5.4 Version 0.25

5.4.1 What’s new in 0.25.3 (October 31, 2019)

These are the changes in pandas 0.25.3. See Release notes for a full changelog including other versions of pandas.
Bug fixes

GroupBy/resample/rolling

- Bug in DataFrameGroupBy.quantile() where NA values in the grouping could cause segfaults or incorrect results (GH28882)

Contributors

A total of 2 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

- Will Ayd
- William Ayd

5.4.2 What’s new in 0.25.2 (October 15, 2019)

These are the changes in pandas 0.25.2. See Release notes for a full changelog including other versions of pandas.

Note: pandas 0.25.2 adds compatibility for Python 3.8 (GH28147).

Bug fixes

Indexing

- Fix regression in DataFrame.reindex() not following the limit argument (GH28631).
- Fix regression in RangeIndex.get_indexer() for decreasing RangeIndex where target values may be improperly identified as missing/present (GH28678)

IO

- Fix regression in notebook display where <th> tags were missing for DataFrame.index values (GH28204).
- Regression in to_csv() where writing a Series or DataFrame indexed by an IntervalIndex would incorrectly raise a TypeError (GH28210)
- Fix to_csv() with ExtensionArray with list-like values (GH28840).

GroupBy/resample/rolling

- Bug incorrectly raising an IndexError when passing a list of quantiles to pandas.core.groupby.DataFrameGroupBy.quantile() (GH28113).
- Bug in pandas.core.groupby.GroupBy.shift(), pandas.core.groupby.GroupBy.bfill() and pandas.core.groupby.GroupBy.ffill() where timezone information would be dropped (GH19995, GH27992)
Other

- Compatibility with Python 3.8 in DataFrame.query() (GH27261)
- Fix to ensure that tab-completion in an IPython console does not raise warnings for deprecated attributes (GH27900).

Contributors

A total of 6 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

- Felix Divo +
- Jeremy Schendel
- Joris Van den Bossche

5.4.3 What’s new in 0.25.1 (August 21, 2019)

These are the changes in pandas 0.25.1. See Release notes for a full changelog including other versions of pandas.

IO and LZMA

Some users may unknowingly have an incomplete Python installation lacking the lzma module from the standard library. In this case, import pandas failed due to an ImportError (GH27575). pandas will now warn, rather than raising an ImportError if the lzma module is not present. Any subsequent attempt to use lzma methods will raise a RuntimeError. A possible fix for the lack of the lzma module is to ensure you have the necessary libraries and then re-install Python. For example, on MacOS installing Python with pyenv may lead to an incomplete Python installation due to unmet system dependencies at compilation time (like xz). Compilation will succeed, but Python might fail at run time. The issue can be solved by installing the necessary dependencies and then re-installing Python.

Bug fixes

Categorical

- Bug in Categorical.fillna() that would replace all values, not just those that are NaN (GH26215)
Datetimelike

- Bug in `to_datetime()` where passing a timezone-naive `DatetimeArray` or `DatetimeIndex` and `utc=True` would incorrectly return a timezone-naive result (GH27733)
- Bug in `Period.to_timestamp()` where a Period outside the `Timestamp` implementation bounds (roughly 1677-09-21 to 2262-04-11) would return an incorrect `Timestamp` instead of raising `OutOfBoundsDatetime` (GH19643)
- Bug in iterating over `DatetimeIndex` when the underlying data is read-only (GH28055)

Timezones

- Bug in `Index` where a numpy object array with a timezone aware `Timestamp` and `np.nan` would not return a `DatetimeIndex` (GH27011)

Numeric

- Bug in `Series.interpolate()` when using a timezone aware `DatetimeIndex` (GH27548)
- Bug when printing negative floating point complex numbers would raise an `IndexError` (GH27484)
- Bug where `DataFrame` arithmetic operators such as `DataFrame.mul()` with a `Series` with axis=1 would raise an `AttributeError` on `DataFrame` larger than the minimum threshold to invoke numexpr (GH27636)
- Bug in `DataFrame` arithmetic where missing values in results were incorrectly masked with `NaN` instead of `Inf` (GH27464)

Conversion

- Improved the warnings for the deprecated methods `Series.real()` and `Series.imag()` (GH27610)

Interval

- Bug in `IntervalIndex` where `dir(obj)` would raise `ValueError` (GH27571)

Indexing

- Bug in partial-string indexing returning a NumPy array rather than a `Series` when indexing with a scalar like `.loc['2015']` (GH27516)
- Break reference cycle involving `Index` and other index classes to allow garbage collection of index objects without running the GC. (GH27585, GH27840)
- Fix regression in assigning values to a single column of a `DataFrame` with a `MultiIndex` columns (GH27841).
- Fix regression in `.ix` fallback with an `IntervalIndex` (GH27865).
pandas: powerful Python data analysis toolkit, Release 1.2.5

Missing

- Bug in `pandas.isnull()` or `pandas.isna()` when the input is a type e.g. `type(pandas.Series())` (GH27482)

IO

- Avoid calling `S3File.s3` when reading parquet, as this was removed in s3fs version 0.3.0 (GH27756)
- Better error message when a negative header is passed in `pandas.read_csv()` (GH27779)
- Follow the `min_rows` display option (introduced in v0.25.0) correctly in the HTML repr in the notebook (GH27991).

Plotting

- Added a `pandas_plotting_backends` entrypoint group for registering plot backends. See Plotting backends for more (GH26747).
- Fixed the re-instatement of Matplotlib datetime converters after calling `pandas.plotting.deregister_matplotlib_converters()` (GH27481).
- Fix compatibility issue with matplotlib when passing a pandas `Index` to a plot call (GH27775).

GroupBy/resample/rolling

- Fixed regression in `pandas.core.groupby.DataFrameGroupBy.quantile()` raising when multiple quantiles are given (GH27526)
- Bug in `pandas.core.groupby.DataFrameGroupBy.transform()` where applying a timezone conversion lambda function would drop timezone information (GH27496)
- Bug in `pandas.core.groupby.GroupBy.nth()` where `observed=False` was being ignored for Categorical groupers (GH26385)
- Bug in windowing over read-only arrays (GH27766)
- Fixed segfault in `pandas.core.groupby.DataFrameGroupBy.quantile` when an invalid quantile was passed (GH27470)

Reshaping

- A `KeyError` is now raised if `.unstack()` is called on a `Series` or `DataFrame` with a flat `Index` passing a name which is not the correct one (GH18303)
- Bug `merge_asof()` could not merge `Timedelta` objects when passing `tolerance` kwarg (GH27642)
- Bug in `DataFrame.crosstab()` when `margins` set to `True` and `normalize` is not `False`, an error is raised. (GH27500)
- `DataFrame.join()` now suppresses the `FutureWarning` when the sort parameter is specified (GH21952)
- Bug in `DataFrame.join()` raising with readonly arrays (GH27943)
Sparse

• Bug in reductions for Series with Sparse dtypes (GH27080)

Other

• Bug in Series.replace() and DataFrame.replace() when replacing timezone-aware timestamps using a dict-like replacer (GH27720)
• Bug in Series.rename() when using a custom type indexer. Now any value that isn’t callable or dict-like is treated as a scalar. (GH27814)

Contributors

A total of 5 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

5.4.4 What’s new in 0.25.0 (July 18, 2019)

Warning: Starting with the 0.25.x series of releases, pandas only supports Python 3.5.3 and higher. See Dropping Python 2.7 for more details.

Warning: The minimum supported Python version will be bumped to 3.6 in a future release.

Warning: Panel has been fully removed. For N-D labeled data structures, please use xarray

Warning: read_pickle() and read_msgpack() are only guaranteed backwards compatible back to pandas version 0.20.3 (GH27082)

These are the changes in pandas 0.25.0. See Release notes for a full changelog including other versions of pandas.
Enhancements

GroupBy aggregation with relabeling

pandas has added special groupby behavior, known as “named aggregation”, for naming the output columns when applying multiple aggregation functions to specific columns (GH18366, GH26512).

```
In [1]: animals = pd.DataFrame({'kind': ['cat', 'dog', 'cat', 'dog'],
                          ...
                          'height': [9.1, 6.0, 9.5, 34.0],
                          ...
                          'weight': [7.9, 7.5, 9.9, 198.0]})

In [2]: animals
Out[2]:
   kind  height  weight
0    cat     9.1     7.9
1    dog     6.0     7.5
2    cat     9.5     9.9
3    dog    34.0   198.0
[4 rows x 3 columns]

In [3]: animals.groupby("kind").agg(
       ...
       min_height=pd.NamedAgg(column='height', aggfunc='min'),
       ...
       max_height=pd.NamedAgg(column='height', aggfunc='max'),
       ...
       average_weight=pd.NamedAgg(column='weight', aggfunc=np.mean),
       ...
   )

Out[3]:
   min_height  max_height  average_weight
  kind       
  cat         9.1          9.5          8.90
  dog         6.0         34.0        102.75

In [4]: animals.groupby("kind").agg(
       ...
       min_height=('height', 'min'),
       ...
       max_height=('height', 'max'),
       ...
       average_weight=('weight', np.mean),
       ...
   )

Out[4]:
   min_height  max_height  average_weight
  kind       
  cat         9.1          9.5          8.90
  dog         6.0         34.0        102.75
```

Pass the desired columns names as the **kwargs to .agg. The values of **kwargs should be tuples where the first element is the column selection, and the second element is the aggregation function to apply. pandas provides the pandas.NamedAgg namedtuple to make it clearer what the arguments to the function are, but plain tuples are accepted as well.

(continues on next page)
Named aggregation is the recommended replacement for the deprecated “dict-of-dicts” approach to naming the output of column-specific aggregations (Deprecate groupby.agg() with a dictionary when renaming).

A similar approach is now available for Series groupby objects as well. Because there’s no need for column selection, the values can just be the functions to apply

```
In [5]: animals.groupby("kind").height.agg(
   ...:     min_height="min",
   ...:     max_height="max",
   ...: )
   ...
Out[5]:
         min_height  max_height
      kind     
      cat     9.1        9.5
      dog     6.0       34.0
```

This type of aggregation is the recommended alternative to the deprecated behavior when passing a dict to a Series groupby aggregation (Deprecate groupby.agg() with a dictionary when renaming).

See Named aggregation for more.

### GroupBy aggregation with multiple lambdas

You can now provide multiple lambda functions to a list-like aggregation in pandas.core.groupby.GroupBy.agg (GH26430).

```
In [6]: animals.groupby('kind').height.agg([
   ...:     lambda x: x.iloc[0], lambda x: x.iloc[-1]
   ...: ])  
   ...
Out[6]:
                                      <lambda_0>  <lambda_1>
                                     kind        
                                    cat      9.1       9.5
                                    dog      6.0     34.0
```

```
In [7]: animals.groupby('kind').agg([
   ...:     lambda x: x.iloc[0] - x.iloc[1],
   ...:     lambda x: x.iloc[0] + x.iloc[1]
   ...: ])
   ...
Out[7]:
                                         height   weight
                                     kind     
                                     cat <lambda_0> <lambda_1> <lambda_0> <lambda_1>
                                     dog <lambda_0> <lambda_1> <lambda_0> <lambda_1>
```

(continues on next page)
Previously, these raised a `SpecificationError`.

**Better repr for MultiIndex**

Printing of `MultiIndex` instances now shows tuples of each row and ensures that the tuple items are vertically aligned, so it's now easier to understand the structure of the `MultiIndex`. ([GH13480](https://github.com/pandas-dev/pandas/issues/13480)):

The repr now looks like this:

```python
In [8]: pd.MultiIndex.from_product([['a', 'abc'], range(500)])
```

```python
Out[8]:
MultiIndex([( 'a', 0),
( 'a', 1),
( 'a', 2),
( 'a', 3),
( 'a', 4),
( 'a', 5),
( 'a', 6),
( 'a', 7),
( 'a', 8),
( 'a', 9),
...
( 'abc', 490),
( 'abc', 491),
( 'abc', 492),
( 'abc', 493),
( 'abc', 494),
( 'abc', 495),
( 'abc', 496),
( 'abc', 497),
( 'abc', 498),
( 'abc', 499)],
length=1000)
```

Previously, outputting a `MultiIndex` printed all the levels and codes of the `MultiIndex`, which was visually unappealing and made the output more difficult to navigate. For example (limiting the range to 5):

```python
In [1]: pd.MultiIndex.from_product([['a', 'abc'], range(5)])
```

```python
Out[1]: MultiIndex(levels=[['a', 'abc'], [0, 1, 2, 3]],
...: codes=[[0, 0, 0, 0, 1, 1, 1, 1], [0, 1, 2, 3, 0, 1, 2, 3]])
```

In the new repr, all values will be shown, if the number of rows is smaller than `options.display.max_seq_items` (default: 100 items). Horizontally, the output will truncate, if it's wider than `options.display.width` (default: 80 characters).
Shorter truncated repr for Series and DataFrame

Currently, the default display options of pandas ensure that when a Series or DataFrame has more than 60 rows, its repr gets truncated to this maximum of 60 rows (the `display.max_rows` option). However, this still gives a repr that takes up a large part of the vertical screen estate. Therefore, a new option `display.min_rows` is introduced with a default of 10 which determines the number of rows showed in the truncated repr:

- For small Series or DataFrames, up to `max_rows` number of rows is shown (default: 60).
- For larger Series of DataFrames with a length above `max_rows`, only `min_rows` number of rows is shown (default: 10, i.e. the first and last 5 rows).

This dual option allows to still see the full content of relatively small objects (e.g. `df.head(20)` shows all 20 rows), while giving a brief repr for large objects.

To restore the previous behaviour of a single threshold, set `pd.options.display.min_rows = None`.

JSON normalize with max_level param support

`json_normalize()` normalizes the provided input dict to all nested levels. The new `max_level` parameter provides more control over which level to end normalization (GH23843):

The repr now looks like this:

```python
from pandas.io.json import json_normalize
data = [{
    'CreatedBy': {'Name': 'User001'},
    'Lookup': {'TextField': 'Some text',
               'UserField': {'Id': 'ID001', 'Name': 'Name001'}},
    'Image': {'a': 'b'}
}]
json_normalize(data, max_level=1)
```

Series.explode to split list-like values to rows

Series and DataFrame have gained the `DataFrame.explode()` methods to transform list-likes to individual rows. See section on Exploding list-like column in docs for more information (GH16538, GH10511)

Here is a typical usecase. You have comma separated string in a column.

```python
In [9]: df = pd.DataFrame([{ 'var1': 'a,b,c', 'var2': 1 },
                          { 'var1': 'd,e,f', 'var2': 2 }])

Out[10]:
          var1  var2
0    a,b,c     1
1    d,e,f     2
[2 rows x 2 columns]
```

Creating a long form DataFrame is now straightforward using chained operations
In [11]: df.assign(var1=df.var1.str.split(',',')).explode('var1')
Out[11]:
   var1  var2
0    a    1
0    b    1
0    c    1
1    d    2
1    e    2
1    f    2
[6 rows x 2 columns]

Other enhancements

- `DataFrame.plot()` keywords `logy`, `logx` and `loglog` can now accept the value 'sym' for symlog scaling. (GH24867)
- Added support for ISO week year format ('%G-%V-%u') when parsing datetimes using `to_datetime()` (GH16607)
- Indexing of DataFrame and Series now accepts zerodim np.ndarray (GH24919)
- `Timestamp.replace()` now supports the `fold` argument to disambiguate DST transition times (GH25017)
- `DataFrame.at_time()` and `Series.at_time()` now support `datetime.time` objects with timezones (GH24043)
- `DataFrame.pivot_table()` now accepts an `observed` parameter which is passed to underlying calls to `DataFrame.groupby()` to speed up grouping categorical data. (GH24923)
- `Series.str` has gained `Series.str.casefold()` method to removes all case distinctions present in a string (GH25405)
- `DataFrame.set_index()` now works for instances of abc.Iterator, provided their output is of the same length as the calling frame (GH22484, GH24984)
- `DatetimeIndex.union()` now supports the `sort` argument. The behavior of the sort parameter matches that of `Index.union()` (GH24994)
- `RangeIndex.union()` now supports the sort argument. If sort=False an unsorted Int64Index is always returned. sort=None is the default and returns a monotonically increasing RangeIndex if possible or a sorted Int64Index if not (GH24471)
- `TimedeltaIndex.intersection()` now also supports the sort keyword (GH24471)
- `DataFrame.rename()` now supports the `errors` argument to raise errors when attempting to rename nonexistent keys (GH13473)
- Added `Sparse accessor` for working with a DataFrame whose values are sparse (GH25681)
- `RangeIndex` has gained `start`, `stop`, and `step` attributes (GH25710)
- `datetime.timezone` objects are now supported as arguments to timezone methods and constructors (GH25065)
- `DataFrame.query()` and `DataFrame.eval()` now supports quoting column names with backticks to refer to names with spaces (GH6508)
- `merge_asof()` now gives a more clear error message when merge keys are categoricals that are not equal (GH26136)
pandas: powerful Python data analysis toolkit, Release 1.2.5

- pandas.core.window.Rolling() supports exponential (or Poisson) window type (GH21303)
- Error message for missing required imports now includes the original import error's text (GH23868)
- DatetimeIndex and TimedeltaIndex now have a mean method (GH24757)
- DataFrame.describe() now formats integer percentiles without decimal point (GH26660)
- Added support for reading SPSS .sav files using read_spss() (GH26537)
- Added new option plotting.backend to be able to select a plotting backend different than the existing matplotlib one. Use pandas.set_option('plotting.backend', '<backend-module>') where <backend-module> is a library implementing the pandas plotting API (GH14130)
- pandas.offsets.BusinessHour supports multiple opening hours intervals (GH15481)
- read_excel() can now use openpyxl to read Excel files via the engine='openpyxl' argument. This will become the default in a future release (GH11499)
- Interval, IntervalIndex, and IntervalArray have gained an is_empty attribute denoting if the given interval(s) are empty (GH27219)

Backwards incompatible API changes

Indexing with date strings with UTC offsets

Indexing a DataFrame or Series with a DatetimeIndex with a date string with a UTC offset would previously ignore the UTC offset. Now, the UTC offset is respected in indexing. (GH24076, GH16785)

```python
In [12]: df = pd.DataFrame([0], index=pd.DatetimeIndex(["2019-01-01"], tz='US/Pacific'))

In [13]: df
Out[13]:
   0
2019-01-01 00:00:00-08:00  0
[1 rows x 1 columns]
```

Previous behavior:

```python
In [3]: df['2019-01-01 00:00:00+04:00':'2019-01-01 01:00:00+04:00']
Out[3]:
   0
2019-01-01 00:00:00-08:00  0
```

New behavior:

```python
In [14]: df['2019-01-01 12:00:00+04:00':'2019-01-01 13:00:00+04:00']
Out[14]:
   0
2019-01-01 00:00:00-08:00  0
[1 rows x 1 columns]```
**MultiIndex constructed from levels and codes**

Constructing a `MultiIndex` with NaN levels or codes value < -1 was allowed previously. Now, construction with codes value < -1 is not allowed and NaN levels' corresponding codes would be reassigned as -1. (GH19387)

*Previous behavior:*

```python
In [1]: pd.MultiIndex(levels=[[np.nan, None, pd.NaT, 128, 2]],
                   codes=[[0, -1, 1, 2, 3, 4]])
Out[1]: MultiIndex(levels=[nan, None, NaT, 128, 2],
                   codes=[0, -1, 1, 2, 3, 4])
In [2]: pd.MultiIndex(levels=[[1, 2]], codes=[[0, -2]])
Out[2]: MultiIndex(levels=[[1, 2]],
                   codes=[[0, -2]])
```

*New behavior:*

```python
In [15]: pd.MultiIndex(levels=[[np.nan, None, pd.NaT, 128, 2]],
                   codes=[[0, -1, 1, 2, 3, 4]])
Out[15]: MultiIndex([(nan,),
                    (nan,),
                    (nan,),
                    (nan,),
                    (128,),
                    ( 2,)], )
In [16]: pd.MultiIndex(levels=[[1, 2]], codes=[[0, -2]])
```

```
ValueError Traceback (most recent call last)

    391             raise ValueError(
```

```
ValueError: On level 0, code value (-2) < -1
```
**GroupBy.apply on DataFrame evaluates first group only once**

The implementation of DataFrameGroupBy.apply() previously evaluated the supplied function consistently twice on the first group to infer if it is safe to use a fast code path. Particularly for functions with side effects, this was an undesired behavior and may have led to surprises. (GH2936, GH2656, GH7739, GH10519, GH12155, GH20084, GH21417)

Now every group is evaluated only a single time.

```python
In [17]: df = pd.DataFrame({'a': ['x', 'y'], 'b': [1, 2]})

In [18]: df
Out[18]:
   a b
0  x 1
1  y 2
[2 rows x 2 columns]

In [19]: def func(group):
    ....:     print(group.name)
    ....:     return group
    ....:

Previous behavior:

In [3]: df.groupby('a').apply(func)
   x
   x
   y
Out[3]:
   a b
0  x 1
1  y 2

New behavior:

In [20]: df.groupby('a').apply(func)
   x
   y
Out[20]:
   a b
0  x 1
1  y 2
[2 rows x 2 columns]
```
Concatenating sparse values

When passed DataFrames whose values are sparse, `concat()` will now return a `Series` or `DataFrame` with sparse values, rather than a `SparseDataFrame` (GH25702).

```python
In [21]: df = pd.DataFrame({'A': pd.SparseArray([0, 1])})
```

**Previous behavior:**

```python
In [2]: type(pd.concat([df, df]))
pandas.core.sparse.frame.SparseDataFrame
```

**New behavior:**

```python
In [22]: type(pd.concat([df, df]))
Out[22]: pandas.core.frame.DataFrame
```

This now matches the existing behavior of `concat` on `Series` with sparse values. `concat()` will continue to return a `SparseDataFrame` when all the values are instances of `SparseDataFrame`.

This change also affects routines using `concat()` internally, like `get_dummies()`, which now returns a `DataFrame` in all cases (previously a `SparseDataFrame` was returned if all the columns were dummy encoded, and a `DataFrame` otherwise).

Providing any `SparseSeries` or `SparseDataFrame` to `concat()` will cause a `SparseSeries` or `SparseDataFrame` to be returned, as before.

The `.str`-accessor performs stricter type checks

Due to the lack of more fine-grained dtypes, `Series.str` so far only checked whether the data was of `object` dtype. `Series.str` will now infer the dtype data within the Series; in particular, 'bytes'-only data will raise an exception (except for `Series.str.decode()`, `Series.str.get()`, `Series.str.len()`, `Series.str.slice()`), see GH23163, GH23011, GH23551.

**Previous behavior:**

```python
In [1]: s = pd.Series(np.array(['a', 'ba', 'cba'], 'S'), dtype=object)
In [2]: s
Out[2]:
0   b'a'
1   b'ba'
2   b'cba'
dtype: object
In [3]: s.str.startswith(b'a')
Out[3]:
0    True
1   False
2   False
dtype: bool
```

**New behavior:**
In [23]: s = pd.Series(np.array(['a', 'ba', 'cba'], 'S'), dtype=object)

In [24]: s
Out[24]:
0  b'a'
1  b'ba'
2  b'cba'
Length: 3, dtype: object

In [25]: s.str.startswith(b'a')
---------------------------------------------------------------------------
TypeError Traceback (most recent call last)
<ipython-input-25-ac784692b361> in <module>
----> 1 s.str.startswith(b'a')
pandas/pandas/core/strings/accessor.py in wrapper(self, *args, **kwargs)
    98     f"inferred dtype '{self._inferred_dtype}'."
    99     )
   --> 100     raise TypeError(msg)
   101     return func(self, *args, **kwargs)
   102
TypeError: Cannot use .str.startswith with values of inferred dtype 'bytes'.

Categorical dtypes are preserved during GroupBy

Previously, columns that were categorical, but not the groupby key(s) would be converted to object dtype during groupby operations. pandas now will preserve these dtypes. (GH18502)

In [26]: cat = pd.Categorical(['foo', 'bar', 'bar', 'qux'], ordered=True)

In [27]: df = pd.DataFrame({'payload': [-1, -2, -1, -2], 'col': cat})

In [28]: df
Out[28]:
   payload  col
0     -1    foo
1     -2    bar
2     -1    bar
3     -2    qux

[4 rows x 2 columns]

In [29]: df.dtypes
Out[29]:
payload    int64
col     category
Length: 2, dtype: object
In [5]: df.groupby('payload').first().col.dtype
Out[5]: dtype('O')

New Behavior:

In [30]: df.groupby('payload').first().col.dtype
Out[30]: CategoricalDtype(categories=['bar', 'foo', 'qux'], ordered=True)

Incompatible Index type unions

When performing `Index.union()` operations between objects of incompatible dtypes, the result will be a base `Index` of dtype object. This behavior holds true for unions between `Index` objects that previously would have been prohibited. The dtype of empty `Index` objects will now be evaluated before performing union operations rather than simply returning the other `Index` object. `Index.union()` can now be considered commutative, such that `A.union(B) == B.union(A)` (GH23525).

Previous behavior:

In [1]: pd.period_range('19910905', periods=2).union(pd.Int64Index([1, 2, 3]))
...: ValueError: can only call with other PeriodIndex-ed objects

In [2]: pd.Index([], dtype=object).union(pd.Int64Index([1, 2, 3]))
Out[2]: Int64Index([1, 2, 3], dtype='int64')

New behavior:

In [31]: pd.period_range('19910905', periods=2).union(pd.Int64Index([1, 2, 3]))
Out[31]: Index([1991-09-05, 1991-09-06, 1, 2, 3], dtype='object')

In [32]: pd.Index([], dtype=object).union(pd.Int64Index([1, 2, 3]))
Out[32]: Index([1, 2, 3], dtype='object')

Note that integer- and floating-dtype indexes are considered “compatible”. The integer values are coerced to floating point, which may result in loss of precision. See `Set operations on Index objects` for more.

DataFrame GroupBy ffill/bfill no longer return group labels

The methods `ffill`, `bfill`, `pad` and `backfill` of DataFrameGroupBy previously included the group labels in the return value, which was inconsistent with other groupby transforms. Now only the filled values are returned. (GH21521)

In [33]: df = pd.DataFrame({"a": ["x", "y"], "b": [1, 2]})

In [34]: df
Out[34]:
   a  b
0  x  1
1  y  2
[2 rows x 2 columns]

Previous behavior:
In [3]: df.groupby("a").ffill()
Out[3]:
    a  b
0  x  1
1  y  2

New behavior:

In [35]: df.groupby("a").ffill()
Out[35]:
    b
0  1
1  2

[2 rows x 1 columns]

**DataFrame describe on an empty Categorical / object column will return top and freq**

When calling `DataFrame.describe()` with an empty categorical / object column, the ‘top’ and ‘freq’ columns were previously omitted, which was inconsistent with the output for non-empty columns. Now the ‘top’ and ‘freq’ columns will always be included, with `numpy.nan` in the case of an empty `DataFrame` (GH26397)

In [36]: df = pd.DataFrame({"empty_col": pd.Categorical([])})

In [37]: df
Out[37]:
Empty DataFrame
Columns: [empty_col]
Index: []

[0 rows x 1 columns]

Previous behavior:

In [3]: df.describe()
Out[3]:
    empty_col
       count    0
       unique    0

New behavior:

In [38]: df.describe()
Out[38]:
    empty_col
       count    0
       unique    0
top     NaN
freq    NaN

[4 rows x 1 columns]
__str__ methods now call __repr__ rather than vice versa

pandas has until now mostly defined string representations in a pandas objects’ __str__/__unicode__/__bytes__ methods, and called __str__ from the __repr__ method, if a specific __repr__ method is not found. This is not needed for Python3. In pandas 0.25, the string representations of pandas objects are now generally defined in __repr__, and calls to __str__ in general now pass the call on to the __repr__, if a specific __str__ method doesn’t exist, as is standard for Python. This change is backward compatible for direct usage of pandas, but if you subclass pandas objects and give your subclasses specific __str__/__repr__ methods, you may have to adjust your __str__/__repr__ methods (GH26495).

Indexing an IntervalIndex with Interval objects

Indexing methods for IntervalIndex have been modified to require exact matches only for Interval queries. IntervalIndex methods previously matched on any overlapping Interval. Behavior with scalar points, e.g. querying with an integer, is unchanged (GH16316).

```
In [39]: ii = pd.IntervalIndex.from_tuples([(0, 4), (1, 5), (5, 8)])
In [40]: ii
Out[40]: IntervalIndex([(0, 4], (1, 5], (5, 8]],[closed='right',]
dtype='interval[int64]')
```

The in operator (__contains__) now only returns True for exact matches to Intervals in the IntervalIndex, whereas this would previously return True for any Interval overlapping an Interval in the IntervalIndex.

*Previous behavior:*

```
In [4]: pd.Interval(1, 2, closed='neither') in ii
Out[4]: True
In [5]: pd.Interval(-10, 10, closed='both') in ii
Out[5]: True
```

*New behavior:*

```
In [41]: pd.Interval(1, 2, closed='neither') in ii
Out[41]: False
In [42]: pd.Interval(-10, 10, closed='both') in ii
Out[42]: False
```

The get_loc() method now only returns locations for exact matches to Interval queries, as opposed to the previous behavior of returning locations for overlapping matches. A KeyError will be raised if an exact match is not found.

*Previous behavior:*

```
In [6]: ii.get_loc(pd.Interval(1, 5))
Out[6]: array([0, 1])
In [7]: ii.get_loc(pd.Interval(2, 6))
Out[7]: array([0, 1, 2])
```

*New behavior:*

---

5.4. Version 0.25
Likewise, `get_indexer()` and `get_indexer_non_unique()` will also only return locations for exact matches to `Interval` queries, with -1 denoting that an exact match was not found.

These indexing changes extend to querying a `Series` or `DataFrame` with an `IntervalIndex` index.

```python
In [43]: s = pd.Series(list('abc'), index=ii)

In [44]: s
Out[44]:
(0, 4]  a
(1, 5]  b
(5, 8]  c
Length: 3, dtype: object
```

Selecting from a `Series` or `DataFrame` using `[]` (`__getitem__`) or `loc` now only returns exact matches for `Interval` queries.

**Previous behavior:**

```python
In [8]: s[pd.Interval(1, 5)]
Out[8]:
(0, 4]  a
(1, 5]  b
dtype: object

In [9]: s.loc[pd.Interval(1, 5)]
Out[9]:
(0, 4]  a
(1, 5]  b
dtype: object
```

**New behavior:**

```python
In [45]: s[pd.Interval(1, 5)]
Out[45]: 'b'

In [46]: s.loc[pd.Interval(1, 5)]
Out[46]: 'b'
```

Similarly, a `KeyError` will be raised for non-exact matches instead of returning overlapping matches.

**Previous behavior:**

```python
In [9]: s[pd.Interval(2, 3)]
Out[9]:
(0, 4]  a
(1, 5]  b
dtype: object
```

(continues on next page)
In [10]: s.loc[pd.Interval(2, 3)]
Out[10]:
(0, 4]  a
(1, 5]  b
dtype: object

New behavior:

In [6]: s[pd.Interval(2, 3)]
---------------------------------------------------------------------------
KeyError: Interval(2, 3, closed='right')
In [7]: s.loc[pd.Interval(2, 3)]
---------------------------------------------------------------------------
KeyError: Interval(2, 3, closed='right')

The `overlaps()` method can be used to create a boolean indexer that replicates the previous behavior of returning overlapping matches.

New behavior:

In [47]: idxr = s.index.overlaps(pd.Interval(2, 3))
In [48]: idxr
Out[48]: array([ True, True, False])
In [49]: s[idxr]
Out[49]:
(0, 4]  a
(1, 5]  b
Length: 2, dtype: object
In [50]: s.loc[idxr]
Out[50]:
(0, 4]  a
(1, 5]  b
Length: 2, dtype: object

Binary ufuncs on Series now align

Applying a binary ufunc like `numpy.power()` now aligns the inputs when both are `Series` (GH23293).

In [51]: s1 = pd.Series([1, 2, 3], index=['a', 'b', 'c'])
In [52]: s2 = pd.Series([3, 4, 5], index=['d', 'c', 'b'])
In [53]: s1.pow(s2)
Out[53]:
a  1
b  2
c  3
Length: 3, dtype: int64

In [54]: s2
Out[54]:
d  3
c  4
b  5
Length: 3, dtype: int64

Previous behavior

In [5]: np.power(s1, s2)
Out[5]:
a  1
b  16
c  243
dtype: int64

New behavior

In [55]: np.power(s1, s2)
Out[55]:
a  1.0
b  32.0
c  81.0
d  NaN
Length: 4, dtype: float64

This matches the behavior of other binary operations in pandas, like `Series.add()`. To retain the previous behavior, convert the other `Series` to an array before applying the ufunc.

In [56]: np.power(s1, s2.array)
Out[56]:
a  1
b  16
c  243
Length: 3, dtype: int64

Categorical.argsort now places missing values at the end

Categorical.argsort() now places missing values at the end of the array, making it consistent with NumPy and the rest of pandas (GH21801).

In [57]: cat = pd.Categorical(['b', None, 'a'], categories=['a', 'b'], ordered=True)

Previous behavior

In [2]: cat = pd.Categorical(['b', None, 'a'], categories=['a', 'b'], ordered=True)
In [3]: cat.argsort()
Out[3]: array([1, 2, 0])
In [4]: cat[cat.argsort()]
Out[4]:
[NaN, a, b]
categories (2, object): [a < b]

New behavior

In [58]: cat.argsort()
Out[58]: array([2, 0, 1])
In [59]: cat[cat.argsort()]
Out[59]:
['a', 'b', NaN]
categories (2, object): ['a' < 'b']

Column order is preserved when passing a list of dicts to DataFrame

Starting with Python 3.7 the key-order of dict is guaranteed. In practice, this has been true since Python 3.6. The DataFrame constructor now treats a list of dicts in the same way as it does a list of OrderedDict, i.e. preserving the order of the dicts. This change applies only when pandas is running on Python>=3.6 (GH27309).

In [60]: data = [
......:     {'name': 'Joe', 'state': 'NY', 'age': 18},
......:     {'name': 'Jane', 'state': 'KY', 'age': 19, 'hobby': 'Minecraft'},
......:     {'name': 'Jean', 'state': 'OK', 'age': 20, 'finances': 'good'}
......: ]
......:

Previous Behavior:

The columns were lexicographically sorted previously,

In [1]: pd.DataFrame(data)
Out[1]:
   age  finances  hobby  name  state
0   18      NaN   NaN     Joe    NY
1   19      NaN  Minecraft  Jane  KY
2   20   good      NaN  Jean    OK

New Behavior:

The column order now matches the insertion-order of the keys in the dict, considering all the records from top to bottom. As a consequence, the column order of the resulting DataFrame has changed compared to previous pandas versions.

In [61]: pd.DataFrame(data)
Out[61]:
   name  state  age  hobby  finances
0  Joe    NY   18      NaN        NaN
1  Jane   KY   19  Minecraft  NaN
2  Jean   OK   20      NaN      good

(continues on next page)
[3 rows x 5 columns]

### Increased minimum versions for dependencies

Due to dropping support for Python 2.7, a number of optional dependencies have updated minimum versions (GH25725, GH24942, GH25752). Independently, some minimum supported versions of dependencies were updated (GH23519, GH25554). If installed, we now require:

<table>
<thead>
<tr>
<th>Package</th>
<th>Minimum Version</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>numpy</td>
<td>1.13.3</td>
<td>X</td>
</tr>
<tr>
<td>pytz</td>
<td>2015.4</td>
<td>X</td>
</tr>
<tr>
<td>python-dateutil</td>
<td>2.6.1</td>
<td>X</td>
</tr>
<tr>
<td>bottleneck</td>
<td>1.2.1</td>
<td></td>
</tr>
<tr>
<td>numexpr</td>
<td>2.6.2</td>
<td></td>
</tr>
<tr>
<td>pytest (dev)</td>
<td>4.0.2</td>
<td></td>
</tr>
</tbody>
</table>

For optional libraries the general recommendation is to use the latest version. The following table lists the lowest version per library that is currently being tested throughout the development of pandas. Optional libraries below the lowest tested version may still work, but are not considered supported.

<table>
<thead>
<tr>
<th>Package</th>
<th>Minimum Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>beautifulsoup4</td>
<td>4.6.0</td>
</tr>
<tr>
<td>fastparquet</td>
<td>0.2.1</td>
</tr>
<tr>
<td>gcsfs</td>
<td>0.2.2</td>
</tr>
<tr>
<td>lxml</td>
<td>3.8.0</td>
</tr>
<tr>
<td>matplotlib</td>
<td>2.2.2</td>
</tr>
<tr>
<td>openpyxl</td>
<td>2.4.8</td>
</tr>
<tr>
<td>pyarrow</td>
<td>0.9.0</td>
</tr>
<tr>
<td>pymysql</td>
<td>0.7.1</td>
</tr>
<tr>
<td>pytables</td>
<td>3.4.2</td>
</tr>
<tr>
<td>scipy</td>
<td>0.19.0</td>
</tr>
<tr>
<td>sqlalchemy</td>
<td>1.1.4</td>
</tr>
<tr>
<td>xarray</td>
<td>0.8.2</td>
</tr>
<tr>
<td>xlrd</td>
<td>1.1.0</td>
</tr>
<tr>
<td>xlsxwriter</td>
<td>0.9.8</td>
</tr>
<tr>
<td>xlwt</td>
<td>1.2.0</td>
</tr>
</tbody>
</table>

See Dependencies and Optional dependencies for more.
Other API changes

- `DatetimeTZDtype` will now standardize pytz timezones to a common timezone instance (GH24713)
- `Timestamp` and `Timedelta` scalars now implement the `to_numpy()` method as aliases to `Timestamp.to_datetime64()` and `Timedelta.to_timedelta64()`, respectively. (GH24653)
- `Timestamp.strptime()` will now raise a `NotImplementedError` (GH25016)
- Comparing `Timestamp` with unsupported objects now returns `NotImplemented` instead of raising `TypeError`. This implies that unsupported rich comparisons are delegated to the other object, and are now consistent with Python 3 behavior for `datetime` objects (GH24011)
- Bug in `DatetimeIndex.snap()` which didn’t preserving the name of the input `Index` (GH25575)
- The `arg` argument in `pandas.core.groupby.DataFrameGroupBy.agg()` has been renamed to `func` (GH26089)
- The `arg` argument in `pandas.core.window._Window.aggregate()` has been renamed to `func` (GH26372)
- Most pandas classes had a `__bytes__` method, which was used for getting a python2-style bytestring representation of the object. This method has been removed as part of dropping Python2 (GH26447)
- The `.str`-accessor has been disabled for 1-level `MultiIndex`, use `MultiIndex.to_flat_index()` if necessary (GH23679)
- Removed support of gtk package for clipboards (GH26563)
- Using an unsupported version of Beautiful Soup 4 will now raise an `ImportError` instead of a `ValueError` (GH27063)
- `Series.to_excel()` and `DataFrame.to_excel()` will now raise a `ValueError` when saving timezone aware data. (GH27008, GH7056)
- `ExtensionArray.argsort()` places NA values at the end of the sorted array. (GH21801)
- `DataFrame.to_hdf()` and `Series.to_hdf()` will now raise a `NotImplementedError` when saving a `MultiIndex` with extension data types for a fixed format. (GH7775)
- Passing duplicate names in `read_csv()` will now raise a `ValueError` (GH17346)

Deprecations

Sparse subclasses

The `SparseSeries` and `SparseDataFrame` subclasses are deprecated. Their functionality is better-provided by a `Series` or `DataFrame` with sparse values.

Previous way

```
df = pd.SparseDataFrame({"A": [0, 0, 1, 2]})
df.dtypes
```

New way

```
In [62]: df = pd.DataFrame({"A": pd.SparseArray([0, 0, 1, 2])})

In [63]: df.dtypes
```

Out[63]:

(continues on next page)
The memory usage of the two approaches is identical. See *Migrating* for more (GH19239).

**msgpack format**

The msgpack format is deprecated as of 0.25 and will be removed in a future version. It is recommended to use pyarrow for on-the-wire transmission of pandas objects. (GH27084)

**Other deprecations**

- The deprecated .ix[] indexer now raises a more visible `FutureWarning` instead of `DeprecationWarning` (GH26438).
- Deprecated the units=M (months) and units=Y (year) parameters for units of `pandas.to_timedelta()`, `pandas.Timedelta()` and `pandas.TimedeltaIndex()` (GH16344)
- `pandas.concat()` has deprecated the join_axes-keyword. Instead, use `DataFrame.reindex()` or `DataFrame.reindex_like()` on the result or on the inputs (GH21951)
- The SparseArray.values attribute is deprecated. You can use `np.asarray(...)` or the SparseArray. to_dense() method instead (GH26421).
- The functions `pandas.to_datetime()` and `pandas.to_timedelta()` have deprecated the box keyword. Instead, use `to_numpy()` or `Timestamp.to_datetime64()` or `Timedelta.to_timedelta64()` (GH24416)
- The `DataFrame.compound()` and `Series.compound()` methods are deprecated and will be removed in a future version (GH26405).
- The internal attributes _start, _stop and _step attributes of `RangeIndex` have been deprecated. Use the public attributes start, stop and step instead (GH26581).
- The `Series.dtype()`, `Series.ftypes()` and `DataFrame.ftypes()` methods are deprecated and will be removed in a future version. Instead, use `Series.dtype()` and `DataFrame.dtypes()` (GH26705).
- The `Series.get_values()`, `DataFrame.get_values()`, `Index.get_values()`, `SparseArray.get_values()` and `Categorical.get_values()` methods are deprecated. One of `np.asarray(...)` or `to_numpy()` can be used instead (GH19617).
- The ‘outer’ method on NumPy ufuncs, e.g. `np.subtract.outer` has been deprecated on `Series` objects. Convert the input to an array with `Series.array` first (GH27186)
- `Timedelta.resolution()` is deprecated and replaced with `Timedelta.resolution_string()`. In a future version, `Timedelta.resolution()` will be changed to behave like the standard library `datetime.timedelta.resolution` (GH21344)
- `read_table()` has been undeprecated. (GH25220)
- `Index.dtype_str` is deprecated. (GH18262)
- `Series.imag` and `Series.real` are deprecated. (GH18262)
- `Series.put()` is deprecated. (GH18262)
- `Index.item()` and `Series.item()` is deprecated. (GH18262)
• The default value ordered=None in CategoricalDtype has been deprecated in favor of ordered=False. When converting between categorical types ordered=True must be explicitly passed in order to be preserved. (GH26336)

• Index.contains() is deprecated. Use key in index(__contains__) instead (GH17753).

• DataFrame.get_dtype_counts() is deprecated. (GH18262)

• Categorical.ravel() will return a Categorical instead of a np.ndarray (GH27199)

Removal of prior version deprecations/changes

• Removed Panel (GH25047, GH25191, GH25231)

• Removed the previously deprecated sheetname keyword in read_excel() (GH16442, GH20938)

• Removed the previously deprecated TimeGrouper (GH16942)

• Removed the previously deprecated parse_cols keyword in read_excel() (GH16488)

• Removed the previously deprecated pd.options.html.border (GH16970)

• Removed the previously deprecated convert_objects (GH11221)

• Removed the previously deprecated select method of DataFrame and Series (GH17633)

• Removed the previously deprecated behavior of Series treated as list-like in rename_categories() (GH17982)

• Removed the previously deprecated DataFrame.reindex_axis and Series.reindex_axis (GH17842)

• Removed the previously deprecated behavior of altering column or index labels with Series.rename_axis() or DataFrame.rename_axis() (GH17842)

• Removed the previously deprecated tupleize_cols keyword argument in read_html(), read_csv(), and DataFrame.to_csv() (GH17877, GH17820)

• Removed the previously deprecated DataFrame.from_csv and Series.from_csv (GH17812)

• Removed the previously deprecated raise_on_error keyword argument in DataFrame.where() and DataFrame.mask() (GH17744)

• Removed the previously deprecated ordered and categories keyword arguments in astype (GH17742)

• Removed the previously deprecated cdate_range (GH17691)

• Removed the previously deprecated True option for the dropna keyword argument in SeriesGroupBy.nth() (GH17493)

• Removed the previously deprecated convert keyword argument in Series.take() and DataFrame.take() (GH17352)

• Removed the previously deprecated behavior of arithmetic operations with datetime.date objects (GH21152)
Performance improvements

- Significant speedup in `SparseArray` initialization that benefits most operations, fixing performance regression introduced in v0.20.0 (GH24985)
- `DataFrame.to_stata()` is now faster when outputting data with any string or non-native endian columns (GH25045)
- Improved performance of `Series.searchsorted()`. The speedup is especially large when the dtype is int8/int16/int32 and the searched key is within the integer bounds for the dtype (GH22034)
- Improved performance of `pandas.core.groupby.GroupBy.quantile()` (GH20405)
- Improved performance of slicing and other selected operation on a `RangeIndex` (GH26565, GH26617, GH26722)
- `RangeIndex` now performs standard lookup without instantiating an actual hashtable, hence saving memory (GH16685)
- Improved performance of `read_csv()` by faster tokenizing and faster parsing of small float numbers (GH25784)
- Improved performance of `read_csv()` by faster parsing of N/A and boolean values (GH25804)
- Improved performance of `IntervalIndex.is_monotonic`, `IntervalIndex.is_monotonic_increasing` and `IntervalIndex.is_monotonic_decreasing` by removing conversion to `MultiIndex` (GH24813)
- Improved performance of `DataFrame.to_csv()` when writing datetime dtypes (GH25708)
- Improved performance of `read_csv()` by much faster parsing of MM/YYYY and DD/MM/YYYY datetime formats (GH25922)
- Improved performance of nanops for dtypes that cannot store NaNs. Speedup is particularly prominent for `Series.all()` and `Series.any()` (GH25070)
- Improved performance of `Series.map()` for dictionary mappers on categorical series by mapping the categories instead of mapping all values (GH23785)
- Improved performance of `IntervalIndex.intersection()` (GH24813)
- Improved performance of `read_csv()` by faster concatenating date columns without extra conversion to string for integer/float zero and float NaN; by faster checking the string for the possibility of being a date (GH25754)
- Improved performance of `IntervalIndex.is_unique` by removing conversion to `MultiIndex` (GH24813)
- Restored performance of `DatetimeIndex.__iter__()` by re-enabling specialized code path (GH26702)
- Improved performance when building `MultiIndex` with at least one `CategoricalIndex` level (GH22044)
- Improved performance by removing the need for a garbage collect when checking for `SettingWithCopyWarning` (GH27031)
- For `to_datetime()` changed default value of cache parameter to `True` (GH26043)
- Improved performance of `DatetimeIndex` and `PeriodIndex` slicing given non-unique, monotonic data (GH27136)
- Improved performance of `pd.read_json()` for index-oriented data. (GH26773)
- Improved performance of `MultiIndex.shape()` (GH27384).
Bug fixes

Categorical

• Bug in `DataFrame.at()` and `Series.at()` that would raise exception if the index was a `CategoricalIndex` (GH20629)

• Fixed bug in comparison of ordered `Categorical` that contained missing values with a scalar which sometimes incorrectly resulted in `True` (GH26504)

• Bug in `DataFrame.dropna()` when the `DataFrame` has a `CategoricalIndex` containing `Interval` objects incorrectly raised a `TypeError` (GH25087)

Datetimelike

• Bug in `to_datetime()` which would raise an (incorrect) `ValueError` when called with a date far into the future and the `format` argument specified instead of raising `OutOfBoundsDatetime` (GH23830)

• Bug in `to_datetime()` which would raise `InvalidIndexError: Reindexing only valid with uniquely valued Index objects` when called with `cachex=True`, with `arg` including at least two different elements from the set `{None, numpy.nan, pandas.NaT}` (GH22305)

• Bug in `DataFrame` and `Series` where timezone aware data with `dtype='datetime64[ns]` was not cast to naive (GH25843)

• Improved `Timestamp` type checking in various datetime functions to prevent exceptions when using a subclassed `datetime` (GH25851)

• Bug in `Series` and `DataFrame` repr where `np.datetime64('NaT')` and `np.timedelta64('NaT')` with `dtype=object` would be represented as `NaN` (GH25445)

• Bug in `to_datetime()` which does not replace the invalid argument with `NaT` when `error` is set to `coerce` (GH26122)

• Bug in adding `DateOffset` with nonzero month to `DatetimeIndex` would raise `ValueError` (GH26258)

• Bug in `to_datetime()` which raises unhandled `OverflowError` when called with mix of invalid dates and `NaT` values with `format='%Y%m%d'` and `error='coerce'` (GH25512)

• Bug in `isin()` for datetimelike indexes: `DatetimeIndex`, `TimedeltaIndex` and `PeriodIndex` where the `levels` parameter was ignored. (GH26675)

• Bug in `to_datetime()` which raises `TypeError` for `format='%Y%m%d'` when called for invalid integer dates with length >= 6 digits with `errors='ignore'`

• Bug when comparing a `PeriodIndex` against a zero-dimensional numpy array (GH26689)

• Bug in constructing a `Series` or `DataFrame` from a numpy `datetime64` array with a non-ns unit and out-of-bound timestamps generating rubbish data, which will now correctly raise an `OutOfBoundsDatet imeError` (GH26206).

• Bug in `date_range()` with unnecessary `OverflowError` being raised for very large or very small dates (GH26651)

• Bug where adding `Timestamp` to a `np.timedelta64` object would raise instead of returning a `Timestamp` (GH24775)

• Bug where comparing a zero-dimensional numpy array containing a `np.datetime64` object to a `Timestamp` would incorrect raise `TypeError` (GH26916)
• Bug in `to_datetime()` which would raise `ValueError`: Tz-aware datetime.datetime cannot be converted to datetime64 unless utc=True when called with cache=True, with arg including datetime strings with different offset (GH26097)

Timedelta

• Bug in `TimedeltaIndex.intersection()` where for non-monotonic indices in some cases an empty Index was returned when in fact an intersection existed (GH25913)
• Bug with comparisons between `Timedelta` and NaT raising TypeError (GH26039)
• Bug when adding or subtracting a BusinessHour to a `Timestamp` with the resulting time landing in a following or prior day respectively (GH26381)
• Bug when comparing a `TimedeltaIndex` against a zero-dimensional numpy array (GH26689)

Timezones

• Bug in `DatetimeIndex.to_frame()` where timezone aware data would be converted to timezone naive data (GH25809)
• Bug in `to_datetime()` with utc=True and datetime strings that would apply previously parsed UTC offsets to subsequent arguments (GH24992)
• Bug in `Timestamp.tz_localize()` and `Timestamp.tz_convert()` does not propagate `freq` (GH25241)
• Bug in `Series.at()` where setting `Timestamp` with timezone raises `TypeError` (GH25506)
• Bug in `DataFrame.update()` when updating with timezone aware data would return timezone naive data (GH25807)
• Bug in `to_datetime()` where an uninformative `RuntimeError` was raised when passing a naive `Timestamp` with datetime strings with mixed UTC offsets (GH25978)
• Bug in `to_datetime()` with unit='ns' would drop timezone information from the parsed argument (GH26168)
• Bug in `DataFrame.join()` where joining a timezone aware index with a timezone aware column would result in a column of NaN (GH26335)
• Bug in `date_range()` where ambiguous or nonexistent start or end times were not handled by the ambiguous or nonexistent keywords respectively (GH27088)
• Bug in `DatetimeIndex.union()` when combining a timezone aware and timezone unaware `DatetimeIndex` (GH21671)
• Bug when applying a numpy reduction function (e.g. `numpy.minimum()`) to a timezone aware `Series` (GH15552)
Numeric

- Bug in `to_numeric()` in which large negative numbers were being improperly handled (GH24910)
- Bug in `to_numeric()` in which numbers were being coerced to float, even though `errors` was not set (GH24910)
- Bug in `to_numeric()` in which invalid values for `errors` were being allowed (GH26466)
- Bug in `format` in which floating point complex numbers were not being formatted to proper display precision and trimming (GH25514)
- Bug in error messages in `DataFrame.corr()` and `Series.corr()`. Added the possibility of using a callable. (GH25729)
- Bug in `Series.divmod()` and `Series.rdivmod()` which would raise an (incorrect) `ValueError` rather than return a pair of `Series` objects as result (GH25557)
- Raises a helpful exception when a non-numeric index is sent to `interpolate()` with methods which require numeric index. (GH21662)
- Bug in `eval()` when comparing floats with scalar operators, for example: `x < -0.1` (GH25928)
- Fixed bug where casting all-boolean array to integer extension array failed (GH25211)
- Bug in `divmod` with a `Series` object containing zeros incorrectly raising `AttributeError` (GH26987)
- Inconsistency in `Series` floor-division (`//`) and `divmod` filling positive//zero with NaN instead of Inf (GH27321)

Conversion

- Bug in `DataFrame.astype()` when passing a dict of columns and types the `errors` parameter was ignored. (GH25905)

Strings

- Bug in the `__name__` attribute of several methods of `Series.str`, which were set incorrectly (GH23551)
- Improved error message when passing `Series` of wrong dtype to `Series.str.cat()` (GH22722)

Interval

- Construction of `Interval` is restricted to numeric, `Timestamp` and `Timedelta` endpoints (GH23013)
- Fixed bug in `Series/DataFrame` not displaying NaN in `IntervalIndex` with missing values (GH25984)
- Bug in `IntervalIndex.get_loc()` where a `KeyError` would be incorrectly raised for a decreasing `IntervalIndex` (GH25860)
- Bug in `Index` constructor where passing mixed closed `Interval` objects would result in a `ValueError` instead of an `object` dtype `Index` (GH27172)
Indexing

- Improved exception message when calling `DataFrame.iloc()` with a list of non-numeric objects (GH25753).
- Improved exception message when calling `.iloc` or `.loc` with a boolean indexer with different length (GH26658).
- Bug in `KeyError` exception message when indexing a `MultiIndex` with a non-existent key not displaying the original key (GH27250).
- Bug in `.iloc` and `.loc` with a boolean indexer not raising an `IndexError` when too few items are passed (GH26658).
- Bug in `DataFrame.loc()` and `Series.loc()` where `KeyError` was not raised for a `MultiIndex` when the key was less than or equal to the number of levels in the `MultiIndex` (GH14885).
- Bug in which `DataFrame.append()` produced an erroneous warning indicating that a `KeyError` will be thrown in the future when the data to be appended contains new columns (GH22252).
- Bug in which `DataFrame.to_csv()` caused a segfault for a reindexed data frame, when the indices were single-level `MultiIndex` (GH26303).
- Fixed bug where assigning a `arrays.PandasArray` to a `pandas.core.frame.DataFrame` would raise error (GH26390)
- Allow keyword arguments for callable local reference used in the `DataFrame.query()` string (GH26426)
- Fixed a `KeyError` when indexing a `MultiIndex` level with a list containing exactly one label, which is missing (GH27148)
- Bug which produced `AttributeError` on partial matching `Timestamp` in a `MultiIndex` (GH26944)
- Bug in `Categorical` and `CategoricalIndex` with `Interval` values when using the `in` operator (`__contains__`) with objects that are not comparable to the values in the `Interval` (GH23705)
- Bug in `DataFrame.loc()` and `DataFrame.iloc()` on a `DataFrame` with a single timezone-aware date-time64[ns] column incorrectly returning a scalar instead of a `Series` (GH27110)
- Bug in `CategoricalIndex` and `Categorical` incorrectly raising `ValueError` instead of `TypeError` when a list is passed using the `in` operator (`__contains__`) (GH21729)
- Bug in setting a new value in a `Series` with a `Timedelta` object incorrectly casting the value to an integer (GH22717)
- Bug in `Series` setting a new key (`__setitem__`) with a timezone-aware datetime incorrectly raising `ValueError` (GH12862)
- Bug in `DataFrame.iloc()` when indexing with a read-only indexer (GH17192)
- Bug in `Series` setting an existing tuple key (`__setitem__`) with timezone-aware datetime values incorrectly raising `TypeError` (GH20441)
Missing

- Fixed misleading exception message in `Series.interpolate()` if argument `order` is required, but omitted (GH10633, GH24014).
- Fixed class type displayed in exception message in `DataFrame.dropna()` if invalid `axis` parameter passed (GH25555)
- A `ValueError` will now be thrown by `DataFrame.fillna()` when `limit` is not a positive integer (GH27042)

MultiIndex

- Bug in which incorrect exception raised by `Timedelta` when testing the membership of `MultiIndex` (GH24570)

IO

- Bug in `DataFrame.to_html()` where values were truncated using display options instead of outputting the full content (GH17004)
- Fixed bug in missing text when using `to_clipboard()` if copying utf-16 characters in Python 3 on Windows (GH25040)
- Bug in `read_json()` for `orient='table'` when it tries to infer dtypes by default, which is not applicable as dtypes are already defined in the JSON schema (GH21345)
- Bug in `read_json()` for `orient='table'` and float index, as it infers index dtype by default, which is not applicable because index dtype is already defined in the JSON schema (GH25433)
- Bug in `read_json()` for `orient='table'` and string of float column names, as it makes a column name type conversion to `Timestamp`, which is not applicable because column names are already defined in the JSON schema (GH25435)
- Bug in `json_normalize()` for `errors='ignore'` where missing values in the input data, were filled in resulting `DataFrame` with the string "nan" instead of `numpy.nan` (GH25468)
- `DataFrame.to_html()` now raises `TypeError` when using an invalid type for the `classes` parameter instead of `AssertionError` (GH25608)
- Bug in `DataFrame.to_string()` and `DataFrame.to_latex()` that would lead to incorrect output when the `header` keyword is used (GH16718)
- Bug in `read_csv()` not properly interpreting the UTF8 encoded filenames on Windows on Python 3.6+ (GH15086)
- Improved performance in `pandas.read_stata()` and `pandas.io.stata.StataReader` when converting columns that have missing values (GH25772)
- Bug in `DataFrame.to_html()` where header numbers would ignore display options when rounding (GH17280)
- Bug in `read_hdf()` where reading a table from an HDF5 file written directly with PyTables fails with a `ValueError` when using a sub-selection via the `start` or `stop` arguments (GH11188)
- Bug in `read_hdf()` not properly closing store after a `KeyError` is raised (GH25766)
- Improved the explanation for the failure when value labels are repeated in Stata dta files and suggested workarounds (GH25772)
• Improved `pandas.read_stata()` and `pandas.io.stata.StataReader` to read incorrectly formatted 118 format files saved by Stata (GH25960)

• Improved the `col_space` parameter in `DataFrame.to_html()` to accept a string so CSS length values can be set correctly (GH25941)

• Fixed bug in loading objects from S3 that contain # characters in the URL (GH25945)

• Adds `use_bqstorage_api` parameter to `read_gbq()` to speed up downloads of large data frames. This feature requires version 0.10.0 of the pandas-gbq library as well as the google-cloud-bigquery-storage and fastavro libraries. (GH26104)

• Fixed memory leak in `DataFrame.to_json()` when dealing with numeric data (GH24889)

• Bug in `read_json()` where date strings with Z were not converted to a UTC timezone (GH26168)

• Added `cache_dates=True` parameter to `read_csv()`, which allows to cache unique dates when they are parsed (GH25990)

• `DataFrame.to_excel()` now raises a `ValueError` when the caller’s dimensions exceed the limitations of Excel (GH26051)

• Fixed bug in `pandas.read_csv()` where a BOM would result in incorrect parsing using engine='python' (GH26545)

• `read_excel()` now raises a `ValueError` when input is of type pandas.io.excel.ExcelFile and engine param is passed since pandas.io.excel.ExcelFile has an engine defined (GH26566)

• Bug while selecting from HDFStore with where='' specified (GH26610).

• Fixed bug in `DataFrame.to_excel()` where custom objects (i.e. `PeriodIndex`) inside merged cells were not being converted into types safe for the Excel writer (GH27006)

• Bug in `read_hdf()` where reading a timezone aware `DatetimeIndex` would raise a `TypeError` (GH11926)

• Bug in `to_msgpack()` and `read_msgpack()` which would raise a `ValueError` rather than a `FileNotFoundError` for an invalid path (GH27160)

• Fixed bug in `DataFrame.to_parquet()` which would raise a `ValueError` when the dataframe had no columns (GH27339)

• Allow parsing of `PeriodDtype` columns when using `read_csv()` (GH26934)

**Plotting**

• Fixed bug where `api.extensions.ExtensionArray` could not be used in matplotlib plotting (GH25587)

• Bug in an error message in `DataFrame.plot()`. Improved the error message if non-numerics are passed to `DataFrame.plot()` (GH25481)

• Bug in incorrect ticklabel positions when plotting an index that are non-numeric / non-datetime (GH7612, GH15912, GH22334)

• Fixed bug causing plots of `PeriodIndex` timeseries to fail if the frequency is a multiple of the frequency rule code (GH14763)

• Fixed bug when plotting a `DatetimeIndex` with `datetime.timezone.utc` timezone (GH17173)
GroupBy/resample/rolling

- Bug in pandas.core.resample.Resampler.agg() with a timezone aware index where OverflowError would raise when passing a list of functions (GH22660)
- Bug in pandas.core.groupby.DataFrameGroupBy.nunique() in which the names of column levels were lost (GH23222)
- Bug in pandas.core.groupby.GroupBy.agg() when applying an aggregation function to timezone aware data (GH23683)
- Bug in pandas.core.groupby.GroupBy.first() and pandas.core.groupby.GroupBy.last() where timezone information would be dropped (GH21603)
- Bug in pandas.core.groupby.GroupBy.size() when grouping only NA values (GH23050)
- Bug in Series.groupby() where observed kwarg was previously ignored (GH24880)
- Bug in Series.groupby() where using groupby with a MultiIndex Series with a list of labels equal to the length of the series caused incorrect grouping (GH25704)
- Ensured that ordering of outputs in groupby aggregation functions is consistent across all versions of Python (GH25692)
- Ensured that result group order is correct when grouping on an ordered Categorical and specifying observed=True (GH25871, GH25167)
- Bug in pandas.core.window.Rolling.min() and pandas.core.window.Rolling.max() that caused a memory leak (GH25893)
- Bug in pandas.core.window.Rolling.count() and pandas.core.window.Expanding.count was previously ignoring the axis keyword (GH13503)
- Bug in pandas.core.groupby.GroupBy.idxmax() and pandas.core.groupby.GroupBy.idxmin() with datetime column would return incorrect dtype (GH25444, GH15306)
- Bug in pandas.core.groupby.GroupBy.cumsum(), pandas.core.groupby.GroupBy.cumprod(), pandas.core.groupby.GroupBy.cummin() and pandas.core.groupby.GroupBy.cummax() with categorical column having absent categories, would return incorrect result or segfault (GH16771)
- Bug in pandas.core.groupby.GroupBy.nth() where NA values in the grouping would return incorrect results (GH26011)
- Bug in pandas.core.groupby.SeriesGroupBy.transform() where transforming an empty group would raise a ValueError (GH26208)
- Bug in pandas.core.frame.DataFrame.groupby() where passing a pandas.core.groupby.grouper.Grouper would return incorrect groups when using the .groups accessor (GH26326)
- Bug in pandas.core.groupby.GroupBy.agg() where incorrect results are returned for uint64 columns. (GH26310)
- Bug in pandas.core.window.Rolling.median() and pandas.core.window.Rolling.quantile() where MemoryError is raised with empty window (GH26005)
- Bug in pandas.core.window.Rolling.median() and pandas.core.window.Rolling.quantile() where incorrect results are returned with closed='left' and closed='neither' (GH26005)
- Improved pandas.core.window.Rolling, pandas.core.window.Window and pandas.core.window.ExponentialMovingWindow functions to exclude nuisance columns from results instead of raising errors and raise a DataError only if all columns are nuisance (GH12537)
- Bug in pandas.core.window.Rolling.max() and pandas.core.window.Rolling.min() where incorrect results are returned with an empty variable window (GH26005)
• Raise a helpful exception when an unsupported weighted window function is used as an argument of pandas.core.window.Window.aggregate() (GH26597)

Reshaping

• Bug in pandas.merge() adds a string of None, if None is assigned in suffixes instead of remain the column name as-is (GH24782).

• Bug in merge() when merging by index name would sometimes result in an incorrectly numbered index (missing index values are now assigned NA) (GH24212, GH25009)

• to_records() now accepts dtypes to its column_dtypes parameter (GH24895)

• Bug in concat() where order of OrderedDict (and dict in Python 3.6+) is not respected, when passed in as objs argument (GH21510)

• Bug in pivot_table() where columns with NaN values are dropped even if dropna argument is False, when the aggfunc argument contains a list (GH22159)

• Bug in concat() where the resulting freq of two DatetimeIndex with the same freq would be dropped (GH3232).

• Bug in merge() where merging with equivalent Categorical dtypes was raising an error (GH22501)

• bug in DataFrame instantiating with a dict of iterators or generators (e.g. pd.DataFrame({'A': reversed(range(3)))}) raised an error (GH26349).

• Bug in DataFrame instantiating with a range (e.g. pd.DataFrame(range(3))) raised an error (GH26342).

• Bug in DataFrame constructor when passing non-empty tuples would cause a segmentation fault (GH25691)

• Bug in Series.apply() failed when the series is a timezone aware DatetimeIndex (GH25959)

• Bug in pandas.cut() where large bins could incorrectly raise an error due to an integer overflow (GH26045)

• Bug in DataFrame.sort_index() where an error is thrown when a multi-indexed DataFrame is sorted on all levels with the initial level sorted last (GH26053)

• Bug in Series.nlargest() treats True as smaller than False (GH26154)

• Bug in DataFrame.pivot_table() with a IntervalIndex as pivot index would raise TypeError (GH25814)

• Bug in which DataFrame.from_dict() ignored order of OrderedDict when orient='index' (GH8425).

• Bug in DataFrame.transpose() where transposing a DataFrame with a timezone-aware datetime column would incorrectly raise ValueError (GH26825)

• Bug in pivot_table() when pivoting a timezone aware column as the values would remove timezone information (GH14948)

• Bug in merge_asof() when specifying multiple by columns where one is datetime64[ns, tz] dtype (GH26649)
Sparse

- Significant speedup in SparseArray initialization that benefits most operations, fixing performance regression introduced in v0.20.0 (GH24985)
- Bug in SparseFrame constructor where passing None as the data would cause default_fill_value to be ignored (GH16807)
- Bug in SparseDataFrame when adding a column in which the length of values does not match length of index, AssertionError is raised instead of raising ValueError (GH25484)
- Introduce a better error message in Series.sparse.from_coo() so it returns a TypeError for inputs that are not coo matrices (GH26554)
- Bug in numpy.modf() on a SparseArray. Now a tuple of SparseArray is returned (GH26946).

Build changes

- Fix install error with PyPy on macOS (GH26536)

ExtensionArray

- Bug in factorize() when passing an ExtensionArray with a custom na_sentinel (GH25696).
- Series.count() miscounts NA values in ExtensionArrays (GH26835)
- Added Series.__array_ufunc__ to better handle NumPy ufuncs applied to Series backed by extension arrays (GH23293).
- Keyword argument deep has been removed from ExtensionArray.copy() (GH27083)

Other

- Removed unused C functions from vendored UltraJSON implementation (GH26198)
- Allow Index and RangeIndex to be passed to numpy min and max functions (GH26125)
- Use actual class name in repr of empty objects of a Series subclass (GH27001)
- Bug in DataFrame where passing an object array of timezone-aware datetime objects would incorrectly raise ValueError (GH13287)

5.5 Version 0.24

5.5.1 What's new in 0.24.2 (March 12, 2019)

**Warning:** The 0.24.x series of releases will be the last to support Python 2. Future feature releases will support Python 3 only. See Dropping Python 2.7 for more.

These are the changes in pandas 0.24.2. See Release notes for a full changelog including other versions of pandas.

**Fixed regressions**

- Fixed regression in `DataFrame.all()` and `DataFrame.any()` where `bool_only=True` was ignored (GH25101)
- Fixed issue in `DataFrame` construction with passing a mixed list of mixed types could segfault. (GH25075)
- Fixed regression in `DataFrame.apply()` causing `RecursionError` when `dict`-like classes were passed as argument. (GH25196)
- Fixed regression in `DataFrame.replace()` where `regex=True` was only replacing patterns matching the start of the string (GH25259)
- Fixed regression in `DataFrame.duplicated()`, where empty dataframe was not returning a boolean dtyped Series. (GH25184)
- Fixed regression in `Series.min()` and `Series.max()` where `numeric_only=True` was ignored when the `Series` contained `Categorical` data (GH25299)
- Fixed regression in subtraction between `Series` objects with `datetime64[ns]` dtype incorrectly raising `OverflowError` when the `Series` on the right contains null values (GH25317)
- Fixed regression in `TimedeltaIndex` where `np.sum(index)` incorrectly returned a zero-dimensional object instead of a scalar (GH25282)
- Fixed regression in `IntervalDtype` construction where passing an incorrect string with ‘Interval’ as a prefix could result in a `RecursionError`. (GH25338)
- Fixed regression in creating a period-dtype array from a read-only NumPy array of period objects. (GH25403)
• Fixed regression in Categorical, where constructing it from a categorical Series and an explicit categories= that differed from that in the Series created an invalid object which could trigger segfaults. (GH25318)

• Fixed regression in to_timedelta() losing precision when converting floating data to Timedelta data (GH25077).

• Fixed pip installing from source into an environment without NumPy (GH25193)

• Fixed regression in DataFrame.replace() where largest strings of numbers would be coerced into int64, causing an OverflowError (GH25616)

• Fixed regression in factorize() when passing a custom na_sentinel value with sort=True (GH25409).

• Fixed regression in DataFrame.to_csv() writing duplicate line endings with gzip compress (GH25311)

**Bug fixes**

**I/O**

• Better handling of terminal printing when the terminal dimensions are not known (GH25080)

• Bug in reading a HDF5 table-format DataFrame created in Python 2, in Python 3 (GH24925)

• Bug in reading a JSON with orient='table' generated by DataFrame.to_json() with index=False (GH25170)

• Bug where float indexes could have misaligned values when printing (GH25061)

**Categorical**

• Bug where calling Series.replace() on categorical data could return a Series with incorrect dimensions (GH24971)

•

**Reshaping**

• Bug in transform() where applying a function to a timezone aware column would return a timezone naive result (GH24198)

• Bug in DataFrame.join() when joining on a timezone aware DatetimeIndex (GH23931)

**Visualization**

• Bug in Series.plot() where a secondary y axis could not be set to log scale (GH25545)

**Other**

• Bug in Series.is_unique() where single occurrences of NaN were not considered unique (GH25180)

• Bug in merge() when merging an empty DataFrame with an Int64 column or a non-empty DataFrame with an Int64 column that is all NaN (GH25183)

• Bug in IntervalTree where a RecursionError occurs upon construction due to an overflow when adding endpoints, which also causes IntervalIndex to crash during indexing operations (GH25485)

• Bug in Series.size raising for some extension-array-backed Series, rather than returning the size (GH25580)

• Bug in resampling raising for nullable integer-dtype columns (GH25580)

5.5.2 What’s new in 0.24.1 (February 3, 2019)

**Warning:** The 0.24.x series of releases will be the last to support Python 2. Future feature releases will support Python 3 only. See Dropping Python 2.7 for more.

These are the changes in pandas 0.24.1. See Release notes for a full changelog including other versions of pandas. See What’s new in 0.24.0 (January 25, 2019) for the 0.24.0 changelog.

**API changes**

**Changing the sort parameter for Index set operations**

The default sort value for `Index.union()` has changed from `True` to `None` (GH24959). The default behavior, however, remains the same: the result is sorted, unless

1. `self` and `other` are identical
2. `self` or `other` is empty
3. `self` or `other` contain values that can not be compared (a `RuntimeWarning` is raised).

This change will allow `sort=True` to mean “always sort” in a future release.

The same change applies to `Index.difference()` and `Index.symmetric_difference()`, which would not sort the result when the values could not be compared.

The `sort` option for `Index.intersection()` has changed in three ways.

1. The default has changed from `True` to `False`, to restore the pandas 0.23.4 and earlier behavior of not sorting by default.
2. The behavior of `sort=True` can now be obtained with `sort=None`. This will sort the result only if the values in `self` and `other` are not identical.
3. The value `sort=True` is no longer allowed. A future version of pandas will properly support `sort=True` meaning “always sort”.

**Fixed regressions**

- Fixed regression in `DataFrame.to_dict()` with `records` orient raising an `AttributeError` when the `DataFrame` contained more than 255 columns, or wrongly converting column names that were not valid python identifiers (GH24939, GH24940).
- Fixed regression in `read_sql()` when passing certain queries with MySQL/pymysql (GH24988).
- Fixed regression in `Index.intersection` incorrectly sorting the values by default (GH24959).
- Fixed regression in `merge()` when merging an empty `DataFrame` with multiple timezone-aware columns on one of the timezone-aware columns (GH25014).
- Fixed regression in `Series.rename_axis()` and `DataFrame.rename_axis()` where passing `None` failed to remove the axis name (GH25034)
- Fixed regression in `to_timedelta()` with `box=False` incorrectly returning a `datetime64` object instead of a `timedelta64` object (GH24961)
- Fixed regression where custom hashable types could not be used as column keys in `DataFrame.set_index()` (GH24969)
Bug fixes

Reshaping

- Bug in `DataFrame.groupby()` with `Grouper` when there is a time change (DST) and grouping frequency is '1d' (GH24972)

Visualization

- Fixed the warning for implicitly registered matplotlib converters not showing. See `Restore Matplotlib datetime converter registration` for more (GH24963).

Other

- Fixed AttributeError when printing a DataFrame’s HTML repr after accessing the IPython config object (GH25036)

5.5.3 What’s new in 0.24.0 (January 25, 2019)

Warning: The 0.24.x series of releases will be the last to support Python 2. Future feature releases will support Python 3 only. See Dropping Python 2.7 for more details.

This is a major release from 0.23.4 and includes a number of API changes, new features, enhancements, and performance improvements along with a large number of bug fixes.

Highlights include:

- *Optional Integer NA Support*
- *New APIs for accessing the array backing a Series or Index*
- *A new top-level method for creating arrays*
- *Store Interval and Period data in a Series or DataFrame*
- *Support for joining on two MultiIndexes*

Check the *API Changes* and *deprecations* before updating.

These are the changes in pandas 0.24.0. See *Release notes* for a full changelog including other versions of pandas.
Enhancements

Optional integer NA support

pandas has gained the ability to hold integer dtypes with missing values. This long requested feature is enabled through the use of extension types.

Note: IntegerArray is currently experimental. Its API or implementation may change without warning.

We can construct a Series with the specified dtype. The dtype string Int64 is a pandas ExtensionDtype. Specifying a list or array using the traditional missing value marker of np.nan will infer to integer dtype. The display of the Series will also use the NaN to indicate missing values in string outputs. (GH20700, GH20747, GH22441, GH21789, GH22346)

```
In [1]: s = pd.Series([1, 2, np.nan], dtype='Int64')
In [2]: s
Out[2]:
0      1
1      2
2    <NA>
Length: 3, dtype: Int64
```

Operations on these dtypes will propagate NaN as other pandas operations.

```
# arithmetic
In [3]: s + 1
Out[3]:
0    2
1    3
2    <NA>
Length: 3, dtype: Int64

# comparison
In [4]: s == 1
Out[4]:
0   True
1   False
2    <NA>
Length: 3, dtype: boolean

# indexing
In [5]: s.iloc[1:3]
Out[5]:
1    2
2    <NA>
Length: 2, dtype: Int64

# operate with other dtypes
In [6]: s + s.iloc[1:3].astype('Int8')
Out[6]:
0    <NA>
(continues on next page)
These dtypes can operate as part of a DataFrame.

```python
In [8]: df = pd.DataFrame({'A': s, 'B': [1, 1, 3], 'C': list('aab'))

In [9]: df
Out[9]:
   A  B  C
0  1  1  a
1  2  1  a
2 <NA> 3  b
[3 rows x 3 columns]

In [10]: df.dtypes
Out[10]:
A   Int64
B   int64
C   object
Length: 3, dtype: object
```

These dtypes can be merged, reshaped, and casted.

```python
In [11]: pd.concat([df[['A']], df[['B', 'C']]], axis=1).dtypes
Out[11]:
A   Int64
B   int64
C   object
Length: 3, dtype: object

In [12]: df['A'].astype(float)
Out[12]:
 0  1.0
 1  2.0
 2  NaN
Name: A, Length: 3, dtype: float64
```

Reduction and groupby operations such as `sum` work.

```python
In [13]: df.sum()
Out[13]:
A   3
```
B  5  
C  aab  
Length: 3, dtype: object

In [14]: df.groupby('B').A.sum()
Out[14]:
B
1  3
3  0
Name: A, Length: 2, dtype: Int64

Warning: The Integer NA support currently uses the capitalized dtype version, e.g. Int8 as compared to the traditional int8. This may be changed at a future date.

See Nullable integer data type for more.

Accessing the values in a Series or Index

Series.array and Index.array have been added for extracting the array backing a Series or Index. (GH19954, GH23623)

In [15]: idx = pd.period_range('2000', periods=4)

In [16]: idx.array
Out[16]:
<PeriodArray>
Length: 4, dtype: period[D]

In [17]: pd.Series(idx).array
Out[17]:
<PeriodArray>
Length: 4, dtype: period[D]

Historically, this would have been done with series.values, but with .values it was unclear whether the returned value would be the actual array, some transformation of it, or one of pandas custom arrays (like Categorical). For example, with PeriodIndex, .values generates a new ndarray of period objects each time.

In [18]: idx.values
Out[18]:
array([Period('2000-01-01', 'D'), Period('2000-01-02', 'D'),
       Period('2000-01-03', 'D'), Period('2000-01-04', 'D')], dtype=object)

In [19]: id(idx.values)
Out[19]: 140031521047824

In [20]: id(idx.values)
Out[20]: 140029341412880
If you need an actual NumPy array, use `Series.to_numpy()` or `Index.to_numpy()`.

```python
In [21]: idx.to_numpy()
Out[21]:
array([Period('2000-01-01', 'D'), Period('2000-01-02', 'D'),
       Period('2000-01-03', 'D'), Period('2000-01-04', 'D')],
      dtype=object)
```

```python
In [22]: pd.Series(idx).to_numpy()
Out[22]:
array([Period('2000-01-01', 'D'), Period('2000-01-02', 'D'),
       Period('2000-01-03', 'D'), Period('2000-01-04', 'D')],
      dtype=object)
```

For Series and Indexes backed by normal NumPy arrays, `Series.array` will return a new `arrays.PandasArray`, which is a thin (no-copy) wrapper around a `numpy.ndarray`. `PandasArray` isn’t especially useful on its own, but it does provide the same interface as any extension array defined in pandas or by a third-party library.

```python
In [23]: ser = pd.Series([1, 2, 3])
In [24]: ser.array
Out[24]:
<PandasArray>
[1, 2, 3]
Length: 3, dtype: int64
```

```python
In [25]: ser.to_numpy()
Out[25]:
array([1, 2, 3])
```

We haven’t removed or deprecated `Series.values` or `DataFrame.values`, but we highly recommend and using `.array` or `.to_numpy()` instead.

See `Dtypes` and `Attributes and Underlying Data` for more.

**pandas.array: a new top-level method for creating arrays**

A new top-level method `array()` has been added for creating 1-dimensional arrays (GH22860). This can be used to create any extension array, including extension arrays registered by 3rd party libraries. See the `dtypes docs` for more on extension arrays.

```python
In [26]: pd.array([1, 2, np.nan], dtype='Int64')
Out[26]:
<IntegerArray>
[1, 2, <NA>]
Length: 3, dtype: Int64
```

```python
In [27]: pd.array(['a', 'b', 'c'], dtype='category')
Out[27]:
['a', 'b', 'c']
Categories (3, object): ['a', 'b', 'c']
```

Passing data for which there isn’t dedicated extension type (e.g. float, integer, etc.) will return a new `arrays.PandasArray`, which is just a thin (no-copy) wrapper around a `numpy.ndarray` that satisfies the pandas extension array interface.
On their own, a PandasArray isn’t a very useful object. But if you need write low-level code that works generically for any ExtensionArray, PandasArray satisfies that need.

Notice that by default, if no dtype is specified, the dtype of the returned array is inferred from the data. In particular, note that the first example of [1, 2, np.nan] would have returned a floating-point array, since NaN is a float.

Storing Interval and Period data in Series and DataFrame

Interval and Period data may now be stored in a Series or DataFrame, in addition to an IntervalIndex and PeriodIndex like previously (GH19453, GH22862).

For periods:
Previously, these would be cast to a NumPy array with object dtype. In general, this should result in better performance when storing an array of intervals or periods in a `Series` or column of a `DataFrame`.

Use `Series.array` to extract the underlying array of intervals or periods from the `Series`:

```python
In [36]: ser.array
Out[36]:
<IntervalArray>
[(0, 1], (1, 2], (2, 3], (3, 4], (4, 5]]
Length: 5, closed: right, dtype: interval[int64]
```

```python
In [37]: pser.array
Out[37]:
<PeriodArray>
Length: 5, dtype: period[D]
```

These return an instance of `arrays.IntervalArray` or `arrays.PeriodArray`, the new extension arrays that back interval and period data.

**Warning:** For backwards compatibility, `Series.values` continues to return a NumPy array of objects for Interval and Period data. We recommend using `Series.array` when you need the array of data stored in the `Series`, and `Series.to_numpy()` when you know you need a NumPy array.

See [Dtypes and Attributes and Underlying Data](#) for more.

### Joining with two multi-indexes

`DataFrame.merge()` and `DataFrame.join()` can now be used to join multi-indexed Dataframe instances on the overlapping index levels (GH6360)

See the [Merge, join, and concatenate](#) documentation section.

```python
In [38]: index_left = pd.MultiIndex.from_tuples([('K0', 'X0'), ('K0', 'X1'), ('K1', 'X2'), names=['key', 'X'])
   ....:
   ....:
In [39]: left = pd.DataFrame({'A': ['A0', 'A1', 'A2'],
                            'B': ['B0', 'B1', 'B2'],
                            index=index_left)
   ....:
In [40]: index_right = pd.MultiIndex.from_tuples([('K0', 'Y0'), ('K1', 'Y1'), ('K2', 'Y2'), ('K2', 'Y3'), names=['key', 'Y'])
   ....:
In [41]: right = pd.DataFrame({'C': ['C0', 'C1', 'C2', 'C3'],
                              'D': ['D0', 'D1', 'D2', 'D3'],
                              index=index_right)
   ....:
In [42]: left.join(right)
Out[42]:
(continues on next page)
A B C D
key X Y
K0 X0 Y0 A0 B0 C0 D0
X1 Y0 A1 B1 C0 D0
K1 X2 Y1 A2 B2 C1 D1
[3 rows x 4 columns]

For earlier versions this can be done using the following.

```
In [43]: pd.merge(left.reset_index(), right.reset_index(),
..........:  on=['key'], how='inner').set_index(['key', 'X', 'Y'])
```

```
Out[43]:
A B C D
key X Y
K0 X0 Y0 A0 B0 C0 D0
X1 Y0 A1 B1 C0 D0
K1 X2 Y1 A2 B2 C1 D1
[3 rows x 4 columns]
```

**Function read_html enhancements**

`read_html()` previously ignored colspan and rowspan attributes. Now it understands them, treating them as sequences of cells with the same value. (GH17054)

```
In [44]: result = pd.read_html(""
.......
.....:  <table>
.....:    <thead>
.....:      <tr>
.....:        <th>A</th><th>B</th><th>C</th>
.....:     </tr>
.....:   </thead>
.....:  <tbody>
.....:    <tr>
.....:     <td colspan="2">1</td><td>2</td>
.....:   </tr>
.....:  </tbody>
.....: </table>"")
```

*Previous behavior:*

```
In [13]: result
Out [13]:
[ A B C
  0 1 2 NaN]
```

*New behavior:*
New Styler.pipe() method

The Styler class has gained a `pipe()` method. This provides a convenient way to apply users’ predefined styling functions, and can help reduce “boilerplate” when using DataFrame styling functionality repeatedly within a notebook. (GH23229)

```python
In [46]: df = pd.DataFrame({'N': [1250, 1500, 1750], 'X': [0.25, 0.35, 0.50]})

In [47]: def format_and_align(styler):
   ....:     return styler.format({'N': '{:,.0f}', 'X': '{:.1%}'}).set_properties(**{'text-align': 'right'})

In [48]: df.style.pipe(format_and_align).set_caption('Summary of results.')
```

Similar methods already exist for other classes in pandas, including `DataFrame.pipe()`, `GroupBy.pipe()`, and `Resampler.pipe()`.

Renaming names in a MultiIndex

`DataFrame.rename_axis()` now supports `index` and `columns` arguments and `Series.rename_axis()` supports `index` argument (GH19978).

This change allows a dictionary to be passed so that some of the names of a MultiIndex can be changed.

Example:

```python
In [49]: mi = pd.MultiIndex.from_product([list('AB'), list('CD'), list('EF')], names=['AB', 'CD', 'EF'])

In [50]: df = pd.DataFrame(list(range(len(mi))), index=mi, columns=['N'])

In [51]: df
Out[51]:
    N
   AB  CD  EF
A  C  E  0
   F  1
B  D  E  2
   F  3
C  B  C  E  4
   F  5
```

(continues on next page)
In [52]: df.rename_axis(index={'CD': 'New'})
Out[52]:
   AB  New  EF
A   C   E  0
    F   1
B   C   E  4
    F   5
C   D   E  6
    F   7

[8 rows x 1 columns]

See the Advanced documentation on renaming for more details.

Other enhancements

- `merge()` now directly allows merge between objects of type DataFrame and named Series, without the need to convert the Series object into a DataFrame beforehand (GH21220)
- `ExcelWriter` now accepts mode as a keyword argument, enabling append to existing workbooks when using the openpyxl engine (GH3441)
- `FrozenList` has gained the `.union()` and `.difference()` methods. This functionality greatly simplifies groupby’s that rely on explicitly excluding certain columns. See Splitting an object into groups for more information (GH15475, GH15506).
- `DataFrame.to_parquet()` now accepts index as an argument, allowing the user to override the engine’s default behavior to include or omit the dataframe’s indexes from the resulting Parquet file. (GH20768)
- `read_feather()` now accepts columns as an argument, allowing the user to specify which columns should be read. (GH24025)
- `DataFrame.corr()` and `Series.corr()` now accept a callable for generic calculation methods of correlation, e.g. histogram intersection (GH22684)
- `DataFrame.to_string()` now accepts decimal as an argument, allowing the user to specify which decimal separator should be used in the output. (GH23614)
- `DataFrame.to_html()` now accepts render_links as an argument, allowing the user to generate HTML with links to any URLs that appear in the DataFrame. See the section on writing HTML in the IO docs for example usage. (GH23679)
- `pandas.read_csv()` now supports pandas extension types as an argument to dtype, allowing the user to use pandas extension types when reading CSVs. (GH23228)
- The `shift()` method now accepts fill_value as an argument, allowing the user to specify a value which will be used instead of NA/NaN in the empty periods. (GH15486)
- `to_datetime()` now supports the %Z and %z directive when passed into format (GH13486)
- `Series.mode()` and `DataFrame.mode()` now support the `dropna` parameter which can be used to specify whether `NaN/NaT` values should be considered (GH17534)

- `DataFrame.to_csv()` and `Series.to_csv()` now support the `compression` keyword when a file handle is passed. (GH21227)

- `Index.droplevel()` is now implemented also for flat indexes, for compatibility with `MultiIndex` (GH21115)

- `Series.droplevel()` and `DataFrame.droplevel()` are now implemented (GH20342)

- Added support for reading from/writing to Google Cloud Storage via the `gcsfs` library (GH19454, GH23094)

- `DataFrame.to_gbq()` and `read_gbq()` signature and documentation updated to reflect changes from the `pandas-gbq` library version 0.8.0. Adds a `credentials` argument, which enables the use of any kind of google-auth credentials. (GH21627, GH22557, GH23662)

- New method `HDFStore.walk()` will recursively walk the group hierarchy of an HDF5 file (GH10932)

- `read_html()` copies cell data across `colspan` and `rowspan`, and it treats all-th table rows as headers if header kwarg is not given and there is no `thead` (GH17054)

- `Series.nlargest()`, `Series.nsmallest()`, `DataFrame.nlargest()`, and `DataFrame.nsmallest()` now accept the value "all" for the `keep` argument. This keeps all ties for the nth largest/smallest value (GH16818)

- `IntervalIndex` has gained the `set_closed()` method to change the existing closed value (GH21670)

- `to_csv()`, `to_csv()`, `to_json()`, and `to_json()` now support `compression='infer'` to infer compression based on filename extension (GH15008). The default compression for `to_csv`, `to_json`, and `to_pickle` methods has been updated to 'infer' (GH22004).

- `DataFrame.to_sql()` now supports writing `TIMESTAMP WITH TIME ZONE` types for supported databases. For databases that don’t support timezones, datetime data will be stored as timezone unaware local timestamps. See the `Datetime data types` for implications (GH9086).

- `to_timedelta()` now supports iso-formatted timedelta strings (GH18787)

- `Series` and `DataFrame` now support `Iterable` objects in the constructor (GH2193)

- `DatetimeIndex` has gained the `DatetimeIndex.timetz` attribute. This returns the local time with timezone information. (GH21358)

- `round()`, `ceil()`, and `floor()` for `DatetimeIndex` and `Timestamp` now support an ambiguous argument for handling datetimes that are rounded to ambiguous times (GH18946) and a nonexistent argument for handling datetimes that are rounded to nonexistent times. See `Nonexistent times when localizing` (GH22647)

- The result of `resample()` is now iterable similar to `groupby()` (GH15314).

- `Series.resample()` and `DataFrame.resample()` have gained the `pandas.core.resample.Resampler.quantile()` (GH15023).

- `DataFrame.resample()` and `Series.resample()` with a `PeriodIndex` will now respect the base argument in the same fashion as with a `DatetimeIndex`. (GH23882)

- `pandas.api.types.is_list_like()` has gained a keyword `allow_sets` which is True by default; if False, all instances of `set` will not be considered “list-like” anymore (GH23061)

- `Index.to_frame()` now supports overriding column name(s) (GH22580).

- `Categorical.from_codes()` now can take a `dtype` parameter as an alternative to passing categories and ordered (GH24398).

- New attribute `__git_version__` will return git commit sha of current build (GH21295).

- Compatibility with Matplotlib 3.0 (GH22790).
• Added `Interval.overlaps()`, `arrays.IntervalArray.overlaps()`, and `IntervalIndex.overlaps()` for determining overlaps between interval-like objects (GH21998)

• `read_fwf()` now accepts keyword `infer_nrows` (GH15138).

• `to_parquet()` now supports writing a `DataFrame` as a directory of parquet files partitioned by a subset of the columns when `engine = 'pyarrow'` (GH23283)

• `Timestamp.tz_localize()`, `DatetimeIndex.tz_localize()`, and `Series.tz_localize()` have gained the `nonexistent` argument for alternative handling of nonexistent times. See `Nonexistent times when localizing` (GH8917, GH24466)

• `Index.difference()`, `Index.intersection()`, `Index.union()`, and `Index.symmetric_difference()` now have an optional `sort` parameter to control whether the results should be sorted if possible (GH17839, GH24471)

• `read_excel()` now accepts `usecols` as a list of column names or callable (GH18273)

• `MultiIndex.to_flat_index()` has been added to flatten multiple levels into a single-level `Index` object.

• `DataFrame.to_stata()` and `pandas.io.stata.StataWriter117` can write mixed string columns to Stata strl format (GH23633)

• `DataFrame.between_time()` and `DataFrame.at_time()` have gained the `axis` parameter (GH8839)

• `DataFrame.to_records()` now accepts `index_dtypes` and `column_dtypes` parameters to allow different data types in stored column and index records (GH18146)

• `IntervalIndex` has gained the `is_overlapping` attribute to indicate if the `IntervalIndex` contains any overlapping intervals (GH23309)

• `pandas.DataFrame.to_sql()` has gained the `method` argument to control SQL insertion clause. See the `insertion method` section in the documentation. (GH8953)

• `DataFrame.corrwith()` now supports Spearman’s rank correlation, Kendall’s tau as well as callable correlation methods. (GH21925)

• `DataFrame.to_json()`, `DataFrame.to_csv()`, `DataFrame.to_pickle()`, and other export methods now support tilde(~) in path argument. (GH23473)

**Backwards incompatible API changes**

pandas 0.24.0 includes a number of API breaking changes.

**Increased minimum versions for dependencies**

We have updated our minimum supported versions of dependencies (GH21242, GH18742, GH23774, GH24767). If installed, we now require:
Additionally we no longer depend on feather-format for feather based storage and replaced it with references to pyarrow (GH21639 and GH23053).

**os.linesep is used for line_terminator of DataFrame.to_csv**

*DataFrame.to_csv()* now uses *os.linesep()* rather than '\n' for the default line terminator (GH20353). This change only affects when running on Windows, where '\r\n' was used for line terminator even when '\n' was passed in *line_terminator*.

*Previous behavior* on Windows:

```
In [1]: data = pd.DataFrame({'string_with_lf': ['a\nbc'],
                        'string_with_crlf': ['a\r\nb\nbc']})

In [2]: # When passing file PATH to to_csv,
   ...: # line_terminator does not work, and csv is saved with \r\n.
   ...: # Also, this converts all \n's in the data to \r\n.
   ...: # Also, this converts all \n's in the data to \r\n.  
   ...: data.to_csv("test.csv", index=False, line_terminator='\n')

In [3]: with open("test.csv", mode='rb') as f:
   ...:     print(f.read())
Out[3]: b'string_with_lf,string_with_crlf\n'a\nbc','a\r\nb\nbc'

In [4]: # When passing file OBJECT with newline option to
   ...: # to_csv, line_terminator works.
   ...: with open("test2.csv", mode='w', newline='\n') as f:
   ...:     data.to_csv(f, index=False, line_terminator='\n')

In [5]: with open("test2.csv", mode='rb') as f:
   ...:     print(f.read())
Out[5]: b'string_with_lf,string_with_crlf\n'a\nbc','a\r\nb\nbc''\n'
```

*New behavior* on Windows:

Passing *line_terminator* explicitly, set the line terminator to that character.

```
In [1]: data = pd.DataFrame({'string_with_lf': ['a\nbc'],
                        'string_with_crlf': ['a\r\nb\nbc']})

(continues on next page)```
In [2]: data.to_csv("test.csv", index=False, line_terminator='\n')

In [3]: with open("test.csv", mode='rb') as f:
   ...:     print(f.read())
Out[3]: b'string_with_lf,string_with_crlf\n"a\nb,c","a\nr\nb,c"\n'

On Windows, the value of os.linesep is '\r\n', so if line_terminator is not set, '\r\n' is used for line terminator.

In [1]: data = pd.DataFrame({"string_with_lf": ["a\nb,c"],
   ...:           "string_with_crlf": ["a\nr\nb,c"]})

In [2]: data.to_csv("test.csv", index=False)

In [3]: with open("test.csv", mode='rb') as f:
   ...:     print(f.read())
Out[3]: b'string_with_lf,string_with_crlf\n"a\nb,c","a\nr\nb,c"\n'

For file objects, specifying newline is not sufficient to set the line terminator. You must pass in the line_terminator explicitly, even in this case.

In [1]: data = pd.DataFrame({"string_with_lf": ["a\nb,c"],
   ...:           "string_with_crlf": ["a\nr\nb,c"]})

In [2]: with open("test2.csv", mode='w', newline='\n') as f:
   ...:     data.to_csv(f, index=False)

In [3]: with open("test2.csv", mode='rb') as f:
   ...:     print(f.read())
Out[3]: b'string_with_lf,string_with_crlf\n"a\nb,c","a\nr\nb,c"\n'

Proper handling of np.NaN in a string data-typed column with the Python engine

There was bug in read_excel() and read_csv() with the Python engine, where missing values turned to 'nan' with dtype=str and na_filter=True. Now, these missing values are converted to the string missing indicator, np.nan. (GH20377)

Previous behavior:

In [5]: data = 'a,b,c\n1,,3\n4,5,6'
In [6]: df = pd.read_csv(StringIO(data), engine='python', dtype=str, na_filter=True)
In [7]: df.loc[0, 'b']
Out[7]: 'nan'

New behavior:

In [53]: data = 'a,b,c\n1,,3\n4,5,6'
In [54]: df = pd.read_csv(StringIO(data), engine='python', dtype=str, na_filter=True)
In [55]: df.loc[0, 'b']
Out[55]: nan

Notice how we now instead output np.nan itself instead of a stringified form of it.

**Parsing datetime strings with timezone offsets**

Previously, parsing datetime strings with UTC offsets with `to_datetime()` or `DatetimeIndex` would automatically convert the datetime to UTC without timezone localization. This is inconsistent from parsing the same datetime string with `Timestamp` which would preserve the UTC offset in the `tz` attribute. Now, `to_datetime()` preserves the UTC offset in the `tz` attribute when all the datetime strings have the same UTC offset (GH17697, GH11736, GH22457)

*Previous behavior:*

```python
In [2]: pd.to_datetime("2015-11-18 15:30:00+05:30")
Out[2]: Timestamp('2015-11-18 10:00:00')

In [3]: pd.Timestamp("2015-11-18 15:30:00+05:30")
Out[3]: Timestamp('2015-11-18 15:30:00+0530', tz='pytz.FixedOffset(330)')

# Different UTC offsets would automatically convert the datetimes to UTC (without a UTC␣
˓→timezone)
In [4]: pd.to_datetime(["2015-11-18 15:30:00+05:30", "2015-11-18 16:30:00+06:30"])
Out[4]: DatetimeIndex(["2015-11-18 10:00:00", '2015-11-18 10:00:00'], dtype=
˓→'datetime64[ns]', freq=None)
```

*New behavior:*

```python
In [56]: pd.to_datetime("2015-11-18 15:30:00+05:30")
Out[56]: Timestamp('2015-11-18 15:30:00+0530', tz='pytz.FixedOffset(330)')

In [57]: pd.Timestamp("2015-11-18 15:30:00+05:30")
Out[57]: Timestamp('2015-11-18 15:30:00+0530', tz='pytz.FixedOffset(330)')
```

Parsing datetime strings with the same UTC offset will preserve the UTC offset in the `tz`

```python
In [58]: pd.to_datetime(["2015-11-18 15:30:00+05:30"] * 2)
Out[58]: DatetimeIndex(["2015-11-18 15:30:00+05:30", '2015-11-18 15:30:00+05:30'], dtype=
˓→'datetime64[ns, pytz.FixedOffset(330)]', freq=None)
```

Parsing datetime strings with different UTC offsets will now create an Index of `datetime.datetime` objects with different UTC offsets

```python
In [59]: idx = pd.to_datetime([-"2015-11-18 15:30:00+05:30", "2015-11-18 16:30:00+06:30"])
In [60]: idx
Out[60]: Index([2015-11-18 15:30:00+05:30, 2015-11-18 16:30:00+06:30], dtype='object')

In [61]: idx[0]
Out[61]: datetime.datetime(2015, 11, 18, 15, 30, tzinfo=tzoffset(None, 19800))
```
Passing utc=True will mimic the previous behavior but will correctly indicate that the dates have been converted to UTC.

Parsing mixed-timezones with `read_csv()`

`read_csv()` no longer silently converts mixed-timezone columns to UTC (GH24987).

**Previous behavior**

```python
>>> import io
>>> content = """a
... 2000-01-01T00:00:00+05:00
... 2000-01-01T00:00:00+06:00"
...
>>> df = pd.read_csv(io.StringIO(content), parse_dates=['a'])
>>> df.a
0 1999-12-31 19:00:00
1 1999-12-31 18:00:00
Name: a, dtype: datetime64[ns]
```

**New behavior**

```python
In [64]: import io

In [65]: content = """
      ...: a
      ...: 2000-01-01T00:00:00+05:00
      ...: 2000-01-01T00:00:00+06:00"
      ...
In [66]: df = pd.read_csv(io.StringIO(content), parse_dates=['a'])

In [67]: df.a
Out[67]:
0  2000-01-01 00:00:00+05:00
1  2000-01-01 00:00:00+06:00
Name: a, Length: 2, dtype: object
```

As can be seen, the `dtype` is object; each value in the column is a string. To convert the strings to an array of datetimes, the `date_parser` argument...
In [68]: df = pd.read_csv(io.StringIO(content), parse_dates=['a'],
........:  date_parser=lambda col: pd.to_datetime(col, utc=True))
........:
In [69]: df.a
Out[69]:
0  1999-12-31 19:00:00+00:00
1  1999-12-31 18:00:00+00:00
Name: a, Length: 2, dtype: datetime64[ns, UTC]

See Parsing datetime strings with timezone offsets for more.

Time values in \texttt{dt.end\_time} and \texttt{to\_timestamp(how='end')} 

The time values in \texttt{Period} and \texttt{PeriodIndex} objects are now set to \texttt{‘23:59:59.999999999’} when calling \texttt{Series.dt.end\_time}, \texttt{Period.end\_time}, \texttt{PeriodIndex.end\_time}, \texttt{Period.to\_timestamp()} with \texttt{how=’end’}, or \texttt{PeriodIndex.to\_timestamp()} with \texttt{how=’end’} (GH17157)

\textit{Previous behavior:}

In [2]: p = pd.Period('2017-01-01', 'D')
In [3]: pi = pd.PeriodIndex([p])

In [4]: pd.Series(pi).dt.end_time[0]
Out[4]: Timestamp('2017-01-01 00:00:00')

In [5]: p.end_time
Out[5]: Timestamp('2017-01-01 23:59:59.999999999')

\textit{New behavior:}

Calling \texttt{Series.dt.end\_time} will now result in a time of \texttt{‘23:59:59.999999999’} as is the case with \texttt{Period.end\_time}, for example

In [70]: p = pd.Period('2017-01-01', 'D')

In [71]: pi = pd.PeriodIndex([p])

In [72]: pd.Series(pi).dt.end_time[0]
Out[72]: Timestamp('2017-01-01 23:59:59.999999999')

In [73]: p.end_time
Out[73]: Timestamp('2017-01-01 23:59:59.999999999')
Series.unique for timezone-aware data

The return type of `Series.unique()` for datetime with timezone values has changed from an `numpy.ndarray` of `Timestamp` objects to a `arrays.DatetimeArray` (GH24024).

```python
In [74]: ser = pd.Series([pd.Timestamp('2000', tz='UTC'),
   ....:                 pd.Timestamp('2000', tz='UTC')])
   ....:

Previous behavior:

```python
In [3]: ser.unique()
Out[3]: array([Timestamp('2000-01-01 00:00:00+0000', tz='UTC')], dtype=object)
```

New behavior:

```python
In [75]: ser.unique()
Out[75]: <DatetimeArray>
   ['2000-01-01 00:00:00+00:00']
Length: 1, dtype: datetime64[ns, UTC]
```

Sparse data structure refactor

`SparseArray`, the array backing `SparseSeries` and the columns in a `SparseDataFrame`, is now an extension array (GH21978, GH19056, GH22835). To conform to this interface and for consistency with the rest of pandas, some API breaking changes were made:

- `SparseArray` is no longer a subclass of `numpy.ndarray`. To convert a `SparseArray` to a NumPy array, use `numpy.asarray()`.
- `SparseArray.dtype` and `SparseSeries.dtype` are now instances of `SparseDtype`, rather than `np.dtype`. Access the underlying dtype with `SparseDtype.subtype`.
- `numpy.asarray(sparse_array)` now returns a dense array with all the values, not just the non-fill-value values (GH14167)
- `SparseArray.take` now matches the API of `pandas.api.extensions.ExtensionArray.take()` (GH19506):
  - The default value of `allow_fill` has changed from `False` to `True`.
  - The `out` and `mode` parameters are now longer accepted (previously, this raised if they were specified).
  - Passing a scalar for `indices` is no longer allowed.
- The result of `concat()` with a mix of sparse and dense Series is a Series with sparse values, rather than a `SparseSeries`.
- `SparseDataFrame.combine` and `DataFrame.combine_first` no longer supports combining a sparse column with a dense column while preserving the sparse subtype. The result will be an object-dtype `SparseArray`.
- Setting `SparseArray.fill_value` to a fill value with a different `dtype` is now allowed.
- `DataFrame[column]` is now a `Series` with sparse values, rather than a `SparseSeries`, when slicing a single column with sparse values (GH23559).
- The result of `Series.where()` is now a `Series` with sparse values, like with other extension arrays (GH24077)
Some new warnings are issued for operations that require or are likely to materialize a large dense array:

- A `errors.PerformanceWarning` is issued when using `fillna` with a method, as a dense array is constructed to create the filled array. Filling with a value is the efficient way to fill a sparse array.
- A `errors.PerformanceWarning` is now issued when concatenating sparse Series with differing fill values. The fill value from the first sparse array continues to be used.

In addition to these API breaking changes, many Performance Improvements and Bug Fixes have been made.

Finally, a `Series.sparse` accessor was added to provide sparse-specific methods like `Series.sparse.from_coo()`.

```
In [76]: s = pd.Series([0, 0, 1, 1, 1], dtype='Sparse[int]')
In [77]: s.sparse.density
Out[77]: 0.6
```

**get_dummies() always returns a DataFrame**

Previously, when `sparse=True` was passed to `get_dummies()`, the return value could be either a `DataFrame` or a `SparseDataFrame`, depending on whether all or a just a subset of the columns were dummy-encoded. Now, a `DataFrame` is always returned (GH24284).

*Previous behavior*

The first `get_dummies()` returns a `DataFrame` because the column A is not dummy encoded. When just ["B", "C"] are passed to `get_dummies`, then all the columns are dummy-encoded, and a `SparseDataFrame` was returned.

```
In [2]: df = pd.DataFrame({"A": [1, 2], "B": ['a', 'b'], "C": ['a', 'a']})
In [3]: type(pd.get_dummies(df, sparse=True))
Out[3]: pandas.core.frame.DataFrame
In [4]: type(pd.get_dummies(df[['B', 'C']], sparse=True))
Out[4]: pandas.core.sparse.frame.SparseDataFrame
```

*New behavior*

Now, the return type is consistently a `DataFrame`.

```
In [78]: type(pd.get_dummies(df, sparse=True))
Out[78]: pandas.core.frame.DataFrame
In [79]: type(pd.get_dummies(df[['B', 'C']], sparse=True))
Out[79]: pandas.core.frame.DataFrame
```

**Note:** There's no difference in memory usage between a `SparseDataFrame` and a `DataFrame` with sparse values. The memory usage will be the same as in the previous version of pandas.
Raise ValueError in DataFrame.to_dict(orient='index')

Bug in `DataFrame.to_dict()` raises `ValueError` when used with `orient='index'` and a non-unique index instead of losing data (GH22801)

```
In [80]: df = pd.DataFrame({'a': [1, 2], 'b': [0.5, 0.75]}, index=['A', 'A'])
In [81]: df
Out[81]:
   a  b
A 1  0.50
A 2  0.75
[2 rows x 2 columns]
In [82]: df.to_dict(orient='index')
---------------------------------------------------------------------------
ValueError                         Traceback (most recent call last)
<ipython-input-82-f5309a7c6adb> in <module>()
----> 1 df.to_dict(orient='index')
/pandas/pandas/core/frame.py in to_dict(self, orient, into)
   1605       elif orient == "index":
   1606           if not self.index.is_unique:
-> 1607               raise ValueError("DataFrame index must be unique for orient=
   1608           "index').")
   1609           return into_c(
   1610               (t[0], dict(zip(self.columns, t[1:]))))

ValueError: DataFrame index must be unique for orient='index'.
```

Tick DateOffset normalize restrictions

Creating a `Tick` object (Day, Hour, Minute, Second, Milli, Micro, Nano) with `normalize=True` is no longer supported. This prevents unexpected behavior where addition could fail to be monotone or associative. (GH21427)

```
In [2]: ts = pd.Timestamp('2018-06-11 18:01:14')
In [3]: ts
Out[3]: Timestamp('2018-06-11 18:01:14')
In [4]: tic = pd.offsets.Hour(n=2, normalize=True)
   ...:
In [5]: tic
Out[5]: <2 * Hours>
In [6]: ts + tic
Out[6]: Timestamp('2018-06-11 20:03:14')
```

(continues on next page)
In [7]: ts + tic + tic + tic == ts + (tic + tic + tic)
Out[7]: False

New behavior:

In [83]: ts = pd.Timestamp('2018-06-11 18:01:14')
In [84]: tic = pd.offsets.Hour(n=2)
In [85]: ts + tic + tic + tic == ts + (tic + tic + tic)
Out[85]: True

Period subtraction

Subtraction of a Period from another Period will give a DateOffset, instead of an integer (GH21314)

Previous behavior:

In [2]: june = pd.Period('June 2018')
In [3]: april = pd.Period('April 2018')
In [4]: june - april
Out [4]: 2

New behavior:

In [86]: june = pd.Period('June 2018')
In [87]: april = pd.Period('April 2018')
In [88]: june - april
Out[88]: <2 * MonthEnds>

Similarly, subtraction of a Period from a PeriodIndex will now return an Index of DateOffset objects instead of an Int64Index

Previous behavior:

In [2]: pi = pd.period_range('June 2018', freq='M', periods=3)
In [3]: pi - pi[0]
Out[3]: Int64Index([0, 1, 2], dtype='int64')

New behavior:

In [89]: pi = pd.period_range('June 2018', freq='M', periods=3)
In [90]: pi - pi[0]
Out[90]: Index([<0 * MonthEnds>, <MonthEnd>, <2 * MonthEnds>], dtype='object')
Addition/subtraction of NaN from DataFrame

Adding or subtracting NaN from a DataFrame column with timedelta64[ns] dtype will now raise a TypeError instead of returning all-NaT. This is for compatibility with TimedeltaIndex and Series behavior (GH22163)

```
In [91]: df = pd.DataFrame([pd.Timedelta(days=1)])
Out[92]:
0 1 days
[1 rows x 1 columns]
```

Previous behavior:

```
In [4]: df = pd.DataFrame([pd.Timedelta(days=1)])
In [5]: df - np.nan
Out[5]:
0 0 NaT
```

New behavior:

```
In [2]: df - np.nan
...  
TypeError: unsupported operand type(s) for -: 'TimedeltaIndex' and 'float'
```

DataFrame comparison operations broadcasting changes

Previously, the broadcasting behavior of DataFrame comparison operations (==, !=, ...) was inconsistent with the behavior of arithmetic operations (+, -, ...). The behavior of the comparison operations has been changed to match the arithmetic operations in these cases. (GH22880)

The affected cases are:

- operating against a 2-dimensional np.ndarray with either 1 row or 1 column will now broadcast the same way a np.ndarray would (GH23000).
- a list or tuple with length matching the number of rows in the DataFrame will now raise ValueError instead of operating column-by-column (GH22880).
- a list or tuple with length matching the number of columns in the DataFrame will now operate row-by-row instead of raising ValueError (GH22880).

```
In [93]: arr = np.arange(6).reshape(3, 2)
In [94]: df = pd.DataFrame(arr)
In [95]: df
Out[95]:
   0  1
0 0  1
```

(continues on next page)
Previous behavior:

```python
In [5]: df == arr[[0], :]
   ...: # comparison previously broadcast where arithmetic would raise
Out[5]:
   0   1
0  True  True
1  False False
2  False False

In [6]: df + arr[[0], :]
   ...: # arithmetic previously broadcast where comparison would raise
   ...: ValueError: Unable to coerce to DataFrame, shape must be (3, 2): given (1, 2)

In [7]: df == (1, 2)
   ...: # length matches number of columns;
   ...: # comparison previously raised where arithmetic would broadcast
   ...: ValueError: Invalid broadcasting comparison [(1, 2)] with block values

In [8]: df + (1, 2)
Out[8]:
   0  1
   0  3
   1  5
   2  7

In [9]: df == (1, 2, 3)
   ...: # length matches number of rows
   ...: # comparison previously broadcast where arithmetic would raise
Out[9]:
   0  1
0  False  True
1  True  False
2  False False

In [10]: df + (1, 2, 3)
   ...: ValueError: Unable to coerce to Series, length must be 2: given 3
```

New behavior:

```
# Comparison operations and arithmetic operations both broadcast.
In [96]: df == arr[[0], :]
Out[96]:
   0  1
0  True  True
1  False False
2  False False
```
In 

Out

[3 rows x 2 columns]

In: df + arr[[0], :]
Out:
0 1
0 0 2
1 2 4
2 4 6
[3 rows x 2 columns]

# Comparison operations and arithmetic operations both broadcast.
In: df == (1, 2)
Out:
0 1
0 False False
1 False False
2 False False
[3 rows x 2 columns]

In: df + (1, 2)
Out:
0 1
0 1 3
1 3 5
2 5 7
[3 rows x 2 columns]

# Comparison operations and arithmetic operations both raise ValueError.
In: df == (1, 2, 3)
... ValueError: Unable to coerce to Series, length must be 2: given 3
In: df + (1, 2, 3)
... ValueError: Unable to coerce to Series, length must be 2: given 3

**DataFrames arithmetic operations broadcasting changes**

*DataFrames* arithmetic operations when operating with 2-dimensional *np.ndarray* objects now broadcast in the same way as *np.ndarray* broadcast. (GH23000)

In: arr = np.arange(6).reshape(3, 2)
In: df = pd.DataFrame(arr)
In: df
Out:
Previous behavior:

```python
In [5]: df + arr[[0], :]  # 1 row, 2 columns
   ...:
ValueError: Unable to coerce to DataFrame, shape must be (3, 2): given (1, 2)
In [6]: df + arr[:, [1]]  # 1 column, 3 rows
   ...:
ValueError: Unable to coerce to DataFrame, shape must be (3, 2): given (3, 1)
```

New behavior:

```python
In [103]: df + arr[[0], :]  # 1 row, 2 columns
Out[103]:
   0  1
   0  0  2
   1  2  4
   2  4  6
[3 rows x 2 columns]

In [104]: df + arr[:, [1]]  # 1 column, 3 rows
Out[104]:
   0  1
   0  1  2
   1  5  6
   2  9 10
[3 rows x 2 columns]
```

Series and Index data-dtype incompatibilities

Series and Index constructors now raise when the data is incompatible with a passed `dtype` = (GH15832)

Previous behavior:

```python
In [4]: pd.Series([-1], dtype="uint64")
Out [4]:
     0
0  18446744073709551615
dtype: uint64
```

New behavior:

```python
In [4]: pd.Series([-1], dtype="uint64")
Out [4]:
     0
0  18446744073709551615
```
OverflowError: Trying to coerce negative values to unsigned integers

Concatenation changes

Calling `pandas.concat()` on a `Categorical` of ints with NA values now causes them to be processed as objects when concatenating with anything other than another `Categorical` of ints (GH19214)

```python
In [105]: s = pd.Series([0, 1, np.nan])
In [106]: c = pd.Series([0, 1, np.nan], dtype="category")
```

Previous behavior

```python
In [3]: pd.concat([s, c])
Out[3]:
0  0.0
1  1.0
2  NaN
0  0.0
1  1.0
2  NaN
dtype: float64
```

New behavior

```python
In [107]: pd.concat([s, c])
Out[107]:
0  0.0
1  1.0
2  NaN
0  0.0
1  1.0
2  NaN
Length: 6, dtype: float64
```

Datetimelike API changes

- For `DatetimeIndex` and `TimedeltaIndex` with non-`None` `freq` attribute, addition or subtraction of integer-dtyped array or `Index` will return an object of the same class (GH19959)
- `DateOffset` objects are now immutable. Attempting to alter one of these will now raise `AttributeError` (GH21341)
- `PeriodIndex` subtraction of another `PeriodIndex` will now return an object-dtype `Index` of `DateOffset` objects instead of raising a `TypeError` (GH20049)
- `cut()` and `qcut()` now returns a `DatetimeIndex` or `TimedeltaIndex` bins when the input is datetime or timedelta dtype respectively and `retbins=True` (GH19891)
- `DatetimeIndex.to_period()` and `Timestamp.to_period()` will issue a warning when timezone information will be lost (GH21333)
• PeriodIndex.tz_convert() and PeriodIndex.tz_localize() have been removed (GH21781)

Other API changes

• A newly constructed empty DataFrame with integer as the dtype will now only be cast to float64 if index is specified (GH22858)

• Series.str.cat() will now raise if others is a set (GH23009)

• Passing scalar values to DatetimeIndex or TimedeltaIndex will now raise TypeError instead of ValueError (GH23539)

• max_rows and max_cols parameters removed from HTMLFormatter since truncation is handled by DataFrameFormatter (GH23818)

• read_csv() will now raise a ValueError if a column with missing values is declared as having dtype bool (GH20591)

• The column order of the resultant DataFrame from MultiIndex.to_frame() is now guaranteed to match the MultiIndex.names order. (GH22420)

• Incorrectly passing a DatetimeIndex to MultiIndex.from_tuples(), rather than a sequence of tuples, now raises a TypeError rather than a ValueError (GH24024)

• pd.offsets.generate_range() argument time_rule has been removed; use offset instead (GH24157)

• In 0.23.x, pandas would raise a ValueError on a merge of a numeric column (e.g. int dtype column) and an object dtype column (GH9780). We have re-enabled the ability to merge object and other dtypes; pandas will still raise on a merge between a numeric and an object dtype column that is composed only of strings (GH21681)

• Accessing a level of a MultiIndex with a duplicate name (e.g. in get_level_values()) now raises a ValueError instead of a KeyError (GH21770).

• Invalid construction of IntervalDtype will now always raise a TypeError rather than a ValueError if the subtype is invalid (GH21185)

• Trying to reindex a DataFrame with a non unique MultiIndex now raises a ValueError instead of an Exception (GH21770)

• Index subtraction will attempt to operate element-wise instead of raising TypeError (GH19369)

• pandas.io.formats.style.Styler supports a number-format property when using to_excel() (GH22015)

• DataFrame.corr() and Series.corr() now raise a ValueError along with a helpful error message instead of a KeyError when supplied with an invalid method (GH22298)

• shift() will now always return a copy, instead of the previous behaviour of returning self when shifting by 0 (GH22397)

• DataFrame.set_index() now gives a better (and less frequent) KeyError, raises a ValueError for incorrect types, and will not fail on duplicate column names with drop=True. (GH22484)

• Slicing a single row of a DataFrame with multiple ExtensionArrays of the same type now preserves the dtype, rather than coercing to object (GH22784)

• DateOffset attribute _cacheable and method _should_cache have been removed (GH23118)

• Series.searchsorted(), when supplied a scalar value to search for, now returns a scalar instead of an array (GH23801).
• Categorical.searchsorted(), when supplied a scalar value to search for, now returns a scalar instead of an array (GH23466).

• Categorical.searchsorted() now raises a KeyError rather than a ValueError, if a searched for key is not found in its categories (GH23466).

• Index.hasnans() and Series.hasnans() now always return a python boolean. Previously, a python or a numpy boolean could be returned, depending on circumstances (GH23294).

• The order of the arguments of DataFrame.to_html() and DataFrame.to_string() is rearranged to be consistent with each other. (GH23614)

• CategoricalIndex.reindex() now raises a ValueError if the target index is non-unique and not equal to the current index. It previously only raised if the target index was not of a categorical dtype (GH23963).

• Series.to_list() and Index.to_list() are now aliases of Series.tolist respectively Index.tolist (GH8826)

• The result of SparseSeries.unstack is now a DataFrame with sparse values, rather than a SparseDataFrame (GH24372).

• DatetimeIndex and TimedeltaIndex no longer ignore the dtype precision. Passing a non-nanosecond resolution dtype will raise a ValueError (GH24753)

### Extension type changes

#### Equality and hashability

pandas now requires that extension dtypes be hashable (i.e. the respective ExtensionDtype objects; hashability is not a requirement for the values of the corresponding ExtensionArray). The base class implements a default __eq__ and __hash__. If you have a parametrized dtype, you should update the ExtensionDtype._metadata tuple to match the signature of your __init__ method. See pandas.api.extensions.ExtensionDtype for more (GH22476).

#### New and changed methods

• dropna() has been added (GH21185)

• repeat() has been added (GH24349)

• The ExtensionArray constructor, _from_sequence now take the keyword arg copy=False (GH21185)

• pandas.api.extensions.ExtensionArray.shift() added as part of the basic ExtensionArray interface (GH22387).

• searchsorted() has been added (GH24350)

• Support for reduction operations such as sum, mean via opt-in base class method override (GH22762)

• ExtensionArray.isna() is allowed to return an ExtensionArray (GH22325).

#### Dtype changes

• ExtensionDtype has gained the ability to instantiate from string dtypes, e.g. decimal would instantiate a registered DecimalDtype; furthermore the ExtensionDtype has gained the method construct_array_type (GH21185)

• Added ExtensionDtype._is_numeric for controlling whether an extension dtype is considered numeric (GH22290).

• Added pandas.api.types.register_extension_dtype() to register an extension type with pandas (GH22664)

• Updated the .type attribute for PeriodDtype, DatetimeTZDtype, and IntervalDtype to be instances of the dtype (Period, Timestamp, and Interval respectively) (GH22938)
Operator support

A Series based on an ExtensionArray now supports arithmetic and comparison operators (GH19577). There are two approaches for providing operator support for an ExtensionArray:

1. Define each of the operators on your ExtensionArray subclass.
2. Use an operator implementation from pandas that depends on operators that are already defined on the underlying elements (scalars) of the ExtensionArray.

See the ExtensionArray Operator Support documentation section for details on both ways of adding operator support.

Other changes

- A default repr for pandas.api.extensions.ExtensionArray is now provided (GH23601).
- ExtensionArray._formatting_values() is deprecated. Use ExtensionArray._formatter instead (GH23601).
- An ExtensionArray with a boolean dtype now works correctly as a boolean indexer. pandas.api.types.is_bool_dtype() now properly considers them boolean (GH22326).

Bug fixes

- Bug in Series.get() for Series using ExtensionArray and integer index (GH21257).
- shift() now dispatches to ExtensionArray.shift() (GH22386).
- Series.combine() works correctly with ExtensionArray inside of Series (GH20825).
- Series.combine() with scalar argument now works for any function type (GH21248).
- Series.astype() and DataFrame.astype() now dispatch to ExtensionArray.astype() (GH21185).
- Slicing a single row of a DataFrame with multiple ExtensionArrays of the same type now preserves the dtype, rather than coercing to object (GH22784).
- Bug when concatenating multiple Series with different extension dtypes not casting to object dtype (GH22994).
- Series backed by an ExtensionArray now work with util.hash_pandas_object() (GH23066).
- DataFrame.stack() no longer converts to object dtype for DataFrames where each column has the same extension dtype. The output Series will have the same dtype as the columns (GH23077).
- Series.unstack() and DataFrame.unstack() no longer convert extension arrays to object-dtype ndarrays. Each column in the output DataFrame will now have the same dtype as the input (GH23077).
- Bug when grouping Dataframe.groupby() and aggregating on ExtensionArray it was not returning the actual ExtensionArray dtype (GH23227).
- Bug in pandas.merge() when merging on an extension array-backed column (GH23020).

Deprecations

- MultiIndex.labels has been deprecated and replaced by MultiIndex.codes. The functionality is unchanged. The new name better reflects the natures of these codes and makes the MultiIndex API more similar to the API for CategoricalIndex (GH13443). As a consequence, other uses of the name labels in MultiIndex have also been deprecated and replaced with codes:
  - You should initialize a MultiIndex instance using a parameter named codes rather than labels.
  - MultiIndex.set_labels has been deprecated in favor of MultiIndex.set_codes().
  - For method MultiIndex.copy(), the labels parameter has been deprecated and replaced by a codes parameter.
- `DataFrame.to_stata()`, `read_stata()`. StataReader and StataWriter have deprecated the encoding argument. The encoding of a Stata dta file is determined by the file type and cannot be changed (GH21244)
- `MultiIndex.to_hierarchical()` is deprecated and will be removed in a future version (GH21613)
- `Series.ptp()` is deprecated. Use `numpy.ptp` instead (GH21614)
- `Series.compress()` is deprecated. Use `Series[condition]` instead (GH18262)
- The signature of `Series.to_csv()` has been uniformed to that of `DataFrame.to_csv()`: the name of the first argument is now `path_or_buf`, the order of subsequent arguments has changed, the `header` argument now defaults to `True` (GH19715)
- `Categorical.from_codes()` has deprecated providing float values for the `codes` argument. (GH21767)
- `pandas.read_table()` is deprecated. Instead, use `read_csv()` passing `sep='\t'` if necessary. This deprecation has been removed in 0.25.0. (GH21948)
- `Series.str.cat()` has deprecated using arbitrary list-likes within list-likes. A list-like container may still contain many Series, Index or 1-dimensional `np.ndarray`, or alternatively, only scalar values. (GH21950)
- `FrozenNDArray.searchsorted()` has deprecated the `v` parameter in favor of `value` (GH14645)
- `DatetimeIndex.shift()` and `PeriodIndex.shift()` now accept `periods` argument instead of `n` for consistency with `Index.shift()` and `Series.shift()`. Using `n` throws a deprecation warning (GH22458, GH22912)
- The fastpath keyword of the different Index constructors is deprecated (GH23110).
- `Timestamp.tz_localize()`, `DatetimeIndex.tz_localize()`, and `Series.tz_localize()` have deprecated the `errors` argument in favor of the nonexistent argument (GH8917)
- The class `FrozenNDArray` has been deprecated. When unpickling, `FrozenNDArray` will be unpickled to `np.ndarray` once this class is removed (GH9031)
- The methods `DataFrame.update()` and `Panel.update()` have deprecated the `raise_conflict=False|True` keyword in favor of `errors='ignore' | 'raise'` (GH23585)
- The methods `Series.str.partition()` and `Series.str.rpartition()` have deprecated the `pat` keyword in favor of `sep` (GH22676)
- Deprecated the `nthreads` keyword of `pandas.read_feather()` in favor of `use_threads` to reflect the changes in `pyarrow>=0.11.0`. (GH23053)
- `pandas.read_excel()` has deprecated accepting `usecols` as an integer. Please pass in a list of ints from 0 to `usecols` inclusive instead (GH23527)
- Constructing a `TimedeltaIndex` from data with datetime64-dtyped data is deprecated, will raise `TypeError` in a future version (GH23539)
- Constructing a `DatetimeIndex` from data with timedelta64-dtyped data is deprecated, will raise `TypeError` in a future version (GH23675)
- The `keep_tz=False` option (the default) of the `keep_tz` keyword of `DatetimeIndex.to_series()` is deprecated (GH17832).
- `_timezone` converting a tz-aware `datetime`, `datetime` or `Timestamp` with `Timestamp` and the `tz` argument is now deprecated. Instead, use `Timestamp.tz_convert()` (GH23579)
- `pandas.api.types.is_period()` is deprecated in favor of `pandas.api.types.is_period_dtype` (GH23917)
- `pandas.api.types.is_datetimetz()` is deprecated in favor of `pandas.api.types.is_datet ime64tz` (GH23917)
• Creating a `TimedeltaIndex`, `DatetimeIndex`, or `PeriodIndex` by passing range arguments `start`, `end`, and `periods` is deprecated in favor of `timedelta_range()`, `date_range()`, or `period_range()` (GH23919).

• Passing a string alias like `datetime64[ns, UTC]` as the unit parameter to `Datetimetztype` is deprecated. Use `Datetimetztype.construct_from_string` instead (GH23990).

• The `skipna` parameter of `infer_dtype()` will switch to `True` by default in a future version of pandas (GH17066, GH24050).

• In `Series.where()` with Categorical data, providing an `other` that is not present in the categories is deprecated. Convert the categorical to a different dtype or add the `other` to the categories first (GH24077).

• `Series.clip_lower()`, `Series.clip_upper()`, `DataFrame.clip_lower()` and `DataFrame.clip_upper()` are deprecated and will be removed in a future version. Use `Series.clip(lower=threshold)`, `Series.clip(upper=threshold)` and the equivalent `DataFrame` methods (GH24203).

• `Series.nonzero()` is deprecated and will be removed in a future version (GH18262).

• Passing an integer to `Series.fillna()` and `DataFrame.fillna()` with `timedelta64[ns]` dtypes is deprecated, will raise `TypeError` in a future version. Use `obj.fillna(pd.Timedelta(...))` instead (GH24694).

• `Series.cat.categorical`, `Series.cat.name` and `Series.cat.index` have been deprecated. Use the attributes on `Series.cat` or `Series` directly. (GH24751).

• Passing a dttype without a precision like `np.dtype('datetime64')` or `timedelta64` to `Index`, `DatetimeIndex` and `TimedeltaIndex` is now deprecated. Use the nanosecond-precision dttype instead (GH24753).

**Integer addition/subtraction with datetimes and timedeltaas is deprecated**

In the past, users could—in some cases—add or subtract integers or integer-dtype arrays from `Timestamp`, `DatetimeIndex` and `TimedeltaIndex`.

This usage is now deprecated. Instead add or subtract integer multiples of the object’s `freq` attribute (GH21939, GH23878).

**Previous behavior:**

```
In [6]: ts + 2

In [7]: tdi = pd.timedelta_range('1D', periods=2)
In [8]: tdi - np.array([2, 1])
Out[8]: TimedeltaIndex(['-1 days', '1 days'], dtype='timedelta64[ns]', freq=None)

In [9]: dti = pd.date_range('2001-01-01', periods=2, freq='7D')
In [10]: dti + pd.Index([1, 2])
Out[10]: DatetimeIndex(['2001-01-08', '2001-01-22'], dtype='datetime64[ns]', freq=None)
```

**New behavior:**

```
In [109]: ts + 2 * ts.freq
```
Passing integer data and a timezone to DatetimeIndex

The behavior of `DatetimeIndex` when passed integer data and a timezone is changing in a future version of pandas. Previously, these were interpreted as wall times in the desired timezone. In the future, these will be interpreted as wall times in UTC, which are then converted to the desired timezone (GH24559).

The default behavior remains the same, but issues a warning:

```python
In [3]: pd.DatetimeIndex([946684800000000000], tz="US/Central")
/bin/ipython:1: FutureWarning:
Passing integer-dtype data and a timezone to DatetimeIndex. Integer values will be interpreted differently in a future version of pandas. Previously, these were viewed as datetime64[ns] values representing the wall time *in the specified timezone*. In the future, these will be viewed as datetime64[ns] values representing the wall time *in UTC*. This is similar to a nanosecond-precision UNIX epoch. To accept the future behavior, use

    pd.to_datetime(integer_data, utc=True).tz_convert(tz)

To keep the previous behavior, use

    pd.to_datetime(integer_data).tz_localize(tz)

# !/bin/python3
Out[3]: DatetimeIndex(['2000-01-01 00:00:00-06:00'], dtype='datetime64[ns, US/Central]', freq=None)
```

As the warning message explains, opt in to the future behavior by specifying that the integer values are UTC, and then converting to the final timezone:

```python
In [114]: pd.to_datetime([946684800000000000], utc=True).tz_convert('US/Central')
Out[114]: DatetimeIndex(['1999-12-31 18:00:00-06:00'], dtype='datetime64[ns, US/Central]', freq=None)
```

The old behavior can be retained with by localizing directly to the final timezone:

```python
In [115]: pd.to_datetime([946684800000000000]).tz_localize('US/Central')
Out[115]: DatetimeIndex(['2000-01-01 00:00:00-06:00'], dtype='datetime64[ns, US/Central]', freq=None)
```
Converting timezone-aware Series and Index to NumPy arrays

The conversion from a Series or Index with timezone-aware datetime data will change to preserve timezones by default (GH23569).

NumPy doesn’t have a dedicated dtype for timezone-aware datetimes. In the past, converting a Series or DatetimeIndex with timezone-aware datetimes would convert to a NumPy array by

1. converting the tz-aware data to UTC
2. dropping the timezone-info
3. returning a numpy.ndarray with datetime64[ns] dtype

Future versions of pandas will preserve the timezone information by returning an object-dtype NumPy array where each value is a Timestamp with the correct timezone attached

```python
In [116]: ser = pd.Series(pd.date_range('2000', periods=2, tz='CET'))

In [117]: ser
Out[117]:
0  2000-01-01 00:00:00+01:00
1  2000-01-02 00:00:00+01:00
Length: 2, dtype: datetime64[ns, CET]
```

The default behavior remains the same, but issues a warning

```python
In [8]: np.asarray(ser)
/bin/ipython:1: FutureWarning: Converting timezone-aware DatetimeArray to timezone-naive ndarray with 'datetime64[ns]' dtype. In the future, this will return an ndarray with 'object' dtype where each element is a 'pandas.Timestamp' with the correct 'tz' →.
To accept the future behavior, pass 'dtype=object'.
To keep the old behavior, pass 'dtype=\"datetime64[ns]\"'.

#!/bin/python3
Out[8]:
array(['1999-12-31T23:00:00.000000000', '2000-01-01T23:00:00.000000000'],
dtype='datetime64[ns]')
```

The previous or future behavior can be obtained, without any warnings, by specifying the dtype

**Previous behavior**

```python
In [118]: np.asarray(ser, dtype='datetime64[ns]')
Out[118]:
array(['1999-12-31T23:00:00.000000000', '2000-01-01T23:00:00.000000000'],
dtype='datetime64[ns]')
```

**Future behavior**

```python
# New behavior
In [119]: np.asarray(ser, dtype=object)
Out[119]:
array([Timestamp('2000-01-01 00:00:00+0100', tz='CET', freq='D'),
      Timestamp('2000-01-02 00:00:00+0100', tz='CET', freq='D')],
dtype=object)
```
Or by using `Series.to_numpy()`

```python
In [120]: ser.to_numpy()
Out[120]:
array([Timestamp('2000-01-01 00:00:00+0100', tz='CET', freq='D'),
       Timestamp('2000-01-02 00:00:00+0100', tz='CET', freq='D')],
      dtype=object)

In [121]: ser.to_numpy(dtype="datetime64[ns]")
Out[121]:
array([1999-12-31T23:00:00.000000000,
       2000-01-01T23:00:00.000000000],
      dtype='datetime64[ns]')
```

All the above applies to a `DatetimeIndex` with tz-aware values as well.

**Removal of prior version deprecations/changes**

- The `LongPanel` and `WidePanel` classes have been removed (GH10892)
- `Series.repeat()` has renamed the `reps` argument to `repeats` (GH14645)
- Several private functions were removed from the (non-public) module `pandas.core.common` (GH22001)
- Removal of the previously deprecated module `pandas.core.datetools` (GH14105, GH14094)
- Strings passed into `DataFrame.groupby()` that refer to both column and index levels will raise a `ValueError` (GH14432)
- `Index.repeat()` and `MultiIndex.repeat()` have renamed the `n` argument to `repeats` (GH14645)
- The `Series` constructor and `.astype` method will now raise a `ValueError` if timestamp dtypes are passed in without a unit (e.g. `np.datetime64`) for the `dtype` parameter (GH15987)
- Removal of the previously deprecated `as_indexer` keyword completely from `str.match()` (GH22356, GH6581)
- The modules `pandas.types`, `pandas.computation`, and `pandas.util.decorators` have been removed (GH16157, GH16250)
- Removed the `pandas.formats.style` shim for `pandas.io.formats.style.Styler` (GH16059)
- `pandas.pnow`, `pandas.match`, `pandas.groupby`, `pd.get_store`, `pd.Expr`, and `pd.Term` have been removed (GH15538, GH15940)
- `Categorical.searchsorted()` and `Series.searchsorted()` have renamed the `v` argument to `value` (GH14645)
- `pandas.parser`, `pandas.lib`, and `pandas.tslib` have been removed (GH15537)
- `Index.searchsorted()` have renamed the `key` argument to `value` (GH14645)
- `DataFrame.consolidate` and `Series.consolidate` have been removed (GH15501)
- Removal of the previously deprecated module `pandas.json` (GH19944)
- The module `pandas.tools` has been removed (GH15358, GH16005)
- `SparseArray.get_values()` and `SparseArray.to_dense()` have dropped the `fill` parameter (GH14686)
- `DataFrame.sortlevel` and `Series.sortlevel` have been removed (GH15099)
- `SparseSeries.to_dense()` has dropped the `sparse_only` parameter (GH14686)
pandas: powerful Python data analysis toolkit, Release 1.2.5

- DataFrame.astype() and Series.astype() have renamed the raise_on_error argument to errors (GH14967)
- is_sequence, is_any_int_dtype, and is_floating_dtype have been removed from pandas.api.types (GH16163, GH16189)

Performance improvements

- Slicing Series and DataFrames with an monotonically increasing CategoricalIndex is now very fast and has speed comparable to slicing with an Int64Index. The speed increase is both when indexing by label (using .loc) and position(.iloc) (GH20395) Slicing a monotonically increasing CategoricalIndex itself (i.e. ci[1000:2000]) shows similar speed improvements as above (GH21659)
- Improved performance of CategoricalIndex.equals() when comparing to another CategoricalIndex (GH24023)
- Improved performance of Series.describe() in case of numeric dtypes (GH21274)
- Improved performance of pandas.core.groupby.GroupBy.rank() when dealing with tied rankings (GH21237)
- Improved performance of DataFrame.set_index() with columns consisting of Period objects (GH21582, GH21606)
- Improved performance of Series.at() and Index.get_value() for Extension Arrays values (e.g. Categorical) (GH24204)
- Improved performance of membership checks in Categorical and CategoricalIndex (i.e. x in cat-style checks are much faster). CategoricalIndex.contains() is likewise much faster (GH21369, GH21508)
- Improved performance of HDFStore.groups() (and dependent functions like HDFStore.keys()). (i.e. x in store checks are much faster) (GH21372)
- Improved the performance of pandas.get_dummies() with sparse=True (GH21997)
- Improved performance of IndexEngine.get_indexer_non_unique() for sorted, non-unique indexes (GH9466)
- Improved performance of PeriodIndex.unique() (GH23083)
- Improved performance of concat() for Series objects (GH23404)
- Improved performance of DatetimeIndex.normalize() and Timestamp.normalize() for timezone naive or UTC datetimes (GH23634)
- Improved performance of DatetimeIndex.tz_localize() and various DatetimeIndex attributes with datetime UTC timezone (GH23772)
- Fixed a performance regression on Windows with Python 3.7 of read_csv() (GH23516)
- Improved performance of Categorical constructor for Series objects (GH23814)
- Improved performance of where() for Categorical data (GH24077)
- Improved performance of iterating over a Series. Using DataFrame.itertuples() now creates iterators without internally allocating lists of all elements (GH20783)
- Improved performance of Period constructor, additionally benefitting PeriodArray and PeriodIndex creation (GH24084, GH24118)
- Improved performance of tz-aware DatetimeArray binary operations (GH24491)
Bug fixes

Categorical

- Bug in `Categorical.from_codes()` where NaN values in codes were silently converted to 0 (GH21767). In the future this will raise a `ValueError`. Also changes the behavior of `.from_codes([1.1, 2.0])`.

- Bug in `Categorical.sort_values()` where NaN values were always positioned in front regardless of `na_position` value. (GH22556).

- Bug when indexing with a boolean-valued `Categorical`. Now a boolean-valued `Categorical` is treated as a boolean mask (GH22665)

- Constructing a `CategoricalIndex` with empty values and boolean categories was raising a `ValueError` after a change to dtype coercion (GH22702).

- Bug in `Categorical.take()` with a user-provided `fill_value` not encoding the `fill_value`, which could result in a `ValueError`, incorrect results, or a segmentation fault (GH23296).

- In `Series.unstack()`, specifying a `fill_value` not present in the categories now raises a `TypeError` rather than ignoring the `fill_value` (GH23284)

- Bug when resampling `DataFrame.resample()` and aggregating on categorical data, the categorical dtype was getting lost. (GH23227)

- Bug in many methods of the `.str`-accessor, which always failed on calling the `CategoricalIndex.str` constructor (GH23555, GH23556)

- Bug in `Series.where()` losing the categorical dtype for categorical data (GH24077)

- Bug in `Categorical.apply()` where NaN values could be handled unpredictably. They now remain unchanged (GH24241)

- Bug in `Categorical` comparison methods incorrectly raising `ValueError` when operating against a `DataFrame` (GH24630)

- Bug in `Categorical.set_categories()` where setting fewer new categories with `rename=True` caused a segmentation fault (GH24675)

Datetimelike

- Fixed bug where two `DateOffset` objects with different `normalize` attributes could evaluate as equal (GH21404)

- Fixed bug where `Timestamp.resolution()` incorrectly returned 1-microsecond `timedelta` instead of 1-nanosecond `Timedelta` (GH21336, GH21365)

- Bug in `to_datetime()` that did not consistently return an `Index` when `box=True` was specified (GH21864)

- Bug in `DatetimeIndex` comparisons where string comparisons incorrectly raises `TypeError` (GH22074)

- Bug in `DatetimeIndex` comparisons when comparing against `timedelta64[ns]` dtyped arrays; in some cases `TypeError` was incorrectly raised, in others it incorrectly failed to raise (GH22074)

- Bug in `DatetimeIndex` comparisons when comparing against object-dtyped arrays (GH22074)

- Bug in `DataFrame` with `datetime64[ns]` dtype addition and subtraction with `Timedelta`-like objects (GH22005, GH22163)

- Bug in `DataFrame` with `datetime64[ns]` dtype addition and subtraction with `DateOffset` objects returning an object dtype instead of `datetime64[ns]` dtype (GH21610, GH22163)
pandas: powerful Python data analysis toolkit, Release 1.2.5

- Bug in `DataFrame` with `datetime64[ns]` dtype comparing against `NaT` incorrectly (GH22242, GH22163)
- Bug in `DataFrame` with `datetime64[ns]` dtype subtracting `Timestamp`-like object incorrectly returned `datetime64[ns]` dtype instead of `timedelta64[ns]` dtype (GH8554, GH22163)
- Bug in `DataFrame` with `datetime64[ns]` dtype subtracting `np.datetime64` object with non-nanosecond unit failing to convert to nanoseconds (GH18874, GH22163)
- Bug in `DataFrame` comparisons against `Timestamp`-like objects failing to raise `TypeError` for inequality checks with mismatched types (GH8932, GH22163)
- Bug in `DataFrame` with mixed dtypes including `datetime64[ns]` incorrectly raising `TypeError` on equality comparisons (GH13128, GH22163)
- Bug in `DataFrame.values` returning a `DatetimeIndex` for a single-column `DataFrame` with tz-aware date-time values. Now a 2-D `numpy.ndarray` of `Timestamp` objects is returned (GH24024)
- Bug in `DataFrame.eq()` comparison against `NaT` incorrectly returning True or NaN (GH15697, GH22163)
- Bug in `DatetimeIndex` subtraction that incorrectly failed to raise `OverflowError` (GH22492, GH22508)
- Bug in `DatetimeIndex` incorrectly allowing indexing with `Timedelta` object (GH20464)
- Bug in `DatetimeIndex` where frequency was being set if original frequency was `None` (GH22150)
- Bug in rounding methods of `DatetimeIndex` (`round()`, `ceil()`, `floor()`) and `Timestamp` (`round()`, `ceil()`, `floor()`) could give rise to loss of precision (GH22591)
- Bug in `to_datetime()` with an `Index` argument that would drop the name from the result (GH21697)
- Bug in `PeriodIndex` where adding or subtracting a `timedelta` or `Tick` object produced incorrect results (GH22988)
- Bug in the `Series` repr with period-dtype data missing a space before the data (GH23601)
- Bug in `date_range()` when decrementing a start date to a past end date by a negative frequency (GH23270)
- Bug in `Series.min()` which would return `NaN` instead of `NaT` when called on a series of `NaT` (GH23282)
- Bug in `Series.combine_first()` not properly aligning categoricals, so that missing values in `self` where not filled by valid values from `other` (GH24147)
- Bug in `DataFrame.combine()` with datetimelike values raising a `TypeError` (GH23079)
- Bug in `date_range()` with frequency of `Day` or higher where dates sufficiently far in the future could wrap around to the past instead of raising `OutOfBoundsDatetime` (GH14187)
- Bug in `period_range()` ignoring the frequency of `start` and `end` when those are provided as `Period` objects (GH20535).
- Bug in `PeriodIndex` with attribute `freq.n` greater than 1 where adding a `DateOffset` object would return incorrect results (GH23215)
- Bug in `Series` that interpreted string indices as lists of characters when setting datetimelike values (GH23451)
- Bug in `DataFrame` when creating a new column from an ndarray of `Timestamp` objects with timezones creating an object-dtype column, rather than datetime with timezone (GH23932)
- Bug in `Timestamp` constructor which would drop the frequency of an input `Timestamp` (GH22311)
- Bug in `DatetimeIndex` where calling `np.array(dtindex, dtype=object)` would incorrectly return an array of `long` objects (GH23524)
- Bug in `Index` where passing a timezone-aware `DatetimeIndex` and `dtype=object` would incorrectly raise a `ValueError` (GH23524)
• Bug in `Index` where calling `np.array(dtindex, dtype=object)` on a timezone-naive `DatetimeIndex` would return an array of datetime objects instead of `Timestamp` objects, potentially losing nanosecond portions of the timestamps (GH23524)

• Bug in Categorical.__setitem__ not allowing setting with another Categorical when both are unordered and have the same categories, but in a different order (GH24142)

• Bug in `date_range()` where using dates with millisecond resolution or higher could return incorrect values or the wrong number of values in the index (GH24110)

• Bug in `DatetimeIndex` where constructing a `DatetimeIndex` from a `Categorical` or `CategoricalIndex` would incorrectly drop timezone information (GH18664)

• Bug in `DatetimeIndex` and `TimedeltaIndex` where indexing with `Ellipsis` would incorrectly lose the index’s freq attribute (GH21282)

• Clarified error message produced when passing an incorrect freq argument to `DatetimeIndex` with NaT as the first entry in the passed data (GH11587)

• Bug in `to_datetime()` where box and utc arguments were ignored when passing a `DataFrame` or dict of unit mappings (GH23760)

• Bug in `Series.dt` where the cache would not update properly after an in-place operation (GH24408)

• Bug in `PeriodIndex` where comparisons against an array-like object with length 1 failed to raise ValueError (GH23078)

• Bug in `DatetimeIndex.astype()`, `PeriodIndex.astype()` and `TimedeltaIndex.astype()` ignoring the sign of the dtype for unsigned integer dtypes (GH24405).

• Fixed bug in `Series.max()` with `datetime64[ns]`-dtype failing to return NaT when nulls are present and `skipna=False` is passed (GH24265)

• Bug in `to_datetime()` where arrays of datetime objects containing both timezone-aware and timezone-naive datetimes would fail to raise ValueError (GH24569)

• Bug in `to_datetime()` with invalid datetime format doesn’t coerce input to NaT even if `errors='coerce'` (GH24763)

Timedelta

• Bug in `DataFrame` with `timedelta64[ns]` dtype division by Timedelta-like scalar incorrectly returning `timedelta64[ns]` dtype instead of `float64` dtype (GH20088, GH22163)

• Bug in adding a `Index` with object dtype to a `Series` with `timedelta64[ns]` dtype incorrectly raising (GH22390)

• Bug in multiplying a `Series` with numeric dtype against a `timedelta` object (GH22390)

• Bug in `Series` with numeric dtype when adding or subtracting an array or `Series` with `timedelta64` dtype (GH22390)

• Bug in `Index` with numeric dtype when multiplying or dividing an array with dtype `timedelta64` (GH22390)

• Bug in `TimedeltaIndex` incorrectly allowing indexing with `Timestamp` object (GH20464)

• Fixed bug where subtracting `Timedelta` from an object-dtyped array would raise TypeError (GH21980)

• Fixed bug in adding a `DataFrame` with all-`timedelta64[ns]` dtypes to a `DataFrame` with all-integer dtypes returning incorrect results instead of raising `TypeError` (GH22696)

• Bug in `TimedeltaIndex` where adding a timezone-aware datetime scalar incorrectly returned a timezone-naive `DatetimeIndex` (GH23215)
• Bug in TimedeltaIndex where adding np.timedelta64('NaT') incorrectly returned an all-NaT DatetimeIndex instead of an all-NaT TimedeltaIndex (GH23215)
• Bug in Timedelta and to_timedelta() have inconsistencies in supported unit string (GH21762)
• Bug in TimedeltaIndex division where dividing by another TimedeltaIndex raised TypeError instead of returning a Float64Index (GH23829, GH22631)
• Bug in TimedeltaIndex comparison operations where comparing against non-Timedelta-like objects would raise TypeError instead of returning all-False for __eq__ and all-True for __ne__ (GH24056)
• Bug in TimedeltaIndex comparisons when comparing with a Tick object incorrectly raising TypeError (GH24710)

Timezones

• Bug in Index.shift() where an AssertionError would raise when shifting across DST (GH8616)
• Bug in Timestamp constructor where passing an invalid timezone offset designator (Z) would not raise a ValueError (GH8910)
• Bug in Timestamp.replace() where replacing at a DST boundary would retain an incorrect offset (GH7825)
• Bug in Series.replace() with datetime64[ns, tz] data when replacing NaT (GH11792)
• Bug in Timestamp when passing different string date formats with a timezone offset would produce different timezone offsets (GH12064)
• Bug when comparing a tz-naive Timestamp to a tz-aware DatetimeIndex which would coerce the DatetimeIndex to tz-naive (GH12601)
• Bug in Series.truncate() with a tz-aware DatetimeIndex which would cause a core dump (GH9243)
• Bug in Series constructor which would coerce tz-aware and tz-naive Timestamp to tz-aware (GH13051)
• Bug in Index with datetime64[ns, tz] dtype that did not localize integer data correctly (GH20964)
• Bug in DatetimeIndex where constructing with an integer and tz would not localize correctly (GH12619)
• Fixed bug where DataFrame.describe() and Series.describe() on tz-aware datetimes did not show first and last result (GH21328)
• Bug in DatetimeIndex comparisons failing to raise TypeError when comparing timezone-aware DatetimeIndex against np.datetime64 (GH22074)
• Bug in DataFrame assignment with a timezone-aware scalar (GH19843)
• Bug in DataFrame.asof() that raised a TypeError when attempting to compare tz-naive and tz-aware timestamps (GH21194)
• Bug when constructing a DatetimeIndex with Timestamp constructed with the replace method across DST (GH18785)
• Bug when setting a new value with DataFrame.loc() with a DatetimeIndex with a DST transition (GH18308, GH20724)
• Bug in Index.unique() that did not re-localize tz-aware dates correctly (GH21737)
• Bug when indexing a Series with a DST transition (GH21846)
• Bug in DataFrame.resample() and Series.resample() where an AmbiguousTimeError or NonExistentTimeError would raise if a timezone aware timeseries ended on a DST transition (GH19375, GH10117)
• Bug in `DataFrame.drop()` and `Series.drop()` when specifying a tz-aware Timestamp key to drop from a `DatetimeIndex` with a DST transition (GH21761)

• Bug in `DatetimeIndex` constructor where `NaT` and `dateutil.tz.tzlocal` would raise an `OutOfBoundsDatetime` error (GH23807)

• Bug in `DatetimeIndex.tz_localize()` and `Timestamp.tz_localize()` with `dateutil.tz.tzlocal` near a DST transition that would return an incorrectly localized datetime (GH23807)

• Bug in `to_datetime()` where `utc=True` was not respected when specifying a `unit` and `errors='ignore'` (GH23758)

• Bug in `to_datetime()` where `utc=True` was not respected when passing a `Timestamp` (GH24415)

• Bug in `DataFrame.any()` returns wrong value when `axis=1` and the data is of datetimelike type (GH23070)

• Bug in `Datetimex.to_period()` where a timezone aware index was converted to UTC first before creating `PeriodIndex` (GH22905)

• Bug in `DataFrame.tz_localize()`, `DataFrame.tz_convert()`, `Series.tz_localize()`, and `Series.tz_convert()` where `copy=False` would mutate the original argument inplace (GH6326)

• Bug in `DataFrame.max()` and `DataFrame.min()` with `axis=1` where a `Series` with `NaN` would be returned when all columns contained the same timezone (GH10390)

Offsets

• Bug in FY5253 where date offsets could incorrectly raise an `AssertionError` in arithmetic operations (GH14774)

• Bug in `DateOffset` where keyword arguments `week` and `milliseconds` were accepted and ignored. Passing these will now raise `ValueError` (GH19398)

• Bug in adding `DateOffset` with `DataFrame` or `PeriodIndex` incorrectly raising `TypeError` (GH23215)

• Bug in comparing `DateOffset` objects with non-DateOffset objects, particularly strings, raising `ValueError` instead of returning `False` for equality checks and `True` for not-equal checks (GH23524)

Numeric

• Bug in `Series __rmatmul__` doesn’t support matrix vector multiplication (GH21530)

• Bug in `factorize()` fails with read-only array (GH12813)

• Fixed bug in `unique()` handled signed zeros inconsistently: for some inputs 0.0 and -0.0 were treated as equal and for some inputs as different. Now they are treated as equal for all inputs (GH21866)

• Bug in `DataFrame.agg()`, `DataFrame.transform()` and `DataFrame.apply()` where, when supplied with a list of functions and `axis=1` (e.g. `df.apply(['sum', 'mean'], axis=1)`), a `TypeError` was wrongly raised. For all three methods such calculation are now done correctly. (GH16679).

• Bug in `Series` comparison against datetime-like scalars and arrays (GH22074)

• Bug in `DataFrame` multiplication between boolean dtype and integer returning object dtype instead of integer dtype (GH22047, GH22163)

• Bug in `DataFrame.apply()` where, when supplied with a string argument and additional positional or keyword arguments (e.g. `df.apply('sum', min_count=1)`), a `TypeError` was wrongly raised (GH22376)
• Bug in `DataFrame.astype()` to extension dtype may raise `AttributeError` (GH22578)

• Bug in `DataFrame` with `timedelta64[ns]` dtype arithmetic operations with `ndarray` with integer dtype incorrectly treating the array as `timedelta64[ns]` dtype (GH23114)

• Bug in `Series.rpow()` with object dtype `NaN` for `1 ** NA` instead of `1` (GH22922).

• `Series.agg()` can now handle numpy `NaN`-aware methods like `numpy.nansum()` (GH19629)

• Bug in `Series.rank()` and `DataFrame.rank()` when `pct=True` and more than $2^{31}$ rows are present resulted in percentages greater than `1.0` (GH18271)

• Calls such as `DataFrame.round()` with a non-unique `CategoricalIndex()` now return expected data. Previously, data would be improperly duplicated (GH21809).

• Added `log10`, `floor` and `ceil` to the list of supported functions in `DataFrame.eval()` (GH24139, GH24353)

• Logical operations `&`, `|`, `^` between `Series` and `Index` will no longer raise `ValueError` (GH22092)

• Checking PEP 3141 numbers in `is_scalar()` function returns `True` (GH22903)

• Reduction methods like `Series.sum()` now accept the default value of `keepdims=False` when called from a NumPy ufunc, rather than raising a `TypeError`. Full support for `keepdims` has not been implemented (GH24356).

Conversion

• Bug in `DataFrame.combine_first()` in which column types were unexpectedly converted to float (GH20699)

• Bug in `DataFrame.clip()` in which column types are not preserved and casted to float (GH24162)

• Bug in `DataFrame.clip()` when order of columns of dataframes doesn’t match, result observed is wrong in numeric values (GH20911)

• Bug in `DataFrame.astype()` where converting to an extension dtype when duplicate column names are present causes a `RecursionError` (GH24704)

Strings

• Bug in `Index.str.partition()` was not nan-safe (GH23558).

• Bug in `Index.str.split()` was not nan-safe (GH23677).

• Bug `Series.str.contains()` not respecting the `na` argument for a `Categorical` dtype `Series` (GH22158)

• Bug in `Index.str.cat()` when the result contained only `NaN` (GH24044)

Interval

• Bug in the `IntervalIndex` constructor where the `closed` parameter did not always override the inferred `closed` (GH19370)

• Bug in the `IntervalIndex` repr where a trailing comma was missing after the list of intervals (GH20611)

• Bug in `Interval` where scalar arithmetic operations did not retain the `closed` value (GH22313)

• Bug in `IntervalIndex` where indexing with datetime-like values raised a `KeyError` (GH20636)

• Bug in `IntervalTree` where data containing `NaN` triggered a warning and resulted in incorrect indexing queries with `IntervalIndex` (GH23352)
Indexing

- Bug in `DataFrame.ne()` fails if columns contain column name “dtype” (GH22383)
- The traceback from a `KeyError` when asking `.loc` for a single missing label is now shorter and more clear (GH21557)
- `PeriodIndex` now emits a `KeyError` when a malformed string is looked up, which is consistent with the behavior of `DatetimeIndex` (GH22803)
- When `.ix` is asked for a missing integer label in a `MultiIndex` with a first level of integer type, it now raises a `KeyError`, consistently with the case of a flat `Int64Index`, rather than falling back to positional indexing (GH21593)
- Bug in `Index.reindex()` when reindexing a tz-naive and tz-aware `DatetimeIndex` (GH8306)
- Bug in `Series.reindex()` when reindexing an empty series with a `datetime64[ns, tz]` dtype (GH20869)
- Bug in `DataFrame` when setting values with `.loc` and a timezone aware `DatetimeIndex` (GH11365)
- `DataFrame.__getitem__` now accepts dictionaries and dictionary keys as list-likes of labels, consistently with `Series.__getitem__` (GH21294)
- Fixed `DataFrame[np.nan]` when columns are non-unique (GH21428)
- Bug when indexing `DatetimeIndex` with nanosecond resolution dates and timezones (GH11679)
- Bug where indexing with a Numpy array containing negative values would mutate the indexer (GH21867)
- Bug where mixed indexes wouldn’t allow integers for `.at` (GH19860)
- `Float64Index.get_loc` now raises `KeyError` when boolean key passed. (GH19087)
- Bug in `DataFrame.loc()` when indexing with an `IntervalIndex` (GH19977)
- `Index` no longer mangles None, NaN and NaT, i.e. they are treated as three different keys. However, for numeric Index all three are still coerced to a NaN (GH22332)
- Bug in `scalar` in `Index` if scalar is a float while the `Index` is of integer dtype (GH22085)
- Bug in `MultiIndex.set_levels()` when levels value is not subscriptable (GH23273)
- Bug where setting a timedelta column by `Index` causes it to be casted to double, and therefore lose precision (GH23511)
- Bug in `Index.union()` and `Index.intersection()` where name of the `Index` of the result was not computed correctly for certain cases (GH9943, GH9862)
- Bug in `Index` slicing with boolean `Index` may raise `TypeError` (GH22533)
- Bug in `PeriodArray.__setitem__` when accepting slice and list-like value (GH23978)
- Bug in `DatetimeIndex`, `TimedeltaIndex` where indexing with Ellipsis would lose their `freq` attribute (GH21282)
- Bug in `iat` where using it to assign an incompatible value would create a new column (GH23236)
pandas: powerful Python data analysis toolkit, Release 1.2.5

Missing

- Bug in `DataFrame.fillna()` where a `ValueError` would raise when one column contained a `datetime64[ns, tz]` dtype (GH15522)
- Bug in `Series.hasnans()` that could be incorrectly cached and return incorrect answers if null elements are introduced after an initial call (GH19700)
- `Series.isin()` now treats all NaN-floats as equal also for `np.object`-dtype. This behavior is consistent with the behavior for float64 (GH22119)
- `unique()` no longer mangles NaN-floats and the NaT-object for `np.object`-dtype, i.e. NaT is no longer coerced to a NaN-value and is treated as a different entity. (GH22295)
- `DataFrame` and `Series` now properly handle numpy masked arrays with hardened masks. Previously, constructing a `DataFrame` or `Series` from a masked array with a hard mask would create a pandas object containing the underlying value, rather than the expected NaN. (GH24574)
- Bug in `DataFrame` constructor where `dtype` argument was not honored when handling numpy masked record arrays. (GH24874)

MultiIndex

- Bug in `io.formats.style.Styler.applymap()` where `subset=` with `MultiIndex` slice would reduce to `Series` (GH19861)
- Removed compatibility for `MultiIndex` pickles prior to version 0.8.0; compatibility with `MultiIndex` pickles from version 0.13 forward is maintained (GH21654)
- `MultiIndex.get_loc_level()` (and as a consequence, `.loc` on a `Series` or `DataFrame` with a `MultiIndex` index) will now raise a `KeyError`, rather than returning an empty slice, if asked a label which is present in the levels but is unused (GH22221)
- `MultiIndex` has gained the `MultiIndex.from_frame()`, it allows constructing a `MultiIndex` object from a `DataFrame` (GH22420)
- Fix `TypeError` in Python 3 when creating `MultiIndex` in which some levels have mixed types, e.g. when some labels are tuples (GH15457)

IO

- Bug in `read_csv()` in which a column specified with `CategoricalDtype` of boolean categories was not being correctly coerced from string values to booleans (GH20498)
- Bug in `read_csv()` in which unicode column names were not being properly recognized with Python 2.x (GH13253)
- Bug in `DataFrame.to_sql()` when writing timezone aware data (`datetime64[ns, tz]` dtype) would raise a `TypeError` (GH9086)
- Bug in `DataFrame.to_sql()` where a naive `Datet imeIndex` would be written as `TIMESTAMP WITH TIME ZONE` type in supported databases, e.g. PostgreSQL (GH23510)
- Bug in `read_excel()` when `parse_cols` is specified with an empty dataset (GH9208)
- `read_html()` no longer ignores all-whitespace `<tr>` within `<thead>` when considering the `skiprows` and `header` arguments. Previously, users had to decrease their `header` and `skiprows` values on such tables to work around the issue. (GH21641)
• `read_excel()` will correctly show the deprecation warning for previously deprecated `sheetname` (GH17994)

• `read_csv()` and `read_table()` will throw `UnicodeError` and not coredump on badly encoded strings (GH22748)

• `read_csv()` will correctly parse timezone-aware datetimes (GH22256)

• Bug in `read_csv()` in which memory management was prematurely optimized for the C engine when the data was being read in chunks (GH23509)

• Bug in `read_csv()` in unnamed columns were being improperly identified when extracting a multi-index (GH23687)

• `read_sas()` will parse numbers in sas7bdat-files that have width less than 8 bytes correctly. (GH21616)

• `read_sas()` will correctly parse sas7bdat files with many columns (GH22628)

• `read_sas()` will correctly parse sas7bdat files with data page types having also bit 7 set (so page type is 128 + 256 = 384) (GH16615)

• Bug in `read_sas()` in which an incorrect error was raised on an invalid file format. (GH24548)

• Bug in `detect_client_encoding()` where potential IOError goes unhandled when importing in a mod_wsgi process due to restricted access to stdout. (GH21552)

• Bug in `DataFrame.to_html()` with `index=False` misses truncation indicators (...) on truncated DataFrame (GH15019, GH22783)

• Bug in `DataFrame.to_html()` with `index=False` when both columns and row index are `MultiIndex` (GH22579)

• Bug in `DataFrame.to_html()` with `index_names=False` displaying index name (GH22747)

• Bug in `DataFrame.to_html()` with `header=False` not displaying row index names (GH23788)

• Bug in `DataFrame.to_html()` with `sparsify=False` that caused it to raise `TypeError` (GH22887)

• Bug in `DataFrame.to_string()` that broke column alignment when `index=False` and width of first column’s values is greater than the width of first column’s header (GH16839, GH13032)

• Bug in `DataFrame.to_string()` that caused representations of `DataFrame` to not take up the whole window (GH22984)

• Bug in `DataFrame.to_csv()` where a single level `MultiIndex` incorrectly wrote a tuple. Now just the value of the index is written (GH19589).

• `HDFStore` will raise `ValueError` when the `format` kwarg is passed to the constructor (GH13291)

• Bug in `HDFStore.append()` when appending a `DataFrame` with an empty string column and `min_itemsize < 8` (GH12242)

• Bug in `read_csv()` in which memory leaks occurred in the C engine when parsing NaN values due to insufficient cleanup on completion or error (GH21353)

• Bug in `read_csv()` in which incorrect error messages were being raised when `skipfooter` was passed in along with `nrows`, `iterator`, or `chunksize` (GH23711)

• Bug in `read_csv()` in which `MultiIndex` index names were being improperly handled in the cases when they were not provided (GH23484)

• Bug in `read_csv()` in which unnecessary warnings were being raised when the dialect’s values conflicted with the default arguments (GH23761)

• Bug in `read_html()` in which the error message was not displaying the valid values when an invalid one was provided (GH23549)
pandas: powerful Python data analysis toolkit, Release 1.2.5

- Bug in `read_excel()` in which extraneous header names were extracted, even though none were specified (GH11733)
- Bug in `read_excel()` in which column names were not being properly converted to string sometimes in Python 2.x (GH23874)
- Bug in `read_excel()` in which `index_col=None` was not being respected and parsing index columns anyway (GH18792, GH20480)
- Bug in `read_excel()` in which `usecols` was not being validated for proper column names when passed in as a string (GH20480)
- Bug in `DataFrame.to_dict()` when the resulting dict contains non-Python scalars in the case of numeric data (GH23753)
- `DataFrame.to_string()`, `DataFrame.to_html()`, `DataFrame.to_latex()` will correctly format output when a string is passed as the `float_format` argument (GH21625, GH22270)
- Bug in `read_csv()` that caused it to raise `OverflowError` when trying to use `inf` as `na_value` with integer index column (GH17128)
- Bug in `read_csv()` that caused the C engine on Python 3.6+ on Windows to improperly read CSV filenames with accented or special characters (GH15086)
- Bug in `read_fwf()` in which the compression type of a file was not being properly inferred (GH22199)
- Bug in `DataFrame.to_stata()` and more generally in the floating `repr` formatter. Zeros were not trimmed if `inf` was present in a columns while it was the case with NA values. Zeros are now trimmed as in the presence of NA (GH24861).
- bug in the `repr` when truncating the number of columns and having a wide last column (GH24849).

Plotting

- Bug in `DataFrame.plot.scatter()` and `DataFrame.plot.hexbin()` caused x-axis label and ticklabels to disappear when colorbar was on in IPython inline backend (GH10611, GH10678, and GH20455)
- Bug in plotting a Series with datetimes using `matplotlib.axes.Axes.scatter()` (GH22039)
- Bug in `DataFrame.plot.bar()` caused bars to use multiple colors instead of a single one (GH20585)
- Bug in validating color parameter caused extra color to be appended to the given color array. This happened to multiple plotting functions using matplotlib. (GH20726)
GroupBy/resample/rolling

- Bug in `pandas.core.window.Rolling.min()` and `pandas.core.window.Rolling.max()` with closed='left', a datetime-like index and only one entry in the series leading to segfault (GH24718)
- Bug in `pandas.core.groupby.GroupBy.first()` and `pandas.core.groupby.GroupBy.last()` with as_index=False leading to the loss of timezone information (GH15884)
- Bug in `DataFrame.resample()` when downsampling across a DST boundary (GH8531)
- Bug in `pandas.core.groupby.GroupBy.transform()` which caused missing values when the input function can accept a `DataFrame` but renames it (GH23455).
- Bug in `DataFrame.resample()` when resampling a weekly offset ('W') across a DST transition (GH9119, GH21459)
- Bug in `DataFrame.expanding()` in which the axis argument was not being respected during aggregations (GH23372)
- Bug in `pandas.core.groupby.SeriesGroupBy.mean()` when values were integral but could not fit inside of int64, overflowing instead. (GH22487)
- Bug in `pandas.core.groupby.SeriesGroupBy.pct_change()` or `pandas.core.groupby.DataFrameGroupBy.pct_change()` would previously work across groups when calculating the percent change, where it now correctly works per group (GH21200, GH21235).
- Calling `pandas.core.groupby.GroupBy.rank()` with empty groups and pct=True was raising a ZeroDivisionError (GH22519)
- Bug in `DataFrame.resample()` when resampling NaT in TimeDeltaIndex (GH13223).
- Bug in `DataFrame.groupby()` did not respect the observed argument when selecting a column and instead always used observed=False (GH23970).
- Bug in `pandas.core.groupby.SeriesGroupBy.pct_change()` or `pandas.core.groupby.DataFrameGroupBy.pct_change()` would previously work across groups when calculating the percent change, where it now correctly works per group (GH21200, GH21235).
- Calling `pandas.core.groupby.GroupBy.rank()` with empty groups and pct=True was raising a ZeroDivisionError (GH22519)
- Bug in `DataFrame.resample()` when resampling NaT in TimeDeltaIndex (GH13223).
- Bug in `DataFrame.groupby()` did not respect the observed argument when selecting a column and instead always used observed=False (GH23970).
- Bug preventing hash table creation with very large number (2^32) of rows (GH22805)
- Bug in groupby when grouping on categorical causes ValueError and incorrect grouping if observed=True and nan is present in categorical column (GH24740, GH21151).
Reshaping

- Bug in `pandas.concat()` when joining resampled DataFrames with timezone aware index (GH13783)
- Bug in `pandas.concat()` when joining only Series the names argument of concat is no longer ignored (GH23490)
- Bug in `Series.combine_first()` with `datetime64[ns, tz]` dtype which would return tz-naive result (GH21469)
- Bug in `Series.where()` and `DataFrame.where()` with `datetime64[ns, tz]` dtype (GH21546)
- Bug in `Series.where()` and `DataFrame.where()` with an empty DataFrame and empty cond having non-bool dtype (GH21947)
- Bug in `Series.mask()` and `DataFrame.mask()` with list conditionals (GH21891)
- Bug in `DataFrame.replace()` raises RecursionError when converting OutOfBounds `datetime64[ns, tz]` (GH20380)
- `pandas.core.groupby.GroupBy.rank()` now raises a `ValueError` when an invalid value is passed for argument na_option (GH22124)
- Bug in `get_dummies()` with Unicode attributes in Python 2 (GH22084)
- Bug in `DataFrame.replace()` raises RecursionError when replacing empty lists (GH22083)
- Bug in `Series.replace()` and `DataFrame.replace()` when dict is used as the to_replace value and one key in the dict is another key’s value, the results were inconsistent between using integer key and using string key (GH20656)
- Bug in `DataFrame.drop_duplicates()` for empty DataFrame which incorrectly raises an error (GH20516)
- Bug in `pandas.wide_to_long()` when a string is passed to the stubnames argument and a column name is a substring of that stubname (GH22468)
- Bug in `merge()` when merging `datetime64[ns, tz]` data that contained a DST transition (GH18885)
- Bug in `merge_asof()` when merging on float values within defined tolerance (GH22981)
- Bug in `pandas.concat()` when concatenating a multicolumn DataFrame with tz-aware data against a DataFrame with a different number of columns (GH22796)
- Bug in `merge_asof()` where confusing error message raised when attempting to merge with missing values (GH23189)
- Bug in `DataFrame.nsmallest()` and `DataFrame.nlargest()` for dataframes that have a `MultiIndex` for columns (GH23033).
- Bug in `pandas.melt()` when passing column names that are not present in DataFrame (GH23575)
- Bug in `DataFrame.append()` with a `Series` with a dateutil timezone would raise a `TypeError` (GH23682)
- Bug in `Series` construction when passing no data and `dtype=str` (GH22477)
- Bug in `cut()` with bins as an overlapping `IntervalIndex` where multiple bins were returned per item instead of raising a `ValueError` (GH23980)
- Bug in `pandas.concat()` when joining `Series` datetimetz with `Series` category would lose timezone (GH23816)
- Bug in `DataFrame.join()` when joining partial MultiIndex would drop names (GH20452).
- `DataFrame.nlargest()` and `DataFrame.nsmallest()` now returns the correct n values when keep != ‘all’ also when tied on the first columns (GH22752)
• Constructing a DataFrame with an index argument that wasn’t already an instance of Index was broken (GH22227).

• Bug in DataFrame prevented list subclasses to be used to construction (GH21226)

• Bug in DataFrame.unstack() and DataFrame.pivot_table() returning a misleading error message when the resulting DataFrame has more elements than int32 can handle. Now, the error message is improved, pointing towards the actual problem (GH20601)

• Bug in DataFrame.unstack() where a ValueError was raised when unstacking timezone aware values (GH18338)

• Bug in DataFrame.stack() where timezone aware values were converted to timezone naive values (GH19420)

• Bug in merge_asof() where a TypeError was raised when by_col were timezone aware values (GH21184)

• Bug showing an incorrect shape when throwing error during DataFrame construction. (GH20742)

**Sparse**

• Updating a boolean, datetime, or timedelta column to be Sparse now works (GH22367)

• Bug in Series.to_sparse() with Series already holding sparse data not constructing properly (GH22389)

• Providing a sparse_index to the SparseArray constructor no longer defaults the na-value to np.nan for all dtypes. The correct na_value for data.dtype is now used.

• Bug in SparseArray.nbytes under-reporting its memory usage by not including the size of its sparse index.

• Improved performance of Series.shift() for non-NA fill_value, as values are no longer converted to a dense array.

• Bug in DataFrame.groupby not including fill_value in the groups for non-NA fill_value when grouping by a sparse column (GH5078)

• Bug in unary inversion operator (~) on a SparseSeries with boolean values. The performance of this has also been improved (GH22835)

• Bug in SparseArray.unique() not returning the unique values (GH19595)

• Bug in SparseArray.nonzero() and SparseDataFrame.dropna() returning shifted/incorrect results (GH21172)

• Bug in DataFrame.apply() where dtypes would lose sparseness (GH23744)

• Bug in concat() when concatenating a list of Series with all-sparse values changing the fill_value and converting to a dense Series (GH24371)

**Style**

• background_gradient() now takes a text_color_threshold parameter to automatically lighten the text color based on the luminance of the background color. This improves readability with dark background colors without the need to limit the background colormap range. (GH21258)

• background_gradient() now also supports tablewise application (in addition to rowwise and columnwise) with axis=None (GH15204)

• bar() now also supports tablewise application (in addition to rowwise and columnwise) with axis=None and setting clipping range with vmin and vmax (GH21548 and GH21526). NaN values are also handled properly.
Build changes

- Building pandas for development now requires cython $\geq 0.28.2$ (GH21688)
- Testing pandas now requires hypothesis$\geq 3.58$. You can find the Hypothesis docs here, and a pandas-specific introduction in the contributing guide. (GH22280)
- Building pandas on macOS now targets minimum macOS 10.9 if run on macOS 10.9 or above (GH23424)

Other

- Bug where C variables were declared with external linkage causing import errors if certain other C libraries were imported before pandas. (GH24113)

5.6 Version 0.23

5.6.1 What’s new in 0.23.4 (August 3, 2018)

This is a minor bug-fix release in the 0.23.x series and includes some small regression fixes and bug fixes. We recommend that all users upgrade to this version.

Warning: Starting January 1, 2019, pandas feature releases will support Python 3 only. See Dropping Python 2.7 for more.
What’s new in v0.23.4

- **Fixed regressions**
- **Bug fixes**
- **Contributors**

### Fixed regressions

- Python 3.7 with Windows gave all missing values for rolling variance calculations (GH21813)

### Bug fixes

**Groupby/resample/rolling**

- Bug where calling `DataFrameGroupBy.agg()` with a list of functions including `ohlc` as the non-initial element would raise a `ValueError` (GH21716)
- Bug in `roll_quantile` caused a memory leak when calling `.rolling(...) .quantile(q) with q in (0,1)` (GH21965)

### Missing

- Bug in `Series.clip()` and `DataFrame.clip()` cannot accept list-like threshold containing NaN (GH19992)

### Contributors

A total of 6 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

- Jeff Reback
- MeeseeksMachine +
- Tom Augspurger
- chris-b1
- h-vetinari
- meeseeksdev[bot]

### 5.6.2 What’s new in 0.23.3 (July 7, 2018)

This release fixes a build issue with the sdist for Python 3.7 (GH21785) There are no other changes.
Contributors

A total of 2 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

- Tom Augspurger
- meeseeksdev[bot] +

5.6.3 What’s new in 0.23.2 (July 5, 2018)

This is a minor bug-fix release in the 0.23.x series and includes some small regression fixes and bug fixes. We recommend that all users upgrade to this version.

Note: pandas 0.23.2 is first pandas release that’s compatible with Python 3.7 (GH20552)

Warning: Starting January 1, 2019, pandas feature releases will support Python 3 only. See Dropping Python 2.7 for more.

What’s new in v0.23.2

- Logical reductions over entire DataFrame
- Fixed regressions
- Build changes
- Bug fixes
- Contributors

Logical reductions over entire DataFrame

`DataFrame.all()` and `DataFrame.any()` now accept `axis=None` to reduce over all axes to a scalar (GH19976)

```
In [1]: df = pd.DataFrame({"A": [1, 2], "B": [True, False]})
In [2]: df.all(axis=None)
Out[2]: False
```

This also provides compatibility with NumPy 1.15, which now dispatches to `DataFrame.all`. With NumPy 1.15 and pandas 0.23.1 or earlier, `numpy.all()` will no longer reduce over every axis:

```
>>> # NumPy 1.15, pandas 0.23.1
>>> np.any(pd.DataFrame({"A": [False], "B": [False]}))
A   False
B   False
dtype: bool
```

With pandas 0.23.2, that will correctly return False, as it did with NumPy < 1.5.
In [3]: np.any(pd.DataFrame({"A": [False], "B": [False]}))
Out[3]: False

Fixed regressions

- Fixed regression in to_csv() when handling file-like object incorrectly (GH21471)
- Re-allowed duplicate level names of a MultiIndex. Accessing a level that has a duplicate name by name still raises an error (GH19029).
- Bug in both DataFrame.first_valid_index() and Series.first_valid_index() raised for a row index having duplicate values (GH21441)
- Fixed printing of DataFrames with hierarchical columns with long names (GH21180)
- Fixed regression in reindex() and groupby() with a MultiIndex or multiple keys that contains categorical datetime-like values (GH21390).
- Fixed regression in unary negative operations with object dtype (GH21380)
- Bug in Timestamp.ceil() and Timestamp.floor() when timestamp is a multiple of the rounding frequency (GH21262)
- Fixed regression in to_clipboard() that defaulted to copying dataframes with space delimited instead of tab delimited (GH21104)

Build changes

- The source and binary distributions no longer include test data files, resulting in smaller download sizes. Tests relying on these data files will be skipped when using pandas.test(). (GH19320)

Bug fixes

Conversion

- Bug in constructing Index with an iterator or generator (GH21470)
- Bug in Series.nlargest() for signed and unsigned integer dtypes when the minimum value is present (GH21426)

Indexing

- Bug in Index.get_indexer_non_unique() with categorical key (GH21448)
- Bug in comparison operations for MultiIndex where error was raised on equality / inequality comparison involving a MultiIndex with nlevels == 1 (GH21149)
- Bug in DataFrame.drop() behaviour is not consistent for unique and non-unique indexes (GH21494)
- Bug in DataFrame.duplicated() with a large number of columns causing a 'maximum recursion depth exceeded' (GH21524)

I/O

- Bug in read_csv() that caused it to incorrectly raise an error when nrows=0, low_memory=True, and index_col was not None (GH21141)
- Bug in json_normalize() when formatting the record_prefix with integer columns (GH21536)
• Bug in rendering `Series` with Categorical dtype in rare conditions under Python 2.7 (GH21002)

**Timezones**

• Bug in `Timestamp` and `DatetimeIndex` where passing a `Timestamp` localized after a DST transition would return a datetime before the DST transition (GH20854)
• Bug in comparing `DataFrame` with tz-aware `DatetimeIndex` columns with a DST transition that raised a `KeyError` (GH19970)
• Bug in `DatetimeIndex.shift()` where an `AssertionError` would raise when shifting across DST (GH8616)
• Bug in `Timestamp` constructor where passing an invalid timezone offset designator (Z) would not raise a `ValueError` (GH8910)
• Bug in `Timestamp.replace()` where replacing at a DST boundary would retain an incorrect offset (GH7825)
• Bug in `DatetimeIndex.reindex()` when reindexing a tz-naive and tz-aware `DatetimeIndex` (GH8306)
• Bug in `DatetimeIndex.resample()` when downsampling across a DST boundary (GH8531)

**Timedelta**

• Bug in `Timedelta` where non-zero timedeltas shorter than 1 microsecond were considered False (GH21484)

5.6.4 What’s new in 0.23.1 (June 12, 2018)

This is a minor bug-fix release in the 0.23.x series and includes some small regression fixes and bug fixes. We recommend that all users upgrade to this version.

Warning: Starting January 1, 2019, pandas feature releases will support Python 3 only. See Dropping Python 2.7 for more.

What’s new in v0.23.1

• Fixed regressions
• Performance improvements
• Bug fixes
• Contributors

Fixed regressions

Comparing Series with datetime.date

We’ve reverted a 0.23.0 change to comparing a Series holding datetimes and a datetime.date object (GH21152). In pandas 0.22 and earlier, comparing a Series holding datetimes and datetime.date objects would coerce the datetime.date to a datetime before comparing. This was inconsistent with Python, NumPy, and DatetimeIndex, which never consider a datetime and datetime.date equal.

In 0.23.0, we unified operations between DatetimeIndex and Series, and in the process changed comparisons between a Series of datetimes and datetime.date without warning.

We’ve temporarily restored the 0.22.0 behavior, so datetimes and dates may again compare equal, but restore the 0.23.0 behavior in a future release.

To summarize, here’s the behavior in 0.22.0, 0.23.0, 0.23.1:

```python
# 0.22.0... Silently coerce the datetime.date
>>> import datetime
>>> pd.Series(pd.date_range('2017', periods=2)) == datetime.date(2017, 1, 1)
0   True
1  False
dtype: bool

# 0.23.0... Do not coerce the datetime.date
>>> pd.Series(pd.date_range('2017', periods=2)) == datetime.date(2017, 1, 1)
0   False
1  False
dtype: bool

# 0.23.1... Coerce the datetime.date with a warning
>>> pd.Series(pd.date_range('2017', periods=2)) == datetime.date(2017, 1, 1)
/bin/python:1: FutureWarning: Comparing Series of datetimes with 'datetime.date'.
... Currently, the 'datetime.date' is coerced to a datetime. In the future pandas will
```
not coerce, and the values not compare equal to the 'datetime.date'.
To retain the current behavior, convert the 'datetime.date' to a
datetime with 'pd.Timestamp'.

```python
#!/bin/python3
0    True
1    False
dtype: bool
```

In addition, ordering comparisons will raise a `TypeError` in the future.

**Other fixes**

- Reverted the ability of `to_sql()` to perform multivalue inserts as this caused regression in certain cases (GH21103). In the future this will be made configurable.
- Fixed regression in the `DatetimeIndex.date` and `DatetimeIndex.time` attributes in case of timezone-aware data: `DatetimeIndex.time` returned a tz-aware time instead of tz-naive (GH21267) and `DatetimeIndex.date` returned incorrect date when the input date has a non-UTC timezone (GH21230).
- Fixed regression in `pandas.io.json.json_normalize()` when called with `None` values in nested levels in JSON, and to not drop keys with value as `None` (GH21158, GH21356).
- Bug in `to_csv()` causes encoding error when compression and encoding are specified (GH21241, GH21118)
- Bug preventing pandas from being importable with -OO optimization (GH21071)
- Bug in `Categorical.fillna()` incorrectly raising a `TypeError` when value the individual categories are iterable and value is an iterable (GH21097, GH19788)
- Fixed regression in constructors coercing NA values like `None` to strings when passing `dtype=str` (GH21083)
- Regression in `pivot_table()` where an ordered `Categorical` with missing values for the pivot's index would give a mis-aligned result (GH21133)
- Fixed regression in merging on boolean index/columns (GH21119).

**Performance improvements**

- Improved performance of `CategoricalIndex.is_monotonic_increasing()`, `CategoricalIndex.is_monotonic_decreasing()` and `CategoricalIndex.is_monotonic()` (GH21025)
- Improved performance of `CategoricalIndex.is_unique()` (GH21107)

**Bug fixes**

**Groupby/resample/rolling**

- Bug in `DataFrame.agg()` where applying multiple aggregation functions to a `DataFrame` with duplicated column names would cause a stack overflow (GH21063)
- Bug in `pandas.core.groupby.GroupBy.ffill()` and `pandas.core.groupby.GroupBy.bfill()` where the fill within a grouping would not always be applied as intended due to the implementations' use of a non-stable sort (GH21207)
- Bug in `pandas.core.groupby.GroupBy.rank()` where results did not scale to 100% when specifying `method='dense'` and `pct=True`
- Bug in `pandas.DataFrame.rolling()` and `pandas.Series.rolling()` which incorrectly accepted a 0 window size rather than raising (GH21286)
Data-type specific

- Bug in `Series.str.replace()` where the method throws `TypeError` on Python 3.5.2 (GH21078)
- Bug in `Timedelta` where passing a float with a unit would prematurely round the float precision (GH14156)
- Bug in `pandas.testing.assert_index_equal()` which raised `AssertionError` incorrectly, when comparing two `CategoricalIndex` objects with param `check_categorical=False` (GH19776)

Sparse

- Bug in `SparseArray.shape` which previously only returned the shape `SparseArray.sp_values` (GH21126)

Indexing

- Bug in `Series.reset_index()` where appropriate error was not raised with an invalid level name (GH20925)
- Bug in `interval_range()` when `start/periods` or `end/periods` are specified with float `start` or `end` (GH21161)
- Bug in `MultiIndex.set_names()` where error raised for a `MultiIndex` with `nlevels == 1` (GH21149)
- Bug in `IntervalIndex` constructors where creating an `IntervalIndex` from categorical data was not fully supported (GH21243, GH21253)
- Bug in `MultiIndex.sort_index()` which was not guaranteed to sort correctly with `level=1`; this was also causing data misalignment in particular `DataFrame.stack()` operations (GH20994, GH20945, GH21052)

Plotting

- New keywords (sharex, sharey) to turn on/off sharing of x/y-axis by subplots generated with pandas.DataFrame().groupby().boxplot() (GH20968)

I/O

- Bug in IO methods specifying `compression='zip'` which produced uncompressed zip archives (GH17778, GH21144)
- Bug in `DataFrame.to_stata()` which prevented exporting DataFrames to buffers and most file-like objects (GH21041)
- Bug in `read_stata()` and StataReader which did not correctly decode utf-8 strings on Python 3 from Stata 14 files (dta version 118) (GH21244)
- Bug in IO JSON `read_json()` reading empty JSON schema with `orient='table'` back to `DataFrame` caused an error (GH21287)

Reshaping

- Bug in `concat()` where error was raised in concatenating `Series` with numpy scalar and tuple names (GH21015)
- Bug in `concat()` warning message providing the wrong guidance for future behavior (GH21101)

Other

- Tab completion on `Index` in IPython no longer outputs deprecation warnings (GH21125)
- Bug preventing pandas being used on Windows without C++ redistributable installed (GH21106)

5.6.5 What’s new in 0.23.0 (May 15, 2018)

This is a major release from 0.22.0 and includes a number of API changes, deprecations, new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

Highlights include:

- Round-trippable JSON format with ‘table’ orient.
- Instantiation from dicts respects order for Python 3.6+.
- Dependent column arguments for assign.
- Merging / sorting on a combination of columns and index levels.
- Extending pandas with custom types.
- Excluding unobserved categories from groupby.
- Changes to make output shape of DataFrame.apply consistent.

Check the API Changes and deprecations before updating.

Warning: Starting January 1, 2019, pandas feature releases will support Python 3 only. See Dropping Python 2.7 for more.

What’s new in v0.23.0

- New features
  - JSON read/write round-trippable with orient='table'
  - Method .assign() accepts dependent arguments
  - Merging on a combination of columns and index levels
  - Sorting by a combination of columns and index levels
  - Extending pandas with custom types (experimental)
  - New observed keyword for excluding unobserved categories in GroupBy
  - Rolling/Expanding.apply() accepts raw=False to pass a Series to the function
  - DataFrame.interpolate has gained the limit_area kwarg
  - Function get_dummies now supports dtype argument
  - Timedelta mod method
  - Method .rank() handles inf values when NaN are present
  - Series.str.cat has gained the join kwarg
  - DataFrame.astype performs column-wise conversion to Categorical
  - Other enhancements

- Backwards incompatible API changes
  - Dependencies have increased minimum versions
  - Instantiation from dicts preserves dict insertion order for Python 3.6+
- Deprecate Panel
- pandas.core.common removals
- Changes to make output of DataFrame.apply consistent
- Concatenation will no longer sort
- Build changes
- Index division by zero fills correctly
- Extraction of matching patterns from strings
- Default value for the ordered parameter of CategoricalDtype
- Better pretty-printing of DataFrames in a terminal
- Datetimelike API changes
- Other API changes

• Deprecations
• Removal of prior version deprecations/changes
• Performance improvements
• Documentation changes
• Bug fixes
  - Categorical
  - Datetimelike
  - Timedelta
  - Timezones
  - Offsets
  - Numeric
  - Strings
  - Indexing
  - MultiIndex
  - IO
  - Plotting
  - GroupBy/resample/rolling
  - Sparse
  - Reshaping
  - Other

• Contributors
New features

**JSON read/write round-trippable with orient='table'**

A DataFrame can now be written to and subsequently read back via JSON while preserving metadata through usage of the orient='table' argument (see GH18912 and GH9146). Previously, none of the available orient values guaranteed the preservation of dtypes and index names, amongst other metadata.

```
In [1]: df = pd.DataFrame({'foo': [1, 2, 3, 4],
                        'bar': ['a', 'b', 'c', 'd'],
                        'baz': pd.date_range('2018-01-01', freq='d', periods=4),
                        'qux': pd.Categorical(['a', 'b', 'c', 'c'])},
                        index=pd.Index(range(4), name='idx'))

In [2]: df
Out[2]:
        foo  bar     baz
       idx
     0   1 a 2018-01-01 a
     1   2 b 2018-01-02 b
     2   3 c 2018-01-03 c
     3   4 d 2018-01-04 c

[4 rows x 4 columns]

In [3]: df.dtypes
Out[3]:
foo    int64
bar   object
baz  datetime64[ns]
qux   category
Length: 4, dtype: object

In [4]: df.to_json('test.json', orient='table')

In [5]: new_df = pd.read_json('test.json', orient='table')

In [6]: new_df
Out[6]:
        foo  bar     baz
       idx
     0   1 a 2018-01-01 a
     1   2 b 2018-01-02 b
     2   3 c 2018-01-03 c
     3   4 d 2018-01-04 c

[4 rows x 4 columns]

In [7]: new_df.dtypes
Out[7]:
foo    int64
bar   object

(continues on next page)
Please note that the string index is not supported with the round trip format, as it is used by default in write_json to indicate a missing index name.

```
In [8]: df.index.name = 'index'
In [9]: df.to_json('test.json', orient='table')
In [10]: new_df = pd.read_json('test.json', orient='table')
In [11]: new_df
Out[11]:
<table>
<thead>
<tr>
<th>foo</th>
<th>bar</th>
<th>baz</th>
<th>qux</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1 a</td>
<td>2018-01-01</td>
<td>a</td>
</tr>
<tr>
<td>1</td>
<td>2 b</td>
<td>2018-01-02</td>
<td>b</td>
</tr>
<tr>
<td>2</td>
<td>3 c</td>
<td>2018-01-03</td>
<td>c</td>
</tr>
<tr>
<td>3</td>
<td>4 d</td>
<td>2018-01-04</td>
<td>c</td>
</tr>
</tbody>
</table>
```

```
In [12]: new_df.dtypes
Out[12]:
foo     int64
bar     object
baz    datetime64[ns]
qux    category
Length: 4, dtype: object
```

**Method .assign() accepts dependent arguments**

The DataFrame.assign() now accepts dependent keyword arguments for python version later than 3.6 (see also PEP 468). Later keyword arguments may now refer to earlier ones if the argument is a callable. See the documentation here (GH14207)

```
In [13]: df = pd.DataFrame({'A': [1, 2, 3]})
In [14]: df
Out[14]:
<table>
<thead>
<tr>
<th>A</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
</tr>
<tr>
<td>1</td>
</tr>
<tr>
<td>2</td>
</tr>
</tbody>
</table>

[3 rows x 1 columns]
In [15]: df.assign(B=df.A, C=lambda x: x['A'] + x['B'])
Out[15]:
<table>
<thead>
<tr>
<th>A</th>
<th>B</th>
<th>C</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td></td>
<td></td>
</tr>
<tr>
<td>1</td>
<td></td>
<td></td>
</tr>
<tr>
<td>2</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Warning: This may subtly change the behavior of your code when you’re using .assign() to update an existing column. Previously, callables referring to other variables being updated would get the “old” values.

Previous behavior:

```
In [2]: df = pd.DataFrame({"A": [1, 2, 3]})
In [3]: df.assign(A=lambda df: df.A + 1, C=lambda df: df.A * -1)
Out[3]:
     A  C
0    2 -1
1    3 -2
2    4 -3
```

New behavior:

```
In [16]: df.assign(A=df.A + 1, C=lambda df: df.A * -1)
Out[16]:
     A  C
0    2 -2
1    3 -3
2    4 -4
```

Merging on a combination of columns and index levels

Strings passed to `DataFrame.merge()` as the `on`, `left_on`, and `right_on` parameters may now refer to either column names or index level names. This enables merging `DataFrame` instances on a combination of index levels and columns without resetting indexes. See the `Merge on columns and levels` documentation section. (GH14355)

```
In [17]: left_index = pd.Index(["K0", "K0", "K1", "K2"], name='key1')
In [18]: left = pd.DataFrame({"A": ["A0", "A1", "A2", "A3"],
               ....:     "B": ["B0", "B1", "B2", "B3"],
               ....:     "key2": ["K0", "K1", "K0", "K1"],
               ....:     index=left_index})
In [19]: right_index = pd.Index(["K0", "K1", "K2", "K2"], name='key1')
In [20]: right = pd.DataFrame({"C": ["C0", "C1", "C2", "C3"],
               ....:     "D": ["D0", "D1", "D2", "D3"],
               ....:     "key2": ["K0", "K0", "K0", "K1"],
               ....:     index=right_index})
```
....:
In [21]: left.merge(right, on=['key1', 'key2'])
Out[21]:
<table>
<thead>
<tr>
<th></th>
<th>A</th>
<th>B</th>
<th>key2</th>
<th>C</th>
<th>D</th>
</tr>
</thead>
<tbody>
<tr>
<td>key1</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>K0</td>
<td>A0</td>
<td>B0</td>
<td>K0</td>
<td>C0</td>
<td>D0</td>
</tr>
<tr>
<td>K1</td>
<td>A2</td>
<td>B2</td>
<td>K0</td>
<td>C1</td>
<td>D1</td>
</tr>
<tr>
<td>K2</td>
<td>A3</td>
<td>B3</td>
<td>K1</td>
<td>C3</td>
<td>D3</td>
</tr>
</tbody>
</table>
[3 rows x 5 columns]

Sorting by a combination of columns and index levels

Strings passed to DataFrame.sort_values() as the by parameter may now refer to either column names or index level names. This enables sorting DataFrame instances by a combination of index levels and columns without resetting indexes. See the Sorting by Indexes and Values documentation section. (GH14353)

# Build MultiIndex
In [22]: idx = pd.MultiIndex.from_tuples([('a', 1), ('a', 2), ('a', 2), ('b', 2), ('b', 1), ('b', 1)])

In [23]: idx.names = ['first', 'second']

# Build DataFrame
In [24]: df_multi = pd.DataFrame({'A': np.arange(6, 0, -1)}, index=idx)

In [25]: df_multi
Out[25]:
<p>| |</p>
<table>
<thead>
<tr>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>first</td>
</tr>
<tr>
<td>a</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>b</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>
[6 rows x 1 columns]

# Sort by 'second' (index) and 'A' (column)
In [26]: df_multi.sort_values(by=['second', 'A'])
Out[26]:
<p>| |</p>
<table>
<thead>
<tr>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>first</td>
</tr>
<tr>
<td>b</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>a</td>
</tr>
</tbody>
</table>
Extending pandas with custom types (experimental)

pandas now supports storing array-like objects that aren’t necessarily 1-D NumPy arrays as columns in a DataFrame or values in a Series. This allows third-party libraries to implement extensions to NumPy’s types, similar to how pandas implemented categoricals, datetimes with timezones, periods, and intervals.

As a demonstration, we’ll use cyberpandas, which provides an IPArray type for storing ip addresses.

```
In [1]: from cyberpandas import IPArray

In [2]: values = IPArray([
   ...:     0,
   ...:     3232235777,
   ...:     42540766452641154071740215577757643572
   ...:     ])

IPArray isn’t a normal 1-D NumPy array, but because it’s a pandas ExtensionArray, it can be stored properly inside pandas’ containers.

In [3]: ser = pd.Series(values)

In [4]: ser
Out[4]:
0    0.0.0.0
1  192.168.1.1
2  2001:db8:85a3::8a2e:370:7334
dtype: ip

Notice that the dtype is ip. The missing value semantics of the underlying array are respected:

```
In [5]: ser.isna()
Out[5]:
0   True
1  False
2  False
dtype: bool
```

For more, see the extension types documentation. If you build an extension array, publicize it on our ecosystem page.
New observed keyword for excluding unobserved categories in GroupBy

Grouping by a categorical includes the unobserved categories in the output. When grouping by multiple categorical columns, this means you get the cartesian product of all the categories, including combinations where there are no observations, which can result in a large number of groups. We have added a keyword observed to control this behavior, it defaults to observed=False for backward-compatibility. (GH14942, GH8138, GH15217, GH17594, GH8669, GH20583, GH20902)

```
In [27]: cat1 = pd.Categorical(["a", "a", "b", "b"],
                           categories=["a", "b", "z"], ordered=True)

In [28]: cat2 = pd.Categorical(["c", "d", "c", "d"],
                           categories=["c", "d", "y"], ordered=True)

In [29]: df = pd.DataFrame({"A": cat1, "B": cat2, "values": [1, 2, 3, 4]})

In [30]: df['C'] = ['foo', 'bar'] * 2

In [31]: df
Out[31]:
   A  B  values  C
0  a  c    1   foo
1  a  d    2   bar
2  b  c    3   foo
3  b  d    4   bar
[4 rows x 4 columns]
```

To show all values, the previous behavior:

```
In [32]: df.groupby(['A', 'B', 'C'], observed=False).count()
Out[32]:
    values
   A  B  C
a  c  bar  0
   foo  1
d  bar  1
   foo  0
y  bar  0
... ...
z  c  foo  0
d  bar  0
   foo  0
y  bar  0
   foo  0
[18 rows x 1 columns]
```

To show only observed values:

```
In [33]: df.groupby(['A', 'B', 'C'], observed=True).count()
```

(continues on next page)
For pivoting operations, this behavior is already controlled by the dropna keyword:

```python
In [34]: cat1 = pd.Categorical(['a', 'a', 'b', 'b'],
                             categories=['a', 'b', 'z'], ordered=True)
       ....:                          
       ....:                          
In [35]: cat2 = pd.Categorical(['c', 'd', 'c', 'd'],
                             categories=['c', 'd', 'y'], ordered=True)
       ....:                          
       ....:                          
In [36]: df = pd.DataFrame({'A': cat1, 'B': cat2, 'values': [1, 2, 3, 4]})

In [37]: df
Out[37]:
   A  B  values
 0  a  c    1
 1  a  d    2
 2  b  c    3
 3  b  d    4
[4 rows x 3 columns]
```

```python
In [38]: pd.pivot_table(df, values='values', index=['A', 'B'],
       ....:     dropna=True)
       ....:                          
       ....:                          
Out[38]:
   values
  A  B
 a c  1
 d  2
 b c  3
 d  4
[4 rows x 1 columns]
```

```python
In [39]: pd.pivot_table(df, values='values', index=['A', 'B'],
       ....:     dropna=False)
       ....:                          
       ....:                          
Out[39]:
   values
  A  B
 a c  1.0
```

(continues on next page)
Rolling/Expanding.apply() accepts raw=False to pass a Series to the function

Series.rolling().apply(), DataFrame.rolling().apply(), Series.expanding().apply(), and DataFrame.expanding().apply() have gained a raw=None parameter. This is similar to DataFrame.apply(). This parameter, if True allows one to send a np.ndarray to the applied function. If False a Series will be passed. The default is None, which preserves backward compatibility, so this will default to True, sending an np.ndarray. In a future version the default will be changed to False, sending a Series. (GH5071, GH20584)

Pass a Series:

Mimic the original behavior of passing a ndarray:
DataFrame.interpolate has gained the limit_area kwarg

**DataFrame.interpolate()** has gained a **limit_area** parameter to allow further control of which NaNs are replaced. Use **limit_area='inside'** to fill only NaNs surrounded by valid values or use **limit_area='outside'** to fill only NaNs outside the existing valid values while preserving those inside. (GH16284) See the full documentation here.

```
In [44]: ser = pd.Series([np.nan, np.nan, 5, np.nan, np.nan, 
                          ....: np.nan, 13, np.nan, np.nan])

In [45]: ser
Out[45]:
0    NaN
1    NaN
2    5.0
3    NaN
4    NaN
5    NaN
6   13.0
7    NaN
8    NaN
Length: 9, dtype: float64
```

Fill one consecutive inside value in both directions

```
In [46]: ser.interpolate(limit_direction='both', limit_area='inside', limit=1)
Out[46]:
0    NaN
1    NaN
2    5.0
3    7.0
4    NaN
5   11.0
6   13.0
7    NaN
8    NaN
Length: 9, dtype: float64
```

Fill all consecutive outside values backward

```
In [47]: ser.interpolate(limit_direction='backward', limit_area='outside')
Out[47]:
0    5.0
1    5.0
2    5.0
3    NaN
4    NaN
5    NaN
6   13.0
7    NaN
8    NaN
Length: 9, dtype: float64
```

Fill all consecutive outside values in both directions
In [48]: ser.interpolate(limit_direction='both', limit_area='outside')
Out[48]:
0  5.0
1  5.0
2  5.0
3  NaN
4  NaN
5  NaN
6  13.0
7  13.0
8  13.0
Length: 9, dtype: float64

**Function get_dummies now supports dtype argument**

The `get_dummies()` now accepts a dtype argument, which specifies a dtype for the new columns. The default remains uint8. (GH18330)

In [49]: df = pd.DataFrame({'a': [1, 2], 'b': [3, 4], 'c': [5, 6]})
In [50]: pd.get_dummies(df, columns=['c']).dtypes
Out[50]:
    a  int64
    b  int64
    c_5  uint8
    c_6  uint8
Length: 4, dtype: object
In [51]: pd.get_dummies(df, columns=['c'], dtype=bool).dtypes
Out[51]:
    a  int64
    b  int64
    c_5  bool
    c_6  bool
Length: 4, dtype: object

**Timedelta mod method**

mod (%) and divmod operations are now defined on Timedelta objects when operating with either timedelta-like or with numeric arguments. See the documentation here. (GH19365)

In [52]: td = pd.Timedelta(hours=37)
In [53]: td % pd.Timedelta(minutes=45)
Out[53]: Timedelta('0 days 00:15:00')
Method `.rank()` handles `inf` values when `NaN` are present

In previous versions, `.rank()` would assign `inf` elements `NaN` as their ranks. Now ranks are calculated properly. (GH6945)

```python
In [54]: s = pd.Series([-np.inf, 0, 1, np.nan, np.inf])

In [55]: s
Out[55]:
0  -inf
1   0.0
2   1.0
3   NaN
4   inf
Length: 5, dtype: float64
```

Previous behavior:

```python
In [11]: s.rank()
Out[11]:
0   1.0
1   2.0
2   3.0
3   NaN
4   NaN
dtype: float64
```

Current behavior:

```python
In [56]: s.rank()
Out[56]:
0   1.0
1   2.0
2   3.0
3   NaN
4   4.0
Length: 5, dtype: float64
```

Furthermore, previously if you rank `inf` or `-inf` values together with `NaN` values, the calculation won’t distinguish `NaN` from infinity when using ‘top’ or ‘bottom’ argument.

```python
In [57]: s = pd.Series([np.nan, np.nan, -np.inf, -np.inf])

In [58]: s
Out[58]:
0   NaN
1   NaN
2  -inf
3  -inf
Length: 4, dtype: float64
```

Previous behavior:
In [15]: s.rank(na_option='top')
Out[15]:
0  2.5
1  2.5
2  2.5
3  2.5
dtype: float64

Current behavior:

In [59]: s.rank(na_option='top')
Out[59]:
0  1.5
1  1.5
2  3.5
3  3.5
Length: 4, dtype: float64

These bugs were squashed:

• Bug in DataFrame.rank() and Series.rank() when method='dense' and pct=True in which percentile ranks were not being used with the number of distinct observations (GH15630)

• Bug in Series.rank() and DataFrame.rank() when ascending='False' failed to return correct ranks for infinity if NaN were present (GH19538)

• Bug in DataFrameGroupBy.rank() where ranks were incorrect when both infinity and NaN were present (GH20561)

Series.str.cat has gained the join kwarg

Previously, Series.str.cat() did not – in contrast to most of pandas – align Series on their index before concatenation (see GH18657). The method has now gained a keyword join to control the manner of alignment, see examples below and here.

In v.0.23 join will default to None (meaning no alignment), but this default will change to 'left' in a future version of pandas.

In [60]: s = pd.Series(['a', 'b', 'c', 'd'])

In [61]: t = pd.Series(['b', 'd', 'e', 'c'], index=[1, 3, 4, 2])

In [62]: s.str.cat(t)
Out[62]:
0  NaN
1  bb
2  cc
3  dd
Length: 4, dtype: object

In [63]: s.str.cat(t, join='left', na_rep='—')
Out[63]:
0  a—
1  bb
(continues on next page)
Furthermore, `Series.str.cat()` now works for `CategoricalIndex` as well (previously raised a `ValueError`; see GH20842).

**DataFrame.astype** performs column-wise conversion to `Categorical`

`DataFrame.astype()` can now perform column-wise conversion to `Categorical` by supplying the string 'category' or a `CategoricalDtype`. Previously, attempting this would raise a `NotImplementedError`. See the `Object creation` section of the documentation for more details and examples. (GH12860, GH18099)

Supplying the string 'category' performs column-wise conversion, with only labels appearing in a given column set as categories:

```python
In [64]: df = pd.DataFrame({'A': list('abca'), 'B': list('bccd'))
In [65]: df = df.astype('category')
In [66]: df['A'].dtype
Out[66]: CategoricalDtype(categories=['a', 'b', 'c'], ordered=False)

In [67]: df['B'].dtype
Out[67]: CategoricalDtype(categories=['b', 'c', 'd'], ordered=False)
```

Supplying a `CategoricalDtype` will make the categories in each column consistent with the supplied dtype:

```python
In [68]: from pandas.api.types import CategoricalDtype

In [69]: df = pd.DataFrame({'A': list('abca'), 'B': list('bccd'))
In [70]: cdt = CategoricalDtype(categories=list('abcd'), ordered=True)
In [71]: df = df.astype(cdt)
In [72]: df['A'].dtype
Out[72]: CategoricalDtype(categories=['a', 'b', 'c', 'd'], ordered=True)
In [73]: df['B'].dtype
Out[73]: CategoricalDtype(categories=['a', 'b', 'c', 'd'], ordered=True)
```
pandas: powerful Python data analysis toolkit, Release 1.2.5

Other enhancements

- Unary + now permitted for Series and DataFrame as numeric operator (GH16073)
- Better support for to_excel() output with the xlsxwriter engine. (GH16149)
- pandas.tseries.frequencies.to_offset() now accepts leading ‘+’ signs e.g. ‘+1h’. (GH18171)
- MultiIndex.unique() now supports the level= argument, to get unique values from a specific index level (GH17896)
- pandas.io.formats.style.Styler now has method hide_index() to determine whether the index will be rendered in output (GH14194)
- pandas.io.formats.style.Styler now has method hide_columns() to determine whether columns will be hidden in output (GH14194)
- Improved wording of ValueError raised in to_datetime() when unit= is passed with a non-convertible value (GH14350)
- Series.fillna() now accepts a Series or a dict as a value for a categorical dtype (GH17033)
- pandas.read_clipboard() updated to use qtpy, falling back to PyQt5 and then PyQt4, adding compatibility with Python3 and multiple python-qt bindings (GH17722)
- Improved wording of ValueError raised in read_csv() when the usecols argument cannot match all columns. (GH17301)
- DataFrame.corrwith() now silently drops non-numeric columns when passed a Series. Before, an exception was raised (GH18570).
- IntervalIndex now supports time zone aware Interval objects (GH18537, GH18538)
- Series() / DataFrame() tab completion also returns identifiers in the first level of a MultiIndex(). (GH16326)
- read_excel() has gained the nrows parameter (GH16645)
- DataFrame.append() can now in more cases preserve the type of the calling dataframe’s columns (e.g. if both are CategoricalIndex) (GH18359)
- DataFrame.to_json() and Series.to_json() now accept an index argument which allows the user to exclude the index from the JSON output (GH17394)
- IntervalIndex.to_tuples() has gained the na_tuple parameter to control whether NA is returned as a tuple of NA, or NA itself (GH18756)
- Categorical.rename_categories, CategoricalIndex.rename_categories and Series.cat.rename_categories can now take a callable as their argument (GH18862)
- Interval and IntervalIndex have gained a length attribute (GH18789)
- Resampler objects now have a functioning pipe method. Previously, calls to pipe were diverted to the mean method (GH17905).
- is_scalar() now returns True for DateOffset objects (GH18943).
- DataFrame.pivot() now accepts a list for the values= kwarg (GH17160).
- Added pandas.api.extensions.register_dataframe_accessor(), pandas.api.extensions.register_series_accessor(), and pandas.api.extensions.register_index_accessor(), accessor for libraries downstream of pandas to register custom accessors like .cat on pandas objects. See Registering Custom Accessors for more (GH14781).
IntervalIndex.astype now supports conversions between subtypes when passed an IntervalDtype (GH19197)

IntervalIndex and its associated constructor methods (from_arrays, from_breaks, from_tuples) have gained a dtype parameter (GH19262)

Added pandas.core.groupby.SeriesGroupBy.is_monotonic_increasing() and pandas.core.groupby.SeriesGroupBy.is_monotonic_decreasing() (GH17015)

For subclassed DataFrames, DataFrame.apply() will now preserve the Series subclass (if defined) when passing the data to the applied function (GH19822)

DataFrame.from_dict() now accepts a columns argument that can be used to specify the column names when orient='index' is used (GH18529)

Added option display.html.use_mathjax so MathJax can be disabled when rendering tables in Jupyter notebooks (GH19856, GH19824)

DataFrame.replace() now supports the method parameter, which can be used to specify the replacement method when to_replace is a scalar, list or tuple and value is None (GH19632)

Timestamp.month_name(), DatetimeIndex.month_name(), and Series.dt.month_name() are now available (GH12805)

Timestamp.day_name() and DatetimeIndex.day_name() are now available to return day names with a specified locale (GH12806)

DataFrame.to_sql() now performs a multi-value insert if the underlying connection supports itk rather than inserting row by row. SQLAlchemy dialects supporting multi-value inserts include: mysql, postgresql, sqlite and any dialect with supports_multivalues_insert. (GH14315, GH8953)

read_html() now accepts a displayed_only keyword argument to controls whether or not hidden elements are parsed (True by default) (GH20027)

read_html() now reads all <tbody> elements in a <table>, not just the first. (GH20690)

quantile() and quantile() now accept the interpolation keyword, linear by default (GH20497)

zip compression is supported via compression=zip in DataFrame.to_pickle(), Series.to_pickle(), DataFrame.to_csv(), Series.to_csv(), DataFrame.to_json(), Series.to_json(). (GH17778)

WeekOfMonth constructor now supports n=0 (GH20517).

DataFrame and Series now support matrix multiplication (@) operator (GH10259) for Python>=3.5

Updated DataFrame.to_gbq() and pandas.read_gbq() signature and documentation to reflect changes from the pandas-gbq library version 0.4.0. Adds intersphinx mapping to pandas-gbq library. (GH20564)

Added new writer for exporting Stata data files in version 117, StataWriter117. This format supports exporting strings with lengths up to 2,000,000 characters (GH16450)

to_hdf() and read_hdf() now accept an errors keyword argument to control encoding error handling (GH20835)

cut() has gained the duplicates='raise' | 'drop' option to control whether to raise on duplicated edges (GH20947)

date_range(), timedelta_range(), and interval_range() now return a linearly spaced index if start, stop, and periods are specified, but freq is not. (GH20808, GH20983, GH20976)
Backwards incompatible API changes

Dependencies have increased minimum versions

We have updated our minimum supported versions of dependencies (GH15184). If installed, we now require:

<table>
<thead>
<tr>
<th>Package</th>
<th>Minimum Version</th>
<th>Required</th>
<th>Issue</th>
</tr>
</thead>
<tbody>
<tr>
<td>python-dateutil</td>
<td>2.5.0</td>
<td>X</td>
<td>GH15184</td>
</tr>
<tr>

<td>2.4.0</td>
<td></td>
<td>GH15184</td>
</tr>
<tr>
<td>beautifulsoup4</td>
<td>4.2.1</td>
<td></td>
<td>GH20082</td>
</tr>
<tr>
<td>setuptools</td>
<td>24.2.0</td>
<td></td>
<td>GH20698</td>
</tr>
</tbody>
</table>

Instantiation from dicts preserves dict insertion order for Python 3.6+

Until Python 3.6, dicts in Python had no formally defined ordering. For Python version 3.6 and later, dicts are ordered by insertion order, see PEP 468. pandas will use the dict’s insertion order, when creating a Series or DataFrame from a dict and you’re using Python version 3.6 or higher. (GH19884)

Previous behavior (and current behavior if on Python < 3.6):

```
In [16]: pd.Series({'Income': 2000,
                ....:     'Expenses': -1500,
                ....:     'Taxes': -200,
                ....:     'Net result': 300})
```

```
Out[16]:
Expenses    -1500
Income       2000
Taxes        -200
Net result   300
```

Note the Series above is ordered alphabetically by the index values.

New behavior (for Python >= 3.6):

```
In [74]: pd.Series({'Income': 2000,
                ....:     'Expenses': -1500,
                ....:     'Taxes': -200,
                ....:     'Net result': 300})
```

```
Out[74]:
Income       2000
Expenses     -1500
Taxes        -200
Net result   300
Length: 4, dtype: int64
```

Notice that the Series is now ordered by insertion order. This new behavior is used for all relevant pandas types (Series, DataFrame, SparseSeries and SparseDataFrame).

If you wish to retain the old behavior while using Python >= 3.6, you can use .sort_index():

```python
```

5.6. Version 0.23
In [75]: pd.Series({'Income': 2000,
               'Expenses': -1500,
               'Taxes': -200,
               'Net result': 300}).sort_index()

Out[75]:
Expenses    -1500
Income       2000
Net result   300
Taxes        -200
Length: 4, dtype: int64

Deprecate Panel

Panel was deprecated in the 0.20.x release, showing as a DeprecationWarning. Using Panel will now show a FutureWarning. The recommended way to represent 3-D data are with a MultiIndex on a DataFrame via the to_frame() or with the xarray package. pandas provides a to_xarray() method to automate this conversion (GH13563, GH18324).

In [75]: import pandas._testing as tm

In [76]: p = tm.makePanel()

In [77]: p
Out[77]:
<class 'pandas.core.panel.Panel'>
Dimensions: 3 (items) x 3 (major_axis) x 4 (minor_axis)
Items axis: ItemA to ItemC
Major_axis axis: 2000-01-03 00:00:00 to 2000-01-05 00:00:00
Minor_axis axis: A to D

Convert to a MultiIndex DataFrame

In [78]: p.to_frame()
Out[78]:
major minor  
2000-01-03 A 0.469112 0.721555 0.404705

       [-0.706771, -0.424972, -1.087401, -1.478427],
       [-1.039575,  0.56702 , -0.67369 ,  0.524988]],
      [[ 0.404705, -1.039268, -1.344312, -0.10905 ],
       [ 0.577046, -0.370647,  0.844885,  1.643563],
       [-1.715002, -1.157892,  1.07577 , -1.469388]])
Coordinates:
* items   (items) object 'ItemA' 'ItemB' 'ItemC'
* major_axis (major_axis) datetime64[ns] 2000-01-03 2000-01-04 2000-01-05
* minor_axis (minor_axis) object 'A' 'B' 'C' 'D'
```

**pandas.core.common removals**

The following error & warning messages are removed from `pandas.core.common` (GH13634, GH19769):

- `PerformanceWarning`
- `UnsupportedFunctionCall`
- `UnsortedIndexError`
- `AbstractMethodError`

These are available from import from `pandas.errors` (since 0.19.0).

**Changes to make output of `DataFrame.apply` consistent**

`DataFrame.apply()` was inconsistent when applying an arbitrary user-defined-function that returned a list-like with `axis=1`. Several bugs and inconsistencies are resolved. If the applied function returns a Series, then pandas will return a DataFrame; otherwise a Series will be returned, this includes the case where a list-like (e.g. `tuple` or `list` is returned) (GH16353, GH17437, GH17970, GH17348, GH17892, GH18573, GH17602, GH18775, GH18901, GH18919).

```python
In [76]: df = pd.DataFrame(np.tile(np.arange(3), 6).reshape(6, -1) + 1, 
                      columns=['A', 'B', 'C'])

In [77]: df
Out[77]:
   A  B  C
0  1  2  3
1  1  2  3
2  2  1  3
3  1  2  3
4  1  2  3
```

(continues on next page)
Previous behavior: if the returned shape happened to match the length of original columns, this would return a DataFrame. If the return shape did not match, a Series with lists was returned.

New behavior: When the applied function returns a list-like, this will now always return a Series.

To have expanded columns, you can use result_type='expand'
To broadcast the result across the original columns (the old behaviour for list-likes of the correct length), you can use `result_type='broadcast'`. The shape must match the original columns.

```
In [81]: df.apply(lambda x: [1, 2, 3], axis=1, result_type='broadcast')
Out[81]:
   A   B   C
0  1   2   3
1  1   2   3
2  1   2   3
3  1   2   3
4  1   2   3
5  1   2   3
[6 rows x 3 columns]
```

Returning a `Series` allows one to control the exact return structure and column names:

```
In [82]: df.apply(lambda x: pd.Series([1, 2, 3], index=['D', 'E', 'F']), axis=1)
Out[82]:
   D   E   F
0  1   2   3
1  1   2   3
2  1   2   3
3  1   2   3
4  1   2   3
5  1   2   3
[6 rows x 3 columns]
```

### Concatenation will no longer sort

In a future version of pandas `pandas.concat()` will no longer sort the non-concatenation axis when it is not already aligned. The current behavior is the same as the previous (sorting), but now a warning is issued when `sort` is not specified and the non-concatenation axis is not aligned (GH4588).

```
In [83]: df1 = pd.DataFrame({'a': [1, 2], 'b': [1, 2]}, columns=['b', 'a'])
In [84]: df2 = pd.DataFrame({'a': [4, 5]})
In [85]: pd.concat([df1, df2])
Out[85]:
```

To keep the previous behavior (sorting) and silence the warning, pass `sort=True`

```
In [86]: pd.concat([df1, df2], sort=True)
Out[86]:
a   b
0 1.0 1
1 2.0 2
0  NaN 4
1  NaN 5
[4 rows x 2 columns]
```

To accept the future behavior (no sorting), pass `sort=False`

Note that this change also applies to `DataFrame.append()`, which has also received a `sort` keyword for controlling this behavior.

**Build changes**

- Building pandas for development now requires `cython >= 0.24` (GH18613)
- Building from source now explicitly requires `setuptools` in `setup.py` (GH18113)
- Updated conda recipe to be in compliance with conda-build 3.0+ (GH18002)

**Index division by zero fills correctly**

Division operations on `Index` and subclasses will now fill division of positive numbers by zero with `np.inf`, division of negative numbers by zero with `-np.inf` and `0 / 0` with `np.nan`. This matches existing `Series` behavior. (GH19322, GH19347)

Previous behavior:

```
In [6]: index = pd.Int64Index([-1, 0, 1])
In [7]: index / 0
Out[7]: Int64Index([0, 0, 0], dtype='int64')
```

# Previous behavior yielded different results depending on the type of zero in the divider
```
In [8]: index / 0.0
Out[8]: Float64Index([-inf, nan, inf], dtype='float64')
```

```
In [9]: index = pd.UInt64Index([0, 1])
```
In [10]: index / np.array([0, 0], dtype=np.uint64)
Out[10]: UInt64Index([0, 0], dtype='uint64')

In [11]: pd.RangeIndex(1, 5) / 0
ZeroDivisionError: integer division or modulo by zero

Current behavior:

In [87]: index = pd.Int64Index([-1, 0, 1])

# division by zero gives -infinity where negative,
# +infinity where positive, and NaN for 0 / 0
In [88]: index / 0
Out[88]: Float64Index([-inf, nan, inf], dtype='float64')

# The result of division by zero should not depend on
# whether the zero is int or float
In [89]: index / 0.0
Out[89]: Float64Index([-inf, nan, inf], dtype='float64')

In [90]: index = pd.UInt64Index([0, 1])

In [91]: index / np.array([0, 0], dtype=np.uint64)
Out[91]: Float64Index([nan, inf], dtype='float64')

In [92]: pd.RangeIndex(1, 5) / 0
Out[92]: Float64Index([inf, inf, inf, inf], dtype='float64')

Extraction of matching patterns from strings

By default, extracting matching patterns from strings with `str.extract()` used to return a `Series` if a single group was being extracted (a `DataFrame` if more than one group was extracted). As of pandas 0.23.0 `str.extract()` always returns a `DataFrame`, unless `expand` is set to `False`. Finally, `None` was an accepted value for the `expand` parameter (which was equivalent to `False`), but now raises a `ValueError`. (GH11386)

Previous behavior:

In [1]: s = pd.Series(['number 10', '12 eggs'])

In [2]: extracted = s.str.extract(r'.*(\d\d).*')

In [3]: extracted
Out [3]:
          0      1
0    10
1    12
dtype: object

In [4]: type(extracted)
Out [4]:
<class 'pandas.core.series.Series'>
New behavior:

```python
In [93]: s = pd.Series(['number 10', '12 eggs'])
In [94]: extracted = s.str.extract(r'.*(\d\d).*')
In [95]: extracted
Out[95]:
0    10
1    12
[2 rows x 1 columns]
In [96]: type(extracted)
Out[96]: pandas.core.frame.DataFrame
```

To restore previous behavior, simply set `expand` to `False`:

```python
In [97]: s = pd.Series(['number 10', '12 eggs'])
In [98]: extracted = s.str.extract(r'.*(\d\d).*', expand=False)
In [99]: extracted
Out[99]:
0    10
1    12
Length: 2, dtype: object
In [100]: type(extracted)
Out[100]: pandas.core.series.Series
```

**Default value for the ordered parameter of CategoricalDtype**

The default value of the `ordered` parameter for `CategoricalDtype` has changed from `False` to `None` to allow updating of categories without impacting `ordered`. Behavior should remain consistent for downstream objects, such as `Categorical` (GH18790).

In previous versions, the default value for the `ordered` parameter was `False`. This could potentially lead to the ordered parameter unintentionally being changed from `True` to `False` when users attempt to update categories if `ordered` is not explicitly specified, as it would silently default to `False`. The new behavior for `ordered=None` is to retain the existing value of `ordered`.

New behavior:

```python
In [2]: from pandas.api.types import CategoricalDtype
In [3]: cat = pd.Categorical(list('abcaba'), ordered=True, categories=list('cba'))
In [4]: cat
Out[4]:
[a, b, c, a, b, a]
Categories (3, object): [c < b < a]
```

(continues on next page)
In [5]: cdt = CategoricalDtype(categories=list('cbad'))

In [6]: cat.astype(cdt)
Out[6]:
[a, b, c, a, b, a]
Categories (4, object): [c < b < a < d]

Notice in the example above that the converted Categorical has retained ordered=True. Had the default value for ordered remained as False, the converted Categorical would have become unordered, despite ordered=False never being explicitly specified. To change the value of ordered, explicitly pass it to the new dtype, e.g. CategoricalDtype(categories=list('cbad'), ordered=False).

Note that the unintentional conversion of ordered discussed above did not arise in previous versions due to separate bugs that prevented astype from doing any type of category to category conversion (GH10696, GH18593). These bugs have been fixed in this release, and motivated changing the default value of ordered.

**Better pretty-printing of DataFrames in a terminal**

Previously, the default value for the maximum number of columns was pd.options.display.max_columns=20. This meant that relatively wide data frames would not fit within the terminal width, and pandas would introduce line breaks to display these 20 columns. This resulted in an output that was relatively difficult to read:
If Python runs in a terminal, the maximum number of columns is now determined automatically so that the printed data frame fits within the current terminal width (pd.options.display.max_columns=0) (GH17023). If Python runs as a Jupyter kernel (such as the Jupyter QtConsole or a Jupyter notebook, as well as in many IDEs), this value cannot be inferred automatically and is thus set to 20 as in previous versions. In a terminal, this results in a much nicer output:

![Image of terminal output]

Note that if you don’t like the new default, you can always set this option yourself. To revert to the old setting, you can run this line:

```python
pd.options.display.max_columns = 20
```

**Datetimelike API changes**

- The default Timedelta constructor now accepts an ISO 8601 Duration string as an argument (GH19040)
- Subtracting NaT from a Series with dtype='datetime64[ns]' returns a Series with dtype='timedelta64[ns]' instead of dtype='datetime64[ns]' (GH18808)
- Addition or subtraction of NaT from a TimedeltaIndex will return TimedeltaIndex instead of DatetimeIndex (GH19124)
- DatetimeIndex.shift() and TimedeltaIndex.shift() will now raise NullFrequencyError (which subclasses ValueError, which was raised in older versions) when the index object frequency is None (GH19147)
- Addition and subtraction of NaN from a Series with dtype='timedelta64[ns]' will raise a TypeError instead of treating the NaN as NaT (GH19274)
• NaT division with `datetime.timedelta` will now return NaN instead of raising (GH17876)
• Operations between a `Series` with dtype `datetime64[ns]` and a `PeriodIndex` will correctly raise `TypeError` (GH18850)
• Subtraction of `Series` with timezone-aware dtype='datetime64[ns]' with mismatched timezones will raise `TypeError` instead of `ValueError` (GH18817)
• `Timestamp` will no longer silently ignore unused or invalid tz or tzinfo keyword arguments (GH17690)
• `Timestamp` will no longer silently ignore invalid freq arguments (GH5168)
• `CacheableOffset` and WeekDay are no longer available in the `pandas.tseries.offsets` module (GH17830)
• `pandas.tseries.frequencies.get_freq_group()` and `pandas.tseries.frequencies.DAYS` are removed from the public API (GH18034)
• `Series.truncate()` and `DataFrame.truncate()` will raise a `ValueError` if the index is not sorted instead of an unhelpful `KeyError` (GH19735)
• `Series.first` and `DataFrame.first` will now raise a `TypeError` rather than `NotImplementedError` when index is not a `DatetimeIndex` (GH20725)
• `Series.last` and `DataFrame.last` will now raise a `TypeError` rather than `NotImplementedError` when index is not a `DatetimeIndex` (GH20725).
• Restricted `DateOffset` keyword arguments. Previously, `DateOffset` subclasses allowed arbitrary keyword arguments which could lead to unexpected behavior. Now, only valid arguments will be accepted. (GH17176, GH18226).
• `pandas.merge()` provides a more informative error message when trying to merge on timezone-aware and timezone-naive columns (GH15800)
• For `DatetimeIndex` and `TimedeltaIndex` with `freq=None`, addition or subtraction of integer-dtyped array or `Index` will raise `NullFrequencyError` instead of `TypeError` (GH19895)
• `Timestamp` constructor now accepts a `nanosecond` keyword or positional argument (GH18898)
• `DatetimeIndex` will now raise an `AttributeError` when the `tz` attribute is set after instantiation (GH3746)
• `DatetimeIndex` with a `pytz` timezone will now return a consistent `pytz` timezone (GH18595)

Other API changes

• `Series.astype()` and `Index.astype()` with an incompatible dtype will now raise a `TypeError` rather than a `ValueError` (GH18231)
• Series construction with an `object` dtypes tz-aware datetime and `dtype=object` specified, will now return an `object` dtyped `Series`, previously this would infer the datetime dtype (GH18231)
• A `Series` of dtype=category constructed from an empty dict will now have categories of dtype=object rather than dtype=object64, consistently with the case in which an empty list is passed (GH18515)
• All-NaN levels in a `MultiIndex` are now assigned `float` rather than object dtype, promoting consistency with `Index` (GH17929).
• Levels names of a `MultiIndex` (when not None) are now required to be unique: trying to create a `MultiIndex` with repeated names will raise a `ValueError` (GH18872)
• Both construction and renaming of `Index/MultiIndex` with non-hashable name/names will now raise `TypeError` (GH20527)
• `Index.map()` can now accept `Series` and dictionary input objects (GH12756, GH18482, GH18509).
- `DataFrame.unstack()` will now default to filling with `np.nan` for `object` columns. (GH12815)
- `IntervalIndex` constructor will raise if the `closed` parameter conflicts with how the input data is inferred to be closed (GH18421)
- Inserting missing values into indexes will work for all types of indexes and automatically insert the correct type of missing value (NaN, NaT, etc.) regardless of the type passed in (GH18295)
- When created with duplicate labels, `MultiIndex` now raises a `ValueError`. (GH17464)
- `Series.fillna()` now raises a `TypeError` instead of a `ValueError` when passed a list, tuple or DataFrame as a value (GH18293)
- `pandas.DataFrame.merge()` no longer casts a `float` column to `object` when merging on `int` and `float` columns (GH16572)
- `pandas.merge()` now raises a `ValueError` when trying to merge on incompatible data types (GH9780)
- The default NA value for `UInt64Index` has changed from 0 to NaN, which impacts methods that mask with NA, such as `UInt64Index.where()` (GH18398)
- Refactored `setup.py` to use `find_packages` instead of explicitly listing out all subpackages (GH18535)
- Rearranged the order of keyword arguments in `read_excel()` to align with `read_csv()` (GH16672)
- `wide_to_long()` previously kept numeric-like suffixes as object dtype. Now they are cast to numeric if possible (GH17627)
- In `read_excel()`, the comment argument is now exposed as a named parameter (GH18735)
- The options `html.border` and `mode.use_inf_as_null` were deprecated in prior versions, these will now show `FutureWarning` rather than a `DeprecationWarning` (GH19003)
- `IntervalIndex` and `IntervalDtype` no longer support categorical, object, and string subtypes (GH19016)
- `IntervalDtype` now returns `True` when compared against 'interval' regardless of subtype, and `IntervalDtype.name` now returns 'interval' regardless of subtype (GH18980)
- `KeyError` now raises instead of `ValueError` in `drop()`, `drop()`, `drop()`, `drop()` when dropping a non-existent element in an axis with duplicates (GH19186)
- `Series.to_csv()` now accepts a `compression` argument that works in the same way as the `compression` argument in `DataFrame.to_csv()` (GH18958)
- Set operations (union, difference...) on `IntervalIndex` with incompatible index types will now raise a `TypeError` rather than a `ValueError` (GH19329)
- `DateOffset` objects render more simply, e.g. `<DateOffset: days=1>` instead of `<DateOffset: kwd={`days': 1}> (GH19403)
- `Categorical.fillna` now validates its value and method keyword arguments. It now raises when both or none are specified, matching the behavior of `Series.fillna()` (GH19682)
- `pd.to_datetime('today')` now returns a datetime, consistent with `pd.Timestamp('today')`; previously `pd.to_datetime('today')` returned a `.normalized()` datetime (GH19935)
- `Series.str.replace()` now takes an optional `regex` keyword which, when set to False, uses literal string replacement rather than regex replacement (GH16808)
- `DatetimeIndex.strftime()` and `PeriodIndex.strftime()` now return an `Index` instead of a numpy array to be consistent with similar accessors (GH20127)
- Constructing a Series from a list of length 1 no longer broadcasts this list when a longer index is specified (GH19714, GH20391).
• **DataFrame.to_dict()** with `orient='index'` no longer casts int columns to float for a DataFrame with only int and float columns (GH18580)

• A user-defined-function that is passed to `Series.rolling().aggregate()`, `DataFrame.rolling().aggregate()`, or its expanding cousins, will now **always** be passed a `Series`, rather than a `np.array`; `.apply()` only has the `raw` keyword, see [here](#). This is consistent with the signatures of `.aggregate()` across pandas (GH20584)

• Rolling and Expanding types raise `NotImplementedError` upon iteration (GH11704).

### Deprecations

• `Series.from_array` and `SparseSeries.from_array` are deprecated. Use the normal constructor `Series()` and `SparseSeries()` instead (GH18213).

• `DataFrame.as_matrix` is deprecated. Use `DataFrame.values` instead (GH18458).

• `Series.asobject`, `DatetimeIndex.asobject`, `PeriodIndex.asobject` and `TimeDeltaIndex.asobject` have been deprecated. Use `.astype(object)` instead (GH18572)

• Grouping by a tuple of keys now emits a `FutureWarning` and is deprecated. In the future, a tuple passed to `'by'` will always refer to a single key that is the actual tuple, instead of treating the tuple as multiple keys. To retain the previous behavior, use a list instead of a tuple (GH18314)

• `Series.valid` is deprecated. Use `Series.dropna()` instead (GH18800).

• `read_excel()` has deprecated the `skip_footer` parameter. Use `skipfooter` instead (GH18836)

• `ExcelFile.parse()` has deprecated `sheetname` in favor of `sheet_name` for consistency with `read_excel()` (GH20920).

• The `is_copy` attribute is deprecated and will be removed in a future version (GH18801).

• `IntervalIndex.from_intervals` is deprecated in favor of the `IntervalIndex` constructor (GH19263)

• `DataFrame.from_items` is deprecated. Use `DataFrame.from_dict()` instead, or `DataFrame.from_dict(OrderedDict())` if you wish to preserve the key order (GH17320, GH17312)

• Indexing a `MultiIndex` or a `FloatIndex` with a list containing some missing keys will now show a `FutureWarning`, which is consistent with other types of indexes (GH17758).

• The broadcast parameter of `.apply()` is deprecated in favor of `result_type='broadcast'` (GH18577)

• The reduce parameter of `.apply()` is deprecated in favor of `result_type='reduce'` (GH18577)

• The order parameter of `factorize()` is deprecated and will be removed in a future release (GH19727)

• `Timestamp.weekday_name`, `DatetimeIndex.weekday_name`, and `Series.dt.weekday_name` are deprecated in favor of `Timestamp.day_name()`, `DatetimeIndex.day_name()`, and `Series.dt.day_name()` (GH12806)

• `pandas.tseries.plotting.tsplot` is deprecated. Use `Series.plot()` instead (GH18627)

• `Index.summary()` is deprecated and will be removed in a future version (GH18217)

• `NDFrame.get_ftype_counts()` is deprecated and will be removed in a future version (GH18243)

• The `convert_datetime64` parameter in `DataFrame.to_records()` has been deprecated and will be removed in a future version. The NumPy bug motivating this parameter has been resolved. The default value for this parameter has also changed from `True` to `None` (GH18160).

• `Series.rolling().apply()`, `DataFrame.rolling().apply()`, `Series.expanding().apply()`, and `DataFrame.expanding().apply()` have deprecated passing an `np.array` by default. One will need to pass the new `raw` parameter to be explicit about what is passed (GH20584)
pandas: powerful Python data analysis toolkit, Release 1.2.5

- The data, base, strides, flags and itemsize properties of the Series and Index classes have been deprecated and will be removed in a future version (GH20419).
- DatetimeIndex.offset is deprecated. Use DatetimeIndex.freq instead (GH20716)
- Floor division between an integer ndarray and a Timedelta is deprecated. Divide by Timedelta.value instead (GH19761)
- Setting PeriodIndex.freq (which was not guaranteed to work correctly) is deprecated. Use PeriodIndex.asfreq() instead (GH20678)
- Index.get_duplicates() is deprecated and will be removed in a future version (GH20239)
- The previous default behavior of negative indices in Categorical.take is deprecated. In a future version it will change from meaning missing values to meaning positional indices from the right. The future behavior is consistent with Series.take() (GH20664).
- Passing multiple axes to the axis parameter in DataFrame.dropna() has been deprecated and will be removed in a future version (GH20987)

Removal of prior version deprecations/changes

- Warnings against the obsolete usage Categorical(codes, categories), which were emitted for instance when the first two arguments to Categorical() had different dtypes, and recommended the use of Categorical.from_codes, have now been removed (GH8074)
- The levels and labels attributes of a MultiIndex can no longer be set directly (GH4039).
- pd.tseries.util.pivot_annual has been removed (deprecated since v0.19). Use pivot_table instead (GH18370)
- pd.tseries.util.isleapyear has been removed (deprecated since v0.19). Use .is_leap_year property in Datetime-likes instead (GH18370)
- pd.ordered_merge has been removed (deprecated since v0.19). Use pd.merge_ordered instead (GH18459)
- The SparseList class has been removed (GH14007)
- The pandas.io.wb and pandas.io.data stub modules have been removed (GH13735)
- Categorical.from_array has been removed (GH13854)
- The freq and how parameters have been removed from the rolling/expanding/ewm methods of DataFrame and Series (deprecated since v0.18). Instead, resample before calling the methods. (GH18601 & GH18668)
- DatetimeIndex.to_datetime, Timestamp.to_datetime, PeriodIndex.to_datetime, and Index.to_datetime have been removed (GH8254, GH14096, GH14113)
- read_csv() has dropped the skip_footer parameter (GH13386)
- read_csv() has dropped the as_recarray parameter (GH13373)
- read_csv() has dropped the buffer_lines parameter (GH13360)
- read_csv() has dropped the compact_ints and use_unsigned parameters (GH13323)
- The Timestamp class has dropped the offset attribute in favor of freq (GH13593)
- The Series, Categorical, and Index classes have dropped the reshape method (GH13012)
- pandas.tseries.frequencies.get_standard_freq has been removed in favor of pandas.tseries.frequencies.to_offset(freq).rule_code (GH13874)
- The freqstr keyword has been removed from pandas.tseries.frequencies.to_offset in favor of freq (GH13874)
- The Panel4D and PanelND classes have been removed (GH13776)
- The Panel class has dropped the to_long and toLong methods (GH19077)
- The options display.line_with and display.height are removed in favor of display.width and display.max_rows respectively (GH4391, GH19107)
- The labels attribute of the Categorical class has been removed in favor of `Categorical.codes` (GH7768)
- The flavor parameter have been removed from func:to_sql method (GH13611)
- The modules pandas.tools.hashing and pandas.util.hashing have been removed (GH16223)
- The top-level functions `pd.rolling_*`, `pd.expanding_*` and `pd.ewm*` have been removed (Deprecated since v0.18). Instead, use the DataFrame/Series methods `rolling`, `expanding` and `ewm` (GH18723)
- Imports from pandas.core.common for functions such as `is_datetime64_dtype` are now removed. These are located in pandas.api.types. (GH13634, GH19769)
- The infer_dst keyword in `Series.tz_localize()`, `DatetimeIndex.tz_localize()` and `DatetimeIndex` have been removed. `infer_dst=True` is equivalent to ambiguous='infer', and `infer_dst=False` to ambiguous='raise' (GH7963).
- When `.resample()` was changed from an eager to a lazy operation, like `.groupby()` in v0.18.0, we put in place compatibility (with a FutureWarning), so operations would continue to work. This is now fully removed, so a Resampler will no longer forward compat operations (GH20554)
- Remove long deprecated `axis=None` parameter from `.replace()` (GH20271)

**Performance improvements**

- Indexers on Series or DataFrame no longer create a reference cycle (GH17956)
- Added a keyword argument, cache, to `to_datetime()` that improved the performance of converting duplicate datetime arguments (GH11665)
- `DateOffset` arithmetic performance is improved (GH18218)
- Converting a Series of Timedelta objects to days, seconds, etc... sped up through vectorization of underlying methods (GH18092)
- Improved performance of `.map()` with a Series/dict input (GH15081)
- The overridden Timedelta properties of days, seconds and microseconds have been removed, leveraging their built-in Python versions instead (GH18242)
- Series construction will reduce the number of copies made of the input data in certain cases (GH17449)
- Improved performance of `Series.dt.date()` and `DatetimeIndex.date()` (GH18058)
- Improved performance of `Series.dt.time()` and `DatetimeIndex.time()` (GH18461)
- Improved performance of `IntervalIndex.symmetric_difference()` (GH18475)
- Improved performance of DatetimeIndex and Series arithmetic operations with Business-Month and Business-Quarter frequencies (GH18489)
- `Series() / DataFrame()` tab completion limits to 100 values, for better performance. (GH18587)
- Improved performance of `DataFrame.median()` with axis=1 when bottleneck is not installed (GH16468)
- Improved performance of `MultiIndex.get_loc()` for large indexes, at the cost of a reduction in performance for small ones (GH18519)
• Improved performance of `MultiIndex.remove_unused_levels()` when there are no unused levels, at the cost of a reduction in performance when there are (GH19289)

• Improved performance of `Index.get_loc()` for non-unique indexes (GH19478)

• Improved performance of pairwise `.rolling()` and `.expanding()` with `.cov()` and `.corr()` operations (GH17917)

• Improved performance of `pandas.core.groupby.GroupBy.rank()` (GH15779)

• Improved performance of variable `.rolling()` on `.min()` and `.max()` (GH19521)

• Improved performance of `pandas.core.groupby.GroupBy.ffill()` and `pandas.core.groupby.GroupBy.bfill()` (GH11296)

• Improved performance of `pandas.core.groupby.GroupBy.any()` and `pandas.core.groupby.GroupBy.all()` (GH15435)

• Improved performance of `pandas.core.groupby.GroupBy.pct_change()` (GH19165)

• Improved performance of `Series.isin()` in the case of categorical dtypes (GH20003)

• Improved performance of `getattr(Series, attr)` when the Series has certain index types. This manifested in slow printing of large Series with a `DatetimeIndex` (GH19764)

• Fixed a performance regression for `GroupBy.nth()` and `GroupBy.last()` with some object columns (GH19283)

• Improved performance of `pandas.core.arrays.Categorical.from_codes()` (GH18501)

**Documentation changes**

Thanks to all of the contributors who participated in the pandas Documentation Sprint, which took place on March 10th. We had about 500 participants from over 30 locations across the world. You should notice that many of the `API/docstrings` have greatly improved.

There were too many simultaneous contributions to include a release note for each improvement, but this GitHub search should give you an idea of how many docstrings were improved.

Special thanks to Marc Garcia for organizing the sprint. For more information, read the NumFOCUS blogpost recapping the sprint.

• Changed spelling of “numpy” to “NumPy”, and “python” to “Python”. (GH19017)

• Consistency when introducing code samples, using either colon or period. Rewrote some sentences for greater clarity; added more dynamic references to functions, methods and classes. (GH18941, GH18948, GH18973, GH19017)

• Added a reference to `DataFrame.assign()` in the concatenate section of the merging documentation (GH18665)
Bug fixes

Categorical

**Warning:** A class of bugs were introduced in pandas 0.21 with CategoricalDtype that affects the correctness of operations like merge, concat, and indexing when comparing multiple unordered Categorical arrays that have the same categories, but in a different order. We highly recommend upgrading or manually aligning your categories before doing these operations.

- Bug in Categorical.equals returning the wrong result when comparing two unordered Categorical arrays with the same categories, but in a different order (GH16603)
- Bug in pandas.api.types.union_categoricals() returning the wrong result when for unordered categories with the categories in a different order. This affected pandas.concat() with Categorical data (GH19096).
- Bug in pandas.merge() returning the wrong result when joining on an unordered Categorical that had the same categories but in a different order (GH19551)
- Bug in CategoricalIndex.get_indexer() returning the wrong result when target was an unordered Categorical that had the same categories as self but in a different order (GH19551)
- Bug in Index.astype() with a categorical dtype where the resultant index is not converted to a CategoricalIndex for all types of index (GH18630)
- Bug in Series.astype() and Categorical.astype() where an existing categorical data does not get updated (GH10696, GH18593)
- Bug in Series.str.split() with expand=True incorrectly raising an IndexError on empty strings (GH20002).
- Bug in Index constructor with dtype=CategoricalDtype(...) where categories and ordered are not maintained (GH19032)
- Bug in Series constructor with scalar and dtype=CategoricalDtype(...) where categories and ordered are not maintained (GH19565)
- Bug in Categorical.__iter__ not converting to Python types (GH19909)
- Bug in pandas.factorize() returning the unique codes for the uniques. This now returns a Categorical with the same dtype as the input (GH19721)
- Bug in pandas.factorize() including an item for missing values in the uniques return value (GH19721)
- Bug in Series.take() with categorical data interpreting -1 in indices as missing value markers, rather than the last element of the Series (GH20664)

Datetimelike

- Bug in Series.__sub__() subtracting a non-nanosecond np.datetime64 object from a Series gave incorrect results (GH7996)
- Bug in DatetimeIndex, TimedeltaIndex addition and subtraction of zero-dimensional integer arrays gave incorrect results (GH19012)
- Bug in DatetimeIndex and TimedeltaIndex where adding or subtracting an array-like of DateOffset objects either raised (np.array, pd.Index) or broadcast incorrectly (pd.Series) (GH18849)
• Bug in Series.__add__() adding Series with dtype timedelta64[ns] to a timezone-aware DatetimeIndex incorrectly dropped timezone information (GH13905)

• Adding a Period object to a datetime or Timestamp object will now correctly raise a TypeError (GH17983)

• Bug in Timestamp where comparison with an array of Timestamp objects would result in a RecursionError (GH15183)

• Bug in Series floor-division where operating on a scalar timedelta raises an exception (GH18846)

• Bug in .astype() to non-ns timedelta units would hold the incorrect dtype (GH19176, GH19223, GH12425)

• Bug in subtracting Series from NaT incorrectly returning NaT (GH19158)

• Bug in Series.truncate() which raises TypeError with a monotonic PeriodIndex (GH17717)

• Bug in comparison of DatetimeIndex against None or datetime.date objects raising TypeError for == and != comparisons instead of all-False and all-True, respectively (GH19301)

• Bug in DatetimeIndex and TimedeltaIndex addition and subtraction where name of the returned object was not always set consistently. (GH19744)

• Bug in Timedelta.__floordiv__() and Timedelta.__rfloordiv__() dividing by many incompatible numpy objects was incorrectly allowed (GH18846)

• Bug where dividing a scalar timedelta-like object with TimedeltaIndex performed the reciprocal operation (GH19125)

• Bug in TimedeltaIndex where division by a Series would return a TimedeltaIndex instead of a Series (GH19042)

**Timedelta**

• Bug in Timedelta.__mul__() where multiplying by NaT returned NaT instead of raising a TypeError (GH19819)

• Bug in Series with dtype='timedelta64[ns]' where addition or subtraction of TimedeltaIndex had results cast to dtype='int64' (GH17250)

• Bug in Series with dtype='timedelta64[ns]' where addition or subtraction of TimedeltaIndex could return a Series with an incorrect name (GH19043)

• Bug in Timedelta.__floordiv__() and Timedelta.__rfloordiv__() dividing by many incompatible numpy objects was incorrectly allowed (GH18846)

• Bug where dividing a scalar timedelta-like object with TimedeltaIndex performed the reciprocal operation (GH19125)

• Bug in TimedeltaIndex where division by a Series would return a TimedeltaIndex instead of a Series (GH19042)
• Bug in Timedelta.__add__(), Timedelta.__sub__() where adding or subtracting a np.timedelta64 object would return another np.timedelta64 instead of a Timedelta (GH19738)
• Bug in Timedelta.__floordiv__(), Timedelta.__rfloordiv__() where operating with a Tick object would raise a TypeError instead of returning a numeric value (GH19738)
• Bug in Period.asfreq() where periods near datetime(1, 1, 1) could be converted incorrectly (GH19643, GH19834)
• Bug in Timedelta.total_seconds() causing precision errors, for example Timedelta('30S').total_seconds()==30.000000000000004 (GH19458)
• Bug in Timedelta.__rmod__() where operating with a numpy.timedelta64 returned a timedelta64 object instead of a Timedelta (GH19820)
• Multiplication of TimedeltaIndex by TimedeltaIndex will now raise TypeError instead of raising ValueError in cases of length mismatch (GH19333)
• Bug in indexing a TimedeltaIndex with a np.timedelta64 object which was raising a TypeError (GH20393)

Timezones

• Bug in creating a Series from an array that contains both tz-naive and tz-aware values will result in a Series whose dtype is tz-aware instead of object (GH16406)
• Bug in comparison of timezone-aware DatetimeIndex against NaT incorrectly raising TypeError (GH19276)
• Bug in DatetimeIndex.astype() when converting between timezone aware dtypes, and converting from timezone aware to naive (GH18951)
• Bug in comparing DatetimeIndex, which failed to raise TypeError when attempting to compare timezone-aware and timezone-naive datetimelike objects (GH18162)
• Bug in localization of a naive, datetime string in a Series constructor with a datetime64[ns, tz] dtype (GH174151)
• Timestamp.replace() will now handle Daylight Savings transitions gracefully (GH18319)
• Bug in tz-aware DatetimeIndex where addition/subtraction with a TimedeltaIndex or array with dtype='timedelta64[ns]' was incorrect (GH17558)
• Bug in DatetimeIndex.insert() where inserting NaT into a timezone-aware index incorrectly raised (GH16357)
• Bug in DataFrame constructor, where tz-aware Datetimeindex and a given column name will result in an empty DataFrame (GH19157)
• Bug in Timestamp.tz_localize() where localizing a timestamp near the minimum or maximum valid values could overflow and return a timestamp with an incorrect nanosecond value (GH12677)
• Bug when iterating over DatetimeIndex that was localized with fixed timezone offset that rounded nanosecond precision to microseconds (GH19603)
• Bug in DataFrame.diff() that raised an IndexError with tz-aware values (GH18578)
• Bug in melt() that converted tz-aware dtypes to tz-naive (GH15785)
• Bug in Dataframe.count() that raised an ValueError, if Dataframe.dropna() was called for a single column with timezone-aware values. (GH13407)
Offsets

- Bug in WeekOfMonth and Week where addition and subtraction did not roll correctly (GH18510, GH18672, GH18864)
- Bug in WeekOfMonth and LastWeekOfMonth where default keyword arguments for constructor raised ValueError (GH19142)
- Bug in FY5253Quarter, LastWeekOfMonth where rollback and rollforward behavior was inconsistent with addition and subtraction behavior (GH18854)
- Bug in FY5253 where datetime addition and subtraction incremented incorrectly for dates on the year-end but not normalized to midnight (GH18854)
- Bug in FY5253 where date offsets could incorrectly raise an AssertionError in arithmetic operations (GH14774)

Numeric

- Bug in Series constructor with an int or float list where specifying dtype=str, dtype='str' or dtype='U' failed to convert the data elements to strings (GH16605)
- Bug in Index multiplication and division methods where operating with a Series would return an Index object instead of a Series object (GH19042)
- Bug in the DataFrame constructor in which data containing very large positive or very large negative numbers was causing OverflowError (GH18584)
- Bug in Index constructor with dtype='uint64' where int-like floats were not coerced to UInt64Index (GH18400)
- Bug in DataFrame flex arithmetic (e.g. df.add(other, fill_value=foo)) with a fill_value other than None failed to raise NotImplementedError in corner cases where either the frame or other has length zero (GH19522)
- Multiplication and division of numeric-dtyped Index objects with timedelta-like scalars returns TimedeltaIndex instead of raising TypeError (GH19333)
- Bug where NaN was returned instead of 0 by Series.pct_change() and DataFrame.pct_change() when fill_method is not None (GH19873)

Strings

- Bug in Series.str.get() with a dictionary in the values and the index not in the keys, raising KeyError (GH20671)

Indexing

- Bug in Index construction from list of mixed type tuples (GH18505)
- Bug in Index.drop() when passing a list of both tuples and non-tuples (GH18304)
- Bug in DataFrame.drop(), Panel.drop(), Series.drop(), Index.drop() where no KeyError is raised when dropping a non-existent element from an axis that contains duplicates (GH19186)
- Bug in indexing a datetimelike Index that raised ValueError instead of IndexError (GH18386).
- Index.to_series() now accepts index and name kwargs (GH18699)
- `DatetimeIndex.to_series()` now accepts `index` and `name` kwargs (GH18699)
- Bug in indexing non-scalar value from `Series` having non-unique `Index` will return value flattened (GH17610)
- Bug in indexing with iterator containing only missing keys, which raised no error (GH20748)
- Fixed inconsistency in `.ix` between list and scalar keys when the index has integer dtype and does not include the desired keys (GH20753)
- Bug in `__setitem__` when indexing a `DataFrame` with a 2-d boolean ndarray (GH18582)
- Bug in `str.extractall` when there were no matches empty `Index` was returned instead of appropriate `MultiIndex` (GH19034)
- Bug in `IntervalIndex` where empty and purely NA data was constructed inconsistently depending on the construction method (GH18421)
- Bug in `IntervalIndex.symmetric_difference()` where the symmetric difference with a non-`IntervalIndex` did not raise (GH18475)
- Bug in `IntervalIndex` where set operations that returned an empty `IntervalIndex` had the wrong dtype (GH19101)
- Bug in `DataFrame.drop_duplicates()` where no `KeyError` is raised when passing in columns that don’t exist on the `DataFrame` (GH19726)
- Bug in `Index` subclasses constructors that ignore unexpected keyword arguments (GH19348)
- Bug in `Index.difference()` when taking difference of an `Index` with itself (GH20040)
- Bug in `DataFrame.first_valid_index()` and `DataFrame.last_valid_index()` in presence of entire rows of NaNs in the middle of values (GH20499).
- Bug in `IntervalIndex` where some indexing operations were not supported for overlapping or non-monotonic `uint64` data (GH20636)
- Bug in `Series.is_unique` where extraneous output in stderr is shown if Series contains objects with `__ne__` defined (GH20661)
- Bug in `.loc` assignment with a single-element list-like incorrectly assigns as a list (GH19474)
- Bug in partial string indexing on a `Series/DataFrame` with a monotonic decreasing `DatetimeIndex` (GH19362)
- Bug in performing in-place operations on a `DataFrame` with a duplicate `Index` (GH17105)
- Bug in `IntervalIndex.get_loc()` and `IntervalIndex.get_indexer()` when used with an `IntervalIndex` containing a single interval (GH17284, GH20921)
- Bug in `.loc` with a `uint64` indexer (GH20722)

**MultiIndex**

- Bug in `MultiIndex.__contains__()` where non-tuple keys would return `True` even if they had been dropped (GH19027)
- Bug in `MultiIndex.set_labels()` which would cause casting (and potentially clipping) of the new labels if the `level` argument is not 0 or a list like `[0, 1, ...]` (GH19057)
- Bug in `MultiIndex.get_level_values()` which would return an invalid index on level of ints with missing values (GH17924)
- Bug in `MultiIndex.unique()` when called on empty `MultiIndex` (GH20568)
• Bug in `MultiIndex.unique()` which would not preserve level names (GH20570)
• Bug in `MultiIndex.remove_unused_levels()` which would fill nan values (GH18417)
• Bug in `MultiIndex.from_tuples()` which would fail to take zipped tuples in python3 (GH18434)
• Bug in `MultiIndex.get_loc()` which would fail to automatically cast values between float and int (GH18818, GH15994)
• Bug in `MultiIndex.get_loc()` which would cast boolean to integer labels (GH19086)
• Bug in `MultiIndex.get_loc()` which would fail to locate keys containing NaN (GH18485)
• Bug in `MultiIndex.get_loc()` in large `MultiIndex`, would fail when levels had different dtypes (GH18520)
• Bug in indexing where nested indexers having only numpy arrays are handled incorrectly (GH19686)

IO

• `read_html()` now rewinds seekable IO objects after parse failure, before attempting to parse with a new parser. If a parser errors and the object is non-seekable, an informative error is raised suggesting the use of a different parser (GH17975)
• `DataFrame.to_html()` now has an option to add an id to the leading `<table>` tag (GH8496)
• Bug in `read_msgpack()` with a non existent file is passed in Python 2 (GH15296)
• Bug in `read_csv()` where a MultiIndex with duplicate columns was not being mangled appropriately (GH18062)
• Bug in `read_csv()` where missing values were not being handled properly when keep_default_na=False with dictionary na_values (GH19227)
• Bug in `read_csv()` causing heap corruption on 32-bit, big-endian architectures (GH20785)
• Bug in `read_sas()` where a file with 0 variables gave an AttributeError incorrectly. Now it gives an EmptyDataError (GH18184)
• Bug in `DataFrame.to_latex()` where pairs of braces meant to serve as invisible placeholders were escaped (GH18667)
• Bug in `DataFrame.to_latex()` where a NaN in a MultiIndex would cause an IndexError or incorrect output (GH14249)
• Bug in `DataFrame.to_latex()` where a non-string index-level name would result in an AttributeError (GH19981)
• Bug in `DataFrame.to_latex()` where the combination of an index name and the index_names=False option would result in incorrect output (GH18326)
• Bug in `DataFrame.to_latex()` where a MultiIndex with an empty string as its name would result in incorrect output (GH18669)
• Bug in `DataFrame.to_latex()` where missing space characters caused wrong escaping and produced non-valid latex in some cases (GH20859)
• Bug in `read_json()` where large numeric values were causing an OverflowError (GH18842)
• Bug in `DataFrame.to_parquet()` where an exception was raised if the write destination is S3 (GH19134)
• Interval now supported in `DataFrame.to_excel()` for all Excel file types (GH19242)
• Timedelta now supported in `DataFrame.to_excel()` for all Excel file types (GH19242, GH9155, GH19900)
• Bug in `pandas.io.stata.StataReader.value_labels()` raising an `AttributeError` when called on very old files. Now returns an empty dict (GH19417)
• Bug in `read_pickle()` when unpickling objects with `TimedeltaIndex` or `Float64Index` created with pandas prior to version 0.20 (GH19939)
• Bug in `pandas.io.json.json_normalize()` where sub-records are not properly normalized if any sub-records values are `NoneType` (GH20030)
• Bug in `usecols` parameter in `read_csv()` where error is not raised correctly when passing a string. (GH20529)
• Bug in `HDFStore.keys()` when reading a file with a soft link causes exception (GH20523)
• Bug in `HDFStore.select_column()` where a key which is not a valid store raised an `AttributeError` instead of a `KeyError` (GH17912)

Plotting

• Better error message when attempting to plot but matplotlib is not installed (GH19810).
• `DataFrame.plot()` now raises a `ValueError` when the `x` or `y` argument is improperly formed (GH18671)
• Bug in `DataFrame.plot()` when `x` and `y` arguments given as positions caused incorrect referenced columns for line, bar and area plots (GH20056)
• Bug in formatting tick labels with `datetime.time()` and fractional seconds (GH18478).
• `Series.plot.kde()` has exposed the args `ind` and `bw_method` in the docstring (GH18461). The argument `ind` may now also be an integer (number of sample points).
• `DataFrame.plot()` now supports multiple columns to the `y` argument (GH19699)

GroupBy/resample/rolling

• Bug when grouping by a single column and aggregating with a class like `list` or `tuple` (GH18079)
• Fixed regression in `DataFrame.groupby()` which would not emit an error when called with a tuple key not in the index (GH18798)
• Bug in `DataFrame.resample()` which silently ignored unsupported (or mistyped) options for `label`, `closed` and convention (GH19303)
• Bug in `DataFrame.groupby()` where tuples were interpreted as lists of keys rather than as keys (GH17979, GH18249)
• Bug in `DataFrame.groupby()` where aggregation by `first/last/min/max` was causing timestamps to lose precision (GH19526)
• Bug in `DataFrame.transform()` where particular aggregation functions were being incorrectly cast to match the `dtype(s)` of the grouped data (GH19200)
• Bug in `DataFrame.groupby()` passing the `on=` kwarg, and subsequently using `.apply()` (GH17813)
• Bug in `DataFrame.resample().aggregate` not raising a `KeyError` when aggregating a non-existent column (GH16766, GH19566)
• Bug in `DataFrameGroupBy.cumsum()` and `DataFrameGroupBy.cumprod()` when `skipna` was passed (GH19806)
• Bug in `DataFrame.resample()` that dropped timezone information (GH13238)
• Bug in `DataFrame.groupby()` where transformations using `np.all` and `np.any` were raising a `ValueError` (GH20653)

• Bug in `DataFrame.resample()` where `ffill`, `bfill`, `pad`, `backfill`, `fillna`, `interpolate`, and `asfreq` were ignoring `loffset`. (GH20744)

• Bug in `DataFrame.groupby()` when applying a function that has mixed data types and the user supplied function can fail on the grouping column (GH20949)

• Bug in `DataFrameGroupBy.rolling().apply()` where operations performed against the associated `DataFrameGroupBy` object could impact the inclusion of the grouped item(s) in the result (GH14013)

Sparse

• Bug in which creating a `SparseDataFrame` from a dense `Series` or an unsupported type raised an uncontrolled exception (GH19374)

• Bug in `SparseDataFrame.to_csv` causing exception (GH19384)

• Bug in `SparseSeries.memory_usage` which caused segfault by accessing non sparse elements (GH19368)

• Bug in constructing a `SparseArray`: if `data` is a scalar and `index` is defined it will coerce to `float64` regardless of scalar’s dtype. (GH19163)

Reshaping

• Bug in `DataFrame.merge()` where referencing a `CategoricalIndex` by name, where the `by` kwarg would `KeyError` (GH20777)

• Bug in `DataFrame.stack()` which fails trying to sort mixed type levels under Python 3 (GH18310)

• Bug in `DataFrame.unstack()` which casts int to float if `columns` is a `MultiIndex` with unused levels (GH17845)

• Bug in `DataFrame.unstack()` which raises an error if `index` is a `MultiIndex` with unused labels on the unstacked level (GH18562)

• Fixed construction of a `Series` from a `dict` containing `NaN` as key (GH18480)

• Fixed construction of a `DataFrame` from a `dict` containing `NaN` as key (GH18455)

• Disabled construction of a `Series` where `len(index) > len(data) = 1`, which previously would broadcast the data item, and now raises a `ValueError` (GH18819)

• Suppressed error in the construction of a `DataFrame` from a `dict` containing scalar values when the corresponding keys are not included in the passed index (GH18600)

• Fixed (changed from object to `float64`) dtype of `DataFrame` initialized with axes, no data, and `dtype=int` (GH19646)

• Bug in `Series.rank()` where `Series` containing `NaT` modifies the `Series` inplace (GH18521)

• Bug in `cut()` which fails when using readonly arrays (GH18773)

• Bug in `DataFrame.pivot_table()` which fails when the `aggfunc` arg is of type string. The behavior is now consistent with other methods like `agg` and `apply` (GH18713)

• Bug in `DataFrame.merge()` in which merging using `Index` objects as vectors raised an `Exception` (GH19038)

• Bug in `DataFrame.stack()`, `DataFrame.unstack()`, `Series.unstack()` which were not returning subclasses (GH15563)
• Bug in timezone comparisons, manifesting as a conversion of the index to UTC in .concat() (GH18523)
• Bug in concat() when concatenating sparse and dense series it returns only a SparseDataFrame. Should be a DataFrame. (GH18914, GH18686, and GH16874)
• Improved error message for DataFrame.merge() when there is no common merge key (GH19427)
• Bug in DataFrame.join() which does an outer instead of a left join when being called with multiple DataFrames and some have non-unique indices (GH19624)
• Series.rename() now accepts axis as a kwarg (GH18589)
• Bug in rename() where an Index of same-length tuples was converted to a MultiIndex (GH19497)
• Comparisons between Series and Index would return a Series with an incorrect name, ignoring the Index’s name attribute (GH19582)
• Bug in qcut() where datetime and timedelta data with NaT present raised a ValueError (GH19768)
• Bug in DataFrame.iterrows(), which would infers strings not compliant to ISO8601 to datetimes (GH19671)
• Bug in Series constructor with Categorical where a ValueError is not raised when an index of different length is given (GH19342)
• Bug in DataFrame.astype() where column metadata is lost when converting to categorical or a dictionary of dtypes (GH19920)
• Bug in cut() and qcut() where timezone information was dropped (GH19872)
• Bug in Series constructor with a dtype=str, previously raised in some cases (GH19853)
• Bug in get_dummies(), and select_dtypes(), where duplicate column names caused incorrect behavior (GH20848)
• Bug in isna(), which cannot handle ambiguous typed lists (GH20675)
• Bug in concat() which raises an error when concatenating TZ-aware dataframes and all-NaT dataframes (GH12396)
• Bug in concat() which raises an error when concatenating empty TZ-aware series (GH18447)

Other

• Improved error message when attempting to use a Python keyword as an identifier in a numexpr backed query (GH18221)
• Bug in accessing a pandas.get_option(), which raised KeyError rather than OptionError when looking up a non-existent option key in some cases (GH19789)
• Bug in testing.assert_series_equal() and testing.assert_frame_equal() for Series or DataFrames with differing unicode data (GH20503)

5.7 Version 0.22

5.7.1 Version 0.22.0 (December 29, 2017)

This is a major release from 0.21.1 and includes a single, API-breaking change. We recommend that all users upgrade to this version after carefully reading the release note (singular!).

Backwards incompatible API changes

pandas 0.22.0 changes the handling of empty and all-NA sums and products. The summary is that

- The sum of an empty or all-NA Series is now 0
- The product of an empty or all-NA Series is now 1
- We’ve added a min_count parameter to .sum() and .prod() controlling the minimum number of valid values for the result to be valid. If fewer than min_count non-NA values are present, the result is NA. The default is 0. To return NaN, the 0.21 behavior, use min_count=1.

Some background: In pandas 0.21, we fixed a long-standing inconsistency in the return value of all-NA series depending on whether or not bottleneck was installed. See *Sum/prod of all-NaN or empty Series/DataFrames is now consistently NaN*. At the same time, we changed the sum and prod of an empty Series to also be NaN.

Based on feedback, we’ve partially reverted those changes.

Arithmetic operations

The default sum for empty or all-NA Series is now 0.

pandas 0.21.x

```
In [1]: pd.Series([]).sum()
Out[1]: nan

In [2]: pd.Series([np.nan]).sum()
Out[2]: nan
```

pandas 0.22.0
The default behavior is the same as pandas 0.20.3 with bottleneck installed. It also matches the behavior of NumPy's np.nansum on empty and all-NA arrays.

To have the sum of an empty series return NaN (the default behavior of pandas 0.20.3 without bottleneck, or pandas 0.21.x), use the min_count keyword.

```
In [3]: pd.Series([]).sum(min_count=1)
Out[3]: nan
```

Thanks to the skipna parameter, the .sum on an all-NA series is conceptually the same as the .sum of an empty one with skipna=True (the default).

```
In [4]: pd.Series([np.nan]).sum(min_count=1)  # skipna=True by default
Out[4]: nan
```

The min_count parameter refers to the minimum number of non-null values required for a non-NA sum or product. Series.prod() has been updated to behave the same as Series.sum(), returning 1 instead.

```
In [5]: pd.Series([]).prod()
Out[5]: 1.0

In [6]: pd.Series([np.nan]).prod()
Out[6]: 1.0

In [7]: pd.Series([]).prod(min_count=1)
Out[7]: nan
```

These changes affect DataFrame.sum() and DataFrame.prod() as well. Finally, a few less obvious places in pandas are affected by this change.

**Grouping by a Categorical**

Grouping by a Categorical and summing now returns 0 instead of NaN for categories with no observations. The product now returns 1 instead of NaN.

```
pandas 0.21.x
```

```
In [8]: grouper = pd.Categorical(['a', 'a'], categories=['a', 'b'])

In [9]: pd.Series([1, 2]).groupby(grouper).sum()
Out[9]:
   a  3.0
   b  NaN
dtype: float64
```

```
pandas 0.22
```
In [8]: grouper = pd.Categorical(['a', 'a'], categories=['a', 'b'])

In [9]: pd.Series([1, 2]).groupby(grouper).sum()
Out[9]:
a  3
b  0
Length: 2, dtype: int64

To restore the 0.21 behavior of returning NaN for unobserved groups, use min_count>=1.

In [10]: pd.Series([1, 2]).groupby(grouper).sum(min_count=1)
Out[10]:
a  3.0
b  NaN
Length: 2, dtype: float64

Resample

The sum and product of all-NA bins has changed from NaN to 0 for sum and 1 for product.

pandas 0.21.x

In [11]: s = pd.Series([1, 1, np.nan, np.nan],
           index=pd.date_range('2017', periods=4))
In [12]: s.resample('2d').sum()
Out[12]:
2017-01-01  2.0
2017-01-03  NaN
Freq: 2D, Length: 2, dtype: float64

pandas 0.22.0

In [11]: s = pd.Series([1, 1, np.nan, np.nan], index=pd.date_range('2017', periods=4))
In [12]: s.resample('2d').sum()
Out[12]:
2017-01-01  2.0
2017-01-03  0.0
Freq: 2D, Length: 2, dtype: float64

To restore the 0.21 behavior of returning NaN, use min_count>=1.

In [13]: s.resample('2d').sum(min_count=1)
In particular, upsampling and taking the sum or product is affected, as upsampling introduces missing values even if the original series was entirely valid.

```python
In [14]: idx = pd.DatetimeIndex(['2017-01-01', '2017-01-02'])

In [15]: pd.Series([1, 2], index=idx).resample('12H').sum()
Out[15]:
2017-01-01 00:00:00    1.0
2017-01-01 12:00:00   NaN
2017-01-02 00:00:00    2.0
Freq: 12H, Length: 3, dtype: float64
```

Once again, the `min_count` keyword is available to restore the 0.21 behavior.

```python
In [16]: pd.Series([1, 2], index=idx).resample('12H').sum(min_count=1)
Out[16]:
2017-01-01 00:00:00    1.0
2017-01-01 12:00:00   NaN
2017-01-02 00:00:00    2.0
Freq: 12H, Length: 3, dtype: float64
```

**Rolling and expanding**

Rolling and expanding already have a `min_periods` keyword that behaves similar to `min_count`. The only case that changes is when doing a rolling or expanding sum with `min_periods=0`. Previously this returned `NaN`, when fewer than `min_periods` non-`NA` values were in the window. Now it returns 0.

```python
In [17]: s = pd.Series([np.nan, np.nan])

In [18]: s.rolling(2, min_periods=0).sum()
Out[18]:
0    NaN
1    NaN
dtype: float64
```
pandas 0.22.0

In [17]: s = pd.Series([np.nan, np.nan])

In [18]: s.rolling(2, min_periods=0).sum()
Out[18]:
0   0.0
1   0.0
Length: 2, dtype: float64

The default behavior of min_periods=None, implying that min_periods equals the window size, is unchanged.

Compatibility

If you maintain a library that should work across pandas versions, it may be easiest to exclude pandas 0.21 from your requirements. Otherwise, all your sum() calls would need to check if the Series is empty before summing.

With setuptools, in your setup.py use:

install_requires=['pandas!=0.21.*', ...]

With conda, use

requirements:
  run:
    - pandas !=0.21.0, !=0.21.1

Note that the inconsistency in the return value for all-NA series is still there for pandas 0.20.3 and earlier. Avoiding pandas 0.21 will only help with the empty case.

5.8 Version 0.21

5.8.1 Version 0.21.1 (December 12, 2017)

This is a minor bug-fix release in the 0.21.x series and includes some small regression fixes, bug fixes and performance improvements. We recommend that all users upgrade to this version.

Highlights include:

• Temporarily restore matplotlib datetime plotting functionality. This should resolve issues for users who implicitly relied on pandas to plot datetimes with matplotlib. See here.
• Improvements to the Parquet IO functions introduced in 0.21.0. See here.
What’s new in v0.21.1

**Restore Matplotlib datetime converter registration**

pandas implements some matplotlib converters for nicely formatting the axis labels on plots with datetime or Period values. Prior to pandas 0.21.0, these were implicitly registered with matplotlib, as a side effect of `import pandas`.

In pandas 0.21.0, we required users to explicitly register the converter. This caused problems for some users who relied on those converters being present for regular `matplotlib.pyplot` plotting methods, so we’re temporarily reverting that change; pandas 0.21.1 again registers the converters on import, just like before 0.21.0.

We’ve added a new option to control the converters: `pd.options.plotting.matplotlib.register_converters`. By default, they are registered. Toggling this to `False` removes pandas’ formatters and restore any converters we overwrote when registering them (GH18301).

We’re working with the matplotlib developers to make this easier. We’re trying to balance user convenience (automatically registering the converters) with import performance and best practices (importing pandas shouldn’t have the side effect of overwriting any custom converters you’ve already set). In the future we hope to have most of the datetime formatting functionality in matplotlib, with just the pandas-specific converters in pandas. We’ll then gracefully deprecate the automatic registration of converters in favor of users explicitly registering them when they want them.
New features

Improvements to the Parquet IO functionality

- `DataFrame.to_parquet()` will now write non-default indexes when the underlying engine supports it. The indexes will be preserved when reading back in with `read_parquet()` (GH18581).
- `read_parquet()` now allows to specify the columns to read from a parquet file (GH18154)
- `read_parquet()` now allows to specify kwargs which are passed to the respective engine (GH18216)

Other enhancements

- `Timestamp.timestamp()` is now available in Python 2.7. (GH17329)
- `Grouper` and `TimeGrouper` now have a friendly repr output (GH18203).

Deprecations

- `pandas.tseries.register` has been renamed to `pandas.plotting.register_matplotlib_converters()` (GH18301)

Performance improvements

- Improved performance of plotting large series/dataframes (GH18236).

Bug fixes

Conversion

- Bug in `TimedeltaIndex` subtraction could incorrectly overflow when NaT is present (GH17791)
- Bug in `DatetimeIndex` subtracting datetimelike from DatetimeIndex could fail to overflow (GH18020)
- Bug in `IntervalIndex.copy()` when copying and `IntervalIndex` with non-default closed (GH18339)
- Bug in `DataFrame.to_dict()` where columns of datetime that are tz-aware were not converted to required arrays when used with orient='records', raising TypeError (GH18372)
- Bug in `DateTimeIndex` and `date_range()` where mismatching tz-aware start and end timezones would not raise an err if `end.tzinfo` is None (GH18431)
- Bug in `Seriesfillna()` which raised when passed a long integer on Python 2 (GH18159).
Indexing

- Bug in a boolean comparison of a `datetime.datetime` and a `datetime64[ns]` dtype Series (GH17965)
- Bug where a `MultiIndex` with more than a million records was not raising `AttributeError` when trying to access a missing attribute (GH18165)
- Bug in `IntervalIndex` constructor when a list of intervals is passed with non-default `closed` (GH18334)
- Bug in `Index.putmask` when an invalid mask passed (GH18368)
- Bug in masked assignment of a `timedelta64[ns]` dtype Series, incorrectly coerced to float (GH18493)

IO

- Bug in class: `~pandas.io.stata.StataReader` not converting date/time columns with display formatting addressed (GH17990). Previously columns with display formatting were normally left as ordinal numbers and not converted to datetime objects.
- Bug in `read_csv()` when reading a compressed UTF-16 encoded file (GH18071)
- Bug in `read_csv()` for handling null values in index columns when specifying `na_filter=False` (GH5239)
- Bug in `read_csv()` when reading numeric category fields with high cardinality (GH18186)
- Bug in `DataFrame.to_csv()` when the table had `MultiIndex` columns, and a list of strings was passed in for `header` (GH5539)
- Bug in parsing integer datetime-like columns with specified format in `read_sql` (GH17855).
- Bug in `DataFrame.to_msgpack()` when serializing data of the `numpy.bool_` datatype (GH18390)
- Bug in `read_json()` not decoding when reading line delimited JSON from S3 (GH17200)
- Bug in `pandas.io.json.json_normalize()` to avoid modification of `meta` (GH18610)
- Bug in `to_latex()` where repeated `MultiIndex` values were not printed even though a higher level index differed from the previous row (GH14484)
- Bug when reading NaN-only categorical columns in `HDFStore` (GH18413)
- Bug in `DataFrame.to_latex()` with `longtable=True` where a latex multicolumn always spanned over three columns (GH17959)

Plotting

- Bug in `DataFrame.plot()` and `Series.plot()` with `DatetimeIndex` where a figure generated by them is not pickleable in Python 3 (GH18439)
GroupBy/resample/rolling

- Bug in DataFrame.resample(...).apply(...) when there is a callable that returns different columns (GH15169)
- Bug in DataFrame.resample(...) when there is a time change (DST) and resampling frequency is 12h or higher (GH15549)
- Bug in pd.DataFrameGroupBy.count() when counting over a datetimelike column (GH13393)
- Bug in rolling.var where calculation is inaccurate with a zero-valued array (GH18430)

Reshaping

- Error message in pd.merge_asof() for key datatype mismatch now includes datatype of left and right key (GH18068)
- Bug in pd.concat when empty and non-empty DataFrames or Series are concatenated (GH18178 GH18187)
- Bug in DataFrame.filter(...) when unicode is passed as a condition in Python 2 (GH13101)
- Bug when merging empty DataFrames when np.seterr(divide='raise') is set (GH17776)

Numeric

- Bug in pd.Series.rolling.skew() and rolling.kurt() with all equal values has floating issue (GH18044)

Categorical

- Bug in DataFrame.astype() where casting to 'category' on an empty DataFrame causes a segmentation fault (GH18004)
- Error messages in the testing module have been improved when items have different CategoricalDtype (GH18069)
- CategoricalIndex can now correctly take a pd.api.types.CategoricalDtype as its dtype (GH18116)
- Bug in Categorical.unique() returning read-only codes array when all categories were NaN (GH18051)
- Bug in DataFrame.groupby(axis=1) with a CategoricalIndex (GH18432)

String

- Series.str.split() will now propagate NaN values across all expanded columns instead of None (GH18450)

5.8.2 Version 0.21.0 (October 27, 2017)

This is a major release from 0.20.3 and includes a number of API changes, deprecations, new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

Highlights include:

- Integration with Apache Parquet, including a new top-level `read_parquet()` function and `DataFrame.to_parquet()` method, see here.
- New user-facing `pandas.api.types.CategoricalDtype` for specifying categoricals independent of the data, see here.
- The behavior of `sum` and `prod` on all-NaN Series/DataFrames is now consistent and no longer depends on whether bottleneck is installed, and `sum` and `prod` on empty Series now return NaN instead of 0, see here.
- Compatibility fixes for pypy, see here.
- Additions to the `drop`, `reindex` and `rename` API to make them more consistent, see here.
- Addition of the new methods `DataFrame.infer_objects` (see here) and `GroupBy.pipe` (see here).
- Indexing with a list of labels, where one or more of the labels is missing, is deprecated and will raise a `KeyError` in a future version, see here.

Check the API Changes and deprecations before updating.

### What's new in v0.21.0

- **New features**
  - Integration with Apache Parquet file format
  - Method `infer_objects` type conversion
  - Improved warnings when attempting to create columns
- Method `drop` now also accepts index/columns keywords
- Methods `rename`, `reindex` now also accept axis keyword
- `CategoricalDtype` for specifying categoricals
- `GroupBy` objects now have a `pipe` method
- `Categorical.rename_categories` accepts a dict-like
- Other enhancements

- **Backwards incompatible API changes**
  - Dependencies have increased minimum versions
  - `Sum/prod` of all-NaN or empty Series/DataFrames is now consistently `NaN`
  - Indexing with a list with missing labels is deprecated
  - `NA` naming changes
  - Iteration of Series/Index will now return Python scalars
  - Indexing with a `Boolean Index`
  - `PeriodIndex` resampling
  - Improved error handling during item assignment in `pd.eval`
  - `Dtype` conversions
  - `MultiIndex` constructor with a single level
  - `UTC` localization with `Series`
  - Consistency of range functions
  - No automatic `Matplotlib` converters
  - Other API changes

- **Deprecations**
  - `Series.select` and `DataFrame.select`
  - `Series.argmax` and `Series.argmin`

- **Removal of prior version deprecations/changes**

- **Performance improvements**

- **Documentation changes**

- **Bug fixes**
  - Conversion
  - Indexing
  - `IO`
  - Plotting
  - `GroupBy/resample/rolling`
  - `Sparse`
  - `Reshaping`
New features

Integration with Apache Parquet file format

Integration with Apache Parquet, including a new top-level `read_parquet()` and `DataFrame.to_parquet()` method, see here (GH15838, GH17438).

Apache Parquet provides a cross-language, binary file format for reading and writing dataframes efficiently. Parquet is designed to faithfully serialize and de-serialize `DataFrame`s, supporting all of the pandas dtypes, including extension dtypes such as datetime with timezones.

This functionality depends on either the pyarrow or fastparquet library. For more details, see the IO docs on Parquet.

Method `infer_objects` type conversion

The `DataFrame.infer_objects()` and `Series.infer_objects()` methods have been added to perform dtype inference on object columns, replacing some of the functionality of the deprecated `convert_objects` method. See the documentation here for more details. (GH11221)

This method only performs soft conversions on object columns, converting Python objects to native types, but not any coercive conversions. For example:

```python
In [1]: df = pd.DataFrame({'A': [1, 2, 3],
                        'B': np.array([1, 2, 3], dtype='object'),
                        'C': ['1', '2', '3']})

In [2]: df.dtypes
Out[2]:
A    int64
B  object
C  object
Length: 3, dtype: object

In [3]: df.infer_objects().dtypes
Out[3]:
A    int64
B    int64
C  object
Length: 3, dtype: object
```

Note that column 'C' was not converted - only scalar numeric types will be converted to a new type. Other types of conversion should be accomplished using the `to_numeric()` function (or `to_datetime()`, `to_timedelta()`).
Improved warnings when attempting to create columns

New users are often puzzled by the relationship between column operations and attribute access on DataFrame instances (GH7175). One specific instance of this confusion is attempting to create a new column by setting an attribute on the DataFrame:

```
In [1]: df = pd.DataFrame({'one': [1., 2., 3.]})
In [2]: df.two = [4, 5, 6]
```

This does not raise any obvious exceptions, but also does not create a new column:

```
In [3]: df
Out[3]:
    one
   0 1.0
   1 2.0
   2 3.0
```

Setting a list-like data structure into a new attribute now raises a `UserWarning` about the potential for unexpected behavior. See `Attribute Access`.

Method drop now also accepts index/columns keywords

The `drop()` method has gained `index/columns` keywords as an alternative to specifying the `axis`. This is similar to the behavior of `reindex` (GH12392).

For example:

```
In [7]: df = pd.DataFrame(np.arange(8).reshape(2, 4),
                      columns=['A', 'B', 'C', 'D'])
In [8]: df
Out[8]:
      A  B  C  D
   0  0  1  2  3
   1  4  5  6  7
[2 rows x 4 columns]
```
Methods rename, reindex now also accept axis keyword

The `DataFrame.rename()` and `DataFrame.reindex()` methods have gained the `axis` keyword to specify the axis to target with the operation (GH12392).

Here's rename:

```python
In [11]: df = pd.DataFrame({'A': [1, 2, 3], 'B': [4, 5, 6]})
```

```python
In [12]: df.rename(str.lower, axis='columns')
```

```python
Out[12]:
    a b
0 1 4
1 2 5
2 3 6
```

```python
[3 rows x 2 columns]
```

```python
In [13]: df.rename(id, axis='index')
```

```python
Out[13]:
     A  B
94698745933024 1 4
94698745933056 2 5
94698745933088 3 6
```

```python
[3 rows x 2 columns]
```

And reindex:

```python
In [14]: df.reindex(['A', 'B', 'C'], axis='columns')
```

```python
Out[14]:
     A  B  C
0  1  4  NaN
1  2  5  NaN
```

(continues on next page)
The “index, columns” style continues to work as before.

We highly encourage using named arguments to avoid confusion when using either style.

CategoricalDtype for specifying categoricals

pandas.api.types.CategoricalDtype has been added to the public API and expanded to include the categories and ordered attributes. A CategoricalDtype can be used to specify the set of categories and orderedness of an array, independent of the data. This can be useful for example, when converting string data to a Categorical (GH14711, GH15078, GH16015, GH17643):

In [18]: from pandas.api.types import CategoricalDtype

In [19]: s = pd.Series(['a', 'b', 'c', 'a']) # strings

In [20]: dtype = CategoricalDtype(categories=['a', 'b', 'c', 'd'], ordered=True)

In [21]: s.astype(dtype)
Out[21]:
0  a
One place that deserves special mention is in `read_csv()`. Previously, with `dtype={'col': 'category'}`, the returned values and categories would always be strings.

```
In [22]: data = 'A,B
   ...: a,1
   ...: b,2
   ...: c,3'

In [23]: pd.read_csv(StringIO(data), dtype={'B': 'category'}).B.cat.categories
Out[23]: Index(['1', '2', '3'], dtype='object')
```

Notice the “object” dtype.

With a `CategoricalDtype` of all numerics, datetimes, or timedeltas, we can automatically convert to the correct type

```
In [24]: dtype = {'B': CategoricalDtype([1, 2, 3])}

In [25]: pd.read_csv(StringIO(data), dtype=dtype).B.cat.categories
Out[25]: Int64Index([1, 2, 3], dtype='int64')
```

The values have been correctly interpreted as integers.

The `.dtype` property of a `Categorical`, `CategoricalIndex` or a `Series` with categorical type will now return an instance of `CategoricalDtype`. While the repr has changed, `str(CategoricalDtype())` is still the string `'category'`. We’ll take this moment to remind users that the preferred way to detect categorical data is to use `pandas.api.types.is_categorical_dtype()`, and not `str(dtype) == 'category'`.

See the `CategoricalDtype docs` for more.

---

**GroupBy objects now have a pipe method**

GroupBy objects now have a `pipe` method, similar to the one on DataFrame and Series, that allow for functions that take a GroupBy to be composed in a clean, readable syntax. (GH17871)

For a concrete example on combining `.groupby` and `.pipe`, imagine having a DataFrame with columns for stores, products, revenue and sold quantity. We’d like to do a groupwise calculation of prices (i.e. revenue/quantity) per store and per product. We could do this in a multi-step operation, but expressing it in terms of piping can make the code more readable.

First we set the data:

```
In [26]: import numpy as np

In [27]: n = 1000

In [28]: df = pd.DataFrame({'Store': np.random.choice(['Store_1', 'Store_2'], n),
   ....:                 'Product': np.random.choice(['Product_1', 'Product_2', 'Product_3'], n),
   ....:                 'Revenue': (np.random.random(n) * 50 + 10).round(2),
```

(continues on next page)
....:     'Quantity': np.random.randint(1, 10, size=n))

In [29]: df.head(2)
Out[29]:
     Store  Product  Revenue  Quantity
0  Store_2  Product_2     32.09       7
1  Store_1  Product_3     14.20       1
[2 rows x 4 columns]

Now, to find prices per store/product, we can simply do:

In [30]: (df.groupby(['Store', 'Product'])
       ....:     .pipe(lambda grp: grp.Revenue.sum() / grp.Quantity.sum())
       ....:     .unstack().round(2))

Out[30]:
         Product_1  Product_2  Product_3
Store
  Store_1   6.730  6.724      7.139
  Store_2   7.588  6.986      7.229

[2 rows x 3 columns]

See the documentation for more.

**Categorical.rename_categories accepts a dict-like**

`rename_categories()` now accepts a dict-like argument for `new_categories`. The previous categories are looked up in the dictionary’s keys and replaced if found. The behavior of missing and extra keys is the same as in `DataFrame.rename()`.

In [31]: c = pd.Categorical(['a', 'a', 'b'])

In [32]: c.rename_categories({'a': 'eh', 'b': 'bee'})
Out[32]:
['eh', 'eh', 'bee']
Categories (2, object): ['eh', 'bee']

**Warning**: To assist with upgrading pandas, `rename_categories` treats `Series` as list-like. Typically, `Series` are considered to be dict-like (e.g. in `.rename`, `.map`). In a future version of pandas `rename_categories` will change to treat them as dict-like. Follow the warning message’s recommendations for writing future-proof code.

In [33]: c.rename_categories(pd.Series([0, 1], index=['a', 'c']))
FutureWarning: Treating Series 'new_categories' as a list-like and using the values. In a future version, 'rename_categories' will treat Series like a dictionary.
For dict-like, use 'new_categories.to_dict()'
For list-like, use 'new_categories.values'.

Out[33]:
[0, 0, 1]
Categories (2, int64): [0, 1]
Other enhancements

New functions or methods

- *nearest()* is added to support nearest-neighbor upsampling (GH17496).
- *Index* has added support for a *to_frame* method (GH15230).

New keywords

- Added a *skipna* parameter to *infer_dtype()* to support type inference in the presence of missing values (GH17059).
- *Series.to_dict()* and *DataFrame.to_dict()* now support an *into* keyword which allows you to specify the collections.*Mapping* subclass that you would like returned. The default is dict, which is backwards compatible. (GH16122)
- *Series.set_axis()* and *DataFrame.set_axis()* now support the *inplace* parameter. (GH14636)
- *Series.to_pickle()* and *DataFrame.to_pickle()* have gained a *protocol* parameter (GH16252). By default, this parameter is set to *HIGHEST_PROTOCOL*.
- *read_feather()* has gained the *nthreads* parameter for multi-threaded operations (GH16359)
- *DataFrame.clip()* and *Series.clip()* have gained an *inplace* argument. (GH15388)
- *crosstab()* has gained a *margins_name* parameter to define the name of the row / column that will contain the totals when *margins=True*. (GH15972)
- *read_json()* now accepts a *chunksize* parameter that can be used when *lines=True*. If *chunksize* is passed, *read_json* now returns an iterator which reads in *chunksize* lines with each iteration. (GH17048)

Various enhancements

- Improved the import time of pandas by about 2.25x. (GH16764)
- Support for PEP 519 – Adding a file system path protocol on most readers (e.g. *read_csv()*)) and writers (e.g. *DataFrame.to_csv()* (GH13823).
- Added a *__fspath__* method to *pd.HDFStore, pd.ExcelFile, and pd.ExcelWriter* to work properly with the file system path protocol (GH13823).
- The *validate* argument for *merge()* now checks whether a merge is one-to-one, one-to-many, many-to-one, or many-to-many. If a merge is found to not be an example of specified merge type, an exception of type *MergeError* will be raised. For more, see here (GH16270)
- Added support for PEP 518 (*pyproject.toml*) to the build system (GH16745)
- *RangeIndex.append()* now returns a *RangeIndex* object when possible (GH16212)
- *Series.rename_axis()* and *DataFrame.rename_axis()* with *inplace=True* now return None while renaming the axis inplace. (GH15704)
• `api.types.infer_dtype()` now infers decimals. (GH15690)
• `DataFrame.select_dtypes()` now accepts scalar values for include/exclude as well as list-like. (GH16855)
• `date_range()` now accepts ‘YS’ in addition to ‘AS’ as an alias for start of year. (GH9313)
• `date_range()` now accepts ‘Y’ in addition to ‘A’ as an alias for end of year. (GH9313)
• `DataFrame.add_prefix()` and `DataFrame.add_suffix()` now accept strings containing the ‘%’ character. (GH17151)
• Read/write methods that infer compression (`read_csv()`, `read_table()`, `read_pickle()`, and `to_pickle()`) can now infer from path-like objects, such as `pathlib.Path`. (GH17206)
• `read_sas()` now recognizes much more of the most frequently used date (datetime) formats in SAS7BDAT files. (GH15871)
• `DataFrame.items()` and `Series.items()` are now present in both Python 2 and 3 and is lazy in all cases. (GH13918, GH17213)
• `pandas.io.formats.style.Styler.where()` has been implemented as a convenience for `pandas.io.formats.style.Styler.applymap()`. (GH17474)
• `MultiIndex.is_monotonic_decreasing()` has been implemented. Previously returned `False` in all cases. (GH16554)
• `read_excel()` raises `ImportError` with a better message if `xlrd` is not installed. (GH17613)
• `DataFrame.assign()` will preserve the original order of `**kwargs` for Python 3.6+ users instead of sorting the column names. (GH14207)
• `Series.reindex()`, `DataFrame.reindex()`, `Index.get_indexer()` now support list-like argument for tolerance. (GH17367)

Backwards incompatible API changes

Dependencies have increased minimum versions

We have updated our minimum supported versions of dependencies (GH15206, GH15543, GH15214). If installed, we now require:

<table>
<thead>
<tr>
<th>Package</th>
<th>Minimum Version</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Numpy</td>
<td>1.9.0</td>
<td>X</td>
</tr>
<tr>
<td>Matplotlib</td>
<td>1.4.3</td>
<td></td>
</tr>
<tr>
<td>Scipy</td>
<td>0.14.0</td>
<td></td>
</tr>
<tr>
<td>Bottleneck</td>
<td>1.0.0</td>
<td></td>
</tr>
</tbody>
</table>

Additionally, support has been dropped for Python 3.4 (GH15251).
**Sum/prod of all-NaN or empty Series/DataFrames is now consistently NaN**

**Note:** The changes described here have been partially reverted. See the [v0.22.0 Whatsnew](https://pandas.pydata.org/docs/whatsnew/) for more.

The behavior of `sum` and `prod` on all-NaN Series/DataFrames no longer depends on whether `bottleneck` is installed, and return value of `sum` and `prod` on an empty Series has changed (GH9422, GH15507).

Calling `sum` or `prod` on an empty or all-NaN Series, or columns of a DataFrame, will result in NaN. See the [docs](https://pandas.pydata.org/docs/user_guide/).

```
In [33]: s = pd.Series([np.nan])
```

Previously WITHOUT bottleneck installed:

```
In [2]: s.sum()
Out[2]: np.nan
```

Previously WITH bottleneck:

```
In [2]: s.sum()
Out[2]: 0.0
```

New behavior, without regard to the bottleneck installation:

```
In [34]: s.sum()
Out[34]: 0.0
```

Note that this also changes the sum of an empty Series. Previously this always returned 0 regardless of a bottleneck installation:

```
In [1]: pd.Series([]).sum()
Out[1]: 0
```

but for consistency with the all-NaN case, this was changed to return NaN as well:

```
In [35]: pd.Series([]).sum()
Out[35]: 0.0
```

**Indexing with a list with missing labels is deprecated**

Previously, selecting with a list of labels, where one or more labels were missing would always succeed, returning NaN for missing labels. This will now show a `FutureWarning`. In the future this will raise a `KeyError` (GH15747). This warning will trigger on a DataFrame or a Series for using `.loc[]` or `[[ ] ]` when passing a list-of-labels with at least 1 missing label. See the [deprecation docs](https://pandas.pydata.org/docs/user_guide/).

```
In [36]: s = pd.Series([1, 2, 3])

In [37]: s
Out[37]:
0   1
1   2
2   3
Length: 3, dtype: int64
```
Previous behavior

```python
In [4]: s.loc[[1, 2, 3]]
Out[4]:
1  2.0
2  3.0
3  NaN
dtype: float64
```

Current behavior

```python
In [4]: s.loc[[1, 2, 3]]
```

Passing list-likes to .loc or [] with any missing label will raise
KeyError in the future, you can use .reindex() as an alternative.

```python
Out[4]:
1  2.0
2  3.0
3  NaN
dtype: float64
```

The idiomatic way to achieve selecting potentially not-found elements is via .reindex()

```python
In [38]: s.reindex([1, 2, 3])
Out[38]:
1  2.0
2  3.0
3  NaN
Length: 3, dtype: float64
```

Selection with all keys found is unchanged.

```python
In [39]: s.loc[[1, 2]]
Out[39]:
1   2
2   3
Length: 2, dtype: int64
```

**NA naming changes**

In order to promote more consistency among the pandas API, we have added additional top-level functions `isna()` and `notna()` that are aliases for `isnull()` and `notnull()`. The naming scheme is now more consistent with methods like `.dropna()` and `.fillna()`. Furthermore in all cases where `.isnull()` and `.notnull()` methods are defined, these have additional methods named `.isna()` and `.notna()`, these are included for classes Categorical, Index, Series, and DataFrame. (GH1500).  

The configuration option `pd.options.mode.use_inf_as_null` is deprecated, and `pd.options.mode.use_inf_as_na` is added as a replacement.
Iteration of Series/Index will now return Python scalars

Previously, when using certain iteration methods for a Series with dtype int or float, you would receive a numpy scalar, e.g. a np.int64, rather than a Python int. Issue (GH10904) corrected this for Series.tolist() and list(Series). This change makes all iteration methods consistent, in particular, for __iter__() and .map(); note that this only affects int/float dtypes. (GH13236, GH13258, GH14216).

```python
In [40]: s = pd.Series([1, 2, 3])
In [41]: s
Out[41]:
0    1
1    2
2    3
Length: 3, dtype: int64
```

Previously:

```python
In [2]: type(list(s)[0])
Out[2]: numpy.int64
```

New behavior:

```python
In [42]: type(list(s)[0])
Out[42]: int
```

Furthermore this will now correctly box the results of iteration for DataFrame.to_dict() as well.

```python
In [43]: d = {'a': [1], 'b': ['b']}
In [44]: df = pd.DataFrame(d)
```

Previously:

```python
In [8]: type(df.to_dict()['a'][0])
Out[8]: numpy.int64
```

New behavior:

```python
In [45]: type(df.to_dict()['a'][0])
Out[45]: int
```

Indexing with a Boolean Index

Previously when passing a boolean Index to .loc, if the index of the Series/DataFrame had boolean labels, you would get a label based selection, potentially duplicating result labels, rather than a boolean indexing selection (where True selects elements), this was inconsistent how a boolean numpy array indexed. The new behavior is to act like a boolean numpy array indexer. (GH17738)

Previous behavior:

```python
In [46]: s = pd.Series([1, 2, 3], index=[False, True, False])
```
In [47]: s
Out[47]:
False  1
True   2
False  3
Length: 3, dtype: int64

In [59]: s.loc[pd.Index([True, False, True])]
Out[59]:
True   2
False  1
False  3
True   2
dtype: int64

Current behavior

In [48]: s.loc[pd.Index([True, False, True])]
Out[48]:
False  1
False  3
Length: 2, dtype: int64

Furthermore, previously if you had an index that was non-numeric (e.g. strings), then a boolean Index would raise a KeyError. This will now be treated as a boolean indexer.

Previously behavior:

In [49]: s = pd.Series([1, 2, 3], index=['a', 'b', 'c'])

In [50]: s
Out[50]:
a    1
b    2
c    3
Length: 3, dtype: int64

In [39]: s.loc[pd.Index([True, False, True])]
KeyError: "None of [Index([True, False, True], dtype='object')] are in the [index]"

Current behavior

In [51]: s.loc[pd.Index([True, False, True])]
Out[51]:
a    1
c    3
Length: 2, dtype: int64
### PeriodIndex resampling

In previous versions of pandas, resampling a Series/DataFrame indexed by a PeriodIndex returned a DatetimeIndex in some cases (GH12884). Resampling to a multiplied frequency now returns a PeriodIndex (GH15944). As a minor enhancement, resampling a PeriodIndex can now handle NaT values (GH13224).

**Previous behavior:**

```python
In [1]: pi = pd.period_range('2017-01', periods=12, freq='M')
In [2]: s = pd.Series(np.arange(12), index=pi)
In [3]: resampled = s.resample('2Q').mean()
In [4]: resampled
Out[4]:
2017-03-31    1.0
2017-09-30    5.5
2018-03-31   10.0
Freq: 2Q-DEC, dtype: float64
In [5]: resampled.index
Out[5]: DatetimeIndex(['2017-03-31', '2017-09-30', '2018-03-31'], dtype='datetime64[ns]', freq='2Q-DEC')
```

**New behavior:**

```python
In [52]: pi = pd.period_range('2017-01', periods=12, freq='M')
In [53]: s = pd.Series(np.arange(12), index=pi)
In [54]: resampled = s.resample('2Q').mean()
In [55]: resampled
Out[55]:
2017Q1   2.5
2017Q3   8.5
Freq: 2Q-DEC, Length: 2, dtype: float64
In [56]: resampled.index
Out[56]: PeriodIndex(['2017Q1', '2017Q3'], dtype='period[2Q-DEC]', freq='2Q-DEC')
```

Upsampling and calling `.ohlc()` previously returned a Series, basically identical to calling `.asfreq()`. OHLC upsampling now returns a DataFrame with columns `open`, `high`, `low` and `close` (GH13083). This is consistent with downsampling and DatetimeIndex behavior.

**Previous behavior:**

```python
In [1]: pi = pd.period_range(start='2000-01-01', freq='D', periods=10)
In [2]: s = pd.Series(np.arange(10), index=pi)
In [3]: s.resample('H').ohlc()
Out[3]:
```

(continues on next page)
In [4]: s.resample('M').ohlc()
Out[4]:
          open  high  low  close
2000-01 0 9 0 9

New behavior:

In [57]: pi = pd.period_range(start='2000-01-01', freq='D', periods=10)
In [58]: s = pd.Series(np.arange(10), index=pi)
In [59]: s.resample('H').ohlc()
Out[59]:
          open  high  low  close
2000-01-01 00:00 0.0 0.0 0.0 0.0
2000-01-01 01:00 NaN NaN NaN NaN
2000-01-01 02:00 NaN NaN NaN NaN
2000-01-01 03:00 NaN NaN NaN NaN
2000-01-01 04:00 NaN NaN NaN NaN
... ... ... ... ...
2000-01-10 19:00 NaN NaN NaN NaN
2000-01-10 20:00 NaN NaN NaN NaN
2000-01-10 21:00 NaN NaN NaN NaN
2000-01-10 22:00 NaN NaN NaN NaN
2000-01-10 23:00 NaN NaN NaN NaN
[240 rows x 4 columns]
In [60]: s.resample('M').ohlc()
Out[60]:
          open  high  low  close
2000-01 0 9 0 9
[1 rows x 4 columns]

Improved error handling during item assignment in pd.eval

eval() will now raise a ValueError when item assignment malfunctions, or inplace operations are specified, but there is no item assignment in the expression (GH16732)

In [61]: arr = np.array([1, 2, 3])

Previously, if you attempted the following expression, you would get a not very helpful error message:

In [3]: pd.eval("a = 1 + 2", target=arr, inplace=True)...

(continues on next page)
IndexError: only integers, slices (`:`), ellipsis (`...`), numpy.newaxis (`None`) and integer or boolean arrays are valid indices

This is a very long way of saying numpy arrays don’t support string-item indexing. With this change, the error message is now this:

```python
In [3]: pd.eval("a = 1 + 2", target=arr, inplace=True)...
ValueError: Cannot assign expression output to target
```

It also used to be possible to evaluate expressions inplace, even if there was no item assignment:

```python
In [4]: pd.eval("1 + 2", target=arr, inplace=True)
Out[4]: 3
```

However, this input does not make much sense because the output is not being assigned to the target. Now, a `ValueError` will be raised when such an input is passed in:

```python
In [4]: pd.eval("1 + 2", target=arr, inplace=True)...
ValueError: Cannot operate inplace if there is no assignment
```

### Dtype conversions

Previously assignments, `.where() and `.fillna()` with a bool assignment, would coerce to same the type (e.g. int / float), or raise for datetimelikes. These will now preserve the bools with `object` dtypes. (GH16821).

```python
In [62]: s = pd.Series([1, 2, 3])
```

```python
In [5]: s[1] = True
In [6]: s
Out[6]:
   0  1
   1  1
   2  3
dtype: int64
```

New behavior

```python
In [63]: s[1] = True
In [64]: s
Out[64]:
   0  1
   1 True
   2  3
Length: 3, dtype: object
```

Previously, as assignment to a datetimelike with a non-datetimelike would coerce the non-datet ime-like item being assigned (GH14145).
In [65]: s = pd.Series([pd.Timestamp('2011-01-01'), pd.Timestamp('2012-01-01')])

In [1]: s[1] = 1

In [2]: s
Out[2]:
0  2011-01-01 00:00:00.000000000
1  2012-01-01 00:00:00.000000001
dtype: datetime64[ns]

These now coerce to object dtype.

In [66]: s[1] = 1

In [67]: s
Out[67]:
0  2011-01-01 00:00:00
1  1
Length: 2, dtype: object

• Inconsistent behavior in .where() with datetimelikes which would raise rather than coerce to object (GH16402)
• Bug in assignment against int64 data with np.ndarray with float64 dtype may keep int64 dtype (GH14001)

**MultiIndex constructor with a single level**

The `MultiIndex` constructors no longer squeezes a `MultiIndex` with all length-one levels down to a regular `Index`. This affects all the `MultiIndex` constructors. (GH17178)

Previous behavior:

In [2]: pd.MultiIndex.from_tuples([('a',), ('b',)])
Out[2]: Index(['a', 'b'], dtype='object')

Length 1 levels are no longer special-cased. They behave exactly as if you had length 2+ levels, so a `MultiIndex` is always returned from all of the `MultiIndex` constructors:

In [68]: pd.MultiIndex.from_tuples([('a',), ('b',)])
Out[68]: MultiIndex([('a',), ('b',)])
UTC localization with Series

Previously, `to_datetime()` did not localize datetime Series data when `utc=True` was passed. Now, `to_datetime()` will correctly localize Series with a `datetime64[ns, UTC]` dtype to be consistent with how list-like and Index data are handled. (GH6415).

Previous behavior

```
In [69]: s = pd.Series(['20130101 00:00:00'] * 3)
```

```
In [12]: pd.to_datetime(s, utc=True)
Out[12]:
0    2013-01-01
1    2013-01-01
2    2013-01-01
dtype: datetime64[ns]
```

New behavior

```
In [70]: pd.to_datetime(s, utc=True)
Out[70]:
0    2013-01-01 00:00:00+00:00
1    2013-01-01 00:00:00+00:00
2    2013-01-01 00:00:00+00:00
Length: 3, dtype: datetime64[ns, UTC]
```

Additionally, DataFrames with datetime columns that were parsed by `read_sql_table()` and `read_sql_query()` will also be localized to UTC only if the original SQL columns were timezone aware datetime columns.

Consistency of range functions

In previous versions, there were some inconsistencies between the various range functions: `date_range()`, `bdate_range()`, `period_range()`, `timedelta_range()`, and `interval_range()`. (GH17471).

One of the inconsistent behaviors occurred when the `start`, `end` and `period` parameters were all specified, potentially leading to ambiguous ranges. When all three parameters were passed, `interval_range` ignored the `period` parameter, `period_range` ignored the `end` parameter, and the other range functions raised. To promote consistency among the range functions, and avoid potentially ambiguous ranges, `interval_range` and `period_range` will now raise when all three parameters are passed.

Previous behavior:

```
In [2]: pd.interval_range(start=0, end=4, periods=6)
Out[2]:
IntervalIndex([(0, 1], (1, 2], (2, 3]], closed='right',
              dtype='interval[int64]')
```

```
In [3]: pd.period_range(start='2017Q1', end='2017Q4', periods=6, freq='Q')
Out[3]: PeriodIndex(['2017Q1', '2017Q2', '2017Q3', '2017Q4', '2018Q1', '2018Q2'],
                 dtype='period[Q-DEC]', freq='Q-DEC')
```

New behavior:
In 

```
In [2]: pd.interval_range(start=0, end=4, periods=6)
---------------------------------------------------------------------------
ValueError: Of the three parameters: start, end, and periods, exactly two must be.specified

In [3]: pd.period_range(start='2017Q1', end='2017Q4', periods=6, freq='Q')
---------------------------------------------------------------------------
ValueError: Of the three parameters: start, end, and periods, exactly two must be.specified
```

Additionally, the endpoint parameter `end` was not included in the intervals produced by `interval_range`. However, all other range functions include `end` in their output. To promote consistency among the range functions, `interval_range` will now include `end` as the right endpoint of the final interval, except if `freq` is specified in a way which skips end.

Previous behavior:

```
In [4]: pd.interval_range(start=0, end=4)
Out[4]:
IntervalIndex([(0, 1], (1, 2], (2, 3]],
closed='right',
dtype='interval[int64]')
```

New behavior:

```
In [71]: pd.interval_range(start=0, end=4)
Out[71]:
IntervalIndex([(0, 1], (1, 2], (2, 3], (3, 4]],[
closed='right',
dtype='interval[int64]')
```

### No automatic Matplotlib converters

`pandas` no longer registers our `date`, `time`, `datetime`, `datetime64`, and `Period` converters with `matplotlib` when `pandas` is imported. `Matplotlib` plot methods (`plt.plot`, `ax.plot`, `...`), will not nicely format the x-axis for `DatetimeIndex` or `PeriodIndex` values. You must explicitly register these methods:

`pandas` built-in `Series.plot` and `DataFrame.plot` will register these converters on first-use (GH17710).

**Note:** This change has been temporarily reverted in `pandas` 0.21.1, for more details see [here](#).

### Other API changes

- The Categorical constructor no longer accepts a scalar for the `categories` keyword. (GH16022)
- Accessing a non-existent attribute on a closed `HDFStore` will now raise an `AttributeError` rather than a `ClosedFileError` (GH16301)
- `read_csv()` now issues a `UserWarning` if the `names` parameter contains duplicates (GH17095)
- `read_csv()` now treats 'null' and 'n/a' strings as missing values by default (GH16471, GH16078)
• pandas.HDFStore’s string representation is now faster and less detailed. For the previous behavior, use pandas.HDFStore.info(). (GH16503)

• Compression defaults in HDF stores now follow pytables standards. Default is no compression and if complib is missing and complevel > 0 zlib is used (GH15943)

• Index.get_indexer_non_unique() now returns a ndarray indexer rather than an Index; this is consistent with Index.get_indexer() (GH16819)

• Removed the @slow decorator from pandas._testing, which caused issues for some downstream packages’ test suites. Use @pytest.mark.slow instead, which achieves the same thing (GH16850)

• Moved definition of MergeError to the pandas.errors module.

• The signature of Series.set_axis() and DataFrame.set_axis() has been changed from set_axis(axis, labels) to set_axis(labels, axis=0), for consistency with the rest of the API. The old signature is deprecated and will show a FutureWarning (GH14636)

• Series.argmin() and Series.argmax() will now raise a TypeError when used with object dtypes, instead of a ValueError (GH13595)

• Period is now immutable, and will now raise an AttributeError when a user tries to assign a new value to the ordinal or freq attributes (GH17116).

• to_datetime() when passed a tz-aware origin= kwarg will now raise a more informative ValueError rather than a TypeError (GH16842)

• to_datetime() now raises a ValueError when format includes %W or %U without also including day of the week and calendar year (GH16774)

• Renamed non-functional index to index_col in read_stata() to improve API consistency (GH16342)

• Bug in DataFrame.drop() caused boolean labels False and True to be treated as labels 0 and 1 respectively when dropping indices from a numeric index. This will now raise a ValueError (GH16877)

• RestrictedDateOffset keyword arguments. Previously, DateOffset subclasses allowed arbitrary keyword arguments which could lead to unexpected behavior. Now, only valid arguments will be accepted. (GH17176).

**Deprecations**

• DataFrame.from_csv() and Series.from_csv() have been deprecated in favor of read_csv() (GH4191)

• read_excel() has deprecated sheetname in favor of sheet_name for consistency with .to_excel() (GH10559).

• read_excel() has deprecated parse_cols in favor of usecols for consistency with read_csv() (GH4988)

• read_csv() has deprecated the tupleize_cols argument. Column tuples will always be converted to a MultiIndex (GH17060)

• DataFrame.to_csv() has deprecated the tupleize_cols argument. MultiIndex columns will be always written as rows in the CSV file (GH17060)

• The convert parameter has been deprecated in the .take() method, as it was not being respected (GH16948)

• pd.options.html.border has been deprecated in favor of pd.options.display.html.border (GH15793).

• SeriesGroupBy.nth() has deprecated True in favor of 'all' for its kwarg dropna (GH11038).

• DataFrame.as_blocks() is deprecated, as this is exposing the internal implementation (GH17302)

• pd.TimeGrouper is deprecated in favor of pandas.Grouper (GH16747)
• `cdate_range` has been deprecated in favor of `bdate_range()`, which has gained weekmask and holidays parameters for building custom frequency date ranges. See the documentation for more details (GH17596)

• passing categories or ordered kwarg to `Series.astype()` is deprecated, in favor of passing a `CategoricalDtype` (GH17636)

• `.get_value` and `.set_value` on Series, DataFrame, Panel, SparseSeries, and SparseDataFrame are deprecated in favor of using `.iat[]` or `.at[]` accessors (GH15269)

• Passing a non-existent column in `.to_excel(..., columns=)` is deprecated and will raise a `KeyError` in the future (GH17295)

• `raise_on_error` parameter to `Series.where()`, `Series.mask()`, `DataFrame.where()`, `DataFrame.mask()` is deprecated, in favor of `errors=` (GH14968)

• Using `DataFrame.rename_axis()` and `Series.rename_axis()` to alter index or column labels is now deprecated in favor of using `.rename`. `rename_axis` may still be used to alter the name of the index or columns (GH17833).

• `reindex_axis()` has been deprecated in favor of `reindex()`. See here for more (GH17833).

### Series.select and DataFrame.select

The `Series.select()` and `DataFrame.select()` methods are deprecated in favor of using `df.loc[labels.map(crit)]` (GH12401)

```python
In [72]: df = pd.DataFrame({'A': [1, 2, 3], 'index': ['foo', 'bar', 'baz']})
```

```python
In [3]: df.select(lambda x: x in ['bar', 'baz'])
```

```
FutureWarning: select is deprecated and will be removed in a future release. You can use_.loc[crit] as a replacement
```

```python
Out[3]:
   A
bar 2
baz 3
```

```python
In [73]: df.loc[df.index.map(lambda x: x in ['bar', 'baz'])]
```

```
Out[73]:
   A
bar 2
baz 3
```

```
[2 rows x 1 columns]
```

### Series.argmax and Series.argmin

The behavior of `Series.argmax()` and `Series.argmin()` have been deprecated in favor of `Series.idxmax()` and `Series.idxmin()`, respectively (GH16830).

For compatibility with NumPy arrays, `pd.Series` implements `argmax` and `argmin`. Since pandas 0.13.0, `argmax` has been an alias for `pandas.Series.idxmax()`, and `argmin` has been an alias for `pandas.Series.idxmin()`. They return the `label` of the maximum or minimum, rather than the `position`.

We've deprecated the current behavior of `Series.argmax` and `Series.argmin`. Using either of these will emit a `FutureWarning`. Use `Series.idxmax()` if you want the label of the maximum. Use `Series.values.argmax()` if
you want the position of the maximum. Likewise for the minimum. In a future release Series.argmax and Series.argmin will return the position of the maximum or minimum.

Removal of prior version deprecations/changes

- `read_excel()` has dropped the `has_index_names` parameter (GH10967)
- The `pd.options.display.height` configuration has been dropped (GH3663)
- The `pd.options.display.line_width` configuration has been dropped (GH2881)
- The `pd.options.display.mpl_style` configuration has been dropped (GH12190)
- Index has dropped the `.sym_diff()` method in favor of `.symmetric_difference()` (GH12591)
- `Categorical` has dropped the `.order()` and `.sort()` methods in favor of `.sort_values()` (GH12882)
- `eval()` and `DataFrame.eval()` have changed the default of `inplace` from `None` to `False` (GH11149)
- The function `get_offset_name` has been dropped in favor of the `.freqstr` attribute for an offset (GH11834)
- `pandas` no longer tests for compatibility with hdf5-files created with `pandas < 0.11` (GH17404).

Performance improvements

- Improved performance of instantiating `SparseDataFrame` (GH16773)
- `Series.dt` no longer performs frequency inference, yielding a large speedup when accessing the attribute (GH17210)
- Improved performance of `set_categories()` by not materializing the values (GH17508)
- `Timestamp.microsecond` no longer re-computes on attribute access (GH17331)
- Improved performance of the `CategoricalIndex` for data that is already categorical dtype (GH17513)
- Improved performance of `RangeIndex.min()` and `RangeIndex.max()` by using `RangeIndex` properties to perform the computations (GH17607)

Documentation changes

- Several `NaT` method docstrings (e.g. `NaT.ctime()`) were incorrect (GH17327)
- The documentation has had references to versions < v0.17 removed and cleaned up (GH17442, GH17442, GH17404 & GH17504)

Bug fixes

Conversion

- Bug in assignment against datetime-like data with `int` may incorrectly convert to datetime-like (GH14145)
- Bug in assignment against `int64` data with `np.ndarray` with `float64` dtype may keep `int64` dtype (GH14001)
- Fixed the return type of `IntervalIndex.is_non_overlapping_monotonic` to be a Python bool for consistency with similar attributes/methods. Previously returned a `numpy.bool_` (GH17237)
- Bug in `IntervalIndex.is_non_overlapping_monotonic` when intervals are closed on both sides and overlap at a point (GH16560)
- Bug in `Series.fillna()` returns frame when `inplace=True` and `value` is dict (GH16156)
- Bug in `Timestamp.weekday_name` returning a UTC-based weekday name when localized to a timezone (GH17354)
- Bug in `Timestamp.replace` when replacing tzinfo around DST changes (GH15683)
- Bug in `Timedelta` construction and arithmetic that would not propagate the `Overflow` exception (GH17367)
- Bug in `astype()` converting to object dtype when passed extension type classes (`DatetimeTZDtype`, `CategoricalDtype`) rather than instances. Now a `TypeError` is raised when a class is passed (GH17780).
- Bug in `to_numeric()` in which elements were not always being coerced to numeric when `errors='coerce'` (GH17007, GH17125)
- Bug in `DataFrame` and `Series` constructors where `range` objects are converted to `int32` dtype on Windows instead of `int64` (GH16804)

**Indexing**

- When called with a null slice (e.g. `df.iloc[:]`), the `.iloc` and `.loc` indexers return a shallow copy of the original object. Previously they returned the original object. (GH13873).
- When called on an unsorted `MultiIndex`, the loc indexer now will raise `UnsortedIndexError` only if proper slicing is used on non-sorted levels (GH16734).
- Fixes regression in 0.20.3 when indexing with a string on a `TimedeltaIndex` (GH16896).
- Fixed `TimedeltaIndex.get_loc()` handling of `np.timedelta64` inputs (GH16909).
- Fix `MultiIndex.sort_index()` ordering when `ascending` argument is a list, but not all levels are specified, or are in a different order (GH16934).
- Fixes bug where indexing with `np.inf` caused an `OverflowError` to be raised (GH16957)
- Bug in reindexing on an empty `CategoricalIndex` (GH16770)
- Fixes `DataFrame.loc` for setting with alignment and tz-aware `DatetimeIndex` (GH16889)
- Avoids `IndexError` when passing an Index or Series to `.iloc` with older numpy (GH17193)
- Allow unicode empty strings as placeholders in multilevel columns in Python 2 (GH17099)
- Bug in `.iloc` when used with inplace addition or assignment and an int indexer on a `MultiIndex` causing the wrong indexes to be read from and written to (GH17148)
- Bug in `.isin()` in which checking membership in empty `Series` objects raised an error (GH16991)
- Bug in `CategoricalIndex` reindexing in which specified indices containing duplicates were not being respected (GH17323)
- Bug in intersection of `RangeIndex` with negative step (GH17296)
- Bug in `IntervalIndex` where performing a scalar lookup fails for included right endpoints of non-overlapping monotonic decreasing indexes (GH16417, GH17271)
- Bug in `DataFrame.first_valid_index()` and `DataFrame.last_valid_index()` when no valid entry (GH17400)
- Bug in `Series.rename()` when called with a callable, incorrectly alters the name of the `Series`, rather than the name of the `Index`. (GH17407)
- Bug in `String.str_get()` raises `IndexError` instead of inserting NaNs when using a negative index. (GH17704)
IO

- Bug in `read_hdf()` when reading a timezone aware index from fixed format HDFStore (GH17618)
- Bug in `read_csv()` in which columns were not being thoroughly de-duplicated (GH17060)
- Bug in `read_csv()` in which specified column names were not being thoroughly de-duplicated (GH17095)
- Bug in `read_csv()` in which non integer values for the header argument generated an unhelpful / unrelated error message (GH16338)
- Bug in `read_csv()` in which memory management issues in exception handling, under certain conditions, would cause the interpreter to segfault (GH14696, GH16798).
- Bug in `read_csv()` when called with `low_memory=False` in which a CSV with at least one column > 2GB in size would incorrectly raise a `MemoryError` (GH16798).
- Bug in `read_csv()` when called with a single-element list `header` would return a DataFrame of all NaN values (GH7757)
- Bug in `DataFrame.to_csv()` defaulting to `ascii` encoding in Python 3, instead of `utf-8` (GH17097)
- Bug in `read_stata()` where value labels could not be read when using an iterator (GH16923)
- Bug in `read_stata()` where the index was not set (GH16342)
- Bug in `read_html()` where import check fails when run in multiple threads (GH16928)
- Bug in `read_csv()` where automatic delimiter detection caused a `TypeError` to be thrown when a bad line was encountered rather than the correct error message (GH13374)
- Bug in `DataFrame.to_html()` with `notebook=True` where DataFrames with named indices or non-MultiIndex indices had undesired horizontal or vertical alignment for column or row labels, respectively (GH16792)
- Bug in `DataFrame.to_html()` in which there was no validation of the `justify` parameter (GH17527)
- Bug in `HDFStore.select()` when reading a contiguous mixed-data table featuring VLArray (GH17021)
- Bug in `to_json()` where several conditions (including objects with unprintable symbols, objects with deep recursion, overlapped labels) caused segfaults instead of raising the appropriate exception (GH14256)

Plotting

- Bug in plotting methods using `secondary_y` and `fontsize` not setting secondary axis font size (GH12565)
- Bug when plotting `timedelta` and `datetime` dtypes on y-axis (GH16953)
- Line plots no longer assume monotonic x data when calculating xlimits, they show the entire lines now even for unsorted x data. (GH11310, GH11471)
- With matplotlib 2.0.0 and above, calculation of x limits for line plots is left to matplotlib, so that its new default settings are applied. (GH15495)
- Bug in `Series.plot.bar` or `DataFrame.plot.bar` with `y` not respecting user-passed color (GH16822)
- Bug causing `plotting.parallel_coordinates` to reset the random seed when using random colors (GH17525)
GroupBy/resample/rolling

- Bug in `DataFrame.resample(...)`.size() where an empty DataFrame did not return a Series (GH14962)
- Bug in `infer_freq()` causing indices with 2-day gaps during the working week to be wrongly inferred as business daily (GH16624)
- Bug in `.rolling(...)`.quantile() which incorrectly used different defaults than `Series.quantile()` and `DataFrame.quantile()` (GH9413, GH16211)
- Bug in groupby.transform() that would coerce boolean dtypes back to float (GH16875)
- Bug in `Series.resample(...).apply()` where an empty Series modified the source index and did not return the name of a Series (GH14313)
- Bug in `.rolling(...).apply(...)` with a DataFrame with a DatetimeIndex, a window of a timedelta-convertible and min_periods >= 1 (GH15305)
- Bug in `DataFrame.groupby` where index and column keys were not recognized correctly when the number of keys equaled the number of elements on the groupby axis (GH16859)
- Bug in `groupby.nunique()` with TimeGrouper which cannot handle NaT correctly (GH17575)
- Bug in `DataFrame.groupby` where a single level selection from a MultiIndex unexpectedly sorts (GH17537)
- Bug in `DataFrame.groupby` where spurious warning is raised when Grouper object is used to override ambiguous column name (GH17383)
- Bug in TimeGrouper differs when passes as a list and as a scalar (GH17530)

Sparse

- Bug in SparseSeries raises AttributeError when a dictionary is passed in as data (GH16905)
- Bug in SparseDataFrame.fillna() not filling all NaNs when frame was instantiated from SciPy sparse matrix (GH16112)
- Bug in SparseSeries.unstack() and SparseDataFrame.stack() (GH16614, GH15045)
- Bug in make_sparse() treating two numeric/boolean data, which have same bits, as same when array dtype is object (GH17574)
- SparseArray.all() and SparseArray.any() are now implemented to handle SparseArray, these were used but not implemented (GH17570)

Reshaping

- Joining/Merging with a non unique PeriodIndex raised a TypeError (GH16871)
- Bug in crosstab() where non-aligned series of integers were casted to float (GH17005)
- Bug in merging with categorical dtypes with datetimelikes incorrectly raised a TypeError (GH16900)
- Bug when using isin() on a large object series and large comparison array (GH16012)
- Fixes regression from 0.20, `Series.aggregate()` and `DataFrame.aggregate()` allow dictionaries as return values again (GH16741)
- Fixes dtype of result with integer dtype input, from `pivot_table()` when called with margins=True (GH17013)
- Bug in crosstab() where passing two Series with the same name raised a KeyError (GH13279)
• `Series.argmin()`, `Series.argmax()`, and their counterparts on DataFrame and groupby objects work correctly with floating point data that contains infinite values (GH13595).

• Bug in `unique()` where checking a tuple of strings raised a `TypeError` (GH17108)

• Bug in `concat()` where order of result index was unpredictable if it contained non-comparable elements (GH17344)

• Fixes regression when sorting by multiple columns on a `datetime64` dtype `Series` with `NaT` values (GH16836)

• Bug in `pivot_table()` where the result’s columns did not preserve the categorical dtype of columns when `dropna` was `False` (GH17842)

• Bug in `DataFrame.drop_duplicates` where dropping with non-unique column names raised a `ValueError` (GH17836)

• Bug in `unstack()` which, when called on a list of levels, would discard the `fillna` argument (GH13971)

• Bug in the alignment of `range` objects and other list-likes with `DataFrame` leading to operations being performed row-wise instead of column-wise (GH17901)

**Numeric**

• Bug in `.clip()` with `axis=1` and a list-like for `threshold` is passed; previously this raised `ValueError` (GH15390)

  `Series.clip()` and `DataFrame.clip()` now treat NA values for upper and lower arguments as `None` instead of raising `ValueError` (GH17276).

**Categorical**

• Bug in `Series.isin()` when called with a categorical (GH16639)

• Bug in the categorical constructor with empty values and categories causing the `.categories` to be an empty `Float64Index` rather than an empty `Index` with object dtype (GH17248)

• Bug in categorical operations with `Series.cat` not preserving the original Series’ name (GH17509)

• Bug in `DataFrame.merge()` failing for categorical columns with boolean/int data types (GH17187)

• Bug in constructing a Categorical/CategoricalDtype when the specified categories are of categorical type (GH17884).

**PyPy**

• Compatibility with PyPy in `read_csv()` with `usecols=\[<unsorted ints>\]` and `read_json()` (GH17351)

• Split tests into cases for CPython and PyPy where needed, which highlights the fragility of index matching with `float('nan'), np.nan` and `NAT` (GH17351)

• Fix `DataFrame.memory_usage()` to support PyPy. Objects on PyPy do not have a fixed size, so an approximation is used instead (GH17228)
Other

- Bug where some inplace operators were not being wrapped and produced a copy when invoked (GH12962)
- Bug in `eval()` where the `inplace` parameter was being incorrectly handled (GH16732)

5.9 Version 0.20

5.9.1 Version 0.20.3 (July 7, 2017)

This is a minor bug-fix release in the 0.20.x series and includes some small regression fixes and bug fixes. We recommend that all users upgrade to this version.

What's new in v0.20.3

- **Bug fixes**
  - Conversion
  - Indexing
  - IO
  - Plotting
  - Reshaping
  - Categorical
- **Contributors**

**Bug fixes**

- Fixed a bug in failing to compute rolling computations of a column-MultiIndexed DataFrame (GH16789, GH16825)
- Fixed a pytest marker failing downstream packages' tests suites (GH16680)

**Conversion**

- Bug in pickle compat prior to the v0.20.x series, when UTC is a timezone in a Series/DataFrame/Index (GH16608)
- Bug in Series construction when passing a Series with dtype='category' (GH16524).
- Bug in DataFrame.astype() when passing a Series as the dtype kwarg. (GH16717).

**Indexing**

- Bug in Float64Index causing an empty array instead of None to be returned from .get(np.nan) on a Series whose index did not contain any NaNs (GH8569)
- Bug in MultiIndex.isin causing an error when passing an empty iterable (GH16777)
- Fixed a bug in a slicing DataFrame/Series that have a TimedeltaIndex (GH16637)
IO

- Bug in `read_csv()` in which files weren’t opened as binary files by the C engine on Windows, causing EOF characters mid-field, which would fail (GH16039, GH16559, GH16675)
- Bug in `read_hdf()` in which reading a `Series` saved to an HDF file in ‘fixed’ format fails when an explicit `mode='r'` argument is supplied (GH16583)
- Bug in `DataFrame.to_latex()` where `bold_rows` was wrongly specified to be `True` by default, whereas in reality row labels remained non-bold whatever parameter provided. (GH16707)
- Fixed an issue with `DataFrame.style()` where generated element ids were not unique (GH16780)
- Fixed loading a `DataFrame` with a `PeriodIndex`, from a `format='fixed'` HDFStore, in Python 3, that was written in Python 2 (GH16781)

Plotting

- Fixed regression that prevented RGB and RGBA tuples from being used as color arguments (GH16233)
- Fixed an issue with `DataFrame.plot.scatter()` that incorrectly raised a `KeyError` when categorical data is used for plotting (GH16199)

Reshaping

- `PeriodIndex/TimedeltaIndex.join` was missing the `sort=` kwarg (GH16541)
- Bug in joining on a `MultiIndex` with a category dtype for a level (GH16627).
- Bug in `merge()` when merging/joining with multiple categorical columns (GH16767)

Categorical

- Bug in `DataFrame.sort_values` not respecting the `kind` parameter with categorical data (GH16793)

Contributors

A total of 20 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

This is a minor bug-fix release in the 0.20.x series and includes some small regression fixes, bug fixes and performance improvements. We recommend that all users upgrade to this version.

What’s new in v0.20.2

- Enhancements
- Performance improvements
- Bug fixes
  - Conversion
  - Indexing
  - IO
  - Plotting
  - GroupBy/resample/rolling
  - Sparse
  - Reshaping
  - Numeric
  - Categorical
  - Other
- Contributors
Enhancements

• Series provides a to_latex method (GH16180)

• A new groupby method ngroup(), parallel to the existing cumcount(), has been added to return the group order (GH11642); see here.

Performance improvements

• Performance regression fix when indexing with a list-like (GH16285)

• Performance regression fix for MultiIndexes (GH16319, GH16346)

• Improved performance of .clip() with scalar arguments (GH15400)

• Improved performance of groupby with categorical groupers (GH16413)

• Improved performance of MultiIndex.removeUnusedLevels() (GH16556)

Bug fixes

• Silenced a warning on some Windows environments about “tput: terminal attributes: No such device or address” when detecting the terminal size. This fix only applies to python 3 (GH16496)

• Bug in using pathlib.Path or py.path.local objects with io functions (GH16291)

• Bug in Index.symmetric_difference() on two equal MultiIndex’s, results in a TypeError (GH13490)

• Bug in DataFrame.update() with overwrite=False and NaN values (GH15593)

• Passing an invalid engine to read_csv() now raises an informative ValueError rather than UnboundLocalError. (GH16511)

• Bug in unique() on an array of tuples (GH16519)

• Bug in cut() when labels are set, resulting in incorrect label ordering (GH16459)

• Fixed a compatibility issue with IPython 6.0’s tab completion showing deprecation warnings on Categoricals (GH16409)

Conversion

• Bug in to_numeric() in which empty data inputs were causing a segfault of the interpreter (GH16302)

• Silence numpy warnings when broadcasting DataFrame to Series with comparison ops (GH16378, GH16306)
Indexing

- Bug in `DataFrame.reset_index(level=)` with single level index (GH16263)
- Bug in partial string indexing with a monotonic, but not strictly-monotonic, index incorrectly reversing the slice bounds (GH16515)
- Bug in `MultiIndex.remove_unused_levels()` that would not return a `MultiIndex` equal to the original (GH16556)

IO

- Bug in `read_csv()` when comment is passed in a space delimited text file (GH16472)
- Bug in `read_csv()` not raising an exception with nonexistent columns in `usecols` when it had the correct length (GH14671)
- Bug that would force importing of the clipboard routines unnecessarily, potentially causing an import error on startup (GH16288)
- Bug that raised `IndexError` when HTML-rendering an empty `DataFrame` (GH15953)
- Bug in `read_csv()` in which tarfile object inputs were raising an error in Python 2.x for the C engine (GH16530)
- Bug where `DataFrame.to_html()` ignored the `index_names` parameter (GH16493)
- Bug where `pd.read_hdf()` returns numpy strings for index names (GH13492)
- Bug in `HDFStore.select_as_multiple()` where start/stop arguments were not respected (GH16209)

Plotting

- Bug in `DataFrame.plot` with a single column and a list-like `color` (GH3486)
- Bug in `plot` where NaT in DatetimeIndex results in `Timestamp.min` (GH12405)
- Bug in `DataFrame.boxplot` where `figsize` keyword was not respected for non-grouped boxplots (GH11959)

GroupBy/resample/rolling

- Bug in creating a time-based rolling window on an empty `DataFrame` (GH15819)
- Bug in `rolling.cov()` with offset window (GH16058)
- Bug in `.resample()` and `.groupby()` when aggregating on integers (GH16361)

Sparse

- Bug in construction of `SparseDataFrame` from `scipy.sparse.dok_matrix` (GH16179)
Reshaping

- Bug in `DataFrame.stack` with unsorted levels in `MultiIndex` columns (GH16323)
- Bug in `pd.wide_to_long()` where no error was raised when i was not a unique identifier (GH16382)
- Bug in `Series.isin()` with a list of tuples (GH16394)
- Bug in construction of a `DataFrame` with mixed dtypes including an all-NaT column. (GH16395)
- Bug in `DataFrame.agg()` and `Series.agg()` with aggregating on non-callable attributes (GH16405)

Numeric

- Bug in `.interpolate()`, where `limit_direction` was not respected when `limit=None` (default) was passed (GH16282)

Categorical

- Fixed comparison operations considering the order of the categories when both categoricals are unordered (GH16014)

Other

- Bug in `DataFrame.drop()` with an empty-list with non-unique indices (GH16270)

5.9.3 Version 0.20.1 (May 5, 2017)

This is a major release from 0.19.2 and includes a number of API changes, deprecations, new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

Highlights include:

• New .agg() API for Series/DataFrame similar to the groupby-rolling-resample API’s, see here
• Integration with the feather-format, including a new top-level pd.read_feather() and DataFrame.to_feather() method, see here.
• The .ix indexer has been deprecated, see here
• Panel has been deprecated, see here
• Addition of an IntervalIndex and Interval scalar type, see here
• Improved user API when grouping by index levels in .groupby(), see here
• Improved support for UInt64 dtypes, see here
• A new orient for JSON serialization, orient='table', that uses the Table Schema spec and that gives the possibility for a more interactive repr in the Jupyter Notebook, see here
• Experimental support for exporting styled DataFrames (DataFrame.style) to Excel, see here
• Window binary corr/cov operations now return a MultiIndexed DataFrame rather than a Panel, as Panel is now deprecated, see here
• Support for S3 handling now uses s3fs, see here
• Google BigQuery support now uses the pandas-gbq library, see here

**Warning:** pandas has changed the internal structure and layout of the code base. This can affect imports that are not from the top-level pandas.* namespace, please see the changes here.

Check the API Changes and deprecations before updating.

**Note:** This is a combined release for 0.20.0 and 0.20.1. Version 0.20.1 contains one additional change for backwards-compatibility with downstream projects using pandas’ utils routines. (GH16250)

### What’s new in v0.20.0

**New features**

- Method agg API for DataFrame/Series
- Keyword argument dtype for data IO
- Method .to_datetime() has gained an origin parameter
- GroupBy enhancements
- Better support for compressed URLs in read_csv
- Pickle file IO now supports compression
- UInt64 support improved
- GroupBy on categoricals
- Table schema output
- SciPy sparse matrix from/to SparseDataFrame
- Excel output for styled DataFrames
- IntervalIndex
- Other enhancements

**Backwards incompatible API changes**

- Possible incompatibility for HDF5 formats created with pandas < 0.13.0
- Map on Index types now return other Index types
- Accessing datetime fields of Index now return Index
- pd.unique will now be consistent with extension types
- S3 file handling
- Partial string indexing changes
- Concat of different float dtypes will not automatically upcast
- pandas Google BigQuery support has moved
- Memory usage for Index is more accurate
- DataFrame.sort_index changes
- GroupBy describe formatting
- Window binary corr/cov operations return a MultiIndex DataFrame
- HDFStore where string comparison
- Index.intersection and inner join now preserve the order of the left Index
- Pivot table always returns a DataFrame
- Other API changes
- Reorganization of the library: privacy changes
  - Modules privacy has changed
  - pandas.errors
  - pandas.testing
  - pandas.plotting
  - Other development changes
- Deprecations
  - Deprecate .ix
  - Deprecate Panel
  - Deprecate groupby.agg() with a dictionary when renaming
  - Deprecate .plotting
  - Other deprecations
- Removal of prior version deprecations/changes
- Performance improvements
- Bug fixes
  - Conversion
  - Indexing
  - IO
  - Plotting
  - GroupBy/resample/rolling
  - Sparse
  - Reshaping
  - Numeric
  - Other
- Contributors
New features

Method `agg` API for DataFrame/Series

Series & DataFrame have been enhanced to support the aggregation API. This is a familiar API from groupby, window operations, and resampling. This allows aggregation operations in a concise way by using `agg()` and `transform()`. The full documentation is here (GH1623).

Here is a sample

```python
In [1]: df = pd.DataFrame(np.random.randn(10, 3), columns=['A', 'B', 'C'],
                   index=pd.date_range('1/1/2000', periods=10))
...

In [2]: df.iloc[3:7] = np.nan

Out[3]:
      A      B      C
2000-01-01  0.469112 -0.282863 -1.509059
2000-01-02 -1.135632  1.212112 -0.173215
2000-01-03  0.119209 -1.044236 -0.861849
2000-01-04  NaN      NaN      NaN
2000-01-05  NaN      NaN      NaN
2000-01-06  NaN      NaN      NaN
2000-01-07  NaN      NaN      NaN
2000-01-08  0.113648 -1.478427  0.524988
2000-01-09  0.404705  0.577046 -1.715002
2000-01-10 -1.039268 -0.370647 -1.157892
```

One can operate using string function names, callables, lists, or dictionaries of these.

Using a single function is equivalent to `.apply`.

```python
In [4]: df.agg('sum')
Out[4]:
      A      B      C
A  -1.068226 -1.387015 -4.892029
B  -1.135632 -1.478427 -1.715002
C  -4.892029  0.524988  0.577046
Length: 3, dtype: float64
```

Multiple aggregations with a list of functions.

```python
In [5]: df.agg(['sum', 'min'])
Out[5]:
   A      B      C
sum -1.068226 -1.387015 -4.892029
min -1.135632 -1.478427 -1.715002
```

Using a dict provides the ability to apply specific aggregations per column. You will get a matrix-like output of all of the aggregators. The output has one column per unique function. Those functions applied to a particular column will
be NaN:

```python
In [6]: df.agg({'A': ['sum', 'min'], 'B': ['min', 'max']})
Out[6]:
   A         B
sum -1.068226  NaN
min -1.135632 -1.478427
max  NaN  1.212112
[3 rows x 2 columns]
```

The API also supports a `.transform()` function for broadcasting results.

```python
In [7]: df.transform(['abs', lambda x: x - x.min()])
Out[7]:
     A         B         C
   abs <lambda> abs <lambda> abs <lambda>
2000-01-01  0.469112  1.604745  0.282863  1.195563  1.509059  0.205944
2000-01-02  1.135632  0.000000  1.212112  2.690539  0.173215  1.541787
2000-01-03  0.119209  1.254841  1.044236  0.434191  0.861849  0.853153
2000-01-04  NaN  NaN  NaN  NaN  NaN  NaN
2000-01-05  NaN  NaN  NaN  NaN  NaN  NaN
2000-01-06  NaN  NaN  NaN  NaN  NaN  NaN
2000-01-07  NaN  NaN  NaN  NaN  NaN  NaN
2000-01-08  0.113648  1.249281  1.478427  0.000000  0.524988  2.239990
2000-01-09  0.404705  1.540338  0.577046  2.055473  1.715002  0.000000
2000-01-10  1.039268  0.096364  0.370647  1.107780  1.157892  0.557110
[10 rows x 6 columns]
```

When presented with mixed dtypes that cannot be aggregated, `.agg()` will only take the valid aggregations. This is similar to how groupby `.agg()` works. (GH15015)

```python
In [8]: df = pd.DataFrame({'A': [1, 2, 3],
                      'B': [1., 2., 3.],
                      'C': ['foo', 'bar', 'baz'],
                      'D': pd.date_range('20130101', periods=3)})
In [9]: df.dtypes
Out[9]:
A       int64
B       float64
C      object
D  datetime64[ns]
Length: 4, dtype: object
```

```python
In [10]: df.agg(['min', 'sum'])
Out[10]:
   A     B         C         D
min 1  1.0  bar  2013-01-01
sum 6  6.0 foobar baz  NaT
[2 rows x 4 columns]
```
Keyword argument **dtype** for data IO

The 'python' engine for **read_csv()**, as well as the **read_fwf()** function for parsing fixed-width text files and **read_excel()** for parsing Excel files, now accept the **dtype** keyword argument for specifying the types of specific columns (GH14295). See the io docs for more information.

```
In [11]: data = "a  b\n
1  2
3  4"
In [12]: pd.read_fwf(StringIO(data)).dtypes
Out[12]:
a     int64
b     int64
Length: 2, dtype: object

In [13]: pd.read_fwf(StringIO(data), dtype={"a": 'float64', "b": 'object'}).dtypes
Out[13]:
a    float64
b     object
Length: 2, dtype: object
```

Method **.to_datetime()** has gained an origin parameter

**.to_datetime()** has gained a new parameter, **origin**, to define a reference date from where to compute the resulting timestamps when parsing numerical values with a specific unit specified. (GH11276, GH11745)

For example, with 1960-01-01 as the starting date:

```
In [14]: pd.to_datetime([1, 2, 3], unit='D', origin=pd.Timestamp('1960-01-01'))
Out[14]: DatetimeIndex(['1960-01-02', '1960-01-03', '1960-01-04'], dtype='datetime64[ns] →', freq=None)
```

The default is set at **origin='unix'**, which defaults to 1970-01-01 00:00:00, which is commonly called ‘unix epoch’ or POSIX time. This was the previous default, so this is a backward compatible change.

```
In [15]: pd.to_datetime([1, 2, 3], unit='D')
```

GroupBy enhancements

Strings passed to **DataFrame.groupby()** as the by parameter may now reference either column names or index level names. Previously, only column names could be referenced. This allows to easily group by a column and index level at the same time. (GH5677)

```
In [16]: arrays = [[["bar", "bar", "baz", "baz", "foo", "foo", "qux", "qux"],
       .....:       ["one", "two", "one", "two", "one", "two", "one", "two"]]
       .....:

In [17]: index = pd.MultiIndex.from_arrays(arrays, names=['first', 'second'])
In [18]: df = pd.DataFrame({'A': [1, 1, 1, 2, 2, 3, 3],
```

(continues on next page)
In 

...: 'B': np.arange(8)},
...:
   index=index)

In [19]: df
Out[19]:
   A  B
first second
bar  one  1  0
two  1  1
baz  one  1  2
two  1  3
foo  one  2  4
two  2  5
qux one  3  6
two  3  7

[8 rows x 2 columns]

In [20]: df.groupby(['second', 'A']).sum()
Out[20]:
   B
second A
one  1  2
  2  4
  3  6
two  1  4
   2  5
   3  7

[6 rows x 1 columns]

**Better support for compressed URLs in read_csv**

The compression code was refactored (GH12688). As a result, reading dataframes from URLs in `read_csv()` or `read_table()` now supports additional compression methods: xz, bz2, and zip (GH14570). Previously, only gzip compression was supported. By default, compression of URLs and paths are now inferred using their file extensions. Additionally, support for bz2 compression in the python 2 C-engine improved (GH14874).

In [21]: url = ('https://github.com/{repo}/raw/{branch}/{path}'
   ....:   .format(repo='pandas-dev/pandas',
   ....:            branch='master',
   ....:            path='pandas/tests/io/parser/data/salaries.csv.bz2'))

   # default, infer compression
   In [22]: df = pd.read_csv(url, sep='\t', compression='infer')

   # explicitly specify compression
   In [23]: df = pd.read_csv(url, sep='\t', compression='bz2')

(continues on next page)
In [24]: df.head(2)

Out[24]:
     S  X  E  M
0  13876  1  1  1
1  11608  1  3  0
[2 rows x 4 columns]

Pickle file IO now supports compression

`read_pickle()`, `DataFrame.to_pickle()` and `Series.to_pickle()` can now read from and write to compressed pickle files. Compression methods can be an explicit parameter or be inferred from the file extension. See the docs here.

In [25]: df = pd.DataFrame({'A': np.random.randn(1000),
                      'B': 'foo',
                      'C': pd.date_range('20130101', periods=1000, freq='s')})

Using an explicit compression type

In [26]: df.to_pickle("data.pkl.compress", compression="gzip")

In [27]: rt = pd.read_pickle("data.pkl.compress", compression="gzip")

In [28]: rt.head()

Out[28]:
     A        B          C
0 -1.344312  foo 2013-01-01 00:00:00
1  0.844885  foo 2013-01-01 00:00:01
2  1.075770  foo 2013-01-01 00:00:02
3 -0.109050  foo 2013-01-01 00:00:03
4  1.643563  foo 2013-01-01 00:00:04
[5 rows x 3 columns]

The default is to infer the compression type from the extension (compression='infer'):

In [29]: df.to_pickle("data.pkl.gz")

In [30]: rt = pd.read_pickle("data.pkl.gz")

In [31]: rt.head()

Out[31]:
     A        B          C
0 -1.344312  foo 2013-01-01 00:00:00
1  0.844885  foo 2013-01-01 00:00:01
2  1.075770  foo 2013-01-01 00:00:02
3 -0.109050  foo 2013-01-01 00:00:03
4  1.643563  foo 2013-01-01 00:00:04

(continues on next page)
In [32]: df["A"].to_pickle("s1.pkl.bz2")

In [33]: rt = pd.read_pickle("s1.pkl.bz2")

In [34]: rt.head()
Out[34]:
   0   -1.344312
   1    0.844885
   2     1.075770
   3   -0.109050
   4     1.643563
Name: A, Length: 5, dtype: float64

**UInt64 support improved**

pandas has significantly improved support for operations involving unsigned, or purely non-negative, integers. Previously, handling these integers would result in improper rounding or data-type casting, leading to incorrect results. Notably, a new numerical index, UInt64Index, has been created (GH14937)

In [35]: idx = pd.UInt64Index([1, 2, 3])

In [36]: df = pd.DataFrame({'A': ['a', 'b', 'c']}, index=idx)

In [37]: df.index
Out[37]: UInt64Index([1, 2, 3], dtype='uint64')

• Bug in converting object elements of array-like objects to unsigned 64-bit integers (GH4471, GH14982)
• Bug in Series.unique() in which unsigned 64-bit integers were causing overflow (GH14721)
• Bug in DataFrame construction in which unsigned 64-bit integer elements were being converted to objects (GH14881)
• Bug in pd.read_csv() in which unsigned 64-bit integer elements were being improperly converted to the wrong data types (GH14983)
• Bug in pd.unique() in which unsigned 64-bit integers were causing overflow (GH14915)
• Bug in pd.value_counts() in which unsigned 64-bit integers were being erroneously truncated in the output (GH14934)

**GroupBy on categoricals**

In previous versions, .groupby(..., sort=False) would fail with a ValueError when grouping on a categorical series with some categories not appearing in the data. (GH13179)

In [38]: chromosomes = np.r_[np.arange(1, 23).astype(str), ['X', 'Y']]

In [39]: df = pd.DataFrame({
      .....:   'A': np.random.randint(100),
})
In [40]: df
Out[40]:
   A   B   C chromosomes
0  87  22  81       4
1  87  22  81      13
2  87  22  81      22
3  87  22  81       2
4  87  22  81       6
...  ...  ...     ...
95  87  22  81      8
96  87  22  81      11
97  87  22  81     X
98  87  22  81       1
99  87  22  81      19

[100 rows x 4 columns]

Previous behavior:

In [3]: df[df.chromosomes != '1'].groupby('chromosomes', sort=False).sum()
---------------------------------------------------------------------------
ValueError: items in new_categories are not the same as in old categories

New behavior:

In [41]: df[df.chromosomes != '1'].groupby('chromosomes', sort=False).sum()
Out[41]:
    A   B   C
chromosomes
 2  348  88  324
 3  348  88  324
 4  348  88  324
 5  261  66  243
 6  174  44  162
...  ...  ...     ...
22  348  88  324
X  348  88  324
Y   435 110  405
 1    0    0    0
 21   0    0    0

[24 rows x 3 columns]
Table schema output

The new orient 'table' for `DataFrame.to_json()` will generate a Table Schema compatible string representation of the data.

```python
In [42]: df = pd.DataFrame(
    ....:     {'A': [1, 2, 3],
    ....:     'B': ['a', 'b', 'c'],
    ....:     'C': pd.date_range('2016-01-01', freq='d', periods=3),
    ....:     index=pd.Index(range(3), name='idx'))

In [43]: df
Out[43]:
A  B  C
idx
0  1  a  2016-01-01
1  2  b  2016-01-02
2  3  c  2016-01-03
[3 rows x 3 columns]
```

```python
In [44]: df.to_json(orient='table')
Out[44]:
"schema": {
"fields": [{
"name": "idx",
"type": "integer"
}, {
"name": "A",
"type": "integer"
}, {
"name": "B",
"type": "string"
}, {
"name": "C",
"type": "datetime"
}],
"primaryKey": ["idx"],
"pandas_version": "0.20.0",

```

See [IO: Table Schema for more information.](https://pandas.pydata.org/pandas-docs/stable/io.html#table-schemas)

Additionally, the repr for DataFrame and Series can now publish this JSON Table schema representation of the Series or DataFrame if you are using IPython (or another frontend like nteract using the Jupyter messaging protocol). This gives frontends like the Jupyter notebook and nteract more flexibility in how they display pandas objects, since they have more information about the data. You must enable this by setting the `display.html.table_schema` option to `True`.

### SciPy sparse matrix from/to SparseDataFrame

pandas now supports creating sparse dataframes directly from `scipy.sparse.spmatrix` instances. See the [documentation](https://pandas.pydata.org/pandas-docs/stable/sparse.html) for more information. (GH4343)

All sparse formats are supported, but matrices that are not in [COOrdinate](https://pandas.pydata.org/pandas-docs/stable/sparse.html#co-ordinate) format will be converted, copying data as needed.

```python
from scipy.sparse import csr_matrix
arr = np.random.random(size=(1000, 5))
arr[arr < .9] = 0
sp_arr = csr_matrix(arr)
sp_arr
sdf = pd.SparseDataFrame(sp_arr)
sdf
```

To convert a `SparseDataFrame` back to sparse SciPy matrix in COO format, you can use:
sdf.to_coo()

### Excel output for styled DataFrames

Experimental support has been added to export DataFrame.style formats to Excel using the openpyxl engine. ([GH15530](https://github.com/pandas-dev/pandas/pull/15530))

For example, after running the following, `styled.xlsx` renders as below:

```python
In [45]: np.random.seed(24)
In [46]: df = pd.DataFrame({'A': np.linspace(1, 10, 10)})
In [47]: df = pd.concat([df, pd.DataFrame(np.random.RandomState(24).randn(10, 4),
                    columns=list('BCDE'))], axis=1)
In [48]: df.iloc[0, 2] = np.nan
In [49]: df
Out[49]:
    A      B       C       D       E
0  1.0  1.329212 NaN  -0.316280  -0.990810
1  2.0 -1.070816 -1.438713  0.564417  0.295722
2  3.0 -1.626404  0.219565  0.678805  1.889273
3  4.0  0.961538  0.104011 -0.481165  0.515018
4  5.0  1.453425  1.057737  0.165562  0.515018
5  6.0 -1.336936  0.562861  1.392855 -0.063328
6  7.0  0.121668  1.207603 -0.002040  1.627796
7  8.0  0.354493  1.037528 -0.385684  0.519818
8  9.0  1.686583 -1.325963  1.428984 -2.089354
9 10.0 -0.129820  0.631523 -0.586538  0.290720
[10 rows x 5 columns]
In [50]: styled = (df.style
                   .applymap(lambda val: 'color: %s' % 'red' if val < 0 else 'black')
                   .highlight_max())
In [51]: styled.to_excel('styled.xlsx', engine='openpyxl')
```
IntervalIndex

pandas has gained an IntervalIndex with its own dtype, interval as well as the Interval scalar type. These allow first-class support for interval notation, specifically as a return type for the categories in cut() and qcut(). The IntervalIndex allows some unique indexing, see the docs. (GH7640, GH8625)

Warning: These indexing behaviors of the IntervalIndex are provisional and may change in a future version of pandas. Feedback on usage is welcome.

Previous behavior:
The returned categories were strings, representing Intervals

```python
In [1]: c = pd.cut(range(4), bins=2)
In [2]: c
Out[2]:
[(-0.003, 1.5], (-0.003, 1.5], (1.5, 3], (1.5, 3]
Categories (2, object): [(-0.003, 1.5] < (1.5, 3]

In [3]: c.categories
Out[3]: Index(['(-0.003, 1.5]', '(1.5, 3]'], dtype='object')
```

New behavior:

```python
In [52]: c = pd.cut(range(4), bins=2)
In [53]: c
Out[53]:
[(-0.003, 1.5], (-0.003, 1.5], (1.5, 3.0], (1.5, 3.0]
Categories (2, interval[float64]): [(-0.003, 1.5] < (1.5, 3.0]

In [54]: c.categories
Out[54]:
```

(continues on next page)
Furthermore, this allows one to bin *other* data with these same bins, with NaN representing a missing value similar to other dtypes.

```
In [55]: pd.cut([0, 3, 5, 1], bins=c.categories)
Out[55]:
[(-0.003, 1.5], (1.5, 3.0], NaN, (-0.003, 1.5]]
```

Categories (2, interval[float64]): [(-0.003, 1.5] < (1.5, 3.0]]

An IntervalIndex can also be used in Series and DataFrame as the index.

```
In [56]: df = pd.DataFrame({'A': range(4),
                      'B': pd.cut([0, 3, 1, 1], bins=c.categories)}).set_index('B')
```

```
In [57]: df
Out[57]:
   A
B
(-0.003, 1.5]  0
(1.5, 3.0]   1
(-0.003, 1.5]  2
(-0.003, 1.5]  3
```

Selecting via a specific interval:

```
In [58]: df.loc[pd.Interval(1.5, 3.0)]
Out[58]:
   A
Name: (1.5, 3.0], Length: 1, dtype: int64
```

Selecting via a scalar value that is contained *in* the intervals.

```
In [59]: df.loc[0]
Out[59]:
   A
B
(-0.003, 1.5]  0
(-0.003, 1.5]  2
(-0.003, 1.5]  3
```

[3 rows x 1 columns]
Other enhancements

- DataFrame.rolling() now accepts the parameter closed='right'|'left'|'both'|'neither' to choose the rolling window-endpoint closedness. See the documentation (GH13965)
- Integration with the feather-format, including a new top-level pd.read_feather() and DataFrame.to_feather() method, see here.
- Series.str.replace() now accepts a callable, as replacement, which is passed to re.sub (GH15055)
- Series.str.replace() now accepts a compiled regular expression as a pattern (GH15446)
- Series.sort_index accepts parameters kind and na_position (GH13589, GH14444)
- DataFrame and DataFrame.groupby() have gained a nunique() method to count the distinct values over an axis (GH14336, GH15197).
- DataFrame has gained a melt() method, equivalent to pd.melt(), for unpivoting from a wide to long format (GH12640).
- pd.read_excel() now preserves sheet order when using sheetname=None (GH9930)
- Multiple offset aliases with decimal points are now supported (e.g. 0.5min is parsed as 30s) (GH8419)
- .isnull() and .notnull() have been added to Index object to make them more consistent with the Series API (GH15300)
- New UnsortedIndexError (subclass of KeyError) raised when indexing/slicing into an unsorted MultiIndex (GH11897). This allows differentiation between errors due to lack of sorting or an incorrect key. See here
- MultiIndex has gained a .to_frame() method to convert to a DataFrame (GH12397)
- pd.cut and pd.qcut now support datetime64 and timedelta64 dtypes (GH14714, GH14798)
- pd.qcut has gained the duplicates='raise'|'drop' option to control whether to raise on duplicated edges (GH7751)
- Series provides a to_excel method to output Excel files (GH8825)
- The usecols argument in pd.read_csv() now accepts a callable function as a value (GH14154)
- The skiprows argument in pd.read_csv() now accepts a callable function as a value (GH10882)
- The nrows and chunksize arguments in pd.read_csv() are supported if both are passed (GH6774, GH15755)
- DataFrame.plot now prints a title above each subplot if suplots=True and title is a list of strings (GH14753)
- DataFrame.plot can pass the matplotlib 2.0 default color cycle as a single string as color parameter, see here. (GH15516)
- Series.interpolate() now supports timedelta as an index type with method='time' (GH6424)
- Addition of a level keyword to DataFrame/Series.rename to rename labels in the specified level of a MultiIndex (GH4160).
- DataFrame.reset_index() will now interpret a tuple index.name as a key spanning across levels of columns, if this is a MultiIndex (GH16164)
- Timedelta.isoformat method added for formatting Timedeltas as an ISO 8601 duration. See the Timedelta docs (GH15136)
- .select_dtypes() now allows the string datetimetz to generically select datetimes with tz (GH14910)
- The .to_latex() method will now accept multicolumn and multirow arguments to use the accompanying LaTeX enhancements
pd.merge_asof() gained the option direction='backward'|'forward'|'nearest' (GH14887)
Series/DataFrame.asfreq() have gained a fill_value parameter, to fill missing values (GH3715).
Series/DataFrame.resample.asfreq have gained a fill_value parameter, to fill missing values during resampling (GH3715).
pandas.util.hash_pandas_object() has gained the ability to hash a MultiIndex (GH15224)
Series/DataFrame.squeeze() have gained the axis parameter. (GH15339)
DataFrame.to_excel() has new freeze_panes parameter to turn on Freeze Panes when exporting to Excel (GH15160)
pd.read_html() will parse multiple header rows, creating a MultiIndex header. (GH13434).
HTML table output skips colspan or rowspan attribute if equal to 1. (GH15403)
pandas.io.formats.style.Styler template now has blocks for easier extension, see the example notebook (GH15649)
Styler.render() now accepts **kwargs to allow user-defined variables in the template (GH15649)
Compatibility with Jupyter notebook 5.0; MultiIndex column labels are left-aligned and MultiIndex row-labels are top-aligned (GH15379)
TimedeltaIndex now has a custom date-tick formatter specifically designed for nanosecond level precision (GH8711)
pd.api.types.union_categoricals gained the ignore_ordered argument to allow ignoring the ordered attribute of unioned categoricals (GH13410). See the categorical union docs for more information.
DataFrame.to_latex() and DataFrame.to_string() now allow optional header aliases. (GH14326)
Added .empty property to subclasses of Index. (GH15270)
Enabled floor division for Timedelta and TimedeltaIndex (GH15828)
pandas.io.json.json_normalize() gained the option errors='ignore'|'raise'; the default is errors='raise' which is backward compatible. (GH14583)
pandas.io.json.json_normalize() with an empty list will return an empty DataFrame (GH15334)
pandas.io.json.json_normalize() has gained a sep option that accepts str to separate joined fields; the default is "", which is backward compatible. (GH14883)
MultiIndex.remove_unused_levels() has been added to facilitate removing unused levels. (GH15694)
pd.read_csv() will now raise a ParserError error whenever any parsing error occurs (GH15913, GH15925)
pd.read_csv() now supports the error_bad_lines and warn_bad_lines arguments for the Python parser (GH15925)
The display.show_dimensions option can now also be used to specify whether the length of a Series should be shown in its repr (GH7117).
parallel_coordinates() has gained a sort_labels keyword argument that sorts class labels and the colors assigned to them (GH15908)
Options added to allow one to turn on/off using bottleneck and numexpr, see here (GH16157)
DataFrame.style.bar() now accepts two more options to further customize the bar chart. Bar alignment is set with align='left'|'mid'|'zero', the default is "left", which is backward compatible; You can now pass a list of color=[color_negative, color_positive]. (GH14757)
Backwards incompatible API changes

Possible incompatibility for HDF5 formats created with pandas < 0.13.0

pd.TimeSeries was deprecated officially in 0.17.0, though has already been an alias since 0.13.0. It has been dropped in favor of pd.Series. (GH15098).

This may cause HDF5 files that were created in prior versions to become unreadable if pd.TimeSeries was used. This is most likely to be for pandas < 0.13.0. If you find yourself in this situation. You can use a recent prior version of pandas to read in your HDF5 files, then write them out again after applying the procedure below.

```python
In [2]: s = pd.TimeSeries([1, 2, 3], index=pd.date_range('20130101', periods=3))
In [3]: s
Out[3]:
2013-01-01    1
2013-01-02    2
2013-01-03    3
Freq: D, dtype: int64
In [4]: type(s)
Out[4]: pandas.core.series.TimeSeries
In [5]: s = pd.Series(s)
In [6]: s
Out[6]:
2013-01-01    1
2013-01-02    2
2013-01-03    3
Freq: D, dtype: int64
In [7]: type(s)
Out[7]: pandas.core.series.Series
```

Map on Index types now return other Index types

map on an Index now returns an Index, not a numpy array (GH12766)

```python
In [60]: idx = pd.Index([1, 2])
In [61]: idx
Out[61]: Int64Index([1, 2], dtype='int64')
In [62]: mi = pd.MultiIndex.from_tuples([(1, 2), (2, 4)])
In [63]: mi
Out[63]: MultiIndex([(1, 2),
                    (2, 4),
                    ])
```

Previous behavior:
In [5]: idx.map(lambda x: x * 2)
Out[5]: array([2, 4])

In [6]: idx.map(lambda x: (x, x * 2))
Out[6]: array([(1, 2), (2, 4)], dtype=object)

In [7]: mi.map(lambda x: x)
Out[7]: array([(1, 2), (2, 4)], dtype=object)

In [8]: mi.map(lambda x: x[0])
Out[8]: array([1, 2])

New behavior:

In [64]: idx.map(lambda x: x * 2)
Out[64]: Int64Index([2, 4], dtype='int64')

In [65]: idx.map(lambda x: (x, x * 2))
Out[65]: MultiIndex([(1, 2), (2, 4)],
                  )

In [66]: mi.map(lambda x: x)
Out[66]: MultiIndex([(1, 2),
                  (2, 4)],
                  )

In [67]: mi.map(lambda x: x[0])
Out[67]: Int64Index([1, 2], dtype='int64')

map on a Series with datetime64 values may return int64 dtypes rather than int32

In [68]: s = pd.Series(pd.date_range('2011-01-02T00:00', '2011-01-02T02:00', freq='H')
                   .tz_localize('Asia/Tokyo'))
   ....:.....
In [69]: s
Out[69]:
0  2011-01-02 00:00:00+09:00
1  2011-01-02 01:00:00+09:00
2  2011-01-02 02:00:00+09:00
Length: 3, dtype: datetime64[ns, Asia/Tokyo]

Previous behavior:

In [9]: s.map(lambda x: x.hour)
Out[9]:
0  0
1  1
2  2
dtype: int32
New behavior:

```python
In [70]: s.map(lambda x: x.hour)
Out[70]:
0  0
1  1
2  2
Length: 3, dtype: int64
```

## Accessing datetime fields of Index now return Index

The datetime-related attributes (see [here](#) for an overview) of `DatetimeIndex`, `PeriodIndex` and `TimedeltaIndex` previously returned numpy arrays. They will now return a new `Index` object, except in the case of a boolean field, where the result will still be a boolean ndarray. ([GH15022](#))

Previous behaviour:

```python
In [1]: idx = pd.date_range("2015-01-01", periods=5, freq='10H')
In [2]: idx.hour
Out[2]: array([ 0, 10, 20, 6, 16], dtype=int32)
```

New behavior:

```python
In [71]: idx = pd.date_range("2015-01-01", periods=5, freq='10H')
In [72]: idx.hour
Out[72]: Int64Index([0, 10, 20, 6, 16], dtype='int64')
```

This has the advantage that specific `Index` methods are still available on the result. On the other hand, this might have backward incompatibilities: e.g. compared to numpy arrays, `Index` objects are not mutable. To get the original ndarray, you can always convert explicitly using `np.asarray(idx.hour)`.

## `pd.unique` will now be consistent with extension types

In prior versions, using `Series.unique()` and `pandas.unique()` on `Categorical` and tz-aware data-types would yield different return types. These are now made consistent. ([GH15903](#))

- Datetime tz-aware

  Previous behaviour:

  ```python
  # Series
  In [5]: pd.Series([pd.Timestamp('20160101', tz='US/Eastern'),
     ...:             pd.Timestamp('20160101', tz='US/Eastern')]).unique()
  Out[5]: array([Timestamp('2016-01-01 00:00:00-0500', tz='US/Eastern'),
                dtype=object])
  
  In [6]: pd.unique(pd.Series([pd.Timestamp('20160101', tz='US/Eastern'),
     ...:             pd.Timestamp('20160101', tz='US/Eastern')]))
  Out[6]: array(["2016-01-01T05:00:00.000000000"], dtype='datetime64[ns]')
  ```

(continues on next page)
In [7]: pd.Index([pd.Timestamp('20160101', tz='US/Eastern'),
    ...:         pd.Timestamp('20160101', tz='US/Eastern')]).unique()
Out[7]: DatetimeIndex(['2016-01-01 00:00:00-05:00'],
 dtype='datetime64[ns, US/Eastern]', freq=None)

In [8]: pd.unique([pd.Timestamp('20160101', tz='US/Eastern'),
    ...:         pd.Timestamp('20160101', tz='US/Eastern')])
Out[8]: array(['2016-01-01T05:00:00.000000000'], dtype='datetime64[ns]')

New behavior:

# Series, returns an array of Timestamp tz-aware
In [73]: pd.Series([pd.Timestamp('20160101', tz='US/Eastern'),
    ...:         pd.Timestamp('20160101', tz='US/Eastern')]).unique()
Out[73]: <DatetimeArray>
['2016-01-01 00:00:00-05:00']
Length: 1, dtype: datetime64[ns, US/Eastern]

In [74]: pd.unique(pd.Series([pd.Timestamp('20160101', tz='US/Eastern'),
    ...:         pd.Timestamp('20160101', tz='US/Eastern')]))
Out[74]: <DatetimeArray>
['2016-01-01 00:00:00-05:00']
Length: 1, dtype: datetime64[ns, US/Eastern]

# Index, returns a DatetimeIndex
In [75]: pd.Index([pd.Timestamp('20160101', tz='US/Eastern'),
    ...:         pd.Timestamp('20160101', tz='US/Eastern')]).unique()
Out[75]: DatetimeIndex(['2016-01-01 00:00:00-05:00'],
 dtype='datetime64[ns, US/Eastern]', freq=None)

In [76]: pd.unique(pd.Index([pd.Timestamp('20160101', tz='US/Eastern'),
    ...:         pd.Timestamp('20160101', tz='US/Eastern')]))
Out[76]: DatetimeIndex(['2016-01-01 00:00:00-05:00'],
 dtype='datetime64[ns, US/Eastern]', freq=None)

• Categoricals

Previous behaviour:

In [1]: pd.Series(list('baabc'), dtype='category').unique()
Out[1]:
[b, a, c]
Categories (3, object): [b, a, c]

In [2]: pd.unique(pd.Series(list('baabc'), dtype='category'))
Out[2]: array(['b', 'a', 'c'], dtype=object)

New behavior:
S3 file handling

pandas now uses `s3fs` for handling S3 connections. This shouldn’t break any code. However, since `s3fs` is not a required dependency, you will need to install it separately, like `boto` in prior versions of pandas. (GH11915).

Partial string indexing changes

`DatetimeIndex Partial String Indexing` now works as an exact match, provided that string resolution coincides with index resolution, including a case when both are seconds (GH14826). See `Slice vs. Exact Match` for details.
Concat of different float dtypes will not automatically upcast

Previously, `concat` of multiple objects with different float dtypes would automatically upcast results to a dtype of float64. Now the smallest acceptable dtype will be used (GH13247)

```python
In [80]: df1 = pd.DataFrame(np.array([1.0], dtype=np.float32, ndmin=2))
In [81]: df1.dtypes
Out[81]:
0 float32
Length: 1, dtype: object
In [82]: df2 = pd.DataFrame(np.array([np.nan], dtype=np.float32, ndmin=2))
In [83]: df2.dtypes
Out[83]:
0 float32
Length: 1, dtype: object
```

Previous behavior:

```python
In [7]: pd.concat([df1, df2]).dtypes
Out[7]:
0 float64
dtype: object
```

New behavior:

```python
In [84]: pd.concat([df1, df2]).dtypes
Out[84]:
0 float32
Length: 1, dtype: object
```

pandas Google BigQuery support has moved

pandas has split off Google BigQuery support into a separate package pandas-gbq. You can conda install pandas-gbq -c conda-forge or pip install pandas-gbq to get it. The functionality of `read_gbq()` and `DataFrame.to_gbq()` remain the same with the currently released version of pandas-gbq=0.1.4. Documentation is now hosted here (GH15347)

Memory usage for Index is more accurate

In previous versions, showing `.memory_usage()` on a pandas structure that has an index, would only include actual index values and not include structures that facilitated fast indexing. This will generally be different for `Index` and `MultiIndex` and less-so for other index types. (GH15237)

Previous behavior:

```python
In [8]: index = pd.Index(['foo', 'bar', 'baz'])
In [9]: index.memory_usage(deep=True)
Out[9]: 180
```

(continues on next page)
In [10]: index.get_loc('foo')
Out[10]: 0

In [11]: index.memory_usage(deep=True)
Out[11]: 180

New behavior:

In [8]: index = pd.Index(['foo', 'bar', 'baz'])
In [9]: index.memory_usage(deep=True)
Out[9]: 180
In [10]: index.get_loc('foo')
Out[10]: 0
In [11]: index.memory_usage(deep=True)
Out[11]: 260

**DataFrame.sort_index changes**

In certain cases, calling `.sort_index()` on a MultiIndexed DataFrame would return the same DataFrame without seeming to sort. This would happen with a lexsorted, but non-monotonic levels. (GH15622, GH15687, GH14015, GH13431, GH15797)

This is unchanged from prior versions, but shown for illustration purposes:

In [85]: df = pd.DataFrame(np.arange(6), columns=['value'],
                      index=pd.MultiIndex.from_product([list('BA'), range(3)])
     
In [86]: df
Out[86]:
   value
      B  0  0
      1  1
      2  2
      A  0  3
      1  4
      2  5

[6 rows x 1 columns]

In [87]: df.index.is_lexsorted()
Out[87]: False

In [88]: df.index.is_monotonic
Out[88]: False

Sorting works as expected
In [89]: df.sort_index()
Out[89]:
   value
A 0  3
  1  4
  2  5
B 0  0
  1  1
  2  2

[6 rows x 1 columns]

In [90]: df.sort_index().index.is_lexsorted()
Out[90]: True

In [91]: df.sort_index().index.is_monotonic
Out[91]: True

However, this example, which has a non-monotonic 2nd level, doesn’t behave as desired.

In [92]: df = pd.DataFrame({
        'value': [1, 2, 3, 4],
        index=pd.MultiIndex([['a', 'b'], ['bb', 'aa']],
                            [[0, 0, 1, 1], [0, 1, 0, 1]])})

In [93]: df
Out[93]:
   value
a bb  1
    aa  2
b bb  3
    aa  4

[4 rows x 1 columns]

Previous behavior:

In [11]: df.sort_index()
Out[11]:
   value
a bb  1
    aa  2
b bb  3
    aa  4

In [14]: df.sort_index().index.is_lexsorted()
Out[14]: True

In [15]: df.sort_index().index.is_monotonic
Out[15]: False

New behavior:
In [94]: df.sort_index()
Out[94]:
   value
a aa  2
   bb  1
b aa  4
   bb  3
[4 rows x 1 columns]

In [95]: df.sort_index().index.is_lexsorted()
Out[95]: True

In [96]: df.sort_index().index.is_monotonic
Out[96]: True

GroupBy describe formatting

The output formatting of `groupby.describe()` now labels the `describe()` metrics in the columns instead of the index. This format is consistent with `groupby.agg()` when applying multiple functions at once. (GH4792)

Previous behavior:

In [1]: df = pd.DataFrame({'A': [1, 1, 2, 2], 'B': [1, 2, 3, 4]})

In [2]: df.groupby('A').describe()
Out[2]:
    B
   A
1  count 2.000000
   mean 1.500000
   std  0.707107
   min  1.000000
  25%  1.250000
  50%  1.500000
  75%  1.750000
   max  2.000000
2  count 2.000000
   mean 3.500000
   std  0.707107
   min  3.000000
  25%  3.250000
  50%  3.500000
  75%  3.750000
   max  4.000000

In [3]: df.groupby('A').agg([np.mean, np.std, np.min, np.max])
Out[3]:
    B
   A
1  mean  1.5  std  0.707107  amin  1  amax  2
2  mean  3.5  std  0.707107  amin  3  amax  4

(continues on next page)
New behavior:

```
In [97]: df = pd.DataFrame({'A': [1, 1, 2, 2], 'B': [1, 2, 3, 4]})

In [98]: df.groupby('A').describe()
Out[98]:
                   B
        count    mean   std     min    25%  50%   75%    max
    A  
    1  2.0  1.5  0.707107  1.0  1.25  1.5  1.75   2.0
    2  2.0  3.5  0.707107  3.0  3.25  3.5  3.75   4.0

[2 rows x 8 columns]
```

```
In [99]: df.groupby('A').agg([np.mean, np.std, np.min, np.max])
Out[99]:
                   B
                      mean   std  amin  amax
    A  
    1  1.5  0.707107  1.0   2.0
    2  3.5  0.707107  3.0   4.0

[2 rows x 4 columns]
```

**Window binary corr/cov operations return a MultiIndex DataFrame**

A binary window operation, like `corr()` or `cov()`, when operating on a `.rolling(...)`, `.expanding(...)`, or `.ewm(...)` object, will now return a 2-level MultiIndexed DataFrame rather than a `Panel`, as `Panel` is now deprecated, see here. These are equivalent in function, but a MultiIndexed DataFrame enjoys more support in pandas. See the section on **Windowed Binary Operations** for more information. (GH15677)

```
In [100]: np.random.seed(1234)

In [101]: df = pd.DataFrame(np.random.rand(100, 2),
                   columns=pd.Index(['A', 'B'], name='bar'),
                   index=pd.date_range('20160101', periods=100, freq='D', name='foo'))

In [102]: df.tail()
Out[102]:
    bar    A    B
   foo
2016-04-05  0.640880  0.126205
2016-04-06  0.171465  0.737086
2016-04-07  0.127029  0.369650
2016-04-08  0.604334  0.103104
2016-04-09  0.802374  0.945553
```
Previous behavior:

```
In [2]: df.rolling(12).corr()
Out[2]:
<class 'pandas.core.panel.Panel'>
Dimensions: 100 (items) x 2 (major_axis) x 2 (minor_axis)
Items axis: 2016-01-01 00:00:00 to 2016-04-09 00:00:00
Major_axis axis: A to B
Minor_axis axis: A to B
```

New behavior:

```
In [103]: res = df.rolling(12).corr()
In [104]: res.tail()
Out[104]:
bar       A   B
foo       A   B
2016-04-07 1  0.132090  1.000000
2016-04-08 1  0.145775  1.000000
2016-04-09 1  0.119645  1.000000
```

Retrieving a correlation matrix for a cross-section

```
In [105]: df.rolling(12).corr().loc['2016-04-07']
Out[105]:
bar     A   B
foo     A   B
2016-04-07 1  0.132090  1.000000
```

**HDFStore where string comparison**

In previous versions most types could be compared to string column in a HDFStore usually resulting in an invalid comparison, returning an empty result frame. These comparisons will now raise a TypeError (GH15492)

```
In [106]: df = pd.DataFrame({'unparsed_date': ['2014-01-01', '2014-01-01']})
In [107]: df.to_hdf('store.h5', 'key', format='table', data_columns=True)
In [108]: df.dtypes
Out[108]:
unparsed_date     object
Length: 1, dtype: object
```
Previous behavior:

```python
In [4]: pd.read_hdf('store.h5', 'key', where='unparsed_date > ts')
File "<string>", line 1
    (unparsed_date > 1970-01-01 00:00:01.388552400)
^  
SyntaxError: invalid token
```

New behavior:

```python
In [18]: ts = pd.Timestamp('2014-01-01')
In [19]: pd.read_hdf('store.h5', 'key', where='unparsed_date > ts')
```

```python
TypeError: Cannot compare 2014-01-01 00:00:00 of type <class 'pandas.tslib.Timestamp'> to string column
```

**Index.intersection and inner join now preserve the order of the left Index**

`Index.intersection()` now preserves the order of the calling Index (left) instead of the other Index (right) (GH15582). This affects inner joins, `DataFrame.join()` and `merge()`, and the `.align` method.

- **Index.intersection**

  ```python
  In [109]: left = pd.Index([2, 1, 0])
  In [110]: left
  Out[110]: Int64Index([2, 1, 0], dtype='int64')
  In [111]: right = pd.Index([1, 2, 3])
  In [112]: right
  Out[112]: Int64Index([1, 2, 3], dtype='int64')
  Previous behavior:
  In [4]: left.intersection(right)
  Out[4]: Int64Index([1, 2], dtype='int64')
  New behavior:
  In [113]: left.intersection(right)
  Out[113]: Int64Index([2, 1], dtype='int64')
  ```

- **DataFrame.join and pd.merge**

  ```python
  In [114]: left = pd.DataFrame({'a': [20, 10, 0]}, index=[2, 1, 0])
  In [115]: left
  Out[115]:
  a
  2  20
  1  10
  0  0
  ```

(continues on next page)
In [116]: right = pd.DataFrame({'b': [100, 200, 300], index=[1, 2, 3])

In [117]: right
Out[117]:
     b
1  100
2  200
3  300

Previous behavior:

In [4]: left.join(right, how='inner')
Out[4]:
     a  b
1  10 100
2  20 200

New behavior:

In [118]: left.join(right, how='inner')
Out[118]:
     a  b
2  20 200
1  10 100

Pivot table always returns a DataFrame

The documentation for `pivot_table()` states that a DataFrame is always returned. Here a bug is fixed that allowed this to return a Series under certain circumstance. (GH4386)

In [119]: df = pd.DataFrame({'col1': [3, 4, 5],
    ...:        'col2': ['C', 'D', 'E'],
    ...:        'col3': [1, 3, 9]})

In [120]: df
Out[120]:
     col1 col2  col3
0     3      C     1
1     4      D     3
2     5      E     9

Previous behavior:
In [2]: df.pivot_table('col1', index=['col3', 'col2'], aggfunc=np.sum)
Out[2]:
col3  col2
1   C   3
3   D   4
9   E   5
Name: col1, dtype: int64

New behavior:
In [121]: df.pivot_table('col1', index=['col3', 'col2'], aggfunc=np.sum)
Out[121]:
col1
col3  col2
1   C   3
3   D   4
9   E   5
[3 rows x 1 columns]

Other API changes

- `numexpr` version is now required to be >= 2.4.6 and it will not be used at all if this requisite is not fulfilled (GH15213).
- `CParseError` has been renamed to `ParserError` in `pd.read_csv()` and will be removed in the future (GH12665)
- `SparseArray.cumsum()` and `SparseSeries.cumsum()` will now always return `SparseArray` and `SparseSeries` respectively (GH12855)
- `DataFrame.applymap()` with an empty `DataFrame` will return a copy of the empty `DataFrame` instead of a `Series` (GH8222)
- `Series.map()` now respects default values of dictionary subclasses with a `__missing__` method, such as `collections.Counter` (GH15999)
- `.loc` has compat with `.ix` for accepting iterators, and NamedTuples (GH15120)
- `interpolate()` and `fillna()` will raise a `ValueError` if the `limit` keyword argument is not greater than 0. (GH9217)
- `pd.read_csv()` will now issue a `ParserWarning` whenever there are conflicting values provided by the dialect parameter and the user (GH14898)
- `pd.read_csv()` will now raise a `ValueError` for the C engine if the quote character is larger than one byte (GH11592)
- `inplace` arguments now require a boolean value, else a `ValueError` is thrown (GH14189)
- `pandas.api.types.is_datetime64_ns_dtype` will now report `True` on a tz-aware dtype, similar to `pandas.api.types.is_datetime64_any_dtype`
- `DataFrame.asof()` will return a null filled `Series` instead the scalar `NaN` if a match is not found (GH15118)
- Specific support for `copy.copy()` and `copy.deepcopy()` functions on `NDFrame` objects (GH15444)
- `Series.sort_values()` accepts a one element list of bool for consistency with the behavior of `DataFrame.sort_values()` (GH15604)
• `.merge()` and `.join()` on category dtype columns will now preserve the category dtype when possible (GH10409)

• `SparseDataFrame.default_fill_value` will be 0, previously was `nan` in the return from `pd.get_dummies(..., sparse=True)` (GH15594)

• The default behaviour of `Series.str.match` has changed from extracting groups to matching the pattern. The extracting behaviour was deprecated since pandas version 0.13.0 and can be done with the `Series.str.extract` method (GH5224). As a consequence, the `as_indexer` keyword is ignored (no longer needed to specify the new behaviour) and is deprecated.

• `NaT` will now correctly report `False` for datetimelike boolean operations such as `is_month_start` (GH15781)

• `NaT` will now correctly return `np.nan` for `Timedelta` and `Period` accessors such as `days` and `quarter` (GH15782)

• `NaT` will now returns `NaT` for `tz_localize` and `tz_convert` methods (GH15830)

• `DataFrame` and `Panel` constructors with invalid input will now raise `ValueError` rather than `PandasError`, if called with scalar inputs and not axes (GH15541)

• `DataFrame` and `Panel` constructors with invalid input will now raise `ValueError` rather than `pandas.core.common.PandasError`, if called with scalar inputs and not axes; The exception `PandasError` is removed as well. (GH15541)

• The exception `pandas.core.common.AmbiguousIndexError` is removed as it is not referenced (GH15541)

Reorganization of the library: privacy changes

Modules privacy has changed

Some formerly public python/c/c++/cython extension modules have been moved and/or renamed. These are all removed from the public API. Furthermore, the `pandas.core`, `pandas.compat`, and `pandas.util` top-level modules are now considered to be PRIVATE. If indicated, a deprecation warning will be issued if you reference these modules. (GH12588)
Some new subpackages are created with public functionality that is not directly exposed in the top-level namespace: pandas.errors, pandas.plotting and pandas.testing (more details below). Together with pandas.api.types and certain functions in the pandas.io and pandas.tseries submodules, these are now the public subpackages.

Further changes:

- The function `union_categoricals()` is now importable from pandas.api.types, formerly from pandas.types.concat (GH15998)
- The type import pandas.tslib.NaTType is deprecated and can be replaced by using `type(pandas.NaT)` (GH16146)
- The public functions in pandas.tools.hashing deprecated from that locations, but are now importable from pandas.util (GH16223)
- The modules in pandas.util: decorators, print_versions, doctools, validators, depr_module are now private. Only the functions exposed in pandas.util itself are public (GH16223)

**pandas.errors**

We are adding a standard public module for all pandas exceptions & warnings pandas.errors. (GH14800). Previously these exceptions & warnings could be imported from pandas.core.common or pandas.io.common. These exceptions and warnings will be removed from the *.common locations in a future release. (GH15541)

The following are now part of this API:

```python
['DtypeWarning',
 'EmptyDataError',
]
```

(continues on next page)
pandas: powerful Python data analysis toolkit, Release 1.2.5

(...continued from previous page)

'OutOfBoundsDatetime',
'ParserError',
'ParserWarning',
'PerformanceWarning',
'UnsortedIndexError',
'UnsupportedFunctionCall']

pandas.testing

We are adding a standard module that exposes the public testing functions in pandas.testing (GH9895). Those functions can be used when writing tests for functionality using pandas objects.

The following testing functions are now part of this API:

- testing.assert_frame_equal()
- testing.assert_series_equal()
- testing.assert_index_equal()

pandas.plotting

A new public pandas.plotting module has been added that holds plotting functionality that was previously in either pandas.tools.plotting or in the top-level namespace. See the deprecations sections for more details.

Other development changes

- Building pandas for development now requires cython >= 0.23 (GH14831)
- Require at least 0.23 version of cython to avoid problems with character encodings (GH14699)
- Switched the test framework to use pytest (GH13097)
- Reorganization of tests directory layout (GH14854, GH15707).

Deprecations

Deprecate .ix

The .ix indexer is deprecated, in favor of the more strict .iloc and .loc indexers. .ix offers a lot of magic on the inference of what the user wants to do. To wit, .ix can decide to index positionally OR via labels, depending on the data type of the index. This has caused quite a bit of user confusion over the years. The full indexing documentation is here. (GH14218)

The recommended methods of indexing are:

- .iloc if you want to label index
- .loc if you want to positionally index.

Using .ix will now show a DeprecationWarning with a link to some examples of how to convert code here.
Previous behavior, where you wish to get the 0th and the 2nd elements from the index in the ‘A’ column.

Using .ix. Here we will select the appropriate indexes from the index, then use label indexing.

```
In [3]: df.ix[[0, 2], 'A']
Out[3]:
   1
 a 1
 c 3
Name: A, dtype: int64
```

Using .loc. Here we will select the appropriate indexes from the index, then use label indexing.

```
In [124]: df.loc[df.index[[0, 2]], 'A']
Out[124]:
   1
 a 1
 c 3
Name: A, Length: 2, dtype: int64
```

Using .iloc. Here we will get the location of the ‘A’ column, then use positional indexing to select things.

```
In [125]: df.iloc[[0, 2], df.columns.get_loc('A')]
Out[125]:
   1
 a 1
 c 3
Name: A, Length: 2, dtype: int64
```

Deprecate Panel

Panel is deprecated and will be removed in a future version. The recommended way to represent 3-D data are with a MultiIndex on a DataFrame via the to_frame() or with the xarray package. pandas provides a to_xarray() method to automate this conversion (GH13563).

```
In [133]: import pandas._testing as tm
In [134]: p = tm.makePanel()
In [135]: p
Out[135]:
<class 'pandas.core.panel.Panel'>
Dimensions: 3 (items) x 3 (major_axis) x 4 (minor_axis)
```
Convert to a MultiIndex DataFrame

```
In [136]: p.to_frame()
Out[136]:
       ItemA    ItemB    ItemC
major minor
2000-01-03 A  0.628776 -1.409432  0.209395
         B  0.988138 -1.347533 -0.896581
         C -0.938153  1.272395 -0.161137
         D -0.223019 -0.591863 -1.051539
2000-01-04 A  0.186494  1.422986 -0.592886
         B -0.072608  0.363565  1.104352
         C -1.239072 -1.449567  0.889157
         D  2.123692 -0.414505 -0.319561
2000-01-05 A  0.952478 -2.147855 -1.473116
         B -0.550603 -0.014752 -0.431550
         C  0.139683 -1.195524  0.288377
         D  0.122273 -1.425795 -0.619993
[12 rows x 3 columns]
```

Convert to an xarray DataArray

```
In [137]: p.to_xarray()
Out[137]:
<xarray.DataArray (items: 3, major_axis: 3, minor_axis: 4)>

* minor_axis (minor_axis) object 'A' 'B' 'C' 'D'
```
**Deprecate groupby.agg() with a dictionary when renaming**

The `.groupby()..agg()..rolling()..agg()..` and `.resample()..agg()` syntax can accept a variable of inputs, including scalars, list, and a dict of column names to scalars or lists. This provides a useful syntax for constructing multiple (potentially different) aggregations.

However, `.agg()` can also accept a dict that allows 'renaming' of the result columns. This is a complicated and confusing syntax, as well as not consistent between `Series` and `DataFrame`. We are deprecating this 'renaming' functionality.

- We are deprecating passing a dict to a grouped/rolled/resampled `Series`. This allowed one to `rename` the resulting aggregation, but this had a completely different meaning than passing a dictionary to a grouped `DataFrame`, which accepts column-to-aggregations.
- We are deprecating passing a dict-of-hicts to a grouped/rolled/resampled `DataFrame` in a similar manner.

This is an illustrative example:

```
In [126]: df = pd.DataFrame({'A': [1, 1, 1, 2, 2],
                      'B': range(5),
                      'C': range(5))

In [127]: df.groupby('A').agg({'B': 'sum', 'C': 'min'})
```

Here's an example of the first deprecation, passing a dict to a grouped `Series`. This is a combination aggregation & renaming:

```
In [6]: df.groupby('A').agg({'foo': 'count'})
```

FutureWarning: using a dict on a Series for aggregation is deprecated and will be removed in a future version
foo
A
  1  3
  2  2

You can accomplish the same operation, more idiomatically by:

```
In [129]: df.groupby('A').B.agg(['count']).rename(columns={'count': 'foo'})
Out[129]:
foo
A
  1  3
  2  2
[2 rows x 1 columns]
```

Here's an example of the second deprecation, passing a dict-of-dict to a grouped DataFrame:

```
In [23]: (df.groupby('A')
    ...: .agg({'B': {'foo': 'sum', 'C': 'min'}})
    ...: ).rename(columns={'B': 'foo', 'C': 'bar'})
```

```
FutureWarning: using a dict with renaming is deprecated and
will be removed in a future version
```

```
Out[23]:
   B   C
foo  bar
A
  1  3  0
  2  7  3
```

You can accomplish nearly the same by:

```
In [130]: (df.groupby('A')
    ...: .agg({'B': 'sum', 'C': 'min'})
    ...: .rename(columns={'B': 'foo', 'C': 'bar'})
    ...: )
```

```
Out[130]:
   foo  bar
A
  1  3  0
  2  7  3
[2 rows x 2 columns]
```
Depricate .plotting

The pandas.tools.plotting module has been deprecated, in favor of the top level pandas.plotting module. All the public plotting functions are now available from pandas.plotting (GH12548).

Furthermore, the top-level pandas.scatter_matrix and pandas.plot_params are deprecated. Users can import these from pandas.plotting as well.

Previous script:

```python
pd.tools.plotting.scatter_matrix(df)
pd.scatter_matrix(df)
```

Should be changed to:

```python
pd.plotting.scatter_matrix(df)
```

Other deprecations

- `SparseArray.to_dense()` has deprecated the `fill` parameter, as that parameter was not being respected (GH14647)
- `SparseSeries.to_dense()` has deprecated the `sparse_only` parameter (GH14647)
- `Series.repeat()` has deprecated the `reps` parameter in favor of `repeats` (GH12662)
- The `Series` constructor and `.astype` method have deprecated accepting timestamp dtypes without a frequency (e.g. `np.datetime64`) for the `dtype` parameter (GH15524)
- `Index.repeat()` and `MultiIndex.repeat()` have deprecated the `n` parameter in favor of `repeats` (GH12662)
- `Categorical.searchsorted()` and `Series.searchsorted()` have deprecated the `v` parameter in favor of `value` (GH12662)
- `TimedeltaIndex.searchsorted()`, `DatetimeIndex.searchsorted()`, and `PeriodIndex.searchsorted()` have deprecated the `key` parameter in favor of `value` (GH12662)
- `DataFrame.astype()` has deprecated the `raise_on_error` parameter in favor of `errors` (GH14878)
- `Series.sortlevel` and `DataFrame.sortlevel` have been deprecated in favor of `Series.sort_index` and `DataFrame.sort_index` (GH15099)
- importing `concat` from pandas.tools.merge has been deprecated in favor of imports from the pandas namespace. This should only affect explicit imports (GH15358)
- `Series/DataFrame/Panel.consolidate()` been deprecated as a public method. (GH15483)
- The `as_indexer` keyword of `Series.str.match()` has been deprecated (ignored keyword) (GH15257).
- The following top-level pandas functions have been deprecated and will be removed in a future version (GH13790, GH15940)
  - `pd.pnow()`, replaced by `Period.now()`
  - `pd.Term`, is removed, as it is not applicable to user code. Instead use in-line string expressions in the where clause when searching in HDFStore
  - `pd.Expr`, is removed, as it is not applicable to user code.
  - `pd.match()`, is removed.
- `pd.groupby()`, replaced by using the `.groupby()` method directly on a `Series/DataFrame`
- `pd.get_store()`, replaced by a direct call to `pd.HDFStore(...)`

- `is_any_int_dtypes`, `is_floating_dtypes`, and `is_sequence` are deprecated from `pandas.api.types` (GH16042)

**Removal of prior version deprecations/changes**

- The `pandas.rpy` module is removed. Similar functionality can be accessed through the `rpy2` project. See the R interfacing docs for more details.
- The `pandas.io.ga` module with a `google-analytics` interface is removed (GH11308). Similar functionality can be found in the `Google2Pandas` package.
- `pd.to_datetime` and `pd.to_timedelta` have dropped the `coerce` parameter in favor of `errors` (GH13602)
- `pandas.stats.fama_macbeth`, `pandas.stats.ols`, `pandas.stats.plm` and `pandas.stats.var`, as well as the top-level `pandas.fama_macbeth` and `pandas.ols` routines are removed. Similar functionality can be found in the `statsmodels` package. (GH11898)
- The `TimeSeries` and `SparseTimeSeries` classes, aliases of `Series` and `SparseSeries`, are removed (GH10890, GH15098).
- `Series.is_time_series` is dropped in favor of `Series.index.is_all_dates` (GH15098)
- The deprecated `irow`, `icol`, `iget` and `iget_value` methods are removed in favor of `iloc` and `iat` as explained [here](GH10711).
- The deprecated `DataFrame.iterkv()` has been removed in favor of `DataFrame.iteritems()` (GH10711)
- The `Categorical` constructor has dropped the `name` parameter (GH10632)
- `Categorical` has dropped support for `NaN` categories (GH10748)
- The `take_last` parameter has been dropped from `duplicated()`, `drop_duplicates()`, `nlargest()`, and `nsmallest()` methods (GH10236, GH10792, GH10920)
- `Series`, `Index`, and `DataFrame` have dropped the `sort` and `order` methods (GH10726)
- Where clauses in `pytables` are only accepted as strings and expressions types and not other data-types (GH12027)
- `DataFrame` has dropped the `combineAdd` and `combineMult` methods in favor of `add` and `mul` respectively (GH10735)

**Performance improvements**

- Improved performance of `pd.wide_to_long()` (GH14779)
- Improved performance of `pd.factorize()` by releasing the GIL with object dtype when inferred as strings (GH14859, GH16057)
- Improved performance of timeseries plotting with an irregular DatetimeIndex (or with `compat_x=True`) (GH15073).
- Improved performance of `groupby().cummin()` and `groupby().cummax()` (GH15048, GH15109, GH15561, GH15635)
- Improved performance and reduced memory when indexing with a `MultiIndex` (GH15245)
- When reading buffer object in `read_sas()` method without specified format, filepath string is inferred rather than buffer object. (GH14947)
• Improved performance of .rank() for categorical data (GH15498)
• Improved performance when using .unstack() (GH15503)
• Improved performance of merge/join on category columns (GH10409)
• Improved performance of drop_duplicates() on bool columns (GH12963)
• Improve performance of pd.core.groupby.GroupBy.apply when the applied function used the .name attribute of the group DataFrame (GH15062).
• Improved performance of iloc indexing with a list or array (GH15504).
• Improved performance of Series.sort_index() with a monotonic index (GH15694)
• Improved performance in pd.read_csv() on some platforms with buffered reads (GH16039)

Bug fixes

Conversion

• Bug in Timestamp.replace now raises TypeError when incorrect argument names are given; previously this raised ValueError (GH15240)
• Bug in Timestamp.replace with compat for passing long integers (GH15030)
• Bug in Timestamp returning UTC based time/date attributes when a timezone was provided (GH13303, GH6538)
• Bug in Timestamp incorrectly localizing timezones during construction (GH11481, GH15777)
• Bug in TimedeltaIndex addition where overflow was being allowed without error (GH14816)
• Bug in TimedeltaIndex raising a ValueError when boolean indexing with loc (GH14946)
• Bug in catching an overflow in Timestamp + Timedelta/Offset operations (GH15126)
• Bug in DatetimeIndex.round() and Timestamp.round() floating point accuracy when rounding by milliseconds or less (GH14440, GH15578)
• Bug in astype() where inf values were incorrectly converted to integers. Now raises error now with astype() for Series and DataFrames (GH14265)
• Bug in DataFrame(...) .apply(to_numeric) when values are of type decimal.Decimal. (GH14827)
• Bug in describe() when passing a numpy array which does not contain the median to the percentiles keyword argument (GH14908)
• Cleaned up PeriodIndex constructor, including raising on floats more consistently (GH13277)
• Bug in using __deepcopy__ on empty NDFrame objects (GH15370)
• Bug in .replace() may result in incorrect dtypes. (GH12747, GH15765)
• Bug in Series.replace and DataFrame.replace which failed on empty replacement dicts (GH15289)
• Bug in Series.replace which replaced a numeric by string (GH15743)
• Bug in Index construction with NaN elements and integer dtype specified (GH15187)
• Bug in Series construction with a datetimetz (GH14928)
• Bug in Series.dt.round() inconsistent behaviour on NaT ‘s with different arguments (GH14940)
• Bug in Series constructor when both copy=True and dtype arguments are provided (GH15125)
• Incorrect dtyped Series was returned by comparison methods (e.g., `lt`, `gt`, ...) against a constant for an empty DataFrame (GH15077)
• Bug in Series.ffill() with mixed dtypes containing tz-aware datetimes. (GH14956)
• Bug in DataFrame.fillna() where the argument `downcast` was ignored when fillna value was of type dict (GH15277)
• Bug in `.asfreq()`, where frequency was not set for empty Series (GH14320)
• Bug in DataFrame construction with nulls and datetimes in a list-like (GH15869)
• Bug in DataFrame.fillna() with tz-aware datetimes (GH15855)
• Bug in is_string_dtype, is_timedelta64_ns_dtype, and is_string_like_dtype in which an error was raised when `None` was passed in (GH15941)
• Bug in the return type of `pd.unique` on a Categorical, which was returning an `ndarray` and not a Categorical (GH15903)
• Bug in Index.to_series() where the index was not copied (and so mutating later would change the original), (GH15949)
• Bug in indexing with partial string indexing with a len-1 DataFrame (GH16071)
• Bug in Series construction where passing invalid dtype didn’t raise an error. (GH15520)

Indexing

• Bug in Index power operations with reversed operands (GH14973)
• Bug in DataFrame.sort_values() when sorting by multiple columns where one column is of type `int64` and contains `NaT` (GH14922)
• Bug in DataFrame.reindex() in which `method` was ignored when passing `columns` (GH14992)
• Bug in DataFrame.loc with indexing a MultiIndex with a Series indexer (GH14730, GH15424)
• Bug in DataFrame.loc with indexing a MultiIndex with a numpy array (GH15434)
• Bug in Series.asof which raised if the series contained all `np.nan` (GH15713)
• Bug in .at when selecting from a tz-aware column (GH15822)
• Bug in Series.where() and DataFrame.where() where array-like conditionals were being rejected (GH15414)
• Bug in Series.where() where TZ-aware data was converted to float representation (GH15701)
• Bug in .loc that would not return the correct dtype for scalar access for a DataFrame (GH11617)
• Bug in output formatting of a MultiIndex when names are integers (GH12223, GH15262)
• Bug in Categorical.searchsorted() where alphabetical instead of the provided categorical order was used (GH14522)
• Bug in Series.iloc where a Categorical object for list-like indexes input was returned, where a Series was expected. (GH14580)
• Bug in DataFrame.isin comparing datetimelike to empty frame (GH15473)
• Bug in .reset_index() when an all NaN level of a MultiIndex would fail (GH6322)
• Bug in .reset_index() when raising error for index name already present in MultiIndex columns (GH16120)
• Bug in creating a MultiIndex with tuples and not passing a list of names; this will now raise ValueError (GH15110)
• Bug in the HTML display with a MultiIndex and truncation (GH14882)
• Bug in the display of .info() where a qualifier (+) would always be displayed with a MultiIndex that contains only non-strings (GH15245)
• Bug in pd.concat() where the names of MultiIndex of resulting DataFrame are not handled correctly when None is presented in the names of MultiIndex of input DataFrame (GH15787)
• Bug in DataFrame.sort_index() and Series.sort_index() where na_position doesn’t work with a MultiIndex (GH14784, GH16604)
• Bug in pd.concat() when combining objects with a CategoricalIndex (GH16111)
• Bug in indexing with a scalar and a CategoricalIndex (GH16123)

IO

• Bug in pd.to_numeric() in which float and unsigned integer elements were being improperly casted (GH14941, GH15005)
• Bug in pd.read_fwf() where the skiprows parameter was not being respected during column width inference (GH11256)
• Bug in pd.read_csv() in which the dialect parameter was not being verified before processing (GH14898)
• Bug in pd.read_csv() in which missing data was being improperly handled with usecols (GH6710)
• Bug in pd.read_csv() in which a file containing a row with many columns followed by rows with fewer columns would cause a crash (GH14125)
• Bug in pd.read_csv() for the C engine where usecols were being indexed incorrectly with parse_dates (GH14792)
• Bug in pd.read_csv() with parse_dates when multi-line headers are specified (GH15376)
• Bug in pd.read_csv() with float_precision='round_trip' which caused a segfault when a text entry is parsed (GH15140)
• Bug in pd.read_csv() when an index was specified and no values were specified as null values (GH15835)
• Bug in pd.read_csv() in which certain invalid file objects caused the Python interpreter to crash (GH15337)
• Bug in pd.read_csv() in which invalid values for nrows and chunksize were allowed (GH15767)
• Bug in pd.read_csv() for the Python engine in which unhelpful error messages were being raised when parsing errors occurred (GH15910)
• Bug in pd.read_csv() in which the skipfooter parameter was not being properly validated (GH15925)
• Bug in pd.read_csv() in which there was numeric overflow when a timestamp index was being written (GH15982)
• Bug in pd.util.hashing.hash_pandas_object() in which hashing of categoricals depended on the ordering of categories, instead of just their values. (GH15143)
• Bug in .to_json() where lines=True and contents (keys or values) contain escaped characters (GH15096)
• Bug in .to_json() causing single byte ascii characters to be expanded to four byte unicode (GH15344)
• Bug in .to_json() for the C engine where rollover was not correctly handled for case where frac is odd and diff is exactly 0.5 (GH15716, GH15864)
pandas: powerful Python data analysis toolkit, Release 1.2.5

- Bug in `pd.read_json()` for Python 2 where `lines=True` and contents contain non-ascii unicode characters (GH15132)
- Bug in `pd.read_msgpack()` in which `Series` categoricals were being improperly processed (GH14901)
- Bug in `pd.read_msgpack()` which did not allow loading of a dataframe with an index of type `CategoricalIndex` (GH15487)
- Bug in `pd.read_msgpack()` when deserializing a `CategoricalIndex` (GH15487)
- Bug in `DataFrame.to_records()` with converting a `DatetimeIndex` with a timezone (GH13937)
- Bug in `DataFrame.to_records()` which failed with unicode characters in column names (GH11879)
- Bug in `.to_sql()` when writing a DataFrame with numeric index names (GH15404).
- Bug in `DataFrame.to_html()` with `index=False` and `max_rows` raising in `IndexError` (GH14998)
- Bug in `pd.read_hdf()` passing a `Timestamp` to the `where` parameter with a non date column (GH15492)
- Bug in `DataFrame.to_stata()` and `StataWriter` which produces incorrectly formatted files to be produced for some locales (GH13856)
- Bug in `StataReader` and `StataWriter` which allows invalid encodings (GH15723)
- Bug in the `Series` repr not showing the length when the output was truncated (GH15962).

**Plotting**

- Bug in `DataFrame.hist` where `plt.tight_layout` caused an `AttributeError` (use `matplotlib >= 2.0.1`) (GH9351)
- Bug in `DataFrame.boxplot` where `fontsize` was not applied to the tick labels on both axes (GH15108)
- Bug in the date and time converters pandas registers with `matplotlib` not handling multiple dimensions (GH16026)
- Bug in `pd.scatter_matrix()` could accept either `color` or `c`, but not both (GH14855)

**GroupBy/resample/rolling**

- Bug in `.groupby(...).resample()` when passed the `on` kwarg. (GH15021)
- Properly set `__name__` and `__qualname__` for `Groupby.*` functions (GH14620)
- Bug in `GroupBy.get_group()` failing with a categorical grouper (GH15155)
- Bug in `.groupby(...).rolling(...)` when `on` is specified and using a `DatetimeIndex` (GH15130, GH13966)
- Bug in `groupby` operations with `timedelta64` when passing `numeric_only=False` (GH5724)
- Bug in `groupby.apply()` coercing `object` dtypes to numeric types, when not all values were numeric (GH14423, GH15421, GH15670)
- Bug in `resample`, where a non-string `loffset` argument would not be applied when resampling a timeseries (GH13218)
- Bug in `DataFrame.groupby().describe()` when grouping on `Index` containing tuples (GH14848)
- Bug in `groupby() .nunique()` with a datetimelike-grouper where bins counts were incorrect (GH13453)
- Bug in `groupby().transform()` that would coerce the resultant dtypes back to the original (GH10972, GH11444)
- Bug in `groupby.agg()` incorrectly localizing timezone on `datetime` (GH15426, GH10668, GH13046)
- Bug in `.rolling/expanding()` functions where `count()` was not counting `np.Inf`, nor handling `object` dtypes (GH12541)
- Bug in `.rolling()` where `pd.Timedelta` or `datetime.timedelta` was not accepted as a window argument (GH15440)
- Bug in `Rolling.quantile` function that caused a segmentation fault when called with a quantile value outside of the range [0, 1] (GH15463)
- Bug in `DataFrame.resample().median()` if duplicate column names are present (GH14233)

**Sparse**

- Bug in `SparseSeries.reindex` on single level with list of length 1 (GH15447)
- Bug in repr-formatting a `SparseDataFrame` after a value was set on (a copy of) one of its series (GH15488)
- Bug in `SparseDataFrame` construction with lists not coercing to dtype (GH15682)
- Bug in sparse array indexing in which indices were not being validated (GH15863)

**Reshaping**

- Bug in `pd.merge_asof()` where `left_index` or `right_index` caused a failure when multiple by was specified (GH15676)
- Bug in `pd.merge_asof()` where `left_index/right_index` together caused a failure when `tolerance` was specified (GH15135)
- Bug in `DataFrame.pivot_table()` where `dropna=True` would not drop all-NaN columns when the columns was a `category` dtype (GH15193)
- Bug in `pd.melt()` where passing a tuple value for `value_vars` caused a `TypeError` (GH15348)
- Bug in `pd.pivot_table()` where no error was raised when values argument was not in the columns (GH14938)
- Bug in `pd.concat()` in which concatenating with an empty dataframe with `join='inner'` was being improperly handled (GH15328)
- Bug with `sort=True` in `DataFrame.join` and `pd.merge` when joining on indexes (GH15582)
- Bug in `DataFrame.nsmallest` and `DataFrame.nlargest` where identical values resulted in duplicated rows (GH15297)
- Bug in `pandas.pivot_table()` incorrectly raising `UnicodeError` when passing unicode input for `margins` keyword (GH13292)

5.9. Version 0.20
**Numeric**

- Bug in `.rank()` which incorrectly ranks ordered categories (GH15420)
- Bug in `.corr()` and `.cov()` where the column and index were the same object (GH14617)
- Bug in `.mode()` where mode was not returned if was only a single value (GH15714)
- Bug in `pd.cut()` with a single bin on an all 0s array (GH15428)
- Bug in `pd.qcut()` with a single quantile and an array with identical values (GH15431)
- Bug in `pandas.tools.utils.cartesian_product()` with large input can cause overflow on windows (GH15265)
- Bug in `.eval()` which caused multi-line evals to fail with local variables not on the first line (GH15342)

**Other**

- Compat with SciPy 0.19.0 for testing on `.interpolate()` (GH15662)
- Compat for 32-bit platforms for `.qcut/cut`; bins will now be int64 dtype (GH14866)
- Bug in interactions with Qt when a QtApplication already exists (GH14372)
- Avoid use of `np.finfo()` during import pandas removed to mitigate deadlock on Python GIL misuse (GH14641)

**Contributors**

A total of 204 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

5.10 Version 0.19

5.10.1 Version 0.19.2 (December 24, 2016)

This is a minor bug-fix release in the 0.19.x series and includes some small regression fixes, bug fixes and performance improvements. We recommend that all users upgrade to this version.

Highlights include:
- Compatibility with Python 3.6
- Added a Pandas Cheat Sheet. (GH13202).

What's new in v0.19.2

- Enhancements
- Performance improvements
- Bug fixes
- Contributors

Enhancements

The `pd.merge_asof()` added in 0.19.0, gained some improvements:
- `pd.merge_asof()` gained `left_index/right_index` and `left_by/right_by` arguments (GH14253)
- `pd.merge_asof()` can take multiple columns in `by` parameter and has specialized dtypes for better performance (GH13936)
Performance improvements

- Performance regression with PeriodIndex (GH14822)
- Performance regression in indexing with getitem (GH14930)
- Improved performance of .replace() (GH12745)
- Improved performance Series creation with a datetime index and dictionary data (GH14894)

Bug fixes

- Compat with python 3.6 for pickling of some offsets (GH14685)
- Compat with python 3.6 for some indexing exception types (GH14684, GH14689)
- Compat with python 3.6 for deprecation warnings in the test suite (GH14681)
- Compat with python 3.6 for Timestamp pickles (GH14689)
- Compat with dateutil==2.6.0; segfault reported in the testing suite (GH14621)
- Allow nanoseconds in Timestamp.replace as a kwarg (GH14621)
- Bug in pd.read_csv in which aliasing was being done for na_values when passed in as a dictionary (GH14203)
- Bug in pd.read_csv in which column indices for a dict-like na_values were not being respected (GH14203)
- Bug in pd.read_csv where reading files fails, if the number of headers is equal to the number of lines in the file (GH14515)
- Bug in pd.read_csv for the Python engine in which an unhelpful error message was being raised when multi-char delimiters were not being respected with quotes (GH14582)
- Fix bugs (GH14734, GH13654) in pd.read_sas and pandas.io.sas.sas7bdat.SAS7BDATReader that caused problems when reading a SAS file incrementally.
- Bug in pd.read_csv for the Python engine in which an unhelpful error message was being raised when skipfooter was not being respected by Python’s CSV library (GH13879)
- Bug in .fillna() in which timezone aware datetime64 values were incorrectly rounded (GH14872)
- Bug in .groupby(..., sort=True) of a non-lexsorted MultiIndex when grouping with multiple levels (GH14776)
- Bug in pd.cut with negative values and a single bin (GH14652)
- Bug in pd.to_numeric where a 0 was not unsigned on a downcast=’unsigned’ argument (GH14401)
- Bug in plotting regular and irregular timeseries using shared axes (sharex=True or ax.twinx()) (GH13341, GH14322).
- Bug in not propagating exceptions in parsing invalid datetimes, noted in python 3.6 (GH14561)
- Bug in resampling a DatetimeIndex in local TZ, covering a DST change, which would raise AmbiguousTimeError (GH14682)
- Bug in indexing that transformed RecursionError into KeyError or IndexError (GH14554)
- Bug in HDFStore when writing a MultiIndex when using data_columns=True (GH14435)
- Bug in HDFStore.append() when writing a Series and passing a min_itemsize argument containing a value for the index (GH11412)
• Bug when writing to a HDFStore in table format with a min_itemsize value for the index and without asking to append (GH10381)
• Bug in Series.groupby.nunique() raising an IndexError for an empty Series (GH12553)
• Bug in DataFrame.nlargest and DataFrame.nsmallest when the index had duplicate values (GH13412)
• Bug in clipboard functions on linux with python2 with unicode and separators (GH13747)
• Bug in clipboard functions on Windows 10 and python 3 (GH14362, GH12807)
• Bug in .to_clipboard() and Excel compat (GH12529)
• Bug in DataFrame.combine_first() for integer columns (GH14687).
• Bug in pd.read_csv() in which the dtype parameter was not being respected for empty data (GH14712)
• Bug in pd.read_csv() in which the nrows parameter was not being respected for large input when using the C engine for parsing (GH7626)
• Bug in pd.merge_asof() could not handle timezone-aware DatetimeIndex when a tolerance was specified (GH14844)
• Explicit check in to_stata and StataWriter for out-of-range values when writing doubles (GH14618)
• Bug in .plot(kind='kde') which did not drop missing values to generate the KDE Plot, instead generating an empty plot. (GH14821)
• Bug in unstack() if called with a list of column(s) as an argument, regardless of the dtypes of all columns, they get coerced to object (GH11847)

5.10.2 Version 0.19.1 (November 3, 2016)

This is a minor bug-fix release from 0.19.0 and includes some small regression fixes, bug fixes and performance improvements. We recommend that all users upgrade to this version.

What’s new in v0.19.1

- **Performance improvements**
- **Bug fixes**
- **Contributors**

Performance improvements

- Fixed performance regression in factorization of `Period` data (GH14338)
- Fixed performance regression in `Series.asof(where)` when `where` is a scalar (GH14461)
- Improved performance in `DataFrame.asof(where)` when `where` is a scalar (GH14461)
- Improved performance in `.to_json()` when `lines=True` (GH14408)
- Improved performance in certain types of `loc` indexing with a MultiIndex (GH14551).
Bug fixes

- Source installs from PyPI will now again work without cython installed, as in previous versions (GH14204)
- Compares with Cython 0.25 for building (GH14496)
- Fixed regression where user-provided file handles were closed in read_csv (c engine) (GH14418).
- Fixed regression in DataFrame.quantile when missing values where present in some columns (GH14357).
- Fixed regression in Index.difference where the freq of a DatetimeIndex was incorrectly set (GH14323)
- Added back pandas.core.common.array_equivalent with a deprecation warning (GH14555).
- Bug in pd.read_csv for the C engine in which quotation marks were improperly parsed in skipped rows (GH14459)
- Bug in pd.read_csv for Python 2.x in which Unicode quote characters were no longer being respected (GH14477)
- Fixed regression in Index.append when categorical indices were appended (GH14545).
- Fixed regression in pd.DataFrame where constructor fails when given dict with None value (GH14381)
- Fixed regression in DatetimeIndex._maybe_cast_slice_bound when index is empty (GH14354).
- Bug in localizing an ambiguous timezone when a boolean is passed (GH14402)
- Bug in TimedeltaIndex addition with a Datetime-like object where addition overflow in the negative direction was not being caught (GH14068, GH14453)
- Bug in string indexing against data with object Index may raise AttributeError (GH14424)
- Correctly raise ValueError on empty input to pd.eval() and df.query() (GH13139)
- Bug in RangeIndex.intersection when result is a empty set (GH14364).
- Bug in groupby-transform broadcasting that could cause incorrect dtype coercion (GH14457)
- Bug in Series._setitem_ which allowed mutating read-only arrays (GH14359).
- Bug in DataFrame.insert where multiple calls with duplicate columns can fail (GH14291)
- pd.merge() will raise ValueError with non-boolean parameters in passed boolean type arguments (GH14434)
- Bug in Timestamp where dates very near the minimum (1677-09) could underflow on creation (GH14415)
- Bug in pd.concat where names of the keys were not propagated to the resulting MultiIndex (GH14252)
- Bug in pd.concat where axis cannot take string parameters 'rows' or 'columns' (GH14369)
- Bug in pd.concat with dataframes heterogeneous in length and tuple keys (GH14438)
- Bug in MultiIndex.set_level where illegal level values were still set after raising an error (GH13754)
- Bug in DataFrame.to_json where lines=True and a value contained a } character (GH14391)
- Bug in df.groupby causing an AttributeError when grouping a single index frame by a column and the index level (GH14327)
- Bug in df.groupby where TypeError raised when pd.Grouper(key=...) is passed in a list (GH14334)
- Bug in pd.pivot_table may raise TypeError or ValueError when index or columns is not scalar and values is not specified (GH14380)

5.10.3 Version 0.19.0 (October 2, 2016)

This is a major release from 0.18.1 and includes number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

Highlights include:

- `merge_asof()` for asof-style time-series joining, see here
- `.rolling()` is now time-series aware, see here
- `read_csv()` now supports parsing Categorical data, see here
- A function `union_categorical()` has been added for combining categoricals, see here
- `PeriodIndex` now has its own period dtype, and changed to be more consistent with other `Index` classes. See here
- Sparse data structures gained enhanced support of int and bool dtypes, see here
- Comparison operations with `Series` no longer ignores the index, see here for an overview of the API changes.
- Introduction of a pandas development API for utility functions, see here.
- Deprecation of `Panel4D` and `PanelND`. We recommend to represent these types of n-dimensional data with the xarray package.
- Removal of the previously deprecated modules `pandas.io.data`, `pandas.io.wb`, `pandas.tools.rplot`.

**Warning:** pandas >= 0.19.0 will no longer silence numpy ufunc warnings upon import, see here.

What's new in v0.19.0

- **New features**
  - Function `merge_asof` for asof-style time-series joining
  - Method `.rolling()` is now time-series aware
  - Method `read_csv` has improved support for duplicate column names
  - Method `read_csv` supports parsing Categorical directly
  - Categorical concatenation
  - Semi-month offsets
  - New Index methods
  - Google BigQuery enhancements
  - Fine-grained NumPy errstate
  - Method `get_dummies` now returns integer dtypes
  - Downcast values to smallest possible dtype in `to_numeric`
  - pandas development API
  - Other enhancements

- **API changes**
Series.tolist() will now return Python types

Series operators for different indexes
* Arithmetic operators
* Comparison operators
* Logical operators
* Flexible comparison methods

Series type promotion on assignment

Function .to_datetime() changes

Merging changes

Method .describe() changes

Period changes
* The PeriodIndex now has period dtype
* Period('NaT') now returns pd.NaT
* PeriodIndex.values now returns array of Period object

Index + / ~ no longer used for set operations

Index.difference and .symmetric_difference changes

Index.unique consistently returns Index

MultiIndex constructors, groupby and set_index preserve categorical dtypes

Function read_csv will progressively enumerate chunks

Sparse changes
* Types int64 and bool support enhancements
* Operators now preserve dtypes
* Other sparse fixes

Indexer dtype changes

Other API changes

Deprecations

Removal of prior version deprecations/changes

Performance improvements

Bug fixes

Contributors
New features

Function merge_asof for asof-style time-series joining

A long-time requested feature has been added through the `merge_asof()` function, to support asof style joining of time-series (GH1870, GH13695, GH13709, GH13902). Full documentation is here.

The `merge_asof()` performs an asof merge, which is similar to a left-join except that we match on nearest key rather than equal keys.

```
In [1]: left = pd.DataFrame({"a": [1, 5, 10], "left_val": ["a", "b", "c"]})
In [2]: right = pd.DataFrame({"a": [1, 2, 3, 6, 7], "right_val": [1, 2, 3, 6, 7]})
In [3]: left
Out[3]:
       a  left_val
0     1      a
1     5      b
2    10      c
[3 rows x 2 columns]

In [4]: right
Out[4]:
       a  right_val
0     1       1
1     2       2
2     3       3
3     6       6
4     7       7
[5 rows x 2 columns]
```

We typically want to match exactly when possible, and use the most recent value otherwise.

```
In [5]: pd.merge_asof(left, right, on="a")
Out[5]:
       a  left_val  right_val
0     1      a       1
1     5      b       3
2    10      c       7
[3 rows x 3 columns]
```

We can also match rows ONLY with prior data, and not an exact match.

```
In [6]: pd.merge_asof(left, right, on="a", allow_exact_matches=False)
Out[6]:
       a  left_val  right_val
0     1      a       NaN
1     5      b       3.0
2    10      c       7.0
```

(continues on next page)
In a typical time-series example, we have trades and quotes and we want to asof-join them. This also illustrates using the by parameter to group data before merging.

```python
In [7]: trades = pd.DataFrame(
    ...:     {
    ...:         "time": pd.to_datetime(
    ...:             [
    ...:             "20160525 13:30:00.023",
    ...:             "20160525 13:30:00.038",
    ...:             "20160525 13:30:00.048",
    ...:             "20160525 13:30:00.048",
    ...:             "20160525 13:30:00.048",
    ...:             "20160525 13:30:00.048",
    ...:             ],
    ...:         ),
    ...:         "ticker": ["MSFT", "MSFT", "GOOG", "GOOG", "AAPL"],
    ...:         "price": [51.95, 51.95, 720.77, 720.92, 98.00],
    ...:         "quantity": [75, 155, 100, 100, 100],
    ...:     },
    ...:     columns=["time", "ticker", "price", "quantity"],
    ...: )

In [8]: quotes = pd.DataFrame(
    ...:     {
    ...:         "time": pd.to_datetime(
    ...:             [
    ...:             "20160525 13:30:00.023",
    ...:             "20160525 13:30:00.023",
    ...:             "20160525 13:30:00.030",
    ...:             "20160525 13:30:00.041",
    ...:             "20160525 13:30:00.048",
    ...:             "20160525 13:30:00.049",
    ...:             "20160525 13:30:00.072",
    ...:             "20160525 13:30:00.075",
    ...:             ],
    ...:         ),
    ...:         "ticker": ["GOOG", "MSFT", "MSFT", "MSFT", "GOOG", "AAPL", "GOOG", "MSFT"],
    ...:         "bid": [720.50, 51.95, 51.97, 51.99, 720.50, 97.99, 720.50, 52.01],
    ...:         "ask": [720.93, 51.96, 51.98, 52.00, 720.93, 98.01, 720.88, 52.03],
    ...:     },
    ...:     columns=["time", "ticker", "bid", "ask"],
    ...: )
```

```python
In [9]: trades
Out[9]:
   time  ticker  price  quantity
0  2016-05-25 13:30:00.023   MSFT    51.95     75
```
An asof merge joins on the `on`, typically a datetimelike field, which is ordered, and in this case we are using a grouper in the `by` field. This is like a left-outer join, except that forward filling happens automatically taking the most recent non-NaN value.

```python
In [11]: pd.merge_asof(trades, quotes, on="time", by="ticker")
Out[11]:
     time    ticker  price  quantity bid  ask
0 2016-05-25 13:30:00.023  MSFT  51.95      75  51.95  51.96
1 2016-05-25 13:30:00.038  MSFT  51.95     155  51.97  51.98
2 2016-05-25 13:30:00.048  GOOG  720.77     100  720.50  720.93
3 2016-05-25 13:30:00.048  GOOG  720.92     100  720.50  720.93
4 2016-05-25 13:30:00.049  AAPL  97.99     100  NaN    NaN
5 2016-05-25 13:30:00.072  GOOG  720.50     100  720.50  720.88
6 2016-05-25 13:30:00.075  MSFT  52.01     100  52.01  52.03
```

This returns a merged DataFrame with the entries in the same order as the original left passed DataFrame (`trades` in this case), with the fields of the `quotes` merged.

**Method .rolling() is now time-series aware**

`.rolling()` objects are now time-series aware and can accept a time-series offset (or convertible) for the `window` argument (GH13327, GH12995). See the full documentation [here](#).

```python
In [12]: dft = pd.DataFrame(
    .....:     .....:               {"B": [0, 1, 2, np.nan, 4]},
    .....:               index=pd.date_range("20130101 09:00:00", periods=5, freq="s"),
    .....:               )
    .....:               
In [13]: dft
```
This is a regular frequency index. Using an integer window parameter works to roll along the window frequency.

```
In [14]: dft.rolling(2).sum()
Out[14]:
   B
2013-01-01 09:00:00  NaN
2013-01-01 09:00:01  1.0
2013-01-01 09:00:02  3.0
2013-01-01 09:00:03  NaN
2013-01-01 09:00:04  NaN
```

```
In [15]: dft.rolling(2, min_periods=1).sum()
Out[15]:
   B
2013-01-01 09:00:00  0.0
2013-01-01 09:00:01  1.0
2013-01-01 09:00:02  3.0
2013-01-01 09:00:03  2.0
2013-01-01 09:00:04  4.0
```

Specifying an offset allows a more intuitive specification of the rolling frequency.

```
In [16]: dft.rolling("2s").sum()
Out[16]:
   B
2013-01-01 09:00:00  0.0
2013-01-01 09:00:01  1.0
2013-01-01 09:00:02  3.0
2013-01-01 09:00:03  2.0
2013-01-01 09:00:04  4.0
```

Using a non-regular, but still monotonic index, rolling with an integer window does not impart any special calculation.
In [18]: dft
Out[18]:
          B
    foo
2013-01-01 09:00:00  0.0
2013-01-01 09:00:02  1.0
2013-01-01 09:00:03  2.0
2013-01-01 09:00:05  NaN
2013-01-01 09:00:06  4.0

[5 rows x 1 columns]

In [19]: dft.rolling(2).sum()
Out[19]:
          B
    foo
2013-01-01 09:00:00  NaN
2013-01-01 09:00:02  1.0
2013-01-01 09:00:03  3.0
2013-01-01 09:00:05  NaN
2013-01-01 09:00:06  NaN

[5 rows x 1 columns]

Using the time-specification generates variable windows for this sparse data.

In [20]: dft.rolling("2s").sum()
Out[20]:
          B
    foo
2013-01-01 09:00:00  0.0
2013-01-01 09:00:02  1.0
2013-01-01 09:00:03  3.0
2013-01-01 09:00:05  NaN
2013-01-01 09:00:06  4.0

[5 rows x 1 columns]

Furthermore, we now allow an optional on parameter to specify a column (rather than the default of the index) in a DataFrame.
```
In [21]: dft = dft.reset_index()

In [22]: dft
Out[22]:
   foo   B
0  2013-01-01 09:00:00  0.0
1  2013-01-01 09:00:02  1.0
2  2013-01-01 09:00:03  2.0
3  2013-01-01 09:00:05  NaN
4  2013-01-01 09:00:06  4.0

[5 rows x 2 columns]

In [23]: dft.rolling("2s", on="foo").sum()
Out[23]:
   foo   B
0  2013-01-01 09:00:00  0.0
1  2013-01-01 09:00:02  1.0
2  2013-01-01 09:00:03  3.0
3  2013-01-01 09:00:05  NaN
4  2013-01-01 09:00:06  4.0

[5 rows x 2 columns]
```

**Method read_csv has improved support for duplicate column names**

Duplicate column names are now supported in `read_csv()` whether they are in the file or passed in as the names parameter (GH7160, GH9424)

```
In [24]: data = "0,1,2

   3,4,5"

In [25]: names = ["a", "b", "a"]

Previous behavior:

```
In [2]: pd.read_csv(StringIO(data), names=names)
Out[2]:
 a  b  a
 0  2  1  2
 1  5  4  5
```

The first a column contained the same data as the second a column, when it should have contained the values [0, 3].

**New behavior:**

```
In [26]: pd.read_csv(StringIO(data), names=names)
---------------------------------------------------------------------------
ValueError                         Traceback (most recent call last)
<ipython-input-26-a095135d9435> in <module>
----> 1 pd.read_csv(StringIO(data), names=names)
/pandas/pandas/io/parsers.py in read_csv(filepath_or_buffer, sep, delimiter, header, names, index_col, usecols, squeeze, prefix, mangle_dupe_cols, dtypes, engine, converters, true_values, false_values, skipinitialspace, skiprows, skipfooter, nrows, na_values, keep_default_na, na_filter, verbose, skip_blank_lines, parse_dates, infer_datetime_format, keep_date_col, date_parser, dayfirst, cache_dates, iterator, chunksize, compression, thousands, decimal, lineterminator, quotechar, quoting, doublequote, escapechar, comment, encoding, dialect, error_bad_lines, warn_bad_lines, delim_whitespace, low_memory, memory_map, float_precision, storage_options)
```

Method read_csv supports parsing Categorical directly

The read_csv() function now supports parsing a Categorical column when specified as a dtype (GH10153). Depending on the structure of the data, this can result in a faster parse time and lower memory usage compared to converting to Categorical after parsing. See the io docs here.
Individual columns can be parsed as a Categorical using a dict specification

```
In [31]: pd.read_csv(StringIO(data), dtype={"col1": "category"}).dtypes
Out[31]:
col1 category
col2 object
col3 int64
Length: 3, dtype: object
```

Note: The resulting categories will always be parsed as strings (object dtype). If the categories are numeric they can be converted using the to_numeric() function, or as appropriate, another converter such as to_datetime().

```
In [32]: df = pd.read_csv(StringIO(data), dtype="category")

In [33]: df.dtypes
Out[33]:
col1 category
col2 category
col3 category
Length: 3, dtype: object

In [34]: df["col3"]
Out[34]:
0   1
1   2
2   3
Name: col3, Length: 3, dtype: category
Categories (3, object): ['1', '2', '3']

In [35]: df["col3"].cat.categories = pd.to_numeric(df["col3"].cat.categories)

In [36]: df["col3"]
Out[36]:
0   1
1   2
2   3
Name: col3, Length: 3, dtype: category
Categories (3, int64): [1, 2, 3]
```
Categorical concatenation

- A function `union_categoricals()` has been added for combining categoricals, see *Unioning Categoricals* (GH13361, GH13763, GH13846, GH14173)

```
In [37]: from pandas.api.types import union_categoricals
In [38]: a = pd.Categorical(["b", "c"])
In [39]: b = pd.Categorical(["a", "b")
In [40]: union_categoricals([a, b])
Out[40]:
['b', 'c', 'a', 'b']
Categories (3, object): ['b', 'c', 'a']
```

- `concat` and `append` now can concat category dtypes with different categories as object dtype (GH13524)

```
In [41]: s1 = pd.Series(["a", "b"], dtype="category")
In [42]: s2 = pd.Series(["b", "c"], dtype="category")
```

Previous behavior:

```
In [1]: pd.concat([s1, s2])
ValueError: incompatible categories in categorical concat
```

New behavior:

```
In [43]: pd.concat([s1, s2])
Out[43]:
0  a
1  b
0  b
1  c
Length: 4, dtype: object
```

Semi-month offsets

pandas has gained new frequency offsets, `SemiMonthEnd('SM')` and `SemiMonthBegin('SMS')`. These provide date offsets anchored (by default) to the 15th and end of month, and 15th and 1st of month respectively. (GH1543)

```
In [44]: from pandas.tseries.offsets import SemiMonthEnd, SemiMonthBegin
```

SemiMonthEnd:

```
In [45]: pd.Timestamp("2016-01-01") + SemiMonthEnd()
Out[45]: Timestamp('2016-01-15 00:00:00')
```

```
In [46]: pd.date_range("2015-01-01", freq="SM", periods=4)
```
SemiMonthBegin:

```python
In [47]: pd.Timestamp("2016-01-01") + SemiMonthBegin()
Out[47]: Timestamp('2016-01-15 00:00:00')
```

```python
In [48]: pd.date_range("2015-01-01", freq="SMS", periods=4)
```

Using the anchoring suffix, you can also specify the day of month to use instead of the 15th.

```python
In [49]: pd.date_range("2015-01-01", freq="SMS-16", periods=4)
Out[49]: DatetimeIndex(['2015-01-01', '2015-01-16', '2015-02-01', '2015-02-16'], dtype='datetime64[ns]', freq='SMS-16')
```

```python
In [50]: pd.date_range("2015-01-01", freq="SM-14", periods=4)
Out[50]: DatetimeIndex(['2015-01-14', '2015-01-31', '2015-02-14', '2015-02-28'], dtype='datetime64[ns]', freq='SM-14')
```

New Index methods

The following methods and options are added to Index, to be more consistent with the Series and DataFrame API.

Index now supports the .where() function for same shape indexing (GH13170)

```python
In [51]: idx = pd.Index(["a", "b", "c"])
In [52]: idx.where([True, False, True])
Out[52]: Index(['a', nan, 'c'], dtype=object)
```

Index now supports .dropna() to exclude missing values (GH6194)

```python
In [53]: idx = pd.Index([1, 2, np.nan, 4])
In [54]: idx.dropna()
Out[54]: Float64Index([1.0, 2.0, 4.0], dtype='float64')
```

For MultiIndex, values are dropped if any level is missing by default. Specifying how='all' only drops values where all levels are missing.

```python
In [55]: midx = pd.MultiIndex.from_arrays([[1, 2, np.nan, 4], [1, 2, np.nan, np.nan]])
In [56]: midx
Out[56]: MultiIndex([(1.0, 1.0),
  (2.0, 2.0),
  (nan, nan),
  (4.0, nan)],
  )
In [57]: midx.dropna()
Out[57]: MultiIndex([(1, 1),
  (4, 2)],
  )
```

(continues on next page)
Index now supports .str.extractall() which returns a DataFrame, see the docs here (GH10008, GH13156)

```python
In [59]: idx = pd.Index(['a1a2', 'b1', 'c1'])
In [60]: idx.str.extractall(r'\[ab\](?P<digit>\d)')
Out[60]:
          digit
    match
   0   1
   1   2
   1   1
[3 rows x 1 columns]
```

Index.astype() now accepts an optional boolean argument copy, which allows optional copying if the requirements on dtype are satisfied (GH13209)

**Google BigQuery enhancements**

- The `read_gbq()` method has gained the dialect argument to allow users to specify whether to use BigQuery’s legacy SQL or BigQuery’s standard SQL. See the docs for more details (GH13615).
- The `to_gbq()` method now allows the DataFrame column order to differ from the destination table schema (GH11359).

**Fine-grained NumPy errstate**

Previous versions of pandas would permanently silence numpy’s ufunc error handling when pandas was imported. pandas did this in order to silence the warnings that would arise from using numpy ufuncs on missing data, which are usually represented as NaNs. Unfortunately, this silenced legitimate warnings arising in non-pandas code in the application. Starting with 0.19.0, pandas will use the `numpy.errstate` context manager to silence these warnings in a more fine-grained manner, only around where these operations are actually used in the pandas code base. (GH13109, GH13145)

After upgrading pandas, you may see new `RuntimeWarning` being issued from your code. These are likely legitimate, and the underlying cause likely existed in the code when using previous versions of pandas that simply silenced the warning. Use `numpy.errstate` around the source of the `RuntimeWarning` to control how these conditions are handled.
Method `get_dummies` now returns integer dtypes

The `pd.get_dummies` function now returns dummy-encoded columns as small integers, rather than floats (GH8725). This should provide an improved memory footprint.

**Previous behavior:**

```python
In [1]: pd.get_dummies(['a', 'b', 'a', 'c']).dtypes
Out[1]:
    a    float64
    b    float64
c    float64
dtype: object
```

**New behavior:**

```python
In [61]: pd.get_dummies(['a', 'b', 'a', 'c']).dtypes
Out[61]:
    a    uint8
    b    uint8
c    uint8
Length: 3, dtype: object
```

Downcast values to smallest possible dtype in `to_numeric`

`pd.to_numeric()` now accepts a `downcast` parameter, which will downcast the data if possible to smallest specified numerical dtype (GH13352)

```python
In [62]: s = ['1', 2, 3]
In [63]: pd.to_numeric(s, downcast="unsigned")
Out[63]: array([1, 2, 3], dtype=uint8)
In [64]: pd.to_numeric(s, downcast="integer")
Out[64]: array([1, 2, 3], dtype=int8)
```

**pandas development API**

As part of making pandas API more uniform and accessible in the future, we have created a standard sub-package of pandas, pandas.api to hold public API’s. We are starting by exposing type introspection functions in pandas.api.types. More sub-packages and officially sanctioned API’s will be published in future versions of pandas (GH13147, GH13634)

The following are now part of this API:

```python
In [65]: import pprint
In [66]: from pandas.api import types
In [67]: funcs = [f for f in dir(types) if not f.startswith("_")]  
```
In [68]: pprint.pprint(funcs)
['CategoricalDtype',
'DatetimeTZDtype',
'IntervalDtype',
'PeriodDtype',
'infer_dtype',
'is_array_like',
'is_bool',
'is_bool_dtype',
'is_categorical',
'is_categorical_dtype',
'is_complex',
'is_complex_dtype',
'is_datetime64_any_dtype',
'is_datetime64_dtype',
'is_datetime64_ns_dtype',
'is_datetime64tz_dtype',
'is_dict_like',
'is_dtype_equal',
'is_extension_array_dtype',
'is_extension_type',
'is_file_like',
'is_float',
'is_float_dtype',
'is_hashable',
'is_int64_dtype',
'is_integer',
'is_integer_dtype',
'is_interval',
'is_interval_dtype',
'is_iterator',
'is_list_like',
'is_named_tuple',
'is_number',
'is_numeric_dtype',
'is_object_dtype',
'is_period_dtype',
'is_re',
'is_re_compilable',
'is_scalar',
'is_signed_integer_dtype',
'is_sparse',
'is_string_dtype',
'is_timedelta64_dtype',
'is_timedelta64_ns_dtype',
'is_unsigned_integer_dtype',
'pandas_dtype',
'union_categoricals']

Note: Calling these functions from the internal module pandas.core.common will now show a DeprecationWarning (GH13990)
Other enhancements

- **Timestamp** can now accept positional and keyword parameters similar to `datetime.datetime()` (GH10758, GH11630)

```python
In [69]: pd.Timestamp(2012, 1, 1)
Out[69]: Timestamp('2012-01-01 00:00:00')

In [70]: pd.Timestamp(year=2012, month=1, day=1, hour=8, minute=30)
Out[70]: Timestamp('2012-01-01 08:30:00')
```

- The `.resample()` function now accepts a `on=` or `level=` parameter for resampling on a datetime-like column or `MultiIndex` level (GH13500)

```python
In [71]: df = pd.DataFrame(
   ....:     {"date": pd.date_range("2015-01-01", freq="W", periods=5), "a": np.
   ....:            arange(5)},
   ....:     index=pd.MultiIndex.from_arrays(
   ....:         [[1, 2, 3, 4, 5], pd.date_range("2015-01-01", freq="W",
   ....:            periods=5)],
   ....:         names=["v", "d"],
   ....:     ),
   ....: )

In [72]: df
Out[72]:
           date  a
        v   d
0  2015-01-04 2015-01-04 6
1  2015-01-11 2015-01-11 6
2  2015-01-18 2015-01-18 6
3  2015-01-25 2015-01-25 6
4  2015-02-01 2015-02-01 6

[5 rows x 2 columns]

In [73]: df.resample("M", on="date").sum()
Out[73]:
     a
date
2015-01-31 6
2015-02-28 6

[2 rows x 1 columns]

In [74]: df.resample("M", level="d").sum()
Out[74]:
     a
date
2015-01-31 6
2015-02-28 6

[2 rows x 1 columns]
• The .get_credentials() method of GbqConnector can now first try to fetch the application default credentials. See the docs for more details (GH13577).

• The .tz_localize() method of DatetimeIndex and Timestamp has gained the errors keyword, so you can potentially coerce nonexistent timestamps to NaT. The default behavior remains to raising a NonExistentTimeError (GH13057)

• .to_hdf/read_hdf() now accept path objects (e.g. pathlib.Path, py.path.local) for the file path (GH11773)

• The pd.read_csv() with engine='python' has gained support for the decimal (GH12933), na_filter (GH13321) and the memory_map option (GH13381).

• Consistent with the Python API, pd.read_csv() will now interpret +inf as positive infinity (GH13274)

• The pd.read_html() has gained support for the na_values, converters, keep_default_na options (GH13461)

• Categorical.astype() now accepts an optional boolean argument copy, effective when dtype is categorical (GH13209)

• DataFrame has gained the .asof() method to return the last non-NaN values according to the selected subset (GH13358)

• The DataFrame constructor will now respect key ordering if a list of OrderedDict objects are passed in (GH13304)

• pd.read_html() has gained support for the decimal option (GH12907)

• Series has gained the properties .is_monotonic, .is_monotonic_increasing, .is_monotonic_decreasing, similar to Index (GH13336)

• DataFrame.to_sql() now allows a single value as the SQL type for all columns (GH11886).

• Series.append now supports the ignore_index option (GH13677)

• .to_stata() and StataWriter can now write variable labels to Stata dta files using a dictionary to make column names to labels (GH13535, GH13536)

• .to_stata() and StataWriter will automatically convert datetime64[ns] columns to Stata format %tc, rather than raising a ValueError (GH12259)

• read_stata() and StataReader raise with a more explicit error message when reading Stata files with repeated value labels when convert_categoricals=True (GH13923)

• DataFrame.style will now render sparsified MultiIndexes (GH11655)

• DataFrame.style will now show column level names (e.g. DataFrame.columns.names) (GH13775)

• DataFrame has gained support to re-order the columns based on the values in a row using df.sort_values(by='...', axis=1) (GH10806)

```
In [75]: df = pd.DataFrame({"A": [2, 7], "B": [3, 5], "C": [4, 8]}, index=["row1", "row2"])

In [76]: df
Out[76]:
       A  B  C
row1   2  3  4
row2   7  5  8

[2 rows x 3 columns]
```

(continues on next page)
• Added documentation to I/O regarding the perils of reading in columns with mixed dtypes and how to handle it (GH13746)
• to_html() now has a border argument to control the value in the opening <table> tag. The default is the value of the html.border option, which defaults to 1. This also affects the notebook HTML repr, but since Jupyter’s CSS includes a border-width attribute, the visual effect is the same. (GH11563).
• Raise ImportError in the sql functions when sqlalchemym is not installed and a connection string is used (GH11920).
• Compatibility with matplotlib 2.0. Older versions of pandas should also work with matplotlib 2.0 (GH13333)
• Timestamp, Period, DatetimeIndex, PeriodIndex and .dt accessor have gained a .is_leap_year property to check whether the date belongs to a leap year. (GH13727)
• astype() will now accept a dict of column name to data types mapping as the dtype argument. (GH12086)
• The pd.read_json and DataFrame.to_json has gained support for reading and writing json lines with lines option see Line delimited json (GH9180)
• read_excel() now supports the true_values and false_values keyword arguments (GH13347)
• groupby() will now accept a scalar and a single-element list for specifying level on a non-MultiIndex grouper. (GH13907)
• Non-convertible dates in an excel date column will be returned without conversion and the column will be object dtype, rather than raising an exception (GH10001).
• pd.Timedelta(None) is now accepted and will return NaT, mirroring pd.Timestamp (GH13687)
• pd.read_stata() can now handle some format 111 files, which are produced by SAS when generating Stata dta files (GH11526)
• Series and Index now support divmod which will return a tuple of series or indices. This behaves like a standard binary operator with regards to broadcasting rules (GH14208).

API changes

Series.tolist() will now return Python types

Series.tolist() will now return Python types in the output, mimicking NumPy .tolist() behavior (GH10904)

Previous behavior:

In [7]: type(s.tolist()[0])
Out[7]:
<class 'numpy.int64'>
New behavior:

In [79]: type(s.tolist()[0])
Out[79]: int

Series operators for different indexes

Following Series operators have been changed to make all operators consistent, including DataFrame (GH1134, GH4581, GH13538)

- Series comparison operators now raise ValueError when index are different.
- Series logical operators align both index of left and right hand side.

Warning: Until 0.18.1, comparing Series with the same length, would succeed even if the .index are different (the result ignores .index). As of 0.19.0, this will raise ValueError to be more strict. This section also describes how to keep previous behavior or align different indexes, using the flexible comparison methods like .eq.

As a result, Series and DataFrame operators behave as below:

Arithmetic operators

Arithmetic operators align both index (no changes).

In [80]: s1 = pd.Series([1, 2, 3], index=list("ABC"))
In [81]: s2 = pd.Series([2, 2, 2], index=list("ABD"))
In [82]: s1 + s2
Out[82]:
A  3.0
B  4.0
C  NaN
D  NaN
Length: 4, dtype: float64

In [83]: df1 = pd.DataFrame([1, 2, 3], index=list("ABC"))
In [84]: df2 = pd.DataFrame([2, 2, 2], index=list("ABD"))
In [85]: df1 + df2
Out[85]:
0
A  3.0
B  4.0
C  NaN
D  NaN
[4 rows x 1 columns]
Comparison operators

Comparison operators raise `ValueError` when `.index` are different.

**Previous behavior (Series):**

Series compared values ignoring the `.index` as long as both had the same length:

```python
In [1]: s1 == s2
Out[1]:
A   False
B   True
C   False
dtype: bool
```

**New behavior (Series):**

```python
In [2]: s1 == s2
Out[2]:
ValueError: Can only compare identically-labeled Series objects
```

**Note:** To achieve the same result as previous versions (compare values based on locations ignoring `.index`), compare both `.values`.

```python
In [86]: s1.values == s2.values
Out[86]: array([False, True, False])
```

If you want to compare Series aligning its `.index`, see flexible comparison methods section below:

```python
In [87]: s1.eq(s2)
Out[87]:
A   False
B   True
C   False
D   False
Length: 4, dtype: bool
```

**Current behavior (DataFrame, no change):**

```python
In [3]: df1 == df2
Out[3]:
ValueError: Can only compare identically-labeled DataFrame objects
```
Logical operators

Logical operators align both `.index` of left and right hand side.

**Previous behavior** (Series), only left hand side index was kept:

```python
In [4]: s1 = pd.Series([True, False, True], index=list('ABC'))
In [5]: s2 = pd.Series([True, True, True], index=list('ABD'))
In [6]: s1 & s2
Out[6]:
A   True
B   False
C   False
dtype: bool
```

**New behavior** (Series):

```python
In [88]: s1 = pd.Series([True, False, True], index=list('ABC'))
In [89]: s2 = pd.Series([True, True, True], index=list('ABD'))
In [90]: s1 & s2
Out[90]:
A   True
B   False
C   False
D   False
Length: 4, dtype: bool
```

**Note:** Series logical operators fill a NaN result with False.

**Note:** To achieve the same result as previous versions (compare values based on only left hand side index), you can use `reindex_like`:

```python
In [91]: s1 & s2.reindex_like(s1)
Out[91]:
A   True
B   False
C   False
D   False
Length: 3, dtype: bool
```

**Current behavior** (DataFrame, no change):

```python
In [92]: df1 = pd.DataFrame([True, False, True], index=list('ABC'))
In [93]: df2 = pd.DataFrame([True, True, True], index=list('ABD'))
In [94]: df1 & df2
Out[94]:
   
A   True
```

(continues on next page)
Flexible comparison methods

Series flexible comparison methods like eq, ne, le, lt, ge and gt now align both index. Use these operators if you want to compare two Series which has the different index.

```
In [95]: s1 = pd.Series([1, 2, 3], index=["a", "b", "c")
In [96]: s2 = pd.Series([2, 2, 2], index=["b", "c", "d")
In [97]: s1.eq(s2)
Out[97]:
a   False
b   True
c   False
d   False
Length: 4, dtype: bool
```

```
In [98]: s1.ge(s2)
Out[98]:
a   False
b   True
c   True
d   False
Length: 4, dtype: bool
```

Previously, this worked the same as comparison operators (see above).

Series type promotion on assignment

A Series will now correctly promote its dtype for assignment with incompat values to the current dtype (GH13234)

```
In [99]: s = pd.Series()
```

Previous behavior:

```
In [2]: s["a"] = pd.Timestamp("2016-01-01")
In [3]: s["b"] = 3.0
TypeError: invalid type promotion
```

New behavior:

```
In [100]: s["a"] = pd.Timestamp("2016-01-01")
```
In [101]: s["b"] = 3.0

In [102]: s
Out[102]:
   a  2016-01-01 00:00:00
   b       3.0
Length: 2, dtype: object

In [103]: s.dtype
Out[103]:
dtype('O')

Function .to_datetime() changes

Previously if .to_datetime() encountered mixed integers/floats and strings, but no datetimes with errors='coerce' it would convert all to NaT.

Previous behavior:

In [2]: pd.to_datetime([1, 'foo'], errors='coerce')
Out[2]: DatetimeIndex(['NaT', 'NaT'], dtype='datetime64[ns]', freq=None)

Current behavior:

This will now convert integers/floats with the default unit of ns.

In [104]: pd.to_datetime([1, "foo"], errors="coerce")
Out[104]: DatetimeIndex(['1970-01-01 00:00:00.000000001', 'NaT'], dtype='datetime64[ns]',
   freq=None)

Bug fixes related to .to_datetime():

• Bug in pd.to_datetime() when passing integers or floats, and no unit and errors='coerce' (GH13180).
• Bug in pd.to_datetime() when passing invalid data types (e.g. bool); will now respect the errors keyword (GH13176)
• Bug in pd.to_datetime() which overflowed on int8, and int16 dtypes (GH13451)
• Bug in pd.to_datetime() raise AttributeError with NaN and the other string is not valid when errors='ignore' (GH12424)
• Bug in pd.to_datetime() did not cast floats correctly when unit was specified, resulting in truncated datetime (GH13834)

Merging changes

Merging will now preserve the dtype of the join keys (GH8596)
In [107]: df2 = pd.DataFrame({'key': [1, 2], 'v1': [20, 30]})

In [108]: df2
Out[108]:
   key  v1
0    1  20
1    2  30

Previous behavior:

In [5]: pd.merge(df1, df2, how='outer')
Out[5]:
   key  v1
0   1.0 10.0
1   1.0 20.0
2   2.0 30.0

In [6]: pd.merge(df1, df2, how='outer').dtypes
Out[6]:
   key  float64
  v1    float64
dtype: object

New behavior:

We are able to preserve the join keys

In [109]: pd.merge(df1, df2, how='outer')
Out[109]:
   key  v1
0    1  10
1    1  20
2    2  30

In [110]: pd.merge(df1, df2, how='outer').dtypes
Out[110]:
   key  int64
  v1    int64
Length: 2, dtype: object

Of course if you have missing values that are introduced, then the resulting dtype will be upcast, which is unchanged from previous.

In [111]: pd.merge(df1, df2, how='outer', on='key')
Out[111]:
(continues on next page)
pandas: powerful Python data analysis toolkit, Release 1.2.5

(continued from previous page)

<table>
<thead>
<tr>
<th>key</th>

</tr>
</tbody>
</table>

[2 rows x 3 columns]

In [112]: pd.merge(df1, df2, how="outer", on="key").dtypes
Out[112]:
key    int64
v1_x   float64
v1_y   int64
Length: 3, dtype: object

**Method `describe()` changes**

Percentile identifiers in the index of a `describe()` output will now be rounded to the least precision that keeps them distinct (GH13104)

In [113]: s = pd.Series([0, 1, 2, 3, 4])
In [114]: df = pd.DataFrame([0, 1, 2, 3, 4])

**Previous behavior:**

The percentiles were rounded to at most one decimal place, which could raise `ValueError` for a data frame if the percentiles were duplicated.

In [3]: s.describe(percentiles=[0.0001, 0.0005, 0.001, 0.999, 0.9995, 0.9999])

[12 rows x 1 columns]

Furthermore:

• Passing duplicated percentiles will now raise a ValueError.

• Bug in .describe() on a DataFrame with a mixed-dtype column index, which would previously raise a TypeError (GH13288)

**Period changes**

**The PeriodIndex now has period dtype**

PeriodIndex now has its own period dtype. The period dtype is a pandas extension dtype like category or the timezone aware dtype (datetime64[ns, tz]) (GH13941). As a consequence of this change, PeriodIndex no longer has an integer dtype:

**Previous behavior:**

In [1]: pi = pd.PeriodIndex(['2016-08-01'], freq='D')
In [2]: pi
Out[2]: PeriodIndex(['2016-08-01'], dtype='int64', freq='D')

In [3]: pd.api.types.is_integer_dtype(pi)
Out[3]: True

In [4]: pi.dtype
Out[4]: dtype('int64')

New behavior:

In [117]: pi = pd.PeriodIndex(['2016-08-01'], freq='D')
In [118]: pi
Out[118]: PeriodIndex(['2016-08-01'], dtype='period[D]', freq='D')

In [119]: pd.api.types.is_integer_dtype(pi)
Out[119]: False

In [120]: pd.api.types.is_period_dtype(pi)
Out[120]: True

In [121]: pi.dtype
Out[121]: period[D]

In [122]: type(pi.dtype)
Out[122]: pandas.core.dtypes.dtypes.PeriodDtype

Period('NaT') now returns pd.NaT

Previously, Period has its own Period('NaT') representation different from pd.NaT. Now Period('NaT') has been changed to return pd.NaT. (GH12759, GH13582)

Previous behavior:

In [5]: pd.Period('NaT', freq='D')
Out[5]: Period('NaT', 'D')

New behavior:

These result in pd.NaT without providing freq option.

In [123]: pd.Period("NaT")
Out[123]: NaT

In [124]: pd.Period(None)
Out[124]: NaT

To be compatible with Period addition and subtraction, pd.NaT now supports addition and subtraction with int. Previously it raised ValueError.

Previous behavior:
In [5]: pd.NaT + 1
...:
ValueError: Cannot add integral value to Timestamp without freq.

New behavior:

In [125]: pd.NaT + 1
Out[125]: NaT
In [126]: pd.NaT - 1
Out[126]: NaT

PeriodIndex.values now returns array of Period object

.values is changed to return an array of Period objects, rather than an array of integers (GH13988).

Previous behavior:

In [6]: pi = pd.PeriodIndex(['2011-01', '2011-02'], freq='M')
In [7]: pi.values
Out[7]: array([492, 493])

New behavior:

In [127]: pi = pd.PeriodIndex(['2011-01', '2011-02'], freq='M')
In [128]: pi.values
Out[128]: array([Period('2011-01', 'M'), Period('2011-02', 'M')], dtype=object)

Index + / - no longer used for set operations

Addition and subtraction of the base Index type and of DatetimeIndex (not the numeric index types) previously performed set operations (set union and difference). This behavior was already deprecated since 0.15.0 (in favor using the specific .union() and .difference() methods), and is now disabled. When possible, + and - are now used for element-wise operations, for example for concatenating strings or subtracting datetimes (GH8227, GH14127).

Previous behavior:

In [1]: pd.Index(['a', 'b']) + pd.Index(['a', 'c'])
FutureWarning: using '+' to provide set union with Indexes is deprecated, use '|' or .union()
Out[1]: Index(['a', 'b', 'c'], dtype='object')

New behavior: the same operation will now perform element-wise addition:

In [129]: pd.Index(['a', 'b']) + pd.Index(['a', 'c'])
Out[129]: Index(['aa', 'bc'], dtype='object')

Note that numeric Index objects already performed element-wise operations. For example, the behavior of adding two integer Indexes is unchanged. The base Index is now made consistent with this behavior.
Further, because of this change, it is now possible to subtract two DatetimeIndex objects resulting in a TimedeltaIndex:

**Previous behavior:**

```python
In [1]: (pd.DatetimeIndex(['2016-01-01', '2016-01-02']))
    ...: - pd.DatetimeIndex(['2016-01-02', '2016-01-03']))
FutureWarning: using '-' to provide set differences with datetimelike Indexes is deprecated, use .difference()
Out[1]: DatetimeIndex(['2016-01-01'], dtype='datetime64[ns]', freq=None)
```

**New behavior:**

```python
In [131]: (  
    ...:    pd.DatetimeIndex(['2016-01-01', '2016-01-02']))
    ...:    - pd.DatetimeIndex(['2016-01-02', '2016-01-03']))
    ...:    )
    ...:
Out[131]: TimedeltaIndex(['-1 days', '-1 days'], dtype='timedelta64[ns]', freq=None)
```

**Index.difference and .symmetric_difference changes**

Index.difference and Index.symmetric_difference will now, more consistently, treat NaN values as any other values. (GH13514)

**Previous behavior:**

```python
In [3]: idx1.difference(idx2)
Out[3]: Float64Index([nan, 2.0, 3.0], dtype='float64')
```

```python
In [4]: idx1.symmetric_difference(idx2)
Out[4]: Float64Index([0.0, nan, 2.0, 3.0], dtype='float64')
```

**New behavior:**

```python
In [134]: idx1.difference(idx2)
Out[134]: Float64Index([2.0, 3.0], dtype='float64')
```

```python
In [135]: idx1.symmetric_difference(idx2)
Out[135]: Float64Index([0.0, 2.0, 3.0], dtype='float64')
```
Index.unique consistently returns Index

Index.unique() now returns unique values as an Index of the appropriate dtype. (GH13395). Previously, most Index classes returned np.ndarray, and DatetimeIndex, TimedeltaIndex and PeriodIndex returned Index to keep metadata like timezone.

Previous behavior:

```python
In [1]: pd.Index([1, 2, 3]).unique()
Out[1]: array([1, 2, 3])

In [2]: pd.DatetimeIndex(["2011-01-01", '2011-01-02',
                           ...
                           '2011-01-03'], tz='Asia/Tokyo').unique()
Out[2]:
      DatetimeIndex(['2011-01-01 00:00:00+09:00', '2011-01-02 00:00:00+09:00',
                      '2011-01-03 00:00:00+09:00'],
dtype='datetime64[ns, Asia/Tokyo]', freq=None)
```

New behavior:

```python
In [136]: pd.Index([1, 2, 3]).unique()
Out[136]: Int64Index([1, 2, 3], dtype='int64')

In [137]: pd.DatetimeIndex(
                           ...
                           ["2011-01-01", "2011-01-02", "2011-01-03"],
                           tz="Asia/Tokyo"
                           ...
                           ).unique()
Out[137]:
      DatetimeIndex(['2011-01-01 00:00:00+09:00', '2011-01-02 00:00:00+09:00',
                      '2011-01-03 00:00:00+09:00'],
dtype='datetime64[ns, Asia/Tokyo]', freq=None)
```

MultiIndex constructors, groupby and set_index preserve categorical dtypes

MultiIndex.from_arrays and MultiIndex.from_product will now preserve categorical dtype in MultiIndex levels (GH13743, GH13854).

```python
In [138]: cat = pd.Categorical(['a', 'b'], categories=list("bac"))

In [139]: lvl1 = ["foo", "bar"]

In [140]: midx = pd.MultiIndex.from_arrays([cat, lvl1])

In [141]: midx
Out[141]:
    MultiIndex([(a, foo),
                 (b, bar)],
               )

Previous behavior:

```python
In [4]: midx.levels[0]
Out[4]: Index(['b', 'a', 'c'], dtype='object')
```
In [5]: midx.get_level_values(0)
Out[5]: Index(['a', 'b'], dtype='object')

New behavior: the single level is now a CategoricalIndex:

In [142]: midx.levels[0]
Out[142]: CategoricalIndex(['b', 'a', 'c'], categories=['b', 'a', 'c'], ordered=False, dtype='category')

In [143]: midx.get_level_values(0)
Out[143]: CategoricalIndex(['a', 'b'], categories=['b', 'a', 'c'], ordered=False, dtype='category')

An analogous change has been made to MultiIndex.from_product. As a consequence, groupby and set_index also preserve categorical dtypes in indexes

In [144]: df = pd.DataFrame({'A': [0, 1], 'B': [10, 11], 'C': cat})
In [145]: df_grouped = df.groupby(by=['A', 'C']).first()
In [146]: df_set_idx = df.set_index(['A', 'C'])

Previous behavior:

In [11]: df_grouped.index.levels[1]
Out[11]: Index(['b', 'a', 'c'], dtype='object', name='C')
In [12]: df_grouped.reset_index().dtypes
Out[12]:
A    int64
C    object
B  float64
dtype: object

In [13]: df_set_idx.index.levels[1]
Out[13]: Index(['b', 'a', 'c'], dtype='object', name='C')
In [14]: df_set_idx.reset_index().dtypes
Out[14]:
A    int64
C    object
B    int64
dtype: object

New behavior:

In [147]: df_grouped.index.levels[1]
Out[147]: CategoricalIndex(['b', 'a', 'c'], categories=['b', 'a', 'c'], ordered=False, name='C', dtype='category')

In [148]: df_grouped.reset_index().dtypes
Out[148]:
A    int64
C  category
B  float64
Length: 3, dtype: object

In [149]: df_set_idx.index.levels[1]
Out[149]: CategoricalIndex(['b', 'a', 'c'], categories=['b', 'a', 'c'], ordered=False,
    name='C', dtype='category')

In [150]: df_set_idx.reset_index().dtypes
Out[150]:
   A  int64
   C  category
   B  int64
Length: 3, dtype: object

**Function `read_csv` will progressively enumerate chunks**

When `read_csv()` is called with `chunksize=n` and without specifying an index, each chunk used to have an independently generated index from 0 to n-1. They are now given instead a progressive index, starting from 0 for the first chunk, from n for the second, and so on, so that, when concatenated, they are identical to the result of calling `read_csv()` without the `chunksize=` argument (GH12185).

In [151]: data = "A,B
0,1
2,3
4,5
6,7"

**Previous behavior:**

In [2]: pd.concat(pd.read_csv(StringIO(data), chunksize=2))
Out[2]:
   A  B
0  0  1
1  2  3
0  4  5
1  6  7

**New behavior:**

In [152]: pd.concat(pd.read_csv(StringIO(data), chunksize=2))
Out[152]:
   A  B
0  0  1
1  2  3
2  4  5
3  6  7

[4 rows x 2 columns]
Sparse changes

These changes allow pandas to handle sparse data with more dtypes, and for work to make a smoother experience with data handling.

Types int64 and bool support enhancements

Sparse data structures now gained enhanced support of int64 and bool dtype (GH667, GH13849).

Previously, sparse data were float64 dtype by default, even if all inputs were of int or bool dtype. You had to specify dtype explicitly to create sparse data with int64 dtype. Also, fill_value had to be specified explicitly because the default was np.nan which doesn’t appear in int64 or bool data.

As of v0.19.0, sparse data keeps the input dtype, and uses more appropriate fill_value defaults (0 for int64 dtype, False for bool dtype).

See the docs for more details.
Operators now preserve dtypes

- Sparse data structure now can preserve dtype after arithmetic ops (GH13848)

```python
s = pd.SparseSeries([0, 2, 0, 1], fill_value=0, dtype=np.int64)
s.dtype
s + 1
```

- Sparse data structure now support astype to convert internal dtype (GH13900)

```python
s = pd.SparseSeries([1.0, 0.0, 2.0, 0.0], fill_value=0)
s
s.astype(np.int64)
```

astype fails if data contains values which cannot be converted to specified dtype. Note that the limitation is applied to fill_value which default is np.nan.

```python
In [7]: pd.SparseSeries([1., np.nan, 2., np.nan]).astype(np.int64)
Out[7]:
ValueError: unable to coerce current fill_value nan to int64 dtype
```

Other sparse fixes

- Subclassed SparseDataFrame and SparseSeries now preserve class types when slicing or transposing. (GH13787)
- SparseArray with bool dtype now supports logical (bool) operators (GH14000)
- Bug in SparseSeries with MultiIndex [] indexing may raise IndexError (GH13144)
- Bug in SparseSeries with MultiIndex [] indexing result may have normal Index (GH13144)
- Bug in SparseDataFrame in which axis=None did not default to axis=0 (GH13048)
- Bug in SparseSeries and SparseDataFrame creation with object dtype may raise TypeError (GH11633)
- Bug in SparseDataFrame doesn’t respect passed SparseArray or SparseSeries ‘s dtype and fill_value (GH13866)
- Bug in SparseArray and SparseSeries don’t apply ufunc to fill_value (GH13853)
- Bug in SparseSeries.abs incorrectly keeps negative fill_value (GH13853)
- Bug in single row slicing on multi-type SparseDataFrame s, types were previously forced to float (GH13917)
- Bug in SparseSeries slicing changes integer dtype to float (GH8292)
- Bug in SparseDataFrame comparison ops may raise TypeError (GH13001)
- Bug in SparseDataFrame.isnull raises ValueError (GH8276)
- Bug in SparseDataFrame representation with bool dtype may raise IndexError (GH13110)
- Bug in SparseSeries and SparseDataFrame of bool or int64 dtype may display its values like float64 dtype (GH13110)
- Bug in sparse indexing using SparseArray with bool dtype may return incorrect result (GH13985)
- Bug in SparseArray created from SparseSeries may lose dtype (GH13999)
pandas: powerful Python data analysis toolkit, Release 1.2.5

- Bug in SparseSeries comparison with dense returns normal Series rather than SparseSeries (GH13999)

Indexer dtype changes

**Note:** This change only affects 64 bit python running on Windows, and only affects relatively advanced indexing operations

Methods such as `Index.get_indexer` that return an indexer array, coerce that array to a “platform int”, so that it can be directly used in 3rd party library operations like `numpy.take`. Previously, a platform int was defined as `np.int_` which corresponds to a C integer, but the correct type, and what is being used now, is `np.intp`, which corresponds to the C integer size that can hold a pointer (GH3033, GH13972).

These types are the same on many platform, but for 64 bit python on Windows, `np.int_` is 32 bits, and `np.intp` is 64 bits. Changing this behavior improves performance for many operations on that platform.

**Previous behavior:**

```
In [1]: i = pd.Index(['a', 'b', 'c'])

In [2]: i.get_indexer(['b', 'b', 'c']).dtype
Out[2]: dtype('int32')
```

**New behavior:**

```
In [1]: i = pd.Index(['a', 'b', 'c'])

In [2]: i.get_indexer(['b', 'b', 'c']).dtype
Out[2]: dtype('int64')
```

Other API changes

- `Timestamp.to_pydatetime` will issue a `UserWarning` when `warn=True`, and the instance has a non-zero number of nanoseconds, previously this would print a message to stdout (GH14101).
- `Series.unique()` with datetime and timezone now returns return array of `Timestamp` with timezone (GH13565).
- `Panel.to_sparse()` will raise a `NotImplementedError` exception when called (GH13778).
- `Index.reshape()` will raise a `NotImplementedError` exception when called (GH12882).
- `.filter()` enforces mutual exclusion of the keyword arguments (GH12399).
- eval's upcasting rules for `float32` types have been updated to be more consistent with NumPy's rules. New behavior will not upcast to `float64` if you multiply a pandas `float32` object by a scalar `float64` (GH12388).
- An `UnsupportedFunctionCall` error is now raised if NumPy ufuncs like `np.mean` are called on groupby or resample objects (GH12811).
- `__setitem__` will no longer apply a callable rhs as a function instead of storing it. Call `where` directly to get the previous behavior (GH13299).
- Calls to `.sample()` will respect the random seed set via `numpy.random.seed(n)` (GH13161)
• **Styler.apply** is now more strict about the outputs your function must return. For `axis=0` or `axis=1`, the output shape must be identical. For `axis=None`, the output must be a DataFrame with identical columns and index labels (GH13222).

• **Float64Index.astype(int)** will now raise **ValueError** if `Float64Index` contains NaN values (GH13149)

• **TimedeltaIndex.astype(int)** and **DatetimeIndex.astype(int)** will now return **Int64Index** instead of np.array (GH13209)

• Passing **Period** with multiple frequencies to normal Index now returns Index with **object** dtype (GH13664)

• **PeriodIndex.fillna** with **Period** has different freq now coerces to object dtype (GH13664)

• Faceted boxplots from DataFrame.boxplot(by=col) now return a Series when return_type is not None. Previously these returned an OrderedDict. Note that when return_type=None, the default, these still return a 2-D NumPy array (GH12216, GH7096).

• **pd.read_hdf** will now raise a **ValueError** instead of **KeyError**, if a mode other than r, r+ and a is supplied. (GH13623)

• **pd.read_csv(), pd.read_table(), and pd.read_hdf()** raise the built-in FileNotFoundError exception for Python 3.x when called on a nonexistent file; this is back-ported as IOError in Python 2.x (GH14086)

• More informative exceptions are passed through the csv parser. The exception type would now be the original exception type instead of CParserError (GH13652).

• **pd.read_csv()** in the C engine will now issue a **ParserWarning** or raise a **ValueError** when sep encoded is more than one character long (GH14065)

• **DataFrame.values** will now return float64 with a DataFrame of mixed int64 and uint64 dtypes, conforming to np.find_common_type (GH10364, GH13917)

• **.groupby.groups** will now return a dictionary of Index objects, rather than a dictionary of np.ndarray or lists (GH14293)

**Deprecations**

• **Series.reshape** and **Categorical.reshape** have been deprecated and will be removed in a subsequent release (GH12882, GH12882)

• **PeriodIndex.to_datetime** has been deprecated in favor of **PeriodIndex.to_timestamp** (GH8254)

• **Timestamp.to_datetime** has been deprecated in favor of **Timestamp.to_pydatetime** (GH8254)

• **Index.to_datetime** and **DatetimeIndex.to_datetime** have been deprecated in favor of **pd.to_datetime** (GH8254)

• **pandas.core.datetools** module has been deprecated and will be removed in a subsequent release (GH14094)

• **SparseList** has been deprecated and will be removed in a future version (GH13784)

• **DataFrame.to_html()** and **DataFrame.to_latex()** have dropped the colSpace parameter in favor of col_space (GH13857)

• **DataFrame.to_sql()** has deprecated the flavor parameter, as it is superfluous when SQLAlchemy is not installed (GH13611)

• Deprecated read_csv keywords:

  - **compact_ints** and **use_unsigned** have been deprecated and will be removed in a future version (GH13320)

  - **buffer_lines** has been deprecated and will be removed in a future version (GH13360)
- `as_recarray` has been deprecated and will be removed in a future version (GH13373)
- `skip_footer` has been deprecated in favor of `skipfooter` and will be removed in a future version (GH13349)

- top-level `pd.ordered_merge()` has been renamed to `pd.merge_ordered()` and the original name will be removed in a future version (GH13358)
- `Timestamp.offset` property (and named arg in the constructor), has been deprecated in favor of `freq` (GH12160)
- `pd.tseries.util.pivot_annual` is deprecated. Use `pivot_table` as alternative, an example is here (GH736)
- `pd.tseries.util.isleapyear` has been deprecated and will be removed in a subsequent release. Datetime-likes now have a `is_leap_year` property (GH13727)
- `Panel4D` and `PanelND` constructors are deprecated and will be removed in a future version. The recommended way to represent these types of n-dimensional data are with the `xarray` package. pandas provides a `to_xarray()` method to automate this conversion (GH13564).
- `pandas.tseries.frequencies.get_standard_freq` is deprecated. Use `pandas.tseries.frequencies.to_offset(freq).rule_code` instead (GH13874)
- `pandas.tseries.frequencies.to_offset`’s `freqstr` keyword is deprecated in favor of `freq` (GH13874)
- `Categorical.from_array` has been deprecated and will be removed in a future version (GH13854)

**Removal of prior version deprecations/changes**

- The `SparsePanel` class has been removed (GH13778)
- The `pd.sandbox` module has been removed in favor of the external library `pandas-qt` (GH13670)
- The `pandas.io.data` and `pandas.io.wb` modules are removed in favor of the `pandas-datareader` package (GH13724).
- The `pandas.tools.rplot` module has been removed in favor of the `seaborn` package (GH13855)
- `DataFrame.to_csv()` has dropped the `engine` parameter, as was deprecated in 0.17.1 (GH11274, GH13419)
- `DataFrame.to_dict()` has dropped the `outtype` parameter in favor of `orient` (GH13627, GH8486)
- `pd.Categorical` has dropped setting of the `ordered` attribute directly in favor of the `set_ordered` method (GH13671)
- `pd.Categorical` has dropped the `levels` attribute in favor of `categories` (GH8376)
- `DataFrame.to_sql()` has dropped the `mysql` option for the `flavor` parameter (GH13611)
- `Panel.shift()` has dropped the `lags` parameter in favor of `periods` (GH14041)
- `pd.Index` has dropped the `diff` method in favor of `difference` (GH13669)
- `pd.DataFrame` has dropped the `to_wide` method in favor of `to_panel` (GH14039)
- `Series.to_csv` has dropped the `nanRep` parameter in favor of `na_rep` (GH13804)
- `Series.xs`, `DataFrame.xs`, `Panel.xs`, `Panel.major_xs`, and `Panel.minor_xs` have dropped the `copy` parameter (GH13781)
- `str.split` has dropped the `return_type` parameter in favor of `expand` (GH13701)
• Removal of the legacy time rules (offset aliases), deprecated since 0.17.0 (this has been alias since 0.8.0) (GH13590, GH13868). Now legacy time rules raises ValueError. For the list of currently supported offsets, see here.

• The default value for the return_type parameter for DataFrame.plot.box and DataFrame.boxplot changed from None to "axes". These methods will now return a matplotlib axes by default instead of a dictionary of artists. See here (GH6581).

• The tquery and uquery functions in the pandas.io.sql module are removed (GH5950).

Performance improvements

• Improved performance of sparse IntIndex.intersect (GH13082)
• Improved performance of sparse arithmetic with BlockIndex when the number of blocks are large, though recommended to use IntIndex in such cases (GH13082)
• Improved performance of DataFrame.quantile() as it now operates per-block (GH11623)
• Improved performance of float64 hash table operations, fixing some very slow indexing and groupby operations in python 3 (GH13166, GH13334)
• Improved performance of DataFrameGroupBy.transform (GH12737)
• Improved performance of Index and Series.duplicated (GH10235)
• Improved performance of Index.difference (GH12044)
• Improved performance of RangeIndex.is_monotonic_increasing and is_monotonic_decreasing (GH13749)
• Improved performance of datetime string parsing in DatetimeIndex (GH13692)
• Improved performance of hashing Period (GH12817)
• Improved performance of factorize of datetime with timezone (GH13750)
• Improved performance of by lazily creating indexing hashtables on larger Indexes (GH14266)
• Improved performance of groupby.groups (GH14293)
• Unnecessary materializing of a MultiIndex when introspecting for memory usage (GH14308)

Bug fixes

• Bug in groupby().shift(), which could cause a segfault or corruption in rare circumstances when grouping by columns with missing values (GH13813)
• Bug in groupby().cumsum() calculating cumprod when axis=1. (GH13994)
• Bug in pd.to_timedelta() in which the errors parameter was not being respected (GH13613)
• Bug in io.json.json_normalize(), where non-ascii keys raised an exception (GH13213)
• Bug when passing a not-default-indexed Series as xerr or yerr in .plot() (GH11858)
• Bug in area plot draws legend incorrectly if subplot is enabled or legend is moved after plot (matplotlib 1.5.0 is required to draw area plot legend properly) (GH9161, GH13544)
• Bug in DataFrame assignment with an object-dtyped Index where the resultant column is mutable to the original object. (GH13522)
• Bug in matplotlib AutoDataFormatter; this restores the second scaled formatting and re-adds micro-second scaled formatting (GH13131)
• Bug in selection from a HDFStore with a fixed format and start and/or stop specified will now return the selected range (GH8287)
• Bug in Categorical.from_codes() where an unhelpful error was raised when an invalid ordered parameter was passed in (GH14058)
• Bug in Series construction from a tuple of integers on windows not returning default dtype (int64) (GH13646)
• Bug in TimedeltaIndex addition with a Datetime-like object where addition overflow was not being caught (GH14068)
• Bug in .groupby(..).resample(..) when the same object is called multiple times (GH13174)
• Bug in .to_records() when index name is a unicode string (GH13172)
• Bug in calling .memory_usage() on object which doesn’t implement (GH12924)
• Regression in Series.quantile with nans (also shows up in .median() and .describe()); furthermore now names the Series with the quantile (GH13098, GH13146)
• Bug in SeriesGroupBy.transform with datetime values and missing groups (GH13191)
• Bug where empty Series were incorrectly coerced in datatype-like numeric operations (GH13844)
• Bug in Categorical constructor when passed a Categorical containing datetimes with timezones (GH14190)
• Bug in Series.str.extractall() with str index raises ValueError (GH13156)
• Bug in Series.str.extractall() with single group and quantifier (GH13382)
• Bug in DatetimeIndex and Period subtraction raises ValueError or AttributeError rather than TypeError (GH13078)
• Bug in Index and Series created with NaN and NaT mixed data may not have datetime64 dtype (GH13324)
• Bug in Index and Series may ignore np.datetime64('nat') and np.timedelta64('nat') to infer dtype (GH13324)
• Bug in PeriodIndex and Period subtraction raises AttributeError (GH13071)
• Bug in PeriodIndex construction returning a float64 index in some circumstances (GH13067)
• Bug in .resample(..) with a PeriodIndex not changing its freq appropriately when empty (GH13067)
• Bug in .resample(..) with a PeriodIndex not retaining its type or name with an empty DataFrame appropriately when empty (GH13212)
• Bug in groupby(..).apply(..) when the passed function returns scalar values per group (GH13468).
• Bug in groupby(..).resample(..) where passing some keywords would raise an exception (GH13235)
• Bug in .tz_convert on a tz-aware DateTimeIndex that relied on index being sorted for correct results (GH13306)
• Bug in .tz_localize with dateutil.tz.tzlocal may return incorrect result (GH13583)
• Bug in DatetimeTZDtype dtype with dateutil.tz.tzlocal cannot be regarded as valid dtype (GH13583)
• Bug in pd.read_hdf() where attempting to load an HDF file with a single dataset, that had one or more categorical columns, failed unless the key argument was set to the name of the dataset. (GH13231)
• Bug in .rolling() that allowed a negative integer window in construction of the Rolling() object, but would later fail on aggregation (GH13383)
•Bug in Series indexing with tuple-valued data and a numeric index (GH13509)
• Bug in printing pd.DataFrame where unusual elements with the object dtype were causing segfaults (GH13717)
• Bug in ranking Series which could result in segfaults (GH13445)
• Bug in various index types, which did not propagate the name of passed index (GH12309)
• Bug in DatetimeIndex, which did not honour the copy=True (GH13205)
• Bug in DatetimeIndex.is_normalized returns incorrectly for normalized date_range in case of local timezones (GH13459)
• Bug in pd.concat and .append may coerce datetime64 and timedelta to object dtype containing python built-in datetime or timedelta rather than Timestamp or Timedelta (GH13626)
• Bug in PeriodIndex.append may raises AttributeError when the result is object dtype (GH13221)
• Bug in CategoricalIndex.append may accept normal list (GH13626)
• Bug in pd.concat and .append with the same timezone get reset to UTC (GH7795)
• Bug in Series and DataFrame .append raises AmbiguousTimeError if data contains datetime near DST boundary (GH13626)
• Bug in DataFrame.to_csv() in which float values were being quoted even though quotations were specified for non-numeric values only (GH12922, GH13259)
• Bug in DataFrame.describe() raising ValueError with only boolean columns (GH13898)
• Bug in MultiIndex slicing where extra elements were returned when level is non-unique (GH12896)
• Bug in .str.replace does not raise TypeError for invalid replacement (GH13438)
• Bug in MultiIndex.from_arrays which didn’t check for input array lengths matching (GH13599)
• Bug in cartesian_product and MultiIndex.from_product which may raise with empty input arrays (GH12258)
• Bug in pd.read_csv() which may cause a segfault or corruption when iterating in large chunks over a stream/file under rare circumstances (GH13703)
• Bug in pd.read_csv() which caused errors to be raised when a dictionary containing scalars is passed in for na_values (GH12224)
• Bug in pd.read_csv() which caused BOM files to be incorrectly parsed by not ignoring the BOM (GH4793)
• Bug in pd.read_csv() with engine='python' which raised errors when a numpy array was passed in for usecols (GH12546)
• Bug in pd.read_csv() where the index columns were being incorrectly parsed when parsed as dates with a thousands parameter (GH14066)
• Bug in pd.read_csv() with engine='python' in which NaN values weren’t being detected after data was converted to numeric values (GH13314)
• Bug in pd.read_csv() in which the nrows argument was not properly validated for both engines (GH10476)
• Bug in pd.read_csv() with engine='python' in which infinities of mixed-case forms were not being interpreted properly (GH13274)
• Bug in pd.read_csv() with engine='python' in which trailing NaN values were not being parsed (GH13320)
• Bug in pd.read_csv() with engine='python' when reading from a tempfile.TemporaryFile on Windows with Python 3 (GH13398)
• Bug in pd.read_csv() that prevents usecols kwarg from accepting single-byte unicode strings (GH13219)
• Bug in pd.read_csv() that prevents usecols from being an empty set (GH13402)
• Bug in pd.read_csv() in the C engine where the NULL character was not being parsed as NULL (GH14012)
• Bug in `pd.read_csv()` with `engine='c'` in which NULL quotechar was not accepted even though quoting was specified as None (GH13411)
• Bug in `pd.read_csv()` with `engine='c'` in which fields were not properly cast to float when quoting was specified as non-numeric (GH13411)
• Bug in `pd.read_csv()` in Python 2.x with non-UTF8 encoded, multi-character separated data (GH3404)
• Bug in `pd.read_csv()`, where aliases for utf-xx (e.g. UTF-xx, UTF_xx, utf_xx) raised UnicodeDecodeError (GH13549)
• Bug in `pd.read_csv`, `pd.read_table`, `pd.read_fwf`, `pd.read_stata` and `pd.read_sas` where files were opened by parsers but not closed if both `chunksize` and `iterator` were None. (GH13940)
• Bug in StataReader, StataWriter, XportReader and SAS7BDATReader where a file was not properly closed when an error was raised. (GH13940)
• Bug in `pd.pivot_table()` where `margins_name` is ignored when `aggfunc` is a list (GH13354)
• Bug in `pd.Series.str.zfill`, `center`, `ljust`, `rjust`, and `pad` when passing non-integers, did not raise TypeError (GH13598)
• Bug in checking for any null objects in a TimedeltaIndex, which always returned True (GH13603)
• Bug in Series arithmetic raises TypeError if it contains datetime-like as object dtype (GH13043)
• Bug Series.isnull() and Series.notnull() ignore Period('NaT') (GH13737)
• Bug Series.fillna() and Series.dropna() don't affect to Period('NaT') (GH13737)
• Bug in .fillna(value=np.nan) incorrectly raises KeyError on a category dtyped Series (GH14021)
• Bug in extension dtype creation where the created types were not is/identical (GH13285)
• Bug in .resample(..) where incorrect warnings were triggered by IPython introspection (GH13618)
• Bug in NaT - Period raises AttributeError (GH13071)
• Bug in Series comparison may output incorrect result if rhs contains NaT (GH9005)
• Bug in Series and Index comparison may output incorrect result if it contains NaT with object dtype (GH13592)
• Bug in Period addition raises TypeError if Period is on right hand side (GH13069)
• Bug in Period and Series or Index comparison raises TypeError (GH13200)
• Bug in pd.set_eng_float_format() that would prevent NaN and Inf from formatting (GH11981)
• Bug in .unstack with Categorical dtype resets .ordered to True (GH13249)
• Clean some compile time warnings in datetime parsing (GH13607)
• Bug in factorize raises AmbiguousTimeError if data contains datetime near DST boundary (GH13750)
• Bug in .set_index raises AmbiguousTimeError if new index contains DST boundary and multi levels (GH12920)
• Bug in .shift raises AmbiguousTimeError if data contains datetime near DST boundary (GH13926)
• Bug in `pd.read_hdf()` returns incorrect result when a DataFrame with a categorical column and a query which doesn’t match any values (GH13792)
• Bug in .iloc when indexing with a non lexsorted MultiIndex (GH13797)
• Bug in .loc when indexing with date strings in a reverse sorted DatetimeIndex (GH14316)
• Bug in Series comparison operators when dealing with zero dim NumPy arrays (GH13006)
• Bug in `.combine_first` may return incorrect dtype (GH7630, GH10567)
• Bug in `groupby` where `apply` returns different result depending on whether first result is `None` or not (GH12824)
• Bug in `groupby(..).nth()` where the group key is included inconsistently if called after `.head()/.tail()` (GH12839)
• Bug in `.to_html`, `.to_latex` and `.to_string` silently ignore custom datetime formatter passed through the `formatters` key word (GH10690)
• Bug in `DataFrame.iterrows()`, not yielding a `Series` subclasse if defined (GH13977)
• Bug in `pd.to_numeric` when `errors='coerce'` and input contains non-hashable objects (GH13324)
• Bug in invalid Timedelta arithmetic and comparison may raise `ValueError` rather than `TypeError` (GH13624)
• Bug in invalid datetime parsing in `to_datetime` and `DatetimeIndex` may raise `TypeError` rather than `ValueError` (GH11169, GH11287)
• Bug in `Index` created with tz-aware `Timestamp` and mismatched `tz` option incorrectly coerces timezone (GH13692)
• Bug in `DatetimeIndex` with nanosecond frequency does not include timestamp specified with `end` (GH13672)
• Bug in `Series` when setting a slice with a `np.timedelta64` (GH14155)
• Bug in `Index` raises `OutOfBoundsDatetime` if datetime exceeds `datetime64[ns]` bounds, rather than coercing to object dtype (GH13663)
• Bug in `Index` may ignore specified `datetime64` or `timedelta64` passed as `dtype` (GH13981)
• Bug in `RangeIndex` can be created without no arguments rather than raises `TypeError` (GH13793)
• Bug in `.value_counts()` raises `OutOfBoundsDatetime` if data exceeds `datetime64[ns]` bounds (GH13663)
• Bug in `DatetimeIndex` may raise `OutOfBoundsDatetime` if input `np.datetime64` has other unit than `ns` (GH9114)
• Bug in `Series` creation with `np.datetime64` which has other unit than `ns` as object dtype results in incorrect values (GH13876)
• Bug in `resample` with timedelta data where data was casted to float (GH13119).
• Bug in `pd.isnull()` `pd.notnull()` raise `TypeError` if input datetime-like has other unit than `ns` (GH13389)
• Bug in `pd.merge()` may raise `TypeError` if input datetime-like has other unit than `ns` (GH13389)
• Bug in `HDFStore/read_hdf()` discarded `DatetimeIndex.name` if `tz` was set (GH13884)
• Bug in `Categorical.remove_unused_categories()` changes .codes dtype to platform int (GH13261)
• Bug in `groupby` with `as_index=False` returns all NaN’s when grouping on multiple columns including a categorical one (GH13204)
• Bug in `df.groupby(...)[[...]]` where getitem with `Int64Index` raised an error (GH13731)
• Bug in the CSS classes assigned to `DataFrame.style` for index names. Previously they were assigned "col_heading level<n> col<c>" where n was the number of levels + 1. Now they are assigned "index_name level<n>" where n is the correct level for that MultiIndex.
• Bug where `pd.read_gbq()` could throw `ImportError: No module named discovery` as a result of a naming conflict with another python package called apiclient (GH13454)
• Bug in `Index.union` returns an incorrect result with a named empty index (GH13432)
• Bugs in Index.difference and DataFrame.join raise in Python3 when using mixed-integer indexes (GH13432, GH12814)
• Bug in subtract tz-aware datetime.datetime from tz-aware datetime64 series (GH14088)
• Bug in .to_excel() when DataFrame contains a MultiIndex which contains a label with a NaN value (GH13511)
• Bug in invalid frequency offset string like “D1”, “-2-3H” may not raise ValueError (GH13930)
• Bug in concat and groupby for hierarchical frames with RangeIndex levels (GH13542).
• Bug in Series.str.contains() for Series containing only NaN values of object dtype (GH14171)
• Bug in agg() function on groupby dataframe changes dtype of datetime64[ns] column to float64 (GH12821)
• Bug in using NumPy ufunc with PeriodIndex to add or subtract integer raise IncompatibleFrequency. Note that using standard operator like + or - is recommended, because standard operators use more efficient path (GH13980)
• Bug in operations on NaT returning float instead of datetime64[ns] (GH12941)
• Bug in Series flexible arithmetic methods (like .add()) raises ValueError when axis=None (GH13894)
• Bug in DataFrame.to_csv() with MultiIndex columns in which a stray empty line was added (GH6618)
• Bug in DatetimeIndex, TimedeltaIndex and PeriodIndex.equals() may return True when input isn’t Index but contains the same values (GH13107)
• Bug in assignment against datetime with timezone may not work if it contains datetime near DST boundary (GH14146)
• Bug in pd.eval() and HDFStore query truncating long float literals with python 2 (GH14241)
• Bug in Index raises KeyError displaying incorrect column when column is not in the df and columns contains duplicate values (GH13822)
• Bug in Period and PeriodIndex creating wrong dates when frequency has combined offset aliases (GH13874)
• Bug in .to_string() when called with an integer line_width and index=False raises an UnboundLocalError exception because idx referenced before assignment.
• Bug in eval() where the resolvers argument would not accept a list (GH14095)
• Bugs in stack, get_dummies, make_axis_dummies which don't preserve categorical dtypes in (multi)indexes (GH13854)
• PeriodIndex can now accept list and array which contains pd.NaT (GH13430)
• Bug in df.groupby where .median() returns arbitrary values if grouped dataframe contains empty bins (GH13629)
• Bug in Index.copy() where name parameter was ignored (GH14302)

5.11 Version 0.18

5.11.1 Version 0.18.1 (May 3, 2016)

This is a minor bug-fix release from 0.18.0 and includes a large number of bug fixes along with several new features, enhancements, and performance improvements. We recommend that all users upgrade to this version.

Highlights include:

• `.groupby(...)` has been enhanced to provide convenient syntax when working with `.rolling(..), .expanding(..)`, and `.resample(..)` per group, see [here](#).
• `pd.to_datetime()` has gained the ability to assemble dates from a `DataFrame`, see [here](#).
• Method chaining improvements, see [here](#).
• Custom business hour offset, see [here](#).
• Many bug fixes in the handling of `sparse`, see [here](#).
• Expanded the [Tutorials section](#) with a feature on modern pandas, courtesy of @TomAugsburger. (GH13045).

What’s new in v0.18.1

• **New features**
  – Custom business hour
  – Method `.groupby(...) syntax with window and resample operations`
  – Method chaining improvements
    * Methods `.where()` and `.mask()
    * Methods `.loc[]`, `.iloc[]`, `.ix[]`
    * Indexing with ```
  – Partial string indexing on `DatetimeIndex` when part of a `MultiIndex`
New features

Custom business hour

The CustomBusinessHour is a mixture of BusinessHour and CustomBusinessDay which allows you to specify arbitrary holidays. For details, see Custom Business Hour (GH11514)

```python
In [1]: from pandas.tseries.offsets import CustomBusinessHour
In [2]: from pandas.tseries.holiday import USFederalHolidayCalendar
In [3]: bhour_us = CustomBusinessHour(calendar=USFederalHolidayCalendar())
```

Friday before MLK Day

```python
In [4]: import datetime
In [5]: dt = datetime.datetime(2014, 1, 17, 15)
In [6]: dt + bhour_us
Out[6]: Timestamp('2014-01-17 16:00:00')
```

Tuesday after MLK Day (Monday is skipped because it’s a holiday)

```python
In [7]: dt + bhour_us * 2
Out[7]: Timestamp('2014-01-20 09:00:00')
```
Method `.groupby(…) syntax with window and resample operations

`.groupby(…)` has been enhanced to provide convenient syntax when working with `.rolling(…), .expanding(…)` and `.resample(…)` per group, see (GH12486, GH12738).

You can now use `.rolling(…)` and `.expanding(…)` as methods on groupbys. These return another deferred object (similar to what `.rolling()` and `.expanding()` do on ungrouped pandas objects). You can then operate on these `RollingGroupby` objects in a similar manner.

Previously you would have to do this to get a rolling window mean per-group:

```python

In [9]: df
Out[9]:
   A  B
0  1  0
1  1  1
2  1  2
3  1  3
4  1  4
... ...
35 3 35
36 3 36
37 3 37
38 3 38
39 3 39
[40 rows x 2 columns]

In [10]: df.groupby("A").apply(lambda x: x.rolling(4).B.mean())
Out[10]:
A
1  0    NaN
   1    NaN
   2    NaN
   3    1.5
   4    2.5
...
3 35    33.5
36    34.5
37    35.5
38    36.5
39    37.5
Name: B, Length: 40, dtype: float64
```

Now you can do:

```python
In [11]: df.groupby("A").rolling(4).B.mean()
Out[11]:
A
1  0    NaN
   1    NaN
   2    NaN
```

(continues on next page)
For `.resample(..)` type of operations, previously you would have to:

```python
In [12]: df = pd.DataFrame(
    ....:     {
    ....:         "date": pd.date_range(start="2016-01-01", periods=4, freq="W"),
    ....:         "group": [1, 1, 2, 2],
    ....:         "val": [5, 6, 7, 8],
    ....:     }
    ....: ).set_index("date")
    ....:
```

```python
In [13]: df
```

```
  group  val
date
2016-01-03  1  5
2016-01-10  1  6
2016-01-17  2  7
2016-01-24  2  8

[4 rows x 2 columns]
```

```python
In [14]: df.groupby("group").apply(lambda x: x.resample("1D").ffill())
```

```
  group  val
group  date
1  2016-01-03  1  5
     2016-01-04  1  5
     2016-01-05  1  5
     2016-01-06  1  5
     2016-01-07  1  5
     ...
     2016-01-20  2  7
     2016-01-21  2  7
     2016-01-22  2  7
     2016-01-23  2  7
     2016-01-24  2  8

[16 rows x 2 columns]
```

Now you can do:
Method chaining improvements

The following methods / indexers now accept a callable. It is intended to make these more useful in method chains, see the documentation. (GH11485, GH12533)

- `.where()` and `.mask()`
- `.loc[]`, `.iloc[]` and `.ix[]`
- `[]` indexing

Methods `.where()` and `.mask()`

These can accept a callable for the condition and other arguments.
**Methods** `.loc[]`, `.iloc[]`, `.ix[]`

These can accept a callable, and a tuple of callable as a slicer. The callable can return a valid boolean indexer or anything which is valid for these indexer's input.

```python
# callable returns bool indexer
In [18]: df.loc[lambda x: x.A >= 2, lambda x: x.sum() > 10]
Out[18]:
   B  C
0  1  5  8
1  2  6  9
[2 rows x 2 columns]

# callable returns list of labels
In [19]: df.loc[lambda x: [1, 2], lambda x: ["A", "B"]]
Out[19]:
   A  B
0  1  2
1  2  3
[2 rows x 2 columns]
```

**Indexing with** `[]`

Finally, you can use a callable in `[ ]` indexing of Series, DataFrame and Panel. The callable must return a valid input for `[ ]` indexing depending on its class and index type.

```python
In [20]: df[lambda x: "A"]
Out[20]:
   0  1
0  1  2
1  2  3
Name: A, Length: 3, dtype: int64
```

Using these methods / indexers, you can chain data selection operations without using temporary variable.

```python
In [21]: bb = pd.read_csv("data/baseball.csv", index_col="id")

In [22]: (bb.groupby(["year", "team"]).sum().loc[lambda df: df.r > 100])
Out[22]:
   stint  g  ab  r  h  X2b  X3b  hr  rbi  sb  cs  bb  so  ibb  hbp  sh  sf  gidp
                year  team
  2007  6  379  745  101  203  35  2  36  125.0  10.0  1.0  105  127.0  14.0  1.0  1.0  15.0  18.0
  2008  5  301  1062  162  283  54  4  37  144.0  24.0  7.0  97  176.0  3.0  10.0  4.0  8.0  28.0
  2009  4  311  926  109  218  47  6  14  77.0  10.0  4.0  60  212.0  3.0
  2010  11  413  1021  153  293  61  3  36  154.0  7.0  5.0  114  141.0  8.0
```

(continues on next page)
Partial string indexing now matches on DateTimeIndex when part of a MultiIndex

Partial string indexing now matches on DateTimeIndex when part of a MultiIndex (GH10331)

```
In [23]: dft2 = pd.DataFrame(
    ...:     np.random.randn(20, 1),
    ...:     columns=['A'],
    ...:     index=pd.MultiIndex.from_product(
    ...:         [pd.date_range("20130101", periods=10, freq="12H"), ["a", "b"]],
    ...:     ),
    ...: )

In [24]: dft2
Out[24]:
     A

[4 rows x 1 columns]
```

### Assembling datetimes

`pd.to_datetime()` has gained the ability to assemble datetimes from a passed in DataFrame or a dict. (GH8158).

```python
In [30]: df = pd.DataFrame(
   ....:     {"year": [2015, 2016], "month": [2, 3], "day": [4, 5], "hour": [2, 3]}
   ....: )

In [31]: df
Out[31]:
   year  month  day  hour
0  2015     2     4     2
1  2016     3     5     3
[2 rows x 4 columns]
```

Assembling using the passed frame.
In [32]: pd.to_datetime(df)
Out[32]:
0  2015-02-04 02:00:00
1  2016-03-05 03:00:00
Length: 2, dtype: datetime64[ns]

You can pass only the columns that you need to assemble.

In [33]: pd.to_datetime(df["year", "month", "day"])  
Out[33]:
0  2015-04-02
1  2016-03-05
Length: 2, dtype: datetime64[ns]

Other enhancements

- `pd.read_csv()` now supports `delim_whitespace=True` for the Python engine (GH12958)
- `pd.read_csv()` now supports opening ZIP files that contains a single CSV, via extension inference or explicit `compression='zip'` (GH12175)
- `pd.read_csv()` now supports opening files using xz compression, via extension inference or explicit `compression='xz'` is specified; xz compressions is also supported by DataFrame.to_csv in the same way (GH11852)
- `pd.read_msgpack()` now always gives writeable ndarrays even when compression is used (GH12359).
- `pd.read_msgpack()` now supports serializing and de-serializing categoricals with msgpack (GH12573)
- `.to_json()` now supports `NDFrame` that contain categorical and sparse data (GH10778)
- `interpolate()` now supports method='akima' (GH7588).
- `pd.read_excel()` now accepts path objects (e.g. `pathlib.Path`, `py.path.local`) for the file path, in line with other read_* functions (GH12655)
- Added `.weekday_name` property as a component to `DatetimeIndex` and the `.dt` accessor. (GH11128)
- Index.take now handles `allow_fill` and `fill_value` consistently (GH12631)

```
In [34]: idx = pd.Index([1.0, 2.0, 3.0, 4.0], dtype=\"float\")

# default, allow_fill=True, fill_value=None
In [35]: idx.take([2, -1])
Out[35]: Float64Index([3.0, 4.0], dtype='float64')

In [36]: idx.take([2, -1], fill_value=True)
Out[36]: Float64Index([3.0, nan], dtype='float64')
```

- Index now supports `.str.get_dummies()` which returns `MultiIndex`, see Creating Indicator Variables (GH10008, GH10103)

```
In [37]: idx = pd.Index([\"a\b", \"a\c", \"b\c\"])

In [38]: idx.str.get_dummies("|")
Out[38]:
```

(continues on next page)
MultiIndex([(1, 1, 0),
            (1, 0, 1),
            (0, 1, 1)],
           names=['a', 'b', 'c']
)

- `pd.crosstab()` has gained a `normalize` argument for normalizing frequency tables (GH12569). Examples in the updated docs [here](#).
- `.resample(..).interpolate()` is now supported (GH12925)
- `.isin()` now accepts passed sets (GH12988)

**Sparse changes**

These changes conform sparse handling to return the correct types and work to make a smoother experience with indexing.

SparseArray.take now returns a scalar for scalar input, SparseArray for others. Furthermore, it handles a negative indexer with the same rule as Index (GH10560, GH12796)

```python
s = pdSparseArray([np.nan, np.nan, 1, 2, 3, np.nan, 4, 5, np.nan, 6])
s.take(0)
s.take([1, 2, 3])
```

- Bug in SparseSeries[] indexing with Ellipsis raises KeyError (GH9467)
- Bug in SparseArray[] indexing with tuples are not handled properly (GH12966)
- Bug in SparseSeries.loc[] with list-like input raises TypeError (GH10560)
- Bug in SparseSeries.iloc[] with scalar input may raise IndexError (GH10560)
- Bug in SparseSeries.loc[], .iloc[] with slice returns SparseArray, rather than SparseSeries (GH10560)
- Bug in SparseDataFrame.loc[], .iloc[] may results in dense Series, rather than SparseSeries (GH12787)
- Bug in SparseArray addition ignores `fill_value` of right hand side (GH12910)
- Bug in SparseArray mod raises AttributeError (GH12910)
- Bug in SparseArray pow calculates 1 ** np.nan as np.nan which must be 1 (GH12910)
- Bug in SparseArray comparison output may incorrect result or raise ValueError (GH12971)
- Bug in SparseSeries.__repr__ raises TypeError when it is longer than `max_rows` (GH10560)
- Bug in SparseSeries.shape ignores `fill_value` (GH10452)
- Bug in SparseSeries and SparseArray may have different dtype from its dense values (GH12908)
- Bug in SparseSeries.reindex incorrectly handle `fill_value` (GH12797)
- Bug in SparseArray.to_frame() results in DataFrame, rather than SparseDataFrame (GH9850)
- Bug in SparseSeries.value_counts() does not count `fill_value` (GH6749)
- Bug in SparseArray.to_dense() does not preserve dtype (GH10648)
- Bug in SparseArray.to_dense() incorrectly handle `fill_value` (GH12797)
- Bug in pd.concat() of SparseSeries results in dense (GH10536)
• Bug in `pd.concat()` of `SparseDataFrame` incorrectly handle `fill_value` (GH9765)
• Bug in `pd.concat()` of `SparseDataFrame` may raise `AttributeError` (GH12174)
• Bug in `SparseArray.shift()` may raise `NameError` or `TypeError` (GH12908)

API changes

Method `.groupby(..).nth()` changes

The index in `.groupby(..).nth()` output is now more consistent when the `as_index` argument is passed (GH11039):

```python
In [39]: df = pd.DataFrame({"A": ["a", "b", "a"], "B": [1, 2, 3]})

In [40]: df
Out[40]:
   A  B
0  a  1
1  b  2
2  a  3
[3 rows x 2 columns]
```

Previous behavior:

```python
In [3]: df.groupby('A', as_index=True)['B'].nth(0)
Out[3]:
   0   1
Name: B, dtype: int64

In [4]: df.groupby('A', as_index=False)['B'].nth(0)
Out[4]:
   1   2
Name: B, dtype: int64
```

New behavior:

```python
In [41]: df.groupby("A", as_index=True)['B'].nth(0)
Out[41]:
   a   1
   b   2
Name: B, Length: 2, dtype: int64

In [42]: df.groupby("A", as_index=False)['B'].nth(0)
Out[42]:
   0   1
   1   2
Name: B, Length: 2, dtype: int64
```

Furthermore, previously, a `.groupby` would always sort, regardless if `sort=False` was passed with `.nth()`.
In [43]: np.random.seed(1234)

In [44]: df = pd.DataFrame(np.random.randn(100, 2), columns=['a', 'b'])

In [45]: df['c'] = np.random.randint(0, 4, 100)

Previous behavior:

In [4]: df.groupby('c', sort=True).nth(1)
Out[4]:
   a     b
  c
0 -0.334077  0.002118
1  0.036142 -2.074978
2 -0.720589  0.887163
3  0.859588 -0.636524

In [5]: df.groupby('c', sort=False).nth(1)
Out[5]:
   a     b
  c
0 -0.334077  0.002118
1  0.036142 -2.074978
2 -0.720589  0.887163
3  0.859588 -0.636524

New behavior:

In [46]: df.groupby("c", sort=True).nth(1)
Out[46]:
   a     b
  c
0 -0.334077  0.002118
1  0.036142 -2.074978
2 -0.720589  0.887163
3  0.859588 -0.636524

In [47]: df.groupby("c", sort=False).nth(1)
Out[47]:
   a     b
  c
2 -0.720589  0.887163
3  0.859588 -0.636524
0 -0.334077  0.002118
1  0.036142 -2.074978

[4 rows x 2 columns]
NumPy function compatibility

Compatibility between pandas array-like methods (e.g. \texttt{sum} and \texttt{take}) and their \texttt{numpy} counterparts has been greatly increased by augmenting the signatures of the pandas methods so as to accept arguments that can be passed in from \texttt{numpy}, even if they are not necessarily used in the pandas implementation (GH12644, GH12638, GH12687)

- \texttt{.searchsorted()} for \texttt{Index} and \texttt{TimedeltaIndex} now accept a \texttt{sorter} argument to maintain compatibility with \texttt{numpy}'s \texttt{searchsorted} function (GH12238)
- Bug in \texttt{numpy} compatibility of \texttt{np.round()} on a \texttt{Series} (GH12600)

An example of this signature augmentation is illustrated below:

```python
sp = pd.SparseDataFrame([1, 2, 3])
sp

Previous behaviour:
```
In [2]: np.cumsum(sp, axis=0)
...
TypeError: cumsum() takes at most 2 arguments (4 given)
```

New behaviour:

```python
np.cumsum(sp, axis=0)
```

Using \texttt{.apply} on GroupBy resampling

Using \texttt{apply} on resampling groupby operations (using a \texttt{pd.TimeGrouper}) now has the same output types as similar \texttt{apply} calls on other groupby operations. (GH11742).

```python
In [48]: df = pd.DataFrame(
    ....:     
    ....:
    ....:     {"date": pd.to_datetime(["10/10/2000", "11/10/2000"]), "value": [10, 13]}
    ....:     )
    ....:

In [49]: df
Out[49]:
   date  value
0 1000-10-10   10
1 1000-11-10   13

[2 rows x 2 columns]

Previous behavior:
```
In [1]: df.groupby(pd.TimeGrouper(key='date',
    ....:     freq='M')).apply(lambda x: x.value.sum())
Out[1]:
...
TypeError: cannot concatenate a non-NDFrame object
```

# Output is a Series

```python
In [2]: df.groupby(pd.TimeGrouper(key='date',
    ....:     freq='M')).apply(lambda x: x.value.sum())
```
...:
Out[2]:
date
2000-10-31  value   10
2000-11-30  value   13
dtype: int64

New behavior:

# Output is a Series
In [55]: df.groupby(pd.TimeGrouper(key='date',
                      ...: freq='M')).apply(lambda x: x.value.sum())
Out[55]:
date
2000-10-31  10
2000-11-30  13
Freq: M, dtype: int64

# Output is a DataFrame
In [56]: df.groupby(pd.TimeGrouper(key='date',
                      ...: freq='M')).apply(lambda x: x[['value']].sum())
Out[56]:
   value
date
2000-10-31   10
2000-11-30   13

Changes in read_csv exceptions

In order to standardize the read_csv API for both the c and python engines, both will now raise an EmptyDataError, a subclass of ValueError, in response to empty columns or header (GH12493, GH12506)

Previous behaviour:

In [1]: import io
In [2]: df = pd.read_csv(io.StringIO(''), engine='c')
   ...: ValueError: No columns to parse from file
In [3]: df = pd.read_csv(io.StringIO(''), engine='python')
   ...: StopIteration

New behaviour:

In [1]: df = pd.read_csv(io.StringIO(''), engine='c')
   ...: pandas.io.common.EmptyDataError: No columns to parse from file
In [2]: df = pd.read_csv(io.StringIO(''), engine='python')
In addition to this error change, several others have been made as well:

- CParserError now sub-classes ValueError instead of just a Exception (GH12551)
- A CParserError is now raised instead of a generic Exception in read_csv when the c engine cannot parse a column (GH12506)
- A ValueError is now raised instead of a generic Exception in read_csv when the c engine encounters an element in a column containing unencodable bytes (GH12506)
- A ValueError is now raised instead of a generic Exception in read_csv when true_values is specified, and the c engine encounters an element in a column containing unencodable bytes (GH12506)
- pandas.parser.OverflowError exception has been removed and has been replaced with Python’s built-in OverflowError exception (GH12506)
- pd.read_csv() no longer allows a combination of strings and integers for the usecols parameter (GH12678)

**Method to_datetime error changes**

Bugs in pd.to_datetime() when passing a unit with convertible entries and errors='coerce' or non-convertible with errors='ignore'. Furthermore, an OutOfBoundsDatetime exception will be raised when an out-of-range value is encountered for that unit when errors='raise'. (GH11758, GH13052, GH13059)

Previous behaviour:

```
In [27]: pd.to_datetime(1420043460, unit='s', errors='coerce')
Out[27]: NaT
```

```
In [28]: pd.to_datetime(11111111, unit='D', errors='ignore')
OverflowError: Python int too large to convert to C long
```

```
In [29]: pd.to_datetime(11111111, unit='D', errors='raise')
OverflowError: Python int too large to convert to C long
```

New behaviour:

```
In [2]: pd.to_datetime(1420043460, unit='s', errors='coerce')
Out[2]: Timestamp('2014-12-31 16:31:00')
```

```
In [3]: pd.to_datetime(11111111, unit='D', errors='ignore')
Out[3]: 11111111
```

```
In [4]: pd.to_datetime(11111111, unit='D', errors='raise')
OutOfBoundsDatetime: cannot convert input with unit 'D'
```
Other API changes

- `.swaplevel()` for `Series`, `DataFrame`, `Panel`, and `MultiIndex` now features defaults for its first two parameters `i` and `j` that swap the two innermost levels of the index. (GH12934)
- `.searchsorted()` for `Index` and `TimedeltaIndex` now accept a `sorter` argument to maintain compatibility with numpy’s `searchsorted` function (GH1238)
- `Period` and `PeriodIndex` now raises `IncompatibleFrequency` error which inherits `ValueError` rather than raw `ValueError` (GH12615)
- `Series.apply` for category dtype now applies the passed function to each of the `.categories` (and not the `.codes`), and returns a category dtype if possible (GH12473)
- `read_csv` will now raise a `TypeError` if `parse_dates` is neither a boolean, list, or dictionary (matches the doc-string) (GH5636)
- The default for `.query()/.eval()` is now `engine=None`, which will use `numexpr` if it’s installed; otherwise it will fallback to the python engine. This mimics the pre-0.18.1 behavior if `numexpr` is installed (and which, previously, if `numexpr` was not installed, `.query()/.eval()` would raise). (GH12749)
- `pd.show_versions()` now includes `pandas_datareader` version (GH12740)
- Provide a proper `__name__` and `__qualname__` attributes for generic functions (GH12021)
- `pd.concat(ignore_index=True)` now uses `RangeIndex` as default (GH12695)
- `pd.merge()` and `DataFrame.join()` will show a `UserWarning` when merging/joining a single- with a multi-leveled dataframe (GH9455, GH12219)
- Compat with scipy > 0.17 for deprecated `piecewise_polynomial` interpolation method; support for the replacement from `derivatives` method (GH12887)

Deprecations

- The method name `Index.sym_diff()` is deprecated and can be replaced by `Index.symmetric_difference()` (GH12591)
- The method name `Categorical.sort()` is deprecated in favor of `Categorical.sort_values()` (GH12882)

Performance improvements

- Improved speed of SAS reader (GH12656, GH12961)
- Performance improvements in `.groupby(..).cumcount()` (GH11039)
- Improved memory usage in `pd.read_csv()` when using `skiprows=an_integer` (GH13005)
- Improved performance of `DataFrame.to_sql` when checking case sensitivity for tables. Now only checks if table has been created correctly when table name is not lower case. (GH12876)
- Improved performance of `Period` construction and time series plotting (GH12903, GH11831).
- Improved performance of `.str.encode()` and `.str.decode()` methods (GH13008)
- Improved performance of `to_numeric` if input is numeric dtype (GH12777)
- Improved performance of sparse arithmetic with `IntIndex` (GH13036)
Bug fixes

- usecols parameter in pd.read_csv is now respected even when the lines of a CSV file are not even (GH12203)
- Bug in groupby.transform(..) when axis=1 is specified with a non-monotonic ordered index (GH12713)
- Bug in Period and PeriodIndex creation raises KeyError if freq="Minute" is specified. Note that “Minute” freq is deprecated in v0.17.0, and recommended to use freq="T" instead (GH11854)
- Bug in .resample(..).count() with a PeriodIndex always raising a TypeError (GH12774)
- Bug in .resample(..) with a PeriodIndex casting to a DatetimeIndex when empty (GH12868)
- Bug in printing data which contains Period with different freq raises ValueError (GH12615)
- Bug in Series construction with Categorical and dtype='category' is specified (GH12574)
- Bugs in concatenation with a coercible dtype was too aggressive, resulting in different dtypes in output formatting when an object was longer than display.max_rows (GH12411, GH12045, GH11594, GH10571, GH12211)
- Bug in float_format option with option not being validated as a callable. (GH12706)
- Bug in GroupBy.filter when dropna=False and no groups fulfilled the criteria (GH12768)
- Bug in __name__ of .cum* functions (GH12021)
- Bug in .astype() of a Float64Inde/Int64Index to an Int64Index (GH12881)
- Bug in round tripping an integer based index in .to_json()/read_json() when orient='index' (the default) (GH12866)
- Bug in plotting Categorical dtypes cause error when attempting stacked bar plot (GH13019)
- Compat with >= numpy 1.11 for NaT comparisons (GH12969)
- Bug in .drop() with a non-unique MultiIndex. (GH12701)
- Bug in .concat() with a non-unique MultiIndex. (GH12701)
- Bug in correctly raising a ValueError in .resample(..).fillna(..) when passing a non-string (GH12952)
- Bug fixes in various encoding and header processing issues in pd.read_sas() (GH12659, GH12654, GH12647, GH12809)
- Bug in pd.crosstab() where would silently ignore aggfunc if values=None (GH12569).
- Potential segfault in DataFrame.to_json when serialising datetime.time (GH11473).
- Potential segfault in DataFrame.to_json when attempting to serialise 0d array (GH11299).
- Segfault in to_json when attempting to serialise a DataFrame or Series with non-ndarray values; now supports serialization of category, sparse, and datetime64[ns, tz] dtypes (GH10778).
- Bug in DataFrame.to_json with unsupported dtype not passed to default handler (GH12554).
- Bug in .align not returning the sub-class (GH12983)
- Bug in aligning a Series with a DataFrame (GH13037)
- Bug in ABCPanel in which Panel4D was not being considered as a valid instance of this generic type (GH12810)
- Bug in consistency of .name on .groupby(..).apply(..) cases (GH12363)
- Bug in Timestamp.__repr__ that caused pprint to fail in nested structures (GH12622)
- Bug in Timedelta.min and Timedelta.max, the properties now report the true minimum/maximum timedeltas as recognized by pandas. See the documentation. (GH12727)
• Bug in .quantile() with interpolation may coerce to float unexpectedly (GH12772)
• Bug in .quantile() with empty Series may return scalar rather than empty Series (GH12772)
• Bug in .loc with out-of-bounds in a large indexer would raise IndexError rather than KeyError (GH12527)
• Bug in resampling when using a TimedeltaIndex and .asfreq(), would previously not include the final fencepost (GH12926)
• Bug in equality testing with a Categorical in a DataFrame (GH12564)
• Bug in GroupBy.first(), .last() returns incorrect row when TimeGrouper is used (GH7453)
• Bug in pd.read_csv() with the c engine when specifying skiprows with newlines in quoted items (GH10911, GH12775)
• Bug in DataFrame timezone lost when assigning tz-aware datetime Series with alignment (GH12981)
• Bug in .value_counts() when normalize=True and dropna=True where nulls still contributed to the normalized count (GH12558)
• Bug in Series.value_counts() loses name if its dtype is category (GH12835)
• Bug in Series.value_counts() loses timezone info (GH12835)
• Bug in Series.value_counts(normalize=True) with Categorical raises UnboundLocalError (GH12835)
• Bug in Panel.fillna() ignoring inplace=True (GH12633)
• Bug in pd.read_csv() when specifying names, usecols, and parse_dates simultaneously with the c engine (GH9755)
• Bug in pd.read_csv() when specifying delim_whitespace=True and lineterminator simultaneously with the c engine (GH12912)
• Bug in Series.rename, DataFrame.rename and DataFrame.rename_axis not treating Series as mappings to relabel (GH12623)
• Clean in .rolling.min and .rolling.max to enhance dtype handling (GH12373)
• Bug in groupby where complex types are coerced to float (GH12902)
• Bug in Series.map raises TypeError if its dtype is category or tz-aware datetime (GH12473)
• Bugs on 32bit platforms for some test comparisons (GH12972)
• Bug in index coercion when falling back from RangeIndex construction (GH12893)
• Better error message in window functions when invalid argument (e.g. a float window) is passed (GH12669)
• Bug in slicing subclassed DataFrame defined to return subclassed Series may return normal Series (GH11559)
• Bug in .str accessor methods may raise ValueError if input has name and the result is DataFrame or MultiIndex (GH12617)
• Bug in DataFrame.last_valid_index() and DataFrame.first_valid_index() on empty frames (GH12800)
• Bug in CategoricalIndex.get_loc returns different result from regular Index (GH12531)
• Bug in PeriodIndex.resample where name not propagated (GH12769)
• Bug in date_range closed keyword and timezones (GH12684).
• Bug in pd.concat raises AttributeError when input data contains tz-aware datetime and timedelta (GH12620)
• Bug in pd.concat did not handle empty Series properly (GH11082)
• Bug in .plot.bar alignment when width is specified with int (GH12979)
• Bug in fill_value is ignored if the argument to a binary operator is a constant (GH12723)
• Bug in pd.read_html() when using bs4 flavor and parsing table with a header and only one column (GH9178)
• Bug in .pivot_table when margins=True and dropna=True where nulls still contributed to margin count (GH12577)
• Bug in .pivot_table when dropna=False where table index/column names disappear (GH12133)
• Bug in pd.crosstab() when margins=True and dropna=False which raised (GH12642)
• Bug in Series.name when name attribute can be a hashable type (GH12610)
• Bug in .describe() resets categorical columns information (GH11558)
• Bug where loffset argument was not applied when calling resample().count() on a timeseries (GH12725)
• pd.read_excel() now accepts column names associated with keyword argument names (GH12870)
• Bug in pd.to_numeric() with Index returns np.ndarray, rather than Index (GH12777)
• Bug in pd.to_numeric() with datetime-like may raise TypeError (GH12777)
• Bug in pd.to_numeric() with scalar raises ValueError (GH12777)

5.11.2 Version 0.18.0 (March 13, 2016)

This is a major release from 0.17.1 and includes a small number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

**Warning:** pandas >= 0.18.0 no longer supports compatibility with Python version 2.6 and 3.3 (GH7718, GH11273)

**Warning:** numexpr version 2.4.4 will now show a warning and not be used as a computation back-end for pandas because of some buggy behavior. This does not affect other versions (>= 2.1 and >= 2.4.6). (GH12489)

Highlights include:

• Moving and expanding window functions are now methods on Series and DataFrame, similar to .groupby, see here.
• Adding support for a RangeIndex as a specialized form of the Int64Index for memory savings, see here.
• API breaking change to the .resample method to make it more .groupby like, see here.
• Removal of support for positional indexing with floats, which was deprecated since 0.14.0. This will now raise a TypeError, see here.
• The .to_xarray() function has been added for compatibility with the xarray package, see here.
• The read_sas function has been enhanced to read sas7bdat files, see here.
• Addition of the .str.extractall() method, and API changes to the .str.extract() method and .str.cat() method.
• pd.test() top-level nose test runner is available (GH4327).

Check the **API Changes** and **deprecations** before updating.

What’s new in v0.18.0

• New features
  – Window functions are now methods
  – Changes to rename
  – Range Index
  – Changes to str.extract
  – Addition of str.extractall
- Changes to `str.cat`
- Datetimelike rounding
- Formatting of integers in `FloatIndex`
- Changes to `dtypes` assignment behaviors
- Method to `_xarray`
- Latex representation
- `pd.read_sas()` changes
- Other enhancements

- Backwards incompatible API changes
  - `NaT` and `Timedelta` operations
  - Changes to `msgpack`
  - Signature change for `.rank`
  - Bug in `QuarterBegin` with `n=0`
  - Resample API
    * Downsampling
    * Upsampling
      * Previous API will work but with deprecations
  - Changes to `eval`
  - Other API changes
  - Deprecations
  - Removal of deprecated float indexers
  - Removal of prior version deprecations/changes

- Performance improvements
- Bug fixes
- Contributors

New features

Window functions are now methods

Window functions have been refactored to be methods on `Series/DataFrame` objects, rather than top-level functions, which are now deprecated. This allows these window-type functions, to have a similar API to that of `.groupby`. See the full documentation [here](GH11603, GH12373)

```
In [1]: np.random.seed(1234)
In [2]: df = pd.DataFrame({'A': range(10), 'B': np.random.randn(10)})
In [3]: df
```
```
Out[3]:
   A   B
0  0  0.471435
1  1 -1.190976
2  2  1.432707
3  3 -0.312652
4  4 -0.720589
5  5  0.887163
6  6  0.859588
7  7 -0.636524
8  8  0.015696
9  9 -2.242685
[10 rows x 2 columns]
```

Previous behavior:
```
In [8]: pd.rolling_mean(df, window=3)
```

FutureWarning: pd.rolling_mean is deprecated for DataFrame and will be removed in a future version, replace with
```
DataFrame.rolling(window=3,center=False).mean()
```

```
Out[8]:
   A   B
0 Nan Nan
1 Nan Nan
2  1  0.237722
3  2 -0.023640
4  3  0.133155
5  4 -0.048693
6  5  0.342054
7  6  0.370076
8  7  0.079587
9  8 -0.954504
```

New behavior:
```
In [4]: r = df.rolling(window=3)
```

These show a descriptive repr
```
In [5]: r
Out[5]: Rolling [window=3,center=False,axis=0]
```

with tab-completion of available methods and properties.
```
In [9]: r.<TAB>  # noqa E225, E999
   r.A        r.agg        r.apply        r.count        r.exclusions  r.max        r.
   –median    r.name        r.skew        r.sum
   r.B        r.aggregate    r.corr        r.cov          r.kurt        r.mean        r.
   –min       r.quantile    r.std          r.var
```

The methods operate on the Rolling object itself
In [6]: r.mean()
Out[6]:

<table>
<thead>
<tr>

<td>1.0</td>
</tr>
<tr>
<td>9</td>
<td>8.0</td>
<td>1.0</td>
</tr>
</tbody>
</table>

[10 rows x 4 columns]
Changes to rename

Series.rename and NDFrame.rename_axis can now take a scalar or list-like argument for altering the Series or axis name, in addition to their old behaviors of altering labels. (GH9494, GH11965)

```
In [9]: s = pd.Series(np.random.randn(5))
In [10]: s.rename('newname')
Out[10]:
0  1.150036
1  0.991946
2  0.953324
3 -2.021255
4 -0.334077
Name: newname, Length: 5, dtype: float64
```

```
In [11]: df = pd.DataFrame(np.random.randn(5, 2))
In [12]: (df.rename_axis("indexname")
    ....: .rename_axis("columns_name", axis="columns"))
    ....:
Out[12]:
columns_name  0  1
indexname
0  0.002118  0.405453
1  0.289092  1.321158
2 -1.546906 -0.202646
3 -0.655969  0.193421
4  0.553439  1.318152
[5 rows x 2 columns]
```

The new functionality works well in method chains. Previously these methods only accepted functions or dicts mapping a label to a new label. This continues to work as before for function or dict-like values.

Range Index

A RangeIndex has been added to the Int64Index sub-classes to support a memory saving alternative for common use cases. This has a similar implementation to the python range object (xrange in python 2), in that it only stores the start, stop, and step values for the index. It will transparently interact with the user API, converting to Int64Index if needed.

This will now be the default constructed index for NDFrame objects, rather than previous an Int64Index. (GH939, GH12070, GH12071, GH12109, GH12888)

Previous behavior:

```
In [3]: s = pd.Series(range(1000))
In [4]: s.index
Out[4]:
Int64Index([0, 1, 2, 3, 4, 5, 6, 7, 8, 9, ...
```

(continues on next page)
990, 991, 992, 993, 994, 995, 996, 997, 998, 999], dtype='int64', length=1000)

In [6]: s.index.nbytes
Out[6]: 8000

New behavior:

In [13]: s = pd.Series(range(1000))
In [14]: s.index
Out[14]: RangeIndex(start=0, stop=1000, step=1)
In [15]: s.index.nbytes
Out[15]: 128

Changes to str.extract

The .str.extract method takes a regular expression with capture groups, finds the first match in each subject string, and returns the contents of the capture groups (GH11386).

In v0.18.0, the expand argument was added to extract.

- expand=False: it returns a Series, Index, or DataFrame, depending on the subject and regular expression pattern (same behavior as pre-0.18.0).
- expand=True: it always returns a DataFrame, which is more consistent and less confusing from the perspective of a user.

Currently the default is expand=None which gives a FutureWarning and uses expand=False. To avoid this warning, please explicitly specify expand.

In [1]: pd.Series(['a1', 'b2', 'c3']).str.extract(r'[^a][b]\(\d\)', expand=None)
FutureWarning: currently extract(expand=None) means expand=False (return Index/Series/DataFrame)
but in a future version of pandas this will be changed to expand=True (return DataFrame)

Out[1]:
<table>
<thead>
<tr>
<th></th>
<th>1</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>1</td>
<td>2</td>
</tr>
<tr>
<td>2</td>
<td>NaN</td>
</tr>
</tbody>
</table>

dtype: object

Extracting a regular expression with one group returns a Series if expand=False.

In [16]: pd.Series(['a1', 'b2', 'c3']).str.extract(r'[^a][b]\(\d\)', expand=False)
Out[16]:
<table>
<thead>
<tr>
<th></th>
<th>1</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>1</td>
<td>2</td>
</tr>
<tr>
<td>2</td>
<td>NaN</td>
</tr>
</tbody>
</table>
Length: 3, dtype: object

It returns a DataFrame with one column if expand=True.
Calling on an Index with a regex with exactly one capture group returns an Index if expand=False.

```
In [18]: s = pd.Series(['a1', 'b2', 'c3'], ['A11', 'B22', 'C33'])
In [19]: s.index
Out[19]: Index(['A11', 'B22', 'C33'], dtype='object')
In [20]: s.index.str.extract("(?P<letter>[a-zA-Z])", expand=False)
Out[20]: Index(['A', 'B', 'C'], dtype='object', name='letter')
```

It returns a DataFrame with one column if expand=True.

```
In [21]: s.index.str.extract("(?P<letter>[a-zA-Z])([0-9]+)", expand=True)
Out[21]:
   letter 1
0   A 11
1   B 22
2   C 33
```

Calling on an Index with a regex with more than one capture group raises ValueError if expand=False.

```
>>> s.index.str.extract("(?P<letter>[a-zA-Z])([0-9]+)", expand=False)
ValueError: only one regex group is supported with Index
```

It returns a DataFrame if expand=True.

```
In [22]: s.index.str.extract("(?P<letter>[a-zA-Z])([0-9]+)", expand=True)
Out[22]:
   letter 1
0   A 11
1   B 22
2   C 33
```

In summary, extract(expand=True) always returns a DataFrame with a row for every subject string, and a column for every capture group.
Addition of str.extractall

The `.str.extractall` method was added (GH11386). Unlike extract, which returns only the first match.

```python
In [23]: s = pd.Series(["ala2", "b1", "c1"], ["A", "B", "C"])

In [24]: s
Out[24]:
A  a1a2
B  b1
C  c1
Length: 3, dtype: object

In [25]: s.str.extract(r"(?P<letter>[ab])(?P<digit>\d)", expand=False)
Out[25]:
    letter digit
A   a   1
B   b   1
C  NaN  NaN
[3 rows x 2 columns]
```

The `extractall` method returns all matches.

```python
In [26]: s.str.extractall(r"(?P<letter>[ab])(?P<digit>\d)")
Out[26]:
    letter digit
match
A   a   1
   1   a   2
B   b   1
[3 rows x 2 columns]
```

Changes to str.cat

The method `.str.cat()` concatenates the members of a Series. Before, if NaN values were present in the Series, calling `.str.cat()` on it would return NaN, unlike the rest of the Series.str.* API. This behavior has been amended to ignore NaN values by default. (GH11435).

A new, friendlier `ValueError` is added to protect against the mistake of supplying the `sep` as an arg, rather than as a kwarg. (GH11334).

```python
In [27]: pd.Series(['a', 'b', np.nan, 'c']).str.cat(sep=' ')
Out[27]: 'a b ? c'

In [28]: pd.Series(['a', 'b', np.nan, 'c']).str.cat(sep=' ', na_rep='?')
Out[28]: 'a b ? c'

In [2]: pd.Series(['a', 'b', np.nan, 'c']).str.cat(' ')
ValueError: Did you mean to supply a 'sep' keyword?
```
Datetimelike rounding

DateTimeIndex, Timestamp, TimedeltaIndex, Timedelta have gained the .round(), .floor() and .ceil() method for datetimelike rounding, flooring and ceiling. (GH4314, GH11963)

Naive datetimes

```
In [29]: dr = pd.date_range('20130101 09:12:56.1234', periods=3)
In [30]: dr
Out[30]: DatetimeIndex(['2013-01-01 09:12:56.123400', '2013-01-02 09:12:56.123400',
   '2013-01-03 09:12:56.123400'], dtype='datetime64[ns]', freq='D')

In [31]: dr.round('s')
Out[31]: DatetimeIndex(['2013-01-01 09:12:56', '2013-01-02 09:12:56',
   '2013-01-03 09:12:56'], dtype='datetime64[ns]', freq=None)
```

Naive datetimes

```
In [32]: dr[0]
Out[32]: Timestamp('2013-01-01 09:12:56.123400', freq='D')

In [33]: dr[0].round('10s')
Out[33]: Timestamp('2013-01-01 09:13:00')
```

Tz-aware are rounded, floored and ceiled in local times

```
In [34]: dr = dr.tz_localize('US/Eastern')
In [35]: dr
Out[35]: DatetimeIndex(['2013-01-01 09:12:56.123400-05:00',
   '2013-01-02 09:12:56.123400-05:00',
   '2013-01-03 09:12:56.123400-05:00'], dtype='datetime64[ns, US/Eastern]', freq=None)

In [36]: dr.round('s')
Out[36]: DatetimeIndex(['2013-01-01 09:12:56-05:00', '2013-01-02 09:12:56-05:00',
   '2013-01-03 09:12:56-05:00'], dtype='datetime64[ns, US/Eastern]', freq=None)
```

Timedeltas

```
In [37]: t = pd.timedelta_range('1 days 2 hr 13 min 45 us', periods=3, freq='d')
In [38]: t
Out[38]: TimedeltaIndex(['1 days 02:13:00.000045', '2 days 02:13:00.000045',
   '3 days 02:13:00.000045'], dtype='timedelta64[ns]', freq='D')
```
In [39]: t.round('10min')
Out[39]: TimedeltaIndex(['1 days 02:10:00', '2 days 02:10:00', '3 days 02:10:00'], dtype='timedelta64[ns]', freq=None)

# Timedelta scalar
In [40]: t[0]
Out[40]: Timedelta('1 days 02:13:00.000045')

In [41]: t[0].round('2h')
Out[41]: Timedelta('1 days 02:00:00')

In addition, `.round()`, `.floor()` and `.ceil()` will be available through the `.dt` accessor of `Series`.

In [42]: s = pd.Series(dr)

In [43]: s
Out[43]:
0  2013-01-01 09:12:56.123400-05:00
1  2013-01-02 09:12:56.123400-05:00
2  2013-01-03 09:12:56.123400-05:00
Length: 3, dtype: datetime64[ns, US/Eastern]

In [44]: s.dt.round('D')
Out[44]:
0  2013-01-01 00:00:00-05:00
1  2013-01-02 00:00:00-05:00
2  2013-01-03 00:00:00-05:00
Length: 3, dtype: datetime64[ns, US/Eastern]

**Formatting of integers in FloatIndex**

Integers in `FloatIndex`, e.g. 1., are now formatted with a decimal point and a 0 digit, e.g. 1.0 (GH11713) This change not only affects the display to the console, but also the output of IO methods like `.to_csv` or `.to_html`.

Previous behavior:

In [2]: s = pd.Series([1, 2, 3], index=np.arange(3.))

In [3]: s
Out[3]:
0    1
1    2
2    3
dtype: int64

In [4]: s.index
Out[4]: Float64Index([0.0, 1.0, 2.0], dtype='float64')

In [5]: print(s.to_csv(path=None))
0,1
New behavior:

```python
In [45]: s = pd.Series([1, 2, 3], index=np.arange(3.))
```

```python
In [46]: s
Out[46]:
0.0 1
1.0 2
2.0 3
Length: 3, dtype: int64
```

```python
In [47]: s.index
Out[47]: Float64Index([0.0, 1.0, 2.0], dtype='float64')
```

```python
In [48]: print(s.to_csv(path_or_buf=None, header=False))
0.0,1
1.0,2
2.0,3
```

Changes to dtype assignment behaviors

When a DataFrame’s slice is updated with a new slice of the same dtype, the dtype of the DataFrame will now remain the same. (GH10503)

Previous behavior:

```python
In [5]: df = pd.DataFrame({'a': [0, 1, 1],
                     'b': pd.Series([100, 200, 300], dtype='uint32')})
```

```python
In [7]: df.dtypes
Out[7]:
a int64
b uint32
dtype: object
```

```python
In [8]: ix = df['a'] == 1
In [9]: df.loc[ix, 'b'] = df.loc[ix, 'b']
```

```python
In [11]: df.dtypes
Out[11]:
a int64
b int64
dtype: object
```

New behavior:

```python
In [49]: df = pd.DataFrame({'a': [0, 1, 1],
                      'b': pd.Series([100, 200, 300], dtype='uint32')})
```

(continues on next page)
In [50]: df.dtypes
Out[50]:
    a  int64
    b  uint32
Length: 2, dtype: object

In [51]: ix = df['a'] == 1
In [52]: df.loc[ix, 'b'] = df.loc[ix, 'b']

In [53]: df.dtypes
Out[53]:
    a  int64
    b  uint32
Length: 2, dtype: object

When a DataFrame's integer slice is partially updated with a new slice of floats that could potentially be down-casted to integer without losing precision, the dtype of the slice will be set to float instead of integer.

Previous behavior:

In [4]: df = pd.DataFrame(np.array(range(1,10)).reshape(3,3),
                       columns=list('abc'),
                       index=[[4,4,8], [8,10,12]])

In [5]: df
Out[5]:
          a   b   c
    4  8  1  2  3
    10  4  5  6
    8  12  7  8  9

In [7]: df.ix[4, 'c'] = np.array([0., 1.])

In [8]: df
Out[8]:
          a   b   c
    4  8  1  2  0
    10  4  5  1
    8  12  7  8  9

New behavior:

In [54]: df = pd.DataFrame(np.array(range(1,10)).reshape(3,3),
                       columns=list('abc'),
                       index=[[4,4,8], [8,10,12]])

In [55]: df
Out[55]:
          a   b   c
4  8  1  2  0
10  4  5  1
8 12  7  8  9

(continues on next page)
Method to_to_xarray

In a future version of pandas, we will be deprecating Panel and other > 2 ndim objects. In order to provide for continuity, all NDFrame objects have gained the .to_xarray() method in order to convert to xarray objects, which has a pandas-like interface for > 2 ndim. (GH11972)

See the xarray full-documentation here.
Latex representation

DataFrame has gained a \_repr\_latex\_() method in order to allow for conversion to latex in a ipython/jupyter notebook using nbconvert. (GH11778)

Note that this must be activated by setting the option pd.display.latex.repr=True (GH12182)

For example, if you have a jupyter notebook you plan to convert to latex using nbconvert, place the statement pd.display.latex.repr=True in the first cell to have the contained DataFrame output also stored as latex.

The options display.latex.escape and display.latex.longtable have also been added to the configuration and are used automatically by the to\_latex method. See the available options docs for more info.

pd.read\_sas() changes

read_sas has gained the ability to read SAS7BDAT files, including compressed files. The files can be read in entirety, or incrementally. For full details see here. (GH4052)

Other enhancements

- Handle truncated floats in SAS xport files (GH11713)
- Added option to hide index in Series.to\_string (GH11729)
- read\_excel now supports s3 urls of the format s3://bucketname/filename (GH11447)
- add support for AWS\_S3\_HOST env variable when reading from s3 (GH12198)
- A simple version of Panel.round\() is now implemented (GH11763)
- For Python 3.x, round(DataFrame), round(Series), round(Panel) will work (GH11763)
- sys.getsizeof(obj) returns the memory usage of a pandas object, including the values it contains (GH11597)
- Series gained an is\_unique attribute (GH11946)
- DataFrame.quantile and Series.quantile now accept interpolation keyword (GH10174).
- Added DataFrame.style\_format for more flexible formatting of cell values (GH11692)
- DataFrame.select\_dtypes now allows the np.float16 type code (GH11990)
- pivot\_table() now accepts most iterables for the values parameter (GH12017)
- Added Google BigQuery service account authentication support, which enables authentication on remote servers. (GH11881, GH12572). For further details see here
- HDFStore is now iterable: for k in store is equivalent to for k in store.keys() (GH12221).
- Add missing methods/fields to .dt for Period (GH8848)
- The entire code base has been PEP-iﬁed (GH12096)
Backwards incompatible API changes

- the leading white spaces have been removed from the output of `.to_string(index=False)` method (GH11833)
- the `out` parameter has been removed from the `Series.round()` method. (GH11763)
- `DataFrame.round()` leaves non-numeric columns unchanged in its return, rather than raises. (GH11885)
- `DataFrame.head(0)` and `DataFrame.tail(0)` return empty frames, rather than `self`. (GH11937)
- `Series.head(0)` and `Series.tail(0)` return empty series, rather than `self`. (GH11937)
- `to_msgpack` and `read_msgpack` encoding now defaults to `'utf-8'`. (GH12170)
- the order of keyword arguments to text file parsing functions (.read_csv(), .read_table(), .read_fwf()) changed to group related arguments. (GH11555)
- `NaTType.isoformat` now returns the string 'NaT' to allow the result to be passed to the constructor of `Timestamp`. (GH12300)

NaT and Timedelta operations

`NaT` and `Timedelta` have expanded arithmetic operations, which are extended to `Series` arithmetic where applicable. Operations defined for `datetime64[ns]` or `timedelta64[ns]` are now also defined for `NaT` (GH11564).

`NaT` now supports arithmetic operations with integers and floats.

```
In [58]: pd.NaT * 1
Out[58]: NaT

In [59]: pd.NaT * 1.5
Out[59]: NaT

In [60]: pd.NaT / 2
Out[60]: NaT

In [61]: pd.NaT * np.nan
Out[61]: NaT
```

`NaT` defines more arithmetic operations with `datetime64[ns]` and `timedelta64[ns]`.

```
In [62]: pd.NaT / pd.NaT
Out[62]: nan

In [63]: pd.Timedelta('1s') / pd.NaT
Out[63]: nan
```

`NaT` may represent either a `datetime64[ns]` null or a `timedelta64[ns]` null. Given the ambiguity, it is treated as a `timedelta64[ns]`, which allows more operations to succeed.

```
In [64]: pd.NaT + pd.NaT
Out[64]: NaT

# same as
In [65]: pd.Timedelta('1s') + pd.Timedelta('1s')
Out[65]: Timedelta('0 days 00:00:02')
```
as opposed to

```python
In [3]: pd.Timestamp('19900315') + pd.Timestamp('19900315')
TypeError: unsupported operand type(s) for +: 'Timestamp' and 'Timestamp'
```

However, when wrapped in a `Series` whose dtype is `datetime64[ns]` or `timedelta64[ns]`, the dtype information is respected.

```python
In [1]: pd.Series([pd.NaT], dtype='<M8[ns]') + pd.Series([pd.NaT], dtype='<M8[ns]')
```

```python
In [66]: pd.Series([pd.NaT], dtype='<m8[ns]') + pd.Series([pd.NaT], dtype='<m8[ns]')
Out[66]:
0   NaT
Length: 1, dtype: timedelta64[ns]
```

Timedelta division by floats now works.

```python
In [67]: pd.Timedelta('1s') / 2.0
Out[67]: Timedelta('0 days 00:00:00.500000')
```

Subtraction by Timedelta in a Series by a Timestamp works (GH11925)

```python
In [68]: ser = pd.Series(pd.timedelta_range('1 day', periods=3))
In [69]: ser
Out[69]:
0 1 days
1 2 days
2 3 days
Length: 3, dtype: timedelta64[ns]
```

```python
In [70]: pd.Timestamp('2012-01-01') - ser
Out[70]:
0 2011-12-31
1 2011-12-30
2 2011-12-29
Length: 3, dtype: datetime64[ns]
```

`NaT.isoformat()` now returns 'NaT'. This change allows `pd.Timestamp` to rehydrate any timestamp like object from its isoformat (GH12300).

**Changes to msgpack**

Forward incompatible changes in msgpack writing format were made over 0.17.0 and 0.18.0; older versions of pandas cannot read files packed by newer versions (GH12129, GH10527)

Bugs in `to_msgpack` and `read_msgpack` introduced in 0.17.0 and fixed in 0.18.0, caused files packed in Python 2 unreadable by Python 3 (GH12142). The following table describes the backward and forward compat of msgpacks.

**Warning:**
0.18.0 is backward-compatible for reading files packed by older versions, except for files packed with 0.17 in Python 2, in which case only they can only be unpacked in Python 2.

**Signature change for .rank**

Series.rank and DataFrame.rank now have the same signature (GH11759)

Previous signature

```python
In [3]: pd.Series([0,1]).rank(method='average', na_option='keep', ascending=True, pct=False)
```

```
Out[3]:
    0    1
   --- ---
   0 1  2
dtype: float64
```

```python
In [4]: pd.DataFrame([[0,1]]).rank(axis=0, numeric_only=None, method='average', na_option='keep', ascending=True, pct=False)
```

```
Out[4]:
    0 1
   --- ---
   0 1  2
dtype: float64
```

New signature

```python
In [71]: pd.Series([0,1]).rank(axis=0, method='average', numeric_only=None, na_option='keep', ascending=True, pct=False)
```

```
Out[71]:
    0    1.0
   --- ---
   0 1  2.0
Length: 2, dtype: float64
```

```python
In [72]: pd.DataFrame([[0,1]]).rank(axis=0, method='average', numeric_only=None, na_option='keep', ascending=True, pct=False)
```

```
Out[72]:
    0 1.0
   --- ---
   0 1  2.0
   1 2.0
```

(continues on next page)
Bug in QuarterBegin with n=0

In previous versions, the behavior of the QuarterBegin offset was inconsistent depending on the date when the n parameter was 0. (GH11406)

The general semantics of anchored offsets for n=0 is to not move the date when it is an anchor point (e.g., a quarter start date), and otherwise roll forward to the next anchor point.

```
In [73]: d = pd.Timestamp('2014-02-01')
In [74]: d
Out[74]: Timestamp('2014-02-01 00:00:00')
In [75]: d + pd.offsets.QuarterBegin(n=0, startingMonth=2)
Out[75]: Timestamp('2014-02-01 00:00:00')
In [76]: d + pd.offsets.QuarterBegin(n=0, startingMonth=1)
Out[76]: Timestamp('2014-04-01 00:00:00')
```

For the QuarterBegin offset in previous versions, the date would be rolled backwards if date was in the same month as the quarter start date.

```
In [3]: d = pd.Timestamp('2014-02-15')
In [4]: d + pd.offsets.QuarterBegin(n=0, startingMonth=2)
Out[4]: Timestamp('2014-02-01 00:00:00')
```

This behavior has been corrected in version 0.18.0, which is consistent with other anchored offsets like MonthBegin and YearBegin.

```
In [77]: d = pd.Timestamp('2014-02-15')
In [78]: d + pd.offsets.QuarterBegin(n=0, startingMonth=2)
Out[78]: Timestamp('2014-05-01 00:00:00')
```

Resample API

Like the change in the window functions API above, .resample(...) is changing to have a more groupby-like API. (GH11732, GH12702, GH12202, GH12332, GH12334, GH12348, GH12448).

```
In [79]: np.random.seed(1234)
In [80]: df = pd.DataFrame(np.random.rand(10,4),
    ....:                  columns=list('ABCD'),
    ....:                  index=pd.date_range('2010-01-01 09:00:00',
    ....:                  periods=10, freq='s'))
```
Previous API:

You would write a resampling operation that immediately evaluates. If a `how` parameter was not provided, it would default to `how='mean'`.

```
In [6]: df.resample('2s')
Out[6]:
     A      B      C      D
2010-01-01 09:00:00 0.485748 0.447351 0.357096 0.793615
2010-01-01 09:00:02 0.820801 0.794317 0.364034 0.531096
2010-01-01 09:00:04 0.433985 0.314582 0.424104 0.625733
2010-01-01 09:00:06 0.624988 0.609738 0.633165 0.612452
2010-01-01 09:00:08 0.510470 0.534317 0.573201 0.806949
```

You could also specify a `how` directly

```
In [7]: df.resample('2s', how='sum')
Out[7]:
     A      B      C      D
2010-01-01 09:00:00 0.971495 0.894701 0.714192 1.587231
2010-01-01 09:00:02 1.641602 1.588635 0.728068 1.062191
2010-01-01 09:00:04 1.867969 1.588635 0.728068 1.062191
2010-01-01 09:00:06 1.249976 1.219477 1.266330 1.224904
2010-01-01 09:00:08 1.020940 1.068634 1.146402 1.613897
```

New API:

Now, you can write `.resample(..)` as a 2-stage operation like `.groupby(..)`, which yields a `Resampler`.

```
In [82]: r = df.resample('2s')
In [83]: r
Out[83]: <pandas.core.resample.DatetimeIndexResampler object at 0x7f5b4467d280>
```
Downsampling

You can then use this object to perform operations. These are downsampling operations (going from a higher frequency to a lower one).

```python
In [84]: r.mean()
Out[84]:
          A     B     C     D
2010-01-01 09:00:00  0.485748  0.447351  0.357096  0.793615
2010-01-01 09:00:02  0.820801  0.794317  0.364034  0.531096
2010-01-01 09:00:04  0.433985  0.314582  0.424104  0.625733
2010-01-01 09:00:06  0.624988  0.609738  0.633165  0.612452
2010-01-01 09:00:08  0.510470  0.534317  0.573201  0.806949
```

5 rows x 4 columns

```python
In [85]: r.sum()
Out[85]:
          A     B     C     D
2010-01-01 09:00:00  0.971495  0.894701  0.714192  1.587231
2010-01-01 09:00:02  1.641602  1.588635  0.728068  1.062191
2010-01-01 09:00:04  0.867969  0.629165  0.848208  1.251465
2010-01-01 09:00:06  1.249976  1.219477  1.266330  1.224904
2010-01-01 09:00:08  1.020940  1.068634  1.146402  1.613897
```

5 rows x 4 columns

Furthermore, resample now supports `getitem` operations to perform the resample on specific columns.

```python
In [86]: r[['A','C']].mean()
Out[86]:
          A     C
2010-01-01 09:00:00  0.485748  0.357096
2010-01-01 09:00:02  0.820801  0.364034
2010-01-01 09:00:04  0.433985  0.424104
2010-01-01 09:00:06  0.624988  0.633165
2010-01-01 09:00:08  0.510470  0.573201
```

5 rows x 2 columns

and `aggregate` type operations.

```python
In [87]: r.agg({'A': 'mean', 'B': 'sum'})
Out[87]:
          A     B
2010-01-01 09:00:00  0.485748  0.894701
2010-01-01 09:00:02  0.820801  1.588635
2010-01-01 09:00:04  0.433985  0.629165
2010-01-01 09:00:06  0.624988  1.219477
2010-01-01 09:00:08  0.510470  1.068634
```

5 rows x 2 columns

These accessors can of course, be combined.
In [88]: r[['A', 'B']].agg(['mean', 'sum'])
Out[88]:
   A  B
0  0.485748  0.971495  0.447351  0.894701
1  0.820801  1.641602  0.794317  1.588635
2  0.433985  0.867969  0.314582  0.629165
3  0.624988  1.249976  0.609738  1.219477
4  0.510470  1.020940  0.534317  1.068634

[5 rows x 4 columns]

**Upsampling**

Upsampling operations take you from a lower frequency to a higher frequency. These are now performed with the Resampler objects with backfill(), ffill(), fillna() and asfreq() methods.

In [89]: s = pd.Series(np.arange(5, dtype='int64'),
                   index=pd.date_range('2010-01-01', periods=5, freq='Q'))
In [90]: s
Out[90]:
2010-03-31 0
2010-06-30 1
2010-09-30 2
2010-12-31 3
2011-03-31 4
Freq: Q-DEC, Length: 5, dtype: int64

Previously

In [6]: s.resample('M', fill_method='ffill')
Out[6]:
2010-03-31 0
2010-04-30 0
2010-05-31 0
2010-06-30 1
2010-07-31 1
2010-08-31 1
2010-09-30 2
2010-10-31 2
2010-11-30 2
2010-12-31 3
2011-01-31 3
2011-02-28 3
2011-03-31 4
Freq: M, dtype: int64

New API
In [91]: s.resample('M').ffill()
Out[91]:
2010-03-31  0
2010-04-30  0
2010-05-31  0
2010-06-30  1

Freq: M, Length: 13, dtype: int64

Note: In the new API, you can either downsample OR upsample. The prior implementation would allow you to pass an aggregator function (like `mean`) even though you were upsampling, providing a bit of confusion.

Previous API will work but with deprecations

Warning: This new API for resample includes some internal changes for the prior-to-0.18.0 API, to work with a deprecation warning in most cases, as the resample operation returns a deferred object. We can intercept operations and just do what the (pre 0.18.0) API did (with a warning). Here is a typical use case:

In [4]: r = df.resample('2s')

In [6]: r*10
pandas/tseries/resample.py:80: FutureWarning: .resample() is now a deferred operation
use .resample(...).mean() instead of .resample(...)

Out[6]:

<table>
<thead>
<tr>
<th></th>
<th>A</th>
<th>B</th>
<th>C</th>
<th>D</th>
</tr>
</thead>
<tbody>
<tr>
<td>2010-01-01 09:00:00</td>
<td>4.857476</td>
<td>4.473507</td>
<td>3.570960</td>
<td>7.936154</td>
</tr>
<tr>
<td>2010-01-01 09:00:02</td>
<td>8.208011</td>
<td>7.943173</td>
<td>3.640340</td>
<td>5.310957</td>
</tr>
<tr>
<td>2010-01-01 09:00:04</td>

<td>5.732009</td>
<td>8.069486</td>
</tr>
</tbody>
</table>

However, getting and assignment operations directly on a Resampler will raise a ValueError:

In [7]: r.iloc[0] = 5
ValueError: .resample() is now a deferred operation
use .resample(...).mean() instead of .resample(...)

There is a situation where the new API can not perform all the operations when using original code. This code is intending to resample every 2s, take the mean AND then take the min of those results.
In [4]: df.resample('2s').min()

Out[4]:
A  0.433985
B  0.314582
C  0.357096
D  0.531096
dtype: float64

The new API will:

In [92]: df.resample('2s').min()

Out[92]:
2010-01-01 09:00:00 0.191519 0.272593 0.276464 0.785359
2010-01-01 09:00:02 0.683463 0.712702 0.357817 0.500995
2010-01-01 09:00:04 0.364886 0.013768 0.075381 0.368824
2010-01-01 09:00:06 0.316836 0.568099 0.397203 0.436173
2010-01-01 09:00:08 0.218792 0.143767 0.442141 0.704581
[5 rows x 4 columns]

The good news is the return dimensions will differ between the new API and the old API, so this should loudly raise an exception.

To replicate the original operation

In [93]: df.resample('2s').mean().min()

Out[93]:
A  0.433985
B  0.314582
C  0.357096
D  0.531096
Length: 4, dtype: float64

Changes to eval

In prior versions, new columns assignments in an eval expression resulted in an inplace change to the DataFrame. (GH9297, GH8664, GH10486)

In [94]: df = pd.DataFrame({'a': np.linspace(0, 10, 5), 'b': range(5)})

In [95]: df

Out[95]:
a   b
0   0.0  0
1   2.5  1
2   5.0  2
3   7.5  3
4  10.0  4
[5 rows x 2 columns]
In [12]: df.eval('c = a + b')
FutureWarning: eval expressions containing an assignment currently default to operating
... inplace.
This will change in a future version of pandas, use inplace=True to avoid this warning.

In [13]: df
Out[13]:
    a    b    c
0  0.0  0.0  0.0
1  2.5  1.0  3.5
2  5.0  2.0  7.0
3  7.5  3.0 10.5
4 10.0  4.0 14.0

In version 0.18.0, a new inplace keyword was added to choose whether the assignment should be done inplace or return a copy.

In [96]: df
Out[96]:
    a    b    c
0  0.0  0.0  0.0
1  2.5  1.0  3.5
2  5.0  2.0  7.0
3  7.5  3.0 10.5
4 10.0  4.0 14.0

[5 rows x 3 columns]

In [97]: df.eval('d = c - b', inplace=False)
Out[97]:
    a    b    c    d
0  0.0  0.0  0.0  0.0
1  2.5  1.0  3.5  2.5
2  5.0  2.0  7.0  5.0
3  7.5  3.0 10.5  7.5
4 10.0  4.0 14.0 10.0

[5 rows x 4 columns]

In [98]: df
Out[98]:
    a    b    c
0  0.0  0.0  0.0
1  2.5  1.0  3.5
2  5.0  2.0  7.0
3  7.5  3.0 10.5
4 10.0  4.0 14.0

[5 rows x 3 columns]

In [99]: df.eval('d = c - b', inplace=True)

In [100]: df
Warning: For backwards compatibility, inplace defaults to True if not specified. This will change in a future version of pandas. If your code depends on an inplace assignment you should update to explicitly set inplace=True

The inplace keyword parameter was also added the query method.

In [101]: df.query('a > 5')
Out[101]:
    a  b  c  d
0  0.0  0  0.0  0.0
1  2.5  1  3.5  2.5
2  5.0  2  7.0  5.0
3  7.5  3 10.5  7.5
4 10.0  4 14.0 10.0
[5 rows x 4 columns]

In [102]: df.query('a > 5', inplace=True)

In [103]: df
Out[103]:
    a  b  c  d
0  0.0  0  0.0  0.0
1  2.5  1  3.5  2.5
2  5.0  2  7.0  5.0
3  7.5  3 10.5  7.5
4 10.0  4 14.0 10.0
[5 rows x 4 columns]

Warning: Note that the default value for inplace in a query is False, which is consistent with prior versions.

eval has also been updated to allow multi-line expressions for multiple assignments. These expressions will be evaluated one at a time in order. Only assignments are valid for multi-line expressions.

In [104]: df
Out[104]:
    a  b  c  d
0  0.0  0  0.0  0.0
1  2.5  1  3.5  2.5
2  5.0  2  7.0  5.0
3  7.5  3 10.5  7.5
4 10.0  4 14.0 10.0
[5 rows x 4 columns]

In [105]: df.eval(""
       ......: e = d + a
       ......: f = e - 22"
(continues on next page)
.....: g = f / 2.0""", inplace=True)
.....:

In [106]: df
Out[106]:
   a   b   c   d   e   f   g
3  7.5  3.0  7.5 15.0 -7.0 -3.5
4 10.0  4.0 14.0 20.0 -2.0 -1.0
[2 rows x 7 columns]

Other API changes

- `DataFrame.between_time` and `Series.between_time` now only parse a fixed set of time strings. Parsing of date strings is no longer supported and raises a `ValueError`. (GH11818)

```
In [107]: s = pd.Series(range(10), pd.date_range('2015-01-01', freq='H', periods=10))
In [108]: s.between_time("7:00am", "9:00am")
Out[108]:
2015-01-01 07:00:00    7
2015-01-01 08:00:00    8
2015-01-01 09:00:00    9
Freq: H, Length: 3, dtype: int64
```

This will now raise.

```
In [2]: s.between_time('20150101 07:00:00','20150101 09:00:00')
ValueError: Cannot convert arg ['20150101 07:00:00'] to a time.
```

- `.memory_usage()` now includes values in the index, as does `memory_usage` in `.info()` (GH11597)
- `DataFrame.to_latex()` now supports non-ascii encodings (eg utf-8) in Python 2 with the parameter encoding (GH7061)
- `pandas.merge()` and `DataFrame.merge()` will show a specific error message when trying to merge with an object that is not of type `DataFrame` or a subclass (GH12081)
- `DataFrame.unstack` and `Series.unstack` now take `fill_value` keyword to allow direct replacement of missing values when an unstack results in missing values in the resulting `DataFrame`. As an added benefit, specifying `fill_value` will preserve the data type of the original stacked data. (GH9746)
- As part of the new API for `window functions` and `resampling`, aggregation functions have been clarified, raising more informative error messages on invalid aggregations. (GH9052). A full set of examples are presented in `groupby`.
- Statistical functions for `NDFrame` objects (like `sum()`, `mean()`, `min()`) will now raise if non-numpy-compatible arguments are passed in for `**kwargs` (GH12301)
- `.to_latex` and `.to_html` gain a `decimal` parameter like `.to_csv`; the default is "." (GH12031)
- More helpful error message when constructing a `DataFrame` with empty data but with indices (GH8020)
- `.describe()` will now properly handle bool dtypes as a categorical (GH6625)
• More helpful error message with an invalid .transform with user defined input (GH10165)
• Exponentially weighted functions now allow specifying alpha directly (GH10789) and raise ValueError if parameters violate $0 < \alpha \leq 1$ (GH12492)

**Deprecations**

• The functions pd.rolling_*, pd.expanding_* and pd.ewm* are deprecated and replaced by the corresponding method call. Note that the new suggested syntax includes all of the arguments (even if default) (GH11603)

```python
In [1]: s = pd.Series(range(3))

In [2]: pd.rolling_mean(s, window=2, min_periods=1)
    FutureWarning: pd.rolling_mean is deprecated for Series and will be removed in a future version, replace with Series.rolling(min_periods=1, window=2, center=False).mean()

Out[2]:
    0   0.0
    1   0.5
    2   1.5
dtype: float64

In [3]: pd.rolling_cov(s, s, window=2)
    FutureWarning: pd.rolling_cov is deprecated for Series and will be removed in a future version, replace with Series.rolling(window=2).cov(other=<Series>)

Out[3]:
    0   NaN
    1   0.5
    2   0.5
dtype: float64
```

• The `freq` and `how` arguments to the .rolling, .expanding, and .ewm (new) functions are deprecated, and will be removed in a future version. You can simply resample the input prior to creating a window function. (GH11603).

For example, instead of `s.rolling(window=5, freq='D').max()` to get the max value on a rolling 5 Day window, one could use `s.resample('D').mean().rolling(window=5).max()`, which first resamples the data to daily data, then provides a rolling 5 day window.

• `pd.tseries.frequencies.get_offset_name` function is deprecated. Use offset’s .freqstr property as alternative (GH11192)

• `pandas.stats.fama_macbeth` routines are deprecated and will be removed in a future version (GH6077)

• `pandas.stats.ols, pandas.stats.plm` and `pandas.stats.var` routines are deprecated and will be removed in a future version (GH6077)

• show a FutureWarning rather than a DeprecationWarning on using long-time deprecated syntax in `HDFStore.select`, where the where clause is not a string-like (GH12027)

• The `pandas.options.display.mpl_style` configuration has been deprecated and will be removed in a future version of pandas. This functionality is better handled by matplotlib’s style sheets (GH11783).
Removal of deprecated float indexers

In GH4892 indexing with floating point numbers on a non-Float64Index was deprecated (in version 0.14.0). In 0.18.0, this deprecation warning is removed and these will now raise a TypeError. (GH12165, GH12333)

```python
In [109]: s = pd.Series([1, 2, 3], index=[4, 5, 6])

In [110]: s
Out[110]:
   4  1
   5  2
   6  3
Length: 3, dtype: int64

In [111]: s2 = pd.Series([1, 2, 3], index=list('abc'))

In [112]: s2
Out[112]:
  a  1
  b  2
  c  3
Length: 3, dtype: int64

Previous behavior:

# this is label indexing
In [2]: s[5.0]
FutureWarning: scalar indexers for index type Int64Index should be integers and not floating point
Out[2]: 2

# this is positional indexing
In [3]: s.iloc[1.0]
FutureWarning: scalar indexers for index type Int64Index should be integers and not floating point
Out[3]: 2

# this is label indexing
In [4]: s.loc[5.0]
FutureWarning: scalar indexers for index type Int64Index should be integers and not floating point
Out[4]: 2

# .ix would coerce 1.0 to the positional 1, and index
In [5]: s2.ix[1.0] = 10
FutureWarning: scalar indexers for index type Index should be integers and not floating point

In [6]: s2
Out[6]:
  a  1
  b 10
  c  3
dtype: int64
```
New behavior:

For iloc, getting & setting via a float scalar will always raise.

```
In [3]: s.iloc[2.0]
TypeError: cannot do label indexing on <class 'pandas.indexes.numeric.Int64Index'> with these indexers [2.0] of <type 'float'>
```

Other indexers will coerce to a like integer for both getting and setting. The FutureWarning has been dropped for .loc, .ix and [].

```
In [113]: s[5.0]
Out[113]: 2

In [114]: s.loc[5.0]
Out[114]: 2
```

and setting

```
In [115]: s_copy = s.copy()
In [116]: s_copy[5.0] = 10

In [117]: s_copy
Out[117]:
   4  1
   5 10
   6  3
Length: 3, dtype: int64

In [118]: s_copy = s.copy()
In [119]: s_copy.loc[5.0] = 10

In [120]: s_copy
Out[120]:
   4  1
   5 10
   6  3
Length: 3, dtype: int64
```

Positional setting with .ix and a float indexer will ADD this value to the index, rather than previously setting the value by position.

```
In [3]: s2.ix[1.0] = 10
In [4]: s2
Out[4]:
   a  1
   b  2
   c  3
   1.0 10
dtype: int64
```

Slicing will also coerce integer-like floats to integers for a non-Float64Index.
In [121]: s.loc[5.0:6]  
Out[121]:  
5  
6  
Length: 2, dtype: int64  

Note that for floats that are NOT coercible to ints, the label based bounds will be excluded

In [122]: s.loc[5.1:6]  
Out[122]:  
6  
Length: 1, dtype: int64  

Float indexing on a Float64Index is unchanged.

In [123]: s = pd.Series([1, 2, 3], index=np.arange(3.))  
In [124]: s[1.0]  
Out[124]: 2  
In [125]: s[1.0:2.5]  
Out[125]:  
1.0  
2.0  
Length: 2, dtype: int64

Removal of prior version deprecations/changes

- Removal of `rolling_corr_pairwise` in favor of `.rolling().corr(pairwise=True)` (GH4950)
- Removal of `expanding_corr_pairwise` in favor of `.expanding().corr(pairwise=True)` (GH4950)
- Removal of `DataMatrix` module. This was not imported into the pandas namespace in any event (GH12111)
- Removal of `cols` keyword in favor of `subset` in `DataFrame.duplicated()` and `DataFrame.drop_duplicates()` (GH6680)
- Removal of the `read_frame` and `frame_query` (both aliases for `pd.read_sql`) and `write_frame` (alias of `to_sql`) functions in the `pd.io.sql` namespace, deprecated since 0.14.0 (GH6292).
- Removal of the `order` keyword from `.factorize()` (GH6930)

Performance improvements

- Improved performance of `andrews_curves` (GH11534)
- Improved huge `DatetimeIndex`, `PeriodIndex` and `TimedeltaIndex`'s ops performance including NaT (GH10277)
- Improved performance of `pandas.concat` (GH11958)
- Improved performance of `StataReader` (GH11591)
- Improved performance in construction of `Categoricals with Series` of datetimes containing NaT (GH12077)
- Improved performance of ISO 8601 date parsing for dates without separators (GH11899), leading zeros (GH11871) and with white space preceding the time zone (GH9714)
Bug fixes

- Bug in `GroupBy.size` when data-frame is empty. (GH11699)
- Bug in `Period.end_time` when a multiple of time period is requested (GH11738)
- Regression in `.clip` with tz-aware datetimes (GH11838)
- Bug in `date_range` when the boundaries fell on the frequency (GH11804, GH12409)
- Bug in consistency of passing nested dicts to `.groupby(...).agg(...)` (GH9052)
- Accept unicode in `Timedelta` constructor (GH11995)
- Bug in value label reading for `StataReader` when reading incrementally (GH12014)
- Bug in `vectorized DateOffset` when n parameter is 0 (GH11370)
- Compat for numpy 1.11 w.r.t. NaT comparison changes (GH12049)
- Bug in `read_csv` when reading from a `StringIO` in threads (GH11790)
- Bug in `not treating NaT as a missing value in datetimelikes` when factorizing & with `Categoricals` (GH12077)
- Bug in `getitem` when the values of a `Series` were tz-aware (GH12089)
- Bug in `Series.str.get_dummies` when one of the variables was 'name' (GH12180)
- Bug in `pd.concat` while concatenating tz-aware NaT series. (GH11693, GH11755, GH12217)
- Bug in `pd.read_stata` with concatenating tz-aware NaT series. (GH11693, GH11755, GH12217)
- Bug in `Series.resample` using a frequency of `Nano` when the index is a `DatetimeIndex` and contains non-zero nanosecond parts (GH12037)
- Bug in resampling with `.nunique` and a sparse index (GH12352)
- Removed some compiler warnings (GH12471)
- Work around `boto` issues with `boto` in python 3.5 (GH11915)
- Bug in `NaT` subtraction from `Timestamp` or `DatetimeIndex` with timezones (GH11718)
- Bug in `subtraction of Series` of a single tz-aware `Timestamp` (GH12290)
- Use compat iterators in PY2 to support `.next()` (GH12299)
- Bug in `Timedelta.round` with negative values (GH11690)
- Bug in `.loc` against `CategoricalIndex` may result in normal `Index` (GH11586)
- Bug in `DataFrame.info` when duplicated column names exist (GH11761)
- Bug in `.copy` of datetime tz-aware objects (GH11794)
- Bug in `Series.apply` and `Series.map` where `timedelta64` was not boxed (GH11349)
- Bug in `DataFrame.set_index()` with tz-aware `Series` (GH12358)
- Bug in subclasses of `DataFrame` where `AttributeError` did not propagate (GH11808)
- Bug in `groupby` on tz-aware data where selection not returning `Timestamp` (GH11616)
- Bug in `pd.read_clipboard` and `pd.to_clipboard` functions not supporting Unicode; upgrade included pyperclip to v1.5.15 (GH9263)
- Bug in `DataFrame.query` containing an assignment (GH8664)
- Bug in `from_msgpack` where `__contains__()` fails for columns of the unpacked `DataFrame`, if the `DataFrame` has object columns. (GH11880)
· Bug in `resample` on categorical data with `TimedeltaIndex` (GH12169)
· Bug in timezone info lost when broadcasting scalar datetime to `DataFrame` (GH11682)
· Bug in Index creation from `Timestamp` with mixed tz coerces to UTC (GH11488)
· Bug in `to_numeric` where it does not raise if input is more than one dimension (GH11776)
· Bug in parsing timezone offset strings with non-zero minutes (GH11708)
· Bug in `df.plot` using incorrect colors for bar plots under matplotlib 1.5+ (GH11614)
· Bug in the groupby plot method when using keyword arguments (GH11805).
· Bug in `DataFrame.duplicated` and `drop_duplicates` causing spurious matches when setting `keep=False` (GH11864)
· Bug in `.loc` result with duplicated key may have `Index` with incorrect dtype (GH11497)
· Bug in `pd.rolling_median` where memory allocation failed even with sufficient memory (GH11696)
· Bug in `DataFrame.style` with spurious zeros (GH12134)
· Bug in `DataFrame.style` with integer columns not starting at 0 (GH12125)
· Bug in `.style.bar` may not rendered properly using specific browser (GH11678)
· Bug in rich comparison of `Timedelta` with a `numpy.array` of `Timedelta` that caused an infinite recursion (GH11835)
· Bug in `DataFrame.round` dropping column index name (GH11986)
· Bug in `df.replace` while replacing value in mixed dtype DataFrame (GH11698)
· Bug in `Index` prevents copying name of passed `Index` when a new name is not provided (GH11193)
· Bug in `read_excel` failing to read any non-empty sheets when empty sheets exist and `sheetname=None` (GH11711)
· Bug in `read_excel` failing to raise `NotImplemented` error when keywords `parse_dates` and `date_parser` are provided (GH11544)
· Bug in `read_sql` with `pymysql` connections failing to return chunked data (GH11522)
· Bug in `.to_csv` ignoring formatting parameters `decimal`, `na_rep`, `float_format` for float indexes (GH11553)
· Bug in `Int64Index` and `Float64Index` preventing the use of the modulo operator (GH9244)
· Bug in `MultiIndex.drop` for not lexsorted MultiIndexes (GH12078)
· Bug in `DataFrame` when masking an empty DataFrame (GH11859)
· Bug in `.plot` potentially modifying the `colors` input when the number of columns didn’t match the number of series provided (GH12039).
· Bug in `Series.plot` failing when index has a `CustomBusinessDay` frequency (GH7222).
· Bug in `.to_sql` for `datetime.time` values with sqlite fallback (GH8341)
· Bug in `read_excel` failing to read data with one column when `squeeze=True` (GH12157)
· Bug in `read_excel` failing to read one empty column (GH12292, GH9002)
· Bug in `.groupby` where a `KeyError` was not raised for a wrong column if there was only one row in the dataframe (GH11741)
· Bug in `.read_csv` with dtype specified on empty data producing an error (GH12048)
· Bug in `.read_csv` where strings like ‘2E’ are treated as valid floats (GH12237)
• Bug in building *pandas* with debugging symbols (GH12123)
• Removed millisecond property of *DatetimeIndex*. This would always raise a *ValueError* (GH12019).
• Bug in *Series* constructor with read-only data (GH11502)
• Removed *pandas._testing.choice()*. Should use *np.random.choice()*, instead. (GH12386)
• Bug in `.loc` setitem indexer preventing the use of a TZ-aware *DatetimeIndex* (GH12050)
• Bug in `.style` indexes and MultiIndexes not appearing (GH11655)
• Bug in `to_msgpack` and `from_msgpack` which did not correctly serialize or deserialize *NaT* (GH12307).
• Bug in `.skew` and `.kurt` due to roundoff error for highly similar values (GH11974)
• Bug in *Timestamp* constructor where microsecond resolution was lost if HHMMSS were not separated with ‘:’ (GH10041)
• Bug in `buffer_rd_bytes src->buffer` could be freed more than once if reading failed, causing a segfault (GH12098)
• Bug in `crosstab` where arguments with non-overlapping indexes would return a *KeyError* (GH10291)
• Bug in *DataFrame.apply* in which reduction was not being prevented for cases in which *dtype* was not a *numpy dtype* (GH12244)
• Bug when initializing categorical series with a scalar value. (GH12336)
• Bug when specifying a UTC *DatetimeIndex* by setting *utc=True* in `.to_datetime` (GH11934)
• Bug when increasing the buffer size of CSV reader in `read_csv` (GH12494)
• Bug when setting columns of a *DataFrame* with duplicate column names (GH12344)

Note: We are proud to announce that *pandas* has become a sponsored project of the (NumFOCUS organization). This will help ensure the success of development of *pandas* as a world-class open-source project.

This is a minor bug-fix release from 0.17.0 and includes a large number of bug fixes along several new features, enhancements, and performance improvements. We recommend that all users upgrade to this version.

Highlights include:

- Support for Conditional HTML Formatting, see [here](#)
- Releasing the GIL on the csv reader & other ops, see [here](#)
- Fixed regression in DataFrame.drop_duplicates from 0.16.2, causing incorrect results on integer values (GH11376)

### What’s new in v0.17.1

- **New features**
  - Conditional HTML formatting
- **Enhancements**
- **API changes**
  - Deprecations
New features

Conditional HTML formatting

**Warning:** This is a new feature and is under active development. We’ll be adding features an possibly making breaking changes in future releases. Feedback is welcome.

We’ve added experimental support for conditional HTML formatting: the visual styling of a DataFrame based on the data. The styling is accomplished with HTML and CSS. Accesses the styler class with the `pandas.DataFrame.style`, attribute, an instance of Styler with your data attached.

Here’s a quick example:

```python
In [1]: np.random.seed(123)
In [2]: df = pd.DataFrame(np.random.randn(10, 5), columns=list("abcde"))
In [3]: html = df.style.background_gradient(cmap="viridis", low=0.5)
```

We can render the HTML to get the following table.

Styler interacts nicely with the Jupyter Notebook. See the documentation for more.

Enhancements

- `DatetimeIndex` now supports conversion to strings with `astype(str)` (GH10442)
- Support for compression (gzip/bz2) in `pandas.DataFrame.to_csv()` (GH7615)
- `pd.read_*` functions can now also accept `pathlib.Path, or py._path.local.LocalPath` objects for the `filepath_or_buffer` argument. (GH11033) - The `DataFrame` and `Series` functions `to_csv()`, `.to_html()` and `.to_latex()` can now handle paths beginning with tildes (e.g. ~/Documents/) (GH11438)
- `DataFrame` now uses the fields of a `namedtuple` as columns, if columns are not supplied (GH11181)
- `DataFrame.itertuples()` now returns `namedtuple` objects, when possible. (GH11269, GH11625)
- Added `axvlines_kwds` to parallel coordinates plot (GH10709)
- Option to `.info()` and `.memory_usage()` to provide for deep introspection of memory consumption. Note that this can be expensive to compute and therefore is an optional parameter. (GH11595)

```python
In [4]: df = pd.DataFrame({"A": ["foo"] * 1000}) # noqa: F821
In [5]: df["B"] = df["A"].astype("category")
# shows the '+' as we have object dtypes
In [6]: df.info()
```
Index now has a `fillna` method (GH10089)

```
In [8]: pd.Index([1, np.nan, 3]).fillna(2)
Out[8]: Float64Index([1.0, 2.0, 3.0], dtype='float64')
```

Series of type `category` now make `.str.<...>` and `.dt.<...>` accessor methods / properties available, if the categories are of that type. (GH10661)

```
In [9]: s = pd.Series(list("aabb")).astype("category")

In [10]: s
Out[10]:
0  a
1  a
2  b
3  b
Length: 4, dtype: category
Categories (2, object): [ 'a', 'b' ]

In [11]: s.str.contains("a")
Out[11]:
0   True
1   True
2  False
3  False
Length: 4, dtype: bool
```

```
In [12]: date = pd.Series(pd.date_range("1/1/2015", periods=5)).astype("category")

In [13]: date
```

(continues on next page)
Out[13]:
0  2015-01-01
1  2015-01-02
2  2015-01-03
3  2015-01-04
4  2015-01-05
Length: 5, dtype: category

In [14]: date.dt.day
Out[14]:
0   1
1   2
2   3
3   4
4   5
Length: 5, dtype: int64

• **pivot_table** now has a `margins_name` argument so you can use something other than the default of ‘All’ ([GH3335](#GH3335))

• Implement export of `datetime64[ns, tz]` dtypes with a fixed HDF5 store ([GH11411](#GH11411))

• Pretty printing sets (e.g. in DataFrame cells) now uses set literal syntax (`{x, y}`) instead of Legacy Python syntax (`set([x, y])`) ([GH11215](#GH11215))

• Improve the error message in `pandas.io.gbq.to_gbq()` when a streaming insert fails ([GH11285](#GH11285)) and when the DataFrame does not match the schema of the destination table ([GH11359](#GH11359))

**API changes**

• raise `NotImplementedError` in `Index.shift` for non-supported index types ([GH8038](#GH8038))

• `min` and `max` reductions on `datetime64` and `timedelta64` dtyped series now result in `NaT` and not `nan` ([GH11245](#GH11245)).

• Indexing with a null key will raise a `TypeError`, instead of a `ValueError` ([GH11356](#GH11356))

• `Series.ptp` will now ignore missing values by default ([GH11163](#GH11163))

**Deprecations**

• The `pandas.io.ga` module which implements google-analytics support is deprecated and will be removed in a future version ([GH11308](#GH11308))

• Deprecate the `engine` keyword in `.to_csv()`, which will be removed in a future version ([GH11274](#GH11274))
Performance improvements

- Checking monotonic-ness before sorting on an index (GH11080)
- Series.dropna performance improvement when its dtype can’t contain NaN (GH11159)
- Release the GIL on most datetime field operations (e.g. DatetimeIndex.year, Series.dt.year), normalization, and conversion to and from Period, DatetimeIndex.to_period and PeriodIndex.to_timestamp (GH11263)
- Release the GIL on some rolling algos: rolling_median, rolling_mean, rolling_max, rolling_min, rolling_var, rolling_kurt, rolling_skew (GH11450)
- Release the GIL when reading and parsing text files in read_csv, read_table (GH11272)
- Improved performance of rolling_median (GH11450)
- Improved performance of to_excel (GH11352)
- Performance bug in repr of Categorical categories, which was rendering the strings before chopping them for display (GH11305)
- Performance improvement in Categorical.remove_unused_categories, (GH11643).
- Improved performance of Series constructor with no data and DatetimeIndex (GH11433)
- Improved performance of shift, cumprod, and cumsum with groupby (GH4095)

Bug fixes

- SparseArray.__iter__() now does not cause PendingDeprecationWarning in Python 3.5 (GH11622)
- Regression from 0.16.2 for output formatting of long floats/nan, restored in (GH11302)
- Series.sort_index() now correctly handles the inplace option (GH11402)
- Incorrectly distributed .c file in the build on PyPi when reading a csv of floats and passing na_values=<a scalar> would show an exception (GH11374)
- Bug in .to_latex() output broken when the index has a name (GH10660)
- Bug in HDFStore.append with strings whose encoded length exceeded the max unencoded length (GH11234)
- Bug in merging datetime64[ns, tz] dtypes (GH11405)
- Bug in HDFStore.select when comparing with a numpy scalar in a where clause (GH11283)
- Bug in using DataFrame.ix with a MultiIndex indexer (GH11372)
- Bug in date_range with ambiguous endpoints (GH11626)
- Prevent adding new attributes to the accessors .str, .dt and .cat. Retrieving such a value was not possible, so error out on setting it. (GH10673)
- Bug in tz-conversions with an ambiguous time and .dt accessors (GH11295)
- Bug in output formatting when using an index of ambiguous times (GH11619)
- Bug in comparisons of Series vs list-likes (GH11339)
- Bug in DataFrame.replace with a datetime64[ns, tz] and a non-compat to_replace (GH11326, GH11153)
- Bug in isnull where numpy.datetime64('NaT') in a numpy.array was not determined to be null(GH11206)
• Bug in list-like indexing with a mixed-integer Index (GH11320)
• Bug in pivot_table with margins=True when indexes are of Categorical dtype (GH10993)
• Bug in DataFrame.plot cannot use hex strings colors (GH10299)
• Regression in DataFrame.drop_duplicates from 0.16.2, causing incorrect results on integer values (GH11376)
• Bug in pd.eval where unary ops in a list error (GH11235)
• Bug in squeeze() with zero length arrays (GH11230, GH8999)
• Bug in describe() dropping column names for hierarchical indexes (GH11517)
• Bug in DataFrame.pct_change() not propagating axis keyword on .fillna method (GH11150)
• Bug in .to_csv() when a mix of integer and string column names are passed as the columns parameter (GH11637)
• Bug in indexing with a range, (GH11652)
• Bug in inference of numpy scalars and preserving dtype when setting columns (GH11638)
• Bug in to_sql using unicode column names giving UnicodeEncodeError with (GH11431).
• Fix regression in setting of xticks in plot (GH11529).
• Bug in holiday.dates where observance rules could not be applied to holiday and doc enhancement (GH11477, GH11533)
• Fix plotting issues when having plain Axes instances instead of SubplotAxes (GH11520, GH11556).
• Bug in DataFrame.to_latex() produces an extra rule when header=False (GH7124)
• Bug in df.groupby(...).apply(func) when a func returns a Series containing a new datetimelike column (GH11324)
• Bug in pandas.json when file to load is big (GH11344)
• Bugs in to_excel with duplicate columns (GH11007, GH10982, GH10970)
• Fixed a bug that prevented the construction of an empty series of dtype datetime64[ns, tz] (GH11245).
• Bug in read_excel with MultiIndex containing integers (GH11317)
• Bug in to_excel with openpyxl 2.2+ and merging (GH11408)
• Bug in DataFrame.to_dict() produces a np.datetime64 object instead of Timestamp when only datetime is present in data (GH11327)
• Bug in DataFrame.corr() raises exception when computes Kendall correlation for DataFrames with boolean and not boolean columns (GH11560)
• Bug in the link-time error caused by C inline functions on FreeBSD 10+ (with clang) (GH10510)
• Bug in DataFrame.to_csv in passing through arguments for formatting MultiIndexes, including date_format (GH7791)
• Bug in DataFrame.join() with how='right' producing a TypeError (GH11519)
• Bug in Series.quantile with empty list results has Index with object dtype (GH11588)
• Bug in pd.merge results in empty Int64Index rather than Index(dtype=object) when the merge result is empty (GH11588)
• Bug in Categorical.remove_unused_categories when having NaN values (GH11599)
• Bug in DataFrame.to_sparse() loses column names for MultiIndexes (GH11600)
- Bug in `DataFrame.round()` with non-unique column index producing a Fatal Python error (GH11611)
- Bug in `DataFrame.round()` with decimals being a non-unique indexed Series producing extra columns (GH11618)

5.12.2 Version 0.17.0 (October 9, 2015)

This is a major release from 0.16.2 and includes a small number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

**Warning:** pandas >= 0.17.0 will no longer support compatibility with Python version 3.2 (GH9118)

**Warning:** The pandas.io.data package is deprecated and will be replaced by the pandas-datareader package. This will allow the data modules to be independently updated to your pandas installation. The API for pandas-datreader v0.1.1 is exactly the same as in pandas v0.17.0 (GH8961, GH10861).

After installing pandas-datareader, you can easily change your imports:

```python
from pandas.io import data, wb
```

becomes

```python
from pandas_datareader import data, wb
```

Highlights include:

- Release the Global Interpreter Lock (GIL) on some cython operations, see [here](#)
- Plotting methods are now available as attributes of the `.plot` accessor, see [here](#)
- The sorting API has been revamped to remove some long-time inconsistencies, see [here](#)
- Support for a `datetime64[ns]` with timezones as a first-class dtype, see [here](#)
- The default for `to_datetime` will now be to raise when presented with unparsable formats, previously this would return the original input. Also, date parse functions now return consistent results. See [here](#)
- The default for `dropna` in HDFStore has changed to False, to store by default all rows even if they are all NaN, see [here](#)
- Datetime accessor (`dt`) now supports `Series.dt.strftime` to generate formatted strings for datetime-likes, and `Series.dt.total_seconds` to generate each duration of the timedelta in seconds. See [here](#)
- Period and PeriodIndex can handle multiplied freq like `3D`, which corresponding to 3 days span. See [here](#)
- Development installed versions of pandas will now have PEP440 compliant version strings (GH9518)
- Development support for benchmarking with the Air Speed Velocity library (GH8361)
- Support for reading SAS xport files, see [here](#)
- Documentation comparing SAS to pandas, see [here](#)
- Removal of the automatic TimeSeries broadcasting, deprecated since 0.8.0, see [here](#)
- Display format with plain text can optionally align with Unicode East Asian Width, see [here](#)
- Compatibility with Python 3.5 (GH11097)
- Compatibility with matplotlib 1.5.0 (GH11111)

Check the API Changes and deprecations before updating.
What's new in v0.17.0

- **New features**
  - Datetime with TZ
  - Releasing the GIL
  - Plot submethods
  - Additional methods for dt accessor
    * Series.dt.strftime
    * Series.dt.total_seconds
  - Period frequency enhancement
  - Support for SAS XPORT files
  - Support for math functions in .eval()
  - Changes to Excel with MultiIndex
  - Google BigQuery enhancements
  - Display alignment with Unicode East Asian width
  - Other enhancements

- **Backwards incompatible API changes**
  - Changes to sorting API
  - Changes to to_datetime and to_timedelta
    * Error handling
    * Consistent parsing
  - Changes to Index comparisons
  - Changes to boolean comparisons vs. None
  - HDFStore dropna behavior
  - Changes to display.precision option
  - Changes to Categorical.unique
  - Changes to bool passed as header in parsers
  - Other API changes
  - Deprecations
  - Removal of prior version deprecations/changes

- **Performance improvements**

- **Bug fixes**

- **Contributors**
New features

Datetime with TZ

We are adding an implementation that natively supports datetime with timezones. A Series or a DataFrame column previously could be assigned a datetime with timezones, and would work as an object dtype. This had performance issues with a large number rows. See the docs for more details. (GH8260, GH10763, GH11034).

The new implementation allows for having a single-timezone across all rows, with operations in a performant manner.

```python
In [1]: df = pd.DataFrame(
    ...:     {
    ...:         "A": pd.date_range("20130101", periods=3),
    ...:         "B": pd.date_range("20130101", periods=3, tz="US/Eastern"),
    ...:         "C": pd.date_range("20130101", periods=3, tz="CET"),
    ...:     })

In [2]: df
Out[2]:
A       B          C
0 2013-01-01 00:00:00-05:00 2013-01-01 00:00:00+01:00
1 2013-01-02 00:00:00-05:00 2013-01-02 00:00:00+01:00
2 2013-01-03 00:00:00-05:00 2013-01-03 00:00:00+01:00

[3 rows x 3 columns]

In [3]: df.dtypes
Out[3]:
A    datetime64[ns]
B  datetime64[ns, US/Eastern]
C  datetime64[ns, CET]
Length: 3, dtype: object
```

```
In [4]: df.B
Out[4]:
0  2013-01-01 00:00:00-05:00
1  2013-01-02 00:00:00-05:00
2  2013-01-03 00:00:00-05:00
Name: B, Length: 3, dtype: datetime64[ns, US/Eastern]
```

```
In [5]: df.B.dt.tz_localize(None)
Out[5]:
0  2013-01-01
1  2013-01-02
2  2013-01-03
Name: B, Length: 3, dtype: datetime64[ns]
```

This uses a new-dtype representation as well, that is very similar in look-and-feel to its numpy cousin datetime64[ns]

```
In [6]: df["B"].dtype
Out[6]: datetime64[ns, US/Eastern]
```
In [7]: `type(df['B'].dtype)`
Out[7]: pandas.core.dtypes.dtypes.DatetimeTZDtype

Note: There is a slightly different string repr for the underlying DatetimeIndex as a result of the dtype changes, but functionally these are the same.

Previous behavior:

In [1]: `pd.date_range('20130101', periods=3, tz='US/Eastern')`
Out[1]: DatetimeIndex(['2013-01-01 00:00:00-05:00', '2013-01-02 00:00:00-05:00', '2013-01-03 00:00:00-05:00'], dtype='datetime64[ns]', freq='D', tz='US/Eastern')

In [2]: `pd.date_range('20130101', periods=3, tz='US/Eastern').dtype`
Out[2]: dtype('<M8[ns]')

New behavior:

In [8]: `pd.date_range("20130101", periods=3, tz="US/Eastern")`
Out[8]: DatetimeIndex(['2013-01-01 00:00:00-05:00', '2013-01-02 00:00:00-05:00', '2013-01-03 00:00:00-05:00'], dtype='datetime64[ns, US/Eastern]', freq='D')

In [9]: `pd.date_range("20130101", periods=3, tz="US/Eastern").dtype`
Out[9]: datetime64[ns, US/Eastern]

Releasing the GIL

We are releasing the global-interpreter-lock (GIL) on some cython operations. This will allow other threads to run simultaneously during computation, potentially allowing performance improvements from multi-threading. Notably groupby, nsmallest, value_counts and some indexing operations benefit from this. (GH8882)

For example the groupby expression in the following code will have the GIL released during the factorization step, e.g. df.groupby('key') as well as the .sum() operation.

```python
N = 1000000
ngroups = 10
df = DataFrame(
    {"key": np.random.randint(0, ngroups, size=N), "data": np.random.randn(N)}
)
df.groupby("key")["data"].sum()
```

Releasing of the GIL could benefit an application that uses threads for user interactions (e.g. QT), or performing multi-threaded computations. A nice example of a library that can handle these types of computation-in-parallel is the dask library.
Plot submethods

The Series and DataFrame .plot() method allows for customizing plot types by supplying the kind keyword arguments. Unfortunately, many of these kinds of plots use different required and optional keyword arguments, which makes it difficult to discover what any given plot kind uses out of the dozens of possible arguments.

To alleviate this issue, we have added a new, optional plotting interface, which exposes each kind of plot as a method of the .plot attribute. Instead of writing `series.plot(kind=<kind>, ...)`, you can now also use `series.plot.<kind>(...)`:

```
In [10]: df = pd.DataFrame(np.random.rand(10, 2), columns=['a', 'b'])
In [11]: df.plot.bar()
```

As a result of this change, these methods are now all discoverable via tab-completion:

```
In [12]: df.plot.<TAB>  # noqa: E225, E999
df.plot.area    df.plot.barh    df.plot.density df.plot.hist df.plot.line df.
               _plot.scatter
               df.plot.bar    df.plot.box    df.plot.hexbin df.plot.kde    df.plot.pie
```

Each method signature only includes relevant arguments. Currently, these are limited to required arguments, but in the future these will include optional arguments, as well. For an overview, see the new Plotting API documentation.

Additional methods for dt accessor

Series.dt.strftime

We are now supporting a Series.dt.strftime method for datetime-likes to generate a formatted string (GH10110). Examples:

```
# DatetimeIndex
In [13]: s = pd.Series(pd.date_range("20130101", periods=4))
In [14]: s
Out[14]:
```

(continues on next page)
In [15]: s.dt.strftime("%Y/%m/%d")
Out[15]:
0 2013/01/01
1 2013/01/02
2 2013/01/03
3 2013/01/04
Length: 4, dtype: object

The string format is as the python standard library and details can be found here

Series.dt.total_seconds

d.Series of type timedelta64 has new method .dt.total_seconds() returning the duration of the timedelta in seconds (GH10817)

# TimedeltaIndex
In [19]: s = pd.Series(pd.timedelta_range("1 minutes", periods=4))

In [20]: s
Out[20]:
0 0 days 00:01:00
1 1 days 00:01:00
2 2 days 00:01:00
3 3 days 00:01:00
Length: 4, dtype: timedelta64[ns]
In [21]: s.dt.total_seconds()
Out[21]:
   0   60.0
   1  86460.0
   2 172860.0
   3 259260.0
Length: 4, dtype: float64

Period frequency enhancement

Period, PeriodIndex and period_range can now accept multiplied freq. Also, Period.freq and PeriodIndex.freq are now stored as a DateOffset instance like DatetimeIndex, and not as str (GH7811)

A multiplied freq represents a span of corresponding length. The example below creates a period of 3 days. Addition and subtraction will shift the period by its span.

In [22]: p = pd.Period("2015-08-01", freq="3D")
In [23]: p
Out[23]: Period('2015-08-01', '3D')

In [24]: p + 1
Out[24]: Period('2015-08-04', '3D')

In [25]: p - 2
Out[25]: Period('2015-07-26', '3D')

In [26]: p.to_timestamp()
Out[26]: Timestamp('2015-08-01 00:00:00')

In [27]: p.to_timestamp(how="E")
Out[27]: Timestamp('2015-08-03 23:59:59.999999999')

You can use the multiplied freq in PeriodIndex and period_range.

In [28]: idx = pd.period_range("2015-08-01", periods=4, freq="2D")

In [29]: idx
Out[29]: PeriodIndex(["2015-08-01", '2015-08-03', '2015-08-05', '2015-08-07'], dtype='period[2D]', freq='2D')

In [30]: idx + 1
Out[30]: PeriodIndex(["2015-08-03", '2015-08-05', '2015-08-07', '2015-08-09'], dtype='period[2D]', freq='2D')
Support for SAS XPORT files

`read_sas()` provides support for reading SAS XPORT format files. (GH4052).

```python
df = pd.read_sas("sas_xport.xpt")
```

It is also possible to obtain an iterator and read an XPORT file incrementally.

```python
for df in pd.read_sas("sas_xport.xpt", chunksize=10000):
    do_something(df)
```

See the docs for more details.

Support for math functions in `.eval()`

`.eval()` now supports calling math functions (GH4893)

```python
df = pd.DataFrame({"a": np.random.randn(10)})
df.eval("b = sin(a)")
```

The support math functions are sin, cos, exp, log, exp1, log1p, sqrt, sinh, cosh, tanh, arcsin, arccos, arctan, arccosh, arccsin, arctanh, abs and arctan2.

These functions map to the intrinsics for the NumExpr engine. For the Python engine, they are mapped to NumPy calls.

Changes to Excel with MultiIndex

In version 0.16.2 a DataFrame with MultiIndex columns could not be written to Excel via `to_excel`. That functionality has been added (GH10564), along with updating `read_excel` so that the data can be read back with, no loss of information, by specifying which columns/rows make up the MultiIndex in the `header` and `index_col` parameters (GH4679).

See the documentation for more details.

```
In[31]: df = pd.DataFrame(
    ....:     [[1, 2, 3, 4], [5, 6, 7, 8]],
    ....:     columns=pd.MultiIndex.from_product(
    ....:         ["foo", "bar"], ["a", "b"], names=["col1", "col2"]
    ....:     ),
    ....:     index=pd.MultiIndex.from_product(["j", ["i1", "i2"]], names=["il", "i2"]),
    ....: )

In[32]: df
Out[32]:
   col1  foo bar
  col2   a   b   a   b
     i1   i2
    j  1  2  3  4
    k  5  6  7  8
[2 rows x 4 columns]
```

(continues on next page)
Previously, it was necessary to specify the has_index_names argument in read_excel, if the serialized data had index names. For version 0.17.0 the output format of to_excel has been changed to make this keyword unnecessary - the change is shown below.

**Warning:** Excel files saved in version 0.16.2 or prior that had index names will still able to be read in, but the has_index_names argument must specified to True.
pandas: powerful Python data analysis toolkit, Release 1.2.5

Google BigQuery enhancements

- Added ability to automatically create a table/dataset using the pandas.io.gbq.to_gbq() function if the destination table/dataset does not exist. (GH8325, GH11121).
- Added ability to replace an existing table and schema when calling the pandas.io.gbq.to_gbq() function via the if_exists argument. See the docs for more details (GH8325).
- `InvalidColumnOrder` and `InvalidPageToken` in the gbq module will raise `ValueError` instead of `IOError`.
- The `generate_bq_schema()` function is now deprecated and will be removed in a future version (GH11121).
- The gbq module will now support Python 3 (GH11094).

Display alignment with Unicode East Asian width

**Warning:** Enabling this option will affect the performance for printing of `DataFrame` and `Series` (about 2 times slower). Use only when it is actually required.

Some East Asian countries use Unicode characters its width is corresponding to 2 alphabets. If a `DataFrame` or `Series` contains these characters, the default output cannot be aligned properly. The following options are added to enable precise handling for these characters.

- `display.unicode.east_asian_width`: Whether to use the Unicode East Asian Width to calculate the display text width. (GH2612)
- `display.unicode.ambiguous_as_wide`: Whether to handle Unicode characters belong to Ambiguous as Wide. (GH11102)

```python
In [36]: df = pd.DataFrame({'": ["UK", u'"'], u"": ["Alice", u'""]})

In [37]: df;
```

```python
In [38]: pd.set_option("display.unicode.east_asian_width", True)

In [39]: df;
```

For further details, see [here](http://pandas.pydata.org/pandas-docs/stable/generated/pandas.set_option.html)
Other enhancements

- Support for `openpyxl >= 2.2`. The API for style support is now stable (GH10125)
- `merge` now accepts the argument `indicator` which adds a Categorical-type column (by default called `_merge`) to the output object that takes on the values (GH8790)

<table>
<thead>
<tr>
<th>Observation Origin</th>
<th>_merge value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Merge key only in 'left' frame</td>
<td>left_only</td>
</tr>
<tr>
<td>Merge key only in 'right' frame</td>
<td>right_only</td>
</tr>
<tr>
<td>Merge key in both frames</td>
<td>both</td>
</tr>
</tbody>
</table>

```
In [40]: df1 = pd.DataFrame({"col1": [0, 1], "col_left": ["a", "b"]})
In [41]: df2 = pd.DataFrame({"col1": [1, 2, 2], "col_right": [2, 2, 2]})
In [42]: pd.merge(df1, df2, on="col1", how="outer", indicator=True)
Out[42]:
  col1  col_left  col_right  _merge
0  0.0       a          NaN  left_only
1  1.0       b    2.000000  both
2  2.0  NaN    2.000000  right_only
3  2.0  NaN    2.000000  right_only
```

For more, see the updated docs

- `pd.to_numeric` is a new function to coerce strings to numbers (possibly with coercion) (GH11133)
- `pd.merge` will now allow duplicate column names if they are not merged upon (GH10639).
- `pd.pivot` will now allow passing index as `None` (GH3962).
- `pd.concat` will now use existing Series names if provided (GH10698).

```
In [43]: foo = pd.Series([1, 2], name="foo")
In [44]: bar = pd.Series([1, 2])
In [45]: baz = pd.Series([4, 5])

Previous behavior:
```
In [1]: pd.concat([foo, bar, baz], 1)
Out[1]:
  0 1 2
  0 1 4
  1 2 5
```

New behavior:
```
In [46]: pd.concat([foo, bar, baz], 1)
Out[46]:
  foo  0 1
```
0   1   4
1   2   5
[2 rows x 3 columns]

• DataFrame has gained the `nlargest` and `nsmallest` methods (GH10393)

• Add a `limit_direction` keyword argument that works with `limit` to enable `interpolate` to fill NaN values forward, backward, or both (GH9218, GH10420, GH11115)

```python
In [47]: ser = pd.Series([np.nan, np.nan, 5, np.nan, np.nan, np.nan, 13])
In [48]: ser.interpolate(limit=1, limit_direction="both")
Out[48]:
0   NaN
1   5.0
2   5.0
3   7.0
4   NaN
5  11.0
6  13.0
Length: 7, dtype: float64
```

• Added a `DataFrame.round` method to round the values to a variable number of decimal places (GH10568).

```python
In [49]: df = pd.DataFrame(
    ....:     np.random.random([3, 3]),
    ....:     columns=["A", "B", "C"],
    ....:     index=["first", "second", "third"],
    ....: )
In [50]: df
Out[50]:
     A      B      C
first 0.12697 0.966718 0.260476
second 0.897237 0.37675 0.336222
third 0.451376 0.840255 0.123102
[3 rows x 3 columns]
In [51]: df.round(2)
Out[51]:
     A      B      C
first 0.13 0.97 0.26
second 0.9 0.38 0.34
third 0.45 0.84 0.12
[3 rows x 3 columns]
In [52]: df.round({"A": 0, "C": 2})
Out[52]:
     A     B    C
first 0.1 0.97 0.26
second 0.9 0.38 0.34
third 0.45 0.84 0.12
[3 rows x 3 columns]
```
first  0.0  0.966718  0.26
second 1.0  0.376750  0.34
third  0.0  0.840255  0.12
[3 rows x 3 columns]

- drop_duplicates and duplicated now accept a keep keyword to target first, last, and all duplicates. The take_last keyword is deprecated, see here (GH6511, GH8505)

```python
In [53]: s = pd.Series(['A', 'B', 'C', 'A', 'B', 'D'])

In [54]: s.drop_duplicates()
Out[54]:
0   A
1   B
2   C
3   A
4   B
5   D
Length: 4, dtype: object

In [55]: s.drop_duplicates(keep="last")
Out[55]:
2   C
3   A
4   B
5   D
Length: 4, dtype: object

In [56]: s.drop_duplicates(keep=False)
Out[56]:
2   C
5   D
Length: 2, dtype: object
```

- Reindex now has a tolerance argument that allows for finer control of Limits on filling while reindexing (GH10411):

```python
In [57]: df = pd.DataFrame({'x': range(5), 't': pd.date_range('2000-01-01', periods=5)})

In [58]: df.reindex([0.1, 1.9, 3.5], method='nearest', tolerance=0.2)
Out[58]:
     x     t
0  0.1  2000-01-01
1  1.9  2000-01-03
2  3.5    NaN    NaT

When used on a DatetimeIndex, TimedeltaIndex or PeriodIndex, tolerance will coerced into a Timedelta if possible. This allows you to specify tolerance with a string:

```python
In [59]: df = df.set_index('t')
```

(continues on next page)
In [60]: df.reindex(pd.to_datetime(["1999-12-31"], method="nearest", tolerance="1 day"))
Out[60]:
   1999-12-31
   0
[1 rows x 1 columns]

tolerance is also exposed by the lower level `Index.get_indexer` and `Index.get_loc` methods.

- Added functionality to use the base argument when resampling a `TimeDeltaIndex` (GH10530)
- `DatetimeIndex` can be instantiated using strings contains `NaT` (GH7599)
- `to_datetime` can now accept the `yearfirst` keyword (GH7599)
- `pandas.tseries.offsets` larger than the `Day` offset can now be used with a `Series` for addition/subtraction (GH10699). See the docs for more details.
- `pd.Timedelta.total_seconds()` now returns Timedelta duration to ns precision (previously microsecond precision) (GH10939)
- `PeriodIndex` now supports arithmetic with `np.ndarray` (GH10638)
- Support pickling of `Period` objects (GH10439)
- `.as_blocks` will now take a `copy` optional argument to return a copy of the data, default is to copy (no change in behavior from prior versions), (GH9607)
- `regex` argument to `DataFrame.filter` now handles numeric column names instead of raising `ValueError` (GH10844).
- Enable reading gzip compressed files via URL, either by explicitly setting the compression parameter or by inferring from the presence of the HTTP Content-Encoding header in the response (GH8685)
- Enable writing Excel files in memory using `StringIO/BytesIO` (GH7074)
- Enable serialization of lists and dicts to strings in `ExcelWriter` (GH8188)
- SQL io functions now accept a SQLAlchemy connectable. (GH7877)
- `pd.read_sql` and `to_sql` can accept database URI as `con` parameter (GH10214)
- `read_sql_table` will now allow reading from views (GH10750).
- Enable writing complex values to HDFStores when using the `table` format (GH10447)
- Enable `pd.read_hdf` to be used without specifying a key when the HDF file contains a single dataset (GH10443)
- `pd.read_stata` will now read Stata 118 type files. (GH9882)
- `msgpack` submodule has been updated to 0.4.6 with backward compatibility (GH10581)
- `DataFrame.to_dict` now accepts `orient='index'` keyword argument (GH10844).
- `DataFrame.apply` will return a Series of dicts if the passed function returns a dict and `reduce=True` (GH8735).
- Allow passing `kwargs` to the interpolation methods (GH10378).
- Improved error message when concatenating an empty iterable of `DataFrame` objects (GH9157)
- `pd.read_csv` can now read bz2-compressed files incrementally, and the `C` parser can read bz2-compressed files from AWS S3 (GH10170, GH11072).
- In `pd.read_csv`, recognize `s3n://` and `s3a://` URLs as designating S3 file storage (GH11070, GH11071).
• Read CSV files from AWS S3 incrementally, instead of first downloading the entire file. (Full file download still required for compressed files in Python 2.) (GH11070, GH11073)
• `pd.read_csv` is now able to infer compression type for files read from AWS S3 storage (GH11070, GH11074).

### Backwards incompatible API changes

#### Changes to sorting API

The sorting API has had some longtime inconsistencies. (GH9816, GH8239).

Here is a summary of the API PRIOR to 0.17.0:

- `Series.sort` is INPLACE while `DataFrame.sort` returns a new object.
- `Series.order` returns a new object
- It was possible to use `Series/DataFrame.sort_index` to sort by values by passing the by keyword.
- `Series/DataFrame.sortlevel` worked only on a MultiIndex for sorting by index.

To address these issues, we have revamped the API:

- We have introduced a new method, `DataFrame.sort_values()`, which is the merger of `DataFrame.sort()`, `Series.sort()`, and `Series.order()`, to handle sorting of values.
- The existing methods `Series.sort()`, `Series.order()`, and `DataFrame.sort()` have been deprecated and will be removed in a future version.
- The `by` argument of `DataFrame.sort_index()` has been deprecated and will be removed in a future version.
- The existing method .sort_index() will gain the `level` keyword to enable level sorting.

We now have two distinct and non-overlapping methods of sorting. A * marks items that will show a FutureWarning.

To sort by the values:

<table>
<thead>
<tr>
<th>Previous</th>
<th>Replacement</th>
</tr>
</thead>
<tbody>
<tr>
<td>*Series.order()</td>
<td>Series.sort_values()</td>
</tr>
<tr>
<td>*Series.sort()</td>
<td>Series.sort_values(inplace=True)</td>
</tr>
<tr>
<td>*DataFrame.sort(columns=...)</td>
<td>DataFrame.sort_values(by=...)</td>
</tr>
</tbody>
</table>

To sort by the index:

<table>
<thead>
<tr>
<th>Previous</th>
<th>Replacement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Series.sort_index()</td>
<td>Series.sort_index()</td>
</tr>
<tr>
<td>Series.sortlevel(level=...)</td>
<td>Series.sort_index(level=...)</td>
</tr>
<tr>
<td>DataFrame.sort_index()</td>
<td>DataFrame.sort_index()</td>
</tr>
<tr>
<td>DataFrame.sortlevel(level=...)</td>
<td>DataFrame.sort_index(level=...)</td>
</tr>
<tr>
<td>*DataFrame.sort()</td>
<td>DataFrame.sort_index()</td>
</tr>
</tbody>
</table>

We have also deprecated and changed similar methods in two Series-like classes, Index and Categorical.

<table>
<thead>
<tr>
<th>Previous</th>
<th>Replacement</th>
</tr>
</thead>
<tbody>
<tr>
<td>*Index.order()</td>
<td>Index.sort_values()</td>
</tr>
<tr>
<td>*Categorical.order()</td>
<td>Categorical.sort_values()</td>
</tr>
</tbody>
</table>
Changes to `to_datetime` and `to_timedelta`

**Error handling**

The default for `pd.to_datetime` error handling has changed to `errors='raise'`. In prior versions it was `errors='ignore'`. Furthermore, the `coerce` argument has been deprecated in favor of `errors='coerce'`. This means that invalid parsing will raise rather than return the original input as in previous versions. (GH10636)

Previous behavior:

```python
In [2]: pd.to_datetime(['2009-07-31', 'asd'])
Out[2]: array(['2009-07-31', 'asd'], dtype=object)
```

New behavior:

```python
In [3]: pd.to_datetime(['2009-07-31', 'asd'])
ValueError: Unknown string format
```

Of course you can coerce this as well.

```python
In [61]: pd.to_datetime(['2009-07-31', 'asd'], errors='coerce')
Out[61]: DatetimeIndex(['2009-07-31', 'NaT'], dtype='datetime64[ns]', freq=None)
```

To keep the previous behavior, you can use `errors='ignore'`:

```python
In [62]: pd.to_datetime(['2009-07-31', 'asd'], errors='ignore')
Out[62]: Index(['2009-07-31', 'asd'], dtype='object')
```

Furthermore, `pd.to_timedelta` has gained a similar API, of `errors='raise'`|`'ignore'`|`'coerce'`, and the `coerce` keyword has been deprecated in favor of `errors='coerce'`.

**Consistent parsing**

The string parsing of `to_datetime`, `Timestamp` and `DatetimeIndex` has been made consistent. (GH7599)

Prior to v0.17.0, `Timestamp` and `to_datetime` may parse year-only datetime-string incorrectly using today's date, otherwise `DatetimeIndex` uses the beginning of the year. `Timestamp` and `to_datetime` may raise `ValueError` in some types of datetime-string which `DatetimeIndex` can parse, such as a quarterly string.

Previous behavior:

```python
In [1]: pd.Timestamp('2012Q2')
Traceback...
ValueError: Unable to parse 2012Q2
```

```python
# Results in today's date.
In [2]: pd.Timestamp('2014')
Out [2]: 2014-08-12 00:00:00
```

v0.17.0 can parse them as below. It works on `DatetimeIndex` also.

New behavior:
Note: If you want to perform calculations based on today's date, use `Timestamp.now()` and `pandas.tseries.offsets`.

```python
In [66]: import pandas.tseries.offsets as offsets

In [67]: pd.Timestamp.now()
Out[67]: Timestamp('2021-06-22 10:37:34.673025')

In [68]: pd.Timestamp.now() + offsets.DateOffset(years=1)
Out[68]: Timestamp('2022-06-22 10:37:34.673808')
```

### Changes to Index comparisons

Operator equal on `Index` should behave similarly to `Series` ([GH9947, GH10637](https://github.com/pandas-dev/pandas/pull/9947)).

Starting in v0.17.0, comparing `Index` objects of different lengths will raise a `ValueError`. This is to be consistent with the behavior of `Series`.

Previous behavior:

```python
In [2]: pd.Index([1, 2, 3]) == pd.Index([1, 4, 5])
Out[2]: array([ True, False, False], dtype=bool)

In [3]: pd.Index([1, 2, 3]) == pd.Index([2])
Out[3]: array([False, True, False], dtype=bool)

In [4]: pd.Index([1, 2, 3]) == pd.Index([1, 2])
Out[4]: False
```

New behavior:

```python
In [8]: pd.Index([1, 2, 3]) == pd.Index([1, 4, 5])
Out[8]: array([ True, False, False], dtype=bool)

In [9]: pd.Index([1, 2, 3]) == pd.Index([2])
ValueError: Lengths must match to compare

In [10]: pd.Index([1, 2, 3]) == pd.Index([1, 2])
ValueError: Lengths must match to compare
```

Note that this is different from the `numpy` behavior where a comparison can be broadcast:
In [69]: np.array([1, 2, 3]) == np.array([1])
Out[69]: array([ True, False, False])

or it can return False if broadcasting can not be done:

In [70]: np.array([1, 2, 3]) == np.array([1, 2])
Out[70]: False

Changes to boolean comparisons vs. None

Boolean comparisons of a Series vs None will now be equivalent to comparing with np.nan, rather than raise TypeError. (GH1079).

In [71]: s = pd.Series(range(3))

In [72]: s.iloc[1] = None

In [73]: s
Out[73]:
0    0.0
1   NaN
2    2.0
Length: 3, dtype: float64

Previous behavior:

In [5]: s == None
TypeError: Could not compare <type 'NoneType'> type with Series

New behavior:

In [74]: s == None
Out[74]:
0   False
1   False
2   False
Length: 3, dtype: bool

Usually you simply want to know which values are null.

In [75]: s.isnull()
Out[75]:
0   False
1    True
2   False
Length: 3, dtype: bool

**Warning:** You generally will want to use isnull/notnull for these types of comparisons, as isnull/notnull tells you which elements are null. One has to be mindful that nan’s don’t compare equal, but None’s do. Note that pandas/numpy uses the fact that np.nan != np.nan, and treats None like np.nan.
HDFStore dropna behavior

The default behavior for HDFStore write functions with `format='table'` is now to keep rows that are all missing. Previously, the behavior was to drop rows that were all missing save the index. The previous behavior can be replicated using the `dropna=True` option. (GH9382)

Previous behavior:

```python
In [78]: df_with_missing = pd.DataFrame(
    ....:   {"col1": [0, np.nan, 2], "col2": [1, np.nan, np.nan]}
    ....: )
    ....:
In [79]: df_with_missing
df_with_missing
Out[79]:
        col1  col2
0      0.0   1.0
1      NaN   NaN
2      2.0   NaN
[3 rows x 2 columns]
```

```python
In [27]:
df_with_missing.to_hdf('file.h5', 'df_with_missing', format='table', mode='w')
In [28]: pd.read_hdf('file.h5', 'df_with_missing')
Out[28]:
        col1  col2
0      0.0   1.0
2      2.0   NaN
```

New behavior:

```python
In [80]: df_with_missing.to_hdf("file.h5", "df_with_missing", format="table", mode="w")
In [81]: pd.read_hdf("file.h5", "df_with_missing")
Out[81]:
        col1  col2
0      0.0   1.0
1      NaN   NaN
2      2.0   NaN
```

(continues on next page)
See the docs for more details.

**Changes to display.precision option**

The display.precision option has been clarified to refer to decimal places (GH10451).

Earlier versions of pandas would format floating point numbers to have one less decimal place than the value in display.precision.

```python
In [1]: pd.set_option('display.precision', 2)
In [2]: pd.DataFrame({'x': [123.456789]})
Out[2]:
   x
0  123.5
```

If interpreting precision as “significant figures” this did work for scientific notation but that same interpretation did not work for values with standard formatting. It was also out of step with how numpy handles formatting.

Going forward the value of display.precision will directly control the number of places after the decimal, for regular formatting as well as scientific notation, similar to how numpy’s precision print option works.

```python
In [82]: pd.set_option("display.precision", 2)
In [83]: pd.DataFrame({'x': [123.456789]})
Out[83]:
   x
0  123.46
```

To preserve output behavior with prior versions the default value of display.precision has been reduced to 6 from 7.

**Changes to Categorical.unique**

Categorical.unique now returns new Categoricals with categories and codes that are unique, rather than returning np.array (GH10508)

• unordered category: values and categories are sorted by appearance order.
• ordered category: values are sorted by appearance order, categories keep existing order.

```python
In [84]: cat = pd.Categorical(['C', 'A', 'B', 'C'], categories=['A', 'B', 'C'], ordered=True)
In [85]: cat
Out[85]:
['C', 'A', 'B', 'C']
```

(continues on next page)
Categories (3, object): ['A' < 'B' < 'C']

In [86]: cat.unique()
Out[86]:
['C', 'A', 'B']
Categories (3, object): ['A' < 'B' < 'C']

In [87]: cat = pd.Categorical(['C', 'A', 'B', 'C'], categories=['A', 'B', 'C'])

In [88]: cat
Out[88]:
['C', 'A', 'B', 'C']
Categories (3, object): ['A', 'B', 'C']

In [89]: cat.unique()
Out[89]:
['C', 'A', 'B']
Categories (3, object): ['C', 'A', 'B']

Changes to bool passed as header in parsers

In earlier versions of pandas, if a bool was passed the header argument of read_csv, read_excel, or read_html it was implicitly converted to an integer, resulting in header=0 for False and header=1 for True (GH6113)

A bool input to header will now raise a TypeError

In [29]: df = pd.read_csv('data.csv', header=False)
TypeError: Passing a bool to header is invalid. Use header=None for no header or header=int or list-like of ints to specify the row(s) making up the column names

Other API changes

- Line and kde plot with subplots=True now uses default colors, not all black. Specify color='k' to draw all lines in black (GH9894)
- Calling the .value_counts() method on a Series with a categorical dtype now returns a Series with a CategoricalIndex (GH10704)
- The metadata properties of subclasses of pandas objects will now be serialized (GH10553).
- groupby using Categorical follows the same rule as Categorical.unique described above (GH10508)
- When constructing DataFrame with an array of complex64 dtype previously meant the corresponding column was automatically promoted to the complex128 dtype. pandas will now preserve the itemsize of the input for complex data (GH10952)
- some numeric reduction operators would return ValueError, rather than TypeError on object types that includes strings and numbers (GH11131)
- Passing currently unsupported chunksize argument to read_excel or ExcelFile.parse will now raise NotImplementedError (GH8011)
- Allow an ExcelFile object to be passed into read_excel (GH11198)
• DatetimeIndex.union does not infer freq if self and the input have None as freq (GH11086)

• NaT’s methods now either raise ValueError, or return np.nan or NaT (GH9513)

<table>
<thead>
<tr>
<th>Behavior</th>
<th>Methods</th>
</tr>
</thead>
<tbody>
<tr>
<td>return np.nan</td>
<td>weekday, isoweekday</td>
</tr>
<tr>
<td>return NaT</td>
<td>date, now, replace, to_datetime, today</td>
</tr>
<tr>
<td>return np.datetime64('NaT')</td>
<td>to_datetime64 (unchanged)</td>
</tr>
<tr>
<td>raise ValueError</td>
<td>All other public methods (names not beginning with underscores)</td>
</tr>
</tbody>
</table>

Deprecations

• For Series the following indexing functions are deprecated (GH10177).

<table>
<thead>
<tr>
<th>Deprecated Function</th>
<th>Replacement</th>
</tr>
</thead>
<tbody>
<tr>
<td>.irow(i)</td>
<td>.iloc[i] or .iat[i]</td>
</tr>
<tr>
<td>.iget(i)</td>
<td>.iloc[i] or .iat[i]</td>
</tr>
<tr>
<td>.iget_value(i)</td>
<td>.iloc[i] or .iat[i]</td>
</tr>
</tbody>
</table>

• For DataFrame the following indexing functions are deprecated (GH10177).

<table>
<thead>
<tr>
<th>Deprecated Function</th>
<th>Replacement</th>
</tr>
</thead>
<tbody>
<tr>
<td>.irow(i)</td>
<td>.iloc[i]</td>
</tr>
<tr>
<td>.iget_value(i, j)</td>
<td>.iloc[i, j] or .iat[i, j]</td>
</tr>
<tr>
<td>.icol(j)</td>
<td>.iloc[:, j]</td>
</tr>
</tbody>
</table>

Note: These indexing function have been deprecated in the documentation since 0.11.0.

• Categorical.name was deprecated to make Categorical more numpy.ndarray like. Use Series(cat, name="whatever") instead (GH10482).

• Setting missing values (NaN) in a Categorical’s categories will issue a warning (GH10748). You can still have missing values in the values.

• drop_duplicates and duplicated’s take_last keyword was deprecated in favor of keep. (GH6511, GH8505)

• Series.nsmallest and nlargest’s take_last keyword was deprecated in favor of keep. (GH10792)

• DataFrame.combineAdd and DataFrame.combineMult are deprecated. They can easily be replaced by using the add and mul methods: DataFrame.add(other, fill_value=0) and DataFrame.mul(other, fill_value=1.) (GH10735).

• TimeSeries deprecated in favor of Series (note that this has been an alias since 0.13.0), (GH10890)

• SparsePanel deprecated and will be removed in a future version (GH11157).

• Series.is_time_series deprecated in favor of Series.index.is_all_dates (GH11135)

• Legacy offsets (like 'A@JAN') are deprecated (note that this has been alias since 0.8.0) (GH10878)

• WidePanel deprecated in favor of Panel, LongPanel in favor of DataFrame (note these have been aliases since < 0.11.0), (GH10892)
• **DataFrame.convert_objects** has been deprecated in favor of type-specific functions **pd.to_datetime**, **pd.to_timestamp** and **pd.to_numeric** (new in 0.17.0) (GH11133).

**Removal of prior version deprecations/changes**

• Removal of na_last parameters from **Series.order()** and **Series.sort()**, in favor of na_position. (GH5231)

• Remove of percentile_width from **.describe()**, in favor of percentiles. (GH7088)

• Removal of colSpace parameter from **DataFrame.to_string()**, in favor of col_space, circa 0.8.0 version.

• Removal of automatic time-series broadcasting (GH2304)

In [90]: np.random.seed(1234)

In [91]: df = pd.DataFrame(
    ....:     np.random.randn(5, 2),
    ....:     columns=list("AB"),
    ....:     index=pd.date_range("2013-01-01", periods=5),
    ....:     )

[5 rows x 2 columns]

- Remove `table` keyword in `HDFStore.put/append`, in favor of using `format=` (GH4645)
- Remove kind in `read_excel/ExcelFile` as its unused (GH4712)
- Remove `infer_type` keyword from `pd.read_html` as its unused (GH4770, GH7032)
- Remove `offset` and `timeRule` keywords from `Series.tshift/shift`, in favor of `freq` (GH4853, GH4864)
- Remove `pd.load/pd.save` aliases in favor of `pd.to_pickle/pd.read_pickle` (GH3787)

**Performance improvements**

- Development support for benchmarking with the Air Speed Velocity library (GH8361)
- Added vbench benchmarks for alternative ExcelWriter engines and reading Excel files (GH7171)
- Performance improvements in `Categorical.value_counts` (GH10804)
- Performance improvements in `SeriesGroupBy.nunique` and `SeriesGroupBy.value_counts` and `SeriesGroupBy.transform` (GH10820, GH11077)
- Performance improvements in `DataFrame.drop_duplicates` with integer dtypes (GH10917)
- Performance improvements in `DataFrame.duplicated` with wide frames. (GH10161, GH11180)
- 4x improvement in `timedelta` string parsing (GH6755, GH10426)
- 8x improvement in `timedelta64` and `datetime64` ops (GH6755)
- Significantly improved performance of indexing `MultiIndex` with slicers (GH10287)
- 8x improvement in `iloc` using list-like input (GH10791)
- Improved performance of `Series.isin` for datetimelike/integer Series (GH10287)
- 20x improvement in `concat` of Categoricals when categories are identical (GH10587)
- Improved performance of `to_datetime` when specified format string is ISO8601 (GH10178)
- 2x improvement of `Series.value_counts` for float dtype (GH10821)
- Enable `infer_datetime_format` in `to_datetime` when date components do not have 0 padding (GH11142)
- Regression from 0.16.1 in constructing `DataFrame` from nested dictionary (GH11084)
- Performance improvements in addition/subtraction operations for `DateOffset` with `Series` or `DatetimeIndex` (GH10744, GH11205)
Bug fixes

- Bug in incorrect computation of .mean() on timedelta64[ns] because of overflow (GH9442)
- Bug in .isin on older numpies (GH11232)
- Bug in DataFrame.to_html(index=False) renders unnecessary name row (GH10344)
- Bug in DataFrame.to_latex() the column_format argument could not be passed (GH9402)
- Bug in DatetimeIndex when localizing with NaT (GH10477)
- Bug in Series.dt ops in preserving meta-data (GH10477)
- Bug in preserving NaT when passed in an otherwise invalid to_datetime construction (GH10477)
- Bug in DataFrame.apply when function returns categorical series. (GH9573)
- Bug in to_datetime with invalid dates and formats supplied (GH10154)
- Bug in Index.drop_duplicates dropping name(s) (GH10115)
- Bug in Series.quantile dropping name (GH10881)
- Bug in pd.Series when setting a value on an empty Series whose index has a frequency. (GH10193)
- Bug in pd.Series.interpolate with invalid order keyword values. (GH10633)
- Bug in DataFrame.plot raises ValueError when color name is specified by multiple characters (GH1037)
- Bug in Index construction with a mixed list of tuples (GH10697)
- Bug in DataFrame.reset_index when index contains NaT. (GH10388)
- Bug in ExcelReader when worksheet is empty (GH6403)
- Bug in BinGrouper.group_info where returned values are not compatible with base class (GH10914)
- Bug in clearing the cache on DataFrame.pop and a subsequent inplace op (GH10912)
- Bug in indexing with a mixed-integer Index causing an ImportError (GH10610)
- Bug in Series.count when index has nulls (GH10946)
- Bug in pickling of a non-regular freq DatetimeIndex (GH11002)
- Bug causing DataFrame.where to not respect the axis parameter when the frame has a symmetric shape. (GH9736)
- Bug in Table.select_column where name is not preserved (GH10392)
- Bug in offsets.generate_range where start and end have finer precision than offset (GH9907)
- Bug in pd.rolling_* where Series.name would be lost in the output (GH10565)
- Bug in stack when index or columns are not unique. (GH10417)
- Bug in setting a Panel when an axis has a MultiIndex (GH10360)
- Bug in USFederalHolidayCalendar where USMemorialDay and USMartinLutherKingJr were incorrect (GH10278 and GH9760)
- Bug in .sample() where returned object, if set, gives unnecessary SettingWithCopyWarning (GH10738)
- Bug in .sample() where weights passed as Series were not aligned along axis before being treated positionally, potentially causing problems if weight indices were not aligned with sampled object. (GH10738)
- Regression fixed in (GH9311, GH6620, GH9345), where groupby with a datetime-like converting to float with certain aggregators (GH10979)
- Bug in `DataFrame.interpolate` with `axis=1` and `inplace=True` (GH10395)
- Bug in `io.sql.get_schema` when specifying multiple columns as primary key (GH10385).
- Bug in `groupby(sort=False)` with datetime-like `Categorical` raises `ValueError` (GH10505)
- Bug in `groupby(axis=1)` with `filter()` throws `IndexError` (GH11041)
- Bug in `test_categorical` on big-endian builds (GH10425)
- Bug in `Series.shift` and `DataFrame.shift` not supporting categorical data (GH9416)
- Bug in `Series.map` using categorical `Series` raises `AttributeError` (GH10324)
- Bug in `MultiIndex.get_level_values` including `Categorical` raises `AttributeError` (GH10460)
- Bug in `pd.get_dummies` with `sparse=True` not returning `SparseDataFrame` (GH10531)
- Bug in `Index.subtypes` (such as `PeriodIndex`) not returning their own type for `.drop` and `.insert` methods (GH10620)
- Bug in `algos.outer_join_indexer` when right array is empty (GH10618)
- Bug in `filter` (regression from 0.16.0) and `transform` when grouping on multiple keys, one of which is datetime-like (GH10114)
- Bug in `to_datetime` and `to_timedelta` causing `Index` name to be lost (GH10875)
- Bug in `len(DataFrame.groupby)` causing `IndexError` when there's a column containing only NaNs (GH11016)
- Bug that caused segfault when resampling an empty `Series` (GH10228)
- Bug in `DatetimeIndex` and `PeriodIndex.value_counts` resets name from its result, but retains in result's `Index` (GH10150)
- Bug in `pd.eval` using `numexpr` engine coerces 1 element numpy array to scalar (GH10546)
- Bug in `pd.concat` with `axis=0` when column is of dtype `category` (GH10177)
- Bug in `pd.read_msgpack` where input type is not always checked (GH10369, GH10630)
- Bug in `pd.read_csv` with `index_col=False`, `index_col=['a', 'b']` or `dtype` (GH10413, GH10467, GH10577)
- Bug in `Series.from_csv` with `header` kwarg not setting the `Series.name` or the `Series.index.name` (GH10483)
- Bug in `groupby.var` which caused variance to be inaccurate for small float values (GH10448)
- Bug in `Series.plot(kind='hist')` Y Label not informative (GH10485)
- Bug in `read_csv` when using a converter which generates a `uint8` type (GH9266)
- Bug causes memory leak in time-series line and area plot (GH9003)
- Bug when setting a `Panel` sliced along the major or minor axes when the right-hand side is a `DataFrame` (GH11014)
- Bug that returns `None` and does not raise `NotImplementedError` when operator functions (e.g. `.add`) of `Panel` are not implemented (GH7692)
- Bug in `line` and `kde` plot cannot accept multiple colors when `subplots=True` (GH9894)
- Bug in `DataFrame.plot` raises `ValueError` when color name is specified by multiple characters (GH10387)
- Bug in `DataFrame.plot` raises `ValueError` when `subplots=True` (GH10665)
- Bug in `left` and `right` `align` of `Series` with `MultiIndex` may be inverted (GH10671)
• Bug in read_stata when reading a file with a different order set in columns (GH10757)
• Bug in Categorical may not representing properly when category contains tz or Period (GH10713)
• Bug in Categorical.__iter__ may not returning correct datetime and Period (GH10713)
• Bug in indexing with a PeriodIndex on an object with a PeriodIndex (GH4125)
• Bug in read_csv with engine='c': EOF preceded by a comment, blank line, etc. was not handled correctly (GH10728, GH10548)
• Reading “famafrench” data via DataReader results in HTTP 404 error because of the website url is changed (GH10591).
• Bug in read_msgpack where DataFrame to decode has duplicate column names (GH9618)
• Bug in io.common.get_filepath_or_buffer which caused reading of valid S3 files to fail if the bucket also contained keys for which the user does not have read permission (GH10604)
• Bug in vectorised setting of timestamp columns with python datetime.date and numpy datetime64 (GH10408, GH10412)
• Bug in Index.take may add unnecessary freq attribute (GH10791)
• Bug in merge with empty DataFrame may raise IndexError (GH10824)
• Bug in to_latex where unexpected keyword argument for some documented arguments (GH10888)
• Bug in indexing of large DataFrame where IndexError is uncaught (GH10645 and GH10692)
• Bug in read_csv when using the nrows or chunksize parameters if file contains only a header line (GH9535)
• Bug in serialization of category types in HDF5 in presence of alternate encodings. (GH10366)
• Bug in pd.DataFrame when constructing an empty DataFrame with a string dtype (GH9428)
• Bug in pd.DataFrame.diff when DataFrame is not consolidated (GH10907)
• Bug in pd.unique for arrays with the datetime64 or timedelta64 dtype that meant an array with object dtype was returned instead the original dtype (GH9431)
• Bug in Timedelta raising error when slicing from 0s (GH10583)
• Bug in DatetimeIndex.take and TimedeltaIndex.take may not raise IndexError against invalid index (GH10295)
• Bug in Series([np.nan]).astype('M8[ms]'), which now returns Series([pd.NaT]) (GH10747)
• Bug in PeriodIndex.order reset freq (GH10295)
• Bug in date_range when freq divides end as nanos (GH10885)
• Bug in iloc allowing memory outside bounds of a Series to be accessed with negative integers (GH10779)
• Bug in read_msgpack where encoding is not respected (GH10581)
• Bug preventing access to the first index when using iloc with a list containing the appropriate negative integer (GH10547, GH10779)
• Bug in TimedeltaIndex formatter causing error while trying to save DataFrame with TimedeltaIndex using to_csv (GH10833)
• Bug in DataFrame.where when handling Series slicing (GH10218, GH9558)
• Bug where pd.read_gbq throws ValueError when Bigquery returns zero rows (GH10273)
• Bug in to_json which was causing segmentation fault when serializing 0-rank ndarray (GH9576)
• Bug in plotting functions may raise IndexError when plotted on GridSpec (GH10819)
• Bug in plot result may show unnecessary minor ticklabels (GH10657)
• Bug in groupby incorrect computation for aggregation on DataFrame with NaT (E.g first, last, min). (GH10590, GH11010)
• Bug when constructing DataFrame where passing a dictionary with only scalar values and specifying columns did not raise an error (GH10856)
• Bug in .var() causing roundoff errors for highly similar values (GH10242)
• Bug in DataFrame.plot(subplots=True) with duplicated columns outputs incorrect result (GH10962)
• Bug in Index arithmetic may result in incorrect class (GH10638)
• Bug in date_range results in empty if freq is negative annually, quarterly and monthly (GH11018)
• Bug in DatetimeIndex cannot infer negative freq (GH11018)
• Remove use of some deprecated numpy comparison operations, mainly in tests. (GH10569)
• Bug in Index dtype may not applied properly (GH11017)
• Bug in io.gbq when testing for minimum google api client version (GH10652)
• Bug in DataFrame construction from nested dict with timedelta keys (GH11129)
• Bug in .fillna against may raise TypeError when data contains datetime dtype (GH7095, GH11153)
• Bug in groupby when number of keys to group by is same as length of index (GH11185)
• Bug in convert_objects where converted values might not be returned if all null and coerce (GH9589)
• Bug in convert_objects where copy keyword was not respected (GH9589)

5.13 Version 0.16

5.13.1 Version 0.16.2 (June 12, 2015)

This is a minor bug-fix release from 0.16.1 and includes a large number of bug fixes along some new features (pipe() method), enhancements, and performance improvements.

We recommend that all users upgrade to this version.

Highlights include:

- A new pipe method, see here
- Documentation on how to use numba with pandas, see here
What's new in v0.16.2

- New features
  - Pipe
  - Other enhancements
- API changes
- Performance improvements
- Bug fixes
- Contributors

New features

Pipe

We've introduced a new method `DataFrame.pipe()`. As suggested by the name, pipe should be used to pipe data through a chain of function calls. The goal is to avoid confusing nested function calls like

```python
# df is a DataFrame
# f, g, and h are functions that take and return DataFrames
f(g(h(df), arg1=1), arg2=2, arg3=3)  # noqa F821
```

The logic flows from inside out, and function names are separated from their keyword arguments. This can be rewritten as

```python
(df.pipe(h)  # noqa F821
 .pipe(g, arg1=1)  # noqa F821
 .pipe(f, arg2=2, arg3=3)  # noqa F821
)
```

Now both the code and the logic flow from top to bottom. Keyword arguments are next to their functions. Overall the code is much more readable.

In the example above, the functions `f`, `g`, and `h` each expected the DataFrame as the first positional argument. When the function you wish to apply takes its data anywhere other than the first argument, pass a tuple of `(function, keyword)` indicating where the DataFrame should flow. For example:

```python
In [1]: import statsmodels.formula.api as sm
In [2]: bb = pd.read_csv("data/baseball.csv", index_col="id")
In [3]: (  
...:     bb.query("h > 0")  
...:     .assign(ln_h=lambda df: np.log(df.h))  
...:     .pipe((sm.ols, "data"), "hr ~ ln_h + year + g + C(lg)")  
...:     .fit()  
...:     .summary()  
```

(continues on next page)
...: )
...

```python
Out[3]:
<class 'statsmodels.iolib.summary.Summary'>
```
```

===============================================================================
Notes:
[1] Standard Errors assume that the covariance matrix of the errors is correctly specified.
[2] The condition number is large, 1.49e+07. This might indicate that there are strong multicollinearity or other numerical problems.
```

The pipe method is inspired by unix pipes, which stream text through processes. More recently `dplyr` and `magrittr` have introduced the popular `%>%` pipe operator for R.

See the documentation for more. (GH10129)
Other enhancements

- Added rsplit to Index/Series String Methods (GH10303)
- Removed the hard-coded size limits on the DataFrame HTML representation in the IPython notebook, and leave this to IPython itself (only for IPython v3.0 or greater). This eliminates the duplicate scroll bars that appeared in the notebook with large frames (GH10231).

Note that the notebook has a toggle output scrolling feature to limit the display of very large frames (by clicking left of the output). You can also configure the way DataFrames are displayed using the pandas options, see here.

- axis parameter of DataFrame.quantile now accepts also index and column. (GH9543)

API changes

- Holiday now raises NotImplementedError if both offset and observance are used in the constructor instead of returning an incorrect result (GH10217).

Performance improvements

- Improved Series.resample performance with dtype=datet ime64[ns] (GH7754)
- Increase performance of str.split when expand=True (GH10081)

Bug fixes

- Bug in Series.hist raises an error when a one row Series was given (GH10214)
- Bug where HDFStore.select modifies the passed columns list (GH7212)
- Bug in Categorical repr with display.width of None in Python 3 (GH10087)
- Bug in to_json with certain orients and a CategoricalIndex would segfault (GH10317)
- Bug where some of the nan functions do not have consistent return dtypes (GH10251)
- Bug in DataFrame.quantile on checking that a valid axis was passed (GH9543)
- Bug in groupby.apply aggregation for Categorical not preserving categories (GH10138)
- Bug in to_csv where date_format is ignored if the datetime is fractional (GH10209)
- Bug in DataFrame.to_json with mixed data types (GH10289)
- Bug in cache updating when consolidating (GH10264)
- Bug in mean() where integer dtypes can overflow (GH10172)
- Bug where Panel.from_dict does not set dtype when specified (GH10058)
- Bug in Index.union raises AttributeError when passing array-like. (GH10149)
- Bug in Timestamp’s’ microsecond, quarter, dayofyear, week and daysinmonth properties return np.int type, not built-in int. (GH10050)
- Bug in NaT raises AttributeError when accessing to daysinmonth, dayofweek properties. (GH10096)
- Bug in Index repr when using the max_seq_items=None setting (GH10182).
- Bug in getting timezone data with dateutil on various platforms (GH9059, GH8639, GH9663, GH10121)
• Bug in displaying datetimes with mixed frequencies; display ‘ms’ datetimes to the proper precision. (GH10170)
• Bug in setitem where type promotion is applied to the entire block (GH10280)
• Bug in Series arithmetic methods may incorrectly hold names (GH10068)
• Bug in GroupBy.get_group when grouping on multiple keys, one of which is categorical. (GH10132)
• Bug in DateTimeIndex and TimedeltaIndex names are lost after timedelta arithmetic (GH9926)
• Bug in DataFrame construction from nested dict with datetime64 (GH10160)
• Bug in Series construction from dict with datetime64 keys (GH9456)
• Bug in Series.plot(label="LABEL") not correctly setting the label (GH10119)
• Bug in plot not defaulting to matplotlib axes.grid setting (GH9792)
• Bug causing strings containing an exponent, but no decimal to be parsed as int instead of float in engine='python' for the read_csv parser (GH9565)
• Bug in Series.align resets name when fill_value is specified (GH10067)
• Bug in read_csv causing index name not to be set on an empty DataFrame (GH10184)
• Bug in SparseSeries.abs resets name (GH10241)
• Bug in TimedeltaIndex slicing may reset freq (GH10292)
• Bug in GroupBy.get_group raises ValueError when group key contains NaN (GH6992)
• Bug in SparseSeries constructor ignores input data name (GH10258)
• Bug in Categorical.remove_categories causing a ValueError when removing the NaN category if underlying dtype is floating-point (GH10156)
• Bug where infer_freq infers time rule (WOM-5XXX) unsupported by to_offset (GH9425)
• Bug in DataFrame.to_hdf() where table format would raise a seemingly unrelated error for invalid (non-string) column names. This is now explicitly forbidden. (GH9057)
• Bug to handle masking empty DataFrame (GH10126).
• Bug where MySQL interface could not handle numeric table/column names (GH10255)
• Bug in read_csv with a date_parser that returned a datetime64 array of other time resolution than [ns] (GH10245)
• Bug in Panel.apply when the result has ndim=0 (GH10332)
• Bug in read_hdf where auto_close could not be passed (GH9327).
• Bug in read_hdf where open stores could not be used (GH10330).
• Bug in adding empty DataFrames, now results in a DataFrame that .equals an empty DataFrame (GH10181).
• Bug in to_hdf and HDFStore which did not check that complib choices were valid (GH4582, GH8874).

5.13.2 Version 0.16.1 (May 11, 2015)

This is a minor bug-fix release from 0.16.0 and includes a large number of bug fixes along several new features, enhancements, and performance improvements. We recommend that all users upgrade to this version.

Highlights include:

• Support for a CategoricalIndex, a category based index, see here
• New section on how-to-contribute to pandas, see here
• Revised “Merge, join, and concatenate” documentation, including graphical examples to make it easier to understand each operations, see here
• New method sample for drawing random samples from Series, DataFrames and Panels. See here
• The default Index printing has changed to a more uniform format, see here
• BusinessHour datetime-offset is now supported, see here
• Further enhancement to the .str accessor to make string operations easier, see here

What's new in v0.16.1

• Enhancements
  – CategoricalIndex
  – Sample
  – String methods enhancements
  – Other enhancements
• API changes
  – Deprecations
• Index representation
• Performance improvements
• Bug fixes
• Contributors

Warning: In pandas 0.17.0, the sub-package pandas.io.data will be removed in favor of a separately installable package (GH8961).
Enhancements

CategoricalIndex

We introduce a CategoricalIndex, a new type of index object that is useful for supporting indexing with duplicates. This is a container around a Categorical (introduced in v0.15.0) and allows efficient indexing and storage of an index with a large number of duplicated elements. Prior to 0.16.1, setting the index of a DataFrame/Series with a category dtype would convert this to regular object-based Index.

```python
In [1]: df = pd.DataFrame({'A': np.arange(6),
                      'B': pd.Series(list('aabbca'))
                      .astype('category', categories=list('cab'))
                      .
                      )

In [2]: df
Out[2]:
     A  B
0   0  a
1   1  a
2   2  b
3   3  b
4   4  c
5   5  a

In [3]: df.dtypes
Out[3]:
A  int64
B  category
dtype: object

In [4]: df.B.cat.categories
Out[4]: Index(['c', 'a', 'b'], dtype='object')
```

setting the index, will create a CategoricalIndex

```python
In [5]: df2 = df.set_index('B')

In [6]: df2.index
Out[6]: CategoricalIndex(['a', 'a', 'b', 'c', 'a'], categories=['c', 'a', 'b'],
                          ordered=False, name='B', dtype='category')
```

indexing with __getitem__/.iloc/.loc/.ix works similarly to an Index with duplicates. The indexers MUST be in the category or the operation will raise.

```python
In [7]: df2.loc['a']
Out[7]:
   A  B
   a  0
   a  1
   a  5
```

and preserves the CategoricalIndex
In [8]: df2.loc['a'].index
Out[8]: CategoricalIndex(['a', 'a', 'a'], categories=['c', 'a', 'b'], ordered=False, name='B', dtype='category')

Sorting will order by the order of the categories

In [9]: df2.sort_index()
Out[9]:
     A  B  c  a  b
0  4  0  0  1  2
1  6  1  0  5  3

Groupby operations on the index will preserve the index nature as well

In [10]: df2.groupby(level=0).sum()
Out[10]:
     A  B  c  a  b
0  4  0  0  1  2
In [11]: df2.groupby(level=0).sum().index
Out[11]: CategoricalIndex(['c', 'a', 'b'], categories=['c', 'a', 'b'], ordered=False, name='B', dtype='category')

Reindexing operations, will return a resulting index based on the type of the passed indexer, meaning that passing a list will return a plain-old-Index; indexing with a Categorical will return a CategoricalIndex, indexed according to the categories of the PASSED Categorical dtype. This allows one to arbitrarily index these even with values NOT in the categories, similarly to how you can reindex ANY pandas index.

In [12]: df2.reindex(['a', 'e'])
Out[12]:
     A  B  a  0.0  e  NaN
     a  1.0
     a  5.0
In [13]: df2.reindex(['a', 'e']).index
Out[13]: pd.Index(['a', 'a', 'a', 'e'], dtype='object', name='B')

In [14]: df2.reindex(pd.Categorical(['a', 'e'], categories=list('abcde')))
Out[14]:
     A  B  a  0.0
(continues on next page)
In [15]: df2.reindex(pd.Categorical(['a', 'e'], categories=['a', 'b', 'c', 'd', 'e']),
               ordered=False, name='B',
               dtype='category').index
Out[15]: pd.CategoricalIndex(['a', 'a', 'a', 'e'], categories=['a', 'b', 'c', 'd', 'e'],
                        ordered=False, name='B',
                        dtype='category')

See the documentation for more. (GH7629, GH10038, GH10039)

Sample

Series, DataFrames, and Panels now have a new method: `sample()`. The method accepts a specific number of rows or columns to return, or a fraction of the total number of rows or columns. It also has options for sampling with or without replacement, for passing in a column for weights for non-uniform sampling, and for setting seed values to facilitate replication. (GH2419)

In [1]: example_series = pd.Series([0, 1, 2, 3, 4, 5])

# When no arguments are passed, returns 1
In [2]: example_series.sample()
Out[2]:

3 3
Length: 1, dtype: int64

# One may specify either a number of rows:
In [3]: example_series.sample(n=3)
Out[3]:
2 2
1 1
0 0
Length: 3, dtype: int64

# Or a fraction of the rows:
In [4]: example_series.sample(frac=0.5)
Out[4]:
1 1
5 5
3 3
Length: 3, dtype: int64

# weights are accepted.
In [5]: example_weights = [0, 0, 0.2, 0.2, 0.2, 0.4]

In [6]: example_series.sample(n=3, weights=example_weights)
Out[6]:
2 2
4 4
3 3

(continues on next page)
Length: 3, dtype: int64

# weights will also be normalized if they do not sum to one,
# and missing values will be treated as zeros.
In [7]: example_weights2 = [0.5, 0, 0, None, np.nan]

In [8]: example_series.sample(n=1, weights=example_weights2)
Out[8]:

0 0
Length: 1, dtype: int64

When applied to a DataFrame, one may pass the name of a column to specify sampling weights when sampling from rows.

In [9]: df = pd.DataFrame({'col1': [9, 8, 7, 6], 'weight_column': [0.5, 0.4, 0.1, 0]})

In [10]: df.sample(n=3, weights='weight_column')
Out[10]:

<table>
<thead>
<tr>
<th>col1</th>
<th>weight_column</th>
</tr>
</thead>
<tbody>
<tr>
<td>9</td>
<td>0.5</td>
</tr>
<tr>
<td>8</td>
<td>0.4</td>
</tr>
<tr>
<td>7</td>
<td>0.1</td>
</tr>
</tbody>
</table>

[3 rows x 2 columns]

### String methods enhancements

*Continuing from v0.16.0*, the following enhancements make string operations easier and more consistent with standard python string operations.

- Added `StringMethods (.str accessor)` to `Index` (GH9068)

  The `.str accessor` is now available for both `Series` and `Index`.

In [11]: idx = pd.Index(['jack', 'jill', 'jesse', 'frank'])

In [12]: idx.str.strip()
Out[12]: Index(['jack', 'jill', 'jesse', 'frank'], dtype='object')

One special case for the `.str accessor` on `Index` is that if a string method returns `bool`, the `.str accessor` will return a `np.array` instead of a boolean `Index` (GH8875). This enables the following expression to work naturally:

In [13]: idx = pd.Index(['a1', 'a2', 'b1', 'b2'])

In [14]: s = pd.Series(range(4), index=idx)

In [15]: s
Out[15]:
a1 0
a2 1
b1 2

(continues on next page)
b2 3
Length: 4, dtype: int64

In [16]: idx.str.startswith("a")
Out[16]: array([ True,  True, False, False])

In [17]: s[s.index.str.startswith("a")]
Out[17]:
a1 0
a2 1
Length: 2, dtype: int64

• The following new methods are accessible via .str accessor to apply the function to each values. (GH9766, GH9773, GH10031, GH10045, GH10052)

<table>
<thead>
<tr>
<th>Methods</th>
<th>capitalize()</th>
<th>swapcase()</th>
<th>normalize()</th>
<th>partition()</th>
<th>rpartition()</th>
</tr>
</thead>
<tbody>
<tr>
<td>index()</td>
<td>rindex()</td>
<td>translate()</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

• split now takes expand keyword to specify whether to expand dimensionality. return_type is deprecated. (GH9847)

In [18]: s = pd.Series(["a,b", "a,c", "b,c"])

# return Series
In [19]: s.str.split(",")
Out[19]:
0  [a, b]
1  [a, c]
2  [b, c]
Length: 3, dtype: object

# return DataFrame
In [20]: s.str.split(",", expand=True)
Out[20]:
    0 1
0 a b
1 a c
2 b c

[3 rows x 2 columns]

In [21]: idx = pd.Index(["a,b", "a,c", "b,c"])

# return Index
In [22]: idx.str.split(",")
Out[22]: Index([['a', 'b'], ['a', 'c'], ['b', 'c']], dtype='object')

# return MultiIndex
In [23]: idx.str.split(",", expand=True)
Out[23]: MultiIndex([[a', 'b'],]
• Improved extract and get_dummies methods for Index.str (GH9980)

Other enhancements

• BusinessHour offset is now supported, which represents business hours starting from 09:00 - 17:00 on BusinessDay by default. See Here for details. (GH7905)

```python
In [24]: pd.Timestamp("2014-08-01 09:00") + pd.tseries.offsets.BusinessHour()
Out[24]: Timestamp('2014-08-01 10:00:00')
In [25]: pd.Timestamp("2014-08-01 07:00") + pd.tseries.offsets.BusinessHour()
Out[25]: Timestamp('2014-08-01 10:00:00')
In [26]: pd.Timestamp("2014-08-01 16:30") + pd.tseries.offsets.BusinessHour()
Out[26]: Timestamp('2014-08-04 09:30:00')
```

• DataFrame.diff now takes an axis parameter that determines the direction of differencing (GH9727)

• Allow clip, clip_lower, and clip_upper to accept array-like arguments as thresholds (This is a regression from 0.11.0). These methods now have an axis parameter which determines how the Series or DataFrame will be aligned with the threshold(s). (GH6966)

• DataFrame.mask() and Series.mask() now support same keywords as where (GH8801)

• drop function can now accept errors keyword to suppress ValueError raised when any of label does not exist in the target data. (GH6736)

```python
In [27]: df = pd.DataFrame(np.random.randn(3, 3), columns=['A', 'B', 'C'])
In [28]: df.drop(['A', 'X'], axis=1, errors="ignore")
Out[28]:
   B  C
0 -0.706771 -1.039575
1 -0.424972  0.567020
2 -1.087401 -0.673690
[3 rows x 2 columns]
```

• Add support for separating years and quarters using dashes, for example 2014-Q1. (GH9688)

• Allow conversion of values with dtype datetime64 or timedelta64 to strings using astype(str) (GH9757)

• get_dummies function now accepts sparse keyword. If set to True, the return DataFrame is sparse, e.g. SparseDataFrame. (GH8823)

• Period now accepts datetime64 as value input. (GH9054)

• Allow timedelta string conversion when leading zero is missing from time definition, i.e. 0:00:00 vs 00:00:00. (GH9570)

• Allow Panel.shift with axis='items' (GH9890)
• Trying to write an excel file now raises `NotImplementedError` if the DataFrame has a MultiIndex instead of writing a broken Excel file. (GH9794)

• Allow `Categorical.add_categories` to accept `Series` or `np.array`. (GH9927)

• Add/delete `str/dt/cat` accessors dynamically from `__dir__`. (GH9910)

• Add `normalize` as a `dt` accessor method. (GH10047)

• DataFrame and Series now have `_constructor_expanddim` property as overridable constructor for one higher dimensionality data. This should be used only when it is really needed, see here

• `pd.lib.infer_dtype` now returns `'bytes'` in Python 3 where appropriate. (GH10032)

API changes

• When passing in an ax to `df.plot( ..., ax=ax)`, the `sharex` kwarg will now default to `False`. The result is that the visibility of xlabels and xticklabels will not anymore be changed. You have to do that by yourself for the right axes in your figure or set `sharex=True` explicitly (but this changes the visible for all axes in the figure, not only the one which is passed in!). If pandas creates the subplots itself (e.g. no passed in ax kwarg), then the default is still `sharex=True` and the visibility changes are applied.

• `assign()` now inserts new columns in alphabetical order. Previously the order was arbitrary. (GH9777)

• By default, `read_csv` and `read_table` will now try to infer the compression type based on the file extension. Set `compression=None` to restore the previous behavior (no decompression). (GH9770)

Deprecations

• Series.str.split’s `return_type` keyword was removed in favor of `expand` (GH9847)

Index representation

The string representation of `Index` and its sub-classes have now been unified. These will show a single-line display if there are few values; a wrapped multi-line display for a lot of values (but less than `display.max_seq_items`; if lots of items (> `display.max_seq_items`) will show a truncated display (the head and tail of the data). The formatting for `MultiIndex` is unchanged (a multi-line wrapped display). The display width responds to the option `display.max_seq_items`, which is defaulted to 100. (GH6482)

Previous behavior

```
In [2]: pd.Index(range(4), name='foo')
Out[2]: Int64Index([0, 1, 2, 3], dtype='int64')

In [3]: pd.Index(range(104), name='foo')
Out[3]: Int64Index([0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99, ...], dtype='int64')

In [4]: pd.date_range('20130101', periods=4, name='foo', tz='US/Eastern')
Out[4]: <class 'pandas.tseries.index.DatetimeIndex'>
[2013-01-01 00:00:00-05:00, ..., 2013-01-04 00:00:00-05:00]
```
In [29]: pd.set_option("display.width", 80)

New behavior

In [30]: pd.Index(range(4), name="foo")
Out[30]: RangeIndex(start=0, stop=4, step=1, name='foo')

In [31]: pd.Index(range(30), name="foo")
Out[31]: RangeIndex(start=0, stop=29, step=1, name='foo')

In [32]: pd.Index(range(104), name="foo")
Out[32]: RangeIndex(start=0, stop=103, step=1, name='foo')

In [33]: pd.CategoricalIndex(['a', 'bb', 'ccc', 'dddd'], ordered=True, name='foobar')
Out[33]: CategoricalIndex(['a', 'bb', 'ccc', 'dddd'], categories=['a', 'bb', 'ccc', 'dddd'], ordered=True, name='foobar', dtype='category')

In [34]: pd.CategoricalIndex(['a', 'bb', 'ccc', 'dddd'] * 10, ordered=True, name='foobar')
Out[34]: CategoricalIndex(['a', 'bb', 'ccc', 'dddd'] * 10, categories=['a', 'bb', 'ccc', 'dddd'], ordered=True, name='foobar', dtype='category')

In [35]: pd.CategoricalIndex(['a', 'bb', 'ccc', 'dddd'] * 100, ordered=True, name='foobar')
Out[35]: CategoricalIndex(['a', 'bb', 'ccc', 'dddd'] * 100, categories=['a', 'bb', 'ccc', 'dddd'], ordered=True, name='foobar', dtype='category', length=1000)

In [36]: pd.date_range("20130101", periods=4, name="foo", tz="US/Eastern")
Out[36]: DatetimeIndex(['2013-01-01 00:00:00-05:00', '2013-01-02 00:00:00-05:00', '2013-01-03 00:00:00-05:00', '2013-01-04 00:00:00-05:00'], dtype='datetime64[ns, US/Eastern]', name='foo', freq='D')
In [37]: pd.date_range("20130101", periods=25, freq="D")
Out[37]:
DatetimeIndex(['2013-01-01', '2013-01-02', '2013-01-03', '2013-01-04',
    '2013-01-25'],
dtype='datetime64[ns]', freq='D')

In [38]: pd.date_range("20130101", periods=104, name="foo", tz="US/Eastern")
Out[38]:

dtype='datetime64[ns, US/Eastern]', name='foo', length=104, freq='D')

Performance improvements

- Improved csv write performance with mixed dtypes, including datetimes by up to 5x (GH9940)
- Improved csv write performance generally by 2x (GH9940)
- Improved the performance of `pd.lib.max_len_string_array` by 5-7x (GH10024)

Bug fixes

- Bug where labels did not appear properly in the legend of `DataFrame.plot()`, passing `label=` arguments works, and Series indices are no longer mutated. (GH9542)
- Bug in json serialization causing a segfault when a frame had zero length. (GH9805)
- Bug in `read_csv` where missing trailing delimiters would cause segfault. (GH5664)
- Bug in retaining index name on appending (GH9862)
- Bug in `scatter_matrix` draws unexpected axis ticklabels (GH5662)
- Fixed bug in `StataWriter` resulting in changes to input `DataFrame` upon save (GH9795).
- Bug in `transform` causing length mismatch when null entries were present and a fast aggregator was being used (GH9697)
- Bug in `equals` causing false negatives when block order differed (GH9330)
- Bug in grouping with multiple `pd.Grouper` where one is non-time based (GH10063)
• Bug in `read_sql_table` error when reading postgres table with timezone (GH7139)
• Bug in DataFrame slicing may not retain metadata (GH9776)
• Bug where TimedeltaIndex were not properly serialized in fixed HDFStore (GH9635)
• Bug with TimedeltaIndex constructor ignoring name when given another TimedeltaIndex as data (GH10025).
• Bug in DataFrameFormatter._get_formatted_index with not applying max_colwidth to the DataFrame index (GH7856)
• Bug in `.loc` with a read-only ndarray data source (GH10043)
• Bug in groupby.apply() that would raise if a passed user defined function either returned only None (for all input). (GH9685)
• Always use temporary files in pytables tests (GH9992)
• Bug in plotting continuously using `secondary_y` may not show legend properly. (GH9610, GH9779)
• Bug in `DataFrame.plot(kind="hist")` results in TypeError when DataFrame contains non-numeric columns (GH9853)
• Bug where repeated plotting of DataFrame with a DatetimeIndex may raise TypeError (GH9852)
• Bug in setup.py that would allow an incompat cython version to build (GH9827)
• Bug in plotting `secondary_y` incorrectly attaches `right_ax` property to secondary axes specifying itself recursively. (GH9861)
• Bug in Series.quantile on empty Series of type Datetime or Timedelta (GH9675)
• Bug in where causing incorrect results when upcasting was required (GH9731)
• Bug in FloatArrayFormatter where decision boundary for displaying “small” floats in decimal format is off by one order of magnitude for a given display.precision (GH9764)
• Fixed bug where DataFrame.plot() raised an error when both color and style keywords were passed and there was no color symbol in the style strings (GH9671)
• Not showing a DeprecationWarning on combining list-likes with an Index (GH10083)
• Bug in `read_csv` and `read_table` when using skip_rows parameter if blank lines are present. (GH9832)
• Bug in `read_csv()` interprets index_col=True as 1 (GH9798)
• Bug in index equality comparisons using == failing on Index/MultiIndex type incompatibility (GH9785)
• Bug in which SparseDataFrame could not take nan as a column name (GH8822)
• Bug in to_msgpack and read_msgpack zlib and blosc compression support (GH9783)
• Bug GroupBy.size doesn’t attach index name properly if grouped by a TimeGrouper (GH9925)
• Bug causing an exception in slice assignments because length_of_indexer returns wrong results (GH9995)
• Bug in csv parser causing lines with initial white space plus one non-space character to be skipped. (GH9710)
• Bug in C csv parser causing spurious NaNs when data started with newline followed by white space. (GH10022)
• Bug causing elements with a null group to spill into the final group when grouping by a Categorical (GH9603)
• Bug where .iloc and .loc behavior is not consistent on empty dataframes (GH9964)
• Bug in invalid attribute access on a TimedeltaIndex incorrectly raised ValueError instead of AttributeError (GH9680)
• Bug in unequal comparisons between categorical data and a scalar, which was not in the categories (e.g. Series(Categorical(list("abc"), ordered=True)) > "d". This returned False for all elements, but now raises a TypeError. Equality comparisons also now return False for == and True for !=. (GH9848)

• Bug in DataFrame __setitem__ when right hand side is a dictionary (GH9874)

• Bug in where when dtype is datetime64/timedelta64, but dtype of other is not (GH9804)

• Bug in MultiIndex.sortlevel() results in unicode level name breaks (GH9856)

• Bug in which groupby.transform incorrectly enforced output dtypes to match input dtypes. (GH9807)

• Bug in DataFrame constructor when columns parameter is set, and data is an empty list (GH9939)

• Bug in bar plot with log=True raises TypeError if all values are less than 1 (GH9905)

• Bug in horizontal bar plot ignores log=True (GH9905)

• Bug in PyTables queries that did not return proper results using the index (GH8265, GH9676)

• Bug where dividing a dataframe containing values of type Decimal by another Decimal would raise. (GH9787)

• Bug where using DataFrames asfreq would remove the name of the index. (GH9885)

• Bug causing extra index point when resample BM/BQ (GH9756)

• Changed caching in AbstractHolidayCalendar to be at the instance level rather than at the class level as the latter can result in unexpected behaviour. (GH9552)

• Fixed latex output for MultiIndexed dataframes (GH9778)

• Bug causing an exception when setting an empty range using DataFrame.loc (GH9596)

• Bug in hiding ticklabels with subplots and shared axes when adding a new plot to an existing grid of axes (GH9158)

• Bug in transform and filter when grouping on a categorical variable (GH9921)

• Bug in transform when groups are equal in number and dtype to the input index (GH9700)

• Google BigQuery connector now imports dependencies on a per-method basis. (GH9713)

• Updated BigQuery connector to no longer use deprecated oauth2client.tools.run() (GH8327)

• Bug in subclassed DataFrame. It may not return the correct class, when slicing or subsetting it. (GH9632)

• Bug in .median() where non-float null values are not handled correctly (GH10040)

• Bug in Series.fillna() where it raises if a numerically convertible string is given (GH10092)

5.13.3 Version 0.16.0 (March 22, 2015)

This is a major release from 0.15.2 and includes a small number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

Highlights include:

- DataFrame.assign method, see here
- Series.to_coo/from_coo methods to interact with scipy.sparse, see here
- Backwards incompatible change to Timedelta to conform the .seconds attribute with datetime.timedelta, see here
- Changes to the .loc slicing API to conform with the behavior of .ix see here
- Changes to the default for ordering in the Categorical constructor, see here
- Enhancement to the .str accessor to make string operations easier, see here
- The pandas.tools.rplot, pandas.sandbox.qtpandas and pandas.rpy modules are deprecated. We refer users to external packages like seaborn, pandas-qt and rpy2 for similar or equivalent functionality, see here

Check the API Changes and deprecations before updating.

What's new in v0.16.0

- New features
  - DataFrame assign
  - Interaction with scipy.sparse
  - String methods enhancements
New features

**Dataframe assign**

Inspired by dplyr's `mutate` verb, DataFrame has a new `assign()` method. The function signature for `assign` is simply `**kwargs`. The keys are the column names for the new fields, and the values are either a value to be inserted (for example, a `Series` or NumPy array), or a function of one argument to be called on the `DataFrame`. The new values are inserted, and the entire DataFrame (with all original and new columns) is returned.

```
In [1]: iris = pd.read_csv('data/iris.data')
In [2]: iris.head()
Out[2]:
     SepalLength  SepalWidth  PetalLength  PetalWidth  Name
0          5.1       3.5         1.4        0.2  Iris-setosa
1          4.9       3.0         1.4        0.2  Iris-setosa
2          4.7       3.2         1.3        0.2  Iris-setosa
3          4.6       3.1         1.5        0.2  Iris-setosa
4          5.0       3.6         1.4        0.2  Iris-setosa
[5 rows x 5 columns]
```

```
In [3]: iris.assign(sepal_ratio=iris['SepalWidth'] / iris['SepalLength']).head()
Out[3]:
     SepalLength  SepalWidth  PetalLength  PetalWidth  Name     sepal_ratio
0          5.1       3.5         1.4        0.2  Iris-setosa  0.686275
1          4.9       3.0         1.4        0.2  Iris-setosa  0.612245
2          4.7       3.2         1.3        0.2  Iris-setosa  0.680851
3          4.6       3.1         1.5        0.2  Iris-setosa  0.673913
4          5.0       3.6         1.4        0.2  Iris-setosa  0.720000
[5 rows x 6 columns]
```

Above was an example of inserting a precomputed value. We can also pass in a function to be evaluated.
The power of `assign` comes when used in chains of operations. For example, we can limit the DataFrame to just those with a Sepal Length greater than 5, calculate the ratio, and plot

```
In [5]: iris = pd.read_csv('data/iris.data')

In [6]: (iris.query('SepalLength > 5')
    ...:     .assign(SepalRatio=lambda x: x.SepalWidth / x.SepalLength,
    ...:                   PetalRatio=lambda x: x.PetalWidth / x.PetalLength)
    ...:     .plot(kind='scatter', x='SepalRatio', y='PetalRatio'))
```

See the documentation for more. (GH9229)

**Interaction with scipy.sparse**

Added `SparseSeries.to_coo()` and `SparseSeries.from_coo()` methods (GH8048) for converting to and from `scipy.sparse.coo_matrix` instances (see here). For example, given a SparseSeries with MultiIndex we can convert to a `scipy.sparse.coo_matrix` by specifying the row and column labels as index levels:

```
s = pd.Series([3.0, np.nan, 1.0, 3.0, np.nan, np.nan])
s.index = pd.MultiIndex.from_tuples([(1, 2, 'a', 0),
                                     (1, 2, 'a', 1),
                                     (1, 1, 'b', 0),
                                     (1, 1, 'b', 1),
                                     (2, 1, 'b', 0),
                                     (2, 1, 'b', 1)],
```

(continues on next page)
names=["A",'B', 'C', 'D'])

s

# SparseSeries
ss = s.to_sparse()

A, rows, columns = ss.to_coo(row_levels=['A', 'B'],
                            column_levels=['C', 'D'],
                            sort_labels=False)

A
A.todense()
rows
columns

The from_coo method is a convenience method for creating a SparseSeries from a scipy.sparse.coo_matrix:

from scipy import sparse
A = sparse.coo_matrix(([3.0, 1.0, 2.0], ([1, 0, 0], [0, 2, 3])),
                      shape=(3, 4))
A
A.todense()

ss = pd.SparseSeries.from_coo(A)
ss

String methods enhancements

• Following new methods are accessible via .str accessor to apply the function to each values. This is intended to make it more consistent with standard methods on strings. (GH9282, GH9352, GH9386, GH9387, GH9439)

<table>
<thead>
<tr>
<th>Methods</th>
<th>Methods</th>
</tr>
</thead>
<tbody>
<tr>
<td>isalnum()</td>
<td>isalpha()</td>
</tr>
<tr>
<td>islower()</td>
<td>isupper()</td>
</tr>
<tr>
<td>find()</td>
<td>rfind()</td>
</tr>
<tr>
<td>isspace()</td>
<td>isdigit()</td>
</tr>
<tr>
<td>isnumeric()</td>
<td>isdecimal()</td>
</tr>
</tbody>
</table>

In [7]: s = pd.Series(['abcd', '3456', 'EFGH'])

In [8]: s.str.isalpha()

Out[8]:
0   True
1   False
2   True
Length: 3, dtype: bool

In [9]: s.str.find('ab')

Out[9]:
0   0

(continues on next page)
• `Series.str.pad()` and `Series.str.center()` now accept `fillchar` option to specify filling character (GH9352)

```python
In [10]: s = pd.Series(['12', '300', '25'])
In [11]: s.str.pad(5, fillchar='_')
Out[11]:
0   ___12
1   __300
2   ___25
Length: 3, dtype: object
```

• Added `Series.str.slice_replace()`, which previously raised `NotImplementedError` (GH8888)

```python
In [12]: s = pd.Series(['ABCD', 'EFGH', 'IJK'])
In [13]: s.str.slice_replace(1, 3, 'X')
Out[13]:
0   AXD
1   EXH
2    IX
Length: 3, dtype: object
# replaced with empty char
In [14]: s.str.slice_replace(0, 1)
Out[14]:
0   BCD
1   FGH
2    JK
Length: 3, dtype: object
```

Other enhancements

• Reindex now supports `method='nearest'` for frames or series with a monotonic increasing or decreasing index (GH9258):

```python
In [15]: df = pd.DataFrame({'x': range(5)})
In [16]: df.reindex([0.2, 1.8, 3.5], method='nearest')
Out[16]:
x
0.2  0
1.8  2
3.5  4
[3 rows x 1 columns]
```

This method is also exposed by the lower level `Index.get_indexer` and `Index.get_loc` methods.
• The `read_excel()` function’s `sheetname` argument now accepts a list and `None`, to get multiple or all sheets respectively. If more than one sheet is specified, a dictionary is returned. (GH9450)

```python
# Returns the 1st and 4th sheet, as a dictionary of DataFrames.
pd.read_excel('path_to_file.xls', sheetname=['Sheet1', 3])
```

• Allow Stata files to be read incrementally with an iterator; support for long strings in Stata files. See the docs `here` (GH9493).

• Paths beginning with ~ will now be expanded to begin with the user’s home directory (GH9066)

• Added time interval selection in `get_data_yahoo` (GH9071)

• Added `Timestamp.to_datetime64()` to complement `Timedelta.to_timedelta64()` (GH9255)

• `tseries.frequencies.to_offset()` now accepts `Timedelta` as input (GH9064)

• Lag parameter was added to the autocorrelation method of `Series`, defaults to lag-1 autocorrelation (GH9192)

• `Timedelta` will now accept `nanoseconds` keyword in constructor (GH9273)

• SQL code now safely escapes table and column names (GH8986)

• Added auto-complete for `Series.str.<tab>`, `Series.dt.<tab>` and `Series.cat.<tab>` (GH9322)

• `Index.get_indexer` now supports `method='pad'` and `method='backfill'` even for any target array, not just monotonic targets. These methods also work for monotonic decreasing as well as monotonic increasing indexes (GH9258).

• `Index.asof` now works on all index types (GH9258).

• A `verbose` argument has been augmented in `io.read_excel()`, defaults to False. Set to True to print sheet names as they are parsed. (GH9450)

• Added `days_in_month` (compatibility alias `daysinmonth`) property to `Timestamp`, `DatetimeIndex`, `Period`, `PeriodIndex`, and `Series.dt` (GH9572)

• Added decimal option in `to_csv` to provide formatting for non-`.` decimal separators (GH781)

• Added normalize option for `Timestamp` to normalized to midnight (GH8794)

• Added example for `DataFrame` import to R using HDF5 file and `rhdf5` library. See the `documentation` for more (GH9636).

**Backwards incompatible API changes**

**Changes in timedelta**

In v0.15.0 a new scalar type `Timedelta` was introduced, that is a sub-class of `datetime.timedelta`. Mentioned `here` was a notice of an API change w.r.t. the `.seconds` accessor. The intent was to provide a user-friendly set of accessors that give the ‘natural’ value for that unit, e.g. if you had a `Timedelta('1 day, 10:11:12')`, then `.seconds` would return 12. However, this is at odds with the definition of `datetime.timedelta`, which defines `.seconds` as `10 * 3600 + 11 * 60 + 12 == 36672`.

So in v0.16.0, we are restoring the API to match that of `datetime.timedelta`. Further, the component values are still available through the `.components` accessor. This affects the `.seconds` and `.microseconds` accessors, and removes the `.hours`, `.minutes`, `.milliseconds` accessors. These changes affect `TimedeltaIndex` and the `Series` `.dt` accessor as well. (GH9185, GH9139)

Previous behavior
In [2]: t = pd.Timedelta('1 day, 10:11:12.100123')

In [3]: t.days
Out[3]: 1

In [4]: t.seconds
Out[4]: 12

In [5]: t.microseconds
Out[5]: 123

New behavior

In [17]: t = pd.Timedelta('1 day, 10:11:12.100123')

In [18]: t.days
Out[18]: 1

In [19]: t.seconds
Out[19]: 36672

In [20]: t.microseconds
Out[20]: 100123

Using .components allows the full component access

In [21]: t.components
Out[21]: Components(days=1, hours=10, minutes=11, seconds=12, milliseconds=100.0, microseconds=123, nanoseconds=0)

In [22]: t.components.seconds
Out[22]: 12

Indexing changes

The behavior of a small sub-set of edge cases for using .loc have changed (GH8613). Furthermore we have improved the content of the error messages that are raised:

- Slicing with .loc where the start and/or stop bound is not found in the index is now allowed; this previously would raise a KeyError. This makes the behavior the same as .ix in this case. This change is only for slicing, not when indexing with a single label.

In [23]: df = pd.DataFrame(np.random.randn(5, 4),
                           columns=list('ABCD'),
                           index=pd.date_range('20130101', periods=5))

In [24]: df
Out[24]:
     A          B          C          D
2013-01-01  0.469112  -0.282863  -1.509059  -1.135632
2013-01-02  1.212112  -0.173215   0.119209  -1.044236
In [25]: `s = pd.Series(range(5), [-2, -1, 1, 2, 3])`

In [26]: `s`

Out[26]:

-2  0
-1  1
 1  2
 2  3
 3  4
Length: 5, dtype: int64

Allow slicing with float-like values on an integer index for `.ix`. Previously this was only enabled for `.loc`:

Previous behavior

In [4]: df.loc['2013-01-02':'2013-01-10']

KeyError: 'stop bound [2013-01-10] is not in the [index]'

In [6]: s.loc[-10:3]

KeyError: 'start bound [-10] is not the [index]'
New behavior

<table>
<thead>
<tr>
<th>In [2]: s.ix[-1.0:2]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Out[2]:</td>
</tr>
<tr>
<td>-1  1</td>
</tr>
<tr>
<td>1  2</td>
</tr>
<tr>
<td>2  3</td>
</tr>
<tr>
<td>dtype: int64</td>
</tr>
</tbody>
</table>

- Provide a useful exception for indexing with an invalid type for that index when using .loc. For example trying to use .loc on an index of type DatetimeIndex or PeriodIndex or TimedeltaIndex, with an integer (or a float).

Previous behavior

<table>
<thead>
<tr>
<th>In [4]: df.loc[2:3]</th>
</tr>
</thead>
<tbody>
<tr>
<td>KeyError: 'start bound [2] is not the [index]'</td>
</tr>
</tbody>
</table>

New behavior

<table>
<thead>
<tr>
<th>In [4]: df.loc[2:3]</th>
</tr>
</thead>
<tbody>
<tr>
<td>TypeError: Cannot do slice indexing on &lt;class 'pandas.tseries.index.DatetimeIndex'&gt; with &lt;type 'int'&gt; keys</td>
</tr>
</tbody>
</table>

**Categorical changes**

In prior versions, Categoricals that had an unspecified ordering (meaning no ordered keyword was passed) were defaulted as ordered Categoricals. Going forward, the ordered keyword in the Categorical constructor will default to False. Ordering must now be explicit.

Furthermore, previously you could change the ordered attribute of a Categorical by just setting the attribute, e.g. cat.ordered=True; This is now deprecated and you should use cat.as_ordered() or cat.as_unordered(). These will by default return a new object and not modify the existing object. (GH9347, GH9190)

Previous behavior

<table>
<thead>
<tr>
<th>In [3]: s = pd.Series([0, 1, 2], dtype='category')</th>
</tr>
</thead>
<tbody>
<tr>
<td>In [4]: s</td>
</tr>
<tr>
<td>Out[4]:</td>
</tr>
<tr>
<td>0  0</td>
</tr>
<tr>
<td>1  1</td>
</tr>
<tr>
<td>2  2</td>
</tr>
<tr>
<td>dtype: category</td>
</tr>
<tr>
<td>Categories (3, int64): [0 &lt; 1 &lt; 2]</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>In [5]: s.cat.ordered</th>
</tr>
</thead>
<tbody>
<tr>
<td>Out[5]: True</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>In [6]: s.cat.ordered = False</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>In [7]: s</th>
</tr>
</thead>
<tbody>
<tr>
<td>Out[7]: 0</td>
</tr>
</tbody>
</table>
New behavior

In [29]: s = pd.Series([0, 1, 2], dtype='category')

In [30]: s
Out[30]:
0    0
1    1
2    2
Length: 3, dtype: category
Categories (3, int64): [0, 1, 2]

In [31]: s.cat.ordered
Out[31]: False

In [32]: s = s.cat.as_ordered()

In [33]: s
Out[33]:
0    0
1    1
2    2
Length: 3, dtype: category
Categories (3, int64): [0 < 1 < 2]

In [34]: s.cat.ordered
Out[34]: True

# you can set in the constructor of the Categorical
In [35]: s = pd.Series(pd.Categorical([0, 1, 2], ordered=True))

In [36]: s
Out[36]:
0    0
1    1
2    2
Length: 3, dtype: category
Categories (3, int64): [0 < 1 < 2]

In [37]: s.cat.ordered
Out[37]: True

For ease of creation of series of categorical data, we have added the ability to pass keywords when calling .astype(). These are passed directly to the constructor.
In [55]: s
Out[55]:
0 a
1 b
2 c
3 a
dtype: category
Categories (3, object): [a < b < c]

In [56]: s = (pd.Series(["a", "b", "c", "a"])
       ....: .astype('category', categories=list('abcdef'), ordered=False))

In [57]: s
Out[57]:
0 a
1 b
2 c
3 a
dtype: category
Categories (6, object): [a, b, c, d, e, f]

Other API changes

- `Index.duplicated` now returns `np.array(dtype=bool)` rather than `Index(dtype=object)` containing bool values. (GH8875)

- `DataFrame.to_json` now returns accurate type serialisation for each column for frames of mixed dtype (GH9037)

  Previously data was coerced to a common dtype before serialisation, which for example resulted in integers being serialised to floats:

  ```
  In [2]: pd.DataFrame({'i': [1,2], 'f': [3.0, 4.2]}).to_json()
  Out[2]: '{"f":{"0":3.0, "1":4.2},"i":{"0":1.0, "1":2.0}}'
  ```

  Now each column is serialised using its correct dtype:

  ```
  In [2]: pd.DataFrame({'i': [1,2], 'f': [3.0, 4.2]}).to_json()
  Out[2]: '{"f":{"0":3.0, "1":4.2},"i":{"0":1, "1":2}}'
  ```

- `DatetimeIndex`, `PeriodIndex` and `TimedeltaIndex.summary` now output the same format. (GH9116)

- `TimedeltaIndex.freqstr` now output the same string format as `DatetimeIndex`. (GH9116)

- Bar and horizontal bar plots no longer add a dashed line along the info axis. The prior style can be achieved with matplotlib's `axhline` or `axvline` methods (GH9088).

- Series accessors `.dt`, `.cat` and `.str` now raise `AttributeError` instead of `TypeError` if the series does not contain the appropriate type of data (GH9617). This follows Python's built-in exception hierarchy more closely and ensures that tests like `hasattr(s, 'cat')` are consistent on both Python 2 and 3.

- Series now supports bitwise operation for integral types (GH9016). Previously even if the input dtypes were integral, the output dtype was coerced to bool.

Previous behavior
New behavior. If the input dtypes are integral, the output dtype is also integral and the output values are the result of the bitwise operation.

During division involving a Series or DataFrame, 0/0 and 0//0 now give np.nan instead of np.inf. (GH9144, GH8445)

Previous behavior

New behavior
Length: 2, dtype: float64

- `Series.values_counts` and `Series.describe` for categorical data will now put NaN entries at the end. (GH9443)
- `Series.describe` for categorical data will now give counts and frequencies of 0, not NaN, for unused categories (GH9443)
- Due to a bug fix, looking up a partial string label with `DatetimeIndex.asof` now includes values that match the string, even if they are after the start of the partial string label (GH9258).

Old behavior:

```python
In [4]: pd.to_datetime(["2000-01-31", '2000-02-28']).asof('2000-02')
Out[4]: Timestamp('2000-01-31 00:00:00')
```

Fixed behavior:

```python
In [41]: pd.to_datetime(["2000-01-31", '2000-02-28']).asof('2000-02')
Out[41]: Timestamp('2000-02-28 00:00:00')
```

To reproduce the old behavior, simply add more precision to the label (e.g., use `2000-02-01` instead of `2000-02`).

Deprecations

- The `rplot` trellis plotting interface is deprecated and will be removed in a future version. We refer to external packages like `seaborn` for similar but more refined functionality (GH3445). The documentation includes some examples how to convert your existing code from `rplot` to `seaborn` here.
- The `pandas.sandbox.qtpandas` interface is deprecated and will be removed in a future version. We refer users to the external package `pandas-qt` (GH9615)
- The `pandas.rpy` interface is deprecated and will be removed in a future version. Similar functionality can be accessed through the `rpy2` project (GH9602)
- Adding `DatetimeIndex/PeriodIndex` to another `DatetimeIndex/PeriodIndex` is being deprecated as a set-operation. This will be changed to a `TypeError` in a future version. `.union()` should be used for the union set operation. (GH9094)
- Subtracting `DatetimeIndex/PeriodIndex` from another `DatetimeIndex/PeriodIndex` is being deprecated as a set-operation. This will be changed to an actual numeric subtraction yielding a `TimeDeltaIndex` in a future version. `.difference()` should be used for the differencing set operation. (GH9094)

Removal of prior version deprecations/changes

- `DataFrame.pivot_table` and `crosstab`'s `rows` and `cols` keyword arguments were removed in favor of `index` and `columns` (GH6581)
- `DataFrame.to_excel` and `DataFrame.to_csv` `cols` keyword argument was removed in favor of `columns` (GH6581)
- Removed `convert_dummies` in favor of `get_dummies` (GH6581)
- Removed `value_range` in favor of `describe` (GH6581)
Performance improvements

- Fixed a performance regression for .loc indexing with an array or list-like (GH9126).
- DataFrame.to_json 30x performance improvement for mixed dtype frames. (GH9037)
- Performance improvements in MultiIndex.duplicated by working with labels instead of values (GH9125)
- Improved the speed of nunique by calling unique instead of value_counts (GH9129, GH7771)
- Performance improvement of up to 10x in DataFrame.count and DataFrame.dropna by taking advantage of homogeneous/heterogeneous dtypes appropriately (GH9136)
- Performance improvement of up to 20x in DataFrame.count when using a MultiIndex and the level keyword argument (GH9163)
- Performance and memory usage improvements in merge when key space exceeds int64 bounds (GH9151)
- Performance improvements in multi-key groupby (GH9429)
- Performance improvements in MultiIndex.sortlevel (GH9445)
- Performance and memory usage improvements in DataFrame.duplicated (GH9398)
- Cythonized Period (GH9440)
- Decreased memory usage on to_hdf (GH9648)

Bug fixes

- Changed .to_html to remove leading/trailing spaces in table body (GH4987)
- Fixed issue using read_csv on s3 with Python 3 (GH9452)
- Fixed compatibility issue in DatetimeIndex affecting architectures where numpy.int_ defaults to numpy.int32 (GH8943)
- Bug in Panel indexing with an object-like (GH9140)
- Bug in the returned Series.dt.components index was reset to the default index (GH9247)
- Bug in Categorical.__getitem__/__setitem__ with listlike input getting incorrect results from indexer coercion (GH9469)
- Bug in partial setting with a DatetimeIndex (GH9478)
- Bug in groupby for integer and datetime64 columns when applying an aggregator that caused the value to be changed when the number was sufficiently large (GH9311, GH6620)
- Fixed bug in to_sql when mapping a Timestamp object column (datetime column with timezone info) to the appropriate sqlalchemy type (GH9085).
- Fixed bug in to_sql dtype argument not accepting an instantiated SQLAlchemy type (GH9083).
- Bug in .loc partial setting with a np.datetime64 (GH9516)
- Incorrect dtypes inferred on datetimelike looking Series & on .xs slices (GH9477)
- Items in Categorical.unique() (and s.unique() if s is of dtype category) now appear in the order in which they are originally found, not in sorted order (GH9331). This is now consistent with the behavior for other dtypes in pandas.
- Fixed bug on big endian platforms which produced incorrect results in StataReader (GH8688).
- Bug in MultiIndex.has_duplicates when having many levels causes an indexer overflow (GH9075, GH5873).
• Bug in pivot and unstack where nan values would break index alignment (GH4862, GH7401, GH7403, GH7405, GH7466, GH9497)
• Bug in left join on MultiIndex with sort=True or null values (GH9210).
• Bug in MultiIndex where inserting new keys would fail (GH9250).
• Bug in groupby when key space exceeds int64 bounds (GH9096).
• Bug in unstack with TimedeltaIndex or DatetimeIndex and nulls (GH9491).
• Bug in rank where comparing floats with tolerance will cause inconsistent behaviour (GH8365).
• Fixed character encoding bug in read_stata and StataReader when loading data from a URL (GH9231).
• Bug in adding offsets.Nano to other offsets raises TypeError (GH9284)
• Bug in DatetimeIndex iteration, related to (GH8890), fixed in (GH9100)
• Bugs in resample around DST transitions. This required fixing offset classes so they behave correctly on DST transitions. (GH5172, GH8744, GH8653, GH9173, GH9468).
• Bug in binary operator method (eg .mul()) alignment with integer levels (GH9463).
• Bug in boxplot, scatter and hexbin plot may show an unnecessary warning (GH8877)
• Bug in subplot with layout kw may show unnecessary warning (GH9464)
• Bug in using grouper functions that need passed through arguments (e.g. axis), when using wrapped function (e.g. fillna), (GH9221)
• DataFrame now properly supports simultaneous copy and dtype arguments in constructor (GH9099)
• Bug in read_csv when using skiprows on a file with CR line endings with the c engine. (GH9079)
• isnull now detects NaT in PeriodIndex (GH9129)
• Bug in groupby .nth() with a multiple column groupby (GH8979)
• Bug in DataFrame.where and Series.where coerce numerics to string incorrectly (GH9280)
• Bug in DataFrame.where and Series.where raise ValueError when string list-like is passed. (GH9280)
• Accessing Series.str methods on with non-string values now raises TypeError instead of producing incorrect results (GH9184)
• Bug in DatetimeIndex.__contains__ when index has duplicates and is not monotonic increasing (GH9512)
• Fixed division by zero error for Series.kurt() when all values are equal (GH9197)
• Fixed issue in the xlsxwriter engine where it added a default ‘General’ format to cells if no other format was applied. This prevented other row or column formatting being applied. (GH9167)
• Fixes issue with index_col=False when usecols is also specified in read_csv. (GH9082)
• Bug where wide_to_long would modify the input stub names list (GH9204)
• Bug in to_sql not storing float64 values using double precision. (GH9009)
• SparseSeries and SparsePanel now accept zero argument constructors (same as their non-sparse counterparts) (GH9272).
• Regression in merging Categorical and object dtypes (GH9426)
• Bug in read_csv with buffer overflows with certain malformed input files (GH9205)
• Bug in groupby MultiIndex with missing pair (GH9049, GH9344)
• Fixed bug in Series.groupby where grouping on MultiIndex levels would ignore the sort argument (GH9444)
• Fix bug in `DataFrame.Groupby` where sort=False is ignored in the case of Categorical columns. (GH8868)
• Fixed bug with reading CSV files from Amazon S3 on python 3 raising a TypeError (GH9452)
• Bug in the Google BigQuery reader where the 'jobComplete' key may be present but False in the query results (GH8728)
• Bug in `Series.values_counts` with excluding NaN for categorical type `Series` with dropna=True (GH9443)
• Fixed missing numeric_only option for `DataFrame.std/var/sem` (GH9201)
• Support constructing `Panel` or `Panel4D` with scalar data (GH8285)
• `Series` text representation disconnected from max_rows/max_columns (GH7508).

• `Series` number formatting inconsistent when truncated (GH8532).

Previous behavior

<table>

5.14 Version 0.15

5.14.1 Version 0.15.2 (December 12, 2014)

This is a minor release from 0.15.1 and includes a large number of bug fixes along with several new features, enhancements, and performance improvements. A small number of API changes were necessary to fix existing bugs. We recommend that all users upgrade to this version.

- **Enhancements**
- **API Changes**
- **Performance Improvements**
- **Bug Fixes**

**API changes**

- Indexing in MultiIndex beyond lex-sort depth is now supported, though a lexically sorted index will have a better performance. (GH2646)

```python
In [1]: df = pd.DataFrame({'jim':[0, 0, 1, 1],
                       'joe':['x', 'x', 'z', 'y'],
                       'jolie':np.random.rand(4)}).set_index(['jim', 'joe'])

In [2]: df
Out[2]:
       jolie
    jim   joe
0     x  0.126970
     x  0.966718
1     z  0.260476
     y  0.897237

[4 rows x 1 columns]

In [3]: df.index.lexsort_depth
Out[3]: 1

# in prior versions this would raise a KeyError
# will now show a PerformanceWarning

In [4]: df.loc[(1, 'z')]
Out[4]:
       jolie
    jim   joe
1     z  0.260476

[1 rows x 1 columns]

# lexically sorting

In [5]: df2 = df.sort_index()

In [6]: df2
```

(continues on next page)
Out[6]:
  jolie
jim joe
0   x  0.126970
   x  0.966718
1   y  0.897237
   z  0.260476
[4 rows x 1 columns]

In [7]: df2.index.lexsort_depth
Out[7]: 2

In [8]: df2.loc[(1, 'z')]
Out[8]:
  jolie
jim joe
1   z  0.260476
[1 rows x 1 columns]

• Bug in unique of Series with category dtype, which returned all categories regardless whether they were “used” or not (see GH8559 for the discussion). Previous behaviour was to return all categories:

```
In [3]: cat = pd.Categorical(['a', 'b', 'a'], categories=['a', 'b', 'c'])
In [4]: cat
Out[4]:
[a, b, a]
Categories (3, object): [a < b < c]
In [5]: cat.unique()
Out[5]: array(['a', 'b', 'c'], dtype=object)
```

Now, only the categories that do effectively occur in the array are returned:

```
In [9]: cat = pd.Categorical(['a', 'b', 'a'], categories=['a', 'b', 'c'])
In [10]: cat.unique()
Out[10]:
['a', 'b']
Categories (2, object): ['a', 'b']
```

• Series.all and Series.any now support the level and skipna parameters. Series.all, Series.any, Index.all, and Index.any no longer support the out and keepdims parameters, which existed for compatibility with ndarray. Various index types no longer support the all and any aggregation functions and will now raise TypeError. (GH8302).

• Allow equality comparisons of Series with a categorical dtype and object dtype; previously these would raise TypeError (GH8938)

• Bug in NDFrame: conflicting attribute/column names now behave consistently between getting and setting. Previously, when both a column and attribute named y existed, data.y would return the attribute, while data.y = z would update the column (GH8994)
In [11]: data = pd.DataFrame({'x': [1, 2, 3]})

In [12]: data.y = 2

In [13]: data['y'] = [2, 4, 6]

In [14]: data

Out[14]:
          x  y
0     1  2
1     2  4
2     3  6
[3 rows x 2 columns]

# this assignment was inconsistent
In [15]: data.y = 5

Old behavior:

In [6]: data.y

Out[6]: 2

In [7]: data['y'].values

Out[7]: array([5, 5, 5])

New behavior:

In [16]: data.y

Out[16]: 5

In [17]: data['y'].values

Out[17]: array([2, 4, 6])

- Timestamp('now') is now equivalent to Timestamp.now() in that it returns the local time rather than UTC. Also, Timestamp('today') is now equivalent to Timestamp.today() and both have tz as a possible argument. (GH9000)

- Fix negative step support for label-based slices (GH8753)

Old behavior:

In [1]: s = pd.Series(np.arange(3), ['a', 'b', 'c'])

Out[1]:
          a  
        b  
        c  

In [2]: s.loc['c':'a':-1]

Out[2]:
          c  

New behavior:
In [18]: s = pd.Series(np.arange(3), ['a', 'b', 'c'])

In [19]: s.loc['c':'a'-1]
Out[19]:
c 2
b 1
a 0
Length: 3, dtype: int64

Enhancements

Categorical enhancements:

- Added ability to export Categorical data to Stata (GH8633). See [here](#) for limitations of categorical variables exported to Stata data files.

- Added flag `order_categoricals` to `StataReader` and `read_stata` to select whether to order imported categorical data (GH8836). See [here](#) for more information on importing categorical variables from Stata data files.

- Added ability to export Categorical data to/from HDF5 (GH7621). Queries work the same as if it was an object array. However, the category dtype data is stored in a more efficient manner. See [here](#) for an example and caveats w.r.t. prior versions of pandas.

- Added support for `searchsorted()` on Categorical class (GH8420).

Other enhancements:

- Added the ability to specify the SQL type of columns when writing a DataFrame to a database (GH8778). For example, specifying to use the sqlalchemy `String` type instead of the default `Text` type for string columns:

```python
from sqlalchemy.types import String
data.to_sql('data_dtype', engine, dtype={'Col_1': String})  # noqa F821
```

- `Series.all` and `Series.any` now support the `level` and `skipna` parameters (GH8302):

```python
In [20]: s = pd.Series([False, True, False], index=[0, 0, 1])
In [21]: s.any(level=0)
Out[21]:
0     True
1    False
Length: 2, dtype: bool
```

- Panel now supports the `all` and `any` aggregation functions. (GH8302):

```python
>>> p = pd.Panel(np.random.rand(2, 5, 4) > 0.1)
>>> p.all()
0    1   2   3
0   True True  True
1   True  False True
2   True  True True
3  False True False
4   True  True True
```

- Added support for `utctfromtimestamp()`, `fromtimestamp()`, and `combine()` on `Timestamp` class (GH5351).
pandas: powerful Python data analysis toolkit, Release 1.2.5

- Added Google Analytics (pandas.io.ga) basic documentation (GH8835). See here.
- Timedelta arithmetic returns NotImplemented in unknown cases, allowing extensions by custom classes (GH8813).
- Timedelta now supports arithmetic with numpy.ndarray objects of the appropriate dtype (numpy 1.8 or newer only) (GH8884).
- Added Timedelta.to_timedelta64() method to the public API (GH8884).
- Added gbq.generate_bq_schema() function to the gbq module (GH8325).
- Series now works with map objects the same way as generators (GH8909).
- Added context manager to HDFStore for automatic closing (GH8791).
- to_datetime gains an exact keyword to allow for a format to not require an exact match for a provided format string (if its False). exact defaults to True (meaning that exact matching is still the default) (GH8904)
- Added axvlines boolean option to parallel_coordinates plot function, determines whether vertical lines will be printed, default is True
- Added ability to read table footers to read_html (GH8552)
- to_sql now infers data types of non-NA values for columns that contain NA values and have dtype object (GH8778).

Performance

- Reduce memory usage when skiprows is an integer in read_csv (GH8681)
- Performance boost for to_datetime conversions with a passed format=, and the exact=False (GH8904)

Bug fixes

- Bug in concat of Series with category dtype which were coercing to object. (GH8641)
- Bug in Timestamp-Timestamp not returning a Timedelta type and datelike-datelike ops with timezones (GH8865)
- Made consistent a timezone mismatch exception (either tz operated with None or incompatible timezone), will now return TypeError rather than ValueError (a couple of edge cases only), (GH8865)
- Bug in using a pd.Grouper(key=...) with no level/axis or level only (GH8795, GH8866)
- Report a TypeError when invalid/no parameters are passed in a groupby (GH8015)
- Bug in packaging pandas with py2app/cx_Freeze (GH8602, GH8831)
- Bug in groupby signatures that didn’t include *args or **kwargs (GH8733).
- io.data.Options now raises RemoteDataError when no expiry dates are available from Yahoo and when it receives no data from Yahoo (GH8761), (GH8783).
- Unclear error message in csv parsing when passing dtype and names and the parsed data is a different data type (GH8833)
- Bug in slicing a MultiIndex with an empty list and at least one boolean indexer (GH8781)
- io.data.Options now raises RemoteDataError when no expiry dates are available from Yahoo (GH8761).
- Timedelta kwargs may now be numpy ints and floats (GH8757).
- Fixed several outstanding bugs for Timedelta arithmetic and comparisons (GH8813, GH5963, GH5436).
- sql_schema now generates dialect appropriate CREATE TABLE statements (GH8697)
• slice string method now takes step into account (GH8754)
• Bug in BlockManager where setting values with different type would break block integrity (GH8850)
• Bug in DatetimeIndex when using time object as key (GH8667)
• Bug in merge where how='left' and sort=False would not preserve left frame order (GH7331)
• Bug in MultiIndex.reindex where reindexing at level would not reorder labels (GH4088)
• Bug in certain operations with dateutil timezones, manifesting with dateutil 2.3 (GH8639)
• Regression in DatetimeIndex iteration with a Fixed/Local offset timezone (GH8890)
• Bug in to_datetime when parsing a nanoseconds using the %f format (GH8989)
• io.data.Options now raises RemoteDataError when no expiry dates are available from Yahoo and when it receives no data from Yahoo (GH8761), (GH8783).
• Fix: The font size was only set on x axis if vertical or the y axis if horizontal. (GH8765)
• Fixed division by 0 when reading big csv files in python 3 (GH8621)
• Bug in outputting a MultiIndex with to_html, index=False which would add an extra column (GH8452)
• Imported categorical variables from Stata files retain the ordinal information in the underlying data (GH8836).
• Defined .size attribute across NDFrame objects to provide compat with numpy >= 1.9.1; buggy with np. array_split (GH8846)
• Skip testing of histogram plots for matplotlib <= 1.2 (GH8648).
• Bug where get_data_google returned object dtypes (GH3995)
• Bug in DataFrame.stack(..., dropna=False) when the DataFrame's columns is a MultiIndex whose labels do not reference all its levels. (GH8844)
• Bug in that Option context applied on __enter__ (GH8514)
• Bug in resample that causes a ValueError when resampling across multiple days and the last offset is not calculated from the start of the range (GH8683)
• Bug where DataFrame.plot(kind='scatter') fails when checking if an np.array is in the DataFrame (GH8852)
• Bug in pd.infer_freq/DataFrame.inferred_freq that prevented proper sub-daily frequency inference when the index contained DST days (GH8772).
• Bug where index name was still used when plotting a series with use_index=False (GH8558).
• Bugs when trying to stack multiple columns, when some (or all) of the level names are numbers (GH8584).
• Bug in MultiIndex where __contains__ returns wrong result if index is not lexically sorted or unique (GH7724)
• BUG CSV: fix problem with trailing white space in skipped rows, (GH8679), (GH8661), (GH8983)
• Regression in Timestamp does not parse ‘Z’ zone designator for UTC (GH8771)
• Bug in StataWriter the produces writes strings with 244 characters irrespective of actual size (GH8969)
• Fixed ValueError raised by cummin/cummax when datetime64 Series contains NaT. (GH8965)
• Bug in DataReader returns object dtype if there are missing values (GH8980)
• Bug in plotting if sharex was enabled and index was a timeseries, would show labels on multiple axes (GH3964).
• Bug where passing a unit to the TimedeltaIndex constructor applied the to nano-second conversion twice. (GH9011).
• Bug in plotting of a period-like array (GH9012)

This is a minor bug-fix release from 0.15.0 and includes a small number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

**Enhancements**

**API Changes**

**Bug Fixes**

API changes

- `s.dt.hour` and other `.dt` accessors will now return `np.nan` for missing values (rather than previously -1), (GH8689)

```
In [1]: s = pd.Series(pd.date_range("20130101", periods=5, freq="D"))

In [2]: s.iloc[2] = np.nan

In [3]: s
Out[3]:
0 2013-01-01
1 2013-01-02
2 NaT
```
3  2013-01-04
4  2013-01-05
Length: 5, dtype: datetime64[ns]

previous behavior:

```python
In [6]: s.dt.hour
Out[6]:
0   0
1   0
2   -1
3   0
4   0
dtype: int64
```

current behavior:

```python
In [4]: s.dt.hour
Out[4]:
0  0.0
1  0.0
2  NaN
3  0.0
4  0.0
Length: 5, dtype: float64
```

- `groupby` with `as_index=False` will not add erroneous extra columns to result (GH8582):

```python
In [5]: np.random.seed(2718281)
In [6]: df = pd.DataFrame(np.random.randint(0, 100, (10, 2)), columns=['jim', 'joe'])
In [7]: df.head()
Out[7]:
     jim  joe
0     61   81
1     96   49
2     55   65
3     72   51
4     77   12

[5 rows x 2 columns]
In [8]: ts = pd.Series(5 * np.random.randint(0, 3, 10))

previous behavior:

```python
In [4]: df.groupby(ts, as_index=False).max()
Out[4]:
        NaN  jim  joe
0  0.0  72.0  83.0
(continues on next page)```
current behavior:

In [9]: df.groupby(ts, as_index=False).max()
Out[9]:
    jim  joe
   0   72  83
   1   77  84
   2   96  65

[3 rows x 2 columns]

• groupby will not erroneously exclude columns if the column name conflicts with the grouper name (GH8112):

previous behavior (excludes 1st column from output):

In [4]: gr.apply(sum)
Out[4]:
    jim  j
False  24
True    1

current behavior:

In [13]: gr.apply(sum)
Out[13]:
    jim  j
   Jim  9  24
   True 1  11

[2 rows x 2 columns]

• Support for slicing with monotonic decreasing indexes, even if start or stop is not found in the index (GH7860):
In [14]: s = pd.Series(['a', 'b', 'c', 'd'], [4, 3, 2, 1])

In [15]: s
Out[15]:
4  a
3  b
2  c
1  d
Length: 4, dtype: object

previous behavior:

In [8]: s.loc[3.5:1.5]
KeyError: 3.5

current behavior:

In [16]: s.loc[3.5:1.5]
Out[16]:
3  b
2  c
Length: 2, dtype: object

• io.data.Options has been fixed for a change in the format of the Yahoo Options page (GH8612), (GH8741)

Note: As a result of a change in Yahoo’s option page layout, when an expiry date is given, Options methods now return data for a single expiry date. Previously, methods returned all data for the selected month.

The month and year parameters have been undeprecated and can be used to get all options data for a given month.

If an expiry date that is not valid is given, data for the next expiry after the given date is returned.

Option data frames are now saved on the instance as callsYYMDD or putsYYMDD. Previously they were saved as callsMMYY and putsMMYY. The next expiry is saved as calls and puts.

New features:

– The expiry parameter can now be a single date or a list-like object containing dates.
– A new property expiry_dates was added, which returns all available expiry dates.

Current behavior:

In [17]: from pandas.io.data import Options

In [18]: aapl = Options('aapl', 'yahoo')

In [19]: aapl.get_call_data().iloc[0:5, 0:1]
Out[19]:
     Strike  Expiry         Type Symbol          Last
0  2014-11-14     call AAPL141114C000080000  29.05
1  2014-11-14     call AAPL141114C000084000  24.80
2  2014-11-14     call AAPL141114C000085000  24.05
3  2014-11-14     call AAPL141114C000087000  24.05
4  2014-11-14     call AAPL141114C000088000  24.05

(continues on next page)
In [20]: aapl.expiry_dates
Out[20]:
[datetime.date(2014, 11, 14),
datetime.date(2014, 11, 22),
datetime.date(2014, 11, 28),
datetime.date(2014, 12, 5),
datetime.date(2014, 12, 12),
datetime.date(2014, 12, 20),
datetime.date(2015, 1, 17),
datetime.date(2015, 2, 20),
datetime.date(2015, 4, 17),
datetime.date(2015, 7, 17),
datetime.date(2016, 1, 15),
datetime.date(2017, 1, 20)]

In [21]: aapl.get_near_stock_price(expiry=aapl.expiry_dates[0:3]).iloc[0:5, 0:1]
Out[21]:

<table>
<thead>
<tr>
<th>Strike</th>
<th>Expiry</th>
<th>Type</th>
<th>Symbol</th>
<th>Last</th>
</tr>
</thead>
<tbody>
<tr>
<td>109</td>
<td>2014-11-22</td>
<td>call</td>
<td>AAPL141122C001090000</td>
<td>1.48</td>
</tr>
<tr>
<td></td>
<td>2014-11-28</td>

<td>1.32</td>
</tr>
</tbody>
</table>

- pandas now also registers the `datetime64` dtype in matplotlib's units registry to plot such values as datetimes. This is activated once pandas is imported. In previous versions, plotting an array of `datetime64` values will have resulted in plotted integer values. To keep the previous behaviour, you can do `del matplotlib.units.registry[np.datetime64]` (GH8614).

**Enhancements**

- `concat` permits a wider variety of iterables of pandas objects to be passed as the first parameter (GH8645):

```python
In [17]: from collections import deque
In [18]: df1 = pd.DataFrame([1, 2, 3])
In [19]: df2 = pd.DataFrame([4, 5, 6])

previous behavior:

```python
In [7]: pd.concat(deque((df1, df2)))
```

```
TypeError: first argument must be a list-like of pandas objects, you passed an object of type "deque"
```

current behavior:
In [20]: pd.concat(deque((df1, df2)))
Out[20]:
<table>
<thead>
<tr>
<th></th>
<th>0</th>
<th>1</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>2</td>
<td>3</td>
</tr>
<tr>
<td>1</td>
<td>4</td>
<td>5</td>
</tr>
<tr>
<td>2</td>
<td>6</td>
<td></td>
</tr>
</tbody>
</table>

[6 rows x 1 columns]

- Represent MultiIndex labels with a dtype that utilizes memory based on the level size. In prior versions, the memory usage was a constant 8 bytes per element in each level. In addition, in prior versions, the reported memory usage was incorrect as it didn’t show the usage for the memory occupied by the underlying data array. (GH8456)

In [21]: dfi = pd.DataFrame(
    ...: 1, index=pd.MultiIndex.from_product(["a", range(1000)]), columns=["A"
    ...: 1])

previous behavior:

# this was underreported in prior versions
In [1]: dfi.memory_usage(index=True)
Out[1]:
Index     8000 # took about 24008 bytes in < 0.15.1
A         8000
dtype: int64
current behavior:

In [22]: dfi.memory_usage(index=True)
Out[22]:
Index     44212
A         8000
Length: 2, dtype: int64

- Added Index properties `is_monotonic_increasing` and `is_monotonic_decreasing` (GH8680).
- Added option to select columns when importing Stata files (GH7935)
- Qualify memory usage in `DataFrame.info()` by adding `+` if it is a lower bound (GH8578)
- Raise errors in certain aggregation cases where an argument such as `numeric_only` is not handled (GH8592).
- Added support for 3-character ISO and non-standard country codes in `io.wb.download()` (GH8482)
- World Bank data requests now will warn/raise based on an `errors` argument, as well as a list of hard-coded country codes and the World Bank’s JSON response. In prior versions, the error messages didn’t look at the World Bank's JSON response. Problem-inducing input were simply dropped prior to the request. The issue was that many good countries were cropped in the hard-coded approach. All countries will work now, but some bad countries will raise exceptions because some edge cases break the entire response. (GH8482)
- Added option to `Series.str.split()` to return a `DataFrame` rather than a `Series` (GH8428)
• Added option to `df.info(null_counts=None|True|False)` to override the default display options and force showing of the null-counts (GH8701)

Bug fixes

• Bug in unpickling of a `CustomBusinessDay` object (GH8591)
• Bug in coercing `Categorical` to a records array, e.g. `df.to_records()` (GH8626)
• Bug in `Categorical` not created properly with `Series.to_frame()` (GH8626)
• Bug in coercing in `astype` of a `Categorical` of a passed `pd.Categorical` (this now raises `TypeError` correctly), (GH8626)
• Bug in `cut/qcut` when using `Series` and `retbins=True` (GH8589)
• Bug in writing `Categorical` columns to an SQL database with `to_sql` (GH8624).
• Bug in comparing `Categorical` of datetime raising when being compared to a scalar datetime (GH8687)
• Bug in selecting from a `Categorical` with `.iloc` (GH8623)
• Bug in `groupby-transform` with a `Categorical` (GH8623)
• Bug in duplicated/drop_duplicates with a `Categorical` (GH8623)
• Bug in `Categorical` reflected comparison operator raising if the first argument was a numpy array scalar (e.g. `np.int64`) (GH8658)
• Bug in `Panel` indexing with a list-like (GH8710)
• Compat issue is `DataFrame.dtypes` when `options.mode.use_inf_as_null` is `True` (GH8722)
• Bug in `read_csv`, `dialect` parameter would not take a string (GH8703)
• Bug in `slicing` a `MultiIndex` level with an empty-list (GH8737)
• Bug in numeric index operations of `add/sub` with `Float/Index Index` with `numpy` arrays (GH8608)
• Bug in `setting` with empty indexer and unwanted coercion of `dtypes` (GH8669)
• Bug in `ix/loc` block splitting on `setting` (manifests with integer-like `dtypes`, e.g. `datetime64`) (GH8607)
• Bug when doing label based indexing with integers not found in the index for non-unique but monotonic indexes (GH8680).  
• Bug when indexing a `Float64Index` with `np.nan` on `numpy` 1.7 (GH8980).
• Fix `shape` attribute for `MultiIndex` (GH8609)
• Bug in `GroupBy` where a name conflict between the grouper and columns would break `groupby` operations (GH7115, GH8112)
• Fixed a bug where plotting a column `y` and specifying a label would mutate the index name of the original `DataFrame` (GH8494)
• Fix regression in plotting of a `DatetimeIndex` directly with `matplotlib` (GH8614).
• Bug in `date_range` where partially-specified dates would incorporate current date (GH6961)
• Bug in `setting` by indexer to a scalar value with a mixed-dtype `Panel4d` was failing (GH8702)
• Bug where `DataReader`’s would fail if one of the symbols passed was invalid. Now returns data for valid symbols and `np.nan` for invalid (GH8494)
• Bug in `get_quote_yahoo` that wouldn’t allow non-float return values (GH5229).

5.14.3 Version 0.15.0 (October 18, 2014)

This is a major release from 0.14.1 and includes a small number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

Warning: pandas >= 0.15.0 will no longer support compatibility with NumPy versions < 1.7.0. If you want to use the latest versions of pandas, please upgrade to NumPy >= 1.7.0 (GH7711)

- Highlights include:
  - The Categorical type was integrated as a first-class pandas type, see here
  - New scalar type Timedelta, and a new index type TimedeltaIndex, see here
– New datetimelike properties accessor .dt for Series, see Datetimelike Properties
– New DataFrame default display for df.info() to include memory usage, see Memory Usage
– read_csv will now by default ignore blank lines when parsing, see here
– API change in using Indexes in set operations, see here
– Enhancements in the handling of timezones, see here
– A lot of improvements to the rolling and expanding moment functions, see here
– Internal refactoring of the Index class to no longer sub-class ndarray, see Internal Refactoring
– dropping support for PyTables less than version 3.0.0, and numexpr less than version 2.1 (GH7990)
– Split indexing documentation into Indexing and Selecting Data and MultiIndex / Advanced Indexing
– Split out string methods documentation into Working with Text Data

• Check the API Changes and deprecations before updating
• Other Enhancements
• Performance Improvements
• Bug Fixes

**Warning:** In 0.15.0 Index has internally been refactored to no longer sub-class ndarray but instead subclass PandasObject, similarly to the rest of the pandas objects. This change allows very easy subclassing and creation of new index types. This should be a transparent change with only very limited API implications (See the Internal Refactoring)

**Warning:** The refactoring in Categorical changed the two argument constructor from “codes/labels and levels” to “values and levels (now called ‘categories’)”. This can lead to subtle bugs. If you use Categorical directly, please audit your code before updating to this pandas version and change it to use the from_codes() constructor. See more on Categorical here

**New features**

**Categoricals in Series/DataFrame**

Categorical can now be included in Series and DataFrames and gained new methods to manipulate. Thanks to Jan Schulz for much of this API/implementation. (GH3943, GH5313, GH5314, GH7444, GH7839, GH7848, GH7864, GH7914, GH7768, GH8006, GH3678, GH8075, GH8076, GH8143, GH8453, GH8518).

For full docs, see the categorical introduction and the API documentation.

```
In [1]: df = pd.DataFrame({"id": [1, 2, 3, 4, 5, 6],
                        "raw_grade": ["a", "b", "b", "a", "a", "e"]})
...:
...

In [2]: df["grade"] = df["raw_grade"].astype("category")

good 2
very good 3
Length: 5, dtype: int64

• pandas.core.groupby and pandas.core.factor_group were removed. As an alternative, construct a
dataframe and use df.groupby(<group>).agg(<func>).
Supplying “codes/labels and levels” to the `Categorical` constructor is not supported anymore. Supplying two arguments to the constructor is now interpreted as “values and levels (now called ‘categories’)”. Please change your code to use the `from_codes()` constructor.

The `Categorical.labels` attribute was renamed to `Categorical.codes` and is read only. If you want to manipulate codes, please use one of the API methods on `Categoricals`.

The `Categorical.levels` attribute is renamed to `Categorical.categories`.

### TimedeltaIndex/scalar

We introduce a new scalar type `Timedelta`, which is a subclass of `datetime.timedelta`, and behaves in a similar manner, but allows compatibility with `np.timedelta64` types as well as a host of custom representation, parsing, and attributes. This type is very similar to how `Timestamp` works for `datetimes`. It is a nice-API box for the type. See the `docs`.

```
# Timedelta accessor
In [9]: tds = pd.Timedelta('31 days 5 min 3 sec')

In [10]: tds.minutes
Out[10]: 5L

In [11]: tds.seconds
Out[11]: 3L

# datetime.timedelta accessor
# this is 5 minutes * 60 + 3 seconds
In [12]: tds.to_pytimedelta().seconds
Out[12]: 303
```

**Note:** this is no longer true starting from v0.16.0, where full compatibility with `datetime.timedelta` is introduced. See the `0.16.0 whatsnew entry`

```
Warning: Timedelta scalars (and TimedeltaIndex) component fields are not the same as the component fields on a `datetime.timedelta` object. For example, .seconds on a `datetime.timedelta` object returns the total number of seconds combined between hours, minutes and seconds. In contrast, the pandas Timedelta breaks out hours, minutes, microseconds and nanoseconds separately.
```

```
Warning: Prior to 0.15.0 `pd.to_timedelta` would return a `Series` for list-like/Series input, and a `np.timedelta64` for scalar input. It will now return a TimedeltaIndex for list-like input, Series for Series input, and Timedelta for scalar input.

The arguments to `pd.to_timedelta` are now (arg,unit='ns',box=True,coerce=False), previously were (arg,box=True,unit='ns') as these are more logical.
```

```
Construct a scalar

In [9]: pd.Timedelta('1 days 06:05:01.00003')
Out[9]: Timedelta('1 days 06:05:01.00003')

In [10]: pd.Timedelta('15.5us')
```

(continues on next page)
Out[10]: Timedelta('0 days 00:00:00.000015500')

In [11]: pd.Timedelta('1 hour 15.5us')
Out[11]: Timedelta('0 days 01:00:00.000015500')

# negative Timedeltas have this string repr
# to be more consistent with datetime.timedelta conventions
In [12]: pd.Timedelta('-1us')
Out[12]: Timedelta('-1 days +23:59:59.999999')

# a NaT
In [13]: pd.Timedelta('nan')
Out[13]: NaT

Access fields for a Timedelta

In [14]: td = pd.Timedelta('1 hour 3m 15.5us')

In [15]: td.seconds
Out[15]: 3780

In [16]: td.microseconds
Out[16]: 15

In [17]: td.nanoseconds
Out[17]: 500

Construct a TimedeltaIndex

In [18]: pd.TimedeltaIndex(['1 days', '1 days', '00:00:05',
   ...:             np.timedelta64(2, 'D'),
   ...:             datetime.timedelta(days=2, seconds=2)])

Out[18]: TimedeltaIndex(['1 days 00:00:00', '1 days 00:00:05', '2 days 00:00:00',
   '2 days 00:00:02'],
   dtype='timedelta64[ns]', freq=None)

Constructing a TimedeltaIndex with a regular range

In [19]: pd.timedelta_range('1 days', periods=5, freq='D')
Out[19]: TimedeltaIndex(['1 days', '2 days', '3 days', '4 days', '5 days'],
   dtype='timedelta64[ns]', freq='D')

In [20]: pd.timedelta_range(start='1 days', end='2 days', freq='30T')
Out[20]: TimedeltaIndex(['1 days 00:00:00', '1 days 00:30:00', '1 days 01:00:00',
   '1 days 01:30:00', '1 days 02:00:00', '1 days 02:30:00',
   '1 days 03:00:00', '1 days 03:30:00', '1 days 04:00:00',
   '1 days 04:30:00', '1 days 05:00:00', '1 days 05:30:00',
   '1 days 06:00:00', '1 days 06:30:00', '1 days 07:00:00',
   '1 days 07:30:00', '1 days 08:00:00', '1 days 08:30:00',
   '1 days 09:00:00', '1 days 09:30:00', '1 days 10:00:00',
   '1 days 10:30:00'],
   freq='30T')
You can now use a TimedeltaIndex as the index of a pandas object

```
In [21]: s = pd.Series(np.arange(5),
                      index=pd.timedelta_range('1 days', periods=5, freq='S'))

In [22]: s
Out[22]:
          0          1          2          3          4
1 days 00:00:00 1 days 00:00:01 1 days 00:00:02 1 days 00:00:03 1 days 00:00:04
Freq: S, Length: 5, dtype: int64
```

You can select with partial string selections

```
In [23]: s['1 day 00:00:02']
Out[23]: 2
```

```
In [24]: s['1 day': '1 day 00:00:02']
Out[24]:
          0          1          2
1 days 00:00:00 1 days 00:00:01 1 days 00:00:02
Freq: S, Length: 3, dtype: int64
```

Finally, the combination of TimedeltaIndex with DatetimeIndex allow certain combination operations that are NaT preserving:

```
In [25]: tdi = pd.TimedeltaIndex(['1 days', pd.NaT, '2 days'])

In [26]: tdi.tolist()
Out[26]: [Timedelta('1 days 00:00:00'), NaT, Timedelta('2 days 00:00:00')]
```

```
In [27]: dti = pd.date_range('20130101', periods=3)

In [28]: dti.tolist()
Out[28]: [Timestamp('2013-01-01 00:00:00', freq='D'),
          Timestamp('2013-01-02 00:00:00', freq='D'),
          Timestamp('2013-01-03 00:00:00', freq='D')]
```
Iteration of a Series e.g. `list(Series(...))` of `timedelta64[ns]` would prior to v0.15.0 return `np.timedelta64` for each element. These will now be wrapped in `Timedelta`.

### Memory usage

Implemented methods to find memory usage of a DataFrame. See the FAQ for more. (GH6852).

A new display option `display.memory_usage` (see Options and settings) sets the default behavior of the `memory_usage` argument in the `df.info()` method. By default `display.memory_usage` is `True`.

```python
In [31]: dtypes = ['int64', 'float64', 'datetime64[ns]', 'timedelta64[ns]',
       ...
             'complex128', 'object', 'bool']

In [32]: n = 5000

In [33]: data = {t: np.random.randint(100, size=n).astype(t) for t in dtypes}

In [34]: df = pd.DataFrame(data)

In [35]: df['categorical'] = df['object'].astype('category')

In [36]: df.info()
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 5000 entries, 0 to 4999
Data columns (total 8 columns):
# Column       Non-Null Count   Dtype
--- -------- -------------- ----- 
0 int64    5000 non-null   int64
1 float64  5000 non-null   float64
2 datetime64[ns]  5000 non-null   datetime64[ns]
3 timedelta64[ns]  5000 non-null   timedelta64[ns]
4 complex128  5000 non-null   complex128
5 object   5000 non-null   object
6 bool     5000 non-null   bool
7 categorical  5000 non-null   category
dtypes: bool(1), category(1), complex128(1), datetime64[ns](1), float64(1), int64(1),
       ... object(1), timedelta64[ns](1)
memory usage: 288.2+ KB
```

Additionally `memory_usage()` is an available method for a dataframe object which returns the memory usage of each column.
Series.dt accessor

Series has gained an accessor to succinctly return datetime like properties for the values of the Series, if its a datetime/period like Series. (GH7207) This will return a Series, indexed like the existing Series. See the docs.

```
In [38]: s = pd.Series(pd.date_range('20130101 09:10:12', periods=4))

In [39]: s
Out[39]:
0  2013-01-01 09:10:12
1  2013-01-02 09:10:12
2  2013-01-03 09:10:12
3  2013-01-04 09:10:12
Length: 4, dtype: datetime64[ns]

In [40]: s.dt.hour
Out[40]:
0   9
1   9
2   9
3   9
Length: 4, dtype: int64

In [41]: s.dt.second
Out[41]:
0  12
1  12
2  12
3  12
Length: 4, dtype: int64

In [42]: s.dt.day
Out[42]:
0   1
1   2
2   3
3   4
```
This enables nice expressions like this:

```python
In [44]: s[s.dt.day == 2]
Out[44]:
1  2013-01-02 09:10:12
Length: 1, dtype: datetime64[ns]
```

You can easily produce tz aware transformations:

```python
In [45]: stz = s.dt.tz_localize('US/Eastern')
In [46]: stz
Out[46]:
0  2013-01-01 09:10:12-05:00
1  2013-01-02 09:10:12-05:00
2  2013-01-03 09:10:12-05:00
3  2013-01-04 09:10:12-05:00
Length: 4, dtype: datetime64[ns, US/Eastern]
```

You can also chain these types of operations:

```python
In [48]: s.dt.tz_localize('UTC').dt.tz_convert('US/Eastern')
Out[48]:
0  2013-01-01 04:10:12-05:00
1  2013-01-02 04:10:12-05:00
2  2013-01-03 04:10:12-05:00
3  2013-01-04 04:10:12-05:00
Length: 4, dtype: datetime64[ns, US/Eastern]
```

The `.dt` accessor works for period and timedelta dtypes.

```python
# period
In [49]: s = pd.Series(pd.period_range('20130101', periods=4, freq='D'))
In [50]: s
Out[50]:
0  2013-01-01
1  2013-01-02
2  2013-01-03
3  2013-01-04
Length: 4, dtype: period[D]
```

```python
In [51]: s.dt.year
Out[51]:
0  2013
```
1 2013
2 2013
3 2013
Length: 4, dtype: int64

In [52]: s.dt.day
Out[52]:
0   1
1   2
2   3
3   4
Length: 4, dtype: int64

# timedelta
In [53]: s = pd.Series(pd.timedelta_range('1 day 00:00:05', periods=4, freq='s'))

In [54]: s
Out[54]:
0   1 days 00:00:05
1   1 days 00:00:06
2   1 days 00:00:07
3   1 days 00:00:08
Length: 4, dtype: timedelta64[ns]

In [55]: s.dt.days
Out[55]:
0   1
1   1
2   1
3   1
Length: 4, dtype: int64

In [56]: s.dt.seconds
Out[56]:
0    5
1    6
2    7
3    8
Length: 4, dtype: int64

In [57]: s.dt.components
Out[57]:
   days  hours  minutes  seconds  milliseconds  microseconds  nanoseconds
0     1      0        0         5               0              0              0
1     1      0        0         6               0              0              0
2     1      0        0         7               0              0              0
3     1      0        0         8               0              0              0
[4 rows x 7 columns]
Timezone handling improvements

- `tz_localize(None)` for tz-aware Timestamp and DatetimeIndex now removes timezone holding local time, previously this resulted in `Exception` or `TypeError` (GH7812)

```python
In [58]: ts = pd.Timestamp('2014-08-01 09:00', tz='US/Eastern')
In [59]: ts
Out[59]: Timestamp('2014-08-01 09:00:00-0400', tz='US/Eastern')
In [60]: ts.tz_localize(None)
Out[60]: Timestamp('2014-08-01 09:00:00')
In [61]: didx = pd.date_range(start='2014-08-01 09:00', freq='H', periods=10, tz='US/Eastern')
In [62]: didx
Out[62]: DatetimeIndex(['2014-08-01 09:00:00-04:00', '2014-08-01 10:00:00-04:00', '2014-08-01 11:00:00-04:00', '2014-08-01 12:00:00-04:00', '2014-08-01 13:00:00-04:00', '2014-08-01 14:00:00-04:00', '2014-08-01 15:00:00-04:00', '2014-08-01 16:00:00-04:00', '2014-08-01 17:00:00-04:00', '2014-08-01 18:00:00-04:00'], dtype='datetime64[ns, US/Eastern]', freq='H')
In [63]: didx.tz_localize(None)
Out[63]: DatetimeIndex(['2014-08-01 09:00:00', '2014-08-01 10:00:00', '2014-08-01 11:00:00', '2014-08-01 12:00:00', '2014-08-01 13:00:00', '2014-08-01 14:00:00', '2014-08-01 15:00:00', '2014-08-01 16:00:00', '2014-08-01 17:00:00', '2014-08-01 18:00:00'], dtype='datetime64[ns]', freq=None)
```

- `tz_localize` now accepts the `ambiguous` keyword which allows for passing an array of bools indicating whether the date belongs in DST or not, `NaT` for setting transition times to `NaT`, `infer` for inferring DST/non-DST, and `raise` (default) for an `AmbiguousTimeError` to be raised. See the docs for more details (GH7943)

- `DataFrame.tz_localize` and `DataFrame.tz_convert` now accepts an optional `level` argument for localizing a specific level of a MultiIndex (GH7846)

- `Timestamp.tz_localize` and `Timestamp.tz_convert` now raise `TypeError` in error cases, rather than `Exception` (GH8025)

- a timeseries/index localized to UTC when inserted into a Series/DataFrame will preserve the UTC timezone (rather than being a naive `datetime64[ns]`) as object dtype (GH8411)

- `Timestamp.__repr__` displays `dateutil.tz.tzoffset` info (GH7907)
Rolling/expanding moments improvements

- `rolling_min()`, `rolling_max()`, `rolling_cov()`, and `rolling_corr()` now return objects with all NaN when `len(arg) < min_periods <= window` rather than raising. (This makes all rolling functions consistent in this behavior). (GH7766)

Prior to 0.15.0

```
In [64]: s = pd.Series([10, 11, 12, 13])
In [15]: pd.rolling_min(s, window=10, min_periods=5)
ValueError: min_periods (5) must be <= window (4)
```

New behavior

```
In [4]: pd.rolling_min(s, window=10, min_periods=5)
Out[4]:
0  NaN
1  NaN
2  NaN
3  NaN
dtype: float64
```

- `rolling_max()`, `rolling_min()`, `rolling_sum()`, `rolling_mean()`, `rolling_median()`, `rolling_std()`, `rolling_var()`, `rolling_skew()`, `rolling_kurt()`, `rolling_quantile()`, `rolling_cov()`, `rolling_corr()`, `rolling_corr_pairwise()`, `rolling_window()`, and `rolling_apply()` with `center=True` previously would return a result of the same structure as the input `arg` with NaN in the final `(window-1)/2` entries.

Now the final `(window-1)/2` entries of the result are calculated as if the input `arg` were followed by `(window-1)/2` NaN values (or with shrinking windows, in the case of `rolling_apply()`). (GH7925, GH8269)

Prior behavior (note final value is NaN):

```
In [7]: pd.rolling_sum(Series(range(4)), window=3, min_periods=0, center=True)
Out[7]:
0    1
1    3
2    6
3  NaN
dtype: float64
```

New behavior (note final value is 5 = sum([2, 3, NaN])):

```
In [7]: pd.rolling_sum(pd.Series(range(4)), window=3, 
                   ....: min_periods=0, center=True)
Out[7]:
0    1
1    3
2    6
3    5
dtype: float64
```

- `rolling_window()` now normalizes the weights properly in rolling mean mode (`mean=True`) so that the calculated weighted means (e.g. ‘triang’, ‘gaussian’) are distributed about the same means as those calculated without weighting (i.e. ‘boxcar’). See the note on normalization for further details. (GH7618)
In [65]: s = pd.Series([10.5, 8.8, 11.4, 9.7, 9.3])

Behavior prior to 0.15.0:

In [39]: pd.rolling_window(s, window=3, win_type='triang', center=True)
Out[39]:
0     NaN
1  6.583333
2  6.883333
3  6.683333
4     NaN
dtype: float64

New behavior

In [10]: pd.rolling_window(s, window=3, win_type='triang', center=True)
Out[10]:
0     NaN
1  9.875
2 10.325
3 10.025
4     NaN
dtype: float64

• Removed center argument from all expanding_* functions (see list), as the results produced when center=True did not make much sense. (GH7925)

• Added optional ddof argument to expanding_cov() and rolling_cov(). The default value of 1 is backwards-compatible. (GH8279)

• Documented the ddof argument to expanding_var(), expanding_std(), rolling_var(), and rolling_std(). These functions’ support of a ddof argument (with a default value of 1) was previously undocumented. (GH8064)

• ewma(), ewmstd(), ewmvol(), ewmvar(), ewmcov(), and ewmcorr() now interpret min_periods in the same manner that the rolling_*() and expanding_*() functions do: a given result entry will be NaN if the (expanding, in this case) window does not contain at least min_periods values. The previous behavior was to set to NaN the min_periods entries starting with the first non- NaN value. (GH7977)

Prior behavior (note values start at index 2, which is min_periods after index 0 (the index of the first non-empty value)):

In [66]: s = pd.Series([1, None, None, None, 2, 3])

In [51]: ewma(s, com=3., min_periods=2)
Out[51]:
0     NaN
1     NaN
2 1.000000
3 1.000000
4 1.571429
5 2.189189
dtype: float64

New behavior (note values start at index 4, the location of the 2nd (since min_periods=2) non-empty value):

3218 Chapter 5. Release notes

- `ewmstd()`, `ewmvol()`, `ewmvar()`, `ewmcov()`, and `ewmcorr()` now have an optional `adjust` argument, just like `ewma()` does, affecting how the weights are calculated. The default value of `adjust` is `True`, which is backwards-compatible. See Exponentially weighted moment functions for details. (GH7911)

- `ewma()`, `ewmstd()`, `ewmvol()`, `ewmvar()`, `ewmcov()`, and `ewmcorr()` now have an optional `ignore_na` argument. When `ignore_na=False` (the default), missing values are taken into account in the weights calculation. When `ignore_na=True` (which reproduces the pre-0.15.0 behavior), missing values are ignored in the weights calculation. (GH7543)

In [7]: pd.ewma(pd.Series([None, 1., 8.]), com=2.)

**Warning:** By default (`ignore_na=False`) the `ewm*()` functions’ weights calculation in the presence of missing values is different than in pre-0.15.0 versions. To reproduce the pre-0.15.0 calculation of weights in the presence of missing values one must specify explicitly `ignore_na=True`.

- Bug in `expanding_cov()`, `expanding_corr()`, `rolling_cov()`, `rolling_cor()`, `ewmcov()`, and `ewmcorr()` returning results with columns sorted by name and producing an error for non-unique columns; now handles non-unique columns and returns columns in original order (except for the case of two DataFrames with `pairwise=False`, where behavior is unchanged) (GH7542)

- Bug in `rolling_count()` and `expanding_*()` functions unnecessarily producing error message for zero-length data (GH8056)
• Bug in rolling_apply() and expanding_apply() interpreting min_periods=0 as min_periods=1 (GH8080)

• Bug in expanding_std() and expanding_var() for a single value producing a confusing error message (GH7900)

• Bug in rolling_std() and rolling_var() for a single value producing a confusing error message (GH7900)

• Bug in ewmstd(), ewmvol(), ewmvar(), and ewmcov() calculation of de-biasing factors when bias=False (the default). Previously an incorrect constant factor was used, based on adjust=True, ignore_na=True, and an infinite number of observations. Now a different factor is used for each entry, based on the actual weights (analogous to the usual \( N/(N-1) \) factor). In particular, for a single point a value of NaN is returned when bias=False, whereas previously a value of (approximately) \( 0 \) was returned.

For example, consider the following pre-0.15.0 results for ewmvar(..., bias=False), and the corresponding debiasing factors:

```python
In [67]: s = pd.Series([1., 2., 0., 4.])
In [89]: ewmvar(s, com=2., bias=False)
Out[89]:
0   -2.775558e-16
1      3.000000e-01
2      9.556787e-01
3      3.585799e+00
dtype: float64
In [90]: ewmvar(s, com=2., bias=False) / ewmvar(s, com=2., bias=True)
Out[90]:
0   1.25
1   1.25
2   1.25
3   1.25
dtype: float64
```

Note that entry 0 is approximately 0, and the debiasing factors are a constant 1.25. By comparison, the following 0.15.0 results have a NaN for entry 0, and the debiasing factors are decreasing (towards 1.25):

```python
In [14]: pd.ewmvar(s, com=2., bias=False)
Out[14]:
0      NaN
1  0.500000
2  1.210526
3  4.089069
dtype: float64
In [15]: pd.ewmvar(s, com=2., bias=False) / pd.ewmvar(s, com=2., bias=True)
Out[15]:
0      NaN
1  2.083333
2  1.583333
3  1.425439
dtype: float64
```

See Exponentially weighted moment functions for details. (GH7912)
Improvements in the SQL IO module

- Added support for a chunksize parameter to `to_sql` function. This allows DataFrame to be written in chunks and avoid packet-size overflow errors (GH8062).
- Added support for a chunksize parameter to `read_sql` function. Specifying this argument will return an iterator through chunks of the query result (GH2908).
- Added support for writing `datetime.date` and `datetime.time` object columns with `to_sql` (GH7952). For example:

```python
df.to_sql('table', engine, schema='other_schema')  # noqa F821
pd.read_sql_table('table', engine, schema='other_schema')  # noqa F821
```

- Added support for writing NaN values with `to_sql` (GH2754).
- Added support for writing datetime64 columns with `to_sql` for all database flavors (GH7103).

Backwards incompatible API changes

Breaking changes

API changes related to `Categorical` (see here for more details):

- The `Categorical` constructor with two arguments changed from “codes/labels and levels” to “values and levels (now called ‘categories’)”. This can lead to subtle bugs. If you use `Categorical` directly, please audit your code by changing it to use the `from_codes()` constructor.

An old function call like (prior to 0.15.0):

```python
pd.Categorical([0,1,0,2,1], levels=['a', 'b', 'c'])
```

will have to adapted to the following to keep the same behaviour:

```python
In [2]: pd.Categorical.from_codes([0,1,0,2,1], categories=['a', 'b', 'c'])
Out[2]:
[a, b, a, c, b]
Categories (3, object): [a, b, c]
```

API changes related to the introduction of the `Timedelta` scalar (see above for more details):

- Prior to 0.15.0 `to_timedelta()` would return a Series for list-like/Series input, and a `np.timedelta64` for scalar input. It will now return a TimedeltaIndex for list-like input, Series for Series input, and Timedelta for scalar input.

For API changes related to the rolling and expanding functions, see detailed overview above.

Other notable API changes:

- Consistency when indexing with `.loc` and a list-like indexer when no values are found.

```python
In [68]: df = pd.DataFrame([['a'], ['b']], index=[1, 2])
In [69]: df
Out[69]:
0
```

In prior versions there was a difference in these two constructs:

- `df.loc[[3]]` would return a frame reindexed by 3 (with all np.nan values)
- `df.loc[[3],:]` would raise KeyError.

Both will now raise a KeyError. The rule is that at least 1 indexer must be found when using a list-like and `.loc` (GH7999)

Furthermore in prior versions these were also different:

- `df.loc[[1,3]]` would return a frame reindexed by [1,3]
- `df.loc[[1,3],:]` would raise KeyError.

Both will now return a frame reindex by [1,3]. E.g.

```
In [3]: df.loc[[1, 3]]
Out[3]:
0  
1 a
3 NaN

In [4]: df.loc[[1, 3], :]
Out[4]:
0  
1 a
3 NaN
```

This can also be seen in multi-axis indexing with a Panel.

```python
>>> p = pd.Panel(np.arange(2 * 3 * 4).reshape(2, 3, 4),
... items=['ItemA', 'ItemB'],
... major_axis=[1, 2, 3],
... minor_axis=['A', 'B', 'C', 'D'])
>>> p
<class 'pandas.core.panel.Panel'>
Dimensions: 2 (items) x 3 (major_axis) x 4 (minor_axis)
Items axis: ItemA to ItemB
Major_axis axis: 1 to 3
Minor_axis axis: A to D
```

The following would raise KeyError prior to 0.15.0:

```
In [5]:
Out[5]:
   ItemA   ItemD
0  3  NaN
1  7  NaN
3 11  NaN
```

Furthermore, `.loc` will raise If no values are found in a MultiIndex with a list-like indexer:
In [70]: s = pd.Series(np.arange(3, dtype='int64'),
    ....:     index=pd.MultiIndex.from_product([['A'], ['foo', 'bar', 'baz']],
    ....:     names=['one', 'two'])).sort_index()

In [71]: s
Out[71]:
one  two  
A   bar   1
    baz   2
    foo   0
Length: 3, dtype: int64

In [72]: try:
    ....:     s.loc[['D']]
    ....: except KeyError as e:
    ....:     print("KeyError: " + str(e))
KeyError: "['D'] not in index"

• Assigning values to `None` now considers the dtype when choosing an ‘empty’ value (GH7941).

Previously, assigning to `None` in numeric containers changed the dtype to object (or errored, depending on the call). It now uses `NaN`:

In [73]: s = pd.Series([1, 2, 3])

In [74]: s.loc[0] = None

In [75]: s
Out[75]:
0 NaN
1 2.0
2 3.0
Length: 3, dtype: float64

`NaN` is now used similarly for datetime containers.

For object containers, we now preserve `None` values (previously these were converted to `NaN` values).

In [76]: s = pd.Series(['a', 'b', 'c'])

In [77]: s.loc[0] = None

In [78]: s
Out[78]:
0 None
1 b
2 c
Length: 3, dtype: object

To insert a `NaN`, you must explicitly use `np.nan`. See the `docs`. 
• In prior versions, updating a pandas object inplace would not reflect in other python references to this object. (GH8511, GH5104)

```python
In [79]: s = pd.Series([1, 2, 3])
In [80]: s2 = s
In [81]: s += 1.5
```

Behavior prior to v0.15.0

```python
# the original object
In [5]: s
Out[5]:
0    2.5
1    3.5
2    4.5
dtype: float64

# a reference to the original object
In [7]: s2
Out[7]:
0    1
1    2
2    3
dtype: int64
```

This is now the correct behavior

```python
# the original object
In [82]: s
Out[82]:
0    2.5
1    3.5
2    4.5
Length: 3, dtype: float64

# a reference to the original object
In [83]: s2
Out[83]:
0    2.5
1    3.5
2    4.5
Length: 3, dtype: float64
```

• Made both the C-based and Python engines for `read_csv` and `read_table` ignore empty lines in input as well as white space-filled lines, as long as `sep` is not white space. This is an API change that can be controlled by the keyword parameter `skip_blank_lines`. See the docs (GH4466)

• A timeseries/index localized to UTC when inserted into a Series/DataFrame will preserve the UTC timezone and inserted as `object` dtype rather than being converted to a naive `datetime64[ns]` (GH8411).

• Bug in passing a `DatetimeIndex` with a timezone that was not being retained in DataFrame construction from a `dict` (GH7822)
In prior versions this would drop the timezone, now it retains the timezone, but gives a column of object dtype:

```
In [84]: i = pd.date_range('1/1/2011', periods=3, freq='10s', tz='US/Eastern')
In [85]: i
Out[85]:
DatetimeIndex(['2011-01-01 00:00:00-05:00', '2011-01-01 00:00:10-05:00',
              '2011-01-01 00:00:20-05:00'],
dtype='datetime64[ns, US/Eastern]', freq='10S')
```

```
In [86]: df = pd.DataFrame({'a': i})
In [87]: df
Out[87]:
a    0 2011-01-01 00:00:00-05:00
     1 2011-01-01 00:00:10-05:00
     2 2011-01-01 00:00:20-05:00
[3 rows x 1 columns]
```

Previously this would have yielded a column of datetime64 dtype, but without timezone info.

The behaviour of assigning a column to an existing dataframe as `df['a'] = i` remains unchanged (this already returned an object column with a timezone).

- When passing multiple levels to `stack()`, it will now raise a `ValueError` when the levels aren’t all level names or all level numbers (GH7660). See Reshaping by stacking and unstacking.

- Raise a `ValueError` in `df.to_hdf` with ‘fixed’ format, if `df` has non-unique columns as the resulting file will be broken (GH7761)

- SettingWithCopy raise/warnings (according to the option `mode.chained_assignment`) will now be issued when setting a value on a sliced mixed-dtype DataFrame using chained-assignment. (GH7845, GH7950)

```
In [1]: df = pd.DataFrame(np.arange(0, 9), columns=['count'])
In [2]: df['group'] = 'b'
In [3]: df.iloc[0:5]['group'] = 'a'
/usr/local/bin/ipython:1: SettingWithCopyWarning:
A value is trying to be set on a copy of a slice from a DataFrame.
Try using .loc[row_indexer,col_indexer] = value instead
See the caveats in the documentation: https://pandas.pydata.org/pandas-docs/stable/
˓→indexing.html#indexing-view-versus-copy
```

- `merge`, `DataFrame.merge`, and `ordered_merge` now return the same type as the `left` argument (GH7737).

- Previously an enlargement with a mixed-dtype frame would act unlike `.append` which will preserve dtypes (related GH2578, GH8176):

5.14. Version 0.15
In [89]: df = pd.DataFrame([[True, 1], [False, 2]],
                     columns=["female", "fitness"])

In [90]: df
Out[90]:
female  fitness
0    True     1
1   False     2
[2 rows x 2 columns]

In [91]: df.dtypes
Out[91]:
female    bool
fitness  int64
Length: 2, dtype: object

# dtypes are now preserved

In [93]: df
Out[93]:
female  fitness
0    True     1
1   False     2
2   False     2
[3 rows x 2 columns]

In [94]: df.dtypes
Out[94]:
female    bool
fitness  int64
Length: 2, dtype: object

• Series.to_csv() now returns a string when path=None, matching the behaviour of DataFrame.to_csv() (GH8215).

• read_hdf now raises IOError when a file that doesn’t exist is passed in. Previously, a new, empty file was created, and a KeyError raised (GH7715).

• DataFrame.info() now ends its output with a newline character (GH8114)

• Concatenating no objects will now raise a ValueError rather than a bare Exception.

• Merge errors will now be sub-classes of ValueError rather than raw Exception (GH8501)

• DataFrame.plot and Series.plot keywords are now have consistent orders (GH8037)
Internal refactoring

In 0.15.0 Index has internally been refactored to no longer sub-class ndarray but instead subclass PandasObject, similarly to the rest of the pandas objects. This change allows very easy sub-classing and creation of new index types. This should be a transparent change with only very limited API implications (GH5080, GH7439, GH7796, GH8024, GH8367, GH7997, GH8522):

- you may need to unpickle pandas version < 0.15.0 pickles using pd.read_pickle rather than pickle.load. See pickle docs
- when plotting with a PeriodIndex, the matplotlib internal axes will now be arrays of Period rather than a PeriodIndex (this is similar to how a DatetimeIndex passes arrays of datetimes now)
- MultiIndexes will now raise similarly to other pandas objects w.r.t. truth testing, see here (GH7897).
- When plotting a DatetimeIndex directly with matplotlib’s plot function, the axis labels will no longer be formatted as dates but as integers (the internal representation of a datetime64).

Deprecations

- The attributes Categorical labels and levels attributes are deprecated and renamed to codes and categories.
- The outtype argument to pd.DataFrame.to_dict has been deprecated in favor of orient. (GH7840)
- The convert_dummies method has been deprecated in favor of get_dummies (GH8140)
- The infer_dst argument in tz_localize will be deprecated in favor of ambiguous to allow for more flexibility in dealing with DST transitions. Replace infer_dst=True with ambiguous='infer' for the same behavior (GH7943). See the docs for more details.
- The top-level pd.value_range has been deprecated and can be replaced by .describe() (GH8481)
- The Index set operations + and - were deprecated in order to provide these for numeric type operations on certain index types. + can be replaced by .union() or |, and - by .difference(). Further the method name Index.diff() is deprecated and can be replaced by Index.difference() (GH8226)

```
# +
pd.Index(['a', 'b', 'c']) + pd.Index(['b', 'c', 'd'])
# should be replaced by
pd.Index(['a', 'b', 'c']).union(pd.Index(['b', 'c', 'd']))
```

```
# -
pd.Index(['a', 'b', 'c']) - pd.Index(['b', 'c', 'd'])
# should be replaced by
pd.Index(['a', 'b', 'c']).difference(pd.Index(['b', 'c', 'd']))
```

- The infer_types argument to read_html() now has no effect and is deprecated (GH7762, GH7032).
Removal of prior version deprecations/changes

- Remove DataFrame.delevel method in favor of DataFrame.reset_index

Enhancements

Enhancements in the importing/exporting of Stata files:

- Added support for bool, uint8, uint16 and uint32 data types in to_stata (GH7097, GH7365)
- Added conversion option when importing Stata files (GH8527)
- DataFrame.to_stata and StataWriter check string length for compatibility with limitations imposed in dta files where fixed-width strings must contain 244 or fewer characters. Attempting to write Stata dta files with strings longer than 244 characters raises a ValueError. (GH7858)
- read_stata and StataReader can import missing data information into a DataFrame by setting the argument convert_missing to True. When using this options, missing values are returned as StataMissingValue objects and columns containing missing values have object data type. (GH8045)

Enhancements in the plotting functions:

- Added layout keyword to DataFrame.plot. You can pass a tuple of (rows, columns), one of which can be -1 to automatically infer (GH6667, GH8071).
- Allow to pass multiple axes to DataFrame.plot, hist and boxplot (GH5353, GH6970, GH7069)
- Added support for c, colormap and colorbar arguments for DataFrame.plot with kind='scatter' (GH7780)
- Histogram from DataFrame.plot with kind='hist' (GH7809), See the docs.
- Boxplot from DataFrame.plot with kind='box' (GH7998), See the docs.

Other:

- read_csv now has a keyword parameter float_precision which specifies which floating-point converter the C engine should use during parsing, see here (GH8002, GH8044)
- Added searchsorted method to Series objects (GH7447)
- describe() on mixed-types DataFrames is more flexible. Type-based column filtering is now possible via the include/exclude arguments. See the docs (GH8164).

```python
In [95]: df = pd.DataFrame({'catA': ['foo', 'foo', 'bar'] * 8,
                           'catB': ['a', 'b', 'c', 'd'] * 6,
                           'numC': np.arange(24),
                           'numD': np.arange(24.) + .5})

In [96]: df.describe(include=['object'])
Out[96]:
   catA  catB
count  24   24
unique  2   4
top    foo  b
freq   16   6
```

(continues on next page)
In [97]: df.describe(include=['number', 'object'], exclude=['float'])
Out[97]:
    catA  catB  numC
  count    24   24  24.000000
  unique   2    4    NaN
  top      foo  b    NaN
  freq     16    6    NaN
  mean    NaN  NaN   11.500000
  std     NaN  NaN    7.071068
  min     NaN  NaN    0.000000
  25%     NaN  NaN    5.750000
  50%     NaN  NaN   11.500000
  75%     NaN  NaN   17.250000
  max     NaN  NaN   23.000000
[11 rows x 3 columns]

Requesting all columns is possible with the shorthand ‘all’

In [98]: df.describe(include='all')
Out[98]:
    catA  catB  numC  numD
  count    24   24  24.000000  24.000000
  unique   2    4    NaN    NaN
  top      foo  b    NaN    NaN
  freq     16    6    NaN    NaN
  mean    NaN  NaN   11.500000  12.000000
  std     NaN  NaN    7.071068  7.071068
  min     NaN  NaN    0.000000  0.500000
  25%     NaN  NaN    5.750000  6.250000
  50%     NaN  NaN   11.500000  12.000000
  75%     NaN  NaN   17.250000  17.750000
  max     NaN  NaN   23.000000  23.500000
[11 rows x 4 columns]

Without those arguments, describe will behave as before, including only numerical columns or, if none are, only categorical columns. See also the docs

- Added split as an option to the orient argument in pd.DataFrame.to_dict. (GH7840)
- The get_dummies method can now be used on DataFrames. By default only categorical columns are encoded as 0’s and 1’s, while other columns are left untouched.

In [99]: df = pd.DataFrame({'A': ['a', 'b', 'a'], 'B': ['c', 'c', 'b'],
                          'C': [1, 2, 3]})
In [100]: pd.get_dummies(df)
Out[100]:
   C   A_a  A_b  B_b  B_c
0  1    1    0    0    1
1 2 0 1 0 1
2 3 1 0 1 0
[3 rows x 5 columns]

- PeriodIndex supports resolution as the same as DatetimeIndex (GH7708)
- pandas.tseries.holiday has added support for additional holidays and ways to observe holidays (GH7070)
- pandas.tseries.holiday.Holiday now supports a list of offsets in Python3 (GH7070)
- pandas.tseries.holiday.Holiday now supports a days_of_week parameter (GH7070)
- GroupBy.nth() now supports selecting multiple nth values (GH7910)

```python
In [101]: business_dates = pd.date_range(start='4/1/2014', end='6/30/2014', freq='B')
In [102]: df = pd.DataFrame(1, index=business_dates, columns=['a', 'b'])
# get the first, 4th, and last date index for each month
In [103]: df.groupby([df.index.year, df.index.month]).nth([0, 3, -1])
Out[103]:
   a  b
2014 1 1
   4 1 1
   4 1 1
   5 1 1
   5 1 1
   5 1 1
   6 1 1
   6 1 1
   6 1 1
[9 rows x 2 columns]
```

- Period and PeriodIndex supports addition/subtraction with timedelta-likes (GH7966)

If Period freq is D, H, T, L, U, N, Timedelta-like can be added if the result can have same freq. Otherwise, only the same offsets can be added.

```python
In [104]: idx = pd.period_range('2014-07-01 09:00', periods=5, freq='H')
In [105]: idx
Out[105]:
PeriodIndex(['2014-07-01 09:00', '2014-07-01 10:00', '2014-07-01 11:00',
            '2014-07-01 12:00', '2014-07-01 13:00'],
            dtype='period[H]', freq='H')
In [106]: idx + pd.offsets.Hour(2)
Out[106]:
PeriodIndex(['2014-07-01 11:00', '2014-07-01 12:00', '2014-07-01 13:00',
            '2014-07-01 14:00', '2014-07-01 15:00'],
            dtype='period[H]', freq='H')
```
In [107]: idx + pd.Timedelta('120m')
Out[107]:
PeriodIndex(['2014-07-01 11:00', '2014-07-01 12:00', '2014-07-01 13:00',
            '2014-07-01 14:00', '2014-07-01 15:00'],
           dtype='period[H]', freq='H')

In [108]: idx = pd.period_range('2014-07', periods=5, freq='M')

In [109]: idx
Out[109]:
            dtype='period[M]', freq='M')

In [110]: idx + pd.offsets.MonthEnd(3)
Out[110]:
            dtype='period[M]', freq='M')

- Added experimental compatibility with openpyxl for versions >= 2.0. The DataFrame.to_excel method engine keyword now recognizes openpyxl1 and openpyxl2 which will explicitly require openpyxl v1 and v2 respectively, failing if the requested version is not available. The openpyxl engine is a now a meta-engine that automatically uses whichever version of openpyxl is installed. (GH7177)

- DataFrame.fillna can now accept a DataFrame as a fill value (GH8377)

- Passing multiple levels to stack() will now work when multiple level numbers are passed (GH7660). See Reshaping by stacking and unstacking.

- set_names(), set_labels(), and set_levels() methods now take an optional level keyword argument to all modification of specific level(s) of a MultiIndex. Additionally set_names() now accepts a scalar string value when operating on an Index or on a specific level of a MultiIndex (GH7792)

In [111]: idx = pd.MultiIndex.from_product([['a'], range(3), list('pqr')],
                                      names=['foo', 'bar', 'baz'])

In [112]: idx.set_names('qux', level=0)
Out[112]:
MultiIndex(['a', 0, 'p'],
           ['a', 0, 'q'],
           ['a', 0, 'r'],
           ['a', 1, 'p'],
           ['a', 1, 'q'],
           ['a', 1, 'r'],
           ['a', 2, 'p'],
           ['a', 2, 'q'],
           ['a', 2, 'r'],
           names=['qux', 'bar', 'baz'])

In [113]: idx.set_names(['qux', 'corge'], level=[0, 1])
Out[113]:
MultiIndex(['a', 0, 'p'],
           ['a', 0, 'q'],
           ['a', 0, 'r'],
           ['a', 1, 'p'],
           ['a', 1, 'q'],
           names=['qux', 'corge'])
In [114]: idx.set_levels(['a', 'b', 'c'], level='bar')

Out[114]:
MultiIndex([(‘a’, ‘a’, 1),
             (‘a’, ‘a’, 2),
             (‘a’, ‘a’, 3),
             (‘a’, ‘b’, 1),
             (‘a’, ‘b’, 2),
             (‘a’, ‘b’, 3),
             (‘a’, ‘c’, 1),
             (‘a’, ‘c’, 2),
             (‘a’, ‘c’, 3)],
            names=['foo', 'bar', 'baz'])

In [115]: idx.set_levels([['a', 'b', 'c'], [1, 2, 3]], level=[1, 2])

Out[115]:
MultiIndex([(‘a’, ‘a’, 1),
             (‘a’, ‘a’, 2),
             (‘a’, ‘a’, 3),
             (‘a’, ‘b’, 1),
             (‘a’, ‘b’, 2),
             (‘a’, ‘b’, 3),
             (‘a’, ‘c’, 1),
             (‘a’, ‘c’, 2),
             (‘a’, ‘c’, 3)],
            names=['foo', 'bar', 'baz'])

• Index.isin now supports a level argument to specify which index level to use for membership tests (GH7892, GH7890)

In [1]: idx = pd.MultiIndex.from_product([[0, 1], ['a', 'b', 'c']])

In [2]: idx.values

Out[2]: array([(0, ’a’), (0, ’b’), (0, ’c’), (1, ’a’), (1, ’b’), (1, ’c’)],
dtype=object)

In [3]: idx.isin([‘a’, ‘c’, ‘e’], level=1)

Out[3]: array([ True, False, True, True, False, True], dtype=bool)

• Index now supports duplicated and drop_duplicates. (GH4060)

In [116]: idx = pd.Index([1, 2, 3, 4, 1, 2])

In [117]: idx

Out[117]: Int64Index([1, 2, 3, 4, 1, 2], dtype=’int64’)

In [118]: idx.duplicated()
• add copy=True argument to pd.concat to enable pass through of complete blocks (GH8252)
• Added support for numpy 1.8+ data types (bool_, int_, float_, string_) for conversion to R dataframe (GH8400)

Performance

• Performance improvements in DatetimeIndex.__iter__ to allow faster iteration (GH7683)
• Performance improvements in Period creation (and PeriodIndex setitem) (GH5155)
• Improvements in Series.transform for significant performance gains (revised) (GH6496)
• Performance improvements in StataReader when reading large files (GH8040, GH8073)
• Performance improvements in StataWriter when writing large files (GH8079)
• Performance and memory usage improvements in multi-key groupby (GH8128)
• Performance improvements in groupby .agg and .apply where builtins max/min were not mapped to numpy/cythonized versions (GH7722)
• Performance improvement in writing to sql (to_sql) of up to 50% (GH8208).
• Performance benchmarking of groupby for large value of ngroups (GH6787)
• Performance improvement in CustomBusinessDay, CustomBusinessMonth (GH8236)
• Performance improvement for MultiIndex.values for multi-level indexes containing datetimes (GH8543)

Bug fixes

• Bug in pivot_table, when using margins and a dict aggfunc (GH8349)
• Bug in read_csv where squeeze=True would return a view (GH8217)
• Bug in checking of table name in read_sql in certain cases (GH7826).
• Bug in DataFrame.groupby where Grouper does not recognize level when frequency is specified (GH7885)
• Bug in multiindexes dtypes getting mixed up when DataFrame is saved to SQL table (GH8021)
• Bug in Series 0-division with a float and integer operand dtypes (GH7785)
• Bug in Series.astype("unicode") not calling unicode on the values correctly (GH7758)
• Bug in DataFrame.as_matrix() with mixed datetime64[ns] and timedelta64[ns] dtypes (GH7778)
• Bug in HDFStore.select_column() not preserving UTC timezone info when selecting a DatetimeIndex (GH7777)
• Bug in to_datetime when format='%Y%m%d' and coerce=True are specified, where previously an object array was returned (rather than a coerced time-series with NaT), (GH7930)
• Bug in DatetimeIndex and PeriodIndex in-place addition and subtraction cause different result from normal one (GH6527)
• Bug in adding and subtracting PeriodIndex with PeriodIndex raise TypeError (GH7741)
• Bug in combine_first with PeriodIndex data raises TypeError (GH3367)
• Bug in MultiIndex slicing with missing indexers (GH7866)
• Bug in MultiIndex slicing with various edge cases (GH8132)
• Regression in MultiIndex indexing with a non-scalar type object (GH7914)
• Bug in Timestamp comparisons with == and int64 dtype (GH8058)
• Bug in pickles contains DateOffset may raise AttributeError when normalize attribute is referred internally (GH7748)
• Bug in Panel when using major_xs and copy=False is passed (deprecation warning fails because of missing warnings) (GH8152).
• Bug in pickle deserialization that failed for pre-0.14.1 containers with dup items trying to avoid ambiguity when matching block and manager items, when there’s only one block there’s no ambiguity (GH7794)
• Bug in putting a PeriodIndex into a Series would convert to int64 dtype, rather than object of Periods (GH7932)
• Bug in HDFStore iteration when passing a where (GH8014)
• Bug in DataFrameGroupby.transform when transforming with a passed non-sorted key (GH8046, GH8430)
• Bug in repeated timeseries line and area plot may result in ValueError or incorrect kind (GH7733)
• Bug in inference in a MultiIndex with datetime.date inputs (GH7888)
• Bug in get where an IndexError would not cause the default value to be returned (GH7725)
• Bug in offsets.apply, rollforward and rollback may reset nanosecond (GH7697)
• Bug in offsets.apply, rollforward and rollback may raise AttributeError if Timestamp has dateutil.tzinfo (GH7697)
• Bug in sorting a MultiIndex frame with a Float64Index (GH8017)
• Bug in inconsistent panel setitem with a rhs of a DataFrame for alignment (GH7763)
• Bug in is_superperiod and is_subperiod cannot handle higher frequencies than S (GH7760, GH7772, GH7803)
• Bug in 32-bit platforms with Series.shift (GH8129)
• Bug in PeriodIndex.unique returns int64 np.ndarray (GH7540)
• Bug in groupby.apply with a non-affecting mutation in the function (GH8467)
• Bug in DataFrame.reset_index which has MultiIndex contains PeriodIndex or DatetimeIndex with tz raises ValueError (GH7746, GH7793)
• Bug in DataFrame.plot with subplots=True may draw unnecessary minor xticks and yticks (GH7801)
• Bug in StataReader which did not read variable labels in 117 files due to difference between Stata documentation and implementation (GH7816)
• Bug in StataReader where strings were always converted to 244 characters-fixed width irrespective of underlying string size (GH7858)
• Bug in DataFrame.plot and Series.plot may ignore rot and fontsize keywords (GH7844)
• Bug in DatetimeIndex.value_counts doesn’t preserve tz (GH7735)
• Bug in PeriodIndex.value_counts results in Int64Index (GH7735)
• Bug in DataFrame.join when doing left join on index and there are multiple matches (GH5391)
• Bug in GroupBy.transform() where int groups with a transform that didn’t preserve the index were incorrectly truncated (GH7972).
• Bug in groupby where callable objects without name attributes would take the wrong path, and produce a DataFrame instead of a Series (GH7929)
• Bug in groupby error message when a DataFrame grouping column is duplicated (GH7511)
• Bug in read_html where the infer_types argument forced coercion of date-likes incorrectly (GH7762, GH7032).
• Bug in Series.str.cat with an index which was filtered as to not include the first item (GH7857)
• Bug in Timestamp cannot parse nanosecond from string (GH7878)
• Bug in Timestamp with string offset and tz results incorrect (GH7833)
• Bug in tslib.tz_convert and tslib.tz_convert_single may return different results (GH7798)
• Bug in DatetimeIndex.intersection of non-overlapping timestamps with tz raises IndexError (GH7880)
• Bug in alignment with TimeOps and non-unique indexes (GH8363)
• Bug in GroupBy.filter() where fast path vs. slow path made the filter return a non scalar value that appeared valid but wasn’t (GH7870).
• Bug in date_range()/DatetimeIndex() when the timezone was inferred from input dates yet incorrect times were returned when crossing DST boundaries (GH7835, GH7901).
• Bug in to_excel() where a negative sign was being prepended to positive infinity and was absent for negative infinity (GH7949)
• Bug in area plot draws legend with incorrect alpha when stacked=True (GH8027)
• Period and PeriodIndex addition/subtraction with np.timedelta64 results in incorrect internal representations (GH7740)
• Bug in Holiday with no offset or observance (GH7987)
• Bug in DataFrame.to_latex formatting when columns or index is a MultiIndex (GH7982).
• Bug in DateOffset around Daylight Savings Time produces unexpected results (GH5175).
• Bug in DataFrame.shift where empty columns would throw ZeroDivisionError on numpy 1.7 (GH8019)
• Bug in installation where html_encoding/*.html wasn’t installed and therefore some tests were not running correctly (GH7927).
• Bug in read_html where bytes objects were not tested for in _read (GH7927).
• Bug in DataFrame.stack() when one of the column levels was a datelike (GH8039)
• Bug in broadcasting numpy scalars with DataFrame (GH8116)
• Bug in pivot_table performed with nameless index and columns raises KeyError (GH8103)
• Bug in DataFrame.plot(kind='scatter') draws points and errorbars with different colors when the color is specified by c keyword (GH8081)
• Bug in Float64Index where iat and at were not testing and were failing (GH8092).
• Bug in DataFrame.boxplot() where y-limits were not set correctly when producing multiple axes (GH7528, GH5517).
• Bug in read_csv where line comments were not handled correctly given a custom line terminator or delim_whitespace=True (GH8122).
- Bug in `read_html` where empty tables caused a `StopIteration` (GH7575)
- Bug in casting when setting a column in a same-dtype block (GH7704)
- Bug in accessing groups from a `GroupBy` when the original grouper was a tuple (GH8121).
- Bug in `.at` that would accept integer indexers on a non-integer index and do fallback (GH7814)
- Bug with `kde` plot and `NaNs` (GH8182)
- Bug in `GroupBy.count` with `float32` data type were `NaN` values were not excluded (GH8169).
- Bug with stacked barplots and `NaNs` (GH8175).
- Bug in resample with non evenly divisible offsets (e.g. ‘7s’) (GH8371)
- Bug in interpolation methods with the limit keyword when no values needed interpolating (GH7173).
- Bug where `col_space` was ignored in `DataFrame.to_string()` when `header=False` (GH8230).
- Bug with `DatetimeIndex.asof` incorrectly matching partial strings and returning the wrong date (GH8245).
- Bug in plotting methods modifying the global matplotlib `rcParams` (GH8242).
- Bug in `DataFrame.__setitem__` that caused errors when setting a dataframe column to a sparse array (GH8131)
- Bug where `DataFrame.boxplot()` failed when entire column was empty (GH8181).
- Bug with messed variables in `radviz` visualization (GH8199).
- Bug in interpolation methods with the limit keyword when no values needed interpolating (GH7173).
- Bug where `col_space` was ignored in `DataFrame.to_string()` when `header=False` (GH8230).
- Bug in `to_clipboard` that would clip long column data (GH8305)
- Bug in `DataFrame` terminal display: Setting `max_column/max_rows` to zero did not trigger auto-resizing of dfs to fit terminal width/height (GH7180).
- Bug in OLS where running with “cluster” and “nw_lags” parameters did not work correctly, but also did not throw an error (GH5884).
- Bug in `DataFrame.dropna` that interpreted non-existent columns in the subset argument as the ‘last column’ (GH8303)
- Bug in `Index.intersection` on non-monotonic non-unique indexes (GH8362).
- Bug in masked series assignment where mismatching types would break alignment (GH8387)
- Bug in `NDFrame.equals` gives false negatives with `dtype=object` (GH8437)
- Bug in assignment with indexer where type diversity would break alignment (GH8258)
- Bug in `NDFrame.loc` indexing when row/column names were lost when target was a list/ndarray (GH6552)
- Regression in `NDFrame.loc` indexing when rows/columns were converted to `Float64Index` if target was an empty list/ndarray (GH7774)
- Bug in `Series` that allows it to be indexed by a `DataFrame` which has unexpected results. Such indexing is no longer permitted (GH8444)
- Bug in item assignment of a `DataFrame` with `MultiIndex` columns where right-hand-side columns were not aligned (GH7655)
- Suppress FutureWarning generated by NumPy when comparing object arrays containing `NaN` for equality (GH7065)
- Bug in `DataFrame.eval()` where the `dtype` of the `not` operator (~) was not correctly inferred as `bool`

5.15 Version 0.14

5.15.1 Version 0.14.1 (July 11, 2014)

This is a minor release from 0.14.0 and includes a small number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

- Highlights include:
  - New methods `select_dtypes()` to select columns based on the dtype and `sem()` to calculate the standard error of the mean.
  - Support for dateutil timezones (see docs).
  - Support for ignoring full line comments in the `read_csv()` text parser.
  - New documentation section on Options and Settings.
  - Lots of bug fixes.

- Enhancements
- API Changes
- Performance Improvements
- Experimental Changes
- Bug Fixes
API changes

- Openpyxl now raises a ValueError on construction of the openpyxl writer instead of warning on pandas import (GH7284).

- For StringMethods.extract, when no match is found, the result - only containing NaN values - now also has dtype=object instead of float (GH7242)

- Period objects no longer raise a TypeError when compared using == with another object that isn’t a Period. Instead when comparing a Period with another object using == if the other object isn’t a Period False is returned. (GH7376)

- Previously, the behaviour on resetting the time or not in offsets.apply, rollforward and rollback operations differed between offsets. With the support of the normalize keyword for all offsets(see below) with a default value of False (preserve time), the behaviour changed for certain offsets (BusinessMonthBegin, MonthEnd, BusinessMonthEnd, CustomBusinessMonthEnd, BusinessYearBegin, LastWeekOfMonth, FY5253Quarter, LastWeekOfMonth, Easter):

  ```
  In [6]: from pandas.tseries import offsets
  In [7]: d = pd.Timestamp('2014-01-01 09:00')
  # old behaviour < 0.14.1
  In [8]: d + offsets.MonthEnd()
  Out[8]: pd.Timestamp('2014-01-31 00:00:00')
  ```

  Starting from 0.14.1 all offsets preserve time by default. The old behaviour can be obtained with normalize=True

  ```
  # new behaviour
  In [1]: d + offsets.MonthEnd()
  Out[1]: Timestamp('2014-01-31 09:00:00')
  In [2]: d + offsets.MonthEnd(normalize=True)
  Out[2]: Timestamp('2014-01-31 00:00:00')
  ```

  Note that for the other offsets the default behaviour did not change.

- Add back #N/A N/A as a default NA value in text parsing. (regression from 0.12) (GH5521)

- Raise a TypeError on inplace-setting with a .where and a non np.nan value as this is inconsistent with a set-item expression like df[mask] = None (GH7656)

Enhancements

- Add dropna argument to value_counts and nunique (GH5569).

- Add select_dtypes() method to allow selection of columns based on dtype (GH7316). See the docs.

- All offsets supports the normalize keyword to specify whether offsets.apply, rollforward and rollback resets the time (hour, minute, etc) or not (default False, preserves time) (GH7156):

  ```
  import pandas.tseries.offsets as offsets
  day = offsets.Day()
  day.apply(pd.Timestamp("2014-01-01 09:00"))
  ```

(continues on next page)
day = offsets.Day(normalize=True)
day.apply(pd.Timestamp("2014-01-01 09:00"))

• PeriodIndex is represented as the same format as DatetimeIndex (GH7601)
• StringMethods now work on empty Series (GH7242)
• The file parsers read_csv and read_table now ignore line comments provided by the parameter comment, which accepts only a single character for the C reader. In particular, they allow for comments before file data begins (GH2685)
• Add NotImplementedError for simultaneous use of chunksize and nrows for read_csv() (GH6774).
• Tests for basic reading of public S3 buckets now exist (GH7281).
• read_html now sports an encoding argument that is passed to the underlying parser library. You can use this to read non-ascii encoded web pages (GH7323).
• read_excel now supports reading from URLs in the same way that read_csv does. (GH6809)
• Support for dateutil timezones, which can now be used in the same way as pytz timezones across pandas. (GH4688)

In [3]: rng = pd.date_range(
   ...: "3/6/2012 00:00", periods=10, freq="D", tz="dateutil/Europe/London"
   ...: )
   ...

In [4]: rng.tz
Out[4]: tzfile('/usr/share/zoneinfo/Europe/London')

See the docs.
• Implemented sem (standard error of the mean) operation for Series, DataFrame, Panel, and Groupby (GH6897)
• Add nlargest and nsmallest to the Series groupby allowlist, which means you can now use these methods on a SeriesGroupBy object (GH7053).
• All offsets apply, rollforward and rollback can now handle np.datetime64, previously results in ApplyTypeError (GH7452)
• Period and PeriodIndex can contain NaT in its values (GH7485)
• Support pickling Series, DataFrame and Panel objects with non-unique labels along item axis (index, columns and items respectively) (GH7370).
• Improved inference of datetime/timedelta with mixed null objects. Regression from 0.13.1 in interpretation of an object Index with all null elements (GH7431)
pandas: powerful Python data analysis toolkit, Release 1.2.5

Performance

- Improvements in dtype inference for numeric operations involving yielding performance gains for dtypes: int64, timedelta64, datetime64 (GH7223)
- Improvements in Series.transform for significant performance gains (GH6496)
- Improvements in DataFrame.transform with ufuncs and built-in grouper functions for significant performance gains (GH7383)
- Regression in groupby aggregation of datetime64 dtypes (GH7555)
- Improvements in MultiIndex.from_product for large iterables (GH7627)

Experimental

- pandas.io.data.Options has a new method, get_all_data method, and now consistently returns a MultiIndexed DataFrame (GH5602)
- io.gbq.read_gbq and io.gbq.to_gbq were refactored to remove the dependency on the Google bq.py command line client. This submodule now uses httplib2 and the Google apiclient and oauth2client API client libraries which should be more stable and, therefore, reliable than bq.py. See the docs. (GH6937)

Bug fixes

- Bug in DataFrame.where with a symmetric shaped frame and a passed other of a DataFrame (GH7506)
- Bug in Panel indexing with a MultiIndex axis (GH7516)
- Regression in datetimelike slice indexing with a duplicated index and non-exact end-points (GH7523)
- Bug in setitem with list-of-lists and single vs mixed types (GH7551)
- Bug in time ops with non-aligned Series (GH7500)
- Bug in timedelta inference when assigning an incomplete Series (GH7592)
- Bug in groupby .nth with a Series and integer-like column name (GH7559)
- Bug in Series.get with a boolean accessor (GH7407)
- Bug in value_counts where NaT did not qualify as missing (NaN) (GH7423)
- Bug in to_timedelta that accepted invalid units and misinterpreted 'm/h' (GH7611, GH6423)
- Bug in line plot doesn’t set correct xlim if secondary_y= True (GH7459)
- Bug in grouped hist and scatter plots use old figsize default (GH7394)
- Bug in plotting subplots with DataFrame.plot, hist clears passed ax even if the number of subplots is one (GH7391).
- Bug in plotting subplots with DataFrame.boxplot with by kw raises ValueError if the number of subplots exceeds 1 (GH7391).
- Bug in subplots displays ticklabels and labels in different rule (GH5897)
- Bug in Panel.apply with a MultiIndex as an axis (GH7469)
- Bug in DatetimeIndex.insert doesn’t preserve name and tz (GH7299)
- Bug in DatetimeIndex.asobject doesn’t preserve name (GH7299)
- Bug in MultiIndex slicing with datetimelike ranges (strings and Timestamps), (GH7429)
Bug in `Index.min` and `max` doesn’t handle `nan` and `NaT` properly (GH7261)

Bug in `PeriodIndex.min/max` results in `int` (GH7609)

Bug in `resample` where `fill_method` was ignored if you passed `how` (GH2073)

Bug in `TimeGrouper` doesn’t exclude column specified by `key` (GH7227)

Bug in `DataFrame` and `Series` bar and barh plot raises `TypeError` when `bottom` and `left` keyword is specified (GH7226)

Bug in `DataFrame.hist` raises `TypeError` when it contains non numeric column (GH7277)

Bug in `Index.delete` does not preserve `name` and `freq` attributes (GH7302)

Bug in `DataFrame.query() / eval` where local string variables with the @ sign were being treated as temporaries attempting to be deleted (GH7300).

Bug in `Float64Index` which didn’t allow duplicates (GH7149).

Bug in `DataFrame.replace()` where truthy values were being replaced (GH7140).

Bug in `StringMethods.extract()` where a single match group Series would use the matcher’s name instead of the group name (GH7313).

Bug in `isnull()` when `mode.use_inf_as_null == True` where isnull wouldn’t test `True` when it encountered an `inf/-inf` (GH7315).

Bug in `inferred_freq` results in `None` for eastern hemisphere timezones (GH7310)

Bug in `Easter` returns incorrect date when offset is negative (GH7195)

Bug in broadcasting with `.div`, integer dtypes and divide-by-zero (GH7325)

Bug in `CustomBusinessDay.apply` raises `NameError` when `np.datetime64` object is passed (GH7196)

Bug in `MultiIndex.append`, `concat` and `pivot_table` don’t preserve timezone (GH6606)

Bug in `.loc` with a list of indexers on a single-multi index level (that is not nested) (GH7349)

Bug in `Series.map` when mapping a dict with tuple keys of different lengths (GH7333)

Bug all `StringMethods` now work on empty Series (GH7242)

Fix delegation of `read_sql` to `read_sql_query` when query does not contain ‘select’ (GH7324).

Bug where a string column name assignment to a `DataFrame` with a `Float64Index` raised a `TypeError` during a call to `np.isnan` (GH7366).

Bug where `NDFrame.replace()` didn’t correctly replace objects with `Period` values (GH7379).

Bug in `.ix` getitem should always return a Series (GH7150)

Bug in `MultiIndex` slicing with incomplete indexers (GH7399)

Bug in `MultiIndex` slicing with a step in a sliced level (GH7400)

Bug where negative indexers in `DatetimeIndex` were not correctly sliced (GH7408)

Bug where `NaT` wasn’t repr’d correctly in a `MultiIndex` (GH7406, GH7409).

Bug where bool objects were converted to `nan` in `convert_objects` (GH7416).

Bug in quantile ignoring the axis keyword argument (GH7306)

Bug where `nanops._maybe_null_out` doesn’t work with complex numbers (GH7353)

Bug in several `nanops` functions when `axis==0` for 1-dimensional `nan` arrays (GH7354)

Bug where `nanops.nanmedian` doesn’t work when `axis==None` (GH7352)
Bug where nanops._has_infs doesn’t work with many dtypes (GH7357)

Bug in StataReader.data where reading a 0-observation dta failed (GH7369)

Bug in StataReader when reading Stata 13 (117) files containing fixed width strings (GH7360)

Bug in StataWriter where encoding was ignored (GH7286)

Bug in DatetimeIndex comparison doesn’t handle NaT properly (GH7529)

Bug in passing input with tzinfo to some offsets apply, rollforward or rollback resets tzinfo or raises ValueError (GH7465)

Bug in DatetimeIndex.to_period, PeriodIndex.asobject, PeriodIndex.to_timestamp doesn’t preserve name (GH7485)

Bug in DatetimeIndex.to_period and PeriodIndex.to_timestamp handle NaT incorrectly (GH7228)

Bug in offsets.apply, rollforward and rollback may return normal datetime (GH7502)

Bug in resample raises ValueError when target contains NaT (GH7227)

Bug in Timestamp.tz_localize resets nanosecond info (GH7534)

Bug in DatetimeIndex.asobject raises ValueError when it contains NaT (GH7539)

Bug in Timestamp.__new__ doesn’t preserve nanosecond properly (GH7610)

Bug in Index.astype(float) where it would return an object dtype Index (GH7464).

Bug in DataFrame.reset_index loses tz (GH3950)

Bug in DatetimeIndex.freqstr raises AttributeError when freq is None (GH7606)

Bug in GroupBy.size created by TimeGrouper raises AttributeError (GH7453)

Bug in single column bar plot is misaligned (GH7498).

Bug in area plot with tz-aware time series raises ValueError (GH7471)

Bug in non-monotonic Index.union may preserve name incorrectly (GH7458)

Bug in DatetimeIndex.intersection doesn’t preserve timezone (GH4690)

Bug in rolling_var where a window larger than the array would raise an error (GH7297)

Bug with last plotted timeseries dictating xlim (GH2960)

Bug with secondary_y axis not being considered for timeseries xlim (GH3490)

Bug in Float64Index assignment with a non scalar indexer (GH7586)

Bug in pandas.core.strings.str_contains does not properly match in a case insensitive fashion when regex=False and case=False (GH7505)

Bug in expanding_cov, expanding_corr, rolling_cov, and rolling_corr for two arguments with mismatched index (GH7512)

Bug in to_sql taking the boolean column as text column (GH7678)

Bug in grouped hist doesn’t handle rot kw and sharex kw properly (GH7234)

Bug in .loc performing fallback integer indexing with object dtype indices (GH7496)

Bug (regression) in PeriodIndex constructor when passed Series objects (GH7701).

5.15.2 Version 0.14.0 (May 31, 2014)

This is a major release from 0.13.1 and includes a small number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

• Highlights include:
  – Officially support Python 3.4
  – SQL interfaces updated to use `sqlalchemy`, See Here.
  – Display interface changes, See Here
  – MultiIndexing Using Slicers, See Here.
  – Ability to join a singly-indexed DataFrame with a MultiIndexed DataFrame, see Here
  – More consistency in groupby results and more flexible groupby specifications, See Here
  – Holiday calendars are now supported in `CustomBusinessDay`, see Here
  – Several improvements in plotting functions, including: hexbin, area and pie plots, see Here.
  – Performance doc section on I/O operations, See Here

• Other Enhancements
• API Changes
• Text Parsing API Changes
• Groupby API Changes
• Performance Improvements
• Prior Deprecations
• Deprecations
• Known Issues
• Bug Fixes
Warning: In 0.14.0 all NDFrame based containers have undergone significant internal refactoring. Before that each block of homogeneous data had its own labels and extra care was necessary to keep those in sync with the parent container's labels. This should not have any visible user/API behavior changes (GH6745)

API changes

- `read_excel` uses 0 as the default sheet (GH6573)
- `iloc` will now accept out-of-bounds indexers for slices, e.g. a value that exceeds the length of the object being indexed. These will be excluded. This will make pandas conform more with python/numpy indexing of out-of-bounds values. A single indexer that is out-of-bounds and drops the dimensions of the object will still raise `IndexError` (GH6296, GH6299). This could result in an empty axis (e.g. an empty DataFrame being returned)

```
In [1]: dfl = pd.DataFrame(np.random.randn(5, 2), columns=list('AB'))

In [2]: dfl
Out[2]:
          A         B
    0  0.469112  -0.282863
    1 -1.509059  -1.135632
    2  1.212112  -0.173215
    3  0.119209  -1.044236
    4 -0.861849  -2.104569

[5 rows x 2 columns]

In [3]: dfl.iloc[:, 2:3]
Out[3]:
Empty DataFrame
Columns: []
Index: [0, 1, 2, 3, 4]

[5 rows x 0 columns]

In [4]: dfl.iloc[:, 1:3]
Out[4]:
         B
    0  -0.282863
    1  -1.135632
    2  -0.173215
    3  -1.044236
    4  -2.104569

[5 rows x 1 columns]

In [5]: dfl.iloc[4:6]
Out[5]:
          A         B
    4  -0.861849  -2.104569

[1 rows x 2 columns]
```

These are out-of-bounds selections
Slicing with negative start, stop & step values handles corner cases better (GH6531):

- `df.iloc[: -len(df)]` is now empty
- `df.iloc[len(df): -1]` now enumerates all elements in reverse

The `DataFrame.interpolate()` keyword `downcast` default has been changed from `infer` to `None`. This is to preserve the original dtyoe unless explicitly requested otherwise (GH6290).

When converting a dataframe to HTML it used to return `Empty DataFrame`. This special case has been removed, instead a header with the column names is returned (GH6062).

Series and Index now internally share more common operations, e.g. `factorize()`, `nunique()`, `value_counts()` are now supported on Index types as well. The `Series.weekday` property from is removed from Series for API consistency. Using a `DatetimeIndex/PeriodIndex` method on a Series will now raise a `TypeError` (GH4551, GH4056, GH5519, GH6380, GH7206).

Add `is_month_start`, `is_month_end`, `is_quarter_start`, `is_quarter_end`, `is_year_start`, `is_year_end` accessors for `DateTimeIndex / Timestamp` which return a boolean array of whether the timestamp(s) are at the start/end of the month/quarter/year defined by the frequency of the `DateTimeIndex / Timestamp` (GH4565, GH6998).

Local variable usage has changed in `pandas.eval() / DataFrame.eval() / DataFrame.query()` (GH5987). For the `DataFrame` methods, two things have changed

- Column names are now given precedence over locals
- Local variables must be referred to explicitly. This means that even if you have a local variable that is not a column you must still refer to it with the '@' prefix.
- You can have an expression like `df.query('@a < a')` with no complaints from pandas about ambiguity of the name `a`.
- The top-level `pandas.eval()` function does not allow you use the '@' prefix and provides you with an error message telling you so.
- `NameResolutionError` was removed because it isn't necessary anymore.

Define and document the order of column vs index names in `query/eval` (GH6676)

`concat` will now concatenate mixed Series and DataFrames using the Series name or numbering columns as needed (GH2385). See the docs

Slicing and advanced/boolean indexing operations on Index classes as well as `Index.delete()` and `Index.drop()` methods will no longer change the type of the resulting index (GH6440, GH7040)
Previously, the above operation would return `Int64Index`. If you’d like to do this manually, use `Index.astype()`

```
In [9]: i[[0, 1, 2]].astype(np.int_)
Out[9]: Int64Index([1, 2, 3], dtype='int64')
```

- `set_index` no longer converts MultiIndexes to an Index of tuples. For example, the old behavior returned an Index in this case (GH6459):

```
# Old behavior, casted MultiIndex to an Index
In [10]: tuple_ind
Out[10]: Index([('a', 'c'), ('a', 'd'), ('b', 'c'), ('b', 'd')], dtype='object')

In [11]: df_multi.set_index(tuple_ind)
Out[11]:
   0  1
(a, c) 0.471435 -1.190976
(a, d) 1.432707 -0.312652
(b, c) -0.720589  0.887163
(b, d)  0.859588 -0.636524
[4 rows x 2 columns]

# New behavior
In [12]: mi
Out[12]: MultiIndex([('a', 'c'), ('a', 'd'), ('b', 'c'), ('b', 'd')],
        )

In [13]: df_multi.set_index(mi)
Out[13]:
   0  1
 a c 0.471435 -1.190976
d 1.432707 -0.312652
 b c 0.859588 -0.636524
[4 rows x 2 columns]
```

This also applies when passing multiple indices to `set_index`:

```
# Old output, 2-level MultiIndex of tuples
In [14]: df_multi.set_index([df_multi.index, df_multi.index])
Out[14]:
   0  1
(a, c) (a, c) 0.471435 -1.190976
(a, d) (a, d) 1.432707 -0.312652
(b, c) (b, c) -0.720589  0.887163
(b, d) (b, d)  0.859588 -0.636524
[4 rows x 2 columns]
```

(continues on next page)
pandas: powerful Python data analysis toolkit, Release 1.2.5

(continued from previous page)

# New output, 4-level MultiIndex
In [15]: df_multi.set_index([df_multi.index, df_multi.index])
Out[15]:
     0 1  
an  a c c  0.471435 -1.190976
d  a d     1.432707 -0.312652
bb c c  -0.720589  0.887163
d  b d     0.859588 -0.636524
[4 rows x 2 columns]

• pairwise keyword was added to the statistical moment functions rolling_cov, rolling_corr, ewmcov, ewmcorr, expanding_cov, expanding_corr to allow the calculation of moving window covariance and correlation matrices (GH4950). See Computing rolling pairwise covariances and correlations in the docs.

In [1]: df = pd.DataFrame(np.random.randn(10, 4), columns=list('ABCD'))
In [4]: covs = pd.rolling_cov(df[['A', 'B', 'C']],
                           df[['B', 'C', 'D']],
                           5,
                           pairwise=True)
In [5]: covs[df.index[-1]]
Out[5]:

<table>
<thead>
<tr>
<th></th>
<th>B</th>
<th>C</th>
<th>D</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>0.035310</td>
<td>0.326593</td>
<td>-0.505430</td>
</tr>
<tr>
<td>B</td>
<td>0.137748</td>
<td>-0.006888</td>
<td>-0.005383</td>
</tr>
<tr>
<td>C</td>
<td>-0.006888</td>
<td>0.861040</td>
<td>0.029762</td>
</tr>
</tbody>
</table>

• Series.iteritems() is now lazy (returns an iterator rather than a list). This was the documented behavior prior to 0.14. (GH6760)

• Added nunique and value_counts functions to Index for counting unique elements. (GH6734)

• stack and unstack now raise a ValueError when the level keyword refers to a non-unique item in the Index (previously raised a KeyError). (GH6738)

• drop unused order argument from Series.sort; args now are in the same order as Series.sort; add na_position arg to conform to Series.sort (GH6847)  

• default sorting algorithm for Series.sort is now quicksort, to conform with Series.sort (and numpy defaults)

• add inplace keyword to Series.sort/sort to make them inverses (GH6859)

• DataFrame.sort now places NaNs at the beginning or end of the sort according to the na_position parameter. (GH3917)

• accept TextFileReader in concat, which was affecting a common user idiom (GH6583), this was a regression from 0.13.1

• Added factorize functions to Index and Series to get indexer and unique values (GH7090)

• describe on a DataFrame with a mix of Timestamp and string like objects returns a different Index (GH7088). Previously the index was unintentionally sorted.
Arithmetic operations with only bool dtypes now give a warning indicating that they are evaluated in Python space for +, -, and * operations and raise for all others (GH7011, GH6762, GH7015, GH7210)

```python
>>> x = pd.Series(np.random.rand(10) > 0.5)
>>> y = True
>>> x + y  # warning generated: should do x | y instead
UserWarning: evaluating in Python space because the '+' operator is not supported by numexpr for the bool dtype, use '|' instead
>>> x / y  # this raises because it doesn't make sense
NotImplementedError: operator '/' not implemented for bool dtypes
```

In HDFStore, select_as_multiple will always raise a KeyError, when a key or the selector is not found (GH6177)

df['col'] = value and df.loc[:, 'col'] = value are now completely equivalent; previously the .loc would not necessarily coerce the dtype of the resultant series (GH6149)

dtypes and ftypes now return a series with dtype=object on empty containers (GH5740)

df.to_csv will now return a string of the CSV data if neither a target path nor a buffer is provided (GH6061)

pd.infer_freq() will now raise a TypeError if given an invalid Series/Index type (GH6407, GH6463)

A tuple passed to DataFrame.sort_index will be interpreted as the levels of the index, rather than requiring a list of tuple (GH4370)

all offset operations now return Timestamp types (rather than datetime), Business/Week frequencies were incorrect (GH4069)

to_excel now converts np.inf into a string representation, customizable by the inf_rep keyword argument (Excel has no native inf representation) (GH782)

Replace pandas.compat.scipy.scoreatpercentile with numpy.percentile (GH6810)

.quantile on a datetime[ns] series now returns Timestamp instead of np.datetime64 objects (GH6810)

change AssertionError to TypeError for invalid types passed to concat (GH6583)

Raise a TypeError when DataFrame is passed an iterator as the data argument (GH5357)

**Display changes**

The default way of printing large DataFrames has changed. DataFrames exceeding max_rows and/or max_columns are now displayed in a centrally truncated view, consistent with the printing of a pandas.Series (GH5603).

In previous versions, a DataFrame was truncated once the dimension constraints were reached and an ellipse (...) signaled that part of the data was cut off.
In [1]: import pandas as pd

In [2]: import numpy as np

In [3]: pd.options.display.max_rows = 6

In [4]: pd.options.display.max_columns = 6

In [5]: index = pd.DatetimeIndex(start='2001-01-01', freq='D', periods=10)

In [6]: pd.DataFrame(np.arange(10*10).reshape((10,10)), index=index)

Out[6]:

```
   0   1   2   3   4   5
2001-01-01  0   1   2   3   4   5
2001-01-02  10  11  12  13  14  15
2001-01-03  16  17  18  19  20  21
2001-01-04  22  23  24  25  26  27
2001-01-05  28  29  30  31  32  33
2001-01-06  34  35  36  37  38  39
2001-01-07  40  41  42  43  44  45
2001-01-08  46  47  48  49  50  51
2001-01-09  52  53  54  55  56  57
2001-01-10  58  59  60  61  62  63
```

[10 rows x 10 columns]

In the current version, large DataFrames are centrally truncated, showing a preview of head and tail in both dimensions.

In [24]: pd.DataFrame(np.arange(10*10).reshape((10,10)), index=index)

Out[24]:

```
   0   1   2   3   4   5
2001-01-01  0   1   2   3   4   5
2001-01-02  10  11  12   7   8   9
2001-01-03  16  17  18  19  20  21
2001-01-04  22  23  24  25  26  27
2001-01-05  28  29  30  31  32  33
2001-01-06  34  35  36  37  38  39
2001-01-07  40  41  42  43  44  45
2001-01-08  46  47  48  49  50  51
2001-01-09  52  53  54  55  56  57
2001-01-10  58  59  60  61  62  63
```

[10 rows x 10 columns]

- allow option 'truncate' for display.show_dimensions to only show the dimensions if the frame is truncated (GH6547).

The default for display.show_dimensions will now be truncate. This is consistent with how Series display length.

In [16]: dfd = pd.DataFrame(np.arange(25).reshape(-1, 5),
                      index=[0, 1, 2, 3, 4],
                      columns=[0, 1, 2, 3, 4])

# show dimensions since this is truncated
In [17]: with pd.option_context('display.max_rows', 2, 'display.max_columns', 2, (continues on next page)
.....:     'display.show_dimensions', 'truncate'):
.....:     print(dfd)
.....:
....:     0  ...  4
0 0  ...  4
.. .. ... ..
4 20  ...  24
[5 rows x 5 columns]

# will not show dimensions since it is not truncated

In [18]: with pd.option_context('display.max_rows', 10, 'display.max_columns', 40,
.....:     'display.show_dimensions', 'truncate'):
.....:     print(dfd)
.....:
....:     0 1 2 3 4
0 0 1 2 3 4
1 5 6 7 8 9
2 10 11 12 13 14
3 15 16 17 18 19
4 20 21 22 23 24

• Regression in the display of a MultiIndexed Series with display.max_rows is less than the length of the series (GH7101)
• Fixed a bug in the HTML repr of a truncated Series or DataFrame not showing the class name with the large_repr set to ‘info’ (GH7105)
• The verbose keyword in DataFrame.info(), which controls whether to shorten the info representation, is now None by default. This will follow the global setting in display.max_info_columns. The global setting can be overridden with verbose=True or verbose=False.
• Fixed a bug with the info repr not honoring the display.max_info_columns setting (GH6939)
• Offset/freq info now in Timestamp __repr__ (GH4533)

**Text parsing API changes**

`read_csv()`/`read_table()` will now be noisier w.r.t invalid options rather than falling back to the PythonParser.

• Raise ValueError when sep specified with delim_whitespace=True in `read_csv()`/`read_table()` (GH6607)
• Raise ValueError when engine='c' specified with unsupported options in `read_csv()`/`read_table()` (GH6607)
• Raise ValueError when fallback to python parser causes options to be ignored (GH6607)
• Produce ParserWarning on fallback to python parser when no options are ignored (GH6607)
• Translate sep='\s+' to delim_whitespace=True in `read_csv()`/`read_table()` if no other C-unsupported options specified (GH6607)
GroupBy API changes

More consistent behavior for some groupby methods:

- groupby head and tail now act more like filter rather than an aggregation:

```
In [19]: df = pd.DataFrame([[1, 2], [1, 4], [5, 6]], columns=['A', 'B'])
In [20]: g = df.groupby('A')
In [21]: g.head(1)  # filters DataFrame
Out[21]:
   A  B
0  1  2
2  5  6
[2 rows x 2 columns]
In [22]: g.apply(lambda x: x.head(1))  # used to simply fall-through
Out[22]:
   A  B
A  1  2
5  6
[2 rows x 2 columns]
```

- groupby head and tail respect column selection:

```
In [23]: g[['B']].head(1)
Out[23]:
   B
0  2
2  6
[2 rows x 1 columns]
```

- groupby nth now reduces by default; filtering can be achieved by passing as_index=False. With an optional dropna argument to ignore NaN. See the docs.

```
Reducing
In [24]: df = pd.DataFrame([[1, np.nan], [1, 4], [5, 6]], columns=['A', 'B'])
In [25]: g = df.groupby('A')
In [26]: g.nth(0)
Out[26]:
   B
A
1  NaN
5  6.0
[2 rows x 1 columns]
```

(continues on next page)
# this is equivalent to g.first()

```
In [27]: g.nth(0, dropna='any')
```

```
Out[27]:

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>B</td>
</tr>
<tr>
<td>1</td>
<td>4.0</td>
</tr>
<tr>
<td>5</td>
<td>6.0</td>
</tr>
</tbody>
</table>

[2 rows x 1 columns]
```

# this is equivalent to g.last()

```
In [28]: g.nth(-1, dropna='any')
```

```
Out[28]:

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>B</td>
</tr>
<tr>

[2 rows x 16 columns]

• Allow specification of a more complex groupby via pd.Grouper, such as grouping by a Time and a string field simultaneously. See the docs. (GH3794)

• Better propagation/preservation of Series names when performing groupby operations:
  – SeriesGroupBy.agg will ensure that the name attribute of the original series is propagated to the result (GH6265).
  – If the function provided to GroupBy.apply returns a named series, the name of the series will be kept as the name of the column index of the DataFrame returned by GroupBy.apply (GH6124). This facilitates
DataFrame.stack operations where the name of the column index is used as the name of the inserted column containing the pivoted data.

**SQL**

The SQL reading and writing functions now support more database flavors through SQLAlchemy (GH2717, GH4163, GH5950, GH6292). All databases supported by SQLAlchemy can be used, such as PostgreSQL, MySQL, Oracle, Microsoft SQL server (see documentation of SQLAlchemy on included dialects).

The functionality of providing DBAPI connection objects will only be supported for sqlite3 in the future. The 'mysql' flavor is deprecated.

The new functions read_sql_query() and read_sql_table() are introduced. The function read_sql() is kept as a convenience wrapper around the other two and will delegate to specific function depending on the provided input (database table name or sql query).

In practice, you have to provide a SQLAlchemy engine to the sql functions. To connect with SQLAlchemy you use the create_engine() function to create an engine object from database URI. You only need to create the engine once per database you are connecting to. For an in-memory sqlite database:

```python
In [40]: from sqlalchemy import create_engine

# Create your connection.
In [41]: engine = create_engine('sqlite:///::memory:')
```

This engine can then be used to write or read data to/from this database:

```python
In [42]: df = pd.DataFrame({'A': [1, 2, 3], 'B': ['a', 'b', 'c']})
In [43]: df.to_sql('db_table', engine, index=False)
```

You can read data from a database by specifying the table name:

```python
In [44]: pd.read_sql_table('db_table', engine)
Out[44]:
   A  B
0  1  a
1  2  b
2  3  c
[3 rows x 2 columns]
```

or by specifying a sql query:

```python
In [45]: pd.read_sql_query('SELECT * FROM db_table', engine)
Out[45]:
   A  B
0  1  a
1  2  b
2  3  c
[3 rows x 2 columns]
```

Some other enhancements to the sql functions include:

- support for writing the index. This can be controlled with the index keyword (default is True).
pandas: powerful Python data analysis toolkit, Release 1.2.5

- specify the column label to use when writing the index with `index_label`.
- specify string columns to parse as datetimes with the `parse_dates` keyword in `read_sql_query()` and `read_sql_table()`.

**Warning:** Some of the existing functions or function aliases have been deprecated and will be removed in future versions. This includes: `tquery`, `uquery`, `read_frame`, `frame_query`, `write_frame`.

**Warning:** The support for the ‘mysql’ flavor when using DBAPI connection objects has been deprecated. MySQL will be further supported with SQLAlchemy engines (GH6900).

### Multi-indexing using slicers

In 0.14.0 we added a new way to slice MultiIndexed objects. You can slice a MultiIndex by providing multiple indexers. You can provide any of the selectors as if you are indexing by label, see Selection by Label, including slices, lists of labels, labels, and boolean indexers. You can use `slice(None)` to select all the contents of that level. You do not need to specify all the deeper levels, they will be implied as `slice(None)`.

As usual, both sides of the slicers are included as this is label indexing.

See the docs See also issues (GH6134, GH4036, GH3057, GH2598, GH5641, GH7106)

**Warning:** You should specify all axes in the `.loc` specifier, meaning the indexer for the `index` and for the `columns`. Their are some ambiguous cases where the passed indexer could be mis-interpreted as indexing both axes, rather than into say the MultiIndex for the rows.

You should do this:

```python
>>> df.loc[(slice('A1', 'A3'), ...), :]  # noqa: E901
```
rather than this:

```python
>>> df.loc[(slice('A1', 'A3'), ...)]  # noqa: E901
```

**Warning:** You will need to make sure that the selection axes are fully lexsorted!

```python
In [46]: def mklbl(prefix, n):
    ....:     return ["%s%s" % (prefix, i) for i in range(n)]
    ....:

In [47]: index = pd.MultiIndex.from_product([mklbl('A', 4),
    ....:     mklbl('B', 2),
    ....:     mklbl('C', 4),
    ....:     mklbl('D', 2)])
```
In [48]: columns = pd.MultiIndex.from_tuples([
    ('a', 'foo'), ('a', 'bar'),
    ('b', 'foo'), ('b', 'bah')],
    names=['lvl0', 'lvl1'])

In [49]: df = pd.DataFrame(np.arange(len(index) * len(columns)).reshape((len(index),
    len(columns))),
    index=index,
    columns=columns).sort_index().sort_index(axis=1)

In [50]: df
Out[50]:
lvl0   a   b
lvl1
A0  B0  C0  D0  1   0   3   2
     D1  5   4   7   6
   C1  D0  9   8  11  10
     D1 13  12  15  14
   C2  D0 17  16  19  18
   ... ... ... ... ...
A3  B1  C1  D1 237 236 239 238
   C2  D0 241 240 243 242
     D1 245 244 247 246
   C3  D0 249 248 251 250
     D1 253 252 255 254
[64 rows x 4 columns]

Basic MultiIndex slicing using slices, lists, and labels.

In [51]: df.loc[(slice('A1', 'A3'), slice(None), ['C1', 'C3'])]
Out[51]:
lvl0   a   b
lvl1
A1  B0  C1  D0  73  72  75  74
     D1  77  76  79  78
   C3  D0  89  88  91  90
     D1  93  92  95  94
   B1  C1  D0 105 104 107 106
   ... ... ... ... ...
A3  B0  C3  D1 221 220 223 222
   B1  C1  D0 233 232 235 234
     D1 237 236 239 238
   C3  D0 249 248 251 250
     D1 253 252 255 254
[24 rows x 4 columns]

You can use a pd.IndexSlice to shortcut the creation of these slices.
In [52]: idx = pd.IndexSlice

In [53]: df.loc[idx[:, :, ['C1', 'C3']], idx[:, 'foo']]  
Out[53]:

(continues on next page)
Using a boolean indexer you can provide selection related to the values.

```
In [56]: mask = df[('a', 'foo')] > 200

In [57]: df.loc[idx[mask, :, ['C1', 'C3']], idx[:, 'foo']]
```

```
Out[57]:
     a   b
  lvl0
A3  204  206
C3  216  218
  lvl1
A0  200  200
C0  210  210
```

You can also specify the `axis` argument to `.loc` to interpret the passed slicers on a single axis.

```
In [58]: df.loc(axis=0)[:, :, ['C1', 'C3']]
```

```
Out[58]:
    a   b
  lvl0
A0   9   8
C0  11  10
  lvl1
A0   8   8
C0  12  12
```

Furthermore you can set the values using these methods

```
In [59]: df2 = df.copy()

In [60]: df2.loc(axis=0)[:, :, ['C1', 'C3']] = -10

In [61]: df2
```

```
Out[61]:
     a   b
  lvl0
A3  221  222
C3  233  234
  lvl1
A0  220  220
C0  232  232
```
A0 B0 C0 D0 1 0 3 2
   D1 5 4 7 6
  C1 D0 -10 -10 -10 -10
  D1 -10 -10 -10 -10
  C2 D0 17 16 19 18
... ... ... ...
A3 B1 C1 D1 -10 -10 -10 -10
  C2 D0 241 240 243 242
  D1 245 244 247 246
  C3 D0 -10 -10 -10 -10
  D1 -10 -10 -10 -10

[64 rows x 4 columns]

You can use a right-hand-side of an alignable object as well.

```
In [62]: df2 = df.copy()
In [63]: df2.loc[idx[:, :, ['C1', 'C3']], :] = df2 * 1000
In [64]: df2
```
```
Out[64]:
  lvl0    a    b
  lvl1 bar foo bah foo
A0 B0 C0 D0 1 0 3 2
   D1 5 4 7 6
  C1 D0 9000 8000 11000 10000
  D1 13000 12000 15000 14000
  C2 D0 17 16 19 18
... ... ... ... ...
A3 B1 C1 D1 237000 236000 239000 238000
  C2 D0 241 240 243 242
  D1 245 244 247 246
  C3 D0 249000 248000 251000 250000
  D1 253000 252000 255000 254000

[64 rows x 4 columns]
```

### Plotting

- Hexagonal bin plots from DataFrame.plot with kind='hexbin' *(GH5478)*, See the docs.
- DataFrame.plot and Series.plot now supports area plot with specifying kind='area' *(GH6656)*, See the docs.
- Pie plots from Series.plot and DataFrame.plot with kind='pie' *(GH6976)*, See the docs.
- Plotting with Error Bars is now supported in the .plot method of DataFrame and Series objects *(GH3796, GH6834)*, See the docs.
- DataFrame.plot and Series.plot now support a table keyword for plotting matplotlib.Table. See the docs. The table keyword can receive the following values.
  - False: Do nothing (default).
- True: Draw a table using the DataFrame or Series called plot method. Data will be transposed to meet matplotlib’s default layout.
- DataFrame or Series: Draw matplotlib.table using the passed data. The data will be drawn as displayed in print method (not transposed automatically). Also, helper function pandas.tools.plotting.table is added to create a table from DataFrame and Series, and add it to an matplotlib.Axes.

- plot(legend='reverse') will now reverse the order of legend labels for most plot kinds. (GH6014)
- Line plot and area plot can be stacked by stacked=True (GH6656)
- Following keywords are now acceptable for DataFrame.plot() with kind='bar' and kind='barh':
  - width: Specify the bar width. In previous versions, static value 0.5 was passed to matplotlib and it cannot be overwritten. (GH6604)
  - align: Specify the bar alignment. Default is center (different from matplotlib). In previous versions, pandas passes align='edge' to matplotlib and adjust the location to center by itself, and it results align keyword is not applied as expected. (GH4525)
  - position: Specify relative alignments for bar plot layout. From 0 (left/bottom-end) to 1(right/top-end). Default is 0.5 (center). (GH6604)

Because of the default align value changes, coordinates of bar plots are now located on integer values (0.0, 1.0, 2.0 ...). This is intended to make bar plot be located on the same coordinates as line plot. However, bar plot may differs unexpectedly when you manually adjust the bar location or drawing area, such as using set_xlim, set_ylim, etc. In this cases, please modify your script to meet with new coordinates.

- The parallel_coordinates() function now takes argument color instead of colors. A FutureWarning is raised to alert that the old colors argument will not be supported in a future release. (GH6956)
- The parallel_coordinates() and andrews_curves() functions now take positional argument frame instead of data. A FutureWarning is raised if the old data argument is used by name. (GH6956)
- DataFrame.boxplot() now supports layout keyword (GH6769)
- DataFrame.boxplot() has a new keyword argument, return_type. It accepts 'dict', 'axes', or 'both', in which case a namedtuple with the matplotlib axes and a dict of matplotlib Lines is returned.

Prior version deprecations/changes

There are prior version deprecations that are taking effect as of 0.14.0.
- Remove DateRange in favor of DatetimeIndex (GH6816)
- Remove column keyword from DataFrame.sort (GH4370)
- Remove precision keyword from set_eng_float_format() (GH395)
- Remove force_unicode keyword from DataFrame.to_string(), DataFrame.to_latex(), and DataFrame.to_html(); these function encode in unicode by default (GH2224, GH2225)
- Remove nanRep keyword from DataFrame.to_csv() and DataFrame.to_string() (GH275)
- Remove unique keyword from HDFStore.select_column() (GH3256)
- Remove inferTimeRule keyword from Timestamp.offset() (GH391)
- Remove name keyword from get_data_yahoo() and get_data_google() (commit b921d1a)
- Remove offset keyword from DatetimeIndex constructor (commit 3136390)
- Remove time_rule from several rolling-moment statistical functions, such as rolling_sum() (GH1042)
• Removed neg – boolean operations on numpy arrays in favor of inv ~, as this is going to be deprecated in numpy 1.9 (GH6960)

Deprecations

• The `pivot_table()`/`DataFrame.pivot_table()` and `crosstab()` functions now take arguments `index` and `columns` instead of `rows` and `cols`. A `FutureWarning` is raised to alert that the old `rows` and `cols` arguments will not be supported in a future release (GH5505)

• The `DataFrame.drop_duplicates()` and `DataFrame.duplicated()` methods now take argument `subset` instead of `cols` to better align with `DataFrame.dropna()`. A `FutureWarning` is raised to alert that the old `cols` arguments will not be supported in a future release (GH6680)

• The `DataFrame.to_csv()` and `DataFrame.to_excel()` functions now takes argument `columns` instead of `cols`. A `FutureWarning` is raised to alert that the old `cols` arguments will not be supported in a future release (GH6645)

• Indexers will warn `FutureWarning` when used with a scalar indexer and a non-floating point Index (GH4892, GH6960)

```python
# non-floating point indexes can only be indexed by integers / labels
In [1]: pd.Series(1, np.arange(5))[3.0]
   ...: pandas/core/index.py:469: FutureWarning: scalar indexers for index type...
   ...: Int64Index should be integers and not floating point
Out[1]: 1

In [2]: pd.Series(1, np.arange(5)).iloc[3.0]
   ...: pandas/core/index.py:469: FutureWarning: scalar indexers for index type...
   ...: Int64Index should be integers and not floating point
Out[2]: 1

In [3]: pd.Series(1, np.arange(5)).iloc[3.0:4]
   ...: pandas/core/index.py:527: FutureWarning: slice indexers when using iloc...
   ...: should be integers and not floating point
Out[3]:
   3  1
   dtype: int64

# these are Float64Indexes, so integer or floating point is acceptable
In [4]: pd.Series(1, np.arange(5.))[3]
Out[4]: 1

In [5]: pd.Series(1, np.arange(5.))[3.0]
Out[6]: 1
```

• Numpy 1.9 compat w.r.t. deprecation warnings (GH6960)

• `Panel.shift()` now has a function signature that matches `DataFrame.shift()`. The old positional argument `lags` has been changed to a keyword argument `periods` with a default value of 1. A `FutureWarning` is raised if the old argument `lags` is used by name. (GH6910)

• The `order` keyword argument of `factorize()` will be removed. (GH6926).

• Remove the copy keyword from `DataFrame.xs()`, `Panel.major_xs()`, `Panel.minor_xs()`. A view will be returned if possible, otherwise a copy will be made. Previously the user could think that `copy=False` would ALWAYS return a view. (GH6894)
• The parallel_coordinates() function now takes argument color instead of colors. A FutureWarning is raised to alert that the old colors argument will not be supported in a future release. (GH6956)

• The parallel_coordinates() and andrews_curves() functions now take positional argument frame instead of data. A FutureWarning is raised if the old data argument is used by name. (GH6956)

• The support for the 'mysql' flavor when using DBAPI connection objects has been deprecated. MySQL will be further supported with SQLAlchemy engines (GH6900).

• The following io.sql functions have been deprecated: tquery, uquery, read_frame, frame_query, write_frame.

• The percentile_width keyword argument in describe() has been deprecated. Use the percentiles keyword instead, which takes a list of percentiles to display. The default output is unchanged.

• The default return type of boxplot() will change from a dict to a matplotlib Axes in a future release. You can use the future behavior now by passing return_type='axes' to boxplot.

Known issues

• OpenPyXL 2.0.0 breaks backwards compatibility (GH7169)

Enhancements

• DataFrame and Series will create a MultiIndex object if passed a tuples dict, See the docs (GH3323)

```python
In [65]: pd.Series({('a', 'b'): 1, ('a', 'a'): 0, 
               ....: ('a', 'c'): 2, ('b', 'a'): 3, ('b', 'b'): 4})
Out[65]:
   a b
0 1 0
1 2
2 3
3 4
Length: 5, dtype: int64
```

```python
In [66]: pd.DataFrame({('a', 'b'): {('A', 'B'): 1, ('A', 'C'): 2}, 
               ....: ('a', 'a'): {('A', 'A'): 3, ('A', 'B'): 4}, 
               ....: ('a', 'c'): {('A', 'A'): 5, ('A', 'C'): 6}, 
               ....: ('b', 'a'): {('A', 'A'): 7, ('A', 'B'): 8}, 
               ....: ('b', 'b'): {('A', 'A'): 9, ('A', 'B'): 10}})
Out[66]:
      a  b
   A B  1.0 4.0 5.0 8.0 10.0
   C  2.0 3.0 6.0 7.0 NaN
   D   NaN  NaN  NaN  NaN  9.0
[3 rows x 5 columns]
```

• Added the sym_diff method to Index (GH5543)

• DataFrame.to_latex now takes a longtable keyword, which if True will return a table in a longtable environment. (GH6617)
• Add option to turn off escaping in DataFrame.to_latex (GH6472)

• pd.read_clipboard will, if the keyword sep is unspecified, try to detect data copied from a spreadsheet and parse accordingly. (GH6223)

• Joining a singly-indexed DataFrame with a MultiIndexed DataFrame (GH3662)

See the docs. Joining MultiIndex DataFrames on both the left and right is not yet supported ATM.

```python
In [66]: household = pd.DataFrame({'household_id': [1, 2, 3],
                          'male': [0, 1, 0],
                          'wealth': [196087.3, 316478.7, 294750]},
                         columns=['household_id', 'male', 'wealth']).set_index('household_id')

In [67]: portfolio = pd.DataFrame({'household_id': [1, 2, 2, 3, 3, 3, 4],
                             'asset_id': ['nl0000301109', 'nl0000289783', 'gb00b03mlx29', 'gb00b03mlx29', 'lu0197800237', 'nl0000289965', np.nan],
                             'name': ['ABN Amro', 'Robeco', 'Royal Dutch Shell', 'Royal Dutch Shell', 'AAAB Eastern Europe Equity Fund', 'Postbank BioTech Fonds', np.nan],
                             'share': [1.0, 0.4, 0.6, 0.15, 0.6, 0.25, 1.0]},
                            columns=['household_id', 'asset_id', 'name', 'share']).set_index(['household_id', 'asset_id'])
```

```text
In [68]: household
Out[68]:
      male  wealth
household_id
1      0  196087.3
2      1  316478.7
3      0  294750.0

[3 rows x 2 columns]

In [69]: portfolio
Out[69]:
     name  share
household_id asset_id
1  nl0000301109    ABN Amro  1.00
2  nl0000289783  Robeco  0.40
```

(continues on next page)
pandas: powerful Python data analysis toolkit, Release 1.2.5

In [71]: household.join(portfolio, how='inner')
Out[71]:

[6 rows x 4 columns]

- `quotechar`, `doublequote`, and `escapechar` can now be specified when using `DataFrame.to_csv` (GH5414, GH4528)
- Partially sort by only the specified levels of a MultiIndex with the `sort_remaining` boolean kwarg. (GH3984)
- Added `to_julian_date` to TimeStamp and DatetimeIndex. The Julian Date is used primarily in astronomy and represents the number of days from noon, January 1, 4713 BC. Because nanoseconds are used to define the time in pandas the actual range of dates that you can use is 1678 AD to 2262 AD. (GH4041)
- `DataFrame.to_stata` will now check data for compatibility with Stata data types and will upcast when needed. When it is not possible to losslessly upcast, a warning is issued (GH6327)
- `DataFrame.to_stata` and `StataWriter` will accept keyword arguments `time_stamp` and `data_label` which allow the time stamp and dataset label to be set when creating a file. (GH6545)
- `pandas.io.gbq` now handles reading unicode strings properly. (GH5940)
- `Holidays Calendars` are now available and can be used with the `CustomBusinessDay` offset (GH6719)
- `Float64Index` is now backed by a `float64` dtype ndarray instead of an `object` dtype array (GH6471).
- Implemented `Panel.pct_change` (GH6904)
- Added how option to rolling-moment functions to dictate how to handle resampling: `rolling_max()` defaults to max, `rolling_min()` defaults to min, and all others default to mean (GH6297)
- `CustomBusinessMonthBegin` and `CustomBusinessMonthEnd` are now available (GH6866)
- `Series.quantile()` and `DataFrame.quantile()` now accept an array of quantiles.
- `describe()` now accepts an array of percentiles to include in the summary statistics (GH4196)
- `pivot_table` can now accept `Grouper` by index and columns keywords (GH6913)

In [72]: import datetime

In [73]: df = pd.DataFrame({
    ....:     'Branch': 'A A A A A B'.split(),
    ....: })

(continues on next page)
Arrays of strings can be wrapped to a specified width (str.wrap) (GH6999)

Add nsmallest() and Series.nlargest() methods to Series, See the docs (GH3960)

PeriodIndex fully supports partial string indexing like DatetimeIndex (GH7043)

```
In [76]: prng = pd.period_range('2013-01-01 09:00', periods=100, freq='H')

In [77]: ps = pd.Series(np.random.randn(len(prng)), index=prng)

In [78]: ps
```

- `read_excel` can now read milliseconds in Excel dates and times with `xlrd >= 0.9.3`. (GH5945)
- `pd.stats.moments.rolling_var` now uses Welford’s method for increased numerical stability (GH6817)
- `pd.expanding_apply` and `pd.rolling_apply` now take args and kwargs that are passed on to the func (GH6289)
- `Dataframe.rank()` now has a percentage rank option (GH5971)
- `Series.rank()` now has a percentage rank option (GH5971)
- `Series.rank()` and `DataFrame.rank()` now accept `method='dense'` for ranks without gaps (GH6514)
- Support passing `encoding` with `xlwt` (GH3710)
- Refactor `Block` classes removing `Block.items` attributes to avoid duplication in item handling (GH6745, GH6988).
- Testing statements updated to use specialized asserts (GH6175)
Performance

- Performance improvement when converting `DatetimeIndex` to floating ordinals using `DatetimeConverter` (GH6636)
- Performance improvement for `DataFrame.shift` (GH5609)
- Performance improvement in indexing into a MultiIndexed Series (GH5567)
- Performance improvements in single-dtyped indexing (GH6484)
- Improve performance of `DataFrame` construction with certain offsets, by removing faulty caching (e.g. `MonthEnd`, `BusinessMonthEnd`), (GH6479)
- Improve performance of `CustomBusinessDay` (GH6584)
- Improve performance of slice indexing on Series with string keys (GH6341, GH6372)
- Performance improvement for `DataFrame.from_records` when reading a specified number of rows from an iterable (GH6700)
- Performance improvements in timedelta conversions for integer dtypes (GH6754)
- Improved performance of compatible pickles (GH6899)
- Improve performance in certain reindexing operations by optimizing `take_2d` (GH6749)
- `GroupBy.count()` is now implemented in Cython and is much faster for large numbers of groups (GH7016).

Experimental

There are no experimental changes in 0.14.0

Bug fixes

- Bug in Series `ValueError` when index doesn’t match data (GH6532)
- Prevent segfault due to MultiIndex not being supported in HDFStore table format (GH1848)
- Bug in `pd.DataFrame.sort_index` where mergesort wasn’t stable when `ascending=False` (GH6399)
- Bug in `pd.tseries.frequencies.to_offset` when argument has leading zeros (GH6391)
- Bug in version string gen. for dev versions with shallow clones / install from tarball (GH6127)
- Inconsistent tz parsing `Timestamp / to_datetime` for current year (GH5958)
- Indexing bugs with reordered indexes (GH6252, GH6254)
- Bug in `.xs` with a Series multiindex (GH6258, GH5684)
- Bug in conversion of a string types to a `DatetimeIndex` with a specified frequency (GH6273, GH6274)
- Bug in `eval` where type-promotion failed for large expressions (GH6205)
- Bug in interpolate with `inplace=True` (GH6281)
- HDFStore.remove now handles start and stop (GH6177)
- HDFStore.select_as_multiple handles start and stop the same way as `select` (GH6177)
- HDFStore.select_as_coordinates and `select_column` works with a `where` clause that results in filters (GH6177)
- Regression in join of non_unique_indexes (GH6329)
• Issue with groupby agg with a single function and a mixed-type frame (GH6337)
• Bug in DataFrame.replace() when passing a non-bool to_replace argument (GH6332)
• Raise when trying to align on different levels of a MultiIndex assignment (GH3738)
• Bug in setting complex dtypes via boolean indexing (GH6345)
• Bug in TimeGrouper/resample when presented with a non-monotonic DatetimeIndex that would return invalid results. (GH4161)
• Bug in index name propagation in TimeGrouper/resample (GH4161)
• TimeGrouper has a more compatible API to the rest of the groupers (e.g. groups was missing) (GH3881)
• Bug in multiple grouping with a TimeGrouper depending on target column order (GH6764)
• Bug in pd.eval when parsing strings with possible tokens like '&' (GH6351)
• Bug correctly handle placements of -inf in Panels when dividing by integer 0 (GH6178)
• DataFrame.shift with axis=1 was raising (GH6371)
• Disabled clipboard tests until release time (run locally with no tests -A disabled) (GH6048).
• Bug in DataFrame.replace() when passing a nested dict that contained keys not in the values to be replaced (GH6342)
• str.match ignored the na flag (GH6609).
• Bug in take with duplicate columns that were not consolidated (GH6240)
• Bug in interpolate changing dtypes (GH6290)
• Bug in Series.get was using a buggy access method (GH6383)
• Bug in hdfstore queries of the form where=[('date', '>=' , datetime(2013,1,1)), ('date', '<=', datetime(2014,1,1))] (GH6313)
• Bug in DataFrame.dropna with duplicate indices (GH6355)
• Regression in chained getitem indexing with embedded list-like from 0.12 (GH6394)
• Float64Index with nans not comparing correctly (GH6401)
• eval/query expressions with strings containing the @ character will now work (GH6366).
• Bug in Series.reindex when specifying a method with some nan values was inconsistent (noted on a resample) (GH6418)
• Bug in DataFrame.replace() where nested dicts were erroneously depending on the order of dictionary keys and values (GH5338).
• Performance issue in concatenating with empty objects (GH3259)
• Clarify sorting of sym_diff on Index objects with NaN values (GH6444)
• Regression in MultiIndex.from_product with a DatetimeIndex as input (GH6439)
• Bug in str.extract when passed a non-default index (GH6348)
• Bug in str.split when passed pat=None and n=1 (GH6466)
• Bug in io.data.DataReader when passed "F-F_Momentum_Factor" and data_source="famafrench" (GH6460)
• Bug in sum of a timedelta64[ns] series (GH6462)
• Bug in resample with a timezone and certain offsets (GH6397)
• Bug in iat/iloc with duplicate indices on a Series (GH6493)
• Bug in read_html where nan’s were incorrectly being used to indicate missing values in text. Should use the empty string for consistency with the rest of pandas (GH5129).
• Bug in read_html tests where redirected invalid URLs would make one test fail (GH6445).
• Bug in multi-axis indexing using .loc on non-unique indices (GH6504)
• Bug that caused _ref_locs corruption when slice indexing across columns axis of a DataFrame (GH6525)
• Regression from 0.13 in the treatment of numpy datetime64 non-ns dtypes in Series creation (GH6529)
• .names attribute of MultiIndexes passed to set_index are now preserved (GH6459).
• Bug in setitem with a duplicate index and an alignable rhs (GH6541)
• Bug in setitem with .loc on mixed integer Indexes (GH6546)
• Bug in pd.read_stata which would use the wrong data types and missing values (GH6327)
• Bug in DataFrame.to_stata that lead to data loss in certain cases, and could be exported using the wrong data types and missing values (GH6335)
• StataWriter replaces missing values in string columns by empty string (GH6802)
• Inconsistent types in Timestamp addition/subtraction (GH6543)
• Bug in preserving frequency across Timestamp addition/subtraction (GH4547)
• Bug in empty list lookup caused IndexError exceptions (GH6536, GH6551)
• Series.quantile raising on an object dtype (GH6555)
• Bug in .xs with a nan in level when dropped (GH6574)
• Bug in fillna with method='bfill/ffill' and datetime64[ns] dtype (GH6587)
• Bug in sql writing with mixed dtypes possibly leading to data loss (GH6509)
• Bug in Series.pop (GH6600)
• Bug in ioc indexing when positional indexer matched Int64Index of the corresponding axis and no reordering happened (GH6612)
• Bug in fillna with limit and value specified
• Bug in DataFrame.to_stata when columns have non-string names (GH4558)
• Bug in compat with np.compress, surfaced in (GH6658)
• Bug in binary operations with a rhs of a Series not aligning (GH6681)
• Bug in DataFrame.to_stata which incorrectly handles nan values and ignores with_index keyword argument (GH6685)
• Bug in resample with extra bins when using an evenly divisible frequency (GH4076)
• Bug in consistency of groupby aggregation when passing a custom function (GH6715)
• Bug in resample when how=None resample freq is the same as the axis frequency (GH5955)
• Bug in downcasting inference with empty arrays (GH6733)
• Bug in obj.blocks on sparse containers dropping all but the last items of same for dtype (GH6748)
• Bug in unpickling NaT (NaTType) (GH4606)
• Bug in DataFrame.replace() where regex meta characters were being treated as regex even when regex=False (GH6777).
- Bug in timedelta ops on 32-bit platforms (GH6808)
- Bug in setting a tz-aware index directly via .index (GH6785)
- Bug in expressions.py where numexpr would try to evaluate arithmetic ops (GH6762).
- Bug in Makefile where it didn't remove Cython generated C files with make clean (GH6768)
- Bug in DataFrame._reduce where non bool-like (0/1) integers were being converted into bools. (GH6806)
- Regression from 0.13 with fillna and a Series on datetime-like (GH6344)
- Bug in adding np.timedelta64 to DatetimeIndex with timezone outputs incorrect results (GH6818)
- Bug in DataFrame.replace() where changing a dtype through replacement would only replace the first occurrence of a value (GH6869)
- Better error message when passing a frequency of ‘MS’ in Period construction (GH5332)
- Bug in Series.__unicode__ when max_rows=None and the Series has more than 1000 rows. (GH6863)
- Bug in groupby.get_group where a datelike wasn’t always accepted (GH5267)
- Bug in groupBy.get_group created by TimeGrouper raises AttributeError (GH6914)
- Bug in DatetimeIndex.tz_localize and DatetimeIndex.tz_convert converting NaT incorrectly (GH5546)
- Bug in arithmetic operations affecting NaT (GH6873)
- Bug in Series.str.extract where the resulting Series from a single group match wasn’t renamed to the group name
- Bug in DataFrame.to_csv where setting index=False ignored the header kwarg (GH6186)
- Bug in DataFrame.plot and Series.plot, where the legend behave inconsistently when plotting to the same axes repeatedly (GH6678)
- Internal tests for patching __finalize__ / bug in merge not finalizing (GH6923, GH6927)
- accept TextFileReader in concat, which was affecting a common user idiom (GH6583)
- Bug in C parser with leading white space (GH3374)
- Bug in C parser with delim_whitespace=True and \r-delimited lines
- Bug in python parser with explicit MultiIndex in row following column header (GH6893)
- Bug in Series.rank and DataFrame.rank that caused small floats (<1e-13) to all receive the same rank (GH6886)
- Bug in DataFrame.apply with functions that used *args or **kwargs and returned an empty result (GH6952)
- Bug in sum/mean on 32-bit platforms on overflows (GH6915)
- Moved Panel.shift to NDFrame.slice_shift and fixed to respect multiple dtypes. (GH6959)
- Bug in enabling subplots=True in DataFrame.plot only has single column raises TypeError, and Series.plot raises AttributeError (GH6951)
- Bug in DataFrame.plot draws unnecessary axes when enabling subplots and kind=scatter (GH6951)
- Bug in read_csv from a filesystem with non-utf-8 encoding (GH6807)
- Bug in iloc when setting / aligning (GH6766)
- Bug causing UnicodeEncodeError when get_dummies called with unicode values and a prefix (GH6885)
• Bug in timeseries-with-frequency plot cursor display (GH5453)
• Bug surfaced in groupby.plot when using a Float64Index (GH7025)
• Stopped tests from failing if options data isn’t able to be downloaded from Yahoo (GH7034)
• Bug in parallel_coordinates and radviz where reordering of class column caused possible color/class mismatch (GH6956)
• Bug in radviz and andrews_curves where multiple values of ‘color’ were being passed to plotting method (GH6956)
• Bug in Float64Index.isin() where containing nan s would make indices claim that they contained all the things (GH7066).
• Bug in DataFrame.boxplot where it failed to use the axis passed as the ax argument (GH3578)
• Bug in the XlsxWriter and XlwtWriter implementations that resulted in datetime columns being formatted without the time (GH7075) were being passed to plotting method
• read_fwf() treats None in colspec like regular python slices. It now reads from the beginning or until the end of the line when colspec contains a None (previously raised a TypeError)
• Bug in cache coherence with chained indexing and slicing; add _is_view property to NDFrame to correctly predict views; mark is_copy on xs only if its an actual copy (and not a view) (GH7084)
• Bug in DatetimeIndex creation from string ndarray with dayfirst=True (GH5917)
• Bug in MultiIndex.from_arrays created from DatetimeIndex doesn’t preserve freq and tz (GH7090)
• Bug in unstack raises ValueError when MultiIndex contains PeriodIndex (GH4342)
• Bug in boxplot and hist draws unnecessary axes (GH6769)
• Regression in groupby.nth() for out-of-bounds indexers (GH6621)
• Bug in quantile with datetime values (GH6965)
• Bug in Dataframe.set_index, reindex and pivot don’t preserve DatetimeIndex and PeriodIndex attributes (GH3950, GH5878, GH6631)
• Bug in MultiIndex.get_level_values doesn’t preserve DatetimeIndex and PeriodIndex attributes (GH7092)
• Bug in Groupby doesn’t preserve tz (GH3950)
• Bug in PeriodIndex partial string slicing (GH6716)
• Bug in the HTML repr of a truncated Series or DataFrame not showing the class name with the large_repr set to ‘info’ (GH7105)
• Bug in DatetimeIndex specifying freq raises ValueError when passed value is too short (GH7098)
• Fixed a bug with the info repr not honoring the display.max_info_columns setting (GH6939)
• Bug PeriodIndex string slicing with out of bounds values (GH5407)
• Fixed a memory error in the hashtable implementation/factorizer on resizing of large tables (GH7157)
• Bug in isnull when applied to 0-dimensional object arrays (GH7176)
• Bug in query/eval where global constants were not looked up correctly (GH7178)
• Bug in recognizing out-of-bounds positional list indexers with iloc and a multi-axis tuple indexer (GH7189)
• Bug in setitem with a single value, MultiIndex and integer indices (GH7190, GH7218)
• Bug in expressions evaluation with reversed ops, showing in series-dataframe ops (GH7198, GH7192)
• Bug in multi-axis indexing with > 2 ndim and a MultiIndex (GH7199)
• Fix a bug where invalid eval/query operations would blow the stack (GH5198)

5.16 Version 0.13

5.16.1 Version 0.13.1 (February 3, 2014)

This is a minor release from 0.13.0 and includes a small number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

Highlights include:
• Added `infer_datetime_format` keyword to `read_csv/to_datetime` to allow speedups for homogeneously formatted datetimes.
• Will intelligently limit display precision for datetime/timedelta formats.
• Enhanced Panel `apply()` method.
• Suggested tutorials in new Tutorials section.
• Our pandas ecosystem is growing, we now feature related projects in a new Pandas Ecosystem section.
• Much work has been taking place on improving the docs, and a new Contributing section has been added.
• Even though it may only be of interest to devs, we <3 our new CI status page: ScatterCI.

**Warning:** 0.13.1 fixes a bug that was caused by a combination of having numpy < 1.8, and doing chained assignment on a string-like array. Please review the docs, chained indexing can have unexpected results and should generally be avoided.

This would previously segfault:

```
In [1]: df = pd.DataFrame({'A': np.array(['foo', 'bar', 'bah', 'foo', 'bar'])})
In [2]: df['A'].iloc[0] = np.nan
In [3]: df
Out[3]:
   A
0  NaN
1  bar
2  bah
3  foo
4  bar
```

The recommended way to do this type of assignment is:

```
In [4]: df = pd.DataFrame({'A': np.array(['foo', 'bar', 'bah', 'foo', 'bar'])})
In [5]: df.loc[0, 'A'] = np.nan
In [6]: df
Out[6]:
   A
0  NaN
1  bar
2  bah
3  foo
4  bar
```
Output formatting enhancements

- `df.info()` view now display dtype info per column (GH5682)
- `df.info()` now honors the option `max_info_rows`, to disable null counts for large frames (GH5974)

```python
In [7]: max_info_rows = pd.get_option("max_info_rows")

In [8]: df = pd.DataFrame(
   ...:     {
   ...:         "A": np.random.randn(10),
   ...:         "B": np.random.randn(10),
   ...:         "C": pd.date_range("20130101", periods=10),
   ...:     }
   ...: )
   ...

In [9]: df.iloc[3:6, [0, 2]] = np.nan

# set to not display the null counts
In [10]: pd.set_option("max_info_rows", 0)

In [11]: df.info()
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 10 entries, 0 to 9
Data columns (total 3 columns):
# Column Dtype
--- ------ -------------- ----- 
0 A float64 
1 B float64 
2 C datetime64[ns] 
dtypes: datetime64[ns](1), float64(2)
memory usage: 368.0 bytes

# this is the default (same as in 0.13.0)
In [12]: pd.set_option("max_info_rows", max_info_rows)

In [13]: df.info()
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 10 entries, 0 to 9
Data columns (total 3 columns):
# Column Non-Null Count Dtype
--- ------ -------------- ----- 
0 A 7 non-null float64 
1 B 10 non-null float64 
2 C 7 non-null datetime64[ns] 
dtypes: datetime64[ns](1), float64(2)
memory usage: 368.0 bytes

- Add `show_dimensions` display option for the new DataFrame repr to control whether the dimensions print.

In [14]: df = pd.DataFrame([[1, 2], [3, 4]])
```

(continues on next page)
• The ArrayFormatter for datetime and timedelta64 now intelligently limit precision based on the values in the array (GH3401)

Previously output might look like:

<table>
<thead>
<tr>
<th>age</th>
<th>today</th>
<th>diff</th>
</tr>
</thead>
<tbody>
<tr>
<td>2001-01-01</td>
<td>2013-04-19</td>
<td>4491 days, 00:00:00</td>
</tr>
<tr>
<td>2004-06-01</td>
<td>2013-04-19</td>
<td>3244 days, 00:00:00</td>
</tr>
</tbody>
</table>

Now the output looks like:

```
In [19]: df = pd.DataFrame(
    ....:     [pd.Timestamp("20010101"), pd.Timestamp("20040601")], columns=["age"]
    ....: )
    ....:
In [20]: df["today"] = pd.Timestamp("20130419")
In [21]: df["diff"] = df["today"] - df["age"]
In [22]: df
Out[22]:
        age     today      diff
0 2001-01-01 2013-04-19  4491 days
1 2004-06-01 2013-04-19  3244 days
```

[2 rows x 3 columns]
API changes

- Add -NaN and -nan to the default set of NA values (GH5952). See NA Values.
- Added Series.str.get_dummies vectorized string method (GH6021), to extract dummy/indicator variables for separated string columns:

```
In [23]: s = pd.Series(['a', 'a|b', np.nan, 'a|c'])

In [24]: s.str.get_dummies(sep='|')
Out[24]:
     a  b  c
0    1  0  0
1    1  1  0
2    0  0  0
3    1  0  1
[4 rows x 3 columns]
```

- Added the NDFrame.equals() method to compare if two NDFrames are equal have equal axes, dtypes, and values. Added the array_equivalent function to compare if two ndarrays are equal. NaNs in identical locations are treated as equal. (GH5283) See also the docs for a motivating example.

```
df = pd.DataFrame({'col': ['foo', 0, np.nan]})
df2 = pd.DataFrame({'col': [np.nan, 0, 'foo']}, index=[2, 1, 0])
df.equals(df2)
df.equals(df2.sort_index())
```

- DataFrame.apply will use the reduce argument to determine whether a Series or a DataFrame should be returned when the DataFrame is empty (GH6007).

Previously, calling DataFrame.apply an empty DataFrame would return either a DataFrame if there were no columns, or the function being applied would be called with an empty Series to guess whether a Series or DataFrame should be returned:

```
In [32]: def applied_func(col):
       ....:     print("Apply function being called with: ", col)
       ....:     return col.sum()
       ....:

In [33]: empty = DataFrame(columns=['a', 'b'])

In [34]: empty.apply(applied_func)
Apply function being called with:  Series([], Length: 0, dtype: float64)
Out[34]:
   a    NaN
   b     NaN
Length: 2, dtype: float64
```

Now, when apply is called on an empty DataFrame: if the reduce argument is True a Series will returned, if it is False a DataFrame will be returned, and if it is None (the default) the function being applied will be called with an empty series to try and guess the return type.

```
In [35]: empty.apply(applied_func, reduce=True)
Out[35]:
```
Prior version deprecations/changes

There are no announced changes in 0.13 or prior that are taking effect as of 0.13.1

Deprecations

There are no deprecations of prior behavior in 0.13.1

Enhancements

- `pd.read_csv` and `pd.to_datetime` learned a new `infer_datetime_format` keyword which greatly improves parsing perf in many cases. Thanks to @lexical for suggesting and @danbirk for rapidly implementing. (GH5490, GH6021)

  If `parse_dates` is enabled and this flag is set, pandas will attempt to infer the format of the datetime strings in the columns, and if it can be inferred, switch to a faster method of parsing them. In some cases this can increase the parsing speed by ~5-10x.

```python
# Try to infer the format for the index column
df = pd.read_csv(
    "foo.csv", index_col=0, parse_dates=True, infer_datetime_format=True
)
```

- `date_format` and `datetime_format` keywords can now be specified when writing to excel files (GH4133)

- `MultiIndex.from_product` convenience function for creating a MultiIndex from the cartesian product of a set of iterables (GH6055):

```python
In [25]: shades = ["light", "dark"]
In [26]: colors = ["red", "green", "blue"]
In [27]: pd.MultiIndex.from_product([shades, colors], names=["shade", "color"])
```

(continues on next page)
Panel apply() will work on non-ufuncs. See the docs.

Specifying an apply that operates on a Series (to return a single element)

A similar reduction type operation

5.16. Version 0.13
This is equivalent to

```python
In [34]: panel.sum('major_axis')
Out[34]:
    ItemA   ItemB   ItemC
A  -1.108775 -1.090118 -2.984435
B  -3.705764  0.409204  1.866240
C   2.110856  2.960500 -0.974967
D  -4.532785  0.303202 -3.685193
[4 rows x 3 columns]
```

A transformation operation that returns a Panel, but is computing the z-score across the major_axis

```python
In [35]: result = panel.apply(lambda x: (x - x.mean()) / x.std(), axis='major_axis')
In [36]: result
```

```python
Out[36]:
<class 'pandas.core.panel.Panel'>
Dimensions: 3 (items) x 5 (major_axis) x 4 (minor_axis)
Items axis: ItemA to ItemC
Major_axis axis: 2000-01-03 00:00:00 to 2000-01-07 00:00:00
Minor_axis axis: A to D
```

```python
In [37]: result.loc[:, :, 'ItemA'] # noqa E999
```

```python
Out[37]:
   A     B     C     D
2000-01-03 -0.535778 1.500802 -1.506416 -0.681456
2000-01-04  0.397628 -1.108752  0.360481  1.529895
2000-01-05 -1.489811 -0.339412  0.557374  0.280845
2000-01-06  0.885279  0.421830 -0.453013 -1.053785
2000-01-07  0.742682 -0.474468  1.041575 -0.075499
[5 rows x 4 columns]
```

- Panel apply(\texttt{\textcolor{red}{\texttt{}}}) operating on cross-sectional slabs. (GH1148)

```python
In [38]: def f(x):
    ....:     return ((x.T - x.mean(1)) / x.std(1)).T
    ....:
In [39]: result = panel.apply(f, axis=['items', 'major_axis'])
In [40]: result
```

```python
Out[40]:
<class 'pandas.core.panel.Panel'>
Dimensions: 4 (items) x 5 (major_axis) x 3 (minor_axis)
Items axis: A to D
Major_axis axis: 2000-01-03 00:00:00 to 2000-01-07 00:00:00
Minor_axis axis: ItemA to ItemC
```

```python
In [41]: result.loc[:, :, 'ItemA']
```

(continues on next page)
Out[41]:

<table>

[5 rows x 4 columns]

### Performance

Performance improvements for 0.13.1

- Series datetime/timedelta binary operations ([GH5801](#))
- DataFrame `count/dropna` for `axis=1`
- Series.str.contains now has a `regex=False` keyword which can be faster for plain (non-regex) string patterns. ([GH5879](#))
- Series.str.extract ([GH5944](#))
- `dtypes/ftypes` methods ([GH5968](#))
- Indexing with object dtypes ([GH5968](#))
- DataFrame.apply ([GH6013](#))
- Regression in JSON IO ([GH5765](#))
- Index construction from Series ([GH6150](#))
Experimental

There are no experimental changes in 0.13.1

Bug fixes

- Bug in `io.wb.get_countries` not including all countries (GH6008)
- Bug in Series replace with timestamp dict (GH5797)
- `read_csv/read_table` now respects the `prefix` kwarg (GH5732).
- Bug in selection with missing values via `.ix` from a duplicate indexed DataFrame failing (GH5835)
- Fix issue of boolean comparison on empty DataFrames (GH5808)
- Bug in isnnull handling `NaT` in an object array (GH5443)
- Bug in `to_datetime` when passed a `np.nan` or integer datelike and a format string (GH5863)
- Bug in groupby dtype conversion with datetimelike (GH5869)
- Regression in handling of empty Series as indexers to Series (GH5877)
- Bug in internal caching, related to (GH5727)
- Testing bug in reading JSON/msgpack from a non-filepath on windows under py3 (GH5874)
- Bug when assigning to `.ix[tuple(...)]]` (GH5896)
- Bug in fully reindexing a Panel (GH5905)
- Bug in `idxmin/max` with object dtypes (GH5914)
- Bug in `BusinessDay` when adding n days to a date not on offset when n>5 and n%5==0 (GH5890)
- Bug in assigning to chained series with a series via `ix` (GH5928)
- Bug in creating an empty DataFrame, copying, then assigning (GH5932)
- Bug in `DataFrame.tail` with empty frame (GH5846)
- Bug in propagating metadata on `resample` (GH5862)
- Fixed string-representation of `NaT` to be “NaT” (GH5708)
- Fixed string-representation for `Timestamp` to show nanoseconds if present (GH5912)
- `pd.match` not returning passed sentinel
- `Panel.to_frame()` no longer fails when `major_axis` is a `MultiIndex` (GH5402).
- Bug in `pd.read_msgpack` with inferring a `DateTimeIndex` frequency incorrectly (GH5947)
- Fixed `to_datetime` for array with both Tz-aware datetimes and `NaT`’s (GH5961)
- Bug in rolling skew/kurtosis when passed a Series with bad data (GH5749)
- Bug in `scipy.interpolate` methods with a datetime index (GH5975)
- Bug in `NaT` comparison if a mixed datetime/np.datetime64 with `NaT` were passed (GH5968)
- Fixed bug with `pd.concat` losing dtype information if all inputs are empty (GH5742)
- Recent changes in IPython cause warnings to be emitted when using previous versions of pandas in QTConsole, now fixed. If you’re using an older version and need to suppress the warnings, see (GH5922).
- Bug in merging `timedelta` dtypes (GH5695)
• Bug in plotting.scatter_matrix function. Wrong alignment among diagonal and off-diagonal plots, see (GH5497).
• Regression in Series with a MultiIndex via ix (GH6018)
• Bug in Series.xs with a MultiIndex (GH6018)
• Bug in Series construction of mixed type with datelike and an integer (which should result in object type and not automatic conversion) (GH6028)
• Possible segfault when chained indexing with an object array under NumPy 1.7.1 (GH6026, GH6056)
• Bug in setting using fancy indexing a single element with a non-scalar (e.g. a list), (GH6043)
• to_sql did not respect if_exists (GH4110 GH4304)
• Regression in .get(None) indexing from 0.12 (GH5652)
• Subtle iloc indexing bug, surfaced in (GH6059)
• Bug with insert of strings into DatetimeIndex (GH5818)
• Fixed unicode bug in to_html/HTML repr (GH6098)
• Fixed missing arg validation in get_options_data (GH6105)
• Bug in assignment with duplicate columns in a frame where the locations are a slice (e.g. next to each other) (GH6120)
• Bug in propagating _ref_locs during construction of a DataFrame with dups index/columns (GH6121)
• Bug in DataFrame.apply when using mixed datelike reductions (GH6125)
• Bug in DataFrame.append when appending a row with different columns (GH6129)
• Bug in DataFrame construction with recarray and non-ns datetime dtype (GH6140)
• Bug in .loc setitem indexing with a dataframe on rhs, multiple item setting, and a datetimelike (GH6152)
• Fixed a bug in query/eval during lexicographic string comparisons (GH6155).
• Fixed a bug in query where the index of a single-element Series was being thrown away (GH6148).
• Bug in HDFStore on appending a dataframe with MultiIndexed columns to an existing table (GH6167)
• Consistency with dtypes in setting an empty DataFrame (GH6171)
• Bug in selecting on a MultiIndex HDFStore even in the presence of under specified column spec (GH6169)
• Bug in nanops.var with ddof=1 and 1 elements would sometimes return inf rather than nan on some platforms (GH6136)
• Bug in Series and DataFrame bar plots ignoring the use_index keyword (GH6209)
• Bug in groupby with mixed str/int under python3 fixed; argsort was failing (GH6212)

5.16.2 Version 0.13.0 (January 3, 2014)

This is a major release from 0.12.0 and includes a number of API changes, several new features and enhancements along with a large number of bug fixes.

Highlights include:

- support for a new index type Float64Index, and other Indexing enhancements
- HDFStore has a new string based syntax for query specification
- support for new methods of interpolation
- updated timedelta operations
- a new string manipulation method extract
- Nanosecond support for Offsets
- isin for DataFrames

Several experimental features are added, including:

- new eval/query methods for expression evaluation
- support for msgpack serialization
- an i/o interface to Google’s BigQuery

There are several new or updated docs sections including:

- Comparison with SQL, which should be useful for those familiar with SQL but still learning pandas.
- Comparison with R, idiom translations from R to pandas.
- Enhancing Performance, ways to enhance pandas performance with eval/query.

**Warning:** In 0.13.0 Series has internally been refactored to no longer sub-class ndarray but instead subclass NDFrame, similar to the rest of the pandas containers. This should be a transparent change with only very limited API implications. See Internal Refactoring
API changes

- **read_excel** now supports an integer in its `sheetname` argument giving the index of the sheet to read in (GH4301).
- Text parser now treats anything that reads like inf (“inf”, “Inf”, “-Inf”, “iNf”, etc.) as infinity. (GH4220, GH4219), affecting `read_table`, `read_csv`, etc.
- **pandas** now is Python 2/3 compatible without the need for `2to3` thanks to @jtratner. As a result, pandas now uses iterators more extensively. This also led to the introduction of substantive parts of the Benjamin Peterson’s six library into compat. (GH4384, GH4375, GH4372)
- pandas.util.compat and pandas.util.py3compat have been merged into pandas.compat. pandas.compat now includes many functions allowing 2/3 compatibility. It contains both list and iterator versions of range, filter, map and zip, plus other necessary elements for Python 3 compatibility. `lmap`, `lzip`, `lrange` and `lfilter` all produce lists instead of iterators, for compatibility with `numpy`, subscipting and pandas constructors. (GH4384, GH4375, GH4372)
- **Series.get** with negative indexers now returns the same as [] (GH4390)
- Changes to how `Index` and `MultiIndex` handle metadata (levels, labels, and names) (GH4039):

  ```python
  # previously, you would have set levels or labels directly
  >>> pd.index.levels = [[1, 2, 3, 4], [1, 2, 4, 4]]

  # now, you use the set_levels or set_labels methods
  >>> index = pd.index.set_levels([[1, 2, 3, 4], [1, 2, 4, 4]])

  # similarly, for names, you can rename the object
  # but setting names is not deprecated
  >>> index = pd.index.set_names(['bob', 'cranberry'])

  # and all methods take an inplace kwarg - but return None
  >>> pd.index.set_names(['bob', 'cranberry'], inplace=True)
  ```

- **All** division with `NDFrame` objects is now **true division**, regardless of the future import. This means that operating on pandas objects will by default use floating point division, and return a floating point dtype. You can use `//` and `floordiv` to do integer division.

  **Integer division**

  ```python
  In [3]: arr = np.array([1, 2, 3, 4])
  In [4]: arr2 = np.array([5, 3, 2, 1])
  In [5]: arr / arr2
  Out[5]: array([0, 0, 1, 4])
  ```

  ```python
  In [6]: pd.Series(arr) // pd.Series(arr2)
  Out[6]:
          0  0
       1  0
       2  1
       3  4
dtype: int64
  ```

  **True Division**
In [7]: pd.Series(arr) / pd.Series(arr2)  # no future import required
Out[7]:
   0    0.200000
   1    0.666667
   2    1.500000
   3    4.000000
dtype: float64

• Infer and downcast dtype if downcast='infer' is passed to fillna/ffill/bfill (GH4604)

• __nonzero__ for all NDFrame objects, will now raise a ValueError, this reverts back to (GH1073, GH4633) behavior. See gotchas for a more detailed discussion.

This prevents doing boolean comparison on entire pandas objects, which is inherently ambiguous. These all will raise a ValueError.

```python
>>> df = pd.DataFrame({'A': np.random.randn(10),
                   'B': np.random.randn(10),
                   'C': pd.date_range('20130101', periods=10)
                   })

>>> if df:
...     pass
...     pass
...     pass
Traceback (most recent call last):
  ... ValueError: The truth value of a DataFrame is ambiguous. Use a.empty, a.bool(), a.item(), a.any() or a.all().

>>> df1 = df
>>> df2 = df
>>> df1 and df2
Traceback (most recent call last):
  ... ValueError: The truth value of a DataFrame is ambiguous. Use a.empty, a.bool(), a.item(), a.any() or a.all().
```

Added the .bool() method to NDFrame objects to facilitate evaluating of single-element boolean Series:

```python
In [1]: pd.Series([True]).bool()
Out[1]: True

In [2]: pd.Series([False]).bool()
Out[2]: False
```

(continues on next page)
In [3]: pd.DataFrame([[True]]).bool()
Out[3]: True

In [4]: pd.DataFrame([[False]]).bool()
Out[4]: False

• All non-Index NDFrames (Series, DataFrame, Panel, Panel4D, SparsePanel, etc.), now support the entire set of arithmetic operators and arithmetic flex methods (add, sub, mul, etc.). SparsePanel does not support pow or mod with non-scalars. (GH3765)

• Series and DataFrame now have a mode() method to calculate the statistical mode(s) by axis/Series. (GH5367)

• Chained assignment will now by default warn if the user is assigning to a copy. This can be changed with the option mode.chained_assignment, allowed options are raise/warn/None. See the docs.

In [5]: dfc = pd.DataFrame({'A': ['aaa', 'bbb', 'ccc'], 'B': [1, 2, 3]})

In [6]: pd.set_option('chained_assignment', 'warn')

The following warning / exception will show if this is attempted.

In [7]: dfc.loc[0]['A'] = 1111

Traceback (most recent call last)
... SettingWithCopyWarning:
A value is trying to be set on a copy of a slice from a DataFrame. Try using .loc[row_index,col_indexer] = value instead.

Here is the correct method of assignment.

In [8]: dfc.loc[0, 'A'] = 11

In [9]: dfc
Out[9]:
    A B
0  11 1
1  bbb 2
2  ccc 3

• Panel.reindex has the following call signature Panel.reindex(items=None, major_axis=None, minor_axis=None, **kwargs) to conform with other NDFrame objects. See Internal Refactoring for more information.

• Series.argmin and Series.argmax are now aliased to Series.idxmin and Series.idxmax. These return the index of the min or max element respectively. Prior to 0.13.0 these would return the position of the min / max element. (GH6214)
Prior version deprecations/changes

These were announced changes in 0.12 or prior that are taking effect as of 0.13.0

- Remove deprecated `Factor` (GH3650)
- Remove deprecated `set_printoptions/reset_printoptions` (GH3046)
- Remove deprecated `_verbose_info` (GH3215)
- Remove deprecated `read_clipboard/to_clipboard/ExcelFile/ExcelWriter` from `pandas.io.parsers` (GH3717) These are available as functions in the main pandas namespace (e.g. `pd.read_clipboard`)
- default for `tupleize_cols` is now `False` for both `to_csv` and `read_csv`. Fair warning in 0.12 (GH3604)
- default for `display.max_seq_len` is now 100 rather than `None`. This activates truncated display (“...”) of long sequences in various places. (GH3391)

Deprecations

Deprecated in 0.13.0

- deprecated `iterkv`, which will be removed in a future release (this was an alias of `iteritems` used to bypass 2to3's changes). (GH4384, GH4375, GH4372)
- deprecated the string method `match`, whose role is now performed more idiomatically by `extract`. In a future release, the default behavior of `match` will change to become analogous to `contains`, which returns a boolean indexer. (Their distinction is strictness: `match` relies on `re.match` while `contains` relies on `re.search`.) In this release, the deprecated behavior is the default, but the new behavior is available through the keyword argument `as_indexer=True`.

Indexing API changes

Prior to 0.13, it was impossible to use a label indexer (`.loc/.ix`) to set a value that was not contained in the index of a particular axis. (GH2578). See the docs

In the Series case this is effectively an appending operation

```
In [10]: s = pd.Series([1, 2, 3])

In [11]: s
Out[11]:
0    1
1    2
2    3
dtype: int64

In [13]: s
Out[13]:
0   1.0
1   2.0
2   3.0
5   5.0
dtype: float64
```
In [14]: dfi = pd.DataFrame(np.arange(6).reshape(3, 2),
....:     columns=['A', 'B'])

In [15]: dfi
Out[15]:
   A  B
0  0  1
1  2  3
2  4  5

This would previously KeyError

In [16]: dfi.loc[:, 'C'] = dfi.loc[:, 'A']

In [17]: dfi
Out[17]:
   A  B  C
0  0  1  0
1  2  3  2
2  4  5  4

This is like an append operation.

In [18]: dfi.loc[3] = 5

In [19]: dfi
Out[19]:
   A  B  C
0  0  1  0
1  2  3  2
2  4  5  4
3  5  5  5

A Panel setting operation on an arbitrary axis aligns the input to the Panel

In [20]: p = pd.Panel(np.arange(16).reshape(2, 4, 2),
....:     items=['Item1', 'Item2'],
....:     major_axis=pd.date_range('2001/1/12', periods=4),
....:     minor_axis=['A', 'B'], dtype='float64')

In [21]: p
Out[21]:
<class 'pandas.core.panel.Panel'>
Dimensions: 2 (items) x 4 (major_axis) x 2 (minor_axis)
Items axis: Item1 to Item2
Major_axis axis: 2001-01-12 00:00:00 to 2001-01-15 00:00:00
Minor_axis axis: A to B

In [22]: p.loc[:, :, 'C'] = pd.Series([30, 32], index=p.items)

In [23]: p

(continues on next page)
**Out[23]:**
<code class='highlighter'>pandas.core.panel.Panel'</code>
Dimensions: 2 (items) x 4 (major_axis) x 3 (minor_axis)
Items axis: Item1 to Item2
Major_axis axis: 2001-01-12 00:00:00 to 2001-01-15 00:00:00
Minor_axis axis: A to C

**In [24]:** p.loc[:, :, 'C']
**Out[24]:**

<table>
<thead>
<tr>
<th></th>
<th>Item1</th>
<th>Item2</th>
</tr>
</thead>
<tbody>
<tr>
<td>2001-01-12</td>
<td>30.0</td>
<td>32.0</td>
</tr>
<tr>
<td>2001-01-13</td>
<td>30.0</td>
<td>32.0</td>
</tr>
<tr>
<td>2001-01-14</td>
<td>30.0</td>
<td>32.0</td>
</tr>
<tr>
<td>2001-01-15</td>
<td>30.0</td>
<td>32.0</td>
</tr>
</tbody>
</table>

**Float64Index API change**

- Added a new index type, `Float64Index`. This will be automatically created when passing floating values in index creation. This enables a pure label-based slicing paradigm that makes [], .ix, .loc for scalar indexing and slicing work exactly the same. See the docs, (GH263)

Construction is by default for floating type values.

**In [20]:** index = pd.Index([1.5, 2, 3, 4.5, 5])

**In [21]:** index
**Out[21]:** Float64Index([1.5, 2.0, 3.0, 4.5, 5.0], dtype='float64')

**In [22]:** s = pd.Series(range(5), index=index)

**In [23]:** s
**Out[23]:**
<code class='highlighter'>1.5 0
2.0 1
3.0 2
4.5 3
5.0 4
dtype: int64</code>

Scalar selection for [], .ix, .loc will always be label based. An integer will match an equal float index (e.g. 3 is equivalent to 3.0)

**In [24]:** s[3]
**Out[24]:** 2

**In [25]:** s.loc[3]
**Out[25]:** 2

The only positional indexing is via .iloc

**In [26]:** s.iloc[3]
**Out[26]:** 3
A scalar index that is not found will raise `KeyError`.

Slicing is ALWAYS on the values of the index, for `[]`, `ix`, `loc` and ALWAYS positional with `iloc`.

```
In [27]: s[2:4]
Out[27]:
2.0  1
3.0  2
dtype: int64

In [28]: s.loc[2:4]
Out[28]:
2.0  1
3.0  2
dtype: int64

In [29]: s.iloc[2:4]
Out[29]:
3.0  2
4.5  3
dtype: int64
```

In float indexes, slicing using floats are allowed

```
In [30]: s[2.1:4.6]
Out[30]:
3.0  2
4.5  3
dtype: int64

In [31]: s.loc[2.1:4.6]
Out[31]:
3.0  2
4.5  3
dtype: int64
```

- Indexing on other index types are preserved (and positional fallback for `[]`, `ix`), with the exception, that floating point slicing on indexes on non `Float64Index` will now raise a `TypeError`.

```
In [1]: pd.Series(range(5))[3.5]
TypeError: the label [3.5] is not a proper indexer for this index type (Int64Index)

In [1]: pd.Series(range(5))[3.5:4.5]
TypeError: the slice start [3.5] is not a proper indexer for this index type

In [1]: pd.Series(range(5))[3.5:4.5]
```

Using a scalar float indexer will be deprecated in a future version, but is allowed for now.

```
In [3]: pd.Series(range(5))[3.0]
Out[3]:
3
```
HDFStore API changes

- Query Format Changes. A much more string-like query format is now supported. See the docs.

```python
In [32]: path = 'test.h5'

In [33]: dfq = pd.DataFrame(np.random.randn(10, 4),
      ....:                     columns=list('ABCD'),
      ....:                     index=pd.date_range('20130101', periods=10))

In [34]: dfq.to_hdf(path, 'dfq', format='table', data_columns=True)
```

Use boolean expressions, with in-line function evaluation.

```python
In [35]: pd.read_hdf(path, 'dfq',
      ....:                     where='index>Timestamp('20130104') & columns=['A', 'B'])

Out[35]:
      A    B
2013-01-05  0.424972  0.567020
2013-01-06 -0.673690  0.113648
2013-01-07  0.407405  0.577046
2013-01-08 -0.370647 -1.157892
2013-01-09  1.075770  0.109050
2013-01-10  0.357021 -0.674600

Out[36]:
    A    B    C    D
2013-01-01  0.469112 -0.282863 -1.509059 -1.135632
2013-01-02  1.212112 -0.173215  0.112097 -1.044236
2013-01-04  0.721555 -0.706771 -1.039575  0.271860
2013-01-05 -0.424972  0.567020  0.276232 -1.087401
2013-01-07  0.407405  0.577046 -1.715002  0.109050
2013-01-09  1.075770 -0.109050  1.643563 -1.469388
2013-01-10  0.357021 -0.674600 -1.776904  0.968914
```

- the format keyword now replaces the table keyword; allowed values are fixed(f) or table(t) the same defaults as prior < 0.13.0 remain, e.g. put implies fixed format and append implies table format. This default format can be set as an option by setting io.hdf.default_format.

```python
In [37]: path = 'test.h5'

In [38]: df = pd.DataFrame(np.random.randn(10, 2))

In [39]: df.to_hdf(path, 'df_table', format='table')

In [40]: df.to_hdf(path, 'df_table2', append=True)
```
In [41]: df.to_hdf(path, 'df_fixed')

In [42]: with pd.HDFStore(path) as store:
    ....:     print(store)
    ....:
<class 'pandas.io.pytables.HDFStore'>
File path: test.h5

• Significant table writing performance improvements
• handle a passed Series in table format (GH4330)
• can now serialize a timedelta64[ns] dtype in a table (GH3577), See the docs.
• added an is_open property to indicate if the underlying file handle is open; a closed store will now report ‘CLOSED’ when viewing the store (rather than raising an error) (GH4409)
• a close of a HDFStore now will close that instance of the HDFStore but will only close the actual file if the ref count (by PyTables) w.r.t. all of the open handles are 0. Essentially you have a local instance of HDFStore referenced by a variable. Once you close it, it will report closed. Other references (to the same file) will continue to operate until they themselves are closed. Performing an action on a closed file will raise ClosedFileError

In [43]: path = 'test.h5'

In [44]: df = pd.DataFrame(np.random.randn(10, 2))

In [45]: store1 = pd.HDFStore(path)

In [46]: store2 = pd.HDFStore(path)

In [47]: store1.append('df', df)

In [48]: store2.append('df2', df)

In [49]: store1
Out[49]:
<class 'pandas.io.pytables.HDFStore'>
File path: test.h5

In [50]: store2
Out[50]:
<class 'pandas.io.pytables.HDFStore'>
File path: test.h5

In [51]: store1.close()

In [52]: store2
Out[52]:
<class 'pandas.io.pytables.HDFStore'>
File path: test.h5

In [53]: store2.close()

In [54]: store2
• removed the _quiet attribute, replace by a DuplicateWarning if retrieving duplicate rows from a table (GH4367)

• removed the warn argument from open. Instead a PossibleDataLossError exception will be raised if you try to use mode='w' with an OPEN file handle (GH4367)

• allow a passed locations array or mask as a where condition (GH4467). See the docs for an example.

• add the keyword dropna=True to append to change whether ALL nan rows are not written to the store (default is True, ALL nan rows are NOT written), also settable via the option io.hdf.dropna_table (GH4625)

• pass through store creation arguments; can be used to support in-memory stores

### DataFrame repr changes

The HTML and plain text representations of DataFrame now show a truncated view of the table once it exceeds a certain size, rather than switching to the short info view (GH4886, GH5550). This makes the representation more consistent as small DataFrames get larger.

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>2010-03-30</td>
<td>13.55</td>
<td>13.64</td>
<td>13.18</td>
<td>13.28</td>
<td>142055200</td>
<td>12.70</td>
</tr>
</tbody>
</table>

771 rows × 6 columns

To get the info view, call DataFrame.info(). If you prefer the info view as the repr for large DataFrames, you can set this by running set_option('display.large_repr', 'info').

### Enhancements

• df.to_clipboard() learned a new excel keyword that let’s you paste df data directly into excel (enabled by default). (GH5070).

• read_html now raises a URLError instead of catching and raising a ValueError (GH4303, GH4305)

• Added a test for read_clipboard() and to_clipboard() (GH4282)

• Clipboard functionality now works with PySide (GH4282)

• Added a more informative error message when plot arguments contain overlapping color and style arguments (GH4402)

• to_dict now takes records as a possible out type. Returns an array of column-keyed dictionaries. (GH4936)

• NaN handing in get_dummies (GH4446) with dummy_na

```python
# previously, nan was erroneously counted as 2 here
# now it is not counted at all
In [55]: pd.get_dummies([1, 2, np.nan])
Out[55]:
```

(continues on next page)
In [56]: pd.get_dummies([1, 2, np.nan], dummy_na=True)
Out[56]:
      0  1  2
0  1.0  0  0
1  0  1  0
2  0  0  1

# unless requested

• timedelta64[ns] operations. See the docs.

Warning: Most of these operations require numpy >= 1.7

Using the new top-level to_timedelta, you can convert a scalar or array from the standard timedelta format (produced by to_csv) into a timedelta type (np.timedelta64 in nanoseconds).

A Series of dtype timedelta64[ns] can now be divided by another timedelta64[ns] object, or astyped to yield a float64 dtyped Series. This is frequency conversion. See the docs for the docs.

In [62]: import datetime

In [63]: td = pd.Series(pd.date_range('20130101', periods=4)) - pd.Series(pd.date_range('20121201', periods=4))

In [64]: td[2] += np.timedelta64(datetime.timedelta(minutes=5, seconds=3))
In [65]: td[3] = np.nan

In [66]: td
Out[66]:

Out[74]:
0  31 days 00:05:00.005000
1  31 days 00:05:00.005000
2  31 days 00:10:03.005000
3   NaT
dtype: timedelta64[ns]
```

Fillna is now supported for timedeltas

```
In [75]: td.fillna(pd.Timedelta(0))
Out[75]:
0  31 days 00:00:00
1  31 days 00:00:00
2  31 days 00:05:03
3   0 days 00:00:00
dtype: timedelta64[ns]
```

```
In [76]: td.fillna(datetime.timedelta(days=1, seconds=5))
Out[76]:
0  31 days 00:00:00
1  31 days 00:00:00
2  31 days 00:05:03
3  1 days 00:00:05
dtype: timedelta64[ns]
```

```
You can do numeric reduction operations on timedeltas.

In [77]: td.mean()
```

```
Out[77]: Timedelta('31 days 00:01:41')
```

```
In [78]: td.quantile(.1)
```

```
Out[78]: Timedelta('31 days 00:00:00')
```

- `plot(kind='kde')` now accepts the optional parameters `bw_method` and `ind`, passed to `scipy.stats.gaussian_kde()` (for scipy >= 0.11.0) to set the bandwidth, and to `gkde.evaluate()` to specify the indices at which it is evaluated, respectively. See scipy docs. (GH4298)
- DataFrame constructor now accepts a numpy masked record array (GH3478)
• The new vectorized string method `extract` return regular expression matches more conveniently.

```python
In [79]: pd.Series(['a1', 'b2', 'c3']).str.extract('^[ab]\d$')
Out[79]:
    0 1
   0 1
   1 2
   2 NaN

Elements that do not match return NaN. Extracting a regular expression with more than one group returns a DataFrame with one column per group.

```python
In [80]: pd.Series(['a1', 'b2', 'c3']).str.extract('^[ab](\d)$')
Out[80]:
   0 0 1
   1 2 a 1
   2 NaN NaN

Elements that do not match return a row of NaN. Thus, a Series of messy strings can be converted into a like-indexed Series or DataFrame of cleaned-up or more useful strings, without necessitating `get()` to access tuples or `re.match` objects.

Named groups like

```python
In [81]: pd.Series(['a1', 'b2', 'c3']).str.extract(...: '(?P<letter>[ab])(?P<digit>\d)')
   .....
Out[81]:
    letter digit
   0     a  1
   1     b  2
   2  NaN  NaN

```

and optional groups can also be used.

```python
In [82]: pd.Series(['a1', 'b2', '3']).str.extract(...: '(?P<letter>[ab])?(?P<digit>\d)')
   .....
Out[82]:
    letter digit
   0     a  1
   1     b  2
   2  NaN  3

```

• `read_stata` now accepts Stata 13 format (GH4291)

• `read_fwf` now infers the column specifications from the first 100 rows of the file if the data has correctly separated and properly aligned columns using the delimiter provided to the function (GH4488).

• support for nanosecond times as an offset

**Warning:** These operations require `numpy` >= 1.7
Period conversions in the range of seconds and below were reworked and extended up to nanoseconds. Periods in the nanosecond range are now available.

```python
In [83]: pd.date_range('2013-01-01', periods=5, freq='5N')
Out[83]:
DatetimeIndex(['2013-01-01 00:00:00',
               '2013-01-01 00:00:00.000000005',
               '2013-01-01 00:00:00.000000010',
               '2013-01-01 00:00:00.000000015',
               '2013-01-01 00:00:00.000000020'],
dtype='datetime64[ns]', freq='5N')
```

or with frequency as offset

```python
In [84]: pd.date_range('2013-01-01', periods=5, freq=pd.offsets.Nano(5))
Out[84]:
DatetimeIndex(['2013-01-01 00:00:00',
               '2013-01-01 00:00:00.000000005',
               '2013-01-01 00:00:00.000000010',
               '2013-01-01 00:00:00.000000015',
               '2013-01-01 00:00:00.000000020'],
dtype='datetime64[ns]', freq='5N')
```

Timestamps can be modified in the nanosecond range

```python
In [85]: t = pd.Timestamp('20130101 09:01:02')
In [86]: t + pd.tseries.offsets.Nano(123)
Out[86]: Timestamp('2013-01-01 09:01:02.000000123')
```

A new method, `isin` for DataFrames, which plays nicely with boolean indexing. The argument to `isin`, what we're comparing the DataFrame to, can be a DataFrame, Series, dict, or array of values. See the docs for more.

To get the rows where any of the conditions are met:

```python
In [87]: dfi = pd.DataFrame({'A': [1, 2, 3, 4], 'B': ['a', 'b', 'f', 'n']})
In [88]: dfi
Out[88]:
   A  B
0  1  a
1  2  b
2  3  f
3  4  n
In [89]: other = pd.DataFrame({'A': [1, 3, 3, 7], 'B': ['e', 'f', 'f', 'e']})
In [90]: mask = dfi.isin(other)
In [91]: mask
Out[91]:
   A  B
0  True False
1  False False
2  True True
```

(continues on next page)
3 False False

In [92]: dfi[mask.any(1)]
Out[92]:
   A  B
0  1  a
2  3  f

- Series now supports a to_frame method to convert it to a single-column DataFrame (GH5164)
- All R datasets listed here http://stat.ethz.ch/R-manual/R-devel/library/datasets/html/00Index.html can now be loaded into pandas objects

```python
# note that pandas.rpy was deprecated in v0.16.0
import pandas.rpy.common as com
com.load_data('Titanic')
```

- tz_localize can infer a fall daylight savings transition based on the structure of the unlocalized data (GH4230), see the docs
- DatetimeIndex is now in the API documentation, see the docs
- json_normalize() is a new method to allow you to create a flat table from semi-structured JSON data. See the docs (GH1067)
- Added PySide support for the qtpandas DataFrameModel and DataFrameWidget.
- Python csv parser now supports usecols (GH4335)
- Frequencies gained several new offsets:
  - LastWeekOfMonth (GH4637)
  - FY5253, and FY5253Quarter (GH4511)
- DataFrame has a new interpolate method, similar to Series (GH4434, GH1892)

```python
In [93]: df = pd.DataFrame({'A': [1, 2.1, np.nan, 4.7, 5.6, 6.8],
                          'B': [.25, np.nan, np.nan, 4, 12.2, 14.4]})

In [94]: df.interpolate()
```

Additionally, the method argument to interpolate has been expanded to include 'nearest', 'zero', 'slinear', 'quadratic', 'cubic', 'barycentric', 'krogh', 'piecewise_polynomial', 'pchip', 'polynomial', 'spline' The new methods require scipy. Consult the Scipy reference guide and documentation for more information about when the various methods are appropriate. See the docs.

Interpolate now also accepts a limit keyword argument. This works similar to fillna’s limit:
In [95]: ser = pd.Series([1, 3, np.nan, np.nan, np.nan, 11])

In [96]: ser.interpolate(limit=2)
Out[96]:
0  1.0
1  3.0
2  5.0
3  7.0
4  NaN
5  11.0
dtype: float64

- Added `wide_to_long` panel data convenience function. See the docs.

In [97]: np.random.seed(123)

In [98]: df = pd.DataFrame(
        
        
        
        "A1970" : {0 : "a", 1 : "b", 2 : "c"},
        ....:
        "A1980" : {0 : "d", 1 : "e", 2 : "f"},
        ....:
        "B1970" : {0 : 2.5, 1 : 1.2, 2 : .7},
        ....:
        "B1980" : {0 : 3.2, 1 : 1.3, 2 : .1},
        ....:
        "X" : dict(zip(range(3), np.random.randn(3)))
        ....:
        }

In [99]: df["id"] = df.index

In [100]: df
Out[100]:
0     a     d  2.5     3.2 -1.085631   0
1     b     e  1.2     1.3  0.997345   1
2     c     f  0.7     0.1  0.282978   2

In [101]: pd.wide_to_long(df, ["A", "B"], i="id", j="year")
Out[101]:
   id year     X    A    B
0  1970  -1.085631  a  2.5
1  1970   0.997345  b  1.2
2  1970  0.282978  c  0.7
0  1980 -1.085631  d  3.2
1  1980  0.997345  e  1.3
2  1980  0.282978  f  0.1

- to_csv now takes a date_format keyword argument that specifies how output datetime objects should be formatted. Datetimes encountered in the index, columns, and values will all have this formatting applied. (GH4313)
- DataFrame.plot will scatter plot x versus y by passing kind='scatter' (GH2215)
- Added support for Google Analytics v3 API segment IDs that also supports v2 IDs. (GH5271)
Experimental

- The new `eval()` function implements expression evaluation using `numexpr` behind the scenes. This results in large speedups for complicated expressions involving large DataFrames/Series. For example,

```python
In [102]: nrows, ncols = 20000, 100

In [103]: df1, df2, df3, df4 = [pd.DataFrame(np.random.randn(nrows, ncols))
   ....:     for _ in range(4)]
   ....:

# eval with NumExpr backend
In [104]: %timeit pd.eval('df1 + df2 + df3 + df4')
5.66 ms +- 128 us per loop (mean +- std. dev. of 7 runs, 100 loops each)

# pure Python evaluation
In [105]: %timeit df1 + df2 + df3 + df4
5.81 ms +- 26 us per loop (mean +- std. dev. of 7 runs, 100 loops each)
```

For more details, see the `the docs`

- Similar to `pandas.eval`, `DataFrame` has a new `DataFrame.eval` method that evaluates an expression in the context of the DataFrame. For example,

```python
In [106]: df = pd.DataFrame(np.random.randn(10, 2), columns=['a', 'b'])

In [107]: df.eval('a + b')
Out[107]:
   a    b
0 -0.685204  1.589745
1  0.325441 -1.784153
2 -0.432893  0.171850
3  1.895919  3.065587
4 -0.092759  1.391365
dtype: float64
```

- `query()` method has been added that allows you to select elements of a DataFrame using a natural query syntax nearly identical to Python syntax. For example,

```python
In [108]: n = 20

In [109]: df = pd.DataFrame(np.random.randint(n, size=(n, 3)), columns=['a', 'b', 'c'])

In [110]: df.query('a < b < c')
Out[110]:
   a    b    c
11  10   15   18
15  10   16   19
```

selects all the rows of `df` where `a < b < c` evaluates to `True`. For more details see the `the docs`.
**pandas** powerful Python data analysis toolkit, Release 1.2.5

- `pd.read_msgpack()` and `pd.to_msgpack()` are now a supported method of serialization of arbitrary pandas (and python objects) in a lightweight portable binary format. See the docs

**Warning:** Since this is an EXPERIMENTAL LIBRARY, the storage format may not be stable until a future release.

```python
df = pd.DataFrame(np.random.rand(5, 2), columns=list('AB'))
df.to_msgpack('foo.msg')
pd.read_msgpack('foo.msg')

s = pd.Series(np.random.rand(5), index=pd.date_range('20130101', periods=5))
pd.to_msgpack('foo.msg', df, s)
pd.read_msgpack('foo.msg')
```

You can pass `iterator=True` to iterator over the unpacked results.

```python
for o in pd.read_msgpack('foo.msg', iterator=True):
    print(o)
```

- `pandas.io.gbq` provides a simple way to extract from, and load data into, Google's BigQuery Data Sets by way of pandas DataFrames. BigQuery is a high performance SQL-like database service, useful for performing ad-hoc queries against extremely large datasets. See the docs

```python
from pandas.io import gbq

# A query to select the average monthly temperatures in the
# in the year 2000 across the USA. The dataset,
# publicata:samples.gsod, is available on all BigQuery accounts,
# and is based on NOAA gsod data.
query = """SELECT station_number as STATION, 
    month as MONTH, AVG(mean_temp) as MEAN_TEMP 
FROM publicdata:samples.gsod 
WHERE YEAR = 2000 
GROUP BY STATION, MONTH 
ORDER BY STATION, MONTH ASC""

# Fetch the result set for this query

# Your Google BigQuery Project ID
# To find this, see your dashboard:
# https://console.developers.google.com/iam-admin/projects?authuser=0
projectid = 'xxxxxxxxx'
df = gbq.read_gbq(query, project_id=projectid)

# Use pandas to process and reshape the dataset

df2 = df.pivot(index='STATION', columns='MONTH', values='MEAN_TEMP')
df3 = pd.concat([df2.min(), df2.mean(), df2.max()],
                axis=1, keys=["Min Tem", "Mean Temp", "Max Temp"])
```

The resulting DataFrame is:
Warning: To use this module, you will need a BigQuery account. See <https://cloud.google.com/products/big-query> for details.

As of 10/10/13, there is a bug in Google’s API preventing result sets from being larger than 100,000 rows. A patch is scheduled for the week of 10/14/13.

**Internal refactoring**

In 0.13.0 there is a major refactoring to subclass Series from NDFrame, which is the base class currently for DataFrame and Panel, to unify methods and behaviors. Series formerly subclassed directly from ndarray. (GH4080, GH3862, GH816)

Warning: There are two potential incompatibilities from < 0.13.0

- Using certain numpy functions would previously return a Series if passed a Series as an argument. This seems only to affect np.ones_like, np.empty_like, np.diff and np.where. These now return ndarrays.

```
In [111]: s = pd.Series([1, 2, 3, 4])

Numpy Usage

In [112]: np.ones_like(s)
Out[112]: array([1, 1, 1, 1])

In [113]: np.diff(s)
Out[113]: array([1, 1, 1])

In [114]: np.where(s > 1, s, np.nan)
Out[114]: array([nan, 2., 3., 4.])
```

Pandoc Usage

```
In [115]: pd.Series(1, index=s.index)
Out[115]:
0  1
1  1
```
2  1
3  1
dtype: int64

In [116]: s.diff()
Out[116]:
0  NaN
1  1.0
2  1.0
3  1.0
dtype: float64

In [117]: s.where(s > 1)
Out[117]:
0  NaN
1  2.0
2  3.0
3  4.0
dtype: float64

- Passing a Series directly to a cython function expecting an ndarray type will no long work directly, you must pass Series.values, See Enhancing Performance
- Series(0.5) would previously return the scalar 0.5, instead this will return a 1-element Series
- This change breaks rpy2<=2.3.8. an Issue has been opened against rpy2 and a workaround is detailed in GH5698. Thanks @JanSchulz.

- Pickle compatibility is preserved for pickles created prior to 0.13. These must be unpickled with pd.read_pickle, see Pickling.
- Refactor of series.py/frame.py/panel.py to move common code to generic.py
  - added _setup_axes to created generic NDFrame structures
  - moved methods
    * from_axes,_wrap_array,axes,ix,loc,iloc,shape,empty,swapaxes,transpose,pop
    * __iter__,keys,contains,len,neg,invert
    * convert_objects,as_blocks,as_matrix,values
    * __getstate__,__setstate__ (compat remains in frame/panel)
    * __getattr__,__setattr__
    * _indexed_same,reindex_like,align,where,mask
    * fillna,replace (Series replace is now consistent with DataFrame)
    * filter (also added axis argument to selectively filter on a different axis)
    * reindex,reindex_axis,take
    * truncate (moved to become part of NDFrame)
- These are API changes which make Panel more consistent with DataFrame
  - swapaxes on a Panel with the same axes specified now return a copy
  - support attribute access for setting
- filter supports the same API as the original DataFrame filter
- Reindex called with no arguments will now return a copy of the input object
- TimeSeries is now an alias for Series. the property is_time_series can be used to distinguish (if desired)
- Refactor of Sparse objects to use BlockManager
  - Created a new block type in internals, SparseBlock, which can hold multi-dtypes and is non-consolidatable. SparseSeries and SparseDataFrame now inherit more methods from there hierarchy (Series/DataFrame), and no longer inherit from SparseArray (which instead is the object of the SparseBlock)
  - Sparse suite now supports integration with non-sparse data. Non-float sparse data is supportable (partially implemented)
  - Operations on sparse structures within DataFrames should preserve sparseness, merging type operations will convert to dense (and back to sparse), so might be somewhat inefficient
  - enable setitem on SparseSeries for boolean/integer/slices
  - SparsePanels implementation is unchanged (e.g. not using BlockManager, needs work)
- added ftypes method to Series/DataFrame, similar to dtypes, but indicates if the underlying is sparse/dense (as well as the dtype)
  - All NDFrame objects can now use __finalize__() to specify various values to propagate to new objects from an existing one (e.g. name in Series will follow more automatically now)
  - Internal type checking is now done via a suite of generated classes, allowing isinstance(value, klass) without having to directly import the klass, courtesy of @jtratner
- Bug in Series update where the parent frame is not updating its cache based on changes (GH4080) or types (GH3217), fillna (GH3386)
- Indexing with dtype conversions fixed (GH4463, GH4204)
- Refactor Series.reindex to core/generic.py (GH4604, GH4618), allow method= in reindexing on a Series to work
- Series.copy no longer accepts the order parameter and is now consistent with NDFrame copy
- Refactor rename methods to core/generic.py; fixes Series.rename for (GH4605), and adds rename with the same signature for Panel
- Refactor clip methods to core/generic.py (GH4798)
- Refactor of _get_numeric_data/_get_bool_data to core/generic.py, allowing Series/Panel functionality
- Series (for index) / Panel (for items) now allow attribute access to its elements (GH1903)

```
In [118]: s = pd.Series([1, 2, 3], index=list('abc'))

In [119]: s.b
Out[119]: 2

In [120]: s.a = 5

In [121]: s
Out[121]:
    a  5
    b  2
```

(continues on next page)
Bug fixes

- HDFStore
  - raising an invalid TypeError rather than ValueError when appending with a different block ordering (GH4096)
  - read_hdf was not respecting as passed mode (GH4504)
  - appending a 0-len table will work correctly (GH4273)
  - to_hdf was raising when passing both arguments append and table (GH4584)
  - reading from a store with duplicate columns across dtypes would raise (GH4767)
  - Fixed a bug where ValueError wasn’t correctly raised when column names weren’t strings (GH4956)
  - A zero length series written in Fixed format not deserializing properly. (GH4708)
  - Fixed decoding perf issue on pyt3 (GH5441)
  - Validate levels in a MultiIndex before storing (GH5527)
  - Correctly handle data_columns with a Panel (GH5717)
- Fixed bug in tslib.tz_convert(vals, tz1, tz2): it could raise IndexError exception while trying to access trans[pos + 1] (GH4496)
- The by argument now works correctly with the layout argument (GH4102, GH4014) in *.hist plotting methods
- Fixed bug in PeriodIndex.map where using str would return the str representation of the index (GH4136)
- Fixed test failure test_time_series_plot_color_with_empty_kwargs when using custom matplotlib default colors (GH4345)
- Fix running of stata IO tests. Now uses temporary files to write (GH4353)
- Fixed an issue where DataFrame.sum was slower than DataFrame.mean for integer valued frames (GH4365)
- read_html tests now work with Python 2.6 (GH4351)
- Fixed bug where network testing was throwing NameError because a local variable was undefined (GH4381)
- In to_json, raise if a passed orient would cause loss of data because of a duplicate index (GH4359)
- In to_json, fix date handling so millisecond are the default timestamp as the docstring says (GH4362).
- as_index is no longer ignored when doing groupby apply (GH4648, GH3417)
- JSON NaT handling fixed, NaTs are now serialized to null (GH4499)
- Fixed JSON handling of escapable characters in JSON object keys (GH4593)
- Fixed passing keep_default_na=False when na_values=None (GH4318)
- Fixed bug with values raising an error on a DataFrame with duplicate columns and mixed dtypes, surfaced in (GH4377)
- Fixed bug with duplicate columns and type conversion in read_json when orient='split' (GH4377)
• Fixed JSON bug where locales with decimal separators other than ‘,’ threw exceptions when encoding / decoding certain values. (GH4918)
• Fix .iat indexing with a PeriodIndex (GH4390)
• Fixed an issue where PeriodIndex joining with self was returning a new instance rather than the same instance (GH4379); also adds a test for this for the other index types
• Fixed a bug with all the dtypes being converted to object when using the CSV parser with the usecols parameter (GH3192)
• Fix an issue in merging blocks where the resulting DataFrame had partially set _ref_locs (GH4403)
• Fixed an issue where hist subplots were being overwritten when they were called using the top level matplotlib API (GH4408)
• Fixed a bug where calling Series.astype(str) would truncate the string (GH4405, GH4437)
• Fixed a py3 compat issue where bytes were being repr’d as tuples (GH4455)
• Fixed Panel attribute naming conflict if item is named ‘a’ (GH3440)
• Fixed an issue where duplicate indexes were raising when plotting (GH4486)
• Fixed an issue where cumsum and cumprod didn’t work with bool dtypes (GH4170, GH4440)
• Fixed Panel slicing issued in xs that was returning an incorrect dimmed object (GH4016)
• Fix resampling bug where custom reduce function not used if only one group (GH3849, GH4494)
• Fixed Panel assignment with a transposed frame (GH3830)
• Raise on set indexing with a Panel and a Panel as a value which needs alignment (GH3777)
• frozenset objects now raise in the Series constructor (GH4482, GH4480)
• Fixed issue with sorting a duplicate MultiIndex that has multiple dtypes (GH4516)
• Fixed bug in DataFrame.set_values which was causing name attributes to be lost when expanding the index. (GH3742, GH4039)
• Fixed issue where individual names, levels and labels could be set on MultiIndex without validation (GH3714, GH4039)
• Fixed (GH3334) in pivot_table. Margins did not compute if values is the index.
• Fix bug in having a rhs of np.timedelta64 or np.offsets.DateOffset when operating with datetimes (GH4532)
• Fix arithmetic with series/datetimeindex and np.timedelta64 not working the same (GH4134) and buggy timedelta in NumPy 1.6 (GH4135)
• Fix bug in pd.read_clipboard on windows with PY3 (GH4561); not decoding properly
• tslib.get_period_field() and tslib.get_period_field_arr() now raise if code argument out of range (GH4519, GH4520)
• Fix boolean indexing on an empty series loses index names (GH4235), infer_dtype works with empty arrays.
• Fix reindexing with multiple axes; if an axes match was not replacing the current axes, leading to a possible lazy frequency inference issue (GH3317)
• Fixed issue where DataFrame.apply was reraising exceptions incorrectly (causing the original stack trace to be truncated). 
• Fix selection with ix/loc and non_unique selectors (GH4619)
• Fix assignment with iloc/loc involving a dtype change in an existing column (GH4312, GH5702) have internal setitem_with_indexer in core/indexing to use Block.setitem
• Fixed bug where thousands operator was not handled correctly for floating point numbers in csv_import (GH4322)
• Fix an issue with CacheableOffset not properly being used by many DateOffset; this prevented the DateOffset from being cached (GH4609)
• Fix boolean comparison with a DataFrame on the lhs, and a list/tuple on the rhs (GH4576)
• Fix error/dtype conversion with setitem of None on Series/DataFrame (GH4667)
• Fix decoding based on a passed in non-default encoding in pd.read_stata (GH4626)
• Fix DataFrame.from_records with a plain-vanilla ndarray. (GH4727)
• Fix some inconsistencies with Index.rename and MultiIndex.rename, etc. (GH4718, GH4628)
• Bug in using iloc/loc with a cross-sectional and duplicate indices (GH4726)
• Bug with using QUOTE_NONE with to_csv causing Exception. (GH4328)
• Bug with Series indexing not raising an error when the right-hand-side has an incorrect length (GH2702)
• Bug in MultiIndexing with a partial string selection as one part of a MultiIndex (GH4758)
• Bug with reindexing on the index with a non-unique index will now raise ValueError (GH4746)
• Bug in setting with loc/ix a single indexer with a MultiIndex axis and a NumPy array, related to (GH3777)
• Bug in concatenation with duplicate columns across dtypes not merging with axis=0 (GH4771, GH4975)
• Bug in iloc with a slice index failing (GH4771)
• Incorrect error message with no colspecs or width in read_fwf. (GH4774)
• Fix bugs in indexing in a Series with a duplicate index (GH4548, GH4550)
• Fixed bug with reading compressed files with read_fwf in Python 3. (GH3963)
• Fixed an issue with a duplicate index and assignment with a dtype change (GH4686)
• Fixed an issue related to ticklocs/ticklabels with log scale bar plots across different versions of matplotlib (GH4789)
• Suppressed DeprecationWarning associated with internal calls issued by repr() (GH4391)
• Fixed an issue with a duplicate index and duplicate selector with .loc (GH4825)
• Fixed an issue with DataFrame.sort_index where, when sorting by a single column and passing a list for ascending, the argument for ascending was being interpreted as True (GH4839, GH4846)
• Fixed Panel.tshift not working. Added freq support to Panel.shift (GH4853)
• Fix an issue in TextFileReader w/ Python engine (i.e. PythonParser) with thousands != “,” (GH4596)
• Bug in getitem with a duplicate index when using where (GH4879)
• Fix Type inference code coerces float column into datetime (GH4601)
• Fixed _ensure_numeric does not check for complex numbers (GH4902)
• Fixed a bug in Series.hist where two figures were being created when the by argument was passed (GH4112, GH4113).
• Fixed a bug in `convert_objects` for > 2 ndims (GH4937)
• Fixed a bug in DataFrame/Panel cache insertion and subsequent indexing (GH4939, GH5424)
• Fixed string methods for FrozenNDArray and FrozenList (GH4929)
• Fixed a bug with setting invalid or out-of-range values in indexing enlargement scenarios (GH4940)
• Tests for fillna on empty Series (GH4346), thanks @immerrr
• Fixed copy() to shallow copy axes/indices as well and thereby keep separate metadata. (GH4202, GH4830)
• Fixed skiprows option in Python parser for read_csv (GH4382)
• Fixed bug preventing cut from working with np.inf levels without explicitly passing labels (GH3415)
• Fixed wrong check for overlapping in DatetimeIndex.union (GH4564)
• Fixed conflict between thousands separator and date parser in csv_parser (GH4678)
• Fix appending when dtypes are not the same (error showing mixing float/np.datetime64) (GH4993)
• Fix repr for DateOffset. No longer show duplicate entries in kwds. Removed unused offset fields. (GH4638)
• Fixed wrong index name during read_csv if using usecols. Applies to csv_parser only. (GH4201)
• Timestamp objects can now appear in the left hand side of a comparison operation with a Series or DataFrame object (GH4982).
• Fix a bug when indexing with np.nan via iloc/loc (GH5016)
• Fixed a bug where low memory c parser could create different types in different chunks of the same file. Now coerces to numerical type or raises warning. (GH3866)
• Fix a bug where reshaping a Series to its own shape raised TypeError (GH4554) and other reshaping issues.
• Bug in setting with ix/loc and a mixed int/string index (GH4544)
• Make sure series-series boolean comparisons are label based (GH4947)
• Bug in multi-level indexing with a Timestamp partial indexer (GH4294)
• Tests/fix for MultiIndex construction of an all-nan frame (GH4078)
• Fixed a bug where `read_html()` wasn't correctly inferring values of tables with commas (GH5029)
• Fixed a bug where `read_html()` wasn't providing a stable ordering of returned tables (GH4770, GH5029).
• Fixed a bug where `read_html()` was incorrectly parsing when passed `index_col=0` (GH5066).
• Fixed a bug where `read_html()` was incorrectly inferring the type of headers (GH5048).
• Fixed a bug where DatetimeIndex joins with PeriodIndex caused a stack overflow (GH3899).
• Fixed a bug where `groupby` objects didn't allow plots (GH5102).
• Fixed a bug where `groupby` objects weren't tab-completing column names (GH5102).
• Fixed a bug where `groupby.plot()` and friends were duplicating figures multiple times (GH5102).
• Provide automatic conversion of `object` dtypes on fillna, related (GH5103)
• Fixed a bug where default options were being overwritten in the option parser cleaning (GH5121).
• Treat a list/ndarray identically for iloc indexing with list-like (GH5006)
• Fix MultiIndex.get_level_values() with missing values (GH5074)
• Fix bound checking for `Timestamp()` with datetime64 input (GH4065)
• Fix a bug where `TestReadHtml` wasn't calling the correct `read_html()` function (GH5150).
• Fix a bug with `NDFrame.replace()` which made replacement appear as though it was (incorrectly) using regular expressions (GH5143).
• Fix better error message for `to_datetime` (GH4928)
• Made sure different locales are tested on travis-ci (GH4918). Also adds a couple of utilities for getting locales and setting locales with a context manager.
• Fixed segfault on `isnull(MultiIndex)` (now raises an error instead) (GH5123, GH5125)
• Allow duplicate indices when performing operations that align (GH5185, GH5639)
• Compound dtypes in a constructor raise `NotImplementedError` (GH5191)
• Bug in comparing duplicate frames (GH4421) related
• Bug in describe on duplicate frames
• Bug in `to_datetime` with a format and `coerce=True` not raising (GH5195)
• Bug in `loc` setting with multiple indexers and a rhs of a Series that needs broadcasting (GH5206)
• Fixed bug where inplace setting of levels or labels on `MultiIndex` would not clear cached values property and therefore return wrong values. (GH5215)
• Fixed bug where filtering a grouped DataFrame or Series did not maintain the original ordering (GH4621).
• Fixed `Period` with a business date freq to always roll-forward if on a non-business date. (GH5203)
• Fixed bug in Excel writers where frames with duplicate column names weren't written correctly. (GH5235)
• Fixed issue with `drop` and a non-unique index on Series (GH5248)
• Fixed segfault in C parser caused by passing more names than columns in the file. (GH5156)
• Fix `Series.isin` with date/time-like dtypes (GH5021)
• C and Python Parser can now handle the more common MultiIndex column format which doesn’t have a row for index names (GH4702)
• Bug when trying to use an out-of-bounds date as an object dtype (GH5312)
• Bug when trying to display an embedded PandasObject (GH5324)
• Allows operating of Timestamps to return a datetime if the result is out-of-bounds related (GH5312)
• Fix return value/type signature of `initObjToJSON()` to be compatible with numpy's `import_array()` (GH5334, GH5326)
• Bug when renaming then set_index on a DataFrame (GH5344)
• Test suite no longer leaves around temporary files when testing graphics. (GH5347) (thanks for catching this @yarakoptic!)
• Fixed html tests on win32. (GH4580)
• Make sure that `head/tail` are `iloc` based. (GH5370)
• Fixed bug for `PeriodIndex` string representation if there are 1 or 2 elements. (GH5372)
• The GroupBy methods `transform` and `filter` can be used on Series and DataFrames that have repeated (non-unique) indices. (GH4620)
• Fix empty series not printing name in repr (GH4651)
• Make tests create temp files in temp directory by default. (GH5419)
• `pd.to_timedelta` of a scalar returns a scalar (GH5410)
• `pd.to_timedelta` accepts NaN and NaT, returning NaT instead of raising (GH5437)
• performance improvements in `isnull` on larger size pandas objects
• Fixed various `setitem` with 1d `ndarray` that does not have a matching length to the indexer (GH5508)
• Bug in `getitem` with a MultiIndex and `iloc` (GH5528)
• Bug in `delitem` on a Series (GH5542)
• Bug fix in `apply` when using custom function and objects are not mutated (GH5545)
• Bug in selecting from a non-unique index with `iloc` (GH5553)
• Bug in `groupby` returning non-consistent types when user function returns a `None` (GH5592)
• Work around regression in numpy 1.7.0 which erroneously raises IndexError from `ndarray.item` (GH5666)
• Bug in repeated indexing of object with resultant non-unique index (GH5678)
• Bug in `fillna` with Series and a passed series/dict (GH5703)
• Bug in `groupby` transform with a datetime-like grouper (GH5712)
• Bug in MultiIndex selection in PY3 when using certain keys (GH5725)
• Row-wise concat of differing dtypes failing in certain cases (GH5754)

5.17 Version 0.12

5.17.1 Version 0.12.0 (July 24, 2013)

This is a major release from 0.11.0 and includes several new features and enhancements along with a large number of bug fixes.

Highlights include a consistent I/O API naming scheme, routines to read html, write MultiIndexes to csv files, read & write STATA data files, read & write JSON format files, Python 3 support for HDFStore, filtering of groupby expressions via filter, and a revamped replace routine that accepts regular expressions.
API changes

- The I/O API is now much more consistent with a set of top level reader functions accessed like `pd.read_csv()` that generally return a pandas object.
  - `read_csv`
  - `read_excel`
  - `read_hdf`
  - `read_sql`
  - `read_json`
  - `read_html`
  - `read_stata`
  - `read_clipboard`

The corresponding writer functions are object methods that are accessed like `df.to_csv()`
  - `to_csv`
  - `to_excel`
  - `to_hdf`
  - `to_sql`
  - `to_json`
  - `to_html`
  - `to_stata`
  - `to_clipboard`

- Fix modulo and integer division on Series,DataFrames to act similarly to float dtypes to return `np.nan` or `np.inf` as appropriate (GH3590). This correct a numpy bug that treats integer and float dtypes differently.

```
In [1]: p = pd.DataFrame({"first": [4, 5, 8], "second": [0, 0, 3]})

In [2]: p % 0
Out[2]:
     first  second

• Add squeeze keyword to groupby to allow reduction from DataFrame -> Series if groups are unique. This is a
Regression from 0.10.1. We are reverting back to the prior behavior. This means groupby will return the same
shaped objects whether the groups are unique or not. Revert this issue (GH2893) with (GH3596).
In [2]: df2 = pd.DataFrame([{"val1": 1, "val2": 20},
...:
{"val1": 1, "val2": 19},
...:
{"val1": 1, "val2": 27},
...:
{"val1": 1, "val2": 12}])
In [3]: def func(dataf):
...:
return dataf["val2"] - dataf["val2"].mean()

• Raise on iloc when boolean indexing with a label based indexer mask e.g. a boolean Series, even with integer
labels, will raise. Since iloc is purely positional based, the labels on the Series are not alignable (GH3631)
This case is rarely used, and there are plenty of alternatives. This preserves the iloc API to be purely positional
based.
In [6]: df = pd.DataFrame(range(5), index=list("ABCDE"), columns=["a"])
In [7]: mask = df.a % 2 == 0
In [8]: mask
Out[8]:
A
True
B
False
(continues on next page)

5.17. Version 0.12

3321


C    True
D    False
E    True
Name: a, dtype: bool

# this is what you should use
In [9]: df.loc[mask]
Out[9]:
    a
   A  0
   C  2
   E  4

# this will work as well
In [10]: df.iloc[mask.values]
Out[10]:
    a
   A  0
   C  2
   E  4

df.iloc[mask] will raise a ValueError

• The raise_on_error argument to plotting functions is removed. Instead, plotting functions raise a TypeError
  when the dtype of the object is object to remind you to avoid object arrays whenever possible and thus you
  should cast to an appropriate numeric dtype if you need to plot something.

• Add colormap keyword to DataFrame plotting methods. Accepts either a matplotlib colormap object (ie, mat-
  plotlib.cm.jet) or a string name of such an object (ie, 'jet'). The colormap is sampled to select the color for each
  column. Please see Colormaps for more information. (GH3860)

• DataFrame.interpolate() is now deprecated. Please use DataFrame.fillna() and DataFrame.
  replace() instead. (GH3582, GH3675, GH3676)

• the method and axis arguments of DataFrame.replace() are deprecated

• DataFrame.replace 's infer_types parameter is removed and now performs conversion by default.
  (GH3907)

• Add the keyword allow_duplicates to DataFrame.insert to allow a duplicate column to be inserted if
  True, default is False (same as prior to 0.12) (GH3679)

• Implement __nonzero__ for NDFrame objects (GH3691, GH3696)

• IO api
  – added top-level function read_excel to replace the following, The original API is deprecated and will be
    removed in a future version

    >>> from pandas.io.parsers import ExcelFile
    >>> xls = ExcelFile("path_to_file.xls")
    >>> xls.parse("Sheet1", index_col=None, na_values=['NA'])

    With
import pandas as pd

pd.read_excel("path_to_file.xls", "Sheet1", index_col=None, na_values=["NA"])

- added top-level function read_sql that is equivalent to the following

from pandas.io.sql import read_frame

read_frame(...)

- DataFrame.to_html and DataFrame.to_latex now accept a path for their first argument (GH3702)

- Do not allow astypes on datetime64[ns] except to object, and timedelta64[ns] to object/int (GH3425)

- The behavior of datetime64 dtypes has changed with respect to certain so-called reduction operations (GH3726). The following operations now raise a TypeError when performed on a Series and return an empty Series when performed on a DataFrame similar to performing these operations on, for example, a DataFrame of slice objects:
  - sum, prod, mean, std, var, skew, kurt, corr, and cov

- read_html now defaults to None when reading, and falls back on bs4 + html5lib when lxml fails to parse. A list of parsers to try until success is also valid

- The internal pandas class hierarchy has changed (slightly). The previous PandasObject now is called PandasContainer and a new PandasObject has become the base class for PandasContainer as well as Index, Categorical, GroupBy, SparseList, and SparseArray (+ their base classes). Currently, PandasObject provides string methods (from StringMixin). (GH4090, GH4092)

- New StringMixin that, given a __unicode__ method, gets python 2 and python 3 compatible string methods (__str__, __bytes__, and __repr__). Plus string safety throughout. Now employed in many places throughout the pandas library. (GH4090, GH4092)

**IO enhancements**

- pd.read_html() can now parse HTML strings, files or urls and return DataFrames, courtesy of @cpcloud. (GH3477, GH3605, GH3606, GH3616). It works with a single parser backend: BeautifulSoup4 + html5lib See the docs

You can use pd.read_html() to read the output from DataFrame.to_html() like so

```python
In [11]: df = pd.DataFrame({"a": range(3), "b": list("abc"))

In [12]: print(df)
a  b
0  0  a
1  1  b
2  2  c

In [13]: html = df.to_html()

In [14]: alist = pd.read_html(html, index_col=0)

In [15]: print(df == alist[0])
a  b
0  True True
```
Note that `alist` here is a Python list so `pd.read_html()` and `DataFrame.to_html()` are not inverses.

- `pd.read_html()` no longer performs hard conversion of date strings (GH3656).

**Warning:** You may have to install an older version of BeautifulSoup4, See the installation docs

- Added module for reading and writing Stata files: `pandas.io.stata` (GH1512) accessible via `read_stata` top-level function for reading, and `to_stata DataFrame` method for writing, See the docs

- Added module for reading and writing json format files: `pandas.io.json` accessible via `read_json` top-level function for reading, and `to_json DataFrame` method for writing, See the docs various issues (GH1226, GH3804, GH3876, GH3867, GH1305)

- MultiIndex column support for reading and writing csv format files
  - The `header` option in `read_csv` now accepts a list of the rows from which to read the index.
  - The option, `tupleize_cols` can now be specified in both `to_csv` and `read_csv` to provide compatibility for the pre 0.12 behavior of writing and reading MultiIndex columns via a list of tuples. The default in 0.12 is to write lists of tuples and *not* interpret list of tuples as a MultiIndex column.

  Note: The default behavior in 0.12 remains unchanged from prior versions, but starting with 0.13, the default to write and read MultiIndex columns will be in the new format. (GH3571, GH1651, GH3141)

  - If an `index_col` is not specified (e.g. you don’t have an index, or wrote it with `df.to_csv(..., index=False)`), then any names on the columns index will be *lost.*

```
In [16]: from pandas._testing import makeCustomDataframe as mkdf

In [17]: df = mkdf(5, 3, r_idx_nlevels=2, c_idx_nlevels=4)

In [18]: df.to_csv("mi.csv")

In [19]: print(open("mi.csv").read())
C0,,C_l0_g0,C_l0_g1,C_l0_g2
C1,,C_l1_g0,C_l1_g1,C_l1_g2
C2,,C_l2_g0,C_l2_g1,C_l2_g2

C2  C_l2_g0  C_l2_g1  C_l2_g2
```
Support for HDFStore (via PyTables 3.0.0) on Python3

Iterator support via read_hdf that automatically opens and closes the store when iteration is finished. This is only for tables

```
In [25]: path = 'store_iterator.h5'

In [26]: pd.DataFrame(np.random.randn(10, 2)).to_hdf(path, 'df', table=True)

In [27]: for df in pd.read_hdf(path, 'df', chunksize=3):
       ....:     print(df)
       ....:
0 1
  0 0.713216 -0.778461
  1 -0.661062 0.862877
  2 0.344342 0.149565
  3 -0.626968 -0.875772
  4 -0.930687 -0.218983
  5 0.949965 -0.442354
  6 -0.402985 1.111358
  7 -0.241527 -0.670477
  8 0.049355 0.632633
  9 -1.502767 -1.225492
```

read_csv will now throw a more informative error message when a file contains no columns, e.g., all newline characters

Other enhancements

Dataframe.replace() now allows regular expressions on contained Series with object dtype. See the examples section in the regular docs Replacing via String Expression

For example you can do

```
In [21]: df = pd.DataFrame({'a': list('ab..'), 'b': [1, 2, 3, 4]})

In [22]: df.replace(regex=r'^\s*\.', value=np.nan)
Out[22]:
   a  b
0  a  1
1  b  2
```

(continues on next page)
to replace all occurrences of the string ' . ' with zero or more instances of surrounding white space with NaN.

Regular string replacement still works as expected. For example, you can do

```
In [23]: df.replace(". ", np.nan)
Out[23]:
   a  b
0  a  1
1  b  2
2  NaN  3
3  NaN  4
```

to replace all occurrences of the string ' . ' with NaN.

- `pd.melt()` now accepts the optional parameters `var_name` and `value_name` to specify custom column names of the returned DataFrame.
- `pd.set_option()` now allows N option, value pairs (GH3667).

Let's say that we had an option 'a.b' and another option 'b.c'. We can set them at the same time:

```
In [31]: pd.set_option('a.b', 1, 'b.c', 4)
In [32]: pd.get_option('a.b')
Out[32]: 1
In [33]: pd.get_option('b.c')
Out[33]: 4
```

- The `filter` method for group objects returns a subset of the original object. Suppose we want to take only elements that belong to groups with a group sum greater than 2.

```
In [24]: sf = pd.Series([1, 1, 2, 3, 3, 3])
In [25]: sf.groupby(sf).filter(lambda x: x.sum() > 2)
Out[25]:
3  3
4  3
5  3
dtype: int64
```

The argument of `filter` must a function that, applied to the group as a whole, returns `True` or `False`.

Another useful operation is filtering out elements that belong to groups with only a couple members.
In [26]: dff = pd.DataFrame(  
                       {"A": np.arange(8),  
                        "B": list("aabbbbcc"))

In [27]: dff.groupby("B").filter(lambda x: len(x) > 2)
Out[27]:
      A B
    2 2 b
    3 3 b
    4 4 b
    5 5 b

Alternatively, instead of dropping the offending groups, we can return a like-indexed objects where the groups that do not pass the filter are filled with NaNs.

In [28]: dff.groupby("B").filter(lambda x: len(x) > 2, dropna=False)
Out[28]:
      A   B
    0  NaN  NaN
    1  NaN  NaN
    2  2.0  b
    3  3.0  b
    4  4.0  b
    5  5.0  b
    6  NaN  NaN
    7  NaN  NaN

- Series and DataFrame hist methods now take a figsize argument (GH3834)
- DatetimeIndexes no longer try to convert mixed-integer indexes during join operations (GH3877)
- Timestamp.min and Timestamp.max now represent valid Timestamp instances instead of the default datetime.min and datetime.max (respectively), thanks @SleepingPills
- read_html now raises when no tables are found and BeautifulSoup==4.2.0 is detected (GH4214)

**Experimental features**

- Added experimental CustomBusinessDay class to support DateOffsets with custom holiday calendars and custom weekmasks. (GH2301)

*Note:* This uses the numpy.busdaycalendar API introduced in Numpy 1.7 and therefore requires Numpy 1.7.0 or newer.

In [29]: from pandas.tseries.offsets import CustomBusinessDay

In [30]: from datetime import datetime

# As an interesting example, let's look at Egypt where
# a Friday-Saturday weekend is observed.
In [31]: weekmask_egypt = "Sun Mon Tue Wed Thu"

# They also observe International Workers' Day so let's
# add that for a couple of years

(continues on next page)
In [32]: holidays = ["2012-05-01", datetime(2013, 5, 1), np.datetime64("2014-05-01")]

In [33]: bday_egypt = CustomBusinessDay(holidays=holidays, weekmask=weekmask_egypt)

In [34]: dt = datetime(2013, 4, 30)

In [35]: print(dt + 2 * bday_egypt)
2013-05-05 00:00:00

In [36]: dts = pd.date_range(dt, periods=5, freq=bday_egypt)

In [37]: print(pd.Series(dts.weekday, dts).map(pd.Series("Mon Tue Wed Thu Fri Sat Sun".split())))
2013-04-30 Tue
2013-05-02 Thu
2013-05-05 Sun
2013-05-06 Mon
2013-05-07 Tue
Freq: C, dtype: object

Bug fixes

• Plotting functions now raise a TypeError before trying to plot anything if the associated objects have a dtype of object (GH1818, GH3572, GH3911, GH3912), but they will try to convert object arrays to numeric arrays if possible so that you can still plot, for example, an object array with floats. This happens before any drawing takes place which eliminates any spurious plots from showing up.

•fillna methods now raise a TypeError if the value parameter is a list or tuple.

• Series.str now supports iteration (GH3638). You can iterate over the individual elements of each string in the Series. Each iteration yields a Series with either a single character at each index of the original Series or NaN. For example,

In [38]: strs = "go", "bow", "joe", "slow"

In [39]: ds = pd.Series(strs)

In [40]: for s in ds.str:
   ....:     print(s)
   ....:
0 g
1 b
2 j
3 s
dtype: object
0 o
1 o
2 o
3 l
dtype: object
0 NaN

(continues on next page)
The last element yielded by the iterator will be a `Series` containing the last element of the longest string in the `Series` with all other elements being NaN. Here since 'slow' is the longest string and there are no other strings with the same length 'w' is the only non-null string in the yielded `Series`.

- **HDFStore**
  - will retain index attributes (freq,tz,name) on recreation (GH3499)
  - will warn with an `AttributeConflictWarning` if you are attempting to append an index with a different frequency than the existing, or attempting to append an index with a different name than the existing
  - support datelike columns with a timezone as data_columns (GH2852)

- **Non-unique index support clarified (GH3468).**
  - Fix assigning a new index to a duplicate index in a DataFrame would fail (GH3468)
  - Fix construction of a DataFrame with a duplicate index
  - ref_locs support to allow duplicative indices across dtypes, allows iget support to always find the index (even across dtypes) (GH2194)
  - applymap on a DataFrame with a non-unique index now works (removed warning) (GH2786), and fix (GH3230)
  - Fix to_csv to handle non-unique columns (GH3495)
  - Duplicate indexes with getitem will return items in the correct order (GH3455, GH3457) and handle missing elements like unique indices (GH3561)
  - Duplicate indexes with and empty DataFrame.from_records will return a correct frame (GH3562)
  - Concat to produce a non-unique columns when duplicates are across dtypes is fixed (GH3602)
  - Allow insert/delete to non-unique columns (GH3679)
  - Non-unique indexing with a slice via loc and friends fixed (GH3659)
  - Allow insert/delete to non-unique columns (GH3679)
pandas: powerful Python data analysis toolkit, Release 1.2.5

- Extend `reindex` to correctly deal with non-unique indices (GH3679)
- `DataFrame.itertuples()` now works with frames with duplicate column names (GH3873)
- Bug in non-unique indexing via `iloc` (GH4017); added `takeable` argument to `reindex` for location-based taking
- Allow non-unique indexing in series via `.ix/.loc` and `__getitem__` (GH4246)
- Fixed non-unique indexing memory allocation issue with `.ix/.loc` (GH4280)

- **DataFrame.from_records** did not accept empty recarrays (GH3682)
- `read_html` now correctly skips tests (GH3741)
- Fixed a bug where `DataFrame.replace` with a compiled regular expression in the `to_replace` argument wasn’t working (GH3907)
- Improved network test decorator to catch `IOError` (and therefore `URLError` as well). Added `with_connectivity_check` decorator to allow explicitly checking a website as a proxy for seeing if there is network connectivity. Plus, new `optional_args` decorator factory for decorators. (GH3910, GH3914)
- Fixed testing issue where too many sockets where open thus leading to a connection reset issue (GH3982, GH3985, GH4028, GH4054)
- Fixed failing tests in `test_yahoo`, `test_google` where symbols were not retrieved but were being accessed (GH3982, GH3985, GH4028, GH4054)
- `Series.hist` will now take the figure from the current environment if one is not passed
- Fixed bug where a 1xN DataFrame would barf on a 1xN mask (GH4071)
- Fixed running of `tox` under python3 where the pickle import was getting rewritten in an incompatible way (GH4062, GH4063)
- Fixed bug where `sharex` and `sharey` were not being passed to `grouped_hist` (GH4089)
- Fixed bug in `DataFrame.replace` where a nested dict wasn’t being iterated over when `regex=False` (GH4115)
- Fixed bug in the parsing of microseconds when using the `format` argument in `to_datetime` (GH4152)
- Fixed bug in `PandasAutoDateLocator` where `invert_xaxis` triggered incorrectly `MilliSecondLocator` (GH3990)
- Fixed bug in plotting that wasn’t raising on invalid colormap for matplotlib 1.1.1 (GH4215)
- Fixed the legend displaying in `DataFrame.plot(kind='kde')` (GH4216)
- Fixed bug where `Index` slices weren’t carrying the name attribute (GH4226)
- Fixed bug in initializing `DatetimeIndex` with an array of strings in a certain time zone (GH4229)
- Fixed bug where `html5lib` wasn’t being properly skipped (GH4265)
- Fixed bug where `get_data_famafrench` wasn’t using the correct file edges (GH4281)

See the [full release notes](https://github.com/pandas-dev/pandas/releases) or issue tracker on GitHub for a complete list.

5.18 Version 0.11

5.18.1 Version 0.11.0 (April 22, 2013)

This is a major release from 0.10.1 and includes many new features and enhancements along with a large number of bug fixes. The methods of Selecting Data have had quite a number of additions, and Dtype support is now full-fledged. There are also a number of important API changes that long-time pandas users should pay close attention to.

There is a new section in the documentation, 10 Minutes to Pandas, primarily geared to new users.

There is a new section in the documentation, Cookbook, a collection of useful recipes in pandas (and that we want contributions!).

There are several libraries that are now Recommended Dependencies

Selection choices

Starting in 0.11.0, object selection has had a number of user-requested additions in order to support more explicit location based indexing. pandas now supports three types of multi-axis indexing.

• .loc is strictly label based, will raise KeyError when the items are not found, allowed inputs are:
  – A single label, e.g. 5 or 'a', (note that 5 is interpreted as a label of the index. This use is not an integer position along the index)
  – A list or array of labels ['a', 'b', 'c']
  – A slice object with labels 'a': 'f', (note that contrary to usual python slices, both the start and the stop are included!)
A boolean array

See more at Selection by Label

- `.iloc` is strictly integer position based (from 0 to `length-1` of the axis), will raise `IndexError` when the requested indices are out of bounds. Allowed inputs are:
  - An integer e.g. 5
  - A list or array of integers `[4, 3, 0]`
  - A slice object with ints `1:7`
  - A boolean array

See more at Selection by Position

- `.ix` supports mixed integer and label based access. It is primarily label based, but will fallback to integer positional access. `.ix` is the most general and will support any of the inputs to `.loc` and `.iloc`, as well as support for floating point label schemes. `.ix` is especially useful when dealing with mixed positional and label based hierarchical indexes.

As using integer slices with `.ix` have different behavior depending on whether the slice is interpreted as position based or label based, it’s usually better to be explicit and use `.iloc` or `.loc`.

See more at Advanced Indexing and Advanced Hierarchical.

Selection deprecations

Starting in version 0.11.0, these methods *may* be deprecated in future versions.

- `irow`
- `icol`
- `iget_value`

See the section Selection by Position for substitutes.

Dtypes

Numeric dtypes will propagate and can coexist in DataFrames. If a dtype is passed (either directly via the `dtype` keyword, a passed `ndarray`, or a passed `Series`, then it will be preserved in DataFrame operations. Furthermore, different numeric dtypes will NOT be combined. The following example will give you a taste.

```
In [1]: df1 = pd.DataFrame(np.random.randn(8, 1), columns=['A'], dtype='float32')

In [2]: df1

Out[2]:
   A
0  0.469112
1  0.282863
2  1.509058
3  1.135632
4  1.212112
5  0.173215
6  0.119209
7  1.044236
```

(continues on next page)
```python
In [3]: df1.dtypes
Out[3]:
A  float32
dtype: object
```

```python
In [4]: df2 = pd.DataFrame({'A': pd.Series(np.random.randn(8), dtype='float16'),
                      'B': pd.Series(np.random.randn(8)),
                      'C': pd.Series(range(8), dtype='uint8')})
```

```python
In [5]: df2
Out[5]:
     A     B     C
0 -0.8618 0.4249 0
1 -2.1055 0.5670 1
2 -0.4949 0.2762 2
3  1.0723 -1.0874 3
4  0.7217 -0.6737 4
5 -0.7065 0.1136 5
6 -1.0400 -1.4784 6
7  0.2719 0.5249 7
```

```python
In [6]: df2.dtypes
Out[6]:
A  float16
B  float64
C   uint8
dtype: object
```

```python
# here you get some upcasting
In [7]: df3 = df1.reindex_like(df2).fillna(value=0.0) + df2
```

```python
In [8]: df3
Out[8]:
     A     B     C
0 -0.3927 0.4249 0.0
1 -2.1055 0.5670 1.0
2 -0.4949 0.2762 2.0
3  1.0723 -1.0874 3.0
4  0.7217 -0.6737 4.0
5 -0.8798 0.1136 5.0
6 -0.9208 -1.4784 6.0
7  0.2719 0.5249 7.0
```

```python
In [9]: df3.dtypes
Out[9]:
A  float32
B  float64
C  float64
dtype: object
```
Dtype conversion

This is lower-common-denominator upcasting, meaning you get the dtype which can accommodate all of the types

```
In [10]: df3.values.dtype
Out[10]: dtype('float64')
```

Conversion

```
In [11]: df3.astype('float32').dtypes
Out[11]:
A    float32
B    float32
C    float32
dtype: object
```

Mixed conversion

```
In [12]: df3['D'] = '1.'
In [13]: df3['E'] = '1'

In [14]: df3.convert_objects(convert_numeric=True).dtypes
Out[14]:
A    float32
B    float64
C    float64
D    float64
E    int64
dtype: object
```

# same, but specific dtype conversion
```
In [15]: df3['D'] = df3['D'].astype('float16')
In [16]: df3['E'] = df3['E'].astype('int32')
```

Forcing date coercion (and setting NaT when not datelike)

```
In [18]: import datetime
In [19]: s = pd.Series([datetime.datetime(2001, 1, 1, 0, 0), 'foo', 1.0, 1,
                       pd.Timestamp('20010104'), '20010105'], dtype='O')
In [20]: s.convert_objects(convert_dates='coerce')
```
Dtype gotchas

Platform gotchas

Starting in 0.11.0, construction of DataFrame/Series will use default dtypes of `int64` and `float64`, regardless of platform. This is not an apparent change from earlier versions of pandas. If you specify dtypes, they WILL be respected, however (GH2837)

The following will all result in `int64` dtypes

```python
In [21]: pd.DataFrame([1, 2], columns=['a']).dtypes
Out[21]:
a  int64
dtype: object

In [22]: pd.DataFrame({ 'a': [1, 2]}).dtypes
Out[22]:
a  int64
dtype: object

In [23]: pd.DataFrame({ 'a': 1}, index=range(2)).dtypes
Out[23]:
a  int64
dtype: object
```

Keep in mind that `DataFrame(np.array([1,2]))` WILL result in `int32` on 32-bit platforms!

Upcasting gotchas

Performing indexing operations on integer type data can easily upcast the data. The dtype of the input data will be preserved in cases where nans are not introduced.

```python
In [24]: dfi = df3.astype('int32')

In [25]: dfi['D'] = dfi['D'].astype('int64')

In [26]: dfi
Out[26]:
    A  B  C  D  E
0  0  0  0  1  1
1 -2  0  1  1  1
2 -2  0  2  1  1
3  0 -1  3  1  1
4  1  0  4  1  1
```
In [27]: dfi.dtypes
Out[27]:
A  int32
B  int32
C  int32
D  int64
E  int32
dtype: object

In [28]: casted = dfi[dfi > 0]

In [29]: casted
Out[29]:
      A     B     C   D   E
0  NaN   NaN   NaN  1.0  1.0
1  NaN   NaN   NaN  2.0  1.0
2  NaN   NaN   NaN  3.0  1.0
3  NaN   NaN   NaN  4.0  1.0
4  1.0   NaN   NaN  5.0  1.0
5  NaN   NaN   NaN  6.0  1.0
6  NaN   NaN   NaN  7.0  1.0

In [30]: casted.dtypes
Out[30]:
A  float64
B  float64
C  float64
D  int64
E  int32
dtype: object

While float dtypes are unchanged.

In [31]: df4 = df3.copy()

In [32]: df4['A'] = df4['A'].astype('float32')

In [33]: df4.dtypes
Out[33]:
A  float32
B  float64
C  float64
D  float16
E  int32
dtype: object

In [34]: casted = df4[df4 > 0]

(continues on next page)
In [35]: casted
Out[35]:

## Datetimes conversion

Datetimes conversion

Datet ime64[ns] columns in a DataFrame (or a Series) allow the use of np.nan to indicate a nan value, in addition to the traditional NaT, or not-a-time. This allows convenient nan setting in a generic way. Furthermore datetime64[ns] columns are created by default, when passed datetimelike objects (this change was introduced in 0.10.1) (GH2809, GH2810)

In [12]: df = pd.DataFrame(np.random.randn(6, 2), pd.date_range('20010102', periods=6),
                   columns=['A', 'B'])
   ....:

In [13]: df['timestamp'] = pd.Timestamp('20010103')

In [14]: df
Out[14]:

<table>
<thead>
<tr>
<th></th>
<th>A</th>
<th>B</th>
<th>timestamp</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0.404705</td>
<td>0.577046</td>
<td>2001-01-03</td>

5  1.643563 -1.469388 2001-01-03

Astype conversion on datetime64[ns] to object, implicitly converts NaT to np.nan

In [18]: s = pd.Series([datetime.datetime(2001, 1, 2, 0, 0) for i in range(3)])

In [19]: s.dtype
Out[19]: dtype('<M8[ns]')

In [20]: s[1] = np.nan

In [21]: s
Out[21]:
0  2001-01-02
1   NaT
2  2001-01-02
dtype: datetime64[ns]

In [22]: s.dtype
Out[22]: dtype('<M8[ns]')

In [23]: s = s.astype('O')

In [24]: s
Out[24]:
0  2001-01-02 00:00:00
1   NaT
2  2001-01-02 00:00:00
dtype: object

In [25]: s.dtype
Out[25]: dtype('O')
API changes

- **Added to_series() method to indices**, to facilitate the creation of indexers (GH3275)
- **HDFStore**
  - added the method `select_column` to select a single column from a table as a Series.
  - deprecated the unique method, can be replicated by `select_column(key, column).unique()`
  - `min_itemsize` parameter to append will now automatically create data_columns for passed keys

Enhancements

- **Improved performance of df.to_csv()** by up to 10x in some cases. (GH3059)
- Numexpr is now a **Recommended Dependencies**, to accelerate certain types of numerical and boolean operations
- Bottleneck is now a **Recommended Dependencies**, to accelerate certain types of nan operations
- **HDFStore**
  - **support read_hdf/to_hdf API similar to read_csv/to_csv**
    ```python
    In [26]: df = pd.DataFrame({'A': range(5), 'B': range(5)})
    In [27]: df.to_hdf('store.h5', 'table', append=True)
    In [28]: pd.read_hdf('store.h5', 'table', where=['index > 2'])
    Out[28]:
    A  B
    3  3  3
    4  4  4
    ```
  - **provide dotted attribute access to get from stores**, e.g. `store.df == store['df']`
  - **new keywords** `iterator=boolean, and chunksize=number_in_a_chunk` are provided to support iteration on `select` and `select_as_multiple` (GH3076)
  - You can now select timestamps from an **unordered** timeseries similarly to an **ordered** timeseries (GH2437)
  - You can now select with a string from a DataFrame with a datelike index, in a similar way to a Series (GH3070)
    ```python
    In [29]: idx = pd.date_range("2001-10-1", periods=5, freq='M')
    In [30]: ts = pd.Series(np.random.rand(len(idx)), index=idx)
    In [31]: ts['2001']
    Out[31]:
    2001-10-31    0.117967

>>> p.reindex(items=['ItemA'], minor=['B']).squeeze()
Freq: D, Name: B, dtype: float64
```

In `pd.io.data.Options`,

- Fix bug when trying to fetch data for the current month when already past expiry.
- Now using lxml to scrape html instead of BeautifulSoup (lxml was faster).
- New instance variables for calls and puts are automatically created when a method that creates them is called. This works for current month where the instance variables are simply `calls` and `puts`. Also works for future expiry months and save the instance variable as `callsMMYY` or `putsMMYY`, where `MMYY` are, respectively, the month and year of the option's expiry.
- `Options.get_near_stock_price` now allows the user to specify the month for which to get relevant options data.
- `Options.get_forward_data` now has optional kwargs `near` and `above_below`. This allows the user to specify if they would like to only return forward looking data for options near the current stock price. This just obtains the data from `Options.get_near_stock_price` instead of `Options.get_xxx_data()` (GH2758).

- Cursor coordinate information is now displayed in time-series plots.
- added option `display.max_seq_items` to control the number of elements printed per sequence pprinting it. (GH2979)
- added option `display.chop_threshold` to control display of small numerical values. (GH2739)
pandas: powerful Python data analysis toolkit, Release 1.2.5

- added option `display.max_info_rows` to prevent verbose_info from being calculated for frames above 1M rows (configurable). (GH2807, GH2918)
- `value_counts()` now accepts a “normalize” argument, for normalized histograms. (GH2710).
- DataFrame.from_records now accepts not only dicts but any instance of the collections.Mapping ABC.
- added option `display.mpl_style` providing a sleeker visual style for plots. Based on https://gist.github.com/huyng/816622 (GH3075).
- Treat boolean values as integers (values 1 and 0) for numeric operations. (GH2641)
- `to_html()` now accepts an optional “escape” argument to control reserved HTML character escaping (enabled by default) and escapes & in addition to < and >. (GH2919)

See the full release notes or issue tracker on GitHub for a complete list.

5.19  Version 0.10

5.19.1  Version 0.10.1 (January 22, 2013)

This is a minor release from 0.10.0 and includes new features, enhancements, and bug fixes. In particular, there is substantial new HDFStore functionality contributed by Jeff Reback.

An undesired API breakage with functions taking the inplace option has been reverted and deprecation warnings added.
pandas: powerful Python data analysis toolkit, Release 1.2.5

API changes

- Functions taking an `inplace` option return the calling object as before. A deprecation message has been added
- Groupby aggregations Max/Min no longer exclude non-numeric data (GH2700)
- Resampling an empty DataFrame now returns an empty DataFrame instead of raising an exception (GH2640)
- The file reader will now raise an exception when NA values are found in an explicitly specified integer column instead of converting the column to float (GH2631)
- `DatetimeIndex.unique` now returns a `DatetimeIndex` with the same name and timezone instead of an array (GH2563)

New features

- MySQL support for database (contribution from Dan Allan)

HDFStore

You may need to upgrade your existing data files. Please visit the compatibility section in the main docs.

You can designate (and index) certain columns that you want to be able to perform queries on a table, by passing a list to `data_columns`

```
In [1]: store = pd.HDFStore("store.h5")

In [2]: df = pd.DataFrame(
    ...:     np.random.randn(8, 3),
    ...:     index=pd.date_range("1/1/2000", periods=8),
    ...:     columns=["A", "B", "C"],
    ...: )

In [3]: df["string"] = "foo"

In [4]: df.loc[df.index[4:6], "string"] = np.nan

In [5]: df.loc[df.index[7:9], "string"] = "bar"

In [6]: df["string2"] = "cool"

In [7]: df
Out[7]:
   A         B         C     string  string2
0  2000-01-01  0.469112  -0.282863  1.509059    foo     cool
1  2000-01-02 -1.135632   1.212112  -0.173215    foo     cool
2  2000-01-03  0.119209  -1.044236  -0.861849    foo     cool
3  2000-01-04 -2.104569  -0.494929   1.071804    foo     cool
4  2000-01-05  0.721555  -0.706771  -1.039575   NaN     cool
5  2000-01-06  0.271860  -0.424972   0.567020   NaN     cool
6  2000-01-07  0.276232  -1.087401  -0.673690    foo     cool
7  2000-01-08  0.113648  -1.478427   0.524988    bar     cool

(continues on next page)
# on-disk operations

```
In [8]: store.append("df", df, data_columns=['B', 'C', 'string', 'string2'])
```

```
In [9]: store.select("df", "B>0 and string=='foo'")
Out[9]:
   B       C  string  string2
0  2.00   3.00     foo     cool
```

# this is in-memory version of this type of selection

```
In [10]: df[(df.B > 0) & (df.string == "foo")]
Out[10]:
   B       C  string  string2
0  2.00   3.00     foo     cool
```

Retrieving unique values in an indexable or data column.

```
# note that this is deprecated as of 0.14.0
# can be replicated by: store.select_column(df,'index').unique()
store.unique("df", "index")
safe.unique("df", "string")
```

You can now store `datetime64` in data columns

```
In [11]: df_mixed = df.copy()

In [12]: df_mixed["datetime64"] = pd.Timestamp("20010102")

In [13]: df_mixed.loc[df_mixed.index[3:4], ["A", "B"]]= np.nan

In [14]: store.append("df_mixed", df_mixed)

In [15]: df_mixed1 = store.select("df_mixed")

In [16]: df_mixed1
Out[16]:
   A       B       C  string  string2  datetime64
       0.469112 -0.282863 -1.509059     foo     cool 2001-01-02
0  -1.135632  1.212112 -0.173215     foo     cool 2001-01-02
0  -1.135632  1.212112 -0.173215     foo     cool 2001-01-02
0  0.119209 -1.044236 -0.861849     foo     cool 2001-01-02
0  0.721555 -0.706771 -1.039575  NaN    cool 2001-01-02
0  0.271860 -0.424972  0.567020  NaN    cool 2001-01-02
0  0.276232 -1.087401 -0.673690     foo     cool 2001-01-02
0  0.113648 -1.478427  0.524988  NaN    cool 2001-01-02

In [17]: df_mixed1.dtypes.value_counts()
Out[17]:
float64      3
object       2
datetime64[ns]  1
dtype: int64
```

You can pass columns keyword to select to filter a list of the return columns, this is equivalent to passing a
Term('columns', list_of_columns_to_filter)

```python
In [18]: store.select("df", columns=['A', 'B'])
Out[18]:
       A     B
2000-01-01  0.469112 -0.282863
2000-01-02 -1.135632  1.212112
2000-01-03  0.119209 -1.044236
2000-01-04 -2.104569 -0.494929
2000-01-05  0.721555 -0.706771
2000-01-06  0.271860 -0.424972
2000-01-07  0.276232 -1.087401
2000-01-08  0.113648 -1.478427
```

HDFStore now serializes MultiIndex dataframes when appending tables.

```python
In [19]: index = pd.MultiIndex(levels=[['foo', 'bar', 'baz', 'qux'], ['one', 'two', 'three']], labels=[[0, 0, 0, 1, 1, 2, 2, 3, 3, 3], [0, 1, 2, 0, 1, 1, 2, 0, 1, 2]], names=['foo', 'bar'])

In [20]: df = pd.DataFrame(np.random.randn(10, 3), index=index, columns=['A', 'B', 'C'])

In [21]: df
Out[21]:
       A     B     C
foo bar
foo one  0.116619  0.295575 -1.047704
two  1.640556  1.905836  2.772115
three  0.088787 -1.144197 -0.633372
bar one  0.925372 -0.006438 -0.820408
two  0.600874 -1.039266  0.824758
baz two  0.824095 -0.337730 -0.927764
three  0.840123  0.248505 -0.109250
qux one  0.431977 -0.460710  0.336505
two -3.207595 -1.535854  0.409769
three  0.673145 -0.741113 -0.110891

In [22]: store.append('mi', df)

In [23]: store.select('mi')
Out[23]:
       A     B     C
foo bar
foo one  0.116619  0.295575 -1.047704
two  1.640556  1.905836  2.772115
three  0.088787 -1.144197 -0.633372
bar one  0.925372 -0.006438 -0.820408

baz two  0.824095 -0.337730 -0.927764
```
Multi-table creation via `append_to_multiple` and selection via `select_as_multiple` can create/select from multiple tables and return a combined result, by using `where` on a selector table.

```
In [19]: df_mt = pd.DataFrame(
    ....:     np.random.randn(8, 6),
    ....:     index=pd.date_range("1/1/2000", periods=8),
    ....:     columns=["A", "B", "C", "D", "E", "F"],
    ....:     )
    ....:

In [20]: df_mt["foo"] = "bar"

# you can also create the tables individually
In [21]: store.append_to_multiple(
    ....:     {"df1_mt": ["A", "B"], "df2_mt": None}, df_mt, selector="df1_mt"
    ....:     )
    ....:

In [22]: store
Out[22]:
<class 'pandas.io.pytables.HDFStore'>
File path: store.h5

# individual tables were created
In [23]: store.select("df1_mt")
Out[23]:

Enhancements

- **HDFStore** now can read native PyTables table format tables
- You can pass `nan_rep = 'my_nan_rep'` to append, to change the default nan representation on disk (which converts to/from np.nan), this defaults to nan.
- You can pass `index` to append. This defaults to True. This will automatically create indices on the indexables and data columns of the table
- You can pass `chunksize=an integer` to append, to change the writing chunksize (default is 50000). This will significantly lower your memory usage on writing.
- You can pass `expectedrows=an integer` to the first append, to set the TOTAL number of expected rows that PyTables will expected. This will optimize read/write performance.
- **Select** now supports passing `start` and `stop` to provide selection space limiting in selection.
- Greatly improved ISO8601 (e.g., yyyy-mm-dd) date parsing for file parsers (GH2698)
- Allow DataFrame.merge to handle combinatorial sizes too large for 64-bit integer (GH2690)
- Series now has unary negation (-series) and inversion (~series) operators (GH2686)
- DataFrame.plot now includes a `logx` parameter to change the x-axis to log scale (GH2327)
- Series arithmetic operators can now handle constant and ndarray input (GH2574)
- ExcelFile now takes a kind argument to specify the file type (GH2613)
- A faster implementation for Series.str methods (GH2602)

Bug Fixes

- **HDFStore** tables can now store float32 types correctly (cannot be mixed with float64 however)
- Fixed Google Analytics prefix when specifying request segment (GH2713).
- Function to reset Google Analytics token store so users can recover from improperly setup client secrets (GH2687).
- Fixed groupby bug resulting in segfault when passing in MultiIndex (GH2706)
Fixed bug where passing a Series with datetime64 values into `to_datetime` results in bogus output values (GH2699)

- Fixed bug in `pattern in HDFStore` expressions when pattern is not a valid regex (GH2694)
- Fixed performance issues while aggregating boolean data (GH2692)
- When given a boolean mask key and a Series of new values, Series `__setitem__` will now align the incoming values with the original Series (GH2686)
- Fixed MemoryError caused by performing counting sort on sorting MultiIndex levels with a very large number of combinatorial values (GH2684)
- Fixed bug that causes plotting to fail when the index is a DatetimeIndex with a fixed-offset timezone (GH2683)
- Corrected business day subtraction logic when the offset is more than 5 bdays and the starting date is on a weekend (GH2680)
- Fixed C file parser behavior when the file has more columns than data (GH2668)
- Fixed file reader bug that misaligned columns with data in the presence of an implicit column and a specified usecols value
- DataFrames with numerical or datetime indices are now sorted prior to plotting (GH2609)
- Fixed DataFrame.from_records error when passed columns, index, but empty records (GH2633)
- Several bug fixed for Series operations when dtype is datetime64 (GH2689, GH2629, GH2626)

See the full release notes or issue tracker on GitHub for a complete list.

5.19.2 Version 0.10.0 (December 17, 2012)

This is a major release from 0.9.1 and includes many new features and enhancements along with a large number of bug fixes. There are also a number of important API changes that long-time pandas users should pay close attention to.

File parsing new features

The delimited file parsing engine (the guts of read_csv and read_table) has been rewritten from the ground up and now uses a fraction the amount of memory while parsing, while being 40% or more faster in most use cases (in some cases much faster).

There are also many new features:

• Much-improved Unicode handling via the encoding option.
• Column filtering (usecols)
• Dtype specification (dtype argument)
• Ability to specify strings to be recognized as True/False
• Ability to yield NumPy record arrays (as_recarray)
• High performance delim_whitespace option
• Decimal format (e.g. European format) specification
• Easier CSV dialect options: escapechar, lineterminator, quotechar, etc.
• More robust handling of many exceptional kinds of files observed in the wild

API changes

Deprecated DataFrame BINOP TimeSeries special case behavior

The default behavior of binary operations between a DataFrame and a Series has always been to align on the DataFrame’s columns and broadcast down the rows, except in the special case that the DataFrame contains time series. Since there are now method for each binary operator enabling you to specify how you want to broadcast, we are phasing out this special case (Zen of Python: Special cases aren’t special enough to break the rules). Here’s what I’m talking about:

```python
In [1]: import pandas as pd

In [2]: df = pd.DataFrame(np.random.randn(6, 4), index=pd.date_range("1/1/2000", periods=6))

In [3]: df
Out[3]:
   0        1        2        3

You will get a deprecation warning in the 0.10.x series, and the deprecated functionality will be removed in 0.11 or later.

**Altered resample default behavior**

The default time series resample binning behavior of daily D and higher frequencies has been changed to closed='left', label='left'. Lower nfrequencies are unaffected. The prior defaults were causing a great deal of confusion for users, especially resampling data to daily frequency (which labeled the aggregated group with the end of the interval: the next day).
pandas: powerful Python data analysis toolkit, Release 1.2.5

In [4]: series.resample('D', how='sum')

2000-01-04    93
2000-01-05   129
Freq: D, dtype: int64

• Infinity and negative infinity are no longer treated as NA by isnull and notnull. That they ever were was a relic of early pandas. This behavior can be re-enabled globally by the mode.use_inf_as_null option:

In [6]: s = pd.Series([1.5, np.inf, 3.4, -np.inf])

In [7]: pd.isnull(s)
Out[7]:
0   False
1   False
2   False
3   False

(continues on next page)
Length: 4, dtype: bool

In [8]: s.fillna(0)
Out[8]:
0  1.500000
1   inf
2  3.400000
3  -inf
Length: 4, dtype: float64

In [9]: pd.set_option('use_inf_as_null', True)

In [10]: pd.isnull(s)
Out[10]:
0  False
1  True
2  False
3  True
Length: 4, dtype: bool

In [11]: s.fillna(0)
Out[11]:
0  1.5
1  0.0
2  3.4
3  0.0
Length: 4, dtype: float64

In [12]: pd.reset_option('use_inf_as_null')

• Methods with the inplace option now all return None instead of the calling object. E.g. code written like df =
  df.fillna(0, inplace=True) may stop working. To fix, simply delete the unnecessary variable assignment.

• pandas.merge no longer sorts the group keys (sort=False) by default. This was done for performance reasons:
  the group-key sorting is often one of the more expensive parts of the computation and is often unnecessary.

• The default column names for a file with no header have been changed to the integers 0 through N − 1. This is
to create consistency with the DataFrame constructor with no columns specified. The v0.9.0 behavior (names
X0, X1, ...) can be reproduced by specifying prefix='X':

In [6]: import io
In [7]: data = ""
   ...: a,b,c
   ...: 1,Yes,2
   ...: 3,No,4
   ...: ""
   ...
In [8]: print(data)
    a,b,c
    1,Yes,2
    3,No,4
Values like 'Yes' and 'No' are not interpreted as boolean by default, though this can be controlled by new `true_values` and `false_values` arguments:

```
In [11]: print(data)
a,b,c
1,Yes,2
3,No,4
```

```
In [12]: pd.read_csv(io.StringIO(data))
Out[12]:
   a  b  c
0  1  Yes  2
1  3  No   4
```

```
In [13]: pd.read_csv(io.StringIO(data), true_values=['Yes'], false_values=['No'])
Out[13]:
   a  b  c
0  1  True  2
1  3  False 4
```

The file parsers will not recognize non-string values arising from a converter function as NA if passed in the `na_values` argument. It’s better to do post-processing using the `replace` function instead.

Calling `fillna` on Series or DataFrame with no arguments is no longer valid code. You must either specify a fill value or an interpolation method:

```
In [14]: s = pd.Series([np.nan, 1.0, 2.0, np.nan, 4])
In [15]: s
Out[15]:
0    NaN
1    1.0
2  2.0
3    NaN
```
In [16]: s.fillna(0)
Out[16]:
0    0.0
1    1.0
2    2.0
3    0.0
4    4.0
dtype: float64

In [17]: s.fillna(method="pad")
Out[17]:
0    NaN
1    1.0
2    2.0
3    2.0
4    4.0
dtype: float64

Convenience methods ffill and bfill have been added:

In [18]: s.ffill()
Out[18]:
0    NaN
1    1.0
2    2.0
3    2.0
4    4.0
dtype: float64

- Series.apply will now operate on a returned value from the applied function, that is itself a series, and possibly upcast the result to a DataFrame

In [19]: def f(x):
    ....:     return pd.Series([x, x ** 2], index=["x", "x^2"])
    ....:

In [20]: s = pd.Series(np.random.rand(5))

In [21]: s
Out[21]:
0    0.340445
1    0.984729
2    0.919540
3    0.037772
4    0.861549
dtype: float64

In [22]: s.apply(f)
Out[22]:
(continues on next page)
• New API functions for working with pandas options (GH2097):
  
  get_option/set_option - get/set the value of an option. Partial names are accepted. reset_option - reset one or more options to their default value. Partial names are accepted. describe_option - print a description of one or more options. When called with no arguments, print all registered options.

Note: set_printoptions/reset_printoptions are now deprecated (but functioning), the print options now live under "display.XYZ". For example:

```
In [23]: pd.get_option("display.max_rows")
Out[23]: 15
```

• to_string() methods now always return unicode strings (GH2224).

New features

Wide DataFrame printing

Instead of printing the summary information, pandas now splits the string representation across multiple rows by default:

```
In [24]: wide_frame = pd.DataFrame(np.random.randn(5, 16))
In [25]: wide_frame
Out[25]:
       0     1     2     3     4     5 ...    10    11
0 -0.548702 1.467327 -1.015962 -0.483075 1.637550 -1.217659 ... -0.919069 0.266046
    -0.709661 1.669052 1.037882 -1.705775
1 -0.919854 -0.042379 1.247642 -0.009920 0.290213 0.495767 ... 0.337863 -0.945867
    -0.932132 1.956030 0.017587 -0.016692
2 -0.575247 0.254161 -1.143704 0.215897 1.193555 -0.077118 ... 1.627081 -0.990582
    -0.441652 1.211526 0.268520 0.024580
3 -1.577585 0.396823 -0.105381 -0.532532 1.453749 1.208843 ... 0.339969 -0.693205
    -0.339355 0.593616 0.884345 1.591431
4  0.141809 0.220390 0.435589 0.192451 -0.096701 0.803351 ... 1.018601 -0.595447
    -1.395433 -0.392670 0.007207 1.928123
```

The old behavior of printing out summary information can be achieved via the ‘expand_frame_repr’ print option:

```
in [26]: pd.set_option("expand_frame_repr", False)
in [27]: wide_frame
Out[27]:
      0  1  2  3  4  5  ...  10  11
     --- --- --- --- --- --- ... --- ---
0 -0.548702 1.467327 -1.015962 -0.483075 1.637550 -1.217659 ... -0.919069 0.266046
    -0.709661 1.669052 1.037882 -1.705775
1 -0.919854 -0.042379 1.247642 -0.009920 0.290213 0.495767 ... 0.337863 -0.945867
    -0.932132 1.956030 0.017587 -0.016692
2 -0.575247 0.254161 -1.143704 0.215897 1.193555 -0.077118 ... 1.627081 -0.990582
    -0.441652 1.211526 0.268520 0.024580
3 -1.577585 0.396823 -0.105381 -0.532532 1.453749 1.208843 ... 0.339969 -0.693205
    -0.339355 0.593616 0.884345 1.591431
4  0.141809 0.220390 0.435589 0.192451 -0.096701 0.803351 ... 1.018601 -0.595447
    -1.395433 -0.392670 0.007207 1.928123
```
The width of each line can be changed via `line_width` (80 by default):

```python
pd.set_option("line_width", 40)
wide_frame
```

### Updated PyTables Support

*Docs* for PyTables Table format & several enhancements to the api. Here is a taste of what to expect.

```python
In [41]: store = pd.HDFStore('store.h5')

In [42]: df = pd.DataFrame(np.random.randn(8, 3),
                          index=pd.date_range('1/1/2000', periods=8),
                          columns=['A', 'B', 'C'])

In [43]: df
Out[43]:

[8 rows x 5 columns]

In [69]: df1.get_dtype_counts()
Out[69]:
float64 3
int64   1
object  1
dtype: int64

- performance improvements on table writing
- support for arbitrarily indexed dimensions
- SparseSeries now has a density property (GH2384)
- enable Series.str.strip/lstrip/rstrip methods to take an input argument to strip arbitrary characters (GH2411)
- implement value_vars in melt to limit values to certain columns and add melt to pandas namespace (GH2412)

Bug Fixes

- added Term method of specifying where conditions (GH1996).
- del store['df'] now call store.remove('df') for store deletion
- deleting of consecutive rows is much faster than before
- min_itemsize parameter can be specified in table creation to force a minimum size for indexing columns (the previous implementation would set the column size based on the first append)
- indexing support via create_table_index (requires PyTables >= 2.3) (GH698).
- appending on a store would fail if the table was not first created via put
- fixed issue with missing attributes after loading a pickled dataframe (GH2431)
- minor change to select and remove: require a table ONLY if where is also provided (and not None)

Compatibility
0.10 of HDFStore is backwards compatible for reading tables created in a prior version of pandas, however, query terms using the prior (undocumented) methodology are unsupported. You must read in the entire file and write it out using the new format to take advantage of the updates.

N dimensional panels (experimental)

Adding experimental support for Panel4D and factory functions to create n-dimensional named panels. Here is a taste of what to expect.

```python
In [58]: p4d = Panel4D(np.random.randn(2, 2, 5, 4),
               labels=['Label1', 'Label2'],
               items=['Item1', 'Item2'],
               major_axis=date_range('1/1/2000', periods=5),
               minor_axis=['A', 'B', 'C', 'D'])

In [59]: p4d
Out[59]:
<class 'pandas.core.panelnd.Panel4D'>
Dimensions: 2 (labels) x 2 (items) x 5 (major_axis) x 4 (minor_axis)
Labels axis: Label1 to Label2
Items axis: Item1 to Item2
Major_axis axis: 2000-01-01 00:00:00 to 2000-01-05 00:00:00
Minor_axis axis: A to D
```

This is a bug fix release from 0.9.0 and includes several new features and enhancements along with a large number of bug fixes. The new features include by-column sort order for DataFrame and Series, improved NA handling for the rank method, masking functions for DataFrame, and intraday time-series filtering for DataFrame.

New features

* Series.sort, DataFrame.sort, and DataFrame.sort_index can now be specified in a per-column manner to support multiple sort orders (GH928)

```
In [2]: df = pd.DataFrame(np.random.randint(0, 2, (6, 3)),
                     columns=['A', 'B', 'C'])

In [3]: df.sort(['A', 'B'], ascending=[1, 0])
```

* DataFrame.rank now supports additional argument values for the na_option parameter so missing values can be assigned either the largest or the smallest rank (GH1508, GH2159)

```
In [1]: df = pd.DataFrame(np.random.randn(6, 3), columns=['A', 'B', 'C'])
In [3]: df.rank()
Out[3]:
   A  B  C
0  3.0  2.0  1.0
1  1.0  3.0  2.0
2  NaN NaN NaN
3  NaN NaN NaN
4  NaN NaN NaN
5  2.0  1.0  3.0
[6 rows x 3 columns]
In [4]: df.rank(na_option='top')
Out[4]:
   A  B  C
0  6.0  5.0  4.0
1  4.0  6.0  5.0

• DataFrame has new where and mask methods to select values according to a given boolean mask (GH2109, GH2151)

DataFrame currently supports slicing via a boolean vector the same length as the DataFrame (inside the []). The returned DataFrame has the same number of columns as the original, but is sliced on its index.
If a DataFrame is sliced with a DataFrame based boolean condition (with the same size as the original DataFrame), then a DataFrame the same size (index and columns) as the original is returned, with elements that do not meet the boolean condition as NaN. This is accomplished via the new method DataFrame.where. In addition, where takes an optional other argument for replacement.

In [9]: df[df>0]
Out[9]:

(continues on next page)
Furthermore, where now aligns the input boolean condition (ndarray or DataFrame), such that partial selection with setting is possible. This is analogous to partial setting via .ix (but on the contents rather than the axis labels).

```
In [12]: df2 = df.copy()
In [13]: df2[ df2[1:4] > 0 ] = 3
In [14]: df2
```
```
Out[14]:
    A       B       C
0  0.276232  -1.087401 -0.673690
1  3.000000  -1.478427  3.000000
2  3.000000   3.000000 -1.715002
3 -1.039268  -0.370647 -1.157892
4 -1.344312   0.844885  1.075770
```

DataFrame.mask is the inverse boolean operation of where.

```
In [15]: df.mask(df<=0)
```
```
Out[15]:
    A       B       C
0  0.276232 NaN   NaN
1  0.113648 NaN   0.524988
2  0.404705  0.577046 NaN
3   NaN   NaN   NaN
4   NaN   0.844885  1.075770
```

• Enable referencing of Excel columns by their column names (GH1936)

```
In [16]: xl = pd.ExcelFile('data/test.xls')

In [17]: xl.parse('Sheet1', index_col=0, parse_dates=True,
           ....: parse_cols='A:D')
           ....:
```
```
Out[17]:
    A       B       C       D
2000-01-03  0.980269  3.685731 -0.364217 -1.159738

[5 rows x 3 columns]
pandas: powerful Python data analysis toolkit, Release 1.2.5

- Added option to disable pandas-style tick locators and formatters using `series.plot(x_compat=True)` or `pandas.plot_params['x_compat'] = True` (GH2205)
- Existing TimeSeries methods `at_time` and `between_time` were added to DataFrame (GH2149)
- DataFrame.dot can now accept ndarrays (GH2042)
- DataFrame.drop now supports non-unique indexes (GH2101)
- Panel.shift now supports negative periods (GH2164)
- DataFrame now support unary ~ operator (GH2110)

**API changes**

- Upsampling data with a PeriodIndex will result in a higher frequency TimeSeries that spans the original time window

```
In [1]: prng = pd.period_range('2012Q1', periods=2, freq='Q')
In [2]: s = pd.Series(np.random.randn(len(prng)), prng)
In [4]: s.resample('M')
Out[4]:
2012-01    -1.471992
2012-02      NaN
2012-03      NaN
2012-04    -0.493593
2012-05      NaN
2012-06      NaN
Freq: M, dtype: float64
```

- `Period.end_time` now returns the last nanosecond in the time interval (GH2124, GH2125, GH1764)

```
In [18]: p = pd.Period('2012')
In [19]: p.end_time
Out[19]: Timestamp('2012-12-31 23:59:59.999999999')
```

- File parsers no longer coerce to float or bool for columns that have custom converters specified (GH2184)

```
In [20]: import io
In [21]: data = ('A,B,C
   ....:
   ....:   00001,001,5
   ....:   00002,002,6')
In [22]: pd.read_csv(io.StringIO(data), converters={'A': lambda x: x.strip()})
Out[22]:
     A  B  C
0   00001  1  5
1   00002  2  6
```

See the [full release notes](https://pandas.pydata.org/pandas-docs/stable/change_log.html) or issue tracker on GitHub for a complete list.

5.20.2 Version 0.9.0 (October 7, 2012)

This is a major release from 0.8.1 and includes several new features and enhancements along with a large number of bug fixes. New features include vectorized unicode encoding/decoding for `Series.str.to_latex` method to DataFrame, more flexible parsing of boolean values, and enabling the download of options data from Yahoo! Finance.

New features

- Add `encode` and `decode` for unicode handling to `vectorized string processing methods` in `Series.str` (GH1706)
- Add `DataFrame.to_latex` method (GH1735)
- Add convenient expanding window equivalents of all `rolling_*` ops (GH1785)
- Add Options class to pandas.io.data for fetching options data from Yahoo! Finance (GH1748, GH1739)
- More flexible parsing of boolean values (Yes, No, TRUE, FALSE, etc) (GH1691, GH1295)
- Add `level` parameter to `Series.reset_index`
- `TimeSeries.between_time` can now select times across midnight (GH1871)
- `Series` constructor can now handle generator as input (GH1679)
- `DataFrame.dropna` can now take multiple axes (tuple/list) as input (GH924)
- Enable `skip_footer` parameter in `ExcelFile.parse` (GH1843)
API changes

- The default column names when header=None and no column names passed to functions like read_csv has changed to be more Pythonic and amenable to attribute access:

```python
In [1]: import io
In [2]: data = ""
   ...: 0,0,1
   ...: 1,1,0
   ...: 0,1,0
   ...: ""
   ...
In [3]: df = pd.read_csv(io.StringIO(data), header=None)
```

```
In [4]: df
Out[4]:
   0 1 2
0 0 0 1
1 1 1 0
2 0 1 0
```

- Creating a Series from another Series, passing an index, will cause reindexing to happen inside rather than treating the Series like an ndarray. Technically improper usages like Series(df[col1], index=df[col2]) that worked before “by accident” (this was never intended) will lead to all NA Series in some cases. To be perfectly clear:

```python
In [5]: s1 = pd.Series([1, 2, 3])
In [6]: s1
Out[6]:
   0 1
  1 2
  2 3
Length: 3, dtype: int64
In [7]: s2 = pd.Series(s1, index=["foo", "bar", "baz"])
In [8]: s2
Out[8]:
   foo  NaN
   bar  NaN
   baz  NaN
Length: 3, dtype: float64
```

- Deprecated day_of_year API removed from PeriodIndex, use dayofyear (GH1723)
- Don’t modify NumPy suppress printoption to True at import time
- The internal HDF5 data arrangement for DataFrames has been transposed. Legacy files will still be readable by HDFStore (GH1834, GH1824)
- Legacy cruft removed: pandas.stats.misc.quantileTS
• Use ISO8601 format for Period repr: monthly, daily, and on down (GH1776)
• Empty DataFrame columns are now created as object dtype. This will prevent a class of TypeErrors that was occurring in code where the dtype of a column would depend on the presence of data or not (e.g. a SQL query having results) (GH1783)
• Setting parts of DataFrame/Panel using ix now aligns input Series/DataFrame (GH1630)
• first and last methods in GroupBy no longer drop non-numeric columns (GH1809)
• Resolved inconsistencies in specifying custom NA values in text parser. na_values of type dict no longer override default NAs unless keep_default_na is set to false explicitly (GH1657)
• DataFrame.dot will not do data alignment, and also work with Series (GH1915)

See the full release notes or issue tracker on GitHub for a complete list.

5.21 Version 0.8

5.21.1 Version 0.8.1 (July 22, 2012)

This release includes a few new features, performance enhancements, and over 30 bug fixes from 0.8.0. New features include notably NA friendly string processing functionality and a series of new plot types and options.

New features

- Add vectorized string processing methods accessible via Series.str (GH620)
- Add option to disable adjustment in EWMA (GH1584)
- Radviz plot (GH1566)
- Parallel coordinates plot
- Bootstrap plot
- Per column styles and secondary y-axis plotting (GH1559)
- New datetime converters millisecond plotting (GH1599)
- Add option to disable “sparse” display of hierarchical indexes (GH1538)
- Series/DataFrame’s set_index method can append levels to an existing Index/MultiIndex (GH1569, GH1577)

Performance improvements

- Improved implementation of rolling min and max (thanks to Bottleneck !)
- Add accelerated 'median' GroupBy option (GH1358)
- Significantly improve the performance of parsing ISO8601-format date strings with DatetimeIndex or to_datetime (GH1571)
- Improve the performance of GroupBy on single-key aggregations and use with Categorical types
- Significant datetime parsing performance improvements

Contributors

A total of 5 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

- Vytautas Jancauskas
- Wes McKinney
5.21.2 Version 0.8.0 (June 29, 2012)

This is a major release from 0.7.3 and includes extensive work on the time series handling and processing infrastructure as well as a great deal of new functionality throughout the library. It includes over 700 commits from more than 20 distinct authors. Most pandas 0.7.3 and earlier users should not experience any issues upgrading, but due to the migration to the NumPy datetime64 dtype, there may be a number of bugs and incompatibilities lurking. Lingering incompatibilities will be fixed ASAP in a 0.8.1 release if necessary. See the full release notes or issue tracker on GitHub for a complete list.

Support for non-unique indexes

All objects can now work with non-unique indexes. Data alignment / join operations work according to SQL join semantics (including, if application, index duplication in many-to-many joins)

NumPy datetime64 dtype and 1.6 dependency

Time series data are now represented using NumPy’s datetime64 dtype; thus, pandas 0.8.0 now requires at least NumPy 1.6. It has been tested and verified to work with the development version (1.7+) of NumPy as well which includes some significant user-facing API changes. NumPy 1.6 also has a number of bugs having to do with nanosecond resolution data, so I recommend that you steer clear of NumPy 1.6’s datetime64 API functions (though limited as they are) and only interact with this data using the interface that pandas provides.

See the end of the 0.8.0 section for a “porting” guide listing potential issues for users migrating legacy code bases from pandas 0.7 or earlier to 0.8.0.

Bug fixes to the 0.7.x series for legacy NumPy < 1.6 users will be provided as they arise. There will be no more further development in 0.7.x beyond bug fixes.

Time Series changes and improvements

Note: With this release, legacy scikit.timeseries users should be able to port their code to use pandas.

Note: See documentation for overview of pandas timeseries API.

- New datetime64 representation speeds up join operations and data alignment, reduces memory usage, and improve serialization / deserialization performance significantly over datetime.datetime
- High performance and flexible resample method for converting from high-to-low and low-to-high frequency. Supports interpolation, user-defined aggregation functions, and control over how the intervals and result labeling are defined. A suite of high performance Cython/C-based resampling functions (including Open-High-Low-Close) have also been implemented.
- Revamp of frequency aliases and support for frequency shortcuts like ‘15min’, or ‘1h30min’
- New DatetimeIndex class supports both fixed frequency and irregular time series. Replaces now deprecated DateRange class
- New PeriodIndex and Period classes for representing time spans and performing calendar logic, including the 12 fiscal quarterly frequencies <timeseries.quarterly>. This is a partial port of, and a substantial enhancement to, elements of the scikit.timeseries code base. Support for conversion between PeriodIndex and DatetimeIndex
• New Timestamp data type subclasses `datetime.datetime`, providing the same interface while enabling working with nanosecond-resolution data. Also provides easy time zone conversions.

• Enhanced support for time zones. Add `tz_convert` and `tz_localize` methods to TimeSeries and DataFrame. All timestamps are stored as UTC; Timestamps from DatetimeIndex objects with time zone set will be localized to local time. Time zone conversions are therefore essentially free. User needs to know very little about pytz library now; only time zone names as strings are required. Time zone-aware timestamps are equal if and only if their UTC timestamps match. Operations between time zone-aware time series with different time zones will result in a UTC-indexed time series.

• Time series string indexing conveniences / shortcuts: slice years, year and month, and index values with strings

• Enhanced time series plotting; adaptation of scikits.timeseries matplotlib-based plotting code

• New `date_range`, `bdate_range`, and `period_range` factory functions

• Robust frequency inference function `infer_freq` and `inferred_freq` property of DatetimeIndex, with option to infer frequency on construction of DatetimeIndex

• to_datetime function efficiently parses array of strings to DatetimeIndex. DatetimeIndex will parse array or list of strings to datetime64

• Optimized support for datetime64-dtype data in Series and DataFrame columns

• New NaT (Not-a-Time) type to represent NA in timestamp arrays

• Optimize Series.asof for looking up “as of” values for arrays of timestamps

• Milli, Micro, Nano date offset objects

• Can index time series with datetime.time objects to select all data at particular time of day (`TimeSeries.at_time`) or between two times (`TimeSeries.between_time`)

• Add `tshift` method for leading/lagging using the frequency (if any) of the index, as opposed to a naive lead/lag using shift

**Other new features**

• New `cut` and `qcut` functions (like R’s cut function) for computing a categorical variable from a continuous variable by binning values either into value-based (`cut`) or quantile-based (`qcut`) bins

• Rename Factor to Categorical and add a number of usability features

• Add `limit` argument to fillna/reindex

• More flexible multiple function application in GroupBy, and can pass list (name, function) tuples to get result in particular order with given names

• Add flexible `replace` method for efficiently substituting values

• Enhanced `read_csv/read_table` for reading time series data and converting multiple columns to dates

• Add `comments` option to parser functions: `read_csv`, etc.

• Add `dayfirst` option to parser functions for parsing international DD/MM/YYYY dates

• Allow the user to specify the CSV reader `dialect` to control quoting etc.

• Handling `thousands` separators in `read_csv` to improve integer parsing.

• Enable unstacking of multiple levels in one shot. Alleviate `pivot_table` bugs (empty columns being introduced)

• Move to klib-based hash tables for indexing; better performance and less memory usage than Python’s dict
• Add first, last, min, max, and prod optimized GroupBy functions
• New *ordered_merge* function
• Add flexible *comparison* instance methods eq, ne, lt, gt, etc. to DataFrame, Series
• Improve *scatter_matrix* plotting function and add histogram or kernel density estimates to diagonal
• Add ‘*kde*’ plot option for density plots
• Support for converting DataFrame to R data.frame through rpy2
• Improved support for complex numbers in Series and DataFrame
• Add *pct_change* method to all data structures
• Add max_colwidth configuration option for DataFrame console output
• *Interpolate* Series values using index values
• Can select multiple columns from GroupBy
• Add *update* methods to Series/DataFrame for updating values in place
• Add *any* and *all* method to DataFrame

**New plotting methods**

```python
import pandas as pd
fx = pd.read_pickle("data/fx_prices")
import matplotlib.pyplot as plt
```

Series.plot now supports a *secondary_y* option:

```python
plt.figure()
fx["FR"].plot(style="g")
fx["IT"].plot(style="k--", secondary_y=True)
```

Vytautas Jancauskas, the 2012 GSOC participant, has added many new plot types. For example, 'kde' is a new option:

```python
In [1]: s = pd.Series(
   ...:     np.concatenate((np.random.randn(1000), np.random.randn(1000) * 0.5 + 3))
   ...: )
   ...

In [2]: plt.figure()
Out[2]: <Figure size 640x480 with 0 Axes>

In [3]: s.hist(density=True, alpha=0.2)
Out[3]: <AxesSubplot:>

In [4]: s.plot(kind="kde")
Out[4]: <AxesSubplot:ylabel='Density'>
```

See the *plotting page* for much more.
Other API changes

- Deprecation of `offset`, `time_rule`, and `timeRule` arguments names in time series functions. Warnings will be printed until pandas 0.9 or 1.0.

Potential porting issues for pandas <= 0.7.3 users

The major change that may affect you in pandas 0.8.0 is that time series indexes use NumPy’s `datetime64` data type instead of `dtype=object` arrays of Python’s built-in `datetime.datetime` objects. `DateRange` has been replaced by `DatetimeIndex` but otherwise behaved identically. But, if you have code that converts `DateRange` or `Index` objects that used to contain `datetime.datetime` values to plain NumPy arrays, you may have bugs lurking with code using scalar values because you are handing control over to NumPy:

```python
In [5]: import datetime
In [6]: rng = pd.date_range("1/1/2000", periods=10)
In [7]: rng[5]  
Out[7]: Timestamp('2000-01-06 00:00:00', freq='D')
In [8]: isinstance(rng[5], datetime.datetime)  
Out[8]: True
In [9]: rng_asarray = np.asarray(rng)  
In [10]: scalar_val = rng_asarray[5]
In [11]: type(scalar_val)  
Out[11]: numpy.datetime64
```

pandas’s `Timestamp` object is a subclass of `datetime.datetime` that has nanosecond support (the `nanosecond` field store the nanosecond value between 0 and 999). It should substitute directly into any code that used `datetime.datetime` values before. Thus, I recommend not casting `DatetimeIndex` to regular NumPy arrays.

If you have code that requires an array of `datetime.datetime` objects, you have a couple of options. First, the `astype(object)` method of `DatetimeIndex` produces an array of `Timestamp` objects:

```python
In [12]: stamp_array = rng.astype(object)  
In [13]: stamp_array
Out[13]: Index(['2000-01-01 00:00:00', '2000-01-02 00:00:00', '2000-01-03 00:00:00', '2000-01-04 00:00:00', '2000-01-05 00:00:00', '2000-01-06 00:00:00', '2000-01-07 00:00:00', '2000-01-08 00:00:00', '2000-01-09 00:00:00', '2000-01-10 00:00:00'], dtype='object')
```

To get an array of proper `datetime.datetime` objects, use the `to_pydatetime` method:

```python
In [14]: stamp_array[5]  
Out[14]: Timestamp('2000-01-06 00:00:00', freq='D')
```

(continues on next page)
In [16]: dt_array
Out[16]:
array([datetime.datetime(2000, 1, 1, 0, 0),
       datetime.datetime(2000, 1, 2, 0, 0),
       datetime.datetime(2000, 1, 3, 0, 0),
       datetime.datetime(2000, 1, 4, 0, 0),
       datetime.datetime(2000, 1, 5, 0, 0),
       datetime.datetime(2000, 1, 6, 0, 0),
       datetime.datetime(2000, 1, 7, 0, 0),
       datetime.datetime(2000, 1, 8, 0, 0),
       datetime.datetime(2000, 1, 9, 0, 0),
       datetime.datetime(2000, 1, 10, 0, 0)], dtype=object)

In [17]: dt_array[5]
Out[17]:
datetime.datetime(2000, 1, 6, 0, 0)

matplotlib knows how to handle datetime.datetime but not Timestamp objects. While I recommend that you plot time series using TimeSeries.plot, you can either use to_pydatetime or register a converter for the Timestamp type. See matplotlib documentation for more on this.

Warning: There are bugs in the user-facing API with the nanosecond datetime64 unit in NumPy 1.6. In particular, the string version of the array shows garbage values, and conversion to dtype=object is similarly broken.

In [18]: rng = pd.date_range("1/1/2000", periods=10)

In [19]: rng
Out[19]:
               '2000-01-09', '2000-01-10'],
              dtype='datetime64[ns]', freq='D')

In [20]: np.asarray(rng)
Out[20]:
array(['2000-01-01T00:00:00.000000000', '2000-01-02T00:00:00.000000000',
       '2000-01-03T00:00:00.000000000', '2000-01-04T00:00:00.000000000',
       '2000-01-05T00:00:00.000000000', '2000-01-06T00:00:00.000000000',

       '2000-01-09T00:00:00.000000000', '2000-01-10T00:00:00.000000000'],
      dtype='datetime64[ns]')

In [21]: converted = np.asarray(rng, dtype=object)

In [22]: converted[5]
Out[22]:
Timestamp('2000-01-06 00:00:00', freq='D')

Trust me: don’t panic. If you are using NumPy 1.6 and restrict your interaction with datetime64 values to pandas’s API you will be just fine. There is nothing wrong with the data-type (a 64-bit integer internally); all of the important data processing happens in pandas and is heavily tested. I strongly recommend that you do not work directly with datetime64 arrays in NumPy 1.6 and only use the pandas API.

Support for non-unique indexes: In the latter case, you may have code inside a try:... catch: block that failed due
to the index not being unique. In many cases it will no longer fail (some method like `append` still check for uniqueness unless disabled). However, all is not lost: you can inspect `index.is_unique` and raise an exception explicitly if it is `False` or go to a different code branch.

5.22 Version 0.7

5.22.1 Version 0.7.3 (April 12, 2012)

This is a minor release from 0.7.2 and fixes many minor bugs and adds a number of nice new features. There are also a couple of API changes to note; these should not affect very many users, and we are inclined to call them “bug fixes” even though they do constitute a change in behavior. See the full release notes or issue tracker on GitHub for a complete list.

New features

- New fixed width file reader, `read_fwf`
- New `scatter_matrix` function for making a scatter plot matrix

```python
from pandas.tools.plotting import scatter_matrix
scatter_matrix(df, alpha=0.2)  # noqa F821
```

- Add stacked argument to Series and DataFrame’s `plot` method for stacked bar plots.

```python
df.plot(kind="bar", stacked=True)  # noqa F821
df.plot(kind="barh", stacked=True)  # noqa F821
```

- Add log x and y scaling options to DataFrame.plot and Series.plot
- Add kurt methods to Series and DataFrame for computing kurtosis

NA boolean comparison API change

Reverted some changes to how NA values (represented typically as `NaN` or `None`) are handled in non-numeric Series:

```python
In [1]: series = pd.Series(["Steve", np.nan, "Joe")
In [2]: series == "Steve"
Out[2]:
0   True
1   False
2   False
Length: 3, dtype: bool
In [3]: series != "Steve"
Out[3]:
0   False
1   True
2   True
Length: 3, dtype: bool
```

In comparisons, NA / NaN will always come through as `False` except with `!=` which is `True`. Be very careful with boolean arithmetic, especially negation, in the presence of NA data. You may wish to add an explicit NA filter into boolean array operations if you are worried about this.
While propagating NA in comparisons may seem like the right behavior to some users (and you could argue on purely technical grounds that this is the right thing to do), the evaluation was made that propagating NA everywhere, including in numerical arrays, would cause a large amount of problems for users. Thus, a “practicality beats purity” approach was taken. This issue may be revisited at some point in the future.

Other API changes

When calling `apply` on a grouped Series, the return value will also be a Series, to be more consistent with the `groupby` behavior with DataFrame:

```python
In [6]: df = pd.DataFrame(
    ...:     {
    ...:         "A": ["foo", "bar", "foo", "bar", "foo", "foo", "foo"],
    ...:         "B": ["one", "one", "two", "three", "two", "two", "one" ],
    ...:         "C": np.random.randn(8),
    ...:         "D": np.random.randn(8),
    ...:     }
    ...
)
```

```python
In [7]: df
Out[7]:
   A   B    C    D
0  foo  one  0.469112 -0.861849
1  bar  one  -0.282863 -2.104569
2  foo  two  -1.509059 -0.494929
3  bar  three -1.135632  1.071804
4  foo  two   1.212112  0.721555
5  bar  two  -0.173215 -0.706771
6  foo  one   0.119209 -1.039575
7  foo  three -1.044236  0.271860
```

```python
In [8]: grouped = df.groupby("A")["C"]
```

```python
In [9]: grouped.describe()
Out[9]:
            count   mean       std           min          25%          50%          75%          max
A   bar      3.0  -0.530570  0.526860  -1.135632  -0.709248  -0.282863  -0.228039  -0.173215
    foo      5.0  -0.150572  1.113308  -1.509059  -1.044236  0.119209  0.469112  1.212112
```

In [10]: grouped.apply(lambda x: x.sort_values()[-2:])  # top 2 values
Out[10]:
A
bar 1 -0.282863
  5 -0.173215
foo 0  0.469112
  4  1.212112
Name: C, Length: 4, dtype: float64

5.22.2 Version 0.7.2 (March 16, 2012)

This release targets bugs in 0.7.1, and adds a few minor features.
New features

- Add additional tie-breaking methods in DataFrame.rank (GH874)
- Add ascending parameter to rank in Series, DataFrame (GH875)
- Add coerce_float option to DataFrame.from_records (GH893)
- Add sort_columns parameter to allow unsorted plots (GH918)
- Enable column access via attributes on GroupBy (GH882)
- Can pass dict of values to DataFrame.fillna (GH661)
- Can select multiple hierarchical groups by passing list of values in .ix (GH134)
- Add axis option to DataFrame.fillna (GH174)
- Add level keyword to drop for dropping values from a level (GH159)

Performance improvements

- Use khash for Series.value_counts, add raw function to algorithms.py (GH861)
- Intercept __builtin__.sum in groupby (GH885)

Contributors

A total of 12 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

- Adam Klein
- Benjamin Gross +
- Dan Birken +
- Dieter Vandenbussche
- Josh +

5.22.3 Version 0.7.1 (February 29, 2012)

This release includes a few new features and addresses over a dozen bugs in 0.7.0.

New features

- Add `to_clipboard` function to pandas namespace for writing objects to the system clipboard (GH774)
- Add `itertuples` method to DataFrame for iterating through the rows of a dataframe as tuples (GH818)
- Add ability to pass `fill_value` and method to DataFrame and Series align method (GH806, GH807)
- Add `fill_value` option to reindex, align methods (GH784)
- Enable `concat` to produce DataFrame from Series (GH787)
- Add `between` method to Series (GH802)
- Add HTML representation hook to DataFrame for the IPython HTML notebook (GH773)
- Support for reading Excel 2007 XML documents using openpyxl

Performance improvements

- Improve performance and memory usage of `fillna` on DataFrame
- Can concatenate a list of Series along `axis=1` to obtain a DataFrame (GH787)

Contributors

A total of 9 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

- Adam Klein
- Brian Granger +
- Chang She
- Dieter Vandenbussche

5.22.4 Version 0.7.0 (February 9, 2012)

New features

- New unified *merge function* for efficiently performing full gamut of database / relational-algebra operations. Refactored existing join methods to use the new infrastructure, resulting in substantial performance gains (GH220, GH249, GH267)

- New *unified concatenation function* for concatenating Series, DataFrame or Panel objects along an axis. Can form union or intersection of the other axes. Improves performance of *Series.append* and *DataFrame.append* (GH468, GH479, GH273)

- *Can* pass multiple DataFrames to *DataFrame.append* to concatenate (stack) and multiple Series to *Series.append* too

- *Can* pass list of dicts (e.g., a list of JSON objects) to DataFrame constructor (GH526)

- You can now set *multiple columns* in a DataFrame via `__getitem__`, useful for transformation (GH342)

- Handle differently-indexed output values in *DataFrame.apply* (GH498)

```python
In [1]: df = pd.DataFrame(np.random.randn(10, 4))
In [2]: df.apply(lambda x: x.describe())
Out[2]:
<table>
<thead>
<tr>
<th></th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>count</td>
<td>10.000000</td>
<td>10.000000</td>
<td>10.000000</td>
<td>10.000000</td>
</tr>
<tr>
<td>mean</td>
<td>0.190912</td>
<td>-0.395125</td>
<td>-0.731920</td>
<td>-0.403130</td>
</tr>
<tr>
<td>std</td>
<td>0.730951</td>
<td>0.813266</td>
<td>1.112016</td>
<td>0.961912</td>
</tr>
<tr>
<td>min</td>
<td>-0.861849</td>
<td>-2.104569</td>
<td>-1.776904</td>
<td>-1.469388</td>
</tr>
<tr>
<td>25%</td>
<td>-0.411391</td>
<td>-0.698728</td>
<td>-1.501401</td>
<td>-1.076610</td>
</tr>
<tr>
<td>50%</td>
<td>0.380863</td>
<td>-0.228039</td>
<td>-1.191943</td>
<td>-1.004091</td>
</tr>
<tr>
<td>75%</td>
<td>0.658444</td>
<td>0.057974</td>
<td>-0.034326</td>

<td>1.212112</td>
<td>0.577046</td>
<td>1.643563</td>
<td>1.071804</td>
</tr>
</tbody>
</table>
```

- *Add* reorder_levels method to Series and DataFrame (GH534)

- *Add* dict-like get function to DataFrame and Panel (GH521)

- *Add* DataFrame.iterrows method for efficiently iterating through the rows of a DataFrame

- Add DataFrame.to_panel with code adapted from LongPanel.to_long

- *Add* reindex_axis method added to DataFrame

- *Add* level option to binary arithmetic functions on DataFrame and Series

- *Add* level option to the reindex and align methods on Series and DataFrame for broadcasting values across a level (GH542, GH552, others)

- Add attribute-based item access to Panel and add IPython completion (GH563)

- *Add* logy option to Series.plot for log-scaling on the Y axis

- *Add* index and header options to DataFrame.to_string

- *Can* pass multiple DataFrames to *DataFrame.join* to join on index (GH115)

- *Can* pass multiple Panels to *Panel.join* (GH115)
• *Added* justify argument to `DataFrame.to_string` to allow different alignment of column headers
• *Add* sort option to GroupBy to allow disabling sorting of the group keys for potential speedups (GH595)
• *Can* pass MaskedArray to Series constructor (GH563)
• Add Panel item access via attributes and IPython completion (GH554)
• Implement `DataFrame.lookup`, fancy-indexing analogue for retrieving values given a sequence of row and column labels (GH338)
• Can pass a *list of functions* to aggregate with groupby on a DataFrame, yielding an aggregated result with hierarchical columns (GH166)
• Can call cummin and cummax on Series and DataFrame to get cumulative minimum and maximum, respectively (GH647)
• value_range added as utility function to get min and max of a dataframe (GH288)
• Added encoding argument to `read_csv`, `read_table`, `to_csv` and `from_csv` for non-ascii text (GH717)
• *Added* abs method to pandas objects
• *Added* crosstab function for easily computing frequency tables
• *Added* isin method to index objects
• *Added* level argument to `xs` method of DataFrame.

**API changes to integer indexing**

One of the potentially riskiest API changes in 0.7.0, but also one of the most important, was a complete review of how *integer indexes* are handled with regard to label-based indexing. Here is an example:

```python
In [3]: s = pd.Series(np.random.randn(10), index=range(0, 20, 2))

In [4]: s
Out[4]:
   0   -1.294524
   2    0.413738
   4    0.276662
   6   -0.472035
   8   -0.013960
  10   -0.362543
  12   -0.006154
  14   -0.923061
  16    0.895717
  18    0.805244
Length: 10, dtype: float64

In [5]: s[0]
Out[5]: -1.2945235902555294

In [6]: s[2]
Out[6]: 0.41373810535784006

In [7]: s[4]
Out[7]: 0.2766617129497566
```
This is all exactly identical to the behavior before. However, if you ask for a key **not** contained in the Series, in versions 0.6.1 and prior, Series would fall back on a location-based lookup. This now raises a `KeyError`:

```python
In [2]: s[1]
KeyError: 1
```

This change also has the same impact on DataFrame:

```python
In [3]: df = pd.DataFrame(np.random.randn(8, 4), index=range(0, 16, 2))

In [4]: df
Out[4]:
0     0.88427  0.33630  -0.17870  0.03162
2     0.14451  0.14150   0.25040   0.58374
4    -1.44779  0.91860  -1.49960   0.27163
6    -0.26598  2.41840  -0.26580   0.11503
8    -0.58776  0.31440  -0.85660   0.61941
10   0.10940  -0.71750  -1.01080   0.47990
12  -1.16919  -0.30870  -0.60490  -0.43544
14  -0.07337   0.34100   0.04240  -0.16037

In [5]: df.ix[3]
KeyError: 3
```

In order to support purely integer-based indexing, the following methods have been added:

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Series.iget_value(i)</code></td>
<td>Retrieve value stored at location i</td>
</tr>
<tr>
<td><code>Series.iget(i)</code></td>
<td>Alias for <code>iget_value</code></td>
</tr>
<tr>
<td><code>DataFrame.irow(i)</code></td>
<td>Retrieve the i-th row</td>
</tr>
<tr>
<td><code>DataFrame.icol(j)</code></td>
<td>Retrieve the j-th column</td>
</tr>
<tr>
<td><code>DataFrame.iget_value(i, j)</code></td>
<td>Retrieve the value at row i and column j</td>
</tr>
</tbody>
</table>

**API tweaks regarding label-based slicing**

Label-based slicing using `ix` now requires that the index be sorted (monotonic) **unless** both the start and endpoint are contained in the index:

```python
In [1]: s = pd.Series(np.random.randn(6), index=list('gmkaec'))

In [2]: s
Out[2]:
  g   -1.182230
  m   -0.276183
  k   -0.243550
  a    1.628992
  e    0.073308
  c   -0.539890
dtype: float64
```

Then this is OK:
In [3]: s.ix['k':'e']
Out[3]:
   k   0.243550
   a  1.628992
   e  0.073308
   dtype: float64

But this is not:

In [12]: s.ix['b':'h']
KeyError 'b'

If the index had been sorted, the “range selection” would have been possible:

In [4]: s2 = s.sort_index()
In [5]: s2
Out[5]:
   a  1.628992
   c -0.539890
   e  0.073308
   g -1.182230
   k -0.243550
   m -0.276183
   dtype: float64
In [6]: s2.ix['b':'h']
Out[6]:
   c -0.539890
   e  0.073308
   g -1.182230
   dtype: float64

Changes to Series [] operator

As as notational convenience, you can pass a sequence of labels or a label slice to a Series when getting and setting values via [] (i.e. the __getitem__ and __setitem__ methods). The behavior will be the same as passing similar input to ix except in the case of integer indexing:

In [8]: s = pd.Series(np.random.randn(6), index=list('acegkm'))
In [9]: s
Out[9]:
   a  -1.206412
   c   2.565646
   e   1.431256
   g   1.349309
   k  -1.170299
   m  -0.226169
Length: 6, dtype: float64
In [10]: s[['m', 'a', 'c', 'e']]
(continues on next page)
In the case of integer indexes, the behavior will be exactly as before (shadowing ndarray):

```python
In [13]: s = pd.Series(np.random.randn(6), index=range(0, 12, 2))
```

```python
In [14]: s[[4, 0, 2]]
```

```
Out[14]:
   4    0.132003
   0    0.410835
   2    0.813850
Length: 3, dtype: float64
```

```python
In [15]: s[1:5]
```

```
Out[15]:
   2    0.813850
   4    0.132003
   6   -0.827317
   8   -0.076467
Length: 4, dtype: float64
```

If you wish to do indexing with sequences and slicing on an integer index with label semantics, use `ix`. 

Out[10]:
```
m  -0.226169
a  -1.206412
c   2.565646
e   1.431256
Length: 4, dtype: float64
```

In [11]: s['b':'l']

```
Out[11]:
c   2.565646
e   1.431256
g   1.340309
k  -1.170299
Length: 4, dtype: float64
```

In [12]: s['c':'k']

```
Out[12]:
c   2.565646
e   1.431256
g   1.340309
k  -1.170299
Length: 4, dtype: float64
```
Other API changes

- The deprecated `LongPanel` class has been completely removed
- If `Series.sort` is called on a column of a DataFrame, an exception will now be raised. Before it was possible to accidentally mutate a DataFrame's column by doing `df[col].sort()` instead of the side-effect free method `df[col].order()` (GH316)
- Miscellaneous renames and deprecations which will (harmlessly) raise `FutureWarning`
- `drop` added as an optional parameter to `DataFrame.reset_index` (GH699)

Performance improvements

- `Cythonized GroupBy aggregations` no longer presort the data, thus achieving a significant speedup (GH93). GroupBy aggregations with Python functions significantly sped up by clever manipulation of the ndarray data type in Cython (GH496).
- Better error message in DataFrame constructor when passed column labels don’t match data (GH497)
- Substantially improve performance of multi-GroupBy aggregation when a Python function is passed, reuse ndarray object in Cython (GH496)
- Can store objects indexed by tuples and floats in HDFStore (GH492)
- Don’t print length by default in `Series.to_string`, add `length` option (GH489)
- Improve Cython code for multi-groupby to aggregate without having to sort the data (GH93)
- Improve `MultiIndex` reindexing speed by storing tuples in the `MultiIndex`, test for backwards unpickling compatibility
- Improve column reindexing performance by using specialized Cython take function
- Further performance tweaking of `Series.__getitem__` for standard use cases
- Avoid `Index` dict creation in some cases (i.e. when getting slices, etc.), regression from prior versions
- Friendlier error message in `setup.py` if NumPy not installed
- Use common set of NA-handling operations (sum, mean, etc.) in `Panel` class also (GH536)
- Default name assignment when calling `reset_index` on DataFrame with a regular (non-hierarchical) index (GH476)
- Use Cythonized groupers when possible in Series/DataFrame stat ops with `level` parameter passed (GH545)
- Ported skiplist data structure to C to speed up `rolling_median` by about 5-10x in most typical use cases (GH374)

5.23 Version 0.6

5.23.1 Version 0.6.1 (December 13, 2011)

New features

• Can append single rows (as Series) to a DataFrame
• Add Spearman and Kendall rank correlation options to Series.corr and DataFrame.corr (GH428)
• Added get_value and set_value methods to Series, DataFrame, and Panel for very low-overhead access (>2x faster in many cases) to scalar elements (GH437, GH438). set_value is capable of producing an enlarged object.
• Add PyQt table widget to sandbox (GH435)
• DataFrame.align can accept Series arguments and an axis option (GH461)
• Implement new SparseArray and SparseList data structures. SparseSeries now derives from SparseArray (GH463)
• Better console printing options (GH453)
• Implement fast data ranking for Series and DataFrame, fast versions of scipy.stats.rankdata (GH428)
• Implement DataFrame.from_items alternate constructor (GH444)
• DataFrame.convert_objects method for inferring better dtypes for object columns (GH302)
• Add rolling_corr_pairwise function for computing Panel of correlation matrices (GH189)
• Add margins option to pivot_table for computing subgroup aggregates (GH114)
• Add Series.from_csv function (GH482)
• Can pass DataFrame/DataFrame and DataFrame/Series to rolling_corr/rolling_cov (GH #462)
• MultiIndex.get_level_values can accept the level name

Performance improvements

• Improve memory usage of DataFrame.describe (do not copy data unnecessarily) (PR #425)
• Optimize scalar value lookups in the general case by 25% or more in Series and DataFrame
• Fix performance regression in cross-sectional count in DataFrame, affecting DataFrame.dropna speed
• Column deletion in DataFrame copies no data (computes views on blocks) (GH #158)

5.23.2 Version 0.6.0 (November 25, 2011)

New features

• Added melt function to pandas.core.reshape
• Added level parameter to group by level in Series and DataFrame descriptive statistics (GH313)
• Added head and tail methods to Series, analogous to DataFrame (GH296)
• Added Series.isin function which checks if each value is contained in a passed sequence (GH289)
• Added float_format option to Series.to_string
• Added skip_footer (GH291) and converters (GH343) options to read_csv and read_table
• Added drop_duplicates and duplicated functions for removing duplicate DataFrame rows and checking for duplicate rows, respectively (GH319)
• Implemented operators ‘&’, ‘|’, ‘^’, ‘-’ on DataFrame (GH347)
• Added Series.mad, mean absolute deviation
• Added QuarterEnd DateOffset (GH321)
• Added dot to DataFrame (GH65)
• Added orient option to Panel.from_dict (GH359, GH301)
• Added orient option to DataFrame.from_dict
• Added passing list of tuples or list of lists to DataFrame.from_records (GH357)
• Added multiple levels to groupby (GH103)
• Allow multiple columns in by argument of DataFrame.sort_index (GH92, GH362)
• Added fast get_value and put_value methods to DataFrame (GH360)
• Added cov instance methods to Series and DataFrame (GH194, GH362)
• Added kind='bar' option to DataFrame.plot (GH348)
• Added idxmin and idxmax to Series and DataFrame (GH286)
• Added read_clipboard function to parse DataFrame from clipboard (GH300)
• Added nunique function to Series for counting unique elements (GH297)
• Made DataFrame constructor use Series name if no columns passed (GH373)
• Support regular expressions in read_table/read_csv (GH364)
• Added DataFrame.to_html for writing DataFrame to HTML (GH387)
• Added support for MaskedArray data in DataFrame, masked values converted to NaN (GH396)
• Added DataFrame.boxplot function (GH368)
• Can pass extra args, kwds to DataFrame.apply (GH376)
• Implement DataFrame.join with vector on argument (GH312)
• Added legend boolean flag to DataFrame.plot (GH324)
• Can pass multiple levels to stack and unstack (GH370)
• Can pass multiple values columns to pivot_table (GH381)
• Use Series name in GroupBy for result index (GH363)
• Added raw option to DataFrame.apply for performance if only need ndarray (GH309)
• Added proper, tested weighted least squares to standard and panel OLS (GH303)

Performance enhancements

• VBENCH Cythonized cache_readonly, resulting in substantial micro-performance enhancements throughout the code base (GH361)
• VBENCH Special Cython matrix iterator for applying arbitrary reduction operations with 3-5x better performance than np.apply_along_axis (GH309)
• VBENCH Improved performance of MultiIndex.from_tuples
• VBENCH Special Cython matrix iterator for applying arbitrary reduction operations
• VBENCH + DOCUMENT Add raw option to DataFrame.apply for getting better performance when
• VBENCH Faster cythonized count by level in Series and DataFrame (GH341)
• VBENCH? Significant GroupBy performance enhancement with multiple keys with many “empty” combinations
• VBENCH New Cython vectorized function map_infer speeds up Series.apply and Series.map significantly when passed elementwise Python function, motivated by (GH355)
• VBENCH Significantly improved performance of Series.order, which also makes np.unique called on a Series faster (GH327)
• VBENCH Vastly improved performance of GroupBy on axes with a MultiIndex (GH299)

5.24 Version 0.5

5.24.1 Version 0.5.0 (October 24, 2011)

New features

- *Added* DataFrame.align method with standard join options
- *Added* parse_dates option to read_csv and read_table methods to optionally try to parse dates in the index columns
- *Added* nrows, chunksize, and iterator arguments to read_csv and read_table. The last two return a new TextParser class capable of lazily iterating through chunks of a flat file (GH242)
- *Added* ability to join on multiple columns in DataFrame.join (GH214)
- *Added* private _get_duplicates function to Index for identifying duplicate values more easily (ENH5c)
- *Added* column attribute access to DataFrame.
- *Added* Python tab completion hook for DataFrame columns. (GH233, GH230)
- *Implemented* Series.describe for Series containing objects (GH241)
- *Added* inner join option to DataFrame.join when joining on key(s) (GH248)
- *Implemented* selecting DataFrame columns by passing a list to __getitem__ (GH253)
- *Implemented* & and | to intersect / union Index objects, respectively (GH261)
- *Added* pivot_table convenience function to pandas namespace (GH234)
- *Implemented* Panel.rename_axis function (GH243)
- *DataFrame* will show index level names in console output (GH334)
- *Implemented* Panel.take
- *Added* set_eng_float_format for alternate DataFrame floating point string formatting (ENH61)
- *Added* convenience set_index function for creating a DataFrame index from its existing columns
- *Implemented* groupby hierarchical index level name (GH223)
pandas: powerful Python data analysis toolkit, Release 1.2.5

- Added support for different delimiters in DataFrame.to_csv (GH244)
- TODO: DOCS ABOUT TAKE METHODS

Performance enhancements

- VBENCH Major performance improvements in file parsing functions read_csv and read_table
- VBENCH Added Cython function for converting tuples to ndarray very fast. Speeds up many MultiIndex-related operations
- VBENCH Refactored merging / joining code into a tidy class and disabled unnecessary computations in the float/object case, thus getting about 10% better performance (GH211)
- VBENCH Improved speed of DataFrame.xs on mixed-type DataFrame objects by about 5x, regression from 0.3.0 (GH215)
- VBENCH With new DataFrame.align method, speeding up binary operations between differently-indexed DataFrame objects by 10-25%.
- VBENCH Significantly sped up conversion of nested dict into DataFrame (GH212)
- VBENCH Significantly speed up DataFrame.__repr__ and count on large mixed-type DataFrame objects

Contributors

5.25 Version 0.4

5.25.1 Versions 0.4.1 through 0.4.3 (September 25 - October 9, 2011)

New features

- Added Python 3 support using 2to3 (GH200)
- Added name attribute to Series, now prints as part of Series.__repr__
- Added instance methods isnull and notnull to Series (GH209, GH203)
- Added Series.align method for aligning two series with choice of join method (ENH56)
• **Added** method `get_level_values` to `MultiIndex` (GH188)
• Set values in mixed-type `DataFrame` objects via `.ix` indexing attribute (GH135)
• Added new `DataFrame` methods `get_dtype_counts` and property `dtypes` (ENHdc)
• Added `ignore_index` option to `DataFrame.append` to stack `DataFrames` (ENH1b)
• `read_csv` tries to **sniff** delimiters using `csv.Sniffer` (GH146)
• `read_csv` can **read** multiple columns into a `MultiIndex`; `DataFrames`' `to_csv` method writes out a corresponding `MultiIndex` (GH151)
• `DataFrame.rename` has a new `copy` parameter to **rename** a `DataFrame` in place (ENHed)
• **Enable** unstacking by name (GH142)
• **Enable** `sortlevel` to work by level (GH141)

**Performance enhancements**

• Altered binary operations on differently-indexed `SparseSeries` objects to use the integer-based (dense) alignment logic which is faster with a larger number of blocks (GH205)
• Wrote faster Cython data alignment / merging routines resulting in substantial speed increases
• Improved performance of `isnull` and `notnull`, a regression from v0.3.0 (GH187)
• Refactored code related to `DataFrame.join` so that intermediate aligned copies of the data in each `DataFrame` argument do not need to be created. Substantial performance increases result (GH176)
• Substantially improved performance of generic `Index.intersection` and `Index.union`
• Implemented `BlockManager.take` resulting in significantly faster `take` performance on mixed-type `DataFrame` objects (GH104)
• Improved performance of `Series.sort_index`
• Significant groupby performance enhancement: removed unnecessary integrity checks in `DataFrame` internals that were slowing down slicing operations to retrieve groups
• Optimized `_ensure_index` function resulting in performance savings in type-checking `Index` objects
• Wrote fast time series merging / joining methods in Cython. Will be integrated later into `DataFrame.join` and related functions
