_csv() (GH6774).
- Tests for basic reading of public S3 buckets now exist (GH7281).
- read_html now sports an encoding argument that is passed to the underlying parser library. You can use this to read non-ascii encoded web pages (GH7323).
- read_excel now supports reading from URLs in the same way that read_csv does. (GH6809)
- Support for dateutil timezones, which can now be used in the same way as pytz timezones across pandas. (GH4688)

```
In [3]: rng = pd.date_range(
    ...: "3/6/2012 00:00", periods=10, freq="D", tz="dateutil/Europe/London"
    ...: )
    ...:

In [4]: rng.tz
Out[4]: tzfile('/usr/share/zoneinfo/Europe/London')
```

See the docs.
- Implemented sem (standard error of the mean) operation for Series, DataFrame, Panel, and Groupby (GH6897)
- Add nlargest and nsmallest to the Series groupby allowlist, which means you can now use these methods on a SeriesGroupBy object (GH7053).
- All offsets apply, rollforward and rollback can now handle np.datetime64, previously results in ApplyTypeError (GH7452)
- Period and PeriodIndex can contain NaT in its values (GH7485)
- Support pickling Series, DataFrame and Panel objects with non-unique labels along item axis (index, columns and items respectively) (GH7370).
- Improved inference of datetime/timedelta with mixed null objects. Regression from 0.13.1 in interpretation of an object Index with all null elements (GH7431)
Performance

- Improvements in dtype inference for numeric operations involving yielding performance gains for dtypes: int64, timedelta64, datetime64 (GH7223)
- Improvements in Series.transform for significant performance gains (GH6496)
- Improvements in DataFrame.transform with ufuncs and built-in grouper functions for significant performance gains (GH7383)
- Regression in groupby aggregation of datetime64 dtypes (GH7555)
- Improvements in MultiIndex.from_product for large iterables (GH7627)

Experimental

- pandas.io.data.Options has a new method, get_all_data method, and now consistently returns a Multi-Indexed DataFrame (GH5602)
- io.gbq.read_gbq and io.gbq.to_gbq were refactored to remove the dependency on the Google bq.py command line client. This submodule now uses httplib2 and the Google apiclient and oauth2client API client libraries which should be more stable and, therefore, reliable than bq.py. See the docs. (GH6937).

Bug fixes

- Bug in DataFrame.where with a symmetric shaped frame and a passed other of a DataFrame (GH7506)
- Bug in Panel indexing with a MultiIndex axis (GH7516)
- Regression in datetimelike slice indexing with a duplicated index and non-exact end-points (GH7523)
- Bug in setitem with list-of-lists and single vs mixed types (GH7551)
- Bug in time ops with non-aligned Series (GH7500)
- Bug in timedelta inference when assigning an incomplete Series (GH7592)
- Bug in groupby .nth with a Series and integer-like column name (GH7559)
- Bug in Series.get with a boolean accessor (GH7407)
- Bug in value_counts where NaT did not qualify as missing (NaN) (GH7423)
- Bug in to_timedelta that accepted invalid units and misinterpreted 'm/h' (GH7611, GH6423)
- Bug in line plot doesn't set correct xlim if secondary_y=True (GH7459)
- Bug in grouped hist and scatter plots use old figsize default (GH7394)
- Bug in plotting subplots with DataFrame.plot, hist clears passed ax even if the number of subplots is one (GH7391).
- Bug in plotting subplots with DataFrame.boxplot with by kw raises ValueError if the number of subplots exceeds 1 (GH7391).
- Bug in subplots displays ticklabels and labels in different rule (GH5897)
- Bug in Panel.apply with a MultiIndex as an axis (GH7469)
- Bug in DatetimeIndex.insert doesn't preserve name and tz (GH7299)
- Bug in DatetimeIndex.asobject doesn't preserve name (GH7299)
- Bug in MultiIndex slicing with datetimelike ranges (strings and Timestamps), (GH7429)
- Bug in Index.min and max doesn't handle nan and NaT properly (GH7261)
- Bug in PeriodIndex.min/max results in int (GH7609)
- Bug in resample where fill_method was ignored if you passed how (GH2073)
- Bug in TimeGrouper doesn't exclude column specified by key (GH7227)
- Bug in DataFrame and Series bar and barh plot raises TypeError when bottom and left keyword is specified (GH7226)
- Bug in DataFrame.hist raises TypeError when it contains non numeric column (GH7277)
- Bug in Index.delete does not preserve name and freq attributes (GH7302)
- Bug in DataFrame.query()/eval where local string variables with the @ sign were being treated as temporaries attempting to be deleted (GH7300).
- Bug in Float64Index which didn't allow duplicates (GH7149).
- Bug in DataFrame.replace() where truthy values were being replaced (GH7140).
- Bug in StringMethods.extract() where a single match group Series would use the matcher's name instead of the group name (GH7313).
- Bug in isnull() when mode.use_inf_as_null == True where isnull wouldn't test True when it encountered an inf/-inf (GH7315).
- Bug in inferred_freq results in None for eastern hemisphere timezones (GH7310)
- Bug in Easter returns incorrect date when offset is negative (GH7195)
- Bug in broadcasting with .div, integer dtypes and divide-by-zero (GH7325)
- Bug in CustomBusinessDay.apply raises NameError when np.datetime64 object is passed (GH7196)
- Bug in MultiIndex.append, concat and pivot_table don't preserve timezone (GH6606)
- Bug in .loc with a list of indexers on a single-multi index level (that is not nested) (GH7349)
- Bug in Series.map when mapping a dict with tuple keys of different lengths (GH7333)
- Bug all StringMethods now work on empty Series (GH7242)
- Fix delegation of read_sql to read_sql_query when query does not contain ‘select’ (GH7324).
- Bug where a string column name assignment to a DataFrame with a Float64Index raised a TypeError during a call to np.isnan (GH7366).
- Bug where NDFrame.replace() didn't correctly replace objects with Period values (GH7379).
- Bug in .ix getitem should always return a Series (GH7150)
- Bug in MultiIndex slicing with incomplete indexers (GH7399)
- Bug in MultiIndex slicing with a step in a sliced level (GH7400)
- Bug where negative indexers in DatetimeIndex were not correctly sliced (GH7408)
- Bug where NaT wasn't repr'd correctly in a MultiIndex (GH7406, GH7409).
- Bug where bool objects were converted to nan in convert_objects (GH7416).
- Bug in quantile ignoring the axis keyword argument (GH7306)
- Bug where nanops._maybe_null_out doesn’t work with complex numbers (GH7353)
- Bug in several nanops functions when axis==0 for 1-dimensional nan arrays (GH7354)
- Bug where nanops.nanmedian doesn't work when axis==None (GH7352)
• Bug where nanops._has_infs doesn’t work with many dtypes (GH7357)
• Bug in StataReader.data where reading a 0-observation dta failed (GH7369)
• Bug in StataReader when reading Stata 13 (117) files containing fixed width strings (GH7360)
• Bug in StataWriter where encoding was ignored (GH7286)
• Bug in DatetimeIndex comparison doesn’t handle NaT properly (GH7529)
• Bug in passing input with tzinfo to some offsets apply, rollforward or rollback resets tzinfo or raises ValueError (GH7465)
• Bug in DatetimeIndex.to_period, PeriodIndex.asobject, PeriodIndex.to_timestamp doesn’t preserve name (GH7485)
• Bug in DatetimeIndex.to_period and PeriodIndex.to_timestamp handle NaT incorrectly (GH7228)
• Bug in offsets.apply, rollforward and rollback may return normal datetime (GH7502)
• Bug in resample raises ValueError when target contains NaT (GH7227)
• Bug in Timestamp.tz_localize resets nanosecond info (GH7534)
• Bug in DatetimeIndex.asobject raises ValueError when it contains NaT (GH7539)
• Bug in Timestamp.__new__ doesn’t preserve nanosecond properly (GH7610)
• Bug in Index.astype(float) where it would return an object dtype Index (GH7464).
• Bug in DataFrame.reset_index loses tz (GH3950)
• Bug in DatetimeIndex.freqstr raises AttributeError when freq is None (GH7606)
• Bug in GroupBy.size created by TimeGrouper raises AttributeError (GH7453)
• Bug in single column bar plot is misaligned (GH7498).
• Bug in area plot with tz-aware time series raises ValueError (GH7471)
• Bug in non-monotonic Index.union may preserve name incorrectly (GH7458)
• Bug in DatetimeIndex.intersection doesn’t preserve timezone (GH4690)
• Bug in rolling_var where a window larger than the array would raise an error (GH7297)
• Bug with last plotted timeseries dictating xlim (GH2960)
• Bug with secondary_y axis not being considered for timeseries xlim (GH3490)
• Bug in Float64Index assignment with a non scalar indexer (GH7586)
• Bug in pandas.core.strings.str_contains does not properly match in a case insensitive fashion when regex=False and case=False (GH7505)
• Bug in expanding_cov, expanding_corr, rolling_cov, and rolling_corr for two arguments with mismatched index (GH7512)
• Bug in to_sql taking the boolean column as text column (GH7678)
• Bug in grouped hist doesn’t handle rot kw and sharex kw properly (GH7234)
• Bug in .loc performing fallback integer indexing with object dtype indices (GH7496)
• Bug (regression) in PeriodIndex constructor when passed Series objects (GH7701).

This is a major release from 0.13.1 and includes a small number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

- Highlights include:
  - Officially support Python 3.4
  - SQL interfaces updated to use sqlalchomy, See Here.
  - Display interface changes, See Here
  - MultiIndexing Using Slicers, See Here.
  - Ability to join a singly-indexed DataFrame with a MultiIndexed DataFrame, see Here
  - More consistency in groupby results and more flexible groupby specifications, See Here
  - Holiday calendars are now supported in CustomBusinessDay, see Here
  - Several improvements in plotting functions, including: hexbin, area and pie plots, see Here.
  - Performance doc section on I/O operations, See Here

- Other Enhancements
- API Changes
- Text Parsing API Changes
- Groupby API Changes
- Performance Improvements
- Prior Deprecations
- Deprecations
- Known Issues
- Bug Fixes
Warning: In 0.14.0 all NDFrame based containers have undergone significant internal refactoring. Before that each block of homogeneous data had its own labels and extra care was necessary to keep those in sync with the parent container’s labels. This should not have any visible user/API behavior changes (GH6745)

API changes

- `read_excel` uses 0 as the default sheet (GH6573)
- `iloc` will now accept out-of-bounds indexers for slices, e.g. a value that exceeds the length of the object being indexed. These will be excluded. This will make pandas conform more with python/numpy indexing of out-of-bounds values. A single indexer that is out-of-bounds and drops the dimensions of the object will still raise `IndexError` (GH6296, GH6299). This could result in an empty axis (e.g. an empty DataFrame being returned)

```python
In [1]: dfl = pd.DataFrame(np.random.randn(5, 2), columns=list('AB'))

In [2]: dfl
Out[2]:
   A    B
0  0.469112 -0.282863
1 -1.509059 -1.135632
2  1.212112 -0.173215
3  0.119209 -1.044236
4 -0.861849 -2.104569

[5 rows x 2 columns]

In [3]: dfl.iloc[:, 2:3]
Out[3]:
Empty DataFrame
Columns: []
Index: [0, 1, 2, 3, 4]

[5 rows x 0 columns]

In [4]: dfl.iloc[:, 1:3]
Out[4]:
   B
0  -0.282863
1  -1.135632
2  -0.173215
3  -1.044236
4  -2.104569

[5 rows x 1 columns]

In [5]: dfl.iloc[4:6]
Out[5]:
   A    B
4 -0.861849 -2.104569

[1 rows x 2 columns]
```

These are out-of-bounds selections
>>> df.iloc[[4, 5, 6]]
IndexError: positional indexers are out-of-bounds

>>> df.iloc[:, 4]
IndexError: single positional indexer is out-of-bounds

- Slicing with negative start, stop & step values handles corner cases better (GH6531):
  - df.iloc[:len(df)] is now empty
  - df.iloc[len(df)::1] now enumerates all elements in reverse

- The DataFrame.interpolate() keyword downcast default has been changed from infer to None. This is to preserve the original dtype unless explicitly requested otherwise (GH6290).

- When converting a dataframe to HTML it used to return Empty DataFrame. This special case has been removed, instead a header with the column names is returned (GH6062).

- Series and Index now internally share more common operations, e.g. factorize(),nunique(), value_counts() are now supported on Index types as well. The Series.weekday property from is removed from Series for API consistency. Using a DatetimeIndex/PeriodIndex method on a Series will now raise a TypeError. (GH4551, GH4056, GH5519, GH6380, GH7206).

- Add is_month_start, is_month_end, is_quarter_start, is_quarter_end, is_year_start, is_year_end accessor for DatetimeIndex / Timestamp which return a boolean array of whether the timestamp(s) are at the start/end of the month/quarter/year defined by the frequency of the DatetimeIndex / Timestamp (GH4565, GH6998)

- Local variable usage has changed in pandas.eval()/DataFrame.eval()/DataFrame.query() (GH5987). For the DataFrame methods, two things have changed
  - Column names are now given precedence over locals
  - Local variables must be referred to explicitly. This means that even if you have a local variable that is not a column you must still refer to it with the '@' prefix.
  - You can have an expression like df.query('a < @a') with no complaints from pandas about ambiguity of the name a.
  - The top-level pandas.eval() function does not allow you use the '@' prefix and provides you with an error message telling you so.
  - NameResolutionError was removed because it isn’t necessary anymore.

- Define and document the order of column vs index names in query/eval (GH6676)

- concat will now concatenate mixed Series and DataFrames using the Series name or numbering columns as needed (GH2385). See the docs

- Slicing and advanced/boolean indexing operations on Index classes as well as Index.delete() and Index.drop() methods will no longer change the type of the resulting index (GH6440, GH7040)

```python
In [7]: i = pd.Index([1, 2, 3, 'a', 'b', 'c'])

In [7]: i[[0, 1, 2]]
Out[7]: Index([1, 2, 3], dtype='object')

In [8]: i.drop(['a', 'b', 'c'])
Out[8]: Index([1, 2, 3], dtype='object')
```
Previously, the above operation would return Int64Index. If you’d like to do this manually, use `Index.astype()`

```python
In [9]: i[[0, 1, 2]].astype(np.int_)
Out[9]: Int64Index([1, 2, 3], dtype='int64')
```

• `set_index` no longer converts MultiIndexes to an Index of tuples. For example, the old behavior returned an Index in this case (GH6459):

```python
# Old behavior, casted MultiIndex to an Index
In [10]: tuple_ind
Out[10]: Index([('a', 'c'), ('a', 'd'), ('b', 'c'), ('b', 'd')], dtype='object')

In [11]: df_multi.set_index(tuple_ind)
Out[11]:
   0  1
(a, c) 0.471435 -1.190976
(a, d) 1.432707 -0.312652
(b, c) -0.720589  0.887163
(b, d)  0.859588 -0.636524

[4 rows x 2 columns]

# New behavior
In [12]: mi
Out[12]: MultiIndex([('a', 'c'),
                     ('a', 'd'),
                     ('b', 'c'),
                     ('b', 'd')],
                   )

In [13]: df_multi.set_index(mi)
Out[13]:
   0    1
a c  0.471435 -1.190976
d  1.432707 -0.312652
b c -0.720589  0.887163
d  0.859588 -0.636524

[4 rows x 2 columns]
```

This also applies when passing multiple indices to `set_index`:

```python
# Old output, 2-level MultiIndex of tuples
In [14]: df_multi.set_index([df_multi.index, df_multi.index])
Out[14]:
   0    1
(a, c) (a, c)  0.471435 -1.190976
(a, d) (a, d)  1.432707 -0.312652
(b, c) (b, c) -0.720589  0.887163
(b, d) (b, d)  0.859588 -0.636524

[4 rows x 2 columns]
```
# New output, 4-level MultiIndex

```
In [15]: df_multi.set_index([df_multi.index, df_multi.index])
Out[15]:
          0      1
a c a 0.471435 -1.190976
  d a  1.432707 -0.312652
b c b -0.720589  0.887163
d b d  0.859588 -0.636524
```

- `pairwise` keyword was added to the statistical moment functions `rolling_cov`, `rolling_corr`, `ewmcov`, `ewmcorr`, `expanding_cov`, `expanding_corr` to allow the calculation of moving window covariance and correlation matrices (GH4950). See *Computing rolling pairwise covariances and correlations* in the docs.

```
In [1]: df = pd.DataFrame(np.random.randn(10, 4), columns=list('ABCD'))
In [4]: covs = pd.rolling_cov(df[['A', 'B', 'C']],
                          df[['B', 'C', 'D']],
                          5,
                          pairwise=True)
In [5]: covs[df.index[-1]]
Out[5]:
       B         C         D
    A  0.035310  0.326593 -0.505430
    B  0.137748 -0.006888 -0.005383
    C -0.006888  0.861040  0.020762
```

- `Series.iteritems()` is now lazy (returns an iterator rather than a list). This was the documented behavior prior to 0.14. (GH6760)
- Added `nunique` and `value_counts` functions to `Index` for counting unique elements. (GH6734)
- `stack` and `unstack` now raise a `ValueError` when the `level` keyword refers to a non-unique item in the `Index` (previously raised a `KeyError`). (GH6738)
- drop unused order argument from `Series.sort`; args now are in the same order as `Series.order`; add `na_position` arg to conform to `Series.order` (GH6847)
- default sorting algorithm for `Series.order` is now quicksort, to conform with `Series.sort` (and numpy defaults)
- add `inplace` keyword to `Series.order/sort` to make them inverses (GH6859)
- `Dataframe.sort` now places NaNs at the beginning or end of the sort according to the `na_position` parameter. (GH3917)
- accept `TextFileReader` in `concat`, which was affecting a common user idiom (GH6583), this was a regression from 0.13.1
- Added `factorize` functions to `Index` and `Series` to get indexer and unique values (GH7090)
- `describe` on a `Dataframe` with a mix of `Timestamp` and string like objects returns a different `Index` (GH7088). Previously the index was unintentionally sorted.
• Arithmetic operations with only bool dtypes now give a warning indicating that they are evaluated in Python space for +, -, and * operations and raise for all others (GH7011, GH7672, GH7015, GH7210)

```python
>>> x = pd.Series(np.random.rand(10) > 0.5)
>>> y = True
>>> x + y  # warning generated: should do x | y instead
UserWarning: evaluating in Python space because the '+' operator is not supported by numexpr for the bool dtype, use '|' instead
>>> x / y  # this raises because it doesn't make sense
NotImplementedError: operator '/' not implemented for bool dtypes
```

• In HDFStore, select_as_multiple will always raise a KeyError, when a key or the selector is not found (GH6177)
• df['col'] = value and df.loc[:, 'col'] = value are now completely equivalent; previously the .loc would not necessarily coerce the dtype of the resultant series (GH6149)
• dtypes and ftypes now return a series with dtype=object on empty containers (GH5740)
• df.to_csv will now return a string of the CSV data if neither a target path nor a buffer is provided (GH6061)
• pd.infer_freq() will now raise a TypeError if given an invalid Series/Index type (GH6407, GH6463)
• A tuple passed to DataFrame.sort_index will be interpreted as the levels of the index, rather than requiring a list of tuple (GH4370)
• all offset operations now return Timestamp types (rather than datetime), Business/Week frequencies were incorrect (GH4069)
• to_excel now converts np.inf into a string representation, customizable by the inf_rep keyword argument (Excel has no native inf representation) (GH6782)
• Replace pandas.compat.scipy.scoreatpercentile with numpy.percentile (GH6810)
• .quantile on a datetime[ns] series now returns Timestamp instead of np.datetime64 objects (GH6810)
• change AssertionError to TypeError for invalid types passed to concat (GH6583)
• Raise a TypeError when DataFrame is passed an iterator as the data argument (GH5357)

Display changes

• The default way of printing large DataFrames has changed. DataFrames exceeding max_rows and/or max_columns are now displayed in a centrally truncated view, consistent with the printing of a pandas.Series (GH5603).

In previous versions, a DataFrame was truncated once the dimension constraints were reached and an ellipse (...) signaled that part of the data was cut off.
In [1]: import pandas as pd
In [2]: import numpy as np
In [3]: pd.options.display.max_rows = 6
In [4]: pd.options.display.max_columns = 6
In [5]: index = pd.DatetimeIndex(start='2001-01-01',freq='D',periods=10)
In [6]: pd.DataFrame(np.arange(10*10).reshape((10,10)),index=index)
Out[6]:
          0  1  2  3  4  5
2001-01-01 0  1  2  3  4  5 ...  
2001-01-02 10 11 12 13 14 15 ...  
2001-01-03 20 21 22 23 24 25 ...  
2001-01-04 30 31 32 33 34 35 ...  
2001-01-05 40 41 42 43 44 45 ...  
2001-01-06 50 51 52 53 54 55 ...  
          ... ... ... ... ...
[10 rows x 10 columns]

In the current version, large DataFrames are centrally truncated, showing a preview of head and tail in both dimensions.

In [24]: pd.DataFrame(np.arange(10*10).reshape((10,10)),index=index)
Out[24]:
          0  1  2  3  4  5
2001-01-01 0  1  2  3  4  5 ...  
2001-01-02 10 11 12 13 14 15 ...  
2001-01-03 20 21 22 23 24 25 ...  
2001-01-04 30 31 32 33 34 35 ...  
2001-01-05 40 41 42 43 44 45 ...  
2001-01-06 50 51 52 53 54 55 ...  
          ... ... ... ... ...
2001-01-08 70 71 72 73 74 75 ...  
2001-01-09 80 81 82 83 84 85 ...  
2001-01-10 90 91 92 93 94 95 ...  
[10 rows x 10 columns]

• allow option 'truncate' for display.show_dimensions to only show the dimensions if the frame is truncated (GH6547).

The default for display.show_dimensions will now be truncate. This is consistent with how Series display length.
Regression in the display of a MultiIndexed Series with `display.max_rows` is less than the length of the series (GH7101)

Fixed a bug in the HTML repr of a truncated Series or DataFrame not showing the class name with the `large_repr` set to ‘info’ (GH7105)

The `verbose` keyword in `DataFrame.info()`, which controls whether to shorten the info representation, is now `None` by default. This will follow the global setting in `display.max_info_columns`. The global setting can be overridden with `verbose=True` or `verbose=False`.

Fixed a bug with the `info` repr not honoring the `display.max_info_columns` setting (GH6939)

Offset/freq info now in Timestamp __repr__ (GH4553)

**Text parsing API changes**

`read_csv()`/`read_table()` will now be noisier w.r.t invalid options rather than falling back to the PythonParser.

- Raise `ValueError` when `sep` specified with `delim_whitespace=True` in `read_csv()`/`read_table()` (GH6607)
- Raise `ValueError` when `engine='c'` specified with unsupported options in `read_csv()`/`read_table()` (GH6607)
- Raise `ValueError` when fallback to python parser causes options to be ignored (GH6607)
- Produce `ParserWarning` on fallback to python parser when no options are ignored (GH6607)
- Translate `sep='\s+'` to `delim_whitespace=True` in `read_csv()`/`read_table()` if no other C-unsupported options specified (GH6607)
GroupBy API changes

More consistent behavior for some groupby methods:

- groupby head and tail now act more like filter rather than an aggregation:

```python
In [19]: df = pd.DataFrame([[1, 2], [1, 4], [5, 6]], columns=['A', 'B'])
In [20]: g = df.groupby('A')
In [21]: g.head(1)  # filters DataFrame
Out[21]:
     A  B
0   1  2
2   5  6
[2 rows x 2 columns]

In [22]: g.apply(lambda x: x.head(1))  # used to simply fall-through
Out[22]:
     A  B
A   1  1  2
5   5  6
[2 rows x 2 columns]
```

- groupby head and tail respect column selection:

```python
In [23]: g[['B']].head(1)
Out[23]:
     B
0   2
2   6
[2 rows x 1 columns]
```

- groupby nth now reduces by default; filtering can be achieved by passing as_index=False. With an optional dropna argument to ignore NaN. See the docs.

Reducing

```python
In [24]: df = pd.DataFrame([[1, np.nan], [1, 4], [5, 6]], columns=['A', 'B'])
In [25]: g = df.groupby('A')
In [26]: g.nth(0)
Out[26]:
     A  B
A  1  NaN
5  6.0
[2 rows x 1 columns]
```
# this is equivalent to g.first()
In [27]: g.nth(0, dropna='any')

Out[27]:
   A  B
0  1  4.0
5  6.0

[2 rows x 1 columns]

# this is equivalent to g.last()
In [28]: g.nth(-1, dropna='any')

Out[28]:
   A  B
0  1  4.0
5  6.0

[2 rows x 1 columns]

Filtering

In [29]: gf = df.groupby('A', as_index=False)

In [30]: gf.nth(0)

Out[30]:
   A  B
0 A  1  NaN
5 A  5  6.0

[2 rows x 2 columns]

In [31]: gf.nth(0, dropna='any')

Out[31]:
   A  B
0 A  1  4.0
5 A  5  6.0

[2 rows x 2 columns]

• groupby will now not return the grouped column for non-cython functions (GH5610, GH5614, GH6732), as its already the index

In [32]: df = pd.DataFrame([[1, np.nan], [1, 4], [5, 6], [5, 8]], columns=['A', 'B'])

In [33]: g = df.groupby('A')

In [34]: g.count()

Out[34]:
   B
0 A
1 A
5 B

(continues on next page)
A
1 1
5 2
[2 rows x 1 columns]

In [35]: g.describe()
Out[35]:

      B
   count mean std  min 25% 50% 75%  max
A
1   1.0  4.0  NaN  4.0  4.0  4.0  4.0
5   2.0  7.0  1.414214 6.0  6.5  7.0  7.5  8.0
[2 rows x 8 columns]

• passing as_index will leave the grouped column in-place (this is not change in 0.14.0)

In [36]: df = pd.DataFrame([[1, np.nan], [1, 4], [5, 6], [5, 8]], columns=['A', 'B'])
In [37]: g = df.groupby('A', as_index=False)

In [38]: g.count()
Out[38]:

      A  B
0     1  1
1     5  2
[2 rows x 2 columns]

In [39]: g.describe()
Out[39]:

      A  B
   count mean std  min 25% 50% 75%  max count mean std  min 25% 50% 75%  max
0     2.0  1.0  0.0  1.0  1.0  1.0  1.0  4.0 NaN  4.0  4.0  4.0  4.0  4.0
1     2.0  5.0  0.0  5.0  5.0  5.0  5.0  2.0  7.0  1.414214 6.0  6.5  7.0  7.5  8.0
[2 rows x 16 columns]

• Allow specification of a more complex groupby via pd.Grouper, such as grouping by a Time and a string field simultaneously. See the docs. (GH3794)

• Better propagation/preservation of Series names when performing groupby operations:
  – SeriesGroupBy.agg will ensure that the name attribute of the original series is propagated to the result (GH6265).
  – If the function provided to GroupBy.apply returns a named series, the name of the series will be kept as the name of the column index of the DataFrame returned by GroupBy.apply (GH6124). This facilitates
DataFrame.stack operations where the name of the column index is used as the name of the inserted column containing the pivoted data.

**SQL**

The SQL reading and writing functions now support more database flavors through SQLAlchemy (GH2717, GH4163, GH5950, GH6292). All databases supported by SQLAlchemy can be used, such as PostgreSQL, MySQL, Oracle, Microsoft SQL server (see documentation of SQLAlchemy on included dialects).

The functionality of providing DBAPI connection objects will only be supported for sqlite3 in the future. The 'mysql' flavor is deprecated.

The new functions read_sql_query() and read_sql_table() are introduced. The function read_sql() is kept as a convenience wrapper around the other two and will delegate to specific function depending on the provided input (database table name or sql query).

In practice, you have to provide a SQLAlchemy engine to the sql functions. To connect with SQLAlchemy you use the create_engine() function to create an engine object from database URI. You only need to create the engine once per database you are connecting to. For an in-memory sqlite database:

```python
In [40]: from sqlalchemy import create_engine

# Create your connection.
In [41]: engine = create_engine('sqlite:///memory:')
```

This engine can then be used to write or read data to/from this database:

```python
In [42]: df = pd.DataFrame({
'A': [1, 2, 3],
'B': ['a', 'b', 'c']})
In [43]: df.to_sql('db_table', engine, index=False)
```

You can read data from a database by specifying the table name:

```python
In [44]: pd.read_sql_table('db_table', engine)
Out[44]:
   A  B
0  1  a
1  2  b
2  3  c

[3 rows x 2 columns]
```

or by specifying a sql query:

```python
In [45]: pd.read_sql_query('SELECT * FROM db_table', engine)
Out[45]:
   A  B
0  1  a
1  2  b
2  3  c

[3 rows x 2 columns]
```

Some other enhancements to the sql functions include:

- support for writing the index. This can be controlled with the index keyword (default is True).
• specify the column label to use when writing the index with `index_label`.

• specify string columns to parse as datetimes with the `parse_dates` keyword in `read_sql_query()` and `read_sql_table()`.

**Warning:** Some of the existing functions or function aliases have been deprecated and will be removed in future versions. This includes: `tquery`, `uquery`, `read_frame`, `frame_query`, `write_frame`.

**Warning:** The support for the `mysql` flavor when using DBAPI connection objects has been deprecated. MySQL will be further supported with SQLAlchemy engines (GH6900).

**Multi-indexing using slicers**

In 0.14.0 we added a new way to slice MultiIndexed objects. You can slice a MultiIndex by providing multiple indexers. You can provide any of the selectors as if you are indexing by label, see *Selection by Label*, including slices, lists of labels, labels, and boolean indexers.

You can use `slice(None)` to select all the contents of that level. You do not need to specify all the deeper levels, they will be implied as `slice(None)`.

As usual, **both sides** of the slicers are included as this is label indexing.

See the docs See also issues (GH6134, GH4036, GH3057, GH2598, GH5641, GH7106)

**Warning:**

You should specify all axes in the `.loc` specifier, meaning the indexer for the `index` and for the `columns`. Their are some ambiguous cases where the passed indexer could be mis-interpreted as indexing both axes, rather than into say the MultiIndex for the rows.

You should do this:

```python
>>> df.loc[(slice('A1', 'A3'), ...), :]  # noqa: E901
```

rather than this:

```python
>>> df.loc[(slice('A1', 'A3'), ...)]  # noqa: E901
```

**Warning:** You will need to make sure that the selection axes are fully lexsorted!

```python
In [46]: def mklbl(prefix, n):
....:     return ["%s%s" % (prefix, i) for i in range(n)]
....:

In [47]: index = pd.MultiIndex.from_product([mklbl('A', 4),
....:     mklbl('B', 2),
....:     mklbl('C', 4),
....:     mklbl('D', 2)])
```
In [48]: columns = pd.MultiIndex.from_tuples([('a', 'foo'), ('a', 'bar'), ('b', 'foo'), ('b', 'bah')], names=['lvl0', 'lvl1'])

In [49]: df = pd.DataFrame(np.arange(len(index) * len(columns)).reshape((len(index), len(columns))), index=index, columns=columns).sort_index().sort_index(axis=1)

In [50]: df
Out[50]:
   lvl0  a  b
  lvl1  bar  foo  bah  foo
A0  B0  C0  D0  1  0  3  2
   D1  5  4  7  6
C1  D0  9  8  11 10
   D1 13 12 15 14
C2  D0 17 16 19 18
... ... ... ... ...
A3  B1  C1  D1 237 236 239 238
   B1  C1  D0 241 240 243 242
   D1 245 244 247 246
C3  D0 249 248 251 250
   D1 253 252 255 254
[64 rows x 4 columns]

Basic MultiIndex slicing using slices, lists, and labels.

In [51]: df.loc[(slice('A1', 'A3'), slice(None), ['C1', 'C3'])]
Out[51]:
   lvl0  a  b
  lvl1  bar  foo  bah  foo
A1  B0  C1  D0  73  72  75  74
   D1  77  76  79  78
C3  D0  89  88  91  90
   D1  93  92  95  94
B1  C1  D0 105 104 107 106
... ... ... ... ...
A3  B0  C3  D1 221 220 223 222
B1  C1  D0 233 232 235 234
   D1 237 236 239 238
C3  D0 249 248 251 250
   D1 253 252 255 254
[24 rows x 4 columns]

You can use a pd.IndexSlice to shortcut the creation of these slices
In [52]: idx = pd.IndexSlice

In [53]: df.loc[idx[:, :, ['C1', 'C3']], idx[:, 'foo']]

Out[53]:
lvl0  a  b
lvl1   foo
A0 B0 C1 D0  8  10
  D1  12  14
  C3 D0  24  26
  D1  28  30
B1 C1 D0  40  42
... ... ...
A3 B0 C3 D1 220 222
B1 C1 D0 232 234
  D1  236 238
  C3 D0  248 250
  D1  252 254
[32 rows x 2 columns]

It is possible to perform quite complicated selections using this method on multiple axes at the same time.

In [54]: df.loc['A1', (slice(None), 'foo')]

Out[54]:
lvl0  a  b
lvl1   foo
B0 C0 D0  64  66
  D1  68  70
  C1 D0  72  74
  D1  76  78
C2 D0  80  82
... ... ...
B1 C1 D1  108 110
C2 D0  112 114
  D1  116 118
  C3 D0  120 122
  D1  124 126
[16 rows x 2 columns]

In [55]: df.loc[idx[:, :, ['C1', 'C3']], idx[:, 'foo']]

Out[55]:
lvl0  a  b
lvl1   foo
A0 B0 C1 D0  8  10
  D1  12  14
  C3 D0  24  26
  D1  28  30
B1 C1 D0  40  42
... ... ...
A3 B0 C3 D1 220 222
B1 C1 D0 232 234
  D1  236 238
 ... (continues on next page)
Using a boolean indexer you can provide selection related to the values.

```python
In [56]: mask = df[('a', 'foo')] > 200
In [57]: df.loc[idx[mask, :, ['C1', 'C3']], idx[:, 'foo']]
Out[57]:
    a    b
lvc0 C3 D0 204 206
lvc1 D1 220 222
lvc2 B1 C1 D0 232 234
    D1 236 238
    C3 D0 248 250
    D1 252 254
```

You can also specify the axis argument to `loc` to interpret the passed slicers on a single axis.

```python
In [58]: df.loc(axis=0)[:, :, ['C1', 'C3']]
Out[58]:
    a    b
lvc0 C3 D0 204 206
lvc1 B1 C1 D0 232 234
    D1 236 238
    C3 D0 248 250
    D1 252 254
```

Furthermore you can set the values using these methods

```python
In [59]: df2 = df.copy()
In [60]: df2.loc(axis=0)[:, :, ['C1', 'C3']] = -10
In [61]: df2
Out[61]:
    a    b
lvc0 B0 C1 D0  9   8  11  10
lvc1 D1  13  12  15  14
lvc2 C3 D0  25  24  27  26
    D1  29  28  31  30
lvc3 B1 C1 D0  41  40  43  42
    D1  45  44  47  46
... ... ... ... ...
```

(continues on next page)
A0 B0 C0 D0 1 0 3 2
    D1  5  4  7  6
C1 D0 -10 -10 -10 -10
    D1 -10 -10 -10 -10
C2 D0  17  16  19  18
... ... ... ... ...
A3 B1 C1 D1 -10 -10 -10 -10
C2 D0 241 240 243 242
    D1 245 244 247 246
C3 D0 -10 -10 -10 -10
    D1 -10 -10 -10 -10
[64 rows x 4 columns]

You can use a right-hand-side of an alignable object as well.

```
In [62]: df2 = df.copy()
In [63]: df2.loc[idx[:, :, ['C1', 'C3']], :] = df2 * 1000
In [64]: df2
```

```
Out[64]:
   A0  B0  C0  D0
lvl0
lvl1  bar  foo  bah  foo
A0  B0  C0  D0  1  0  3  2
    D1  5  4  7  6
C1  D0  9000  8000 11000 10000
    D1 13000 12000 15000 14000
C2  D0  17  16  19  18
... ... ... ... ...
A3  B1  C1  D1 237000 236000 239000 238000
C2  D0 241 240 243 242
    D1 245 244 247 246
C3  D0 249000 248000 251000 250000
    D1 253000 252000 255000 254000
[64 rows x 4 columns]
```

### Plotting

- Hexagonal bin plots from `DataFrame.plot` with `kind='hexbin'` (GH5478), See the docs.
- `DataFrame.plot` and `Series.plot` now supports area plot with specifying `kind='area'` (GH6656), See the docs
- Pie plots from `Series.plot` and `DataFrame.plot` with `kind='pie'` (GH6976), See the docs.
- Plotting with Error Bars is now supported in the .plot method of `DataFrame` and `Series` objects (GH3796, GH6834), See the docs.
- `DataFrame.plot` and `Series.plot` now support a table keyword for plotting `matplotlib.Table`, See the docs. The table keyword can receive the following values.
  - False: Do nothing (default).
- True: Draw a table using the DataFrame or Series called plot method. Data will be transposed to meet matplotlib's default layout.
- DataFrame or Series: Draw matplotlib.table using the passed data. The data will be drawn as displayed in print method (not transposed automatically). Also, helper function pandas.tools.plotting.table is added to create a table from DataFrame and Series, and add it to an matplotlib.Axes.

- plot(legend='reverse') will now reverse the order of legend labels for most plot kinds. (GH6014)
- Line plot and area plot can be stacked by stacked=True (GH6656)
- Following keywords are now acceptable for DataFrame.plot() with kind='bar' and kind='barh':
  - width: Specify the bar width. In previous versions, static value 0.5 was passed to matplotlib and it cannot be overwritten. (GH6604)
  - align: Specify the bar alignment. Default is center (different from matplotlib). In previous versions, pandas passes align='edge' to matplotlib and adjust the location to center by itself, and it results align keyword is not applied as expected. (GH4525)
  - position: Specify relative alignments for bar plot layout. From 0 (left/bottom-end) to 1(right/top-end). Default is 0.5 (center). (GH6604)

  Because of the default align value changes, coordinates of bar plots are now located on integer values (0.0, 1.0, 2.0 ...). This is intended to make bar plot be located on the same coordinates as line plot. However, bar plot may differs unexpectedly when you manually adjust the bar location or drawing area, such as using set_xlim, set_ylim, etc. In this cases, please modify your plot to meet with new coordinates.

- The parallel_coordinates() function now takes argument color instead of colors. A FutureWarning is raised to alert that the old colors argument will not be supported in a future release. (GH6956)
- The parallel_coordinates() and andrews_curves() functions now take positional argument frame instead of data. A FutureWarning is raised if the old data argument is used by name. (GH6956)
- DataFrame.boxplot() now supports layout keyword (GH6769)
- DataFrame.boxplot() has a new keyword argument, return_type. It accepts 'dict', 'axes', or 'both', in which case a namedtuple with the matplotlib axes and a dict of matplotlib Lines is returned.

Prior version deprecations/changes

There are prior version deprecations that are taking effect as of 0.14.0.

- Remove DateRange in favor of DatetimeIndex (GH6816)
- Remove column keyword from DataFrame.sort (GH4370)
- Remove precision keyword from set_eng_float_format() (GH395)
- Remove force_unicode keyword from DataFrame.to_string(), DataFrame.to_latex(), and DataFrame.to_html(); these function encode in unicode by default (GH2224, GH2225)
- Remove nanRep keyword from DataFrame.to_csv() and DataFrame.to_string() (GH275)
- Remove unique keyword from HDFStore.select_column() (GH3256)
- Remove inferTimeRule keyword from Timestamp.offset() (GH391)
- Remove name keyword from get_data_yahoo() and get_data_google() (commit b921d1a)
- Remove offset keyword from DatetimeIndex constructor (commit 3136390)
- Remove time_rule from several rolling-moment statistical functions, such as rolling_sum() (GH1042)
• Removed neg - boolean operations on numpy arrays in favor of inv ~, as this is going to be deprecated in numpy 1.9 (GH6960)

Deprecations

• The \texttt{pivot_table()}/\texttt{DataFrame.pivot_table()} and \texttt{crosstab()} functions now take arguments \texttt{index} and \texttt{columns} instead of \texttt{rows} and \texttt{cols}. A \texttt{FutureWarning} is raised to alert that the old \texttt{rows} and \texttt{cols} arguments will not be supported in a future release (GH5505)

• The \texttt{DataFrame.drop_duplicates()} and \texttt{DataFrame.duplicated()} methods now take argument \texttt{subset} instead of \texttt{cols} to better align with \texttt{DataFrame.dropna()}. A \texttt{FutureWarning} is raised to alert that the old \texttt{cols} arguments will not be supported in a future release (GH6680)

• The \texttt{DataFrame.to_csv()} and \texttt{DataFrame.to_excel()} functions now takes argument \texttt{columns} instead of \texttt{cols}. A \texttt{FutureWarning} is raised to alert that the old \texttt{cols} arguments will not be supported in a future release (GH6645)

• Indexers will warn \texttt{FutureWarning} when used with a scalar indexer and a non-floating point Index (GH4892, GH6960)

```python
# non-floating point indexes can only be indexed by integers / labels
In [1]: pd.Series(1, np.arange(5))[3.0]
   pandas/core/index.py:469: FutureWarning: scalar indexers for index type _Int64Index should be integers and not floating point
Out[1]: 1

In [2]: pd.Series(1, np.arange(5)).iloc[3.0]
   pandas/core/index.py:469: FutureWarning: scalar indexers for index type _Int64Index should be integers and not floating point
Out[2]: 1

In [3]: pd.Series(1, np.arange(5)).iloc[3.0:4]
   pandas/core/index.py:527: FutureWarning: slice indexers when using iloc should be integers and not floating point
Out[3]:
   3  1
   dtype: int64

# these are Float64Indexes, so integer or floating point is acceptable
In [4]: pd.Series(1, np.arange(5.))[3]
Out[4]: 1

In [5]: pd.Series(1, np.arange(5.))[3.0]
Out[6]: 1
```

• Numpy 1.9 compat w.r.t. deprecation warnings (GH6960)

• \texttt{Panel.shift()} now has a function signature that matches \texttt{DataFrame.shift()}. The old positional argument \texttt{lags} has been changed to a keyword argument \texttt{periods} with a default value of 1. A \texttt{FutureWarning} is raised if the old argument \texttt{lags} is used by name. (GH6910)

• The \texttt{order} keyword argument of \texttt{factorize()} will be removed. (GH6926).

• Remove the \texttt{copy} keyword from \texttt{DataFrame.xs()}, \texttt{Panel.major_xs()}, \texttt{Panel.minor_xs()}. A view will be returned if possible, otherwise a copy will be made. Previously the user could think that \texttt{copy=False} would ALWAYS return a view. (GH6894)
• The `parallel_coordinates()` function now takes argument `color` instead of `colors`. A `FutureWarning` is raised to alert that the old `colors` argument will not be supported in a future release. (GH6956)

• The `parallel_coordinates()` and `andrews_curves()` functions now take positional argument `frame` instead of `data`. A `FutureWarning` is raised if the old `data` argument is used by name. (GH6956)

• The support for the 'mysql' flavor when using DBAPI connection objects has been deprecated. MySQL will be further supported with SQLAlchemy engines (GH6900).

• The following `io.sql` functions have been deprecated: `tquery`, `uquery`, `read_frame`, `frame_query`, `write_frame`.

• The `percentile_width` keyword argument in `describe()` has been deprecated. Use the `percentiles` keyword instead, which takes a list of percentiles to display. The default output is unchanged.

• The default return type of `boxplot()` will change from a dict to a matplotlib Axes in a future release. You can use the future behavior now by passing `return_type='axes'` to `boxplot`.

**Known issues**

• OpenPyXL 2.0.0 breaks backwards compatibility (GH7169)

**Enhancements**

• DataFrame and Series will create a MultiIndex object if passed a tuples dict, See the docs (GH3323)

```
In [65]: pd.Series({('a', 'b'): 1, ('a', 'a'): 0,
                ....:     ('a', 'c'): 2, ('b', 'a'): 3, ('b', 'b'): 4})
Out[65]:
   a  b
---
   a  1
   c  2
   b  a  3
   b  4
Length: 5, dtype: int64

In [66]: pd.DataFrame({('a', 'b'): {('A', 'B'): 1, ('A', 'C'): 2},
                   ....:     ('a', 'a'): {('A', 'B'): 3, ('A', 'C'): 4},

  C  2.0 3.0 6.0 7.0 NaN
  D NaN NaN NaN NaN  9.0
[3 rows x 5 columns]
```

• Added the `sym_diff` method to `Index` (GH5543)

• `DataFrame.to_latex` now takes a longtable keyword, which if True will return a table in a longtable environment. (GH6617)

5.16. Version 0.14 3463
- Add option to turn off escaping in DataFrame.to_latex (GH6472)

- `pd.read_clipboard` will, if the keyword `sep` is unspecified, try to detect data copied from a spreadsheet and parse accordingly. (GH6223)

- Joining a singly-indexed DataFrame with a MultiIndexed DataFrame (GH3662)

See the docs. Joining MultiIndex DataFrames on both the left and right is not yet supported ATM.

```python
In [67]: household = pd.DataFrame({'household_id': [1, 2, 3],
                               'male': [0, 1, 0],
                               'wealth': [196087.3, 316478.7, 294750],
                               },
                               columns=['household_id', 'male', 'wealth'])

   household_id    male    wealth
  1           1.00  196087.3
  2            1.00  316478.7
  3            1.00  294750.0

[3 rows x 2 columns]

In [68]: household

Out[68]:

   male  wealth
  household_id
1     0.00  196087.3
2     1.00  316478.7
3     0.00  294750.0

In [69]: portfolio = pd.DataFrame({'household_id': [1, 2, 2, 3, 3, 3, 4],
                               'asset_id': ['nl0000301109',
                               'nl0000289783',
                               'gb00b03mlx29',
                               'gb00b03mlx29',
                               'lu0197800237',
                               'nl0000289965',
                               np.nan],
                               'name': ['ABN Amro',
                               'Robeco',
                               'Royal Dutch Shell',
                               'Royal Dutch Shell',
                               'AAB Eastern Europe Equity Fund',
                               'Postbank BioTech Fonds',
                               np.nan],
                               'share': [1.0, 0.4, 0.6, 0.15, 0.6, 0.25, 1.0],
                               },
                               columns=['household_id', 'asset_id', 'name',
                               'share'])

   household_id  asset_id          name   share
  1           1.00  nl0000301109   ABN Amro  1.00
  2           1.00  nl0000289783   Robeco   0.40
```

(continues on next page)
• quotationchar, doublequote, and escapechar can now be specified when using DataFrame.to_csv (GH5414, GH4528)

• Partially sort by only the specified levels of a MultiIndex with the sort_remaining boolean kwarg. (GH3984)

• Added to_julian_date to TimeStamp and DatetimeIndex. The Julian Date is used primarily in astronomy and represents the number of days from noon, January 1, 4713 BC. Because nanoseconds are used to define the time in pandas the actual range of dates that you can use is 1678 AD to 2262 AD. (GH4041)

• DataFrame.to_stata will now check data for compatibility with Stata data types and will upcast when needed. When it is not possible to losslessly upcast, a warning is issued (GH6327)

• DataFrame.to_stata and StataWriter will accept keyword arguments time_stamp and data_label which allow the time stamp and dataset label to be set when creating a file. (GH6545)

• pandas.io.gbq now handles reading unicode strings properly. (GH5940)

• Holidays Calendars are now available and can be used with the CustomBusinessDay offset (GH6719)

• Float64Index is now backed by a float64 dtype ndarray instead of an object dtype array (GH6471).

• Implemented Panel.pct_change (GH6904)

• Added how option to rolling-moment functions to dictate how to handle resampling: rolling_max() defaults to max, rolling_min() defaults to min, and all others default to mean (GH6297)

• CustomBusinessMonthBegin and CustomBusinessMonthEnd are now available (GH6866)

• Series.quantile() and DataFrame.quantile() now accept an array of quantiles.

• describe() now accepts an array of percentiles to include in the summary statistics (GH4196)

• pivot_table can now accept Grouper by index and columns keywords (GH6913)

In [72]: import datetime

In [73]: df = pd.DataFrame({
   ....:   'Branch': 'A A A A A B'.split(),
   ....:   })

(continues on next page)
arrays of strings can be wrapped to a specified width (str.\_wrap) (\text{GH6999})

- Add \text{nsmallest()} and \text{Series.nlargest()} methods to \text{Series}, See the docs (\text{GH3960})

- PeriodIndex fully supports partial string indexing like \text{DatetimeIndex} (\text{GH7043})

\begin{Verbatim}
\text{In [76]:} prng = pd.period\_range('2013-01-01 09:00', periods=100, freq='H')
\text{In [77]:} ps = pd.Series(np.random.randn(len(prng)), index=prng)
\text{In [78]:} ps
\end{Verbatim}

Freq: H, Length: 24, dtype: float64

- read_excel can now read milliseconds in Excel dates and times with xlrd >= 0.9.3. (GH5945)
- pd.stats.moments.rolling_var now uses Welford’s method for increased numerical stability (GH6817)
- pd.expanding_apply and pd.rolling_apply now take args and kwargs that are passed on to the func (GH6289)
- DataFrame.rank() now has a percentage rank option (GH5971)
- Series.rank() now has a percentage rank option (GH5971)
- Series.rank() and DataFrame.rank() now accept method=’dense’ for ranks without gaps (GH6514)
- Support passing encoding with xlwt (GH3710)
- Refactor Block classes removing Block.items attributes to avoid duplication in item handling (GH6745, GH6988).
- Testing statements updated to use specialized asserts (GH6175)
Performance

- Performance improvement when converting DatetimeIndex to floating ordinals using DatetimeConverter (GH6636)
- Performance improvement for DataFrame.shift (GH5609)
- Performance improvement in indexing into a MultiIndexed Series (GH5567)
- Performance improvements in single-dtyped indexing (GH6484)
- Improve performance of DataFrame construction with certain offsets, by removing faulty caching (e.g. MonthEnd, BusinessMonthEnd), (GH6479)
- Improve performance of CustomBusinessDay (GH6584)
- Improve performance of slice indexing on Series with string keys (GH6341, GH6372)
- Performance improvement for DataFrame.from_records when reading a specified number of rows from an iterable (GH6700)
- Performance improvements in timedelta conversions for integer dtypes (GH6754)
- Improved performance of compatible pickles (GH6899)
- Improve performance in certain reindexing operations by optimizing take_2d (GH6749)
- GroupBy.count() is now implemented in Cython and is much faster for large numbers of groups (GH7016).

Experimental

There are no experimental changes in 0.14.0

Bug fixes

- Bug in Series ValueError when index doesn’t match data (GH6532)
- Prevent segfault due to MultiIndex not being supported in HDFStore table format (GH1848)
- Bug in pd.DataFrame.sort_index where mergesort wasn’t stable when ascending=False (GH6399)
- Bug in pd.tseries.frequencies.to_offset when argument has leading zeros (GH6391)
- Bug in version string gen. for dev versions with shallow clones / install from tarball (GH6127)
- Inconsistent tz parsing Timestamp / to_datetime for current year (GH5958)
- Indexing bugs with reordered indexes (GH6252, GH6254)
- Bug in .xs with a Series multiindex (GH6258, GH5684)
- Bug in conversion of a string types to a DatetimeIndex with a specified frequency (GH6273, GH6274)
- Bug in eval where type-promotion failed for large expressions (GH6205)
- Bug in interpolate with inplace=True (GH6281)
- HDFStore.remove now handles start and stop (GH6177)
- HDFStore.select_as_multiple handles start and stop the same way as select (GH6177)
- HDFStore.select_as_coordinates and select_column works with a where clause that results in filters (GH6177)
- Regression in join of non_unique_indexes (GH6329)
• Issue with groupby agg with a single function and a mixed-type frame (GH6337)
• Bug in DataFrame.replace() when passing a non-bool to_replace argument (GH6332)
• Raise when trying to align on different levels of a MultiIndex assignment (GH3738)
• Bug in setting complex dtypes via boolean indexing (GH6345)
• Bug in TimeGrouper/resample when presented with a non-monotonic DatetimeIndex that would return invalid results. (GH4161)
• Bug in index name propagation in TimeGrouper/resample (GH4161)
• TimeGrouper has a more compatible API to the rest of the groupers (e.g. groups was missing) (GH3881)
• Bug in multiple grouping with a TimeGrouper depending on target column order (GH6764)
• Bug in pd.eval when parsing strings with possible tokens like '&' (GH6351)
• Bug correctly handle placements of -inf in Panels when dividing by integer 0 (GH6178)
• DataFrame.shift with axis=1 was raising (GH6371)
• Disabled clipboard tests until release time (run locally with nosetests -A disabled) (GH6048).
• Bug in DataFrame.replace() when passing a nested dict that contained keys not in the values to be replaced (GH6342)
• str.match ignored the na flag (GH6609).
• Bug in take with duplicate columns that were not consolidated (GH6240)
• Bug in interpolate changing dtypes (GH6290)
• Bug in Series.get was using a buggy access method (GH6383)
• Bug in hdfstore queries of the form where=[('date', '>=', datetime(2013,1,1)), ('date', '<=', datetime(2014,1,1))] (GH6313)
• Bug in DataFrame.dropna with duplicate indices (GH6355)
• Regression in chained getitem indexing with embedded list-like from 0.12 (GH6394)
• Float64Index with nans not comparing correctly (GH6401)
• eval/query expressions with strings containing the @ character will now work (GH6366).
• Bug in Series.reindex when specifying a method with some nan values was inconsistent (noted on a resample) (GH6418)
• Bug in DataFrame.replace() where nested dicts were erroneously depending on the order of dictionary keys and values (GH5338).
• Performance issue in concatenating with empty objects (GH3259)
• Clarify sorting of sym_diff on Index objects with NaN values (GH6444)
• Regression in MultiIndex.from_product with a DatetimeIndex as input (GH6439)
• Bug in str.extract when passed a non-default index (GH6348)
• Bug in str.split when passed pat=None and n=1 (GH6466)
• Bug in io.data.DataReader when passed "F-F_Momentum_Factor" and data_source="famafrench" (GH6460)
• Bug in sum of a timedelta64[ns] series (GH6462)
• Bug in resample with a timezone and certain offsets (GH6397)
• Bug in iat/iloc with duplicate indices on a Series (GH6493)
• Bug in read_html where nan’s were incorrectly being used to indicate missing values in text. Should use the empty string for consistency with the rest of pandas (GH5129).
• Bug in read_html tests where redirected invalid URLs would make one test fail (GH6445).
• Bug in multi-axis indexing using .loc on non-unique indices (GH6504)
• Bug that caused _ref_locs corruption when slice indexing across columns axis of a DataFrame (GH6525)
• Regression from 0.13 in the treatment of numpy datetime64 non-ns dtypes in Series creation (GH6529)
• .names attribute of MultiIndexes passed to set_index are now preserved (GH6459).
• Bug in setitem with a duplicate index and an alignable rhs (GH6541)
• Bug in setitem with .loc on mixed integer Indexes (GH6546)
• Bug in pd.read_stata which would use the wrong data types and missing values (GH6327)
• Bug in DataFrame.to_stata that lead to data loss in certain cases, and could be exported using the wrong data types and missing values (GH6335)
• StataWriter replaces missing values in string columns by empty string (GH6802)
• Inconsistent types in Timestamp addition/subtraction (GH6543)
• Bug in preserving frequency across Timestamp addition/subtraction (GH4547)
• Bug in empty list lookup caused IndexError exceptions (GH6536, GH6551)
• Series.quantile raising on an object dtype (GH6555)
• Bug in .xs with a nan in level when dropped (GH6574)
• Bug in fillna with method='bfill/ffill' and datetime64[ns] dtype (GH6587)
• Bug in sql writing with mixed dtypes possibly leading to data loss (GH6509)
• Bug in Series.pop (GH6600)
• Bug in iloc indexing when positional indexer matched Int64Index of the corresponding axis and no reordering happened (GH6612)
• Bug in fillna with limit and value specified
• Bug in DataFrame.to_stata when columns have non-string names (GH4558)
• Bug in compat with np.compress, surfaced in (GH6658)
• Bug in binary operations with a rhs of a Series not aligning (GH6681)
• Bug in DataFrame.to_stata which incorrectly handles nan values and ignores with_index keyword argument (GH6685)
• Bug in resample with extra bins when using an evenly divisible frequency (GH4076)
• Bug in consistency of groupby aggregation when passing a custom function (GH6715)
• Bug in resample when how=None resample freq is the same as the axis frequency (GH5955)
• Bug in downcasting inference with empty arrays (GH6733)
• Bug in obj.blocks on sparse containers dropping all but the last items of same for dtype (GH6748)
• Bug in unpickling NaT (NaTType) (GH4606)
• Bug in DataFrame.replace() where regex meta characters were being treated as regex even when regex=False (GH6777).
• Bug in timedelta ops on 32-bit platforms (GH6808)
• Bug in setting a tz-aware index directly via .index (GH6785)
• Bug in expressions.py where numexpr would try to evaluate arithmetic ops (GH6762).
• Bug in Makefile where it didn't remove Cython generated C files with make clean (GH6768)
• Bug in DataFrame._reduce where non bool-like (0/1) integers were being converted into bools. (GH6806)
• Regression from 0.13 with fillna and a Series on datetime-like (GH6344)
• Bug in adding np.timedelta64 to DatetimeIndex with timezone outputs incorrect results (GH6818)
• Bug in DataFrame.replace() where changing a dtype through replacement would only replace the first occurrence of a value (GH6689)
• Better error message when passing a frequency of ‘MS’ in Period construction (GH5332)
• Bug in Series.__unicode__ when max_rows=None and the Series has more than 1000 rows. (GH6863)
• Bug in groupby.get_group where a datelike wasn't always accepted (GH5267)
• Bug in groupBy.get_group created by TimeGrouper raises AttributeError (GH6914)
• Bug in DatetimeIndex.tz_localize and DatetimeIndex.tz_convert converting NaT incorrectly (GH5546)
• Bug in arithmetic operations affecting NaT (GH6873)
• Bug in Series.str.extract where the resulting Series from a single group match wasn't renamed to the group name
• Bug in DataFrame.to_csv where setting index=False ignored the header kwarg (GH6186)
• Bug in DataFrame.plot and Series.plot, where the legend behave inconsistently when plotting to the same axes repeatedly (GH6678)
• Internal tests for patching __finalize__/ bug in merge not finalizing (GH6923, GH6927)
• accept TextFileReader in concat, which was affecting a common user idiom (GH6583)
• Bug in C parser with leading white space (GH3374)
• Bug in C parser with delim_whitespace=True and \r-delimited lines
• Bug in python parser with explicit MultiIndex in row following column header (GH6893)
• Bug in Series.rank and DataFrame.rank that caused small floats (<1e-13) to all receive the same rank (GH6886)
• Bug in DataFrame.apply with functions that used *args or **kwargs and returned an empty result (GH6952)
• Bug in sum/mean on 32-bit platforms on overflows (GH6915)
• Moved Panel.shift to NDFrame.slice_shift and fixed to respect multiple dtypes. (GH6959)
• Bug in enabling subplots=True in DataFrame.plot only has single column raises TypeError, and Series.plot raises AttributeError (GH6951)
• Bug in DataFrame.plot draws unnecessary axes when enabling subplots and kind=scatter (GH6951)
• Bug in read_csv from a filesystem with non-utf-8 encoding (GH6807)
• Bug in iloc when setting / aligning (GH6766)
• Bug causing UnicodeEncodeError when get_dummies called with unicode values and a prefix (GH6885)
- Bug in timeseries-with-frequency plot cursor display (GH5453)
- Bug surfaced in groupby.plot when using a Float64Index (GH7025)
- Stopped tests from failing if options data isn’t able to be downloaded from Yahoo (GH7034)
- Bug in parallel_coordinates and radviz where reordering of class column caused possible color/class mismatch (GH6956)
- Bug in radviz and andrews_curves where multiple values of ‘color’ were being passed to plotting method (GH6956)
- Bug in Float64Index.isin() where containing nan s would make indices claim that they contained all the things (GH7066).
- Bug in DataFrame.boxplot where it failed to use the axis passed as the ax argument (GH3578)
- Bug in the XlsxWriter and XlwtWriter implementations that resulted in datetime columns being formatted without the time (GH7075) were being passed to plotting method
- read_fwf() treats None in colspec like regular python slices. It now reads from the beginning or until the end of the line when colspec contains a None (previously raised a TypeError)
- Bug in cache coherence with chained indexing and slicing; add _is_view property to NDFrame to correctly predict views; mark is_copy on xs only if its an actual copy (and not a view) (GH7084)
- Bug in DatetimeIndex creation from string ndarray with dayfirst=True (GH5917)
- Bug in MultiIndex.from_arrays created from DatetimeIndex doesn’t preserve freq and tz (GH7090)
- Bug in unstack raises ValueError when MultiIndex contains PeriodIndex (GH4342)
- Bug in boxplot and hist draws unnecessary axes (GH6769)
- Regression in groupby.nth() for out-of-bounds indexers (GH6621)
- Bug in quantile with datetime values (GH6965)
- Bug in Dataframe.set_index, reindex and pivot don’t preserve DatetimeIndex and PeriodIndex attributes (GH3950, GH5878, GH6631)
- Bug in MultiIndex.get_level_values doesn’t preserve DatetimeIndex and PeriodIndex attributes (GH7092)
- Bug in Groupby doesn’t preserve tz (GH3950)
- Bug in PeriodIndex partial string slicing (GH6716)
- Bug in the HTML repr of a truncated Series or DataFrame not showing the class name with the large_repr set to ‘info’ (GH7105)
- Bug in DatetimeIndex specifying freq raises ValueError when passed value is too short (GH7098)
- Fixed a bug with the info repr not honoring the display.max_info_columns setting (GH6939)
- Bug PeriodIndex string slicing with out of bounds values (GH5407)
- Fixed a memory error in the hashtable implementation/factorizer on resizing of large tables (GH7157)
- Bug in isnull when applied to 0-dimensional object arrays (GH7176)
- Bug in query/eval where global constants were not looked up correctly (GH7178)
- Bug in recognizing out-of-bounds positional list indexers with iloc and a multi-axis tuple indexer (GH7189)
- Bug in setitem with a single value, MultiIndex and integer indices (GH7190, GH7218)
- Bug in expressions evaluation with reversed ops, showing in series-dataframe ops (GH7198, GH7192)
• Bug in multi-axis indexing with > 2 ndim and a MultiIndex (GH7199)
• Fix a bug where invalid eval/query operations would blow the stack (GH5198)

5.17 Version 0.13

5.17.1 Version 0.13.1 (February 3, 2014)

This is a minor release from 0.13.0 and includes a small number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

Highlights include:
• Added infer_datetime_format keyword to read_csv/to_datetime to allow speedups for homogeneously formatted datetimes.
• Will intelligently limit display precision for datetime/timedelta formats.
• Enhanced Panel apply() method.
• Suggested tutorials in new Tutorials section.
• Our pandas ecosystem is growing, We now feature related projects in a new Pandas Ecosystem section.
• Much work has been taking place on improving the docs, and a new Contributing section has been added.
• Even though it may only be of interest to devs, we <3 our new CI status page: ScatterCI.

**Warning:** 0.13.1 fixes a bug that was caused by a combination of having numpy < 1.8, and doing chained assignment on a string-like array. Please review the docs, chained indexing can have unexpected results and should generally be avoided.

This would previously segfault:

```
In [1]: df = pd.DataFrame({"A": np.array(["foo", "bar", "bah", "foo", "bar"])})
In [2]: df["A"].iloc[0] = np.nan
In [3]: df
Out[3]:
     A
0   NaN
1   bar
2   bah
3   foo
4   bar
```

The recommended way to do this type of assignment is:

```
In [4]: df = pd.DataFrame({"A": np.array(["foo", "bar", "bah", "foo", "bar"])})
In [5]: df.loc[0, "A"] = np.nan
In [6]: df
Out[6]:
     A
0   NaN
1   bar
2   bah
3   foo
4   bar
```
Output formatting enhancements

- `df.info()` view now display dtype info per column (GH5682)
- `df.info()` now honors the option `max_info_rows`, to disable null counts for large frames (GH5974)

```
In [7]: max_info_rows = pd.get_option("max_info_rows")
In [8]: df = pd.DataFrame(
    ...:     {
    ...:         "A": np.random.randn(10),
    ...:         "B": np.random.randn(10),
    ...:         "C": pd.date_range("20130101", periods=10),
    ...:     }
    ...: )
    ...

In [9]: df.iloc[3:6, [0, 2]] = np.nan

# set to not display the null counts
In [10]: pd.set_option("max_info_rows", 0)
In [11]: df.info()
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 10 entries, 0 to 9
Data columns (total 3 columns):
#  Column      Dtype
---  ------ -------------- -----
0   A    float64
1   B    float64
2   C    datetime64[ns]
dtypes: datetime64[ns](1), float64(2)
memory usage: 368.0 bytes

# this is the default (same as in 0.13.0)
In [12]: pd.set_option("max_info_rows", max_info_rows)
In [13]: df.info()
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 10 entries, 0 to 9
Data columns (total 3 columns):
#  Column      Non-Null Count  Dtype
---  ------  ---------------  ------
0   A       7 non-null  float64
1   B       10 non-null  float64
2   C       7 non-null  datetime64[ns]
dtypes: datetime64[ns](1), float64(2)
memory usage: 368.0 bytes
```

- Add `show_dimensions` display option for the new DataFrame repr to control whether the dimensions print.

```
In [14]: df = pd.DataFrame([[1, 2], [3, 4]])
```

(continues on next page)
In [15]: pd.set_option("show_dimensions", False)

In [16]: df
Out[16]:
   0   1
0  1  2
1  3  4

In [17]: pd.set_option("show_dimensions", True)

In [18]: df
Out[18]:
   0   1
0  1  2
1  3  4

[2 rows x 2 columns]

- The ArrayFormatter for datetime and timedelta64 now intelligently limit precision based on the values in the array (GH3401)

Previously output might look like:

<table>
<thead>
<tr>
<th>age</th>
<th>today</th>
<th>diff</th>
</tr>
</thead>
<tbody>
<tr>
<td>2001-01-01 00:00:00</td>
<td>2013-04-19 00:00:00</td>
<td>4491 days, 00:00:00</td>
</tr>
<tr>
<td>2004-06-01 00:00:00</td>
<td>2013-04-19 00:00:00</td>
<td>3244 days, 00:00:00</td>
</tr>
</tbody>
</table>

Now the output looks like:

In [19]: df = pd.DataFrame(
        ....:     [pd.Timestamp("20010101"), pd.Timestamp("20040601")], columns=["age"]
        ....: )
        ....:

In [20]: df["today"] = pd.Timestamp("20130419")

In [21]: df["diff"] = df["today"] - df["age"]

In [22]: df
Out[22]:
   age     today     diff
0 2001-01-01 2013-04-19 4491 days
1 2004-06-01 2013-04-19 3244 days

[2 rows x 3 columns]
API changes

- Add -NaN and -nan to the default set of NA values (GH5952). See NA Values.

- Added Series.str.get_dummies vectorized string method (GH6021), to extract dummy/indicator variables for separated string columns:

```python
In [23]: s = pd.Series(["a", "a|b", np.nan, "a|c"])
In [24]: s.str.get_dummies(sep="|")
Out[24]:
   a  b  c
0  1  0  0
1  1  1  0
2  0  0  0
3  1  0  1
[4 rows x 3 columns]
```

- Added the NDFrame.equals() method to compare if two NDFrames are equal have equal axes, dtypes, and values. Added the array_equivalent function to compare if two ndarrays are equal. NaNs in identical locations are treated as equal. (GH5283) See also the docs for a motivating example.

```python
df = pd.DataFrame({"col": ['foo', 0, np.nan]})
df2 = pd.DataFrame({"col": [np.nan, 0, "foo"], index=[2, 1, 0]})
df.equals(df2)
df.equals(df2.sort_index())
```

- DataFrame.apply will use the reduce argument to determine whether a Series or a DataFrame should be returned when the DataFrame is empty (GH6007).

Previously, calling DataFrame.apply an empty DataFrame would return either a DataFrame if there were no columns, or the function being applied would be called with an empty Series to guess whether a Series or DataFrame should be returned:

```python
In [32]: def applied_func(col):
    ....:     print("Apply function being called with: ", col)
    ....:     return col.sum()
    ....:
In [33]: empty = DataFrame(columns=['a', 'b'])
In [34]: empty.apply(applied_func)
Apply function being called with:  Series([], Length: 0, dtype: float64)
```

Now, when apply is called on an empty DataFrame: if the reduce argument is True a Series will returned, if it is False a DataFrame will be returned, and if it is None (the default) the function being applied will be called with an empty series to try and guess the return type.

```python
In [35]: empty.apply(applied_func, reduce=True)
Out[35]:
```
Prior version deprecations/changes

There are no announced changes in 0.13 or prior that are taking effect as of 0.13.1

Deprecations

There are no deprecations of prior behavior in 0.13.1

Enhancements

- `pd.read_csv` and `pd.to_datetime` learned a new `infer_datetime_format` keyword which greatly improves parsing perf in many cases. Thanks to @lexical for suggesting and @danbirken for rapidly implementing. (GH5490, GH6021)

  If `parse_dates` is enabled and this flag is set, pandas will attempt to infer the format of the datetime strings in the columns, and if it can be inferred, switch to a faster method of parsing them. In some cases this can increase the parsing speed by ~5-10x.

  ```python
  # Try to infer the format for the index column
  df = pd.read_csv(
      "foo.csv", index_col=0, parse_dates=True, infer_datetime_format=True
  )
  ```

- `date_format` and `datetime_format` keywords can now be specified when writing to `excel` files (GH4133)

- `MultiIndex.from_product` convenience function for creating a MultiIndex from the cartesian product of a set of iterables (GH6055):

  ```python
  In [25]: shades = ["light", "dark"]
  In [26]: colors = ["red", "green", "blue"]
  In [27]: pd.MultiIndex.from_product([shades, colors], names=["shade", "color"])
  Out[27]:
  MultiIndex([( 'light', 'red'),
               ( 'light', 'green'),
               ( 'light', 'blue'),
               ( 'dark', 'red'),
               ( 'dark', 'green'),
               ( 'light', 'red'),
               ( 'light', 'green'),
               ( 'light', 'blue'),
               ( 'dark', 'red'),
               ( 'dark', 'green'),
               ( 'light', 'red'),
               ( 'light', 'green'),
               ( 'light', 'blue'),
               ( 'dark', 'red'),
               ( 'dark', 'green')],
                dtype=object,
               names=["shade", "color"])
  ```
Panel apply() will work on non-ufuncs. See the docs.

Specifying an apply that operates on a Series (to return a single element)

A similar reduction type operation
This is equivalent to

```
In [34]: panel.sum('major_axis')
Out[34]:
     ItemA     ItemB     ItemC
A -1.108775 -1.090118 -2.984435
B -3.705764  0.409204  1.866240
C  2.110856  2.960500 -0.974967
D -4.532785  0.303202 -3.685193
[4 rows x 3 columns]
```

A transformation operation that returns a Panel, but is computing the z-score across the major_axis

```
In [35]: result = panel.apply(lambda x: (x - x.mean()) / x.std(), axis='major_axis')

In [36]: result
Out[36]:
<class 'pandas.core.panel.Panel'>
Dimensions: 3 (items) x 5 (major_axis) x 4 (minor_axis)
Items axis: ItemA to ItemC
Major_axis axis: 2000-01-03 00:00:00 to 2000-01-07 00:00:00
Minor_axis axis: A to D
```

```
In [37]: result['ItemA']  # noqa E999
Out[37]:
     A    B    C    D
2000-01-03 -0.535778  1.500802 -1.506416 -0.681456
2000-01-04  0.397628 -1.108752  0.360481  1.529895
2000-01-05 -1.489811 -0.339412  0.557374  0.280845

2000-01-07  0.742682 -0.474468  1.041575 -0.075499
[5 rows x 4 columns]
```

• Panel apply() operating on cross-sectional slabs. (GH1148)

```
In [38]: def f(x):
    ....:    return ((x.T - x.mean(1)) / x.std(1)).T
    ....:

In [39]: result = panel.apply(f, axis=['items', 'major_axis'])

In [40]: result
Out[40]:
<class 'pandas.core.panel.Panel'>
Dimensions: 4 (items) x 5 (major_axis) x 3 (minor_axis)
Items axis: A to D
Major_axis axis: 2000-01-03 00:00:00 to 2000-01-07 00:00:00
Minor_axis axis: ItemA to ItemC
```

```
In [41]: result.loc[:, :, 'ItemA']
(continues on next page)
```
Out[41]:

<table>

[5 rows x 4 columns]

**Performance**

Performance improvements for 0.13.1

- Series datetime/timedelta binary operations (GH5801)
- DataFrame count/dropna for axis=1
- Series.str.contains now has a regex=False keyword which can be faster for plain (non-regex) string patterns. (GH5879)
- Series.str.extract (GH5944)
- dtypes/ftypes methods (GH5968)
- indexing with object dtypes (GH5968)
- DataFrame.apply (GH6013)
- Regression in JSON IO (GH5765)
- Index construction from Series (GH6150)
Experimental

There are no experimental changes in 0.13.1

Bug fixes

• Bug in `io.wb.get_countries` not including all countries (GH6008)
• Bug in Series replace with timestamp dict (GH5797)
• `read_csv/read_table` now respects the `prefix` kwarg (GH5732).
• Bug in selection with missing values via `.ix` from a duplicate indexed DataFrame failing (GH5835)
• Fix issue of boolean comparison on empty DataFrames (GH5808)
• Bug in `isnull` handling `NaT` in an object array (GH5443)
• Bug in `to_datetime` when passed a `np.nan` or integer datelike and a format string (GH5863)
• Bug in groupby dtype conversion with datetimelike (GH5869)
• Regression in handling of empty Series as indexers to Series (GH5877)
• Bug in internal caching, related to (GH5727)
• Testing bug in reading JSON/msgpack from a non-filepath on windows under py3 (GH5874)
• Bug when assigning to `.ix[tuple(...)]` (GH5896)
• Bug in fully reindexing a Panel (GH5905)
• Bug in `idxmin/max` with object dtypes (GH5914)
• Bug in `BusinessDay` when adding n days to a date not on offset when n>5 and n%5==0 (GH5890)
• Bug in assigning to chained series with a series via `ix` (GH5928)
• Bug in creating an empty DataFrame, copying, then assigning (GH5932)
• Bug in `DataFrame.tail` with empty frame (GH5846)
• Bug in propagating metadata on `resample` (GH5862)
• Fixed string-representation of `NaT` to be “NaT” (GH5708)
• Fixed string-representation for `Timestamp` to show nanoseconds if present (GH5912)
• `pd.match` not returning passed sentinel
• `Panel.to_frame()` no longer fails when `major_axis` is a `MultiIndex` (GH5402).
• Bug in `pd.read_msgpack` with inferring a `DateTimeIndex` frequency incorrectly (GH5947)
• Fixed `to_datetime` for array with both Tz-aware datetimes and `NaT`’s (GH5961)
• Bug in rolling skew/kurtosis when passed a Series with bad data (GH5749)
• Bug in `scipy.interpolate` methods with a datetime index (GH5975)
• Bug in `NaT` comparison if a mixed datetime/np.datetime64 with `NaT` were passed (GH5968)
• Fixed bug with `pd.concat` losing dtype information if all inputs are empty (GH5742)
• Recent changes in `IPython` cause warnings to be emitted when using previous versions of `pandas` in `QTConsole`, now fixed. If you’re using an older version and need to suppress the warnings, see (GH5922).
• Bug in merging `timedelta` dtypes (GH5695)
• Bug in plotting.scatter_matrix function. Wrong alignment among diagonal and off-diagonal plots, see (GH5497).
• Regression in Series with a MultiIndex via ix (GH6018)
• Bug in Series.xs with a MultiIndex (GH6018)
• Bug in Series construction of mixed type with datelike and an integer (which should result in object type and not automatic conversion) (GH6028)
• Possible segfault when chained indexing with an object array under NumPy 1.7.1 (GH6026, GH6056)
• Bug in setting using fancy indexing a single element with a non-scalar (e.g. a list), (GH6043)
• to_sql did not respect if_exists (GH4110 GH4304)
• Regression in .get(None) indexing from 0.12 (GH5652)
• Subtle iloc indexing bug, surfaced in (GH6059)
• Bug with insert of strings into DatetimeIndex (GH5818)
• Fixed unicode bug in to_html/HTML repr (GH6098)
• Fixed missing arg validation in get_options_data (GH6105)
• Bug in assignment with duplicate columns in a frame where the locations are a slice (e.g. next to each other) (GH6120)
• Bug in propagating _ref_locs during construction of a DataFrame with dups index/columns (GH6121)
• Bug in DataFrame.apply when using mixed datelike reductions (GH6125)
• Bug in DataFrame.append when appending a row with different columns (GH6129)
• Bug in DataFrame construction with recarray and non-ns datetime dtype (GH6140)
• Bug in .loc setitem indexing with a dataframe on rhs, multiple item setting, and a datetimelike (GH6152)
• Fixed a bug in query/eval during lexicographic string comparisons (GH6155).
• Fixed a bug in query where the index of a single-element Series was being thrown away (GH6148).
• Bug in HDFStore on appending a dataframe with MultiIndexed columns to an existing table (GH6167)
• Consistency with dtypes in setting an empty DataFrame (GH6171)
• Bug in selecting on a MultiIndex HDFStore even in the presence of under specified column spec (GH6169)
• Bug in nanops.var with ddof=1 and 1 elements would sometimes return inf rather than nan on some platforms (GH6136)
• Bug in Series and DataFrame bar plots ignoring the use_index keyword (GH6209)
• Bug in groupby with mixed str/int under python3 fixed; argsort was failing (GH6212)

This is a major release from 0.12.0 and includes a number of API changes, several new features and enhancements along with a large number of bug fixes.

Highlights include:

- support for a new index type Float64Index, and other Indexing enhancements
- HDFStore has a new string based syntax for query specification
- support for new methods of interpolation
- updated timedelta operations
- a new string manipulation method extract
- Nanosecond support for Offsets
- isin for DataFrames

Several experimental features are added, including:

- new eval/query methods for expression evaluation
- support for msgpack serialization
- an i/o interface to Google’s BigQuery

Their are several new or updated docs sections including:

- *Comparison with SQL*, which should be useful for those familiar with SQL but still learning pandas.
- *Comparison with R*, idiom translations from R to pandas.
- *Enhancing Performance*, ways to enhance pandas performance with eval/query.

**Warning:** In 0.13.0 Series has internally been refactored to no longer sub-class ndarray but instead subclass NDFrame, similar to the rest of the pandas containers. This should be a transparent change with only very limited API implications. See *Internal Refactoring*
API changes

- `read_excel` now supports an integer in its `sheetname` argument giving the index of the sheet to read in (GH4301).
- Text parser now treats anything that reads like inf ("inf", "Inf", "-Inf", "iNf", etc.) as infinity. (GH4220, GH4219), affecting `read_table`, `read_csv`, etc.
- `pandas` now is Python 2/3 compatible without the need for 2to3 thanks to @jtratner. As a result, pandas now uses iterators more extensively. This also led to the introduction of substantive parts of the Benjamin Peterson’s six library into compat. (GH4384, GH4375, GH4372)
- `pandas.util.compat` and `pandas.util.py3compat` have been merged into `pandas.compat`. `pandas.compat` now includes many functions allowing 2/3 compatibility. It contains both list and iterator versions of range, filter, map and zip, plus other necessary elements for Python 3 compatibility. `1map`, `1zip`, `1range` and `1filter` all produce lists instead of iterators, for compatibility with numpy, subscripting and pandas constructors.(GH4384, GH4375, GH4372)
- `Series.get` with negative indexers now returns the same as `[]` (GH4390)
- Changes to how `Index` and `MultiIndex` handle metadata (levels, labels, and names) (GH4039):

```
# previously, you would have set levels or labels directly
>>> pd.index.levels = [[1, 2, 3, 4], [1, 2, 4, 4]]

# now, you use the set_levels or set_labels methods
>>> index = pd.index.set_levels([[1, 2, 3, 4], [1, 2, 4, 4]])

# similarly, for names, you can rename the object
# but setting names is not deprecated
>>> index = pd.index.set_names(["bob", "cranberry"])

# and all methods take an inplace kwarg - but return None
>>> pd.index.set_names(["bob", "cranberry"], inplace=True)
```

- **All** division with `NDFrame` objects is now `true division`, regardless of the future import. This means that operating on pandas objects will by default use `floating point` division, and return a floating point dtype. You can use `//` and `floordiv` to do integer division.

Integer division

```
In [3]: arr = np.array([1, 2, 3, 4])

In [4]: arr2 = np.array([5, 3, 2, 1])

In [5]: arr / arr2
Out[5]: array([0, 0, 1, 4])

In [6]: pd.Series(arr) // pd.Series(arr2)
Out[6]:
0    0
1    0

True Division
In [7]: pd.Series(arr) / pd.Series(arr2)  # no future import required
Out[7]:
0   0.200000
1   0.666667
2   1.500000
3   4.000000
dtype: float64

• Infer and downcast dtype if downcast='infer' is passed to fillna/ffill/bfill (GH4604)

• __nonzero__ for all NDFrame objects, will now raise a ValueError, this reverts back to (GH1073, GH4633) behavior. See gotchas for a more detailed discussion.

This prevents doing boolean comparison on entire pandas objects, which is inherently ambiguous. These all will raise a ValueError.

    >>> df = pd.DataFrame({
        'A': np.random.randn(10),
        'B': np.random.randn(10),
        'C': pd.date_range('20130101', periods=10)
    })
    >>> if df:
    ...     pass
    ...     pass
    Traceback (most recent call last):
    ...
    ValueError: The truth value of a DataFrame is ambiguous. Use a.empty, a.bool(), a.item(), a.any() or a.all().

    >>> df1 = df
    >>> df2 = df
    >>> df1 and df2
    Traceback (most recent call last):
    ...
    ValueError: The truth value of a DataFrame is ambiguous. Use a.empty, a.bool(), a.item(), a.any() or a.all().

    >>> d = [1, 2, 3]
    >>> s1 = pd.Series(d)
    >>> s2 = pd.Series(d)
    >>> s1 and s2
    Traceback (most recent call last):
    ...
    ValueError: The truth value of a DataFrame is ambiguous. Use a.empty, a.bool(), a.item(), a.any() or a.all().

Added the .bool() method to NDFrame objects to facilitate evaluating of single-element boolean Series:

In [1]: pd.Series([True]).bool()
Out[1]: True

In [2]: pd.Series([False]).bool()
Out[2]: False

(continues on next page)
In [3]: pd.DataFrame([[True]]).bool()
Out[3]: True

In [4]: pd.DataFrame([[False]]).bool()
Out[4]: False

- All non-Index NDFrame (Series, DataFrame, Panel, Panel4D, SparsePanel, etc.), now support the entire set of arithmetic operators and arithmetic flex methods (add, sub, mul, etc.). SparsePanel does not support pow or mod with non-scalars. (GH3765)

- Series and DataFrame now have a mode() method to calculate the statistical mode(s) by axis/Series. (GH5367)

- Chained assignment will now by default warn if the user is assigning to a copy. This can be changed with the option `chained_assignment`, allowed options are `raise/warn/None`. See the docs.

In [5]: dfc = pd.DataFrame({'A': ['aaa', 'bbb', 'ccc'], 'B': [1, 2, 3]})

In [6]: pd.set_option('chained_assignment', 'warn')

The following warning / exception will show if this is attempted.

In [7]: dfc.loc[0]['A'] = 1111

```
Traceback (most recent call last)
...  
SettingWithCopyWarning:  
   A value is trying to be set on a copy of a slice from a DataFrame.  
   Try using .loc[row_index,col_indexer] = value instead  

Here is the correct method of assignment.
```

In [8]: dfc.loc[0, 'A'] = 11

In [9]: dfc
Out[9]:
    A  B
0  11  1
1  bbb  2
2  ccc  3

- Panel.reindex has the following call signature : Panel.reindex(items=None, major_axis=None, minor_axis=None, **kwargs) to conform with other NDFrame objects. See Internal Refactoring for more information.

- Series.argmin and Series.argmax are now aliased to Series.idxmin and Series.idxmax. These return the index of the min or max element respectively. Prior to 0.13.0 these would return the position of the min / max element. (GH6214)
Prior version deprecations/changes

These were announced changes in 0.12 or prior that are taking effect as of 0.13.0

- Remove deprecated Factor (GH3650)
- Remove deprecated set_printoptions/reset_printoptions (GH3046)
- Remove deprecated _verbose_info (GH3215)
- Remove deprecated read_clipboard/to_clipboard/ExcelFile/ExcelWriter from pandas.io.parsers (GH3717) These are available as functions in the main pandas namespace (e.g. pd.read_clipboard)
- default for tupleize_cols is now False for both to_csv and read_csv. Fair warning in 0.12 (GH3604)
- default for display.max_seq_len is now 100 rather than None. This activates truncated display ("...") of long sequences in various places. (GH3391)

Deprecations

Deprecated in 0.13.0

- deprecated iterkv, which will be removed in a future release (this was an alias of iteritems used to bypass 2to3's changes). (GH4384, GH4375, GH4372)
- deprecated the string method match, whose role is now performed more idiomatically by extract. In a future release, the default behavior of match will change to become analogous to contains, which returns a boolean indexer. (Their distinction is strictness: match relies on re.match while contains relies on re.search.) In this release, the deprecated behavior is the default, but the new behavior is available through the keyword argument as_indexer=True.

Indexing API changes

Prior to 0.13, it was impossible to use a label indexer (.loc/.ix) to set a value that was not contained in the index of a particular axis. (GH2578). See the docs

In the Series case this is effectively an appending operation

```
In [10]: s = pd.Series([1, 2, 3])
In [11]: s
Out[11]:
0    1
1    2
2    3
dtype: int64
In [13]: s
Out[13]:
0   1.0
1   2.0
2   3.0
5   5.0
dtype: float64
```
In [14]: dfi = pd.DataFrame(np.arange(6).reshape(3, 2),
                      columns=['A', 'B'])

In [15]: dfi
Out[15]:
   A  B
0  0  1
1  2  3
2  4  5

This would previously KeyError

In [16]: dfi.loc[:, 'C'] = dfi.loc[:, 'A']

In [17]: dfi
Out[17]:
   A  B  C
0  0  1  0
1  2  3  2
2  4  5  4

This is like an append operation.

In [18]: dfi.loc[3] = 5

In [19]: dfi
Out[19]:
   A  B  C
0  0  1  0
1  2  3  2
2  4  5  4
3  5  5  5

A Panel setting operation on an arbitrary axis aligns the input to the Panel

In [20]: p = pd.Panel(np.arange(16).reshape(2, 4, 2),
                 items=['Item1', 'Item2'],
                 major_axis=pd.date_range('2001/1/12', periods=4),
                 minor_axis=['A', 'B'], dtype='float64')

In [21]: p
Out[21]:
Dimensions: 2 (items) x 4 (major_axis) x 2 (minor_axis)
Items axis: Item1 to Item2
Major_axis axis: 2001-01-12 00:00:00 to 2001-01-15 00:00:00
Minor_axis axis: A to B

In [22]: p.loc[::, :, 'C'] = pd.Series([30, 32], index=p.items)

In [23]: p

(continues on next page)
Out[23]:
<class 'pandas.core.panel.Panel'>
Dimensions: 2 (items) x 4 (major_axis) x 3 (minor_axis)
Items axis: Item1 to Item2
Major_axis axis: 2001-01-12 00:00:00 to 2001-01-15 00:00:00
Minor_axis axis: A to C

In [24]: p.loc[:, :, 'C']
Out[24]:
     Item1  Item2
2001-01-12  30.0  32.0
2001-01-13  30.0  32.0
2001-01-14  30.0  32.0
2001-01-15  30.0  32.0

Float64Index API change

- Added a new index type, Float64Index. This will be automatically created when passing floating values in index creation. This enables a pure label-based slicing paradigm that makes [],ix,.loc for scalar indexing and slicing work exactly the same. See the docs, (GH263)

Construction is by default for floating type values.

In [20]: index = pd.Index([1.5, 2, 3, 4.5, 5])

In [21]: index
Out[21]: Float64Index([1.5, 2.0, 3.0, 4.5, 5.0], dtype='float64')

In [22]: s = pd.Series(range(5), index=index)

In [23]: s
Out[23]:
1.5 0
2.0 1
3.0 2
4.5 3
5.0 4
dtype: int64

Scalar selection for [],ix,.loc will always be label based. An integer will match an equal float index (e.g. 3 is equivalent to 3.0)

In [24]: s[3]
Out[24]: 2

In [25]: s.loc[3]
Out[25]: 2

The only positional indexing is via iloc

In [26]: s.iloc[3]
Out[26]: 3
A scalar index that is not found will raise `KeyError`

Slicing is ALWAYS on the values of the index, for `[]`, `ix`, `loc` and ALWAYS positional with `iloc`

```python
In [27]: s[2:4]
Out[27]:
2.0 1
3.0 2
dtype: int64

In [28]: s.loc[2:4]
Out[28]:
2.0 1
3.0 2
dtype: int64

In [29]: s.iloc[2:4]
Out[29]:
3.0 2
4.5 3
dtype: int64
```

In float indexes, slicing using floats are allowed

```python
In [30]: s[2.1:4.6]
Out[30]:
3.0 2
4.5 3
dtype: int64

In [31]: s.loc[2.1:4.6]
Out[31]:
3.0 2
4.5 3
dtype: int64
```

• Indexing on other index types are preserved (and positional fallback for `[]`, `ix`), with the exception, that floating point slicing on indexes on non `Float64Index` will now raise a `TypeError`.

```python
In [1]: pd.Series(range(5))[3.5]
TypeError: the label [3.5] is not a proper indexer for this index type (Int64Index)

In [1]: pd.Series(range(5))[3.5:4.5]
TypeError: the slice start [3.5] is not a proper indexer for this index type
```

Using a scalar float indexer will be deprecated in a future version, but is allowed for now.

```python
In [3]: pd.Series(range(5))[3.0]
Out[3]: 3
```
HDFStore API changes

- Query Format Changes. A much more string-like query format is now supported. See the docs.

```python
In [32]: path = 'test.h5'
In [33]: dfq = pd.DataFrame(np.random.randn(10, 4),
                         columns=list('ABCD'),
                         index=pd.date_range('20130101', periods=10))
In [34]: dfq.to_hdf(path, 'dfq', format='table', data_columns=True)
```

Use boolean expressions, with in-line function evaluation.

```python
In [35]: pd.read_hdf(path, 'dfq',
                       where="index>Timestamp('20130104') & columns=['A', 'B']")
Out[35]:
          A     B
2013-01-05 -0.424972  0.567020
2013-01-06 -0.673690  0.113648
2013-01-07  0.404705  0.577046
2013-01-08 -0.370647 -1.157892
2013-01-09  1.075770 -0.109050
2013-01-10  0.357021 -0.674600
```

Use an inline column reference

```python
In [36]: pd.read_hdf(path, 'dfq',
                       where="A>0 or C>0")
Out[36]:
          A     B     C     D
2013-01-01  0.469112 -0.282863 -1.509059 -1.135632
2013-01-02  1.212112 -0.173215  0.119209 -1.044236
2013-01-04  0.721555 -0.706771 -1.039575  0.271860
2013-01-05 -0.424972  0.567020  0.276232 -1.087401
2013-01-07  0.404705  0.577046 -1.715002 -1.039268
2013-01-09  1.075770 -0.109050  1.643563 -1.469388
2013-01-10  0.357021 -0.674600 -1.776904 -0.968914
```

- the format keyword now replaces the table keyword; allowed values are fixed(f) or table(t) the same defaults as prior < 0.13.0 remain, e.g. put implies fixed format and append implies table format. This default format can be set as an option by setting io.hdf.default_format.

```python
In [37]: path = 'test.h5'
In [38]: df = pd.DataFrame(np.random.randn(10, 2))
In [39]: df.to_hdf(path, 'df_table', format='table')
In [40]: df.to_hdf(path, 'df_table2', append=True)
```
In [41]: df.to_hdf(path, 'df_fixed')

In [42]: with pd.HDFStore(path) as store:
   ....:     print(store)
   ....:
<class 'pandas.io.pytables.HDFStore'>
File path: test.h5

• Significant table writing performance improvements
• handle a passed Series in table format (GH4330)
• can now serialize a timedelta64[ns] dtype in a table (GH3577), See the docs.
• added an is_open property to indicate if the underlying file handle is_open; a closed store will now report ‘CLOSED’ when viewing the store (rather than raising an error) (GH4409)
• a close of a HDFStore now will close that instance of the HDFStore but will only close the actual file if the ref count (by PyTables) w.r.t. all of the open handles are 0. Essentially you have a local instance of HDFStore referenced by a variable. Once you close it, it will report closed. Other references (to the same file) will continue to operate until they themselves are closed. Performing an action on a closed file will raise ClosedFileError

In [43]: path = 'test.h5'
In [44]: df = pd.DataFrame(np.random.randn(10, 2))
In [45]: store1 = pd.HDFStore(path)
In [46]: store2 = pd.HDFStore(path)
In [47]: store1.append('df', df)
In [48]: store2.append('df2', df)
In [49]: store1
Out[49]:
<class 'pandas.io.pytables.HDFStore'>
File path: test.h5

In [50]: store2
Out[50]:
<class 'pandas.io.pytables.HDFStore'>
File path: test.h5

In [51]: store1.close()
In [52]: store2
Out[52]:
<class 'pandas.io.pytables.HDFStore'>
File path: test.h5
In [53]: store2.close()
In [54]: store2
removed the _quiet attribute, replace by a DuplicateWarning if retrieving duplicate rows from a table (GH4367)

• removed the warn argument from open. Instead a PossibleDataLossError exception will be raised if you try to use mode='w' with an OPEN file handle (GH4367)

• allow a passed locations array or mask as a where condition (GH4467). See the docs for an example.

• add the keyword dropna=True to append to change whether ALL nan rows are not written to the store (default is True, ALL nan rows are NOT written), also settable via the option io.hdf.dropna_table (GH4625)

• pass through store creation arguments; can be used to support in-memory stores

DataFrame repr changes

The HTML and plain text representations of DataFrame now show a truncated view of the table once it exceeds a certain size, rather than switching to the short info view (GH4886, GH5550). This makes the representation more consistent as small DataFrames get larger.

```
| 2010-03-30 | 13.55 | 13.64 | 13.18 | 13.28 | 142055200 | 12.70 |
...     | ...   | ...   | ...   | ...   |       |     |
```

771 rows × 6 columns

To get the info view, call DataFrame.info(). If you prefer the info view as the repr for large DataFrames, you can set this by running set_option('display.large_repr', 'info').

Enhancements

• df.to_clipboard() learned a new excel keyword that let’s you paste df data directly into excel (enabled by default). (GH5070).

• read_html now raises a URLError instead of catching and raising a ValueError (GH4303, GH4305)

• Added a test for read_clipboard() and to_clipboard() (GH4282)

• Clipboard functionality now works with PySide (GH4282)

• Added a more informative error message when plot arguments contain overlapping color and style arguments (GH4402)

• to_dict now takes records as a possible out type. Returns an array of column-keyed dictionaries. (GH4936)

• NaN handing in get_dummies (GH4446) with dummy_na

```python
# previously, nan was erroneously counted as 2 here
# now it is not counted at all
In [55]: pd.get_dummies([1, 2, np.nan])
Out[55]:
```

(continues on next page)
In [56]: pd.get_dummies([1, 2, np.nan], dummy_na=True)
Out[56]:
1.0 2.0 NaN
0 1 0 0
1 0 1 0
2 0 0 1

- timedelta64[ns] operations. See the docs.

**Warning:** Most of these operations require numpy >= 1.7

Using the new top-level to_timedelta, you can convert a scalar or array from the standard timedelta format (produced by to_csv) into a timedelta type (np.timedelta64 in nanoseconds).

In [57]: pd.to_timedelta('1 days 06:05:01.00003')
Out[57]: Timedelta('1 days 06:05:01.000030')

In [58]: pd.to_timedelta('15.5us')
Out[58]: Timedelta('0 days 00:00:00.000015500')

In [59]: pd.to_timedelta(['1 days 06:05:01.00003', '15.5us', 'nan'])
Out[59]: TimedeltaIndex(['1 days 06:05:01.000030', '0 days 00:00:00.000015500', NaT], dtype='timedelta64[ns]', freq=None)

In [60]: pd.to_timedelta(np.arange(5), unit='s')
Out[60]: TimedeltaIndex(['0 days 00:00:00', '0 days 00:00:01', '0 days 00:00:02', '0 days 00:00:03', '0 days 00:00:04'], dtype='timedelta64[ns]', freq=None)

In [61]: pd.to_timedelta(np.arange(5), unit='d')
Out[61]: TimedeltaIndex(['0 days', '1 days', '2 days', '3 days', '4 days'], dtype='timedelta64[ns]', freq=None)

A Series of dtype timedelta64[ns] can now be divided by another timedelta64[ns] object, or astyped to yield a float64 dtyped Series. This is frequency conversion. See the docs for the docs.

In [62]: import datetime

In [63]: td = pd.Series(pd.date_range('20130101', periods=4)) - pd.Series(pd.date_range('20121201', periods=4))

In [64]: td[2] += np.timedelta64(datetime.timedelta(minutes=5, seconds=3))
In [65]: td[3] = np.nan
In [66]: td
Out[66]:
0 31 days 00:00:00
1 31 days 00:00:00
2 31 days 00:05:03
3 NaT
dtype: timedelta64[ns]

# to days
In [67]: td / np.timedelta64(1, 'D')
Out[67]:
0 31.000000
1 31.000000
2 31.003507
3 NaN
dtype: float64

In [68]: td.astype('timedelta64[D]')
Out[68]:
0 31.0
1 31.0
2 31.0
3 NaN
dtype: float64

# to seconds
In [69]: td / np.timedelta64(1, 's')
Out[69]:
0 2678400.0
1 2678400.0
2 2678703.0
3 NaN
dtype: float64

In [70]: td.astype('timedelta64[s]')
Out[70]:
0 2678400.0
1 2678400.0
2 2678703.0
3 NaN
dtype: float64

Dividing or multiplying a timedelta64[ns] Series by an integer or integer Series
In [71]: td * -1
Out[71]:
0 -31 days +00:00:00
1 -31 days +00:00:00
2 -32 days +23:54:57
3 NaN

dtype: timedelta64[ns]

```
In [72]: td * pd.Series([1, 2, 3, 4])
Out[72]:
0   31 days 00:00:00
1   62 days 00:00:00
2   93 days 00:15:09
3     NaT
dtype: timedelta64[ns]
```

Absolute DateOffset objects can act equivalently to timedeltas

```
In [73]: from pandas import offsets
In [74]: td + offsets.Minute(5) + offsets.Milli(5)
Out[74]:
0   31 days 00:05:00.005000
1   31 days 00:05:00.005000
2   31 days 00:10:03.005000
3     NaT
dtype: timedelta64[ns]
```

Fillna is now supported for timedeltas

```
In [75]: td.fillna(pd.Timedelta(0))
Out[75]:
0   31 days 00:00:00
1   31 days 00:00:00
2   31 days 00:05:03
3   0 days 00:00:00
dtype: timedelta64[ns]

In [76]: td.fillna(datetime.timedelta(days=1, seconds=5))
Out[76]:
0   31 days 00:00:00
1   31 days 00:00:00
2   31 days 00:05:03
3   1 days 00:00:05
dtype: timedelta64[ns]
```

You can do numeric reduction operations on timedeltas.

```
In [77]: td.mean()
Out[77]: Timedelta('31 days 00:01:41')

In [78]: td.quantile(.1)
Out[78]: Timedelta('31 days 00:00:00')
```

- `plot(kind='kde')` now accepts the optional parameters `bw_method` and `ind`, passed to scipy.stats.gaussian_kde() (for scipy >= 0.11.0) to set the bandwidth, and to gkde.evaluate() to specify the indices at which it is evaluated, respectively. See scipy docs. (GH4298)
- DataFrame constructor now accepts a numpy masked record array (GH3478)
The new vectorized string method `extract` return regular expression matches more conveniently.

```python
In [79]: pd.Series(['a1', 'b2', 'c3']).str.extract('[ab](\d)')
Out[79]:
       0
0    1
1    2
2   NaN
```

Elements that do not match return NaN. Extracting a regular expression with more than one group returns a DataFrame with one column per group.

```python
In [80]: pd.Series(['a1', 'b2', 'c3']).str.extract('([ab])([\d])')
Out[80]:
      0  1
  0  a  1
  1  b  2
  2  NaN NaN
```

Elements that do not match return a row of NaN. Thus, a Series of messy strings can be converted into a like-indexed Series or DataFrame of cleaned-up or more useful strings, without necessitating `get()` to access tuples or `re.match` objects.

Named groups like

```python
In [81]: pd.Series(['a1', 'b2', 'c3']).str.extract('(?P<letter>[ab])(?P<digit>\d)')
Out[81]:
      letter  digit
    0       a       1
    1       b       2
    2  NaN  NaN
```

and optional groups can also be used.

```python
In [82]: pd.Series(['a1', 'b2', '3']).str.extract('(?P<letter>[ab])?(?P<digit>\d)')
Out[82]:
      letter  digit
    0       a       1
    1       b       2
    2  NaN     3
```

- `read_stata` now accepts Stata 13 format (GH4291)
- `read_fwf` now infers the column specifications from the first 100 rows of the file if the data has correctly separated and properly aligned columns using the delimiter provided to the function (GH4488).
- support for nanosecond times as an offset

**Warning:** These operations require `numpy` >= 1.7
Period conversions in the range of seconds and below were reworked and extended up to nanoseconds. Periods in the nanosecond range are now available.

In [83]: pd.date_range('2013-01-01', periods=5, freq='5N')
Out[83]:
DatetimeIndex(['2013-01-01 00:00:00','2013-01-01 00:00:00.000000005','2013-01-01 00:00:00.000000010','2013-01-01 00:00:00.000000015','2013-01-01 00:00:00.000000020'],
dtype='datetime64[ns]', freq='5N')

or with frequency as offset

In [84]: pd.date_range('2013-01-01', periods=5, freq=pd.offsets.Nano(5))
Out[84]:
DatetimeIndex(['2013-01-01 00:00:00','2013-01-01 00:00:00.000000005','2013-01-01 00:00:00.000000010','2013-01-01 00:00:00.000000015','2013-01-01 00:00:00.000000020'],
dtype='datetime64[ns]', freq='5N')

Timestamps can be modified in the nanosecond range

In [85]: t = pd.Timestamp('20130101 09:01:02')
In [86]: t + pd.tseries.offsets.Nano(123)
Out[86]:
Timestamp('2013-01-01 09:01:02.000000123')

• A new method, isin for DataFrames, which plays nicely with boolean indexing. The argument to isin, what we’re comparing the DataFrame to, can be a DataFrame, Series, dict, or array of values. See the docs for more.

To get the rows where any of the conditions are met:

In [87]: dfi = pd.DataFrame({'A': [1, 2, 3, 4], 'B': ['a', 'b', 'f', 'n']})
In [88]: dfi
Out[88]:
      A B
0    1 a
1    2 b
2    3 f
3    4 n
In [89]: other = pd.DataFrame({'A': [1, 3, 3, 7], 'B': ['e', 'f', 'f', 'e']})
In [90]: mask = dfi.isin(other)
In [91]: mask
Out[91]:
   A   B
0  True False
1  False False
2  True False
(continues on next page)
In [92]: dfi[mask.any(1)]
Out[92]:
          A  B
0       1  a
2       3  f

- Series now supports a `to_frame` method to convert it to a single-column DataFrame (GH5164)
- All R datasets listed here [http://stat.ethz.ch/R-manual/R-devel/library/datasets/html/00Index.html](http://stat.ethz.ch/R-manual/R-devel/library/datasets/html/00Index.html) can now be loaded into pandas objects

```python
# note that pandas.rpy was deprecated in v0.16.0
import pandas.rpy.common as com
com.load_data('Titanic')
```

- `tz_localize` can infer a fall daylight savings transition based on the structure of the unlocalized data (GH4230), see the docs
- `DatetimeIndex` is now in the API documentation, see the docs
- `json_normalize()` is a new method to allow you to create a flat table from semi-structured JSON data. See the docs (GH1067)
- Added PySide support for the qtpandas DataFrameModel and DataFrameWidget.
- Python csv parser now supports usecols (GH4335)
- Frequencies gained several new offsets:
  - LastWeekOfMonth (GH4637)
  - FY5253, and FY5253Quarter (GH4511)
- DataFrame has a new `interpolate` method, similar to Series (GH4434, GH1892)

```python
In [93]: df = pd.DataFrame({'A': [1, 2.1, np.nan, 4.7, 5.6, 6.8],
                      'B': [.25, np.nan, np.nan, 4, 12.2, 14.4]})

In [94]: df.interpolate()
Out[94]:
          A  B
0     1.0 0.25
1    2.1 1.50
2    3.4 2.75
3    4.7 4.00
4   5.6 12.20
5   6.8 14.40
```

Additionally, the method argument to `interpolate` has been expanded to include 'nearest', 'zero', 'slinear', 'quadratic', 'cubic', 'barycentric', 'krogh', 'piecewise_polynomial', 'pchip', 'polynomial', 'spline' The new methods require scipy. Consult the Scipy reference guide and documentation for more information about when the various methods are appropriate. See the docs.

Interpolate now also accepts a `limit` keyword argument. This works similar to `fillna`'s limit:
In [95]: ser = pd.Series([1, 3, np.nan, np.nan, np.nan, 11])

In [96]: ser.interpolate(limit=2)
Out[96]:
   0   1.0
   1   3.0
   2   5.0
   3   7.0
   4   NaN
   5  11.0
dtype: float64

• Added `wide_to_long` panel data convenience function. See the docs.

In [97]: np.random.seed(123)

In [98]: df = pd.DataFrame({"A1970" : {0 : "a", 1 : "b", 2 : "c"},
                   ....:               "A1980" : {0 : "d", 1 : "e", 2 : "f"},
                   ....:               "B1970" : {0 : 2.5, 1 : 1.2, 2 : .7},
                   ....:               "B1980" : {0 : 3.2, 1 : 1.3, 2 : .1},
                   ....:               "X" : dict(zip(range(3), np.random.randn(3)))
                   ....:               })

In [99]: df["id"] = df.index

In [100]: df
Out[100]:
0           a       d   2.5    3.2  -1.085631   0
1           b       e  1.2     1.3   0.997345   1
2           c       f  0.7     0.1   0.282978   2

In [101]: pd.wide_to_long(df, ["A", "B"], i="id", j="year")
Out[101]:
       X  A  B
    id year
0   1970 -1.085631  a  2.5
1   1970  0.997345  b  1.2
2   1970  0.282978  c  0.7
0   1980 -1.085631  d  3.2
1   1980  0.997345  e  1.3
2   1980  0.282978  f  0.1

• `to_csv` now takes a `date_format` keyword argument that specifies how output datetime objects should be formatted. Datetimes encountered in the index, columns, and values will all have this formatting applied. (GH4313)

• `DataFrame.plot` will scatter plot x versus y by passing kind='scatter' (GH2215)

• Added support for Google Analytics v3 API segment IDs that also supports v2 IDs. (GH5271)
Experimental

- The new `eval()` function implements expression evaluation using `numexpr` behind the scenes. This results in large speedups for complicated expressions involving large DataFrames/Series. For example,

```python
In [102]: nrows, ncols = 20000, 100
In [103]: df1, df2, df3, df4 = [pd.DataFrame(np.random.randn(nrows, ncols))
    .....:     for _ in range(4)]

# eval with NumExpr backend
In [104]: %timeit pd.eval('df1 + df2 + df3 + df4')
11.1 ms +- 760 us per loop (mean +- std. dev. of 7 runs, 100 loops each)

# pure Python evaluation
In [105]: %timeit df1 + df2 + df3 + df4
15.1 ms +- 510 us per loop (mean +- std. dev. of 7 runs, 100 loops each)
```

For more details, see the docs

- Similar to `pandas.eval`, `DataFrame` has a new `DataFrame.eval` method that evaluates an expression in the context of the DataFrame. For example,

```python
In [106]: df = pd.DataFrame(np.random.randn(10, 2), columns=['a', 'b'])
In [107]: df.eval('a + b')
Out[107]:
   a    b
0 -0.685204  1.589745
1  0.325441 -1.784153
2 -0.432893  0.171850
3  1.895919  3.065587
4 -0.092759  1.391365
5  1.895919  3.065587
6 -0.092759  1.391365
7  3.065587  1.895919
8  1.391365 -0.092759
9  1.391365 -0.092759
dtype: float64
```

- `query()` method has been added that allows you to select elements of a `DataFrame` using a natural query syntax nearly identical to Python syntax. For example,

```python
In [108]: n = 20
In [109]: df = pd.DataFrame(np.random.randint(n, size=(n, 3)), columns=['a', 'b', 'c'])
In [110]: df.query('a < b < c')
Out[110]:
   a   b   c
10  1   5   8
15  8  16  19
```

selects all the rows of `df` where `a < b < c` evaluates to `True`. For more details see the docs.
• pd.read_msgpack() and pd.to_msgpack() are now a supported method of serialization of arbitrary pandas
(and python objects) in a lightweight portable binary format. See the docs

**Warning:** Since this is an EXPERIMENTAL LIBRARY, the storage format may not be stable until a future
release.

```
df = pd.DataFrame(np.random.rand(5, 2), columns=list('AB'))
df.to_msgpack('foo.msg')
pd.read_msgpack('foo.msg')

s = pd.Series(np.random.rand(5), index=pd.date_range('20130101', periods=5))
pd.to_msgpack('foo.msg', df, s)
pd.read_msgpack('foo.msg')
```

You can pass iterator=True to iterator over the unpacked results

```
for o in pd.read_msgpack('foo.msg', iterator=True):
    print(o)
```

• pandas.io.gbq provides a simple way to extract from, and load data into, Google's BigQuery Data Sets by
way of pandas DataFrames. BigQuery is a high performance SQL-like database service, useful for performing
ad-hoc queries against extremely large datasets. See the docs

```
from pandas.io import gbq

# A query to select the average monthly temperatures in the
# in the year 2000 across the USA. The dataset,
# publicata:samples.gsod, is available on all BigQuery accounts,
# and is based on NOAA gsod data.

query = """SELECT station_number as STATION,
month as MONTH, AVG(mean_temp) as MEAN_TEMP
FROM publicdata:samples.gsod
WHERE YEAR = 2000
GROUP BY STATION, MONTH
ORDER BY STATION, MONTH ASC"""

# Fetch the result set for this query

# Your Google BigQuery Project ID
# To find this, see your dashboard:
# https://console.developers.google.com/iam-admin/projects?authuser=0
projectid = 'xxxxxxxxx'
df = gbq.read_gbq(query, project_id=projectid)

# Use pandas to process and reshape the dataset

df2 = df.pivot(index='STATION', columns='MONTH', values='MEAN_TEMP')
df3 = pd.concat([df2.min(), df2.mean(), df2.max()],
  axis=1, keys=['Min Tem', 'Mean Temp', 'Max Temp'])
```

The resulting DataFrame is:
Warning: To use this module, you will need a BigQuery account. See <https://cloud.google.com/products/big-query> for details.

As of 10/10/13, there is a bug in Google’s API preventing result sets from being larger than 100,000 rows. A patch is scheduled for the week of 10/14/13.

Internal refactoring

In 0.13.0 there is a major refacto primarily to subclass Series from NDFrame, which is the base class currently for DataFrame and Panel, to unify methods and behaviors. Series formerly subclassed directly from ndarray. (GH4080, GH3862, GH816)

Warning: There are two potential incompatibilities from < 0.13.0

- Using certain numpy functions would previously return a Series if passed a Series as an argument. This seems only to affect np.ones_like, np.empty_like, np.diff and np.where. These now return ndarrays.

<table>
<thead>
<tr>
<th>In [111]:</th>
<th>s = pd.Series([1, 2, 3, 4])</th>
</tr>
</thead>
</table>

Numpy Usage

<table>
<thead>
<tr>
<th>In [112]:</th>
<th>np.ones_like(s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Out[112]:</td>
<td>array([1, 1, 1, 1])</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>In [113]:</th>
<th>np.diff(s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Out[113]:</td>
<td>array([1, 1, 1])</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>In [114]:</th>
<th>np.where(s &gt; 1, s, np.nan)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Out[114]:</td>
<td>array([nan, 2., 3., 4.])</td>
</tr>
</tbody>
</table>

Pandonic Usage

<table>
<thead>
<tr>
<th>In [115]:</th>
<th>pd.Series(1, index=s.index)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Out[115]:</td>
<td>0 1</td>
</tr>
<tr>
<td></td>
<td>1 1</td>
</tr>
</tbody>
</table>
2 1
dtype: int64

In [116]: s.diff()
Out[116]:
0   NaN
1   1.0
2   1.0
3   1.0
dtype: float64

In [117]: s.where(s > 1)
Out[117]:
0   NaN
1   2.0
2   3.0
3   4.0
dtype: float64

• Passing a Series directly to a cython function expecting an ndarray type will no long work directly, you must pass Series.values, See Enhancing Performance
• Series(0.5) would previously return the scalar 0.5, instead this will return a 1-element Series
• This change breaks rpy2<=2.3.8. an Issue has been opened against rpy2 and a workaround is detailed in GH5698. Thanks @JanSchulz.

• Pickle compatibility is preserved for pickles created prior to 0.13. These must be unpickled with pd.read_pickle, see Pickling.
• Refactor of series.py/frame.py/panel.py to move common code to generic.py
  – added _setup_axes to created generic NDFrame structures
  – moved methods
    * from_axes,_wrap_array,axes,ix,loc,iloc,shape,empty,swapaxes,transpose,pop
    * __iter__,keys,__contains__,__len__,__neg__,__invert__
    * convert_objects,as_blocks,as_matrix,values
    * __getstate__,__setstate__ (compat remains in frame/panel)
    * __getattr__,__setattr__
    * _indexed_same,reindex_like,align,where,mask
    * fillna,replace (Series replace is now consistent with DataFrame)
    * filter (also added axis argument to selectively filter on a different axis)
    * reindex,reindex_axis,take
    * truncate (moved to become part of NDFrame)
• These are API changes which make Panel more consistent with DataFrame
  – swapaxes on a Panel with the same axes specified now return a copy
  – support attribute access for setting
– filter supports the same API as the original DataFrame filter
• Reindex called with no arguments will now return a copy of the input object
• TimeSeries is now an alias for Series. the property is_time_series can be used to distinguish (if desired)
• Refactor of Sparse objects to use BlockManager
  – Created a new block type in internals, SparseBlock, which can hold multi-dtypes and is non-consolidatable. SparseSeries and SparseDataFrame now inherit more methods from there hierarchy (Series/DataFrame), and no longer inherit from SparseArray (which instead is the object of the SparseBlock)
  – Sparse suite now supports integration with non-sparse data. Non-float sparse data is supportable (partially implemented)
  – Operations on sparse structures within DataFrames should preserve sparseness, merging type operations will convert to dense (and back to sparse), so might be somewhat inefficient
  – enable setitem on SparseSeries for boolean/integer/slices
  – SparsePanels implementation is unchanged (e.g. not using BlockManager, needs work)
• added ftypes method to Series/DataFrame, similar to dtypes, but indicates if the underlying is sparse/dense (as well as the dtype)
• All NDFrame objects can now use __finalize__() to specify various values to propagate to new objects from an existing one (e.g. name in Series will follow more automatically now)
• Internal type checking is now done via a suite of generated classes, allowing isinstance(value, klass) without having to directly import the klass, courtesy of @jtratner
• Bug in Series update where the parent frame is not updating its cache based on changes (GH4080) or types (GH3217), fillna (GH3386)
• Indexing with dtype conversions fixed (GH4463, GH4204)
• Refactor Series.reindex to core/generic.py (GH4604, GH4618), allow method= in reindexing on a Series to work
• Series.copy no longer accepts the order parameter and is now consistent with NDFrame copy
• Refactor rename methods to core/generic.py; fixes Series.rename for (GH4605), and adds rename with the same signature for Panel
• Refactor clip methods to core/generic.py (GH4798)
• Refactor of _get_numeric_data/_get_bool_data to core/generic.py, allowing Series/Panel functionality
• Series (for index) / Panel (for items) now allow attribute access to its elements (GH1903)
Bug fixes

- **HDFStore**
  - raising an invalid TypeError rather than ValueError when appending with a different block ordering (GH4096)
  - read_hdf was not respecting as passed mode (GH4504)
  - appending a 0-len table will work correctly (GH4273)
  - to_hdf was raising when passing both arguments append and table (GH4584)
  - reading from a store with duplicate columns across dtypes would raise (GH4767)
  - Fixed a bug where ValueError wasn't correctly raised when column names weren't strings (GH4956)
  - A zero length series written in Fixed format not deserializing properly. (GH4708)
  - Fixed decoding perf issue on pyt3 (GH5441)
  - Validate levels in a MultiIndex before storing (GH5527)
  - Correctly handle data_columns with a Panel (GH5717)

- Fixed bug in tslib.tz_convert(vals, tz1, tz2): it could raise IndexError exception while trying to access trans[pos + 1] (GH4496)

- The by argument now works correctly with the layout argument (GH4102, GH4014) in *.hist plotting methods

- Fixed bug in PeriodIndex.map where using str would return the str representation of the index (GH4136)

- Fixed test failure test_time_series_plot_color_with_empty_kwargs when using custom matplotlib default colors (GH4345)

- Fix running of stata IO tests. Now uses temporary files to write (GH4353)

- Fixed an issue where DataFrame.sum was slower than DataFrame.mean for integer valued frames (GH4365)

- read_html tests now work with Python 2.6 (GH4351)

- Fixed bug where network testing was throwing NameError because a local variable was undefined (GH4381)

- In to_json, raise if a passed orient would cause loss of data because of a duplicate index (GH4359)

- In to_json, fix date handling so milliseconds are the default timestamp as the docstring says (GH4362).

- as_index is no longer ignored when doing groupby apply (GH4648, GH3417)

- JSON NaT handling fixed, NaTs are now serialized to null (GH4498)

- Fixed JSON handling of escapable characters in JSON object keys (GH4593)

- Fixed passing keep_default_na=False when na_values=None (GH4318)

- Fixed bug with values raising an error on a DataFrame with duplicate columns and mixed dtypes, surfaced in (GH4377)

- Fixed bug with duplicate columns and type conversion in read_json when orient='split' (GH4377)
• Fixed JSON bug where locales with decimal separators other than ‘.’ threw exceptions when encoding / decoding certain values. (GH4918)

• Fix .iat indexing with a PeriodIndex (GH4390)

• Fixed an issue where PeriodIndex joining with self was returning a new instance rather than the same instance (GH4379); also adds a test for this for the other index types

• Fixed a bug with all the dtypes being converted to object when using the CSV parser with the usecols parameter (GH3192)

• Fix an issue in merging blocks where the resulting DataFrame had partially set _ref_locs (GH4403)

• Fixed an issue where hist subplots were being overwritten when they were called using the top level matplotlib API (GH4408)

• Fixed a bug where calling Series.astype(str) would truncate the string (GH4405, GH4437)

• Fixed a py3 compat issue where bytes were being repr’d as tuples (GH4455)

• Fixed Panel attribute naming conflict if item is named ‘a’ (GH3440)

• Fixed an issue where duplicate indexes were raising when plotting (GH4486)

• Fixed an issue where cumsum and cumprod didn’t work with bool dtypes (GH4170, GH4440)

• Fixed Panel slicing issued in xs that was returning an incorrect dimmed object (GH4016)

• Fix resampling bug where custom reduce function not used if only one group (GH3849, GH4494)

• Fixed Panel assignment with a transposed frame (GH3830)

• Raise on set indexing with a Panel and a Panel as a value which needs alignment (GH3777)

• frozenset objects now raise in the Series constructor (GH4482, GH4480)

• Fixed issue with sorting a duplicate MultiIndex that has multiple dtypes (GH4516)

• Fixed bug in DataFrame.set_values which was causing name attributes to be lost when expanding the index. (GH3742, GH4039)

• Fixed issue where individual names, levels and labels could be set on MultiIndex without validation (GH3714, GH4039)

• Fixed (GH3334) in pivot_table. Margins did not compute if values is the index.

• Fix bug in having a rhs of np.timedelta64 or np.offsets.DateOffset when operating with datetimes (GH4532)

• Fix arithmetic with series/datetimedelta and np.timedelta64 not working the same (GH4134) and buggy timedelta in NumPy 1.6 (GH4135)

• Fix bug in pd.read_clipboard on windows with PY3 (GH4561); not decoding properly

• tslib.get_period_field() and tslib.get_period_field_arr() now raise if code argument out of range (GH4519, GH4520)

• Fix boolean indexing on an empty series loses index names (GH4235), infer_dtype works with empty arrays.

• Fix reindexing with multiple axes; if an axes match was not replacing the current axes, leading to a possible lazy frequency inference issue (GH3317)

• Fixed issue where DataFrame.apply was reraising exceptions incorrectly (causing the original stack trace to be truncated).

• Fix selection with ix/loc and non_unique selectors (GH4619)
• Fix assignment with iloc/loc involving a dtype change in an existing column (GH4312, GH5702) have internal setitem_with_indexer in core/indexing to use Block.setitem
• Fixed bug where thousands operator was not handled correctly for floating point numbers in csv_import (GH4322)
• Fix an issue with CacheableOffset not properly being used by many DateOffset; this prevented the DateOffset from being cached (GH4609)
• Fix boolean comparison with a DataFrame on the lhs, and a list/tuple on the rhs (GH4576)
• Fix error/dtype conversion with setitem of None on Series/DataFrame (GH4667)
• Fix decoding based on a passed in non-default encoding in pd.read_stata (GH4626)
• Fix DataFrame.from_records with a plain-vanilla ndarray. (GH4727)
• Fix some inconsistencies with Index.rename and MultiIndex.rename, etc. (GH4718, GH4628)
• Bug in using iloc/loc with a cross-sectional and duplicate indices (GH4726)
• Bug with using QUOTE_NONE with to_csv causing Exception. (GH4328)
• Bug with Series indexing not raising an error when the right-hand-side has an incorrect length (GH2702)
• Bug in MultiIndexing with a partial string selection as one part of a MultiIndex (GH4758)
• Bug with reindexing on the index with a non-unique index will now raise ValueError (GH4746)
• Bug in setting with loc/ix a single indexer with a MultiIndex axis and a NumPy array, related to (GH3777)
• Bug in concatenation with duplicate columns across dtypes not merging with axis=0 (GH4771, GH4975)
• Bug in iloc with a slice index failing (GH4771)
• Incorrect error message with no colspecs or width in read_fwf. (GH4774)
• Fix bugs in indexing in a Series with a duplicate index (GH4548, GH4550)
• Fixed bug with reading compressed files with read_fwf in Python 3. (GH3963)
• Fixed an issue with a duplicate index and assignment with a dtype change (GH4686)
• Fixed an issue related to ticklocs/ticklabels with log scale bar plots across different versions of matplotlib (GH4789)
• Suppressed DeprecationWarning associated with internal calls issued by repr() (GH4391)
• Fixed an issue with a duplicate index and duplicate selector with .loc (GH4825)
• Fixed an issue with DataFrame.sort_index where, when sorting by a single column and passing a list for ascending, the argument for ascending was being interpreted as True (GH4839, GH4846)
• Fixed Panel.tshift not working. Added freq support to Panel.shift (GH4853)
• Fix an issue in TextFileReader w/ Python engine (i.e. PythonParser) with thousands != “,” (GH4596)
• Bug in getitem with a duplicate index when using where (GH4879)
• Fix Type inference code coerces float column into datetime (GH4601)
• Fixed _ensure_numeric does not check for complex numbers (GH4902)
• Fixed a bug in Series.hist where two figures were being created when the by argument was passed (GH4112, GH4113).
• Fixed a bug in `convert_objects` for > 2 ndims (GH4937)
• Fixed a bug in DataFrame/Panel cache insertion and subsequent indexing (GH4939, GH5424)
• Fixed string methods for `FrozenNDArray` and `FrozenList` (GH4929)
• Fixed a bug with setting invalid or out-of-range values in indexing enlargement scenarios (GH4940)
• Tests for fillna on empty Series (GH4346), thanks @immerrr
• Fixed `copy()` to shallow copy axes/indices as well and thereby keep separate metadata. (GH4202, GH4830)
• Fixed `skiprows` option in Python parser for read_csv (GH4382)
• Fixed bug preventing `cut` from working with `np.inf` levels without explicitly passing labels (GH3415)
• Fixed wrong check for overlapping in `DatetimeIndex.union` (GH4564)
• Fixed conflict between thousands separator and date parser in csv_parser (GH4678)
• `Timestamp` objects can now appear in the left hand side of a comparison operation with a `Series` or `DataFrame` object (GH4982).
• Fix a bug when indexing with `np.nan` via `iloc/loc` (GH5016)
• Fixed a bug where low memory c parser could create different types in different chunks of the same file. Now coerces to numerical type or raises warning. (GH3866)
• Fix a bug where reshaping a `Series` to its own shape raised `TypeError` (GH4554) and other reshaping issues.
• Bug in setting with `ix/loc` and a mixed int/string index (GH4544)
• Make sure series-series boolean comparisons are label based (GH4947)
• Bug in multi-level indexing with a `Timestamp` partial indexer (GH4294)
• Tests/fix for MultiIndex construction of an all-nan frame (GH4078)
• Fixed a bug where `read_html()` wasn’t correctly inferring values of tables with commas (GH5029)
• Fixed a bug where `read_html()` wasn’t providing a stable ordering of returned tables (GH4770, GH5029).
• Fixed a bug where `read_html()` was incorrectly parsing when passed `index_col=0` (GH5066).
• Fixed a bug where `read_html()` was incorrectly inferring the type of headers (GH5048).
• Fixed a bug where `DatetimeIndex` joins with `PeriodIndex` caused a stack overflow (GH3899).
• Fixed a bug where `groupby` objects didn’t allow plots (GH5102).
• Fixed a bug where `groupby` objects weren’t tab-completing column names (GH5102).
• Fixed a bug where `groupby.plot()` and friends were duplicating figures multiple times (GH5102).
• Provide automatic conversion of `object` dtypes on fillna, related (GH5103)
• Fixed a bug where default options were being overwritten in the option parser cleaning (GH5121).
• Treat a list/ndarray identically for `iloc` indexing with list-like (GH5006)
• Fix `MultiIndex.get_level_values()` with missing values (GH5074)
• Fix bound checking for `Timestamp()` with datetime64 input (GH4065)
• Fix a bug where `TestReadHtml` wasn’t calling the correct `read_html()` function (GH5150).
• Fix a bug with NDFrame.replace() which made replacement appear as though it was (incorrectly) using regular expressions (GH5143).
• Fix better error message for to_datetime (GH4928).
• Made sure different locales are tested on travis-ci (GH4918). Also adds a couple of utilities for getting locales and setting locales with a context manager.
• Fixed segfault on isnull(MultiIndex) (now raises an error instead) (GH5123, GH5125).
• Allow duplicate indices when performing operations that align (GH5185, GH5639).
• Compound dtypes in a constructor raise NotImplementedError (GH5191).
• Bug in comparing duplicate frames (GH4421) related
• Bug in describe on duplicate frames
• Bug in to_datetime with a format and coerce=True not raising (GH5195).
• Bug in loc setting with multiple indexers and a rhs of a Series that needs broadcasting (GH5206).
• Fixed bug where inplace setting of levels or labels on MultiIndex would not clear cached values property and therefore return wrong values. (GH5215).
• Fixed bug where filtering a grouped DataFrame or Series did not maintain the original ordering (GH4621).
• Fixed Period with a business date freq to always roll-forward if on a non-business date. (GH5203).
• Fixed bug in Excel writers where frames with duplicate column names weren’t written correctly. (GH5235).
• Fixed issue with drop and a non-unique index on Series (GH5248).
• Fixed segfault in C parser caused by passing more names than columns in the file. (GH5156).
• Fix Series.isin with date/time-like dtypes (GH5021).
• C and Python Parser can now handle the more common MultiIndex column format which doesn’t have a row for index names (GH4702).
• Bug when trying to use an out-of-bounds date as an object dtype (GH5312).
• Bug when trying to display an embedded PandasObject (GH5324).
• Allows operating of Timestamps to return a datetime if the result is out-of-bounds related (GH5312).
• Fix return value/type signature of initObjToJSON() to be compatible with numpy’s import_array() (GH5334, GH5326).
• Bug when renaming then set_index on a DataFrame (GH5344).
• Test suite no longer leaves around temporary files when testing graphics. (GH5347) (thanks for catching this @yarikoptic!).
• Fixed html tests on win32. (GH4580).
• Make sure that head/tail are iloc based, (GH5370).
• Fixed bug for PeriodIndex string representation if there are 1 or 2 elements. (GH5372).
• The GroupBy methods transform and filter can be used on Series and DataFrames that have repeated (non-unique) indices. (GH4620).
• Fix empty series not printing name in repr (GH4651).
• Make tests create temp files in temp directory by default. (GH5419).
• pd.to_timedelta of a scalar returns a scalar (GH5410).
• `pd.to_timedelta` accepts NaN and NaT, returning NaT instead of raising (GH5437)
• performance improvements in `isnull` on larger size pandas objects
• Fixed various setitem with 1d ndarray that does not have a matching length to the indexer (GH5508)
• Bug in getitem with a MultiIndex and `iloc` (GH5528)
• Bug in delitem on a Series (GH5542)
• Bug fix in apply when using custom function and objects are not mutated (GH5545)
• Bug in selecting from a non-unique index with `loc` (GH5553)
• Bug in groupby returning non-consistent types when user function returns a `None`, (GH5592)
• Work around regression in numpy 1.7.0 which erroneously raises `IndexError` from `ndarray.item` (GH5666)
• Bug in repeated indexing of object with resultant non-unique index (GH5678)
• Bug in fillna with Series and a passed series/dict (GH5703)
• Bug in groupby transform with a datetime-like grouper (GH5712)
• Bug in MultiIndex selection in PY3 when using certain keys (GH5725)
• Row-wise concat of differing dtypes failing in certain cases (GH5754)

5.18 Version 0.12

5.18.1 Version 0.12.0 (July 24, 2013)

This is a major release from 0.11.0 and includes several new features and enhancements along with a large number of bug fixes.

Highlights include a consistent I/O API naming scheme, routines to read html, write MultiIndexes to csv files, read & write STATA data files, read & write JSON format files, Python 3 support for HDFStore, filtering of groupby expressions via filter, and a revamped replace routine that accepts regular expressions.
API changes

- The I/O API is now much more consistent with a set of top level **reader** functions accessed like `pd.read_csv()` that generally return a **pandas** object.
  - `read_csv`
  - `read_excel`
  - `read_hdf`
  - `read_sql`
  - `read_json`
  - `read_html`
  - `read_stata`
  - `read_clipboard`

  The corresponding **writer** functions are object methods that are accessed like `df.to_csv()`
  - `to_csv`
  - `to_excel`
  - `to_hdf`
  - `to_sql`
  - `to_json`
  - `to_html`
  - `to_stata`
  - `to_clipboard`

- Fix modulo and integer division on Series,DataFrames to act similarly to **float** dtypes to return `np.nan` or `np.inf` as appropriate (GH3590). This correct a numpy bug that treats integer and float dtypes differently.

```
In [1]: p = pd.DataFrame(  
                   {"first": [4, 5, 8],  
                    "second": [0, 0, 3]})

In [2]: p % 0
Out[2]:
   first second
  0   NaN   NaN
  1   NaN   NaN
  2   NaN   NaN

In [3]: p % p
Out[3]:
   first  second
  0  0.0  NaN
  1  0.0  NaN
  2  0.0  0.0

In [4]: p / p
Out[4]:
   first  second
  0   1.0   NaN

• Add squeeze keyword to groupby to allow reduction from DataFrame -> Series if groups are unique. This is a
Regression from 0.10.1. We are reverting back to the prior behavior. This means groupby will return the same
shaped objects whether the groups are unique or not. Revert this issue (GH2893) with (GH3596).
In [2]: df2 = pd.DataFrame([{"val1": 1, "val2": 20},
...:
{"val1": 1, "val2": 19},
...:
{"val1": 1, "val2": 27},
...:
{"val1": 1, "val2": 12}])
In [3]: def func(dataf):
...:
return dataf["val2"] - dataf["val2"].mean()
...:
In [4]: # squeezing the result frame to a series (because we have unique groups)

• Raise on iloc when boolean indexing with a label based indexer mask e.g. a boolean Series, even with integer
labels, will raise. Since iloc is purely positional based, the labels on the Series are not alignable (GH3631)
This case is rarely used, and there are plenty of alternatives. This preserves the iloc API to be purely positional
based.
In [6]: df = pd.DataFrame(range(5), index=list("ABCDE"), columns=["a"])
In [7]: mask = df.a % 2 == 0
In [8]: mask
Out[8]:
A
True
B
False
(continues on next page)

5.18. Version 0.12

3519


C True
D False
E True
Name: a, dtype: bool

# this is what you should use
In [9]: df.loc[mask]
Out[9]:
   a
  A 0
  C 2
  E 4

# this will work as well
In [10]: df.iloc[mask.values]
Out[10]:
   a
  A 0
  C 2
  E 4

df.iloc[mask] will raise a ValueError

- The raise_on_error argument to plotting functions is removed. Instead, plotting functions raise a TypeError when the dtype of the object is object to remind you to avoid object arrays whenever possible and thus you should cast to an appropriate numeric dtype if you need to plot something.

- Add colormap keyword to DataFrame plotting methods. Accepts either a matplotlib colormap object (ie, matplotlib.cm.jet) or a string name of such an object (ie, ‘jet’). The colormap is sampled to select the color for each column. Please see Colormaps for more information. (GH3860)

- DataFrame.interpolate() is now deprecated. Please use DataFrame.fillna() and DataFrame.replace() instead. (GH3582, GH3675, GH3676)

- the method and axis arguments of DataFrame.replace() are deprecated

- DataFrame.replace’s infer_types parameter is removed and now performs conversion by default. (GH3907)

- Add the keyword allow_duplicates to DataFrame.insert to allow a duplicate column to be inserted if True, default is False (same as prior to 0.12) (GH3679)

- Implement __nonzero__ for NDFrame objects (GH3691, GH3696)

- IO api
  - added top-level function read_excel to replace the following, The original API is deprecated and will be removed in a future version

    ```python
    from pandas.io.parsers import ExcelFile
    xls = ExcelFile("path_to_file.xls")
    xls.parse("Sheet1", index_col=None, na_values=["NA"])
    ```

    With
import pandas as pd

pd.read_excel("path_to_file.xls", "Sheet1", index_col=None, na_values=["NA"])

- added top-level function read_sql that is equivalent to the following

```python
from pandas.io.sql import read_frame
read_frame(...)
```

- DataFrame.to_html and DataFrame.to_latex now accept a path for their first argument (GH3702)
- Do not allow astypes on datetime64[ns] except to object, and timedelta64[ns] to object/int (GH3425)
- The behavior of datetime64 dtypes has changed with respect to certain so-called reduction operations (GH3726). The following operations now raise a TypeError when performed on a Series and return an empty Series when performed on a DataFrame similar to performing these operations on, for example, a DataFrame of slice objects:
  - sum, prod, mean, std, var, skew, kurt, corr, and cov
- read_html now defaults to None when reading, and falls back on bs4 + html5lib when lxml fails to parse. a list of parsers to try until success is also valid
- The internal pandas class hierarchy has changed (slightly). The previous PandasObject now is called PandasContainer and a new PandasObject has become the base class for PandasContainer as well as Index, Categorical, GroupBy, SparseList, and SparseArray (+ their base classes). Currently, PandasObject provides string methods (from StringMixin). (GH4090, GH4092)
- New StringMixin that, given a __unicode__ method, gets python 2 and python 3 compatible string methods (__str__, __bytes__, and __repr__). Plus string safety throughout. Now employed in many places throughout the pandas library. (GH4090, GH4092)

### IO enhancements

- pd.read_html() can now parse HTML strings, files or urls and return DataFrames, courtesy of @cpcloud. (GH3477, GH3605, GH3606, GH3616). It works with a single parser backend: BeautifulSoup4 + html5lib See the docs

You can use pd.read_html() to read the output from DataFrame.to_html() like so

```python
In [11]: df = pd.DataFrame({"a": range(3), "b": list("abc")})

In [12]: print(df)
a b
0 0 a
1 1 b
2 2 c

In [13]: html = df.to_html()

In [14]: alist = pd.read_html(html, index_col=0)

In [15]: print(df == alist[0])
a b
0 True True
```

(continues on next page)
Note that `alist` here is a Python list so `pd.read_html()` and `DataFrame.to_html()` are not inverses.

- `pd.read_html()` no longer performs hard conversion of date strings (GH3656).

**Warning:** You may have to install an older version of BeautifulSoup4, *See the installation docs*

- Added module for reading and writing Stata files: `pandas.io.stata` (GH1512) accessible via `read_stata` top-level function for reading, and `to_stata` DataFrame method for writing, *See the docs*

- Added module for reading and writing json format files: `pandas.io.json` accessible via `read_json` top-level function for reading, and `to_json` DataFrame method for writing, *See the docs* various issues (GH1226, GH3804, GH3876, GH3867, GH1305)

- MultiIndex column support for reading and writing csv format files

  - The `header` option in `read_csv` now accepts a list of the rows from which to read the index.

  - The option, `tupleize_cols` can now be specified in both `to_csv` and `read_csv` to provide compatibility for the pre 0.12 behavior of writing and reading MultiIndex columns via a list of tuples. The default in 0.12 is to write lists of tuples and not interpret list of tuples as a MultiIndex column.

  Note: The default behavior in 0.12 remains unchanged from prior versions, but starting with 0.13, the default to write and read MultiIndex columns will be in the new format. (GH3571, GH1651, GH3141)

  - If an `index_col` is not specified (e.g. you don't have an index, or wrote it with `df.to_csv(..., index=False)`), then any names on the columns index will be lost.

```
In [16]: from pandas._testing import makeCustomDataFrame as mkdf

In [17]: df = mkdf(5, 3, r_idx_nlevels=2, c_idx_nlevels=4)

In [18]: df.to_csv("mi.csv")

In [19]: print(open("mi.csv").read())

```
• Support for HDFStore (via PyTables 3.0.0) on Python3

• Iterator support via read_hdf that automatically opens and closes the store when iteration is finished. This is only for tables

```python
In [25]: path = 'store_iterator.h5'

In [26]: pd.DataFrame(np.random.randn(10, 2)).to_hdf(path, 'df', table=True)

In [27]: for df in pd.read_hdf(path, 'df', chunksize=3):
   ....:     print(df)
   ....:
0 0 1
0 0.713216 -0.778461
1 -0.661062 0.862877
2 0.344342 0.149565
0 1
3 -0.626968 -0.875772
4 -0.930687 -0.218983
5 0.949965 -0.442354
0 1
6 -0.402985 1.111358
7 -0.241527 -0.670477
8 0.049355 0.632633
0 1
```

• read_csv will now throw a more informative error message when a file contains no columns, e.g., all newline characters

Other enhancements

• DataFrame.replace() now allows regular expressions on contained Series with object dtype. See the examples section in the regular docs Replacing via String Expression

For example you can do

```python
In [21]: df = pd.DataFrame({'a': list('ab..'), 'b': [1, 2, 3, 4]})

In [22]: df.replace(regex=r'\s*\..*', value=np.nan)
```

Out[22]:

```
a b
\0 a 1
1 b 2
```
to replace all occurrences of the string '. ' with zero or more instances of surrounding white space with NaN. Regular string replacement still works as expected. For example, you can do

```python
In [23]: df.replace(". ", np.nan)
Out[23]:
     a  b
0    a  1
1    b  2
2   NaN  3
3   NaN  4
```

to replace all occurrences of the string '. ' with NaN.

- `pd.melt()` now accepts the optional parameters `var_name` and `value_name` to specify custom column names of the returned DataFrame.
- `pd.set_option()` now allows N option, value pairs (GH3667).

Let’s say that we had an option 'a.b' and another option 'b.c'. We can set them at the same time:

```python
In [31]: pd.get_option('a.b')
Out[31]: 2
In [32]: pd.get_option('b.c')
Out[32]: 3
In [33]: pd.set_option('a.b', 1, 'b.c', 4)
In [34]: pd.get_option('a.b')
Out[34]: 1
In [35]: pd.get_option('b.c')
Out[35]: 4
```

- The `filter` method for group objects returns a subset of the original object. Suppose we want to take only elements that belong to groups with a group sum greater than 2.

```python
In [24]: sf = pd.Series([1, 1, 2, 3, 3, 3])
In [25]: sf.groupby(sf).filter(lambda x: x.sum() > 2)
Out[25]:
          3  3  3  3
        3
Name: sf, dtype: int64
```

The argument of `filter` must a function that, applied to the group as a whole, returns `True` or `False`. Another useful operation is filtering out elements that belong to groups with only a couple members.
In [26]: diff = pd.DataFrame({'A': np.arange(8), 'B': list('aabbccba')})

In [27]: diff.groupby('B').filter(lambda x: len(x) > 2)
Out[27]:
     A  B
2  2  b
3  3  b
4  4  b
5  5  b

Alternatively, instead of dropping the offending groups, we can return a like-indexed objects where the groups that do not pass the filter are filled with NaNs.

In [28]: diff.groupby('B').filter(lambda x: len(x) > 2, dropna=False)
Out[28]:
     A  B
   0 NaN NaN
   1 NaN NaN
  2 2.0  b
  3 3.0  b
  4 4.0  b
  5 5.0  b
  6 NaN NaN
  7 NaN NaN

• Series and DataFrame hist methods now take a figsize argument (GH3834)
• DatetimeIndexes no longer try to convert mixed-integer indexes during join operations (GH3877)
• Timestamp.min and Timestamp.max now represent valid Timestamp instances instead of the default datetime.min and datetime.max (respectively), thanks @SleepingPills
• read_html now raises when no tables are found and BeautifulSoup==4.2.0 is detected (GH4214)

Experimental features

• Added experimental CustomBusinessDay class to support DateOffsets with custom holiday calendars and custom weekmasks. (GH2301)

Note: This uses the numpy.busdaycalendar API introduced in Numpy 1.7 and therefore requires Numpy 1.7.0 or newer.

In [29]: from pandas.tseries.offsets import CustomBusinessDay
In [30]: from datetime import datetime

# As an interesting example, let's look at Egypt where
# a Friday-Saturday weekend is observed.
In [31]: weekmask_egypt = "Sun Mon Tue Wed Thu"

# They also observe International Workers' Day so let's
# add that for a couple of years

(continues on next page)
In [32]: holidays = ["2012-05-01", datetime(2013, 5, 1), np.datetime64("2014-05-01")]

In [33]: bday_egypt = CustomBusinessDay(holidays=holidays, weekmask=weekmask_egypt)

In [34]: dt = datetime(2013, 4, 30)

In [35]: print(dt + 2 * bday_egypt)
2013-05-05 00:00:00

In [36]: dts = pd.date_range(dt, periods=5, freq=bday_egypt)

In [37]: print(pd.Series(dts.weekday, dts).map(pd.Series("Mon Tue Wed Thu Fri Sat Sun".split())))

Freq: C, dtype: object

Bug fixes

- Plotting functions now raise a TypeError before trying to plot anything if the associated objects have a dtype of object (GH1818, GH3572, GH3911, GH3912), but they will try to convert object arrays to numeric arrays if possible so that you can still plot, for example, an object array with floats. This happens before any drawing takes place which eliminates any spurious plots from showing up.

-fillna methods now raise a TypeError if the value parameter is a list or tuple.

- Series.str now supports iteration (GH3638). You can iterate over the individual elements of each string in the Series. Each iteration yields a Series with either a single character at each index of the original Series or NaN. For example,

In [38]: strs = "go", "bow", "joe", "slow"

In [39]: ds = pd.Series(strs)

In [40]: for s in ds.str:
   ....:     print(s)
   ....:
0  g
1  b
2  j
3  s
dtype: object
0  o
1  o
2  o
3  l
dtype: object
0  NaN
The last element yielded by the iterator will be a `Series` containing the last element of the longest string in the `Series` with all other elements being NaN. Here since 'slow' is the longest string and there are no other strings with the same length 'w' is the only non-null string in the yielded `Series`.

- **HDFStore**
  - will retain index attributes (freq, tz, name) on recreation (GH3499)
  - will warn with an `AttributeConflictWarning` if you are attempting to append an index with a different frequency than the existing, or attempting to append an index with a different name than the existing
  - support datelike columns with a timezone as data_columns (GH2852)

- **Non-unique index support clarified (GH3468).**
  - Fix assigning a new index to a duplicate index in a DataFrame would fail (GH3468)
  - Fix construction of a DataFrame with a duplicate index
  - ref_locs support to allow duplicative indices across dtypes, allows `iget` support to always find the index (even across dtypes) (GH2194)
  - applymap on a DataFrame with a non-unique index now works (removed warning) (GH2786), and fix (GH3230)
  - Fix to_csv to handle non-unique columns (GH3495)
  - Duplicate indexes with `getitem` will return items in the correct order (GH3455, GH3457) and handle missing elements like unique indices (GH3561)
  - Duplicate indexes with and empty DataFrame.from_records will return a correct frame (GH3562)
  - Concat to produce a non-unique columns when duplicates are across dtypes is fixed (GH3602)
  - Allow insert/delete to non-unique columns (GH3679)
  - Non-unique indexing with a slice via `loc` and friends fixed (GH3659)
  - Allow insert/delete to non-unique columns (GH3679)
– Extend reindex to correctly deal with non-unique indices (GH3679)
– DataFrame.itertuples() now works with frames with duplicate column names (GH3873)
– Bug in non-unique indexing via iloc (GH4017); added takeable argument to reindex for location-based taking
– Allow non-unique indexing in series via .ix/.loc and __getitem__ (GH4246)
– Fixed non-unique indexing memory allocation issue with .ix/.loc (GH4280)

- DataFrame.from_records did not accept empty recarrays (GH3682)
- read_html now correctly skips tests (GH3741)
- Fixed a bug where DataFrame.replace with a compiled regular expression in the to_replace argument wasn't working (GH3907)
- Improved network test decorator to catch IOError (and therefore URLError as well). Added with_connectivity_check decorator to allow explicitly checking a website as a proxy for seeing if there is network connectivity. Plus, new optional_args decorator factory for decorators. (GH3910, GH3914)
- Fixed testing issue where too many sockets where open thus leading to a connection reset issue (GH3982, GH3985, GH4028, GH4054)
- Fixed failing tests in test_yahoo, test_google where symbols were not retrieved but were being accessed (GH3982, GH3985, GH4028, GH4054)
- Series.hist will now take the figure from the current environment if one is not passed
- Fixed bug where a 1xN DataFrame would barf on a 1xN mask (GH4071)
- Fixed running of tox under python3 where the pickle import was getting rewritten in an incompatible way (GH4062, GH4063)
- Fixed bug where sharex and sharey were not being passed to grouped_hist (GH4089)
- Fixed bug in DataFrame.replace where a nested dict wasn’t being iterated over when regex=False (GH4115)
- Fixed bug in the parsing of microseconds when using the format argument in to_datetime (GH4152)
- Fixed bug in PandasAutoDateLocator where invert_xaxis triggered incorrectly MilliSecondLocator (GH3990)
- Fixed bug in plotting that wasn’t raising on invalid colormap for matplotlib 1.1.1 (GH4215)
- Fixed the legend displaying in DataFrame.plot(kind='kde') (GH4216)
- Fixed bug where Index slices weren’t carrying the name attribute (GH4226)
- Fixed bug in initializing DatetimeIndex with an array of strings in a certain time zone (GH4229)
- Fixed bug where html5lib wasn’t being properly skipped (GH4265)
- Fixed bug where get_data_famafrench wasn’t using the correct file edges (GH4281)

See the full release notes or issue tracker on GitHub for a complete list.

5.19 Version 0.11

5.19.1 Version 0.11.0 (April 22, 2013)

This is a major release from 0.10.1 and includes many new features and enhancements along with a large number of bug fixes. The methods of Selecting Data have had quite a number of additions, and Dtype support is now full-fledged. There are also a number of important API changes that long-time pandas users should pay close attention to.

There is a new section in the documentation, 10 Minutes to Pandas, primarily geared to new users.

There is a new section in the documentation, Cookbook, a collection of useful recipes in pandas (and that we want contributions!).

There are several libraries that are now Recommended Dependencies

Selection choices

Starting in 0.11.0, object selection has had a number of user-requested additions in order to support more explicit location based indexing. pandas now supports three types of multi-axis indexing.

- `.loc` is strictly label based, will raise `KeyError` when the items are not found, allowed inputs are:
  - A single label, e.g. 5 or 'a', (note that 5 is interpreted as a label of the index. This use is not an integer position along the index)
  - A list or array of labels ['a', 'b', 'c']
  - A slice object with labels 'a': 'f', (note that contrary to usual python slices, both the start and the stop are included!)
- A boolean array

See more at *Selection by Label*

• `.iloc` is strictly integer position based (from 0 to `length-1` of the axis), will raise `IndexError` when the requested indices are out of bounds. Allowed inputs are:
  - An integer e.g. 5
  - A list or array of integers `[4, 3, 0]`
  - A slice object with ints `1:7`
  - A boolean array

See more at *Selection by Position*

• `.ix` supports mixed integer and label based access. It is primarily label based, but will fallback to integer positional access. `.ix` is the most general and will support any of the inputs to `.loc` and `.iloc`, as well as support for floating point label schemes. `.ix` is especially useful when dealing with mixed positional and label based hierarchical indexes.

As using integer slices with `.ix` have different behavior depending on whether the slice is interpreted as position based or label based, it’s usually better to be explicit and use `.iloc` or `.loc`.

See more at *Advanced Indexing* and *Advanced Hierarchical*.

**Selection deprecations**

Starting in version 0.11.0, these methods *may* be deprecated in future versions.

• `irow`
• `icol`
• `iget_value`

See the section *Selection by Position* for substitutes.

**Dtypes**

Numeric dtypes will propagate and can coexist in DataFrames. If a dtype is passed (either directly via the `dtype` keyword, a passed `ndarray`, or a passed `Series`, then it will be preserved in DataFrame operations. Furthermore, different numeric dtypes will **NOT** be combined. The following example will give you a taste.

```
in [1]: df1 = pd.DataFrame(np.random.randn(8, 1), columns=['A'], dtype='float32')
In [2]: df1
Out[2]:
   A
0  0.469112
1  0.282863
2  1.509058
3  1.135632
4  1.212112
5  0.173215
6  0.119209
7  1.044236
```

(continues on next page)
In [3]: df1.dtypes
Out[3]:
A  float32
dtype: object

In [4]: df2 = pd.DataFrame({'A': pd.Series(np.random.randn(8), dtype='float16'),
                        'B': pd.Series(np.random.randn(8)),
                        'C': pd.Series(range(8), dtype='uint8')})

In [5]: df2
Out[5]:
     A      B      C
0  0.8618   -0.4249   0
1 -2.1055    0.5670    1
2 -0.4949    0.2762    2
3  1.0723   -1.0874    3
4  0.7217   -0.6737    4
5 -0.7065    0.1136    5
6 -1.0400   -1.4784    6
7  0.2719    0.5249    7

In [6]: df2.dtypes
Out[6]:
A  float16
B    float64
C     uint8
dtype: object

# here you get some upcasting
In [7]: df3 = df1.reindex_like(df2).fillna(value=0.0) + df2

In [8]: df3
Out[8]:
     A      B      C
0 -0.3927   -0.4249    0.0
1 -2.3883    0.5670    1.0
2 -2.0039    0.2762    2.0
3 -2.0039   -1.0874    3.0
4  1.9338   -0.6737    4.0
5 -0.8798    0.1136    5.0
6 -0.9208   -1.4784    6.0
7 -0.7723    0.5249    7.0

In [9]: df3.dtypes
Out[9]:
A   float32
B   float64
C   float64
dtype: object
Dtype conversion

This is lower-common-denominator upcasting, meaning you get the dtype which can accommodate all of the types

```python
In [10]: df3.values.dtype
Out[10]: dtype('float64')
```

Conversion

```python
In [11]: df3.astype('float32').dtypes
Out[11]:
A    float32
B    float32
C    float32
dtype: object
```

Mixed conversion

```python
In [12]: df3['D'] = '1.'
In [13]: df3['E'] = '1'
In [14]: df3.convert_objects(convert_numeric=True).dtypes
Out[14]:
A    float32
B    float64
C    float64
D    float64
E    int64
dtype: object
```

# same, but specific dtype conversion
```python
In [15]: df3['D'] = df3['D'].astype('float16')
In [16]: df3['E'] = df3['E'].astype('int32')
```

```python
In [17]: df3.dtypes
Out[17]:
A    float32
B    float64
C    float64
D    float16
E    int32
dtype: object
```

Forcing date coercion (and setting NaT when not datelike)

```python
In [18]: import datetime
In [19]: s = pd.Series([datetime.datetime(2001, 1, 1, 0, 0), 'foo', 1.0, 1, ....:    pd.Timestamp('20010104'), '20010105'], dtype='O')
...:
In [20]: s.convert_objects(convert_dates='coerce')
```

(continues on next page)
Dtype gotchas

Platform gotchas

Starting in 0.11.0, construction of DataFrame/Series will use default dtypes of `int64` and `float64`, regardless of platform. This is not an apparent change from earlier versions of pandas. If you specify dtypes, they **WILL** be respected, however (GH2837).

The following will all result in `int64` dtypes

<table>
<thead>
<tr>
<th>In [21]:</th>
<th>pd.DataFrame([1, 2], columns=['a']).dtypes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Out[21]:</td>
<td>a  int64</td>
</tr>
<tr>
<td></td>
<td>dtype: object</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>In [22]:</th>
<th>pd.DataFrame({'a': [1, 2]}).dtypes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Out[22]:</td>
<td>a  int64</td>
</tr>
<tr>
<td></td>
<td>dtype: object</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>In [23]:</th>
<th>pd.DataFrame({'a': 1}, index=range(2)).dtypes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Out[23]:</td>
<td>a  int64</td>
</tr>
<tr>
<td></td>
<td>dtype: object</td>
</tr>
</tbody>
</table>

Keep in mind that `DataFrame(np.array([1,2]))` **WILL** result in `int32` on 32-bit platforms!

Upcasting gotchas

Performing indexing operations on integer type data can easily upcast the data. The dtype of the input data will be preserved in cases where nans are not introduced.

<table>
<thead>
<tr>
<th>In [24]:</th>
<th>dfi = df3.astype('int32')</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>In [25]:</th>
<th>dfi['D'] = dfi['D'].astype('int64')</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>In [26]:</th>
<th>dfi</th>
</tr>
</thead>
<tbody>
<tr>
<td>Out[26]:</td>
<td>A  B  C  D  E</td>
</tr>
<tr>
<td></td>
<td>0 0 0 0 1 1</td>
</tr>
<tr>
<td></td>
<td>1 -2 0 1 1 1</td>
</tr>
<tr>
<td></td>
<td>2 -2 0 2 1 1</td>
</tr>
<tr>
<td></td>
<td>3 0 -1 3 1 1</td>
</tr>
<tr>
<td></td>
<td>4 1 0 4 1 1</td>
</tr>
</tbody>
</table>
In [27]: dfi.dtypes
Out[27]:
A  int32
B  int32
C  int32
D  int64
E  int32
dtype: object

In [28]: casted = dfi[dfi > 0]

In [29]: casted
Out[29]:
A  B  C  D  E
0  NaN NaN NaN 1.0 NaN
0  NaN NaN NaN 2.0 NaN
0  NaN NaN NaN 3.0 NaN
0  NaN NaN NaN 4.0 NaN
0  NaN NaN NaN 5.0 NaN
0  NaN NaN NaN 6.0 NaN
0  NaN NaN NaN 7.0 NaN

In [30]: casted.dtypes
Out[30]:
A  float64
B  float64
C  float64
D  int64
E  int32
dtype: object

While float dtypes are unchanged.

In [31]: df4 = df3.copy()

In [32]: df4['A'] = df4['A'].astype('float32')

In [33]: df4.dtypes
Out[33]:
A  float32
B  float64
C  float64
D  float16
E  int32
dtype: object

In [34]: casted = df4[df4 > 0]
Datetimes conversion

Datet ime64[ns] columns in a DataFrame (or a Series) allow the use of np.nan to indicate a nan value, in addition to the traditional NaT, or not-a-time. This allows convenient nan setting in a generic way. Furthermore datetime64[ns] columns are created by default, when passed datetimelike objects (this change was introduced in 0.10.1) (GH2809, GH2810)
# use the traditional nan, which is mapped to NaT internally
In[16]: df.loc[df.index[2:4], ['A', 'timestamp']] = np.nan

In[17]: df

Out[17]:
   A      B  timestamp
0  2001-01-02 0.404705 0.577046
1  2001-01-03 -1.715002 -1.039268
2  2001-01-04       NaN       NaN
3  2001-01-05       NaN       NaN
4  2001-01-06 1.075770 -0.109050
5  2001-01-07 1.643563 -1.469388

Astype conversion on datetime64[ns] to object, implicitly converts NaT to np.nan

In[18]: import datetime

In[19]: s = pd.Series([datetime.datetime(2001, 1, 2, 0, 0) for i in range(3)])

In[20]: s.dtype

Out[20]: dtype('<M8[ns]')

In[21]: s[1] = np.nan

In[22]: s

Out[22]:
0  2001-01-02
1  NaN
2  2001-01-02
dtype: datetime64[ns]

In[23]: s.dtype

Out[23]: dtype('<M8[ns]')

In[24]: s = s.astype('O')

In[25]: s

Out[25]:
0  2001-01-02 00:00:00
1  NaN
2  2001-01-02 00:00:00
dtype: object

In[26]: s.dtype

Out[26]: dtype('O')
**API changes**

- Added `to_series()` method to indices, to facilitate the creation of indexers (GH3275)
- HDFStore
  - added the method `select_column` to select a single column from a table as a Series.
  - deprecated the `unique` method, can be replicated by `select_column(key, column).unique()
  - `min_itemsize` parameter to `append` will now automatically create `data_columns` for passed keys

**Enhancements**

- Improved performance of `df.to_csv()` by up to 10x in some cases. (GH3059)
- Numexpr is now a **Recommended Dependencies**, to accelerate certain types of numerical and boolean operations
- Bottleneck is now a **Recommended Dependencies**, to accelerate certain types of `nan` operations
- HDFStore
  - support `read_hdf/to_hdf` API similar to `read_csv/to_csv`

```
In [27]: df = pd.DataFrame({'A': range(5), 'B': range(5)})

In [28]: df.to_hdf('store.h5', 'table', append=True)

In [29]: pd.read_hdf('store.h5', 'table', where=['index > 2'])
```

- provide dotted attribute access to `get` from stores, e.g. `store.df == store['df']`
- new keywords `iterator=boolean, and chunksize=number_in_a_chunk` are provided to support iteration on `select` and `select_as_multiple` (GH3076)

- You can now select timestamps from an `unordered` timeseries similarly to an `ordered` timeseries (GH2437)
- You can now select with a string from a DataFrame with a datelike index, in a similar way to a Series (GH3070)

```
In [30]: idx = pd.date_range("2001-10-1", periods=5, freq='M')

In [31]: ts = pd.Series(np.random.rand(len(idx)), index=idx)

In [32]: ts['2001']
Out[32]:
2001-10-31  0.117967
2001-11-30  0.702184
2001-12-31  0.414034
Freq: M, dttype: float64

In [33]: df = pd.DataFrame({'A': ts})

In [34]: df['2001']
Out[34]:
```
• Squeeze to possibly remove length 1 dimensions from an object.

```python
>>> p = pd.Panel(np.random.randn(3, 4, 4), items=['ItemA', 'ItemB', 'ItemC'],
               major_axis=pd.date_range('20010102', periods=4),
               minor_axis=['A', 'B', 'C', 'D'])
>>> p
<class 'pandas.core.panel.Panel'>
Dimensions: 3 (items) x 4 (major_axis) x 4 (minor_axis)
Items axis: ItemA to ItemC
Major_axis axis: 2001-01-02 00:00:00 to 2001-01-05 00:00:00
Minor_axis axis: A to D
```

```plaintext
>>> p.reindex(items=['ItemA']).squeeze()
   A  B  C  D
2001-01-02  0.926089 -2.026458  0.501277 -0.204683
2001-01-03 -0.076524  1.081161  1.141361  0.479243
2001-01-04  0.641817 -0.185352  1.824568  0.809152
2001-01-05  0.575237  0.669934  1.398014 -0.399338
```

```plaintext
>>> p.reindex(items=['ItemA'], minor=['B']).squeeze()
Freq: D, Name: B, dtype: float64
```

• In `pd.io.data.Options`,
  - Fix bug when trying to fetch data for the current month when already past expiry.
  - Now using lxml to scrape html instead of BeautifulSoup (lxml was faster).
  - New instance variables for calls and puts are automatically created when a method that creates them is called. This works for current month where the instance variables are simply calls and puts. Also works for future expiry months and save the instance variable as `callsMMYY` or `putsMMYY`, where `MMYY` are, respectively, the month and year of the option’s expiry.
  - `Options.get_near_stock_price` now allows the user to specify the month for which to get relevant options data.
  - `Options.get_forward_data` now has optional kwargs `near` and `above_below`. This allows the user to specify if they would like to only return forward looking data for options near the current stock price. This just obtains the data from `Options.get_near_stock_price` instead of `Options.get_xxx_data()` (GH2758).

• Cursor coordinate information is now displayed in time-series plots.
• added option `display.max_seq_items` to control the number of elements printed per sequence pprinting it. (GH2979)
• added option `display.chop_threshold` to control display of small numerical values. (GH2739)
pandas: powerful Python data analysis toolkit, Release 1.3.5

• added option `display.max_info_rows` to prevent `verbose_info` from being calculated for frames above 1M rows (configurable). (GH2807, GH2918)

• `value_counts()` now accepts a “normalize” argument, for normalized histograms. (GH2710).

• `DataFrame.from_records` now accepts not only dicts but any instance of the collections.Mapping ABC.

• added option `display.mpl_style` providing a sleeker visual style for plots. Based on https://gist.github.com/huyng/816622 (GH3075).

• Treat boolean values as integers (values 1 and 0) for numeric operations. (GH2641)

• `to_html()` now accepts an optional “escape” argument to control reserved HTML character escaping (enabled by default) and escapes & in addition to < and >. (GH2919)

See the full release notes or issue tracker on GitHub for a complete list.

5.20 Version 0.10

5.20.1 Version 0.10.1 (January 22, 2013)

This is a minor release from 0.10.0 and includes new features, enhancements, and bug fixes. In particular, there is substantial new HDFStore functionality contributed by Jeff Reback.

An undesired API breakage with functions taking the inplace option has been reverted and deprecation warnings added.
API changes

- Functions taking an `inplace` option return the calling object as before. A deprecation message has been added.
- Groupby aggregations Max/Min no longer exclude non-numeric data (GH2700)
- Resampling an empty DataFrame now returns an empty DataFrame instead of raising an exception (GH2640)
- The file reader will now raise an exception when NA values are found in an explicitly specified integer column instead of converting the column to float (GH2631)
- `DatetimeIndex.unique` now returns a `DatetimeIndex` with the same name and timezone instead of an array (GH2563)

New features

- MySQL support for database (contribution from Dan Allan)

HDFStore

You may need to upgrade your existing data files. Please visit the `compatibility` section in the main docs.

You can designate (and index) certain columns that you want to be able to perform queries on a table, by passing a list to `data_columns`.

```
In [1]: store = pd.HDFStore("store.h5")

In [2]: df = pd.DataFrame(
   ...:     np.random.randn(8, 3),
   ...:     index=pd.date_range("1/1/2000", periods=8),

```

HDFStore now serializes MultiIndex dataframes when appending tables.

```
In [19]: index = pd.MultiIndex(levels=[["foo", "bar", "baz", "qux"],
                            ['one', 'two', 'three']],
                   labels=[[0, 0, 0, 1, 1, 2, 2, 3, 3, 3],
                           [0, 1, 2, 0, 1, 1, 2, 0, 1, 2]],
                   names=['foo', 'bar'])

In [20]: df = pd.DataFrame(np.random.randn(10, 3), index=index,
                         columns=['A', 'B', 'C'])

In [21]: df
Out[21]:
     A   B   C

Enhancements

- HDFStore now can read native PyTables table format tables
- You can pass nan_rep = 'my_nan_rep' to append, to change the default nan representation on disk (which converts to/from np.nan), this defaults to nan.
- You can pass index to append. This defaults to True. This will automagically create indices on the indexables and data columns of the table
- You can pass chunksize=an integer to append, to change the writing chunksize (default is 50000). This will significantly lower your memory usage on writing.
- You can pass expectedrows=an integer to the first append, to set the TOTAL number of expected rows that PyTables will expected. This will optimize read/write performance.
- Select now supports passing start and stop to provide selection space limiting in selection.
- Greatly improved ISO8601 (e.g., yyyy-mm-dd) date parsing for file parsers (GH2698)
- Allow DataFrame.merge to handle combinatorial sizes too large for 64-bit integer (GH2690)
- Series now has unary negation (-series) and inversion (~series) operators (GH2686)
- DataFrame.plot now includes a logx parameter to change the x-axis to log scale (GH2327)
- Series arithmetic operators can now handle constant and ndarray input (GH2574)
- ExcelFile now takes a kind argument to specify the file type (GH2613)
- A faster implementation for Series.str methods (GH2602)

Bug Fixes

- HDFStore tables can now store float32 types correctly (cannot be mixed with float64 however)
- Fixed Google Analytics prefix when specifying request segment (GH2713).
- Function to reset Google Analytics token store so users can recover from improperly setup client secrets (GH2687).
- Fixed groupby bug resulting in segfault when passing in MultiIndex (GH2706)
• Fixed bug where passing a Series with datetime64 values into `to_datetime` results in bogus output values (GH2699)

• Fixed bug in `pattern in HDFStore` expressions when pattern is not a valid regex (GH2694)

• Fixed performance issues while aggregating boolean data (GH2692)

• When given a boolean mask key and a Series of new values, `Series.__setitem__` will now align the incoming values with the original Series (GH2686)

• Fixed MemoryError caused by performing counting sort on sorting MultiIndex levels with a very large number of combinatorial values (GH2684)

• Fixed bug that causes plotting to fail when the index is a DatetimeIndex with a fixed-offset timezone (GH2683)

• Corrected business day subtraction logic when the offset is more than 5 bdays and the starting date is on a weekend (GH2680)

• Fixed C file parser behavior when the file has more columns than data (GH2668)

• Fixed file reader bug that misaligned columns with data in the presence of an implicit column and a specified `usecols` value

• DataFrames with numerical or datetime indices are now sorted prior to plotting (GH2609)

• Fixed DataFrame.from_records error when passed columns, index, but empty records (GH2633)

• Several bug fixed for Series operations when dtype is datetime64 (GH2689, GH2629, GH2626)

See the full release notes or issue tracker on GitHub for a complete list.

5.20.2 Version 0.10.0 (December 17, 2012)

This is a major release from 0.9.1 and includes many new features and enhancements along with a large number of bug fixes. There are also a number of important API changes that long-time pandas users should pay close attention to.

File parsing new features

The delimited file parsing engine (the guts of read_csv and read_table) has been rewritten from the ground up and now uses a fraction the amount of memory while parsing, while being 40% or more faster in most use cases (in some cases much faster).

There are also many new features:

• Much-improved Unicode handling via the encoding option.
• Column filtering (usecols)
• Dtype specification (dtype argument)
• Ability to specify strings to be recognized as True/False
• Ability to yield NumPy record arrays (as_recarray)
• High performance delim_whitespace option
• Decimal format (e.g. European format) specification
• Easier CSV dialect options: escapechar, lineterminator, quotechar, etc.
• More robust handling of many exceptional kinds of files observed in the wild

API changes

Deprecated DataFrame BINOP TimeSeries special case behavior

The default behavior of binary operations between a DataFrame and a Series has always been to align on the DataFrame’s columns and broadcast down the rows, except in the special case that the DataFrame contains time series. Since there are now method for each binary operator enabling you to specify how you want to broadcast, we are phasing out this special case (Zen of Python: Special cases aren’t special enough to break the rules). Here’s what I’m talking about:

```python
In [1]: import pandas as pd
In [2]: df = pd.DataFrame(np.random.randn(6, 4), index=pd.date_range("1/1/2000", periods=6))
In [3]: df
Out[3]:
   0   1   2   3

```

You will get a deprecation warning in the 0.10.x series, and the deprecated functionality will be removed in 0.11 or later.

**Altered resample default behavior**

The default time series resample binning behavior of daily D and higher frequencies has been changed to closed='left', label='left'. Lower nfrequencies are unaffected. The prior defaults were causing a great deal of confusion for users, especially resampling data to daily frequency (which labeled the aggregated group with the end of the interval: the next day).

```
In [1]: dates = pd.date_range('1/1/2000', '1/5/2000', freq='4h')
In [2]: series = pd.Series(np.arange(len(dates)), index=dates)
In [3]: series
```

```

Freq: D, dtype: int64

• Infinity and negative infinity are no longer treated as NA by isnull and notnull. That they ever were was a relic of early pandas. This behavior can be re-enabled globally by the mode.use_inf_as_null option:

In [6]: s = pd.Series([1.5, np.inf, 3.4, -np.inf])

In [7]: pd.isnull(s)

Out[7]:
0   False
1   False
2   False
3   False
In [8]: s.fillna(0)
Out[8):
0  1.500000
1   inf
2  3.400000
3  -inf
Length: 4, dtype: float64

In [9]: pd.set_option('use_inf_as_null', True)

In [10]: pd.isnull(s)
Out[10]:
0  False
1   True
2  False
3   True
Length: 4, dtype: bool

In [11]: s.fillna(0)
Out[11]:
0   1.5
1   0.0
2   3.4
3   0.0
Length: 4, dtype: float64

In [12]: pd.reset_option('use_inf_as_null')

- Methods with the inplace option now all return None instead of the calling object. E.g. code written like df = df.fillna(0, inplace=True) may stop working. To fix, simply delete the unnecessary variable assignment.
- pandas.merge no longer sorts the group keys (sort=False) by default. This was done for performance reasons: the group-key sorting is often one of the more expensive parts of the computation and is often unnecessary.
- The default column names for a file with no header have been changed to the integers 0 through N - 1. This is to create consistency with the DataFrame constructor with no columns specified. The v0.9.0 behavior (names X0, X1, ...) can be reproduced by specifying prefix='X':

In [6]: import io

In [7]: data = ""
   ...: a,b,c
   ...: 1,Yes,2
   ...: 3,No,4
   ...: ""
   ...:

In [8]: print(data)

a,b,c
1,Yes,2

(continues on next page)
Values like 'Yes' and 'No' are not interpreted as boolean by default, though this can be controlled by new `true_values` and `false_values` arguments:

```python
In [11]: print(data)
a,b,c
1,Yes,2
3,No,4
```

```python
In [12]: pd.read_csv(io.StringIO(data))
Out[12]:
a b c
0  1 Yes  2
1  3 No  4
```

```python
In [13]: pd.read_csv(io.StringIO(data), true_values=['Yes'], false_values=['No'])
Out[13]:
a b c
0  1 True  2
1  3 False 4
```

The file parsers will not recognize non-string values arising from a converter function as NA if passed in the `na_values` argument. It's better to do post-processing using the `replace` function instead.

Calling `fillna` on Series or DataFrame with no arguments is no longer valid code. You must either specify a fill value or an interpolation method:

```python
In [14]: s = pd.Series([np.nan, 1.0, 2.0, np.nan, 4])
```

```python
In [15]: s
Out[15]:
0   NaN
1   1.0
2   2.0
3  NaN
```
Convenience methods `ffill` and `bfill` have been added:

```
In [18]: s.ffill()
Out[18]:
0   NaN
1   1.0
2   2.0
3   2.0
4   4.0
dtype: float64
```

- `Series.apply` will now operate on a returned value from the applied function, that is itself a series, and possibly upcast the result to a DataFrame

```
In [19]: def f(x):
       ....:     return pd.Series([x, x ** 2], index=['x', 'x^2'])
       ....:

In [20]: s = pd.Series(np.random.rand(5))

In [21]: s
Out[21]:
0   0.340445
1   0.984729
2   0.919540
3   0.037772
4   0.861549
dtype: float64

In [22]: s.apply(f)
Out[22]:
```
• New API functions for working with pandas options (GH2097):
  – **get_option** / **set_option** - get/set the value of an option. Partial names are accepted. - **reset_option** - reset one or more options to their default value. Partial names are accepted. - **describe_option** - print a description of one or more options. When called with no arguments, print all registered options.

Note: **set_printoptions** / **reset_printoptions** are now deprecated (but functioning), the print options now live under "display.XYZ". For example:

```python
In [23]: pd.get_option("display.max_rows")
Out[23]: 15
```

• to_string() methods now always return unicode strings (GH2224).

### New features

#### Wide DataFrame printing

Instead of printing the summary information, pandas now splits the string representation across multiple rows by default:

```python
In [24]: wide_frame = pd.DataFrame(np.random.randn(5, 16))
In [25]: wide_frame
Out[25]:
    0     1     2     3     4     5    ...    10    11     12    13    14    15
[5 rows x 16 columns]
```

The old behavior of printing out summary information can be achieved via the `expand_frame_repr` print option:

```python
In [26]: pd.set_option("expand_frame_repr", False)
In [27]: wide_frame
Out[27]:
    0     1     2     3     4     5    ...    10    11    12    13    14    15
[5 rows x 16 columns]
```
The width of each line can be changed via ‘line_width’ (80 by default):

```python
pd.set_option("line_width", 40)
wide_frame
```

### Updated PyTables support

*Docs* for PyTables Table format & several enhancements to the api. Here is a taste of what to expect.

```python
In [41]: store = pd.HDFStore('store.h5')
```

```python
In [42]: df = pd.DataFrame(np.random.randn(8, 3),
                      index=pd.date_range('1/1/2000', periods=8),
                      columns=['A', 'B', 'C'])
```

```python
In [43]: df
Out[43]:
```

<table>
<thead>
<tr>
<th></th>
<th>A</th>
<th>B</th>
<th>C</th>
</tr>
</thead>
<tbody>

[8 rows x 5 columns]

In [69]: df1.get_dtype_counts()

| dtype: float64 | 3 |
| dtype: int64   | 1 |
| dtype: object  | 1 |

- performance improvements on table writing
- support for arbitrarily indexed dimensions
- SparseSeries now has a density property (GH2384)
- enable Series.str.strip/lstrip/rstrip methods to take an input argument to strip arbitrary characters (GH2411)
- implement value_vars in melt to limit values to certain columns and add melt to pandas namespace (GH2412)

**Bug Fixes**

- added Term method of specifying where conditions (GH1996).
- del store['df'] now call store.remove('df') for store deletion
- deleting of consecutive rows is much faster than before
- min_itemsize parameter can be specified in table creation to force a minimum size for indexing columns (the previous implementation would set the column size based on the first append)
- indexing support via create_table_index (requires PyTables >= 2.3) (GH698).
- appending on a store would fail if the table was not first created via put
- fixed issue with missing attributes after loading a pickled dataframe (GH2431)
- minor change to select and remove: require a table ONLY if where is also provided (and not None)

**Compatibility**
0.10 of HDFStore is backwards compatible for reading tables created in a prior version of pandas, however, query terms using the prior (undocumented) methodology are unsupported. You must read in the entire file and write it out using the new format to take advantage of the updates.

### N dimensional panels (experimental)

Adding experimental support for Panel4D and factory functions to create n-dimensional named panels. Here is a taste of what to expect.

```python
In [58]: p4d = Panel4D(np.random.randn(2, 2, 5, 4),
....:                labels=['Label1','Label2'],
....:                items=['Item1', 'Item2'],
....:                major_axis=date_range('1/1/2000', periods=5),
....:                minor_axis=['A', 'B', 'C', 'D'])

In [59]: p4d
```

```
Out[59]:
<class 'pandas.core.panel.Panel4D'>
Dimensions: 2 (labels) x 2 (items) x 5 (major_axis) x 4 (minor_axis)
Labels axis: Label1 to Label2
Items axis: Item1 to Item2
Major_axis axis: 2000-01-01 00:00:00 to 2000-01-05 00:00:00
Minor_axis axis: A to D
```

See the full release notes or issue tracker on GitHub for a complete list.

5.21 Version 0.9

5.21.1 Version 0.9.1 (November 14, 2012)

This is a bug fix release from 0.9.0 and includes several new features and enhancements along with a large number of bug fixes. The new features include by-column sort order for DataFrame and Series, improved NA handling for the rank method, masking functions for DataFrame, and intraday time-series filtering for DataFrame.

New features

• Series.sort, DataFrame.sort, and DataFrame.sort_index can now be specified in a per-column manner to support multiple sort orders (GH928)

```python
In [2]: df = pd.DataFrame(np.random.randint(0, 2, (6, 3)),
                      columns=['A', 'B', 'C'])

In [3]: df.sort(['A', 'B'], ascending=[1, 0])
```

Out[3]:
```
   A  B  C
3  1  0  1
4  1  0  1
2  0  0  1
0  1  0  0
1  0  1  0
5  1  0  0
```

• DataFrame.rank now supports additional argument values for the na_option parameter so missing values can be assigned either the largest or the smallest rank (GH1508, GH2159)
In [1]: df = pd.DataFrame(np.random.randn(6, 3), columns=['A', 'B', 'C'])

In [3]: df.rank()
Out[3]:
   A  B  C
0  3.0  2.0  1.0
1  1.0  3.0  2.0
2 NaN NaN NaN
3 NaN NaN NaN
4 NaN NaN NaN
5  2.0  1.0  3.0
[6 rows x 3 columns]

In [4]: df.rank(na_option='top')
Out[4]:
   A  B  C
0  6.0  5.0  4.0
1  4.0  6.0  5.0
2  2.0  2.0  2.0
3  2.0  2.0  2.0
4  2.0  2.0  2.0
5  5.0  4.0  6.0
[6 rows x 3 columns]

In [5]: df.rank(na_option='bottom')
Out[5]:
   A  B  C
0  3.0  2.0  1.0
1  1.0  3.0  2.0
2  5.0  5.0  5.0
3  5.0  5.0  5.0
4  5.0  5.0  5.0
5  2.0  1.0  3.0
[6 rows x 3 columns]

- DataFrame has new `where` and `mask` methods to select values according to a given boolean mask (GH2109, GH2151)

DataFrame currently supports slicing via a boolean vector the same length as the DataFrame (inside the []). The returned DataFrame has the same number of columns as the original, but is sliced on its index.

In [6]: df = DataFrame(np.random.randn(5, 3), columns=['A', 'B', 'C'])

In [7]: df
Out[7]:
   A   B   C
0  0.276232 -1.087401 -0.673690
If a DataFrame is sliced with a DataFrame based boolean condition (with the same size as the original DataFrame), then a DataFrame the same size (index and columns) as the original is returned, with elements that do not meet the boolean condition as NaN. This is accomplished via the new method DataFrame.where. In addition, where takes an optional other argument for replacement.

In [9]: df[df>0]
Out[9]:
    A    B    C
0  0.276232  NaN  NaN
1  0.113648  NaN  0.524988
2  0.404705  0.577046  NaN
3  NaN  NaN  NaN
4  NaN  0.844885  1.075770

[5 rows x 3 columns]

In [10]: df.where(df>0)
Out[10]:
    A    B    C
0  0.276232  NaN  NaN
1  0.113648  NaN  0.524988
2  0.404705  0.577046  NaN
3  NaN  NaN  NaN
4  NaN  0.844885  1.075770

[5 rows x 3 columns]

In [11]: df.where(df>0,-df)
Out[11]:
    A    B    C
0  0.276232  1.087401  0.673690
1  0.113648  1.478427  0.524988
2  0.404705  0.577046  1.715002
3  1.039268  0.370647  1.157892
4  1.344312  0.844885  1.075770

(continues on next page)
Furthermore, `where` now aligns the input boolean condition (ndarray or DataFrame), such that partial selection with setting is possible. This is analogous to partial setting via `.ix` (but on the contents rather than the axis labels).

```python
In [12]: df2 = df.copy()

In [13]: df2[ df2[1:4] > 0 ] = 3

In [14]: df2
```
```
Out[14]:
     A    B       C
0  0.2762  NaN   NaN
1  3.0000  NaN  3.0000
2  3.0000  NaN -1.7150
3  3.0000  NaN -1.7150
4  3.0000  NaN  1.0758
```

`DataFrame.mask` is the inverse boolean operation of `where`.

```python
In [15]: df.mask(df<=0)
```
```
Out[15]:
     A    B       C
0  0.2762  NaN  NaN
1  0.1136  NaN  0.5249
2  0.4047  NaN  NaN
3  NaN   NaN  NaN
4  NaN   0.8449  1.0758
```

- Enable referencing of Excel columns by their column names (GH1936)

```python
In [16]: xl = pd.ExcelFile('data/test.xls')

In [17]: xl.parse('Sheet1', index_col=0, parse_dates=True,  
....:         parse_cols='A:D')
....:
```
```
Out[17]:
     A    B    C     D
2000-01-03 0.9802 3.6857 -0.3642 -1.1597
2000-01-04 1.0479 -0.0412 -0.1618  0.2125
2000-01-05 0.4986 0.7312 -0.5377  1.3463

```

pandas: powerful Python data analysis toolkit, Release 1.3.5

- Added option to disable pandas-style tick locators and formatters using `series.plot(x_compat=True)` or `pandas.plot_params['x_compat'] = True` (GH2205)
- Existing TimeSeries methods `at_time` and `between_time` were added to DataFrame (GH2149)
- DataFrame.dot can now accept ndarrays (GH2042)
- DataFrame.drop now supports non-unique indexes (GH2101)
- Panel.shift now supports negative periods (GH2164)
- DataFrame now support unary ~ operator (GH2110)

API changes

- Upsampling data with a PeriodIndex will result in a higher frequency TimeSeries that spans the original time window

```python
In [1]: prng = pd.period_range('2012Q1', periods=2, freq='Q')
In [2]: s = pd.Series(np.random.randn(len(prng)), prng)
In [4]: s.resample('M')
Out[4]:
2012-01 -1.471992
2012-02 NaN
2012-03 NaN
2012-04 -0.493593
2012-05 NaN
2012-06 NaN
Freq: M, dtype: float64
```

- `Period.end_time` now returns the last nanosecond in the time interval (GH2124, GH2125, GH1764)

```python
In [18]: p = pd.Period('2012')
In [19]: p.end_time
Out[19]: Timestamp('2012-12-31 23:59:59.999999999')
```

- File parsers no longer coerce to float or bool for columns that have custom converters specified (GH2184)

```python
In [20]: import io
In [21]: data = ('A,B,C\n' '....:
  ' '00001,001,5\n' '....:
  ' '00002,002,6'

In [22]: pd.read_csv(io.StringIO(data), converters={'A': lambda x: x.strip()})
Out[22]:
   A  B  C
0  1  5
1  2  6
[2 rows x 3 columns]
```

See the full release notes or issue tracker on GitHub for a complete list.

5.21.2 Version 0.9.0 (October 7, 2012)

This is a major release from 0.8.1 and includes several new features and enhancements along with a large number of bug fixes. New features include vectorized unicode encoding/decoding for Series.str.to_latex method to DataFrame, more flexible parsing of boolean values, and enabling the download of options data from Yahoo! Finance.

New features

- Add encode and decode for unicode handling to *vectorized string processing methods* in Series.str (GH1706)
- Add DataFrame.to_latex method (GH1735)
- Add convenient expanding window equivalents of all rolling_* ops (GH1785)
- Add Options class to pandas.io.data for fetching options data from Yahoo! Finance (GH1748, GH1739)
- More flexible parsing of boolean values (Yes, No, TRUE, FALSE, etc) (GH1691, GH1295)
- Add level parameter to Series.reset_index
- TimeSeries.between_time can now select times across midnight (GH1871)
- Series constructor can now handle generator as input (GH1679)
- DataFrame.dropna can now take multiple axes (tuple/list) as input (GH924)
- Enable skip_footer parameter in ExcelFile.parse (GH1843)
API changes

- The default column names when header=None and no column names passed to functions like `read_csv` has changed to be more Pythonic and amenable to attribute access:

```
In [1]: import io

In [2]: data = ""
   ...: 0,0,1
   ...: 1,1,0
   ...: 0,1,0
   ...:
   ...:

In [3]: df = pd.read_csv(io.StringIO(data), header=None)

In [4]: df
Out[4]:
          0  1  2
       0  0  0  1
       1  1  1  0
       2  0  1  0
[3 rows x 3 columns]
```

- Creating a Series from another Series, passing an index, will cause reindexing to happen inside rather than treating the Series like an ndarray. Technically improper usages like `Series(df[col1], index=df[col2])` that worked before “by accident” (this was never intended) will lead to all NA Series in some cases. To be perfectly clear:

```
In [5]: s1 = pd.Series([1, 2, 3])

In [6]: s1
Out[6]:
   0   1
   1   2
   2   3
Length: 3, dtype: int64

In [7]: s2 = pd.Series(s1, index=["foo", "bar", "baz"])

In [8]: s2
Out[8]:
   foo   NaN
   bar   NaN
   baz   NaN
Length: 3, dtype: float64
```

- Deprecated day_of_year API removed from PeriodIndex, use dayofyear (GH1723)

- Don’t modify NumPy suppress printoption to True at import time

- The internal HDF5 data arrangement for DataFrames has been transposed. Legacy files will still be readable by HDFStore (GH1834, GH1824)

- Legacy cruft removed: pandas.stats.misc.quantileTS
• Use ISO8601 format for Period repr: monthly, daily, and on down (GH1776)

• Empty DataFrame columns are now created as object dtype. This will prevent a class of TypeErrors that was occurring in code where the dtype of a column would depend on the presence of data or not (e.g. a SQL query having results) (GH1783)

• Setting parts of DataFrame/Panel using ix now aligns input Series/DataFrame (GH1630)

• first and last methods in GroupBy no longer drop non-numeric columns (GH1809)

• Resolved inconsistencies in specifying custom NA values in text parser. na_values of type dict no longer override default NAs unless keep_default_na is set to false explicitly (GH1657)

• DataFrame.dot will not do data alignment, and also work with Series (GH1915)

See the full release notes or issue tracker on GitHub for a complete list.

5.22 Version 0.8

5.22.1 Version 0.8.1 (July 22, 2012)

This release includes a few new features, performance enhancements, and over 30 bug fixes from 0.8.0. New features include notably NA friendly string processing functionality and a series of new plot types and options.

New features

- Add vectorized string processing methods accessible via Series.str (GH620)
- Add option to disable adjustment in EWMA (GH1584)
- Radviz plot (GH1566)
- Parallel coordinates plot
- Bootstrap plot
- Per column styles and secondary y-axis plotting (GH1559)
- New datetime converters millisecond plotting (GH1599)
- Add option to disable “sparse” display of hierarchical indexes (GH1538)
- Series/DataFrame’s set_index method can append levels to an existing Index/MultiIndex (GH1569, GH1577)

Performance improvements

- Improved implementation of rolling min and max (thanks to Bottleneck !)
- Add accelerated ‘median’ GroupBy option (GH1358)
- Significantly improve the performance of parsing ISO8601-format date strings with DatetimeIndex or to_datetime (GH1571)
- Improve the performance of GroupBy on single-key aggregations and use with Categorical types
- Significant datetime parsing performance improvements

Contributors

A total of 5 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

5.22.2 Version 0.8.0 (June 29, 2012)

This is a major release from 0.7.3 and includes extensive work on the time series handling and processing infrastructure as well as a great deal of new functionality throughout the library. It includes over 700 commits from more than 20 distinct authors. Most pandas 0.7.3 and earlier users should not experience any issues upgrading, but due to the migration to the NumPy datetime64 dtype, there may be a number of bugs and incompatibilities lurking. Lingering incompatibilities will be fixed ASAP in a 0.8.1 release if necessary. See the full release notes or issue tracker on GitHub for a complete list.

Support for non-unique indexes

All objects can now work with non-unique indexes. Data alignment / join operations work according to SQL join semantics (including, if application, index duplication in many-to-many joins)

NumPy datetime64 dtype and 1.6 dependency

Time series data are now represented using NumPy’s datetime64 dtype; thus, pandas 0.8.0 now requires at least NumPy 1.6. It has been tested and verified to work with the development version (1.7+) of NumPy as well which includes some significant user-facing API changes. NumPy 1.6 also has a number of bugs having to do with nanosecond resolution data, so I recommend that you steer clear of NumPy 1.6’s datetime64 API functions (though limited as they are) and only interact with this data using the interface that pandas provides.

See the end of the 0.8.0 section for a “porting” guide listing potential issues for users migrating legacy code bases from pandas 0.7 or earlier to 0.8.0.

Bug fixes to the 0.7.x series for legacy NumPy < 1.6 users will be provided as they arise. There will be no more further development in 0.7.x beyond bug fixes.

Time Series changes and improvements

Note:  With this release, legacy scikits.timeseries users should be able to port their code to use pandas.

Note:  See documentation for overview of pandas timeseries API.

• New datetime64 representation speeds up join operations and data alignment, reduces memory usage, and improve serialization / deserialization performance significantly over datetime.datetime

• High performance and flexible resample method for converting from high-to-low and low-to-high frequency. Supports interpolation, user-defined aggregation functions, and control over how the intervals and result labeling are defined. A suite of high performance Cython/C-based resampling functions (including Open-High-Low-Close) have also been implemented.

• Revamp of frequency aliases and support for frequency shortcuts like ’15min’, or ’1h30min’

• New DatetimeIndex class supports both fixed frequency and irregular time series. Replaces now deprecated DateRange class

• New PeriodIndex and Period classes for representing time spans and performing calendar logic, including the 12 fiscal quarterly frequencies <timeseries.quarterly>. This is a partial port of, and a substantial enhancement to, elements of the scikits.timeseries code base. Support for conversion between PeriodIndex and DatetimeIndex
• New Timestamp data type subclasses `datetime.datetime`, providing the same interface while enabling working with nanosecond-resolution data. Also provides easy time zone conversions.

• Enhanced support for time zones. Add `tz_convert` and `tz_localize` methods to TimeSeries and DataFrame. All timestamps are stored as UTC; Timestamps from DatetimeIndex objects with time zone set will be localized to local time. Time zone conversions are therefore essentially free. User needs to know very little about pytz library now; only time zone names as strings are required. Time zone-aware timestamps are equal if and only if their UTC timestamps match. Operations between time zone-aware time series with different time zones will result in a UTC-indexed time series.

• Time series string indexing conveniences / shortcuts: slice years, year and month, and index values with strings

• Enhanced time series plotting; adaptation of scikits.timeseries matplotlib-based plotting code

• New `date_range`, `bdate_range`, and `period_range` factory functions

• Robust frequency inference function `infer_freq` and `inferred_freq` property of DatetimeIndex, with option to infer frequency on construction of DatetimeIndex

• `to_datetime` function efficiently parses array of strings to DatetimeIndex. DatetimeIndex will parse array or list of strings to datetime64

• Optimized support for datetime64-dtype data in Series and DataFrame columns

• New NaT (Not-a-Time) type to represent NA in timestamp arrays

• Optimize Series.asof for looking up “as of” values for arrays of timestamps

• Milli, Micro, Nano date offset objects

• Can index time series with `datetime.time` objects to select all data at particular time of day (TimeSeries.at_time) or between two times (TimeSeries.between_time)

• Add `tshift` method for leading/lagging using the frequency (if any) of the index, as opposed to a naive lead/lag using shift

Other new features

• New `cut` and `qcut` functions (like R’s cut function) for computing a categorical variable from a continuous variable by binning values either into value-based (`cut`) or quantile-based (`qcut`) bins

• Rename Factor to Categorical and add a number of usability features

• Add `limit` argument to fillna/reindex

• More flexible multiple function application in GroupBy, and can pass list (name, function) tuples to get result in particular order with given names

• Add flexible `replace` method for efficiently substituting values

• Enhanced `read_csv/read_table` for reading time series data and converting multiple columns to dates

• Add `comments` option to parser functions: `read_csv`, etc.

• Add `dayfirst` option to parser functions for parsing international DD/MM/YYYY dates

• Allow the user to specify the CSV reader `dialect` to control quoting etc.

• Handling thousands separators in `read_csv` to improve integer parsing.

• Enable unstacking of multiple levels in one shot. Alleviate `pivot_table` bugs (empty columns being introduced)

• Move to klib-based hash tables for indexing; better performance and less memory usage than Python’s dict
• Add first, last, min, max, and prod optimized GroupBy functions
• New `ordered_merge` function
• Add flexible `comparison` instance methods `eq`, `ne`, `lt`, `gt`, etc. to DataFrame, Series
• Improve `scatter_matrix` plotting function and add histogram or kernel density estimates to diagonal
• Add `'kde'` plot option for density plots
• Support for converting DataFrame to R data.frame through rpy2
• Improved support for complex numbers in Series and DataFrame
• Add `pct_change` method to all data structures
• Add `max_colwidth` configuration option for DataFrame console output
• `Interpolate` Series values using index values
• Can select multiple columns from GroupBy
• Add `update` methods to Series/DataFrame for updating values in place
• Add `any` and `all` method to DataFrame

**New plotting methods**

```python
import pandas as pd
fx = pd.read_pickle("data/fx_prices")
import matplotlib.pyplot as plt

Series.plot now supports a `secondary_y` option:

```python
plt.figure()
fx["FR"].plot(style="g")
fx["IT"].plot(style="k--", secondary_y=True)
```

Vytautas Jancauskas, the 2012 GSOC participant, has added many new plot types. For example, `'kde'` is a new option:

```python
s = pd.Series(
    np.concatenate((np.random.randn(1000), np.random.randn(1000) * 0.5 + 3))
)
plt.figure()
s.hist(density=True, alpha=0.2)
s.plot(kind="kde")
```

See the plotting page for much more.
Other API changes

- Deprecation of `offset`, `time_rule`, and `timeRule` arguments names in time series functions. Warnings will be printed until pandas 0.9 or 1.0.

Potential porting issues for pandas <= 0.7.3 users

The major change that may affect you in pandas 0.8.0 is that time series indexes use NumPy’s `datetime64` data type instead of `dtype=object` arrays of Python’s built-in `datetime.datetime` objects. `DateRange` has been replaced by `DatetimeIndex` but otherwise behaved identically. But, if you have code that converts `DateRange` or `Index` objects that used to contain `datetime.datetime` values to plain NumPy array, you may have bugs lurking with code using scalar values because you are handing control over to NumPy:

```python
In [1]: import datetime
In [2]: rng = pd.date_range("1/1/2000", periods=10)
In [3]: rng[5]
Out[3]: Timestamp('2000-01-06 00:00:00', freq='D')
In [4]: isinstance(rng[5], datetime.datetime)
Out[4]: True
In [5]: rng_asarray = np.asarray(rng)
In [6]: scalar_val = rng_asarray[5]
In [7]: type(scalar_val)
Out[7]: numpy.datetime64
```

Pandas’s `Timestamp` object is a subclass of `datetime.datetime` that has nanosecond support (the nanosecond field store the nanosecond value between 0 and 999). It should substitute directly into any code that used `datetime.datetime` values before. Thus, I recommend not casting `DatetimeIndex` to regular NumPy arrays.

If you have code that requires an array of `datetime.datetime` objects, you have a couple of options. First, the `astype(object)` method of `DatetimeIndex` produces an array of `Timestamp` objects:

```python
In [8]: stamp_array = rng.astype(object)
In [9]: stamp_array
Out[9]: Index([2000-01-01 00:00:00, 2000-01-02 00:00:00, 2000-01-03 00:00:00,
               2000-01-04 00:00:00, 2000-01-05 00:00:00, 2000-01-06 00:00:00,
               2000-01-07 00:00:00, 2000-01-08 00:00:00, 2000-01-09 00:00:00,
               2000-01-10 00:00:00], dtype='object')
In [10]: stamp_array[5]
Out[10]: Timestamp('2000-01-06 00:00:00', freq='D')
```

To get an array of proper `datetime.datetime` objects, use the `to_pydatetime` method:

```python
In [11]: dt_array = rng.to_pydatetime()
```
In [12]: dt_array
Out[12]:
array([[datetime.datetime(2000, 1, 1, 0, 0),
       datetime.datetime(2000, 1, 2, 0, 0),
       datetime.datetime(2000, 1, 3, 0, 0),
       datetime.datetime(2000, 1, 4, 0, 0),
       datetime.datetime(2000, 1, 5, 0, 0),
       datetime.datetime(2000, 1, 6, 0, 0),
       datetime.datetime(2000, 1, 7, 0, 0),
       datetime.datetime(2000, 1, 8, 0, 0),
       datetime.datetime(2000, 1, 9, 0, 0),
       datetime.datetime(2000, 1, 10, 0, 0)],
      dtype=object))

In [13]: dt_array[5]
Out[13]:
datetime.datetime(2000, 1, 6, 0, 0)

matplotlib knows how to handle `datetime.datetime` but not Timestamp objects. While I recommend that you plot time series using `TimeSeries.plot`, you can either use `to_pydatetime` or register a converter for the Timestamp type. See matplotlib documentation for more on this.

Warning: There are bugs in the user-facing API with the nanosecond `datetime64` unit in NumPy 1.6. In particular, the string version of the array shows garbage values, and conversion to `dtype=object` is similarly broken.

In [14]: rng = pd.date_range("1/1/2000", periods=10)

In [15]: rng
Out[15]:
               '2000-01-09', '2000-01-10'],
              dtype='datetime64[ns]', freq='D')

In [16]: np.asarray(rng)
Out[16]:
array(['2000-01-01T00:00:00.000000000', '2000-01-02T00:00:00.000000000',
      '2000-01-03T00:00:00.000000000', '2000-01-04T00:00:00.000000000',
      '2000-01-05T00:00:00.000000000', '2000-01-06T00:00:00.000000000',
      '2000-01-07T00:00:00.000000000', '2000-01-08T00:00:00.000000000',
      '2000-01-09T00:00:00.000000000', '2000-01-10T00:00:00.000000000'],
     dtype='datetime64[ns]')

In [17]: converted = np.asarray(rng, dtype=object)

In [18]: converted[5]
Out[18]:
Timestamp('2000-01-06 00:00:00', freq='D')

Trust me: don't panic. If you are using NumPy 1.6 and restrict your interaction with `datetime64` values to pandas's API you will be just fine. There is nothing wrong with the data-type (a 64-bit integer internally); all of the important data processing happens in pandas and is heavily tested. I strongly recommend that you do not work directly with `datetime64` arrays in NumPy 1.6 and only use the pandas API.

Support for non-unique indexes: In the latter case, you may have code inside a try:... catch: block that failed due
to the index not being unique. In many cases it will no longer fail (some method like `append` still check for uniqueness unless disabled). However, all is not lost: you can inspect `index.is_unique` and raise an exception explicitly if it is `False` or go to a different code branch.

5.23 Version 0.7

5.23.1 Version 0.7.3 (April 12, 2012)

This is a minor release from 0.7.2 and fixes many minor bugs and adds a number of nice new features. There are also a couple of API changes to note; these should not affect very many users, and we are inclined to call them “bug fixes” even though they do constitute a change in behavior. See the full release notes or issue tracker on GitHub for a complete list.

New features

• New fixed width file reader, read_fwf
• New scatter_matrix function for making a scatter plot matrix

```
from pandas.tools.plotting import scatter_matrix

scatter_matrix(df, alpha=0.2) # noqa F821
```

• Add stacked argument to Series and DataFrame’s plot method for stacked bar plots.

```
df.plot(kind="bar", stacked=True) # noqa F821

df.plot(kind="barh", stacked=True) # noqa F821
```

• Add log x and y scaling options to DataFrame.plot and Series.plot
• Add kurt methods to Series and DataFrame for computing kurtosis

NA boolean comparison API change

Reverted some changes to how NA values (represented typically as NaN or None) are handled in non-numeric Series:

```
In [1]: series = pd.Series(["Steve", np.nan, "Joe"])

In [2]: series == "Steve"
Out[2]:
0   True
1   False
2   False
Length: 3, dtype: bool

In [3]: series != "Steve"
Out[3]:
0   False
1   True
2   True
Length: 3, dtype: bool
```

In comparisons, NA / NaN will always come through as False except with != which is True. Be very careful with boolean arithmetic, especially negation, in the presence of NA data. You may wish to add an explicit NA filter into boolean array operations if you are worried about this:
While propagating NA in comparisons may seem like the right behavior to some users (and you could argue on purely technical grounds that this is the right thing to do), the evaluation was made that propagating NA everywhere, including in numerical arrays, would cause a large amount of problems for users. Thus, a “practicality beats purity” approach was taken. This issue may be revisited at some point in the future.

Other API changes

When calling `apply` on a grouped Series, the return value will also be a Series, to be more consistent with the `groupby` behavior with DataFrame:

```python
In [6]: df = pd.DataFrame(
       ...:     {
       ...:         "A": ["foo", "bar", "foo", "bar", "foo", "foo", "foo"],
       ...:         "B": ["one", "one", "two", "three", "two", "two", "one"],
       ...:         "C": np.random.randn(8),
       ...:         "D": np.random.randn(8),
       ...:     })

In [7]: df
Out[7]:

5.23.2 Version 0.7.2 (March 16, 2012)

This release targets bugs in 0.7.1, and adds a few minor features.
New features

- Add additional tie-breaking methods in DataFrame.rank (GH874)
- Add ascending parameter to rank in Series, DataFrame (GH875)
- Add coerce_float option to DataFrame.from_records (GH893)
- Add sort_columns parameter to allow unsorted plots (GH918)
- Enable column access via attributes on GroupBy (GH882)
- Can pass dict of values to DataFrame.fillna (GH661)
- Can select multiple hierarchical groups by passing list of values in .ix (GH134)
- Add axis option to DataFrame.fillna (GH174)
- Add level keyword to drop for dropping values from a level (GH159)

Performance improvements

- Use khash for Series.value_counts, add raw function to algorithms.py (GH861)
- Intercept __builtin__.sum in groupby (GH885)

Contributors

5.23.3 Version 0.7.1 (February 29, 2012)

This release includes a few new features and addresses over a dozen bugs in 0.7.0.

New features

- Add `to_clipboard` function to pandas namespace for writing objects to the system clipboard (GH774)
- Add `itertuples` method to DataFrame for iterating through the rows of a dataframe as tuples (GH818)
- Add ability to pass `fill_value` and method to DataFrame and Series align method (GH806, GH807)
- Add `fill_value` option to reindex, align methods (GH784)
- Enable `concat` to produce DataFrame from Series (GH787)
- Add `between` method to Series (GH802)
- Add HTML representation hook to DataFrame for the IPython HTML notebook (GH773)
- Support for reading Excel 2007 XML documents using openpyxl

Performance improvements

- Improve performance and memory usage of fillna on DataFrame
- Can concatenate a list of Series along axis=1 to obtain a DataFrame (GH787)

Contributors

A total of 9 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

- Adam Klein
- Brian Granger +

5.23.4 Version 0.7.0 (February 9, 2012)

New features

- New unified *merge function* for efficiently performing full gamut of database / relational-algebra operations. Refactored existing join methods to use the new infrastructure, resulting in substantial performance gains (GH220, GH249, GH267)

- New unified *concatenation function* for concatenating Series, DataFrame or Panel objects along an axis. Can form union or intersection of the other axes. Improves performance of `Series.append` and `DataFrame.append` (GH468, GH479, GH273)

- *Can* pass multiple DataFrames to `DataFrame.append` to concatenate (stack) and multiple Series to `Series.append` too

- *Can* pass list of dicts (e.g., a list of JSON objects) to DataFrame constructor (GH526)

- You can now *set multiple columns* in a DataFrame via `__getitem__`, useful for transformation (GH342)

- Handle differently-indexed output values in `DataFrame.apply` (GH498)

```
In [1]: df = pd.DataFrame(np.random.randn(10, 4))
In [2]: df.apply(lambda x: x.describe())
Out[2]:
        0      1      2      3
count    10  10.0000  10.0000  10.0000
mean     0.1909 -0.3951 -0.7319 -0.4031
std      0.7309  0.8133  1.1120  0.9619
min     -0.8618 -2.1046 -1.7769 -1.4694
25%      -0.4114 -0.6987 -1.5014 -1.0766
50%       0.3809 -0.2280 -1.1919 -1.0041
75%       0.6584  0.0579 -0.0343  0.4617
max      1.2121  0.5770  1.6436  1.0718
[8 rows x 4 columns]
```

- *Add* `reorder_levels` method to Series and DataFrame (GH534)

- *Add* dict-like `get` function to DataFrame and Panel (GH521)

- *Add* `DataFrame.iterrows` method for efficiently iterating through the rows of a DataFrame

- Add `DataFrame.to_panel` with code adapted from `LongPanel.to_long`

- *Add* `reindex_axis` method added to DataFrame

- *Add* level option to binary arithmetic functions on DataFrame and Series

- *Add* level option to the `reindex` and `align` methods on Series and DataFrame for broadcasting values across a level (GH542, GH552, others)

- Add attribute-based item access to Panel and add IPython completion (GH563)

- *Add* `logy` option to `Series.plot` for log-scaling on the Y axis

- *Add* index and header options to `DataFrame.to_string`

- *Can* pass multiple DataFrames to `DataFrame.join` to join on index (GH115)

- *Can* pass multiple Panels to `Panel.join` (GH115)

- *Added* `justify` argument to `DataFrame.to_string` to allow different alignment of column headers
• Add `sort` option to GroupBy to allow disabling sorting of the group keys for potential speedups (GH595)

• Can pass MaskedArray to Series constructor (GH563)

• Add Panel item access via attributes and IPython completion (GH554)

• Implement DataFrame.lookup, fancy-indexing analogue for retrieving values given a sequence of row and column labels (GH338)

• Can pass a list of functions to aggregate with groupby on a DataFrame, yielding an aggregated result with hierarchical columns (GH166)

• Can call `cummin` and `cummax` on Series and DataFrame to get cumulative minimum and maximum, respectively (GH647)

• `value_range` added as utility function to get min and max of a dataframe (GH288)

• Added encoding argument to `read_csv`, `read_table`, `to_csv` and `from_csv` for non-ascii text (GH717)

• Added `abs` method to pandas objects

• Added `crosstab` function for easily computing frequency tables

• Added `isin` method to index objects

• Added `level` argument to `xs` method of DataFrame.

API changes to integer indexing

One of the potentially riskiest API changes in 0.7.0, but also one of the most important, was a complete review of how integer indexes are handled with regard to label-based indexing. Here is an example:

```python
In [3]: s = pd.Series(np.random.rand(10), index=range(0, 20, 2))
In [4]: s
Out[4]:
0   -1.294524
2    0.413738
4    0.276662
6   -0.472035
8    -0.013960
10   -0.362543
12   -0.006154
14   -0.923061
16    0.895717
18    0.805244
Length: 10, dtype: float64
In [5]: s[0]
Out[5]: -1.2945235902555294
In [6]: s[2]
Out[6]: 0.41373810535784006
In [7]: s[4]
Out[7]: 0.2766617129497566
```

This is all exactly identical to the behavior before. However, if you ask for a key not contained in the Series, in versions 0.6.1 and prior, Series would fall back on a location-based lookup. This now raises a `KeyError`:
This change also has the same impact on DataFrame:

```
In [3]: df = pd.DataFrame(np.random.randn(8, 4), index=range(0, 16, 2))
```
```
In [4]: df
```
```
<p>| | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0.88427</td>
<td>0.3363</td>
<td>-0.1787</td>
</tr>
<tr>
<td>2</td>
<td>0.14451</td>
<td>-0.1415</td>
<td>0.2504</td>
</tr>
<tr>
<td>4</td>
<td>-1.44779</td>
<td>-0.9186</td>
<td>-1.4996</td>
</tr>
<tr>
<td>6</td>
<td>-0.26598</td>
<td>-2.4184</td>
<td>-0.2658</td>
</tr>
<tr>
<td>8</td>
<td>-0.58776</td>
<td>0.3144</td>
<td>-0.8566</td>
</tr>
<tr>
<td>10</td>
<td>0.10940</td>
<td>-0.7175</td>
<td>-1.0108</td>
</tr>
<tr>
<td>12</td>
<td>-1.16919</td>
<td>-0.3087</td>
<td>-0.6049</td>
</tr>
<tr>
<td>14</td>
<td>-0.07337</td>
<td>0.3410</td>
<td>0.0424</td>
</tr>
</tbody>
</table>
```
```
In [5]: df.ix[3]
KeyError: 3
```

In order to support purely integer-based indexing, the following methods have been added:

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Series.iget_value(i)</td>
<td>Retrieve value stored at location i</td>
</tr>
<tr>
<td>Series.iget(i)</td>
<td>Alias for iget_value</td>
</tr>
<tr>
<td>DataFrame.irow(i)</td>
<td>Retrieve the i-th row</td>
</tr>
<tr>
<td>DataFrame.icol(j)</td>
<td>Retrieve the j-th column</td>
</tr>
<tr>
<td>DataFrame.iget_value(i, j)</td>
<td>Retrieve the value at row i and column j</td>
</tr>
</tbody>
</table>

**API tweaks regarding label-based slicing**

Label-based slicing using ix now requires that the index be sorted (monotonic) unless both the start and endpoint are contained in the index:

```
In [1]: s = pd.Series(np.random.randn(6), index=list('gmkaec'))
```
```
In [2]: s
Out[2]:
    g   -1.182230
    m   -0.276183
    k   -0.243550
    a   1.628992
    e   0.073308
    c  -0.539890
dtype: float64
```
```
Then this is OK:
```
In [3]: s.ix['k':'e']
Out[3]:
    k   -0.243550
```

(continues on next page)
a  1.628992
e  0.073308
dtype: float64

But this is not:

In [12]: s.ix['b':'h']
KeyError 'b'

If the index had been sorted, the “range selection” would have been possible:

In [4]: s2 = s.sort_index()
In [5]: s2
Out[5]:
a  1.628992
c -0.539890
e  0.073308
g -1.182230
k -0.243550
m -0.276183
dtype: float64
In [6]: s2.ix['b':'h']
Out[6]:
c -0.539890
e  0.073308
g -1.182230
dtype: float64

**Changes to Series [] operator**

As as notational convenience, you can pass a sequence of labels or a label slice to a Series when getting and setting values via [] (i.e. the __getitem__ and __setitem__ methods). The behavior will be the same as passing similar input to ix except in the case of integer indexing:

In [8]: s = pd.Series(np.random.randn(6), index=list('acegkm'))

In [9]: s
Out[9]:
a -1.206412
c  2.565646
e  1.431256
g  1.340309
k -1.170299
m -0.226169
Length: 6, dtype: float64
In [10]: s[['m', 'a', 'c', 'e']]
Out[10]:
m -0.226169
In the case of integer indexes, the behavior will be exactly as before (shadowing `ndarray`):

```python
In [13]: s = pd.Series(np.random.randn(6), index=range(0, 12, 2))
In [14]: s[[4, 0, 2]]
Out[14]:
4  0.132003
0  0.410835
2  0.813850
Length: 3, dtype: float64
In [15]: s[1:5]
Out[15]:
2  0.813850
4  0.132003
6 -0.827317
8 -0.076467
Length: 4, dtype: float64
```

If you wish to do indexing with sequences and slicing on an integer index with label semantics, use `ix`.

**Other API changes**

- The deprecated `LongPanel` class has been completely removed
- If `Series.sort` is called on a column of a DataFrame, an exception will now be raised. Before it was possible to accidentally mutate a DataFrame's column by doing `df[col].sort()` instead of the side-effect free method `df[col].order()` (GH316)
- Miscellaneous renames and deprecations which will (harmlessly) raise `FutureWarning`
- `drop` added as an optional parameter to `DataFrame.reset_index` (GH699)
Performance improvements

- **Cythonized GroupBy aggregations** no longer presort the data, thus achieving a significant speedup (GH93). GroupBy aggregations with Python functions significantly sped up by clever manipulation of the ndarray data type in Cython (GH496).
- Better error message in DataFrame constructor when passed column labels don’t match data (GH497)
- Substantially improve performance of multi-GroupBy aggregation when a Python function is passed, reuse ndarray object in Cython (GH496)
- Can store objects indexed by tuples and floats in HDFStore (GH492)
- Don’t print length by default in Series.to_string, add length option (GH489)
- Improve Cython code for multi-groupby to aggregate without having to sort the data (GH93)
- Improve MultiIndex reindexing speed by storing tuples in the MultiIndex, test for backwards unpickling compatibility
- Improve column reindexing performance by using specialized Cython take function
- Further performance tweaking of Series.__getitem__ for standard use cases
- Avoid Index dict creation in some cases (i.e. when getting slices, etc.), regression from prior versions
- Friendlier error message in setup.py if NumPy not installed
- Use common set of NA-handling operations (sum, mean, etc.) in Panel class also (GH536)
- Default name assignment when calling reset_index on DataFrame with a regular (non-hierarchical) index (GH476)
- Use Cythonized groupers when possible in Series/DataFrame stat ops with level parameter passed (GH545)
- Ported skiplist data structure to C to speed up rolling_median by about 5-10x in most typical use cases (GH374)

5.24 Version 0.6

5.24.1 Version 0.6.1 (December 13, 2011)

New features

- Can **append single rows** (as Series) to a DataFrame
- Add Spearman and Kendall rank **correlation** options to Series.corr and DataFrame.corr (GH428)
- **Added** `get_value` and `set_value` methods to Series, DataFrame, and Panel for very low-overhead access (>2x faster in many cases) to scalar elements (GH437, GH438). `set_value` is capable of producing an enlarged object.
- Add PyQt table widget to sandbox (GH435)
- DataFrame.align can **accept Series arguments** and an **axis option** (GH461)
- Implement new **SparseArray** and **SparseList** data structures. SparseSeries now derives from SparseArray (GH463)
- **Better console printing options** (GH453)
- Implement fast **data ranking** for Series and DataFrame, fast versions of scipy.stats.rankdata (GH428)
- Implement `DataFrame.from_items` alternate constructor (GH444)
- `DataFrame.convert_objects` method for **inferring better dtypes** for object columns (GH302)
- Add **rolling_corr_pairwise** function for computing Panel of correlation matrices (GH189)
- Add **margins** option to `pivot_table` for computing subgroup aggregates (GH114)
- Add `Series.from_csv` function (GH482)
- **Can pass** DataFrame/DataFrame and DataFrame/Series to `rolling_corr/rolling_cov` (GH #462)
- MultiIndex.get_level_values can **accept the level name**
Performance improvements

- Improve memory usage of DataFrame.describe (do not copy data unnecessarily) (PR #425)
- Optimize scalar value lookups in the general case by 25% or more in Series and DataFrame
- Fix performance regression in cross-sectional count in DataFrame, affecting DataFrame.dropna speed
- Column deletion in DataFrame copies no data (computes views on blocks) (GH #158)

Contributors

A total of 7 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

- Dieter Vandenbussche
- Fernando Perez +
- Jev Kuznetsov +
- Joon Ro
- Ralph Bean +
- Wes McKinney
- Wouter Overmeire

5.24.2 Version 0.6.0 (November 25, 2011)

New features

- Added melt function to pandas.core.reshape
- Added level parameter to group by level in Series and DataFrame descriptive statistics (GH313)
- Added head and tail methods to Series, analogous to DataFrame (GH296)
- Added Series.isin function which checks if each value is contained in a passed sequence (GH289)
- Added float_format option to Series.to_string
- Added skip_footer (GH291) and converters (GH343) options to read_csv and read_table
- Added drop_duplicates and duplicated functions for removing duplicate DataFrame rows and checking for duplicate rows, respectively (GH319)
- Implemented operators ‘&’, ‘|’, ‘^’, ‘¬’ on DataFrame (GH347)
- Added Series.mad, mean absolute deviation
- Added QuarterEnd DateOffset (GH321)
- Added dot to DataFrame (GH65)
- Added orient option to Panel.from_dict (GH359, GH301)
- Added orient option to DataFrame.from_dict
- Added passing list of tuples or list of lists to DataFrame.from_records (GH357)
- Added multiple levels to groupby (GH103)
- Allow multiple columns in by argument of DataFrame.sort_index (GH92, GH362)
- *Added* fast `get_value` and `put_value` methods to DataFrame (GH360)
- *Added* `cov` instance methods to Series and DataFrame (GH194, GH362)
- *Added* `kind='bar'` option to `DataFrame.plot` (GH348)
- *Added* `idxmin` and `idxmax` to Series and DataFrame (GH286)
- *Added* `read_clipboard` function to parse DataFrame from clipboard (GH300)
- *Added* `nunique` function to Series for counting unique elements (GH297)
- *Made* DataFrame constructor use Series name if no columns passed (GH373)
- *Support* regular expressions in `read_table/read_csv` (GH364)
- *Added* `DataFrame.to_html` for writing DataFrame to HTML (GH387)
- *Added* support for MaskedArray data in DataFrame, masked values converted to NaN (GH396)
- *Added* `DataFrame.boxplot` function (GH368)
- *Can* pass extra args, kwds to `DataFrame.apply` (GH376)
- *Implement* `DataFrame.join` with vector on argument (GH312)
- *Added* `legend` boolean flag to `DataFrame.plot` (GH324)
- *Can* pass multiple levels to `stack` and `unstack` (GH370)
- *Can* pass multiple values columns to `pivot_table` (GH381)
- *Use* Series name in `GroupBy` for result index (GH363)
- *Added* `raw` option to `DataFrame.apply` for performance if only need ndarray (GH309)
- *Added* proper, tested weighted least squares to standard and panel OLS (GH303)

**Performance enhancements**

- VBENCH Cythonized `cache_readonly`, resulting in substantial micro-performance enhancements throughout the code base (GH361)
- VBENCH Special Cython matrix iterator for applying arbitrary reduction operations with 3-5x better performance than `np.apply_along_axis` (GH309)
- VBENCH Improved performance of `MultiIndex.from_tuples`
- VBENCH Special Cython matrix iterator for applying arbitrary reduction operations
- VBENCH + DOCUMENT Add `raw` option to `DataFrame.apply` for getting better performance when
- VBENCH Faster cythonized count by level in Series and DataFrame (GH341)
- VBENCH? Significant `GroupBy` performance enhancement with multiple keys with many “empty” combinations
- VBENCH New Cython vectorized function `map_infer` speeds up `Series.apply` and `Series.map` significantly when passed elementwise Python function, motivated by (GH355)
- VBENCH Significantly improved performance of `Series.order`, which also makes `np.unique` called on a Series faster (GH327)
- VBENCH Vastly improved performance of `GroupBy` on axes with a MultiIndex (GH299)

5.25 Version 0.5

5.25.1 Version 0.5.0 (October 24, 2011)

New features

- Added `DataFrame.align` method with standard join options
- Added `parse_dates` option to `read_csv` and `read_table` methods to optionally try to parse dates in the index columns
- Added `nrows`, `chunksize`, and `iterator` arguments to `read_csv` and `read_table`. The last two return a new `TextParser` class capable of lazily iterating through chunks of a flat file (GH242)
- Added ability to join on multiple columns in `DataFrame.join` (GH214)
- Added private `_get_duplicates` function to `Index` for identifying duplicate values more easily (ENH5c)
- Added column attribute access to `DataFrame`.
- Added Python tab completion hook for `DataFrame` columns. (GH233, GH230)
- Implemented `Series.describe` for `Series` containing objects (GH241)
- Added `inner` join option to `DataFrame.join` when joining on key(s) (GH248)
- Implemented selecting `DataFrame` columns by passing a list to `__getitem__` (GH253)
- Implemented `&` and `|` to intersect / union `Index` objects, respectively (GH261)
- Added `pivot_table` convenience function to pandas namespace (GH234)
- Implemented `Panel.rename_axis` function (GH243)
- `DataFrame` will show index level names in console output (GH334)
- Implemented `Panel.take`
- Added `set_eng_float_format` for alternate `DataFrame` floating point string formatting (ENH61)
- Added convenience `set_index` function for creating a `DataFrame` index from its existing columns
- Implemented `groupby` hierarchical index level name (GH223)
• *Added* support for different delimiters in `DataFrame.to_csv` (GH244)
• TODO: DOCS ABOUT TAKE METHODS

**Performance enhancements**

• VBENCH Major performance improvements in file parsing functions `read_csv` and `read_table`
• VBENCH Added Cython function for converting tuples to ndarray very fast. Speeds up many MultiIndex-related operations
• VBENCH Refactored merging / joining code into a tidy class and disabled unnecessary computations in the float/object case, thus getting about 10% better performance (GH211)
• VBENCH Improved speed of `DataFrame.xs` on mixed-type `DataFrame` objects by about 5x, regression from 0.3.0 (GH215)
• VBENCH With new `DataFrame.align` method, speeding up binary operations between differently-indexed `DataFrame` objects by 10-25%.
• VBENCH Significantly sped up conversion of nested dict into `DataFrame` (GH212)
• VBENCH Significantly speed up `DataFrame.__repr__` and `count` on large mixed-type `DataFrame` objects

**Contributors**

### 5.26 Version 0.4

**5.26.1 Versions 0.4.1 through 0.4.3 (September 25 - October 9, 2011)**

**New features**

• Added Python 3 support using 2to3 (GH200)
• *Added* `name` attribute to `Series`, now prints as part of `Series.__repr__`
• *Added* instance methods `isnull` and `notnull` to `Series` (GH209, GH203)
• *Added* `Series.align` method for aligning two series with choice of join method (ENH56)
• *Added* method `get_level_values` to `MultiIndex` (GH188)
• Set values in mixed-type `DataFrame` objects via `.ix` indexing attribute (GH135)
• Added new `DataFrame` methods `get_dtype_counts` and property `dtypes` (ENHdc)
• Added `ignore_index` option to `DataFrame.append` to stack `DataFrames` (ENH1b)
• `read_csv` tries to *sniff* delimiters using `csv.Sniffer` (GH146)
• `read_csv` can read multiple columns into a `MultiIndex`; `DataFrame's to_csv` method writes out a corresponding `MultiIndex` (GH151)
• `DataFrame.rename` has a new `copy` parameter to *rename* a `DataFrame` in place (ENHed)
• *Enable* unstacking by name (GH142)
• *Enable* `sortlevel` to work by level (GH141)

**Performance enhancements**

• Altered binary operations on differently-indexed `SparseSeries` objects to use the integer-based (dense) alignment logic which is faster with a larger number of blocks (GH205)
• Wrote faster Cython data alignment / merging routines resulting in substantial speed increases
• Improved performance of `isnull` and `notnull`, a regression from v0.3.0 (GH187)
• Refactored code related to `DataFrame.join` so that intermediate aligned copies of the data in each `DataFrame` argument do not need to be created. Substantial performance increases result (GH176)
• Substantially improved performance of generic `Index.intersection` and `Index.union`
• Implemented `BlockManager.take` resulting in significantly faster `take` performance on mixed-type `DataFrame` objects (GH104)
• Improved performance of `Series.sort_index`
• Significant groupby performance enhancement: removed unnecessary integrity checks in `DataFrame` internals that were slowing down slicing operations to retrieve groups
• Optimized `_ensure_index` function resulting in performance savings in type-checking `Index` objects
• Wrote fast time series merging / joining methods in Cython. Will be integrated later into `DataFrame.join` and related functions

**Contributors**

A total of 2 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

• Thomas Kluyver +
• Wes McKinney
