Previously the methods DataFrameGroupBy.aggregate(), SeriesGroupBy.aggregate(), DataFrameGroupBy.transform(), and SeriesGroupBy.transform() might cast the result dtype when the argument func is callable, possibly leading to undesirable results (GH21240). The cast would occur if the result is numeric and casting back to the input dtype does not change any values as measured by np.allclose. Now no such casting occurs.

```
In [31]: df = pd.DataFrame({
                      'key': [1, 1],
                      'a': [True, False],
                      'b': [True, True])
```

```
In [32]: df
Out[32]:
    key  a  b
   0  1  True  True
   1  1  False  True
```

**Previous behavior:**
```
In [5]: df.groupby('key').agg(
                  lambda x: x.sum())
Out[5]:
      a  b
    key
    1  True  2
```

**New behavior:**
```
In [33]: df.groupby('key').agg(
                  lambda x: x.sum())
Out[33]:
      a  b
    key
    1  1  2
```

**float result for GroupBy.mean(), GroupBy.median(), and GroupBy.var()**

Previously, these methods could result in different dtypes depending on the input values. Now, these methods will always return a float dtype. (GH41137)

```
In [34]: df = pd.DataFrame({'a': [True], 'b': [1], 'c': [1.0]})
```

**Previous behavior:**
```
In [5]: df.groupby(df.index).mean()
Out[5]:
   a  b  c
  0  True  1  1.0
```

**New behavior:**
Try operating inplace when setting values with \texttt{loc} and \texttt{iloc}

When setting an entire column using \texttt{loc} or \texttt{iloc}, pandas will try to insert the values into the existing data rather than create an entirely new array.

In both the new and old behavior, the data in \texttt{values} is overwritten, but in the old behavior the dtype of \texttt{df["A"]} changed to \texttt{int64}.

\textit{Previous behavior:}

In pandas 1.3.0, \texttt{df} continues to share data with \texttt{values}

\textit{New behavior:}

```python
In [40]: df.dtypes
Out[40]:
A    float64
dtype: object
In [41]: np.shares_memory(df["A"].values, new)
Out[41]: False
In [42]: np.shares_memory(df["A"].values, values)
Out[42]: True
```
Never operate inplace when setting `frame[keys] = values`

When setting multiple columns using `frame[keys] = values` new arrays will replace pre-existing arrays for these keys, which will *not* be over-written (GH39510). As a result, the columns will retain the dtype(s) of `values`, never casting to the dtypes of the existing arrays.

```python
In [43]: df = pd.DataFrame(range(3), columns=['A'], dtype='float64')
In [44]: df[['A']] = 5
```

In the old behavior, 5 was cast to `float64` and inserted into the existing array backing `df`:

**Previous behavior**:

```python
In [1]: df.dtypes
Out[1]:
A    float64
```

In the new behavior, we get a new array, and retain an integer-dtyped 5:

**New behavior**:

```python
In [45]: df.dtypes
Out[45]:
A    int64
dtype: object
```

### Consistent casting with setting into Boolean Series

Setting non-boolean values into a `Series` with `dtype=bool` now consistently casts to `dtype=object` (GH38709)

```python
In [46]: orig = pd.Series([True, False])
In [47]: ser = orig.copy()
In [48]: ser.iloc[1] = np.nan
In [49]: ser2 = orig.copy()
In [50]: ser2.iloc[1] = 2.0
```

**Previous behavior**:

```python
In [1]: ser
Out [1]:
0   1.0
1   NaN
dtype: float64
```

```python
In [2]: ser2
Out [2]:
0   True
1   2.0
dtype: object
```

**New behavior**:
GroupBy.rolling no longer returns grouped-by column in values

The group-by column will now be dropped from the result of a `groupby.rolling` operation (GH32262)

```
In [53]: df = pd.DataFrame({"A": [1, 1, 2, 3], "B": [0, 1, 2, 3]})

In [54]: df
Out [54]:
   A  B
0  1  0
1  1  1
2  2  2
3  3  3

Previous behavior:

```
In [1]: df.groupby("A").rolling(2).sum()
Out [1]:
         A  B
      A
0     0  NaN NaN
1   2.0  1.0
2  NaN  NaN
3  NaN  NaN

New behavior:

```
In [55]: df.groupby("A").rolling(2).sum()
Out [55]:
         B
      A
0     0  NaN
1   1.0
2  NaN
3  NaN
```
**Removed artificial truncation in rolling variance and standard deviation**

Rolling.std() and Rolling.var() will no longer artificially truncate results that are less than \(1\times10^{-8}\) and \(1\times10^{-15}\) respectively to zero (GH37051, GH40448, GH39872).

However, floating point artifacts may now exist in the results when rolling over larger values.

```python
In [56]: s = pd.Series([7, 5, 5, 5])
In [57]: s.rolling(3).var()
Out[57]:
   0   NaN
   1   NaN
   2 1.333333e+00
   3 4.440892e-16
(dtype: float64)
```

**GroupBy.rolling with MultiIndex no longer drops levels in the result**

GroupBy.rolling() will no longer drop levels of a DataFrame with a MultiIndex in the result. This can lead to a perceived duplication of levels in the resulting MultiIndex, but this change restores the behavior that was present in version 1.1.3 (GH38787, GH38523).

```python
In [58]: index = pd.MultiIndex.from_tuples([('idx1', 'idx2')], names=['label1', 'label2'])
In [59]: df = pd.DataFrame({'a': [1], 'b': [2]}, index=index)
In [60]: df
Out[60]:
   a  b
  label1 label2
  idx1 idx2  1  2
```

*Previous behavior:*

```python
In [1]: df.groupby('label1').rolling(1).sum()
Out[1]:
   a  b
  label1
  idx1  1.0  2.0
```

*New behavior:*

```python
In [61]: df.groupby('label1').rolling(1).sum()
Out[61]:
   a  b
  label1 label1 label2
  idx1 idx1 idx2  1.0  2.0
```
### Backwards incompatible API changes

### Increased minimum versions for dependencies

Some minimum supported versions of dependencies were updated. If installed, we now require:

<table>
<thead>
<tr>
<th>Package</th>
<th>Minimum Version</th>
<th>Required</th>
<th>Changed</th>
</tr>
</thead>
<tbody>
<tr>
<td>numpy</td>
<td>1.17.3</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>pytz</td>
<td>2017.3</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>python-dateutil</td>
<td>2.7.3</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>bottleneck</td>
<td>1.2.1</td>
<td></td>
<td></td>
</tr>
<tr>
<td>numexpr</td>
<td>2.7.0</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>pytest (dev)</td>
<td>6.0</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>mypy (dev)</td>
<td>0.812</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>setuptools</td>
<td>38.6.0</td>
<td></td>
<td>X</td>
</tr>
</tbody>
</table>

For optional libraries the general recommendation is to use the latest version. The following table lists the lowest version per library that is currently being tested throughout the development of pandas. Optional libraries below the lowest tested version may still work, but are not considered supported.

<table>
<thead>
<tr>
<th>Package</th>
<th>Minimum Version</th>
<th>Changed</th>
</tr>
</thead>
<tbody>
<tr>
<td>beautifulsoup4</td>
<td>4.6.0</td>
<td></td>
</tr>
<tr>

</tr>
</tbody>
</table>

See Dependencies and Optional dependencies for more.
Other API changes

- Partially initialized `CategoricalDtype` objects (i.e. those with `categories=None`) will no longer compare as equal to fully initialized dtype objects (GH38516)

- Accessing `_constructor_expanddim` on a `DataFrame` and `_constructor_sliced` on a `Series` now raise an `AttributeError`. Previously a `NotImplementedError` was raised (GH38782)

- Added new `engine` and `**engine_kwargs` parameters to `DataFrame.to_sql()` to support other future “SQL engines”. Currently we still only use SQLAlchemy under the hood, but more engines are planned to be supported such as turbodbc (GH36893)

- Removed redundant `freq` from `PeriodIndex` string representation (GH41653)

- `ExtensionDtype.construct_array_type()` is now a required method instead of an optional one for `ExtensionDtype` subclasses (GH24860)

- Calling `hash` on non-hashable pandas objects will now raise `TypeError` with the built-in error message (e.g. unhashable type: 'Series'). Previously it would raise a custom message such as 'Series' objects are mutable, thus they cannot be hashed. Furthermore, `isinstance(<Series>, abc.collections.Hashable)` will now return `False` (GH40013)

- `Styler.from_custom_template()` now has two new arguments for template names, and removed the old name, due to template inheritance having been introducing for better parsing (GH42053). Subclassing modifications to `Styler` attributes are also needed.

Build

- Documentation in `.pptx` and `.pdf` formats are no longer included in wheels or source distributions. (GH30741)

Deprecations

**Deprecated dropping nuisance columns in DataFrame reductions and DataFrameGroupBy operations**

Calling a reduction (e.g. `.min`, `.max`, `.sum`) on a `DataFrame` with `numeric_only=None` (the default), columns where the reduction raises a `TypeError` are silently ignored and dropped from the result.

This behavior is deprecated. In a future version, the `TypeError` will be raised, and users will need to select only valid columns before calling the function.

For example:

```python
In [62]: df = pd.DataFrame({'A': [1, 2, 3, 4], 'B': pd.date_range('2016-01-01', periods=4)})

In [63]: df
Out[63]:
   A     B
0  1 2016-01-01
1  2 2016-01-02
2  3 2016-01-03
3  4 2016-01-04
```

Old behavior:
Future behavior:

In [4]: df.prod()
...
TypeError: 'DatetimeArray' does not implement reduction 'prod'

In [5]: df["A"].prod()
Out[5]:
A   24
dtype: int64

Similarly, when applying a function to DataFrameGroupBy, columns on which the function raises TypeError are currently silently ignored and dropped from the result.

This behavior is deprecated. In a future version, the TypeError will be raised, and users will need to select only valid columns before calling the function.

For example:

In [64]: df = pd.DataFrame({"A": [1, 2, 3, 4], "B": pd.date_range("2016-01-01", periods=4)})
In [65]: gb = df.groupby([1, 1, 2, 2])

Old behavior:

In [4]: gb.prod(numeric_only=False)
Out[4]:
A
1  2
2 12

Future behavior:

In [5]: gb.prod(numeric_only=False)
...
TypeError: datetime64 type does not support prod operations

In [6]: gb["A"].prod(numeric_only=False)
Out[6]:
   A
1  2
2 12
Other Deprecations

- Deprecated allowing scalars to be passed to the `Categorical` constructor (GH38433)
- Deprecated constructing `CategoricalIndex` without passing list-like data (GH38944)
- Deprecated allowing subclass-specific keyword arguments in the `Index` constructor, use the specific subclass directly instead (GH14093, GH21311, GH22315, GH26974)
- Deprecated the `astype()` method of datetimelike (`timedelta64[ns]`, `datetime64[ns]`, `Datetime64TZDtype`, `PeriodDtype`) to convert to integer dtypes, use `values.view(...)` instead (GH38544)
- Deprecated `MultiIndex.is_lexsorted()` and `MultiIndex.lexsort_depth()`, use `MultiIndex.is_monotonic_increasing()` instead (GH32259)
- Deprecated keyword `try_cast` in `Series.where()`, `Series.mask()`, `DataFrame.where()`, `DataFrame.mask()`; cast results manually if desired (GH38836)
- Deprecated comparison of `Timestamp` objects with `datetime.date` objects. Instead of e.g. `ts <= mydate` use `ts <= pd.Timestamp(mydate)` or `ts.date() <= mydate` (GH36131)
- Deprecated `Rolling.win_type` returning "freq" (GH38963)
- Deprecated `Rolling.is_datetimelike` (GH38963)
- Deprecated `DataFrame` indexer for `Series.__setitem__()` and `DataFrame.__setitem__()` (GH39004)
- Deprecated `ExponentialMovingWindow.vol()` (GH39220)
- Using `.astype` to convert between `datetime64[ns]` dtype and `DatetimeTZDtype` is deprecated and will raise in a future version, use `obj.tz_localize` or `obj.dt.tz_localize` instead (GH38622)
- Deprecated casting `datetime.date` objects to `datetime64` when used as `fill_value` in `DataFrame.unstack()`, `DataFrame.shift()`, `Series.shift()`, and `DataFrame.reindex()`, pass `pd.Timestamp(dateobj)` instead (GH39767)
- Deprecated `Styler.set_na_rep()` and `Styler.set_precision()` in favor of `Styler.format()` with `na_rep` and `precision` as existing and new input arguments respectively (GH40134, GH40425)
- Deprecated `Styler.where()` in favor of using an alternative formulation with `Styler.applymap()` (GH40821)
- Deprecated allowing partial failure in `Series.transform()` and `DataFrame.transform()` when `func` is list-like or dict-like and raises anything but `TypeError`; `func` raising anything but a `TypeError` will raise in a future version (GH40211)
- Deprecated arguments `error_bad_lines` and `warn_bad_lines` in `read_csv()` and `read_table()` in favor of argument `on_bad_lines` (GH15122)
- Deprecated support for `np.ma.mrecords.MaskedRecords` in the `DataFrame` constructor, pass `{name: data[name] for name in data.dtype.names}` instead (GH40363)
- Deprecated using `merge()`, `DataFrame.merge()`, and `DataFrame.join()` on a different number of levels (GH34862)
- Deprecated the use of `**kwargs` in `ExcelWriter`; use the keyword argument `engine_kwargs` instead (GH40430)
- Deprecated the level keyword for `DataFrame` and `Series` aggregations; use `groupby` instead (GH39983)
- Deprecated the `inplace` parameter of `Categorical.remove_categories()`, `Categorical.add_categories()`, `Categorical.reorder_categories()`, `Categorical.rename_categories()`, `Categorical.set_categories()` and will be removed in a future version (GH37643)

- Deprecated `merge()` producing duplicated columns through the `suffixes` keyword and already existing columns (GH22818)

- Deprecated setting `Categorical._codes`, create a new `Categorical` with the desired codes instead (GH40606)

- Deprecated the `convert_float` optional argument in `read_excel()` and `ExcelFile.parse()` (GH41127)

- Deprecated behavior of `DatetimeIndex.union()` with mixed timezones; in a future version both will be cast to UTC instead of object dtype (GH39328)

- Deprecated using `usecols` with out of bounds indices for `read_csv()` with engine="c" (GH25623)

- Deprecated special treatment of lists with first element a Categorical in the `DataFrame` constructor; pass as `pd.DataFrame({col: categorical, ...})` instead (GH38845)

- Deprecated behavior of `DataFrame` constructor when a `dtype` is passed and the data cannot be cast to that dtype. In a future version, this will raise instead of being silently ignored (GH24435)

- Deprecated the `Timestamp.freq` attribute. For the properties that use it (`is_month_start`, `is_month_end`, `is_quarter_start`, `is_quarter_end`, `is_year_start`, `is_year_end`), when you have a `freq`, use e.g. `freq.is_month_start(ts)` (GH15146)

- Deprecated construction of `Series` or `DataFrame` with DatetimeTZDtype data and `datetime64[ns]` dtype. Use `Series(data).dt.tz_localize(None)` instead (GH41555, GH33401)

- Deprecated behavior of `Series` construction with large-integer values and small-integer dtype silently overflowing; use `Series(data).astype(dtype)` instead (GH41734)

- Deprecated behavior of `DataFrame` construction with floating data and integer dtype casting even when lossy; in a future version this will remain floating, matching `Series` behavior (GH41770)

- Deprecated inference of `timedelta64[ns]`, `datetime64[ns]`, or DatetimeTZDtype dtypes in `Series` construction when data containing strings is passed and no `dtype` is passed (GH33558)

- In a future version, constructing `Series` or `DataFrame` with `datetime64[ns]` data and DatetimeTZDtype will treat the data as wall-times instead of as UTC times (matching DatetimeIndex behavior). To treat the data as UTC times, use `pd.Series(data).dt.tz_localize("UTC").dt.tz_convert(dtype.tz)` or `pd.Series(data.view("int64"), dtype=dtype)` (GH33401)

- Deprecated passing lists as key to `DataFrame.xs()` and `Series.xs()` (GH41760)

- Deprecated boolean arguments of inclusive in `Series.between()` to have "left", "right", "neither", "both" as standard argument values (GH40628)

- Deprecated passing arguments as positional for all of the following, with exceptions noted (GH41485):
  - `concat()` (other than `objs`)
  - `read_csv()` (other than `filepath_or_buffer`)
  - `read_table()` (other than `filepath_or_buffer`)
  - `DataFrame.clip()` and `Series.clip()` (other than `upper` and `lower`)
  - `DataFrame.drop_duplicates()` (except for `subset`), `Series.drop_duplicates()`, `Index.drop_duplicates()` and `MultiIndex.drop_duplicates()` and `DataFrame.drop()` (other than `labels`) and `Series.drop()`
pandas: powerful Python data analysis toolkit, Release 1.3.1

- `DataFrame.dropna()` and `Series.dropna()`
- `DataFrame.ffill()`, `Series.ffill()`, `DataFrame.bfill()`, and `Series.bfill()`
- `DataFrame.fillna()` and `Series.fillna()` (apart from `value`)
- `DataFrame.interpolate()` and `Series.interpolate()` (other than `method`)
- `DataFrame.mask()` and `Series.mask()` (other than `cond` and `other`)
- `DataFrame.reset_index()` (other than `level`) and `Series.reset_index()`
- `DataFrame.set_axis()` and `Series.set_axis()` (other than `labels`)
- `DataFrame.set_index()` (other than `keys`)
- `DataFrame.sort_index()` and `Series.sort_index()`
- `DataFrame.sort_values()` (other than `by`) and `Series.sort_values()`
- `DataFrame.where()` and `Series.where()` (other than `cond` and `other`)
- `Index.set_names()` and `MultiIndex.set_names()` (except for `names`)
- `MultiIndex.codes()` (except for `codes`)
- `MultiIndex.set_levels()` (except for `levels`)
- `Resampler.interpolate()` (other than `method`)

Performance improvements

- Performance improvement in `IntervalIndex.isin()` (GH38353)
- Performance improvement in `Series.mean()` for nullable data types (GH34814)
- Performance improvement in `Series.isin()` for nullable data types (GH38340)
- Performance improvement in `DataFrame.fillna()` with `method="pad"` or `method="backfill"` for nullable floating and nullable integer dtypes (GH39953)
- Performance improvement in `DataFrame.corr()` for `method=kendall` (GH28329)
- Performance improvement in `DataFrame.corr()` for `method=spearman` (GH40956, GH41885)
- Performance improvement in `Rolling.corr()` and `Rolling.cov()` (GH39388)
- Performance improvement in `RollingGroupby.corr()`, `ExpandingGroupby.corr()`, `ExpandingGroupby.corr()` and `ExpandingGroupby.cov()` (GH39591)
- Performance improvement in `unique()` for object data type (GH37615)
- Performance improvement in `json_normalize()` for basic cases (including separators) (GH40035, GH15621)
- Performance improvement in `ExpandingGroupby` aggregation methods (GH39664)
- Performance improvement in `Styler` where render times are more than 50% reduced and now matches `DataFrame.to_html()` (GH39972, GH39952, GH40425)
- The method `Styler.set_td_classes()` is now as performant as `Styler.apply()` and `Styler.applymap()`, and even more so in some cases (GH40453)
- Performance improvement in `ExponentialMovingWindow.mean()` with `times` (GH39784)
- Performance improvement in `GroupBy.apply()` when requiring the Python fallback implementation (GH40176)
• Performance improvement in the conversion of a PyArrow Boolean array to a pandas nullable Boolean array (GH41051)
• Performance improvement for concatenation of data with type CategoricalDtype (GH40193)
• Performance improvement in GroupBy.cummin() and GroupBy.cummax() with nullable data types (GH37493)
• Performance improvement in Series.nunique() with nan values (GH40865)
• Performance improvement in DataFrame.transpose(), Series.unstack() with DatetimeTZDtype (GH40149)
• Performance improvement in Series.plot() and DataFrame.plot() with entry point lazy loading (GH41492)

Bug fixes

Categorical

• Bug in CategoricalIndex incorrectly failing to raise TypeError when scalar data is passed (GH38614)
• Bug in CategoricalIndex.reindex failed when the Index passed was not categorical but whose values were all labels in the category (GH28690)
• Bug where constructing a Categorical from an object-dtype array of date objects did not round-trip correctly with astype (GH38552)
• Bug in constructing a DataFrame from an ndarray and a CategoricalDtype (GH38857)
• Bug in setting categorical values into an object-dtype column in a DataFrame (GH39136)
• Bug in DataFrame.reindex() was raising an IndexError when the new index contained duplicates and the old index was a CategoricalIndex (GH38906)
• Bug in Categorical.fillna() with a tuple-like category raising NotImplementedError instead of ValueError when filling with a non-category tuple (GH41914)

Datetimelike

• Bug in DataFrame and Series constructors sometimes dropping nanoseconds from Timestamp (resp. Timedelta) data, with dtype=datet ime64[ns] (resp. timedelta64[ns]) (GH38032)
• Bug in DataFrame.first() and Series.first() with an offset of one month returning an incorrect result when the first day is the last day of a month (GH29623)
• Bug in constructing a DataFrame or Series with mismatched datet ime64 data and timedelta64 dtype, or vice-versa, failing to raise a TypeError (GH38575, GH38764, GH38792)
• Bug in constructing a Series or DataFrame with a datetime object out of bounds for datet ime64[ns] dtype or a timedelta object out of bounds for timedelta64[ns] dtype (GH38792, GH38965)
• Bug in DatetimeIndex.intersection(), DatetimeIndex.symmetric_difference(), PeriodIndex.intersection(), PeriodIndex.symmetric_difference() always returning object-dtype when operating with CategoricalIndex (GH38741)
• Bug in DatetimeIndex.intersection() giving incorrect results with non-Tick frequencies with n != 1 (GH42104)
• Bug in `Series.where()` incorrectly casting datetime64 values to int64 (GH37682)
• Bug in `Categorical` incorrectly typecasting datetime object to Timestamp (GH38878)
• Bug in comparisons between `Timestamp` object and datetime64 objects just outside the implementation bounds for nanosecond datetime64 (GH39221)
• Bug in `Timestamp.round()`, `Timestamp.floor()`, `Timestamp.ceil()` for values near the implementation bounds of `Timestamp` (GH39244)
• Bug in `Timedelta.round()`, `Timedelta.floor()`, `Timedelta.ceil()` for values near the implementation bounds of `Timedelta` (GH38964)
• Bug in `date_range()` incorrectly creating `DatetimeIndex` containing NaT instead of raising OutOfBoundsDatetime in corner cases (GH24124)
• Bug in `infer_freq()` incorrectly fails to infer ‘H’ frequency of `DatetimeIndex` if the latter has a timezone and crosses DST boundaries (GH39556)
• Bug in `Series` backed by DatetimeArray or TimedeltaArray sometimes failing to set the array’s freq to None (GH41425)

**Timedelta**

• Bug in constructing `Timedelta` from np.timedelta64 objects with non-nanosecond units that are out of bounds for timedelta64[ns] (GH38965)
• Bug in constructing a `TimedeltaIndex` incorrectly accepting np.datetime64("NaT") objects (GH39462)
• Bug in constructing `Timedelta` from an input string with only symbols and no digits failed to raise an error (GH39710)
• Bug in `TimedeltaIndex` and `to_timedelta()` failing to raise when passed non-nanosecond timedelta64 arrays that overflow when converting to timedelta64[ns] (GH40008)

**Timezones**

• Bug in different tzinfo objects representing UTC not being treated as equivalent (GH39216)
• Bug in dateutil.tz.gettz("UTC") not being recognized as equivalent to other UTC-representing tzin-

**Numeric**

• Bug in `DataFrame.quantile()`, `DataFrame.sort_values()` causing incorrect subsequent indexing behavior (GH38351)
• Bug in `DataFrame.sort_values()` raising an IndexError for empty by (GH40258)
• Bug in `DataFrame.select_dtypes()` with include=np.number would drop numeric ExtensionDtype columns (GH35340)
• Bug in `DataFrame.mode()` and `Series.mode()` not keeping consistent integer Index for empty input (GH33321)
• Bug in `DataFrame.rank()` when the DataFrame contained np.inf (GH32593)
Bug in `DataFrame.rank()` with axis=0 and columns holding incomparable types raising an `IndexError` (GH38932)

Bug in `Series.rank()`, `DataFrame.rank()`, and `GroupBy.rank()` treating the most negative `int64` value as missing (GH32859)

Bug in `DataFrame.select_dtypes()` different behavior between Windows and Linux with `include=\"int\"` (GH36596)

Bug in `DataFrame.apply()` and `DataFrame.agg()` when passed the argument func="size" would operate on the entire `DataFrame` instead of rows or columns (GH39934)

Bug in `DataFrame.transform()` would raise a `SpecificationError` when passed a dictionary and columns were missing; will now raise a `KeyError` instead (GH40004)

Bug in `GroupBy.rank()` giving incorrect results with `pct=True` and equal values between consecutive groups (GH40518)

Bug in `Series.count()` would result in an `int32` result on 32-bit platforms when argument `level=None` (GH40908)

Bug in `Series` and `DataFrame` reductions with methods `any` and `all` not returning Boolean results for object data (GH12863, GH35450, GH27709)

Bug in `Series.clip()` would fail if the Series contains NA values and has nullable int or float as a data type (GH40851)

Bug in `UInt64Index.where()` and `UInt64Index.putmask()` with an np.int64 dtype other incorrectly raising `TypeError` (GH41974)

Bug in `DataFrame.agg()` not sorting the aggregated axis in the order of the provided aggregation functions when one or more aggregation function fails to produce results (GH33634)

Bug in `DataFrame.clip()` not interpreting missing values as no threshold (GH40420)

**Conversion**

Bug in `Series.to_dict()` with orient='records' now returns Python native types (GH25969)

Bug in `Series.view()` and `Index.view()` when converting between datetime-like (datetime64[ns], datetime64[ns, tz], timedelta64, period) dtypes (GH39788)

Bug in creating a `DataFrame` from an empty np.recarray not retaining the original dtypes (GH40121)

Bug in `DataFrame` failing to raise a `TypeError` when constructing from a frozenset (GH40163)

Bug in `Index` construction silently ignoring a passed `dtype` when the data cannot be cast to that `dtype` (GH21311)

Bug in `StringArray.astype()` falling back to NumPy and raising when converting to `dtype='categorical'` (GH40450)

Bug in `factorize()` where, when given an array with a numeric NumPy dtype lower than int64, uint64 and float64, the unique values did not keep their original dtype (GH41132)

Bug in `DataFrame` construction with a dictionary containing an array-like with `ExtensionDtype` and `copy=True` failing to make a copy (GH38939)

Bug in `qcut()` raising error when taking `Float64DType` as input (GH40730)

Bug in `DataFrame` and `Series` construction with `datetime64[ns]` data and `dtype=object` resulting in `datetime` objects instead of `Timestamp` objects (GH41599)
- Bug in DataFrame and Series construction with timedelta64[ns] data and dtype=object resulting in np.timedelta64 objects instead of Timedelta objects (GH41599)
- Bug in DataFrame construction when given a two-dimensional object-dtype np.ndarray of Period or Interval objects failing to cast to PeriodDtype or IntervalDtype, respectively (GH41812)
- Bug in constructing a Series from a list and a PandasDtype (GH39357)
- Bug in creating a Series from a range object that does not fit in the bounds of int64 dtype (GH30173)
- Bug in creating a Series from a dict with all-tuple keys and an Index that requires reindexing (GH41707)
- Bug in infer_dtype() not recognizing Series, Index, or array with a Period dtype (GH23553)
- Bug in infer_dtype() raising an error for general ExtensionArray objects. It will now return "unknown-array" instead of raising (GH37367)
- Bug in DataFrame.convert_dtypes() incorrectly raised a ValueError when called on an empty DataFrame (GH40393)

**Strings**

- Bug in the conversion from pyarrow.ChunkedArray to StringArray when the original had zero chunks (GH41040)
- Bug in Series.replace() and DataFrame.replace() ignoring replacements with regex=True for StringDtype data (GH41333, GH35977)
- Bug in Series.str.extract() with StringArray returning object dtype for an empty DataFrame (GH41441)
- Bug in Series.str.replace() where the case argument was ignored when regex=False (GH41602)

**Interval**

- Bug in IntervalIndex.intersection() and IntervalIndex.symmetric_difference() always returning object-dtype when operating with CategoricalIndex (GH38653, GH38741)
- Bug in IntervalIndex.intersection() returning duplicates when at least one of the Index objects have duplicates which are present in the other (GH38743)
- IntervalIndex.union(), IntervalIndex.intersection(), IntervalIndex.difference(), and IntervalIndex.symmetric_difference() now cast to the appropriate dtype instead of raising a TypeError when operating with another IntervalIndex with incompatible dtype (GH39267)
- PeriodIndex.union(), PeriodIndex.intersection(), PeriodIndex.symmetric_difference(), PeriodIndex.difference() now cast to object dtype instead of raising IncompatibleFrequency when operating with another PeriodIndex with incompatible dtype (GH39306)
- Bug in IntervalIndex.is_monotonic(), IntervalIndex.get_loc(), IntervalIndex.get_indexer_for(), and IntervalIndex.__contains__() when NA values are present (GH41831)
Indexing

- Bug in `Index.union()` and `MultiIndex.union()` dropping duplicate Index values when Index was not monotonic or sort was set to False (GH36289, GH31326, GH40862)
- Bug in `CategoricalIndex.get_indexer()` failing to raise `InvalidIndexError` when non-unique (GH38372)
- Bug in `IntervalIndex.get_indexer()` when target has `CategoricalDtype` and both the index and the target contain NA values (GH41934)
- Bug in `Series.loc()` raising a `ValueError` when input was filtered with a Boolean list and values to set were a list with lower dimension (GH20438)
- Bug in inserting many new columns into a `DataFrame` causing incorrect subsequent indexing behavior (GH38380)
- Bug in `DataFrame.__setitem__()` raising a `ValueError` when setting multiple values to duplicate columns (GH15695)
- Bug in `DataFrame.loc()`, `Series.loc()`, `DataFrame.__getitem__()` and `Series.__getitem__()` returning incorrect elements for non-monotonic `DatetimeIndex` for string slices (GH33146)
- Bug in `DataFrame.reindex()` and `Series.reindex()` with timezone aware indexes raising a `TypeError` for `method="ffill"` and `method="bfill"` and specified tolerance (GH38566)
- Bug in `DataFrame.reindex()` with `datetime64[ns]` or `timedelta64[ns]` incorrectly casting to integers when the `fill_value` requires casting to object dtype (GH39755)
- Bug in `DataFrame.__setitem__()` raising a `ValueError` when setting on an empty `DataFrame` using specified columns and a non-empty `DataFrame` value (GH38831)
- Bug in `DataFrame.loc.__setitem__()` raising a `ValueError` when operating on a unique column when the `DataFrame` has duplicate columns (GH38521)
- Bug in `DataFrame.iloc.__setitem__()` and `DataFrame.loc.__setitem__()` with mixed dtypes when setting with a dictionary value (GH38335)
- Bug in `Series.loc.__setitem__()` and `DataFrame.loc.__setitem__()` raising `KeyError` when provided a Boolean generator (GH39614)
- Bug in `Series.iloc()` and `DataFrame.iloc()` raising a `KeyError` when provided a generator (GH39614)
- Bug in `DataFrame.__setitem__()` not raising a `ValueError` when the right hand side is a `DataFrame` with wrong number of columns (GH38604)
- Bug in `Series.__setitem__()` raising a `ValueError` when setting a `Series` with a scalar indexer (GH38303)
- Bug in `DataFrame.loc()` dropping levels of a `MultiIndex` when the `DataFrame` used as input has only one row (GH10521)
- Bug in `DataFrame.__getitem__()` and `Series.__getitem__()` always raising `KeyError` when slicing with existing strings where the `Index` has milliseconds (GH33589)
- Bug in setting `timedelta64` or `datetime64` values into numeric `Series` failing to cast to object dtype (GH39086, GH39619)
- Bug in setting `Interval` values into a `Series` or `DataFrame` with mismatched `IntervalDtype` incorrectly casting the new values to the existing dtype (GH39120)
• Bug in setting `datetime64` values into a `Series` with integer-dtype incorrectly casting the `datetime64` values to integers (GH39266)

• Bug in setting `np.datetime64("NaT")` into a `Series` with `Datet ime64TZDtype` incorrectly treating the timezone-naive value as timezone-aware (GH39769)

• Bug in `Index.get_loc()` not raising `KeyError` when `key=NaN` and `method` is specified but `NaN` is not in the `Index` (GH39382)

• Bug in `DatetimeIndex.insert()` when inserting `np.datetime64("NaT")` into a timezone-aware index incorrectly treating the timezone-naive value as timezone-aware (GH39769)

• Bug in incorrectly raising in `Index.insert()`, when setting a new column that cannot be held in the existing frame.columns, or in `Series.reset_index()` or `DataFrame.reset_index()` instead of casting to a compatible dtype (GH39068)

• Bug in `RangeIndex.append()` where a single object of length 1 was concatenated incorrectly (GH39401)

• Bug in `RangeIndex.astype()` where when converting to `CategoricalIndex`, the categories became a `Int64Index` instead of a `RangeIndex` (GH41263)

• Bug in setting `numpy.timedelta64` values into an object-dtype `Series` using a Boolean indexer (GH39488)

• Bug in setting numeric values into a into a boolean-dtypes `Series` using `at` or `iat` failing to cast to object-dtype (GH39582)

• Bug in `DataFrame.__setitem__()` and `DataFrame.iloc.__setitem__()` raising `ValueError` when trying to index with a row-slice and setting a list as values (GH40440)

• Bug in `DataFrame.loc()` not raising `KeyError` when the key was not found in `MultiIndex` and the levels were not fully specified (GH41170)

• Bug in `DataFrame.loc.__setitem__()` when setting-with-expansion incorrectly raising when the index in the expanding axis contained duplicates (GH40096)

• Bug in `DataFrame.loc.__getitem__()` with `MultiIndex` casting to float when at least one index column has float dtype and we retrieve a scalar (GH41369)

• Bug in `DataFrame.loc()` incorrectly matching non-Boolean index elements (GH20432)

• Bug in indexing with `np.nan` on a `Series` or `DataFrame` with a `CategoricalIndex` incorrectly raising `KeyError` when `np.nan` keys are present (GH41933)

• Bug in `Series.__delitem__()` with `ExtensionDtype` incorrectly casting to `ndarray` (GH40386)

• Bug in `DataFrame.at()` with a `CategoricalIndex` returning incorrect results when passed integer keys (GH41846)

• Bug in `DataFrame.loc()` returning a `MultiIndex` in the wrong order if an indexer has duplicates (GH40978)

• Bug in `DataFrame.__setitem__()` raising a `TypeError` when using a `str` subclass as the column name with a `DatetimeIndex` (GH37366)

• Bug in `PeriodIndex.get_loc()` failing to raise a `KeyError` when given a `Period` with a mismatched freq (GH41670)

• Bug `.loc.__getitem__` with a `UInt64Index` and negative-integer keys raising `OverflowError` instead of `KeyError` in some cases, wrapping around to positive integers in others (GH41777)

• Bug in `Index.get_indexer()` failing to raise `ValueError` in some cases with invalid `method`, `limit`, or `tolerance` arguments (GH41918)
• Bug when slicing a *Series* or *DataFrame* with a *TimedeltaIndex* when passing an invalid string raising `ValueError` instead of a `TypeError` (GH41821)

• Bug in *Index* constructor sometimes silently ignoring a specified `dtype` (GH38879)

  *Index.where()* behavior now mirrors *Index.putmask()* behavior, i.e. `index.where(mask, other)` matches `index.putmask(~mask, other)` (GH39412)

**Missing**

• Bug in *Grouper* did not correctly propagate the `dropna` argument; *DataFrameGroupBy.transform()* now correctly handles missing values for `dropna=True` (GH35612)

• Bug in *isna*, *Series.isna*, *Index.isna*, *DataFrame.isna*, and the corresponding *notna* functions not recognizing `Decimal("NaN")` objects (GH39409)

• Bug in *DataFrame.fillna()* not accepting a dictionary for the `downcast` keyword (GH40809)

• Bug in *isna()* not returning a copy of the mask for nullable types, causing any subsequent mask modification to change the original array (GH40935)

• Bug in *DataFrame* construction with float data containing NaN and an integer `dtype` casting instead of retaining the NaN (GH26919)

• Bug in *Series.isin()* and *MultiIndex.isin()* didn’t treat all nans as equivalent if they were in tuples (GH41836)

**MultiIndex**

• Bug in *DataFrame.drop()* raising a `TypeError` when the *MultiIndex* is non-unique and level is not provided (GH36293)

• Bug in *MultiIndex.intersection()* duplicating NaN in the result (GH38623)

• Bug in *MultiIndex.equals()* incorrectly returning `True` when the *MultiIndex* contained NaN even when they are differently ordered (GH38439)

• Bug in *MultiIndex.intersection()* always returning an empty result when intersecting with *CategoricalIndex* (GH38653)

• Bug in *MultiIndex.difference()* incorrectly raising `TypeError` when indexes contain non-sortable entries (GH41915)

• Bug in *MultiIndex.reindex()* raising a `ValueError` when used on an empty *MultiIndex* and indexing only a specific level (GH41170)

• Bug in *MultiIndex.reindex()* raising `TypeError` when reindexing against a flat *Index* (GH41707)
I/O

- Bug in `Index.__repr__()` when `display.max_seq_items=1` (GH38415)
- Bug in `read_csv()` not recognizing scientific notation if the argument `decimal` is set and `engine="python"` (GH31920)
- Bug in `read_csv()` interpreting NA value as comment, when NA does contain the comment string fixed for `engine="python"` (GH34002)
- Bug in `read_csv()` raising an `IndexError` with multiple header columns and `index_col` is specified when the file has no data rows (GH38292)
- Bug in `read_csv()` not accepting `usecols` with a different length than `names` for `engine="python"` (GH16469)
- Bug in `read_csv()` returning object dtype when `delimiter=","` with `usecols` and `parse_dates` specified for `engine="python"` (GH35873)
- Bug in `read_csv()` raising a `TypeError` when `names` and `parse_dates` is specified for `engine="c"` (GH36909)
- Bug in `read_clipboard()` and `DataFrame.to_clipboard()` not working in WSL (GH38527)
- Allow custom error values for the `parse_dates` argument of `read_sql()`, `read_sql_query()` and `read_sql_table()` (GH35185)
- Bug in `DataFrame.to_hdf()` and `Series.to_hdf()` raising a `KeyError` when trying to apply for subclasses of `DataFrame` or `Series` (GH33748)
- Bug in `HDFStore.put()` raising a wrong `TypeError` when saving a DataFrame with non-string dtype (GH34274)
- Bug in `json_normalize()` resulting in the first element of a generator object not being included in the returned DataFrame (GH35923)
- Bug in `read_csv()` applying the thousands separator to date columns when the column should be parsed for dates and `usecols` is specified for `engine="python"` (GH39365)
- Bug in `read_excel()` forward filling `MultiIndex` names when multiple header and index columns are specified (GH34673)
- Bug in `read_excel()` not respecting `set_option()` (GH34252)
- Bug in `read_csv()` not switching `true_values` and `false_values` for nullable Boolean dtype (GH34655)
- Bug in `read_json()` when `orient="split"` not maintaining a numeric string index (GH28556)
- `read_sql()` returned an empty generator if `chunksize` was non-zero and the query returned no results. Now returns a generator with a single empty DataFrame (GH34411)
- Bug in `read_hdf()` returning unexpected records when filtering on categorical string columns using the `where` parameter (GH39189)
- Bug in `read_sas()` raising a `ValueError` when datetimes were null (GH39725)
- Bug in `read_excel()` dropping empty values from single-column spreadsheets (GH39808)
- Bug in `read_excel()` loading trailing empty rows/columns for some filetypes (GH41167)
- Bug in `read_excel()` raising an `AttributeError` when the excel file had a `MultiIndex` header followed by two empty rows and no index (GH40442)
• Bug in `read_excel()`, `read_csv()`, `read_table()`, `read_fwf()`, and `read_clipboard()` where one blank row after a MultiIndex header with no index would be dropped (GH40442)
• Bug in `DataFrame.to_string()` misplacing the truncation column when `index=False` (GH40904)
• Bug in `DataFrame.to_string()` adding an extra dot and misaligning the truncation row when `index=False` (GH40904)
• Bug in `read_orc()` always raising an `AttributeError` (GH40918)
• Bug in `read_csv()` and `read_table()` silently ignoring `prefix` if `names` and `prefix` are defined, now raising a `ValueError` (GH39123)
• Bug in `read_csv()` and `read_excel()` not respecting the dtype for a duplicated column name when `mangle_dupe_cols` is set to True (GH35211)
• Bug in `read_csv()` silently ignoring `sep` if `delimiter` and `sep` are defined, now raising a `ValueError` (GH39823)
• Bug in `read_csv()` and `read_table()` misinterpreting arguments when `sys.setprofile` had been previously called (GH41069)
• Bug in the conversion from PyArrow to pandas (e.g. for reading Parquet) with nullable dtypes and a PyArrow array whose data buffer size is not a multiple of the dtype size (GH40896)
• Bug in `read_excel()` would raise an error when pandas could not determine the file type even though the user specified the `engine` argument (GH41225)
• Bug in `read_clipboard()` copying from an excel file shifts values into the wrong column if there are null values in first column (GH41108)
• Bug in `DataFrame.to_hdf()` and `Series.to_hdf()` raising a `TypeError` when trying to append a string column to an incompatible column (GH41897)

**Period**

• Comparisons of `Period` objects or `Index`, `Series`, or `DataFrame` with mismatched `PeriodDtype` now behave like other mismatched-type comparisons, returning `False` for equals, `True` for not-equal, and raising `TypeError` for inequality checks (GH39274)

**Plotting**

• Bug in `plotting.scatter_matrix()` raising when 2d `ax` argument passed (GH16253)
• Prevent warnings when Matplotlib’s `constrained_layout` is enabled (GH25261)
• Bug in `DataFrame.plot()` was showing the wrong colors in the legend if the function was called repeatedly and some calls used `yerr` while others didn’t (GH39522)
• Bug in `DataFrame.plot()` was showing the wrong colors in the legend if the function was called repeatedly and some calls used `secondary_y` and others use `legend=False` (GH40044)
• Bug in `DataFrame.plot.box()` when `dark_background` theme was selected, caps or min/max markers for the plot were not visible (GH40769)
Groupby/resample/rolling

- Bug in GroupBy.agg() with PeriodDtype columns incorrectly casting results too aggressively (GH38254)
- Bug in SeriesGroupBy.value_counts() where unobserved categories in a grouped categorical Series were not tallied (GH38672)
- Bug in SeriesGroupBy.value_counts() where an error was raised on an empty Series (GH39172)
- Bug in GroupBy.indices() would contain non-existent indices when null values were present in the groupby keys (GH9304)
- Fixed bug in GroupBy.sum() causing a loss of precision by now using Kahan summation (GH38778)
- Fixed bug in GroupBy.cumsum() and GroupBy.mean() causing loss of precision through using Kahan summation (GH38934)
- Bug in Resampler.aggregate() and DataFrame.transform() raising a TypeError instead of SpecificationError when missing keys had mixed dtypes (GH39025)
- Bug in DataFrameGroupBy.idxmin() and DataFrameGroupBy.idxmax() with ExtensionDtype columns (GH38733)
- Bug in Series.resample() would raise when the index was a PeriodIndex consisting of NaT (GH39227)
- Bug in RollingGroupby.corr() and ExpandingGroupby.corr() where the groupby column would return 0 instead of np.nan when providing other that was longer than each group (GH39591)
- Bug in ExpandingGroupby.corr() and ExpandingGroupby.cov() where 1 would be returned instead of np.nan when providing other that was longer than each group (GH39591)
- Bug in GroupBy.mean(), GroupBy.median() and DataFrame.pivot_table() not propagating metadata (GH28283)
- Bug in Series.rolling() and DataFrame.rolling() not calculating window bounds correctly when window is an offset and dates are in descending order (GH40002)
- Bug in Series.groupby() and DataFrame.groupby() on an empty Series or DataFrame would lose index, columns, and/or data types when directly using the methods idxmax, idxmin, mad, min, max, sum, prod, and skew or using them through apply, aggregate, or resample (GH26411)
- Bug in GroupBy.apply() where a MultiIndex would be created instead of an Index when used on a GroupBy object (GH39732)
- Bug in DataFrameGroupBy.sample() where an error was raised when weights was specified and the index was an Int64Index (GH39927)
- Bug in DataFrameGroupBy.aggregate() and Resampler.aggregate() would sometimes raise a SpecificationError when passed a dictionary and columns were missing; will now always raise a KeyError instead (GH40004)
- Bug in DataFrameGroupBy.sample() where column selection was not applied before computing the result (GH39928)
- Bug in ExponentialMovingWindow when calling __getitem__ would incorrectly raise a ValueError when providing times (GH40164)
- Bug in ExponentialMovingWindow when calling __getitem__ would not retain com, span, alpha or halflife attributes (GH40164)
- ExponentialMovingWindow now raises a NotImplementedException when specifying times with adjust=False due to an incorrect calculation (GH40098)
• Bug in `ExponentialMovingWindowGroupby.mean()` where the times argument was ignored when engine='numba' (GH40951)

• Bug in `ExponentialMovingWindowGroupby.mean()` where the wrong times were used the in case of multiple groups (GH40951)

• Bug in `ExponentialMovingWindowGroupby` where the times vector and values became out of sync for non-trivial groups (GH40951)

• Bug in `Series.asfreq()` and `DataFrame.asfreq()` dropping rows when the index was not sorted (GH39805)

• Bug in aggregation functions for `DataFrame` not respecting numeric_only argument when level keyword was given (GH40660)

• Bug in `SeriesGroupBy.aggregate()` where using a user-defined function to aggregate a Series with an object-typed Index causes an incorrect Index shape (GH40014)

• Bug in `RollingGroupby` where as_index=False argument in groupby was ignored (GH39433)

• Bug in `GroupBy.any()` and `GroupBy.all()` raising a ValueError when using with nullable type columns holding NA even with skipna=True (GH40585)

• Bug in `GroupBy.cummin()` and `GroupBy.cummax()` incorrectly rounding integer values near the int64 implementations bounds (GH40767)

• Bug in `GroupBy.rank()` with nullable dtypes incorrectly raising a TypeError (GH41010)

• Bug in `GroupBy.cummin()` and `GroupBy.cummax()` computing wrong result with nullable data types too large to roundtrip when casting to float (GH37493)

• Bug in `DataFrame.rolling()` returning mean zero for all NaN window with min_periods=0 if calculation is not numerical stable (GH41053)

• Bug in `DataFrame.rolling()` returning sum not zero for all NaN window with min_periods=0 if calculation is not numerical stable (GH41053)

• Bug in `SeriesGroupBy.agg()` failing to retain ordered CategoricalDtype on order-preserving aggregations (GH41147)

• Bug in `GroupBy.min()` and `GroupBy.max()` with multiple object-dtype columns and numeric_only=False incorrectly raising a ValueError (GH41111)

• Bug in `DataFrameGroupBy.rank()` with the GroupBy object’s axis=0 and the rank method’s keyword axis=1 (GH41320)

• Bug in `DataFrameGroupBy.__getitem__()` with non-unique columns incorrectly returning a malformed SeriesGroupBy instead of DataFrameGroupBy (GH41427)

• Bug in `DataFrameGroupBy.transform()` with non-unique columns incorrectly raising an AttributeError (GH41427)

• Bug in `Resampler.apply()` with non-unique columns incorrectly dropping duplicated columns (GH41445)

• Bug in `Series.groupby()` aggregations incorrectly returning empty Series instead of raising TypeError on aggregations that are invalid for its dtype, e.g. .prod with datetime64[ns] dtype (GH41342)

• Bug in `DataFrameGroupBy aggregations incorrectly failing to drop columns with invalid dtypes for that aggregation when there are no valid columns (GH41291)

• Bug in `DataFrame.rolling.__iter__()` where on was not assigned to the index of the resulting objects (GH40373)
• Bug in DataFrameGroupBy.transform() and DataFrameGroupBy.agg() with engine="numba" where *args were being cached with the user passed function (GH41647)
• Bug in DataFrameGroupBy methods agg, transform, sum, bfill, ffill, pad, pct_change, shift, ohlc dropping .columns.names (GH41947)

Reshaping

• Bug in merge() raising error when performing an inner join with partial index and right_index=True when there was no overlap between indices (GH33814)
• Bug in DataFrame.unstack() with missing levels led to incorrect index names (GH37510)
• Bug in merge_asof() propagating the Right Index with left_index=True and right_on specification instead of left Index (GH35363)
• Bug in DataFrame.join() on a DataFrame with a MultiIndex returned the wrong result when one of both indexes had only one level (GH36909)
• merge_asof() now raises a ValueError instead of a cryptic TypeError in case of non-numerical merge columns (GH29130)
• Bug in DataFrame.join() not assigning values correctly when the DataFrame had a MultiIndex where at least one dimension had dtype Categorical with non-alphabetically sorted categories (GH38502)
• Series.value_counts() and Series.mode() now return consistent keys in original order (GH12679, GH11227 and GH39007)
• Bug in DataFrame.stack() not handling NaN in MultiIndex columns correctly (GH39481)
• Bug in DataFrame.apply() would give incorrect results when the argument func was a string, axis=1, and the axis argument was not supported; now raises a ValueError instead (GH39211)
• Bug in DataFrame.sort_values() not reshaping the index correctly after sorting on columns when ignore_index=True (GH39464)
• Bug in DataFrame.append() returning incorrect dtypes with combinations of ExtensionDtype dtypes (GH39454)
• Bug in DataFrame.append() returning incorrect dtypes when used with combinations of datetime64 and timedelta64 dtypes (GH39574)
• Bug in DataFrame.append() with a DataFrame with a MultiIndex and appending a Series whose Index is not a MultiIndex (GH41707)
• Bug in DataFrame.pivot_table() returning a MultiIndex for a single value when operating on an empty DataFrame (GH13483)
• Index can now be passed to the numpy.all() function (GH40180)
• Bug in DataFrame.stack() not preserving CategoricalDtype in a MultiIndex (GH36991)
• Bug in to_datetime() raising an error when the input sequence contained unhashable items (GH39756)
• Bug in Series.explode() preserving the index when ignore_index was True and values were scalars (GH40487)
• Bug in to_datetime() raising a ValueError when Series contains None and NaT and has more than 50 elements (GH39882)
• Bug in Series.unstack() and DataFrame.unstack() with object-dtype values containing timezone-aware datetime objects incorrectly raising TypeError (GH41875)
pandas: powerful Python data analysis toolkit, Release 1.3.1

• Bug in `DataFrame.melt()` raising `InvalidIndexError` when `DataFrame` has duplicate columns used as `value_vars` (GH41951)

Sparse

• Bug in `DataFrame.sparse.to_coo()` raising a `KeyError` with columns that are a numeric `Index` without a 0 (GH18414)
• Bug in `SparseArray.astype()` with `copy=False` producing incorrect results when going from integer dtype to floating dtype (GH34456)
• Bug in `SparseArray.max()` and `SparseArray.min()` would always return an empty result (GH40921)

ExtensionArray

• Bug in `DataFrame.where()` when other is a Series with an `ExtensionDtype` (GH38729)
• Fixed bug where `Series.idxmax()`, `Series.idxmin()`, `Series.argmax()`, and `Series.argmin()` would fail when the underlying data is an `ExtensionArray` (GH32749, GH33719, GH36566)
• Fixed bug where some properties of subclasses of `PandasExtensionDtype` where improperly cached (GH40329)
• Bug in `DataFrame.mask()` where masking a DataFrame with an `ExtensionDtype` raises a `ValueError` (GH40941)

Styler

• Bug in `Styler` where the `subset` argument in methods raised an error for some valid MultiIndex slices (GH33562)
• `Styler` rendered HTML output has seen minor alterations to support w3 good code standards (GH39626)
• Bug in `Styler` where rendered HTML was missing a column class identifier for certain header cells (GH39716)
• Bug in `Styler.background_gradient()` where text-color was not determined correctly (GH39888)
• Bug in `Styler.set_table_styles()` where multiple elements in CSS-selectors of the `table_styles` argument were not correctly added (GH34061)
• Bug in `Styler` where copying from Jupyter dropped the top left cell and misaligned headers (GH12147)
• Bug in `Styler.where` where `kwargs` were not passed to the applicable callable (GH40845)
• Bug in `Styler` causing CSS to duplicate on multiple renders (GH39395, GH40334)
Other

- `inspect.getmembers(Series)` no longer raises an `AbstractMethodError` (GH38782)
- Bug in `Series.where()` with numeric dtype and `other=None` not casting to nan (GH39761)
- Bug in `assert_series_equal()`, `assert_frame_equal()`, `assert_index_equal()` and `assert_extension_array_equal()` incorrectly raising when an attribute has an unrecognized NA type (GH39461)
- Bug in `assert_index_equal()` with `exact=True` not raising when comparing `CategoricalIndex` instances with `Int64Index` and `RangeIndex` categories (GH41263)
- Bug in `DataFrame.equals()`, `Series.equals()`, and `Index.equals()` with object-dtype containing `np.datetime64("NaT")` or `np.timedelta64("NaT")` (GH39650)
- Bug in `show_versions()` where console JSON output was not proper JSON (GH39701)
- pandas can now compile on z/OS when using xlc (GH35826)
- Bug in `pandas.util.hash_pandas_object()` not recognizing `hash_key`, `encoding` and `categorize` when the input object type is a `DataFrame` (GH41404)

5.2 Version 1.2

5.2.1 What’s new in 1.2.5 (June 22, 2021)

These are the changes in pandas 1.2.5. See Release notes for a full changelog including other versions of pandas.

Fixed regressions

• Fixed regression in concat() between two DataFrame where one has an Index that is all-None and the other is DatetimeIndex incorrectly raising (GH40841)
• Fixed regression in DataFrame.sum() and DataFrame.prod() when min_count and numeric_only are both given (GH41074)
• Fixed regression in read_csv() when using memory_map=True with a non-UTF8 encoding (GH40986)
• Fixed regression in DataFrame.replace() and Series.replace() when the values to replace is a NumPy float array (GH40371)
• Fixed regression in ExcelFile() when a corrupt file is opened but not closed (GH41778)
• Fixed regression in DataFrame.astype() with dtype=str failing to convert NaN in categorical columns (GH41797)

5.2.2 What's new in 1.2.4 (April 12, 2021)

These are the changes in pandas 1.2.4. See Release notes for a full changelog including other versions of pandas.

Fixed regressions

- Fixed regression in DataFrame.sum() when min_count greater than the DataFrame shape was passed resulted in a ValueError (GH39738)
- Fixed regression in DataFrame.to_json() raising AttributeError when run on PyPy (GH39837)
- Fixed regression in (in)equality comparison of pd.NaT with a non-datetimelike numpy array returning a scalar instead of an array (GH40722)
- Fixed regression in DataFrame.where() not returning a copy in the case of an all True condition (GH39595)
- Fixed regression in DataFrame.replace() raising IndexError when regex was a multi-key dictionary (GH39338)
- Fixed regression in repr of floats in an object column not respecting float_format when printed in the console or outputted through DataFrame.to_string(), DataFrame.to_html(), and DataFrame.to_latex() (GH40024)
- Fixed regression in NumPy ufuncs such as np.add not passing through all arguments for DataFrame (GH40662)
Contributors

A total of 9 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

5.2.3 What’s new in 1.2.3 (March 02, 2021)

These are the changes in pandas 1.2.3. See Release notes for a full changelog including other versions of pandas.

Fixed regressions

• Fixed regression in `to_excel()` raising `KeyError` when giving duplicate columns with `columns` attribute (GH39695)
• Fixed regression in nullable integer unary ops propagating mask on assignment (GH39943)
• Fixed regression in `DataFrame.__setitem__()` not aligning `DataFrame` on right-hand side for boolean indexer (GH39931)
• Fixed regression in `to_json()` failing to use `compression` with URL-like paths that are internally opened in binary mode or with user-provided file objects that are opened in binary mode (GH39985)
• Fixed regression in `Series.sort_index()` and `DataFrame.sort_index()`, which exited with an ungraceful error when having kwarg `ascending=None` passed. Passing `ascending=None` is still considered invalid, and the improved error message suggests a proper usage (`ascending` must be a boolean or a list-like of boolean) (GH39434)
• Fixed regression in `DataFrame.transform()` and `Series.transform()` giving incorrect column labels when passed a dictionary with a mix of list and non-list values (GH40018)

Contributors

A total of 14 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

5.2.4 What's new in 1.2.2 (February 09, 2021)

These are the changes in pandas 1.2.2. See Release notes for a full changelog including other versions of pandas.

**Fixed regressions**

- Fixed regression in `read_excel()` that caused it to raise `AttributeError` when checking version of older `xlrd` versions (GH38955)
- Fixed regression in `DataFrame` constructor reordering element when construction from datetime ndarray with dtype not "datetime64[ns]" (GH39422)
- Fixed regression in `DataFrame.astype()` and `Series.astype()` not casting to bytes dtype (GH39474)
- Fixed regression in `to_pickle()` failing to create bz2/xz compressed pickle files with protocol=5 (GH39002)
- Fixed regression in `pandas.testing.assert_series_equal()` and `pandas.testing.assert_frame_equal()` always raising `AssertionError` when comparing extension dtypes (GH39410)
- Fixed regression in `to_csv()` opening `codecs.StreamWriter` in binary mode instead of in text mode and ignoring user-provided mode (GH39247)
- Fixed regression in `Categorical.astype()` casting to incorrect dtype when `np.int32` is passed to dtype argument (GH39402)
- Fixed regression in `to_excel()` creating corrupt files when appending (mode="a") to an existing file (GH39576)
- Fixed regression in `DataFrame.transform()` failing in case of an empty `DataFrame` or `Series` (GH39636)
- Fixed regression in `groupby()` or `resample()` when aggregating an all-NaN or numeric object dtype column (GH39329)
- Fixed regression in `Rolling.count()` where the `min_periods` argument would be set to 0 after the operation (GH39554)
- Fixed regression in `read_excel()` that incorrectly raised when the argument `io` was a non-path and non-buffer and the `engine` argument was specified (GH39528)
Bug fixes

- `pandas.read_excel()` error message when a specified `sheetname` does not exist is now uniform across engines (GH39250)
- Fixed bug in `pandas.read_excel()` producing incorrect results when the engine `openpyxl` is used and the excel file is missing or has incorrect dimension information; the fix requires `openpyxl` >= 3.0.0, prior versions may still fail (GH38956, GH39001)
- Fixed bug in `pandas.read_excel()` sometimes producing a DataFrame with trailing rows of `np.nan` when the engine `openpyxl` is used (GH39181)

5.2.5 What’s new in 1.2.1 (January 20, 2021)

These are the changes in pandas 1.2.1. See Release notes for a full changelog including other versions of pandas.

Fixed regressions

- Fixed regression in `to_csv()` that created corrupted zip files when there were more rows than `chunksize` (GH38714)
- Fixed regression in `to_csv()` opening `codecs.StreamReaderWriter` in binary mode instead of in text mode (GH39247)
- Fixed regression in `read_csv()` and other read functions were the encoding error policy `errors` did not default to "replace" when no encoding was specified (GH38989)
- Fixed regression in `read_excel()` with non-rawbyte file handles (GH38788)
• Fixed regression in `DataFrame.to_stata()` not removing the created file when an error occurred (GH39202)
• Fixed regression in DataFrame.\_setitem\_ raising ValueError when expanding DataFrame and new column is from type "0 - name" (GH39010)
• Fixed regression in setting with `DataFrame.loc()` raising ValueError when DataFrame has unsorted MultiIndex columns and indexer is a scalar (GH38601)
• Fixed regression in setting with `DataFrame.loc()` raising KeyError with MultiIndex and list-like columns indexer enlarging DataFrame (GH39147)
• Fixed regression in `groupby()` with Categorical grouping column not showing unused categories for grouped.indices (GH38642)
• Fixed regression in `GroupBy.sem()` where the presence of non-numeric columns would cause an error instead of being dropped (GH38774)
• Fixed regression in `DataFrameGroupBy.diff()` raising for int8 and int16 columns (GH39050)
• Fixed regression in `DataFrame.groupby()` when aggregating an ExtensionDType that could fail for non-numeric values (GH38980)
• Fixed regression in `Rolling.skew()` and `Rolling.kurt()` modifying the object inplace (GH38908)
• Fixed regression in `DataFrame.any()` and `DataFrame.all()` not returning a result for tz-aware datetime64 columns (GH38723)
• Fixed regression in `DataFrame.apply()` with axis=1 using str accessor in apply function (GH38979)
• Fixed regression in `DataFrame.replace()` raising ValueError when DataFrame has dtype bytes (GH38900)
• Fixed regression in `Series.fillna()` that raised RecursionError with datetime64[ns, UTC] dtype (GH38851)
• Fixed regression in comparisons between NaT and datetime.date objects incorrectly returning True (GH39151)
• Fixed regression in calling NumPy accumulate() ufuncs on DataFrames, e.g. np.maximum.accumulate(df) (GH39259)
• Fixed regression in repr of float-like strings of an object dtype having trailing 0's truncated after the decimal (GH38708)
• Fixed regression that raised AttributeError with PyArrow versions [0.16.0, 1.0.0) (GH38801)
• Fixed regression in pandas.testing.assert_frame_equal() raising TypeError with check_like=True when Index or columns have mixed dtype (GH39168)

We have reverted a commit that resulted in several plotting related regressions in pandas 1.2.0 (GH38969, GH38736, GH38865, GH38947 and GH39126). As a result, bugs reported as fixed in pandas 1.2.0 related to inconsistent tick labeling in bar plots are again present (GH26186 and GH11465)
Calling NumPy ufuncs on non-aligned DataFrames

Before pandas 1.2.0, calling a NumPy ufunc on non-aligned DataFrames (or DataFrame / Series combination) would ignore the indices, only match the inputs by shape, and use the index/columns of the first DataFrame for the result:

```
In [1]: df1 = pd.DataFrame({"a": [1, 2], "b": [3, 4]}, index=[0, 1])
In [2]: df2 = pd.DataFrame({"a": [1, 2], "b": [3, 4]}, index=[1, 2])
In [3]: df1
Out[3]:
   a  b
0  1  3
1  2  4
In [4]: df2
Out[4]:
   a  b
0  1  3
1  2  4
In [5]: np.add(df1, df2)
Out[5]:
   a  b
0  2  6
1  4  8
```

This contrasts with how other pandas operations work, which first align the inputs:

```
In [6]: df1 + df2
Out[6]:
   a  b
0  NaN NaN
1  3.0  7.0
2  NaN NaN
```

In pandas 1.2.0, we refactored how NumPy ufuncs are called on DataFrames, and this started to align the inputs first (GH39184), as happens in other pandas operations and as it happens for ufuncs called on Series objects.

For pandas 1.2.1, we restored the previous behaviour to avoid a breaking change, but the above example of `np.add(df1, df2)` with non-aligned inputs will now raise a warning, and a future pandas 2.0 release will start aligning the inputs first (GH39184). Calling a NumPy ufunc on Series objects (eg `np.add(s1, s2)`) already aligns and continues to do so.

To avoid the warning and keep the current behaviour of ignoring the indices, convert one of the arguments to a NumPy array:

```
In [7]: np.add(df1, np.asarray(df2))
Out[7]:
   a  b
0  2  6
1  4  8
```

To obtain the future behaviour and silence the warning, you can align manually before passing the arguments to the ufunc:

```
In [8]: df1, df2 = df1.align(df2)
In [9]: np.add(df1, df2)
Out[9]:
   a  b
0  NaN NaN
```
Bug fixes

- Bug in `read_csv()` with `float_precision="high"` caused segfault or wrong parsing of long exponent strings. This resulted in a regression in some cases as the default for `float_precision` was changed in pandas 1.2.0 (GH38753)
- Bug in `read_csv()` not closing an opened file handle when a `csv.Error` or `UnicodeDecodeError` occurred while initializing (GH39024)
- Bug in `pandas.testing.assert_index_equal()` raising `TypeError` with `check_order=False` when `Index` has mixed dtype (GH39168)

Other

- The deprecated attributes `_AXIS_NAMES` and `_AXIS_NUMBERS` of `DataFrame` and `Series` will no longer show up in `dir` or `inspect.getmembers` calls (GH38740)
- Bumped minimum fastparquet version to 0.4.0 to avoid `AttributeError` from numba (GH38344)
- Bumped minimum pymysql version to 0.8.1 to avoid test failures (GH38344)
- Fixed build failure on MacOS 11 in Python 3.9.1 (GH38766)
- Added reference to backwards incompatible `check_freq` arg of `testing.assert_frame_equal()` and `testing.assert_series_equal()` in pandas 1.1.0 what's new (GH34050)

5.2.6 What’s new in 1.2.0 (December 26, 2020)

These are the changes in pandas 1.2.0. See Release notes for a full changelog including other versions of pandas.

Warning: The xlwt package for writing old-style .xls excel files is no longer maintained. The xlrq package is now only for reading old-style .xls files.

Previously, the default argument engine=None to read_excel() would result in using the xlrq engine in many cases, including new Excel 2007+ (.xlsx) files. If openpyxl is installed, many of these cases will now default to using the openpyxl engine. See the read_excel() documentation for more details.

Thus, it is strongly encouraged to install openpyxl to read Excel 2007+ (.xlsx) files. Please do not report issues when using `xlrq` to read `.xlsx` files. This is no longer supported, switch to using openpyxl instead.

Attempting to use the xlwt engine will raise a FutureWarning unless the option io.excel.xls.writer is set to "xlwt". While this option is now deprecated and will also raise a FutureWarning, it can be globally set and the warning suppressed. Users are recommended to write .xlsx files using the openpyxl engine instead.

Enhancements

Optionally disallow duplicate labels

Series and DataFrame can now be created with allows_duplicate_labels=False flag to control whether the index or columns can contain duplicate labels (GH28394). This can be used to prevent accidental introduction of duplicate labels, which can affect downstream operations.

By default, duplicates continue to be allowed.

```python
In [1]: pd.Series([1, 2], index=['a', 'a'])
Out[1]:
da  1
da  2
Length: 2, dtype: int64

In [2]: pd.Series([1, 2], index=['a', 'a']).set_flags(allows_duplicate_labels=False)
...:
DuplicateLabelError: Index has duplicates.
  positions
label
a    [0, 1]
```

pandas will propagate the allows_duplicate_labels property through many operations.
In [3]: a =
    ...:     pd.Series([1, 2], index=['a', 'b'])
    ...:     .set_flags(allow_duplicates=False)
    ...: 
In [4]: a
Out[4]:
a  1  
b  2  
Length: 2, dtype: int64

# An operation introducing duplicates
In [5]: a.reindex(['a', 'b', 'a'])
...: DuplicateLabelError: Index has duplicates.
   positions
   label
   a    [0, 2]
[1 rows x 1 columns]

**Warning:** This is an experimental feature. Currently, many methods fail to propagate the allows_duplicate_labels value. In future versions it is expected that every method taking or returning one or more DataFrame or Series objects will propagate allows_duplicate_labels.

See [Duplicate Labels](#) for more.

The allows_duplicate_labels flag is stored in the new `DataFrame.flags` attribute. This stores global attributes that apply to the `pandas object`. This differs from `DataFrame.attrs`, which stores information that applies to the dataset.

### Passing arguments to fsspec backends

Many read/write functions have acquired the storage_options optional argument, to pass a dictionary of parameters to the storage backend. This allows, for example, for passing credentials to S3 and GCS storage. The details of what parameters can be passed to which backends can be found in the documentation of the individual storage backends (detailed from the fsspec docs for builtin implementations and linked to external ones). See Section [Reading/writing remote files](#).

GH35655 added fsspec support (including storage_options) for reading excel files.

### Support for binary file handles in to_csv

to_csv() supports file handles in binary mode (GH19827 and GH35058) with encoding (GH13068 and GH23854) and compression (GH22555). If pandas does not automatically detect whether the file handle is opened in binary or text mode, it is necessary to provide mode="wb".

For example:

In [1]: import io
In [2]: data = pd.DataFrame([0, 1, 2])

(continues on next page)
In [3]: buffer = io.BytesIO()
In [4]: data.to_csv(buffer, encoding="utf-8", compression="gzip")

Support for short caption and table position in to_latex

DataFrame.to_latex() now allows one to specify a floating table position (GH35281) and a short caption (GH36267).

The keyword position has been added to set the position.

In [5]: data = pd.DataFrame({'a': [1, 2], 'b': [3, 4]})
In [6]: table = data.to_latex(position='ht')
In [7]: print(table)
\begin{table}
\centering
\begin{tabular}{lrr}
\toprule
{} & a & b \\
\midrule
0 & 1 & 3 \\
1 & 2 & 4 \\
\bottomrule
\end{tabular}
\end{table}

Usage of the keyword caption has been extended. Besides taking a single string as an argument, one can optionally provide a tuple (full_caption, short_caption) to add a short caption macro.

In [8]: data = pd.DataFrame({'a': [1, 2], 'b': [3, 4]})
In [9]: table = data.to_latex(caption=('the full long caption', 'short caption'))
In [10]: print(table)
\begin{table}
\centering
\caption[short caption]{the full long caption}
\begin{tabular}{lrr}
\toprule
{} & a & b \\
\midrule
0 & 1 & 3 \\
1 & 2 & 4 \\
\bottomrule
\end{tabular}
\end{table}
Change in default floating precision for read_csv and read_table

For the C parsing engine, the methods `read_csv()` and `read_table()` previously defaulted to a parser that could read floating point numbers slightly incorrectly with respect to the last bit in precision. The option `floating_precision="high"` has always been available to avoid this issue. Beginning with this version, the default is now to use the more accurate parser by making `floating_precision=None` correspond to the high precision parser, and the new option `floating_precision="legacy"` to use the legacy parser. The change to using the higher precision parser by default should have no impact on performance. (GH17154)

Experimental nullable data types for float data

We’ve added `Float32Dtype/Float64Dtype` and `FloatingArray`. These are extension data types dedicated to floating point data that can hold the `pd.NA` missing value indicator (GH32265, GH34307).

While the default float data type already supports missing values using `np.nan`, these new data types use `pd.NA` (and its corresponding behavior) as the missing value indicator, in line with the already existing nullable `integer` and `boolean` data types.

One example where the behavior of `np.nan` and `pd.NA` is different is comparison operations:

```python
# the default NumPy float64 dtype
In [11]: s1 = pd.Series([1.5, None])

In [12]: s1
Out[12]:
0   1.5
1   NaN
dtype: float64

In [13]: s1 > 1
Out[13]:
0   True
1  False
dtype: bool

# the new nullable float64 dtype
In [14]: s2 = pd.Series([1.5, None], dtype="Float64")

In [15]: s2
Out[15]:
0   1.5
1   <NA>
dtype: Float64

In [16]: s2 > 1
Out[16]:
0   True
1  False
dtype: boolean
```

See the Experimental NA scalar to denote missing values doc section for more details on the behavior when using the `pd.NA` missing value indicator.

As shown above, the dtype can be specified using the “Float64” or “Float32” string (capitalized to distinguish it from the default “float64” data type). Alternatively, you can also use the dtype object:
Operations with the existing integer or boolean nullable data types that give float results will now also use the nullable floating data types (GH38178).

**Warning:** Experimental: the new floating data types are currently experimental, and their behavior or API may still change without warning. Especially the behavior regarding NaN (distinct from NA missing values) is subject to change.

**Index/column name preservation when aggregating**

When aggregating using `concat()` or the `DataFrame` constructor, pandas will now attempt to preserve index and column names whenever possible (GH35847). In the case where all inputs share a common name, this name will be assigned to the result. When the input names do not all agree, the result will be unnamed. Here is an example where the index name is preserved:

```python
In [18]: idx = pd.Index(range(5), name='abc')
In [19]: ser = pd.Series(range(5, 10), index=idx)
In [20]: pd.concat({'x': ser[1:], 'y': ser[:-1]}, axis=1)
```

```
Out[20]:
   x  y
  abc
     NaN  5.0
     6.0  6.0
     7.0  7.0
     8.0  8.0
     9.0  NaN
```

The same is true for `MultiIndex`, but the logic is applied separately on a level-by-level basis.

**GroupBy supports EWM operations directly**

`DataFrameGroupBy` now supports exponentially weighted window operations directly (GH16037).

```python
In [21]: df = pd.DataFrame({'A': ['a', 'b', 'a', 'b'], 'B': range(4)})
In [22]: df.groupby('A').ewm(com=1.0).mean()
```

(continues on next page)
Additionally, `mean` supports execution via Numba with the `engine` and `engine_kwargs` arguments. Numba must be installed as an optional dependency to use this feature.

**Other enhancements**

- Added `day_of_week` (compatibility alias `dayofweek`) property to `Timestamp`, `DatetimeIndex`, `Period`, `PeriodIndex` (GH9605)
- Added `day_of_year` (compatibility alias `dayofyear`) property to `Timestamp`, `DatetimeIndex`, `Period`, `PeriodIndex` (GH9605)
- Added `set_flags()` for setting table-wide flags on a Series or DataFrame (GH28394)
- `DataFrame.applymap()` now supports `na_action` (GH23803)
- `Index` with object dtype supports division and multiplication (GH34160)
- `io.sql.get_schema()` now supports a schema keyword argument that will add a schema into the create table statement (GH28486)
- `DataFrame.explode()` and `Series.explode()` now support exploding of sets (GH35614)
- `DataFrame.hist()` now supports time series (datetime) data (GH32590)
- `Styler.set_table_styles()` now allows the direct styling of rows and columns and can be chained (GH35607)
- `Styler` now allows direct CSS class name addition to individual data cells (GH36159)
- `Rolling.mean()` and `Rolling.sum()` use Kahan summation to calculate the mean to avoid numerical problems (GH10319, GH11645, GH13254, GH32761, GH36031)
- `DatetimeIndex.searchsorted()`, `TimedeltaIndex.searchsorted()`, `PeriodIndex.searchsorted()`, and `Series.searchsorted()` with datetime-like dtypes will now try to cast string arguments (list-like and scalar) to the matching datetime-like type (GH36346)
- Added methods `IntArray.prod()`, `IntArray.min()`, and `IntArray.max()` (GH33790)
- Calling a NumPy ufunc on a DataFrame with extension types now preserves the extension types when possible (GH23743)
- Calling a binary-input NumPy ufunc on multiple DataFrame objects now aligns, matching the behavior of binary operations and ufuncs on Series (GH23743). This change has been reverted in pandas 1.2.1, and the behaviour to not align DataFrames is deprecated instead, see the the 1.2.1 release notes.
- Where possible `RangeIndex.difference()` and `RangeIndex.symmetric_difference()` will return `RangeIndex` instead of `Int64Index` (GH36564)
- `DataFrame.to_parquet()` now supports `MultiIndex` for columns in parquet format (GH34777)
- `read_parquet()` gained a `use_nullable_dtypes=True` option to use nullable dtypes that use `pd.NA` as missing value indicator where possible for the resulting DataFrame (default is `False`, and only applicable for engine="pyarrow") (GH31242)
• Added `Rolling.sem()` and Expanding.sem() to compute the standard error of the mean (GH26476)

• `Rolling.var()` and `Rolling.std()` use Kahan summation and Welford’s Method to avoid numerical issues (GH37051)

• `DataFrame.corr()` and `DataFrame.cov()` use Welford’s Method to avoid numerical issues (GH37448)

• `DataFrame.plot()` now recognizes xlabel and ylabel arguments for plots of type scatter and hexbin (GH37001)

• `DataFrame` now supports the divmod operation (GH37165)

• `DataFrame.to_parquet()` now returns a bytes object when no path argument is passed (GH37105)

• Rolling now supports the closed argument for fixed windows (GH34315)

• `DatetimeIndex` and `Series` with datetime64 or datetime64tz dtypes now support std (GH37436)

• Window now supports all Scipy window types in win_type with flexible keyword argument support (GH34556)

• `testing.assert_index_equal()` now has a check_order parameter that allows indexes to be checked in an order-insensitive manner (GH37478)

• `read_csv()` supports memory-mapping for compressed files (GH37621)

• Add support for min_count keyword for `DataFrame.groupby()` and `DataFrame.resample()` for functions min, max, first and last (GH37821, GH37768)

• Improve error reporting for `DataFrame.merge()` when invalid merge column definitions were given (GH16228)

• Improve numerical stability for `Rolling.skew()`, `Rolling.kurt()`, Expanding.skew() and Expanding.kurt() through implementation of Kahan summation (GH6929)

• Improved error reporting for subsetting columns of a `DataFrameGroupBy` with axis=1 (GH37725)

• Implement method cross for `DataFrame.merge()` and `DataFrame.join()` (GH5401)

• When `read_csv()`, `read_sas()` and `read_json()` are called with chunksize/iterator they can be used in a with statement as they return context-managers (GH38225)

• Augmented the list of named colors available for styling Excel exports, enabling all of CSS4 colors (GH38247)

Notable bug fixes

These are bug fixes that might have notable behavior changes.

Consistency of `DataFrame Reductions`

`DataFrame.any()` and `DataFrame.all()` with bool_only=True now determines whether to exclude object-dtype columns on a column-by-column basis, instead of checking if all object-dtype columns can be considered boolean.

This prevents pathological behavior where applying the reduction on a subset of columns could result in a larger Series result. See (GH37799).

```
In [24]: df = pd.DataFrame({"A": ["foo", "bar"], "B": [True, False]}, dtype=object)
In [25]: df["C"] = pd.Series([True, True])
```
Previous behavior:

In [5]: df.all(bool_only=True)
Out[5]:
C  True
dtype: bool

In [6]: df["B", "C"].all(bool_only=True)
Out[6]:
B  False
C  True
dtype: bool

New behavior:

In [26]: In [5]: df.all(bool_only=True)
Out[26]:
B  False
C  True
dtype: bool

In [27]: In [6]: df["B", "C"].all(bool_only=True)
Out[27]:
B  False
C  True
dtype: bool

Other DataFrame reductions with numeric_only=None will also avoid this pathological behavior (GH37827):

In [28]: df = pd.DataFrame({"A": [0, 1, 2], "B": ["a", "b", "c"], dtype=object)

Previous behavior:

In [3]: df.mean()
Out[3]: Series([], dtype: float64)

In [4]: df["A"].mean()
Out[4]:
A  1.0
dtype: float64

New behavior:

In [29]: df.mean()
Out[29]:
A  1.0
dtype: float64

In [30]: df["A"].mean()
Out[30]:
A  1.0
dtype: float64

Moreover, DataFrame reductions with numeric_only=None will now be consistent with their Series counterparts. In particular, for reductions where the Series method raises TypeError, the DataFrame reduction will now consider that column non-numeric instead of casting to a NumPy array which may have different semantics (GH36076, GH28949, GH21020).

5.2. Version 1.2
In [31]: ser = pd.Series([0, 1], dtype="category", name="A")
In [32]: df = ser.to_frame()

Previous behavior:
In [5]: df.any()
Out[5]:
A    True
dtype: bool

New behavior:
In [33]: df.any()
Out[33]: Series([], dtype: bool)

Increased minimum version for Python

pandas 1.2.0 supports Python 3.7.1 and higher (GH35214).

Increased minimum versions for dependencies

Some minimum supported versions of dependencies were updated (GH35214). If installed, we now require:

<table>
<thead>
<tr>
<th>Package</th>
<th>Minimum Version</th>
<th>Required</th>
<th>Changed</th>
</tr>
</thead>
<tbody>
<tr>
<td>numpy</td>
<td>1.16.5</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>pytz</td>
<td>2017.3</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>python-dateutil</td>
<td>2.7.3</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>bottleneck</td>
<td>1.2.1</td>
<td></td>
<td></td>
</tr>
<tr>
<td>numexpr</td>
<td>2.6.8</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>pytest (dev)</td>
<td>5.0.1</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>mypy (dev)</td>
<td>0.782</td>
<td></td>
<td>X</td>
</tr>
</tbody>
</table>

For optional libraries the general recommendation is to use the latest version. The following table lists the lowest version per library that is currently being tested throughout the development of pandas. Optional libraries below the lowest tested version may still work, but are not considered supported.
### Other API changes

- Sorting in descending order is now stable for `Series.sort_values()` and `Index.sort_values()` for Datetime-like `Index` subclasses. This will affect sort order when sorting a DataFrame on multiple columns, sorting with a key function that produces duplicates, or requesting the sorting index when using `Series.sort_values()`. When using `Series.value_counts()`, the count of missing values is no longer necessarily last in the list of duplicate counts. Instead, its position corresponds to the position in the original Series. When using `Index.sort_values()` for Datetime-like `Index` subclasses, NaTs ignored the `na_position` argument and were sorted to the beginning. Now they respect `na_position`, the default being last, same as other `Index` subclasses (GH35992)

- Passing an invalid `fill_value` to `Categorical.take()`, `DatetimeArray.take()`, `TimedeltaArray.take()`, or `PeriodArray.take()` now raises a `TypeError` instead of a `ValueError` (GH37733)

- Passing an invalid `fill_value` to `Series.shift()` with a `CategoricalDtype` now raises a `TypeError` instead of a `ValueError` (GH37733)

- Passing an invalid value to `IntervalIndex.insert()` or `CategoricalIndex.insert()` now raises a `TypeError` instead of a `ValueError` (GH37733)

- Attempting to reindex a Series with a `CategoricalIndex` with an invalid `fill_value` now raises a `TypeError` instead of a `ValueError` (GH37733)

- `CategoricalIndex.append()` with an index that contains non-category values will now cast instead of raising `TypeError` (GH38098)
Deprecations

- Deprecated parameter `inplace` in `MultiIndex.set_codes()` and `MultiIndex.set_levels()` (GH35626)

- Deprecated parameter `dtype` of method `copy()` for all `Index` subclasses. Use the `astype()` method instead for changing dtype (GH35853)

- Deprecated parameters `levels` and `codes` in `MultiIndex.copy()`. Use the `set_levels()` and `set_codes()` methods instead (GH36685)

- Date parser functions `parse_date_time()`, `parse_date_fields()`, `parse_all_fields()` and `generic_parser()` from `pandas.io.date_converters` are deprecated and will be removed in a future version; use `to_datetime()` instead (GH35741)

- `DataFrame.lookup()` is deprecated and will be removed in a future version, use `DataFrame.melt()` and `DataFrame.loc()` instead (GH35224)

- The method `Index.to_native_types()` is deprecated. Use `.astype(str)` instead (GH28867)

- Deprecated indexing `DataFrame` rows with a single datetime-like string as `df[string]` (given the ambiguity whether it is indexing the rows or selecting a column), use `df.loc[string]` instead (GH36179)

- Deprecated `Index.is_all_dates()` (GH27744)

- The default value of `regex` for `Series.str.replace()` will change from `True` to `False` in a future release. In addition, single character regular expressions will not be treated as literal strings when `regex=True` is set (GH24804)

- Deprecated automatic alignment on comparison operations between `DataFrame` and `Series`, do `frame, ser = frame.align(ser, axis=1, copy=False)` before e.g. `frame == ser` (GH28759)

- `Rolling.count()` with `min_periods=None` will default to the size of the window in a future version (GH31302)

- Using “outer” ufuncs on DataFrames to return 4d ndarray is now deprecated. Convert to an ndarray first (GH37601)

- Deprecated slice-indexing on tz-aware `DatetimeIndex` with naive datetime objects, to match scalar indexing behavior (GH36148)

- `Index.ravel()` returning a np.ndarray is deprecated, in the future this will return a view on the same index (GH19956)

- Deprecate use of strings denoting units with ‘M’, ‘Y’ or ‘y’ in `to_timedelta()` (GH36666)

- `Index` methods `&`, `|`, and `^` behaving as the set operations `Index.intersection()`, `Index.union()`, and `Index.symmetric_difference()`, respectively, are deprecated and in the future will behave as pointwise boolean operations matching `Series` behavior. Use the named set methods instead (GH36758)

- `Categorical.is_dtype_equal()` and `CategoricalIndex.is_dtype_equal()` are deprecated, will be removed in a future version (GH37545)

- `Series.slice_shift()` and `DataFrame.slice_shift()` are deprecated, use `Series.shift()` or `DataFrame.shift()` instead (GH37601)

- Partial slicing on unordered `DatetimeIndex` objects with keys that are not in the index is deprecated and will be removed in a future version (GH18531)

- The `how` keyword in `PeriodIndex.astype()` is deprecated and will be removed in a future version, use `index.to_timestamp(how=how)` instead (GH37982)

- Deprecated `Index.asi8()` for `Index` subclasses other than `DatetimeIndex`, `TimedeltaIndex`, and `PeriodIndex` (GH37877)
• The `inplace` parameter of `Categorical.remove_unused_categories()` is deprecated and will be removed in a future version (GH37643)

• The `null_counts` parameter of `DataFrame.info()` is deprecated and replaced by `show_counts`. It will be removed in a future version (GH37999)

**Calling NumPy ufuncs on non-aligned DataFrames**

Calling NumPy ufuncs on non-aligned DataFrames changed behaviour in pandas 1.2.0 (to align the inputs before calling the ufunc), but this change is reverted in pandas 1.2.1. The behaviour to not align is now deprecated instead, see the [the 1.2.1 release notes](https://pandas.pydata.org/pandas-docs/stable/whatsnew/v1.2.1.html) for more details.

**Performance improvements**

• Performance improvements when creating DataFrame or Series with dtype `str` or `StringDtype` from array with many string elements (GH36304, GH36317, GH36325, GH36432, GH37371)

• Performance improvement in `GroupBy.agg()` with the `numba` engine (GH35759)

• Performance improvements when creating `Series.map()` from a huge dictionary (GH34717)

• Performance improvement in `GroupBy.transform()` with the `numba` engine (GH36240)

• `Styler` uuid method altered to compress data transmission over web whilst maintaining reasonably low table collision probability (GH36345)

• Performance improvement in `to_datetime()` with non-ns time unit for `float` dtype columns (GH20445)

• Performance improvement in setting values on an `IntervalArray` (GH36310)

• The internal index method `_shallow_copy()` now makes the new index and original index share cached attributes, avoiding creating these again, if created on either. This can speed up operations that depend on creating copies of existing indexes (GH36840)

• Performance improvement in `RollingGroupby.count()` (GH35625)

• Small performance decrease to `Rolling.min()` and `Rolling.max()` for fixed windows (GH36567)

• Reduced peak memory usage in `DataFrame.to_pickle()` when using `protocol=5` in python 3.8+ (GH34244)

• Faster `dir` calls when the object has many index labels, e.g. `dir(ser)` (GH37450)

• Performance improvement in `ExpandingGroupby` (GH37064)

• Performance improvement in `Series.astype()` and `DataFrame.astype()` for `Categorical` (GH8628)

• Performance improvement in `DataFrame.groupby()` for `float` dtype (GH28303), changes of the underlying hash-function can lead to changes in float based indexes sort ordering for ties (e.g. `Index.value_counts()`)

• Performance improvement in `pd.isin()` for inputs with more than 1e6 elements (GH36611)

• Performance improvement for `DataFrame._setitem___()` with list-like indexers (GH37954)

• `read_json()` now avoids reading entire file into memory when chunksize is specified (GH34548)
Bug fixes

**Categorical**

- `Categorical.fillna()` will always return a copy, validate a passed fill value regardless of whether there are any NAs to fill, and disallow an NaT as a fill value for numeric categories (GH36530)
- Bug in `Categorical.__setitem__()` that incorrectly raised when trying to set a tuple value (GH20439)
- Bug in `CategoricalIndex.equals()` incorrectly casting non-category entries to `np.nan` (GH37667)
- Bug in `CategoricalIndex.where()` incorrectly setting non-category entries to `np.nan` instead of raising `TypeError` (GH37977)
- Bug in `Categorical.to_numpy()` and `np.array(categorical)` with tz-aware datetime64 categories incorrectly dropping the time zone information instead of casting to object dtype (GH38136)

**Datetime-like**

- Bug in `DataFrame.combine_first()` that would convert datetime-like column on other `DataFrame` to integer when the column is not present in original `DataFrame` (GH28481)
- Bug in `DatetimeArray.date` where a `ValueError` would be raised with a read-only backing array (GH33530)
- Bug in `NaT` comparisons failing to raise `TypeError` on invalid inequality comparisons (GH35046)
- Bug in `DateOffset` where attributes reconstructed from pickle files differ from original objects when input values exceed normal ranges (e.g. `months=12`) (GH34511)
- Bug in `DatetimeIndex.get_slice_bound()` where `datetime.date` objects were not accepted or naive `Timestamp` with a tz-aware `DatetimeIndex` (GH35690)
- Bug in `DatetimeIndex.slice_locs()` where `datetime.date` objects were not accepted (GH34077)
- Bug in `DatetimeIndex.searchsorted()`, `TimedeltaIndex.searchsorted()`, `PeriodIndex.searchsorted()`, and `Series.searchsorted()` with datetime64, timedelta64 or `Period` dtype placement of NaT values being inconsistent with NumPy (GH36176, GH36254)
- Inconsistency in `DatetimeArray`, `TimedeltaArray`, and `PeriodArray` method `__setitem__` casting arrays of strings to datetime-like scalars but not scalar strings (GH36261)
- Bug in `DatetimeArray.take()` incorrectly allowing `fill_value` with a mismatched time zone (GH37356)
- Bug in `DatetimeIndex.shift` incorrectly raising when shifting empty indexes (GH14811)
- `Timestamp` and `DatetimeIndex` comparisons between tz-aware and tz-naive objects now follow the standard library datetime behavior, returning `True/False` for `!===` and raising for inequality comparisons (GH28507)
- Bug in `DatetimeIndex.equals()` and `TimedeltaIndex.equals()` incorrectly considering `int64` indexes as equal (GH36744)
- `Series.to_json()`, `DataFrame.to_json()`, and `read_json()` now implement time zone parsing when orient structure is `table` (GH35973)
- `astype()` now attempts to convert to `datetime64[ns, tz]` directly from `object` with inferred time zone from string (GH35973)
• Bug in TimedeltaIndex.sum() and Series.sum() with timedelta64 dtype on an empty index or series returning NaT instead of Timedelta(0) (GH31751)

• Bug in DatetimeArray.shift() incorrectly allowing fill_value with a mismatched time zone (GH37299)

• Bug in adding a BusinessDay with nonzero offset to a non-scalar other (GH37457)

• Bug in to_datetime() with a read-only array incorrectly raising (GH34857)

• Bug in Series.isin() with datetime64[ns] dtype and DatetimeIndex.isin() incorrectly casting integers to datetimes (GH36621)

• Bug in Series.isin() with datetime64[ns] dtype and DatetimeIndex.isin() failing to consider tz-aware and tz-naive datetimes as always different (GH35728)

• Bug in Series.isin() with PeriodDtype dtype and PeriodIndex.isin() failing to consider arguments with different PeriodDtype as always different (GH37528)

• Bug in Period constructor now correctly handles nanoseconds in the value argument (GH34621 and GH17053)

Timedelta

• Bug in TimedeltaIndex, Series, and DataFrame floor-division with timedelta64 dtypes and NaT in the denominator (GH35529)

• Bug in parsing of ISO 8601 durations in Timedelta and to_datetime() (GH29773, GH36204)

• Bug in to_timedelta() with a read-only array incorrectly raising (GH34857)

• Bug in Timedelta incorrectly truncating to sub-second portion of a string input when it has precision higher than nanoseconds (GH36738)

Timezones

• Bug in date_range() was raising AmbiguousTimeError for valid input with ambiguous=False (GH35297)

• Bug in Timestamp.replace() was losing fold information (GH37610)

Numeric

• Bug in to_numeric() where float precision was incorrect (GH31364)

• Bug in DataFrame.any() with axis=1 and bool_only=True ignoring the bool_only keyword (GH32432)

• Bug in Series.equals() where a ValueError was raised when NumPy arrays were compared to scalars (GH35267)

• Bug in Series where two Series each have a DatetimeIndex with different time zones having those indexes incorrectly changed when performing arithmetic operations (GH33671)

• Bug in pandas.testing module functions when used with check_exact=False on complex numeric types (GH28235)

• Bug in DataFrame.__rmatmul__() error handling reporting transposed shapes (GH21581)
• Bug in `Series` flex arithmetic methods where the result when operating with a list, tuple or np.ndarray would have an incorrect name (GH36760)

• Bug in `IntegerArray` multiplication with `timedelta` and `np.timedelta64` objects (GH36870)

• Bug in `MultiIndex` comparison with tuple incorrectly treating tuple as array-like (GH21517)

• Bug in `DataFrame.diff()` with `datetime64` dtypes including NaT values failing to fill NaT results correctly (GH32441)

• Bug in `DataFrame` arithmetic ops incorrectly accepting keyword arguments (GH36843)

• Bug in `IntervalArray` comparisons with `Series` not returning Series (GH36908)

• Bug in `DataFrame` allowing arithmetic operations with list of array-likes with undefined results. Behavior changed to raising `ValueError` (GH36702)

• Bug in `DataFrame.std()` with `timedelta64` dtype and `skipna=False` (GH37392)

• Bug in `DataFrame.min()` and `DataFrame.max()` with `datetime64` dtype and `skipna=False` (GH36907)

• Bug in `DataFrame.idxmax()` and `DataFrame.idxmin()` with mixed dtypes incorrectly raising `TypeError` (GH38195)

**Conversion**

• Bug in `DataFrame.to_dict()` with `orient='records'` now returns python native datetime objects for datetime-like columns (GH21256)

• Bug in `Series.astype()` conversion from string to float raised in presence of `pd.NA` values (GH37626)

**Strings**

• Bug in `Series.to_string()`, `DataFrame.to_string()`, and `DataFrame.to_latex()` adding a leading space when `index=False` (GH24980)

• Bug in `to_numeric()` raising a `TypeError` when attempting to convert a string dtype `Series` containing only numeric strings and `NA` (GH37262)

**Interval**

• Bug in `DataFrame.replace()` and `Series.replace()` where `Interval` dtypes would be converted to object dtypes (GH34871)

• Bug in `IntervalIndex.take()` with negative indices and `fill_value=None` (GH37330)

• Bug in `IntervalIndex.putmask()` with datetime-like dtype incorrectly casting to object dtype (GH37968)

• Bug in `IntervalArray.astype()` incorrectly dropping dtype information with a `CategoricalDtype` object (GH37984)
Indexing

- Bug in `PeriodIndex.get_loc()` incorrectly raising `ValueError` on non-datetike strings instead of `KeyError`, causing similar errors in `Series.__getitem__()`, `Series.__contains__()`, and `Series.loc.__getitem__()` (GH34240)

- Bug in `Index.sort_values()` where, when empty values were passed, the method would break by trying to compare missing values instead of pushing them to the end of the sort order (GH35584)

- Bug in `Index.get_indexer()` and `Index.get_indexer_non_unique()` where `int64` arrays are returned instead of `intp` (GH36359)

- Bug in `DataFrame.sort_index()` where parameter ascending passed as a list on a single level index gives wrong result (GH32334)

- Bug in `DataFrame.reset_index()` was incorrectly raising a `ValueError` for input with a `MultiIndex` with missing values in a level with `Categorical` dtype (GH24206)

- Bug in indexing with boolean masks on datetime-like values sometimes returning a view instead of a copy (GH36210)

- Bug in `DataFrame.__getitem__()` and `DataFrame.loc.__getitem__()` with `IntervalIndex` columns and a numeric indexer (GH26490)

- Bug in `Series.loc.__getitem__()` with a non-unique `MultiIndex` and an empty-list indexer (GH13691)

- Bug in indexing on a `Series` or `DataFrame` with a `MultiIndex` and a level named "0" (GH37194)

- Bug in `Series.__getitem__()` when using an unsigned integer array as an indexer giving incorrect results or segfaulting instead of raising `KeyError` (GH37218)

- Bug in `Index.where()` incorrectly casting numeric values to strings (GH37591)

- Bug in `DataFrame.loc()` returning empty result when indexer is a slice with negative step size (GH38071)

- Bug in `Series.loc()` and `DataFrame.loc()` raises when the index was of `object` dtype and the given numeric label was in the index (GH26491)

- Bug in `DataFrame.loc()` returned requested key plus missing values when `loc` was applied to single level from a `MultiIndex` (GH27104)

- Bug in indexing on a `Series` or `DataFrame` with a `CategoricalIndex` using a list-like indexer containing NA values (GH37722)

- Bug in `DataFrame.loc.__setitem__()` expanding an empty `DataFrame` with mixed dtypes (GH37932)

- Bug in `DataFrame.xs()` ignored `droplevel=False` for columns (GH19056)

- Bug in `DataFrame.reindex()` raising `IndexingError` wrongly for empty `DataFrame` with tolerance `not None` or method="nearest" (GH27315)

- Bug in indexing on a `Series` or `DataFrame` with a `CategoricalIndex` using list-like indexer that contains elements that are in the index's categories but not in the index itself failing to raise `KeyError` (GH37901)

- Bug on inserting a boolean label into a `DataFrame` with a numeric `Index` columns incorrectly casting to integer (GH36319)

- Bug in `DataFrame.iloc()` and `Series.iloc()` aligning objects in `__setitem__` (GH22046)

- Bug in `MultiIndex.drop()` does not raise if labels are partially found (GH37820)
• Bug in `DataFrame.loc()` did not raise `KeyError` when missing combination was given with `slice(None)` for remaining levels (GH19556)

• Bug in `DataFrame.loc()` raising `TypeError` when non-integer slice was given to select values from `MultiIndex` (GH25165, GH24263)

• Bug in `Series.at()` returning `Series` with one element instead of scalar when index is a `MultiIndex` with one level (GH38053)

• Bug in `DataFrame.loc()` returning and assigning elements in wrong order when indexer is differently ordered than the `MultiIndex` to filter (GH31330, GH34603)

• Bug in `DataFrame.loc()` and `DataFrame.__getitem__()` raising `KeyError` when columns were `MultiIndex` with only one level (GH29749)

• Bug in `Series.__getitem__()` and `DataFrame.__getitem__()` raising blank `KeyError` without missing keys for `IntervalIndex` (GH27365)

• Bug in setting a new label on a `DataFrame` or `Series` with a `CategoricalIndex` incorrectly raising `TypeError` when the new label is not among the index’s categories (GH38098)

• Bug in `Series.loc()` and `Series.iloc()` raising `ValueError` when inserting a list-like `np.array`, `list` or `tuple` in an object `Series` of equal length (GH37748, GH37486)

• Bug in `Series.loc()` and `Series.iloc()` setting all the values of an object `Series` with those of a list-like `ExtensionArray` instead of inserting it (GH38271)

**Missing**

• Bug in `SeriesGroupBy.transform()` now correctly handles missing values for `dropna=False` (GH35014)

• Bug in `Series.nunique()` with `dropna=True` was returning incorrect results when both NA and None missing values were present (GH37566)

• Bug in `Series.interpolate()` where kwarg `limit_area` and `limit_direction` had no effect when using methods `pad` and `backfill` (GH31048)

**MultiIndex**

• Bug in `DataFrame.xs()` when used with `IndexSlice` raises `TypeError` with message "Expected label or tuple of labels" (GH35301)

• Bug in `DataFrame.reset_index()` with NaT values in index raises `ValueError` with message "cannot convert float NaN to integer" (GH36541)

• Bug in `DataFrame.combine_first()` when used with `MultiIndex` containing string and NaN values raises `TypeError` (GH36562)

• Bug in `MultiIndex.drop()` dropped NaN values when non existing key was given as input (GH18853)

• Bug in `MultiIndex.drop()` dropping more values than expected when index has duplicates and is not sorted (GH33494)
I/O

- `read_sas()` no longer leaks resources on failure (GH35566)
- Bug in `DataFrame.to_csv()` and `Series.to_csv()` caused a ValueError when it was called with a filename in combination with mode containing a b (GH35058)
- Bug in `read_csv()` with `float_precision='round_trip'` did not handle decimal and thousands parameters (GH35365)
- `to_pickle()` and `read_pickle()` were closing user-provided file objects (GH35679)
- `to_csv()` passes compression arguments for 'gzip' always to `gzip.GzipFile` (GH28103)
- `to_csv()` did not support zip compression for binary file object not having a filename (GH35058)
- `to_csv()` and `read_csv()` did not honor compression and encoding for path-like objects that are internally converted to file-like objects (GH35677, GH26124, GH32392)
- `DataFrame.to_pickle()`, `Series.to_pickle()`, and `read_pickle()` did not support compression for file-objects (GH26237, GH29054, GH29570)
- Bug in `LongTableBuilder.middle_separator()` was duplicating LaTeX longtable entries in the List of Tables of a LaTeX document (GH34360)
- Bug in `read_csv()` with `engine='python'` truncating data if multiple items present in first row and first element started with BOM (GH36343)
- Removed `private_key` and `verbose` from `read_gbq()` as they are no longer supported in pandas-gbq (GH34654, GH30200)
- Bumped minimum pytables version to 3.5.1 to avoid a ValueError in `read_hdf()` (GH24839)
- Bug in `read_table()` and `read_csv()` when `delim_whitespace=True` and `sep=default` (GH36583)
- Bug in `DataFrame.to_json()` and `Series.to_json()` when used with `lines=True` and `orient='records'` the last line of the record is not appended with 'new line character' (GH36888)
- Bug in `read_parquet()` with fixed offset time zones. String representation of time zones was not recognized (GH35997, GH36004)
- Bug in `DataFrame.to_html()`, `DataFrame.to_string()`, and `DataFrame.to_latex()` ignoring the `na_rep` argument when `float_format` was also specified (GH9046, GH13828)
- Bug in output rendering of complex numbers showing too many trailing zeros (GH36799)
- Bug in HDFStore threw a TypeError when exporting an empty DataFrame with `datetime64[ns, tz]` dtypes with a fixed HDF5 store (GH20594)
- Bug in HDFStore was dropping time zone information when exporting a Series with `datetime64[ns, tz]` dtypes with a fixed HDF5 store (GH20594)
- `read_csv()` was closing user-provided binary file handles when `engine="c"` and an encoding was requested (GH36980)
- Bug in `DataFrame.to_hdf()` was not dropping missing rows with `dropna=True` (GH35719)
- Bug in `read_html()` was raising a TypeError when supplying a `pathlib.Path` argument to the `io` parameter (GH37705)
- `DataFrame.to_excel()`, `Series.to_excel()`, `DataFrame.to_markdown()`, and `Series.to_markdown()` now support writing to fsspec URLs such as S3 and Google Cloud Storage (GH33987)
- Bug in `read_fwf()` with `skip_blank_lines=True` was not skipping blank lines (GH37758)
• Parse missing values using `read_json()` with `dtype=False` to NaN instead of None (GH28501)
• `read_fwf()` was inferring compression with `compression=None` which was not consistent with the other `read_*` functions (GH37909)
• `DataFrame.to_html()` was ignoring formatters argument for `ExtensionDtype` columns (GH36525)
• Bumped minimum xarray version to 0.12.3 to avoid reference to the removed `Panel` class (GH27101, GH37983)
• `DataFrame.to_csv()` was re-opening file-like handles that also implement `os.PathLike` (GH38125)
• Bug in the conversion of a sliced `pyarrow.Table` with missing values to a DataFrame (GH38525)
• Bug in `read_sql_table()` raising a `sqlalchemy.exc.OperationalError` when column names contained a percentage sign (GH37517)

**Period**

• Bug in `DataFrame.replace()` and `Series.replace()` where `Period` dtypes would be converted to object dtypes (GH34871)

**Plotting**

• Bug in `DataFrame.plot()` was rotating xticklabels when `subplots=True`, even if the x-axis wasn’t an irregular time series (GH29460)
• Bug in `DataFrame.plot()` where a marker letter in the `style` keyword sometimes caused a `ValueError` (GH21003)
• Bug in `DataFrame.plot.bar()` and `Series.plot.bar()` where ticks positions were assigned by value order instead of using the actual value for numeric or a smart ordering for string (GH26186, GH11465). This fix has been reverted in pandas 1.2.1, see What’s new in 1.2.1 (January 20, 2021)
• Twinned axes were losing their tick labels which should only happen to all but the last row or column of ‘externally’ shared axes (GH33819)
• Bug in `Series.plot()` and `DataFrame.plot()` was throwing a `ValueError` when the Series or DataFrame was indexed by a `TimedeltaIndex` with a fixed frequency and the x-axis lower limit was greater than the upper limit (GH37454)
• Bug in `DataFrameGroupBy.boxplot()` when `subplots=False` would raise a `KeyError` (GH16748)
• Bug in `DataFrame.plot()` and `Series.plot()` was overwriting matplotlib’s shared y axes behavior when no `sharey` parameter was passed (GH37942)
• Bug in `DataFrame.plot()` was raising a `TypeError` with `ExtensionDtype` columns (GH32073)
Styler

- Bug in `Styler.render()` HTML was generated incorrectly because of formatting error in `rowspan` attribute, it now matches with w3 syntax (GH38234)

Groupby/resample/rolling

- Bug in `DataFrameGroupBy.count()` and `SeriesGroupBy.sum()` returning NaN for missing categories when grouped on multiple Categoricals. Now returning 0 (GH35028)
- Bug in `DataFrameGroupBy.apply()` that would sometimes throw an erroneous `ValueError` if the grouping axis had duplicate entries (GH16646)
- Bug in `DataFrame.resample()` that would throw a `ValueError` when resampling from "D" to "24H" over a transition into daylight savings time (DST) (GH35219)
- Bug when combining methods `DataFrame.groupby()` with `DataFrame.resample()` and `DataFrame.interpolate()` raising a `TypeError` (GH35325)
- Bug in `DataFrameGroupBy.apply()` where a non-nuisance grouping column would be dropped from the output columns if another groupby method was called before `.apply` (GH34566)
- Bug when subsetting columns on a `DataFrameGroupBy` (e.g. `df.groupby('a')[['b']]`) would reset the attributes `axis`, `dropna`, `group_keys`, `level`, `mutated`, `sort`, and `squeeze` to their default values (GH9959)
- Bug in `DataFrameGroupBy.tshift()` failing to raise `ValueError` when a frequency cannot be inferred for the index of a group (GH35937)
- Bug in `DataFrame.groupby()` does not always maintain column index name for any, all, bfill, ffill, shift (GH29764)
- Bug in `DataFrameGroupBy.apply()` raising error with `np.nan` group(s) when `dropna=False` (GH35889)
- Bug in `Rolling.sum()` returned wrong values when dtypes where mixed between float and integer and `axis=1` (GH20649, GH35596)
- Bug in `Rolling.count()` returned `np.nan` with `FixedForwardWindowIndexer` as window, `min_periods=0` and only missing values in the window (GH35579)
- Bug where `pandas.core.window.Rolling` produces incorrect window sizes when using a `PeriodIndex` (GH34225)
- Bug in `DataFrameGroupBy.ffill()` and `DataFrameGroupBy.bfill()` where a NaN group would return filled values instead of NaN when `dropna=True` (GH34725)
- Bug in `RollingGroupby.count()` where a `ValueError` was raised when specifying the `closed` parameter (GH35869)
- Bug in `DataFrameGroupBy.rolling()` returning wrong values with partial centered window (GH36040)
- Bug in `DataFrameGroupBy.rolling()` returned wrong values with time aware window containing NaN. Raises `ValueError` because windows are not monotonic now (GH34617)
- Bug in `Rolling.__iter__()` where a `ValueError` was not raised when `min_periods` was larger than window (GH37156)
- Using `Rolling.var()` instead of `Rolling.std()` avoids numerical issues for `Rolling.corr()` when `Rolling.var()` is still within floating point precision while `Rolling.std()` is not (GH31286)
• Bug in `DataFrameGroupBy.quantile()` and `Resampler.quantile()` raised TypeError when values were of type `Timedelta` (GH29485)
• Bug in `Rolling.median()` and `Rolling.quantile()` returned wrong values for `BaseIndexer` subclasses with non-monotonic starting or ending points for windows (GH37153)
• Bug in `DataFrame.groupby()` dropped nan groups from result with `dropna=False` when grouping over a single column (GH35646, GH35542)
• Bug in `DataFrameGroupBy.head()`, `DataFrameGroupBy.tail()`, `SeriesGroupBy.head()`, and `SeriesGroupBy.tail()` would raise when used with `axis=1` (GH9772)
• Bug in `DataFrameGroupBy.transform()` would raise when used with `axis=1` and a transformation kernel (e.g. "shift") (GH36308)
• Bug in `DataFrameGroupBy.resample()` using `.agg` with sum produced different result than just calling `.sum` (GH35348)
• Bug in `DataFrameGroupBy.apply()` dropped values on nan group when returning the same axes with the original frame (GH38227)
• Bug in `DataFrameGroupBy.quantile()` couldn’t handle with arraylike `q` when grouping by columns (GH33795)
• Bug in `DataFrameGroupBy.rank()` with `datetime64tz` or period dtype incorrectly casting results to those dtypes instead of returning `float64` dtype (GH38187)

**Reshaping**

• Bug in `DataFrame.crosstab()` was returning incorrect results on inputs with duplicate row names, duplicate column names or duplicate names between row and column labels (GH22529)
• Bug in `DataFrame.pivot_table()` with `aggfunc='count'` or `aggfunc='sum'` returning NaN for missing categories when pivoted on a `Categorical`. Now returning 0 (GH31422)
• Bug in `concat()` and `DataFrame` constructor where input index names are not preserved in some cases (GH34735)
• Bug in `func crosstab()` when using multiple columns with `margins=True` and `normalize=True` (GH35144)
• Bug in `DataFrame.stack()` where an empty DataFrame.stack would raise an error (GH36113). Now returning an empty Series with empty MultiIndex.
• Bug in `Series.unstack()`. Now a Series with single level of Index trying to unstack would raise a `ValueError` (GH36113)
• Bug in `DataFrame.agg()` with `func={'name':<FUNC>}` incorrectly raising TypeError when `DataFrame.columns==['Name']` (GH36212)
• Bug in `Series.transform()` would give incorrect results or raise when the argument `func` was a dictionary (GH35811)
• Bug in `DataFrame.pivot()` did not preserve `MultiIndex` level names for columns when rows and columns are both multiindexed (GH36360)
• Bug in `DataFrame.pivot()` modified index argument when columns was passed but values was not (GH37635)
• Bug in `DataFrame.join()` returned a non deterministic level-order for the resulting `MultiIndex` (GH36910)
• Bug in `DataFrame.combine_first()` caused wrong alignment with dtype `string` and one level of MultiIndex containing only NA (GH37591)
• Fixed regression in `merge()` on merging `DatetimeIndex` with empty DataFrame (GH36895)
• Bug in `DataFrame.apply()` not setting index of return value when `func` return type is `dict` (GH37544)
• Bug in `DataFrame.merge()` and `pandas.merge()` returning inconsistent ordering in result for `how=right` and `how=left` (GH35382)
• Bug in `merge_ordered()` couldn’t handle list-like `left_by` or `right_by` (GH35269)
• Bug in `merge_ordered()` returned wrong join result when length of `left_by` or `right_by` equals to the rows of `left` or `right` (GH38166)
• Bug in `merge_ordered()` didn’t raise when elements in `left_by` or `right_by` not exist in `left` columns or `right` columns (GH38167)
• Bug in `DataFrame.drop_duplicates()` not validating bool dtype for `ignore_index` keyword (GH38274)

**ExtensionArray**

• Fixed bug where `DataFrame` column set to scalar extension type via a dict instantiation was considered an object type rather than the extension type (GH35965)
• Fixed bug where `astype()` with equal dtype and `copy=False` would return a new object (GH28488)
• Fixed bug when applying a NumPy ufunc with multiple outputs to an `IntegerArray` returning None (GH36913)
• Fixed an inconsistency in `PeriodArray`'s `__init__` signature to those of `DatetimeArray` and `TimedeltaArray` (GH37289)
• Reductions for `BooleanArray`, `Categorical`, `DatetimeArray`, `FloatingArray`, `IntegerArray`, `PeriodArray`, `TimedeltaArray`, and `PandasArray` are now keyword-only methods (GH37541)
• Fixed a bug where a `TypeError` was wrongly raised if a membership check was made on an `ExtensionArray` containing nan-like values (GH37867)

**Other**

• Bug in `DataFrame.replace()` and `Series.replace()` incorrectly raising an `AssertionError` instead of a `ValueError` when invalid parameter combinations are passed (GH36045)
• Bug in `DataFrame.replace()` and `Series.replace()` with numeric values and string `to_replace` (GH34789)
• Fixed metadata propagation in `Series.abs()` and ufuncs called on Series and DataFrames (GH28283)
• Bug in `DataFrame.replace()` and `Series.replace()` incorrectly casting from `PeriodDtype` to object dtype (GH34871)
• Fixed bug in metadata propagation incorrectly copying DataFrame columns as metadata when the column name overlaps with the metadata name (GH37037)
• Fixed metadata propagation in the `Series.dt`, `Series.str` accessors, `DataFrame.duplicated`, `DataFrame.stack`, `DataFrame.unstack`, `DataFrame.pivot`, `DataFrame.append`, `DataFrame.diff`, `DataFrame.applymap` and `DataFrame.update` methods (GH28283, GH37381)
- Fixed metadata propagation when selecting columns with `DataFrame.__getitem__` (GH28283)
- Bug in `Index.intersection()` with non-`Index` failing to set the correct name on the returned `Index` (GH38111)
- Bug in `RangeIndex.intersection()` failing to set the correct name on the returned `Index` in some corner cases (GH38197)
- Bug in `Index.difference()` failing to set the correct name on the returned `Index` in some corner cases (GH38268)
- Bug in `Index.union()` behaving differently depending on whether operand is an `Index` or other list-like (GH38384)
- Bug in `Index.intersection()` with non-matching numeric dtypes casting to `object` dtype instead of minimal common dtype (GH38122)
- Bug in `IntervalIndex.union()` returning an incorrectly-typed `Index` when empty (GH38282)
- Passing an array with 2 or more dimensions to the `Series` constructor now raises the more specific `ValueError` rather than a bare `Exception` (GH35744)
- Bug in `dir` where `dir(obj)` wouldn’t show attributes defined on the instance for pandas objects (GH37173)
- Bug in `Index.drop()` raising `InvalidIndexError` when index has duplicates (GH38051)
- Bug in `RangeIndex.difference()` returning `Int64Index` in some cases where it should return `RangeIndex` (GH38028)
- Fixed bug in `assert_series_equal()` when comparing a datetime-like array with an equivalent non extension dtype array (GH37609)
- Bug in `is_bool_dtype()` would raise when passed a valid string such as "boolean" (GH38386)
- Fixed regression in logical operators raising `ValueError` when columns of `DataFrame` are a `CategoricalIndex` with unused categories (GH38367)

5.3 Version 1.1

5.3.1 What’s new in 1.1.5 (December 07, 2020)

These are the changes in pandas 1.1.5. See Release notes for a full changelog including other versions of pandas.

Fixed regressions

- Fixed regression in addition of a timedelta-like scalar to a `DatetimeIndex` raising incorrectly (GH37295)
- Fixed regression in `Series.groupby()` raising when the `Index` of the `Series` had a tuple as its name (GH37755)
- Fixed regression in `DataFrame.loc()` and `Series.loc()` for `__setitem__` when one-dimensional tuple was given to select from `MultiIndex` (GH37711)
- Fixed regression in inplace operations on `Series` with `ExtensionDtype` with NumPy dtyped operand (GH37910)
- Fixed regression in metadata propagation for `groupby` iterator (GH37343)
- Fixed regression in `MultiIndex` constructed from a `DatetimeIndex` not retaining frequency (GH35563)
- Fixed regression in `Index` constructor raising an `AttributeError` when passed a `SparseArray` with `datetime64` values (GH35843)
- Fixed regression in `DataFrame.unstack()` with columns with integer dtype (GH37115)
- Fixed regression in indexing on a `Series` with `CategoricalDtype` after unpickling (GH37631)
- Fixed regression in `DataFrame.groupby()` aggregation with out-of-bounds datetime objects in an object-dtype column (GH36003)
- Fixed regression in `df.groupby(..).rolling(..)` with the resulting `MultiIndex` when grouping by a label that is in the index (GH37641)
- Fixed regression in `DataFrame.fillna()` not filling NaN after other operations such as `DataFrame.pivot()` (GH36495).
- Fixed performance regression in `df.groupby(..).rolling(..)` (GH38038)
- Fixed regression in `MultiIndex.intersection()` returning duplicates when at least one of the indexes had duplicates (GH36915)
- Fixed regression in `GroupBy.first()` and `GroupBy.last()` where `None` was considered a non-NA value (GH38286)

Bug fixes

- Bug in pytables methods in python 3.9 (GH38041)
Other

- Only set `--Werror` as a compiler flag in the CI jobs (GH33315, GH33314)

Contributors

A total of 12 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

5.3.2 What’s new in 1.1.4 (October 30, 2020)

These are the changes in pandas 1.1.4. See Release notes for a full changelog including other versions of pandas.

Fixed regressions

- Fixed regression in `read_csv()` raising a `ValueError` when `names` was of type `dict_keys` (GH36928)
- Fixed regression in `read_csv()` with more than 1M rows and specifying a `index_col` argument (GH37094)
- Fixed regression where attempting to mutate a `DateOffset` object would no longer raise an `AttributeError` (GH36940)
- Fixed regression where `DataFrame.agg()` would fail with `TypeError` when passed positional arguments to be passed on to the aggregation function (GH36948).
- Fixed regression in `RollingGroupby` with `sort=False` not being respected (GH36889)
- Fixed regression in `Series.astype()` converting None to "nan" when casting to string (GH36904)
- Fixed regression in `Series.rank()` method failing for read-only data (GH37290)
- Fixed regression in `RollingGroupby` causing a segmentation fault with Index of dtype object (GH36727)
- Fixed regression in `DataFrame.resample(...).apply(...)()` raised `AttributeError` when input was a `DataFrame` and only a `Series` was evaluated (GH36951)
- Fixed regression in `DataFrame.groupby(...).std()` with nullable integer dtype (GH37415)
pandas: powerful Python data analysis toolkit, Release 1.3.1

- Fixed regression in `PeriodDtype` comparing both equal and unequal to its string representation (GH37265)
- Fixed regression where slicing `DatetimeIndex` raised `AssertionError` on irregular time series with `pd.NaT` or on unsorted indices (GH36953 and GH35509)
- Fixed regression in certain offsets (`pd.offsets.Day()` and below) no longer being hashable (GH37267)
- Fixed regression in `StataReader` which required `chunksize` to be manually set when using an iterator to read a dataset (GH37280)
- Fixed regression in `setitem` with `DataFrame.iloc()` which raised error when trying to set a value while filtering with a boolean list (GH36741)
- Fixed regression in `setitem` with a Series getting aligned before setting the values (GH37427)
- Fixed regression in `MultiIndex.is_monotonic_increasing` returning wrong results with NaN in at least one of the levels (GH37220)
- Fixed regression in inplace arithmetic operation on a Series not updating the parent DataFrame (GH36373)

**Bug fixes**

- Bug causing `groupby(...).sum()` and similar to not preserve metadata (GH29442)
- Bug in `Series.isin()` and `DataFrame.isin()` raising a `ValueError` when the target was read-only (GH37174)
- Bug in `GroupBy.fillna()` that introduced a performance regression after 1.0.5 (GH36757)
- Bug in `DataFrame.info()` was raising a `KeyError` when the DataFrame has integer column names (GH37245)
- Bug in `DataFrameGroupby.apply()` would drop a `CategoricalIndex` when grouped on (GH35792)

**Contributors**

A total of 18 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

5.3.3 What’s new in 1.1.3 (October 5, 2020)

These are the changes in pandas 1.1.3. See Release notes for a full changelog including other versions of pandas.

Enhancements

Added support for new Python version

pandas 1.1.3 now supports Python 3.9 (GH36296).

Development Changes

- The minimum version of Cython is now the most recent bug-fix version (0.29.21) (GH36296).

Fixed regressions

- Fixed regression in `DataFrame.agg()`, `DataFrame.apply()`, `Series.agg()`, and `Series.apply()` where internal suffix is exposed to the users when no relabelling is applied (GH36189)
- Fixed regression in `IntArray` unary plus and minus operations raising a `TypeError` (GH36063)
- Fixed regression when adding a `timedelta_range()` to a `Timestamp` raised a `ValueError` (GH35897)
- Fixed regression in `Series.__getitem__()` incorrectly raising when the input was a tuple (GH35534)
- Fixed regression in `Series.__getitem__()` incorrectly raising when the input was a frozenset (GH35747)
- Fixed regression in modulo of `Index`, `Series` and `DataFrame` using `numexpr` using C not Python semantics (GH36047, GH36526)
- Fixed regression in `read_excel()` with `engine="odf"` caused `UnboundLocalError` in some cases where cells had nested child nodes (GH36122, GH35802)
- Fixed regression in `DataFrame.replace()` inconsistent replace when using a float in the replace method (GH35376)
- Fixed regression in `Series.loc()` on a `Series` with a `MultiIndex` containing `Timestamp` raising `InvalidIndexError` (GH35858)
- Fixed regression in `DataFrame` and `Series` comparisons between numeric arrays and strings (GH35700, GH36377)
- Fixed regression in `DataFrame.apply()` with `raw=True` and user-function returning string (GH35940)
- Fixed regression when setting empty `DataFrame` column to a `Series` in preserving name of index in frame (GH36527)
- Fixed regression in `Period` incorrect value for ordinal over the maximum timestamp (GH36430)
• Fixed regression in `read_table()` raised `ValueError` when `delim_whitespace` was set to `True` (GH35958)
• Fixed regression in `Series.dt.normalize()` when normalizing pre-epoch dates the result was shifted one day (GH36294)

**Bug fixes**

• Bug in `read_spss()` where passing a `pathlib.Path` as `path` would raise a `TypeError` (GH33666)
• Bug in `Series.str.startswith()` and `Series.str.endswith()` with category dtype not propagating `na` parameter (GH36241)
• Bug in `Series` constructor where integer overflow would occur for sufficiently large scalar inputs when an index was provided (GH36291)
• Bug in `DataFrame.sort_values()` raising an `AttributeError` when sorting on a key that casts column to categorical dtype (GH36383)
• Bug in `DataFrame.stack()` raising a `ValueError` when stacking `MultiIndex` columns based on position when the levels had duplicate names (GH36353)
• Bug in `Series.astype()` showing too much precision when casting from `np.float32` to string dtype (GH36451)
• Bug in `Series.isin()` and `DataFrame.isin()` when using `NaN` and a row length above 1,000,000 (GH22205)
• Bug in `cut()` raising a `ValueError` when passed a `Series` of labels with `ordered=False` (GH36603)

**Other**

• Reverted enhancement added in pandas-1.1.0 where `timedelta_range()` infers a frequency when passed `start`, `stop`, and `periods` (GH32377)

**Contributors**

5.3.4 What’s new in 1.1.2 (September 8, 2020)

These are the changes in pandas 1.1.2. See Release notes for a full changelog including other versions of pandas.

Fixed regressions

- Regression in `DatetimeIndex.intersection()` incorrectly raising AssertionError when intersecting against a list (GH35876)
- Fix regression in updating a column inplace (e.g. using `df['col'].fillna(..., inplace=True)`) (GH35731)
- Fix regression in `DataFrame.append()` mixing tz-aware and tz-naive datetime columns (GH35460)
- Performance regression for `RangeIndex.format()` (GH35712)
- Regression where `MultiIndex.get_loc()` would return a slice spanning the full index when passed an empty list (GH35878)
- Fix regression in invalid cache after an indexing operation; this can manifest when setting which does not update the data (GH35521)
- Regression in `DataFrame.replace()` where a `TypeError` would be raised when attempting to replace elements of type `Interval` (GH35931)
- Fix regression in pickle roundtrip of the `closed` attribute of `IntervalIndex` (GH35658)
- Fixed regression in `DataFrameGroupBy.agg()` where a `ValueError: buffer source array is read-only` would be raised when the underlying array is read-only (GH36014)
- Fixed regression in `Series.groupby.rolling()` number of levels of `MultiIndex` in input was compressed to one (GH36018)
- Fixed regression in `DataFrameGroupBy` on an empty `DataFrame` (GH36197)

Bug fixes

- Bug in `DataFrame.eval()` with object dtype column binary operations (GH35794)
- Bug in `Series` constructor raising a `TypeError` when constructing sparse datetime64 dtypes (GH35762)
- Bug in `DataFrame.apply()` with `result_type="reduce"` returning with incorrect index (GH35683)
- Bug in `Series.astype()` and `DataFrame.astype()` not respecting the `errors` argument when set to "ignore" for extension dtypes (GH35471)
- Bug in `DateTimeIndex.format()` and `PeriodIndex.format()` with `name=True` setting the first item to "None" where it should be "" (GH35712)
- Bug in `Float64Index.__contains__()` incorrectly raising `TypeError` instead of returning `False` (GH35788)
• Bug in `Series` constructor incorrectly raising a `TypeError` when passed an ordered set (GH36044)
• Bug in `Series.dt.isocalendar()` and `DatetimeIndex.isocalendar()` that returned incorrect year for certain dates (GH36032)
• Bug in `DataFrame` indexing returning an incorrect `Series` in some cases when the series has been altered and a cache not invalidated (GH33675)
• Bug in `DataFrame.corr()` causing subsequent indexing lookups to be incorrect (GH35882)
• Bug in `import_optional_dependency()` returning incorrect package names in cases where package name is different from import name (GH35948)
• Bug when setting empty `DataFrame` column to a `Series` in preserving name of index in frame (GH31368)

Other

• `factorize()` now supports `na_sentinel=None` to include NaN in the uniques of the values and remove `dropna` keyword which was unintentionally exposed to public facing API in 1.1 version from `factorize()` (GH35667)
• `DataFrame.plot()` and `Series.plot()` raise `UserWarning` about usage of `FixedFormatter` and `FixedLocator` (GH35684 and GH35945)

5.3.5 What’s new in 1.1.1 (August 20, 2020)

These are the changes in pandas 1.1.1. See Release notes for a full changelog including other versions of pandas.

Fixed regressions

- Fixed regression in `CategoricalIndex.format()` where, when stringified scalars had different lengths, the shorter string would be right-filled with spaces, so it had the same length as the longest string (GH35439)
- Fixed regression in `Series.truncate()` when trying to truncate a single-element series (GH35544)
- Fixed regression where `DataFrame.to_numpy()` would raise a `RuntimeError` for mixed dtypes when converting to `str` (GH35455)
- Fixed regression where `read_csv()` would raise a `ValueError` when `pandas.options.mode.use_inf_as_na` was set to `True` (GH35493)
- Fixed regression where `pandas.testing.assert_series_equal()` would raise an error when non-numeric dtypes were passed with `check_exact=True` (GH35446)
- Fixed regression in `.groupby(...).rolling(...)` where column selection was ignored (GH35486)
- Fixed regression where `DataFrame.interpolate()` would raise a `TypeError` when the `DataFrame` was empty (GH35598)
- Fixed regression in `DataFrame.shift()` with `axis=1` and heterogeneous dtypes (GH35488)
- Fixed regression in `DataFrame.diff()` with read-only data (GH35559)
- Fixed regression in `.groupby(...).rolling(...)` where a segfault would occur with `center=True` and an odd number of values (GH35552)
- Fixed regression in `DataFrame.apply()` where functions that altered the input in-place only operated on a single row (GH35462)
- Fixed regression in `DataFrame.reset_index()` would raise a `ValueError` on empty `DataFrame` with a `MultiIndex` with a `datetime64` dtype level (GH35606, GH35657)
- Fixed regression where `pandas.merge_asof()` would raise a `UnboundLocalError` when `left_index`, `right_index` and `tolerance` were set (GH35558)
- Fixed regression in `.groupby(...).rolling(...)` where a custom `BaseIndexer` would be ignored (GH35557)
- Fixed regression in `DataFrame.replace()` and `Series.replace()` where compiled regular expressions would be ignored during replacement (GH35680)
- Fixed regression in `aggregate()` where a list of functions would produce the wrong results if at least one of the functions did not aggregate (GH35490)
- Fixed memory usage issue when instantiating large `pandas.arrays.StringArray` (GH35499)
Bug fixes

- Bug in *Styler* whereby *cell_ids* argument had no effect due to other recent changes (GH35588) (GH35663)
- Bug in *pandas.testing.assert_series_equal()* and *pandas.testing.assert_frame_equal()* where extension dtypes were not ignored when *check_dtypes* was set to False (GH35715)
- Bug in *to_timedelta()* fails when *arg* is a *Series* with *Int64* dtype containing null values (GH35574)
- Bug in *groupby(..).rolling(..)* where passing *closed* with column selection would raise a *ValueError* (GH35549)
- Bug in *DataFrame* constructor failing to raise *ValueError* in some cases when *data* and *index* have mismatched lengths (GH33437)

5.3.6 What’s new in 1.1.0 (July 28, 2020)

These are the changes in pandas 1.1.0. See Release notes for a full changelog including other versions of pandas.

Enhancements

KeyErrors raised by loc specify missing labels

Previously, if labels were missing for a .loc call, a KeyError was raised stating that this was no longer supported. Now the error message also includes a list of the missing labels (max 10 items, display width 80 characters). See GH34272.

All dtypes can now be converted to StringDtype

Previously, declaring or converting to StringDtype was in general only possible if the data was already only str or nan-like (GH31204). StringDtype now works in all situations where astype(str) or dtype=str work:

For example, the below now works:

```python
In [1]: ser = pd.Series([1, "abc", np.nan], dtype="string")
In [2]: ser
Out[2]:
0    1
1    abc
2    <NA>
dtype: string

In [3]: ser[0]
Out[3]: '1'

In [4]: pd.Series([1, 2, np.nan], dtype="Int64").astype("string")
Out[4]:
0    1
1    2
2    <NA>
dtype: string
```

Non-monotonic PeriodIndex partial string slicing

PeriodIndex now supports partial string slicing for non-monotonic indexes, mirroring DatetimeIndex behavior (GH31096)

For example:

```python
In [5]: dti = pd.date_range("2014-01-01", periods=30, freq="30D")
In [6]: pi = dti.to_period("D")
In [7]: ser_monotonic = pd.Series(np.arange(30), index=pi)
In [8]: shuffler = list(range(0, 30, 2)) + list(range(1, 31, 2))
```

(continues on next page)
Comparing two DataFrame or two Series and summarizing the differences

We've added DataFrame.compare() and Series.compare() for comparing two DataFrame or two Series (GH30429)
In [14]: df
Out[14]:
   col1  col2  col3
0    a    1.0  1.0
1    a    2.0  2.0
2    b    3.0  3.0
3    b  NaN  4.0
4    a    5.0  5.0

In [15]: df2 = df.copy()

In [16]: df2.loc[0, 'col1'] = 'c'

In [17]: df2.loc[2, 'col3'] = 4.0

In [18]: df2
Out[18]:
   col1  col2  col3
0    c    1.0  1.0
1    a    2.0  2.0
2    b    3.0  4.0
3    b  NaN  4.0
4    a    5.0  5.0

In [19]: df.compare(df2)
Out[19]:
   col1  col3
  self  other  self  other
0    a    c  NaN  NaN
2  NaN  NaN   3.0  4.0

See User Guide for more details.

Allow NA in groupby key

With groupby, we’ve added a dropna keyword to DataFrame.groupby() and Series.groupby() in order to allow NA values in group keys. Users can define dropna to False if they want to include NA values in groupby keys. The default is set to True for dropna to keep backwards compatibility (GH3729)

In [20]: df_list = [[1, 2, 3], [1, None, 4], [2, 1, 3], [1, 2, 2]]

In [21]: df_dropna = pd.DataFrame(df_list, columns=['a', 'b', 'c'])

In [22]: df_dropna
Out[22]:
   a  b  c
0  1  2.0  3
1  1   NaN  4
2  2  1.0  3
3  1  2.0  2

# Default `dropna` is set to True, which will exclude NaNs in keys
In [23]: df_dropna.groupby(by=['b'], dropna=True).sum()
Out[23]:
(continues on next page)
# In order to allow NaN in keys, set `dropna` to False

```
In [24]: df_dropna.groupby(by="b", dropna=False).sum()
Out[24]:
   a  c
  b
1.0 2 3
2.0 2 5
NaN 1 4
```

The default setting of `dropna` argument is `True` which means NA are not included in group keys.

## Sorting with keys

We’ve added a `key` argument to the `DataFrame` and `Series` sorting methods, including `DataFrame.sort_values()`, `DataFrame.sort_index()`, `Series.sort_values()`, and `Series.sort_index()`. The `key` can be any callable function which is applied column-by-column to each column used for sorting, before sorting is performed (GH27237). See `sort_values with keys` and `sort_index with keys` for more information.

```
In [25]: s = pd.Series(['C', 'a', 'B'])

In [26]: s.sort_values()
Out[26]:
2  B
1  a
0  C
```

Note how this is sorted with capital letters first. If we apply the `Series.str.lower()` method, we get

```
In [28]: s.sort_values(key=lambda x: x.str.lower())
Out[28]:
1  a
2  B
0  C
```

When applied to a `DataFrame`, they key is applied per-column to all columns or a subset if `by` is specified, e.g.

```
In [29]: df = pd.DataFrame({'a': ['C', 'C', 'a', 'a', 'B', 'B'], 'b': [1, 2, 3, 4, 5, 6]})
   ....:
   ....:
```
In [30]: df
Out[30]:
   a  b
0  C  1
1  C  2
2  a  3
3  a  4
4  B  5
5  B  6

In [31]: df.sort_values(by=['a'], key=lambda col: col.str.lower())
Out[31]:
   a  b
2  a  3
3  a  4
4  B  5
5  B  6
0  C  1
1  C  2

For more details, see examples and documentation in `DataFrame.sort_values()`, `Series.sort_values()`, and `sort_index()`.

Fold argument support in Timestamp constructor

Timestamp: now supports the keyword-only fold argument according to PEP 495 similar to parent `datetime` class. It supports both accepting fold as an initialization argument and inferring fold from other constructor arguments (GH25057, GH31338). Support is limited to `dateutil` timezones as `pytz` doesn’t support fold.

For example:

In [32]: ts = pd.Timestamp("2019-10-27 01:30:00+00:00")
In [33]: ts.fold
Out[33]: 0

In [34]: ts = pd.Timestamp(year=2019, month=10, day=27, hour=1, minute=30,
.....:           tz="dateutil//usr/share/zoneinfo/Europe/London", fold=1)
.....:

In [35]: ts
Out[35]: Timestamp('2019-10-27 01:30:00+0000', tz='dateutil//usr/share/zoneinfo/Europe/London')

For more on working with fold, see Fold subsection in the user guide.
Parsing timezone-aware format with different timezones in to_datetime

to_datetime() now supports parsing formats containing timezone names (%Z) and UTC offsets (%z) from different timezones then converting them to UTC by setting utc=True. This would return a DatetimeIndex with timezone at UTC as opposed to an Index with object dtype if utc=True is not set (GH32792).

For example:

```python
In [36]: tz_strs = ['2010-01-01 12:00:00 +0100',
                  '2010-01-01 12:00:00 +0300',
                  '2010-01-01 12:00:00 +0400']
In [37]: pd.to_datetime(tz_strs, format='%Y-%m-%d %H:%M:%S %z', utc=True)
Out[37]:
        DatetimeIndex(['2010-01-01 11:00:00+00:00', '2010-01-01 13:00:00+00:00', '2010-01-01 09:00:00+00:00', '2010-01-01 08:00:00+00:00'],
                       dtype='datetime64[ns, UTC]', freq=None)
In [38]: pd.to_datetime(tz_strs, format='%Y-%m-%d %H:%M:%S %z')
Out[38]:
        Index(['2010-01-01 12:00:00+01:00', '2010-01-01 12:00:00-01:00', '2010-01-01 12:00:00+03:00', '2010-01-01 12:00:00+04:00'],
               dtype='object')
```

Grouper and resample now supports the arguments origin and offset

Grouper and DataFrame.resample() now supports the arguments origin and offset. It let the user control the timestamp on which to adjust the grouping. (GH31809)

The bins of the grouping are adjusted based on the beginning of the day of the time series starting point. This works well with frequencies that are multiples of a day (like 30D) or that divides a day (like 90s or 1min). But it can create inconsistencies with some frequencies that do not meet this criteria. To change this behavior you can now specify a fixed timestamp with the argument origin.

Two arguments are now deprecated (more information in the documentation of DataFrame.resample()):

- base should be replaced by offset.
- loffset should be replaced by directly adding an offset to the index DataFrame after being resampled.

Small example of the use of origin:

```python
In [39]: start, end = '2000-10-01 23:30:00', '2000-10-02 00:30:00'
In [40]: middle = '2000-10-02 00:00:00'
In [41]: rng = pd.date_range(start, end, freq='7min')
In [42]: ts = pd.Series(np.arange(len(rng)) * 3, index=rng)
In [43]: ts
Out[43]:
2000-10-01 23:30:00    0
2000-10-01 23:37:00    3
2000-10-01 23:44:00    6
2000-10-01 23:51:00    9
2000-10-01 23:58:00   12
```

(continues on next page)
Resample with the default behavior 'start_day' (origin is 2000-10-01 00:00:00):

```
In [44]: ts.resample('17min').sum()
Out[44]:
2000-10-01 23:14:00  0
2000-10-01 23:31:00  9
2000-10-01 23:48:00  21
2000-10-02  00:05:00  54
2000-10-02  00:22:00  24
Freq: 17T, dtype: int64
```

```
In [45]: ts.resample('17min', origin='start_day').sum()
Out[45]:
2000-10-01 23:14:00  0
2000-10-01 23:31:00  9
2000-10-01 23:48:00  21
2000-10-02  00:05:00  54
2000-10-02  00:22:00  24
Freq: 17T, dtype: int64
```

Resample using a fixed origin:

```
In [46]: ts.resample('17min', origin='epoch').sum()
Out[46]:
2000-10-01 23:18:00  0
2000-10-01 23:35:00  18
2000-10-01 23:52:00  27
2000-10-02  00:09:00  39
2000-10-02  00:26:00  24
Freq: 17T, dtype: int64
```

```
In [47]: ts.resample('17min', origin='2000-01-01').sum()
Out[47]:
2000-10-01 23:24:00  3
2000-10-01 23:41:00  15
2000-10-01 23:58:00  45
2000-10-02  00:15:00  45
Freq: 17T, dtype: int64
```

If needed you can adjust the bins with the argument `offset` (a `Timedelta`) that would be added to the default origin.

For a full example, see: *Use origin or offset to adjust the start of the bins.*
fsspec now used for filesystem handling

For reading and writing to filesystems other than local and reading from HTTP(S), the optional dependency fsspec will be used to dispatch operations (GH33452). This will give unchanged functionality for S3 and GCS storage, which were already supported, but also add support for several other storage implementations such as Azure Datalake and Blob, SSH, FTP, dropbox and github. For docs and capabilities, see the fsspec docs.

The existing capability to interface with S3 and GCS will be unaffected by this change, as fsspec will still bring in the same packages as before.

Other enhancements

- Compatibility with matplotlib 3.3.0 (GH34850)
- IntegerArray.astype() now supports datetime64 dtype (GH32538)
- IntegerArray now implements the sum operation (GH33172)
- Added pandas.errors.InvalidIndexError (GH34570).
- Added DataFrame.value_counts() (GH5377)
- Added a pandas.api.indexers.FixedForwardWindowIndexer() class to support forward-looking windows during rolling operations.
- Added a pandas.api.indexers.VariableOffsetWindowIndexer() class to support rolling operations with non-fixed offsets (GH34994)
- describe() now includes a datetime_is_numeric keyword to control how datetime columns are summarized (GH30164, GH34798)
- Styler may now render CSS more efficiently where multiple cells have the same styling (GH30876)
- highlight_null() now accepts subset argument (GH31345)
- When writing directly to a sqlite connection DataFrame.to_sql() now supports the multi method (GH29921)
- pandas.errors.OptionError is now exposed in pandas.errors (GH27553)
- Added api.extensions.ExtensionArray.argmax() and api.extensions.ExtensionArray.argmin() (GH24382)
- timedelta_range() will now infer a frequency when passed start, stop, and periods (GH32377)
- Positional slicing on a IntervalIndex now supports slices with step > 1 (GH31658)
- Series.str now has a fullmatch method that matches a regular expression against the entire string in each row of the Series, similar to re.fullmatch (GH32806).
- DataFrame.sample() will now also allow array-like and BitGenerator objects to be passed to random_state as seeds (GH32503)
- Index.union() will now raise RunTimeWarning for MultiIndex objects if the object inside are un-sortable. Pass sort=False to suppress this warning (GH33015)
- Added Series.dt.isocalendar() and DatetimeIndex.isocalendar() that returns a DataFrame with year, week, and day calculated according to the ISO 8601 calendar (GH33206, GH34392).
- The DataFrame.to_feather() method now supports additional keyword arguments (e.g. to set the compression) that are added in pyarrow 0.17 (GH33422).
• The `cut()` will now accept parameter `ordered` with default `ordered=True`. If `ordered=False` and no labels are provided, an error will be raised (GH33141).

• `DataFrame.to_csv()`, `DataFrame.to_pickle()`, and `DataFrame.to_json()` now support passing a dict of compression arguments when using the gzip and bz2 protocols. This can be used to set a custom compression level, e.g., `df.to_csv(path, compression={"method": "gzip", 'compresslevel': 1})` (GH33196).

• `melt()` has gained an `ignore_index` (default `True`) argument that, if set to `False`, prevents the method from dropping the index (GH17440).

• `Series.update()` now accepts objects that can be coerced to a `Series`, such as dict and list, mirroring the behavior of `DataFrame.update()` (GH3215).

• `transform()` and `aggregate()` have gained `engine` and `engine_kwargs` arguments that support executing functions with Numba (GH32854, GH33388).

• DataFrameGroupBy and SeriesGroupBy now implement the sample method for doing random sampling within groups (GH31775).

• `DataFrame.to_numpy()` now supports the `na_value` keyword to control the NA sentinel in the output array (GH33820).

• Added `api.extension.ExtensionArray.equals` to the extension array interface, similar to `Series.equals()` (GH27081).

• The minimum supported dtxt version has increased to 105 in `read_stata()` and StataReader (GH26667).

• `to_stata()` supports compression using the `compression` keyword argument. Compression can either be inferred or explicitly set using a string or a dictionary containing both the method and any additional arguments that are passed to the compression library. Compression was also added to the low-level Stata-file writers StataWriter, StataWriter117, and StataWriterUTF8 (GH26599).

• `HDFStore.put()` now accepts a `track_times` parameter. This parameter is passed to the `create_table` method of PyTables (GH32682).

• `Series.plot()` and `DataFrame.plot()` now accepts `xlabel` and `ylabel` parameters to present labels on x and y axis (GH9093).

• Made pandas.core.window.rolling.Rolling and pandas.core.window.expanding.Expanding iterable (GH11704).

• Made `option_context` a `contextlib.ContextDecorator`, which allows it to be used as a decorator over an entire function (GH34253).

• `concat()` and `append()` now preserve extension dtypes, for example combining a nullable integer column with a numpy integer column will no longer result in object dtype but preserve the integer dtype (GH33607, GH34339, GH34095).

• `read_gbq()` now allows to disable progress bar (GH33360).
pandas: powerful Python data analysis toolkit, Release 1.3.1

- `read_gbq()` now supports the `max_results` kwarg from pandas-gbq (GH34639).
- `DataFrame.cov()` and `Series.cov()` now support a new parameter `ddof` to support delta degrees of freedom as in the corresponding numpy methods (GH34611).
- `DataFrame.to_html()` and `DataFrame.to_string()`'s `col_space` parameter now accepts a list or dict to change only some specific columns' width (GH28917).
- `DataFrame.to_excel()` can now also write OpenOffice spreadsheet (.ods) files (GH27222)
- `explode()` now accepts `ignore_index` to reset the index, similar to `pd.concat()` or `DataFrame.sort_values()` (GH34932).
- `DataFrame.to_markdown()` and `Series.to_markdown()` now accept `index` argument as an alias for tabulate's `showindex` (GH32667)
- `read_csv()` now accepts string values like “0”, “0.0”, “1”, “1.0” as convertible to the nullable Boolean dtype (GH34859)
- pandas.core.window.ExponentialMovingWindow now supports a `times` argument that allows mean to be calculated with observations spaced by the timestamps in `times` (GH34839)
- `DataFrame.agg()` and `Series.agg()` now accept named aggregation for renaming the output columns/indexes. (GH26513)
- `compute.use_numba` now exists as a configuration option that utilizes the numba engine when available (GH33966, GH35374)
- `Series.plot()` now supports asymmetric error bars. Previously, if `Series.plot()` received a “2xN” array with error values for `yerr` and/or `xerr`, the left/lower values (first row) were mirrored, while the right/upper values (second row) were ignored. Now, the first row represents the left/lower error values and the second row the right/upper error values. (GH9536)

**Notable bug fixes**

These are bug fixes that might have notable behavior changes.

**MultiIndex.get_indexer interprets method argument correctly**

This restores the behavior of `MultiIndex.get_indexer()` with `method='backfill'` or `method='pad'` to the behavior before pandas 0.23.0. In particular, MultiIndexes are treated as a list of tuples and padding or backfilling is done with respect to the ordering of these lists of tuples (GH29896).

As an example of this, given:

```python
In [48]: df = pd.DataFrame({
.....:     'a': [0, 0, 0, 0],
.....:     'b': [0, 2, 3, 4],
.....:     'c': ['A', 'B', 'C', 'D'],
.....: }).set_index(['a', 'b'])
.....:

In [49]: mi_2 = pd.MultiIndex.from_product([[0], [-1, 0, 1, 3, 4, 5]])
```

The differences in reindexing `df` with `mi_2` and using `method='backfill'` can be seen here:

`pandas >= 0.23, < 1.1.0:`
In [1]: df.reindex(mi_2, method='backfill')
Out[1]:
   c
0 -1  A
  0  A
  1  D
  3  A
  4  A
  5  C

pandas <0.23, >= 1.1.0

In [50]: df.reindex(mi_2, method='backfill')
Out[50]:
   c
0 -1  A
  0  A
  1  B
  3  C
  4  D
  5  NaN

And the differences in reindexing df with mi_2 and using method='pad' can be seen here:

pandas >= 0.23, < 1.1.0

In [1]: df.reindex(mi_2, method='pad')
Out[1]:
   c
0 -1  NaN
  0  NaN
  1  D
  3  NaN
  4  A
  5  C

pandas < 0.23, >= 1.1.0

In [51]: df.reindex(mi_2, method='pad')
Out[51]:
   c
0 -1  NaN
  0  A
  1  A
  3  C
  4  D
  5  D
Failed label-based lookups always raise KeyError

Label lookups `series[key], series.loc[key]` and `frame.loc[key]` used to raise either KeyError or TypeError depending on the type of key and type of Index. These now consistently raise KeyError (GH31867)

```python
In [52]: ser1 = pd.Series(range(3), index=[0, 1, 2])
In [53]: ser2 = pd.Series(range(3), index=pd.date_range("2020-02-01", periods=3))
```

**Previous behavior:**

```python
In [3]: ser1[1.5]
...TypeError: cannot do label indexing on Int64Index with these indexers [1.5] of type float
In [4] ser1["foo"]
...KeyError: 'foo'
In [5]: ser1.loc[1.5]
...TypeError: cannot do label indexing on Int64Index with these indexers [1.5] of type float
In [6]: ser1.loc["foo"]
...KeyError: 'foo'
In [7]: ser1.loc[1]
...TypeError: cannot do label indexing on DatetimeIndex with these indexers [1] of type int
In [8]: ser2.loc[pd.Timestamp(0)]
...KeyError: Timestamp('1970-01-01 00:00:00')
```

**New behavior:**

```python
In [3]: ser1[1.5]
...KeyError: 1.5
In [4] ser1["foo"]
...KeyError: 'foo'
In [5]: ser1.loc[1.5]
...KeyError: 1.5
In [6]: ser1.loc["foo"]
...KeyError: 'foo'
In [7]: ser2.loc[1]
```

(continues on next page)
...  
KeyError: 1  
In [8]: ser2.loc[pd.Timestamp(0)]  
...  
KeyError: Timestamp('1970-01-01 00:00:00')

Similarly, DataFrame.at() and Series.at() will raise a TypeError instead of a ValueError if an incompatible key is passed, and KeyError if a missing key is passed, matching the behavior of .loc[] (GH31722)

Failed Integer Lookups on MultiIndex Raise KeyError

Indexing with integers with a MultiIndex that has an integer-dtype first level incorrectly failed to raise KeyError when one or more of those integer keys is not present in the first level of the index (GH33539)

In [54]: idx = pd.Index(range(4))  
In [55]: dti = pd.date_range("2000-01-03", periods=3)  
In [56]: mi = pd.MultiIndex.from_product([idx, dti])  
In [57]: ser = pd.Series(range(len(mi)), index=mi)

Previous behavior:

In [5]: ser[[5]]  
Out[5]: Series([], dtype: int64)

New behavior:

In [5]: ser[[5]]  
...  
KeyError: '[5] not in index'

DataFrame.merge() preserves right frame's row order

DataFrame.merge() now preserves the right frame’s row order when executing a right merge (GH27453)

In [58]: left_df = pd.DataFrame({'animal': ['dog', 'pig'],  
                             'max_speed': [40, 11]})  
In [59]: right_df = pd.DataFrame({'animal': ['quetzal', 'pig'],  
                                'max_speed': [80, 11]})  
In [60]: left_df
Out[60]:  
   animal  max_speed
0   dog      40
1   pig      11
In [61]: right_df
(continues on next page)
Assignment to multiple columns of a DataFrame when some columns do not exist

Assignment to multiple columns of a DataFrame when some of the columns do not exist would previously assign the values to the last column. Now, new columns will be constructed with the right values. (GH13658)

```python
In [63]: df = pd.DataFrame({'a': [0, 1, 2], 'b': [3, 4, 5]})

In [64]: df
Out[64]:
   a  b
0  0  3
1  1  4
2  2  5

Previous behavior:

In [3]: df[['a', 'c']] = 1
In [4]: df
Out[4]:
   a  b
0  1  1
1  1  1
2  1  1

New behavior:

In [65]: df[['a', 'c']] = 1
In [66]: df
Out[66]:
   a  b  c
0  1  3  1
1  1  4  1
2  1  5  1
```
Consistency across groupby reductions

Using `DataFrame.groupby()` with `as_index=True` and the aggregation `nunique` would include the grouping column(s) in the columns of the result. Now the grouping column(s) only appear in the index, consistent with other reductions. (GH32579)

```python
In [67]: df = pd.DataFrame({"a": ["x", "x", "y", "y"], "b": [1, 1, 2, 3]})
In [68]: df
Out[68]:
   a  b
0  x  1
1  x  1
2  y  2
3  y  3
```

Previous behavior:

```python
In [3]: df.groupby("a", as_index=True).nunique()
Out[4]:
   a  b
   x  1
   y  2
```

New behavior:

```python
In [69]: df.groupby("a", as_index=True).nunique()
Out[69]:
   a  b
   x  1
   y  2
```

Using `DataFrame.groupby()` with `as_index=False` and the function `idxmax`, `idxmin`, `mad`, `nunique`, `sem`, `skew`, or `std` would modify the grouping column. Now the grouping column remains unchanged, consistent with other reductions. (GH21090, GH10355)

Previous behavior:

```python
In [3]: df.groupby("a", as_index=False).nunique()
Out[4]:
   a  b
   0  1
   1  2
```

New behavior:

```python
In [70]: df.groupby("a", as_index=False).nunique()
Out[70]:
   a  b
   0  x
   1  y
```

The method `size()` would previously ignore `as_index=False`. Now the grouping columns are returned as columns, making the result a `DataFrame` instead of a `Series`. (GH32599)

Previous behavior:
In [3]: df.groupby("a", as_index=False).size()
Out[4]:
   a
0 x 2
1 y 2
dtype: int64

New behavior:

In [71]: df.groupby("a", as_index=False).size()
Out[71]:
   a size
0 x 2
1 y 2

agg() lost results with as_index=False when relabeling columns

Previously agg() lost the result columns, when the as_index option was set to False and the result columns were relabeled. In this case the result values were replaced with the previous index (GH32240).

In [72]: df = pd.DataFrame({"key": ["x", "y", "z", "x", "y", "z"],
....:                    "val": [1.0, 0.8, 2.0, 3.0, 3.6, 0.75]})
In [73]: df
Out[73]:
   key  val
0   x   1.00
1   y   0.80
2   z   2.00
3   x   3.00
4   y   3.60
5   z   0.75

Previous behavior:

In [2]: grouped = df.groupby("key", as_index=False)
In [3]: result = grouped.agg(min_val=pd.NamedAgg(column="val", aggfunc="min"))
In [4]: result
Out[4]:
   min_val
0   x
1   y
2   z

New behavior:

In [74]: grouped = df.groupby("key", as_index=False)
In [75]: result = grouped.agg(min_val=pd.NamedAgg(column="val", aggfunc="min"))
In [76]: result
Out[76]:
   key  min_val
0   x   1.00
apply and applymap on DataFrame evaluates first row/column only once

In [77]: df = pd.DataFrame({'a': [1, 2], 'b': [3, 6]})

In [78]: def func(row):
       ....:     print(row)
       ....:     return row
       ....:

Previous behavior:

In [4]: df.apply(func, axis=1)
a 1
b 3
Name: 0, dtype: int64
a 1
b 3
Name: 0, dtype: int64
a 2
b 6
Name: 1, dtype: int64
Out[4]:
a b
0 1 3
1 2 6

New behavior:

In [79]: df.apply(func, axis=1)
a 1
b 3
Name: 0, dtype: int64
a 2
b 6
Name: 1, dtype: int64
Out[79]:
a b
0 1 3
1 2 6

Backwards incompatible API changes

Added check_freq argument to testing.assert_frame_equal and testing.assert_series_equal

The check_freq argument was added to testing.assert_frame_equal() and testing.assert_series_equal() in pandas 1.1.0 and defaults to True. testing.assert_frame_equal() and testing.assert_series_equal() now raise AssertionError if the indexes do not have the same frequency. Before pandas 1.1.0, the index frequency was not checked.
Increased minimum versions for dependencies

Some minimum supported versions of dependencies were updated (GH33718, GH29766, GH29723, pytables >= 3.4.3). If installed, we now require:

<table>
<thead>
<tr>
<th>Package</th>
<th>Minimum Version</th>
<th>Required</th>
<th>Changed</th>
</tr>
</thead>
<tbody>
<tr>
<td>numpy</td>
<td>1.15.4</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>pytz</td>
<td>2015.4</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>python-dateutil</td>
<td>2.7.3</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>bottleneck</td>
<td>1.2.1</td>
<td></td>
<td></td>
</tr>
<tr>
<td>numexpr</td>
<td>2.6.2</td>
<td></td>
<td></td>
</tr>
<tr>
<td>pytest (dev)</td>
<td>4.0.2</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

For optional libraries the general recommendation is to use the latest version. The following table lists the lowest version per library that is currently being tested throughout the development of pandas. Optional libraries below the lowest tested version may still work, but are not considered supported.

<table>
<thead>
<tr>
<th>Package</th>
<th>Minimum Version</th>
<th>Changed</th>
</tr>

</tbody>
</table>

See Dependencies and Optional dependencies for more.

Development changes

- The minimum version of Cython is now the most recent bug-fix version (0.29.16) (GH33334).
Deprecations

- Lookups on a `Series` with a single-item containing a slice (e.g. `ser[[slice(0, 4)]]`) are deprecated and will raise in a future version. Either convert the list to a tuple, or pass the slice directly instead (GH31333)

- `DataFrame.mean()` and `DataFrame.median()` with `numeric_only=None` will include `datetime64` and `datetime64tz` columns in a future version (GH29941)

- Setting values with `.loc` using a positional slice is deprecated and will raise in a future version. Use `.loc` with labels or `.iloc` with positions instead (GH31840)

- `DataFrame.to_dict()` has deprecated accepting short names for `orient` and will raise in a future version (GH32515)

- `Categorical.to_dense()` is deprecated and will be removed in a future version, use `np.asarray(cat)` instead (GH32639)

- The `fastpath` keyword in the `SingleBlockManager` constructor is deprecated and will be removed in a future version (GH33092)

- Providing suffixes as a set in `pandas.merge()` is deprecated. Provide a tuple instead (GH33740, GH34741).

- Indexing a `Series` with a multi-dimensional indexer like `[:, None]` to return an `ndarray` now raises a `FutureWarning`. Convert to a NumPy array before indexing instead (GH27837)

- `Index.is_mixed()` is deprecated and will be removed in a future version, check `index.inferred_type` directly instead (GH32922)

- Passing any arguments but the first one to `read_html()` as positional arguments is deprecated. All other arguments should be given as keyword arguments (GH27573).

- Passing any arguments but `path_or_buf` (the first one) to `read_json()` as positional arguments is deprecated. All other arguments should be given as keyword arguments (GH27573).

- Passing any arguments but the first two to `read_excel()` as positional arguments is deprecated. All other arguments should be given as keyword arguments (GH27573).

- `pandas.api.types.is_categorical()` is deprecated and will be removed in a future version; use `pandas.api.types.is_categorical_dtype()` instead (GH33385)

- `Index.get_value()` is deprecated and will be removed in a future version (GH19728)

- `Series.dt.week()` and `Series.dt.weekofyear()` are deprecated and will be removed in a future version, use `Series.dt.isocalendar().week()` instead (GH33595)

- `DatetimeIndex.week()` and `DatetimeIndex.weekofyear` are deprecated and will be removed in a future version, use `DatetimeIndex.isocalendar().week` instead (GH33595)

- `DatetimeArray.week()` and `DatetimeArray.weekofyear` are deprecated and will be removed in a future version, use `DatetimeArray.isocalendar().week` instead (GH33595)

- `DateOffset.__call__()` is deprecated and will be removed in a future version, use `offset + other` instead (GH34171)

- `apply_index()` is deprecated and will be removed in a future version. Use `offset + other` instead (GH34580)

- `DataFrame.tshift()` and `Series.tshift()` are deprecated and will be removed in a future version, use `DataFrame.shift()` and `Series.shift()` instead (GH11631)

- Indexing an `Index` object with a float key is deprecated, and will raise an `IndexError` in the future. You can manually convert to an integer key instead (GH34191).
pandas: powerful Python data analysis toolkit, Release 1.3.1

- The `squeeze` keyword in `groupby()` is deprecated and will be removed in a future version (GH32380)

- The `tz` keyword in `Period.to_timestamp()` is deprecated and will be removed in a future version; use `per.to_timestamp(...).tz_localize(tz)` instead (GH34522)

- `DatetimeIndex.to_perioddelta()` is deprecated and will be removed in a future version. Use `index.to_period(freq).to_timestamp()` instead (GH34853)

- `DataFrame.melt()` accepting a `value_name` that already exists is deprecated, and will be removed in a future version (GH34731)

- The `center` keyword in the `DataFrame.expanding()` function is deprecated and will be removed in a future version (GH20647)

**Performance improvements**

- Performance improvement in `Timedelta` constructor (GH30543)

- Performance improvement in `Timestamp` constructor (GH30543)

- Performance improvement in flex arithmetic ops between `DataFrame` and `Series` with `axis=0` (GH31296)

- Performance improvement in arithmetic ops between `DataFrame` and `Series` with `axis=1` (GH33600)

- The internal index method `_shallow_copy()` now copies cached attributes over to the new index, avoiding creating these again on the new index. This can speed up many operations that depend on creating copies of existing indexes (GH28584, GH32640, GH32669)

- Significant performance improvement when creating a `DataFrame` with sparse values from `scipy.spmatrix` using the `DataFrame.sparse.from_spmatrix()` constructor (GH32821, GH32825, GH32826, GH32856, GH32858).

- Performance improvement for groupby methods `first()` and `last()` (GH34178)

- Performance improvement in `factorize()` for nullable (integer and Boolean) dtypes (GH33064).

- Performance improvement when constructing `Categorical` objects (GH33921)

- Fixed performance regression in `pandas.qcut()` and `pandas.cut()` (GH33921)

- Performance improvement in reductions (sum, prod, min, max) for nullable (integer and Boolean) dtypes (GH30982, GH33261, GH33442).

- Performance improvement in arithmetic operations between two `DataFrame` objects (GH32779)

- Performance improvement in `pandas.core.groupby.RollingGroupby` (GH34052)

- Performance improvement in arithmetic operations (sub, add, mul, div) for `MultiIndex` (GH34297)

- Performance improvement in `DataFrame[bool_indexer]` when `bool_indexer` is a list (GH33924)

- Significant performance improvement of `io.formats.style.Styler.render()` with styles added with various ways such as `io.formats.style.Styler.apply()`, `io.formats.style.Styler.applymap()` or `io.formats.style.Styler.bar()` (GH19917)
Bug fixes

Categorical

• Passing an invalid `fill_value` to `Categorical.take()` raises a `ValueError` instead of `TypeError` (GH33660)

• Combining a `Categorical` with integer categories and which contains missing values with a float dtype column in operations such as `concat()` or `append()` will now result in a float column instead of an object dtype column (GH33607)

• Bug where `merge()` was unable to join on non-unique categorical indices (GH28189)

• Bug when passing categorical data to `Index` constructor along with `dtype=object` incorrectly returning a `CategoricalIndex` instead of object-dtype `Index` (GH32167)

• Bug where `Categorical` comparison operator `__ne__` would incorrectly evaluate to `False` when either element was missing (GH32276)

• `Categorical.fillna()` now accepts `Categorical` other argument (GH32420)

• Repr of `Categorical` was not distinguishing between `int` and `str` (GH33676)

Datetimelike

• Passing an integer dtype other than `int64` to `np.array(period_index, dtype=...)` will now raise `TypeError` instead of incorrectly using `int64` (GH32255)

• `Series.to_timestamp()` now raises a `TypeError` if the axis is not a `PeriodIndex`. Previously an `AttributeError` was raised (GH33327)

• `Series.to_period()` now raises a `TypeError` if the axis is not a `DatetimeIndex`. Previously an `AttributeError` was raised (GH33327)

• `Period` no longer accepts tuples for the `freq` argument (GH34658)

• Bug in `Timestamp` where constructing a `Timestamp` from ambiguous epoch time and calling constructor again changed the `Timestamp.value()` property (GH24329)

• DatetimeArray.searchsorted(), TimedeltaArray.searchsorted(), PeriodArray.searchsorted() not recognizing non-pandas scalars and incorrectly raising `ValueError` instead of `TypeError` (GH30950)

• Bug in `Timestamp` where constructing `Timestamp` with dateutil timezone less than 128 nanoseconds before daylight saving time switch from winter to summer would result in nonexistent time (GH31043)

• Bug in `Period.to_timestamp()`, `Period.start_time()` with microsecond frequency returning a timestamp one nanosecond earlier than the correct time (GH31475)

• `Timestamp` raised a confusing error message when year, month or day is missing (GH31200)

• Bug in `DatetimeIndex` constructor incorrectly accepting bool-dtype inputs (GH32668)

• Bug in `DatetimeIndex.searchsorted()` not accepting a list or `Series` as its argument (GH32762)

• Bug where `PeriodIndex()` raised when passed a `Series` of strings (GH26109)

• Bug in `Timestamp` arithmetic when adding or subtracting an `np.ndarray` with `timedelta64` dtype (GH33296)

• Bug in `DatetimeIndex.to_period()` not inferring the frequency when called with no arguments (GH33358)
pandas: powerful Python data analysis toolkit, Release 1.3.1

- Bug in `DatetimeIndex.tz_localize()` incorrectly retaining `freq` in some cases where the original `freq` is no longer valid (GH30511)
- Bug in `DatetimeIndex.intersection()` losing `freq` and timezone in some cases (GH33604)
- Bug in `DatetimeIndex.get_indexer()` where incorrect output would be returned for mixed datetime-like targets (GH33741)
- Bug in `DatetimeIndex.addition` and subtraction with some types of `DateOffset` objects incorrectly retaining an invalid `freq` attribute (GH33779)
- Bug in `DatetimeIndex` where setting the `freq` attribute on an index could silently change the `freq` attribute on another index viewing the same data (GH33552)
- `DataFrame.min()` and `DataFrame.max()` were not returning consistent results with `Series.min()` and `Series.max()` when called on objects initialized with empty `pd.to_datetime()`
- Bug in `DatetimeIndex.intersection()` and `TimedeltaIndex.intersection()` with results not having the correct `name` attribute (GH33904)
- Bug in `DatetimeArray.__setitem__()`, `TimedeltaArray.__setitem__()`, `PeriodArray.__setitem__()` incorrectly allowing values with `int64` dtype to be silently cast (GH33717)
- Bug in subtracting `TimedeltaIndex` from `Period` incorrectly raising `TypeError` in some cases where it should succeed and `IncompatibleFrequency` in some cases where it should raise `TypeError` (GH33883)
- Bug in constructing a `Series` or `Index` from a read-only NumPy array with non-ns resolution which converted to object dtype instead of coercing to `datetime64[ns]` dtype when within the timestamp bounds (GH34843).
- The `freq` keyword in `Period`, `date_range()`, `period_range()`, `pd.tseries.frequencies.to_offset()` no longer allows tuples, pass as string instead (GH34703)
- Bug in `DataFrame.append()` when appending a `Series` containing a scalar tz-aware `Timestamp` to an empty `DataFrame` resulted in an object column instead of `datetime64[ns, tz]` dtype (GH35038)
- OutOfBoundsDatetime issues an improved error message when timestamp is out of implementation bounds. (GH32967)
- Bug in `AbstractHolidayCalendar.holidays()` when no rules were defined (GH31415)
- Bug in `Tick` comparisons raising `TypeError` when comparing against timedelta-like objects (GH34088)
- Bug in `Tick` multiplication raising `TypeError` when multiplying by a float (GH34486)

**Timedelta**

- Bug in constructing a `Timedelta` with a high precision integer that would round the `Timedelta` components (GH31354)
- Bug in dividing `np.nan` or `None` by `Timedelta` incorrectly returning `NaT` (GH31869)
- `Timedelta` now understands `µs` as an identifier for microsecond (GH32899)
- `Timedelta` string representation now includes nanoseconds, when nanoseconds are non-zero (GH9309)
- Bug in comparing a `Timedelta` object against an `np.ndarray` with `timedelta64` dtype incorrectly viewing all entries as unequal (GH33441)
- Bug in `timedelta_range()` that produced an extra point on a edge case (GH30353, GH33498)
• Bug in `DataFrame.resample()` that produced an extra point on a edge case (GH30353, GH13022, GH33498)

• Bug in `DataFrame.resample()` that ignored the `loffset` argument when dealing with timedelta (GH7687, GH33498)

• Bug in `Timedelta` and `pandas.to_timedelta()` that ignored the `unit` argument for string input (GH12136)

**Timezones**

• Bug in `to_datetime()` with `infer_datetime_format=True` where timezone names (e.g. UTC) would not be parsed correctly (GH33133)

**Numeric**

• Bug in `DataFrame.floordiv()` with `axis=0` not treating division-by-zero like `Series.floordiv()` (GH31271)

• Bug in `to_numeric()` with string argument "uint64" and `errors="coerce"` silently fails (GH32394)

• Bug in `to_numeric()` with downcast="unsigned" fails for empty data (GH32493)

• Bug in `DataFrame.mean()` with `numeric_only=False` and either `datetime64` dtype or `PeriodDtype` column incorrectly raising `TypeError` (GH32426)

• Bug in `DataFrame.count()` with `level="foo"` and index level "foo" containing NaNs causes segmentation fault (GH21824)

• Bug in `DataFrame.diff()` with `axis=1` returning incorrect results with mixed dtypes (GH32995)

• Bug in `DataFrame.corr()` and `DataFrame.cov()` raising when handling nullable integer columns with `pandas.NA` (GH33803)

• Bug in arithmetic operations between `DataFrame` objects with non-overlapping columns with duplicate labels causing an infinite loop (GH35194)

• Bug in `DataFrame` and `Series` addition and subtraction between object-dtype objects and `datetime64` dtype objects (GH33824)

• Bug in `Index.difference()` giving incorrect results when comparing a `Float64Index` and object `Index` (GH35217)

• Bug in `DataFrame` reductions (e.g. `df.min()`, `df.max()`) with `ExtensionArray` dtypes (GH34520, GH32651)

• `Series.interpolate()` and `DataFrame.interpolate()` now raise a `ValueError` if `limit_direction` is 'forward' or 'both' and method is 'backfill' or 'bfill' or `limit_direction` is 'backward' or 'both' and method is 'pad' or 'ffill' (GH34746)
Conversion

- Bug in `Series` construction from NumPy array with big-endian `datetime64` dtype (GH29684)
- Bug in `Timedelta` construction with large nanoseconds keyword value (GH32402)
- Bug in `DataFrame` construction where sets would be duplicated rather than raising (GH32582)
- The `DataFrame` constructor no longer accepts a list of `DataFrame` objects. Because of changes to NumPy, `DataFrame` objects are now consistently treated as 2D objects, so a list of `DataFrame` objects is considered 3D, and no longer acceptable for the `DataFrame` constructor (GH32289).
- Bug in `DataFrame` when initiating a frame with lists and assign columns with nested list for MultiIndex (GH32173)
- Improved error message for invalid construction of list when creating a new index (GH35190)

Strings

- Bug in the `astype()` method when converting “string” dtype data to nullable integer dtype (GH32450).
- Fixed issue where taking min or max of a `StringArray` or Series with StringDtype type would raise. (GH31746)
- Bug in `Series.str.cat()` returning NaN output when other had `Index` type (GH33425)
- `pandas.api.dtypes.is_string_dtype()` no longer incorrectly identifies categorical series as string.

Interval

- Bug in `IntervalArray` incorrectly allowing the underlying data to be changed when setting values (GH32782)

Indexing

- `DataFrame.xs()` now raises a `TypeError` if a level keyword is supplied and the axis is not a `MultiIndex`. Previously an `AttributeError` was raised (GH33610)
- Bug in slicing on a `DatetimeIndex` with a partial-timestamp dropping high-resolution indices near the end of a year, quarter, or month (GH31064)
- Bug in `PeriodIndex.get_loc()` treating higher-resolution strings differently from `PeriodIndex.get_value` (GH31172)
- Bug in `Series.at()` and `DataFrame.at()` not matching `.loc` behavior when looking up an integer in a `Float64Index` (GH31329)
- Bug in `PeriodIndex.is_monotonic()` incorrectly returning True when containing leading NaT entries (GH31437)
- Bug in `DatetimeIndex.get_loc()` raising `KeyError` with converted-integer key instead of the user-passed key (GH31425)
- Bug in `Series.xs()` incorrectly returning `Timestamp` instead of `datetime64` in some object-dtype cases (GH31630)
- Bug in `DataFrame.iat()` incorrectly returning `Timestamp` instead of `datetime` in some object-dtype cases (GH32809)
- Bug in `DataFrame.at()` when either columns or index is non-unique (GH33041)
- Bug in `Series.loc()` and `DataFrame.loc()` when indexing with an integer key on a object-dtype `Index` that is not all-integers (GH31905)
- Bug in `DataFrame.iloc.__setitem__()` on a `DataFrame` with duplicate columns incorrectly setting values for all matching columns (GH15686, GH22036)
- Bug in `DataFrame.loc()` and `Series.loc()` with a `DatetimeIndex`, `TimedeltaIndex`, or `PeriodIndex` incorrectly allowing lookups of non-matching datetime-like dtypes (GH32650)
- Bug in `Series.__getitem__()` indexing with non-standard scalars, e.g. `np.dtype` (GH32684)
- Bug in `Index` constructor where an unhelpful error message was raised for NumPy scalars (GH33017)
- Bug in `DataFrame.lookup()` incorrectly raising an `AttributeError` when `frame.index` or `frame.columns` is not unique; this will now raise a `ValueError` with a helpful error message (GH33041)
- Bug in `Interval` where a `Timedelta` could not be added or subtracted from a `Timestamp` interval (GH32023)
- Bug in `DataFrame.copy()` not invalidating `_item_cache` after copy caused post-copy value updates to not be reflected (GH31784)
- Fixed regression in `DataFrame.loc()` and `Series.loc()` throwing an error when a `datetime64[ns, tz]` value is provided (GH32395)
- Bug in `Series.__getitem__()` with an integer key and a `MultiIndex` with leading integer level failing to raise `KeyError` if the key is not present in the first level (GH33355)
- Bug in `DataFrame.iloc()` when slicing a single column `DataFrame` with `ExtensionDtype` (e.g. `df.iloc[:, :1]`) returning an invalid result (GH32957)
- Bug in `DatetimeIndex.insert()` and `TimedeltaIndex.insert()` causing `freq` to be lost when setting an element into an empty `Series` (GH33573)
- Bug in `Series.__setitem__()` with an `IntervalIndex` and a list-like key of integers (GH33473)
- Bug in `Series.__getitem__()` allowing missing labels with `np.ndarray`, `Index`, `Series` indexers but not list, these now all raise `KeyError` (GH33646)
- Bug in `DataFrame.truncate()` and `Series.truncate()` where index was assumed to be monotone increasing (GH33756)
- Indexing with a list of strings representing datetimes failed on `DatetimeIndex` or `PeriodIndex` (GH11278)
- Bug in `Series.at()` when used with a `MultiIndex` would raise an exception on valid inputs (GH26989)
- Bug in `DataFrame.loc()` with dictionary of values changes columns with dtype of `int` to `float` (GH34573)
- Bug in `Series.loc()` when used with a `MultiIndex` would raise an `IndexingError` when accessing a `None` value (GH34318)
- Bug in `DataFrame.reset_index()` and `Series.reset_index()` would not preserve data types on an empty `DataFrame` or `Series` with a `MultiIndex` (GH19602)
- Bug in `Series` and `DataFrame` indexing with a time key on a `DatetimeIndex` with `NaT` entries (GH35114)
Missing

- Calling `fillna()` on an empty `Series` now correctly returns a shallow copied object. The behaviour is now consistent with `index`, `DataFrame` and a non-empty `Series` (GH32543).
- Bug in `Series.replace()` when argument `to_replace` is of type dict/list and is used on a `Series` containing `<NA>` was raising a `TypeError`. The method now handles this by ignoring `<NA>` values when doing the comparison for the replacement (GH32621).
- Bug in `any()` and `all()` incorrectly returning `<NA>` for all False or all True values using the nullable Boolean dtype and with `skipna=False` (GH32535).
- Clarified documentation on interpolate with `method=akima`. The `der` parameter must be scalar or `None` (GH33426).
- `DataFrame.interpolate()` uses the correct axis convention now. Previously interpolating along columns lead to interpolation along indices and vice versa. Furthermore interpolating with methods `pad`, `ffill`, `bfill` and `backfill` are identical to using these methods with `DataFrame.fillna()` (GH12918, GH29146).
- Bug in `DataFrame.interpolate()` when called on a `DataFrame` with column names of string type was throwing a `ValueError`. The method is now independent of the type of the column names (GH33956).
- Passing NA into a format string using format specs will now work. For example `"{:.1f}".format(pd.NA)` would previously raise a `ValueError`, but will now return the string "<NA>" (GH34740).
- Bug in `Series.map()` not raising on invalid `na_action` (GH32815).

MultiIndex

- `DataFrame.swaplevels()` now raises a `TypeError` if the axis is not a `MultiIndex`. Previously an `AttributeError` was raised (GH31126).
- Bug in `DataFrame.loc()` when used with a `MultiIndex`. The returned values were not in the same order as the given inputs (GH22797).

```python
In [80]: df = pd.DataFrame(np.arange(4),
                     index=[['a', 'a', 'b', 'b'], [1, 2, 1, 2]])
       ....:
       # Rows are now ordered as the requested keys

In [81]: df.loc[['b', 'a'], [2, 1], :]
Out[81]:
   0  b  2  3
      1  2
   a  2  1
      1  0

In [82]: left = pd.MultiIndex.from_arrays([['b', 'a'], [2, 1]])

In [83]: right = pd.MultiIndex.from_arrays([['a', 'b', 'c'], [1, 2, 3]])

# Common elements are now guaranteed to be ordered by the left side

(continues on next page)
In [84]: left.intersection(right, sort=False)
Out[84]:
MultiIndex([('b', 2),
             ('a', 1)],
           )

- Bug when joining two MultiIndex without specifying level with different columns. Return-indexers parameter was ignored. (GH34074)

**IO**

- Passing a set as names argument to pandas.read_csv(), pandas.read_table(), or pandas.read_fwf() will raise ValueError: Names should be an ordered collection. (GH34946)
- Bug in print-out when display.precision is zero. (GH20359)
- Bug in read_json() where integer overflow was occurring when json contains big number strings. (GH30320)
- read_csv() will now raise a ValueError when the arguments header and prefix both are not None. (GH27394)
- Bug in DataFrame.to_json() was raisingNotFoundError when path_or_buf was an S3 URI (GH28375)
- Bug in DataFrame.to_parquet() overwriting pyarrow’s default for coerce_timestamps; following pyarrow’s default allows writing nanosecond timestamps with version="2.0" (GH31652).
- Bug in read_csv() was raising TypeError when sep=None was used in combination with comment keyword (GH31396)
- Bug in HDFStore that caused it to set to int64 the dtype of a datetime64 column when reading a DataFrame in Python 3 from fixed format written in Python 2 (GH31750)
- read_sas() now handles dates and datetimes larger than Timestamp.max returning them as datetime. datetime objects (GH20927)
- Bug in DataFrame.to_json() where Timedelta objects would not be serialized correctly with date_format="iso" (GH28256)
- read_csv() will raise a ValueError when the column names passed in parse_dates are missing in the Dataframe (GH31251)
- Bug in read_excel() where a UTF-8 string with a high surrogate would cause a segmentation violation (GH23809)
- Bug in read_csv() was causing a file descriptor leak on an empty file (GH31488)
- Bug in read_csv() was causing a segfault when there were blank lines between the header and data rows (GH28071)
- Bug in read_csv() was raising a misleading exception on a permissions issue (GH23784)
- Bug in read_csv() was raising an IndexError when header=None and two extra data columns
- Bug in read_sas() was raising an AttributeError when reading files from Google Cloud Storage (GH3069)
- Bug in DataFrame.to_sql() where an AttributeError was raised when saving an out of bounds date (GH26761)
• Bug in `read_excel()` did not correctly handle multiple embedded spaces in OpenDocument text cells. (GH32207)

• Bug in `read_json()` was raising `TypeError` when reading a list of Booleans into a `Series`. (GH31464)

• Bug in `pandas.io.json.json_normalize()` where location specified by `record_path` doesn’t point to an array. (GH26284)

• `pandas.read_hdf()` has a more explicit error message when loading an unsupported HDF file (GH9539)

• Bug in `read_feather()` was raising an `ArrowIOError` when reading an s3 or http file path (GH29055)

• Bug in `to_excel()` could not handle the column name `render` and was raising an `KeyError` (GH34331)

• Bug in `execute()` was raising a `ProgrammingError` for some DB-API drivers when the SQL statement contained the `%` character and no parameters were present (GH34211)

• Bug in `StataReader()` which resulted in categorical variables with different dtypes when reading data using an iterator. (GH31544)

• `HDFStore.keys()` has now an optional `include` parameter that allows the retrieval of all native HDF5 table names (GH29916)

• `TypeError` exceptions raised by `read_csv()` and `read_table()` were showing as `parser_f` when an unexpected keyword argument was passed (GH25648)

• Bug in `read_excel()` for ODS files removes 0.0 values (GH27222)

• Bug in `ujson.encode()` was raising an `OverflowError` with numbers larger than `sys.maxsize` (GH34395)

• Bug in `HDFStore.append_to_multiple()` was raising a `ValueError` when the `min_itemsize` parameter is set (GH11238)

• Bug in `create_table()` now raises an error when column argument was not specified in `data_columns` on input (GH28156)

• `read_json()` now could read line-delimited json file from a file url while `lines` and `chunksize` are set.

• Bug in `DataFrame.to_sql()` when reading DataFrames with -np.inf entries with MySQL now has a more explicit `ValueError` (GH34431)

• Bug where capitalised files extensions were not decompressed by `read_*` functions (GH35164)

• Bug in `read_excel()` that was raising a `TypeError` when `header=None` and `index_col` is given as a list (GH31783)

• Bug in `read_excel()` where datetime values are used in the header in a `MultiIndex` (GH34748)

• `read_excel()` no longer takes `**kwds` arguments. This means that passing in the keyword argument `chunksize` now raises a `TypeError` (previously raised a `NotImplementedError`), while passing in the keyword argument `encoding` now raises a `TypeError` (GH34464)

• Bug in `DataFrame.to_records()` was incorrectly losing timezone information in timezone-aware datetime64 columns (GH32535)
pandas: powerful Python data analysis toolkit, Release 1.3.1

Plotting

- *DataFrame.plot()* for line/bar now accepts color by dictionary (GH8193).
- Bug in *DataFrame.plot.hist()* where weights are not working for multiple columns (GH33173)
- Bug in *DataFrame.boxplot()* and *DataFrame.plot.boxplot()* lost color attributes of medianprops, whiskerprops, capprops and boxprops (GH30346)
- Bug in *DataFrame.hist()* where the order of column argument was ignored (GH29235)
- Bug in *DataFrame.plot.scatter()* that when adding multiple plots with different *cmap*, colorbars always use the first *cmap* (GH33389)
- Bug in *DataFrame.plot.scatter()* was adding a colorbar to the plot even if the argument *c* was assigned to a column containing color names (GH34316)
- Bug in *pandas.plotting.bootstrap_plot()* was causing cluttered axes and overlapping labels (GH34905)
- Bug in *DataFrame.plot.scatter()* caused an error when plotting variable marker sizes (GH32904)

GroupBy/resample/rolling

- Using a *pandas.api.indexers.BaseIndexer* with count, min, max, median, skew, cov, corr will now return correct results for any monotonic *pandas.api.indexers.BaseIndexer* descendant (GH32865)
- *DataFrameGroupby.mean()* and *SeriesGroupby.mean()* (and similarly for median(), std() and var()) now raise a TypeError if a non-accepted keyword argument is passed into it. Previously an UnsupportedFunctionCall was raised (AssertionError if min_count passed into median()) (GH31485)
- Bug in *GroupBy.apply()* raises ValueError when the by axis is not sorted, has duplicates, and the applied *func* does not mutate passed in objects (GH30667)
- Bug in *DataFrameGroupBy.transform()* produces an incorrect result with transformation functions (GH30918)
- Bug in *Groupby.transform()* was returning the wrong result when grouping by multiple keys of which some were categorical and others not (GH32494)
- Bug in *GroupBy.count()* causes segmentation fault when grouped-by columns contain NaNs (GH32841)
- Bug in *DataFrame.groupby()* and *Series.groupby()* produces inconsistent type when aggregating Boolean Series (GH32894)
- Bug in *DataFrameGroupBy.sum()* and *SeriesGroupBy.sum()* where a large negative number would be returned when the number of non-null values was below min_count for nullable integer dtypes (GH32861)
- Bug in *SeriesGroupBy.quantile()* was raising on nullable integers (GH33136)
- Bug in *DataFrame.resample()* where an AmbiguousTimeError would be raised when the resulting timezone aware DatetimeIndex had a DST transition at midnight (GH25758)
- Bug in *DataFrame.groupby()* where a ValueError would be raised when grouping by a categorical column with read-only categories and sort=False (GH33410)
- Bug in *GroupBy.agg()*, *GroupBy.transform()*, and *GroupBy.resample()* where subclasses are not preserved (GH28330)
pandas: powerful Python data analysis toolkit, Release 1.3.1

- Bug in `SeriesGroupBy.agg()` where any column name was accepted in the named aggregation of `SeriesGroupBy` previously. The behaviour now allows only `str` and callables else would raise `TypeError`. (GH34422)

- Bug in `DataFrame.groupby()` lost the name of the `Index` when one of the `agg` keys referenced an empty list (GH32580)

- Bug in `Rolling.apply()` where `center=True` was ignored when `engine='numba'` was specified (GH34784)

- Bug in `DataFrame.ewm.cov()` was throwing `AssertionError` for `MultiIndex` inputs (GH34440)

- Bug in `core.groupby.DataFrameGroupBy.quantile()` raised `TypeError` for non-numeric types rather than dropping the columns (GH27892)

- Bug in `core.groupby.DataFrameGroupBy.transform()` when `func='nunique'` and columns are of type `datetime64`, the result would also be of type `datetime64` instead of `int64` (GH35109)

- Bug in `DataFrame.groupby()` raising an `AttributeError` when selecting a column and aggregating with `as_index=False` (GH35246)

- Bug in `DataFrameGroupBy.first()` and `DataFrameGroupBy.last()` that would raise an unnecessary `ValueError` when grouping on multiple `Categoricals` (GH34951)

Reshaping

- Bug effecting all numeric and Boolean reduction methods not returning subclassed data type. (GH25596)

- Bug in `DataFrame.pivot_table()` when only `MultiIndexed` columns is set (GH17038)

- Bug in `DataFrame.unstack()` and `Series.unstack()` can take tuple names in `MultiIndexed` data (GH19966)

- Bug in `DataFrame.pivot_table()` when `margin` is `True` and only `column` is defined (GH31016)

- Fixed incorrect error message in `DataFrame.pivot()` when `columns` is set to `None`. (GH31016)

- Bug in `crosstab()` when inputs are two `Series` and have tuple names, the output will keep a dummy `MultiIndex` as columns. (GH18321)

- `DataFrame.pivot()` can now take lists for `index` and `columns` arguments (GH21425)

- Bug in `concat()` where the resulting indices are not copied when `copy=True` (GH29879)

- Bug in `SeriesGroupBy.aggregate()` was resulting in aggregations being overwritten when they shared the same name (GH30880)

- Bug where `Index.astype()` would lose the name attribute when converting from `Float64Index` to `Int64Index`, or when casting to an `ExtensionArray` dtype (GH32013)

- `Series.append()` will now raise a `TypeError` when passed a `DataFrame` or a sequence containing `DataFrame` (GH31413)

- `DataFrame.replace()` and `Series.replace()` will raise a `TypeError` if `to_replace` is not an expected type. Previously the replace would fail silently (GH18634)

- Bug on inplace operation of a `Series` that was adding a column to the `DataFrame` from where it was originally dropped from (using `inplace=True`) (GH30484)

- Bug in `DataFrame.apply()` where callback was called with `Series` parameter even though `raw=True` requested. (GH32423)
• Bug in `DataFrame.pivot_table()` losing timezone information when creating a `MultiIndex` level from a column with timezone-aware dtype (GH32558)
• Bug in `concat()` where when passing a non-dict mapping as `objs` would raise a `TypeError` (GH32863)
• `DataFrame.agg()` now provides more descriptive `SpecificationError` message when attempting to aggregate a non-existent column (GH32755)
• Bug in `DataFrame.unstack()` when `MultiIndex` columns and `MultiIndex` rows were used (GH32624, GH24729 and GH28306)
• Appending a dictionary to a `DataFrame` without passing `ignore_index=True` will raise `TypeError`: Can only append a dict if `ignore_index=True` instead of `TypeError`: Can only append a :class:`Series` if `ignore_index=True` or if the :class:`Series` has a name (GH30871)
• Bug in `DataFrame.corrwith()`, `DataFrame.memory_usage()`, `DataFrame.dot()`, `DataFrame.idxmin()`, `DataFrame.idxmax()`, `DataFrame.duplicated()`, `DataFrame.isin()`, `DataFrame.count()`, `Series.explode()`, `Series.asof()` and `DataFrame.asof()` not returning subclassed types. (GH31331)
• Bug in `concat()` was not allowing for concatenation of `DataFrame` and `Series` with duplicate keys (GH33654)
• Bug in `cut()` raised an error when the argument `labels` contains duplicates (GH33141)
• Ensure only named functions can be used in `eval()` (GH32460)
• Bug in `DataFrame.aggregate()` and `Series.aggregate()` was causing a recursive loop in some cases (GH34224)
• Fixed bug in `melt()` where melting `MultiIndex` columns with `col_level > 0` would raise a `KeyError` on `id_vars` (GH34129)
• Bug in `Series.where()` with an empty `Series` and empty `cond` having non-bool dtype (GH34592)
• Fixed regression where `DataFrame.apply()` would raise `ValueError` for elements with `S` dtype (GH34529)

**Sparse**

• Creating a `SparseArray` from timezone-aware dtype will issue a warning before dropping timezone information, instead of doing so silently (GH32501)
• Bug in `arrays.SparseArray.from_spmatrix()` wrongly read scipy sparse matrix (GH31991)
• Bug in `Series.sum()` with `SparseArray` raised a `TypeError` (GH25777)
• Bug where `DataFrame` containing an all-sparse `SparseArray` filled with NaN when indexed by a list-like (GH27781, GH29563)
• The repr of `SparseDtype` now includes the repr of its `fill_value` attribute. Previously it used `fill_value`'s string representation (GH34352)
• Bug where empty `DataFrame` could not be cast to `SparseDtype` (GH33113)
• Bug in `arrays.SparseArray()` was returning the incorrect type when indexing a sparse dataframe with an iterable (GH34526, GH34540)
ExtensionArray

• Fixed bug where `Series.value_counts()` would raise on empty input of `Int64` dtype (GH33317)
• Fixed bug in `concat()` when concatenating `DataFrame` objects with non-overlapping columns resulting in object-dtype columns rather than preserving the extension dtype (GH27692, GH33027)
• Fixed bug where `StringArray.isna()` would return `False` for NA values when `pandas.options.mode.use_inf_as_na` was set to `True` (GH33655)
• Fixed bug in `Series` construction with EA dtype and index but no data or scalar data fails (GH26469)
• Fixed bug that caused `Series.__repr__()` to crash for extension types whose elements are multidimensional arrays (GH33770).
• Fixed bug where `Series.update()` would raise a `ValueError` for `ExtensionArray` dtypes with missing values (GH33980)
• Fixed bug where `StringArray.memory_usage()` was not implemented (GH33963)
• Fixed bug where `DataFrameGroupBy()` would ignore the `min_count` argument for aggregations on nullable Boolean dtypes (GH34051)
• Fixed bug where the constructor of `DataFrame` with `dtype='string'` would fail (GH27953, GH33623)
• Bug where `DataFrame` column set to scalar extension type was considered an object type rather than the extension type (GH34832)
• Fixed bug in `IntegerArray.astype()` to correctly copy the mask as well (GH34931).

Other

• Set operations on an object-dtype `Index` now always return object-dtype results (GH31401)
• Fixed `pandas.testing.assert_series_equal()` to correctly raise if the left argument is a different subclass with `check_series_type=True` (GH32670).
• Getting a missing attribute in a `DataFrame.query()` or `DataFrame.eval()` string raises the correct `AttributeError` (GH32408)
• Fixed bug in `pandas.testing.assert_series_equal()` where dtypes were checked for `Interval` and `ExtensionArray` operands when `check_dtype` was `False` (GH32747)
• Bug in `DataFrame.__dir__()` caused a segfault when using unicode surrogates in a column name (GH25509)
• Bug in `DataFrame.equals()` and `Series.equals()` in allowing subclasses to be equal (GH34402).

5.4 Version 1.0

5.4.1 What’s new in 1.0.5 (June 17, 2020)

These are the changes in pandas 1.0.5. See Release notes for a full changelog including other versions of pandas.

Fixed regressions

- Fix regression in read_parquet() when reading from file-like objects (GH34467).
- Fix regression in reading from public S3 buckets (GH34626).

Note this disables the ability to read Parquet files from directories on S3 again (GH26388, GH34632), which was added in the 1.0.4 release, but is now targeted for pandas 1.1.0.

- Fixed regression in replace() raising an AssertionError when replacing values in an extension dtype with values of a different dtype (GH34530)

Bug fixes

- Fixed building from source with Python 3.8 fetching the wrong version of NumPy (GH34666)

Contributors

A total of 8 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

- Joris Van den Bossche
- MeeseeksMachine
- Natalie Jann +
- Pandas Development Team
- Simon Hawkins
- Tom Augspurger
- William Ayd
- alimcmaster1
Fixed regressions

- Fix regression where `Series.isna()` and `DataFrame.isna()` would raise for categorical dtype when `pandas.options.mode.use_inf_as_na` was set to True (GH33594)
- Fix regression in `GroupBy.first()` and `GroupBy.last()` where None is not preserved in object dtype (GH32800)
- Fix regression in DataFrame reductions using `numeric_only=True` and ExtensionArrays (GH33256).
- Fix performance regression in `memory_usage(deep=True)` for object dtype (GH33012)
- Fix regression where `Categorical.replace()` would replace with NaN whenever the new value and replacement value were equal (GH33288)
- Fix regression where an ordered `Categorical` containing only NaN values would raise rather than returning NaN when taking the minimum or maximum (GH33450)
- Fix regression in `DataFrameGroupBy.agg()` with dictionary input losing ExtensionArray dtypes (GH32194)
- Fix to preserve the ability to index with the “nearest” method with xarray’s CFTimedeltaIndex, an `Index` subclass (pydata/xarray#3751, GH32905).
- Fix regression in `DataFrame.describe()` raising `TypeError: unhashable type: 'dict'` (GH32409)
- Fix regression in `DataFrame.replace()` casts columns to object dtype if items in `to_replace` not in `values` (GH32988)
- Fix regression in `Series.groupby()` would raise `ValueError` when grouping by `PeriodIndex` level (GH34010)
- Fix regression in `GroupBy.rolling.apply()` ignores `args` and `kwargs` parameters (GH33433)
- Fix regression in error message with `np.min` or `np.max` on unordered `Categorical` (GH33115)
- Fix regression in `DataFrame.loc()` and `Series.loc()` throwing an error when a `datetime64[ns, tz]` value is provided (GH32395)

Bug fixes

- Bug in `SeriesGroupBy.first()`, `SeriesGroupBy.last()`, `SeriesGroupBy.min()`, and `SeriesGroupBy.max()` returning floats when applied to nullable Booleans (GH33071)
- Bug in `Rolling.min()` and `Rolling.max()`: Growing memory usage after multiple calls when using a fixed window (GH30726)
- Bug in `to_parquet()` was not raising `PermissionError` when writing to a private s3 bucket with invalid creds. (GH27679)
- Bug in `to_csv()` was silently failing when writing to an invalid s3 bucket. (GH32486)
- Bug in `read_parquet()` was raising a `FileNotFoundError` when passed an s3 directory path. (GH26388)
• Bug in `to_parquet()` was throwing an AttributeError when writing a partitioned parquet file to s3 (GH27596)

• Bug in `GroupBy.quantile()` causes the quantiles to be shifted when the by axis contains NaN (GH33200, GH33569)

5.4.3 What’s new in 1.0.3 (March 17, 2020)

These are the changes in pandas 1.0.3. See Release notes for a full changelog including other versions of pandas.

Fixed regressions

• Fixed regression in `resample.agg` when the underlying data is non-writeable (GH31710)
• Fixed regression in `DataFrame` exponentiation with reindexing (GH32685)
Bug fixes

Contributors

A total of 5 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

- MeeseeksMachine
- Pandas Development Team
- Tom Augspurger
- William Ayd
- jbrockmendel

5.4.4 What’s new in 1.0.2 (March 12, 2020)

These are the changes in pandas 1.0.2. See Release notes for a full changelog including other versions of pandas.

Fixed regressions

Groupby

- Fixed regression in `groupby(..).agg()` which was failing on frames with MultiIndex columns and a custom function (GH31777)
- Fixed regression in `groupby(..).rolling(..).apply()` (RollingGroupby) where the raw parameter was ignored (GH31754)
- Fixed regression in `rolling(..).corr()` when using a time offset (GH31789)
- Fixed regression in `groupby(..).nunique()` which was modifying the original values if NaN values were present (GH31950)
- Fixed regression in `DataFrame.groupby` raising a `ValueError` from an internal operation (GH31802)
- Fixed regression in `groupby(..).agg()` calling a user-provided function an extra time on an empty input (GH31760)

I/O

- Fixed regression in `read_csv()` in which the encoding option was not recognized with certain file-like objects (GH31819)
- Fixed regression in `DataFrame.to_excel()` when the columns keyword argument is passed (GH31677)
- Fixed regression in ExcelFile where the stream passed into the function was closed by the destructor. (GH31467)
- Fixed regression where `read_pickle()` raised a `UnicodeDecodeError` when reading a py27 pickle with MultiIndex column (GH31988).

Reindexing/alignment

- Fixed regression in `Series.align()` when other is a DataFrame and method is not None (GH31785)
- Fixed regression in `DataFrame.reindex()` and `Series.reindex()` when reindexing with (tz-aware) index and method=nearest (GH26683)
• Fixed regression in `DataFrame.reindex_like()` on a `DataFrame` subclass raised an `AssertionError` (GH31925)

• Fixed regression in `DataFrame` arithmetic operations with mis-matched columns (GH31623)

Other

• Fixed regression in joining on `DatetimeIndex` or `TimedeltaIndex` to preserve `freq` in simple cases (GH32166)

• Fixed regression in `Series.shift()` with `datetime64` dtype when passing an integer `fill_value` (GH32591)

• Fixed regression in the repr of an object-dtype `Index` with bools and missing values (GH32146)

**Indexing with nullable boolean arrays**

Previously indexing with a nullable Boolean array containing NA would raise a `ValueError`, however this is now permitted with NA being treated as `False` (GH31503)

```python
In [1]: s = pd.Series([1, 2, 3, 4])

In [2]: mask = pd.array([True, True, False, None], dtype="boolean")

In [3]: s
Out[3]:
   0  1
  1  2
  2  3
  3  4
dtype: int64

In [4]: mask
Out[4]:
<BooleanArray>
[True, True, False, <NA>]
Length: 4, dtype: boolean
```

```bash
pandas 1.0.0-1.0.1
```

```
>>> s[mask]
Traceback (most recent call last):
...
ValueError: cannot mask with array containing NA / NaN values
```

```bash
pandas 1.0.2
```

```python
In [5]: s[mask]
Out[5]:
   0  1
  1  2
dtype: int64
```
Bug fixes

Datetimelike

- Bug in `Series.astype()` not copying for tz-naive and tz-aware `datetime64` dtype (GH32490)
- Bug where `to_datetime()` would raise when passed `pd.NA` (GH32213)
- Improved error message when subtracting two `Timestamp` that result in an out-of-bounds `Timedelta` (GH31774)

Categorical

- Fixed bug where `Categorical.from_codes()` improperly raised a `ValueError` when passed nullable integer codes. (GH31779)
- Fixed bug where `Categorical()` constructor would raise a `TypeError` when given a numpy array containing `pd.NA`. (GH31927)
- Bug in `Categorical` that would ignore or crash when calling `Series.replace()` with a list-like `to_replace` (GH31720)

I/O

- Using `pd.NA` with `DataFrame.to_json()` now correctly outputs a null value instead of an empty object (GH31615)
- Bug in `pandas.json_normalize()` when value in meta path is not iterable (GH31507)
- Fixed pickling of `pandas.NA`. Previously a new object was returned, which broke computations relying on `NA` being a singleton (GH31847)
- Fixed bug in parquet roundtrip with nullable unsigned integer dtypes (GH31896).

Experimental dtypes

- Fixed bug in `DataFrame.convert_dtypes()` for columns that were already using the "string" dtype (GH31731).
- Fixed bug in `DataFrame.convert_dtypes()` for series with mix of integers and strings (GH32117)
- Fixed bug in `DataFrame.convert_dtypes()` where `BooleanDtype` columns were converted to `Int64` (GH32287)
- Fixed bug in setting values using a slice indexer with string dtype (GH31772)
- Fixed bug where `pandas.core.groupby.GroupBy.first()` and `pandas.core.groupby.GroupBy.last()` would raise a `TypeError` when groups contained `pd.NA` in a column of object dtype (GH32123)
- Fixed bug where `DataFrameGroupBy.mean()`, `DataFrameGroupBy.median()`, `DataFrameGroupBy.var()`, and `DataFrameGroupBy.std()` would raise a `TypeError` on `Int64` dtype columns (GH32219)

Strings

- Using `pd.NA` with `Series.str.repeat()` now correctly outputs a null value instead of raising error for vector inputs (GH31632)

Rolling

- Fixed rolling operations with variable window (defined by time duration) on decreasing time index (GH32385).
Contributors

A total of 25 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

5.4.5 What’s new in 1.0.1 (February 5, 2020)

These are the changes in pandas 1.0.1. See Release notes for a full changelog including other versions of pandas.
Fixed regressions

- Fixed regression in DataFrame setting values with a slice (e.g. df[-4:] = 1) indexing by label instead of position (GH31469)
- Fixed regression when indexing a Series or DataFrame indexed by DatetimeIndex with a slice containing a datetime.date (GH31501)
- Fixed regression in DataFrame.__setitem__ raising an AttributeError with a MultiIndex and a non-monotonic indexer (GH31449)
- Fixed regression in Series multiplication when multiplying a numeric Series with >10000 elements with a timedelta-like scalar (GH31457)
- Fixed regression in .groupby().agg() raising an AssertionError for some reductions like min on object-dtype columns (GH31522)
- Fixed regression in .groupby() aggregations with categorical dtype using Cythonized reduction functions (e.g. first) (GH31450)
- Fixed regression in GroupBy.apply() if called with a function which returned a non-pandas non-scalar object (e.g. a list or numpy array) (GH31441)
- Fixed regression in DataFrame.groupby() whereby taking the minimum or maximum of a column with period dtype would raise a TypeError. (GH31471)
- Fixed regression in DataFrame.groupby() with an empty DataFrame grouping by a level of a MultiIndex (GH31670).
- Fixed regression in DataFrame.apply() with object dtype and non-reducing function (GH31505)
- Fixed regression in to_datetime() when parsing non-nanosecond resolution datetimes (GH31491)
- Fixed regression in to_csv() where specifying a na_rep might truncate the values written (GH31447)
- Fixed regression in Categorical construction with numpy.str_categories (GH31499)
- Fixed regression in DataFrame.loc() and DataFrame.iloc() when selecting a row containing a single datetime64 or timedelta64 column (GH31649)
- Fixed regression where setting pd.options.display.max_colwidth was not accepting negative integer. In addition, this behavior has been deprecated in favor of using None (GH31532)
- Fixed regression in objTOJSON.c fix return-type warning (GH31463)
- Fixed regression in qcut() when passed a nullable integer. (GH31389)
- Fixed regression in assigning to a Series using a nullable integer dtype (GH31446)
- Fixed performance regression when indexing a DataFrame or Series with a MultiIndex for the index using a list of labels (GH31648)
- Fixed regression in read_csv() used in file like object RawIOBase is not recognize encoding option (GH31575)
Deprecations

- Support for negative integer for `pd.options.display.max_colwidth` is deprecated in favor of using `None` (GH31532)

Bug fixes

Datetimelike

- Fixed bug in `to_datetime()` raising when `cache=True` and out-of-bound values are present (GH31491)

Numeric

- Bug in `dtypes` being lost in `DataFrame.__invert__` (~ operator) with mixed dtypes (GH31183) and for extension-array backed `Series` and `DataFrame` (GH23087)

Plotting

- Plotting tz-aware timeseries no longer gives `UserWarning` (GH31205)

Interval

- Bug in `Series.shift()` with `interval` dtype raising a `TypeError` when shifting an interval array of integers or datetimes (GH34195)

Contributors

A total of 15 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

- proost
5.4.6 What’s new in 1.0.0 (January 29, 2020)

These are the changes in pandas 1.0.0. See Release notes for a full changelog including other versions of pandas.

**Note:** The pandas 1.0 release removed a lot of functionality that was deprecated in previous releases (see below for an overview). It is recommended to first upgrade to pandas 0.25 and to ensure your code is working without warnings, before upgrading to pandas 1.0.

**New deprecation policy**

Starting with pandas 1.0.0, pandas will adopt a variant of SemVer to version releases. Briefly,

- Deprecations will be introduced in minor releases (e.g. 1.1.0, 1.2.0, 2.1.0, …)
- Deprecations will be enforced in major releases (e.g. 1.0.0, 2.0.0, 3.0.0, …)
- API-breaking changes will be made only in major releases (except for experimental features)

See Version policy for more.

**Enhancements**

**Using Numba in `rolling.apply` and `expanding.apply`**

We’ve added an engine keyword to `apply()` and `apply()` that allows the user to execute the routine using Numba instead of Cython. Using the Numba engine can yield significant performance gains if the apply function can operate on numpy arrays and the data set is larger (1 million rows or greater). For more details, see `rolling apply documentation` (GH28987, GH30936)

**Defining custom windows for rolling operations**

We’ve added a `pandas.api.indexers.BaseIndexer()` class that allows users to define how window bounds are created during rolling operations. Users can define their own `get_window_bounds` method on a `pandas.api.indexers.BaseIndexer()` subclass that will generate the start and end indices used for each window during the rolling aggregation. For more details and example usage, see the `custom window rolling documentation`

**Converting to markdown**

We’ve added `to_markdown()` for creating a markdown table (GH11052)

```
In [1]: df = pd.DataFrame({'A': [1, 2, 3], 'B': [1, 2, 3]}, index=['a', 'a', 'b'])

In [2]: print(df.to_markdown())
<table>
<thead>
<tr>
<th align="left"></th>
<th align="right">A</th>
<th align="right">B</th>
</tr>
</thead>
<tbody>
<tr>
<td align="left">a</td>
<td align="right">1</td>
<td align="right">1</td>
</tr>
<tr>
<td align="left">a</td>
<td align="right">2</td>
<td align="right">2</td>
</tr>
<tr>
<td align="left">b</td>
<td align="right">3</td>
<td align="right">3</td>
</tr>
</tbody>
</table>
```
Experimental new features

Experimental NA scalar to denote missing values

A new `pd.NA` value (singleton) is introduced to represent scalar missing values. Up to now, pandas used several values to represent missing data: `np.nan` is used for this for float data, `np.nan` or `None` for object-dtype data and `pd.NaT` for datetime-like data. The goal of `pd.NA` is to provide a “missing” indicator that can be used consistently across data types. `pd.NA` is currently used by the nullable integer and boolean data types and the new string data type (GH28095).

**Warning:** Experimental: the behaviour of `pd.NA` can still change without warning.

For example, creating a Series using the nullable integer dtype:

```python
In [3]: s = pd.Series([1, 2, None], dtype="Int64")

In [4]: s
Out[4]:
0   1
1   2
2  <NA>
dtype: Int64

In [5]: s[2]
Out[5]: <NA>
```

Compared to `np.nan`, `pd.NA` behaves differently in certain operations. In addition to arithmetic operations, `pd.NA` also propagates as “missing” or “unknown” in comparison operations:

```python
In [6]: np.nan > 1
Out[6]: False

In [7]: pd.NA > 1
Out[7]: <NA>
```

For logical operations, `pd.NA` follows the rules of the three-valued logic (or Kleene logic). For example:

```python
In [8]: pd.NA | True
Out[8]: True
```

For more, see *NA section* in the user guide on missing data.

Dedicated string data type

We’ve added `StringDtype`, an extension type dedicated to string data. Previously, strings were typically stored in object-dtype NumPy arrays. (GH29975)

**Warning:** `StringDtype` is currently considered experimental. The implementation and parts of the API may change without warning.

The 'string' extension type solves several issues with object-dtype NumPy arrays:
1. You can accidentally store a mixture of strings and non-strings in an object dtype array. A StringArray can only store strings.

2. object dtype breaks dtype-specific operations like DataFrame.select_dtypes(). There isn’t a clear way to select just text while excluding non-text, but still object-dtype columns.

3. When reading code, the contents of an object dtype array is less clear than string.

```
In [9]: pd.Series(['abc', None, 'def'], dtype=pd.StringDtype())
Out[9]:
0    abc
1    <NA>
2     def
dtype: string
```

You can use the alias "string" as well.

```
In [10]: s = pd.Series(['abc', None, 'def'], dtype="string")
In [11]: s
Out[11]:
0    abc
1    <NA>
2     def
dtype: string
```

The usual string accessor methods work. Where appropriate, the return type of the Series or columns of a DataFrame will also have string dtype.

```
In [12]: s.str.upper()
Out[12]:
0    ABC
1    <NA>
2     DEF
dtype: string

In [13]: s.str.split('b', expand=True).dtypes
Out[13]:
0    string
1    string
dtype: object
```

String accessor methods returning integers will return a value with Int64Dtype

```
In [14]: s.str.count("a")
Out[14]:
0     1
1    <NA>
2     0
dtype: Int64
```

We recommend explicitly using the string data type when working with strings. See Text data types for more.
### Boolean data type with missing values support

We’ve added `BooleanDtype`/`BooleanArray`, an extension type dedicated to boolean data that can hold missing values. The default bool data type based on a bool-dtype NumPy array, the column can only hold `True` or `False`, and not missing values. This new `BooleanArray` can store missing values as well by keeping track of this in a separate mask. (GH29555, GH30095, GH31131)

```python
In [15]: pd.Series([True, False, None], dtype=pd.BooleanDtype())
Out[15]:
0   True
1  False
2    <NA>
dtype: boolean
```

You can use the alias "boolean" as well.

```python
In [16]: s = pd.Series([True, False, None], dtype="boolean")
In [17]: s
Out[17]:
0   True
1  False
2    <NA>
dtype: boolean
```

### Method `convert_dtypes` to ease use of supported extension dtypes

In order to encourage use of the extension dtypes `StringDtype`, `BooleanDtype`, `Int64Dtype`, `Int32Dtype`, etc., that support `pd.NA`, the methods `DataFrame.convert_dtypes()` and `Series.convert_dtypes()` have been introduced. (GH29752) (GH30929)

Example:

```python
In [18]: df = pd.DataFrame({'x': ['abc', None, 'def'],
   ....:                  'y': [1, 2, np.nan],
   ....:                  'z': [True, False, True]})

In [19]: df
Out[19]:
   x    y    z
0  abc  1.0  True
1   NaN  2.0  False
2  def   NaN  True

In [20]: df.dtypes
Out[20]:
    x    object
   y  float64
   z    bool
dtype: object

In [21]: converted = df.convert_dtypes()
In [22]: converted
```

(continues on next page)
This is especially useful after reading in data using readers such as `read_csv()` and `read_excel()`. See [here](#) for a description.

**Other enhancements**

- `DataFrame.to_string()` added the `max_colwidth` parameter to control when wide columns are truncated (GH9784)
- Added the `na_value` argument to `Series.to_numpy()`, `Index.to_numpy()` and `DataFrame.to_numpy()` to control the value used for missing data (GH30322)
- `MultiIndex.from_product()` infers level names from inputs if not explicitly provided (GH2792)
- `DataFrame.to_latex()` now accepts `caption` and `label` arguments (GH25436)
- DataFrames with `nullable integer`, the `new string dtype` and period data type can now be converted to pyarrow (>=0.15.0), which means that it is supported in writing to the Parquet file format when using the pyarrow engine (GH28368). Full roundtrip to parquet (writing and reading back in with `to_parquet()` / `read_parquet()`) is supported starting with pyarrow >= 0.16 (GH20612).
- `to_parquet()` now appropriately handles the `schema` argument for user defined schemas in the pyarrow engine. (GH30270)
- `DataFrame.to_json()` now accepts an `indent` integer argument to enable pretty printing of JSON output (GH12004)
- `read_stata()` can read Stata 119 dta files. (GH28250)
- Implemented `pandas.core.window.Window.var()` and `pandas.core.window.Window.std()` functions (GH26597)
- Added `encoding` argument to `DataFrame.to_string()` for non-ascii text (GH28766)
- Added `encoding` argument to `DataFrame.to_html()` for non-ascii text (GH28663)
- `Styler.background_gradient()` now accepts `vmin` and `vmax` arguments (GH12145)
- `Styler.format()` added the `na_rep` parameter to help format the missing values (GH1527, GH28358)
- `read_excel()` now can read binary Excel (.xlsb) files by passing `engine='pyxlsb'`. For more details and example usage, see the *Binary Excel files documentation*. Closes GH8540.
- The `partition_cols` argument in `DataFrame.to_parquet()` now accepts a string (GH27117)
- `pandas.read_json()` now parses NaN, Infinity and -Infinity (GH12213)
- `DataFrame` constructor preserve `ExtensionArray` dtype with `ExtensionArray` (GH11363)
pandas: powerful Python data analysis toolkit, Release 1.3.1

- `DataFrame.sort_values()` and `Series.sort_values()` have gained `ignore_index` keyword to be able to reset index after sorting (GH30114)
- `DataFrame.sort_index()` and `Series.sort_index()` have gained `ignore_index` keyword to reset index (GH30114)
- `DataFrame.drop_duplicates()` has gained `ignore_index` keyword to reset index (GH30114)
- Added new writer for exporting Stata dta files in versions 118 and 119, `StataWriterUTF8`. These files formats support exporting strings containing Unicode characters. Format 119 supports data sets with more than 32,767 variables (GH23573, GH30959)
- `Series.map()` now accepts `collections.abc.Mapping` subclasses as a mapper (GH29733)
- Added an experimental `attrs` for storing global metadata about a dataset (GH29062)
- `Timestamp.fromisocalendar()` is now compatible with python 3.8 and above (GH28115)
- `DataFrame.to_pickle()` and `read_pickle()` now accept URL (GH30163)

**Backwards incompatible API changes**

**Avoid using names from MultiIndex.levels**

As part of a larger refactor to `MultiIndex` the level names are now stored separately from the levels (GH27242). We recommend using `MultiIndex.names` to access the names, and `Index.set_names()` to update the names.

For backwards compatibility, you can still *access* the names via the levels.

```
In [24]: mi = pd.MultiIndex.from_product([[1, 2], ['a', 'b']], names=['x', 'y'])
In [25]: mi.levels[0].name
Out[25]: 'x'
```

However, it is no longer possible to *update* the names of the `MultiIndex` via the level.

```
In [26]: mi.levels[0].name = "new name"
---------------------------------------------------------------------------
RuntimeError                                Traceback (most recent call last)
<ipython-input-26-65f4400a0c97> in <module>
----> 1 mi.levels[0].name = "new name"
/pandas/pandas/core/indexes/base.py in name(self, value)
    1458         # Used in MultiIndex.levels to avoid silently ignoring name updates.
    1459     if self._no_setting_name:
--> 1460         raise RuntimeError(
    1461     "Cannot set name on a level of a MultiIndex. Use "
    1462     "'MultiIndex.set_names' instead."

RuntimeError: Cannot set name on a level of a MultiIndex. Use 'MultiIndex.set_names' instead.
```

```
In [27]: mi.names
Out[27]: FrozenList(['x', 'y'])
```

To update, use `MultiIndex.set_names`, which returns a new `MultiIndex`. 

---

5.4. Version 1.0
**New repr for IntervalArray**

`pandas.arrays.IntervalArray` adopts a new `__repr__` in accordance with other array classes (GH25022)

### pandas 0.25.x

```python
In [1]: pd.arrays.IntervalArray.from_tuples([(0, 1), (2, 3)])
Out[2]:
IntervalArray([(0, 1), (2, 3)],
closed='right',
dtype='interval[int64]')
```

### pandas 1.0.0

```python
In [30]: pd.arrays.IntervalArray.from_tuples([(0, 1), (2, 3)])
Out[30]:
<IntervalArray>
[(0, 1), (2, 3)]
Length: 2, dtype: interval[int64, right]
```

**DataFrame.rename now only accepts one positional argument**

`DataFrame.rename()` would previously accept positional arguments that would lead to ambiguous or undefined behavior. From pandas 1.0, only the very first argument, which maps labels to their new names along the default axis, is allowed to be passed by position (GH29136).

### pandas 0.25.x

```python
In [1]: df = pd.DataFrame([[1]])
In [2]: df.rename({0: 1}, {0: 2})
FutureWarning: ...Use named arguments to resolve ambiguity...
2
1 1
```

### pandas 1.0.0

```python
In [3]: df.rename({0: 1}, {0: 2})
Traceback (most recent call last):
...TypeError: rename() takes from 1 to 2 positional arguments but 3 were given
```

Note that errors will now be raised when conflicting or potentially ambiguous arguments are provided.

### pandas 0.25.x

```python
In [4]: df.rename({0: 1}, index={0: 2})
Out[4]:
0
```

(continues on next page)
In [5]: df.rename(mapper={0: 1}, index={0: 2})
Out[5]:
  0
  2

pandas 1.0.0

In [6]: df.rename({0: 1}, index={0: 2})
Traceback (most recent call last):
...
TypeError: Cannot specify both 'mapper' and any of 'index' or 'columns'

In [7]: df.rename(mapper={0: 1}, index={0: 2})
Traceback (most recent call last):
...
TypeError: Cannot specify both 'mapper' and any of 'index' or 'columns'

You can still change the axis along which the first positional argument is applied by supplying the axis keyword argument.

In [31]: df.rename({0: 1})
Out[31]:
  0
  1

In [32]: df.rename({0: 1}, axis=1)
Out[32]:
    1
   0

If you would like to update both the index and column labels, be sure to use the respective keywords.

In [33]: df.rename(index={0: 1}, columns={0: 2})
Out[33]:
   2
   1

Extended verbose info output for DataFrame

DataFrame.info() now shows line numbers for the columns summary (GH17304)

pandas 0.25.x

In [1]: df = pd.DataFrame({'int_col': [1, 2, 3],
                        'text_col': ['a', 'b', 'c'],
                        'float_col': [0.0, 0.1, 0.2]})

In [2]: df.info(verbos...
dtypes: float64(1), int64(1), object(1)
memory usage: 152.0+ bytes

pandas 1.0.0

```python
In [34]: df = pd.DataFrame({'int_col': [1, 2, 3],
                        'text_col': ['a', 'b', 'c'],
                        'float_col': [0.0, 0.1, 0.2]})
```

```python
In [35]: df.info(verbose=True)
```

<class 'pandas.core.frame.DataFrame'>
RangeIndex: 3 entries, 0 to 2
Data columns (total 3 columns):
# Column Non-Null Count Dtype
--- ------ -------------- ----- 
0 int_col 3 non-null int64 
1 text_col 3 non-null object 
2 float_col 3 non-null float64
dtypes: float64(1), int64(1), object(1)
memory usage: 200.0+ bytes

pandas.array() inference changes

*pandas.array()* now infers pandas’ new extension types in several cases (GH29791):

1. String data (including missing values) now returns a *arrays.StringArray*.
2. Integer data (including missing values) now returns a *arrays.IntegerArray*.
3. Boolean data (including missing values) now returns the new *arrays.BooleanArray*

pandas 0.25.x

```python
In [1]: pd.array(['a', None])
Out[1]:
<PandasArray>
['a', None]
Length: 2, dtype: object
```

```python
In [2]: pd.array([1, None])
Out[2]:
<PandasArray>
[1, None]
Length: 2, dtype: object
```

pandas 1.0.0

```python
In [36]: pd.array(['a', None])
Out[36]:
<StringArray>
['a', <NA>]
Length: 2, dtype: string
```

```python
In [37]: pd.array([1, None])
Out[37]:
```

(continues on next page)
As a reminder, you can specify the dtype to disable all inference.

**arrays.IntegerArray now uses pandas.NA**

*arrays.IntegerArray* now uses *pandas.NA* rather than *numpy.nan* as its missing value marker (*GH29964*).

**pandas 0.25.x**

```python
In [1]: a = pd.array([1, 2, None], dtype="Int64")
In [2]: a
Out[2]:
<IntegerArray>
[1, 2, NaN]
Length: 3, dtype: Int64
```

```python
In [3]: a[2]
Out[3]: nan
```

**pandas 1.0.0**

```python
In [38]: a = pd.array([1, 2, None], dtype="Int64")

In [39]: a
Out[39]:
<IntegerArray>
[1, 2, <NA>]
Length: 3, dtype: Int64
```

```python
In [40]: a[2]
Out[40]: <NA>
```

This has a few API-breaking consequences.

**Converting to a NumPy ndarray**

When converting to a NumPy array missing values will be *pd.NA*, which cannot be converted to a float. So calling *np.asarray(integer_array, dtype="float")* will now raise.

**pandas 0.25.x**

```python
In [1]: np.asarray(a, dtype="float")
Out[1]:
array([ 1., 2., nan])
```

**pandas 1.0.0**

```python
In [41]: np.asarray(a, dtype="float")
---------------------------------------------------------------------------
ValueError               Traceback (most recent call last)
<ipython-input-41-4578f04da2b3> in <module>
----> 1 np.asarray(a, dtype="float")
```

(continues on next page)
/pandas/pandas/core/arrays/masked.py in __array__(self, dtype)
    333   We return an object array here to preserve our scalar values
    334   ""
--> 335   return self.to_numpy(dtype=dtype)
    336
    337 def __arrow_array__(self, type=None):

/pandas/pandas/core/arrays/masked.py in to_numpy(self, dtype, copy, na_value)
    290   and na_value is libmissing.NA
    291  ):
--> 292     raise ValueError(
    293         f"cannot convert to '{dtype}'-dtype NumPy array 
    294     "with missing values. Specify an appropriate 'na_value' 
                  _
        "Specify an appropriate 'na_value' for this dtype.

ValueError: cannot convert to 'float64'-dtype NumPy array with missing values.

Use arrays.IntegerArray.to_numpy() with an explicit na_value instead.

In [42]: a.to_numpy(dtype="float", na_value=np.nan)
Out[42]: array([1., 2., nan])

Reductions can return `pd.NA`_

When performing a reduction such as a sum with skipna=False, the result will now be pd.NA instead of np.nan in presence of missing values (GH30958).

pandas 0.25.x

In [1]: pd.Series(a).sum(skipna=False)
Out[1]:
nan

pandas 1.0.0

In [43]: pd.Series(a).sum(skipna=False)
Out[43]: <NA>

value_counts returns a nullable integer dtype

Series.value_counts() with a nullable integer dtype now returns a nullable integer dtype for the values.

pandas 0.25.x

In [1]: pd.Series([2, 1, 1, None], dtype="Int64").value_counts().dtype
Out[1]:
dtype('int64')

pandas 1.0.0

In [44]: pd.Series([2, 1, 1, None], dtype="Int64").value_counts().dtype
Out[44]: Int64Dtype()

See Experimental NA scalar to denote missing values for more on the differences between pandas.NA and numpy.nan.
arrays.IntegerArray comparisons return arrays.BooleanArray

Comparison operations on a arrays.IntegerArray now return an arrays.BooleanArray rather than a NumPy array (GH29964).

pandas 0.25.x

In [1]: a = pd.array([1, 2, None], dtype="Int64")
In [2]: a
Out[2]:
<IntegerArray>
[1, 2, NaN]
Length: 3, dtype: Int64

In [3]: a > 1
Out[3]:
array([False, True, False])

pandas 1.0.0

In [45]: a = pd.array([1, 2, None], dtype="Int64")
In [46]: a > 1
Out [46]:
<BooleanArray>
[False, True, <NA>]
Length: 3, dtype: boolean

Note that missing values now propagate, rather than always comparing unequal like numpy.nan. See Experimental NA scalar to denote missing values for more.

By default Categorical.min() now returns the minimum instead of np.nan

When Categorical contains np.nan, Categorical.min() no longer return np.nan by default (skipna=True) (GH25303)

pandas 0.25.x

In [1]: pd.Categorical([1, 2, np.nan], ordered=True).min()
Out[1]: nan

pandas 1.0.0

In [47]: pd.Categorical([1, 2, np.nan], ordered=True).min()
Out[47]: 1
Default dtype of empty pandas.Series

Initialising an empty pandas.Series without specifying a dtype will raise a DeprecationWarning now (GH17261). The default dtype will change from float64 to object in future releases so that it is consistent with the behaviour of DataFrame and Index.

pandas 1.0.0

```python
In [1]: pd.Series()
Out[2]:
DeprecationWarning: The default dtype for empty Series will be 'object' instead of 'float64' in a future version. Specify a dtype explicitly to silence this warning.
Series([], dtype: float64)
```

Result dtype inference changes for resample operations

The rules for the result dtype in DataFrame.resample() aggregations have changed for extension types (GH31359). Previously, pandas would attempt to convert the result back to the original dtype, falling back to the usual inference rules if that was not possible. Now, pandas will only return a result of the original dtype if the scalar values in the result are instances of the extension dtype’s scalar type.

```python
In [48]: df = pd.DataFrame({'A': ['a', 'b']}, dtype='category',
                      index=pd.date_range('2000', periods=2))

In [49]: df
Out[49]:
     A
2000-01-01 a
2000-01-02 b

pandas 0.25.x

```python
In [1]: df.resample("2D").agg(lambda x: 'a').A.dtype
Out[1]:
CategoricalDtype(categories=['a', 'b'], ordered=False)
```

pandas 1.0.0

```python
In [50]: df.resample("2D").agg(lambda x: 'a').A.dtype
Out[50]:
dtype('O')
```

This fixes an inconsistency between resample and groupby. This also fixes a potential bug, where the values of the result might change depending on how the results are cast back to the original dtype.

pandas 0.25.x

```python
In [1]: df.resample("2D").agg(lambda x: 'c')
Out[1]:
     A
0   NaN
```

pandas 1.0.0
In [51]: df.resample("2D").agg(lambda x: 'c')
Out[51]:
   A
2000-01-01 c

Increased minimum version for Python

pandas 1.0.0 supports Python 3.6.1 and higher (GH29212).

Increased minimum versions for dependencies

Some minimum supported versions of dependencies were updated (GH29766, GH29723). If installed, we now require:

<table>
<thead>
<tr>
<th>Package</th>
<th>Minimum Version</th>
<th>Required</th>
<th>Changed</th>
</tr>
</thead>
<tbody>
<tr>
<td>numpy</td>
<td>1.13.3</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>pytz</td>
<td>2015.4</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>python-dateutil</td>
<td>2.6.1</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>bottleneck</td>
<td>1.2.1</td>
<td></td>
<td></td>
</tr>
<tr>
<td>numexpr</td>
<td>2.6.2</td>
<td></td>
<td></td>
</tr>
<tr>
<td>pytest (dev)</td>
<td>4.0.2</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

For optional libraries the general recommendation is to use the latest version. The following table lists the lowest version per library that is currently being tested throughout the development of pandas. Optional libraries below the lowest tested version may still work, but are not considered supported.

<table>
<thead>
<tr>
<th>Package</th>
<th>Minimum Version</th>
<th>Changed</th>

pandas: powerful Python data analysis toolkit, Release 1.3.1

Build changes

pandas has added a pyproject.toml file and will no longer include cythonized files in the source distribution uploaded to PyPI (GH28341, GH20775). If you’re installing a built distribution (wheel) or via conda, this shouldn’t have any effect on you. If you’re building pandas from source, you should no longer need to install Cython into your build environment before calling pip install pandas.

Other API changes

• core.groupby.GroupBy.transform now raises on invalid operation names (GH27489)
• pandas.api.types.infer_dtype() will now return “integer-na” for integer and np.nan mix (GH27283)
• MultiIndex.from_arrays() will no longer infer names from arrays if names=None is explicitly provided (GH27292)
• In order to improve tab-completion, pandas does not include most deprecated attributes when introspecting a pandas object using dir (e.g. dir(df)). To see which attributes are excluded, see an object’s _deprecations attribute, for example pd.DataFrame._deprecations (GH28805).
• The returned dtype of unique() now matches the input dtype. (GH27874)
• Changed the default configuration value for options.matplotlib.register_converters from True to "auto" (GH18720). Now, pandas custom formatters will only be applied to plots created by pandas, through plot(). Previously, pandas’ formatters would be applied to all plots created after a plot(). See units registration for more.
• Series.dropna() has dropped its **kwargs argument in favor of a single how parameter. Supplying anything else than how to **kwargs raised a TypeError previously (GH29388)
• When testing pandas, the new minimum required version of pytest is 5.0.1 (GH29664)
• Series.str.__iter__() was deprecated and will be removed in future releases (GH28277).
• Added <NA> to the list of default NA values for read_csv() (GH30821)

Documentation improvements

• Added new section on Scaling to large datasets (GH28315).
• Added sub-section on Query MultiIndex for HDF5 datasets (GH28791).

Deprecations

• Series.item() and Index.item() have been _undeprecated_ (GH29250)
• Index.set_value has been deprecated. For a given index idx, array arr, value in idx of idx_val and a new value of val, idx.set_value(arr, idx_val, val) is equivalent to arr[idx.get_loc(idx_val)] = val, which should be used instead (GH28621).
• is_extension_type() is deprecated, is_extension_array_dtype() should be used instead (GH29457)
• eval() keyword argument “truediv” is deprecated and will be removed in a future version (GH29812)
• DateOffset.isAnchored() and DatetOffset.onOffset() are deprecated and will be removed in a future version, use DateOffset.is_anchored() and DateOffset.is_on_offset() instead (GH30340)

• pandas.tseries.frequencies.get_offset is deprecated and will be removed in a future version, use pandas.tseries.frequencies.to_offset instead (GH4205)

• Categorical.take_nd() and CategoricalIndex.take_nd() are deprecated, use Categorical.take() and CategoricalIndex.take() instead (GH27745)

• The parameter numeric_only of Categorical.min() and Categorical.max() is deprecated and replaced with skipna (GH25303)

• The parameter label in lreshape() has been deprecated and will be removed in a future version (GH29742)

• pandas.core.index has been deprecated and will be removed in a future version, the public classes are available in the top-level namespace (GH19711)

• pandas.json_normalize() is now exposed in the top-level namespace. Usage of json_normalize as pandas.io.json.json_normalize is now deprecated and it is recommended to use json_normalize as pandas.json_normalize() instead (GH27586).

• The numpy argument of pandas.read_json() is deprecated (GH28512).

• DataFrame.to_stata(), DataFrame.to_feather(), and DataFrame.to_parquet() argument “fname” is deprecated, use “path” instead (GH23574)

• The deprecated internal attributes _start, _stop and _step of RangeIndex now raise a FutureWarning instead of a DeprecationWarning (GH26581)

• The pandas.util.testing module has been deprecated. Use the public API in pandas.testing documented at Testing functions (GH16232).

• pandas.SparseArray has been deprecated. Use pandas.arrays.SparseArray (arrays.SparseArray) instead. (GH30642)

• The parameter is_copy of Series.take() and DataFrame.take() has been deprecated and will be removed in a future version. (GH27357)

• Support for multi-dimensional indexing (e.g. index[:, None]) on a Index is deprecated and will be removed in a future version, convert to a numpy array before indexing instead (GH30588)

• The pandas.np submodule is now deprecated. Import numpy directly instead (GH30296)

• The pandas.datetime class is now deprecated. Import from datetime instead (GH30610)

• diff will raise a TypeError rather than implicitly losing the dtype of extension types in the future. Convert to the correct dtype before calling diff instead (GH31025)

Selecting Columns from a Grouped DataFrame

When selecting columns from a DataFrameGroupBy object, passing individual keys (or a tuple of keys) inside single brackets is deprecated, a list of items should be used instead. (GH23566) For example:

```python
def = pd.DataFrame({
    "A": ["foo", "bar", "foo", "bar", "foo", "foo"],
    "B": np.random.randn(8),
    "C": np.random.randn(8),
})
g = df.groupby('A')
# single key, returns SeriesGroupBy
```

(continues on next page)
```
g['B']
# tuple of single key, returns SeriesGroupBy

g[('B',)]
# tuple of multiple keys, returns DataFrameGroupBy, raises FutureWarning

g[('B', 'C')]
# multiple keys passed directly, returns DataFrameGroupBy, raises FutureWarning
# (implicitly converts the passed strings into a single tuple)

g['B','C']
# proper way, returns DataFrameGroupBy

g[['B','C']]
```
• Changed the default “skipna” argument in `pandas.api.types.infer_dtype()` from False to True (GH24050)
• Removed `Series.ix` and `DataFrame.ix` (GH26438)
• Removed `Index.summary` (GH18217)
• Removed the previously deprecated keyword “fastpath” from the `Index` constructor (GH23110)
• Removed `Series.get_value`, `Series.set_value`, `DataFrame.get_value`, `DataFrame.set_value` (GH17739)
• Removed `Series.compound` and `DataFrame.compound` (GH26405)
• Changed the default “inplace” argument in `DataFrame.set_index()` and `Series.set_axis()` from None to False (GH27600)
• Removed `Series.cat.categorical`, `Series.cat.index`, `Series.cat.name` (GH24751)
• Removed the previously deprecated keyword “box” from `to_datetime()` and `to_timedelta()`; in addition these now always return `DatetimeIndex`, `TimedeltaIndex`, `Index`, `Series`, or `DataFrame` (GH24486)
• `to_timedelta()`, `Timedelta`, and `TimedeltaIndex` no longer allow “M”, “y”, or “Y” for the “unit” argument (GH23264)
• Removed the previously deprecated keyword “time_rule” from (non-public) `offsets.generate_range`, which has been moved to `core.arrays._ranges.generate_range()` (GH24157)
• `DataFrame.loc()` or `Series.loc()` with listlike indexers and missing labels will no longer reindex (GH17295)
• `DataFrame.to_excel()` and `Series.to_excel()` with non-existent columns will no longer reindex (GH17295)
• Removed the previously deprecated keyword “join_axes” from `concat()`; use `reindex_like` on the result instead (GH22318)
• Removed the previously deprecated keyword “by” from `DataFrame.sort_index()`, use `DataFrame.sort_values()` instead (GH10726)
• Removed support for nested renaming in `DataFrame.aggregate()`, `Series.aggregate()`, `core.groupby.DataFrameGroupBy.aggregate()`, `core.groupby.SeriesGroupBy.aggregate()`, `core.window.rolling.Rolling.aggregate()` (GH18529)
• Passing `datetime64` data to `TimedeltaIndex` or `timedelta64` data to `DatetimeIndex` now raises `TypeError` (GH23539, GH23937)
• Passing `int64` values to `DatetimeIndex` and a timezone now interprets the values as nanosecond timestamps in UTC, not wall times in the given timezone (GH24559)
• A tuple passed to `DataFrame.groupby()` is now exclusively treated as a single key (GH18314)
• Removed `Index.contains`, use `key in index` instead (GH30103)
• Addition and subtraction of `int` or integer-arrays is no longer allowed in `Timestamp`, `DatetimeIndex`, `TimedeltaIndex`, use `obj + n * obj.freq` instead of `obj + n` (GH22535)
• Removed `Series.ptp` (GH21614)
• Removed `Series.from_array` (GH18258)
• Removed `DataFrame.from_items` (GH18458)
• Removed `DataFrame.as_matrix`, `Series.as_matrix` (GH18458)
• Removed `Series.asobject` (GH18477)
• Removed `DataFrame.as_blocks, Series.as_blocks, DataFrame.blocks, Series.blocks` (GH17656)
• `pandas.Series.str.cat()` now defaults to aligning others, using join='left' (GH27611)
• `pandas.Series.str.cat()` does not accept list-likes within list-likes anymore (GH27611)
• `Series.where()` with Categorical dtype (or `DataFrame.where()` with Categorical column) no longer allows setting new categories (GH24114)
• Removed the previously deprecated keywords “start”, “end”, and “periods” from the `DatetimeIndex, TimedeltaIndex, and PeriodIndex` constructors; use `date_range(), timedelta_range(), and period_range()` instead (GH23919)
• Removed the previously deprecated keyword “verify_integrity” from the `DatetimeIndex` and `TimedeltaIndex` constructors (GH23919)
• Removed the previously deprecated keyword “fastpath” from `pandas.core.internals.blocks.make_block` (GH19265)
• Removed the previously deprecated keyword “dtype” from `pandas.core.internals.blocks.make_block_same_class()` (GH19434)
• Removed `ExtensionArray._formatting_values. Use ExtensionArray._formatter` instead (GH23601)
• Removed `MultiIndex.to_hierarchical` (GH21613)
• Removed `MultiIndex.labels, use MultiIndex.codes` instead (GH23752)
• Removed the previously deprecated keyword “labels” from the `MultiIndex` constructor, use “codes” instead (GH23752)
• Removed `MultiIndex.set_labels, use MultiIndex.set_codes()` instead (GH23752)
• Removed the previously deprecated keyword “labels” from `MultiIndex.set_codes(), MultiIndex.copy(), MultiIndex.drop()`, use “codes” instead (GH23752)
• Removed support for legacy HDF5 formats (GH29787)
• Passing a dtype alias (e.g. ‘datetime64[ns, UTC]’) to `DatetimeTZDtype` is no longer allowed, use `DatetimeTZDtype.construct_from_string()` instead (GH23990)
• Removed the previously deprecated keyword “skip_footer” from `read_excel()`, use “skipfooter” instead (GH18836)
• `read_excel()` no longer allows an integer value for the parameter `usecols`, instead pass a list of integers from 0 to `usecols` inclusive (GH23635)
• Removed the previously deprecated keyword “convert_datetime64” from `DataFrame.to_records()` (GH18902)
• Removed `IntervalIndex.from_intervals` in favor of the `IntervalIndex` constructor (GH19263)
• Changed the default “keep_tz” argument in `DatetimeIndex.to_series()` from None to True (GH23739)
• Removed `api.types.is_period and api.types.is_datetimetz` (GH23917)
• Ability to read pickles containing `Categorical` instances created with pre-0.16 version of pandas has been removed (GH27538)
• Removed `pandas.tseries.plotting.tsplot` (GH18627)
• Removed the previously deprecated keywords “reduce” and “broadcast” from `DataFrame.apply()` (GH18577)
• Removed the previously deprecated `assert_raises_regex` function in `pandas._testing` (GH29174)
• Removed the previously deprecated `FrozenNDArray` class in `pandas.core.indexes.frozen` (GH29335)
• Removed the previously deprecated keyword “nthreads” from `read_feather()`, use “use_threads” instead (GH23053)
• Removed `Index.is_lexsorted_for_tuple` (GH29305)
• Removed support for nested renaming in `DataFrame.aggregate()`, `Series.aggregate()`, `core.groupby.DataFrameGroupBy.aggregate()`, `core.groupby.SeriesGroupBy.aggregate()`, `core.window.rolling.Rolling.aggregate()` (GH29608)
• Removed `Series.valid`; use `Series.dropna()` instead (GH18800)
• Removed `DataFrame.is_copy`, `Series.is_copy` (GH18812)
• Removed `DataFrame.get_ftype_counts`, `Series.get_ftype_counts` (GH18243)
• Removed `DataFrame.ftypes`, `Series.ftypes`, `Seriesftype` (GH26744)
• Removed `Index.get_duplicates`, use `idx[idx.duplicated()].unique()` instead (GH20239)
• Removed `Series.clip_upper`, `Series.clip_lower`, `DataFrame.clip_upper`, `DataFrame.clip_lower` (GH24203)
• Removed the ability to alter `DatetimeIndex.freq`, `TimedeltaIndex.freq`, or `PeriodIndex.freq` (GH20772)
• Removed `DatetimeIndex.offset` (GH20730)
• Removed `DatetimeIndex.asobject`, `TimedeltaIndex.asobject`, `PeriodIndex.asobject`, use `astype(object)` instead (GH29801)
• Removed the previously deprecated keyword “order” from `factorize()` (GH19751)
• Removed the previously deprecated keyword “encoding” from `read_stata()` and `DataFrame.to_stata()` (GH21400)
• Changed the default “sort” argument in `concat()` from `None` to `False` (GH20613)
• Removed the previously deprecated keyword “raise_conflict” from `DataFrame.update()`, use “errors” instead (GH23585)
• Removed the previously deprecated keyword “n” from `DatetimeIndex.shift()`, `TimedeltaIndex.shift()`, `PeriodIndex.shift()` (GH22458)
• Removed the previously deprecated keywords “how”, “fill_method”, and “limit” from `DataFrame.resample()` (GH30139)
• Passing an integer to `Series.fillna()` or `DataFrame.fillna()` with `timedelta64[ns]` dtype now raises `TypeError` (GH24694)
• Passing multiple axes to `DataFrame.dropna()` is no longer supported (GH20995)
• Removed `Series.nonzero`, use `to_numpy().nonzero()` instead (GH24048)
• Passing floating dtype codes to `Categorical.from_codes()` is no longer supported, pass `codes.astype(np.int64)` instead (GH21775)
• Removed the previously deprecated keyword “pat” from `Series.str.partition()` and `Series.str.rpartition()`, use “sep” instead (GH23767)
• Removed `Series.put` (GH27106)
• Removed `Series.real`, `Series.imag` (GH27106)
• Removed `Series.to_dense`, `DataFrame.to_dense` (GH26684)
• Removed `Index.dtype_str`, use `str(index.dtype)` instead (GH27106)
• Categorical.ravel() returns a Categorical instead of an ndarray (GH27199)
• The ‘outer’ method on Numpy ufuncs, e.g. `np.subtract.outer` operating on Series objects is no longer supported, and will raise `NotImplementedError` (GH27198)
• Removed `Series.get_dtype_counts` and `DataFrame.get_dtype_counts` (GH27145)
• Changed the default “fill_value” argument in Categorical.take() from `True` to `False` (GH20841)
• Changed the default value for the raw argument in `Series.rolling()`.apply(), `DataFrame.rolling()`.apply(), `Series.expanding()`.apply(), and `DataFrame.expanding()`.apply() from `None` to `False` (GH20584)
• Removed deprecated behavior of `Series.argmin()` and `Series.argmax()`, use `Series.idxmin()` and `Series.idxmax()` for the old behavior (GH16955)
• Passing a tz-aware datetime.datetime or *Timestamp* into the *Timestamp* constructor with the tz argument now raises a *ValueError* (GH23621)
• Removed `Series.base`, `Index.base`, `Categorical.base`, `Series.flags`, `Index.flags`, `PeriodArray.flags`, `Series.strides`, `Index.strides`, `Series.itemsize`, `Index.itemsize`, `Series.data`, `Index.data` (GH20721)
• Changed `Timedelta.resolution()` to match the behavior of the standard library `datetime.timedelta.resolution`, for the old behavior, use `Timedelta.resolution_string()` (GH26839)
• Removed `Timestamp.weekday_name`, `DatetimeIndex.weekday_name`, and `Series.dt.weekday_name` (GH18164)
• Removed the previously deprecated keyword “errors” in `Timestamp.tz_localize()`, `DatetimeIndex.tz_localize()`, and `Series.tz_localize()` (GH22644)
• Changed the default “ordered” argument in CategoricalDType from `None` to `False` (GH26336)
• `Series.set_axis()` and `DataFrame.set_axis()` now require “labels” as the first argument and “axis” as an optional named parameter (GH30089)
• Removed `to_msgpack`, `read_msgpack`, `DataFrame.to_msgpack`, `Series.to_msgpack` (GH27103)
• Removed `Series.compress` (GH21930)
• Removed the previously deprecated keyword “fill_value” from Categorical.fillna(), use “value” instead (GH19269)
• Removed the previously deprecated keyword “data” from Andrews_curves(), use “frame” instead (GH6956)
• Removed the previously deprecated keyword “data” from parallel_coordinates(), use “frame” instead (GH6956)
• Removed the previously deprecated keyword “colors” from parallel_coordinates(), use “color” instead (GH6956)
• Removed the previously deprecated keywords “verbose” and “private_key” from read_gbq() (GH30200)
• Calling `np.array` and `np.asarray` on tz-aware Series and DatetimeIndex will now return an object array of tz-aware Timestamp (GH24596)
Performance improvements

- Performance improvement in DataFrame arithmetic and comparison operations with scalars (GH24990, GH29853)
- Performance improvement in indexing with a non-unique IntervalIndex (GH27489)
- Performance improvement in MultiIndex.is_monotonic (GH27495)
- Performance improvement in cut() when bins is an IntervalIndex (GH27668)
- Performance improvement when initializing a DataFrame using a range (GH30171)
- Performance improvement in DataFrame.corr() when method is "spearman" (GH28139)
- Performance improvement in DataFrame.replace() when provided a list of values to replace (GH28099)
- Performance improvement in DataFrame.select_dtypes() by using vectorization instead of iterating over a loop (GH28317)
- Performance improvement in Categorical.searchsorted() and CategoricalIndex.searchsorted() (GH28795)
- Performance improvement when comparing a Categorical with a scalar and the scalar is not found in the categories (GH29750)
- Performance improvement when checking if values in a Categorical are equal, equal or larger or larger than a given scalar. The improvement is not present if checking if the Categorical is less than or less than or equal than the scalar (GH29820)
- Performance improvement in Index.equals() and MultiIndex.equals() (GH29134)
- Performance improvement in infer_dtype() when skipna is True (GH28814)

Bug fixes

Categorical

- Added test to assert the fillna() raises the correct ValueError message when the value isn’t a value from categories (GH13628)
- Bug in Categorical.astype() where NaN values were handled incorrectly when casting to int (GH28406)
- DataFrame.reindex() with a CategoricalIndex would fail when the targets contained duplicates, and wouldn’t fail if the source contained duplicates (GH28107)
- Bug in Categorical.astype() not allowing for casting to extension dtypes (GH28668)
- Bug where merge() was unable to join on categorical and extension dtypes columns (GH28668)
- Categorical.searchsorted() and CategoricalIndex.searchsorted() now work on unordered categoricals also (GH21667)
- Added test to assert roundtripping to parquet with DataFrame.to_parquet() or read_parquet() will preserve Categorical dtypes for string types (GH27955)
- Changed the error message in Categorical.remove_categories() to always show the invalid removals as a set (GH28669)
pandas: powerful Python data analysis toolkit, Release 1.3.1

- Using date accessors on a categorical dtyped `Series` of datetimes was not returning an object of the same type as if one used the `str()` / `dt()` on a `Series` of that type. E.g. when accessing `Series.dt.tz_localize()` on a Categorical with duplicate entries, the accessor was skipping duplicates (GH27952)
- Bug in `DataFrame.replace()` and `Series.replace()` that would give incorrect results on categorical data (GH26988)
- Bug where calling `Categorical.min()` or `Categorical.max()` on an empty Categorical would raise a numpy exception (GH30227)
- The following methods now also correctly output values for unobserved categories when called through `groupby(..., observed=False)` (GH17605) * `core.groupby.SeriesGroupBy.count()` * `core.groupby.SeriesGroupBy.size()` * `core.groupby.SeriesGroupBy.nunique()` * `core.groupby.SeriesGroupBy.nth()`

Datetimelike

- Bug in `Series.__setitem__()` incorrectly casting `np.timedelta64("NaT")` to `np.datetime64("NaT")` when inserting into a `Series` with datetime64 dtype (GH27311)
- Bug in `Series.dt()` property lookups when the underlying data is read-only (GH27529)
- Bug in `HDFStore.__getitem__` incorrectly reading tz attribute created in Python 2 (GH26443)
- Bug in `to_datetime()` where passing arrays of malformed `str` with errors="coerce" could incorrectly lead to raising `ValueError` (GH28299)
- Bug in `core.groupby.SeriesGroupBy.nunique()` where NaT values were interfering with the count of unique values (GH27951)
- Bug in `Timestamp` subtraction when subtracting a `Timestamp` from a `np.datetime64` object incorrectly raising `TypeError` (GH28286)
- Addition and subtraction of integer or integer-dtype arrays with `Timestamp` will now raise `NullFrequencyError` instead of `ValueError` (GH28268)
- Bug in `Series` and `DataFrame` with integer dtype failing to raise `TypeError` when adding or subtracting a `np.datetime64` object (GH28080)
- Bug in `Series.astype()`, `Index.astype()`, and `DataFrame.astype()` failing to handle `NaT` when casting to an integer dtype (GH28492)
- Bug in `Week` with weekday incorrectly raising `AttributeError` instead of `TypeError` when adding or subtracting an invalid type (GH28530)
- Bug in `DataFrame` arithmetic operations when operating with a `Series` with dtype 'timedelta64[ns]' (GH28049)
- Bug in `core.groupby.generic.SeriesGroupBy.apply()` raising `ValueError` when a column in the original DataFrame is a datetime and the column labels are not standard integers (GH28247)
- Bug in `pandas._config.localization.get_locales()` where the locales -a encodes the locales list as windows-1252 (GH23638, GH24760, GH27368)
- Bug in `Series.var()` failing to raise `TypeError` when called with `timedelta64[ns]` dtype (GH28289)
- Bug in `DatetimeIndex.strftime()` and `Series.dt.strftime()` where NaT was converted to the string 'NaT' instead of `np.nan` (GH29578)
• Bug in masking datetime-like arrays with a boolean mask of an incorrect length not raising an IndexError (GH30308)
• Bug in Timestamp.resolution being a property instead of a class attribute (GH29910)
• Bug in pandas.to_datetime() when called with None raising TypeError instead of returning NaT (GH30011)
• Bug in pandas.to_datetime() failing for deques when using cache=True (the default) (GH29403)
• Bug in Series.item() with datetime64 or timedelta64 dtype, DatetimeIndex.item(), and TimedeltaIndex.item() returning an integer instead of a Timestamp or Timedelta (GH30175)
• Bug in DatetimeIndex addition when adding a non-optimized DateOffset incorrectly dropping timezone information (GH30336)
• Bug in DataFrame.drop() where attempting to drop non-existent values from a DatetimeIndex would yield a confusing error message (GH30399)
• Bug in DataFrame.append() would remove the timezone-awareness of new data (GH30238)
• Bug in Series.cummin() and Series.cummax() with timezone-aware dtype incorrectly dropping its timezone (GH15553)
• Bug in DatetimeArray, TimedeltaArray, and PeriodArray where inplace addition and subtraction did not actually operate inplace (GH24115)
• Bug in pandas.to_datetime() when called with Series storing IntegerArray raising TypeError instead of returning Series (GH30050)
• Bug in date_range() with custom business hours as freq and given number of periods (GH30593)
• Bug in PeriodIndex comparisons with incorrectly casting integers to Period objects, inconsistent with the Period comparison behavior (GH30722)
• Bug in DatetimeIndex.insert() raising a ValueError instead of a TypeError when trying to insert a timezone-aware Timestamp into a timezone-naive DatetimeIndex, or vice-versa (GH30806)

Timedelta

• Bug in subtracting a TimedeltaIndex or TimedeltaArray from a np.datetime64 object (GH29558)

Timezones

•

Numeric

• Bug in DataFrame.quantile() with zero-column DataFrame incorrectly raising (GH23925)
• DataFrame flex inequality comparisons methods (DataFrame.lt(), DataFrame.le(), DataFrame.gt(), DataFrame.ge()) with object-dtype and complex entries failing to raise TypeError like their Series counterparts (GH28079)
• Bug in DataFrame logical operations (&, |, ^) not matching Series behavior by filling NA values (GH28741)
• Bug in `DataFrame.interpolate()` where specifying axis by name references variable before it is assigned (GH29142)

• Bug in `Series.var()` not computing the right value with a nullable integer dtype series not passing through ddof argument (GH29128)

• Improved error message when using \texttt{frac > 1} and \texttt{replace = False} (GH27451)

• Bug in numeric indexes resulted in it being possible to instantiate an `Int64Index`, `UInt64Index`, or `Float64Index` with an invalid dtype (e.g. datetime-like) (GH29539)

• Bug in `UInt64Index` precision loss while constructing from a list with values in the `np.uint64` range (GH29526)

• Bug in NumericIndex construction that caused indexing to fail when integers in the `np.uint64` range were used (GH28023)

• Bug in NumericIndex construction that caused `UInt64Index` to be casted to `Float64Index` when integers in the `np.uint64` range were used to index a `DataFrame` (GH28279)

• Bug in `Series.interpolate()` when using method=`index` with an unsorted index, would previously return incorrect results. (GH21037)

• Bug in `DataFrame.round()` where a `DataFrame` with a `CategoricalIndex` of `IntervalIndex` columns would incorrectly raise a `TypeError` (GH30063)

• Bug in `Series.pct_change()` and `DataFrame.pct_change()` when there are duplicated indices (GH30463)

• Bug in `DataFrame` cumulative operations (e.g. `cumsum`, `cummax`) incorrect casting to object-dtype (GH19296)

• Bug in `diff` losing the dtype for extension types (GH30889)

• Bug in `DataFrame.diff` raising an `IndexError` when one of the columns was a nullable integer dtype (GH30967)

Conversion

Strings

• Calling `Series.str.isalnum()` (and other “ismethods”) on an empty `Series` would return an object dtype instead of `bool` (GH29624)

Interval

• Bug in `IntervalIndex.get_indexer()` where a `Categorical` or `CategoricalIndex` target would incorrectly raise a `TypeError` (GH30063)

• Bug in `pandas.core.dtypes.cast.infer_dtype_from_scalar` where passing `pandas_dtype=True` did not infer `IntervalDtype` (GH30337)

• Bug in `Series` constructor where constructing a `Series` from a list of `Interval` objects resulted in object dtype instead of `IntervalDtype` (GH23563)
• Bug in `IntervalDtype` where the kind attribute was incorrectly set as `None` instead of "O" (GH30568)

• Bug in `IntervalIndex`, `IntervalArray`, and `Series` with interval data where equality comparisons were incorrect (GH24112)

**Indexing**

• Bug in assignment using a reverse slicer (GH26939)

• Bug in `DataFrame.explode()` would duplicate frame in the presence of duplicates in the index (GH28010)

• Bug in reindexing a `PeriodIndex()` with another type of index that contained a `Period` (GH28323) (GH28337)

• Fix assignment of column via `.loc` with numpy non-ns datetime type (GH27395)

• Bug in `Float64Index.astype()` where `np.inf` was not handled properly when casting to an integer dtype (GH28475)

• `Index.union()` could fail when the left contained duplicates (GH28257)

• Bug when indexing with `.loc` where the index was a `CategoricalIndex` with non-string categories didn’t work (GH17569, GH30225)

• `Index.get_indexer_non_unique()` could fail with `TypeError` in some cases, such as when searching for ints in a string index (GH28257)

• Bug in `Float64Index.get_loc()` incorrectly raising `TypeError` instead of `KeyError` (GH29189)

• Bug in `DataFrame.loc()` with incorrect dtype when setting Categorical value in 1-row DataFrame (GH25495)

• `MultiIndex.get_loc()` can’t find missing values when input includes missing values (GH19132)

• Bug in `Series.__setitem__()` incorrectly assigning values with boolean indexer when the length of new data matches the number of True values and new data is not a `Series` or an `np.array` (GH30567)

• Bug in indexing with a `PeriodIndex` incorrectly accepting integers representing years, use e.g. `ser.loc["2007"]` instead of `ser.loc[2007]` (GH30763)

**Missing**

•

**MultiIndex**

• Constructor for `MultiIndex` verifies that the given sortorder is compatible with the actual `lexsort_depth` if `verify_integrity` parameter is True (the default) (GH28735)

• Series and MultiIndex `.drop` with MultiIndex raise exception if labels not in given in level (GH8594)

•
pandas: powerful Python data analysis toolkit, Release 1.3.1

IO

- `read_csv()` now accepts binary mode file buffers when using the Python csv engine (GH23779)
- Bug in `DataFrame.to_json()` where using a Tuple as a column or index value and using `orient="columns"` or `orient="index"` would produce invalid JSON (GH20500)
- Improve infinity parsing. `read_csv()` now interprets Infinity, +Infinity, -Infinity as floating point values (GH10065)
- Bug in `DataFrame.to_csv()` where values were truncated when the length of `na_rep` was shorter than the text input data. (GH25099)
- Bug in `DataFrame.to_string()` where values were truncated using display options instead of outputting the full content (GH9784)
- Bug in `DataFrame.to_json()` where a datetime column label would not be written out in ISO format with `orient="table"` (GH28130)
- Bug in `DataFrame.to_parquet()` where writing to GCS would fail with `engine='fastparquet'` if the file did not already exist (GH28326)
- Bug in `read_hdf()` closing stores that it didn’t open when Exceptions are raised (GH28699)
- Bug in `DataFrame.read_json()` where using `orient="index"` would not maintain the order (GH28557)
- Bug in `DataFrame.to_html()` where the length of the `formatters` argument was not verified (GH28469)
- Bug in `DataFrame.read_excel()` with `engine='ods'` when sheet_name argument references a non-existent sheet (GH27676)
- Bug in `pandas.io.formats.style.Styler()` formatting for floating values not displaying decimals correctly (GH13257)
- Bug in `DataFrame.to_html()` when using `formatters=<list>` and `max_cols` together. (GH25955)
- Bug in `Styler.background_gradient()` not able to work with dtype Int64 (GH28869)
- Bug in `DataFrame.to_clipboard()` which did not work reliably in ipython (GH22707)
- Bug in `read_json()` where default encoding was not set to `utf-8` (GH29565)
- Bug in `PythonParser` where str and bytes were being mixed when dealing with the decimal field (GH29650)
- `read_gbq()` now accepts `progress_bar_type` to display progress bar while the data downloads. (GH29857)
- Bug in `pandas.io.json.json_normalize()` where a missing value in the location specified by `record_path` would raise a TypeError (GH30148)
- `read_excel()` now accepts binary data (GH15914)
- Bug in `read_csv()` in which encoding handling was limited to just the string `utf-16` for the C engine (GH24130)
Plotting

- Bug in `Series.plot()` not able to plot boolean values (GH23719)
- Bug in `DataFrame.plot()` not able to plot when no rows (GH27758)
- Bug in `DataFrame.plot()` producing incorrect legend markers when plotting multiple series on the same axis (GH18222)
- Bug in `DataFrame.plot()` when `kind='box'` and data contains datetime or timedelta data. These types are now automatically dropped (GH22799)
- Bug in `DataFrame.plot.line()` and `DataFrame.plot.area()` produce wrong xlim in x-axis (GH27686, GH25160, GH24784)
- Bug where `DataFrame.boxplot()` would not accept a color parameter like `DataFrame.plot.box()` (GH26214)
- Bug in the xticks argument being ignored for `DataFrame.plot.bar()` (GH14119)
- `set_option()` now validates that the plot backend provided to 'plotting.backend' implements the backend when the option is set, rather than when a plot is created (GH28163)
- `DataFrame.plot()` now allow a backend keyword argument to allow changing between backends in one session (GH28619).
- Bug in color validation incorrectly raising for non-color styles (GH29122).
- Allow `DataFrame.plot.scatter()` to plot objects and datetime type data (GH18755, GH30391)
- Bug in `DataFrame.hist()`, `xrot=0` does not work with `by` and subplots (GH30288).

GroupBy/resample/rolling

- Bug in `core.groupby.DataFrameGroupBy.apply()` only showing output from a single group when function returns an `Index` (GH28652)
- Bug in `DataFrame.groupby()` with multiple groups where an `IndexError` would be raised if any group contained all NA values (GH20519)
- Bug in `pandas.core.resample.Resampler.size()` and `pandas.core.resample.Resampler.count()` returning wrong dtype when used with an empty `Series` or `DataFrame` (GH28427)
- Bug in `DataFrame.rolling()` not allowing for rolling over datetimes when `axis=1` (GH28192)
- Bug in `DataFrame.rolling()` not allowing rolling over multi-index levels (GH15584).
- Bug in `DataFrame.rolling()` not allowing rolling on monotonic decreasing time indexes (GH19248).
- Bug in `DataFrame.groupby()` not offering selection by column name when `axis=1` (GH27614)
- Bug in `core.groupby.DataFrameGroupby.agg()` not able to use lambda function with named aggregation (GH27519)
- Bug in `DataFrame.groupby()` losing column name information when grouping by a categorical column (GH28787)
- Remove error raised due to duplicated input functions in named aggregation in `DataFrame.groupby()` and `Series.groupby()`. Previously error will be raised if the same function is applied on the same column and now it is allowed if new assigned names are different. (GH28426)
• **core.groupby.SeriesGroupBy.value_counts()** will be able to handle the case even when the `Grouper` makes empty groups (GH28479)

• Bug in `core.window.rolling.Rolling.quantile()` ignoring interpolation keyword argument when used within a groupby (GH28779)

• Bug in `DataFrame.groupby()` where any, all, nunique and transform functions would incorrectly handle duplicate column labels (GH21668)

• Bug in `core.groupby.DataFrameGroupBy.agg()` with timezone-aware datetime64 column incorrectly casting results to the original dtype (GH29641)

• Bug in `DataFrame.groupby()` when using axis=1 and having a single level columns index (GH30208)

• Bug in `DataFrame.groupby()` when using nunique on axis=1 (GH30253)

• Bug in `GroupBy.quantile()` with multiple list-like q value and integer column names (GH30289)

• Bug in `GroupBy.pct_change()` and `core.groupby.SeriesGroupBy.pct_change()` causes `TypeError` when `fill_method` is `None` (GH30463)

• Bug in `Rolling.count()` and `Expanding.count()` argument where `min_periods` was ignored (GH26996)

**Reshaping**

• Bug in `DataFrame.apply()` that caused incorrect output with empty `DataFrame` (GH28202, GH21959)

• Bug in `DataFrame.stack()` not handling non-unique indexes correctly when creating MultiIndex (GH28301)

• Bug in `pivot_table()` not returning correct type `float` when `margins=True` and `aggfunc='mean'` (GH24893)

• Bug `merge_asof()` could not use `datetime.timedelta` for `tolerance` kwarg (GH28098)

• Bug in `merge()`, did not append suffixes correctly with MultiIndex (GH28518)

• `qcut()` and `cut()` now handle boolean input (GH20303)

• Fix to ensure all int dtypes can be used in `merge_asof()` when using a tolerance value. Previously every non-int64 type would raise an erroneous `MergeError` (GH28870).

• Better error message in `get_dummies()` when `columns` isn’t a list-like value (GH28383)

• Bug in `Index.join()` that caused infinite recursion error for mismatched MultiIndex name orders. (GH25760, GH28956)

• Bug `Series.pct_change()` where supplying an anchored frequency would throw a `ValueError` (GH28664)

• Bug where `DataFrame.equals()` returned True incorrectly in some cases when two DataFrames had the same columns in different orders (GH28839)

• Bug in `DataFrame.replace()` that caused non-numeric replacer’s dtype not respected (GH26632)

• Bug in `melt()` where supplying mixed strings and numeric values for `id_vars` or `value_vars` would incorrectly raise a `ValueError` (GH29718)

• Dtypes are now preserved when transposing a `DataFrame` where each column is the same extension dtype (GH30091)

• Bug in `merge_asof()` merging on a tz-aware `left_index` and `right_on` a tz-aware column (GH29864)
- Improved error message and docstring in `cut()` and `qcut()` when `labels=True` (GH13318)
- Bug in missing `fill_na` parameter to `DataFrame.unstack()` with list of levels (GH30740)

**Sparse**

- Bug in `SparseDataFrame` arithmetic operations incorrectly casting inputs to float (GH28107)
- Bug in `DataFrame.sparse` returning a `Series` when there was a column named `sparse` rather than the accessor (GH30758)
- Fixed `operator.xor()` with a boolean-dtype `SparseArray`. Now returns a sparse result, rather than object dtype (GH31025)

**ExtensionArray**

- Bug in `arrays.PandasArray` when setting a scalar string (GH28118, GH28150).
- Bug where nullable integers could not be compared to strings (GH28930)
- Bug where `DataFrame` constructor raised `ValueError` with list-like data and dtype specified (GH30280)

**Other**

- Trying to set the `display.precision`, `display.max_rows` or `display.max_columns` using `set_option()` to anything but a None or a positive int will raise a `ValueError` (GH23348)
- Using `DataFrame.replace()` with overlapping keys in a nested dictionary will no longer raise, now matching the behavior of a flat dictionary (GH27660)
- `DataFrame.to_csv()` and `Series.to_csv()` now support dicts as compression argument with key 'method' being the compression method and others as additional compression options when the compression method is 'zip'. (GH26023)
- Bug in `Series.diff()` where a boolean series would incorrectly raise a `TypeError` (GH17294)
- `Series.append()` will no longer raise a `TypeError` when passed a tuple of `Series` (GH28410)
- Fix corrupted error message when calling `pandas.libs._json.encode()` on a 0d array (GH18878)
- Backtick quoting in `DataFrame.query()` and `DataFrame.eval()` can now also be used to use invalid identifiers like names that start with a digit, are python keywords, or are using single character operators. (GH27017)
- Bug in `pd.core.util.hashing.hash_pandas_object` where arrays containing tuples were incorrectly treated as non-hashable (GH28969)
- Bug in `DataFrame.append()` that raised `IndexError` when appending with empty list (GH28769)
- Fix AbstractHolidayCalendar to return correct results for years after 2030 (now goes up to 2200) (GH27790)
- Fixed `IntegerArray` returning `inf` rather than `NaN` for operations dividing by 0 (GH27398)
- Fixed `pow` operations for `IntegerArray` when the other value is 0 or 1 (GH29997)
- Bug in `Series.count()` raises if `use_inf_as_na` is enabled (GH29478)
- Bug in `Index` where a non-hashable name could be set without raising `TypeError` (GH29069)
pandas: powerful Python data analysis toolkit, Release 1.3.1

- Bug in `DataFrame` constructor when passing a 2D `ndarray` and an extension dtype (GH12513)
- Bug in `DataFrame.to_csv()` when supplied a series with a `dtype="string"` and a `na_rep`, the `na_rep` was being truncated to 2 characters. (GH29975)
- Bug where `DataFrame.itertuples()` would incorrectly determine whether or not namedtuples could be used for dataframes of 255 columns (GH28282)
- Handle nested NumPy object arrays in `testing.assert_series_equal()` for ExtensionArray implementations (GH30841)
- Bug in `Index` constructor incorrectly allowing 2-dimensional input arrays (GH13601, GH27125)

5.5 Version 0.25

5.5.1 What’s new in 0.25.3 (October 31, 2019)

These are the changes in pandas 0.25.3. See Release notes for a full changelog including other versions of pandas.

Bug fixes

GroupBy/resample/rolling

- Bug in DataFrameGroupBy.quantile() where NA values in the grouping could cause segfaults or incorrect results (GH28882)

Contributors

A total of 2 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

- Will Ayd
- William Ayd

5.5.2 What’s new in 0.25.2 (October 15, 2019)

These are the changes in pandas 0.25.2. See Release notes for a full changelog including other versions of pandas.

Note: pandas 0.25.2 adds compatibility for Python 3.8 (GH28147).

Bug fixes

Indexing

- Fix regression in DataFrame.reindex() not following the limit argument (GH28631).
- Fix regression in RangeIndex.get_indexer() for decreasing RangeIndex where target values may be improperly identified as missing/present (GH28678)

IO

- Fix regression in notebook display where <th> tags were missing for DataFrame.index values (GH28204).
- Regression in to_csv() where writing a Series or DataFrame indexed by an IntervalIndex would incorrectly raise a TypeError (GH28210)
- Fix to_csv() with ExtensionArray with list-like values (GH28840).
**GroupBy/resample/rolling**

- Bug incorrectly raising an `IndexError` when passing a list of quantiles to `pandas.core.groupby.DataFrameGroupBy.quantile()` (GH28113).
- Bug in `pandas.core.groupby.GroupBy.shift()`, `pandas.core.groupby.GroupBy.bfill()` and `pandas.core.groupby.GroupBy.ffill()` where timezone information would be dropped (GH19995, GH27992)

**Other**

- Compatibility with Python 3.8 in `DataFrame.query()` (GH27261)
- Fix to ensure that tab-completion in an IPython console does not raise warnings for deprecated attributes (GH27900).

**Contributors**

A total of 6 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

- Felix Divo +
- Jeremy Schendel
- Joris Van den Bossche
- MeeseeksMachine
- Tom Augspurger
- jbrockmendel

**5.5.3 What’s new in 0.25.1 (August 21, 2019)**

These are the changes in pandas 0.25.1. See *Release notes* for a full changelog including other versions of pandas.

**IO and LZMA**

Some users may unknowingly have an incomplete Python installation lacking the `lzma` module from the standard library. In this case, `import pandas` failed due to an `ImportError` (GH27575). pandas will now warn, rather than raising an `ImportError` if the `lzma` module is not present. Any subsequent attempt to use `lzma` methods will raise a `RuntimeError`. A possible fix for the lack of the `lzma` module is to ensure you have the necessary libraries and then re-install Python. For example, on MacOS installing Python with `pyenv` may lead to an incomplete Python installation due to unmet system dependencies at compilation time (like `xz`). Compilation will succeed, but Python might fail at run time. The issue can be solved by installing the necessary dependencies and then re-installing Python.
Bug fixes

Categorical

- Bug in `Categorical.fillna()` that would replace all values, not just those that are NaN (GH26215)

Datetimelike

- Bug in `to_datetime()` where passing a timezone-naive DatetimeArray or DatetimeIndex and `utc=True` would incorrectly return a timezone-naive result (GH27733)
- Bug in `Period.to_timestamp()` where a Period outside the Timestamp implementation bounds (roughly 1677-09-21 to 2262-04-11) would return an incorrect Timestamp instead of raising OutOfBoundsDatetime (GH19643)
- Bug in iterating over DatetimeIndex when the underlying data is read-only (GH28055)

Timezones

- Bug in `Index` where a numpy object array with a timezone aware Timestamp and `np.nan` would not return a DatetimeIndex (GH27011)

Numeric

- Bug in `Series.interpolate()` when using a timezone aware DatetimeIndex (GH27548)
- Bug when printing negative floating point complex numbers would raise an IndexError (GH27484)
- Bug where DataFrame arithmetic operators such as `DataFrame.mul()` with a Series with axis=1 would raise an AttributeError on DataFrame larger than the minimum threshold to invoke numexpr (GH27636)
- Bug in DataFrame arithmetic where missing values in results were incorrectly masked with NaN instead of Inf (GH27464)

Conversion

- Improved the warnings for the deprecated methods `Series.real()` and `Series.imag()` (GH27610)

Interval

- Bug in `IntervalIndex` where `dir(obj)` would raise ValueError (GH27571)
Indexing

- Bug in partial-string indexing returning a NumPy array rather than a Series when indexing with a scalar like .loc['2015'] (GH27516)
- Break reference cycle involving Index and other index classes to allow garbage collection of index objects without running the GC. (GH27585, GH27840)
- Fix regression in assigning values to a single column of a DataFrame with a MultiIndex columns (GH27841).
- Fix regression in .ix fallback with an IntervalIndex (GH27865).

Missing

- Bug in pandas.isnull() or pandas.isna() when the input is a type e.g. type(pandas.Series()) (GH27482)

IO

- Avoid calling S3File.s3 when reading parquet, as this was removed in s3fs version 0.3.0 (GH27756)
- Better error message when a negative header is passed in pandas.read_csv() (GH27779)
- Follow the min_rows display option (introduced in v0.25.0) correctly in the HTML repr in the notebook (GH27991).

Plotting

- Added a pandas_plotting_backends entrypoint group for registering plot backends. See Plotting backends for more (GH26747).
- Fixed the re-instatement of Matplotlib datetime converters after calling pandas.plotting.deregister_matplotlib_converters() (GH27481).
- Fix compatibility issue with matplotlib when passing a pandas Index to a plot call (GH27775).

GroupBy/resample/rolling

- Fixed regression in pandas.core.groupby.DataFrameGroupBy.quantile() raising when multiple quantiles are given (GH27526)
- Bug in pandas.core.groupby.DataFrameGroupBy.transform() where applying a timezone conversion lambda function would drop timezone information (GH27496)
- Bug in pandas.core.groupby.GroupBy.nth() where observed=False was being ignored for Categorical groupers (GH26385)
- Bug in windowing over read-only arrays (GH27766)
- Fixed segfault in pandas.core.groupby.DataFrameGroupBy.quantile when an invalid quantile was passed (GH27470)
Reshaping

- A `KeyError` is now raised if `.unstack()` is called on a `Series` or `DataFrame` with a flat `Index` passing a name which is not the correct one (GH18303)
- Bug in `merge_asof()` could not merge `Timedelta` objects when passing `tolerance` kwarg (GH27642)
- Bug in `DataFrame.crosstab()` when margins set to `True` and `normalize` is not `False`, an error is raised. (GH27500)
- `DataFrame.join()` now suppresses the `FutureWarning` when the `sort` parameter is specified (GH21952)
- Bug in `DataFrame.join()` raising with readonly arrays (GH27943)

Sparse

- Bug in reductions for `Series` with Sparse dtypes (GH27080)

Other

- Bug in `Series.replace()` and `DataFrame.replace()` when replacing timezone-aware timestamps using a dict-like replacer (GH27720)
- Bug in `Series.rename()` when using a custom type indexer. Now any value that isn’t callable or dict-like is treated as a scalar. (GH27814)

5.5.4 What’s new in 0.25.0 (July 18, 2019)

**Warning:** Starting with the 0.25.x series of releases, pandas only supports Python 3.5.3 and higher. See Dropping Python 2.7 for more details.

**Warning:** The minimum supported Python version will be bumped to 3.6 in a future release.

**Warning:** Panel has been fully removed. For N-D labeled data structures, please use `xarray`
Warning: `read_pickle()` and `read_msgpack()` are only guaranteed backwards compatible back to pandas version 0.20.3 (GH27082)

These are the changes in pandas 0.25.0. See Release notes for a full changelog including other versions of pandas.

Enhancements

GroupBy aggregation with relabeling

pandas has added special groupby behavior, known as “named aggregation”, for naming the output columns when applying multiple aggregation functions to specific columns (GH18366, GH26512).

```python
In [1]: animals = pd.DataFrame({'kind': ['cat', 'dog', 'cat', 'dog'],
                           ...:                   'height': [9.1, 6.0, 9.5, 34.0],
                           ...:                   'weight': [7.9, 7.5, 9.9, 198.0]})

In [2]: animals
Out[2]:
   kind  height  weight
0   cat     9.1     7.9
1   dog     6.0     7.5
2   cat     9.5     9.9
3   dog    34.0    198.0

In [3]: animals.groupby("kind").agg(
   ...:     min_height=pd.NamedAgg(column='height', aggfunc='min'),
   ...:     max_height=pd.NamedAgg(column='height', aggfunc='max'),
   ...:     average_weight=pd.NamedAgg(column='weight', aggfunc=np.mean),
   ...: )
   ...:
Out[3]:
   min_height  max_height  average_weight
kind          
  cat         9.1        9.5         8.90
  dog         6.0       34.0       102.75

In [4]: animals.groupby("kind").agg(
   ...:     min_height=('height', 'min'),
   ...:     max_height=('height', 'max'),
   ...:     average_weight=('weight', np.mean),
   ...: )
   ...:
Out[4]:
   min_height  max_height  average_weight
kind          
  cat         9.1        9.5         8.90
  dog         6.0       34.0       102.75
```

Pass the desired columns names as the `**kwargs` to `.agg`. The values of `**kwargs` should be tuples where the first element is the column selection, and the second element is the aggregation function to apply. pandas provides the `pandas.NamedAgg` namedtuple to make it clearer what the arguments to the function are, but plain tuples are accepted as well.
Named aggregation is the recommended replacement for the deprecated “dict-of-dicts” approach to naming the output of column-specific aggregations (*Deprecate groupby.agg() with a dictionary when renaming*).

A similar approach is now available for Series groupby objects as well. Because there’s no need for column selection, the values can just be the functions to apply:

```python
In [5]: animals.groupby("kind").height.agg(
    ...:     min_height="min",
    ...:     max_height="max",
    ...:)
```

```
Out[5]:
   min_height  max_height
kind
  cat     9.1      9.5
  dog     6.0     34.0
```

This type of aggregation is the recommended alternative to the deprecated behavior when passing a dict to a Series groupby aggregation (*Deprecate groupby.agg() with a dictionary when renaming*).

See Named aggregation for more.

### GroupBy aggregation with multiple lambdas

You can now provide multiple lambda functions to a list-like aggregation in `pandas.core.groupby.GroupBy.agg` (*GH26430)*.

```python
In [6]: animals.groupby('kind').height.agg([    ...:     lambda x: x.iloc[0],
    ...:     lambda x: x.iloc[-1]
    ...:])
```

```
Out[6]:
<lambda_0> <lambda_1>
kind
cat   9.1    9.5
dog   6.0    34.0
```

```python
In [7]: animals.groupby('kind').agg([    ...:     lambda x: x.iloc[0] - x.iloc[1],
    ...:     lambda x: x.iloc[0] + x.iloc[1]
    ...:])
```

```
Out[7]:
   height  weight
<lambda_0> <lambda_1> <lambda_0> <lambda_1>
kind
cat  -0.4    18.6  -2.0    17.8
dog -28.0    40.0 -190.5   205.5
```

Previously, these raised a `SpecificationError`. 
Better repr for MultiIndex

Printing of MultiIndex instances now shows tuples of each row and ensures that the tuple items are vertically aligned, so it’s now easier to understand the structure of the MultiIndex. (GH13480):

The repr now looks like this:

```python
In [8]: pd.MultiIndex.from_product([['a', 'abc'], range(500)])
Out[8]:
MultiIndex([( 'a', 0),
( 'a', 1),
( 'a', 2),
( 'a', 3),
( 'a', 4),
( 'a', 5),
( 'a', 6),
( 'a', 7),
( 'a', 8),
( 'a', 9),
...
( 'abc', 490),
( 'abc', 491),
( 'abc', 492),
( 'abc', 493),
( 'abc', 494),
( 'abc', 495),
( 'abc', 496),
( 'abc', 497),
( 'abc', 498),
( 'abc', 499)],
length=1000)
```

Previously, outputting a MultiIndex printed all the levels and codes of the MultiIndex, which was visually unappealing and made the output more difficult to navigate. For example (limiting the range to 5):

```python
In [1]: pd.MultiIndex.from_product([['a', 'abc'], range(5)])
Out[1]:
MultiIndex(levels=[['a', 'abc'], [0, 1, 2, 3]],
...:
codes=[[0, 0, 0, 1, 1, 1], [0, 1, 2, 3, 0, 1, 2, 3]])
```

In the new repr, all values will be shown, if the number of rows is smaller than options.display.max_seq_items (default: 100 items). Horizontally, the output will truncate, if it’s wider than options.display.width (default: 80 characters).

Shorter truncated repr for Series and DataFrame

Currently, the default display options of pandas ensure that when a Series or DataFrame has more than 60 rows, its repr gets truncated to this maximum of 60 rows (the display.max_rows option). However, this still gives a repr that takes up a large part of the vertical screen estate. Therefore, a new option display.min_rows is introduced with a default of 10 which determines the number of rows showed in the truncated repr:

- For small Series or DataFrames, up to max_rows number of rows is shown (default: 60).
- For larger Series of DataFrame with a length above max_rows, only min_rows number of rows is shown (default: 10, i.e. the first and last 5 rows).

This dual option allows to still see the full content of relatively small objects (e.g. df.head(20) shows all 20 rows), while giving a brief repr for large objects.
To restore the previous behaviour of a single threshold, set `pd.options.display.min_rows = None`.

### JSON normalize with max_level param support

`json_normalize()` normalizes the provided input dict to all nested levels. The new `max_level` parameter provides more control over which level to end normalization (GH23843):

The repr now looks like this:

```python
from pandas.io.json import json_normalize
data = [{
    'CreatedBy': {'Name': 'User001'},
    'Lookup': {'TextField': 'Some text',
               'UserField': {'Id': 'ID001', 'Name': 'Name001'}},
    'Image': {'a': 'b'}
}]
json_normalize(data, max_level=1)
```

### Series.explode to split list-like values to rows

`Series` and `DataFrame` have gained the `DataFrame.explode()` methods to transform list-likes to individual rows. See section on Exploding list-like column in docs for more information (GH16538, GH10511)

Here is a typical usecase. You have comma separated string in a column.

```python
In [9]: df = pd.DataFrame([{'var1': 'a,b,c', 'var2': 1},
                        {'var1': 'd,e,f', 'var2': 2}])
Out[9]:
  var1 var2
0 a,b,c 1
1 d,e,f 2

Creating a long form DataFrame is now straightforward using chained operations

```python
In [11]: df.assign(var1=df.var1.str.split(',')).explode('var1')
Out[11]:
  var1 var2
0   a   1
0   b   1
0   c   1
1   d   2
1   e   2
1   f   2
```
Other enhancements

- `DataFrame.plot()` keywords `logy`, `logx` and `loglog` can now accept the value 'sym' for symlog scaling. (GH24867)
- Added support for ISO week year format (‘%G-%V-%u’) when parsing datetimes using `to_datetime()` (GH16607)
- Indexing of `DataFrame` and `Series` now accepts zerodim `np.ndarray` (GH24919)
- `Timestamp.replace()` now supports the `fold` argument to disambiguate DST transition times (GH25017)
- `DataFrame.at_time()` and `Series.at_time()` now support `datetime.time` objects with time-zones (GH24043)
- `DataFrame.pivot_table()` now accepts an `observed` parameter which is passed to underlying calls to `DataFrame.groupby()` to speed up grouping categorical data. (GH24923)
- `Series.str` has gained `Series.str.casefold()` method to removes all case distinctions present in a string (GH25405)
- `DataFrame.set_index()` now works for instances of `abc.Iterator`, provided their output is of the same length as the calling frame (GH22484, GH24984)
- `DatetimeIndex.union()` now supports the `sort` argument. The behavior of the sort parameter matches that of `Index.union()` (GH24994)
- `RangeIndex.union()` now supports the `sort` argument. If `sort=False` an unsorted `Int64Index` is always returned. `sort=None` is the default and returns a monotonically increasing `RangeIndex` if possible or a sorted `Int64Index` if not (GH24471)
- `TimedeltaIndex.intersection()` now also supports the `sort` keyword (GH24471)
- `DataFrame.rename()` now supports the `errors` argument to raise errors when attempting to rename nonexistent keys (GH13473)
- Added `Sparse accessor` for working with a `DataFrame` whose values are sparse (GH25681)
- `RangeIndex` has gained `start`, `stop`, and `step` attributes (GH25710)
- `datetime.timezone` objects are now supported as arguments to timezone methods and constructors (GH25065)
- `DataFrame.query()` and `DataFrame.eval()` now supports quoting column names with backticks to refer to names with spaces (GH6508)
- `merge_asof()` now gives a more clear error message when merge keys are categoricals that are not equal (GH26136)
- `pandas.core.window.Rolling()` supports exponential (or Poisson) window type (GH21303)
- Error message for missing required imports now includes the original import error’s text (GH23868)
- `DatetimeIndex` and `TimedeltaIndex` now have a `mean` method (GH24757)
- `DataFrame.describe()` now formats integer percentiles without decimal point (GH26660)
- Added support for reading SPSS .sav files using `read_spss()` (GH26537)
- Added new option `plotting.backend` to be able to select a plotting backend different than the existing `matplotlib` one. Use `pandas.set_option('plotting.backend', '<backend-module>')` where `<backend-module>` is a library implementing the pandas plotting API (GH14130)
- `pandas.offsets.BusinessHour` supports multiple opening hours intervals (GH15481)
• `read_excel()` can now use `openpyxl` to read Excel files via the `engine='openpyxl'` argument. This will become the default in a future release (GH11499)

• `pandas.io.excel.read_excel()` supports reading OpenDocument tables. Specify `engine='odf'` to enable. Consult the IO User Guide for more details (GH9070)

• `Interval, IntervalIndex, and IntervalArray` have gained an `is_empty` attribute denoting if the given interval(s) are empty (GH27219)

**Backwards incompatible API changes**

**Indexing with date strings with UTC offsets**

Indexing a `DataFrame` or `Series` with a `DatetimeIndex` with a date string with a UTC offset would previously ignore the UTC offset. Now, the UTC offset is respected in indexing. (GH24076, GH16785)

```
In [12]: df = pd.DataFrame([[0]], index=pd.DatetimeIndex(['2019-01-01'], tz='US/Pacific'))
In [13]: df
Out[13]:
     0
2019-01-01 00:00:00-08:00 0
```

Previous behavior:
```
In [3]: df['2019-01-01 00:00:00+04:00':'2019-01-01 01:00:00+04:00']
Out[3]:
     0
2019-01-01 00:00:00-08:00 0
```

New behavior:
```
In [14]: df['2019-01-01 12:00:00+04:00':'2019-01-01 13:00:00+04:00']
Out[14]:
     0
2019-01-01 00:00:00-08:00 0
```

**MultiIndex constructed from levels and codes**

Constructing a `MultiIndex` with NaN levels or codes value < -1 was allowed previously. Now, construction with codes value < -1 is not allowed and NaN levels’ corresponding codes would be reassigned as -1. (GH19387)

Previous behavior:
```
In [1]: pd.MultiIndex(levels=[[np.nan, None, pd.NaT, 128, 2]], codes=[[0, -1, 1, 2, 3, 4]])
    ...:
Out[1]: MultiIndex(levels=[[nan, None, NaT, 128, 2]], codes=[[0, -1, 1, 2, 3, 4]])
```

```
In [2]: pd.MultiIndex(levels=[[1, 2]], codes=[[0, -2]])
Out[2]: MultiIndex(levels=[[1, 2]], codes=[[0, -2]])
```

New behavior:
In [15]: pd.MultiIndex(levels=[[np.nan, None, pd.NaT, 128, 2]],
    codes=[[0, -1, 1, 2, 3, 4]])

Out[15]:
MultiIndex([('', '', '', '', ''), ('', '', '', '', ''), ('', '', '', '', ''), ('', '', '', '', ''), ('128', '', '', '', ''), ('2', '', '', '', '')])

In [16]: pd.MultiIndex(levels=[[1, 2]], codes=[[0, -2]])
ValueError

GroupBy.apply on DataFrame evaluates first group only once

The implementation of DataFrameGroupBy.apply() previously evaluated the supplied function consistently twice on the first group to infer if it is safe to use a fast code path. Particularly for functions with side effects, this was an undesired behavior and may have led to surprises. (GH2936, GH2656, GH7739, GH10519, GH12155, GH20084, GH21417)

Now every group is evaluated only a single time.

In [17]: df = pd.DataFrame({"a": ["x", "y"], "b": [1, 2]})

In [18]: df
Out[18]:
a  b
0  x  1
1  y  2

In [19]: def func(group):
    print(group.name)
....:     return group
....:

Previous behavior:

```python
In [3]: df.groupby('a').apply(func)
x     x
  y     y
Out[3]:
    a  b
  0  x  1
  1  y  2
```

New behavior:

```python
In [20]: df.groupby("a").apply(func)
x
  y
Out[20]:
    a  b
  0  x  1
  1  y  2
```

**Concatenating sparse values**

When passed DataFrames whose values are sparse, `concat()` will now return a `Series` or `DataFrame` with sparse values, rather than a `SparseDataFrame` (GH25702).

```python
In [21]: df = pd.DataFrame({"A": pd.SparseArray([[0, 1]])})
```

Previous behavior:

```python
In [2]: type(pd.concat([df, df]))
pandas.core.sparse.frame.SparseDataFrame
```

New behavior:

```python
In [22]: type(pd.concat([df, df]))
Out[22]: pandas.core.frame.DataFrame
```

This now matches the existing behavior of `concat` on Series with sparse values. `concat()` will continue to return a `SparseDataFrame` when all the values are instances of `SparseDataFrame`.

This change also affects routines using `concat()` internally, like `get_dummies()`, which now returns a `DataFrame` in all cases (previously a `SparseDataFrame` was returned if all the columns were dummy encoded, and a `DataFrame` otherwise).

Providing any `SparseSeries` or `SparseDataFrame` to `concat()` will cause a `SparseSeries` or `SparseDataFrame` to be returned, as before.
The `.str`-accessor performs stricter type checks

Due to the lack of more fine-grained dtypes, `Series.str` so far only checked whether the data was of `object` dtype. `Series.str` will now infer the dtype data *within* the Series; in particular, 'bytes'-only data will raise an exception (except for `Series.str.decode()`, `Series.str.get()`, `Series.str.len()`, `Series.str.slice()`), see GH23163, GH23011, GH23551.

*Previous behavior:*

```python
In [1]: s = pd.Series(np.array(['a', 'ba', 'cba'], 'S'), dtype=object)

In [2]: s
Out[2]:
   0    b'a'
   1    b'ba'
   2    b'cba'
 dtype: object

In [3]: s.str.startswith(b'a')
Out[3]:
   0    True
   1    False
   2    False
 dtype: bool
```

*New behavior:*

```python
In [23]: s = pd.Series(np.array(['a', 'ba', 'cba'], 'S'), dtype=object)

In [24]: s
Out[24]:
   0    b'a'
   1    b'ba'
   2    b'cba'
 dtype: object

In [25]: s.str.startswith(b'a')
---------------------------------------------------------------------------
TypeError                                 Traceback (most recent call last)
<ipython-input-25-ac784692b361> in <module>
----> 1 s.str.startswith(b'a')
/pandas/pandas/core/strings/accessor.py in wrapper(self, *args, **kwargs)
    113       f"inferred dtype '{self._inferred_dtype}'."
    114     )
--> 115     raise TypeError(msg)
    116     return func(self, *args, **kwargs)
    117
TypeError: Cannot use .str.startswith with values of inferred dtype 'bytes'.
```
Categorical dtypes are preserved during GroupBy

Previously, columns that were categorical, but not the groupby key(s) would be converted to object dtype during groupby operations. pandas now will preserve these dtypes. (GH18502)

```python
In [26]: cat = pd.Categorical(['foo', 'bar', 'bar', 'qux'], ordered=True)
In [27]: df = pd.DataFrame({'payload': [-1, -2, -1, -2], 'col': cat})
In [28]: df
Out[28]:
   payload  col
0      -1  foo
1      -2  bar
2      -1  bar
3      -2  qux
In [29]: df.dtypes
Out[29]:
   payload    int64
             col  category
            dtype: object
```

**Previous Behavior:**

```python
In [5]: df.groupby('payload').first().col.dtype
Out[5]: dtype('O')
```

**New Behavior:**

```python
In [30]: df.groupby('payload').first().col.dtype
Out[30]: CategoricalDtype(categories=['bar', 'foo', 'qux'], ordered=True)
```

Incompatible Index type unions

When performing `Index.union()` operations between objects of incompatible dtypes, the result will be a base `Index` of dtype object. This behavior holds true for unions between `Index` objects that previously would have been prohibited. The dtype of empty `Index` objects will now be evaluated before performing union operations rather than simply returning the other `Index` object. `Index.union()` can now be considered commutative, such that `A.union(B) == B.union(A)` (GH23525).

**Previous behavior:**

```python
In [1]: pd.period_range('19910905', periods=2).union(pd.Int64Index([1, 2, 3]))
...: ValueError: can only call with other PeriodIndex-ed objects
In [2]: pd.Index([], dtype=object).union(pd.Index([1, 2, 3]))
Out[2]: Int64Index([1, 2, 3], dtype='int64')
```

**New behavior:**

```python
In [31]: pd.period_range('19910905', periods=2).union(pd.Int64Index([1, 2, 3]))
Out[31]: Index([1991-09-05, 1991-09-06, 1, 2, 3], dtype='object')
```
In [32]: pd.Index([], dtype=object).union(pd.Index([1, 2, 3]))
Out[32]: Index([1, 2, 3], dtype='object')

Note that integer- and floating-dtype indexes are considered “compatible”. The integer values are coerced to floating point, which may result in loss of precision. See Set operations on Index objects for more.

DataFrame GroupBy ffill/bfill no longer return group labels

The methods ffill, bfill, pad and backfill of DataFrameGroupBy previously included the group labels in the return value, which was inconsistent with other groupby transforms. Now only the filled values are returned. (GH21521)

In [33]: df = pd.DataFrame({"a": ["x", "y"], "b": [1, 2]})
In [34]: df
Out[34]:
   a  b
0  x  1
1  y  2

Previous behavior:

In [3]: df.groupby("a").ffill()
Out[3]:
   a  b
0  x  1
1  y  2

New behavior:

In [35]: df.groupby("a").ffill()
Out[35]:
   b
0  1
1  2

DataFrame describe on an empty Categorical / object column will return top and freq

When calling DataFrame.describe() with an empty categorical / object column, the ‘top’ and ‘freq’ columns were previously omitted, which was inconsistent with the output for non-empty columns. Now the ‘top’ and ‘freq’ columns will always be included, with numpy.nan in the case of an empty DataFrame (GH26397)

In [36]: df = pd.DataFrame({"empty_col": pd.Categorical([])})
In [37]: df
Out[37]:
Empty DataFrame
Columns: [empty_col]
Index: []

Previous behavior:
In [3]: df.describe()
Out[3]:
       empty_col
count   0
unique   0

New behavior:

In [38]: df.describe()
Out[38]:
       empty_col
count   0
unique   0
top     NaN
freq    NaN

__str__ methods now call __repr__ rather than vice versa

pandas has until now mostly defined string representations in a pandas objects’
__str__/__unicode__/__bytes__ methods, and called __str__ from the __repr__ method, if a
specific __repr__ method is not found. This is not needed for Python3. In pandas 0.25, the string representations
of pandas objects are now generally defined in __repr__, and calls to __str__ in general now pass the call
on to the __repr__, if a specific __str__ method doesn’t exist, as is standard for Python. This change is
backward compatible for direct usage of pandas, but if you subclass pandas objects and give your subclasses specific
__str__/__repr__ methods, you may have to adjust your __str__/__repr__ methods (GH26495).

Indexing an IntervalIndex with Interval objects

Indexing methods for IntervalIndex have been modified to require exact matches only for Interval queries.
IntervalIndex methods previously matched on any overlapping Interval. Behavior with scalar points, e.g.
querying with an integer, is unchanged (GH16316).

In [39]: ii = pd.IntervalIndex.from_tuples([(0, 4), (1, 5), (5, 8)])
In [40]: ii
Out[40]: IntervalIndex([(0, 4], (1, 5], (5, 8]], dtype='interval[int64, right]')

The in operator (__contains__) now only returns True for exact matches to Intervals in the
IntervalIndex, whereas this would previously return True for any Interval overlapping an Interval in
the IntervalIndex.

Previous behavior:

In [4]: pd.Interval(1, 2, closed='neither') in ii
Out[4]: True
In [5]: pd.Interval(-10, 10, closed='both') in ii
Out[5]: True

New behavior:

In [41]: pd.Interval(1, 2, closed='neither') in ii
Out[41]: False
In [42]: `pd.Interval(-10, 10, closed='both') in ii`
Out[42]: False

The `get_loc()` method now only returns locations for exact matches to `Interval` queries, as opposed to the previous behavior of returning locations for overlapping matches. A `KeyError` will be raised if an exact match is not found.

**Previous behavior:**

In [6]: `ii.get_loc(pd.Interval(1, 5))`
Out[6]: array([0, 1])

In [7]: `ii.get_loc(pd.Interval(2, 6))`
Out[7]: array([0, 1, 2])

**New behavior:**

In [6]: `ii.get_loc(pd.Interval(1, 5))`
Out[6]: 1

In [7]: `ii.get_loc(pd.Interval(2, 6))`

```
KeyError: Interval(2, 6, closed='right')
```

Likewise, `get_indexer()` and `get_indexer_non_unique()` will also only return locations for exact matches to `Interval` queries, with -1 denoting that an exact match was not found.

These indexing changes extend to querying a `Series` or `DataFrame` with an `IntervalIndex` index.

In [43]: `s = pd.Series(list('abc'), index=ii)`

In [44]: `s`
Out[44]:

```
(0, 4]  a
(1, 5]  b
(5, 8]  c
dtype: object
```

Selecting from a `Series` or `DataFrame` using `[]` (`__getitem__`) or `loc` now only returns exact matches for `Interval` queries.

**Previous behavior:**

In [8]: `s[pd.Interval(1, 5)]`
Out[8]:

```
(0, 4]  a
(1, 5]  b
dtype: object
```

In [9]: `s.loc[pd.Interval(1, 5)]`
Out[9]:

```
(0, 4]  a
(1, 5]  b
dtype: object
```

**New behavior:**
Similarly, a `KeyError` will be raised for non-exact matches instead of returning overlapping matches.

**Previous behavior:**

```
In [9]: s[pd.Interval(2, 3)]
Out[9]:
(0, 4]   a
(1, 5]   b
dtype: object

In [10]: s.loc[pd.Interval(2, 3)]
Out[10]:
(0, 4]   a
(1, 5]   b
dtype: object
```

**New behavior:**

```
In [6]: s[pd.Interval(2, 3)]
---------------------------------------------------------------------------
KeyError: Interval(2, 3, closed='right')

In [7]: s.loc[pd.Interval(2, 3)]
---------------------------------------------------------------------------
KeyError: Interval(2, 3, closed='right')
```

The `overlaps()` method can be used to create a boolean indexer that replicates the previous behavior of returning overlapping matches.

**New behavior:**

```
In [47]: idxr = s.index.overlaps(pd.Interval(2, 3))

In [48]: idxr
Out[48]: array([ True,  True, False])

In [49]: s[idxr]
Out[49]:
(0, 4]   a
(1, 5]   b
dtype: object

In [50]: s.loc[idxr]
Out[50]:
(0, 4]   a
(1, 5]   b
dtype: object
```
**Binary ufuncs on Series now align**

Applying a binary ufunc like `numpy.power()` now aligns the inputs when both are `Series` (GH23293).

```python
In [51]: s1 = pd.Series([1, 2, 3], index=['a', 'b', 'c'])
In [52]: s2 = pd.Series([3, 4, 5], index=['d', 'c', 'b'])
In [53]: s1
Out[53]:
   a  1
   b  2
   c  3
dtype: int64
In [54]: s2
Out[54]:
   d  3
   c  4
   b  5
dtype: int64

**Previous behavior**

```python
In [5]: np.power(s1, s2)
Out[5]:
   a   1
   b  16
   c 243
   d  NaN
```

dtype: int64

**New behavior**

```python
In [55]: np.power(s1, s2)
Out[55]:
   a   1.0
   b  32.0
   c 81.0
   d  NaN
dtype: float64
```

This matches the behavior of other binary operations in pandas, like `Series.add()`. To retain the previous behavior, convert the other `Series` to an array before applying the ufunc.

```python
In [56]: np.power(s1, s2.array)
Out[56]:
   a   1
   b  16
   c 243
```
dtype: int64
Categorical.argsort now places missing values at the end

Categorical.argsort() now places missing values at the end of the array, making it consistent with NumPy and the rest of pandas (GH21801).

Previous behavior

```
In [2]: cat = pd.Categorical(['b', None, 'a'], categories=['a', 'b'], ordered=True)
```

```
In [3]: cat.argsort()
Out[3]: array([1, 2, 0])
```

```
In [4]: cat[cat.argsort()]
Out[4]: [NaN, a, b]
categories (2, object): [a < b]
```

New behavior

```
In [58]: cat.argsort()
Out[58]: array([2, 0, 1])
```

```
In [59]: cat[cat.argsort()]
Out[59]: ['a', 'b', NaN]
categories (2, object): ['a' < 'b']
```

Column order is preserved when passing a list of dicts to DataFrame

Starting with Python 3.7 the key-order of dict is guaranteed. In practice, this has been true since Python 3.6. The DataFrame constructor now treats a list of dicts in the same way as it does a list of OrderedDict, i.e. preserving the order of the dicts. This change applies only when pandas is running on Python>=3.6 (GH27309).

```
In [60]: data = [
    ....:     {'name': 'Joe', 'state': 'NY', 'age': 18},
    ....:     {'name': 'Jane', 'state': 'KY', 'age': 19, 'hobby': 'Minecraft'},
    ....:     {'name': 'Jean', 'state': 'OK', 'age': 20, 'finances': 'good'},
    ....:     ]
```

Previous Behavior:

The columns were lexicographically sorted previously.

```
In [1]: pd.DataFrame(data)
Out[1]:
     age  finances  hobby  name  state
0   18    NaN      NaN    Joe   NY
1   19    NaN  Minecraft  Jane   KY
2   20    good     NaN   Jean   OK
```

New Behavior:
The column order now matches the insertion-order of the keys in the `dict`, considering all the records from top to bottom. As a consequence, the column order of the resulting DataFrame has changed compared to previous pandas versions.

```python
In [61]: pd.DataFrame(data)
Out[61]:
     name state  age  hobby   finances
0     Joe    NY  18.0      NaN      NaN
1   Jane   KY  19.0   Minecraft  NaN
2   Jean   OK  20.0        NaN      good
```

### Increased minimum versions for dependencies

Due to dropping support for Python 2.7, a number of optional dependencies have updated minimum versions (GH25725, GH24942, GH25752). Independently, some minimum supported versions of dependencies were updated (GH23519, GH25554). If installed, we now require:

<table>
<thead>
<tr>
<th>Package</th>
<th>Minimum Version</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>numpy</td>
<td>1.13.3</td>
<td>X</td>
</tr>
<tr>
<td>pytz</td>
<td>2015.4</td>
<td>X</td>
</tr>
<tr>
<td>python-dateutil</td>
<td>2.6.1</td>
<td>X</td>
</tr>
<tr>
<td>bottleneck</td>
<td>1.2.1</td>
<td></td>
</tr>
<tr>
<td>numexpr</td>
<td>2.6.2</td>
<td></td>
</tr>
<tr>
<td>pytest (dev)</td>
<td>4.0.2</td>
<td></td>
</tr>
</tbody>
</table>

For optional libraries the general recommendation is to use the latest version. The following table lists the lowest version per library that is currently being tested throughout the development of pandas. Optional libraries below the lowest tested version may still work, but are not considered supported.

<table>
<thead>
<tr>
<th>Package</th>
<th>Minimum Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>beautifulsoup4</td>
<td>4.6.0</td>
</tr>
<tr>
<td>fastparquet</td>
<td>0.2.1</td>
</tr>
<tr>
<td>gcsfs</td>
<td>0.2.2</td>
</tr>
<tr>
<td>lxml</td>
<td>3.8.0</td>
</tr>
<tr>
<td>matplotlib</td>
<td>2.2.2</td>
</tr>
<tr>
<td>openpyxl</td>
<td>2.4.8</td>
</tr>
<tr>
<td>pymysql</td>
<td>0.9.0</td>
</tr>
<tr>
<td>pytables</td>
<td>3.4.2</td>
</tr>
<tr>
<td>scipy</td>
<td>0.19.0</td>
</tr>
<tr>
<td>sqlalchemy</td>
<td>1.1.4</td>
</tr>
<tr>
<td>xarray</td>
<td>0.8.2</td>
</tr>
<tr>
<td>xlrd</td>
<td>1.1.0</td>
</tr>
<tr>
<td>xlswriter</td>
<td>0.9.8</td>
</tr>
<tr>
<td>xlwt</td>
<td>1.2.0</td>
</tr>
</tbody>
</table>

See Dependencies and Optional dependencies for more.
Other API changes

- `DatetimeTZDtype` will now standardize pytz timezones to a common timezone instance (GH24713)
- `Timestamp` and `Timedelta` scalars now implement the `to_numpy()` method as aliases to `Timestamp.to_datetime64()` and `Timedelta.to_timedelta64()`, respectively. (GH24653)
- `Timestamp.strptime()` will now raise a `NotImplementedError` (GH25016)
- Comparing `Timestamp` with unsupported objects now returns `NotImplemented` instead of raising `TypeError`. This implies that unsupported rich comparisons are delegated to the other object, and are now consistent with Python 3 behavior for `datetime` objects (GH24011)
- Bug in `DatetimeIndex.snap()` which didn’t preserving the name of the input `Index` (GH25575)
- The `arg` argument in `pandas.core.groupby.DataFrameGroupBy.agg()` has been renamed to `func` (GH26089)
- The `arg` argument in `pandas.core.window._Window.aggregate()` has been renamed to `func` (GH26372)
- Most pandas classes had a `__bytes__` method, which was used for getting a python2-style bytestring representation of the object. This method has been removed as a part of dropping Python2 (GH26447)
- The `.str_accessor` has been disabled for 1-level `MultiIndex`, use `MultiIndex.to_flat_index()` if necessary (GH23679)
- Removed support of gtk package for clipboards (GH26563)
- Using an unsupported version of Beautiful Soup 4 will now raise an `ImportError` instead of a `ValueError` (GH27063)
- `Series.to_excel()` and `DataFrame.to_excel()` will now raise a `ValueError` when saving timezone aware data. (GH27008, GH7056)
- `DataFrame.to_hdf()` and `Series.to_hdf()` will now raise a `NotImplementedError` when saving a `MultiIndex` with extension data types for a fixed format. (GH7775)
- Passing duplicate names in `read_csv()` will now raise a `ValueError` (GH17346)

Deprecations

Sparse subclasses

The `SparseSeries` and `SparseDataFrame` subclasses are deprecated. Their functionality is better-provided by a `Series` or `DataFrame` with sparse values.

Previous way

```python
def = pd.SparseDataFrame({"A": [0, 0, 1, 2]})
def.dtypes
```

New way

```python
In [62]: df = pd.DataFrame({"A": pd.SparseArray([0, 0, 1, 2])})
```

```python
In [63]: df.dtypes
Out[63]:
```

(continues on next page)
The memory usage of the two approaches is identical. See Migrating for more (GH19239).

msgpack format

The msgpack format is deprecated as of 0.25 and will be removed in a future version. It is recommended to use pyarrow for on-the-wire transmission of pandas objects. (GH27084)

Other deprecations

• The deprecated .ix[] indexer now raises a more visible FutureWarning instead of DeprecationWarning (GH26438).

• Deprecated the units=M (months) and units=Y (year) parameters for units of pandas.to_timedelta(), pandas.Timedelta() and pandas.TimedeltaIndex() (GH16344)

• pandas.concat() has deprecated the join_axes-keyword. Instead, use DataFrame.reindex() or DataFrame.reindex_like() on the result or on the inputs (GH21951)

• The SparseArray.values attribute is deprecated. You can use np.asarray(...) or the SparseArray.to_dense() method instead (GH26421).

• The functions pandas.to_datetime() and pandas.to_timedelta() have deprecated the box keyword. Instead, use to_numpy() or Timestamp.to_datetime64() or Timedelta.to_timedelta64(). (GH24416)

• The DataFrame.compound() and Series.compound() methods are deprecated and will be removed in a future version (GH26405).

• The internal attributes _start, _stop and _step attributes of RangeIndex have been deprecated. Use the public attributes start, stop and step instead (GH26581).

• The Series.ftype(), Series.ftypes() and DataFrame.ftypes() methods are deprecated and will be removed in a future version. Instead, use Series.dtype() and DataFrame.dtypes() (GH26705).

• The Series.get_values(), DataFrame.get_values(), Index.get_values(), SparseArray.get_values() and Categorical.get_values() methods are deprecated. One of np.asarray(...) or to_numpy() can be used instead (GH19617).

• The ‘outer’ method on NumPy ufuncs, e.g. np.subtract.outer has been deprecated on Series objects. Convert the input to an array with Series.array first (GH27186)

• Timedelta.resolution() is deprecated and replaced with Timedelta.resolution_string(). In a future version, Timedelta.resolution() will be changed to behave like the standard library datetime.timedelta.resolution (GH21344)

• read_table() has been undeprecated. (GH25220)

• Index.dtype_str is deprecated. (GH18262)

• Series.imag and Series.real are deprecated. (GH18262)

• Series.put() is deprecated. (GH18262)

• Index.item() and Series.item() is deprecated. (GH18262)
• The default value ordered=None in CategoricalDtype has been deprecated in favor of ordered=False. When converting between categorical types ordered=True must be explicitly passed in order to be preserved. (GH26336)

• Index.contains() is deprecated. Use key in index.__contains__() instead (GH17753).

• DataFrame.get_dtypes() is deprecated. (GH18262)

• Categorical.ravel() will return a Categorical instead of a np.ndarray (GH27199)

Removal of prior version deprecations/changes

• Removed Panel (GH25047, GH25191, GH25231)

• Removed the previously deprecated sheetname keyword in read_excel() (GH16442, GH20938)

• Removed the previously deprecated TimeGrouper (GH16942)

• Removed the previously deprecated parse_cols keyword in read_excel() (GH16488)

• Removed the previously deprecated pd.options.html.border (GH16970)

• Removed the previously deprecated convert_objects (GH11221)

• Removed the previously deprecated select method of DataFrame and Series (GH17633)

• Removed the previously deprecated behavior of Series treated as list-like in rename_categories() (GH17982)

• Removed the previously deprecated DataFrame.reindex_axis and Series.reindex_axis (GH17842)

• Removed the previously deprecated behavior of altering column or index labels with Series.rename_axis() or DataFrame.rename_axis() (GH17842)

• Removed the previously deprecated tupleize_cols keyword argument in read_html(), read_csv(), and DataFrame.to_csv() (GH17877, GH17820)

• Removed the previously deprecated DataFrame.from_csv and Series.from_csv (GH17812)

• Removed the previously deprecated raise_on_error keyword argument in DataFrame.where() and DataFrame.mask() (GH17744)

• Removed the previously deprecated ordered and categories keyword arguments in astype (GH17742)

• Removed the previously deprecated cdate_range (GH17691)

• Removed the previously deprecated True option for the dropna keyword argument in SeriesGroupBy.nth() (GH17493)

• Removed the previously deprecated convert keyword argument in Series.take() and DataFrame.take() (GH17352)

• Removed the previously deprecated behavior of arithmetic operations with datetime.date objects (GH21152)
Performance improvements

- Significant speedup in `SparseArray` initialization that benefits most operations, fixing performance regression introduced in v0.20.0 (GH24985)
- `DataFrame.to_stata()` is now faster when outputting data with any string or non-native endian columns (GH25045)
- Improved performance of `Series.searchsorted()`. The speedup is especially large when the dtype is int8/int16/int32 and the searched key is within the integer bounds for the dtype (GH22034)
- Improved performance of `pandas.core.groupby.GroupBy.quantile()` (GH20405)
- Improved performance of slicing and other selected operation on a `RangeIndex` (GH26565, GH26617, GH26722)
- `RangeIndex` now performs standard lookup without instantiating an actual hashtable, hence saving memory (GH16685)
- Improved performance of `read_csv()` by faster tokenizing and faster parsing of small float numbers (GH25784)
- Improved performance of `read_csv()` by faster parsing of N/A and boolean values (GH25804)
- Improved performance of `IntervalIndex.is_monotonic`, `IntervalIndex.is_monotonic_increasing` and `IntervalIndex.is_monotonic_decreasing` by removing conversion to `MultiIndex` (GH24813)
- Improved performance of `DataFrame.to_csv()` when writing datetime dtypes (GH25708)
- Improved performance of `read_csv()` by much faster parsing of MM/YYYY and DD/MM/YYYY datetime formats (GH25922)
- Improved performance of `Series.all()` and `Series.any()` (GH25070)
- Improved performance of `Series.map()` for dictionary mappers on categorical series by mapping the categories instead of mapping all values (GH23785)
- Improved performance of `IntervalIndex.intersection()` (GH24813)
- Improved performance of `read_csv()` by faster concatenating date columns without extra conversion to string for integer/float zero and float NaN; by faster checking the string for the possibility of being a date (GH25754)
- Improved performance of `IntervalIndex.is_unique` by removing conversion to `MultiIndex` (GH24813)
- Restored performance of `DatetimeIndex.__iter__()` by re-enabling specialized code path (GH26702)
- Improved performance when building `MultiIndex` with at least one `CategoricalIndex` level (GH22044)
- Improved performance by removing the need for a garbage collect when checking for `SettingWithCopyWarning` (GH27031)
- For `to_datetime()` changed default value of cache parameter to `True` (GH26043)
- Improved performance of `DatetimeIndex` and `PeriodIndex` slicing given non-unique, monotonic data (GH27136).
- Improved performance of `pd.read_json()` for index-oriented data. (GH26773)
- Improved performance of `MultiIndex.shape()` (GH27384).
Bug fixes

Categorical

- Bug in `DataFrame.at()` and `Series.at()` that would raise exception if the index was a `CategoricalIndex` (GH20629)
- Fixed bug in comparison of ordered `Categorical` that contained missing values with a scalar which sometimes incorrectly resulted in `True` (GH26504)
- Bug in `DataFrame.dropna()` when the DataFrame has a `CategoricalIndex` containing `Interval` objects incorrectly raised a TypeError (GH25087)

Datetimelike

- Bug in `to_datetime()` which would raise an (incorrect) `ValueError` when called with a date far into the future and the `format` argument specified instead of raising `OutOfBoundsDatetime` (GH23830)
- Bug in `to_datetime()` which would raise `InvalidIndexError: Reindexing only valid with uniquely valued Index objects when called with cache=True, with arg including at least two different elements from the set {None, numpy.nan, pandas.NaT}` (GH22305)
- Bug in `DataFrame` and `Series` where timezone aware data with `dtype='datetime64[ns]` was not cast to naive (GH25843)
- Improved `Timestamp` type checking in various datetime functions to prevent exceptions when using a subclassed datetime (GH25851)
- Bug in `Series` and `DataFrame` repr where `np.datetime64('NaT')` and `np.timedelta64('NaT')` with `dtype=object` would be represented as `NaN` (GH25445)
- Bug in `to_datetime()` which does not replace the invalid argument with NaT when error is set to coerce (GH26122)
- Bug in adding `DateOffset` with nonzero month to `DatetimeIndex` would raise `ValueError` (GH26258)
- Bug in `to_datetime()` which raises unhandled `OverflowError` when called with mix of invalid dates and NaN values with `format='%Y%m%d' and error='coerce'` (GH25512)
- Bug in `isin()` for datetimelike indexes; `DatetimeIndex`, `TimedeltaIndex` and `PeriodIndex` where the levels parameter was ignored. (GH26675)
- Bug in `to_datetime()` which raises `TypeError` for `format='%Y%m%d'` when called for invalid integer dates with length >= 6 digits with `errors='ignore'`
- Bug when comparing a `PeriodIndex` against a zero-dimensional numpy array (GH26689)
- Bug in constructing a `Series` or `DataFrame` from a numpy `datetime64` array with a non-ns unit and out-of-bound timestamps generating rubbish data, which will now correctly raise an `OutOfBoundsDatetime` error (GH26206)
- Bug in `date_range()` with unnecessary `OverflowError` being raised for very large or very small dates (GH26651)
- Bug where adding `Timestamp` to a np.timedelta64 object would raise instead of returning a `Timestamp` (GH24775)
- Bug where comparing a zero-dimensional numpy array containing a np.datetime64 object to a `Timestamp` would incorrect raise `TypeError` (GH26916)
• Bug in `to_datetime()` which would raise `ValueError: Tz-aware datetime.datetime cannot be converted to datetime64 unless utc=True` when called with `cache=True`, with `arg` including datetime strings with different offset (GH26097)

Timedelta

• Bug in `TimedeltaIndex.intersection()` where for non-monotonic indices in some cases an empty `Index` was returned when in fact an intersection existed (GH25913)

• Bug with comparisons between `Timedelta` and `NaT` raising `TypeError` (GH26039)

• Bug when adding or subtracting a `BusinessHour` to a `Timestamp` with the resulting time landing in a following or prior day respectively (GH26381)

• Bug when comparing a `TimedeltaIndex` against a zero-dimensional numpy array (GH26689)

Timezones

• Bug in `DatetimeIndex.to_frame()` where timezone aware data would be converted to timezone naive data (GH25809)

• Bug in `to_datetime()` with `utc=True` and datetime strings that would apply previously parsed UTC offsets to subsequent arguments (GH24992)

• Bug in `Timestamp.tz_localize()` and `Timestamp.tz_convert()` does not propagate `freq` (GH25241)

• Bug in `Series.at()` where setting `Timestamp` with timezone raises `TypeError` (GH25506)

• Bug in `DataFrame.update()` when updating with timezone aware data would return timezone naive data (GH25807)

• Bug in `to_datetime()` where an uninformative `RuntimeError` was raised when passing a naive `Timestamp` with datetime strings with mixed UTC offsets (GH25978)

• Bug in `to_datetime()` with `unit='ns'` would drop timezone information from the parsed argument (GH26168)

• Bug in `DataFrame.join()` where joining a timezone aware index with a timezone aware column would result in a column of `NaT` (GH26335)

• Bug in `date_range()` where ambiguous or nonexistent start or end times were not handled by the ambiguous or nonexistent keywords respectively (GH27088)

• Bug in `DatetimeIndex.union()` when combining a timezone aware and timezone unaware `DatetimeIndex` (GH21671)

• Bug when applying a numpy reduction function (e.g. `numpy.minimum()`) to a timezone aware `Series` (GH15552)
pandas: powerful Python data analysis toolkit, Release 1.3.1

Numeric

- Bug in `to_numeric()` in which large negative numbers were being improperly handled (GH24910)
- Bug in `to_numeric()` in which numbers were being coerced to float, even though `errors` was not `coerce` (GH24910)
- Bug in `to_numeric()` in which invalid values for `errors` were being allowed (GH26466)
- Bug in `format` in which floating point complex numbers were not being formatted to proper display precision and trimming (GH25514)
- Bug in error messages in `DataFrame.corr()` and `Series.corr()`. Added the possibility of using a callable. (GH25729)
- Bug in `Series.divmod()` and `Series.rdivmod()` which would raise an (incorrect) `ValueError` rather than return a pair of `Series` objects as result (GH25557)
- Raises a helpful exception when a non-numeric index is sent to `interpolate()` with methods which require numeric index. (GH21662)
- Bug in `eval()` when comparing floats with scalar operators, for example: `x < -0.1` (GH25928)
- Fixed bug where casting all-boolean array to integer extension array failed (GH25211)
- Bug in `divmod` with a `Series` object containing zeros incorrectly raising `AttributeError` (GH26987)
- Inconsistency in `Series` floor-division (`//`) and `divmod` filling positive//zero with NaN instead of Inf (GH27321)

Conversion

- Bug in `DataFrame.astype()` when passing a dict of columns and types the `errors` parameter was ignored. (GH25905)

Strings

- Bug in the `__name__` attribute of several methods of `Series.str`, which were set incorrectly (GH23551)
- Improved error message when passing `Series` of wrong dtype to `Series.str.cat()` (GH22722)

Interval

- Construction of `Interval` is restricted to numeric, `Timestamp` and `Timedelta` endpoints (GH23013)
- Fixed bug in `Series|DataFrame` not displaying NaN in `IntervalIndex` with missing values (GH25984)
- Bug in `IntervalIndex.get_loc()` where a `KeyError` would be incorrectly raised for a decreasing `IntervalIndex` (GH25860)
- Bug in `Index` constructor where passing mixed closed `Interval` objects would result in a `ValueError` instead of an `object` dtype `Index` (GH27172)
Indexing

- Improved exception message when calling `DataFrame.iloc()` with a list of non-numeric objects (GH25753).
- Improved exception message when calling `.iloc` or `.loc` with a boolean indexer with different length (GH26658).
- Bug in `KeyError` exception message when indexing a `MultiIndex` with a non-existent key not displaying the original key (GH27250).
- Bug in `.iloc` and `.loc` with a boolean indexer not raising an `IndexError` when too few items are passed (GH26658).
- Bug in `DataFrame.loc()` and `Series.loc()` where `KeyError` was not raised for a `MultiIndex` when the key was less than or equal to the number of levels in the `MultiIndex` (GH14885).
- Bug in which `DataFrame.append()` produced an erroneous warning indicating that a `KeyError` will be thrown in the future when the data to be appended contains new columns (GH22252).
- Bug in which `DataFrame.to_csv()` caused a segfault for a reindexed data frame, when the indices were single-level `MultiIndex` (GH26303).
- Fixed bug where assigning a `arrays.PandasArray` to a `pandas.core.frame.DataFrame` would raise error (GH26390).
- Allow keyword arguments for callable local reference used in the `DataFrame.query()` string (GH26426).
- Fixed a `KeyError` when indexing a `MultiIndex` level with a list containing exactly one label, which is missing (GH27148).
- Bug which produced `AttributeError` on partial matching `Timestamp` in a `MultiIndex` (GH26944).
- Bug in `Categorical` and `CategoricalIndex` with `Interval` values when using the `in` operator (`__contains__`) with objects that are not comparable to the values in the `Interval` (GH23705).
- Bug in `DataFrame.loc()` and `DataFrame.iloc()` on a `DataFrame` with a single timezone-aware datetime64[ns] column incorrectly returning a scalar instead of a `Series` (GH27110).
- Bug in `CategoricalIndex` and `Categorical` incorrectly raising `ValueError` instead of `TypeError` when a list is passed using the `in` operator (`__contains__`) (GH21729).
- Bug in setting a new value in a `Series` with a `Timedelta` object incorrectly casting the value to an integer (GH22717).
- Bug in `Series` setting a new key (`__setitem__`) with a timezone-aware datetime incorrectly raising `ValueError` (GH12862).
- Bug in `DataFrame.iloc()` when indexing with a read-only indexer (GH17192).
- Bug in `Series` setting an existing tuple key (`__setitem__`) with timezone-aware datetime values incorrectly raising `TypeError` (GH20441).
Missing

- Fixed misleading exception message in `Series.interpolate()` if argument `order` is required, but omitted (GH10633, GH24014).
- Fixed class type displayed in exception message in `DataFrame.dropna()` if invalid `axis` parameter passed (GH25555).
- A `ValueError` will now be thrown by `DataFrame.fillna()` when `limit` is not a positive integer (GH27042).

MultIndex

- Bug in which incorrect exception raised by `Timedelta` when testing the membership of `MultiIndex` (GH24570).

IO

- Bug in `DataFrame.to_html()` where values were truncated using display options instead of outputting the full content (GH17004).
- Fixed bug in missing text when using `to_clipboard()` if copying utf-16 characters in Python 3 on Windows (GH25040).
- Bug in `read_json()` for `orient='table'` when it tries to infer dtypes by default, which is not applicable as dtypes are already defined in the JSON schema (GH21345).
- Bug in `read_json()` for `orient='table'` and float index, as it infers index dtype by default, which is not applicable because index dtype is already defined in the JSON schema (GH25433).
- Bug in `read_json()` for `orient='table'` and string of float column names, as it makes a column name type conversion to `Timestamp`, which is not applicable because column names are already defined in the JSON schema (GH25435).
- Bug in `json_normalize()` for `errors='ignore'` where missing values in the input data, were filled in resulting `DataFrame` with the string "nan" instead of `numpy.nan` (GH25468).
- `DataFrame.to_html()` now raises `TypeError` when using an invalid type for the `classes` parameter instead of `AssertionError` (GH25608).
- Bug in `DataFrame.to_string()` and `DataFrame.to_latex()` that would lead to incorrect output when the `header` keyword is used (GH16718).
- Bug in `read_csv()` not properly interpreting the UTF8 encoded filenames on Windows on Python 3.6+ (GH15086).
- Improved performance in `pandas.read_stata()` and `pandas.io.stata.StataReader` when converting columns that have missing values (GH25772).
- Bug in `DataFrame.to_html()` where header numbers would ignore display options when rounding (GH17280).
- Bug in `read_hdf()` where reading a table from an HDF5 file written directly with PyTables fails with a `ValueError` when using a sub-selection via the `start` or `stop` arguments (GH11188).
- Bug in `read_hdf()` not properly closing store after a `KeyError` is raised (GH25766).
- Improved the explanation for the failure when value labels are repeated in Stata dta files and suggested work-arounds (GH25772)
- Improved `pandas.read_stata()` and `pandas.io.stata.StataReader` to read incorrectly formatted 118 format files saved by Stata (GH25960)
- Improved the `col_space` parameter in `DataFrame.to_html()` to accept a string so CSS length values can be set correctly (GH25941)
- Fixed bug in loading objects from S3 that contain # characters in the URL (GH25945)
- Adds `use_bqstorage_api` parameter to `read_gbq()` to speed up downloads of large data frames. This feature requires version 0.10.0 of the pandas-gbq library as well as the google-cloud-bigquery-storage and fastavro libraries. (GH26104)
- Fixed memory leak in `DataFrame.to_json()` when dealing with numeric data (GH24889)
- Bug in `read_json()` where date strings with Z were not converted to a UTC timezone (GH26168)
- Added `cache_dates=True` parameter to `read_csv()`, which allows to cache unique dates when they are parsed (GH25990)
- `DataFrame.to_excel()` now raises a `ValueError` when the caller’s dimensions exceed the limitations of Excel (GH26051)
- Fixed bug in `pandas.read_csv()` where a BOM would result in incorrect parsing using engine='python' (GH26545)
- `read_excel()` now raises a `ValueError` when input is of type `pandas.io.excel.ExcelFile` and engine param is passed since `pandas.io.excel.ExcelFile` has an engine defined (GH26566)
- Bug while selecting from HDFStore with `where=''` specified (GH26610).
- Fixed bug in `DataFrame.to_excel()` where custom objects (i.e. PeriodIndex) inside merged cells were not being converted into types safe for the Excel writer (GH27006)
- Bug in `read_hdf()` where reading a timezone aware DatetimeIndex would raise a `TypeError` (GH11926)
- Bug in `to_msgpack()` and `read_msgpack()` which would raise a `ValueError` rather than a `FileNotFoundError` for an invalid path (GH27160)
- Fixed bug in `DataFrame.to_parquet()` which would raise a `ValueError` when the dataframe had no columns (GH27339)
- Allow parsing of PeriodDtype columns when using `read_csv()` (GH26934)

**Plotting**

- Fixed bug where `api.extensions.ExtensionArray` could not be used in matplotlib plotting (GH25587)
- Bug in an error message in `DataFrame.plot()`. Improved the error message if non-numerics are passed to `DataFrame.plot()` (GH25481)
- Bug in incorrect ticklabel positions when plotting an index that are non-numeric / non-datetime (GH7612, GH15912, GH22334)
- Fixed bug causing plots of PeriodIndex timeseries to fail if the frequency is a multiple of the frequency rule code (GH14763)
- Fixed bug when plotting a DatetimeIndex with datetime.timezone.utc timezone (GH17173)
GroupBy/resample/rolling

- Bug in `pandas.core.resample.Resampler.agg()` with a timezone aware index where `OverflowError` would raise when passing a list of functions (GH22660)
- Bug in `pandas.core.groupby.DataFrameGroupBy.nunique()` in which the names of column levels were lost (GH23222)
- Bug in `pandas.core.groupby.GroupBy.agg()` when applying an aggregation function to timezone aware data (GH23683)
- Bug in `pandas.core.groupby.GroupBy.first()` and `pandas.core.groupby.GroupBy.last()` where timezone information would be dropped (GH21603)
- Bug in `Series.groupby()` where observed kwarg was previously ignored (GH24880)
- Bug in `Series.groupby()` where using groupby with a `MultiIndex` Series with a list of labels equal to the length of the series caused incorrect grouping (GH25704)
- Ensured that ordering of outputs in `groupby` aggregation functions is consistent across all versions of Python (GH25692)
- Ensured that result group order is correct when grouping on an ordered `Categorical` and specifying `observed=True` (GH25871, GH25167)
- Bug in `pandas.core.window.Rolling.min()` and `pandas.core.window.Rolling.max()` that caused a memory leak (GH25893)
- Bug in `pandas.core.window.Rolling.count()` and `pandas.core.window.Expanding.count` was previously ignoring the `axis` keyword (GH13503)
- Bug in `pandas.core.groupby.GroupBy.idamax()` and `pandas.core.groupby.GroupBy.idamin()` with datetime column would return incorrect dtype (GH25444, GH15306)
- Bug in `pandas.core.groupby.GroupBy.cumsum()`, `pandas.core.groupby.GroupBy.cumprod()`, `pandas.core.groupby.GroupBy.cummin()` and `pandas.core.groupby.GroupBy.cummax()` with categorical column having absent categories, would return incorrect result or segfault (GH16771)
- Bug in `pandas.core.groupby.GroupBy.nth()` where NA values in the grouping would return incorrect results (GH26011)
- Bug in `pandas.core.groupby.SeriesGroupBy.transform()` where transforming an empty group would raise a `ValueError` (GH26208)
- Bug in `pandas.core.frame.DataFrame.groupby()` where passing a `pandas.core.groupby.Grouper` would return incorrect groups when using the `.groups` accessor (GH26326)
- Bug in `pandas.core.groupby.GroupBy.agg()` where incorrect results are returned for uint64 columns. (GH26310)
- Bug in `pandas.core.window.Rolling.median()` and `pandas.core.window.Rolling.quantile()` where MemoryError is raised with empty window (GH26005)
- Bug in `pandas.core.window.Rolling.median()` and `pandas.core.window.Rolling.quantile()` where incorrect results are returned with `closed='left'` and `closed='neither'` (GH26005)
pandas: powerful Python data analysis toolkit, Release 1.3.1

- **Improved** pandas.core.window.Rolling, pandas.core.window.Window and pandas.core.window.ExponentialMovingWindow functions to exclude nuisance columns from results instead of raising errors and raise a DataError only if all columns are nuisance (GH12537)

- **Bug in** pandas.core.window.Rolling.max() and pandas.core.window.Rolling.min() where incorrect results are returned with an empty variable window (GH26005)

- Raise a helpful exception when an unsupported weighted window function is used as an argument of pandas.core.window.Window.aggregate() (GH26597)

**Reshaping**

- **Bug in** pandas.merge() adds a string of None, if None is assigned in suffixes instead of remain the column name as-is (GH24782).

- **Bug in** merge() when merging by index name would sometimes result in an incorrectly numbered index (missing index values are now assigned NA) (GH24212, GH25009)

- to_records() now accepts dtypes to its column_dtypes parameter (GH24895)

- **Bug in** concat() where order of OrderedDict (and dict in Python 3.6+) is not respected, when passed in as objs argument (GH21510)

- **Bug in** pivot_table() where columns with NaN values are dropped even if dropna argument is False, when the aggfunc argument contains a list (GH22159)

- **Bug in** concat() where the resulting freq of two DatetimeIndex with the same freq would be dropped (GH3232).

- **Bug in** merge() where merging with equivalent Categorical dtypes was raising an error (GH22501)

- Bug in DataFrame instantiating with a dict of iterators or generators (e.g. pd.DataFrame({'A': reversed(range(3))})) raised an error (GH26349).

- **Bug in** DataFrame instantiating with a range (e.g. pd.DataFrame(range(3))) raised an error (GH26342).

- **Bug in** DataFrame constructor when passing non-empty tuples would cause a segmentation fault (GH25691)

- **Bug in** Series.apply() failed when the series is a timezone aware DatetimeIndex (GH25959)

- **Bug in** pandas.cut() where large bins could incorrectly raise an error due to an integer overflow (GH26045)

- **Bug in** DataFrame.sort_index() where an error is thrown when a multi-indexed DataFrame is sorted on all levels with the initial level sorted last (GH26053)

- **Bug in** Series.nlargest() treats True as smaller than False (GH26154)

- **Bug in** DataFrame.pivot_table() with a IntervalIndex as pivot index would raise TypeError (GH25814)

- **Bug in** which DataFrame.from_dict() ignored order of OrderedDict when orient='index' (GH8425).

- **Bug in** DataFrame.transpose() where transposing a DataFrame with a timezone-aware datetime column would incorrectly raise ValueError (GH26825)

- **Bug in** pivot_table() when pivoting a timezone aware column as the values would remove timezone information (GH14948)

- **Bug in** merge_asof() when specifying multiple by columns where one is datetime64 [ns, tz] dtype (GH26649)
Sparse

- Significant speedup in `SparseArray` initialization that benefits most operations, fixing performance regression introduced in v0.20.0 (GH24985)
- Bug in `SparseFrame` constructor where passing None as the data would cause `default_fill_value` to be ignored (GH16807)
- Bug in `SparseDataFrame` when adding a column in which the length of values does not match length of index, `AssertionError` is raised instead of raising `ValueError` (GH25484)
- Introduce a better error message in `Series.sparse.from_coo()` so it returns a `TypeError` for inputs that are not coo matrices (GH26554)
- Bug in `numpy.modf()` on a `SparseArray`. Now a tuple of `SparseArray` is returned (GH26946).

Build changes

- Fix install error with PyPy on macOS (GH26536)

ExtensionArray

- Bug in `factorize()` when passing an `ExtensionArray` with a custom `na_sentinel` (GH25696).
- `Series.count()` miscounts NA values in ExtensionArrays (GH26835)
- Added `Series.__array_ufunc__` to better handle NumPy ufuncs applied to Series backed by extension arrays (GH23293).
- Keyword argument `deep` has been removed from `ExtensionArray.copy()` (GH27083)

Other

- Removed unused C functions from vendored UltraJSON implementation (GH26198)
- Allow `Index` and `RangeIndex` to be passed to `numpy min` and `max` functions (GH26125)
- Use actual class name in `repr` of empty objects of a `Series` subclass (GH27001).
- Bug in `DataFrame` where passing an object array of timezone-aware `datetime` objects would incorrectly raise `ValueError` (GH13287)

5.6 Version 0.24

5.6.1 What’s new in 0.24.2 (March 12, 2019)

**Warning:** The 0.24.x series of releases will be the last to support Python 2. Future feature releases will support Python 3 only. See Dropping Python 2.7 for more.

These are the changes in pandas 0.24.2. See *Release notes* for a full changelog including other versions of pandas.

**Fixed regressions**

- Fixed regression in `DataFrame.all()` and `DataFrame.any()` where `bool_only=True` was ignored (GH25101)
- Fixed issue in `DataFrame` construction with passing a mixed list of mixed types could segfault. (GH25075)
- Fixed regression in `DataFrame.apply()` causing `RecursionError` when dict-like classes were passed as argument. (GH25196)
- Fixed regression in `DataFrame.replace()` where `regex=True` was only replacing patterns matching the start of the string (GH25259)
- Fixed regression in `DataFrame.duplicated()`, where empty dataframe was not returning a boolean dtyped Series. (GH25184)
- Fixed regression in `Series.min()` and `Series.max()` where `numeric_only=True` was ignored when the `Series` contained Categorical data (GH25299)
- Fixed regression in subtraction between `Series` objects with `datetime64[ns]` dtype incorrectly raising `OverflowError` when the `Series` on the right contains null values (GH25317)
- Fixed regression in `TimedeltaIndex` where `np.sum(index)` incorrectly returned a zero-dimensional object instead of a scalar (GH25282)
- Fixed regression in `IntervalDtype` construction where passing an incorrect string with ‘Interval’ as a prefix could result in a `RecursionError`. (GH25338)
- Fixed regression in creating a period-dtype array from a read-only NumPy array of period objects. (GH25403)
• Fixed regression in `Categorical`, where constructing it from a categorical `Series` and an explicit `categories=` that differed from that in the `Series` created an invalid object which could trigger segfaults. (GH25318)

• Fixed regression in `to_timedelta()` losing precision when converting floating data to `Timedelta` data (GH25077).

• Fixed pip installing from source into an environment without NumPy (GH25193)

• Fixed regression in `DataFrame.replace()` where large strings of numbers would be coerced into `int64`, causing an `OverflowError` (GH25616)

• Fixed regression in `factorize()` when passing a custom `na_sentinel` value with `sort=True` (GH25409).

• Fixed regression in `DataFrame.to_csv()` writing duplicate line endings with gzip compress (GH25311)

**Bug fixes**

**I/O**

• Better handling of terminal printing when the terminal dimensions are not known (GH25080)

• Bug in reading a HDF5 table-format `DataFrame` created in Python 2, in Python 3 (GH24925)

• Bug in reading a JSON with `orient='table'` generated by `DataFrame.to_json()` with `index=False` (GH25170)

• Bug where float indexes could have misaligned values when printing (GH25061)

**Categorical**

• Bug where calling `Series.replace()` on categorical data could return a `Series` with incorrect dimensions (GH24971)

•

**Reshaping**

• Bug in `transform()` where applying a function to a timezone aware column would return a timezone naive result (GH24198)

• Bug in `DataFrame.join()` when joining on a timezone aware `DatetimeIndex` (GH23931)

**Visualization**

• Bug in `Series.plot()` where a secondary y axis could not be set to log scale (GH25545)

**Other**

• Bug in `Series.is_unique()` where single occurrences of `NaN` were not considered unique (GH25180)

• Bug in `merge()` when merging an empty `DataFrame` with an `Int64` column or a non-empty `DataFrame` with an `Int64` column that is all `NaN` (GH25183)

• Bug in `IntervalTree` where a `RecursionError` occurs upon construction due to an overflow when adding endpoints, which also causes `IntervalIndex` to crash during indexing operations (GH25485)

• Bug in `Series.size` raising for some extension-array-backed `Series`, rather than returning the size (GH25580)

• Bug in resampling raising for nullable integer-dtype columns (GH25580)

5.6.2 What’s new in 0.24.1 (February 3, 2019)

**Warning:** The 0.24.x series of releases will be the last to support Python 2. Future feature releases will support Python 3 only. See Dropping Python 2.7 for more.

These are the changes in pandas 0.24.1. See Release notes for a full changelog including other versions of pandas. See What’s new in 0.24.0 (January 25, 2019) for the 0.24.0 changelog.

**API changes**

**Changing the sort parameter for Index set operations**

The default sort value for `Index.union()` has changed from True to None (GH24959). The default behavior, however, remains the same: the result is sorted, unless

1. self and other are identical
2. self or other is empty
3. self or other contain values that can not be compared (a RuntimeWarning is raised).

This change will allow sort=True to mean “always sort” in a future release.

The same change applies to `Index.difference()` and `Index.symmetric_difference()`, which would not sort the result when the values could not be compared.

The sort option for `Index.intersection()` has changed in three ways.

1. The default has changed from True to False, to restore the pandas 0.23.4 and earlier behavior of not sorting by default.
2. The behavior of sort=True can now be obtained with sort=None. This will sort the result only if the values in self and other are not identical.
3. The value sort=True is no longer allowed. A future version of pandas will properly support sort=True meaning “always sort”.

**Fixed regressions**

- Fixed regression in `DataFrame.to_dict()` with records orient raising an AttributeError when the DataFrame contained more than 255 columns, or wrongly converting column names that were not valid python identifiers (GH24939, GH24940).
- Fixed regression in `read_sql()` when passing certain queries with MySQL/pymysql (GH24988).
- Fixed regression in `Index.intersection` incorrectly sorting the values by default (GH24959).
- Fixed regression in `merge()` when merging an empty DataFrame with multiple timezone-aware columns on one of the timezone-aware columns (GH25014).
- Fixed regression in `Series.rename_axis()` and `DataFrame.rename_axis()` where passing None failed to remove the axis name (GH25034)
- Fixed regression in `to_timedelta()` with box=False incorrectly returning a datetime64 object instead of a timedelta64 object (GH24961)
- Fixed regression where custom hashable types could not be used as column keys in `DataFrame.set_index()` (GH24969)
Bug fixes

Reshaping

- Bug in `DataFrame.groupby()` with `Grouper` when there is a time change (DST) and grouping frequency is '1d' (GH24972)

Visualization

- Fixed the warning for implicitly registered matplotlib converters not showing. See `Restore Matplotlib datetime converter registration` for more (GH24963).

Other

- Fixed `AttributeError` when printing a DataFrame’s HTML repr after accessing the IPython config object (GH25036)

Contributors

A total of 7 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

5.6.3 What’s new in 0.24.0 (January 25, 2019)

**Warning:** The 0.24.x series of releases will be the last to support Python 2. Future feature releases will support Python 3 only. See `Dropping Python 2.7` for more details.

This is a major release from 0.23.4 and includes a number of API changes, new features, enhancements, and performance improvements along with a large number of bug fixes.

Highlights include:

- *Optional Integer NA Support*
- *New APIs for accessing the array backing a Series or Index*
- *A new top-level method for creating arrays*
- *Store Interval and Period data in a Series or DataFrame*
- *Support for joining on two MultiIndexes*

Check the `API Changes` and `deprecations` before updating.

These are the changes in pandas 0.24.0. See `Release notes` for a full changelog including other versions of pandas.
Enhancements

Optional integer NA support

pandas has gained the ability to hold integer dtypes with missing values. This long requested feature is enabled through the use of extension types.

Note: IntegerArray is currently experimental. Its API or implementation may change without warning.

We can construct a Series with the specified dtype. The dtype string Int64 is a pandas ExtensionDtype. Specifying a list or array using the traditional missing value marker of np.nan will infer to integer dtype. The display of the Series will also use the NaN to indicate missing values in string outputs. (GH20700, GH20747, GH22441, GH21789, GH22346)

```
In [1]: s = pd.Series([1, 2, np.nan], dtype='Int64')
In [2]: s
Out[2]:
0   1
1   2
2  <NA>
dtype: Int64
```

Operations on these dtypes will propagate NaN as other pandas operations.

```
# arithmetic
In [3]: s + 1
Out[3]:
0   2
1   3
2  <NA>
dtype: Int64

# comparison
In [4]: s == 1
Out[4]:
0  True
1 False
2  <NA>
dtype: boolean

# indexing
In [5]: s.iloc[1:3]
Out[5]:
1   2
2  <NA>
dtype: Int64

# operate with other dtypes
In [6]: s + s.iloc[1:3].astype('Int8')
Out[6]:
0  <NA>
1   4
2  <NA>
dtype: Int64
```
# coerce when needed
In [7]: s + 0.01
Out[7]:
0  1.01
1  2.01
2   <NA>
dtype: Float64

These dtypes can operate as part of a DataFrame.

In [8]: df = pd.DataFrame({'A': s, 'B': [1, 1, 3], 'C': list('aab')})
In [9]: df
Out[9]:
   A  B  C
0  1  1  a
1  2  1  a
2   <NA>  3  b
In [10]: df.dtypes
Out[10]:
A    Int64
B     int64
C   object
dtype: object

These dtypes can be merged, reshaped, and casted.

In [11]: pd.concat([df[['A']], df[['B', 'C']]], axis=1).dtypes
Out[11]:
A    Int64
B     int64
C   object
dtype: object

In [12]: df['A'].astype(float)
Out[12]:
0  1.0
1  2.0
2  NaN
Name: A, dtype: float64

Reduction and groupby operations such as sum work.

In [13]: df.sum()
Out[13]:
   A   B   C
0  3   5   a
   dtype: object
In [14]: df.groupby('B').A.sum()
Out[14]:
   B
1  3
Warning: The Integer NA support currently uses the capitalized dtype version, e.g. Int8 as compared to the traditional int8. This may be changed at a future date.

See Nullable integer data type for more.

Accessing the values in a Series or Index

Series.array and Index.array have been added for extracting the array backing a Series or Index. (GH19954, GH23623)

In [15]: idx = pd.period_range('2000', periods=4)

In [16]: idx.array
Out[16]:
<PeriodArray>
Length: 4, dtype: period[D]

In [17]: pd.Series(idx).array
Out[17]:
<PeriodArray>
Length: 4, dtype: period[D]

Historically, this would have been done with series.values, but with .values it was unclear whether the returned value would be the actual array, some transformation of it, or one of pandas custom arrays (like Categorical). For example, with PeriodIndex, .values generates a new ndarray of period objects each time.

In [18]: idx.values
Out[18]:
array([Period('2000-01-01', 'D'), Period('2000-01-02', 'D'),
       Period('2000-01-03', 'D'), Period('2000-01-04', 'D')], dtype=object)

In [19]: id(idx.values)
Out[19]: 139768296308976

In [20]: id(idx.values)
Out[20]: 139768296310992

If you need an actual NumPy array, use Series.to_numpy() or Index.to_numpy().

In [21]: idx.to_numpy()
Out[21]:
array([Period('2000-01-01', 'D'), Period('2000-01-02', 'D'),
       Period('2000-01-03', 'D'), Period('2000-01-04', 'D')], dtype=object)

In [22]: pd.Series(idx).to_numpy()
Out[22]:
(continues on next page)
For Series and Indexes backed by normal NumPy arrays, `Series.array` will return a new `arrays`. `PandasArray`, which is a thin (no-copy) wrapper around a `numpy.ndarray`. `PandasArray` isn’t especially useful on its own, but it does provide the same interface as any extension array defined in pandas or by a third-party library.

```python
In [23]: ser = pd.Series([1, 2, 3])
In [24]: ser.array
Out[24]: <PandasArray>
[1, 2, 3]
Length: 3, dtype: int64
In [25]: ser.to_numpy()
Out[25]: array([1, 2, 3])
```

We haven’t removed or deprecated `Series.values` or `DataFrame.values`, but we highly recommend and using `.array` or `.to_numpy()` instead. See `Dtypes` and `Attributes and Underlying Data` for more.

### `pandas.array`: a new top-level method for creating arrays

A new top-level method `array()` has been added for creating 1-dimensional arrays (GH22860). This can be used to create any extension array, including extension arrays registered by 3rd party libraries. See the `dtypes docs` for more on extension arrays.

```python
In [26]: pd.array([1, 2, np.nan], dtype='Int64')
Out[26]: <IntegerArray>
[1, 2, <NA>]
Length: 3, dtype: Int64
In [27]: pd.array(['a', 'b', 'c'], dtype='category')
Out[27]: ['a', 'b', 'c']
Categories (3, object): ['a', 'b', 'c']
```

Passing data for which there isn’t dedicated extension type (e.g. float, integer, etc.) will return a new `arrays`. `PandasArray`, which is just a thin (no-copy) wrapper around a `numpy.ndarray` that satisfies the pandas extension array interface.

```python
In [28]: pd.array([1, 2, 3])
Out[28]: <IntegerArray>
[1, 2, 3]
Length: 3, dtype: Int64
```

On their own, a `PandasArray` isn’t a very useful object. But if you need write low-level code that works generically for any `ExtensionArray`, `PandasArray` satisfies that need.

Notice that by default, if no `dtype` is specified, the `dtype` of the returned array is inferred from the data. In particular, note that the first example of `[1, 2, np.nan]` would have returned a floating-point array, since NaN is a float.
Storing Interval and Period data in Series and DataFrame

*Interval* and *Period* data may now be stored in a *Series* or *DataFrame*, in addition to an *IntervalIndex* and *PeriodIndex* like previously (GH19453, GH22862).

```python
In [30]: ser = pd.Series(pd.interval_range(0, 5))

In [31]: ser
Out[31]:
0 (0, 1]
1 (1, 2]
2 (2, 3]
3 (3, 4]
4 (4, 5]
dtype: interval

In [32]: ser.dtype
Out[32]: interval[int64, right]

For periods:

```python
In [33]: pser = pd.Series(pd.period_range("2000", freq="D", periods=5))

In [34]: pser
Out[34]:
0 2000-01-01
1 2000-01-02
2 2000-01-03
3 2000-01-04
4 2000-01-05
dtype: period[D]

In [35]: pser.dtype
Out[35]: period[D]
```

Previously, these would be cast to a NumPy array with object dtype. In general, this should result in better performance when storing an array of intervals or periods in a *Series* or column of a *DataFrame*.

Use *Series.array* to extract the underlying array of intervals or periods from the *Series*:

```python
In [36]: ser.array
Out[36]:
<IntervalArray>
[(0, 1], (1, 2], (2, 3], (3, 4], (4, 5]]
Length: 5, dtype: interval[int64, right]

In [37]: pser.array
Out[37]:
<PeriodArray>

(continues on next page)
These return an instance of `arrays.IntervalArray` or `arrays.PeriodArray`, the new extension arrays that back interval and period data.

**Warning:** For backwards compatibility, `Series.values` continues to return a NumPy array of objects for Interval and Period data. We recommend using `Series.array` when you need the array of data stored in the `Series`, and `Series.to_numpy()` when you know you need a NumPy array.

See `Dtypes` and `Attributes and Underlying Data` for more.

### Joining with two multi-indexes

`DataFrame.merge()` and `DataFrame.join()` can now be used to join multi-indexed `DataFrame` instances on the overlapping index levels (GH6360)

See the `Merge, join, and concatenate` documentation section.

```python
In [38]: index_left = pd.MultiIndex.from_tuples([('K0', 'X0'), ('K0', 'X1'),
                          ('K1', 'X2')],
                                   names=['key', 'X'])
           ....: index_right = pd.MultiIndex.from_tuples([('K0', 'Y0'), ('K1', 'Y1'),
                                                         ('K2', 'Y2'), ('K2', 'Y3')],
                                                        names=['key', 'Y'])

In [39]: left = pd.DataFrame({'A': ['A0', 'A1', 'A2'],
                          'B': ['B0', 'B1', 'B2']}, index=index_left)
In [40]: right = pd.DataFrame({'C': ['C0', 'C1', 'C2', 'C3'],
                           'D': ['D0', 'D1', 'D2', 'D3']}, index=index_right)

In [41]: left.join(right)
```

For earlier versions this can be done using the following.

```python
In [43]: pd.merge(left.reset_index(), right.reset_index(),
                          on=['key'], how='inner').set_index(['key', 'X', 'Y'])
```

(continues on next page)
Function `read_html` enhancements

`read_html()` previously ignored `colspan` and `rowspan` attributes. Now it understands them, treating them as sequences of cells with the same value. (GH17054)

```python
In [44]: result = pd.read_html(''
.....:   <table>
.....:     <thead>
.....:       <tr>
.....:         <th>A</th><th>B</th><th>C</th>
.....:       </tr>
.....:     </thead>
.....:     <tbody>
.....:       <tr>
.....:         <td colspan="2">1</td><td>2</td>
.....:       </tr>
.....:     </tbody>
.....: </table>''
```

**Previous behavior:**

```python
In [13]: result
Out [13]:
[ A B C
 0 1 2 NaN]
```

**New behavior:**

```python
In [45]: result
Out[45]:
[ A B C
 0 1 1 2]
```

New `Styler.pipe()` method

The `Styler` class has gained a `pipe()` method. This provides a convenient way to apply users’ predefined styling functions, and can help reduce “boilerplate” when using DataFrame styling functionality repeatedly within a notebook. (GH23229)

```python
In [46]: df = pd.DataFrame({'N': [1250, 1500, 1750], 'X': [0.25, 0.35, 0.50]})
In [47]: def format_and_align(styler):
.....:     return styler.format({'N': '{:,}', 'X': '{:.1%}'})
.....:     .set_properties(**{'text-align': 'right'})
.....:     
In [48]: df.style.pipe(format_and_align).set_caption('Summary of results.')
Out[48]: <pandas.io.formats.style.Styler at 0x7f1e57955400>
```
Similar methods already exist for other classes in pandas, including `DataFrame.pipe()`, `GroupBy.pipe()`, and `Resampler.pipe()`.

### Renaming names in a MultiIndex

`DataFrame.rename_axis()` now supports `index` and `columns` arguments and `Series.rename_axis()` supports `index` argument (GH19978).

This change allows a dictionary to be passed so that some of the names of a MultiIndex can be changed.

Example:

```python
In [49]: mi = pd.MultiIndex.from_product([list('AB'), list('CD'), list('EF')],
   ....:     names=['AB', 'CD', 'EF'])
   ....:

In [50]: df = pd.DataFrame(list(range(len(mi))), index=mi, columns=['N'])

In [51]: df
Out[51]:
     N
AB CD EF
A  C E 0
   F 1
D  E 2
   F 3
B  C E 4
   F 5
D  E 6
   F 7

In [52]: df.rename_axis(index={'CD': 'New'})
Out[52]:
     N
AB New EF
A  C E 0
   F 1
D  E 2
   F 3
B  C E 4
   F 5
D  E 6
   F 7
```

See the [Advanced documentation on renaming](https://pandas.pydata.org/pandas-docs/stable/user_guide/advanced.html) for more details.

### Other enhancements

- `merge()` now directly allows merge between objects of type `DataFrame` and named `Series`, without the need to convert the `Series` object into a `DataFrame` beforehand (GH21220)
- `ExcelWriter` now accepts `mode` as a keyword argument, enabling append to existing workbooks when using the `openpyxl` engine (GH3441)
- `FrozenList` has gained the `.union()` and `.difference()` methods. This functionality greatly simplifies groupby’s that rely on explicitly excluding certain columns. See [Splitting an object into groups](https://pandas.pydata.org/pandas-docs/stable/user_guide/groupby.html) for more information (GH15475, GH15506).
• `DataFrame.to_parquet()` now accepts `index` as an argument, allowing the user to override the engine’s default behavior to include or omit the dataframe’s indexes from the resulting Parquet file. (GH20768)

• `read_feather()` now accepts `columns` as an argument, allowing the user to specify which columns should be read. (GH24025)

• `DataFrame.corr()` and `Series.corr()` now accept a callable for generic calculation methods of correlation, e.g. histogram intersection (GH22684)

• `DataFrame.to_string()` now accepts `decimal` as an argument, allowing the user to specify which decimal separator should be used in the output. (GH23614)

• `DataFrame.to_html()` now accepts `render_links` as an argument, allowing the user to generate HTML with links to any URLs that appear in the DataFrame. See the section on writing HTML in the IO docs for example usage. (GH2679)

• `pandas.read_csv()` now supports pandas extension types as an argument to `dtype`, allowing the user to use pandas extension types when reading CSVs. (GH23228)

• The `shift()` method now accepts `fill_value` as an argument, allowing the user to specify a value which will be used instead of NA/NaT in the empty periods. (GH15486)

• `to_datetime()` now supports the `%Z` and `%z` directive when passed into `format` (GH13486)

• `Series.mode()` and `DataFrame.mode()` now support the `dropna` parameter which can be used to specify whether NaN/NaT values should be considered (GH17534)

• `DataFrame.to_csv()` and `Series.to_csv()` now support the `compression` keyword when a file handle is passed. (GH21227)

• `Index.droplevel()` is now implemented also for flat indexes, for compatibility with `MultiIndex` (GH21115)

• `Series.droplevel()` and `DataFrame.droplevel()` are now implemented (GH20342)

• Added support for reading from/writing to Google Cloud Storage via the `gcsfs` library (GH19454, GH23094)

• `DataFrame.to_gbq()` and `read_gbq()` signature and documentation updated to reflect changes from the pandas-gbq library version 0.8.0. Adds a `credentials` argument, which enables the use of any kind of google-auth credentials. (GH21627, GH22557, GH23662)

• New method `HDFStore.walk()` will recursively walk the group hierarchy of an HDF5 file (GH10932)

• `read_html()` copies cell data across `colspan` and `rowspan`, and it treats all-`th` table rows as headers if `header` kwarg is not given and there is no `thead`. (GH17054)

• `Series.nlargest()`, `Series.nsmallest()`, `DataFrame.nlargest()`, and `DataFrame.nsmallest()` now accept the value "all" for the `keep` argument. This keeps all ties for the nth largest/smallest value (GH16818)

• `IntervalIndex` has gained the `set_closed()` method to change the existing closed value (GH21670)

• `to_csv()`, `to_csv()`, `to_json()`, and `to_json()` now support `compression='infer'` to infer compression based on filename extension (GH15008). The default compression for `to_csv`, `to_json`, and `to_pickle` methods has been updated to 'infer'. (GH22004).

• `DataFrame.to_sql()` now supports writing `TIMESTAMP WITH TIME ZONE` types for supported databases. For databases that don’t support timezones, datetime data will be stored as timezone unaware local timestamps. See the Datetime data types for implications (GH9086).

• `to_timedelta()` now supports iso-formatted timedelta strings (GH21877)

• `Series` and `DataFrame` now support `Iterable` objects in the constructor (GH2193)
• **DatetimeIndex** has gained the `DatetimeIndex.timetz` attribute. This returns the local time with timezone information. (GH21358)

• `round()`, `ceil()`, and `floor()` for `DatetimeIndex` and `Timestamp` now support an ambiguous argument for handling datetimes that are rounded to ambiguous times (GH18946) and a nonexistent argument for handling datetimes that are rounded to nonexistent times. See *Nonexistent times when localizing* (GH22647)

• The result of `resample()` is now iterable similar to `groupby()` (GH15314).

• `Series.resample()` and `DataFrame.resample()` have gained the `pandas.core.resample.Resampler.quantile()` (GH15023).

• `DataFrame.resample()` and `Series.resample()` with a `PeriodIndex` will now respect the base argument in the same fashion as with a `DatetimeIndex`. (GH23882)

• `pandas.api.types.is_list_like()` has gained a keyword `allow_sets` which is `True` by default; if `False`, all instances of `set` will not be considered “list-like” anymore (GH23061)

• `Index.to_frame()` now supports overriding column name(s) (GH22580).

• `Categorical.from_codes()` now can take a `dtype` parameter as an alternative to passing categories and ordered (GH24398).

• New attribute `__git_version__` will return git commit sha of current build (GH21295).

• Compatibility with Matplotlib 3.0 (GH22790).

• Added `Interval.overlaps()`, `arrays.IntervalArray.overlaps()`, and `IntervalIndex.overlaps()` for determining overlaps between interval-like objects (GH21998)

• `read_fwf()` now accepts keyword `infer_nrows` (GH15138).

• `to_parquet()` now supports writing a DataFrame as a directory of parquet files partitioned by a subset of the columns when `engine = 'pyarrow'` (GH23283)

• `Timestamp.tz_localize()`, `DatetimeIndex.tz_localize()`, and `Series.tz_localize()` have gained the nonexistent argument for alternative handling of nonexistent times. See *Nonexistent times when localizing* (GH8917, GH24466)

• `Index.difference()`, `Index.intersection()`, `Index.union()`, and `Index.symmetric_difference()` now have an optional `sort` parameter to control whether the results should be sorted if possible (GH17839, GH24471)

• `read_excel()` now accepts `usecols` as a list of column names or callable (GH18273)

• `MultiIndex.to_flat_index()` has been added to flatten multiple levels into a single-level `Index` object.

• `DataFrame.to_stata()` and pandas.io.stata.StataWriter117 can write mixed string columns to Stata strl format (GH23633)

• `DataFrame.between_time()` and `DataFrame.at_time()` have gained the `axis` parameter (GH8839)

• `DataFrame.to_records()` now accepts `index_dtypes` and `column_dtypes` parameters to allow different data types in stored column and index records (GH18146)

• `IntervalIndex` has gained the `is_overlapping` attribute to indicate if the `IntervalIndex` contains any overlapping intervals (GH23309)

• `pandas.DataFrame.to_sql()` has gained the `method` argument to control SQL insertion clause. See the *insertion method* section in the documentation. (GH8953)
• `DataFrame.corrwith()` now supports Spearman’s rank correlation, Kendall’s tau as well as callable correlation methods. (GH21925)

• `DataFrame.to_json()`, `DataFrame.to_csv()`, `DataFrame.to_pickle()`, and other export methods now support tilde(−) in path argument. (GH23473)

Backwards incompatible API changes

pandas 0.24.0 includes a number of API breaking changes.

Increased minimum versions for dependencies

We have updated our minimum supported versions of dependencies (GH21242, GH18742, GH23774, GH24767). If installed, we now require:

<table>
<thead>
<tr>
<th>Package</th>
<th>Minimum Version</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>numpy</td>
<td>1.12.0</td>
<td>X</td>
</tr>
<tr>
<td>bottleneck</td>
<td>1.2.0</td>
<td></td>
</tr>
<tr>
<td>fastparquet</td>
<td>0.2.1</td>
<td></td>
</tr>
<tr>
<td>matplotlib</td>
<td>2.0.0</td>
<td></td>
</tr>
<tr>
<td>numexpr</td>
<td>2.6.1</td>
<td></td>
</tr>
<tr>
<td>pandas-gbq</td>
<td>0.8.0</td>
<td></td>
</tr>
<tr>
<td>pyarrow</td>
<td>0.9.0</td>
<td></td>
</tr>
<tr>
<td>pytables</td>
<td>3.4.2</td>
<td></td>
</tr>
<tr>
<td>scipy</td>
<td>0.18.1</td>
<td></td>
</tr>
<tr>
<td>xlrd</td>
<td>1.0.0</td>
<td></td>
</tr>
<tr>
<td>pytest (dev)</td>
<td>3.6</td>
<td></td>
</tr>
</tbody>
</table>

Additionally we no longer depend on `feather-format` for feather based storage and replaced it with references to `pyarrow` (GH21639 and GH23053).

`os.linesep` is used for line_terminator of `DataFrame.to_csv`

`DataFrame.to_csv()` now uses `os.linesep()` rather than '\n' for the default line terminator (GH20353). This change only affects when running on Windows, where '\r\n' was used for line terminator even when '\n' was passed in `line_terminator`.

Previous behavior on Windows:

```
In [1]: data = pd.DataFrame({"string_with_lf": ["a

b"],
                         "string_with_crlf": ["a\r\nb"]})

In [2]: # When passing file PATH to to_csv,
   ...
   # line_terminator does not work, and csv is saved with '\r\n'.
   ...
   # Also, this converts all '\n's in the data to '\r\n'.
   ...
   data.to_csv("test.csv", index=False, line_terminator='\n')

In [3]: with open("test.csv", mode='rb') as f:
   ...
   print(f.read())
Out[3]: b'string_with_lf,string_with_crlf\n      a\r\nb','a\r\nb'
```

(continues on next page)
New behavior on Windows:

Passing line_terminator explicitly, set the line terminator to that character.

In [1]: data = pd.DataFrame({'string_with_lf': ["a\nbc"],
                           'string_with_crlf': ["a\r\nbnc"]})
In [2]: data.to_csv("test.csv", index=False, line_terminator='\n')
In [3]: with open("test.csv", mode='rb') as f:
   ...:   print(f.read())
Out[3]: b'string_with_lf,string_with_crlf\na\nbc"",a\r\nbnc"\n'
Proper handling of np.NaN in a string data-typed column with the Python engine

There was bug in read_excel() and read_csv() with the Python engine, where missing values turned to 'nan' with dtype=str and na_filter=True. Now, these missing values are converted to the string missing indicator, np.nan. (GH20377)

Previous behavior:

```
In [5]: data = 'a,b,c
1,,3
4,5,6'
In [6]: df = pd.read_csv(StringIO(data), engine='python', dtype=str, na_filter=True)
In [7]: df.loc[0, 'b']
Out[7]:
'nan'
```

New behavior:

```
In [53]: data = 'a,b,c
1,,3
4,5,6'
In [54]: df = pd.read_csv(StringIO(data), engine='python', dtype=str, na_filter=True)
In [55]: df.loc[0, 'b']
Out[55]:
nan
```

Notice how we now instead output np.nan itself instead of a stringified form of it.

Parsing datetime strings with timezone offsets

Previously, parsing datetime strings with UTC offsets with to_datetime() or DatetimeIndex would automatically convert the datetime to UTC without timezone localization. This is inconsistent from parsing the same datetime string with Timestamp which would preserve the UTC offset in the tz attribute. Now, to_datetime() preserves the UTC offset in the tz attribute when all the datetime strings have the same UTC offset (GH17697, GH11736, GH22457)

Previous behavior:

```
In [2]: pd.to_datetime("2015-11-18 15:30:00+05:30")
Out[2]: Timestamp('2015-11-18 10:00:00')

In [3]: pd.Timestamp("2015-11-18 15:30:00+05:30")
Out[3]: Timestamp('2015-11-18 15:30:00+05:30', tz='pytz.FixedOffset(330)')

# Different UTC offsets would automatically convert the datetimes to UTC (without a UTC timezone)
In [4]: pd.to_datetime(["2015-11-18 15:30:00+05:30", "2015-11-18 16:30:00+06:30"])
Out[4]: DatetimeIndex(["2015-11-18 10:00:00", '2015-11-18 10:00:00'], dtype='datetime64[ns]', freq=None)
```

New behavior:

```
In [56]: pd.to_datetime("2015-11-18 15:30:00+05:30")
Out[56]: Timestamp('2015-11-18 15:30:00+0530', tz='pytz.FixedOffset(330)')

In [57]: pd.Timestamp("2015-11-18 15:30:00+05:30")
Out[57]: Timestamp('2015-11-18 15:30:00+05:30', tz='pytz.FixedOffset(330)')
```

Parsing datetime strings with the same UTC offset will preserve the UTC offset in the tz
Parsing datetime strings with different UTC offsets will now create an Index of \texttt{datetime.datetime} objects with different UTC offsets.

In [59]: idx = pd.to_datetime(['2015-11-18 15:30:00+05:30',
                      '2015-11-18 16:30:00+06:30'])

In [60]: idx
Out[60]: Index(['2015-11-18 15:30:00+05:30', '2015-11-18 16:30:00+06:30'],
              dtype='object')

In [61]: idx[0]
Out[61]: datetime.datetime(2015, 11, 18, 15, 30, tzinfo=tzoffset(None, 19800))

In [62]: idx[1]
Out[62]: datetime.datetime(2015, 11, 18, 16, 30, tzinfo=tzoffset(None, 23400))

Passing \texttt{utc=True} will mimic the previous behavior but will correctly indicate that the dates have been converted to UTC.

In [63]: pd.to_datetime(['2015-11-18 15:30:00+05:30',
                      '2015-11-18 16:30:00+06:30'], utc=True)
Out[63]: DatetimeIndex(['2015-11-18 10:00:00+00:00', '2015-11-18 10:00:00+00:00'],
                       dtype='datetime64[ns, UTC]', freq=None)

Parsing mixed-timezones with \texttt{read_csv()} no longer silently converts mixed-timezone columns to UTC (GH24987).

Previous behavior

In [64]: import io
In [65]: content = ""
   ...: a
   ...: 2000-01-01T00:00:00+05:00
   ...: 2000-01-01T00:00:00+06:00"
In [66]: df = pd.read_csv(io.StringIO(content), parse_dates=['a'])
In [67]: df.a
0  1999-12-31 19:00:00
1  1999-12-31 18:00:00
Name: a, dtype: datetime64[ns]

New behavior

In [68]: import io
In [69]: content = ""
   ...: a
   ...: 2000-01-01T00:00:00+05:00
   ...: 2000-01-01T00:00:00+06:00"
In [70]: df.a
0  1999-12-31 19:00:00
1  1999-12-31 18:00:00
Name: a, dtype: datetime64[ns]
As can be seen, the dtype is object; each value in the column is a string. To convert the strings to an array of datetimes, the date_parser argument

```python
In [68]: df = pd.read_csv(io.StringIO(content), parse_dates=['a'],
   date_parser=lambda col: pd.to_datetime(col, utc=True))
```

```python
In [69]: df.a
```

<p>| | |</p>
<table>

</tr>
<tr>
<td>1</td>
<td>1999-12-31 18:00:00+00:00</td>
</tr>
</tbody>
</table>

Name: a, dtype: datetime64[ns, UTC]

See Parsing datetime strings with timezone offsets for more.

### Time values in `dt.end_time` and `to_timestamp(how='end')`

The time values in Period and PeriodIndex objects are now set to ‘23:59:59.999999999’ when calling Series.dt.end_time, Period.end_time, PeriodIndex.end_time, Period.to_timestamp() with how='end', or PeriodIndex.to_timestamp() with how='end' (GH17157)

**Previous behavior:**

```
In [2]: p = pd.Period('2017-01-01', 'D')
In [3]: pi = pd.PeriodIndex([p])
In [4]: pd.Series(pi).dt.end_time[0]
Out[4]: Timestamp(2017-01-01 00:00:00)
In [5]: p.end_time
Out[5]: Timestamp('2017-01-01 00:00:00')
```

**New behavior:**

Calling Series.dt.end_time will now result in a time of ‘23:59:59.999999999’ as is the case with Period.end_time, for example

```
In [70]: p = pd.Period('2017-01-01', 'D')
In [71]: pi = pd.PeriodIndex([p])
In [72]: pd.Series(pi).dt.end_time[0]
Out[72]: Timestamp('2017-01-01 23:59:59.999999999')
In [73]: p.end_time
Out[73]: Timestamp('2017-01-01 23:59:59.999999999')
```
Series.unique for timezone-aware data

The return type of `Series.unique()` for datetime with timezone values has changed from an `numpy.ndarray` of `Timestamp` objects to a `arrays.DatetimeArray` (GH24024).

```
In [74]: ser = pd.Series([pd.Timestamp('2000', tz='UTC'),
                      pd.Timestamp('2000', tz='UTC')])

Previous behavior:
```
```
In [3]: ser.unique()
Out[3]: array([Timestamp('2000-01-01 00:00:00+0000', tz='UTC')], dtype=object)
```

```
New behavior:
```
```
In [75]: ser.unique()
Out[75]: <DatetimeArray>
[ '2000-01-01 00:00:00+00:00']
Length: 1, dtype: datetime64[ns, UTC]
```

Sparse data structure refactor

`SparseArray`, the array backing `SparseSeries` and the columns in a `SparseDataFrame`, is now an extension array (GH21978, GH19056, GH22835). To conform to this interface and for consistency with the rest of pandas, some API breaking changes were made:

- `SparseArray` is no longer a subclass of `numpy.ndarray`. To convert a `SparseArray` to a NumPy array, use `numpy.asarray()`.
- `SparseArray.dtype` and `SparseSeries.dtype` are now instances of `SparseDtype`, rather than `np.dtype`. Access the underlying dtype with `SparseDtype.subtype`.
- `numpy.asarray(sparse_array)` now returns a dense array with all the values, not just the non-fill-value values (GH14167)
- `SparseArray.take` now matches the API of `pandas.api.extensions.ExtensionArray.take()` (GH19506):
  - The default value of `allow_fill` has changed from `False` to `True`.
  - The `out` and `mode` parameters are now longer accepted (previously, this raised if they were specified).
  - Passing a scalar for `indices` is no longer allowed.
- The result of `concat()` with a mix of sparse and dense Series is a Series with sparse values, rather than a `SparseSeries`.
- `SparseDataFrame.combine` and `DataFrame.combine_first` no longer supports combining a sparse column with a dense column while preserving the sparse subtype. The result will be an object-dtype `SparseArray`.
- Setting `SparseArray.fill_value` to a fill value with a different dtype is now allowed.
- `DataFrame[column]` is now a `Series` with sparse values, rather than a `SparseSeries`, when slicing a single column with sparse values (GH23559).
- The result of `Series.where()` is now a Series with sparse values, like with other extension arrays (GH24077)
Some new warnings are issued for operations that require or are likely to materialize a large dense array:

- A :class:`pandas.errors.PerformanceWarning` is issued when using :func:`fillna` with a method, as a dense array is constructed to create the filled array. Filling with a value is the efficient way to fill a sparse array.

- A :class:`pandas.errors.PerformanceWarning` is now issued when concatenating sparse Series with differing fill values. The fill value from the first sparse array continues to be used.

In addition to these API breaking changes, many *Performance Improvements and Bug Fixes have been made*.

Finally, a :meth:`Series.sparse` accessor was added to provide sparse-specific methods like :meth:`Series.sparse.from_coo`.

```
In [76]: s = pd.Series([0, 0, 1, 1, 1], dtype='Sparse[int]')
In [77]: s.sparse.density
Out[77]: 0.6
```

.. _get_dummies-always-returns-a-DataFrame:

get_dummies() always returns a DataFrame

Previously, when `sparse=True` was passed to :func:`get_dummies`, the return value could be either a :class:`DataFrame` or a :class:`SparseDataFrame`, depending on whether all or a just a subset of the columns were dummy-encoded. Now, a :class:`DataFrame` is always returned (GH24284).

**Previous behavior**

The first :func:`get_dummies` returns a :class:`DataFrame` because the column A is not dummy encoded. When just ['B', "C"] are passed to :func:`get_dummies`, then all the columns are dummy-encoded, and a :class:`SparseDataFrame` was returned.

```
In [2]: df = pd.DataFrame({"A": [1, 2], "B": ['a', 'b'], "C": ['a', 'a']})
In [3]: type(pd.get_dummies(df, sparse=True))
Out[3]: pandas.core.frame.DataFrame
In [4]: type(pd.get_dummies(df[['B', 'C']], sparse=True))
Out[4]: pandas.core.sparse.frame.SparseDataFrame
```

**New behavior**

Now, the return type is consistently a :class:`DataFrame`

```
In [78]: type(pd.get_dummies(df, sparse=True))
Out[78]: pandas.core.frame.DataFrame
In [79]: type(pd.get_dummies(df[['B', 'C']], sparse=True))
Out[79]: pandas.core.frame.DataFrame
```

**Note:** There’s no difference in memory usage between a :class:`SparseDataFrame` and a :class:`DataFrame` with sparse values. The memory usage will be the same as in the previous version of pandas.
Raise ValueError in DataFrame.to_dict(orient='index')

Bug in DataFrame.to_dict() raises ValueError when used with orient='index' and a non-unique index instead of losing data (GH22801)

```
In [80]: df = pd.DataFrame({'a': [1, 2], 'b': [0.5, 0.75]}, index=['A', 'A'])
In [81]: df
Out[81]:
   a  b
A  1  0.50
A  2  0.75

In [82]: df.to_dict(orient='index')
ValueError: DataFrame index must be unique for orient='index'.
```

Tick DateOffset normalize restrictions

Creating a Tick object (Day, Hour, Minute, Second, Milli, Micro, Nano) with normalize=True is no longer supported. This prevents unexpected behavior where addition could fail to be monotone or associative. (GH21427)

Previous behavior:

```
In [2]: ts = pd.Timestamp('2018-06-11 18:01:14')
In [3]: ts
Out[3]: Timestamp('2018-06-11 18:01:14')
In [4]: tic = pd.offsets.Hour(n=2, normalize=True)
   ...
In [5]: tic
Out[5]: <2 * Hours>
In [6]: ts + tic
Out[6]: Timestamp('2018-06-11 00:00:00')
In [7]: ts + tic + tic + tic == ts + (tic + tic + tic)
Out[7]: False
```
Period subtraction

Subtraction of a Period from another Period will give a DateOffset instead of an integer (GH21314)

Previous behavior:

```python
In [2]: june = pd.Period('June 2018')
In [3]: april = pd.Period('April 2018')
In [4]: june - april
Out [4]: 2
```

New behavior:

```python
In [86]: june = pd.Period('June 2018')
In [87]: april = pd.Period('April 2018')
In [88]: june - april
Out[88]: <2 * MonthEnds>
```

Similarly, subtraction of a Period from a PeriodIndex will now return an Index of DateOffset objects instead of an Int64Index

Previous behavior:

```python
In [2]: pi = pd.period_range('June 2018', freq='M', periods=3)
In [3]: pi - pi[0]
Out[3]: Int64Index([0, 1, 2], dtype='int64')
```

New behavior:

```python
In [89]: pi = pd.period_range('June 2018', freq='M', periods=3)
In [90]: pi - pi[0]
Out[90]: Index([<0 * MonthEnds>, <MonthEnd>, <2 * MonthEnds>], dtype='object')
```
Addition/subtraction of NaN from DataFrame

Adding or subtracting NaN from a DataFrame column with timedelta64[ns] dtype will now raise a TypeError instead of returning all-NaT. This is for compatibility with TimedeltaIndex and Series behavior (GH22163)

```python
In [91]: df = pd.DataFrame([pd.Timedelta(days=1)])
In [92]: df
```

```
Out[92]:
0  1 days
```

Previous behavior:

```python
In [4]: df = pd.DataFrame([pd.Timedelta(days=1)])
In [5]: df - np.nan
```

```
Out[5]:
0  NaT
```

New behavior:

```python
In [2]: df - np.nan
```

```
...  TypeError: unsupported operand type(s) for -: 'TimedeltaIndex' and 'float'
```

DataFrame comparison operations broadcasting changes

Previously, the broadcasting behavior of DataFrame comparison operations (==, !=,...) was inconsistent with the behavior of arithmetic operations (+, -, ...). The behavior of the comparison operations has been changed to match the arithmetic operations in these cases. (GH22880)

The affected cases are:

- operating against a 2-dimensional np.ndarray with either 1 row or 1 column will now broadcast the same way a np.ndarray would (GH23000).
- a list or tuple with length matching the number of rows in the DataFrame will now raise ValueError instead of operating column-by-column (GH22880).
- a list or tuple with length matching the number of columns in the DataFrame will now operate row-by-row instead of raising ValueError (GH22880).

```python
In [93]: arr = np.arange(6).reshape(3, 2)
In [94]: df = pd.DataFrame(arr)
In [95]: df
```

```
Out[95]:
   0   1
0  0   1
1  2   3
2  4   5
```
In [5]: df == arr[[0], :]
     ...: # comparison previously broadcast where arithmetic would raise
Out[5]:
   0   1
0  True True
1  False False
2  False False

In [6]: df + arr[[0], :]
     ...
ValueError: Unable to coerce to DataFrame, shape must be (3, 2): given (1, 2)

In [7]: df == (1, 2)
     ...: # length matches number of columns;
     ...: # comparison previously raised where arithmetic would broadcast
     ...
ValueError: Invalid broadcasting comparison [(1, 2)] with block values

In [8]: df + (1, 2)
Out[8]:
   0   1
0  1  3
1  3  5
2  5  7

In [9]: df == (1, 2, 3)
     ...: # length matches number of rows
     ...: # comparison previously broadcast where arithmetic would raise
Out[9]:
   0   1
0  False True
1  True False
2  False False

In [10]: df + (1, 2, 3)
     ...
ValueError: Unable to coerce to Series, length must be 2: given 3

New behavior:

# Comparison operations and arithmetic operations both broadcast.
In [96]: df == arr[[0], :]
Out[96]:
   0   1
0  True True
1  False False
2  False False

In [97]: df + arr[[0], :]
Out[97]:
   0   1
0  1  2
1  2  4
2  4  6

# Comparison operations and arithmetic operations both broadcast.
In [98]: df == (1, 2)
Out[98]:
   0   1
0  False False

(continues on next page)
In [99]: df + (1, 2)
Out[99]:
0 1 3
1 3 5
2 5 7

# Comparison operations and arithmetic operations both raise ValueError.
In [6]: df == (1, 2, 3)
...  
ValueError: Unable to coerce to Series, length must be 2: given 3
In [7]: df + (1, 2, 3)
...  
ValueError: Unable to coerce to Series, length must be 2: given 3

DataFrame arithmetic operations broadcasting changes

*DataFrame* arithmetic operations when operating with 2-dimensional `np.ndarray` objects now broadcast in the same way as `np.ndarray` broadcast. (GH23000)

In [100]: arr = np.arange(6).reshape(3, 2)
In [101]: df = pd.DataFrame(arr)
In [102]: df
Out[102]:
   0  1
0  0  1
1  2  3
2  4  5

*Previous behavior*:

In [5]: df + arr[[0], :]  # 1 row, 2 columns 
...  
ValueError: Unable to coerce to DataFrame, shape must be (3, 2): given (1, 2)
In [6]: df + arr[:, [1]]  # 1 column, 3 rows 
...  
ValueError: Unable to coerce to DataFrame, shape must be (3, 2): given (3, 1)

*New behavior*:

In [103]: df + arr[[0], :]  # 1 row, 2 columns 
Out[103]:
   0  1
0  1  2
1  3  5
2  5  7

In [104]: df + arr[:, [1]]  # 1 column, 3 rows 
...  
(continues on next page)
Series and Index data-dtype incompatibilities

Series and Index constructors now raise when the data is incompatible with a passed dtype= (GH15832)

Previous behavior:

```
In [4]: pd.Series([-1], dtype="uint64")
Out [4]:
0    18446744073709551615
dtype: uint64
```

New behavior:

```
In [4]: pd.Series([-1], dtype="uint64")
...:
OverflowError: Trying to coerce negative values to unsigned integers
```

Concatenation changes

Calling `pandas.concat()` on a Categorical of ints with NA values now causes them to be processed as objects when concatenating with anything other than another Categorical of ints (GH19214)

```
In [105]: s = pd.Series([0, 1, np.nan])

In [106]: c = pd.Series([0, 1, np.nan], dtype="category")
```

Previous behavior

```
In [3]: pd.concat([s, c])
Out[3]:
   0   0.0
   1   1.0
   2  NaN
   0  0.0
   1  1.0
   2  NaN
dtype: float64
```

New behavior

```
In [107]: pd.concat([s, c])
Out[107]:
   0   0.0
   1   1.0
   2  NaN
   0  0.0
```
Datetimelike API changes

- For `DatetimeIndex` and `TimedeltaIndex` with non-None `freq` attribute, addition or subtraction of integer-dtyped array or `Index` will return an object of the same class (GH19959)
- `DateOffset` objects are now immutable. Attempting to alter one of these will now raise `AttributeError` (GH21341)
- `PeriodIndex` subtraction of another `PeriodIndex` will now return an object-dtype `Index` of `DateOffset` objects instead of raising a `TypeError` (GH20049)
- `cut()` and `qcut()` now returns a `DatetimeIndex` or `TimedeltaIndex` bins when the input is datetime or timedelta dtype respectively and `retbins=True` (GH19891)
- `DatetimeIndex.to_period()` and `Timestamp.to_period()` will issue a warning when timezone information will be lost (GH21333)
- `PeriodIndex.tz_convert()` and `PeriodIndex.tz_localize()` have been removed (GH21781)

Other API changes

- A newly constructed empty `DataFrame` with integer as the `dtype` will now only be cast to `float64` if index is specified (GH22858)
- `Series.str.cat()` will now raise if `others` is a set (GH23009)
- Passing scalar values to `DatetimeIndex` or `TimedeltaIndex` will now raise `TypeError` instead of `ValueError` (GH23539)
- `max_rows` and `max_cols` parameters removed from `HTMLFormatter` since truncation is handled by `DataFrameFormatter` (GH23818)
- `read_csv()` will now raise a `ValueError` if a column with missing values is declared as having dtype `bool` (GH20591)
- The column order of the resultant `DataFrame` from `MultiIndex.to_frame()` is now guaranteed to match the `MultiIndex.names` order. (GH22420)
- Incorrectly passing a `DatetimeIndex` to `MultiIndex.from_tuples()`, rather than a sequence of tuples, now raises a `TypeError` rather than a `ValueError` (GH24024)
- `pd.offsets.generate_range()` argument `time_rule` has been removed; use `offset` instead (GH24157)
- In 0.23.x, pandas would raise a `ValueError` on a merge of a numeric column (e.g. `int` dtyped column) and an `object` dtyped column (GH9780). We have re-enabled the ability to merge `object` and other dtypes; pandas will still raise on a merge between a numeric and an `object` dtyped column that is composed only of strings (GH21681)
- Accessing a level of a `MultiIndex` with a duplicate name (e.g. in `get_level_values()`) now raises a `ValueError` instead of a `KeyError` (GH21678).
- Invalid construction of `IntervalDtype` will now always raise a `TypeError` rather than a `ValueError` if the subtype is invalid (GH21185)
• Trying to reindex a DataFrame with a non unique MultiIndex now raises a ValueError instead of an Exception (GH21770)

• Index subtraction will attempt to operate element-wise instead of raising TypeError (GH19369)

• pandas.io.formats.style.Styler supports a number-format property when using to_excel() (GH22015)

• DataFrame.corr() and Series.corr() now raise a ValueError along with a helpful error message instead of a KeyError when supplied with an invalid method (GH22298)

• shift() will now always return a copy, instead of the previous behaviour of returning self when shifting by 0 (GH22397)

• DataFrame.set_index() now gives a better (and less frequent) KeyError, raises a ValueError for incorrect types, and will not fail on duplicate column names with drop=True. (GH22484)

• Slicing a single row of a DataFrame with multiple ExtensionArrays of the same type now preserves the dtype, rather than coercing to object (GH22784)

• DateOffset attribute _cacheable and method _should_cache have been removed (GH23118)

• Series.searchsorted(), when supplied a scalar value to search for, now returns a scalar instead of an array (GH23801).

• Categorical.searchsorted(), when supplied a scalar value to search for, now returns a scalar instead of an array (GH23466).

• Categorical.searchsorted() now raises a KeyError rather that a ValueError, if a searched for key is not found in its categories (GH23466).

• Index.hasnans() and Series.hasnans() now always return a python boolean. Previously, a python or a numpy boolean could be returned, depending on circumstances (GH23294).

• The order of the arguments of DataFrame.to_html() and DataFrame.to_string() is rearranged to be consistent with each other. (GH23614)

• CategoricalIndex.reindex() now raises a ValueError if the target index is non-unique and not equal to the current index. It previously only raised if the target index was not of a categorical dtype (GH23963).

• Series.to_list() and Index.to_list() are now aliases of Series.tolist respectively Index.tolist (GH8826)

• The result of SparseSeries.unstack is now a DataFrame with sparse values, rather than a SparseDataFrame (GH24372).

• DatetimeIndex and TimedeltaIndex no longer ignore the dtype precision. Passing a non-nanosecond resolution dtype will raise a ValueError (GH24753)

**Extension type changes**

**Equality and hashability**

pandas now requires that extension dtypes be hashable (i.e. the respective ExtensionDtype objects; hashability is not a requirement for the values of the corresponding ExtensionArray). The base class implements a default __eq__ and __hash__. If you have a parametrized dtype, you should update the ExtensionDtype._metadata tuple to match the signature of your __init__ method. See pandas.api.extensions.ExtensionDtype for more (GH22476).

**New and changed methods**

• dropna() has been added (GH21185)
pandas: powerful Python data analysis toolkit, Release 1.3.1

• repeat() has been added (GH24349)

• The ExtensionArray constructor, _from_sequence now take the keyword arg copy=False (GH21185)

• pandas.api.extensions.ExtensionArray.shift() added as part of the basic ExtensionArray interface (GH22387).

• searchsorted() has been added (GH24350)

• Support for reduction operations such as sum, mean via opt-in base class method override (GH22762)

• ExtensionArray.isna() is allowed to return an ExtensionArray (GH22325).

Dtype changes

• ExtensionDtype has gained the ability to instantiate from string dtypes, e.g. decimal would instantiate a registered DecimalDtype; furthermore the ExtensionDtype has gained the method construct_array_type (GH21185)

• Added ExtensionDtype._is_numeric for controlling whether an extension dtype is considered numeric (GH22290).

• Added pandas.api.types.register_extension_dtype() to register an extension type with pandas (GH22664)

• Updated the .type attribute for PeriodDtype, DatetimeTZDtype, and IntervalDtype to be instances of the dtype (Period, Timestamp, and Interval respectively) (GH22938)

Operator support

A Series based on an ExtensionArray now supports arithmetic and comparison operators (GH19577). There are two approaches for providing operator support for an ExtensionArray:

1. Define each of the operators on your ExtensionArray subclass.

2. Use an operator implementation from pandas that depends on operators that are already defined on the underlying elements (scalars) of the ExtensionArray.

See the ExtensionArray Operator Support documentation section for details on both ways of adding operator support.

Other changes

• A default repr for pandas.api.extensions.ExtensionArray is now provided (GH23601).

• ExtensionArray._formatting_values() is deprecated. Use ExtensionArray._formatter instead. (GH23601)

• An ExtensionArray with a boolean dtype now works correctly as a boolean indexer. pandas.api.types.is_bool_dtype() now properly considers them boolean (GH22326)

Bug fixes

• Bug in Series.get() for Series using ExtensionArray and integer index (GH21257)

• shift() now dispatches to ExtensionArray.shift() (GH22386)

• Series.combine() works correctly with ExtensionArray inside of Series (GH20825)

• Series.combine() with scalar argument now works for any function type (GH21248)

• Series.astype() and DataFrame.astype() now dispatch to ExtensionArray.astype() (GH21185).

• Slicing a single row of a DataFrame with multiple ExtensionArrays of the same type now preserves the dtype, rather than coercing to object (GH22784)
• Bug when concatenating multiple Series with different extension dtypes not casting to object dtype (GH22994)

• Series backed by an ExtensionArray now work with `util.hash_pandas_object()` (GH23066)

• DataFrame.stack() no longer converts to object dtype for DataFrames where each column has the same extension dtype. The output Series will have the same dtype as the columns (GH23077).

• Series.unstack() and DataFrame.unstack() no longer convert extension arrays to object-dtype ndarrays. Each column in the output DataFrame will now have the same dtype as the input (GH23077).

• Bug when grouping DataFrame.groupby() and aggregating on ExtensionArray it was not returning the actual ExtensionArray dtype (GH23227).

• Bug in pandas.merge() when merging on an extension array-backed column (GH23020).

Deprecations

• MultiIndex.labels has been deprecated and replaced by MultiIndex.codes. The functionality is unchanged. The new name better reflects the natures of these codes and makes the MultiIndex API more similar to the API for CategoricalIndex (GH13443). As a consequence, other uses of the name labels in MultiIndex have also been deprecated and replaced with codes:
  
  – You should initialize a MultiIndex instance using a parameter named codes rather than labels.

  – MultiIndex.set_labels has been deprecated in favor of MultiIndex.set_codes().

  – For method MultiIndex.copy(), the labels parameter has been deprecated and replaced by a codes parameter.

• DataFrame.to_stata(), read_stata(), StataReader and StataWriter have deprecated the encoding argument. The encoding of a Stata dta file is determined by the file type and cannot be changed (GH21244)

• MultiIndex.to_hierarchical() is deprecated and will be removed in a future version (GH21613)

• Series.ptp() is deprecated. Use numpy.ptp instead (GH21614)

• Series.compress() is deprecated. Use Series[condition] instead (GH18262)

• The signature of Series.to_csv() has been uniformed to that of DataFrame.to_csv(): the name of the first argument is now path_or_buf, the order of subsequent arguments has changed, the header argument now defaults to True. (GH19715)

• Categorical.from_codes() has deprecated providing float values for the codes argument. (GH21767)

• pandas.read_table() is deprecated. Instead, use read_csv() passing sep='\t' if necessary. This deprecation has been removed in 0.25.0. (GH21948)

• Series.str.cat() has deprecated using arbitrary list-likes within list-likes. A list-like container may still contain many Series, Index or 1-dimensional np.ndarray, or alternatively, only scalar values. (GH21950)

• FrozenNDArray.searchsorted() has deprecated the v parameter in favor of value (GH14645)

• DatetimeIndex.shift() and PeriodIndex.shift() now accept periods argument instead of n for consistency with Index.shift() and Series.shift(). Using n throws a deprecation warning (GH22458, GH22912)

• The fastpath keyword of the different Index constructors is deprecated (GH23110).
• `Timestamp.tz_localize()`, `DatetimeIndex.tz_localize()`, and `Series.tz_localize()` have deprecated the errors argument in favor of the nonexistent argument (GH8917).

• The class `FrozenNDArray` has been deprecated. When unpickling, `FrozenNDArray` will be unpickled to `np.ndarray` once this class is removed (GH9031).

• The methods `DataFrame.update()` and `Panel.update()` have deprecated the `raise_conflict=False|True` keyword in favor of `errors='ignore'|'raise'` (GH23585).

• The methods `Series.str.partition()` and `Series.str.rpartition()` have deprecated the `pat` keyword in favor of `sep` (GH22676).

• Deprecated the `nthreads` keyword of `pandas.read_feather()` in favor of `use_threads` to reflect the changes in `pyarrow>=0.11.0` (GH23053).

• `pandas.read_excel()` has deprecated accepting `usecols` as an integer. Please pass in a list of ints from 0 to `usecols` inclusive instead (GH23527).

• Constructing a `TimedeltaIndex` from data with `datetime64`-dtyped data is deprecated, will raise `TypeError` in a future version (GH23539).

• Constructing a `DatetimeIndex` from data with `timedelta64`-dtyped data is deprecated, will raise `TypeError` in a future version (GH23675).

• The `keep_tz=False` option (the default) of the `keep_tz` keyword of `DatetimeIndex.to_series()` is deprecated (GH17832).

• Timezone converting a tz-aware `datetime.datetime` or `Timestamp` with `Timestamp` and the `tz` argument is now deprecated. Instead, use `Timestamp.tz_convert()` (GH23579).

• `pandas.api.types.is_period()` is deprecated in favor of `pandas.api.types.is_period_dtype` (GH23917).

• `pandas.api.types.is_datetimetz()` is deprecated in favor of `pandas.api.types.is_datetime64tz` (GH23917).

• Creating a `TimedeltaIndex`, `DatetimeIndex`, or `PeriodIndex` by passing range arguments `start`, `end`, and `periods` is deprecated in favor of `timedelta_range()`, `date_range()`, or `period_range()` (GH23919).

• Passing a string alias like `'datetime64[ns, UTC]'` as the unit parameter to `DatetimeTZDtype` is deprecated. Use `DatetimeTZDtype.construct_from_string` instead (GH23990).

• The `skipna` parameter of `infer_dtypes()` will switch to `True` by default in a future version of pandas (GH17066, GH24050).

• In `Series.where()` with Categorical data, providing an `other` that is not present in the categories is deprecated. Convert the categorical to a different dtype or add the `other` to the categories first (GH24077).

• `Series.clip_lower()`, `Series.clip_upper()`, `DataFrame.clip_lower()` and `DataFrame.clip_upper()` are deprecated and will be removed in a future version. Use `Series.clip(lower=threshold)`, `Series.clip(upper=threshold)` and the equivalent `DataFrame` methods (GH24203).

• `Series.nonzero()` is deprecated and will be removed in a future version (GH18262).

• Passing an integer to `Series.fillna()` and `DataFrame.fillna()` with `timedelta64[ns]` dtypes is deprecated, will raise `TypeError` in a future version. Use `obj.fillna(pd.Timedelta(...))` instead (GH24694).

• `Series.cat.categorical`, `Series.cat.name` and `Series.cat.index` have been deprecated. Use the attributes on `Series.cat` or `Series` directly. (GH24751).
• Passing a dtype without a precision like `np.dtype('datetime64')` or `timedelta64` to `Index`, `DatetimeIndex` and `TimedeltaIndex` is now deprecated. Use the nanosecond-precision dtype instead (GH24753).

**Integer addition/subtraction with datetimes and timedeltas is deprecated**

In the past, users could—in some cases—add or subtract integers or integer-dtype arrays from `Timestamp`, `DatetimeIndex` and `TimedeltaIndex`.

This usage is now deprecated. Instead add or subtract integer multiples of the object’s `freq` attribute (GH21939, GH23878).

**Previous behavior:**

```python
In [6]: ts + 2

In [7]: tdi = pd.timedelta_range('1D', periods=2)
In [8]: tdi - np.array([2, 1])
Out[8]:TimedeltaIndex(['-1 days', '1 days'], dtype='timedelta64[ns]', freq=None)

In [9]: dti = pd.date_range('2001-01-01', periods=2, freq='7D')
In [10]: dti + pd.Index([1, 2])
Out[10]: DatetimeIndex(['2001-01-08', '2001-01-22'], dtype='datetime64[ns]', inplace=False)
```

**New behavior:**

```python
In [109]: ts + 2 * ts.freq

In [110]: tdi = pd.timedelta_range('1D', periods=2)
In [111]: tdi - np.array([2 * tdi.freq, 1 * tdi.freq])
Out[111]: TimedeltaIndex(['-1 days', '1 days'], dtype='timedelta64[ns]', freq=None)

In [112]: dti = pd.date_range('2001-01-01', periods=2, freq='7D')
In [113]: dti + pd.Index([1 * dti.freq, 2 * dti.freq])
Out[113]: DatetimeIndex(['2001-01-08', '2001-01-22'], dtype='datetime64[ns]', inplace=False)
```

**Passing integer data and a timezone to DatetimeIndex**

The behavior of `DatetimeIndex` when passed integer data and a timezone is changing in a future version of pandas. Previously, these were interpreted as wall times in the desired timezone. In the future, these will be interpreted as wall times in UTC, which are then converted to the desired timezone (GH24559).

The default behavior remains the same, but issues a warning:

```python
In [3]: pd.DatetimeIndex([946684800000000000], tz="US/Central")
```

(continues on next page)
Passing integer-dtype data and a timezone to DatetimeIndex. Integer values will be interpreted differently in a future version of pandas. Previously, these were viewed as datetime64[ns] values representing the wall time *in the specified timezone*. In the future, these will be viewed as datetime64[ns] values representing the wall time *in UTC*. This is similar to a nanosecond-precision UNIX epoch. To accept the future behavior, use

```
pd.to_datetime(integer_data, utc=True).tz_convert(tz)
```

To keep the previous behavior, use

```
pd.to_datetime(integer_data).tz_localize(tz)
```

As the warning message explains, opt in to the future behavior by specifying that the integer values are UTC, and then converting to the final timezone:

```
In [114]: pd.to_datetime([946684800000000000], utc=True).tz_convert('US/Central')
Out[114]: DatetimeIndex(['1999-12-31 18:00:00-06:00'], dtype='datetime64[ns, US/Central]', freq=None)
```

The old behavior can be retained with by localizing directly to the final timezone:

```
In [115]: pd.to_datetime([946684800000000000]).tz_localize('US/Central')
Out[115]: DatetimeIndex(['2000-01-01 00:00:00-06:00'], dtype='datetime64[ns, US/Central]', freq=None)
```

### Converting timezone-aware Series and Index to NumPy arrays

The conversion from a *Series* or *Index* with timezone-aware datetime data will change to preserve timezones by default (GH23569).

NumPy doesn’t have a dedicated dtype for timezone-aware datetimes. In the past, converting a *Series* or *DatetimeIndex* with timezone-aware datetimes would convert to a NumPy array by

1. converting the tz-aware data to UTC
2. dropping the timezone-info
3. returning a *numpy.ndarray* with datetime64[ns] dtype

Future versions of pandas will preserve the timezone information by returning an object-dtype NumPy array where each value is a *Timestamp* with the correct timezone attached

```
In [116]: ser = pd.Series(pd.date_range('2000', periods=2, tz="CET"))

In [117]: ser
Out[117]:
0  2000-01-01 00:00:00+01:00
1  2000-01-02 00:00:00+01:00
dtype: datetime64[ns, CET]
```

The default behavior remains the same, but issues a warning
```python
In [8]: np.asarray(ser)
/bin/ipython:1: FutureWarning: Converting timezone-aware DatetimeArray to timezone-naive
   ndarray with 'datetime64[ns]' dtype. In the future, this will return an ndarray
   with 'object' dtype where each element is a 'pandas.Timestamp' with the correct ->'tz'.
   To accept the future behavior, pass 'dtype=object'.
   To keep the old behavior, pass 'dtype="datetime64[ns]"'.
   #!/bin/python3
Out[8]:
array(['1999-12-31T23:00:00.000000000', '2000-01-01T23:00:00.000000000'],
      dtype='datetime64[ns]')
```

The previous or future behavior can be obtained, without any warnings, by specifying the `dtype`

**Previous behavior**

```python
In [118]: np.asarray(ser, dtype='datetime64[ns]')
Out[118]:
array(['1999-12-31T23:00:00.000000000', '2000-01-01T23:00:00.000000000'],
      dtype='datetime64[ns]')
```

**Future behavior**

```python
# New behavior
In [119]: np.asarray(ser, dtype=object)
Out[119]:
array([Timestamp('2000-01-01 00:00:00+0100', tz='CET'),
       Timestamp('2000-01-02 00:00:00+0100', tz='CET')], dtype=object)
```

Or by using `Series.to_numpy()`

```python
In [120]: ser.to_numpy()
Out[120]:
array([Timestamp('2000-01-01 00:00:00+0100', tz='CET'),
       Timestamp('2000-01-02 00:00:00+0100', tz='CET')], dtype=object)
```

```python
In [121]: ser.to_numpy(dtype="datetime64[ns]"")
Out[121]:
array(['1999-12-31T23:00:00.000000000', '2000-01-01T23:00:00.000000000'],
      dtype='datetime64[ns]')
```

All the above applies to a `DatetimeIndex` with tz-aware values as well.

**Removal of prior version deprecations/changes**

- The `LongPanel` and `WidePanel` classes have been removed (GH10892)
- `Series.repeat()` has renamed the `reps` argument to `repeats` (GH14645)
- Several private functions were removed from the (non-public) module `pandas.core.common` (GH22001)
- Removal of the previously deprecated module `pandas.core.datetools` (GH14105, GH14094)
- Strings passed into `DataFrame.groupby()` that refer to both column and index levels will raise a `ValueError` (GH14432)
- `Index.repeat()` and `MultiIndex.repeat()` have renamed the `n` argument to `repeats` (GH14645)
• The Series constructor and .astype method will now raise a ValueError if timestamp dtypes are passed in without a unit (e.g. np.datetime64) for the dtype parameter (GH15987)

• Removal of the previously deprecated as_indexer keyword completely from str.match() (GH22356, GH6581)

• The modules pandas.types, pandas.computation, and pandas.util.decorators have been removed (GH16157, GH16250)

• Removed the pandasformats.style shim for pandas.io.formats.style.Styler (GH16059)

• pandas.pnow, pandas.match, pandas.groupby, pd.get_store, pd.Expr, and pd.Term have been removed (GH15538, GH15940)

• Categorical.searchsorted() and Series.searchsorted() have renamed the v argument to value (GH14645)

• pandas.parser, pandas.lib, and pandas.tslib have been removed (GH15537)

• Index.searchsorted() have renamed the key argument to value (GH14645)

• DataFrame.consolidate and Series.consolidate have been removed (GH15501)

• The module pandas.tools has been removed (GH15358, GH16005)

• SparseArray.get_values() and SparseArray.to_dense() have dropped the fill parameter (GH14686)

• DataFrame.sortlevel and Series.sortlevel have been removed (GH15099)

• SparseSeries.to_dense() has dropped the sparse_only parameter (GH14686)

• DataFrame.astype() and Series.astype() have renamed the raise_on_error argument to errors (GH14967)

• is_sequence, is_any_int_dtype, and is_floating_dtype have been removed from pandas.api.types (GH16163, GH16189)

Performance improvements

• Slicing Series and DataFrames with an monotonically increasing CategoricalIndex is now very fast and has speed comparable to slicing with an Int64Index. The speed increase is both when indexing by label (using .loc) and position(.iloc) (GH20395) Slicing a monotonically increasing CategoricalIndex itself (i.e. ci[1000:2000]) shows similar speed improvements as above (GH21659)

• Improved performance of CategoricalIndex.equals() when comparing to another CategoricalIndex (GH24023)

• Improved performance of Series.describe() in case of numeric dtypes (GH21274)

• Improved performance of pandas.core.groupby.GroupBy.rank() when dealing with tied rankings (GH21237)

• Improved performance of DataFrame.set_index() with columns consisting of Period objects (GH21582, GH21606)

• Improved performance of Series.at() and Index.get_value() for Extension Arrays values (e.g. Categorical)(GH24204)

• Improved performance of membership checks in Categorical and CategoricalIndex (i.e. x in cat-style checks are much faster). CategoricalIndex.contains() is likewise much faster (GH21369, GH21508)
• Improved performance of `HDFStore.groups()` (and dependent functions like `HDFStore.keys()`). (i.e. x in store checks are much faster) (GH21372)

• Improved the performance of `pandas.get_dummies()` with `sparse=True` (GH21997)

• Improved performance of `IndexEngine.get_indexer_non_unique()` for sorted, non-unique indexes (GH9466)

• Improved performance of `PeriodIndex.unique()` (GH23083)

• Improved performance of `concat()` for `Series` objects (GH23404)

• Improved performance of `DatetimeIndex.normalize()` and `Timestamp.normalize()` for time-zone naive or UTC datetimes (GH23634)

• Improved performance of `DatetimeIndex.tz_localize()` and various `DatetimeIndex` attributes with dateutil UTC timezone (GH23772)

• Fixed a performance regression on Windows with Python 3.7 of `read_csv()` (GH23516)

• Improved performance of `Categorical` constructor for `Series` objects (GH23814)

• Improved performance of `where()` for Categorical data (GH24077)

• Improved performance of iterating over a `Series`. Using `DataFrame.itertuples()` now creates iterators without internally allocating lists of all elements (GH20783)

• Improved performance of `Period` constructor, additionally benefitting `PeriodArray` and `PeriodIndex` creation (GH24084, GH24118)

• Improved performance of tz-aware `DatetimeArray` binary operations (GH24491)

**Bug fixes**

**Categorical**

• Bug in `Categorical.from_codes()` where NaN values in codes were silently converted to 0 (GH21767). In the future this will raise a `ValueError`. Also changes the behavior of `from_codes([1.1, 2.0])`.

• Bug in `Categorical.sort_values()` where NaN values were always positioned in front regardless of `na_position` value. (GH22556).

• Bug when indexing with a boolean-valued Categorical. Now a boolean-valued Categorical is treated as a boolean mask (GH22665)

• Constructing a `CategoricalIndex` with empty values and boolean categories was raising a `ValueError` after a change to dtype coercion (GH22702).

• Bug in `Categorical.take()` with a user-provided `fill_value` not encoding the `fill_value`, which could result in a `ValueError`, incorrect results, or a segmentation fault (GH23296).

• In `Series.unstack()`, specifying a `fill_value` not present in the categories now raises a `TypeError` rather than ignoring the `fill_value` (GH23284)

• Bug when resampling `DataFrame.resample()` and aggregating on categorical data, the categorical dtype was getting lost. (GH23227)

• Bug in many methods of the `.str-accessor`, which always failed on calling the `CategoricalIndex.str` constructor (GH23555, GH23556)

• Bug in `Series.where()` losing the categorical dtype for categorical data (GH24077)
• Bug in Categorical.apply() where NaN values could be handled unpredictably. They now remain unchanged (GH24241)
• Bug in Categorical comparison methods incorrectly raising ValueError when operating against a DataFrame (GH24630)
• Bug in Categorical.set_categories() where setting fewer new categories with rename=True caused a segmentation fault (GH24675)

Datetimelike

• Fixed bug where two DateOffset objects with different normalize attributes could evaluate as equal (GH21404)
• Fixed bug where Timestamp.resolution() incorrectly returned 1-microsecond timedelta instead of 1-nanosecond Timedelta (GH21336, GH21365)
• Bug in to_datetime() that did not consistently return an Index when box=True was specified (GH21864)
• Bug in DatetimeIndex comparisons where string comparisons incorrectly raises TypeError (GH22074)
• Bug in DatetimeIndex comparisons when comparing against timedelta64[ns] dtyped arrays; in some cases TypeError was incorrectly raised, in others it incorrectly failed to raise (GH22074)
• Bug in DatetimeIndex comparisons when comparing against object-dtyped arrays (GH22074)
• Bug in DataFrame with datetime64[ns] dtype addition and subtraction with Timedelta-like objects (GH22005, GH22163)
• Bug in DataFrame with datetime64[ns] dtype addition and subtraction with DateOffset objects returning an object dtype instead of datetime64[ns] dtype (GH21610, GH22163)
• Bug in DataFrame with datetime64[ns] dtype comparing against NaT incorrectly (GH22242, GH22163)
• Bug in DataFrame with datetime64[ns] dtype subtracting Timestamp-like object incorrectly returned datetime64[ns] dtype instead of timedelta64[ns] dtype (GH8554, GH22163)
• Bug in DataFrame with datetime64[ns] dtype subtracting np.datetime64 object with non-nanosecond unit failing to convert to nanoseconds (GH18874, GH22163)
• Bug in DataFrame comparisons against Timestamp-like objects failing to raise TypeError for inequality checks with mismatched types (GH8932, GH22163)
• Bug in DataFrame with mixed dtypes including datetime64[ns] incorrectly raising TypeError on equality comparisons (GH13128, GH22163)
• Bug in DataFrame.values returning a DatetimeIndex for a single-column DataFrame with tz-aware datetime values. Now a 2-D numpy.ndarray of Timestamp objects is returned (GH24024)
• Bug in DataFrame.eq() comparison against NaT incorrectly returning True or NaN (GH15697, GH22163)
• Bug in DatetimeIndex subtraction that incorrectly failed to raise OverflowError (GH22492, GH22508)
• Bug in DatetimeIndex incorrectly allowing indexing with Timedelta object (GH20464)
• Bug in DatetimeIndex where frequency was being set if original frequency was None (GH22150)
• Bug in rounding methods of DatetimeIndex (round(), ceil(), floor()) and Timestamp (round(), ceil(), floor()) could give rise to loss of precision (GH22591)
• Bug in to_datetime() with an Index argument that would drop the name from the result (GH21697)
• Bug in `PeriodIndex` where adding or subtracting a `timedelta` or `Tick` object produced incorrect results (GH22988)

• Bug in the `Series` repr with period-dtype data missing a space before the data (GH23601)

• Bug in `date_range()` when decrementing a start date to a past end date by a negative frequency (GH23270)

• Bug in `Series.min()` which would return NaN instead of NaT when called on a series of NaT (GH23282)

• Bug in `Series.combine_first()` not properly aligning categoricals, so that missing values in `self` where not filled by valid values from `other` (GH24147)

• Bug in `DataFrame.combine()` with datetimelike values raising a TypeError (GH23079)

• Bug in `date_range()` with frequency of Day or higher where dates sufficiently far in the future could wrap around to the past instead of raising `OutOfBoundsDatetime` (GH14187)

• Bug in `period_range()` ignoring the frequency of `start` and `end` when those are provided as `Period` objects (GH20535).

• Bug in `PeriodIndex` with attribute `freq.n` greater than 1 where adding a `DateOffset` object would return incorrect results (GH23215)

• Bug in `Series` that interpreted string indices as lists of characters when setting datetimelike values (GH23451)

• Bug in `DataFrame` when creating a new column from an ndarray of `Timestamp` objects with timezones creating an object-dtype column, rather than datetimewith timezone (GH23932)

• Bug in `Timestamp` constructor which would drop the frequency of an input `Timestamp` (GH22311)

• Bug in `DatetimeIndex` where calling `np.array(dtindex, dtype=object)` would incorrectly return an array of `long` objects (GH23524)

• Bug in `Index` where passing a timezone-aware `DatetimeIndex` and `dtype=object` would incorrectly raise a `ValueError` (GH23524)

• Bug in `Index` where calling `np.array(dtindex, dtype=object)` on a timezone-naive `DatetimeIndex` would return an array of datetime objects instead of `Timestamp` objects, potentially losing nanosecond portions of the timestamps (GH23524)

• Bug in `Categorical._setitem_` not allowing setting with another `Categorical` when both are unordered and have the same categories, but in a different order (GH24142)

• Bug in `date_range()` where using dates with millisecond resolution or higher could return incorrect values or the wrong number of values in the index (GH24110)

• Bug in `DatetimeIndex` where constructing a `DatetimeIndex` from a `Categorical` or `CategoricalIndex` would incorrectly drop timezone information (GH18664)

• Bug in `DatetimeIndex` and `TimedeltaIndex` where indexing with `Ellipsis` would incorrectly lose the index’s `freq` attribute (GH21282)

• Clarified error message produced when passing an incorrect `freq` argument to `DatetimeIndex` with NaT as the first entry in the passed data (GH11587)

• Bug in `to_datetime()` where `box` and `utc` arguments were ignored when passing a `DataFrame` or dict of unit mappings (GH23760)

• Bug in `Series.dt` where the cache would not update properly after an in-place operation (GH24408)

• Bug in `PeriodIndex` where comparisons against an array-like object with length 1 failed to raise `ValueError` (GH23078)

• Bug in `DatetimeIndex.astype()`, `PeriodIndex.astype()` and `TimedeltaIndex.astype()` ignoring the sign of the `dtype` for unsigned integer dtypes (GH24405).
pandas: powerful Python data analysis toolkit, Release 1.3.1

- Fixed bug in `Series.max()` with `datetime64[ns]`-dtype failing to return NaT when nulls are present and `skipna=False` is passed (GH24265)
- Bug in `to_datetime()` where arrays of datetime objects containing both timezone-aware and timezone-naive datetimes would fail to raise `ValueError` (GH24569)
- Bug in `to_datetime()` with invalid datetime format doesn’t coerce input to NaT even if `errors='coerce'` (GH24763)

**Timedelta**

- Bug in `DataFrame` with `timedelta64[ns]` dtype division by `Timedelta`-like scalar incorrectly returning `timedelta64[ns]` dtype instead of `float64` dtype (GH20088, GH22163)
- Bug in adding a `Index` with object dtype to a `Series` with `timedelta64[ns]` dtype incorrectly raising (GH22390)
- Bug in adding a `Series` with numeric dtype against a `timedelta` object (GH22390)
- Bug in `Series` with numeric dtype when adding or subtracting an array or `Series` with `timedelta64` dtype (GH22390)
- Bug in `Index` with numeric dtype when multiplying or dividing an array with dtype `timedelta64` (GH22390)
- Bug in `TimedeltaIndex` incorrectly allowing indexing with `Timestamp` object (GH20464)
- Fixed bug where subtracting `Timedelta` from an object-dtyped array would raise `TypeError` (GH21980)
- Fixed bug in adding a `DataFrame` with all-`timedelta64[ns]` dtypes to a `DataFrame` with all-integer dtypes returning incorrect results instead of raising `TypeError` (GH22696)
- Bug in `TimedeltaIndex` where adding a timezone-aware datetime scalar incorrectly returned a timezone-naive `DatetimeIndex` (GH23215)
- Bug in `TimedeltaIndex` where adding `np.timedelta64('NaT')` incorrectly returned an all-NaT `TimedeltaIndex` instead of an all-NaT `TimedeltaIndex` (GH23215)
- Bug in `Timedelta` and `to_timedelta()` have inconsistencies in supported unit string (GH21762)
- Bug in `TimedeltaIndex` division where dividing by another `TimedeltaIndex` raised `TypeError` instead of returning a `Float64Index` (GH23829, GH22631)
- Bug in `TimedeltaIndex` comparison operations where comparing against non-Timedelta-like objects would raise `TypeError` instead of returning all-False for `__eq__` and all-True for `__ne__` (GH24056)
- Bug in `Timedelta` comparisons when comparing with a `Tick` object incorrectly raising `TypeError` (GH24710)

**Timezones**

- Bug in `Index.shift()` where an `AssertionError` would raise when shifting across DST (GH8616)
- Bug in `Timestamp` constructor where passing an invalid timezone offset designator (`Z`) would not raise a `ValueError` (GH8910)
- Bug in `Timestamp.replace()` where replacing at a DST boundary would retain an incorrect offset (GH7825)
- Bug in `Series.replace()` with `datetime64[ns, tz]` data when replacing NaT (GH11792)
- Bug in `Timestamp` when passing different string date formats with a timezone offset would produce different timezone offsets (GH12064)
- Bug when comparing a tz-naive `Timestamp` to a tz-aware `DatetimeIndex` which would coerce the `DatetimeIndex` to tz-naive (GH12601)
- Bug in `Series.truncate()` with a tz-aware `DatetimeIndex` which would cause a core dump (GH9243)
- Bug in `Series` constructor which would coerce tz-aware and tz-naive `Timestamp` to tz-aware (GH13051)
- Bug in `Index` with `datetime64[ns, tz]` dtype that did not localize integer data correctly (GH20964)
- Bug in `DatetimeIndex` where constructing with an integer and tz would not localize correctly (GH12619)
- Fixed bug where `DataFrame.describe()` and `Series.describe()` on tz-aware datetimes did not show first and last result (GH21328)
- Bug in `DatetimeIndex` comparisons failing to raise `TypeError` when comparing timezone-aware `DatetimeIndex` against `np.datetime64` (GH22074)
- Bug in `DataFrame` assignment with a timezone-aware scalar (GH19843)
- Bug in `DataFrame.asof()` that raised a `TypeError` when attempting to compare tz-naive and tz-aware timestamps (GH21194)
- Bug when constructing a `DatetimeIndex` with `Timestamp` constructed with the `replace` method across DST (GH18785)
- Bug when setting a new value with `DataFrame.loc()` with a `DatetimeIndex` with a DST transition (GH18308, GH20724)
- Bug in `Index.unique()` that did not re-localize tz-aware dates correctly (GH21737)
- Bug when indexing a `Series` with a DST transition (GH21846)
- Bug in `DataFrame.resample()` and `Series.resample()` where an `AmbiguousTimeError` or `NonExistentTimeError` would raise if a timezone aware timeseries ended on a DST transition (GH19375, GH10117)
- Bug in `DataFrame.drop()` and `Series.drop()` when specifying a tz-aware `Timestamp` key to drop from a `DatetimeIndex` with a DST transition (GH21761)
- Bug in `DatetimeIndex` constructor where `NaT` and `dateutil.tz.tzlocal` would raise an `OutOfBoundsDatetime` error (GH23807)
- Bug in `DatetimeIndex.tz_localize()` and `Timestamp.tz_localize()` with `dateutil.tz.tzlocal` near a DST transition that would return an incorrectly localized datetime (GH23807)
- Bug in `Timestamp` constructor where a `dateutil.tz.tzutc` timezone passed with a `datetime.datetime` argument would be converted to a `pytz.UTC` timezone (GH23807)
- Bug in `to_datetime()` where `utc=True` was not respected when specifying a unit and errors='ignore' (GH23758)
- Bug in `to_datetime()` where `utc=True` was not respected when passing a `Timestamp` (GH24415)
- Bug in `DataFrame.any()` returns wrong value when `axis=1` and the data is of datetimelike type (GH23070)
- Bug in `DatetimeIndex.to_period()` where a timezone aware index was converted to UTC first before creating `PeriodIndex` (GH22905)
- Bug in `DataFrame.tz_localize()`, `DataFrame.tz_convert()`, `Series.tz_localize()`, and `Series.tz_convert()` where `copy=False` would mutate the original argument inplace (GH6326)
• Bug in `DataFrame.max()` and `DataFrame.min()` with `axis=1` where a `Series` with NaN would be returned when all columns contained the same timezone (GH10390)

Offsets

• Bug in FY5253 where date offsets could incorrectly raise an `AssertionError` in arithmetic operations (GH14774)

• Bug in `DateOffset` where keyword arguments week and milliseconds were accepted and ignored. Passing these will now raise `ValueError` (GH19398)

• Bug in adding `DateOffset` with `DataFrame` or `PeriodIndex` incorrectly raising `TypeError` (GH23215)

• Bug in comparing `DateOffset` objects with non-DateOffset objects, particularly strings, raising `ValueError` instead of returning `False` for equality checks and `True` for not-equal checks (GH23524)

Numeric

• Bug in `Series __rmatmul__` doesn’t support matrix vector multiplication (GH21530)

• Bug in `factorize()` fails with read-only array (GH12813)

• Fixed bug in `unique()` handled signed zeros inconsistently: for some inputs 0.0 and -0.0 were treated as equal and for some inputs as different. Now they are treated as equal for all inputs (GH21866)

• Bug in `DataFrame.agg()`, `DataFrame.transform()` and `DataFrame.apply()` where, when supplied with a list of functions and `axis=1` (e.g. `df.apply([\'sum\', \'mean\'], axis=1)`), a `TypeError` was wrongly raised. For all three methods such calculation are now done correctly. (GH16679).

• Bug in `Series` comparison against datetime-like scalars and arrays (GH22074)

• Bug in `DataFrame` multiplication between boolean dtype and integer returning object dtype instead of integer dtype (GH22047, GH22163)

• Bug in `DataFrame.apply()` where, when supplied with a string argument and additional positional or keyword arguments (e.g. `df.apply(\'sum\', \text{min\_count=1})`), a `TypeError` was wrongly raised (GH22376)

• Bug in `DataFrame.astype()` to extension dtype may raise `AttributeError` (GH22578)

• Bug in `DataFrame` with `timedelta64[ns]` dtype arithmetic operations with `ndarray` with integer dtype incorrectly treating the array as `timedelta64[ns]` dtype (GH23114)

• Bug in `Series.rpow()` with object dtype NaN for `1 \times NA` instead of `1` (GH22922).

• `Series.agg()` can now handle numpify NaN-aware methods like `numpy.nansum()` (GH19629)

• Bug in `Series.rank()` and `DataFrame.rank()` when `pct=True` and more than $2^{24}$ rows are present resulted in percentages greater than 1.0 (GH18271)

• Calls such as `DataFrame.round()` with a non-unique `CategoricalIndex()` now return expected data. Previously, data would be improperly duplicated (GH21809).

• Added log10, floor and ceil to the list of supported functions in `DataFrame.eval()` (GH24139, GH24353)

• Logical operations &, |, ^ between `Series` and `Index` will no longer raise `ValueError` (GH22092)

• Checking PEP 3141 numbers in `is_scalar()` function returns `True` (GH22903)
• Reduction methods like `Series.sum()` now accept the default value of `keepdims=False` when called from a NumPy ufunc, rather than raising a `TypeError`. Full support for `keepdims` has not been implemented (GH24356).

Conversion

• Bug in `DataFrame.combine_first()` in which column types were unexpectedly converted to float (GH20699)
• Bug in `DataFrame.clip()` in which column types are not preserved and casted to float (GH24162)
• Bug in `DataFrame.clip()` when order of columns of dataframes doesn’t match, result observed is wrong in numeric values (GH20911)
• Bug in `DataFrame.astype()` where converting to an extension dtype when duplicate column names are present causes a `RecursionError` (GH24704)

Strings

• Bug in `Index.str.partition()` was not nan-safe (GH23558).
• Bug in `Index.str.split()` was not nan-safe (GH23677).
• Bug in `Series.str.contains()` not respecting the `na` argument for a `Categorical` dtype `Series` (GH22158)
• Bug in `Index.str.cat()` when the result contained only NaN (GH24044)

Interval

• Bug in the `IntervalIndex` constructor where the `closed` parameter did not always override the inferred `closed` (GH19370)
• Bug in the `IntervalIndex` repr where a trailing comma was missing after the list of intervals (GH20611)
• Bug in `Interval` where scalar arithmetic operations did not retain the `closed` value (GH22313)
• Bug in `IntervalIndex` where indexing with datetime-like values raised a `KeyError` (GH20636)
• Bug in `IntervalTree` where data containing NaN triggered a warning and resulted in incorrect indexing queries with `IntervalIndex` (GH23352)

Indexing

• Bug in `DataFrame.ne()` fails if columns contain column name “dtype” (GH22383)
• The traceback from a `KeyError` when asking `.loc` for a single missing label is now shorter and more clear (GH21557)
• `PeriodIndex` now emits a `KeyError` when a malformed string is looked up, which is consistent with the behavior of `DatetimeIndex` (GH22803)
• When `.ix` is asked for a missing integer label in a `MultiIndex` with a first level of integer type, it now raises a `KeyError`, consistently with the case of a flat `Int64Index`, rather than falling back to positional indexing (GH21593)
• Bug in `Index.reindex()` when reindexing a tz-naive and tz-aware `DatetimeIndex` (GH8306)
• Bug in `Series.reindex()` when reindexing an empty series with a `datetime64[ns, tz]` dtype (GH20869)
• Bug in `DataFrame` when setting values with `.loc` and a timezone aware `DatetimeIndex` (GH11365)
• `DataFrame.__getitem__` now accepts dictionaries and dictionary keys as list-likes of labels, consistently with `Series.__getitem__` (GH21294)
• Fixed `DataFrame[np.nan]` when columns are non-unique (GH21428)
• Bug when indexing `DatetimeIndex` with nanosecond resolution dates and timezones (GH11679)
• Bug where indexing with a Numpy array containing negative values would mutate the indexer (GH21867)
• Bug where mixed indexes wouldn’t allow integers for `.at` (GH19860)
• `Float64Index.get_loc` now raises `KeyError` when boolean key passed. (GH19087)
• Bug in `DataFrame.loc()` when indexing with an `IntervalIndex` (GH19977)
• `Index` no longer mangles None, NaN and NaT, i.e. they are treated as three different keys. However, for numeric Index all three are still coerced to a NaN (GH22332)
• Bug in `scalar` in `Index` if scalar is a float while the `Index` is of integer dtype (GH22085)
• Bug in `MultiIndex.set_levels()` when levels value is not subscriptable (GH23273)
• Bug where setting a timedelta column by `Index` causes it to be casted to double, and therefore lose precision (GH23511)
• Bug in `Index.union()` and `Index.intersection()` where name of the `Index` of the result was not computed correctly for certain cases (GH9943, GH9862)
• Bug in `Index` slicing with boolean `Index` may raise `TypeError` (GH22533)
• Bug in `PeriodArray.__setitem__` when accepting slice and list-like value (GH23978)
• Bug in `DatetimeIndex`, `TimedeltaIndex` where indexing with `Ellipsis` would lose their `freq` attribute (GH21282)
• Bug in `iat` where using it to assign an incompatible value would create a new column (GH23236)

**Missing**

• Bug in `DataFrame.fillna()` where a `ValueError` would raise when one column contained a `datetime64[ns, tz]` dtype (GH15522)
• Bug in `Series.hasnans()` that could be incorrectly cached and return incorrect answers if null elements are introduced after an initial call (GH19700)
• `Series.isin()` now treats all NaN-floats as equal also for `np.object_-dtype`. This behavior is consistent with the behavior for float64 (GH22119)
• `unique()` no longer mangles NaN-floats and the NaT-object for `np.object_-dtype`, i.e. NaT is no longer coerced to a NaN-value and is treated as a different entity. (GH22295)
• `DataFrame` and `Series` now properly handle numpy masked arrays with hardened masks. Previously, constructing a `DataFrame` or `Series` from a masked array with a hard mask would create a pandas object containing the underlying value, rather than the expected NaN. (GH24574)
• Bug in `DataFrame` constructor where `dtype` argument was not honored when handling numpy masked record arrays. (GH24874)

## MultiIndex

- Bug in `io.formats.style.Styler.applymap()` where `subset=` with `MultiIndex` slice would reduce to `Series` (GH19861)
- Removed compatibility for `MultiIndex` pickles prior to version 0.8.0; compatibility with `MultiIndex` pickles from version 0.13 forward is maintained (GH21654)
- `MultiIndex.get_loc_level()` (and as a consequence, `.loc` on a `Series` or `DataFrame` with a `MultiIndex` index) will now raise a `KeyError`, rather than returning an empty slice, if asked a label which is present in the levels but is unused (GH22221)
- `MultiIndex` has gained the `MultiIndex.from_frame()`, it allows constructing a `MultiIndex` object from a `DataFrame` (GH22420)
- Fix `TypeError` in Python 3 when creating `MultiIndex` in which some levels have mixed types, e.g. when some labels are tuples (GH15457)

## IO

- Bug in `read_csv()` in which a column specified with `CategoricalDtype` of boolean categories was not being correctly coerced from string values to booleans (GH20498)
- Bug in `read_csv()` in which unicode column names were not being properly recognized with Python 2.x (GH13253)
- Bug in `DataFrame.to_sql()` when writing timezone aware data (`datetime64[ns, tz]` dtype) would raise a `TypeError` (GH9086)
- Bug in `DataFrame.to_sql()` where a naive `DatetimeIndex` would be written as `TIMESTAMP` in supported databases, e.g. PostgreSQL (GH23510)
- Bug in `read_excel()` when `parse_cols` is specified with an empty dataset (GH9208)
- `read_html()` no longer ignores all-whitespace `<tr>` within `<thead>` when considering the `skiprows` and `header` arguments. Previously, users had to decrease their `header` and `skiprows` values on such tables to work around the issue. (GH21641)
- `read_excel()` will correctly show the deprecation warning for previously deprecated `sheetname` (GH17994)
- `read_csv()` and `read_table()` will throw `UnicodeError` and not coredump on badly encoded strings (GH22748)
- `read_csv()` will correctly parse timezone-aware datetimes (GH22256)
- Bug in `read_csv()` in which memory management was prematurely optimized for the C engine when the data was being read in chunks (GH23509)
- Bug in `read_csv()` in unnamed columns were being improperly identified when extracting a multi-index (GH23687)
- `read_sas()` will parse numbers in sas7bdat-files that have width less than 8 bytes correctly. (GH21616)
- `read_sas()` will correctly parse sas7bdat files with many columns (GH22628)
- `read_sas()` will correctly parse sas7bdat files with data page types having also bit 7 set (so page type is 128 + 256 = 384) (GH16615)
- Bug in `read_sas()` in which an incorrect error was raised on an invalid file format. (GH24548)
pandas: powerful Python data analysis toolkit, Release 1.3.1

- Bug in `detect_client_encoding()` where potential IOError goes unhandled when importing in a mod_wsgi process due to restricted access to stdout. (GH21552)
- Bug in `DataFrame.to_html()` with index=False misses truncation indicators (...) on truncated DataFrame (GH15019, GH22783)
- Bug in `DataFrame.to_html()` with index=False when both columns and row index are MultiIndex (GH22579)
- Bug in `DataFrame.to_html()` with index_names=False displaying index name (GH22747)
- Bug in `DataFrame.to_html()` with header=False not displaying row index names (GH23788)
- Bug in `DataFrame.to_html()` with sparsify=False that caused it to raise TypeError (GH22887)
- Bug in `DataFrame.to_string()` that broke column alignment when index=False and width of first column’s values is greater than the width of first column’s header (GH16839, GH13032)
- Bug in `DataFrame.to_string()` that caused representations of DataFrame to not take up the whole window (GH22984)
- Bug in `DataFrame.to_csv()` where a single level MultiIndex incorrectly wrote a tuple. Now just the value of the index is written (GH19589).
- HDFStore will raise ValueError when the format kwarg is passed to the constructor (GH13291)
- Bug in `HDFStore.append()` when appending a DataFrame with an empty string column and min_itemsize < 8 (GH12242)
- Bug in `read_csv()` in which memory leaks occurred in the C engine when parsing NaN values due to insufficient cleanup on completion or error (GH21353)
- Bug in `read_csv()` in which incorrect error messages were being raised when skipfooter was passed in along with nrows, iterator, or chunksize (GH23711)
- Bug in `read_csv()` in which MultiIndex index names were being improperly handled in the cases when they were not provided (GH23484)
- Bug in `read_csv()` in which unnecessary warnings were being raised when the dialect’s values conflicted with the default arguments (GH23761)
- Bug in `read_html()` in which the error message was not displaying the valid flavors when an invalid one was provided (GH23549)
- Bug in `read_excel()` in which extraneous header names were extracted, even though none were specified (GH11733)
- Bug in `read_excel()` in which column names were not being properly converted to string sometimes in Python 2.x (GH23874)
- Bug in `read_excel()` in which index_col=None was not being respected and parsing index columns anyway (GH18792, GH20480)
- Bug in `read_excel()` in which usecols was not being validated for proper column names when passed in as a string (GH20480)
- Bug in `DataFrame.to_dict()` when the resulting dict contains non-Python scalars in the case of numeric data (GH23753)
- `DataFrame.to_string()`, `DataFrame.to_html()`, `DataFrame.to_latex()` will correctly format output when a string is passed as the float_format argument (GH21625, GH22270)
- Bug in `read_csv()` that caused it to raise OverflowError when trying to use ‘inf’ as na_value with integer index column (GH17128)
• Bug in `read_csv()` that caused the C engine on Python 3.6+ on Windows to improperly read CSV filenames with accented or special characters (GH15086)

• Bug in `read_fwf()` in which the compression type of a file was not being properly inferred (GH22199)

• Bug in `pandas.io.json.json_normalize()` that caused it to raise `TypeError` when two consecutive elements of `record_path` are dicts (GH22706)

• Bug in `DataFrame.to_stata()`, `pandas.io.stata.StataWriter` and `pandas.io.stata.StataWriter117` where a exception would leave a partially written and invalid dta file (GH23573)

• Bug in `DataFrame.to_stata()` and `pandas.io.stata.StataWriter117` that produced invalid files when using strLs with non-ASCII characters (GH23573)

• Bug in `HDFStore` that caused it to raise `ValueError` when reading a Dataframe in Python 3 from fixed format written in Python 2 (GH24510)

• Bug in `DataFrame.to_string()` and more generally in the floating `repr` formatter. Zeros were not trimmed if `inf` was present in a columns while it was the case with NA values. Zeros are now trimmed as in the presence of NA (GH24861).

• Bug in the `repr` when truncating the number of columns and having a wide last column (GH24849).

Plotting

• Bug in `DataFrame.plot.scatter()` and `DataFrame.plot.hexbin()` caused x-axis label and tick-labels to disappear when colorbar was on in IPython inline backend (GH10611, GH10678, and GH20455)

• Bug in plotting a Series with datetimes using `matplotlib.axes.Axes.scatter()` (GH22039)

• Bug in `DataFrame.plot.bar()` caused bars to use multiple colors instead of a single one (GH20585)

• Bug in validating color parameter caused extra color to be appended to the given color array. This happened to multiple plotting functions using `matplotlib`. (GH20726)

GroupBy/resample/rolling

• Bug in `pandas.core.window.Rolling.min()` and `pandas.core.window.Rolling.max()` with `closed='left'`, a datetime-like index and only one entry in the series leading to segfault (GH24718)

• Bug in `pandas.core.groupby.GroupBy.first()` and `pandas.core.groupby.GroupBy.last()` with `as_index=False` leading to the loss of timezone information (GH15884)

• Bug in `DataFrame.resample()` when downsampling across a DST boundary (GH8531)

• Bug in date anchoring for `DataFrame.resample()` with offset Day when n > 1 (GH24127)

• Bug where `ValueError` is wrongly raised when calling `count()` method of a SeriesGroupBy when the grouping variable only contains NaNs and numpy version < 1.13 (GH21956).

• Multiple bugs in `pandas.core.window.Rolling.min()` with `closed='left'` and a datetime-like index leading to incorrect results and also segfault. (GH21704)

• Bug in `pandas.core.resample.Resampler.apply()` when passing positional arguments to applied func (GH14615).

• Bug in `Series.resample()` when passing `numpy.timedelta64` to `offset` kwarg (GH7687).

• Bug in `pandas.core.resample.Resampler.asfreq()` when frequency of TimedeltaIndex is a subperiod of a new frequency (GH13022).
• Bug in pandas.core.groupby.SeriesGroupBy.mean() when values were integral but could not fit inside of int64, overflowing instead. (GH22487)

• pandas.core.groupby.RollingGroupby.agg() and pandas.core.groupby.ExpandingGroupby.agg() now support multiple aggregation functions as parameters (GH15072)

• Bug in DataFrame.resample() and Series.resample() when resampling by a weekly offset ('W') across a DST transition (GH9119, GH21459)

• Bug in DataFrame.expanding() in which the axis argument was not being respected during aggregations (GH23372)

• Bug in pandas.core.groupby.GroupBy.transform() which caused missing values when the input function can accept a DataFrame but renames it (GH23455).

• Bug in pandas.core.groupby.GroupBy.nth() where column order was not always preserved (GH20760)

• Bug in pandas.core.groupby.GroupBy.rank() with method='dense' and pct=True when a group has only one member would raise a ZeroDivisionError (GH23666).

• Calling pandas.core.groupby.GroupBy.rank() with empty groups and pct=True was raising a ZeroDivisionError (GH22519)

• Bug in DataFrame.resample() when resampling NaT in TimeDeltaIndex (GH13223).

• Bug in DataFrame.groupby() did not respect the observed argument when selecting a column and instead always used observed=False (GH23970)

• Bug in pandas.core.groupby.SeriesGroupBy.pct_change() or pandas.core.groupby.DataFrameGroupBy.pct_change() would previously work across groups when calculating the percent change, where it now correctly works per group (GH21200, GH21235).

• Bug preventing hash table creation with very large number (2^32) of rows (GH22805)

• Bug in groupby when grouping on categorical causes ValueError and incorrect grouping if observed=True and nan is present in categorical column (GH24740, GH21151).

**Reshaping**

• Bug in pandas.concat() when joining resampled DataFrames with timezone aware index (GH13783)

• Bug in pandas.concat() when joining only Series the names argument of concat is no longer ignored (GH23490)

• Bug in Series.combine_first() with datetime64[ns, tz] dtype which would return tz-naive result (GH21469)

• Bug in Series.where() and DataFrame.where() with datetime64[ns, tz] dtype (GH21546)

• Bug in DataFrame.where() with an empty DataFrame and empty cond having non-boold type (GH21947)

• Bug in Series.mask() and DataFrame.mask() with list conditionals (GH21891)

• Bug in DataFrame.replace() raises RecursionError when converting OutOfBounds datetime64[ns, tz] (GH20380)

• pandas.core.groupby.GroupBy.rank() now raises a ValueError when an invalid value is passed for argument na_option (GH22124)

• Bug in get_dummies() with Unicode attributes in Python 2 (GH22084)

• Bug in DataFrame.replace() raises RecursionError when replacing empty lists (GH22083)
pandas: powerful Python data analysis toolkit, Release 1.3.1

- Bug in `Series.replace()` and `DataFrame.replace()` when dict is used as the `to_replace` value and one key in the dict is another key's value, the results were inconsistent between using integer key and using string key (GH20656)
- Bug in `DataFrame.drop_duplicates()` for empty DataFrame which incorrectly raises an error (GH20516)
- Bug in `pandas.wide_to_long()` when a string is passed to the stubnames argument and a column name is a substring of that stubname (GH22468)
- Bug in `merge()` when merging `datetime64[ns, tz]` data that contained a DST transition (GH18885)
- Bug in `merge_asof()` when merging on float values within defined tolerance (GH22981)
- Bug in `pandas.concat()` when concatenating a multicolumn DataFrame with tz-aware data against a DataFrame with a different number of columns (GH22796)
- Bug in `merge_asof()` where confusing error message raised when attempting to merge with missing values (GH23189)
- Bug in `DataFrame.nsmallest()` and `DataFrame.nlargest()` for dataframes that have a `MultiIndex` for columns (GH23033).
- Bug in `pandas.melt()` when passing column names that are not present in `DataFrame` (GH23575)
- Bug in `DataFrame.append()` with a `Series` with a dateutil timezone would raise a `TypeError` (GH23682)
- Bug in `Series` construction when passing no data and `dtype=str` (GH22477)
- Bug in `cut()` with bins as an overlapping `IntervalIndex` where multiple bins were returned per item instead of raising a `ValueError` (GH23980)
- Bug in `pandas.concat()` when joining `Series` datetimetz with `Series` category would lose timezone (GH23816)
- Bug in `DataFrame.join()` when joining on partial `MultiIndex` would drop names (GH20452).
  - `DataFrame.nlargest()` and `DataFrame.nsmallest()` now returns the correct n values when keep != 'all' also when tied on the first columns (GH22752)
- Constructing a DataFrame with an index argument that wasn’t already an instance of `Index` was broken (GH22227).
- Bug in `DataFrame` prevented list subclasses to be used to construction (GH21226)
- Bug in `DataFrame.unstack()` and `DataFrame.pivot_table()` returning a misleading error message when the resulting DataFrame has more elements than int32 can handle. Now, the error message is improved, pointing towards the actual problem (GH20601)
- Bug in `DataFrame.unstack()` where a `ValueError` was raised when unstacking timezone aware values (GH18338)
- Bug in `DataFrame.stack()` where timezone aware values were converted to timezone naive values (GH19420)
- Bug in `merge_asof()` where a `TypeError` was raised when `by_col` were timezone aware values (GH21184)
- Bug showing an incorrect shape when throwing error during `DataFrame` construction. (GH20742)
pandas: powerful Python data analysis toolkit, Release 1.3.1

Sparse

• Updating a boolean, datetime, or timedelta column to be Sparse now works (GH22367)
• Bug in `Series.to_sparse()` with Series already holding sparse data not constructing properly (GH22389)
• Providing a `sparse_index` to the `SparseArray` constructor no longer defaults the `na-value` to `np.nan` for all dtypes. The correct `na_value` for `data.dtype` is now used.
• Bug in `SparseArray.nbytes` under-reporting its memory usage by not including the size of its sparse index.
• Improved performance of `Series.shift()` for non-NA `fill_value`, as values are no longer converted to a dense array.
• Bug in `DataFrame.groupby` not including `fill_value` in the groups for non-NA `fill_value` when grouping by a sparse column (GH5078)
• Bug in unary inversion operator (~) on a `SparseSeries` with boolean values. The performance of this has also been improved (GH22835)
• Bug in `SparseArray.unique()` not returning the unique values (GH19595)
• Bug in `SparseArray.nonzero()` and `SparseDataFrame.dropna()` returning shifted/incorrect results (GH21172)
• Bug in `DataFrame.apply()` where dtypes would lose sparseness (GH23744)
• Bug in `concat()` when concatenating a list of `Series` with all-sparse values changing the `fill_value` and converting to a dense Series (GH24371)

Style

• `background_gradient()` now takes a `text_color_threshold` parameter to automatically lighten the text color based on the luminance of the background color. This improves readability with dark background colors without the need to limit the background colormap range. (GH21258)
• `background_gradient()` now also supports tablewise application (in addition to rowwise and columnwise) with `axis=None` (GH15204)
• `bar()` now also supports tablewise application (in addition to rowwise and columnwise) with `axis=None` and setting clipping range with `vmin` and `vmax` (GH21548 and GH21526). NaN values are also handled properly.

Build changes

• Building pandas for development now requires `cython >= 0.28.2` (GH21688)
• Testing pandas now requires `hypothesis>=3.58`. You can find the Hypothesis docs here, and a pandas-specific introduction in the contributing guide. (GH22280)
• Building pandas on macOS now targets minimum macOS 10.9 if run on macOS 10.9 or above (GH23424)
Other

- Bug where C variables were declared with external linkage causing import errors if certain other C libraries were imported before pandas. (GH24113)

5.7 Version 0.23

5.7.1 What’s new in 0.23.4 (August 3, 2018)

This is a minor bug-fix release in the 0.23.x series and includes some small regression fixes and bug fixes. We recommend that all users upgrade to this version.

Warning: Starting January 1, 2019, pandas feature releases will support Python 3 only. See Dropping Python 2.7 for more.

What’s new in v0.23.4

- Fixed regressions
- Bug fixes
- Contributors
Fixed regressions

• Python 3.7 with Windows gave all missing values for rolling variance calculations (GH21813)

Bug fixes

Groupby/resample/rolling

• Bug where calling DataFrameGroupBy.agg() with a list of functions including ohlc as the non-initial element would raise a ValueError (GH21716)

• Bug in roll_quantile caused a memory leak when calling .rolling(...).quantile(q) with q in (0,1) (GH21965)

Missing

• Bug in Series.clip() and DataFrame.clip() cannot accept list-like threshold containing NaN (GH19992)

Contributors

A total of 6 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

• Jeff Reback
• MeeseeksMachine +
• Tom Augspurger
• chris-b1
• h-vetinari
• meeseeksdev[bot]

5.7.2 What’s new in 0.23.3 (July 7, 2018)

This release fixes a build issue with the sdist for Python 3.7 (GH21785) There are no other changes.

Contributors

A total of 2 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

• Tom Augspurger
• meeseeksdev[bot] +
5.7.3 What’s new in 0.23.2 (July 5, 2018)

This is a minor bug-fix release in the 0.23.x series and includes some small regression fixes and bug fixes. We recommend that all users upgrade to this version.

Note: pandas 0.23.2 is first pandas release that’s compatible with Python 3.7 (GH20552)

Warning: Starting January 1, 2019, pandas feature releases will support Python 3 only. See Dropping Python 2.7 for more.

What’s new in v0.23.2

- Logical reductions over entire DataFrame
- Fixed regressions
- Build changes
- Bug fixes
- Contributors

Logical reductions over entire DataFrame

`DataFrame.all()` and `DataFrame.any()` now accept `axis=None` to reduce over all axes to a scalar (GH19976)

```
In [1]: df = pd.DataFrame({"A": [1, 2], "B": [True, False]})
In [2]: df.all(axis=None)
Out[2]: False
```

This also provides compatibility with NumPy 1.15, which now dispatches to `DataFrame.all`. With NumPy 1.15 and pandas 0.23.1 or earlier, `numpy.all()` will no longer reduce over every axis:

```
>>> # NumPy 1.15, pandas 0.23.1
>>> np.any(pd.DataFrame({'A': [False], 'B': [False]}))
A    False
B    False
dtype: bool
```

With pandas 0.23.2, that will correctly return False, as it did with NumPy < 1.15.

```
In [3]: np.any(pd.DataFrame({'A': [False], 'B': [False]}))
Out[3]: False
```
Fixed regressions

- Fixed regression in `to_csv()` when handling file-like object incorrectly (GH21471)
- Re-allowed duplicate level names of a MultiIndex. Accessing a level that has a duplicate name by name still raises an error (GH19029).
- Bug in both `DataFrame.first_valid_index()` and `Series.first_valid_index()` raised for a row index having duplicate values (GH21441)
- Fixed printing of DataFrames with hierarchical columns with long names (GH21180)
- Fixed regression in `reindex()` and `groupby()` with a MultiIndex or multiple keys that contains categorical datetime-like values (GH21390).
- Fixed regression in unary negative operations with object dtype (GH21380)
- Bug in `Timestamp.ceil()` and `Timestamp.floor()` when timestamp is a multiple of the rounding frequency (GH21262)
- Fixed regression in `to_clipboard()` that defaulted to copying dataframes with space delimited instead of tab delimited (GH21104)

Build changes

- The source and binary distributions no longer include test data files, resulting in smaller download sizes. Tests relying on these data files will be skipped when using `pandas.test()` (GH19320)

Bug fixes

Conversion

- Bug in constructing `Index` with an iterator or generator (GH21470)
- Bug in `Series.nlargest()` for signed and unsigned integer dtypes when the minimum value is present (GH21426)

Indexing

- Bug in `Index.get_indexer_non_unique()` with categorical key (GH21448)
- Bug in comparison operations for `MultiIndex` where error was raised on equality / inequality comparison involving a MultiIndex with `nlevels == 1` (GH21149)
- Bug in `DataFrame.drop()` behaviour is not consistent for unique and non-unique indexes (GH21494)
- Bug in `DataFrame.duplicated()` with a large number of columns causing a ‘maximum recursion depth exceeded’ (GH21524).

I/O

- Bug in `read_csv()` that caused it to incorrectly raise an error when `nrows=0, low_memory=True, and index_col` was not None (GH21141)
- Bug in `json_normalize()` when formatting the `record_prefix` with integer columns (GH21536)

Categorical

- Bug in rendering `Series` with `Categorical` dtype in rare conditions under Python 2.7 (GH21002)

Timezones
• Bug in `Timestamp` and `DatetimeIndex` where passing a `Timestamp` localized after a DST transition would return a datetime before the DST transition (GH20854)

• Bug in comparing `DataFrame` with tz-aware `DatetimeIndex` columns with a DST transition that raised a `KeyError` (GH19970)

• Bug in `DatetimeIndex.shift()` where an `AssertionError` would raise when shifting across DST (GH8616)

• Bug in `Timestamp` constructor where passing an invalid timezone offset designator (Z) would not raise a `ValueError` (GH8910)

• Bug in `Timestamp.replace()` where replacing at a DST boundary would retain an incorrect offset (GH7825)

• Bug in `DatetimeIndex.reindex()` when reindexing a tz-naive and tz-aware `DatetimeIndex` (GH8306)

• Bug in `DatetimeIndex.resample()` when downsampling across a DST boundary (GH8531)

**Timedelta**

• Bug in `Timedelta` where non-zero timedeltas shorter than 1 microsecond were considered False (GH21484)

**Contributors**

A total of 17 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

5.7.4 What’s new in 0.23.1 (June 12, 2018)

This is a minor bug-fix release in the 0.23.x series and includes some small regression fixes and bug fixes. We recommend that all users upgrade to this version.

Warning: Starting January 1, 2019, pandas feature releases will support Python 3 only. See Dropping Python 2.7 for more.

What’s new in v0.23.1

- Fixed regressions
- Performance improvements
- Bug fixes
- Contributors

Fixed regressions

Comparing Series with datetime.date

We’ve reverted a 0.23.0 change to comparing a Series holding datetimes and a datetime.date object (GH21152). In pandas 0.22 and earlier, comparing a Series holding datetimes and datetime.date objects would coerce the datetime.date to a datetime before comparing. This was inconsistent with Python, NumPy, and DatetimeIndex, which never consider a datetime and datetime.date equal.

In 0.23.0, we unified operations between DatetimeIndex and Series, and in the process changed comparisons between a Series of datetimes and datetime.date without warning.

We’ve temporarily restored the 0.22.0 behavior, so datetimes and dates may again compare equal, but restore the 0.23.0 behavior in a future release.

To summarize, here’s the behavior in 0.22.0, 0.23.0, 0.23.1:

```python
# 0.22.0... Silently coerce the datetime.date
>>> import datetime
generate_html_table=False
>>> pd.Series(pd.date_range('2017', periods=2)) == datetime.date(2017, 1, 1)
0   True
1  False
dtype: bool

# 0.23.0... Do not coerce the datetime.date
>>> pd.Series(pd.date_range('2017', periods=2)) == datetime.date(2017, 1, 1)
0   False
1  False
dtype: bool

# 0.23.1... Coerce the datetime.date with a warning
>>> pd.Series(pd.date_range('2017', periods=2)) == datetime.date(2017, 1, 1)
/bin/python:1: FutureWarning: Comparing Series of datetimes with 'datetime.date'. Current, the 'datetime.date' is coerced to a datetime. In the future pandas will not coerce, and the values not compare equal to the 'datetime.date'.
To retain the current behavior, convert the 'datetime.date' to a
```
In addition, ordering comparisons will raise a `TypeError` in the future.

**Other fixes**

- Reverted the ability of `to_sql()` to perform multivalue inserts as this caused regression in certain cases (GH21103). In the future this will be made configurable.
- Fixed regression in the `DatetimeIndex.date` and `DatetimeIndex.time` attributes in case of timezone-aware data: `DatetimeIndex.time` returned a tz-aware time instead of tz-naive (GH21267) and `DatetimeIndex.date` returned incorrect date when the input date has a non-UTC timezone (GH21230).
- Fixed regression in `pandas.io.json.json_normalize()` when called with None values in nested levels in JSON, and to not drop keys with value as None (GH21158, GH21356).
- Bug in `to_csv()` causes encoding error when compression and encoding are specified (GH21241, GH21118)
- Bug preventing pandas from being importable with -OO optimization (GH21071)
- Bug in `Categorical.fillna()` incorrectly raising a `TypeError` when value the individual categories are iterable and value is an iterable (GH21097, GH19788)
- Fixed regression in constructors coercing NA values like None to strings when passing `dtype=str` (GH21083)
- Regression in `pivot_table()` where an ordered `Categorical` with missing values for the pivot’s index would give a mis-aligned result (GH21133)
- Fixed regression in merging on boolean index/columns (GH21119).

**Performance improvements**

- Improved performance of `CategoricalIndex.is_monotonic_increasing()`, `CategoricalIndex.is_monotonic_decreasing()` and `CategoricalIndex.is_monotonic()` (GH21025)
- Improved performance of `CategoricalIndex.is_unique()` (GH21107)

**Bug fixes**

**Groupby/resample/rolling**

- Bug in `DataFrame.agg()` where applying multiple aggregation functions to a `DataFrame` with duplicated column names would cause a stack overflow (GH21063)
- Bug in `pandas.core.groupby.GroupBy.ffill()` and `pandas.core.groupby.GroupBy.bfill()` where the fill within a grouping would not always be applied as intended due to the implementations’ use of a non-stable sort (GH21207)
- Bug in `pandas.core.groupby.GroupBy.rank()` where results did not scale to 100% when specifying method=’dense’ and pct=True
- Bug in `pandas.Dataframe.rolling()` and `pandas.Series.rolling()` which incorrectly accepted a 0 window size rather than raising (GH21286)
Data-type specific

- Bug in `Series.str.replace()` where the method throws `TypeError` on Python 3.5.2 (GH21078)
- Bug in `Timedelta` where passing a float with a unit would prematurely round the float precision (GH14156)
- Bug in `pandas.testing.assert_index_equal()` which raised `AssertionError` incorrectly, when comparing two `CategoricalIndex` objects with param `check_categorical=False` (GH19776)

Sparse

- Bug in `SparseArray.shape` which previously only returned the shape `SparseArray.sp_values` (GH21126)

Indexing

- Bug in `Series.reset_index()` where appropriate error was not raised with an invalid level name (GH20925)
- Bug in `interval_range()` when `start/periods` or `end/periods` are specified with float `start` or `end` (GH21161)
- Bug in `MultiIndex.set_names()` where error raised for a `MultiIndex` with `nlevels == 1` (GH21149)
- Bug in `IntervalIndex` constructors where creating an `IntervalIndex` from categorical data was not fully supported (GH21243, GH21253)
- Bug in `MultiIndex.sort_index()` which was not guaranteed to sort correctly with `level=1`; this was also causing data misalignment in particular `DataFrame.stack()` operations (GH20994, GH20945, GH21052)

Plotting

- New keywords (sharex, sharey) to turn on/off sharing of x/y-axis by subplots generated with pandas.DataFrame().groupby().boxplot() (GH20968)

I/O

- Bug in IO methods specifying `compression='zip'` which produced uncompressed zip archives (GH17778, GH21144)
- Bug in `DataFrame.to_stata()` which prevented exporting DataFrames to buffers and most file-like objects (GH21041)
- Bug in `read_stata()` and StataReader which did not correctly decode utf-8 strings on Python 3 from Stata 14 files (dta version 118) (GH21244)
- Bug in IO JSON `read_json()` reading empty JSON schema with `orient='table'` back to `DataFrame` caused an error (GH21287)

Reshaping

- Bug in `concat()` where error was raised in concatenating `Series` with numpy scalar and tuple names (GH21015)
- Bug in `concat()` warning message providing the wrong guidance for future behavior (GH21101)

Other

- Tab completion on `Index` in IPython no longer outputs deprecation warnings (GH21125)
- Bug preventing pandas being used on Windows without C++ redistributable installed (GH21106)

5.7.5 What’s new in 0.23.0 (May 15, 2018)

This is a major release from 0.22.0 and includes a number of API changes, deprecations, new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

Highlights include:

- Round-trippable JSON format with ‘table’ orient.
- Instantiation from dicts respects order for Python 3.6+.
- Dependent column arguments for assign.
- Merging / sorting on a combination of columns and index levels.
- Extending pandas with custom types.
- Excluding unobserved categories from groupby.
- Changes to make output shape of DataFrame.apply consistent.

Check the API Changes and deprecations before updating.

**Warning:** Starting January 1, 2019, pandas feature releases will support Python 3 only. See Dropping Python 2.7 for more.

What’s new in v0.23.0

- New features
  - JSON read/write round-trippable with `orient='table'`
  - Method `.assign()` accepts dependent arguments
  - Merging on a combination of columns and index levels
  - Sorting by a combination of columns and index levels
  - Extending pandas with custom types (experimental)
  - New observed keyword for excluding unobserved categories in GroupBy
  - Rolling/Expanding.apply() accepts `raw=False` to pass a Series to the function
  - `DataFrame.interpolate` has gained the `limit_area` kwarg
  - Function `get_dummies` now supports `dtype` argument
  - Timedelta mod method
  - Method `.rank()` handles `inf` values when `NaN` are present
  - `Series.str.cat` has gained the `join` kwarg
  - `DataFrame.astype` performs column-wise conversion to Categorical
  - Other enhancements

- Backwards incompatible API changes
  - Dependencies have increased minimum versions
  - Instantiation from dicts preserves dict insertion order for Python 3.6+
- Deprecate Panel
- pandas.core.common removals
- Changes to make output of \texttt{DataFrame.apply} consistent
- Concatenation will no longer sort
- Build changes
- Index division by zero fills correctly
- Extraction of matching patterns from strings
- Default value for the \texttt{ordered} parameter of \texttt{CategoricalDtype}
- Better pretty-printing of DataFrames in a terminal
- Datetimelike API changes
- Other API changes

- **Deprecations**
- **Removal of prior version deprecations/changes**
- **Performance improvements**
- **Documentation changes**
- **Bug fixes**
  - Categorical
  - Datetimelike
  - Timedelta
  - Timezones
  - Offsets
  - Numeric
  - Strings
  - Indexing
  - MultiIndex
  - IO
  - Plotting
  - GroupBy/resample/rolling
  - Sparse
  - Reshaping
  - Other

- **Contributors**
New features

JSON read/write round-trippable with `orient='table'`

A DataFrame can now be written to and subsequently read back via JSON while preserving metadata through usage of the `orient='table'` argument (see GH18912 and GH9146). Previously, none of the available `orient` values guaranteed the preservation of dtypes and index names, amongst other metadata.

In [1]: df = pd.DataFrame({'foo': [1, 2, 3, 4],
                       'bar': ['a', 'b', 'c', 'd'],
                       'baz': pd.date_range('2018-01-01', freq='d', periods=4),
                       'qux': pd.Categorical(['a', 'b', 'c', 'c']),
                       'idx': pd.Index(range(4), name='idx'))

In [2]: df
Out[2]:
   foo  bar  baz      qux
  idx
0   1    a 2018-01-01 a
1   2    b 2018-01-02 b
2   3    c 2018-01-03 c
3   4    d 2018-01-04 c

[4 rows x 4 columns]

In [3]: df.dtypes
Out[3]:
foo   int64
bar   object
baz  datetime64[ns]
qux  category

In [4]: df.to_json('test.json', orient='table')

In [5]: new_df = pd.read_json('test.json', orient='table')

In [6]: new_df
Out[6]:
   foo  bar  baz      qux
  idx
0   1    a 2018-01-01 a
1   2    b 2018-01-02 b
2   3    c 2018-01-03 c
3   4    d 2018-01-04 c

[4 rows x 4 columns]

In [7]: new_df.dtypes
Out[7]:
foo   int64
bar   object
baz  datetime64[ns]
qux  category

Please note that the string `index` is not supported with the round trip format, as it is used by default in `write_json`
to indicate a missing index name.

```python
In [8]: df.index.name = 'index'

In [9]: df.to_json('test.json', orient='table')

In [10]: new_df = pd.read_json('test.json', orient='table')

In [11]: new_df
Out[11]:
   foo  bar     baz  qux
0  1    a  2018-01-01  a
1  2    b  2018-01-02  b
2  3    c  2018-01-03  c
3  4    d  2018-01-04  c
```

[4 rows x 4 columns]

```python
In [12]: new_df.dtypes
Out[12]:
foo    int64
bar   object
baz  datetime64[ns]
qux    category
Length: 4, dtype: object
```

**Method `.assign()` accepts dependent arguments**

The `DataFrame.assign()` now accepts dependent keyword arguments for python version later than 3.6 (see also PEP 468). Later keyword arguments may now refer to earlier ones if the argument is a callable. See the documentation here (GH14207)

```python
In [13]: df = pd.DataFrame({'A': [1, 2, 3]})

In [14]: df
Out[14]:
   A
0  1
1  2
2  3

[3 rows x 1 columns]

In [15]: df.assign(B=df.A, C=lambda x: x['A'] + x['B'])
Out[15]:
   A  B  C
0  1  1  2
1  2  2  4
2  3  3  6

[3 rows x 3 columns]
```

**Warning:** This may subtly change the behavior of your code when you’re using `.assign()` to update an existing column. Previously, callables referring to other variables being updated would get the “old” values
Previous behavior:

```python
In [2]: df = pd.DataFrame({"A": [1, 2, 3]})

In [3]: df.assign(A=lambda df: df.A + 1, C=lambda df: df.A * -1)
```

```
Out[3]:
   A  C
0  2 -1
1  3 -2
2  4 -3
```

New behavior:

```python
In [16]: df.assign(A=df.A + 1, C=lambda df: df.A * -1)
```

```
Out[16]:
   A  C
0  2 -2
1  3 -3
2  4 -4
[3 rows x 2 columns]
```

### Merging on a combination of columns and index levels

Strings passed to `DataFrame.merge()` as the `on`, `left_on`, and `right_on` parameters may now refer to either column names or index level names. This enables merging `DataFrame` instances on a combination of index levels and columns without resetting indexes. See the [Merge on columns and levels](https://pandas.pydata.org/pandas-docs/stable/user_guide/merging.html) documentation section. (GH14355)

```python
In [17]: left_index = pd.Index(['K0', 'K0', 'K1', 'K2'], name='key1')

In [18]: left = pd.DataFrame({'A': ['A0', 'A1', 'A2', 'A3'],
                          'B': ['B0', 'B1', 'B2', 'B3'],
                          'key2': ['K0', 'K1', 'K0', 'K1'],
                          index=left_index)

In [19]: right_index = pd.Index(['K0', 'K1', 'K2', 'K2'], name='key1')

In [20]: right = pd.DataFrame({'C': ['C0', 'C1', 'C2', 'C3'],
                           'D': ['D0', 'D1', 'D2', 'D3'],
                           'key2': ['K0', 'K0', 'K0', 'K1'],
                           index=right_index)

In [21]: left.merge(right, on=['key1', 'key2'])
```

```
Out[21]:
   A  B key2  C  D
  key1
K0 A0 B0 K0 C0 D0
K1 A2 B2 K0 C1 D1
K2 A3 B3 K1 C3 D3
[3 rows x 5 columns]
```
Strings passed to `DataFrame.sort_values()` as the `by` parameter may now refer to either column names or index level names. This enables sorting `DataFrame` instances by a combination of index levels and columns without resetting indexes. See the Sorting by Indexes and Values documentation section. (GH14353)

```python
# Build MultiIndex
In [22]: idx = pd.MultiIndex.from_tuples([('a', 1), ('a', 2), ('a', 2),
                                     ('b', 2), ('b', 1), ('b', 1)])
In [23]: idx.names = ['first', 'second']

# Build DataFrame
In [24]: df_multi = pd.DataFrame({'A': np.arange(6, 0, -1)},
                             index=idx)
In [25]: df_multi
Out[25]:
     A
    first second
a   1   6
    2   5
    2   4
b   2   3
    1   2
    1   1

[6 rows x 1 columns]

# Sort by 'second' (index) and 'A' (column)
In [26]: df_multi.sort_values(by=['second', 'A'])
Out[26]:
     A
    first second
b   1   1
    1   2
a   1   6
b   2   3
a   2   4
    2   5

[6 rows x 1 columns]
```

Extending pandas with custom types (experimental)

pandas now supports storing array-like objects that aren’t necessarily 1-D NumPy arrays as columns in a DataFrame or values in a Series. This allows third-party libraries to implement extensions to NumPy’s types, similar to how pandas implemented categoricals, datetimes with timezones, periods, and intervals.

As a demonstration, we’ll use cyberpandas, which provides an `IPArray` type for storing ip addresses.

```python
In [1]: from cyberpandas import IPArray
In [2]: values = IPArray({....:
```
IPArray isn’t a normal 1-D NumPy array, but because it’s a pandas ExtensionArray, it can be stored properly inside pandas’ containers.

```
In [3]: ser = pd.Series(values)
In [4]: ser
Out[4]:
          0        0
          1  192.168.1.1
          2  2001:db8:85a3::8a2e:370:7334
dtype: ip
```

Notice that the dtype is ip. The missing value semantics of the underlying array are respected:

```
In [5]: ser.isna()
Out[5]:
   0  True
   1  False
   2  False
dtype: bool
```

For more, see the extension types documentation. If you build an extension array, publicize it on our ecosystem page.

**New observed keyword for excluding unobserved categories in GroupBy**

Grouping by a categorical includes the unobserved categories in the output. When grouping by multiple categorical columns, this means you get the cartesian product of all the categories, including combinations where there are no observations, which can result in a large number of groups. We have added a keyword observed to control this behavior, it defaults to observed=False for backward-compatibility. (GH14942, GH8138, GH15217, GH17594, GH8669, GH20583, GH20902)

```
In [27]: cat1 = pd.Categorical(["a", "a", "b", "b"],
                        categories=["a", "b", "z"], ordered=True)
       ....:
In [28]: cat2 = pd.Categorical(["c", "d", "c", "d"],
                        categories=["c", "d", "y"], ordered=True)
       ....:
In [29]: df = pd.DataFrame({'A': cat1, 'B': cat2, "values": [1, 2, 3, 4]})
In [30]: df['C'] = ['foo', 'bar'] * 2
In [31]: df
Out[31]:
    A  B  values   C
   0  a  c        1 foo
   1  a  d        2 bar
```
To show all values, the previous behavior:

```
In [32]: df.groupby(['A', 'B', 'C'], observed=False).count()
Out[32]:
      values
    A  B  C
  a  c  foo  0
     d  bar  1
  b  c  foo  1
     d  bar  1
  ... ... ...
  z  c  foo  0
     d  bar  0
  y  c  foo  0
     d  bar  0

[18 rows x 1 columns]
```

To show only observed values:

```
In [33]: df.groupby(['A', 'B', 'C'], observed=True).count()
Out[33]:
      values
    A  B  C
  a  c  foo  1
     d  bar  1
  b  c  foo  1
     d  bar  1

[4 rows x 1 columns]
```

For pivoting operations, this behavior is already controlled by the dropna keyword:

```
In [34]: cat1 = pd.Categorical(['a', 'a', 'b', 'b'],
                          categories=['a', 'b', 'z'], ordered=True)
.....:
In [35]: cat2 = pd.Categorical(['c', 'd', 'c', 'd'],
                          categories=['c', 'd', 'y'], ordered=True)
.....:
In [36]: df = pd.DataFrame({'A': cat1, 'B': cat2, 'values': [1, 2, 3, 4]})
In [37]: df
Out[37]:
     A  B  values
 0  a  c     1
 1  a  d     2
 2  b  c     3
 3  b  d     4
```
[4 rows x 3 columns]

In [38]: pd.pivot_table(df, values='values', index=['A', 'B'],
   ....:   dropna=True)
   ....:
Out[38]:
   values
   A B
   a c 1
   d 2
   b c 3
   d 4

[4 rows x 1 columns]

In [39]: pd.pivot_table(df, values='values', index=['A', 'B'],
   ....:   dropna=False)
   ....:
Out[39]:
   values
   A B
   a c 1.0
   d 2.0
   y NaN
   b c 3.0
   d 4.0
   y NaN
   z c NaN
   d NaN
   y NaN

[9 rows x 1 columns]

**Rolling/Expanding.apply() accepts raw=False to pass a Series to the function**

Series.rolling().apply(), DataFrame.rolling().apply(), Series.expanding().
apply(), and DataFrame.expanding().apply() have gained a raw=None parameter. This is similar to
DataFame.apply(). This parameter, if True allows one to send a np.ndarray to the applied function. If
False a Series will be passed. The default is None, which preserves backward compatibility, so this will default
to True, sending an np.ndarray. In a future version the default will be changed to False, sending a Series.
(GH5071, GH20584)

In [40]: s = pd.Series(np.arange(5), np.arange(5) + 1)

In [41]: s
Out[41]:
   0  1
   1  2
   2  3
   3  4
   4  5
Length: 5, dtype: int64

Pass a Series:
In [42]: s.rolling(2, min_periods=1).apply(lambda x: x.iloc[-1], raw=False)
Out[42]:
1  0.0
2  1.0
3  2.0
4  3.0
5  4.0
Length: 5, dtype: float64

Mimic the original behavior of passing a ndarray:

In [43]: s.rolling(2, min_periods=1).apply(lambda x: x[-1], raw=True)
Out[43]:
1  0.0
2  1.0
3  2.0
4  3.0
5  4.0
Length: 5, dtype: float64

**DataFrame.interpolate has gained the limit_area kwarg**

*DataFrame.interpolate()* has gained a *limit_area* parameter to allow further control of which NaN s are replaced. Use *limit_area='inside'* to fill only NaNs surrounded by valid values or use *limit_area='outside'* to fill only NaN s outside the existing valid values while preserving those inside. ([GH16284](https://github.com/pandas-dev/pandas/issues/16284)) See the [full documentation here](https://pandas.pydata.org/pandas-docs/stable/generated/pandas.DataFrame.interpolate.html).

In [44]: ser = pd.Series([np.nan, np.nan, 5, np.nan, np.nan, np.nan, 13, np.nan, np.nan])
   ....:
   ....:

In [45]: ser
Out[45]:
0     NaN
1     NaN
2     5.0
3     NaN
4     NaN
5     NaN
6    13.0
7     NaN
8     NaN
Length: 9, dtype: float64

Fill one consecutive inside value in both directions

In [46]: ser.interpolate(limit_direction='both', limit_area='inside', limit=1)
Out[46]:
0     NaN
1     NaN
2     5.0
3     7.0
4     NaN
5    11.0
6    13.0
(continues on next page)
7 NaN
8 NaN
Length: 9, dtype: float64

Fill all consecutive outside values backward

```
In [47]: ser.interpolate(limit_direction='backward', limit_area='outside')
Out[47]:
0  5.0
1  5.0
2  5.0
3  NaN
4  NaN
5  NaN
6  13.0
7  NaN
8  NaN
Length: 9, dtype: float64
```

Fill all consecutive outside values in both directions

```
In [48]: ser.interpolate(limit_direction='both', limit_area='outside')
Out[48]:
0  5.0
1  5.0
2  5.0
3  NaN
4  NaN
5  NaN
6  13.0
7  13.0
8  13.0
Length: 9, dtype: float64
```

**Function get_dummies now supports dtype argument**

The `get_dummies()` now accepts a `dtype` argument, which specifies a dtype for the new columns. The default remains `uint8`. (GH18330)

```
In [49]: df = pd.DataFrame({'a': [1, 2], 'b': [3, 4], 'c': [5, 6]})

In [50]: pd.get_dummies(df, columns=['c']).dtypes
Out[50]:
a   int64
b   int64
c_5  uint8
c_6  uint8
Length: 4, dtype: object

In [51]: pd.get_dummies(df, columns=['c'], dtype=bool).dtypes
Out[51]:
a   int64
b   int64
c_5  bool
```
**Timedelta mod method**

mod (%) and divmod operations are now defined on Timedelta objects when operating with either timedelta-like or with numeric arguments. See the documentation here. (GH19365)

```
In [52]: td = pd.Timedelta(hours=37)
In [53]: td % pd.Timedelta(minutes=45)
Out[53]: Timedelta('0 days 00:15:00')
```

**Method .rank() handles inf values when NaN are present**

In previous versions, .rank() would assign inf elements NaN as their ranks. Now ranks are calculated properly. (GH6945)

```
In [54]: s = pd.Series([-np.inf, 0, 1, np.nan, np.inf])
In [55]: s
Out[55]:
0  -inf
1    0.0
2     1.0
3     NaN
4      inf
Length: 5, dtype: float64
```

Previous behavior:

```
In [11]: s.rank()
Out[11]:
0    1.0
1    2.0
2    3.0
3    NaN
4    NaN
dtype: float64
```

Current behavior:

```
In [56]: s.rank()
Out[56]:
0    1.0
1    2.0
2    3.0
3    NaN
4    4.0
Length: 5, dtype: float64
```

Furthermore, previously if you rank inf or -inf values together with NaN values, the calculation won’t distinguish NaN from infinity when using ‘top’ or ‘bottom’ argument.
In [57]: s = pd.Series([np.nan, np.nan, -np.inf, -np.inf])

In [58]: s
Out[58]:
0   NaN
1   NaN
2   -inf
3   -inf
Length: 4, dtype: float64

Previous behavior:

In [15]: s.rank(na_option='top')
Out[15]:
0   2.5
1   2.5
2   2.5
3   2.5
dtype: float64

Current behavior:

In [59]: s.rank(na_option='top')
Out[59]:
0   1.5
1   1.5
2   3.5
3   3.5
Length: 4, dtype: float64

These bugs were squashed:

- Bug in `DataFrame.rank()` and `Series.rank()` when method='dense' and pct=True in which percentile ranks were not being used with the number of distinct observations (GH15630)
- Bug in `Series.rank()` and `DataFrame.rank()` when ascending='False' failed to return correct ranks for infinity if NaN were present (GH19538)
- Bug in `DataFrameGroupBy.rank()` where ranks were incorrect when both infinity and NaN were present (GH20561)

**Series.str.cat has gained the join kwarg**

Previously, `Series.str.cat()` did not – in contrast to most of pandas – align `Series` on their index before concatenation (see GH18657). The method has now gained a keyword `join` to control the manner of alignment, see examples below and [here](https://pandas.pydata.org/pandas-docs/stable/reference/api/pandas.Series.str.cat.html).

In v.0.23 `join` will default to None (meaning no alignment), but this default will change to 'left' in a future version of pandas.

In [60]: s = pd.Series(['a', 'b', 'c', 'd'])

In [61]: t = pd.Series(['b', 'd', 'e', 'c'], index=[1, 3, 4, 2])

In [62]: s.str.cat(t)
Out[62]:
0   NaN
(continues on next page)
Furthermore, *Series.str.cat()* now works for *CategoricalIndex* as well (previously raised a *ValueError*; see GH20842).

**DataFrame.astype** performs column-wise conversion to *Categorical*

*DataFrame.astype()* can now perform column-wise conversion to *Categorical* by supplying the string 'category' or a *CategoricalDtype*. Previously, attempting this would raise a *NotImplementedError*. See the *Object creation* section of the documentation for more details and examples. (GH12860, GH18099)

Supplying the string 'category' performs column-wise conversion, with only labels appearing in a given column set as categories:

```
In [64]: df = pd.DataFrame({'A': list('abca'), 'B': list('bccd'))
In [65]: df = df.astype('category')
In [66]: df['A'].dtype
Out[66]: CategoricalDtype(categories=['a', 'b', 'c'], ordered=False)
In [67]: df['B'].dtype
Out[67]: CategoricalDtype(categories=['b', 'c', 'd'], ordered=False)
```

Supplying a *CategoricalDtype* will make the categories in each column consistent with the supplied dtype:

```
In [68]: from pandas.api.types import CategoricalDtype
In [69]: df = pd.DataFrame({'A': list('abca'), 'B': list('bccd'))
In [70]: cdt = CategoricalDtype(categories=list('abcd'), ordered=True)
In [71]: df = df.astype(cdt)
In [72]: df['A'].dtype
Out[72]: CategoricalDtype(categories=['a', 'b', 'c', 'd'], ordered=True)
In [73]: df['B'].dtype
Out[73]: CategoricalDtype(categories=['a', 'b', 'c', 'd'], ordered=True)
```
Other enhancements

- Unary + now permitted for Series and DataFrame as numeric operator (GH16073)
- Better support for `to_excel()` output with the xlsxwriter engine. (GH16149)
- `pandas.tseries.frequencies.to_offset()` now accepts leading ‘+’ signs e.g. ‘+1h’. (GH18171)
- `MultiIndex.unique()` now supports the `level=` argument, to get unique values from a specific index level (GH17896)
- `pandas.io.formats.style.Styler` now has method `hide_index()` to determine whether the index will be rendered in output (GH14194)
- `pandas.io.formats.style.Styler` now has method `hide_columns()` to determine whether columns will be hidden in output (GH14194)
- Improved wording of `ValueError` raised in `to_datetime()` when `unit=` is passed with a non-convertible value (GH14350)
- `Series.fillna()` now accepts a Series or a dict as a value for a categorical dtype (GH17033)
- `pandas.read_clipboard()` updated to use qtpy, falling back to PyQt5 and then PyQt4, adding compatibility with Python3 and multiple python-qt bindings (GH17722)
- Improved wording of `ValueError` raised in `read_csv()` when the `usecols` argument cannot match all columns. (GH17301)
- `DataFrame.corrwith()` now silently drops non-numeric columns when passed a Series. Before, an exception was raised (GH18570).
- `IntervalIndex` now supports time zone aware `Interval` objects (GH18537, GH18538)
- `Series() / DataFrame()` tab completion also returns identifiers in the first level of a `MultiIndex()`. (GH16326)
- `read_excel()` has gained the `nrows` parameter (GH16645)
- `DataFrame.append()` can now in more cases preserve the type of the calling dataframe’s columns (e.g. if both are CategoricalIndex) (GH18359)
- `DataFrame.to_json()` and `Series.to_json()` now accept an `index` argument which allows the user to exclude the index from the JSON output (GH17394)
- `IntervalIndex.to_tuples()` has gained the `na_tuple` parameter to control whether NA is returned as a tuple of NA, or NA itself (GH18756)
- `Categorical.rename_categories`, `CategoricalIndex.rename_categories` and `Series.cat.rename_categories` can now take a callable as their argument (GH18862)
- `Interval` and `IntervalIndex` have gained a `length` attribute (GH18789)
- `Resampler` objects now have a functioning `pipe` method. Previously, calls to `pipe` were diverted to the mean method (GH17905).
- `is_scalar()` now returns `True` for DateOffset objects (GH18943).
- `DataFrame.pivot()` now accepts a list for the `values=` kwarg (GH17160).
- Added `pandas.api.extensions.register_dataframe_accessor()`, `pandas.api.extensions.register_series_accessor()`, and `pandas.api.extensions.register_index_accessor()`, accessor for libraries downstream of pandas to register custom accessors like `.cat` on pandas objects. See Registering Custom Accessors for more (GH14781).
- IntervalIndex.astype now supports conversions between subtypes when passed an IntervalDtype (GH19197)
- IntervalIndex and its associated constructor methods (from_arrays, from_breaks, from_tuples) have gained a dtype parameter (GH19262)
- Added pandas.core.groupby.SeriesGroupBy.is_monotonic_increasing() and pandas.core.groupby.SeriesGroupBy.is_monotonic_decreasing() (GH17015)
- For subclassed DataFrames, DataFrame.apply() will now preserve the Series subclass (if defined) when passing the data to the applied function (GH19822)
- DataFrame.from_dict() now accepts a columns argument that can be used to specify the column names when orient='index' is used (GH18529)
- Added option display.html.use_mathjax so MathJax can be disabled when rendering tables in Jupyter notebooks (GH19856, GH19824)
- DataFrame.replace() now supports the method parameter, which can be used to specify the replacement method when to_replace is a scalar, list or tuple and value is None (GH19632)
- Timestamp.month_name(), DatetimeIndex.month_name(), and Series.dt.month_name() are now available (GH12805)
- Timestamp.day_name() and DatetimeIndex.day_name() are now available to return day names with a specified locale (GH12806)
- DataFrame.to_sql() now performs a multi-value insert if the underlying connection supports itk rather than inserting row by row. SQLAlchemy dialects supporting multi-value inserts include: mysql, postgreSQL, sqlite and any dialect with supports_multivalues_insert. (GH14315, GH8953)
- read_html() now accepts a displayed_only keyword argument to controls whether or not hidden elements are parsed (True by default) (GH20027)
- read_html() now reads all <tbody> elements in a <table>, not just the first. (GH20690)
- quantile() and quantile() now accept the interpolation keyword, linear by default (GH20497)
- zip compression is supported via compression=zip in DataFrame.to_pickle(), Series.to_pickle(), DataFrame.to_csv(), Series.to_csv(), DataFrame.to_json(), Series.to_json(). (GH17778)
- WeekOfMonth constructor now supports n=0 (GH20517).
- DataFrame and Series now support matrix multiplication (@) operator (GH10259) for Python>=3.5
- Updated DataFrame.to_gbq() and pandas.read_gbq() signature and documentation to reflect changes from the pandas-gbq library version 0.4.0. Adds intersphinx mapping to pandas-gbq library. (GH20564)
- Added new writer for exporting Stata dta files in version 117, StataWriter117. This format supports exporting strings with lengths up to 2,000,000 characters (GH16450)
- to_hdf() and read_hdf() now accept an errors keyword argument to control encoding error handling (GH20835)
- cut() has gained the duplicates='raise' | 'drop' option to control whether to raise on duplicated edges (GH20947)
- date_range(), timedelta_range(), and interval_range() now return a linearly spaced index if start, stop, and periods are specified, but freq is not. (GH20808, GH20983, GH20976)
Backwards incompatible API changes

Dependencies have increased minimum versions

We have updated our minimum supported versions of dependencies (GH15184). If installed, we now require:

<table>
<thead>
<tr>
<th>Package</th>
<th>Minimum Version</th>
<th>Required</th>
<th>Issue</th>
</tr>
</thead>
<tbody>
<tr>
<td>python-dateutil</td>
<td>2.5.0</td>
<td>X</td>

<td>GH20698</td>
</tr>
</tbody>
</table>

Instantiation from dicts preserves dict insertion order for Python 3.6+

Until Python 3.6, dicts in Python had no formally defined ordering. For Python version 3.6 and later, dicts are ordered by insertion order, see PEP 468. pandas will use the dict’s insertion order, when creating a Series or DataFrame from a dict and you’re using Python version 3.6 or higher. (GH19884)

Previous behavior (and current behavior if on Python < 3.6):

```python
In [16]: pd.Series({'Income': 2000,
....:   'Expenses': -1500,
....:   'Taxes': -200,
....:   'Net result': 300})
Out[16]:
Expenses    -1500
Income       2000
Net result   300
Taxes        -200
dtype: int64
```

Note the Series above is ordered alphabetically by the index values.

New behavior (for Python >= 3.6):

```python
In [74]: pd.Series({'Income': 2000,
....:   'Expenses': -1500,
....:   'Taxes': -200,
....:   'Net result': 300})
Out[74]:
Income       2000
Expenses     -1500
Taxes        -200
Net result   300
Length: 4, dtype: int64
```

Notice that the Series is now ordered by insertion order. This new behavior is used for all relevant pandas types (Series, DataFrame, SparseSeries and SparseDataFrame).

If you wish to retain the old behavior while using Python >= 3.6, you can use .sort_index():

```python
In [75]: pd.Series({'Income': 2000,
....:   'Expenses': -1500,
....:   'Taxes': -200,
```

(continues on next page)
Deprecate Panel

Panel was deprecated in the 0.20.x release, showing as a DeprecationWarning. Using Panel will now show a FutureWarning. The recommended way to represent 3-D data are with a MultiIndex on a DataFrame via the `to_frame()` or with the xarray package. pandas provides a `to_xarray()` method to automate this conversion (GH13563, GH18324).

In [75]: import pandas._testing as tm
In [76]: p = tm.makePanel()
In [77]: p
Out[77]:
<class 'pandas.core.panel.Panel'>
Dimensions: 3 (items) x 3 (major_axis) x 4 (minor_axis)
Items axis: ItemA to ItemC
Major_axis axis: 2000-01-03 00:00:00 to 2000-01-05 00:00:00
Minor_axis axis: A to D

Convert to a MultiIndex DataFrame

In [78]: p.to_frame()
Out[78]:
   ItemA     ItemB     ItemC
major minor
2000-01-03  A  0.469112  0.721555  0.404705
          B -1.135632  0.271860 -1.039268
          C  0.119209  0.276232 -1.344312
          D -2.104569  0.113648 -0.109050
2000-01-04  A -0.282863 -0.706771  0.577046
          B  1.212112 -0.424972 -0.370647
          C -1.044236 -1.087401  0.844885
          D -0.494929 -1.478427  1.643563
2000-01-05  A -1.509059 -1.039575 -1.715002
          B -0.173215  0.567020 -1.157892
          C -0.861849 -0.673690  1.075770
          D  1.071804  0.524988 -1.469388
[12 rows x 3 columns]

Convert to an xarray DataArray

In [79]: p.to_xarray()
Out[79]:
<xarray.DataArray (items: 3, major_axis: 3, minor_axis: 4)>
(continues on next page)
array([[ 0.469112, -1.135632, 0.119209, -2.104569],

       [-1.044236, -1.044236, -0.861849,  1.071804]],
      [[ 0.404705, -1.039268, -1.344312, -0.109050],
       [-1.509059, -0.173215, -0.861849,  1.071804]],
      [[ 0.404705, -1.039268, -1.344312, -0.109050],
       [-1.509059, -0.173215, -0.861849,  1.071804]])

Coordinates:
* items (items) object 'ItemA' 'ItemB' 'ItemC'
* major_axis (major_axis) datetime64[ns] 2000-01-03 2000-01-04 2000-01-05
* minor_axis (minor_axis) object 'A' 'B' 'C' 'D'

**pandas.core.common removals**

The following error & warning messages are removed from `pandas.core.common` (GH13634, GH19769):

- PerformanceWarning
- UnsupportedFunctionCall
- UnsortedIndexError
- AbstractMethodError

These are available from import from `pandas.errors` (since 0.19.0).

**Changes to make output of `DataFrame.apply` consistent**

`DataFrame.apply()` was inconsistent when applying an arbitrary user-defined-function that returned a list-like with `axis=1`. Several bugs and inconsistencies are resolved. If the applied function returns a Series, then pandas will return a DataFrame; otherwise a Series will be returned, this includes the case where a list-like (e.g. tuple or list is returned) (GH16353, GH17437, GH17970, GH17348, GH17892, GH18573, GH17602, GH18775, GH18901, GH18919).

```python
In [76]: df = pd.DataFrame(np.tile(np.arange(3), 6).reshape(6, -1) + 1,
                   ....: columns=['A', 'B', 'C'])

In [77]: df
Out[77]:
       A  B  C
0    1  2  3
1    2  3  4
2    3  4  5
3    4  5  6
4    5  6  7
5    6  7  8

[6 rows x 3 columns]
```

Previous behavior: if the returned shape happened to match the length of original columns, this would return a `DataFrame`. If the return shape did not match, a `Series` with lists was returned.
New behavior: When the applied function returns a list-like, this will now always return a Series.

To have expanded columns, you can use `result_type='expand'`

To broadcast the result across the original columns (the old behaviour for list-likes of the correct length), you can use `result_type='broadcast'`. The shape must match the original columns.
Returning a Series allows one to control the exact return structure and column names:

```python
In [82]: df.apply(lambda x: pd.Series([1, 2, 3], index=['D', 'E', 'F']), axis=1)
Out[82]:
   D  E  F
0  1  2  3
1  1  2  3
2  1  2  3
3  1  2  3
4  1  2  3
5  1  2  3
[6 rows x 3 columns]
```

**Concatenation will no longer sort**

In a future version of pandas, `pandas.concat()` will no longer sort the non-concatenation axis when it is not already aligned. The current behavior is the same as the previous (sorting), but now a warning is issued when `sort` is not specified and the non-concatenation axis is not aligned (GH4588).

```python
In [83]: df1 = pd.DataFrame({'a': [1, 2], 'b': [1, 2]}, columns=['b', 'a'])
In [84]: df2 = pd.DataFrame({'a': [4, 5]})
In [85]: pd.concat([df1, df2])
Out[85]:
   b  a
0  1  1.0
1  2  2.0
0  NaN 4
1  NaN 5
[4 rows x 2 columns]
```

To keep the previous behavior (sorting) and silence the warning, pass `sort=True`

```python
In [86]: pd.concat([df1, df2], sort=True)
Out[86]:
   a  b
0  1  1.0
1  2  2.0
0  4  NaN
1  5  NaN
```

(continues on next page)
To accept the future behavior (no sorting), pass sort=False
Note that this change also applies to DataFrame.append(), which has also received a sort keyword for controlling this behavior.

Build changes

- Building pandas for development now requires cython >= 0.24 (GH18613)
- Building from source now explicitly requires setuptools in setup.py (GH18113)
- Updated conda recipe to be in compliance with conda-build 3.0+ (GH18002)

Index division by zero fills correctly

Division operations on Index and subclasses will now fill division of positive numbers by zero with np.inf, division of negative numbers by zero with -np.inf and 0 / 0 with np.nan. This matches existing Series behavior. (GH19322, GH19347)

Previous behavior:

```
In [6]: index = pd.Int64Index([-1, 0, 1])
In [7]: index / 0
Out[7]: Int64Index([0, 0, 0], dtype='int64')

# Previous behavior yielded different results depending on the type of zero in the divisor
In [8]: index / 0.0
Out[8]: Float64Index([-inf, nan, inf], dtype='float64')

In [9]: index = pd.UInt64Index([0, 1])
In [10]: index / np.array([0, 0], dtype=np.uint64)
Out[10]: UInt64Index([0, 0], dtype='uint64')

In [11]: pd.RangeIndex(1, 5) / 0
ZeroDivisionError: integer division or modulo by zero
```

Current behavior:

```
In [87]: index = pd.Int64Index([-1, 0, 1])

# division by zero gives -infinity where negative,
# +infinity where positive, and NaN for 0 / 0
In [88]: index / 0
Out[88]: Float64Index([-inf, nan, inf], dtype='float64')

# The result of division by zero should not depend on
# whether the zero is int or float
In [89]: index / 0.0
Out[89]: Float64Index([-inf, nan, inf], dtype='float64')
```
In [90]: index = pd.UInt64Index([0, 1])
In [91]: index / np.array([0, 0], dtype=np.uint64)
Out[91]: Float64Index([nan, inf], dtype='float64')
In [92]: pd.RangeIndex(1, 5) / 0
Out[92]: Float64Index([inf, inf, inf, inf], dtype='float64')

Extraction of matching patterns from strings

By default, extracting matching patterns from strings with `str.extract()` used to return a `Series` if a single group was being extracted (a `DataFrame` if more than one group was extracted). As of pandas 0.23.0 `str.extract()` always returns a `DataFrame`, unless `expand` is set to `False`. Finally, `None` was an accepted value for the `expand` parameter (which was equivalent to `False`), but now raises a `ValueError`. (GH11386)

Previous behavior:

In [1]: s = pd.Series(['number 10', '12 eggs'])
In [2]: extracted = s.str.extract(r'.*(\d\d).*')
In [3]: extracted
Out [3]:
   0  10
   1  12
 dtype: object
In [4]: type(extracted)
Out [4]:
pandas.core.series.Series

New behavior:

In [93]: s = pd.Series(['number 10', '12 eggs'])
In [94]: extracted = s.str.extract(r'.*(\d\d).*')
In [95]: extracted
Out[95]:
   0  10
   1  12
[2 rows x 1 columns]
In [96]: type(extracted)
Out[96]: pandas.core.frame.DataFrame

To restore previous behavior, simply set `expand` to `False`:

In [97]: s = pd.Series(['number 10', '12 eggs'])
In [98]: extracted = s.str.extract(r'.*(\d\d).*', expand=False)
**Default value for the ordered parameter of CategoricalDtype**

The default value of the ordered parameter for CategoricalDtype has changed from False to None to allow updating of categories without impacting ordered. Behavior should remain consistent for downstream objects, such as Categorical (GH18790).

In previous versions, the default value for the ordered parameter was False. This could potentially lead to the ordered parameter unintentionally being changed from True to False when users attempt to update categories if ordered is not explicitly specified, as it would silently default to False. The new behavior for ordered=None is to retain the existing value of ordered.

New behavior:

```python
In [2]: from pandas.api.types import CategoricalDtype
In [3]: cat = pd.Categorical(list('abcaba'), ordered=True, categories=list('cba'))
In [4]: cat
Out[4]:
[a, b, c, a, b, a]
Categories (3, object): [c < b < a]
In [5]: cdt = CategoricalDtype(categories=list('cbad'))
In [6]: cat.astype(cdt)
Out[6]:
[a, b, c, a, b, a]
Categories (4, object): [c < b < a < d]
```

Notice in the example above that the converted Categorical has retained ordered=True. Had the default value for ordered remained as False, the converted Categorical would have become unordered, despite ordered=False never being explicitly specified. To change the value of ordered, explicitly pass it to the new dtype, e.g. CategoricalDtype(categories=list('cbad'), ordered=False).

Note that the unintentional conversion of ordered discussed above did not arise in previous versions due to separate bugs that prevented astype from doing any type of category to category conversion (GH10696, GH18593). These bugs have been fixed in this release, and motivated changing the default value of ordered.
Better pretty-printing of DataFrames in a terminal

Previously, the default value for the maximum number of columns was `pd.options.display.max_columns=20`. This meant that relatively wide data frames would not fit within the terminal width, and pandas would introduce line breaks to display these 20 columns. This resulted in an output that was relatively difficult to read:

![Pythom Console Output](image)

If Python runs in a terminal, the maximum number of columns is now determined automatically so that the printed data frame fits within the current terminal width (`pd.options.display.max_columns=0`) (GH17023). If Python runs as a Jupyter kernel (such as the Jupyter QtConsole or a Jupyter notebook, as well as in many IDEs), this value cannot be inferred automatically and is thus set to 20 as in previous versions. In a terminal, this results in a much nicer output:
Note that if you don’t like the new default, you can always set this option yourself. To revert to the old setting, you can run this line:

```python
pd.options.display.max_columns = 20
```

**Datetimelike API changes**

- The default `Timedelta` constructor now accepts an ISO 8601 Duration string as an argument (GH19040)
- Subtracting `NaT` from a `Series` with `dtype='datetime64[ns]'` returns a `Series` with `dtype='timedelta64[ns]'` instead of `dtype='datetime64[ns]'` (GH18808)
- Addition or subtraction of `NaT` from `TimedeltaIndex` will return `TimedeltaIndex` instead of `DatetimeIndex` (GH19124)
- `TimedeltaIndex.shift()` and `TimedeltaIndex.shift()` will now raise `NullFrequencyError` (which subclasses `ValueError`, which was raised in older versions) when the index object frequency is `None` (GH19147)
- Addition and subtraction of `NaN` from a `Series` with `dtype='timedelta64[ns]'` will raise a `TypeError` instead of treating the `NaN` as `NaT` (GH19274)
- `NaT` division with `datetime.timedelta` will now return `NaN` instead of raising (GH17876)
• Operations between a `Series` with dtype `datetime64[ns]` and a `PeriodIndex` will correctly raise `TypeError` (GH18850)

• Subtraction of `Series` with timezone-aware dtype='datetime64[ns]' with mismatched timezones will raise `TypeError` instead of `ValueError` (GH18817)

• `Timestamp` will no longer silently ignore unused or invalid `tz` or `tzinfo` keyword arguments (GH17690)

• `Timestamp` will no longer silently ignore invalid `freq` arguments (GH5168)

• `CacheableOffset` and `WeekDay` are no longer available in the `pandas.tseries.offsets` module (GH17830)

• `pandas.tseries.frequencies.get_freq_group()` and `pandas.tseries.frequencies.DAYS` are removed from the public API (GH18034)

• `Series.truncate()` and `DataFrame.truncate()` will raise a `ValueError` if the index is not sorted instead of an unhelpful `KeyError` (GH17935)

• `Series.first` and `DataFrame.first` will now raise a `TypeError` rather than `NotImplementedError` when index is not a `DatetimeIndex` (GH20725).

• `Series.last` and `DataFrame.last` will now raise a `TypeError` rather than `NotImplementedError` when index is not a `DatetimeIndex` (GH20725).

• Restricted `DateOffset` keyword arguments. Previously, `DateOffset` subclasses allowed arbitrary keyword arguments which could lead to unexpected behavior. Now, only valid arguments will be accepted. (GH17176, GH18226).

• `pandas.merge()` provides a more informative error message when trying to merge on timezone-aware and timezone-naive columns (GH15800)

• For `DatetimeIndex` and `TimedeltaIndex` with `freq=None`, addition or subtraction of integer-dtyped array or `Index` will raise `NullFrequencyError` instead of `TypeError` (GH19895)

• `Timestamp` constructor now accepts a nanosecond keyword or positional argument (GH18898)

• `DatetimeIndex` will now raise an `AttributeError` when the `tz` attribute is set after instantiation (GH3746)

• `DatetimeIndex` with a `pytz` timezone will now return a consistent `pytz` timezone (GH18595)

Other API changes

• `Series.astype()` and `Index.astype()` with an incompatible dtype will now raise a `TypeError` rather than a `ValueError` (GH18231)

• Series construction with an object dtyped tz-aware datetime and `dtype=object` specified, will now return an `object` dtyped `Series`, previously this would infer the datetime dtype (GH18231)

• A `Series` of `dtype=category` constructed from an empty `dict` will now have categories of `dtype=object` rather than `dtype=float64`, consistently with the case in which an empty list is passed (GH18515)

• All-NaN levels in a `MultiIndex` are now assigned `float` rather than `object` dtype, promoting consistency with `Index` (GH17929).

• Levels names of a `MultiIndex` (when not None) are now required to be unique: trying to create a `MultiIndex` with repeated names will raise a `ValueError` (GH18872)

• Both construction and renaming of `Index/MultiIndex` with non-hashable `name/names` will now raise `TypeError` (GH20527)
Index.map() can now accept Series and dictionary input objects (GH12756, GH18482, GH18509).

DataFrame.unstack() will now default to filling with np.nan for object columns. (GH12815)

IntervalIndex constructor will raise if the closed parameter conflicts with how the input data is inferred to be closed (GH18421)

Inserting missing values into indexes will work for all types of indexes and automatically insert the correct type of missing value (NaN, NaT, etc.) regardless of the type passed in (GH18295)

When created with duplicate labels, MultiIndex now raises a ValueError. (GH17464)

Series.fillna() now raises a TypeError instead of a ValueError when passed a list, tuple or DataFrame as a value (GH18293)

pandas.DataFrame.merge() no longer casts a float column to object when merging on int and float columns (GH16572)

pandas.merge() now raises a ValueError when trying to merge on incompatible data types (GH9780)

The default NA value for UInt64Index has changed from 0 to NaN, which impacts methods that mask with NA, such as UInt64Index.where() (GH18398)

Refactored setup.py to use find_packages instead of explicitly listing out all subpackages (GH18535)

Rearranged the order of keyword arguments in read_excel() to align with read_csv() (GH16672)

wide_to_long() previously kept numeric-like suffixes as object dtype. Now they are cast to numeric if possible (GH17627)

In read_excel(), the comment argument is now exposed as a named parameter (GH18735)

Rearranged the order of keyword arguments in read_excel() to align with read_csv() (GH16672)

The options html.border and mode.use_inf_as_null were deprecated in prior versions, these will now show FutureWarning rather than a DeprecationWarning (GH19003)

IntervalIndex and IntervalDtype no longer support categorical, object, and string subtypes (GH19016)

IntervalDtype now returns True when compared against 'interval' regardless of subtype, and IntervalDtype.name now returns 'interval' regardless of subtype (GH18980)

KeyError now raises instead of ValueError in drop(), drop(), drop(), drop() when dropping a non-existent element in an axis with duplicates (GH19186)

Series.to_csv() now accepts a compression argument that works in the same way as the compression argument in DataFrame.to_csv() (GH18958)

Set operations (union, difference...) on IntervalIndex with incompatible index types will now raise a TypeError rather than a ValueError (GH19329)

DateOffset objects render more simply, e.g. <DateOffset: days=1> instead of <DateOffset: kwds={'days': 1}> (GH19403)

Categorical.fillna now validates its value and method keyword arguments. It now raises when both or none are specified, matching the behavior of Series.fillna() (GH19682)

pd.to_datetime('today') now returns a datetime, consistent with pd.Timestamp('today'); previously pd.to_datetime('today') returned a .normalized() datetime (GH19935)

Series.str.replace() now takes an optional regex keyword which, when set to False, uses literal string replacement rather than regex replacement (GH16808)

DatetimeIndex.strftime() and PeriodIndex.strftime() now return an Index instead of a numpy array to be consistent with similar accessors (GH20127)
• Constructing a Series from a list of length 1 no longer broadcasts this list when a longer index is specified (GH19714, GH20391).

*DataFrame.to_dict()* with orient='index' no longer casts int columns to float for a DataFrame with only int and float columns (GH18580)

• A user-defined-function that is passed to *Series.rolling().aggregate()* or its expanding cousins, will now always be passed a Series, rather than a np.array; *apply()* only has the *raw* keyword, see [here](https://pandas.pydata.org/pandas-docs/stable/reference/api/pandas.Series.apply.html). This is consistent with the signatures of *aggregate()* across pandas (GH20584)

• Rolling and Expanding types raise *NotImplementedError* upon iteration (GH1704).

### Deprecations

- *Series.from_array* and *SparseSeries.from_array* are deprecated. Use the normal constructor *Series(....)* and *SparseSeries(....)* instead (GH18213).

- *DataFrame.as_matrix* is deprecated. Use *DataFrame.values* instead (GH18458).

- *Series.asobject, DatetimeIndex.asobject, PeriodIndex.asobject* and *TimeDeltaIndex.asobject* have been deprecated. Use *astype(object)* instead (GH18572).

- Grouping by a tuple of keys now emits a *FutureWarning* and is deprecated. In the future, a tuple passed to 'by' will always refer to a single key that is the actual tuple, instead of treating the tuple as multiple keys. To retain the previous behavior, use a list instead of a tuple (GH18314).

- *Series.valid* is deprecated. Use *Series.dropna()* instead (GH18800).

- *read_excel()* has deprecated the skip_footer parameter. Use *skipfooter* instead (GH18836).

- *ExcelFile.parse()* has deprecated sheetname in favor of sheet_name for consistency with *read_excel()* (GH20920).

- The *is_copy* attribute is deprecated and will be removed in a future version (GH18801).

- *IntervalIndex.from_intervals* is deprecated in favor of the *IntervalIndex* constructor (GH19263).

- *DataFrame.from_items* is deprecated. Use *DataFrame.from_dict()* instead, or *DataFrame.from_dict(OrderedDict())* if you wish to preserve the key order (GH17320, GH17312).

- Indexing a *MultiIndex* or a *FloatIndex* with a list containing some missing keys will now show a *FutureWarning*, which is consistent with other types of indexes (GH17758).

- The broadcast parameter of *apply()* is deprecated in favor of result_type='broadcast' (GH18577).

- The reduce parameter of *apply()* is deprecated in favor of result_type='reduce' (GH18577).

- The order parameter of *factorize()* is deprecated and will be removed in a future release (GH19727).

- *Timestamp.weekday_name, DatetimeIndex.weekday_name, and Series.dt.weekday_name* are deprecated in favor of *Timestamp.day_name(), DatetimeIndex.day_name(), and Series.dt.day_name()* (GH12806).

- *pandas.tseries.plotting.tsplot* is deprecated. Use *Series.plot()* instead (GH18627).

- *Index.summary()* is deprecated and will be removed in a future version (GH18217).

- *NDFrame.get_ftype_counts()* is deprecated and will be removed in a future version (GH18243).
pandas: powerful Python data analysis toolkit, Release 1.3.1

• The convert_datetime64 parameter in DataFrame.to_records() has been deprecated and will be removed in a future version. The NumPy bug motivating this parameter has been resolved. The default value for this parameter has also changed from True to None (GH18160).

• Series.rolling().apply(), DataFrame.rolling().apply(), Series.expanding().apply(), and DataFrame.expanding().apply() have deprecated passing an np.array by default. One will need to pass the new raw parameter to be explicit about what is passed (GH20584).

• The data, base, strides, flags and itemsize properties of the Series and Index classes have been deprecated and will be removed in a future version (GH20419).

• DatetimeIndex.offset is deprecated. Use DatetimeIndex.freq instead (GH20716).

• Floor division between an integer ndarray and a Timedelta is deprecated. Divide by Timedelta.value instead (GH19761).

• Setting PeriodIndex.freq (which was not guaranteed to work correctly) is deprecated. Use PeriodIndex.asfreq() instead (GH20678).

• Index.get_duplicates() is deprecated and will be removed in a future version (GH20239).

• The previous default behavior of negative indices in Categorical.take is deprecated. In a future version it will change from meaning missing values to meaning positional indices from the right. The future behavior is consistent with Series.take() (GH20664).

• Passing multiple axes to the axis parameter in DataFrame.dropna() has been deprecated and will be removed in a future version (GH20987).

Removal of prior version deprecations/changes

• Warnings against the obsolete usage Categorical(codes, categories), which were emitted for instance when the first two arguments to Categorical() had different dtypes, and recommended the use of Categorical.from_codes, have now been removed (GH8074).

• The levels and labels attributes of a MultiIndex can no longer be set directly (GH4039).

• pd.tseries.util.pivot_annual has been removed (deprecated since v0.19). Use pivot_table instead (GH18370).

• pd.tseries.util.isleapyear has been removed (deprecated since v0.19). Use .is_leap_year property in Datetime-likes instead (GH18370).

• pd.ordered_merge has been removed (deprecated since v0.19). Use pd.merge_ordered instead (GH18459).

• The SparseList class has been removed (GH14007).

• The pandas.io.wb and pandas.io.data stub modules have been removed (GH13735).

• Categorical.from_array has been removed (GH13854).

• The freq and how parameters have been removed from the rolling/expanding/ewm methods of DataFrame and Series (deprecated since v0.18). Instead, resample before calling the methods. (GH18601 & GH18668).

• DatetimeIndex.to_datetime, Timestamp.to_datetime, PeriodIndex.to_datetime, and Index.to_datetime have been removed (GH8254, GH14096, GH14113).

• read_csv() has dropped the skip_footer parameter (GH13386).

• read_csv() has dropped the as_recarray parameter (GH13373).

• read_csv() has dropped the buffer_lines parameter (GH13360).
• `read_csv()` has dropped the `compact_ints` and `use_unsigned` parameters (GH13323)

• The `Timestamp` class has dropped the `offset` attribute in favor of `freq` (GH13593)

• The `Series`, `Categorical`, and `Index` classes have dropped the `reshape` method (GH13012)

• pandas.tseries.frequencies.get_standard_freq has been removed in favor of pandas.tseries.frequencies.to_offset(freq).rule_code (GH13874)

• The `freqstr` keyword has been removed from pandas.tseries.frequencies.to_offset in favor of `freq` (GH13874)

• The `Panel4D` and `PanelND` classes have been removed (GH13776)

• The `Panel` class has dropped the `to_long` and `toLong` methods (GH19077)

• The `options` `display.line_with` and `display.height` are removed in favor of `display.width` and `display.max_rows` respectively (GH4391, GH19107)

• The `labels` attribute of the `Categorical` class has been removed in favor of `Categorical.codes` (GH7768)

• The `flavor` parameter have been removed from func:`to_sql` method (GH13611)

• The modules `pandas.tools.hashing` and `pandas.util.hashing` have been removed (GH16223)

• The top-level functions `pd.rolling_*`, `pd.expanding_*` and `pd.ewm*` have been removed (Deprecated since v0.18). Instead, use the DataFrame/Series methods `rolling`, `expanding` and `ewm` (GH18723)

• Imports from pandas.core.common for functions such as is_datetime64_dtype are now removed. These are located in pandas.api.types. (GH13634, GH19769)

• The `infer_dst` keyword in `Series.tz_localize()`, `DatetimeIndex.tz_localize()` and `DatetimeIndex` have been removed. `infer_dst=True` is equivalent to `ambiguous='infer'`, and `infer_dst=False` to `ambiguous='raise'` (GH7963).

• When `.resample()` was changed from an eager to a lazy operation, like `.groupby()` in v0.18.0, we put in place compatibility (with a FutureWarning), so operations would continue to work. This is now fully removed, so a `Resampler` will no longer forward compat operations (GH20554)

• Remove long deprecated `axis=None` parameter from `.replace()` (GH20271)

Performance improvements

• Indexers on `Series` or `DataFrame` no longer create a reference cycle (GH17956)

• Added a keyword argument, `cache`, to `to_datetime()` that improved the performance of converting duplicate datetime arguments (GH11665)

• DateOffset arithmetic performance is improved (GH18218)

• Converting a `Series` of `Timedelta` objects to days, seconds, etc... sped up through vectorization of underlying methods (GH18092)

• Improved performance of `.map()` with a `Series/dict` input (GH15081)

• The overridden `Timedelta` properties of days, seconds and microseconds have been removed, leveraging their built-in Python versions instead (GH18242)

• Series construction will reduce the number of copies made of the input data in certain cases (GH17449)

• Improved performance of `Series.dt.date()` and `DatetimeIndex.date()` (GH18058)

• Improved performance of `Series.dt.time()` and `DatetimeIndex.time()` (GH18461)

5.7. Version 0.23
• Improved performance of `IntervalIndex.symmetric_difference()` (GH18475)
• Improved performance of `DatetimeIndex` and `Series` arithmetic operations with Business-Month and Business-Quarter frequencies (GH18489)
• `Series() / DataFrame()` tab completion limits to 100 values, for better performance. (GH18587)
• Improved performance of `DataFrame.median()` with `axis=1` when bottleneck is not installed (GH16468)
• Improved performance of `MultiIndex.get_loc()` for large indexes, at the cost of a reduction in performance for small ones (GH18519)
• Improved performance of `MultiIndex.remove_unused_levels()` when there are no unused levels, at the cost of a reduction in performance when there are (GH19289)
• Improved performance of `Index.get_loc()` for non-unique indexes (GH19478)
• Improved performance of pairwise `.rolling()` and `.expanding()` with `.cov()` and `.corr()` operations (GH17917)
• Improved performance of `pandas.core.groupby.GroupBy.rank()` (GH15779)
• Improved performance of variable `.rolling()` on `.min()` and `.max()` (GH19521)
• Improved performance of `pandas.core.groupby.GroupBy.ffill()` and `pandas.core.groupby.GroupBy.bfill()` (GH11296)
• Improved performance of `pandas.core.groupby.GroupBy.any()` and `pandas.core.groupby.GroupBy.all()` (GH15435)
• Improved performance of `pandas.core.groupby.GroupBy.pct_change()` (GH19165)
• Improved performance of `Series.isin()` in the case of categorical dtypes (GH20003)
• Improved performance of `getattr(Series, attr)` when the Series has certain index types. This manifested in slow printing of large Series with a `DatetimeIndex` (GH19764)
• Fixed a performance regression for `GroupBy.nth()` and `GroupBy.last()` with some object columns (GH19283)
• Improved performance of `pandas.core.arrays.Categorical.from_codes()` (GH18501)

Documentation changes

Thanks to all of the contributors who participated in the pandas Documentation Sprint, which took place on March 10th. We had about 500 participants from over 30 locations across the world. You should notice that many of the API docstrings have greatly improved.

There were too many simultaneous contributions to include a release note for each improvement, but this GitHub search should give you an idea of how many docstrings were improved.

Special thanks to Marc Garcia for organizing the sprint. For more information, read the NumFOCUS blogpost recapping the sprint.

• Changed spelling of “numpy” to “NumPy”, and “python” to “Python”. (GH19017)
• Consistency when introducing code samples, using either colon or period. Rewrote some sentences for greater clarity, added more dynamic references to functions, methods and classes. (GH18941, GH18948, GH18973, GH19017)
• Added a reference to `DataFrame.assign()` in the concatenate section of the merging documentation (GH18665)
Bug fixes

Categorical

**Warning:** A class of bugs were introduced in pandas 0.21 with `CategoricalDtype` that affects the correctness of operations like `merge`, `concat`, and indexing when comparing multiple unordered `Categorical` arrays that have the same categories, but in a different order. We highly recommend upgrading or manually aligning your categories before doing these operations.

- Bug in `Categorical.equals` returning the wrong result when comparing two unordered `Categorical` arrays with the same categories, but in a different order (GH16603)
- Bug in `pandas.api.types.union_categoricals()` returning the wrong result when for unordered categoricals with the categories in a different order. This affected `pandas.concat()` with Categorical data (GH19096).
- Bug in `pandas.merge()` returning the wrong result when joining on an unordered `Categorical` that had the same categories but in a different order (GH19551)
- Bug in `CategoricalIndex.get_indexer()` returning the wrong result when `target` was an unordered `Categorical` that had the same categories as `self` but in a different order (GH19551)
- Bug in `Index.astype()` with a categorical dtype where the resultant index is not converted to a `CategoricalIndex` for all types of index (GH18630)
- Bug in `Series.astype()` and `Categorical.astype()` where an existing categorical data does not get updated (GH10696, GH18593)
- Bug in `Series.str.split()` with `expand=True` incorrectly raising an `IndexError` on empty strings (GH20002).
- Bug in `Index` constructor with `dtype=CategoricalDtype(...)` where categories and ordered are not maintained (GH19032)
- Bug in `Series` constructor with scalar and `dtype=CategoricalDtype(...)` where categories and ordered are not maintained (GH19565)
- Bug in `Categorical.__iter__` not converting to Python types (GH19909)
- Bug in `pandas.factorize()` returning the unique codes for the `uniques`. This now returns a `Categorical` with the same `dtype` as the input (GH19721)
- Bug in `pandas.factorize()` including an item for missing values in the `uniques` return value (GH19721)
- Bug in `Series.take()` with categorical data interpreting `-1` in `indices` as missing value markers, rather than the last element of the Series (GH20664)
**Datetimelike**

- Bug in `Series.__sub__()` subtracting a non-nanosecond `np.datetime64` object from a `Series` gave incorrect results (GH7996)

- Bug in `DatetimeIndex, TimedeltaIndex` addition and subtraction of zero-dimensional integer arrays gave incorrect results (GH19012)

- Bug in `DatetimeIndex` and `TimedeltaIndex` where adding or subtracting an array-like of `DateOffset` objects either raised (`np.array, pd.Index`) or broadcast incorrectly (`pd.Series`) (GH18849)

- Bug in `Series.__add__()` adding `Series` with `dtype timedelta64[ns]` to a timezone-aware `DatetimeIndex` incorrectly dropped timezone information (GH13905)

- Adding a `Period` object to a `datetime` or `Timestamp` object will now correctly raise a `TypeError` (GH17983)

- Bug in `Timestamp` where comparison with an array of `Timestamp` objects would result in a `RecursionError` (GH15183)

- Bug in `Series` floor-division where operating on a scalar `timedelta` raises an exception (GH18846)

- Bug in `DatetimeIndex` where the repr was not showing high-precision time values at the end of a day (e.g., 23:59:59.999999999) (GH19030)

- Bug in `astype()` to non-`ns` `timedelta` units would hold the incorrect `dtype` (GH19176, GH19223, GH12425)

- Bug in subtracting `Series` from `NaT` incorrectly returning `NaT` (GH19158)

- Bug in `Series.truncate()` which raises `TypeError` with a monotonic `PeriodIndex` (GH17717)

- Bug in `pct_change()` using periods and `freq` returned different length outputs (GH7292)

- Bug in comparison of `DatetimeIndex` against `None` or `datetime.date` objects raising `TypeError` for `==` and `!=` comparisons instead of all-False and all-True, respectively (GH19301)

- Bug in `Timestamp` and `to_datetime()` where a string representing a barely out-of-bounds timestamp would be incorrectly rounded down instead of raising `OutOfBoundsDatetime` (GH19382)

- Bug in `Timestamp.floor()` `DatetimeIndex.floor()` where time stamps far in the future and past were not rounded correctly (GH19206)

- Bug in `to_datetime()` where passing an out-of-bounds datetime with `errors='coerce'` and `utc=True` would raise `OutOfBoundsDatettime` instead of parsing to `NaT` (GH19612)

- Bug in `DatetimeIndex` and `TimedeltaIndex` addition and subtraction where name of the returned object was not always set consistently. (GH19744)

- Bug in `DatetimeIndex` and `TimedeltaIndex` addition and subtraction where operations with `numpy` arrays raised `TypeError` (GH19847)

- Bug in `DatetimeIndex` and `TimedeltaIndex` where setting the `freq` attribute was not fully supported (GH20678)
Timedelta

- Bug in `Timedelta.__mul__()` where multiplying by `NaT` returned `NaT` instead of raising a `TypeError` (GH19189)
- Bug in `Series` with dtype='timedelta64[ns]' where addition or subtraction of `TimedeltaIndex` had results cast to dtype='int64' (GH17250)
- Bug in `Series` with dtype='timedelta64[ns]' where addition or subtraction of `TimedeltaIndex` could return a `Series` with an incorrect name (GH19043)
- Bug in `Timedelta.__floordiv__()` and `Timedelta.__rfloordiv__()` dividing by many incompatible numpy objects was incorrectly allowed (GH18846)
- Bug where dividing a scalar timedelta-like object with `TimedeltaIndex` performed the reciprocal operation (GH19125)
- Bug in `TimedeltaIndex` where division by a `Series` would return a `TimedeltaIndex` instead of a `Series` (GH19042)
- Bug in `Timedelta.__add__()`, `Timedelta.__sub__()` where adding or subtracting a np. timedelta64 object would return another np.timedelta64 instead of a `Timedelta` (GH19738)
- Bug in `Timedelta.__floordiv__()`, `Timedelta.__rfloordiv__()` where operating with a `Tick` object would raise a `TypeError` instead of returning a numeric value (GH19738)
- Bug in `Period.asfreq()` where periods near `datetime(1, 1, 1)` could be converted incorrectly (GH19643, GH19834)
- Bug in `Timedelta.total_seconds()` causing precision errors, for example `Timedelta('30S').total_seconds()==30.000000000000004` (GH19458)
- Bug in `Timedelta.__rmod__()` where operating with a numpy.timedelta64 returned a timedelta64 object instead of a `Timedelta` (GH19820)
- Multiplication of `TimedeltaIndex` by `TimedeltaIndex` will now raise `TypeError` instead of raising `ValueError` in cases of length mismatch (GH19333)
- Bug in indexing a `TimedeltaIndex` with a np.timedelta64 object which was raising a `TypeError` (GH20393)

Timezones

- Bug in creating a `Series` from an array that contains both tz-naive and tz-aware values will result in a `Series` whose dtype is tz-aware instead of object (GH16406)
- Bug in comparison of timezone-aware `DatetimeIndex` against `NaT` incorrectly raising `TypeError` (GH19276)
- Bug in `DatetimeIndex.astype()` when converting between timezone aware dtypes, and converting from timezone aware to naive (GH18951)
- Bug in comparing `DatetimeIndex`, which failed to raise `TypeError` when attempting to compare timezone-aware and timezone-naive datetimelike objects (GH18162)
- Bug in localization of a naive, datetime string in a `Series` constructor with a datetime64[ns, tz] dtype (GH174151)
- `Timestamp.replace()` will now handle Daylight Savings transitions gracefully (GH18319)
- Bug in tz-aware `DatetimeIndex` where addition/subtraction with a `TimedeltaIndex` or array with dtype='timedelta64[ns]' was incorrect (GH17558)
• Bug in `DateTimeIndex.insert()` where inserting `NaT` into a timezone-aware index incorrectly raised (GH16357)

• Bug in `DataFrame` constructor, where tz-aware Datetimeindex and a given column name will result in an empty `DataFrame` (GH19157)

• Bug in `Timestamp.tz_localize()` where localizing a timestamp near the minimum or maximum valid values could overflow and return a timestamp with an incorrect nanosecond value (GH12677)

• Bug when iterating over `DateTimeIndex` that was localized with fixed timezone offset that rounded nanosecond precision to microseconds (GH19603)

• Bug in `DataFrame.diff()` that raised an `IndexError` with tz-aware values (GH18578)

• Bug in `melt()` that converted tz-aware dtypes to tz-naive (GH15785)

• Bug in `DataFrame.count()` that raised an `ValueError`, if `DataFrame.dropna()` was called for a single column with timezone-aware values. (GH13407)

Offsets

• Bug in `WeekOfMonth` and `Week` where addition and subtraction did not roll correctly (GH18510, GH18672, GH18864)

• Bug in `WeekOfMonth` and `LastWeekOfMonth` where default keyword arguments for constructor raised `ValueError` (GH19142)

• Bug in `FY5253Quarter`, `LastWeekOfMonth` where rollback and rollforward behavior was inconsistent with addition and subtraction behavior (GH18854)

• Bug in `FY5253` where datetime addition and subtraction incremented incorrectly for dates on the year-end but not normalized to midnight (GH18854)

• Bug in `FY5253` where date offsets could incorrectly raise an `AssertionError` in arithmetic operations (GH14774)

Numeric

• Bug in `Series` constructor with an int or float list where specifying `dtype=str`, `dtype='str'` or `dtype='U'` failed to convert the data elements to strings (GH16605)

• Bug in `Index` multiplication and division methods where operating with a `Series` would return an `Index` object instead of a `Series` object (GH19042)

• Bug in the `DataFrame` constructor in which data containing very large positive or very large negative numbers was causing `OverflowError` (GH18584)

• Bug in `Index` constructor with `dtype='uint64'` where int-like floats were not coerced to `UInt64Index` (GH18400)

• Bug in `DataFrame` flex arithmetic (e.g. `df.add(other, fill_value=foo)`) with a `fill_value` other than `None` failed to raise `NotImplementedError` in corner cases where either the frame or other has length zero (GH19522)

• Multiplication and division of numeric-dtyped `Index` objects with timedelta-like scalars returns `TimedeltaIndex` instead of raising `TypeError` (GH19333)

• Bug where `NaN` was returned instead of 0 by `Series.pct_change()` and `DataFrame.pct_change()` when `fill_method` is not `None` (GH19873)
Strings

- Bug in `Series.str.get()` with a dictionary in the values and the index not in the keys, raising `KeyError` (GH20671)

Indexing

- Bug in `Index` construction from list of mixed type tuples (GH18505)
- Bug in `Index.drop()` when passing a list of both tuples and non-tuples (GH18304)
- Bug in `DataFrame.drop()`, `Panel.drop()`, `Series.drop()`, `Index.drop()` where no `KeyError` is raised when dropping a non-existent element from an axis that contains duplicates (GH19186)
- Bug in indexing a datetimelike `Index` that raised `ValueError` instead of `IndexError` (GH18386).
- `Index.to_series()` now accepts `index` and `name` kwargs (GH18699)
- `DatetimeIndex.to_series()` now accepts `index` and `name` kwargs (GH18699)
- Bug in indexing non-scalar value from `Series` having non-unique `Index` will return value flattened (GH17610)
- Bug in indexing with iterator containing only missing keys, which raised no error (GH20748)
- Fixed inconsistency in `.ix` between list and scalar keys when the index has integer dtype and does not include the desired keys (GH20753)
- Bug in `__setitem__` when indexing a `DataFrame` with a 2-d boolean ndarray (GH18582)
- Bug in `str.extractall` when there were no matches empty `Index` was returned instead of appropriate `MultiIndex` (GH19034)
- Bug in `IntervalIndex` where empty and purely NA data was constructed inconsistently depending on the construction method (GH18421)
- Bug in `IntervalIndex.symmetric_difference()` where the symmetric difference with a non-`IntervalIndex` did not raise (GH18475)
- Bug in `IntervalIndex` where set operations that returned an empty `IntervalIndex` had the wrong dtype (GH19101)
- Bug in `DataFrame.drop_duplicates()` where no `KeyError` is raised when passing in columns that don’t exist on the `DataFrame` (GH19726)
- Bug in `Index` subclasses constructors that ignore unexpected keyword arguments (GH19348)
- Bug in `Index.difference()` when taking difference of an `Index` with itself (GH20040)
- Bug in `DataFrame.first_valid_index()` and `DataFrame.last_valid_index()` in presence of entire rows of NaNs in the middle of values (GH20499).
- Bug in `IntervalIndex` where some indexing operations were not supported for overlapping or non-monotonic `uint64` data (GH20636)
- Bug in `Series.is_unique` where extraneous output in stderr is shown if Series contains objects with `__ne__` defined (GH20661)
- Bug in `.loc` assignment with a single-element list-like incorrectly assigns as a list (GH19474)
- Bug in partial string indexing on a `Series/DataFrame` with a monotonic decreasing `DatetimeIndex` (GH19362)
- Bug in performing in-place operations on a `DataFrame` with a duplicate `Index` (GH17105)
pandas: powerful Python data analysis toolkit, Release 1.3.1

- Bug in `IntervalIndex.get_loc()` and `IntervalIndex.get_indexer()` when used with an `IntervalIndex` containing a single interval (GH17284, GH20921)
- Bug in `.loc` with a uint64 indexer (GH20722)

MultiIndex

- Bug in `MultiIndex.__contains__()` where non-tuple keys would return True even if they had been dropped (GH19027)
- Bug in `MultiIndex.set_labels()` which would cause casting (and potentially clipping) of the new labels if the level argument is not 0 or a list like [0, 1, ...] (GH19057)
- Bug in `MultiIndex.get_level_values()` which would return an invalid index on level of ints with missing values (GH17924)
- Bug in `MultiIndex.unique()` when called on empty `MultiIndex` (GH20568)
- Bug in `MultiIndex.unique()` which would not preserve level names (GH20570)
- Bug in `MultiIndex.remove_unused_levels()` which would fill nan values (GH18417)
- Bug in `MultiIndex.from_tuples()` which would fail to take zipped tuples in python3 (GH18434)
- Bug in `MultiIndex.get_loc()` which would fail to automatically cast values between float and int (GH18818, GH15994)
- Bug in `MultiIndex.get_loc()` which would cast boolean to integer labels (GH19086)
- Bug in `MultiIndex.get_loc()` which would fail to locate keys containing NaN (GH18485)
- Bug in `MultiIndex.get_loc()` in large `MultiIndex`, would fail when levels had different dtypes (GH18520)
- Bug in indexing where nested indexers having only numpy arrays are handled incorrectly (GH19686)

IO

- `read_html()` now rewinds seekable IO objects after parse failure, before attempting to parse with a new parser. If a parser errors and the object is non-seekable, an informative error is raised suggesting the use of a different parser (GH17975)
- `DataFrame.to_html()` now has an option to add an id to the leading `<table>` tag (GH8496)
- Bug in `read_msgpack()` with a non existent file is passed in Python 2 (GH15296)
- Bug in `read_csv()` where a MultiIndex with duplicate columns was not being mangled appropriately (GH18062)
- Bug in `read_csv()` where missing values were not being handled properly when `keep_default_na=False` with dictionary `na_values` (GH19227)
- Bug in `read_csv()` causing heap corruption on 32-bit, big-endian architectures (GH20785)
- Bug in `read_sas()` where a file with 0 variables gave an AttributeError incorrectly. Now it gives an EmptyDataError (GH18184)
- Bug in `DataFrame.to_latex()` where pairs of braces meant to serve as invisible placeholders were escaped (GH18667)
- Bug in `DataFrame.to_latex()` where a NaN in a MultiIndex would cause an IndexError or incorrect output (GH14249)
• Bug in `DataFrame.to_latex()` where a non-string index-level name would result in an AttributeError (GH19981)

• Bug in `DataFrame.to_latex()` where the combination of an index name and the `index_names=False` option would result in incorrect output (GH18326)

• Bug in `DataFrame.to_latex()` where a MultiIndex with an empty string as its name would result in incorrect output (GH18669)

• Bug in `DataFrame.to_latex()` where missing space characters caused wrong escaping and produced non-valid latex in some cases (GH20859)

• Bug in `read_json()` where large numeric values were causing an OverflowError (GH18842)

• Bug in `DataFrame.to_parquet()` where an exception was raised if the write destination is S3 (GH19134)

• `Interval` now supported in `DataFrame.to_excel()` for all Excel file types (GH19242)

• `Timedelta` now supported in `DataFrame.to_excel()` for all Excel file types (GH19242, GH9155, GH19900)

• Bug in `pandas.io.stata.StataReader.value_labels()` raising an AttributeError when called on very old files. Now returns an empty dict (GH19417)

• Bug in `read_pickle()` when unpickling objects with `TimedeltaIndex` or `Float64Index` created with pandas prior to version 0.20 (GH19939)

• Bug in `pandas.io.json.json_normalize()` where sub-records are not properly normalized if any sub-records values are NoneType (GH20030)

• Bug in `usecols` parameter in `read_csv()` where error is not raised correctly when passing a string. (GH20529)

• Bug in `HDFStore.keys()` when reading a file with a soft link causes exception (GH20523)

• Bug in `HDFStore.select_column()` where a key which is not a valid store raised an AttributeError instead of a KeyError (GH17912)

**Plotting**

• Better error message when attempting to plot but matplotlib is not installed (GH19810).

• `DataFrame.plot()` now raises a `ValueError` when the `x` or `y` argument is improperly formed (GH18671)

• Bug in `DataFrame.plot()` when `x` and `y` arguments given as positions caused incorrect referenced columns for line, bar and area plots (GH20056)

• Bug in formatting tick labels with `datetime.time()` and fractional seconds (GH18478).

• `Series.plot.kde()` has exposed the args `ind` and `bw_method` in the docstring (GH18461). The argument `ind` may now also be an integer (number of sample points).

• `DataFrame.plot()` now supports multiple columns to the `y` argument (GH19699)
GroupBy/resample/rolling

- Bug when grouping by a single column and aggregating with a class like list or tuple (GH18079)
- Fixed regression in DataFrame.groupby() which would not emit an error when called with a tuple key not in the index (GH18798)
- Bug in DataFrame.resample() which silently ignored unsupported (or mistyped) options for label, closed and convention (GH19303)
- Bug in DataFrame.groupby() where tuples were interpreted as lists of keys rather than as keys (GH17979, GH18249)
- Bug in DataFrame.groupby() where aggregation by first/last/min/max was causing timestamps to lose precision (GH19526)
- Bug in DataFrame.transform() where particular aggregation functions were being incorrectly cast to match the dtype(s) of the grouped data (GH19200)
- Bug in DataFrame.groupby() passing the on= kwarg, and subsequently using .apply() (GH17813)
- Bug in DataFrame.resample().aggregate not raising a KeyError when aggregating a non-existent column (GH16766, GH19566)
- Bug in DataFrameGroupBy.cumsum() and DataFrameGroupBy.cumprod() when skipna was passed (GH19806)
- Bug in DataFrame.resample() that dropped timezone information (GH13238)
- Bug in DataFrame.groupby() where transformations using np.all and np.any were raising a ValueError (GH20653)
- Bug in DataFrame.resample() where ffill, bfill, pad, backfill, fillna, interpolate, and asfreq were ignoring loffset. (GH20744)
- Bug in DataFrame.groupby() when applying a function that has mixed data types and the user supplied function can fail on the grouping column (GH20949)
- Bug in DataFrameGroupBy.rolling().apply() where operations performed against the associated DataFrameGroupBy object could impact the inclusion of the grouped item(s) in the result (GH14013)

Sparse

- Bug in which creating a SparseDataFrame from a dense Series or an unsupported type raised an uncontrolled exception (GH19374)
- Bug in SparseDataFrame.to_csv causing exception (GH19384)
- Bug in SparseSeries.memory_usage which caused segfault by accessing non sparse elements (GH19368)
- Bug in constructing a SparseArray: if data is a scalar and index is defined it will coerce to float64 regardless of scalar’s dtype. (GH19163)
Reshaping

- Bug in `DataFrame.merge()` where referencing a `CategoricalIndex` by name, where the `by` kwarg would `KeyError` (GH20777)
- Bug in `DataFrame.stack()` which fails trying to sort mixed type levels under Python 3 (GH18310)
- Bug in `DataFrame.unstack()` which casts int to float if `columns` is a `MultiIndex` with unused levels (GH17845)
- Bug in `DataFrame.unstack()` which raises an error if `index` is a `MultiIndex` with unused labels on the unstacked level (GH18562)
- Fixed construction of a `Series` from a `dict` containing NaN as key (GH18480)
- Fixed construction of a `DataFrame` from a `dict` containing NaN as key (GH18455)
- Disabled construction of a `Series` where `len(index) > len(data) = 1`, which previously would broadcast the data item, and now raises a `ValueError` (GH18819)
- Suppressed error in the construction of a `DataFrame` from a `dict` containing scalar values when the corresponding keys are not included in the passed index (GH18600)
- Fixed (changed from `object` to `float64`) dtype of `DataFrame` initialized with axes, no data, and `dtype=int` (GH19646)
- Bug in `Series.rank()` where `Series` containing NaT modifies the `Series` inplace (GH18521)
- Bug in `cut()` which fails when using readonly arrays (GH18773)
- Bug in `DataFrame.pivot_table()` which fails when the `aggfunc` arg is of type string. The behavior is now consistent with other methods like `agg` and `apply` (GH18713)
- Bug in `DataFrame.merge()` in which merging using `Index` objects as vectors raised an Exception (GH19038)
- Bug in `DataFrame.stack()`, `DataFrame.unstack()`, `Series.unstack()` which were not returning subclasses (GH15563)
- Bug in timezone comparisons, manifesting as a conversion of the index to UTC in `.concat()` (GH18523)
- Bug in `concat()` when concatenating sparse and dense series it returns only a `SparseDataFrame`. Should be a `DataFrame` (GH18914, GH18686, and GH16874)
- Improved error message for `DataFrame.merge()` when there is no common merge key (GH19427)
- Bug in `DataFrame.join()` which does an outer instead of a left join when being called with multiple `DataFrame`s and some have non-unique indices (GH19624)
- `Series.rename()` now accepts `axis` as a kwarg (GH18589)
- Bug in `rename()` where an Index of same-length tuples was converted to a `MultiIndex` (GH19497)
- Comparisons between `Series` and `Index` would return a `Series` with an incorrect name, ignoring the Index’s name attribute (GH19582)
- Bug in `qcut()` where datetime and timedelta data with NaT present raised a `ValueError` (GH19768)
- Bug in `DataFrame.iterrows()`, which would infers strings not compliant to ISO8601 to datetimes (GH19671)
- Bug in `Series` constructor with `Categorical` where a `ValueError` is not raised when an index of different length is given (GH19342)
- Bug in `DataFrame.astype()` where column metadata is lost when converting to categorical or a dictionary of dtypes (GH19920)
• Bug in `cut()` and `qcut()` where timezone information was dropped (GH19872)
• Bug in `Series` constructor with a `dtype=str`, previously raised in some cases (GH19853)
• Bug in `get_dummies()`, and `select_dtypes()`, where duplicate column names caused incorrect behavior (GH20848)
• Bug in `isna()`, which cannot handle ambiguous typed lists (GH20675)
• Bug in `concat()` which raises an error when concatenating TZ-aware dataframes and all-NaT dataframes (GH12396)
• Bug in `concat()` which raises an error when concatenating empty TZ-aware series (GH18447)

Other

• Improved error message when attempting to use a Python keyword as an identifier in a `numexpr` backed query (GH18221)
• Bug in accessing a `pandas.get_option()`, which raised `KeyError` rather than `OptionError` when looking up a non-existent option key in some cases (GH19789)
• Bug in `testing.assert_series_equal()` and `testing.assert_frame_equal()` for Series or DataFrames with differing unicode data (GH20503)

5.8 Version 0.22

5.8.1 Version 0.22.0 (December 29, 2017)

This is a major release from 0.21.1 and includes a single, API-breaking change. We recommend that all users upgrade to this version after carefully reading the release note (singular!).

Backwards incompatible API changes

pandas 0.22.0 changes the handling of empty and all-NA sums and products. The summary is that

- The sum of an empty or all-NA Series is now 0
- The product of an empty or all-NA Series is now 1
- We’ve added a min_count parameter to .sum() and .prod() controlling the minimum number of valid values for the result to be valid. If fewer than min_count non-NA values are present, the result is NA. The default is 0. To return NaN, the 0.21 behavior, use min_count=1.
Some background: In pandas 0.21, we fixed a long-standing inconsistency in the return value of all-NA series depending on whether or not bottleneck was installed. See *Sum/prod of all-NaN or empty Series/DataFrames is now consistently NaN*. At the same time, we changed the sum and prod of an empty Series to also be NaN.

Based on feedback, we’ve partially reverted those changes.

### Arithmetic operations

The default sum for empty or all-NA Series is now 0.

#### pandas 0.21.x

```python
In [1]: pd.Series([]).sum()
Out[1]: nan
In [2]: pd.Series([np.nan]).sum()
Out[2]: nan
```

#### pandas 0.22.0

```python
In [1]: pd.Series([]).sum()
Out[1]: 0.0
In [2]: pd.Series([np.nan]).sum()
Out[2]: 0.0
```

The default behavior is the same as pandas 0.20.3 with bottleneck installed. It also matches the behavior of NumPy’s `np.nansum` on empty and all-NA arrays.

To have the sum of an empty series return NaN (the default behavior of pandas 0.20.3 without bottleneck, or pandas 0.21.x), use the `min_count` keyword.

```python
In [3]: pd.Series([]).sum(min_count=1)
Out[3]: nan
```

Thanks to the `skipna` parameter, the `.sum` on an all-NA series is conceptually the same as the `.sum` of an empty one with `skipna=True` (the default).

```python
In [4]: pd.Series([np.nan]).sum(min_count=1)  # skipna=True by default
Out[4]: nan
```

The `min_count` parameter refers to the minimum number of non-null values required for a non-NA sum or product. `Series.prod()` has been updated to behave the same as `Series.sum()`, returning 1 instead.

```python
In [5]: pd.Series([]).prod()
Out[5]: 1.0
In [6]: pd.Series([np.nan]).prod()
Out[6]: 1.0
In [7]: pd.Series([]).prod(min_count=1)
Out[7]: nan
```

These changes affect `DataFrame.sum()` and `DataFrame.prod()` as well. Finally, a few less obvious places in pandas are affected by this change.
**Grouping by a Categorical**

Grouping by a `Categorical` and summing now returns 0 instead of NaN for categories with no observations. The product now returns 1 instead of NaN.

**pandas 0.21.x**

```python
In [8]: grouper = pd.Categorical(['a', 'a'], categories=['a', 'b'])
In [9]: pd.Series([1, 2]).groupby(grouper).sum()
Out[9]:
a    3.0
b     NaN
dtype: float64
```

**pandas 0.22**

```python
In [8]: grouper = pd.Categorical(['a', 'a'], categories=['a', 'b'])
In [9]: pd.Series([1, 2]).groupby(grouper).sum()
Out[9]:
a    3
b    0
Length: 2, dtype: int64
```

To restore the 0.21 behavior of returning NaN for unobserved groups, use `min_count>=1`.

```python
In [10]: pd.Series([1, 2]).groupby(grouper).sum(min_count=1)
Out[10]:
a    3.0
b     NaN
Length: 2, dtype: float64
```

**Resample**

The sum and product of all-NA bins has changed from NaN to 0 for sum and 1 for product.

**pandas 0.21.x**

```python
In [11]: s = pd.Series([1, 1, np.nan, np.nan],
                  index=pd.date_range('2017', periods=4))
In [12]: s.resample('2d').sum()
Out[12]:
2017-01-01  1.0
2017-01-03  NaN
Freq: D, dtype: float64
```

**pandas 0.22**

```python
In [11]: s = pd.Series([1, 1, np.nan, np.nan],
                  index=pd.date_range('2017', periods=4))
In [12]: s.resample('2d').sum()
Out[12]:
2017-01-01  2.0
2017-01-03  NaN
Freq: 2D, dtype: float64
```
In [11]: s = pd.Series([1, 1, np.nan, np.nan], index=pd.date_range("2017", periods=4))
In [12]: s.resample("2d").sum()
Out[12]:
2017-01-01   2.0
2017-01-03   0.0
Freq: 2D, Length: 2, dtype: float64

To restore the 0.21 behavior of returning NaN, use min_count=1.

In [13]: s.resample("2d").sum(min_count=1)
Out[13]:
2017-01-01   2.0
2017-01-03   NaN
Freq: 2D, Length: 2, dtype: float64

In particular, upsampling and taking the sum or product is affected, as upsampling introduces missing values even if the original series was entirely valid.

pandas 0.21.x

In [14]: idx = pd.DatetimeIndex(['2017-01-01', '2017-01-02'])
In [15]: pd.Series([1, 2], index=idx).resample('12H').sum()
Out[15]:
2017-01-01 00:00:00   1.0
2017-01-01 12:00:00   NaN
2017-01-02 00:00:00   2.0
Freq: 12H, dtype: float64

pandas 0.22.0

In [14]: idx = pd.DatetimeIndex(['2017-01-01', '2017-01-02'])
In [15]: pd.Series([1, 2], index=idx).resample('12H').sum()
Out[15]:
2017-01-01 00:00:00   1
2017-01-01 12:00:00   0
2017-01-02 00:00:00   2
Freq: 12H, Length: 3, dtype: int64

Once again, the min_count keyword is available to restore the 0.21 behavior.

In [16]: pd.Series([1, 2], index=idx).resample('12H').sum(min_count=1)
Out[16]:
2017-01-01 00:00:00   1.0
2017-01-01 12:00:00   NaN
2017-01-02 00:00:00   2.0
Freq: 12H, Length: 3, dtype: float64
Rolling and expanding

Rolling and expanding already have a `min_periods` keyword that behaves similar to `min_count`. The only case that changes is when doing a rolling or expanding sum with `min_periods=0`. Previously this returned NaN, when fewer than `min_periods` non-NA values were in the window. Now it returns 0.

**pandas 0.21.1**

```python
In [17]: s = pd.Series([np.nan, np.nan])
In [18]: s.rolling(2, min_periods=0).sum()
Out[18]:
0   NaN
1   NaN
dtype: float64
```

**pandas 0.22.0**

```python
In [17]: s = pd.Series([np.nan, np.nan])
In [18]: s.rolling(2, min_periods=0).sum()
Out[18]:
0    0.0
1    0.0
Length: 2, dtype: float64
```

The default behavior of `min_periods=None`, implying that `min_periods` equals the window size, is unchanged.

**Compatibility**

If you maintain a library that should work across pandas versions, it may be easiest to exclude pandas 0.21 from your requirements. Otherwise, all your `sum()` calls would need to check if the `Series` is empty before summing.

With `setuptools`, in your `setup.py` use:

```python
install_requires=['pandas!=0.21.*', ...]
```

With `conda`, use

```yaml
requirements:
  run:
    - pandas !=0.21.0,!=0.21.1
```

Note that the inconsistency in the return value for all-NA series is still there for pandas 0.20.3 and earlier. Avoiding pandas 0.21 will only help with the empty case.

5.9 Version 0.21

5.9.1 Version 0.21.1 (December 12, 2017)

This is a minor bug-fix release in the 0.21.x series and includes some small regression fixes, bug fixes and performance improvements. We recommend that all users upgrade to this version.

Highlights include:

• Temporarily restore matplotlib datetime plotting functionality. This should resolve issues for users who implicitly relied on pandas to plot datetimes with matplotlib. See here.

• Improvements to the Parquet IO functions introduced in 0.21.0. See here.

What’s new in v0.21.1

• Restore Matplotlib datetime converter registration
• New features
  – Improvements to the Parquet IO functionality
  – Other enhancements
• Deprecations
• Performance improvements
• Bug fixes
  – Conversion
  – Indexing
  – IO
  – Plotting
  – GroupBy/resample/rolling
  – Reshaping
  – Numeric
  – Categorical

**Restore Matplotlib datetime converter registration**

pandas implements some matplotlib converters for nicely formatting the axis labels on plots with `datetime` or `Period` values. Prior to pandas 0.21.0, these were implicitly registered with matplotlib, as a side effect of `import pandas`.

In pandas 0.21.0, we required users to explicitly register the converter. This caused problems for some users who relied on those converters being present for regular `matplotlib.pyplot` plotting methods, so we’re temporarily reverting that change; pandas 0.21.1 again registers the converters on import, just like before 0.21.0.

We’ve added a new option to control the converters: `pd.options.plotting.matplotlib.register_converters`. By default, they are registered. Toggling this to `False` removes pandas’ formatters and restore any converters we overwrote when registering them (GH18301).

We’re working with the matplotlib developers to make this easier. We’re trying to balance user convenience (automatically registering the converters) with import performance and best practices (importing pandas shouldn’t have the side effect of overwriting any custom converters you’ve already set). In the future we hope to have most of the date-time formatting functionality in matplotlib, with just the pandas-specific converters in pandas. We’ll then gracefully deprecate the automatic registration of converters in favor of users explicitly registering them when they want them.

**New features**

**Improvements to the Parquet IO functionality**

- `DataFrame.to_parquet()` will now write non-default indexes when the underlying engine supports it. The indexes will be preserved when reading back in with `read_parquet()` (GH18581).
- `read_parquet()` now allows to specify the columns to read from a parquet file (GH18154)
- `read_parquet()` now allows to specify kwargs which are passed to the respective engine (GH18216)

**Other enhancements**

- `Timestamp.timestamp()` is now available in Python 2.7. (GH17329)
- `Grouper` and `TimeGrouper` now have a friendly repr output (GH18203).

**Deprecations**

- `pandas.tseries.register` has been renamed to `pandas.plotting.register_matplotlib_converters()` (GH18301)

**Performance improvements**

- Improved performance of plotting large series/dataframes (GH18236).
Bug fixes

Conversion

- Bug in `TimedeltaIndex` subtraction could incorrectly overflow when NaT is present (GH17791)
- Bug in `DatetimeIndex` subtracting datetimelike from DatetimeIndex could fail to overflow (GH18020)
- Bug in `IntervalIndex.copy()` when copying and `IntervalIndex` with non-default `closed` (GH18339)
- Bug in `DataFrame.to_dict()` where columns of datetime that are tz-aware were not converted to required arrays when used with `orient='records'`, raising `TypeError` (GH18372)
- Bug in `DateTimeIndex` and `date_range()` where mismatching tz-aware `start` and `end` timezones would not raise an err if `end.tzinfo` is None (GH18431)
- Bug in `Series.fillna()` which raised when passed a long integer on Python 2 (GH18159).

Indexing

- Bug in a boolean comparison of a `datetime.datetime` and a `datetime64[ns]` dtype `Series` (GH17965)
- Bug where a `MultiIndex` with more than a million records was not raising `AttributeError` when trying to access a missing attribute (GH18165)
- Bug in `IntervalIndex` constructor when a list of intervals is passed with non-default `closed` (GH18334)
- Bug in `Index.putmask` when an invalid mask passed (GH18368)
- Bug in masked assignment of a `timedelta64[ns]` dtype `Series`, incorrectly coerced to float (GH18493)

IO

- Bug in class:`pandas.io.stata.StataReader` not converting date/time columns with display formatting addressed (GH17990). Previously columns with display formatting were normally left as ordinal numbers and not converted to datetime objects.
- Bug in `read_csv()` when reading a compressed UTF-16 encoded file (GH18071)
- Bug in `read_csv()` for handling null values in index columns when specifying `na_filter=False` (GH5239)
- Bug in `read_csv()` when reading numeric category fields with high cardinality (GH18186)
- Bug in `DataFrame.to_csv()` when the table had `MultiIndex` columns, and a list of strings was passed in for `header` (GH5539)
- Bug in parsing integer datetime-like columns with specified format in `read_sql` (GH17855).
- Bug in `DataFrame.to_msgpack()` when serializing data of the `numpy.bool_` datatype (GH18390)
- Bug in `read_json()` not decoding when reading line delimited JSON from S3 (GH17200)
- Bug in `pandas.io.json.json_normalize()` to avoid modification of `meta` (GH18610)
- Bug in `to_latex()` where repeated `MultiIndex` values were not printed even though a higher level index differed from the previous row (GH14484)
- Bug when reading NaN-only categorical columns in `HDFStore` (GH18413)
• **Bug in `DataFrame.to_latex()`** with longtable=True where a latex multicolumn always spanned over three columns (GH17959)

**Plotting**

• **Bug in `DataFrame.plot()` and Series.plot()`** with `DatetimeIndex` where a figure generated by them is not pickleable in Python 3 (GH18439)

**GroupBy/resample/rolling**

• **Bug in `DataFrame.resample(...).apply(...)`** when there is a callable that returns different columns (GH15169)

• **Bug in `DataFrame.resample(...)`** when there is a time change (DST) and resampling frequency is 12h or higher (GH15549)

• **Bug in `pd.DataFrameGroupBy.count()`** when counting over a datetimelike column (GH13393)

• **Bug in `rolling.var`** where calculation is inaccurate with a zero-valued array (GH18430)

**Reshaping**

• **Error message in `pd.merge_asof()`** for key datatype mismatch now includes datatype of left and right key (GH18068)

• **Bug in `pd.concat`** when empty and non-empty DataFrames or Series are concatenated (GH18178 GH18187)

• **Bug in `DataFrame.filter(...)`** when unicode is passed as a condition in Python 2 (GH13101)

• **Bug when merging empty DataFrames** when `np.seterr(divide='raise')` is set (GH17776)

**Numeric**

• **Bug in `pd.Series.rolling.skew()` and `rolling.kurt()`** with all equal values has floating issue (GH18044)

**Categorical**

• **Bug in `DataFrame.astype()`** where casting to 'category' on an empty `DataFrame` causes a segmentation fault (GH18004)

• **Error messages in the testing module** have been improved when items have different `CategoricalDtype` (GH18069)

• **`CategoricalIndex` can now correctly take a `pd.api.types.CategoricalDtype`** as its dtype (GH18116)

• **Bug in `Categorical.unique()`** returning read-only codes array when all categories were NaN (GH18051)

• **Bug in `DataFrame.groupby(axis=1)` with a `CategoricalIndex`** (GH18432)
String

- `Series.str.split()` will now propagate NaN values across all expanded columns instead of None (GH18450)

5.9.2 Version 0.21.0 (October 27, 2017)

This is a major release from 0.20.3 and includes a number of API changes, deprecations, new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

Highlights include:

- Integration with Apache Parquet, including a new top-level `read_parquet()` function and `DataFrame.to_parquet()` method, see here.
- New user-facing `pandas.api.types.CategoricalDtype` for specifying categoricals independent of the data, see here.
- The behavior of `sum` and `prod` on all-NaN Series/DataFrames is now consistent and no longer depends on whether bottleneck is installed, and `sum` and `prod` on empty Series now return NaN instead of 0, see here.
- Compatibility fixes for pypy, see here.
- Additions to the `drop`, `reindex` and `rename` API to make them more consistent, see here.
- Addition of the new methods `DataFrame.infer_objects` (see here) and `GroupBy.pipe` (see here).
- Indexing with a list of labels, where one or more of the labels is missing, is deprecated and will raise a KeyError in a future version, see here.

Check the API Changes and deprecations before updating.
• New features
  – Integration with Apache Parquet file format
  – Method `infer_objects` type conversion
  – Improved warnings when attempting to create columns
  – Method `drop` now also accepts index/columns keywords
  – Methods `rename`, `reindex` now also accept axis keyword
  – `CategoricalDtype` for specifying categoricals
  – `GroupBy` objects now have a `pipe` method
  – `Categorical.rename_categories` accepts a dict-like
  – Other enhancements

• Backwards incompatible API changes
  – Dependencies have increased minimum versions
  – `Sum/prod` of all-NaN or empty Series/DataFrames is now consistently NaN
  – Indexing with a list with missing labels is deprecated
  – NA naming changes
  – Iteration of Series/Index will now return Python scalars
  – Indexing with a Boolean Index
  – `PeriodIndex` resampling
  – Improved error handling during item assignment in `pd.eval`
  – `Dtype` conversions
  – `MultiIndex` constructor with a single level
  – `UTC` localization with `Series`
  – Consistency of range functions
  – No automatic `Matplotlib` converters
  – Other API changes

• Deprecations
  – `Series.select` and `DataFrame.select`
  – `Series.argmax` and `Series.argmin`

• Removal of prior version deprecations/changes

• Performance improvements

• Documentation changes

• Bug fixes
  – Conversion
  – Indexing
  – IO
New features

Integration with Apache Parquet file format

Integration with Apache Parquet, including a new top-level `read_parquet()` and `DataFrame.to_parquet()` method, see [here](GH15838, GH17438).

Apache Parquet provides a cross-language, binary file format for reading and writing data frames efficiently. Parquet is designed to faithfully serialize and de-serialize `DataFrame` s, supporting all of the pandas dtypes, including extension dtypes such as datetime with timezones.

This functionality depends on either the pyarrow or fastparquet library. For more details, see the IO docs on Parquet.

Method `infer_objects` type conversion

The `DataFrame.infer_objects()` and `Series.infer_objects()` methods have been added to perform dtype inference on object columns, replacing some of the functionality of the deprecated `convert_objects` method. See the documentation [here](GH11221) for more details.

This method only performs soft conversions on object columns, converting Python objects to native types, but not any coercive conversions. For example:

```
In [1]: df = pd.DataFrame({'A': [1, 2, 3],
                       'B': np.array([1, 2, 3], dtype='object'),
                       'C': ['1', '2', '3']})

In [2]: df.dtypes
Out[2]:
A int64
B object
C object
Length: 3, dtype: object

In [3]: df.infer_objects().dtypes
Out[3]:
A int64
B int64
C object
Length: 3, dtype: object
```
Note that column 'C' was not converted - only scalar numeric types will be converted to a new type. Other types of conversion should be accomplished using the `to_numeric()` function (or `to_datetime()`, `to_timedelta()`).

```python
In [4]: df = df.infer_objects()
In [5]: df['C'] = pd.to_numeric(df['C'], errors='coerce')
In [6]: df.dtypes
Out[6]:
A    int64
B    int64
C    int64
Length: 3, dtype: object
```

**Improved warnings when attempting to create columns**

New users are often puzzled by the relationship between column operations and attribute access on `DataFrame` instances (GH7175). One specific instance of this confusion is attempting to create a new column by setting an attribute on the `DataFrame`:

```python
In [1]: df = pd.DataFrame({'one': [1., 2., 3.]})
In [2]: df.two = [4, 5, 6]
```

This does not raise any obvious exceptions, but also does not create a new column:

```python
In [3]: df
Out[3]:
   one
0  1.0
1  2.0
2  3.0
```

Setting a list-like data structure into a new attribute now raises a `UserWarning` about the potential for unexpected behavior. See `Attribute Access`.

**Method `drop` now also accepts `index/columns` keywords**

The `drop()` method has gained `index/columns` keywords as an alternative to specifying the `axis`. This is similar to the behavior of `reindex` (GH12392).

For example:

```python
In [7]: df = pd.DataFrame(np.arange(8).reshape(2, 4),
                      columns=['A', 'B', 'C', 'D'])
In [8]: df
Out[8]:
   A  B  C  D
0  0  1  2  3
1  4  5  6  7
[2 rows x 4 columns]
```
methods rename, reindex now also accept axis keyword

The `DataFrame.rename()` and `DataFrame.reindex()` methods have gained the `axis` keyword to specify the axis to target with the operation (GH12392).

Here's rename:

```python
In [11]: df = pd.DataFrame({'A': [1, 2, 3], 'B': [4, 5, 6]})
In [12]: df.rename(str.lower, axis='columns')
Out[12]:
    a  b
0  1  4
1  2  5
2  3  6
[3 rows x 2 columns]
```

And reindex:

```python
In [14]: df.reindex(['A', 'B', 'C'], axis='columns')
Out[14]:
       A  B  C
0  1  4  NaN
1  2  5  NaN
2  3  6  NaN
[3 rows x 3 columns]
```
In [15]: df.reindex([0, 1, 3], axis='index')
Out[15]:
   A   B
0  1.0  4.0
1  2.0  5.0
3  NaN  NaN
[3 rows x 2 columns]

The “index, columns” style continues to work as before.

In [16]: df.rename(index=id, columns=str.lower)
Out[16]:
   a  b
94138863066336  1  4
94138863066368  2  5
94138863066400  3  6
[3 rows x 2 columns]

In [17]: df.reindex(index=[0, 1, 3], columns=['A', 'B', 'C'])
Out[17]:
   A   B   C
0  1.0  4.0  NaN
1  2.0  5.0  NaN
3  NaN  NaN  NaN
[3 rows x 3 columns]

We highly encourage using named arguments to avoid confusion when using either style.

**CategoricalDtype for specifying categoricals**

`pandas.api.types.CategoricalDtype` has been added to the public API and expanded to include the categories and ordered attributes. A `CategoricalDtype` can be used to specify the set of categories and orderedness of an array, independent of the data. This can be useful for example, when converting string data to a Categorical (GH14711, GH15078, GH16015, GH17643):

In [18]: from pandas.api.types import CategoricalDtype
In [19]: s = pd.Series(['a', 'b', 'c', 'a'])  # strings
In [20]: dtype = CategoricalDtype(categories=['a', 'b', 'c', 'd'], ordered=True)
In [21]: s.astype(dtype)
Out[21]:
     0
0  a
1  b
2  c
3  a
Length: 4, dtype: category
Categories (4, object): ['a' < 'b' < 'c' < 'd']

One place that deserves special mention is in `read_csv()`. Previously, with `dtype={'col': 'category'}`, the returned values and categories would always be strings.
In [22]:
   data = 'A,B
   a,1
   b,2
   c,3'

In [23]:
   pd.read_csv(StringIO(data), dtype={'B': 'category'}).B.cat.categories
Out[23]:
Index(['1', '2', '3'], dtype='object')

Notice the “object” dtype.

With a CategoricalDtype of all numerics, datetimes, or timedeltas, we can automatically convert to the correct type

In [24]:
   dtype = {'B': CategoricalDtype([1, 2, 3])}

In [25]:
   pd.read_csv(StringIO(data), dtype=dtype).B.cat.categories
Out[25]:
Int64Index([1, 2, 3], dtype='int64')

The values have been correctly interpreted as integers.

The .dtype property of a Categorical, CategoricalIndex or a Series with categorical type will now return an instance of CategoricalDtype. While the repr has changed, str(CategoricalDtype()) is still the string 'category'. We’ll take this moment to remind users that the preferred way to detect categorical data is to use pandas.api.types.is_categorical_dtype(), and not str(dtype) == 'category'.

See the CategoricalDtype docs for more.

**GroupBy objects now have a pipe method**

GroupBy objects now have a pipe method, similar to the one on DataFrame and Series, that allow for functions that take a GroupBy to be composed in a clean, readable syntax. (GH17871)

For a concrete example on combining .groupby and .pipe, imagine having a DataFrame with columns for stores, products, revenue and sold quantity. We’d like to do a groupwise calculation of prices (i.e. revenue/quantity) per store and per product. We could do this in a multi-step operation, but expressing it in terms of piping can make the code more readable.

First we set the data:

In [26]:
   import numpy as np

In [27]:
   n = 1000

In [28]:
   df = pd.DataFrame({'Store': np.random.choice(['Store_1', 'Store_2'], n),
   ....:                   'Product': np.random.choice(['Product_1',
   ....:                     'Product_2',
   ....:                     'Product_3',
   ....:                     ], n),
   ....:                   'Revenue': (np.random.random(n) * 50 + 10).round(2),
   ....:                   'Quantity': np.random.randint(1, 10, size=n))
   ....:         
In [29]:
   df.head(2)
Out[29]:
   +--------+--------+-------+-------+
   | Store  | Product| Revenue| Quantity|
   +--------+--------+-------+-------+
   | Store_2 | Product_2| 32.09  |   7   |
   | Store_1 | Product_3| 14.20  |   1   |
   +--------+--------+-------+-------+
   [2 rows x 4 columns]

Now, to find prices per store/product, we can simply do:
In [30]: (df.groupby(['Store', 'Product'])
       ....: .pipe(lambda grp: grp.Revenue.sum() / grp.Quantity.sum())
       ....: .unstack().round(2))

Out[30]:

<table>
<thead>
<tr>
<th>Store</th>
<th>Product_1</th>
<th>Product_2</th>
<th>Product_3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Store_1</td>
<td>6.73</td>
<td>6.72</td>
<td>7.14</td>
</tr>
<tr>
<td>Store_2</td>
<td>7.59</td>
<td>6.98</td>
<td>7.23</td>
</tr>
</tbody>
</table>

[2 rows x 3 columns]

See the documentation for more.

**Categorical.rename_categories accepts a dict-like**

rename_categories() now accepts a dict-like argument for new_categories. The previous categories are looked up in the dictionary's keys and replaced if found. The behavior of missing and extra keys is the same as in DataFrame.rename().

In [31]: c = pd.Categorical(['a', 'a', 'b'])
In [32]: c.rename_categories({'a': 'eh', 'b': 'bee'})

Out[32]:
['eh', 'eh', 'bee']
Categories (2, object): ['eh', 'bee']

**Warning:** To assist with upgrading pandas, rename_categories treats Series as list-like. Typically, Series are considered to be dict-like (e.g. in .rename, .map). In a future version of pandas rename_categories will change to treat them as dict-like. Follow the warning message's recommendations for writing future-proof code.

In [33]: c.rename_categories(pd.Series([0, 1], index=['a', 'c']))

FutureWarning: Treating Series 'new_categories' as a list-like and using the values. In a future version, 'rename_categories' will treat Series like a dictionary.
For dict-like, use 'new_categories.to_dict()'
For list-like, use 'new_categories.values'.

Out[33]:
[0, 0, 1]
Categories (2, int64): [0, 1]

**Other enhancements**

**New functions or methods**

- nearest() is added to support nearest-neighbor upsampling (GH17496).
- Index has added support for a to_frame method (GH15230).
New keywords

- Added a *skipna* parameter to *infer_dtype()* to support type inference in the presence of missing values (GH17059).

- *Series.to_dict()* and *DataFrame.to_dict()* now support an *into* keyword which allows you to specify the *collections.Mapping* subclass that you would like returned. The default is *dict*, which is backwards compatible. (GH16122)

- *Series.set_axis()* and *DataFrame.set_axis()* now support the *inplace* parameter. (GH14636)

- *Series.to_pickle()* and *DataFrame.to_pickle()* have gained a *protocol* parameter (GH16252). By default, this parameter is set to *HIGHEST_PROTOCOL*

- *read_feather()* has gained the *nthreads* parameter for multi-threaded operations (GH16359)

- *Series.to_pickle()* and *DataFrame.to_pickle()* have gained an *inplace* argument. (GH15388)

- *crosstab()* has gained a *margins_name* parameter to define the name of the row / column that will contain the totals when *margins=True*. (GH15972)

- *read_json()* now accepts a *chunksize* parameter that can be used when *lines=True*. If *chunksize* is passed, *read_json* now returns an iterator which reads in *chunksize* lines with each iteration. (GH17048)

- *read_json()* and *to_json()* now accept a *compression* argument which allows them to transparently handle compressed files. (GH17798)

Various enhancements

- Improved the import time of pandas by about 2.25x. (GH16764)

- Support for PEP 519 – Adding a file system path protocol on most readers (e.g. *read_csv()* and writers (e.g. *DataFrame.to_csv()*)) (GH13823).

- Added a __fspath__ method to *pd.HDFStore*, *pd.ExcelFile*, and *pd.ExcelWriter* to work properly with the file system path protocol (GH13823).

- The *validate* argument for *merge()* now checks whether a merge is one-to-one, one-to-many, many-to-one, or many-to-many. If a merge is found to not be an example of specified merge type, an exception of type *MergeError* will be raised. For more, see *here* (GH16270)

- Added support for PEP 518 (*pyproject.toml*) to the build system (GH16745)

- *RangeIndex.append()* now returns a *RangeIndex* object when possible (GH16212)

- *Series.rename_axis()* and *DataFrame.rename_axis()* with *inplace=True* now return None while renaming the axis inplace. (GH15704)

- *api.types.infer_dtype()* now infers decimals. (GH15690)

- *DataFrame.select_dtypes()* now accepts scalar values for include/exclude as well as list-like. (GH16855)

- *date_range()* now accepts ‘YS’ in addition to ‘AS’ as an alias for start of year. (GH9313)

- *date_range()* now accepts ‘Y’ in addition to ‘A’ as an alias for end of year. (GH9313)

- *DataFrame.add_prefix()* and *DataFrame.add_suffix()* now accept strings containing the ‘%’ character. (GH17151)

- Read/write methods that infer compression (*read_csv()*), *read_table()*), *read_pickle()*, and *to_pickle()* can now infer from path-like objects, such as *pathlib.Path*. (GH17206)
• `read_sas()` now recognizes much more of the most frequently used date (datetime) formats in SAS7BDAT files. (GH15871)

• `DataFrame.items()` and `Series.items()` are now present in both Python 2 and 3 and is lazy in all cases. (GH13918, GH17213)

• `pandas.io.formats.style.Styler.where()` has been implemented as a convenience for `pandas.io.formats.style.Styler.applymap()`. (GH17474)

• `MultiIndex.is_monotonic_decreasing()` has been implemented. Previously returned False in all cases. (GH16554)

• `read_excel()` raises ImportError with a better message if `xlrd` is not installed. (GH17613)

• `DataFrame.assign()` will preserve the original order of `**kwargs` for Python 3.6+ users instead of sorting the column names. (GH14207)

• `Series.reindex(), DataFrame.reindex(), Index.get_indexer()` now support list-like argument for tolerance. (GH17367)

**Backwards incompatible API changes**

**Dependencies have increased minimum versions**

We have updated our minimum supported versions of dependencies (GH15206, GH15543, GH15214). If installed, we now require:

<table>
<thead>
<tr>
<th>Package</th>
<th>Minimum Version</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Numpy</td>
<td>1.9.0</td>
<td>X</td>
</tr>
<tr>
<td>Matplotlib</td>
<td>1.4.3</td>
<td></td>
</tr>
<tr>
<td>Scipy</td>
<td>0.14.0</td>
<td></td>
</tr>
<tr>
<td>Bottleneck</td>
<td>1.0.0</td>
<td></td>
</tr>
</tbody>
</table>

Additionally, support has been dropped for Python 3.4 (GH15251).

**Sum/prod of all-NaN or empty Series/DataFrames is now consistently NaN**

**Note:** The changes described here have been partially reverted. See the `v0.22.0 Whatsnew` for more.

The behavior of `sum` and `prod` on all-NaN Series/DataFrames no longer depends on whether bottleneck is installed, and return value of `sum` and `prod` on an empty Series has changed (GH9422, GH15507).

Calling `sum` or `prod` on an empty or all-NaN Series, or columns of a `DataFrame`, will result in NaN. See the docs.

```
In [33]: s = pd.Series([np.nan])
```

Previously WITHOUT bottleneck installed:

```
In [2]: s.sum()
Out[2]: np.nan
```

Previously WITH bottleneck:

```
In [2]: s.sum()
Out[2]: 0.0

New behavior, without regard to the bottleneck installation:

In [34]: s.sum()
Out[34]: 0.0

Note that this also changes the sum of an empty Series. Previously this always returned 0 regardless of a bottleneck installation:

In [1]: pd.Series([]).sum()
Out[1]: 0

but for consistency with the all-NaN case, this was changed to return NaN as well:

In [35]: pd.Series([]).sum()
Out[35]: 0.0

Indexing with a list with missing labels is deprecated

Previously, selecting with a list of labels, where one or more labels were missing would always succeed, returning NaN for missing labels. This will now show a FutureWarning. In the future this will raise a KeyError (GH15747). This warning will trigger on a DataFrame or a Series for using .loc[] or [[]] when passing a list-of-labels with at least 1 missing label. See the deprecation docs.

In [36]: s = pd.Series([1, 2, 3])

In [37]: s
Out[37]:
0  1
1  2
2  3
Length: 3, dtype: int64

Previous behavior

In [4]: s.loc[[1, 2, 3]]
Out[4]:
1  2.0
2  3.0
3  NaN
dtype: float64

Current behavior

In [4]: s.loc[[1, 2, 3]]

Passing list-likes to .loc or [] with any missing label will raise KeyError in the future, you can use .reindex() as an alternative.

See the documentation here:

Out[4]: (continues on next page)
The idiomatic way to achieve selecting potentially not-found elements is via `.reindex()`

```python
In [38]: s.reindex([1, 2, 3])
Out[38]:
   0  2.0
   1  3.0
   2  NaN
Length: 3, dtype: float64
```

Selection with all keys found is unchanged.

```python
In [39]: s.loc[[1, 2]]
Out[39]:
   1  2
   2  3
Length: 2, dtype: int64
```

**NA naming changes**

In order to promote more consistency among the pandas API, we have added additional top-level functions `isna()` and `notna()` that are aliases for `isnull()` and `notnull()`. The naming scheme is now more consistent with methods like `.dropna()` and `.fillna()`. Furthermore in all cases where `.isnull()` and `.notnull()` methods are defined, these have additional methods named `.isna()` and `.notna()`, these are included for classes Categorical, Index, Series, and DataFrame. (GH15001).

The configuration option `pd.options.mode.use_inf_as_null` is deprecated, and `pd.options.mode.use_inf_as_na` is added as a replacement.

**Iteration of Series/Index will now return Python scalars**

Previously, when using certain iteration methods for a Series with dtypes `int` or `float`, you would receive a numpy scalar, e.g. a numpy.int64, rather than a Python int. Issue (GH10904) corrected this for Series.tolist() and list(Series). This change makes all iteration methods consistent, in particular, for __iter__() and .map(); note that this only affects int/float dtypes. (GH13236, GH13258, GH14216).
New behavior:

```python
In [42]: type(list(s)[0])
Out[42]: int
```

Furthermore this will now correctly box the results of iteration for `DataFrame.to_dict()` as well.

```python
In [43]: d = {'a': [1], 'b': ['b']}
In [44]: df = pd.DataFrame(d)
```

Previously:

```python
In [8]: type(df.to_dict()['a'][0])
Out[8]: numpy.int64
```

New behavior:

```python
In [45]: type(df.to_dict()['a'][0])
Out[45]: int
```

### Indexing with a Boolean Index

Previously when passing a boolean `Index` to `.loc`, if the index of the `Series/DataFrame` had boolean labels, you would get a label based selection, potentially duplicating result labels, rather than a boolean indexing selection (where `True` selects elements), this was inconsistent how a boolean numpy array indexed. The new behavior is to act like a boolean numpy array indexer. (GH17738)

Previous behavior:

```python
In [46]: s = pd.Series([1, 2, 3], index=[False, True, False])
In [47]: s
Out[47]:
False 1
True  2
False 3
Length: 3, dtype: int64
```

```python
In [59]: s.loc[pd.Index([True, False, True])]
Out[59]:
True  2
False 1
False 3
True  2
```

Current behavior

```python
In [48]: s.loc[pd.Index([True, False, True])]
Out[48]:
False 1
False 3
Length: 2, dtype: int64
```

Furthermore, previously if you had an index that was non-numeric (e.g. strings), then a boolean Index would raise a `KeyError`. This will now be treated as a boolean indexer.
Previously behavior:

```
In [49]: s = pd.Series([1, 2, 3], index=['a', 'b', 'c'])
In [50]: s
Out[50]:
a 1
b 2
c 3
Length: 3, dtype: int64
```

```
In [39]: s.loc[pd.Index([True, False, True])]
KeyError: "None of [Index([True, False, True], dtype='object')] are in the [index]"
```

Current behavior

```
In [51]: s.loc[pd.Index([True, False, True])]
Out[51]:
a 1
c 3
Length: 2, dtype: int64
```

**PeriodIndex resampling**

In previous versions of pandas, resampling a Series/DataFrame indexed by a PeriodIndex returned a DatetimeIndex in some cases (GH12884). Resampling to a multiplied frequency now returns a PeriodIndex (GH15944). As a minor enhancement, resampling a PeriodIndex can now handle NaT values (GH13224)

Previous behavior:

```
In [1]: pi = pd.period_range('2017-01', periods=12, freq='M')
In [2]: s = pd.Series(np.arange(12), index=pi)
In [3]: resampled = s.resample('2Q').mean()
In [4]: resampled
Out[4]:
2017-03-31  1.0
2017-09-30  5.5
2018-03-31 10.0
Freq: 2Q-DEC, dtype: float64
```

```
In [5]: resampled.index
Out[5]: DatetimeIndex(["2017-03-31", "2017-09-30", "2018-03-31"], dtype='datetime64[ns]', freq='2Q-DEC')
```

New behavior:

```
In [52]: pi = pd.period_range('2017-01', periods=12, freq='M')
In [53]: s = pd.Series(np.arange(12), index=pi)
In [54]: resampled = s.resample('2Q').mean()
In [55]: resampled
```

(continues on next page)
Upsampling and calling `.ohlc()` previously returned a `Series`, basically identical to calling `.asfreq()`. OHLC upsampling now returns a DataFrame with columns `open`, `high`, `low` and `close` (GH13083). This is consistent with downsampling and `DatetimeIndex` behavior.

Previous behavior:

In [1]: pi = pd.period_range(start='2000-01-01', freq='D', periods=10)

In [2]: s = pd.Series(np.arange(10), index=pi)

In [3]: s.resample('H').ohlc()
Out[3]:
2000-01-01 00:00 0.0
... ...
2000-01-10 23:00 NaN
Freq: H, Length: 240, dtype: float64

In [4]: s.resample('M').ohlc()
Out[4]:
open high low close
2000-01 0 9 0 9

New behavior:

In [57]: pi = pd.period_range(start='2000-01-01', freq='D', periods=10)

In [58]: s = pd.Series(np.arange(10), index=pi)

In [59]: s.resample('H').ohlc()
Out[59]:
open high low close
2000-01-01 00:00 0.0 0.0 0.0 0.0
... ...
2000-01-10 19:00 NaN NaN NaN NaN
2000-01-10 20:00 NaN NaN NaN NaN
2000-01-10 21:00 NaN NaN NaN NaN
2000-01-10 22:00 NaN NaN NaN NaN
... ...
2000-01 0 9 0 9

[240 rows x 4 columns]

In [60]: s.resample('M').ohlc()
Out[60]:
open high low close
2000-01 0 9 0 9

(continues on next page)
Improved error handling during item assignment in pd.eval

eval() will now raise a ValueError when item assignment malfunctions, or inplace operations are specified, but there is no item assignment in the expression (GH16732)

Previously, if you attempted the following expression, you would get a not very helpful error message:

```
In [3]: pd.eval("a = 1 + 2", target=arr, inplace=True)
...:
IndexError: only integers, slices (""), ellipsis ("..."), numpy.newaxis ("None")
and integer or boolean arrays are valid indices
```

This is a very long way of saying numpy arrays don’t support string-item indexing. With this change, the error message is now this:

```
In [3]: pd.eval("a = 1 + 2", target=arr, inplace=True)
...
ValueError: Cannot assign expression output to target
```

It also used to be possible to evaluate expressions inplace, even if there was no item assignment:

```
In [4]: pd.eval("1 + 2", target=arr, inplace=True)
Out[4]: 3
```

However, this input does not make much sense because the output is not being assigned to the target. Now, a ValueError will be raised when such an input is passed in:

```
In [4]: pd.eval("1 + 2", target=arr, inplace=True)
...
ValueError: Cannot operate inplace if there is no assignment
```

Dtype conversions

Previously assignments, .where() and .fillna() with a bool assignment, would coerce to the same type (e.g. int / float), or raise for datetimelikes. These will now preserve the bools with object dtypes. (GH16821).

```
in [62]: s = pd.Series([1, 2, 3])

  In [5]: s[1] = True

  In [6]: s
  Out[6]:
  0   1
  1   1
  2   3
dtype: int64
```

New behavior
Previously, as assignment to a datetimelike with a non-datetimelike would coerce the non-datetime-like item being assigned (GH14145).

```python
In [65]: s = pd.Series([pd.Timestamp('2011-01-01'), pd.Timestamp('2012-01-01')])
In [1]: s[1] = 1
In [2]: s
```

```
Out[2]:
0 2011-01-01 00:00:00
1 1970-01-01 00:00:00
dtype: datetime64[ns]
```

These now coerce to `object` dtype.

```python
In [66]: s[1] = 1
In [67]: s
```

```
Out[67]:
0 2011-01-01
1 1
Length: 2, dtype: object
```

- Inconsistent behavior in `.where()` with datetimelikes which would raise rather than coerce to `object` (GH16402)
- Bug in assignment against int64 data with np.ndarray with float64 dtype may keep int64 dtype (GH14001)

**MultiIndex constructor with a single level**

The MultiIndex constructors no longer squeezes a MultiIndex with all length-one levels down to a regular Index. This affects all the MultiIndex constructors. (GH17178)

Previous behavior:

```python
In [2]: pd.MultiIndex.from_tuples([('a',), ('b',)])
```

```
Out[2]: Index(['a', 'b'], dtype='object')
```

Length 1 levels are no longer special-cased. They behave exactly as if you had length 2+ levels, so a `MultiIndex` is always returned from all of the MultiIndex constructors:

```python
In [68]: pd.MultiIndex.from_tuples([('a',), ('b',)])
```

```
Out[68]: MultiIndex([('a',), ('b',)],
                  dtype='object',
                  names=['a', 'b'])
```
UTC localization with Series

Previously, `to_datetime()` did not localize datetime Series data when `utc=True` was passed. Now, `to_datetime()` will correctly localize Series with a `datetime64[ns, UTC]` dtype to be consistent with how list-like and Index data are handled. (GH6415).

Previous behavior

```python
In [69]: s = pd.Series(['20130101 00:00:00'] * 3)
```

```python
In [12]: pd.to_datetime(s, utc=True)
Out[12]:
0    2013-01-01
1    2013-01-01
2    2013-01-01
   dtype: datetime64[ns]
```

New behavior

```python
In [70]: pd.to_datetime(s, utc=True)
Out[70]:
0    2013-01-01 00:00:00+00:00
1    2013-01-01 00:00:00+00:00
2    2013-01-01 00:00:00+00:00
Length: 3, dtype: datetime64[ns, UTC]
```

Additionally, DataFrames with datetime columns that were parsed by `read_sql_table()` and `read_sql_query()` will also be localized to UTC only if the original SQL columns were timezone aware datetime columns.

Consistency of range functions

In previous versions, there were some inconsistencies between the various range functions: `date_range()`, `bdate_range()`, `period_range()`, `timedelta_range()`, and `interval_range()`. (GH17471).

One of the inconsistent behaviors occurred when the `start`, `end` and `period` parameters were all specified, potentially leading to ambiguous ranges. When all three parameters were passed, `interval_range` ignored the `period` parameter, `period_range` ignored the `end` parameter, and the other range functions raised. To promote consistency among the range functions, and avoid potentially ambiguous ranges, `interval_range` and `period_range` will now raise when all three parameters are passed.

Previous behavior:

```python
In [2]: pd.interval_range(start=0, end=4, periods=6)
Out[2]:
IntervalIndex([(0, 1], (1, 2], (2, 3])
   closed='right',
   dtype='interval[int64]')
```

```python
In [3]: pd.period_range(start='2017Q1', end='2017Q4', periods=6, freq='Q')
Out[3]:  PeriodIndex(['2017Q1', '2017Q2', '2017Q3', '2017Q4', '2018Q1', '2018Q2'],
   dtype='period[Q-DEC]', freq='Q-DEC')
```

New behavior:
Additionally, the endpoint parameter end was not included in the intervals produced by `interval_range`. However, all other range functions include end in their output. To promote consistency among the range functions, `interval_range` will now include end as the right endpoint of the final interval, except if freq is specified in a way which skips end.

Previous behavior:

```python
In [4]: pd.interval_range(start=0, end=4)
Out[4]:
IntervalIndex([(0, 1], (1, 2], (2, 3)]
   closed='right',
   dtype='interval[int64]')
```

New behavior:

```python
In [71]: pd.interval_range(start=0, end=4)
Out[71]: IntervalIndex([(0, 1], (1, 2], (2, 3], (3, 4]], dtype='interval[int64, right]')
```

**No automatic Matplotlib converters**

pandas no longer registers our `date`, `time`, `datetime`, `datetime64`, and `Period` converters with matplotlib when pandas is imported. Matplotlib plot methods (`plt.plot`, `ax.plot`, ...), will not nicely format the x-axis for `DatetimeIndex` or `PeriodIndex` values. You must explicitly register these methods:

pandas built-in `Series.plot` and `DataFrame.plot` will register these converters on first-use (GH17710).

**Note:** This change has been temporarily reverted in pandas 0.21.1, for more details see [here](https://github.com/pandas-dev/pandas/issues/17710).

**Other API changes**

- The `Categorical` constructor no longer accepts a scalar for the `categories` keyword. (GH16022)
- Accessing a non-existent attribute on a closed `HDFStore` will now raise an `AttributeError` rather than a `ClosedFileError` (GH16301)
- `read_csv()` now issues a `UserWarning` if the `names` parameter contains duplicates (GH17095)
- `read_csv()` now treats 'null' and 'n/a' strings as missing values by default (GH16471, GH16078)
- `pandas.HDFStore`'s string representation is now faster and less detailed. For the previous behavior, use `pandas.HDFStore.info` (GH16503).
- Compression defaults in HDF stores now follow pytables standards. Default is no compression and if `complib` is missing and `complevel > 0` `zlib` is used (GH15943)
• Index.get_indexer_non_unique() now returns a ndarray indexer rather than an Index; this is consistent with Index.get_indexer() (GH16819)

• Removed the @slow decorator from pandas._testing, which caused issues for some downstream packages’ test suites. Use @pytest.mark.slow instead, which achieves the same thing (GH16850)

• Moved definition of MergeError to the pandas.errors module.

• The signature of Series.set_axis() and DataFrame.set_axis() has been changed from set_axis(axis, labels) to set_axis(labels, axis=0), for consistency with the rest of the API. The old signature is deprecated and will show a FutureWarning (GH14636)

• Series.argmin() and Series.argmax() will now raise a TypeError when used with object dtypes, instead of a ValueError (GH13595)

• Period is now immutable, and will now raise an AttributeError when a user tries to assign a new value to the ordinal or freq attributes (GH17116).

• to_datetime() when passed a tz-aware origin= kwarg will now raise a more informative ValueError rather than a TypeError (GH16842)

• to_datetime() now raises a ValueError when format includes %W or %U without also including day of the week and calendar year (GH16774)

• Renamed non-functional index to index_col in read_stata() to improve API consistency (GH16342)

• Bug in DataFrame.drop() caused boolean labels False and True to be treated as labels 0 and 1 respectively when dropping indices from a numeric index. This will now raise a ValueError (GH16877)

• Restricted DateOffset keyword arguments. Previously, DateOffset subclasses allowed arbitrary keyword arguments which could lead to unexpected behavior. Now, only valid arguments will be accepted. (GH17176).

Deprecations

• DataFrame.from_csv() and Series.from_csv() have been deprecated in favor of read_csv() (GH4191)

• read_excel() has deprecated sheetname in favor of sheet_name for consistency with .to_excel() (GH10559).

• read_excel() has deprecated parse_cols in favor of usecols for consistency with read_csv() (GH4988)

• read_csv() has deprecated the tupleize_cols argument. Column tuples will always be converted to a MultiIndex (GH17060)

• DataFrame.to_csv() has deprecated the tupleize_cols argument. MultiIndex columns will be always written as rows in the CSV file (GH17060)

• The convert parameter has been deprecated in the .take() method, as it was not being respected (GH16948)

• pd.options.html.border has been deprecated in favor of pd.options.display.html.border (GH15793).

• SeriesGroupBy.nth() has deprecated True in favor of 'all' for its kwarg dropna (GH11038).

• DataFrame.as_blocks() is deprecated, as this is exposing the internal implementation (GH17302)

• pd.TimeGrouper is deprecated in favor of pandas.Grouper (GH16747)
• `cdate_range` has been deprecated in favor of `bdate_range()`, which has gained `weekmask` and `holidays` parameters for building custom frequency date ranges. See the documentation for more details (GH17596)

• passing categories or ordered kwargs to `Series.astype()` is deprecated, in favor of passing a `CategoricalDtype` (GH17636)

• `.get_value` and `.set_value` on Series, DataFrame, Panel, SparseSeries, and SparseDataFrame are deprecated in favor of using `.iat[]` or `.at[]` accessors (GH15269)

• Passing a non-existent column in `.to_excel(...)`, `columns=`, is deprecated and will raise a KeyErr in the future (GH17295)

• `raise_on_error` parameter to `Series.where()`, `Series.mask()`, `DataFrame.where()`, `DataFrame.mask()` is deprecated, in favor of `errors=` (GH14968)

• Using `DataFrame.rename_axis()` and `Series.rename_axis()` to alter index or column labels is now deprecated in favor of using `.rename.rename_axis` may still be used to alter the name of the index or columns (GH17833).

• `reindex_axis()` has been deprecated in favor of `reindex()`. See here for more (GH17833).

### Series.select and DataFrame.select

The `Series.select()` and `DataFrame.select()` methods are deprecated in favor of using `df.loc[labels.map(crit)]` (GH12401)

```
In [72]: df = pd.DataFrame({'A': [1, 2, 3]}, index=['foo', 'bar', 'baz'])

In [73]: df.select(lambda x: x in ['bar', 'baz'])
FutureWarning: select is deprecated and will be removed in a future release. You can use .loc[crit] as a replacement
Out[73]:
   A
bar 2
baz 3
```

```
In [73]: df.loc[df.index.map(lambda x: x in ['bar', 'baz'])]
Out[73]:
   A
bar 2
baz 3
[2 rows x 1 columns]
```

### Series.argmax and Series.argmin

The behavior of `Series.argmax()` and `Series.argmin()` have been deprecated in favor of `Series.idxmax()` and `Series.idxmin()`, respectively (GH16830).

For compatibility with NumPy arrays, `pd.Series` implements `argmax` and `argmin`. Since pandas 0.13.0, `argmax` has been an alias for `pandas.Series.idxmax()`, and `argmin` has been an alias for `pandas.Series.idxmin()`. They return the `label` of the maximum or minimum, rather than the `position`.

We’ve deprecated the current behavior of `Series.argmax` and `Series.argmin`. Using either of these will emit a `FutureWarning`. Use `Series.idxmax()` if you want the label of the maximum. Use `Series.values`.

5.9. Version 0.21
argmax() if you want the position of the maximum. Likewise for the minimum. In a future release Series.argmax and Series.argmin will return the position of the maximum or minimum.

Removal of prior version deprecations/changes

- `read_excel()` has dropped the `has_index_names` parameter (GH10967)
- The `pd.options.display.height` configuration has been dropped (GH3663)
- The `pd.options.display.line_width` configuration has been dropped (GH2881)
- The `pd.options.display.mpl_style` configuration has been dropped (GH12190)
- Index has dropped the `.sym_diff()` method in favor of `.symmetric_difference()` (GH12591)
- Categorical has dropped the `.order()` and `.sort()` methods in favor of `.sort_values()` (GH12882)
- `eval()` and `DataFrame.eval()` have changed the default of `inplace` from `None` to `False` (GH11149)
- The function `get_offset_name` has been dropped in favor of the `.freqstr` attribute for an offset (GH11834)
- pandas no longer tests for compatibility with hdf5-files created with pandas < 0.11 (GH17404).

Performance improvements

- Improved performance of instantiating `SparseDataFrame` (GH16773)
- `Series.dt` no longer performs frequency inference, yielding a large speedup when accessing the attribute (GH17210)
- Improved performance of `set_categories()` by not materializing the values (GH17508)
- `Timestamp.microsecond` no longer re-computes on attribute access (GH17331)
- Improved performance of the `CategoricalIndex` for data that is already categorical dtype (GH17513)
- Improved performance of `RangeIndex.min()` and `RangeIndex.max()` by using `RangeIndex` properties to perform the computations (GH17607)

Documentation changes

- Several `NaT` method docstrings (e.g. `NaT.ctime()`) were incorrect (GH17327)
- The documentation has had references to versions < v0.17 removed and cleaned up (GH17442, GH17442, GH17404 & GH17504)

Bug fixes

Conversion

- Bug in assignment against datetime-like data with `int` may incorrectly convert to datetime-like (GH14145)
- Bug in assignment against `int64` data with `np.ndarray` with `float64` dtype may keep `int64` dtype (GH14001)
- Fixed the return type of `IntervalIndex.is_non_overlapping_monotonic` to be a Python `bool` for consistency with similar attributes/methods. Previously returned a `numpy.bool_`. (GH17237)
• Bug in `IntervalIndex.is_non_overlapping_monotonic` when intervals are closed on both sides and overlap at a point (GH16560)

• Bug in `Series.fillna()` returns frame when `inplace=True` and `value` is dict (GH16156)

• Bug in `Timestamp.weekday_name` returning a UTC-based weekday name when localized to a timezone (GH17354)

• Bug in `Timestamp.replace` when replacing `tzinfo` around DST changes (GH15683)

• Bug in `Timedelta` construction and arithmetic that would not propagate the `Overflow` exception (GH17367)

• Bug in `astype()` converting to object dtype when passed extension type classes (`DatetimeTZDtype`, `CategoricalDtype`) rather than instances. Now a `TypeError` is raised when a class is passed (GH17780).

• Bug in `to_numeric()` in which elements were not always being coerced to numeric when `errors='coerce'` (GH17007, GH17125)

• Bug in `DataFrame` and `Series` constructors where `range` objects are converted to `int32` dtype on Windows instead of `int64` (GH16804)

Indexing

• When called with a null slice (e.g. `df.iloc[:],`) the `.iloc` and `.loc` indexers return a shallow copy of the original object. Previously they returned the original object. (GH13873).

• When called on an unsorted `MultiIndex`, the `.loc` indexer now will raise `UnsortedIndexError` only if proper slicing is used on non-sorted levels (GH16734).

• Fixes regression in 0.20.3 when indexing with a string on a `TimedeltaIndex` (GH16896).

• Fixed `TimedeltaIndex.get_loc()` handling of `np.timedelta64` inputs (GH16909).

• Fix `MultiIndex.sort_index()` ordering when `ascending` argument is a list, but not all levels are specified, or are in a different order (GH16934).

• Fixes bug where indexing with `np.inf` caused an `OverflowError` to be raised (GH16957)

• Bug in reindexing on an empty `CategoricalIndex` (GH16770)

• Fixes `DataFrame.loc` for setting with alignment and tz-aware DatetimeIndex (GH16889)

• Avoids `IndexError` when passing an Index or Series to `.iloc` with older numpy (GH17193)

• Allow unicode empty strings as placeholders in multilevel columns in Python 2 (GH17099)

• Bug in `.iloc` when used with inplace addition or assignment and an int indexer on a `MultiIndex` causing the wrong indexes to be read from and written to (GH17148)

• Bug in `.isin()` in which checking membership in empty `Series` objects raised an error (GH16991)

• Bug in `CategoricalIndex` reindexing in which specified indices containing duplicates were not being respected (GH17323)

• Bug in intersection of `RangeIndex` with negative step (GH17296)

• Bug in `IntervalIndex` where performing a scalar lookup fails for included right endpoints of non-overlapping monotonic decreasing indexes (GH16417, GH17271)

• Bug in `DataFrame.first_valid_index()` and `DataFrame.last_valid_index()` when no valid entry (GH17400)

• Bug in `Series.rename()` when called with a callable, incorrectly alters the name of the `Series`, rather than the name of the `Index`. (GH17407)
• Bug in `String.str_get()` raises `IndexError` instead of inserting NaNs when using a negative index. (GH17704)

IO

• Bug in `read_hdf()` when reading a timezone aware index from fixed format HDFStore (GH17618)
• Bug in `read_csv()` in which columns were not being thoroughly de-duplicated (GH17060)
• Bug in `read_csv()` in which specified column names were not being thoroughly de-duplicated (GH17095)
• Bug in `read_csv()` in which non integer values for the header argument generated an unhelpful / unrelated error message (GH16338)
• Bug in `read_csv()` in which memory management issues in exception handling, under certain conditions, would cause the interpreter to segfault (GH14696, GH16798).
• Bug in `read_csv()` when called with `low_memory=False` in which a CSV with at least one column > 2GB in size would incorrectly raise a `MemoryError` (GH16798).
• Bug in `read_csv()` when called with a single-element list `header` would return a `DataFrame` of all NaN values (GH7757)
• Bug in `DataFrame.to_csv()` defaulting to ‘ascii’ encoding in Python 3, instead of ‘utf-8’ (GH17097)
• Bug in `read_stata()` where value labels could not be read when using an iterator (GH16923)
• Bug in `read_stata()` where the index was not set (GH16342)
• Bug in `read_html()` where import check fails when run in multiple threads (GH16928)
• Bug in `read_csv()` where automatic delimiter detection caused a `TypeError` to be thrown when a bad line was encountered rather than the correct error message (GH13374)
• Bug in `DataFrame.to_html()` with `notebook=True` where DataFrames with named indices or non-MultiIndex indices had undesired horizontal or vertical alignment for column or row labels, respectively (GH16792)
• Bug in `DataFrame.to_html()` in which there was no validation of the `justify` parameter (GH17527)
• Bug in `HDFStore.select()` when reading a contiguous mixed-data table featuring VLArray (GH17021)
• Bug in `to_json()` where several conditions (including objects with unprintable symbols, objects with deep recursion, overload labels) caused segfaults instead of raising the appropriate exception (GH14256)

Plotting

• Bug in plotting methods using `secondary_y` and `fontsize` not setting secondary axis font size (GH12565)
• Bug when plotting `timedelta` and `datetime dtypes` on y-axis (GH16953)
• Line plots no longer assume monotonic x data when calculating xlims, they show the entire lines now even for unsorted x data. (GH11310, GH11471)
• With matplotlib 2.0.0 and above, calculation of x limits for line plots is left to matplotlib, so that its new default settings are applied. (GH15495)
• Bug in `Series.plot.bar` or `DataFrame.plot.bar` with `y` not respecting user-passed color (GH16822)
• Bug causing `plotting.parallel_coordinates` to reset the random seed when using random colors (GH17525)
GroupBy/resample/rolling

- Bug in `DataFrame.resample(...)`.size() where an empty DataFrame did not return a Series (GH14962)
- Bug in `infer_freq()` causing indices with 2-day gaps during the working week to be wrongly inferred as business daily (GH16624)
- Bug in `.rolling(...)`.quantile() which incorrectly used different defaults than `Series.quantile()` and `DataFrame.quantile()` (GH9413, GH16211)
- Bug in `groupby.transform()` that would coerce boolean dtypes back to float (GH16875)
- Bug in `Series.resample(...)`.apply() where an empty Series modified the source index and did not return the name of a Series (GH14313)
- Bug in `.rolling(...)`.apply(...) with a DataFrame with a DatetimeIndex, a window of a timedelta-convertible and min_periods >= 1 (GH15305)
- Bug in `DataFrame.groupby` where index and column keys were not recognized correctly when the number of keys equaled the number of elements on the groupby axis (GH16859)
- Bug in `groupby.nunique()` with TimeGrouper which cannot handle NaT correctly (GH17575)
- Bug in `DataFrame.groupby` where a single level selection from a MultiIndex unexpectedly sorts (GH17537)
- Bug in `DataFrame.groupby` where spurious warning is raised when Grouper object is used to override ambiguous column name (GH17383)
- Bug in `TimeGrouper` differs when passes as a list and as a scalar (GH17530)

Sparse

- Bug in `SparseSeries` raises `AttributeError` when a dictionary is passed in as data (GH16905)
- Bug in `SparseDataFrame.fillna()` not filling all NaNs when frame was instantiated from SciPy sparse matrix (GH16112)
- Bug in `SparseSeries.unstack()` and `SparseDataFrame.stack()` (GH16614, GH15045)
- Bug in `make_sparse()` treating two numeric/boolean data, which have same bits, as same when array dtype is object (GH17574)
- `SparseArray.all()` and `SparseArray.any()` are now implemented to handle `SparseArray`, these were used but not implemented (GH17570)

Reshaping

- Joining/Merging with a non unique `PeriodIndex` raised a `TypeError` (GH16871)
- Bug in `crosstab()` where non-aligned series of integers were casted to float (GH17005)
- Bug in merging with categorical dtypes with datetimelikes incorrectly raised a `TypeError` (GH16900)
- Bug when using `isin()` on a large object series and large comparison array (GH16012)
- Fixes regression from 0.20, `Series.aggregate()` and `DataFrame.aggregate()` allow dictionaries as return values again (GH16741)
- Fixes dtype of result with integer dtype input, from `pivot_table()` when called with `margins=True` (GH17013)
- Bug in `crosstab()` where passing two `Series` with the same name raised a `KeyError` (GH13279)
- `Series.argmin()`, `Series.argmax()`, and their counterparts on `DataFrame` and groupby objects work correctly with floating point data that contains infinite values (GH13595).
- Bug in `unique()` where checking a tuple of strings raised a `TypeError` (GH17108)
- Bug in `concat()` where order of result index was unpredictable if it contained non-comparable elements (GH17344)
- Fixes regression when sorting by multiple columns on a `datetime64` dtype `Series` with `NaT` values (GH16836)
- Bug in `pivot_table()` where the result’s columns did not preserve the categorical dtype of columns when `dropna` was `False` (GH17842)
- Bug in `DataFrame.drop_duplicates` where dropping with non-unique column names raised a `ValueError` (GH17836)
- Bug in `unstack()` which, when called on a list of levels, would discard the `fillna` argument (GH13971)
- Bug in the alignment of `range` objects and other list-likes with `DataFrame` leading to operations being performed row-wise instead of column-wise (GH17901)

**Numeric**

- Bug in `.clip()` with `axis=1` and a list-like for `threshold` is passed; previously this raised `ValueError` (GH15390)
- `Series.clip()` and `DataFrame.clip()` now treat NA values for upper and lower arguments as `None` instead of raising `ValueError` (GH17276).

**Categorical**

- Bug in `Series.isin()` when called with a categorical (GH16639)
- Bug in the categorical constructor with empty values and categories causing the `.categories` to be an empty `Float64Index` rather than an empty `Index` with object dtype (GH17248)
- Bug in categorical operations with `Series.cat` not preserving the original `Series`’ name (GH17509)
- Bug in `DataFrame.merge()` failing for categorical columns with boolean/int data types (GH17187)
- Bug in constructing a `Categorical/CategoricalDtype` when the specified `categories` are of categorical type (GH17884).
PyPy

• Compatibility with PyPy in `read_csv()` with `usecols=[<unsorted ints>]` and `read_json()` (GH17351)
• Split tests into cases for CPython and PyPy where needed, which highlights the fragility of index matching with `float('nan'), np.nan` and `NAT` (GH17351)
• Fix `DataFrame.memory_usage()` to support PyPy. Objects on PyPy do not have a fixed size, so an approximation is used instead (GH17228)

Other

• Bug where some inplace operators were not being wrapped and produced a copy when invoked (GH12962)
• Bug in `eval()` where the `inplace` parameter was being incorrectly handled (GH16732)

5.10 Version 0.20

5.10.1 Version 0.20.3 (July 7, 2017)

This is a minor bug-fix release in the 0.20.x series and includes some small regression fixes and bug fixes. We recommend that all users upgrade to this version.

### What’s new in v0.20.3

- **Bug fixes**
  - **Conversion**
  - **Indexing**
  - **IO**
  - **Plotting**
  - **Reshaping**
  - **Categorical**
- **Contributors**

### Bug fixes

- Fixed a bug in failing to compute rolling computations of a column-MultiIndexed DataFrame (GH16789, GH16825)
- Fixed a pytest marker failing downstream packages’ tests suites (GH16680)

### Conversion

- Bug in pickle compat prior to the v0.20.x series, when UTC is a timezone in a Series/DataFrame/Index (GH16608)
- Bug in Series construction when passing a Series with dtype='category' (GH16524).
- Bug in DataFrame.astype() when passing a Series as the dtype kwarg. (GH16717).
Indexing

- Bug in `Float64Index` causing an empty array instead of `None` to be returned from `.get(np.nan)` on a Series whose index did not contain any NaNs (GH8569)
- Bug in `MultiIndex.isin` causing an error when passing an empty iterable (GH16777)
- Fixed a bug in a slicing DataFrame/Series that have a `TimedeltaIndex` (GH16637)

IO

- Bug in `read_csv()` in which files weren’t opened as binary files by the C engine on Windows, causing EOF characters mid-field, which would fail (GH16039, GH16559, GH16675)
- Bug in `read_hdf()` in which reading a Series saved to an HDF file in ‘fixed’ format fails when an explicit `mode='r'` argument is supplied (GH16583)
- Bug in `DataFrame.to_latex()` where `bold_rows` was wrongly specified to be `True` by default, whereas in reality row labels remained non-bold whatever parameter provided. (GH16707)
- Fixed an issue with `DataFrame.style()` where generated element ids were not unique (GH16780)
- Fixed loading a DataFrame with a `PeriodIndex`, from a format='fixed' HDFStore, in Python 3, that was written in Python 2 (GH16781)

Plotting

- Fixed regression that prevented RGB and RGBA tuples from being used as color arguments (GH16233)
- Fixed an issue with `DataFrame.plot.scatter()` that incorrectly raised a `KeyError` when categorical data is used for plotting (GH16199)

Reshaping

- `PeriodIndex/TimedeltaIndex.join` was missing the `sort=` kwarg (GH16541)
- Bug in joining on a `MultiIndex` with a category dtype for a level (GH16627).
- Bug in `merge()` when merging/joining with multiple categorical columns (GH16767)

Categorical

- Bug in `DataFrame.sort_values` not respecting the `kind` parameter with categorical data (GH16793)

5.10.2 Version 0.20.2 (June 4, 2017)

This is a minor bug-fix release in the 0.20.x series and includes some small regression fixes, bug fixes and performance improvements. We recommend that all users upgrade to this version.

What’s new in v0.20.2

• Enhancements
• Performance improvements
• Bug fixes
  – Conversion
  – Indexing
  – IO
  – Plotting
Enhancements

• Series provides a to_latex method (GH16180)

• A new groupby method ngroup(), parallel to the existing cumcount(), has been added to return the group order (GH11642); see here.

Performance improvements

• Performance regression fix when indexing with a list-like (GH16285)

• Performance regression fix for MultiIndexes (GH16319, GH16346)

• Improved performance of .clip() with scalar arguments (GH15400)

• Improved performance of groupby with categorical groupers (GH16413)

• Improved performance of MultiIndex.remove_unused_levels() (GH16556)

Bug fixes

• Silenced a warning on some Windows environments about “tput: terminal attributes: No such device or address” when detecting the terminal size. This fix only applies to python 3 (GH16496)

• Bug in using pathlib.Path or py.path.local objects with io functions (GH16291)

• Bug in Index.symmetric_difference() on two equal MultiIndex’s, results in a TypeError (GH13490)

• Bug in DataFrame.update() with overwrite=False and NaN values (GH15593)

• Passing an invalid engine to read_csv() now raises an informative ValueError rather than UnboundLocalError (GH16511)

• Bug in unique() on an array of tuples (GH16519)

• Bug in cut() when labels are set, resulting in incorrect label ordering (GH16459)

• Fixed a compatibility issue with IPython 6.0’s tab completion showing deprecation warnings on Categoricals (GH16409)
Conversion

- **Bug in `to_numeric()`** in which empty data inputs were causing a segfault of the interpreter (GH16302)
- **Silence numpy warnings when broadcasting DataFrame to Series with comparison ops** (GH16378, GH16306)

Indexing

- **Bug in `DataFrame.reset_index(level=)`** with single level index (GH16263)
- **Bug in partial string indexing with a monotonic, but not strictly-monotonic, index incorrectly reversing the slice bounds** (GH16515)
- **Bug in `MultiIndex.remove_unused_levels()`** that would not return a `MultiIndex` equal to the original. (GH16556)

IO

- **Bug in `read_csv()`** when comment is passed in a space delimited text file (GH16472)
- **Bug in `read_csv()`** not raising an exception with nonexistent columns in `usecols` when it had the correct length (GH14671)
- **Bug that would force importing of the clipboard routines unnecessarily, potentially causing an import error on startup** (GH16288)
- **Bug that raised IndexError when HTML-rendering an empty DataFrame** (GH15953)
- **Bug in `read_csv()`** in which tarfile object inputs were raising an error in Python 2.x for the C engine (GH16530)
- **Bug where `DataFrame.to_html()` ignored the `index_names` parameter** (GH16493)
- **Bug where `pd.read_hdf()` returns numpy strings for index names** (GH13492)
- **Bug in `HDFStore.select_as_multiple()`** where start/stop arguments were not respected (GH16209)

Plotting

- **Bug in `DataFrame.plot`** with a single column and a list-like color (GH3486)
- **Bug in `plot` where NaT in DatetimeIndex results in Timestamp.min** (GH12405)
- **Bug in `DataFrame.boxplot` where figsize keyword was not respected for non-grouped boxplots** (GH11959)
GroupBy/resample/rolling

- Bug in creating a time-based rolling window on an empty DataFrame (GH15819)
- Bug in rolling.cov() with offset window (GH16058)
- Bug in .resample() and .groupby() when aggregating on integers (GH16361)

Sparse

- Bug in construction of SparseDataFrame from scipy.sparse.dok_matrix (GH16179)

Reshaping

- Bug in DataFrame.stack with unsorted levels in MultiIndex columns (GH16323)
- Bug in pd.wide_to_long() where no error was raised when i was not a unique identifier (GH16382)
- Bug in Series.isin(..) with a list of tuples (GH16394)
- Bug in construction of a DataFrame with mixed dtypes including an all-NaT column. (GH16395)
- Bug in DataFrame.agg() and Series.agg() with aggregating on non-callable attributes (GH16405)

Numeric

- Bug in .interpolate(), where limit_direction was not respected when limit=None (default) was passed (GH16282)

Categorical

- Fixed comparison operations considering the order of the categories when both categoricals are unordered (GH16014)

Other

- Bug in DataFrame.drop() with an empty-list with non-unique indices (GH16270)

Contributors

A total of 34 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

- Aaron Barber +
- Andrew +
- Becky Sweger +
- Christian Prinoth +
- Christian Stade-Schuldt +
- DSM
Highlights include:

- **New** `agg()` API for Series/DataFrame similar to the groupby-rolling-resample API’s, see [here](#).
- Integration with the [feather-format](#), including a new top-level `pd.read_feather()` and `DataFrame.to_feather()` method, see [here](#).

---

5.10. Version 0.20

This is a major release from 0.19.2 and includes a number of API changes, deprecations, new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

Highlights include:

- **New** `agg()` API for Series/DataFrame similar to the groupby-rolling-resample API’s, see [here](#).
- Integration with the [feather-format](#), including a new top-level `pd.read_feather()` and `DataFrame.to_feather()` method, see [here](#).
• The .ix indexer has been deprecated, see here
• Panel has been deprecated, see here
• Addition of an IntervalIndex and Interval scalar type, see here
• Improved user API when grouping by index levels in .groupby(), see here
• Improved support for UInt64 dtypes, see here
• A new orient for JSON serialization, orient='table', that uses the Table Schema spec and that gives the possibility for a more interactive repr in the Jupyter Notebook, see here
• Experimental support for exporting styled DataFrames (DataFrame.style) to Excel, see here
• Window binary corr/cov operations now return a MultiIndexed DataFrame rather than a Panel, as Panel is now deprecated, see here
• Support for S3 handling now uses s3fs, see here
• Google BigQuery support now uses the pandas-gbq library, see here

Warning: pandas has changed the internal structure and layout of the code base. This can affect imports that are not from the top-level pandas.* namespace, please see the changes here.

Check the API Changes and deprecations before updating.

Note: This is a combined release for 0.20.0 and 0.20.1. Version 0.20.1 contains one additional change for backwards-compatibility with downstream projects using pandas’ utils routines. (GH16250)
- Possible incompatibility for HDF5 formats created with pandas < 0.13.0
- Map on Index types now return other Index types
- Accessing datetime fields of Index now return Index
- pd.unique will now be consistent with extension types
- S3 file handling
- Partial string indexing changes
- Concat of different float dtypes will not automatically upcast
- pandas Google BigQuery support has moved
- Memory usage for Index is more accurate
- DataFrame.sort_index changes
- GroupBy describe formatting
- Window binary corr/cov operations return a MultiIndex DataFrame
- HDFStore where string comparison
- Index.intersection and inner join now preserve the order of the left Index
- Pivot table always returns a DataFrame
- Other API changes

• Reorganization of the library: privacy changes
  - Modules privacy has changed
    - pandas.errors
    - pandas.testing
    - pandas.plotting
  - Other development changes

• Deprecations
  - Deprecate .ix
  - Deprecate Panel
  - Deprecate groupby.agg() with a dictionary when renaming
  - Deprecate .plotting
  - Other deprecations

• Removal of prior version deprecations/changes

• Performance improvements

• Bug fixes
  - Conversion
  - Indexing
  - IO
  - Plotting
New features

Method `agg` API for DataFrame/Series

Series & DataFrame have been enhanced to support the aggregation API. This is a familiar API from groupby, window operations, and resampling. This allows aggregation operations in a concise way by using `agg()` and `transform()`. The full documentation is here (GH1623).

Here is a sample

```python
In [1]: df = pd.DataFrame(np.random.randn(10, 3), columns=['A', 'B', 'C'],
                        index=pd.date_range('1/1/2000', periods=10))

In [2]: df.iloc[3:7] = np.nan

In [3]: df

Out[3]:
          A         B         C
2000-01-01  0.469112 -0.282863 -1.509059
2000-01-02 -1.135632  1.212112 -0.173215
2000-01-03  0.119209 -1.044236 -0.861849
2000-01-04     NaN     NaN     NaN
2000-01-05     NaN     NaN     NaN
2000-01-06     NaN     NaN     NaN
2000-01-07     NaN     NaN     NaN
2000-01-08  0.113648 -1.478427  0.524988
2000-01-09  0.404705  0.577046 -1.715002
2000-01-10 -1.039268 -0.370647 -1.157892

[10 rows x 3 columns]
```

One can operate using string function names, callables, lists, or dictionaries of these.

Using a single function is equivalent to `.apply`.

```python
In [4]: df.agg('sum')

Out[4]:
          A         B         C
A -1.068226 -1.387015 -4.892029
B  NaN       NaN       NaN
C  NaN       NaN       NaN
Length: 3, dtype: float64
```

Multiple aggregations with a list of functions.
In [5]: df.agg(["sum", "min"])
Out[5]:
     A     B     C
sum -1.068226 -1.387015 -4.892029
min  -1.135632 -1.478427 -1.715002

[2 rows x 3 columns]

Using a dict provides the ability to apply specific aggregations per column. You will get a matrix-like output of all of the aggregators. The output has one column per unique function. Those functions applied to a particular column will be NaN:

In [6]: df.agg({'A': ["sum", "min"], 'B': ['min', 'max']})
Out[6]:
     A     B
sum -1.068226 NaN
min -1.135632 -1.478427
max NaN 1.212112

[3 rows x 2 columns]

The API also supports a .transform() function for broadcasting results.

In [7]: df.transform(['abs', lambda x: x - x.min()])
Out[7]:
     A     B     C
2000-01-01 0.469112 1.604745 0.282863 1.195563 1.509059 0.205944
2000-01-02 1.135632 0.000000 1.212112 2.690539 0.173215 1.541787
2000-01-03 0.119209 1.254841 1.044236 0.434191 0.861849 0.853153
2000-01-04 NaN NaN NaN NaN NaN NaN
2000-01-05 NaN NaN NaN NaN NaN NaN
2000-01-06 NaN NaN NaN NaN NaN NaN
2000-01-07 NaN NaN NaN NaN NaN NaN
2000-01-08 0.113648 1.249281 1.478427 0.000000 0.524988 2.239990
2000-01-09 0.404705 1.540338 0.577046 2.055473 1.715002 0.000000
2000-01-10 1.039268 0.096364 0.370647 1.107780 1.157892 0.557110

[10 rows x 6 columns]

When presented with mixed dtypes that cannot be aggregated, .agg() will only take the valid aggregations. This is similar to how groupby .agg() works. (GH15015)

In [8]: df = pd.DataFrame({"A": [1, 2, 3],
                      ...
                      "B": [1.0, 2.0, 3.0],
                      ...
                      "C": ["foo", "bar", "baz"],
                      ...
                      "D": pd.date_range('20130101', periods=3)})

In [9]: df.dtypes
Out[9]:
A     int64
B    float64
C     object
D  datetime64[ns]
Length: 4, dtype: object
In [10]: df.agg(['min', 'sum'])
Out[10]:
     A   B   C    D
min  1  1.0  bar 2013-01-01
sum  6  6.0 foobarbaz    NaT
[2 rows x 4 columns]

Keyword argument `dtype` for data IO

The 'python' engine for `read_csv()`, as well as the `read_fwf()` function for parsing fixed-width text files and `read_excel()` for parsing Excel files, now accept the `dtype` keyword argument for specifying the types of specific columns (GH14295). See the `io docs` for more information.

In [11]: data = "a   b
1   2
3   4"

In [12]: pd.read_fwf(StringIO(data)).dtypes
Out[12]:
a    int64
b    int64
Length: 2, dtype: object

In [13]: pd.read_fwf(StringIO(data), dtype={'a': 'float64', 'b': 'object'}).dtypes
Out[13]:
a    float64
b    object
Length: 2, dtype: object

Method `.to_datetime()` has gained an `origin` parameter

`.to_datetime()` has gained a new parameter, `origin`, to define a reference date from where to compute the resulting timestamps when parsing numerical values with a specific unit specified. (GH11276, GH11745)

For example, with 1960-01-01 as the starting date:

In [14]: pd.to_datetime([1, 2, 3], unit='D', origin=pd.Timestamp('1960-01-01'))
Out[14]: DatetimeIndex(['1960-01-02', '1960-01-03', '1960-01-04'], dtype='datetime64[ns]', freq=None)

The default is set at `origin='unix'`, which defaults to 1970-01-01 00:00:00, which is commonly called ‘unix epoch’ or POSIX time. This was the previous default, so this is a backward compatible change.

In [15]: pd.to_datetime([1, 2, 3], unit='D')
Out[15]: DatetimeIndex(['1970-01-02', '1970-01-03', '1970-01-04'], dtype='datetime64[ns]', freq=None)
GroupBy enhancements

Strings passed to `DataFrame.groupby()` as the by parameter may now reference either column names or index level names. Previously, only column names could be referenced. This allows to easily group by a column and index level at the same time. (GH5677)

```python
In [16]: arrays = [['bar', 'bar', 'baz', 'baz', 'foo', 'foo', 'qux', 'qux'],
            ['one', 'two', 'one', 'two', 'one', 'two', 'one', 'two']]
In [17]: index = pd.MultiIndex.from_arrays(arrays, names=['first', 'second'])
In [18]: df = pd.DataFrame({'A': [1, 1, 1, 1, 2, 2, 3, 3],
                      'B': np.arange(8),
                      index=index)
In [19]: df
Out[19]:
     A B  
first  
  bar one 1 0
  two  1 1
  baz one 1 2
  two  1 3
  foo one 2 4
  two  2 5
  qux one 3 6
  two  3 7
[8 rows x 2 columns]
In [20]: df.groupby(['second', 'A']).sum()
Out[20]:
   B
second A
  one  2
     4
     6
  two  4
     5
     7
[6 rows x 1 columns]
```

Better support for compressed URLs in `read_csv`

The compression code was refactored (GH12688). As a result, reading dataframes from URLs in `read_csv()` or `read_table()` now supports additional compression methods: xz, bz2, and zip (GH14570). Previously, only gzip compression was supported. By default, compression of URLs and paths are now inferred using their file extensions. Additionally, support for bz2 compression in the python 2 C-engine improved (GH14874).

```python
In [21]: url = ('https://github.com/{repo}/raw/{branch}/{path}'
            .format(repo='pandas-dev/pandas',
                    branch='master',
            (continues on next page))
```
...:
  path='pandas/tests/io/parser/data/salaries.csv.bz2')

# default, infer compression
In [22]: df = pd.read_csv(url, sep='\t', compression='infer')

# explicitly specify compression
In [23]: df = pd.read_csv(url, sep='\t', compression='bz2')

In [24]: df.head(2)
Out[24]:
   S    X   E   M
 0  13876  1  1  1
 1  11608  1  3  0
[2 rows x 4 columns]

Pickle file IO now supports compression

*read_pickle()*, *DataFrame.to_pickle()* and *Series.to_pickle()* can now read from and write to compressed pickle files. Compression methods can be an explicit parameter or be inferred from the file extension. See the docs here.

In [25]: df = pd.DataFrame({'A': np.random.randn(1000),
   .....:   'B': 'foo',
   .....:   'C': pd.date_range('20130101', periods=1000, freq='s')})

Using an explicit compression type

In [26]: df.to_pickle("data.pkl.compress", compression="gzip")
In [27]: rt = pd.read_pickle("data.pkl.compress", compression="gzip")
In [28]: rt.head()
Out[28]:
   A          B          C
 0 -1.344312 foo 2013-01-01 00:00:00
 1  0.844885 foo 2013-01-01 00:00:01
 2  1.075770 foo 2013-01-01 00:00:02
 3 -0.109050 foo 2013-01-01 00:00:03
 4  1.643563 foo 2013-01-01 00:00:04

[5 rows x 3 columns]

The default is to infer the compression type from the extension (compression='infer'):

In [29]: df.to_pickle("data.pkl.gz")
In [30]: rt = pd.read_pickle("data.pkl.gz")
In [31]: rt.head()
Out[31]:
   A          B          C
 0 -1.344312 foo 2013-01-01 00:00:00
pandas: powerful Python data analysis toolkit, Release 1.3.1

3 -0.109050
4  1.643563
Name: A, Length: 5, dtype: float64

UInt64 support improved

pandas has significantly improved support for operations involving unsigned, or purely non-negative, integers. Previously, handling these integers would result in improper rounding or data-type casting, leading to incorrect results. Notably, a new numerical index, UInt64Index, has been created (GH14937)

In [35]: idx = pd.UInt64Index([1, 2, 3])

In [36]: df = pd.DataFrame({'A': ['a', 'b', 'c']}, index=idx)

In [37]: df.index

Out[37]: UInt64Index([1, 2, 3], dtype='uint64')

- Bug in converting object elements of array-like objects to unsigned 64-bit integers (GH4471, GH14982)
- Bug in Series.unique() in which unsigned 64-bit integers were causing overflow (GH14721)
- Bug in DataFrame construction in which unsigned 64-bit integer elements were being converted to objects (GH14881)
- Bug in pd.read_csv() in which unsigned 64-bit integer elements were being improperly converted to the wrong data types (GH14983)
- Bug in pd.unique() in which unsigned 64-bit integers were causing overflow (GH14915)
- Bug in pd.value_counts() in which unsigned 64-bit integers were being erroneously truncated in the output (GH14934)
GroupBy on categoricals

In previous versions, `.groupby(..., sort=False)` would fail with a `ValueError` when grouping on a categorical series with some categories not appearing in the data. (GH13179)

```python
In [38]: chromosomes = np.r_[np.arange(1, 23).astype(str), ['X', 'Y']]
In [39]: df = pd.DataFrame({
      ....: 'A': np.random.randint(100),
      ....: 'B': np.random.randint(100),
      ....: 'C': np.random.randint(100),
      ....: 'chromosomes': pd.Categorical(np.random.choice(chromosomes, 100), categories=chromosomes, ordered=True)}
In [40]: df
Out[40]:
    A   B   C   chromosomes
0  87  22  81     4
1  87  22  81     13
2  87  22  81     22
3  87  22  81     2
4  87  22  81     6
... ... ... ...
95  87  22  81     8
96  87  22  81     11
97  87  22  81     X
98  87  22  81     1
99  87  22  81     19
[100 rows x 4 columns]

Previous behavior:

```python
In [3]: df[df.chromosomes != '1'].groupby('chromosomes', sort=False).sum()
---------------------------------------------------------------------------
ValueError: items in new_categories are not the same as in old categories
```

New behavior:

```python
In [41]: df[df.chromosomes != '1'].groupby('chromosomes', sort=False).sum()
Out[41]:
   A   B   C   chromosomes
  2  348  88  324
  3  348  88  324
  4  348  88  324
  5  261  66  243
  6  174  44  162
  ...  ...  ...  ...
  22  348  88  324
 X  348  88  324
 Y  435  110  405
 1   0   0   0
 21   0   0   0
[24 rows x 3 columns]
```
Table schema output

The new orient 'table' for `DataFrame.to_json()` will generate a Table Schema compatible string representation of the data.

```python
In [42]: df = pd.DataFrame(
       ...:
       ...: {'A': [1, 2, 3],
       ...: 'B': ['a', 'b', 'c'],
       ...: 'C': pd.date_range('2016-01-01', freq='d', periods=3),
       ...: index=pd.Index(range(3), name='idx'))
       ...

In [43]: df
Out[43]:
    A  B    C
   idx
0  1  a  2016-01-01
1  2  b  2016-01-02
2  3  c  2016-01-03
[3 rows x 3 columns]

In [44]: df.to_json(orient='table')
Out[44]:
'{"schema":{"fields":[{"name":"idx","type":"integer"},
{"name":"A","type":"integer"},
{"name":"B","type":"string"},
{"name":"C","type":"datetime"}],
"primaryKey":{"name":"idx"},
"pandas_version":"0.20.0"},
"data":
[{{"idx":0,"A":1,"B":"a","C":"2016-01-01T00:00:00.000Z"},
{"idx":1,"A":2,"B":"b","C":"2016-01-02T00:00:00.000Z"},
{"idx":2,"A":3,"B":"c","C":"2016-01-03T00:00:00.000Z"}]}
'
```

See [IO: Table Schema for more information](https://pandas.pydata.org/pandas-docs/stable/user_guide/io.html#table-schemas).

Additionally, the repr for `DataFrame` and `Series` can now publish this JSON Table schema representation of the Series or DataFrame if you are using IPython (or another frontend like nteract using the Jupyter messaging protocol). This gives frontends like the Jupyter notebook and nteract more flexibility in how they display pandas objects, since they have more information about the data. You must enable this by setting the `display.html.table_schema` option to `True`.

**SciPy sparse matrix from/to SparseDataFrame**

pandas now supports creating sparse dataframes directly from `scipy.sparse.spmatrix` instances. See the documentation for more information. (GH4343)

All sparse formats are supported, but matrices that are not in COOrdinate format will be converted, copying data as needed.

```python
from scipy.sparse import csr_matrix
arr = np.random.random(size=(1000, 5))
arr[arr < .9] = 0
sp_arr = csr_matrix(arr)
sp_arr
sdf = pd.SparseDataFrame(sp_arr)
sdf
```

To convert a `SparseDataFrame` back to sparse SciPy matrix in COO format, you can use:

```python
sdf.to_coo()
```
Excel output for styled DataFrames

Experimental support has been added to export DataFrame.style formats to Excel using the openpyxl engine. (GH15530)

For example, after running the following, styled.xlsx renders as below:

```python
In [45]: np.random.seed(24)
In [46]: df = pd.DataFrame({'A': np.linspace(1, 10, 10)})
In [47]: df = pd.concat([df, pd.DataFrame(np.random.RandomState(24).randn(10, 4),
.....:                        columns=list('BCDE'))],
.....:                        axis=1)
.....:
In [48]: df.iloc[0, 2] = np.nan
In [49]: df
Out[49]:
   A    B     C    D     E
0  1.0  1.329212 NaN -0.316280 -0.990810

2  3.0  1.626404  0.219565  0.678805  1.889273
3  4.0  0.961538  0.104011 -0.481165  0.850229
4  5.0  1.453425  1.057737  0.165562  0.515018
5  6.0  1.336936  0.562861  1.392855  0.063328
6  7.0  0.121668  1.207603 -0.002040  1.627796
7  8.0  0.354493  1.037528 -0.385684  0.519818
8  9.0  1.686583 -1.325963  1.428984 -2.089354
9 10.0 -0.129820  0.631523 -0.586538  0.290720
[10 rows x 5 columns]
In [50]: styled = (df.style
.....:                        .applymap(lambda val: 'color:red;' if val < 0 else 'color:black;')
.....:                        .highlight_max())
.....:
In [51]: styled.to_excel('styled.xlsx', engine='openpyxl')
```

![styled.xlsx preview](image-url)
See the Style documentation for more detail.

**IntervalIndex**

pandas has gained an IntervalIndex with its own dtype, interval as well as the Interval scalar type. These allow first-class support for interval notation, specifically as a return type for the categories in `cut()` and `qcut()`. The IntervalIndex allows some unique indexing, see the docs. (GH7640, GH8625)

**Warning:** These indexing behaviors of the IntervalIndex are provisional and may change in a future version of pandas. Feedback on usage is welcome.

Previous behavior:

The returned categories were strings, representing Intervals

```
In [1]: c = pd.cut(range(4), bins=2)

In [2]: c
Out[2]:
[(-0.003, 1.5], (-0.003, 1.5], (1.5, 3], (1.5, 3]
Categories (2, object): [(-0.003, 1.5] < (1.5, 3]]

In [3]: c.categories
Out[3]: Index([‘(-0.003, 1.5]’, ‘(1.5, 3]’], dtype=’object’)
```

New behavior:

```
In [52]: c = pd.cut(range(4), bins=2)

In [53]: c
Out[53]:
[(-0.003, 1.5], (-0.003, 1.5], (1.5, 3.0], (1.5, 3.0]
Categories (2, interval[float64, right]): [(-0.003, 1.5] < (1.5, 3.0]]

In [54]: c.categories
Out[54]: IntervalIndex([‘(-0.003, 1.5]’, ‘(1.5, 3.0]’], dtype=’interval[float64, right]’)
```

Furthermore, this allows one to bin other data with these same bins, with NaN representing a missing value similar to other dtypes.

```
In [55]: pd.cut([0, 3, 5, 1], bins=c.categories)
Out[55]:
[(-0.003, 1.5], (1.5, 3.0], NaN, (-0.003, 1.5]]
Categories (2, interval[float64, right]): [(-0.003, 1.5] < (1.5, 3.0]]
```

An IntervalIndex can also be used in Series and DataFrame as the index.

```
In [56]: df = pd.DataFrame({'A': range(4),
.....:     'B': pd.cut([0, 3, 1], bins=c.categories)}).set_index('B')

In [57]: df
Out[57]:
A
```

(continues on next page)
Selecting via a specific interval:

```
In [58]: df.loc[pd.Interval(1.5, 3.0)]
Out[58]:
   A
Name: (1.5, 3.0], Length: 1, dtype: int64
```

Selecting via a scalar value that is contained in the intervals.

```
In [59]: df.loc[0]
Out[59]:
   A
   B
(-0.003, 1.5]  0
(-0.003, 1.5]  2
(-0.003, 1.5]  3
[3 rows x 1 columns]
```

Other enhancements

- *DataFrame.rolling()* now accepts the parameter `closed='right'|'left'|'both'|'neither'` to choose the rolling window-endpoint closedness. See the documentation (GH13965)

- Integration with the feather-format, including a new top-level `pd.read_feather()` and `DataFrame.to_feather()` method, see here.

- *Series.str.replace()* now accepts a callable, as replacement, which is passed to `re.sub` (GH15055)

- *Series.str.replace()* now accepts a compiled regular expression as a pattern (GH15446)

- *Series.sort_index* accepts parameters `kind` and `na_position` (GH13589, GH14444)

- *DataFrame* and *DataFrame.groupby()* have gained a `nunique()` method to count the distinct values over an axis (GH14336, GH15197).

- *DataFrame* has gained a `melt()` method, equivalent to `pd.melt()`, for unpivoting from a wide to long format (GH12640).

- *pd.read_excel()* now preserves sheet order when using `sheetname=None` (GH9930)

- Multiple offset aliases with decimal points are now supported (e.g. `0.5min` is parsed as `30s`) (GH8419)

- `.isnull()` and `.notnull()` have been added to `Index` object to make them more consistent with the Series API (GH15300)

- New UnsortedIndexError (subclass of `KeyError`) raised when indexing/slicing into an unsorted MultiIndex (GH11897). This allows differentiation between errors due to lack of sorting or an incorrect key. See here.

- MultiIndex has gained a `.to_frame()` method to convert to a DataFrame (GH12397)
• pd.cut and pd.qcut now support datetime64 and timedelta64 dtypes (GH14714, GH14798)
• pd.qcut has gained the duplicates='raise'|'drop' option to control whether to raise on duplicated edges (GH7751)
• Series provides a to_excel method to output Excel files (GH8825)
• The usecols argument in pd.read_csv() now accepts a callable function as a value (GH14154)
• The skiprows argument in pd.read_csv() now accepts a callable function as a value (GH10882)
• The nrows and chunksize arguments in pd.read_csv() are supported if both are passed (GH6774, GH15755)
• DataFrame.plot now prints a title above each subplot if subplots=True and title is a list of strings (GH14753)
• DataFrame.plot can pass the matplotlib 2.0 default color cycle as a single string as color parameter, see here. (GH15516)
• Series.interpolate() now supports timedelta as an index type with method='time' (GH6424)
• Addition of a level keyword to DataFrame/Series.rename to rename labels in the specified level of a MultiIndex (GH4160).
• DataFrame.reset_index() will now interpret a tuple index.name as a key spanning across levels of columns, if this is a MultiIndex (GH16164)
• Timedelta.isoformat method added for formatting Timedeltas as an ISO 8601 duration. See the Timedelta docs (GH15136)
• .select_dtypes() now allows the string datetimetz to generically select datetimes with tz (GH14910)
• The .to_latex() method will now accept multicolumn and multirow arguments to use the accompanying LaTeX enhancements
• pd.merge_asof() gained the option direction='backward'|'forward'|'nearest' (GH14887)
• Series/DataFrame.asfreq() have gained a fill_value parameter, to fill missing values (GH3715).
• Series/DataFrame.resample.asfreq have gained a fill_value parameter, to fill missing values during resampling (GH3715).
• pandas.util.hash_pandas_object() has gained the ability to hash a MultiIndex (GH15224)
• Series/DataFrame.squeeze() have gained the axis parameter. (GH15339)
• DataFrame.to_excel() has a new freeze_panes parameter to turn on Freeze Panes when exporting to Excel (GH15160)
• pd.read_html() will parse multiple header rows, creating a MultiIndex header. (GH13434).
• HTML table output skips colspan or rowspan attribute if equal to 1. (GH15403)
• pandas.io.formats.style.Styler template now has blocks for easier extension, see the example notebook (GH15649)
• Styler.render() now accepts **kwargs to allow user-defined variables in the template (GH15649)
• Compatibility with Jupyter notebook 5.0; MultiIndex column labels are left-aligned and MultiIndex row-labels are top-aligned (GH15379)
• TimedeltaIndex now has a custom date-tick formatter specifically designed for nanosecond level precision (GH8711)
**pandas: powerful Python data analysis toolkit, Release 1.3.1**

- `pd.api.types.union_categoricals` gained the `ignore_ordered` argument to allow ignoring the ordered attribute of unioned categoricals (GH13410). See the [categorical union docs](https://pandas.pydata.org/pandas-docs/stable/guide/indexing.html#categorical-union) for more information.
- `DataFrame.to_latex()` and `DataFrame.to_string()` now allow optional header aliases. (GH15536)
- Re-enable the `parse_dates` keyword of `pd.read_excel()` to parse string columns as dates (GH14326)
- Added `.empty` property to subclasses of `Index`. (GH15270)
- Enabled floor division for `Timedelta` and `TimedeltaIndex` (GH15828)
- `pandas.io.json.json_normalize()` gained the option `errors='ignore'|'raise';` the default is `errors='raise'` which is backward compatible. (GH14583)
- `pandas.io.json.json_normalize()` with an empty list will return an empty DataFrame (GH15534)
- `pandas.io.json.json_normalize()` has gained a `sep` option that accepts `str` to separate joined fields; the default is `"."`, which is backward compatible. (GH14883)
- `MultiIndex.remove_unused_levels()` has been added to facilitate removing unused levels. (GH15694)
- `pd.read_csv()` will now raise a `ParserError` error whenever any parsing error occurs (GH15913, GH15925)
- `pd.read_csv()` now supports the `error_bad_lines` and `warn_bad_lines` arguments for the Python parser (GH15925)
- The `display.show_dimensions` option can now also be used to specify whether the length of a `Series` should be shown in its repr (GH7117).
- `parallel_coordinates()` has gained a `sort_labels` keyword argument that sorts class labels and the colors assigned to them (GH15908)
- Options added to allow one to turn on/off using `bottleneck` and `numexpr`, see [here](https://github.com/pandas-dev/pandas/issues/15947) (GH16157)
- `DataFrame.style.bar()` now accepts two more options to further customize the bar chart. Bar alignment is set with `align='left'|'mid'|'zero'`, the default is “left”, which is backward compatible; You can now pass a list of `color=[color_negative, color_positive]`. (GH14757)

**Backwards incompatible API changes**

Possible incompatibility for HDF5 formats created with pandas < 0.13.0

`pd.TimeSeries` was deprecated officially in 0.17.0, though has already been an alias since 0.13.0. It has been dropped in favor of `pd.Series`. (GH15098).

This may cause HDF5 files that were created in prior versions to become unreadable if `pd.TimeSeries` was used. This is most likely to be for pandas < 0.13.0. If you find yourself in this situation, you can use a recent prior version of pandas to read in your HDF5 files, then write them out again after applying the procedure below.

```python
In [2]: s = pd.TimeSeries([1, 2, 3], index=pd.date_range('20130101', periods=3))
In [3]: s
Out [3]:
   2013-01-01    1
   2013-01-02    2
   2013-01-03    3
```

(continues on next page)
Freq: D, dtype: int64

In [4]: type(s)
Out[4]: pandas.core.series.TimeSeries

In [5]: s = pd.Series(s)

In [6]: s
Out[6]:
2013-01-01 1
2013-01-02 2
2013-01-03 3
Freq: D, dtype: int64

In [7]: type(s)
Out[7]: pandas.core.series.Series

Map on Index types now return other Index types

map on an Index now returns an Index, not a numpy array (GH12766)

In [60]: idx = pd.Index([1, 2])

In [61]: idx
Out[61]: Int64Index([1, 2], dtype='int64')

In [62]: mi = pd.MultiIndex.from_tuples([(1, 2), (2, 4)])

In [63]: mi
Out[63]: MultiIndex([(1, 2),
                  (2, 4)],

Previous behavior:

In [5]: idx.map(lambda x: x * 2)
Out[5]: array([2, 4])

In [6]: idx.map(lambda x: (x, x * 2))
Out[6]: array([(1, 2), (2, 4)], dtype=object)

In [7]: mi.map(lambda x: x)
Out[7]: array([(1, 2), (2, 4)], dtype=object)

In [8]: mi.map(lambda x: x[0])
Out[8]: array([1, 2])

New behavior:

In [64]: idx.map(lambda x: x * 2)
Out[64]: Int64Index([2, 4], dtype='int64')

In [65]: idx.map(lambda x: (x, x * 2))
Out[65]:

(continues on next page)
map on a Series with datetime64 values may return int64 dtypes rather than int32

```python
In [68]: s = pd.Series(pd.date_range('2011-01-02T00:00', '2011-01-02T02:00', freq='H')
          ....: .tz_localize('Asia/Tokyo'))

In [69]: s
Out[69]:
0  2011-01-02 00:00:00+09:00
1  2011-01-02 01:00:00+09:00
2  2011-01-02 02:00:00+09:00
Length: 3, dtype: datetime64[ns, Asia/Tokyo]
```

Previous behavior:
```
In [9]: s.map(lambda x: x.hour)
Out[9]:
0  0
1  1
2  2
dtype: int32
```

New behavior:
```
In [70]: s.map(lambda x: x.hour)
Out[70]:
0  0
1  1
2  2
Length: 3, dtype: int64
```

Accessing datetime fields of Index now return Index

The datetime-related attributes (see here for an overview) of DatetimeIndex, PeriodIndex and TimedeltaIndex previously returned numpy arrays. They will now return a new Index object, except in the case of a boolean field, where the result will still be a boolean ndarray. (GH15022)

Previous behaviour:
```
In [1]: idx = pd.date_range("2015-01-01", periods=5, freq='10H')
```
In [2]: idx.hour
Out[2]: array([ 0, 10, 20, 6, 16], dtype=int32)

New behavior:

In [71]: idx = pd.date_range("2015-01-01", periods=5, freq='10H')
In [72]: idx.hour
Out[72]: Int64Index([0, 10, 20, 6, 16], dtype='int64')

This has the advantage that specific Index methods are still available on the result. On the other hand, this might have backward incompatibilities: e.g. compared to numpy arrays, Index objects are not mutable. To get the original ndarray, you can always convert explicitly using np.asarray(idx.hour).

**pd.unique will now be consistent with extension types**

In prior versions, using `Series.unique()` and `pandas.unique()` on Categorical and tz-aware data-types would yield different return types. These are now made consistent. (GH15903)

- Datetime tz-aware

  Previous behaviour:

  ```python
  # Series
  In [5]: pd.Series([pd.Timestamp('20160101', tz='US/Eastern'),
                     ...:
                     pd.Timestamp('20160101', tz='US/Eastern')]).unique()
  Out[5]: array([Timestamp('2016-01-01 00:00:00-0500', tz='US/Eastern')],
                dtype=object)
  In [6]: pd.unique(pd.Series([pd.Timestamp('20160101', tz='US/Eastern'),
                            ...:
                            pd.Timestamp('20160101', tz='US/Eastern')]))
  Out[6]: array(['2016-01-01T05:00:00.000000000'], dtype='datetime64[ns]')
  # Index
  In [7]: pd.Index([pd.Timestamp('20160101', tz='US/Eastern'),
                   ...:
                   pd.Timestamp('20160101', tz='US/Eastern')]).unique()
  Out[7]: DatetimeIndex(['2016-01-01 00:00:00-05:00'],
                         dtype='datetime64[ns, US/Eastern]',
                         freq=None)
  In [8]: pd.unique([pd.Timestamp('20160101', tz='US/Eastern'),
                  ...:
                  pd.Timestamp('20160101', tz='US/Eastern')])
  Out[8]: array(['2016-01-01T05:00:00.000000000'], dtype='datetime64[ns]')
  ```

New behavior:

```python
# Series, returns an array of Timestamp tz-aware
In [73]: pd.Series([pd.Timestamp(r'20160101', tz=r'US/Eastern'),
                  ...:
                  pd.Timestamp(r'20160101', tz=r'US/Eastern')]).unique()
Out[73]: <DatetimeArray
['2016-01-01 00:00:00-05:00']
Length: 1, dtype: datetime64[ns, US/Eastern]
In [74]: pd.unique(pd.Series([pd.Timestamp('20160101', tz='US/Eastern'),
                          ...])
```
....:       pd.Timestamp('20160101', tz='US/Eastern'))
....:
Out[74]:
<DatetimeArray>
['2016-01-01 00:00:00-05:00']
Length: 1, dtype: datetime64[ns, US/Eastern]

# Index, returns a DatetimeIndex
In [75]: pd.Index([pd.Timestamp('20160101', tz='US/Eastern'),
....:             pd.Timestamp('20160101', tz='US/Eastern')]).unique()
....:
Out[75]: DatetimeIndex(['2016-01-01 00:00:00-05:00'],
dtype='datetime64[ns, US/Eastern]', freq=None)

In [76]: pd.unique(pd.Index([pd.Timestamp('20160101', tz='US/Eastern'),
....:             pd.Timestamp('20160101', tz='US/Eastern')]))
....:
Out[76]: DatetimeIndex(['2016-01-01 00:00:00-05:00'],
dtype='datetime64[ns, US/Eastern]', freq=None)

• Categoricals

Previous behaviour:

In [1]: pd.Series(list('baabc'), dtype='category').unique()
Out[1]:
[b, a, c]
Categories (3, object): [b, a, c]

In [2]: pd.unique(pd.Series(list('baabc'), dtype='category'))
Out[2]: array(['b', 'a', 'c'], dtype=object)

New behavior:

# returns a Categorical
In [77]: pd.Series(list('baabc'), dtype='category').unique()
Out[77]:
['b', 'a', 'c']
Categories (3, object): ['a', 'b', 'c']

In [78]: pd.unique(pd.Series(list('baabc'), dtype='category'))
Out[78]:
['b', 'a', 'c']
Categories (3, object): ['a', 'b', 'c']
**S3 file handling**

pandas now uses s3fs for handling S3 connections. This shouldn’t break any code. However, since s3fs is not a required dependency, you will need to install it separately, like boto in prior versions of pandas. (GH11915).

**Partial string indexing changes**

DatetimeIndex Partial String Indexing now works as an exact match, provided that string resolution coincides with index resolution, including a case when both are seconds (GH14826). See Slice vs. Exact Match for details.

```
In [79]: df = pd.DataFrame({'a': [1, 2, 3]}, pd.DatetimeIndex(['2011-12-31 23:59:59',
   ....: '2012-01-01 00:00:00',
   ....: '2012-01-01 00:00:01
   ←'])
   ....:

Previous behavior:
```

```
In [4]: df['2011-12-31 23:59:59']
Out[4]:
   a
2011-12-31 23:59:59  1

In [5]: df['a']['2011-12-31 23:59:59']
Out[5]:
   2011-12-31 23:59:59  1
Name: a, dtype: int64
```

New behavior:

```
In [4]: df['2011-12-31 23:59:59']
KeyError: '2011-12-31 23:59:59'

In [5]: df['a']['2011-12-31 23:59:59']
Out[5]: 1
```

**Concat of different float dtypes will not automatically upcast**

Previously, concat of multiple objects with different float dtypes would automatically upcast results to a dtype of float64. Now the smallest acceptable dtype will be used (GH13247)

```
In [80]: df1 = pd.DataFrame(np.array([[1.0]], dtype=np.float32, ndmin=2))
In [81]: df1.dtypes
Out[81]:
0  float32
Length: 1, dtype: object

In [82]: df2 = pd.DataFrame(np.array([[np.nan]], dtype=np.float32, ndmin=2))
In [83]: df2.dtypes
Out[83]:
0  float32
Length: 1, dtype: object
```
**Previous behavior:**

```
In [7]: pd.concat([df1, df2]).dtypes
Out[7]:
       0  float64
dtype: object
```

**New behavior:**

```
In [84]: pd.concat([df1, df2]).dtypes
Out[84]:
       0  float32
Length: 1, dtype: object
```

**pandas Google BigQuery support has moved**

pandas has split off Google BigQuery support into a separate package pandas-gbq. You can `conda install pandas-gbq` or `pip install pandas-gbq` to get it. The functionality of `read_gbq()` and `DataFrame.to_gbq()` remain the same with the currently released version of pandas-gbq=0.1.4. Documentation is now hosted here (GH15347).

**Memory usage for Index is more accurate**

In previous versions, showing `.memory_usage()` on a pandas structure that has an index, would only include actual index values and not include structures that facilitated fast indexing. This will generally be different for Index and MultiIndex and less-so for other index types. (GH15237)

**Previous behavior:**

```
In [8]: index = pd.Index(['foo', 'bar', 'baz'])
In [9]: index.memory_usage(deep=True)
Out[9]: 180
In [10]: index.get_loc('foo')
Out[10]: 0
In [11]: index.memory_usage(deep=True)
Out[11]: 180
```

**New behavior:**

```
In [8]: index = pd.Index(['foo', 'bar', 'baz'])
In [9]: index.memory_usage(deep=True)
Out[9]: 180
In [10]: index.get_loc('foo')
Out[10]: 0
In [11]: index.memory_usage(deep=True)
Out[11]: 260
```
DataFrame.sort_index changes

In certain cases, calling `.sort_index()` on a MultiIndexed DataFrame would return the same DataFrame without seeming to sort. This would happen with a lexicorted, but non-monotonic levels. (GH15622, GH15687, GH14015, GH13431, GH15797)

This is unchanged from prior versions, but shown for illustration purposes:

In [85]: df = pd.DataFrame(np.arange(6), columns=['value'],
   ....: index=pd.MultiIndex.from_product([list('BA'), range(3)]))
   ....:
   ....:
In [86]: df
Out[86]:
   value
  B 0 0
  1 1
  2 2
  A 0 3
  1 4
  2 5
[6 rows x 1 columns]

In [87]: df.index.is_lexsorted()
Out[87]: False

In [88]: df.index.is_monotonic
Out[88]: False

Sorting works as expected

In [87]: df.sort_index()
Out[87]:
   value
  A 0 3
  1 4
  2 5
  B 0 0
  1 1
  2 2
[6 rows x 1 columns]

In [90]: df.sort_index().index.is_lexsorted()
Out[90]: True

In [91]: df.sort_index().index.is_monotonic
Out[91]: True

However, this example, which has a non-monotonic 2nd level, doesn’t behave as desired.

In [88]: df = pd.DataFrame({'value': [1, 2, 3, 4]},
   ....: index=pd.MultiIndex([['a', 'b'], ['bb', 'aa']],
   ....: [[0, 0, 1, 1], [0, 1, 0, 1]])
   ....:  
   ....:
   ....:
(continues on next page)
In [89]: df
Out[89]:
     value
a bb  1
   aa  2
b bb  3
   aa  4
[4 rows x 1 columns]

Previous behavior:

In [11]: df.sort_index()
Out[11]:
     value
a bb  1
   aa  2
b bb  3
   aa  4

In [14]: df.sort_index().index.is_lexsorted()
Out[14]: True

In [15]: df.sort_index().index.is_monotonic
Out[15]: False

New behavior:

In [94]: df.sort_index()
Out[94]:
     value
   aa  2
   bb  1
b aa  4
   bb  3
[4 rows x 1 columns]

In [95]: df.sort_index().index.is_lexsorted()
Out[95]: True

In [96]: df.sort_index().index.is_monotonic
Out[96]: True

**GroupBy describe formatting**

The output formatting of `groupby.describe()` now labels the `describe()` metrics in the columns instead of the index. This format is consistent with `groupby.agg()` when applying multiple functions at once. (GH4792)

Previous behavior:

In [1]: df = pd.DataFrame({'A': [1, 1, 2, 2], 'B': [1, 2, 3, 4]})
In [2]: df.groupby('A').describe()
Out[2]:
(continues on next page)
In [3]: df.groupby('A').agg([np.mean, np.std, np.min, np.max])
Out[3]:

<table>
<thead>
<tr>
<th></th>
<th>mean</th>
<th>std</th>
<th>amin</th>
<th>amax</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1.5</td>
<td>0.7071</td>
<td>1</td>
<td>2</td>
</tr>
<tr>
<td></td>
<td>3.5</td>
<td>0.7071</td>
<td>3</td>
<td>4</td>
</tr>
</tbody>
</table>

New behavior:

In [90]: df = pd.DataFrame({'A': [1, 1, 2, 2], 'B': [1, 2, 3, 4]})
In [91]: df.groupby('A').describe()
Out[91]:

<table>
<thead>
<tr>
<th></th>
<th>count</th>
<th>mean</th>
<th>std</th>
<th>min</th>
<th>25%</th>
<th>50%</th>
<th>75%</th>
<th>max</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>2</td>
<td>1.5</td>
<td>0.7071</td>
<td>1.0</td>
<td>1.25</td>
<td>1.5</td>
<td>1.75</td>
<td>2.0</td>
</tr>
<tr>
<td></td>
<td>2</td>
<td>3.5</td>
<td>0.7071</td>
<td>3.0</td>
<td>3.25</td>
<td>3.5</td>
<td>3.75</td>
<td>4.0</td>
</tr>
</tbody>
</table>

[2 rows x 8 columns]

In [92]: df.groupby('A').agg([np.mean, np.std, np.min, np.max])
Out[92]:

<table>
<thead>
<tr>
<th></th>
<th>mean</th>
<th>std</th>
<th>amin</th>
<th>amax</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1.5</td>
<td>0.7071</td>
<td>1</td>
<td>2</td>
</tr>
<tr>
<td></td>
<td>3.5</td>
<td>0.7071</td>
<td>3</td>
<td>4</td>
</tr>
</tbody>
</table>

[2 rows x 4 columns]
Window binary corr/cov operations return a MultiIndex DataFrame

A binary window operation, like .corr() or .cov(), when operating on a .rolling(), .expanding(), or .ewm() object, will now return a 2-level MultiIndexed DataFrame rather than a Panel, as Panel is now deprecated, see here. These are equivalent in function, but a MultiIndexed DataFrame enjoys more support in pandas. See the section on Windowed Binary Operations for more information. (GH15677)

In [93]: np.random.seed(1234)

In [94]: df = pd.DataFrame(np.random.rand(100, 2),
    ...:    columns=pd.Index(['A', 'B'], name='bar'),
    ...:    index=pd.date_range('20160101',
    ...:    periods=100, freq='D', name='foo'))

In [95]: df.tail()
Out[95]:
   bar   A     B
  foo   bar
2016-04-05 0.640880 0.126205
2016-04-06 0.171465 0.737086
2016-04-07 0.127029 0.369650

    B   0.119645  1.000000
(continues on next page)
HDFStore where string comparison

In previous versions most types could be compared to string column in a HDFStore usually resulting in an invalid comparison, returning an empty result frame. These comparisons will now raise a `TypeError` (GH15492)

```
In [99]: df = pd.DataFrame({'unparsed_date': ['2014-01-01', '2014-01-01']})

In [100]: df.to_hdf('store.h5', 'key', format='table', data_columns=True)

In [101]: df.dtypes
Out[101]:
unparsed_date object
Length: 1, dtype: object

Previous behavior:

```
In [4]: pd.read_hdf('store.h5', 'key', where='unparsed_date > ts')
File "<string>", line 1
   (unparsed_date > 1970-01-01 00:00:01.388552400)
^ SyntaxError: invalid token
```

New behavior:

```
In [18]: ts = pd.Timestamp('2014-01-01')

In [19]: pd.read_hdf('store.h5', 'key', where='unparsed_date > ts')
TypeError: Cannot compare 2014-01-01 00:00:00 of
type <class 'pandas.tslib.Timestamp'> to string column
```

Index.intersection and inner join now preserve the order of the left Index

`Index.intersection()` now preserves the order of the calling Index (left) instead of the other Index (right) (GH15582). This affects inner joins, `DataFrame.join()` and `merge()`, and the `.align` method.

- `Index.intersection`

```
In [102]: left = pd.Index([2, 1, 0])

In [103]: left
Out[103]: Int64Index([2, 1, 0], dtype='int64')

In [104]: right = pd.Index([1, 2, 3])

In [105]: right
Out[105]: Int64Index([1, 2, 3], dtype='int64')
```

Previous behavior:

```python
In [4]: left.intersection(right)
Out[4]: Int64Index([1, 2], dtype='int64')
```

New behavior:

```python
In [106]: left.intersection(right)
Out[106]: Int64Index([2, 1], dtype='int64')
```

- `DataFrame.join` and `pd.merge`

```python
In [107]: left = pd.DataFrame({'a': [20, 10, 0]}, index=[2, 1, 0])
In [108]: left
Out[108]:
   a
2  20
1  10
0  
[3 rows x 1 columns]
In [109]: right = pd.DataFrame({'b': [100, 200, 300]}, index=[1, 2, 3])
In [110]: right
Out[110]:
   b
1  100
2  200
3  300
[3 rows x 1 columns]
```

Previous behavior:

```python
In [4]: left.join(right, how='inner')
Out[4]:
   a b
1  10 100
2  20 200
```

New behavior:

```python
In [111]: left.join(right, how='inner')
Out[111]:
   a b
2  20 200
1  10 100
[2 rows x 2 columns]
Pivot table always returns a DataFrame

The documentation for `pivot_table()` states that a `DataFrame` is always returned. Here a bug is fixed that allowed this to return a `Series` under certain circumstance. (GH4386)

```python
In [112]: df = pd.DataFrame({'col1': [3, 4, 5],
                      'col2': ['C', 'D', 'E'],
                      'col3': [1, 3, 9]})

In [113]: df
Out[113]:
     col1 col2 col3
0     3     C   1
1     4     D   3
2     5     E   9
[3 rows x 3 columns]
```

Previous behavior:

```python
In [2]: df.pivot_table('col1', index=['col3', 'col2'], aggfunc=np.sum)
Out[2]:
          col1
col3 col2
1   C   3
3   D   4
9   E   5
Name: col1, dtype: int64
```

New behavior:

```python
In [114]: df.pivot_table('col1', index=['col3', 'col2'], aggfunc=np.sum)
Out[114]:
          col1
col3 col2
1   C   3
3   D   4
9   E   5
[3 rows x 1 columns]
```

Other API changes

- `numexpr` version is now required to be >= 2.4.6 and it will not be used at all if this requisite is not fulfilled (GH15213).
- `CParseError` has been renamed to `ParserError` in `pd.read_csv()` and will be removed in the future (GH12665)
- `SparseArray.cumsum()` and `SparseSeries.cumsum()` will now always return `SparseArray` and `SparseSeries` respectively (GH12855)
- `DataFrame.applymap()` with an empty DataFrame will return a copy of the empty DataFrame instead of a Series (GH8222)
- `Series.map()` now respects default values of dictionary subclasses with a `__missing__` method, such as `collections.Counter` (GH15999)
• `.loc` has compat with `.ix` for accepting iterators, and NamedTuples (GH15120)
• `interpolate()` and `fillna()` will raise a `ValueError` if the limit keyword argument is not greater than 0. (GH9217)
• `pd.read_csv()` will now issue a `ParserWarning` whenever there are conflicting values provided by the dialect parameter and the user (GH14898)
• `pd.read_csv()` will now raise a `ValueError` for the C engine if the quote character is larger than one byte (GH11592)
• `inplace` arguments now require a boolean value, else a `ValueError` is thrown (GH14189)
• `pandas.api.types.is_datetime64_ns_dtype` will now report True on a tz-aware dtype, similar to `pandas.api.types.is_datetime64_any_dtype`
• `DataFrame.asof()` will return a null filled Series instead the scalar NaN if a match is not found (GH15118)
• Specific support for `copy.copy()` and `copy.deepcopy()` functions on NDFrame objects (GH15444)
• `Series.sort_values()` accepts a one element list of bool for consistency with the behavior of `DataFrame.sort_values()` (GH15604)
• `.merge()` and `.join()` on category dtype columns will now preserve the category dtype when possible (GH10409)
• `SparseDataFrame.default_fill_value` will be 0, previously was nan in the return from `pd.get_dummies(..., sparse=True)` (GH15594)
• The default behaviour of `Series.str.match` has changed from extracting groups to matching the pattern. The extracting behaviour was deprecated since pandas version 0.13.0 and can be done with the `Series.str.extract` method (GH5224). As a consequence, the `as_indexer` keyword is ignored (no longer needed to specify the new behaviour) and is deprecated.
• `NaT` will now correctly report `False` for datetimelike boolean operations such as `is_month_start` (GH15781)
• `NaT` will now correctly return `np.nan` for Timedelta and Period accessors such as `days` and `quarter` (GH15782)
• `NaT` will now returns `NaT` for `tz_localize` and `tz_convert` methods (GH15830)
• `DataFrame` and `Panel` constructors with invalid input will now raise `ValueError` rather than `PandasError`, if called with scalar inputs and not axes (GH15541)
• `DataFrame` and `Panel` constructors with invalid input will now raise `ValueError` rather than `pandas.core.common.PandasError`, if called with scalar inputs and not axes; The exception `PandasError` is removed as well. (GH15541)
• The exception `pandas.core.common.AmbiguousIndexError` is removed as it is not referenced (GH15541)
Reorganization of the library: privacy changes

Modules privacy has changed

Some formerly public python/c/c++/cython extension modules have been moved and/or renamed. These are all removed from the public API. Furthermore, the pandas.core, pandas.compat, and pandas.util top-level modules are now considered to be PRIVATE. If indicated, a deprecation warning will be issued if you reference these modules. (GH12588)

Some new subpackages are created with public functionality that is not directly exposed in the top-level namespace: pandas.errors, pandas.plotting and pandas.testing (more details below). Together with pandas.api.types and certain functions in the pandas.io and pandas.tseries submodules, these are now the public subpackages.

Further changes:

- The function `union_categoricals()` is now importable from pandas.api.types, formerly from pandas.types.concat (GH15998)
- The type import pandas.tslib.NaTType is deprecated and can be replaced by using `type(pandas.NaT)` (GH16146)
- The public functions in pandas.tools.hashing deprecated from that locations, but are now importable from pandas.util (GH16223)
- The modules in pandas.util: decorators, print_versions, doctools, validators, depr_module are now private. Only the functions exposed in pandas.util itself are public (GH16223)
**pandas.errors**

We are adding a standard public module for all pandas exceptions & warnings pandas.errors. (GH14800). Previously these exceptions & warnings could be imported from pandas.core.common or pandas.io.common. These exceptions and warnings will be removed from the *.common locations in a future release. (GH15541)

The following are now part of this API:

```python
['DtypeWarning',
 'EmptyDataError',
 'OutOfBoundsDatetme',
 'ParserError',
 'ParserWarning',
 'PerformanceWarning',
 'UnsupportedFunctionCall']
```

**pandas.testing**

We are adding a standard module that exposes the public testing functions in pandas.testing (GH9895). Those functions can be used when writing tests for functionality using pandas objects.

The following testing functions are now part of this API:

- `testing.assert_frame_equal()`
- `testing.assert_series_equal()`
- `testing.assert_index_equal()`

**pandas.plotting**

A new public pandas.plotting module has been added that holds plotting functionality that was previously in either pandas.tools.plotting or in the top-level namespace. See the deprecations sections for more details.

**Other development changes**

- Building pandas for development now requires cython >= 0.23 (GH14831)
- Require at least 0.23 version of cython to avoid problems with character encodings (GH14699)
- Switched the test framework to use pytest (GH13097)
- Reorganization of tests directory layout (GH14854, GH15707).
Deprecations

Deprecate .ix

The .ix indexer is deprecated, in favor of the more strict .iloc and .loc indexers. .ix offers a lot of magic on the inference of what the user wants to do. More specifically, .ix can decide to index positionally OR via labels, depending on the data type of the index. This has caused quite a bit of user confusion over the years. The full indexing documentation is here. (GH14218)

The recommended methods of indexing are:

- .loc if you want to label index
- .iloc if you want to positionally index.

Using .ix will now show a DeprecationWarning with a link to some examples of how to convert code here.

```
In [115]: df = pd.DataFrame({'A': [1, 2, 3],
                           'B': [4, 5, 6]},
                           index=list('abc'))

In [116]: df
Out[116]:
   A  B
  a 1  4
  b 2  5
  c 3  6
[3 rows x 2 columns]
```

Previous behavior, where you wish to get the 0th and the 2nd elements from the index in the ‘A’ column.

```
In [3]: df.ix[[0, 2], 'A']
Out[3]:
   A
  a 1
  c 3
Name: A, dtype: int64
```

Using .loc. Here we will select the appropriate indexes from the index, then use label indexing.

```
In [117]: df.loc[df.index[[0, 2]], 'A']
Out[117]:
   A
  a 1
  c 3
Name: A, Length: 2, dtype: int64
```

Using .iloc. Here we will get the location of the ‘A’ column, then use positional indexing to select things.

```
In [118]: df.iloc[[0, 2], df.columns.get_loc('A')]
Out[118]:
   A
  a 1
  c 3
Name: A, Length: 2, dtype: int64
```
**Deprecate Panel**

Panel is deprecated and will be removed in a future version. The recommended way to represent 3-D data are with a MultiIndex on a DataFrame via the to_frame() or with the xarray package. pandas provides a to_xarray() method to automate this conversion (GH13563).

```python
In [133]: import pandas._testing as tm
In [134]: p = tm.makePanel()
In [135]: p
Out[135]:
<class 'pandas.core.panel.Panel'>
Dimensions: 3 (items) x 3 (major_axis) x 4 (minor_axis)
Items axis: ItemA to ItemC
Major_axis axis: 2000-01-03 00:00:00 to 2000-01-05 00:00:00
Minor_axis axis: A to D
```

### Convert to a MultiIndex DataFrame

```python
In [136]: p.to_frame()
Out[136]:
ItemA   ItemB   ItemC
major minor
2000-01-03 A  0.628776 -1.409432 0.209395
  B  0.988138 -1.347533 -0.896581
  C -0.938153  1.272395 -0.161137
  D -0.223019 -0.591863 -1.051539
2000-01-04 A  0.186494  1.422986 -0.592886
  B -0.072608  0.363565  1.104352
  C -1.239072 -1.449567  0.889157
  D  2.123692 -0.414505 -0.319561
2000-01-05 A  0.952478 -2.147855 -1.473116
  B -0.550603 -0.014752 -0.431550
  C  0.139683 -1.195524  0.288377
  D  0.122273 -1.425795 -0.619993
[12 rows x 3 columns]
```

### Convert to an xarray DataArray

```python
In [137]: p.to_xarray()
Out[137]:
<xarray.DataArray (items: 3, major_axis: 3, minor_axis: 4)>
array([[[ 0.628776, 0.988138, -0.938153, -0.223019],
       [ 0.186494, -0.072608, -1.239072,  2.123692],
       [ 0.952478, -0.550603,  0.139683,  0.122273]],
      [[-1.409432, -1.347533,  1.272395, -0.591863],
       [ 1.422986,  0.363565, -1.449567, -0.414505],
       [-2.147855, -0.014752, -1.195524, -1.425795]],
      [[ 0.209395, -0.896581, -0.161137, -1.051539],
       [-0.592886,  1.104352,  0.889157, -0.319561],
       [-1.473116, -0.431550,  0.288377, -0.619993]])
Coordinates:
 * items (items) object 'ItemA' 'ItemB' 'ItemC'
```

(continues on next page)
Deprecate groupby.agg() with a dictionary when renaming

The `.groupby(..).agg(..)` and `.rolling(..).agg(..)` syntax can accept a variable of inputs, including scalars, list, and a dict of column names to scalars or lists. This provides a useful syntax for constructing multiple (potentially different) aggregations.

However, `.agg(..)` can also accept a dict that allows ‘renaming’ of the result columns. This is a complicated and confusing syntax, as well as not consistent between Series and DataFrame. We are deprecating this ‘renaming’ functionality.

* We are deprecating passing a dict to a grouped/rolled/resampled Series. This allowed one to rename the resulting aggregation, but this had a completely different meaning than passing a dictionary to a grouped DataFrame, which accepts column-to-aggregations.

* We are deprecating passing a dict-of-dicts to a grouped/rolled/resampled DataFrame in a similar manner.

This is an illustrative example:

```
In [119]: df = pd.DataFrame({'A': [1, 1, 1, 2, 2],
                           'B': range(5),
                           'C': range(5)});

In [120]: df.groupby('A').agg({'B': 'sum', 'C': 'min'})
```

Here is a typical useful syntax for computing different aggregations for different columns. This is a natural, and useful syntax. We aggregate from the dict-to-list by taking the specified columns and applying the list of functions. This returns a MultiIndex for the columns (this is not deprecated).

```
In [121]: df.groupby('A').agg({'B': 'sum', 'C': 'min'})
```

Here’s an example of the first deprecation, passing a dict to a grouped Series. This is a combination aggregation & renaming:

```
In [6]: df.groupby('A').B.agg({'foo': 'count'})
```
is deprecated and will be removed in a future version

```
Out[6]:
  foo
A   
1    3  
2    2
```

You can accomplish the same operation, more idiomatically by:

```
In [122]: df.groupby('A').B.agg(['count']).rename(columns={'count': 'foo'})
Out[122]:
   foo
  
A
1  3
2  2
[2 rows x 1 columns]
```

Here's an example of the second deprecation, passing a dict-of-dict to a grouped DataFrame:

```
In [23]: (df.groupby('A')
            .agg({'B': {'foo': 'sum'}, 'C': {'bar': 'min'}})
            ...: ).
FutureWarning: using a dict with renaming is deprecated and will be removed in a future version

Out[23]:
  B  C
foo  
A
1  3  0  
2  7  3
```

You can accomplish nearly the same by:

```
In [123]: (df.groupby('A')
            ....: .agg({'B': 'sum', 'C': 'min'})
            ....: .rename(columns={'B': 'foo', 'C': 'bar'})
            ....: )
....: 
Out[123]:
  foo  bar
A
1  3  0
2  7  3
[2 rows x 2 columns]
Deprecate .plotting

The pandas.tools.plotting module has been deprecated, in favor of the top level pandas.plotting module. All the public plotting functions are now available from pandas.plotting (GH12548).

Furthermore, the top-level pandas.scatter_matrix and pandas.plot_params are deprecated. Users can import these from pandas.plotting as well.

Previous script:

```python
def tools.plotting.scatter_matrix(df)
def scatter_matrix(df)
```

Should be changed to:

```python
def plotting.scatter_matrix(df)
```

Other deprecations

- `SparseArray.to_dense()` has deprecated the fill parameter, as that parameter was not being respected (GH14647)
- `SparseSeries.to_dense()` has deprecated the sparse_only parameter (GH14647)
- `Series.repeat()` has deprecated the reps parameter in favor of repeats (GH12662)
- The Series constructor and .astype method have deprecated accepting timestamp dtypes without a frequency (e.g. np.datetime64) for the dtype parameter (GH15524)
- `Index.repeat()` and MultiIndex.repeat() have deprecated the n parameter in favor of repeats (GH12662)
- `Categorical.searchsorted()` and Series.searchsorted() have deprecated the v parameter in favor of value (GH12662)
- `TimedeltaIndex.searchsorted()`, `DatetimeIndex.searchsorted()`, and `PeriodIndex.searchsorted()` have deprecated the key parameter in favor of value (GH12662)
- `DataFrame.astype()` has deprecated the raise_on_error parameter in favor of errors (GH14878)
- `Series.sortlevel` and `DataFrame.sortlevel` have been deprecated in favor of `Series.sort_index` and `DataFrame.sort_index` (GH15099)
- importing `concat` from `pandas.tools.merge` has been deprecated in favor of imports from the pandas namespace. This should only affect explicit imports (GH15358)
- `Series/DataFrame/Panel.consolidate()` been deprecated as a public method. (GH15483)
- The as_indexer keyword of `Series.str.match()` has been deprecated (ignored keyword) (GH15257).
- The following top-level pandas functions have been deprecated and will be removed in a future version (GH13790, GH15940)
  - `pd.pnow()`, replaced by `Period.now()`
  - `pd.Term`, is removed, as it is not applicable to user code. Instead use in-line string expressions in the where clause when searching in HDFStore
  - `pd.Expr`, is removed, as it is not applicable to user code.
  - `pd.match()`, is removed.
- `pd.groupby()`, replaced by using the `.groupby()` method directly on a Series/DataFrame
- `pd.get_store()`, replaced by a direct call to `pd.HDFStore(...)`

- `is_any_int_dtype`, `is_floatong_dtype`, and `is_sequence` are deprecated from pandas.api.types (GH16042)

### Removal of prior version deprecations/changes

- The `pandas.rpy` module is removed. Similar functionality can be accessed through the rpy2 project. See the R interfacing docs for more details.
- The `pandas.io.ga` module with a google-analytics interface is removed (GH11308). Similar functionality can be found in the Google2Pandas package.
- `pd.to_datetime` and `pd.to_timedelta` have dropped the `coerce` parameter in favor of `errors` (GH13602)
- `pandas.stats.fama_macbeth`, `pandas.stats.ols`, `pandas.stats.plm` and `pandas.stats.var`, as well as the top-level `pandas.fama_macbeth` and `pandas.ols` routines are removed. Similar functionality can be found in the statsmodels package. (GH11898)
- The `TimeSeries` and `SparseTimeSeries` classes, aliases of `Series` and `SparseSeries`, are removed (GH10890, GH15098).
- `Series.is_time_series` is dropped in favor of `Series.index.is_all_dates` (GH15098)
- The deprecated `irow`, `icol`, `iget` and `iget_value` methods are removed in favor of `iloc` and `iat` as explained here (GH10711).
- The deprecated `DataFrame.iterkv()` has been removed in favor of `DataFrame.iteritems()` (GH10711)
- The `Categorical` constructor has dropped the `name` parameter (GH10632)
- `Categorical` has dropped support for NaN categories (GH10748)
- The `take_last` parameter has been dropped from `duplicated()`, `drop_duplicates()`, `nlargest()`, and `nsmallest()` methods (GH10236, GH10792, GH10920)
- `Series`, `Index`, and `DataFrame` have dropped the `sort` and `order` methods (GH10726)
- Where clauses in `pytables` are only accepted as strings and expressions types and not other data-types (GH12027)
- `DataFrame` has dropped the `combineAdd` and `combineMult` methods in favor of `add` and `mul` respectively (GH10735)

### Performance improvements

- Improved performance of `pd.wide_to_long()` (GH14779)
- Improved performance of `pd.factorize()` by releasing the GIL with object dtype when inferred as strings (GH14859, GH16057)
- Improved performance of timeseries plotting with an irregular DatetimeIndex (or with `compat_x=True`) (GH15073).
- Improved performance of `groupby().cummin()` and `groupby().cummax()` (GH15048, GH15109, GH15561, GH15635)
- Improved performance and reduced memory when indexing with a MultiIndex (GH15245)
• When reading buffer object in `read_sas()` method without specified format, filepath string is inferred rather than buffer object. (GH14947)
• Improved performance of `.rank()` for categorical data (GH15498)
• Improved performance when using `.unstack()` (GH15503)
• Improved performance of merge/join on category columns (GH10409)
• Improved performance of `drop_duplicates()` on bool columns (GH12963)
• Improve performance of `pd.core.groupby.GroupBy.apply` when the applied function used the .name attribute of the group DataFrame (GH15062).
• Improved performance of `iloc` indexing with a list or array (GH15504).
• Improved performance of `Series.sort_index()` with a monotonic index (GH15694)
• Improved performance in `pd.read_csv()` on some platforms with buffered reads (GH16039)

Bug fixes

Conversion

• Bug in `Timestamp.replace` now raises `TypeError` when incorrect argument names are given; previously this raised `ValueError` (GH15240)
• Bug in `Timestamp.replace` with compat for passing long integers (GH15030)
• Bug in `Timestamp` returning UTC based time/date attributes when a timezone was provided (GH13303, GH6538)
• Bug in `Timestamp` incorrectly localizing timezones during construction (GH11481, GH15777)
• Bug in `TimedeltaIndex` addition where overflow was being allowed without error (GH14816)
• Bug in `TimedeltaIndex` raising a `ValueError` when boolean indexing with `loc` (GH14946)
• Bug in catching an overflow in `Timestamp + Timedelta/Offset` operations (GH15126)
• Bug in `DatetimeIndex.round()` and `Timestamp.round()` floating point accuracy when rounding by milliseconds or less (GH14440, GH15578)
• Bug in `astype()` where `inf` values were incorrectly converted to integers. Now raises error now with `astype()` for Series and DataFrames (GH14265)
• Bug in `DataFrame(..).apply(to_numeric)` when values are of type decimal.Decimal. (GH14827)
• Bug in `describe()` when passing a numpy array which does not contain the median to the `percentiles` keyword argument (GH14908)
• Cleaned up `PeriodIndex` constructor, including raising on floats more consistently (GH13277)
• Bug in using `__deepcopy__` on empty NDFrame objects (GH15370)
• Bug in `.replace()` may result in incorrect dtypes. (GH12747, GH15765)
• Bug in `Series.replace` and `DataFrame.replace` which failed on empty replacement dicts (GH15289)
• Bug in `Series.replace` which replaced a numeric by string (GH15743)
• Bug in `Index` construction with NaN elements and integer dtype specified (GH15187)
• Bug in `Series` construction with a datetimetz (GH14928)
• Bug in `Series.dt.round()` inconsistent behaviour on NaT `s with different arguments (GH14940)
• Bug in `Series` constructor when both `copy=True` and `dtype` arguments are provided (GH15125)
• Incorrect dtype `Series` was returned by comparison methods (e.g., `lt`, `gt`, ...) against a constant for an empty `DataFrame` (GH15077)
• Bug in `Series.ffill()` with mixed dtypes containing tz-aware datetimes. (GH14956)
• Bug in `DataFrame.fillna()` where the argument `downcast` was ignored when `fillna` value was of type dict (GH15277)
• Bug in `.asfreq()`, where frequency was not set for empty `Series` (GH14320)
• Bug in `DataFrame` construction with nulls and datetimes in a list-like (GH15869)
• Bug in `DataFrame.fillna()` with tz-aware datetimes (GH15855)
• Bug in `is_string_dtype`, `is_timedelta64_ns_dtype`, and `is_string_like_dtype` in which an error was raised when `None` was passed in (GH15941)
• Bug in the return type of `pd.unique` on a `Categorical`, which was returning an ndarray and not a `Categorical` (GH15903)
• Bug in `Index.to_series()` where the index was not copied (and so mutating later would change the original), (GH15949)
• Bug in indexing with partial string indexing with a len-1 `DataFrame` (GH16071)
• Bug in `Series` construction where passing invalid dtype didn’t raise an error. (GH15520)

**Indexing**

• Bug in `Index` power operations with reversed operands (GH14973)
• Bug in `DataFrame.sort_values()` when sorting by multiple columns where one column is of type `int64` and contains `NaT` (GH14922)
• Bug in `DataFrame.reindex()` in which method was ignored when passing columns (GH14992)
• Bug in `DataFrame.loc` with indexing a `MultiIndex` with a `Series` indexer (GH14730, GH15424)
• Bug in `DataFrame.loc` with indexing a `MultiIndex` with a numpy array (GH15434)
• Bug in `Series.asof` which raised if the series contained all `np.nan` (GH15713)
• Bug in `.at` when selecting from a tz-aware column (GH15822)
• Bug in `Series.where()` and `DataFrame.where()` where array-like conditionals were being rejected (GH15414)
• Bug in `Series.where()` where TZ-aware data was converted to float representation (GH15701)
• Bug in `.loc` that would not return the correct dtype for scalar access for a `DataFrame` (GH11617)
• Bug in output formatting of a `MultiIndex` when names are integers (GH12223, GH15262)
• Bug in `Categorical.searchsorted()` where alphabetical instead of the provided categorical order was used (GH14522)
• Bug in `Series.iloc` where a `Categorical` object for list-like indexes input was returned, where a `Series` was expected. (GH14580)
• Bug in `DataFrame.isin` comparing datetimelike to empty frame (GH15473)
• Bug in `.reset_index()` when an all `NaN` level of a `MultiIndex` would fail (GH6322)
• Bug in `.reset_index()` when raising error for index name already present in MultiIndex columns (GH16120)

• Bug in creating a MultiIndex with tuples and not passing a list of names; this will now raise ValueError (GH15110)

• Bug in the HTML display with a MultiIndex and truncation (GH14882)

• Bug in the display of `.info()` where a qualifier (+) would always be displayed with a MultiIndex that contains only non-strings (GH15245)

• Bug in `pd.concat()` where the names of MultiIndex of resulting DataFrame are not handled correctly when None is presented in the names of MultiIndex of input DataFrame (GH15787)

• Bug in `DataFrame.sort_index()` and `Series.sort_index()` where na_position doesn’t work with a MultiIndex (GH14784, GH16604)

• Bug in `pd.concat()` when combining objects with a CategoricalIndex (GH16111)

• Bug in indexing with a scalar and a CategoricalIndex (GH16123)

IO

• Bug in `pd.to_numeric()` in which float and unsigned integer elements were being improperly casted (GH14941, GH15005)

• Bug in `pd.read_fwf()` where the skiprows parameter was not being respected during column width inference (GH11256)

• Bug in `pd.read_csv()` in which the dialect parameter was not being verified before processing (GH14898)

• Bug in `pd.read_csv()` in which missing data was being improperly handled with usecols (GH6710)

• Bug in `pd.read_csv()` in which a file containing a row with many columns followed by rows with fewer columns would cause a crash (GH14125)

• Bug in `pd.read_csv()` for the C engine where usecols were being indexed incorrectly with parse_dates (GH14792)

• Bug in `pd.read_csv()` with parse_dates when multi-line headers are specified (GH15376)

• Bug in `pd.read_csv()` with float_precision='round_trip' which caused a segfault when a text entry is parsed (GH15140)

• Bug in `pd.read_csv()` when an index was specified and no values were specified as null values (GH15835)

• Bug in `pd.read_csv()` in which certain invalid file objects caused the Python interpreter to crash (GH15337)

• Bug in `pd.read_csv()` in which invalid values for nrows and chunksize were allowed (GH15767)

• Bug in `pd.read_csv()` for the Python engine in which unhelpful error messages were being raised when parsing errors occurred (GH15910)

• Bug in `pd.read_csv()` in which the skipfooter parameter was not being properly validated (GH15925)

• Bug in `pd.to_csv()` in which there was numeric overflow when a timestamp index was being written (GH15982)

• Bug in `pd.read_csv()` where lines=True and contents (keys or values) contain escaped characters (GH15096)
• Bug in `.to_json()` causing single byte ascii characters to be expanded to four byte unicode (GH15344)

• Bug in `.to_json()` for the C engine where rollover was not correctly handled for case where frac is odd and diff is exactly 0.5 (GH15716, GH15864)

• Bug in `pd.read_json()` for Python 2 where lines=True and contents contain non-ascii unicode characters (GH15132)

• Bug in `pd.read_msgpack()` in which Series categoricals were being improperly processed (GH14901)

• Bug in `pd.read_msgpack()` which did not allow loading of a dataframe with an index of type CategoricalIndex (GH15487)

• Bug in `pd.read_msgpack()` when deserializing a CategoricalIndex (GH15487)

• Bug in DataFrame.to_records() with converting a DatetimeIndex with a timezone (GH13937)

• Bug in DataFrame.to_records() which failed with unicode characters in column names (GH11879)

• Bug in `.to_sql()` when writing a DataFrame with numeric index names (GH15404)

• Bug in DataFrame.to_html() with index=False and max_rows raising in IndexError (GH14998)

• Bug in `pd.read_hdf()` passing a Timestamp to the where parameter with a non date column (GH15492)

• Bug in DataFrame.to_stata() and StataWriter which produces incorrectly formatted files to be produced for some locales (GH13856)

• Bug in StataReader and StataWriter which allows invalid encodings (GH15723)

• Bug in the Series repr not showing the length when the output was truncated (GH15962).

Plotting

• Bug in DataFrame.hist where plt.tight_layout caused an AttributeError (use matplotlib >= 2.0.1) (GH9351)

• Bug in DataFrame.boxplot where fontsize was not applied to the tick labels on both axes (GH15108)

• Bug in the date and time converters pandas registers with matplotlib not handling multiple dimensions (GH16026)

• Bug in pd.scatter_matrix() could accept either color or c, but not both (GH14855)

GroupBy/resample/rolling

• Bug in `.groupby(..).resample()` when passed the on= kwarg. (GH15021)

• Properly set __name__ and __qualname__ for Groupby.* functions (GH14620)

• Bug in GroupBy.get_group() failing with a categorical grouper (GH15155)

• Bug in `.groupby(...).rolling(...)` when on is specified and using a DatetimeIndex (GH15130, GH13966)

• Bug in groupby operations with timedelta64 when passing numeric_only=False (GH5724)

• Bug in groupby.apply() coercing object dtypes to numeric types, when not all values were numeric (GH14423, GH15421, GH15670)

• Bug in resample, where a non-string offset argument would not be applied when resampling a timeseries (GH13218)
• Bug in DataFrame.groupby().describe() when grouping on Index containing tuples (GH14848)
• Bug in groupby().nunique() with a datetimelike-grouper where bins counts were incorrect (GH13453)
• Bug in groupby.transform() that would coerce the resultant dtypes back to the original (GH10972, GH11444)
• Bug in groupby.agg() incorrectly localizing timezone on datetime (GH15426, GH10668, GH13046)
• Bug in .rolling/expanding() functions where count() was not counting np.Inf, nor handling object dtypes (GH12541)
• Bug in .rolling() where pd.Timedelta or datetime.timedelta was not accepted as a window argument (GH15440)
• Bug in Rolling.quantile function that caused a segmentation fault when called with a quantile value outside of the range [0, 1] (GH15463)
• Bug in DataFrame.resample().median() if duplicate column names are present (GH14233)

Sparse

• Bug in SparseSeries.reindex on single level with list of length 1 (GH15447)
• Bug in repr-formatting a SparseDataFrame after a value was set on (a copy of) one of its series (GH15488)
• Bug in SparseDataFrame construction with lists not coercing to dtype (GH15682)
• Bug in sparse array indexing in which indices were not being validated (GH15863)

Reshaping

• Bug in pd.merge_asof() where left_index or right_index caused a failure when multiple by was specified (GH15676)
• Bug in pd.merge_asof() where left_index/right_index together caused a failure when tolerance was specified (GH15135)
• Bug in DataFrame.pivot_table() where dropna=True would not drop all-NaN columns when the columns was a category dtype (GH15193)
• Bug in pd.melt() where passing a tuple value for value_vars caused a TypeError (GH15348)
• Bug in pd.pivot_table() where no error was raised when values argument was not in the columns (GH14938)
• Bug in pd.concat() in which concatenating with an empty dataframe with join='inner' was being improperly handled (GH15328)
• Bug with sort=True in DataFrame.join and pd.merge when joining on indexes (GH15582)
• Bug in DataFrame.nsmallest and DataFrame.nlargest where identical values resulted in duplicated rows (GH15297)
• Bug in pandas.pivot_table() incorrectly raising UnicodeError when passing unicode input for margins keyword (GH13292)
pandas: powerful Python data analysis toolkit, Release 1.3.1

Numeric

- Bug in `.rank()` which incorrectly ranks ordered categories (GH15420)
- Bug in `.corr()` and `.cov()` where the column and index were the same object (GH14617)
- Bug in `.mode()` where mode was not returned if was only a single value (GH15714)
- Bug in `pd.cut()` with a single bin on an all 0s array (GH15428)
- Bug in `pd.qcut()` with a single quantile and an array with identical values (GH15431)
- Bug in `pandas.tools.utils.cartesian_product()` with large input can cause overflow on windows (GH15265)
- Bug in `.eval()` which caused multi-line evals to fail with local variables not on the first line (GH15342)

Other

- Compat with SciPy 0.19.0 for testing on `.interpolate()` (GH15662)
- Compat for 32-bit platforms for `qcut/cut`: bins will now be `int64` dtype (GH14866)
- Bug in interactions with Qt when a `QtApplication` already exists (GH14372)
- Avoid use of `np.finfo()` during import pandas removed to mitigate deadlock on Python GIL misuse (GH14641)

5.11 Version 0.19

5.11.1 Version 0.19.2 (December 24, 2016)

This is a minor bug-fix release in the 0.19.x series and includes some small regression fixes, bug fixes and performance improvements. We recommend that all users upgrade to this version.

Highlights include:

- Compatibility with Python 3.6
- Added a Pandas Cheat Sheet. (GH13202).

What’s new in v0.19.2

- Enhancements
- Performance improvements
- Bug fixes
- Contributors

Enhancements

The `pd.merge_asof()` function, added in 0.19.0, gained some improvements:

- `pd.merge_asof()` gained `left_index/right_index` and `left_by/right_by` arguments (GH14253)
- `pd.merge_asof()` can take multiple columns in `by` parameter and has specialized dtypes for better performance (GH13936)
Performance improvements

- Performance regression with PeriodIndex (GH14822)
- Performance regression in indexing with getitem (GH14930)
- Improved performance of .replace() (GH12745)
- Improved performance Series creation with a datetime index and dictionary data (GH14894)

Bug fixes

- Compat with python 3.6 for pickling of some offsets (GH14685)
- Compat with python 3.6 for some indexing exception types (GH14684, GH14689)
- Compat with python 3.6 for deprecation warnings in the test suite (GH14681)
- Compat with python 3.6 for Timestamp pickles (GH14689)
- Compat with dateutil==2.6.0; segfault reported in the testing suite (GH14621)
- Allow nanoseconds in Timestamp.replace as a kwarg (GH14621)
- Bug in pd.read_csv in which aliasing was being done for na_values when passed in as a dictionary (GH14203)
- Bug in pd.read_csv in which column indices for a dict-like na_values were not being respected (GH14203)
- Bug in pd.read_csv where reading files fails, if the number of headers is equal to the number of lines in the file (GH14515)
- Bug in pd.read_csv for the Python engine in which an unhelpful error message was being raised when multi-char delimiters were not being respected with quotes (GH14582)
- Fix bugs (GH14734, GH13654) in pd.read_sas and pandas.io.sas.sas7bdat.SAS7BDATReader that caused problems when reading a SAS file incrementally.
- Bug in pd.read_csv for the Python engine in which an unhelpful error message was being raised when skipfooter was not being respected by Python’s CSV library (GH13879)
- Bug in .fillna() in which timezone aware datetime64 values were incorrectly rounded (GH14872)
- Bug in .groupby(..., sort=True) of a non-lexsorted MultiIndex when grouping with multiple levels (GH14776)
- Bug in pd.cut with negative values and a single bin (GH14652)
- Bug in pd.to_numeric where a 0 was not unsigned on a downcast='unsigned' argument (GH14401)
- Bug in plotting regular and irregular timeseries using shared axes (sharex=True or ax.twinx()) (GH13341, GH14322).
- Bug in not propagating exceptions in parsing invalid datetimes, noted in python 3.6 (GH14561)
- Bug in resampling a DatetimeIndex in local TZ, covering a DST change, which would raise AmbiguousTimeError (GH14682)
- Bug in indexing that transformed RecursionError into KeyError or IndexingError (GH14554)
- Bug in HDFStore when writing a MultiIndex when using data_columns=True (GH14435)
- Bug in HDFStore.append() when writing a Series and passing a min_itemsize argument containing a value for the index (GH1412)
pandas: powerful Python data analysis toolkit, Release 1.3.1

- Bug when writing to a HDFStore in table format with a min_itemsize value for the index and without asking to append (GH10381)
- Bug in Series.groupby.nunique() raising an IndexError for an empty Series (GH12553)
- Bug in DataFrame.nlargest and DataFrame.nsmallest when the index had duplicate values (GH13412)
- Bug in clipboard functions on linux with python2 with unicode and separators (GH13747)
- Bug in clipboard functions on Windows 10 and python 3 (GH14362, GH12807)
- Bug in .to_clipboard() and Excel compat (GH12529)
- Bug in DataFrame.combine_first() for integer columns (GH14687)
- Bug in pd.read_csv() in which the dtype parameter was not being respected for empty data (GH14712)
- Bug in pd.read_csv() in which the nrows parameter was not being respected for large input when using the C engine for parsing (GH7626)
- Bug in pd.merge_asof() could not handle timezone-aware DatetimeIndex when a tolerance was specified (GH14844)
- Explicit check in to_stata and StataWriter for out-of-range values when writing doubles (GH14618)
- Bug in .plot(kind='kde') which did not drop missing values to generate the KDE Plot, instead generating an empty plot. (GH14821)
- Bug in unstack() if called with a list of column(s) as an argument, regardless of the dtypes of all columns, they get coerced to object (GH11847)

5.11.2 Version 0.19.1 (November 3, 2016)

This is a minor bug-fix release from 0.19.0 and includes some small regression fixes, bug fixes and performance improvements. We recommend that all users upgrade to this version.

What’s new in v0.19.1

- Performance improvements
- Bug fixes
- Contributors

Performance improvements

- Fixed performance regression in factorization of Period data (GH14338)
- Fixed performance regression in Series.asof(where) when where is a scalar (GH14461)
- Improved performance in DataFrame.asof(where) when where is a scalar (GH14461)
- Improved performance in .to_json() when lines=True (GH14408)
- Improved performance in certain types of loc indexing with a MultiIndex (GH14551).
Bug fixes

- Source installs from PyPI will now again work without cython installed, as in previous versions (GH14204)
- Compat with Cython 0.25 for building (GH14496)
- Fixed regression where user-provided file handles were closed in read_csv (c engine) (GH14418).
- Fixed regression in DataFrame.quantile when missing values where present in some columns (GH14357).
- Fixed regression in Index.difference where the freq of a DatetimeIndex was incorrectly set (GH14323)
- Added back pandas.core.common.array_equivalent with a deprecation warning (GH14555).
- Bug in pd.read_csv for the C engine in which quotation marks were improperly parsed in skipped rows (GH14459)
- Bug in pd.read_csv for Python 2.x in which Unicode quote characters were no longer being respected (GH14477)
- Fixed regression in Index.append when categorical indices were appended (GH14545).
- Fixed regression in pd.DataFrame where constructor fails when given dict with None value (GH14381)
- Fixed regression in DatetimeIndex._maybe_cast_slice_bound when index is empty (GH14354).
- Bug in localizing an ambiguous timezone when a boolean is passed (GH14402)
- Bug in TimedeltaIndex addition with a Datetime-like object where addition overflow in the negative direction was not being caught (GH14068, GH14453)
- Bug in string indexing against data with object Index may raise AttributeError (GH14424)
- Correctly raise ValueError on empty input to pd.eval() and df.query() (GH13139)
- Bug in RangeIndex.intersection when result is a empty set (GH14364).
- Bug in groupby-transform broadcasting that could cause incorrect dtype coercion (GH14457)
- Bug in Series.__setitem__ which allowed mutating read-only arrays (GH14359).
- Bug in DataFrame.insert where multiple calls with duplicate columns can fail (GH14291)
- pd.merge() will raise ValueError with non-boolean parameters in passed boolean type arguments (GH14434)
- Bug in Timestamp where dates very near the minimum (1677-09) could underflow on creation (GH14415)
- Bug in pd.concat where names of the keys were not propagated to the resulting MultiIndex (GH14252)
- Bug in pd.concat where axis cannot take string parameters 'rows' or 'columns' (GH14369)
- Bug in pd.concat with dataframes heterogeneous in length and tuple keys (GH14438)
- Bug in MultiIndex.set_levels where illegal level values were still set after raising an error (GH13754)
- Bug in DataFrame.to_json where lines=True and a value contained a } character (GH14391)
- Bug in df.groupby causing an AttributeError when grouping a single index frame by a column and the index level (GH14327)
- Bug in df.groupby where TypeError raised when pd.Grouper(key=...) is passed in a list (GH14334)
- Bug in pd.pivot_table may raise TypeError or ValueError when index or columns is not scalar and values is not specified (GH14380)

5.11.3 Version 0.19.0 (October 2, 2016)

This is a major release from 0.18.1 and includes number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

Highlights include:

- `merge_asof()` for asof-style time-series joining, see here
- `.rolling()` is now time-series aware, see here
- `read_csv()` now supports parsing Categorical data, see here
- A function `union_categorical()` has been added for combining categoricals, see here
- `PeriodIndex` now has its own period dtype, and changed to be more consistent with other `Index` classes. See here
- Sparse data structures gained enhanced support of int and bool dtypes, see here
- Comparison operations with `Series` no longer ignores the index, see here for an overview of the API changes.
- Introduction of a pandas development API for utility functions, see here.
- Deprecation of `Panel4D` and `PanelND`. We recommend to represent these types of n-dimensional data with the `xarray` package.
- Removal of the previously deprecated modules `pandas.io.data`, `pandas.io.wb`, `pandas.tools.rplot`.

Warning: pandas >= 0.19.0 will no longer silence numpy ufunc warnings upon import, see here.

What’s new in v0.19.0

- **New features**
  - Function `merge_asof` for asof-style time-series joining
  - Method `.rolling()` is now time-series aware
  - Method `read_csv` has improved support for duplicate column names
  - Method `read_csv` supports parsing Categorical directly
  - Categorical concatenation
  - Semi-month offsets
  - New Index methods
  - Google BigQuery enhancements
  - Fine-grained NumPy errstate
  - Method `get_dummies` now returns integer dtypes
  - Downcast values to smallest possible dtype in `to_numeric`
  - pandas development API
  - Other enhancements
- **API changes**
- Series.tolist() will now return Python types
- Series operators for different indexes
  * Arithmetic operators
  * Comparison operators
  * Logical operators
  * Flexible comparison methods
- Series type promotion on assignment
- Function .to_datetime() changes
- Merging changes
- Method .describe() changes
- Period changes
  * The PeriodIndex now has period dtype
  * Period('NaT') now returns pd.NaT
  * PeriodIndex.values now returns array of Period object
- Index + / – no longer used for set operations
- Index.difference and .symmetric_difference changes
- Index.unique consistently returns Index
- MultiIndex constructors, groupby and set_index preserve categorical dtypes
- Function read_csv will progressively enumerate chunks
- Sparse changes
  * Types int64 and bool support enhancements
  * Operators now preserve dtypes
  * Other sparse fixes
- Indexer dtype changes
- Other API changes

- Deprecations
- Removal of prior version deprecations/changes
- Performance improvements
- Bug fixes
- Contributors
New features

Function merge_asof for asof-style time-series joining

A long-time requested feature has been added through the `merge_asof()` function, to support asof style joining of time-series (GH1870, GH13695, GH13709, GH13902). Full documentation is [here](#).

The `merge_asof()` performs an asof merge, which is similar to a left-join except that we match on nearest key rather than equal keys.

```python
In [1]: left = pd.DataFrame({"a": [1, 5, 10], "left_val": ["a", "b", "c"]})

In [2]: right = pd.DataFrame({"a": [1, 2, 3, 6, 7], "right_val": [1, 2, 3, 6, 7]})

In [3]: left
Out[3]:
      a  left_val
0    1       a
1    5       b
2   10       c

[3 rows x 2 columns]

In [4]: right
Out[4]:
      a  right_val
0    1       1
1    2       2
2    3       3
3    6       6
4    7       7

[5 rows x 2 columns]

We typically want to match exactly when possible, and use the most recent value otherwise.

```python
In [5]: pd.merge_asof(left, right, on="a")
Out[5]:
      a  left_val  right_val
0    1       a       1
1    5       b       3
2   10       c       7

[3 rows x 3 columns]

We can also match rows ONLY with prior data, and not an exact match.

```python
In [6]: pd.merge_asof(left, right, on="a", allow_exact_matches=False)
Out[6]:
      a  left_val  right_val
0    1       a     NaN
1    5       b       3
2   10       c       7

[3 rows x 3 columns]
```

In a typical time-series example, we have trades and quotes and we want to asof-join them. This also illustrates using the by parameter to group data before merging.
In [7]: trades = pd.DataFrame(
            ...
    "time": pd.to_datetime(
            ...
    "20160525 13:30:00.023",
            ...
    "20160525 13:30:00.038",
            ...
    "20160525 13:30:00.048",
            ...
    "20160525 13:30:00.048",
            ...
    "20160525 13:30:00.048",
            ...
    "20160525 13:30:00.048",
            ...
    },
            ...
    "ticker": ["MSFT", "MSFT", "GOOG", "GOOG", "AAPL"],
            ...
    "price": [51.95, 51.95, 720.77, 720.92, 98.00],
            ...
    "quantity": [75, 155, 100, 100, 100],
            ...
    },
            ...
    columns=["time", "ticker", "price", "quantity"],
            ...
    ...
)
            ...
In [8]: quotes = pd.DataFrame(
            ...
    "time": pd.to_datetime(
            ...
    "20160525 13:30:00.023",
            ...
    "20160525 13:30:00.023",
            ...
    "20160525 13:30:00.030",
            ...
    "20160525 13:30:00.041",
            ...
    "20160525 13:30:00.048",
            ...
    "20160525 13:30:00.049",
            ...
    "20160525 13:30:00.072",
            ...
    "20160525 13:30:00.075",
            ...
    },
            ...
    "ticker": ["GOOG", "MSFT", "MSFT", "MSFT", "GOOG", "AAPL", "GOOG",
            ...
    "bid": [720.50, 51.95, 51.97, 51.99, 720.50, 97.99, 720.50, 52.01],
            ...
    "ask": [720.93, 51.96, 51.98, 52.00, 720.93, 98.01, 720.88, 52.03],
            ...
    },
            ...
    columns=["time", "ticker", "bid", "ask"],
            ...
    ...
)
            ...
In [9]: trades
Out[9]:
    time  ticker  price  quantity
0  2016-05-25 13:30:00.023  MSFT  51.95       75
1  2016-05-25 13:30:00.038  MSFT  51.95      155
2  2016-05-25 13:30:00.048  GOOG  720.77     100
3  2016-05-25 13:30:00.048  GOOG  720.92     100
4  2016-05-25 13:30:00.048  AAPL  98.00      100
[5 rows x 4 columns]
In [10]: quotes
Out[10]:
    time  ticker  bid  ask
0  2016-05-25 13:30:00.023  GOOG  720.50  720.93
An asof merge joins on the `on`, typically a datetimelike field, which is ordered, and in this case we are using a grouper in the `by` field. This is like a left-outer join, except that forward filling happens automatically taking the most recent non-NaN value.

```
In [11]: pd.merge_asof(trades, quotes, on="time", by="ticker")
Out[11]:
         time  ticker  price  quantity  bid   ask
0  2016-05-25  13:30:00.023  MSFT  51.95      75  51.95  51.96
1  2016-05-25  13:30:00.038  MSFT  51.95     155  51.97  51.98
2  2016-05-25  13:30:00.048  GOOG  720.77     100  720.50  720.93
3  2016-05-25  13:30:00.048  GOOG  720.92     100  720.50  720.93
4  2016-05-25  13:30:00.048  AAPL   98.00     100    NaN    NaN
```

This returns a merged DataFrame with the entries in the same order as the original left passed DataFrame (`trades` in this case), with the fields of the `quotes` merged.

**Method `.rolling()` is now time-series aware**

`.rolling()` objects are now time-series aware and can accept a time-series offset (or convertible) for the `window` argument (GH13327, GH12995). See the full documentation [here](#).

```
In [12]: dft = pd.DataFrame({
    ....:     "B": [0, 1, 2, np.nan, 4],
    ....:     index=pd.date_range("20130101 09:00:00", periods=5, freq="s"),
    ....:     })

In [13]: dft
Out[13]:
          B
2013-01-01 09:00:00  0.0
2013-01-01 09:00:01  1.0
2013-01-01 09:00:02  2.0
2013-01-01 09:00:03   NaN
2013-01-01 09:00:04  4.0
```

This is a regular frequency index. Using an integer window parameter works to roll along the window frequency.

```
In [14]: dft.rolling(2).sum()
Out[14]:
          B
2013-01-01 09:00:00  0.0
2013-01-01 09:00:01  1.0
2013-01-01 09:00:02  2.0
2013-01-01 09:00:03   NaN
2013-01-01 09:00:04  4.0
```

(continues on next page)
Specifying an offset allows a more intuitive specification of the rolling frequency.

```python
In [16]: dft.rolling("2s").sum()
Out[16]:
B
2013-01-01 09:00:00 0.0
2013-01-01 09:00:01 1.0
2013-01-01 09:00:02 3.0
2013-01-01 09:00:03 2.0
2013-01-01 09:00:04 4.0
```

Using a non-regular, but still monotonic index, rolling with an integer window does not impart any special calculation.

```python
In [17]: dft = pd.DataFrame(
    ....:     {"B": [0, 1, 2, np.nan, 4]},
    ....:     index=pd.Index(
    ....:         [
    ....:             pd.Timestamp("20130101 09:00:00"),
    ....:             pd.Timestamp("20130101 09:00:02"),
    ....:             pd.Timestamp("20130101 09:00:03"),
    ....:             pd.Timestamp("20130101 09:00:05"),
    ....:             pd.Timestamp("20130101 09:00:06"),
    ....:         ],
    ....:         name="foo",
    ....:     ),
    ....: )

In [18]: dft
Out[18]:
B
foo
2013-01-01 09:00:00 0.0
2013-01-01 09:00:02 1.0
2013-01-01 09:00:03 2.0
2013-01-01 09:00:05 NaN
```
Using the time-specification generates variable windows for this sparse data.

```python
In [20]: dft.rolling("2s").sum()
Out[20]:
       B
foo
2013-01-01 09:00:00  0.0
2013-01-01 09:00:02  1.0
2013-01-01 09:00:03  3.0
2013-01-01 09:00:05  NaN
2013-01-01 09:00:06  4.0
[5 rows x 1 columns]
```

Furthermore, we now allow an optional `on` parameter to specify a column (rather than the default of the index) in a DataFrame.

```python
In [21]: dft = dft.reset_index()

In [22]: dft
Out[22]:
       foo  B
0  2013-01-01 09:00:00  0.0
1  2013-01-01 09:00:02  1.0
2  2013-01-01 09:00:03  2.0
3  2013-01-01 09:00:05  NaN
4  2013-01-01 09:00:06  4.0
[5 rows x 2 columns]

In [23]: dft.rolling("2s", on="foo").sum()
Out[23]:
       foo   B
0  2013-01-01 09:00:00  0.0
1  2013-01-01 09:00:02  1.0
2  2013-01-01 09:00:03  3.0
3  2013-01-01 09:00:05  NaN
4  2013-01-01 09:00:06  4.0
[5 rows x 2 columns]
```
Method **read_csv** has improved support for duplicate column names

*Duplicate column names* are now supported in **read_csv()** whether they are in the file or passed in as the names parameter (GH7160, GH9424)

```python
In [24]: data = "0,1,2\n3,4,5"
In [25]: names = ["a", "b", "a"]
```

Previous behavior:

```python
In [2]: pd.read_csv(StringIO(data), names=names)
Out[2]:
   a  b  a
0  2  1  2
1  5  4  5
```
The first a column contained the same data as the second a column, when it should have contained the values [0, 3].

New behavior:

```python
In [26]: pd.read_csv(StringIO(data), names=names)
---------------------------------------------------------------------------
ValueError                                Traceback (most recent call last)
<ipython-input-26-a095135d9435> in
----> 1 pd.read_csv(StringIO(data), names=names)
/pandas/pandas/parsers/readers.py in _read(filepath_or_buffer, kwds)
   309                        stacklevel=stacklevel,
   310                     )
-> 311            return func(*args, **kwargs)
   312
   313                return wrapper
```
```python
/pandas/pandas/io/parsers/readers.py in _validate_names(names)
    477     # Check for duplicates in names.
    478     _validate_names(kwds.get("names", None))
    480
    481     # Create the parser.
```
```python
/pandas/pandas/io/parsers/readers.py in _validate_names(names)
    (continues on next page)
Method read_csv supports parsing Categorical directly

The read_csv() function now supports parsing a Categorical column when specified as a dtype (GH10153). Depending on the structure of the data, this can result in a faster parse time and lower memory usage compared to converting to Categorical after parsing. See the io docs here.

In [27]: data = ""
   .....: col1,col2,col3
   .....: a,b,1
   .....: a,b,2
   .....: c,d,3
   .....: ""
   
In [28]: pd.read_csv(StringIO(data))
Out[28]:
    col1  col2  col3
   0     a     b    1
   1     a     b    2
   2     c     d    3
[3 rows x 3 columns]

In [29]: pd.read_csv(StringIO(data)).dtypes
Out[29]:
    col1  object
    col2  object
    col3   int64
Length: 3, dtype: object

In [30]: pd.read_csv(StringIO(data), dtype="category").dtypes
Out[30]:
    col1  category
    col2  object
    col3   int64
Length: 3, dtype: object

Individual columns can be parsed as a Categorical using a dict specification

In [31]: pd.read_csv(StringIO(data), dtype={"col1": "category"}).dtypes
Out[31]:
    col1  category
    col2  object
    col3   int64
Length: 3, dtype: object
Note: The resulting categories will always be parsed as strings (object dtype). If the categories are numeric they can be converted using the `to_numeric()` function, or as appropriate, another converter such as `to_datetime()`.

```python
In [32]: df = pd.read_csv(StringIO(data), dtype="category")
In [33]: df.dtypes
Out[33]:
col1 category
col2 category
col3 category
Length: 3, dtype: object
In [34]: df['col3']
Out[34]:
0 1
1 2
2 3
Name: col3, Length: 3, dtype: category
Categories (3, object): ['1', '2', '3']
In [35]: df['col3'].cat.categories = pd.to_numeric(df['col3'].cat.categories)
In [36]: df['col3']
Out[36]:
0 1
1 2
2 3
Name: col3, Length: 3, dtype: category
Categories (3, int64): [1, 2, 3]
```

Categorical concatenation

- A function `union_categories()` has been added for combining categoricals, see `Unioning Categoricals` (GH13361, GH13763, GH13846, GH14173)

```python
In [37]: from pandas.api.types import union_categories
In [38]: a = pd.Categorical(['b', 'c'])
In [39]: b = pd.Categorical(['a', 'b'])
In [40]: union_categories([a, b])
Out[40]:
['b', 'c', 'a', 'b']
Categories (3, object): ['b', 'c', 'a']
```

- `concat` and `append` now can concat category dtypes with different categories as object dtype (GH13524)

```python
In [41]: s1 = pd.Series(['a', 'b'], dtype="category")
In [42]: s2 = pd.Series(['b', 'c'], dtype="category")
```
In [1]: pd.concat([s1, s2])
ValueError: incompatible categories in categorical concat

New behavior:

In [43]: pd.concat([s1, s2])
Out[43]:
0  a
1  b
0  b
1  c
Length: 4, dtype: object

Semi-month offsets

pandas has gained new frequency offsets, SemiMonthEnd (‘SM’) and SemiMonthBegin (‘SMS’). These provide date offsets anchored (by default) to the 15th and end of month, and 15th and 1st of month respectively. (GH1543)

In [44]: from pandas.tseries.offsets import SemiMonthEnd, SemiMonthBegin

SemiMonthEnd:

In [45]: pd.Timestamp("2016-01-01") + SemiMonthEnd()
Out[45]: Timestamp('2016-01-15 00:00:00')

In [46]: pd.date_range("2015-01-01", freq="SM", periods=4)
                      dtype='datetime64[ns]', freq='SM-15')

SemiMonthBegin:

In [47]: pd.Timestamp("2016-01-01") + SemiMonthBegin()
Out[47]: Timestamp('2016-01-15 00:00:00')

In [48]: pd.date_range("2015-01-01", freq="SMS", periods=4)
                      dtype='datetime64[ns]', freq='SMS-15')

Using the anchoring suffix, you can also specify the day of month to use instead of the 15th.

In [49]: pd.date_range("2015-01-01", freq="SMS-16", periods=4)
Out[49]: DatetimeIndex(['2015-01-01', '2015-01-16', '2015-02-01', '2015-02-16'],
                      dtype='datetime64[ns]', freq='SMS-16')

In [50]: pd.date_range("2015-01-01", freq="SM-14", periods=4)
                      dtype='datetime64[ns]', freq='SM-14')
**New Index methods**

The following methods and options are added to `Index`, to be more consistent with the `Series` and `DataFrame` API.

Index now supports the `.where()` function for same shape indexing (GH13170)

```python
In [51]: idx = pd.Index(['a', 'b', 'c'])

In [52]: idx.where([True, False, True])
Out[52]: Index(['a', nan, 'c'], dtype='object')
```

Index now supports `.dropna()` to exclude missing values (GH6194)

```python
In [53]: idx = pd.Index([1, 2, np.nan, 4])

In [54]: idx.dropna()
Out[54]: Float64Index([1.0, 2.0, 4.0], dtype='float64')
```

For `MultiIndex`, values are dropped if any level is missing by default. Specifying `how='all'` only drops values where all levels are missing.

```python
In [55]: midx = pd.MultiIndex.from_arrays([[1, 2, np.nan, 4], [1, 2, np.nan, np.nan]])

In [56]: midx
Out[56]: MultiIndex([(1.0, 1.0),
            (2.0, 2.0),
            (nan, nan),
            (4.0, nan)],
           )

In [57]: midx.dropna()
Out[57]: MultiIndex([(1, 1),
               (2, 2)],
              )

In [58]: midx.dropna(how='all')
Out[58]: MultiIndex([(1, 1.0),
               (2, 2.0),
               (4, nan)],
              )
```

Index now supports `.str.extractall()` which returns a `DataFrame`, see the docs here (GH10008, GH13156)

```python
In [59]: idx = pd.Index(['a1a2', 'b1', 'c1'])

In [60]: idx.str.extractall(r'\[ab\](?P<digit>\d)')
Out[60]:
   digit
0    1
1    2
1    1
[3 rows x 1 columns]
```
Index.astype() now accepts an optional boolean argument copy, which allows optional copying if the requirements on dtype are satisfied (GH13209)

Google BigQuery enhancements

- The read_gbq() method has gained the dialect argument to allow users to specify whether to use BigQuery’s legacy SQL or BigQuery’s standard SQL. See the docs for more details (GH13615).
- The to_gbq() method now allows the DataFrame column order to differ from the destination table schema (GH11359).

Fine-grained NumPy errstate

Previous versions of pandas would permanently silence numpy’s ufunc error handling when pandas was imported. pandas did this in order to silence the warnings that would arise from using numpy ufuncs on missing data, which are usually represented as NaNs. Unfortunately, this silenced legitimate warnings arising in non-pandas code in the application. Starting with 0.19.0, pandas will use the numpy.errstate context manager to silence these warnings in a more fine-grained manner, only around where these operations are actually used in the pandas code base. (GH13109, GH13145)

After upgrading pandas, you may see new RuntimeWarnings being issued from your code. These are likely legitimate, and the underlying cause likely existed in the code when using previous versions of pandas that simply silenced the warning. Use numpy.errstate around the source of the RuntimeWarning to control how these conditions are handled.

Method get_dummies now returns integer dtypes

The pd.get_dummies function now returns dummy-encoded columns as small integers, rather than floats (GH8725). This should provide an improved memory footprint.

Previous behavior:

```
In [1]: pd.get_dummies(['A', 'B', 'A', 'C']).dtypes
Out[1]:
    A  float64
    B  float64
    C  float64
dtype: object
```

New behavior:

```
In [61]: pd.get_dummies(['a', 'b', 'a', 'c']).dtypes
Out[61]:
    a   uint8
    b   uint8
    c   uint8
Length: 3, dtype: object
```
Downcast values to smallest possible dtype in `pd.to_numeric`

`pd.to_numeric()` now accepts a `downcast` parameter, which will downcast the data if possible to smallest specified numerical dtype (GH13352)

```
In [62]: s = ['1', 2, 3]

In [63]: pd.to_numeric(s, downcast="unsigned")
Out[63]: array([1, 2, 3], dtype=uint8)

In [64]: pd.to_numeric(s, downcast="integer")
Out[64]: array([1, 2, 3], dtype=int8)
```

`pandas development API`

As part of making pandas API more uniform and accessible in the future, we have created a standard sub-package of pandas, `pandas.api` to hold public API's. We are starting by exposing type introspection functions in `pandas.api.types`. More sub-packages and officially sanctioned API's will be published in future versions of pandas (GH13147, GH13634)

The following are now part of this API:

```
In [65]: import pprint

In [66]: from pandas.api import types

In [67]: func = [f for f in dir(types) if not f.startswith('_')]

In [68]: pprint.pprint(funcs)
['CategoricalDtype',
'DatetimeTZDtype',
'IntervalDtype',
'PeriodDtype',
'infer_dtype',
'is_array_like',
'is_bool',
'is_bool_dtype',
'is_categorical',
'is_categorical_dtype',
'is_complex',
'is_complex_dtype',
'is_datetime64_any_dtype',
'is_datetime64_dtype',
'is_datetime64_ns_dtype',

(continues on next page)
pandas: powerful Python data analysis toolkit, Release 1.3.1

Note: Calling these functions from the internal module pandas.core.common will now show a DeprecationWarning (GH13990)

Other enhancements

- Timestamp can now accept positional and keyword parameters similar to datetime.datetime() (GH10758, GH11630)

```python
In [69]: pd.Timestamp(2012, 1, 1)
Out[69]: Timestamp('2012-01-01 00:00:00')

In [70]: pd.Timestamp(year=2012, month=1, day=1, hour=8, minute=30)
Out[70]: Timestamp('2012-01-01 08:30:00')
```

- The .resample() function now accepts a on= or level= parameter for resampling on a datetimelike column or MultiIndex level (GH13500)

```python
In [71]: df = pd.DataFrame(
    ....:     {"date": pd.date_range("2015-01-01", freq="W", periods=5), "a": np.
    ....:         arange(5)},
    ....:     index=pd.MultiIndex.from_arrays(
    ....:         [[1, 2, 3, 4, 5], pd.date_range("2015-01-01", freq="W",
    ....:          periods=5)],
    ....:         names=["v", "d"],
    ....:     ),
    ....:     )
In [72]: df
Out[72]:
   date   a
   v   d
1 2015-01-04 2015-01-04 0
2 2015-01-11 2015-01-11 1
3 2015-01-18 2015-01-18 2
4 2015-01-25 2015-01-25 3
5 2015-02-01 2015-02-01 4

[5 rows x 2 columns]

In [73]: df.resample("M", on="date").sum()
Out[73]:
   date
2015-01-31  6
2015-02-28  4

[2 rows x 1 columns]

In [74]: df.resample("M", level="d").sum()
Out[74]:
   d
2015-01-31  6
2015-02-28  4

[2 rows x 1 columns]

• The .get_credentials() method of GbqConnector can now first try to fetch the application default credentials. See the docs for more details (GH13577).

• The .tz_localize() method of DatetimeIndex and Timestamp has gained the errors keyword, so you can potentially coerce nonexistent timestamps to NaT. The default behavior remains to raising a NonExistentTimeError (GH13057)

• .to_hdf/read_hdf() now accept path objects (e.g. pathlib.Path, py.path.local) for the file path (GH11773)

• The pd.read_csv() with engine='python' has gained support for the decimal (GH12933), na_filter (GH13321) and the memory_map option (GH13381).

• Consistent with the Python API, pd.read_csv() will now interpret +inf as positive infinity (GH13274)

• The pd.read_html() has gained support for the na_values, converters, keep_default_na options (GH13461)

• Categorical.astype() now accepts an optional boolean argument copy, effective when dtype is categorical (GH13209)

• DataFrame has gained the .asof() method to return the last non-NaN values according to the selected subset (GH13358)

• The DataFrame constructor will now respect key ordering if a list of OrderedDict objects are passed in (GH13304)

• pd.read_html() has gained support for the decimal option (GH12907)

• Series has gained the properties .is_monotonic, .is_monotonic_increasing, .is_monotonic_decreasing, similar to Index (GH13336)

• DataFrame.to_sql() now allows a single value as the SQL type for all columns (GH11886).

• Series.append now supports the ignore_index option (GH13677)
• `.to_stata()` and `StataWriter` can now write variable labels to Stata dta files using a dictionary to make column names to labels (GH13535, GH13536)

• `.to_stata()` and `StataWriter` will automatically convert `datetime64[ns]` columns to Stata format `%tc`, rather than raising a `ValueError` (GH12259)

• `read_stata()` and `StataReader` raise with a more explicit error message when reading Stata files with repeated value labels when `convert_categoricals=True` (GH13923)

• `DataFrame.style` will now render sparsified MultiIndexes (GH11655)

• `DataFrame.style` will now show column level names (e.g. `DataFrame.columns.names`) (GH13775)

• `DataFrame` has gained support to re-order the columns based on the values in a row using `df.sort_values(by='...', axis=1)` (GH10806)

```
In [75]: df = pd.DataFrame({'A': [2, 7], 'B': [3, 5], 'C': [4, 8]}, index=['row1', 'row2'])
In [76]: df
Out[76]:
    A  B  C
row1 2  3  4
row2 7  5  8
[2 rows x 3 columns]
In [77]: df.sort_values(by='row2', axis=1)
Out[77]:
   B  A  C
row1 3  2  4
row2 5  7  8
[2 rows x 3 columns]
```

• Added documentation to I/O regarding the perils of reading in columns with mixed dtypes and how to handle it (GH13746)

• `to_html()` now has a `border` argument to control the value in the opening `<table>` tag. The default is the value of the `html.border` option, which defaults to 1. This also affects the notebook HTML repr, but since Jupyter’s CSS includes a border-width attribute, the visual effect is the same. (GH11563).

• Raise `ImportError` in the sql functions when `sqlalchemy` is not installed and a connection string is used (GH11920).

• Compatibility with matplotlib 2.0. Older versions of pandas should also work with matplotlib 2.0 (GH13333)

• `Timestamp`, `Period`, `DatetimeIndex`, `PeriodIndex` and `.dt` accessor have gained a `.is_leap_year` property to check whether the date belongs to a leap year. (GH13727)

• `astype()` will now accept a dict of column name to data types mapping as the `dtype` argument. (GH12086)

• The `pd.read_json` and `DataFrame.to_json` has gained support for reading and writing json lines with `lines` option see `Line delimited json` (GH9180)

• `read_excel()` now supports the `true_values` and `false_values` keyword arguments (GH13347)

• `groupby()` will now accept a scalar and a single-element list for specifying `level` on a non-MultiIndex grouper. (GH13907)

• Non-convertible dates in an excel date column will be returned without conversion and the column will be `object` dtype, rather than raising an exception (GH10001).
• `pd.Timedelta(None)` is now accepted and will return `NaT`, mirroring `pd.Timestamp` (GH13687)
• `pd.read_stata()` can now handle some format 111 files, which are produced by SAS when generating Stata dta files (GH11526)
• `Series` and `Index` now support `divmod` which will return a tuple of series or indices. This behaves like a standard binary operator with regards to broadcasting rules (GH14208).

API changes

**Series.tolist() will now return Python types**

`Series.tolist()` will now return Python types in the output, mimicking NumPy `tolist()` behavior (GH10904)

```python
In [78]: s = pd.Series([1, 2, 3])
```

**Previous behavior:**

```python
In [7]: type(s.tolist()[0])
Out[7]:
<class 'numpy.int64'>
```

**New behavior:**

```python
In [79]: type(s.tolist()[0])
Out[79]: int
```

**Series operators for different indexes**

Following `Series` operators have been changed to make all operators consistent, including `DataFrame` (GH1134, GH4581, GH13538)

• `Series` comparison operators now raise `ValueError` when `index` are different.
• `Series` logical operators align both `index` of left and right hand side.

**Warning:** Until 0.18.1, comparing `Series` with the same length, would succeed even if the `.index` are different (the result ignores `.index`). As of 0.19.0, this will raises `ValueError` to be more strict. This section also describes how to keep previous behavior or align different indexes, using the flexible comparison methods like `.eq`

As a result, `Series` and `DataFrame` operators behave as below:
Arithmetic operators

Arithmetic operators align both index (no changes).

```python
In [80]: s1 = pd.Series([1, 2, 3], index=list("ABC"))
In [81]: s2 = pd.Series([2, 2, 2], index=list("ABD"))
In [82]: s1 + s2
Out[82]:
A   3.0
B   4.0
C   NaN
D   NaN
Length: 4, dtype: float64
```

```python
In [83]: df1 = pd.DataFrame([1, 2, 3], index=list("ABC"))
In [84]: df2 = pd.DataFrame([2, 2, 2], index=list("ABD"))
In [85]: df1 + df2
Out[85]:
0   3.0
A   3.0
B   4.0
C   NaN
D   NaN
[4 rows x 1 columns]
```

Comparison operators

Comparison operators raise `ValueError` when .index are different.

**Previous behavior** (Series):
Series compared values ignoring the .index as long as both had the same length:

```python
In [1]: s1 == s2
Out[1]:
A   False
B    True
C   False
dtype: bool
```

**New behavior** (Series):

```python
In [2]: s1 == s2
Out[2]:
ValueError: Can only compare identically-labeled Series objects
```

**Note:** To achieve the same result as previous versions (compare values based on locations ignoring .index), compare both .values.

```python
In [86]: s1.values == s2.values
Out[86]: array([False,  True, False])
```
If you want to compare Series aligning its .index, see flexible comparison methods section below:

```
In [87]: s1.eq(s2)
Out[87]:
   A   False
   B    True
   C   False
   D   False
Length: 4, dtype: bool
```

**Current behavior (DataFrame, no change):**

```
In [3]: df1 == df2
Out[3]:
ValueError: Can only compare identically-labeled DataFrame objects
```

**Logical operators**

Logical operators align both .index of left and right hand side.

**Previous behavior (Series), only left hand side index was kept:**

```
In [4]: s1 = pd.Series([True, False, True], index=list('ABC'))
In [5]: s2 = pd.Series([True, True, True], index=list('ABD'))
In [6]: s1 & s2
Out[6]:
   A    True
   B   False
   C   False
dtype: bool
```

**New behavior (Series):**

```
In [88]: s1 = pd.Series([True, False, True], index=list('ABC'))
In [89]: s2 = pd.Series([True, True, True], index=list('ABD'))
In [90]: s1 & s2
Out[90]:
   A    True
   B   False
   C   False
   D   False
Length: 4, dtype: bool
```

**Note:** Series logical operators fill a NaN result with False.

**Note:** To achieve the same result as previous versions (compare values based on only left hand side index), you can use reindex_like:

```
In [91]: s1 & s2.reindex_like(s1)
Out[91]:
```

(continues on next page)
A    True
B    False
C    False
Length: 3, dtype: bool

Current behavior (DataFrame, no change):

```
In [92]: df1 = pd.DataFrame([True, False, True], index=list("ABC"))

In [93]: df2 = pd.DataFrame([True, True, True], index=list("ABD"))

In [94]: df1 & df2
Out[94]:
   0
A    True
B    False
C    False
D    False
[4 rows x 1 columns]
```

Flexible comparison methods

Series flexible comparison methods like eq, ne, le, lt, ge and gt now align both index. Use these operators if you want to compare two Series which has the different index.

```
In [95]: s1 = pd.Series([1, 2, 3], index=["a", "b", "c"])  

In [96]: s2 = pd.Series([2, 2, 2], index=["b", "c", "d"])  

In [97]: s1.eq(s2)  
Out[97]:
   a    False
   b    True
   c    False
   d    False
Length: 4, dtype: bool

In [98]: s1.ge(s2)  
Out[98]:
   a    False
   b    True
   c    True
   d    False
Length: 4, dtype: bool
```

Previously, this worked the same as comparison operators (see above).
Series type promotion on assignment

A Series will now correctly promote its dtype for assignment with incompat values to the current dtype (GH13234)

```python
In [99]: s = pd.Series()

Previous behavior:

```python
In [2]: s["a"] = pd.Timestamp("2016-01-01")
In [3]: s["b"] = 3.0
```

```
TypeError: invalid type promotion
```

New behavior:

```python
In [100]: s["a"] = pd.Timestamp("2016-01-01")
In [101]: s["b"] = 3.0
In [102]: s
Out[102]:
   a  2016-01-01 00:00:00
   b     3.0
Length: 2, dtype: object
```

```
In [103]: s.dtype
Out[103]:
```

Function .to_datetime() changes

Previously if .to_datetime() encountered mixed integers/floats and strings, but no datetimes with errors='coerce' it would convert all to NaT.

Previous behavior:

```python
In [2]: pd.to_datetime([1, 'foo'], errors='coerce')
```

```
Out[2]: DatetimeIndex(['NaT', 'NaT'], dtype='datetime64[ns]', freq=None)
```

Current behavior:

This will now convert integers/floats with the default unit of ns.

```python
In [104]: pd.to_datetime([1, "foo"], errors="coerce")
```

```
Out[104]: DatetimeIndex(['1970-01-01 00:00:00.000000001', 'NaT'], dtype='datetime64[ns]', freq=None)
```

Bug fixes related to .to_datetime():

- Bug in pd.to_datetime() when passing integers or floats, and no unit and errors='coerce' (GH13180).
- Bug in pd.to_datetime() when passing invalid data types (e.g. bool); will now respect the errors keyword (GH13176).
- Bug in pd.to_datetime() which overflowed on int8, and int16 dtypes (GH13451).
- Bug in pd.to_datetime() raise AttributeError with NaN and the other string is not valid when errors='ignore' (GH12424)
• Bug in `pd.to_datetime()` did not cast floats correctly when `unit` was specified, resulting in truncated datetime (GH13834)

### Merging changes

Merging will now preserve the dtype of the join keys (GH8596)

```
In [105]: df1 = pd.DataFrame({'key': [1], 'v1': [10]})
In [106]: df1
Out[106]:
   key  v1
0    1  10

[1 rows x 2 columns]
```

```
In [107]: df2 = pd.DataFrame({'key': [1, 2], 'v1': [20, 30]})
```

```
In [108]: df2
Out[108]:
   key  v1
0    1  20
1    2  30

[2 rows x 2 columns]
```

**Previous behavior:**

```
In [5]: pd.merge(df1, df2, how='outer')
Out[5]:
   key  v1
0  1.0  10.0
1  1.0  20.0
2  2.0  30.0
```

```
In [6]: pd.merge(df1, df2, how='outer').dtypes
Out[6]:
key      float64
v1      float64
dtype: object
```

**New behavior:**

We are able to preserve the join keys

```
In [109]: pd.merge(df1, df2, how='outer')
Out[109]:
   key  v1
0    1  10
1    1  20
2    2  30

[3 rows x 2 columns]
```

```
In [110]: pd.merge(df1, df2, how='outer').dtypes
Out[110]:
key    int64
```

(continues on next page)
Of course if you have missing values that are introduced, then the resulting dtype will be upcast, which is unchanged from previous.

```
In [111]: pd.merge(df1, df2, how="outer", on="key")
Out[111]:
   key  v1_x  v1_y
0   1   10.0   20
1   2     NaN   30
[2 rows x 3 columns]
```

```
In [112]: pd.merge(df1, df2, how="outer", on="key").dtypes
Out[112]:
   key  int64
   v1_x  float64
   v1_y  int64
Length: 3, dtype: object
```

**Method `.describe()` changes**

Percentile identifiers in the index of a `.describe()` output will now be rounded to the least precision that keeps them distinct (GH13104)

```
In [113]: s = pd.Series([0, 1, 2, 3, 4])
In [114]: df = pd.DataFrame([0, 1, 2, 3, 4])
```

**Previous behavior:**

The percentiles were rounded to at most one decimal place, which could raise `ValueError` for a data frame if the percentiles were duplicated.

```
In [3]: s.describe(percentiles=[0.0001, 0.0005, 0.001, 0.999, 0.9995, 0.9999])
Out[3]:
   count    5.000000
   mean    2.000000
   std  1.581139
   min  0.000000
   0.0%  0.000400
   0.1%  0.002000
   0.1%  0.004000
   50%    2.000000
   99.9%  3.996000
   100.0%  3.998000
   100.0%  3.999600
   max    4.000000
dtype: float64
```

```
In [4]: df.describe(percentiles=[0.0001, 0.0005, 0.001, 0.999, 0.9995, 0.9999])
Out[4]:
...  
ValueError: cannot reindex from a duplicate axis
```
New behavior:

```python
In [115]: s.describe(percentiles=[0.0001, 0.0005, 0.001, 0.999, 0.9995, 0.9999])
Out[115]:
   count     5.000000
   mean      2.000000
   std  1.581139
   min      0.000000
  0.01%   0.000400
  0.05%   0.002000
  0.1%    0.004000
   50%    2.000000
  99.9%   3.996000
  99.95%  3.998000
  99.99%  3.999600
   max     4.000000
Length: 12, dtype: float64
```

```python
In [116]: df.describe(percentiles=[0.0001, 0.0005, 0.001, 0.999, 0.9995, 0.9999])
Out[116]:
   0
   count     5.000000
   mean      2.000000
   std  1.581139
   min      0.000000
  0.01%   0.000400
  0.05%   0.002000
  0.1%    0.004000
   50%    2.000000
  99.9%   3.996000
  99.95%  3.998000
  99.99%  3.999600
   max     4.000000
[12 rows x 1 columns]
```

Furthermore:

- Passing duplicated percentiles will now raise a `ValueError`.
- Bug in `.describe()` on a DataFrame with a mixed-dtype column index, which would previously raise a `TypeError` (GH13288)

**Period changes**

The `PeriodIndex` now has period dtype

`PeriodIndex` now has its own period dtype. The period dtype is a pandas extension dtype like `category` or the `timezone aware dtype` (`datetime64[ns, tz]`) (GH13941). As a consequence of this change, `PeriodIndex` no longer has an integer dtype:

Previous behavior:

```python
In [1]: pi = pd.PeriodIndex(['2016-08-01'], freq='D')
In [2]: pi
Out[2]: PeriodIndex(['2016-08-01'], dtype='int64', freq='D')
```
In [3]: pd.api.types.is_integer_dtype(pi)
Out[3]: True

In [4]: pi.dtype
Out[4]: dtype('int64')

New behavior:

In [117]: pi = pd.PeriodIndex(['2016-08-01'], freq='D')

In [118]: pi
Out[118]: PeriodIndex(['2016-08-01'], dtype='period[D]')

In [119]: pd.api.types.is_integer_dtype(pi)
Out[119]: False

In [120]: pd.api.types.is_period_dtype(pi)
Out[120]: True

In [121]: pi.dtype
Out[121]: period[D]

In [122]: type(pi.dtype)
Out[122]: pandas.core.dtypes.dtypes.PeriodDtype

Period('NaT') now returns pd.NaT

Previously, Period has its own Period('NaT') representation different from pd.NaT. Now Period('NaT') has been changed to return pd.NaT. (GH12759, GH13582)

Previous behavior:

In [5]: pd.Period('NaT', freq='D')
Out[5]: Period('NaT', 'D')

New behavior:

These result in pd.NaT without providing freq option.

In [123]: pd.Period('NaT')
Out[123]: NaT

In [124]: pd.Period(None)
Out[124]: NaT

To be compatible with Period addition and subtraction, pd.NaT now supports addition and subtraction with int. Previously it raised ValueError.

Previous behavior:

In [5]: pd.NaT + 1
...  
ValueError: Cannot add integral value to Timestamp without freq.

New behavior:
pandas: powerful Python data analysis toolkit, Release 1.3.1

In [125]: pd.NaT + 1
Out[125]: NaT
In [126]: pd.NaT - 1
Out[126]: NaT

PeriodIndex.values now returns array of Period object
.values is changed to return an array of Period objects, rather than an array of integers (GH13988).
Previous behavior:
In [6]: pi = pd.PeriodIndex(['2011-01', '2011-02'], freq='M')
In [7]: pi.values
Out[7]: array([492, 493])

New behavior:
In [127]: pi = pd.PeriodIndex(["2011-01", "2011-02"], freq="M")
In [128]: pi.values
Out[128]: array([Period('2011-01', 'M'), Period('2011-02', 'M')], dtype=object)

Index + / - no longer used for set operations
Addition and subtraction of the base Index type and of DatetimeIndex (not the numeric index types) previously performed set operations (set union and difference). This behavior was already deprecated since 0.15.0 (in favor using
the specific .union() and .difference() methods), and is now disabled. When possible, + and - are now used
for element-wise operations, for example for concatenating strings or subtracting datetimes (GH8227, GH14127).
Previous behavior:
In [1]: pd.Index(['a', 'b']) + pd.Index(['a', 'c'])
FutureWarning: using '+' to provide set union with Indexes is deprecated, use '|' or .
˓→union()
Out[1]: Index(['a', 'b', 'c'], dtype='object')

New behavior: the same operation will now perform element-wise addition:
In [129]: pd.Index(["a", "b"]) + pd.Index(["a", "c"])
Out[129]: Index(['aa', 'bc'], dtype='object')

Note that numeric Index objects already performed element-wise operations. For example, the behavior of adding two
integer Indexes is unchanged. The base Index is now made consistent with this behavior.
In [130]: pd.Index([1, 2, 3]) + pd.Index([2, 3, 4])
Out[130]: Int64Index([3, 5, 7], dtype='int64')

Further, because of this change, it is now possible to subtract two DatetimeIndex objects resulting in a TimedeltaIndex:
Previous behavior:

3150

Chapter 5. Release notes


In [1]: (pd.DatetimeIndex(['2016-01-01', '2016-01-02'])
    ...: - pd.DatetimeIndex(['2016-01-02', '2016-01-03']))

FutureWarning: using '-' to provide set differences with datetimelike Indexes is deprecated, use .difference()

Out[1]: DatetimeIndex(['2016-01-01'], dtype='datetime64[ns]', freq=None)

New behavior:

In [131]:
   ....: (pd.DatetimeIndex(['2016-01-01', '2016-01-02'])
   ....: - pd.DatetimeIndex(['2016-01-02', '2016-01-03']))
   ....: )
   ....:
Out[131]: TimedeltaIndex(['-1 days', '-1 days'], dtype='timedelta64[ns]', freq=None)

Index.difference and .symmetric_difference changes

Index.difference and Index.symmetric_difference will now, more consistently, treat NaN values as any other values. (GH13514)

In [132]: idx1 = pd.Index([1, 2, 3, np.nan])
In [133]: idx2 = pd.Index([0, 1, np.nan])

Previous behavior:

In [3]: idx1.difference(idx2)
Out[3]: Float64Index([1, 2, 3], dtype='float64')
In [4]: idx1.symmetric_difference(idx2)
Out[4]: Float64Index([0, 1, 2, 3], dtype='float64')

New behavior:

In [134]: idx1.difference(idx2)
Out[134]: Float64Index([2, 3], dtype='float64')
In [135]: idx1.symmetric_difference(idx2)
Out[135]: Float64Index([0, 2, 3], dtype='float64')

Index.unique consistently returns Index

Index.unique() now returns unique values as an Index of the appropriate dtype. (GH13395). Previously, most Index classes returned np.ndarray, and DatetimeIndex, TimedeltaIndex and PeriodIndex returned Index to keep metadata like timezone.

Previous behavior:

In [1]: pd.Index([1, 2, 3]).unique()
Out[1]: array([1, 2, 3])
In [2]: pd.DatetimeIndex(['2011-01-01', '2011-01-02',
        ...:     '2011-01-03'], tz='Asia/Tokyo').unique()
Out[2]:

(continues on next page)
New behavior:

```
In [136]: pd.Index([1, 2, 3]).unique()
Out[136]: Int64Index([1, 2, 3], dtype='int64')

In [137]: pd.DatetimeIndex(
       ["2011-01-01", "2011-01-02", "2011-01-03"], tz="Asia/Tokyo"
).unique()
Out[137]: DatetimeIndex(['2011-01-01 00:00:00+09:00', '2011-01-02 00:00:00+09:00',
                   '2011-01-03 00:00:00+09:00'], dtype='datetime64[ns, Asia/Tokyo]',
                   freq=None)
```

**MultiIndex constructors, groupby and set_index preserve categorical dtypes**

MultiIndex.from_arrays and MultiIndex.from_product will now preserve categorical dtype in MultiIndex levels (GH13743, GH13854).

```
In [138]: cat = pd.Categorical(["a", "b"], categories=list("bac"))

In [139]: lvl1 = ["foo", "bar"]

In [140]: midx = pd.MultiIndex.from_arrays([cat, lvl1])

In [141]: midx
Out[141]: MultiIndex([('a', 'foo'),
                   ('b', 'bar')],
                   )
```

Previous behavior:

```
In [4]: midx.levels[0]
Out[4]: Index(['b', 'a', 'c'], dtype='object')

In [5]: midx.get_level_values[0]
Out[5]: Index(['a', 'b'], dtype='object')
```

New behavior: the single level is now a CategoricalIndex:

```
In [142]: midx.levels[0]
Out[142]: CategoricalIndex(['b', 'a', 'c'], categories=['b', 'a', 'c'], ordered=False,
                          dtype='category')

In [143]: midx.get_level_values(0)
Out[143]: CategoricalIndex(['a', 'b'], categories=['b', 'a', 'c'], ordered=False,
                          dtype='category')
```

An analogous change has been made to MultiIndex.from_product. As a consequence, groupby and set_index also preserve categorical dtypes in indexes.
In [144]: df = pd.DataFrame({"A": [0, 1], "B": [10, 11], "C": cat})
In [145]: df_grouped = df.groupby(by="A", "C").first()
In [146]: df_set_idx = df.set_index("A", "C")

**Previous behavior:**

<table>
<thead>
<tr>
<th>In</th>
<th>Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>11</td>
<td>df_grouped.index.levels[1]</td>
</tr>
<tr>
<td></td>

<tr>
<td></td>
<td>Length: 3, dtype: object</td>
</tr>
</tbody>
</table>
Function **read_csv** will progressively enumerate chunks

When **read_csv()** is called with `chunksize=n` and without specifying an index, each chunk used to have an independently generated index from 0 to `n-1`. They are now given instead a progressive index, starting from 0 for the first chunk, from `n` for the second, and so on, so that, when concatenated, they are identical to the result of calling **read_csv()** without the `chunksize=` argument (GH12185).

```python
In [151]: data = "A,B\n0,1\n2,3\n4,5\n6,7"

Previous behavior:

```python
In [2]: pd.concat(pd.read_csv(StringIO(data), chunksize=2))
Out[2]:
   A  B
0  0  1
1  2  3
2  4  5
3  6  7

New behavior:

```python
In [152]: pd.concat(pd.read_csv(StringIO(data), chunksize=2))
Out[152]:
   A  B
0  0  1
1  2  3
2  4  5
3  6  7

[4 rows x 2 columns]
```

Sparse changes

These changes allow pandas to handle sparse data with more dtypes, and for work to make a smoother experience with data handling.

Types **int64** and **bool** support enhancements

Sparse data structures now gained enhanced support of **int64** and **bool** dtype (GH667, GH13849).

Previously, sparse data were **float64** dtype by default, even if all inputs were of **int** or **bool** dtype. You had to specify dtype explicitly to create sparse data with **int64** dtype. Also, `fill_value` had to be specified explicitly because the default was `np.nan` which doesn’t appear in **int64** or **bool** data.

```python
In [1]: pd.SparseArray([1, 2, 0, 0])
Out[1]:
[1.0, 2.0, 0.0, 0.0]
Fill: nan
IntIndex
Indices: array([0, 1, 2, 3], dtype=int32)

# specifying int64 dtype, but all values are stored in sp_values because
# fill_value default is np.nan
In [2]: pd.SparseArray([1, 2, 0, 0], dtype=np.int64)
```
As of v0.19.0, sparse data keeps the input dtype, and uses more appropriate fill_value defaults (0 for int64 dtype, False for bool dtype).

See the docs for more details.

Operators now preserve dtypes

- Sparse data structure now can preserve dtype after arithmetic ops (GH13848)

```python
s = pd.SparseSeries([0, 2, 0, 1], fill_value=0, dtype=np.int64)
s.dtype
s + 1
```

- Sparse data structure now support astype to convert internal dtype (GH13900)

```python
s = pd.SparseSeries([1.0, 0.0, 2.0, 0.0], fill_value=0)
s
s.astype(np.int64)
```

astype fails if data contains values which cannot be converted to specified dtype. Note that the limitation is applied to fill_value which default is np.nan.

```python
In [7]: pd.SparseSeries([1., np.nan, 2., np.nan], fill_value=np.nan).astype(np.int64)
Out[7]:
ValueError: unable to coerce current fill_value nan to int64 dtype
```
Other sparse fixes

- Subclassed `SparseDataFrame` and `SparseSeries` now preserve class types when slicing or transposing. (GH13787)
- `SparseArray` with bool dtype now supports logical (bool) operators (GH14000)
- Bug in `SparseSeries` with MultiIndex [] indexing may raise IndexError (GH13144)
- Bug in `SparseSeries` with MultiIndex [] indexing result may have normal Index (GH13144)
- Bug in `SparseDataFrame` in which axis=None did not default to axis=0 (GH13048)
- Bug in `SparseSeries` and `SparseDataFrame` creation with object dtype may raise TypeError (GH11633)
- Bug in `SparseDataFrame` doesn’t respect passed `SparseArray` or `SparseSeries` ‘s dtype and fill_value (GH13866)
- Bug in `SparseArray` and `SparseSeries` don’t apply ufunc to fill_value (GH13853)
- Bug in `SparseSeries.abs` incorrectly keeps negative fill_value (GH13853)
- Bug in single row slicing on multi-type `SparseDataFrame`s, types were previously forced to float (GH13917)
- Bug in `SparseSeries` slicing changes integer dtype to float (GH8292)
- Bug in `SparseDataFrame` comparison ops may raise TypeError (GH13001)
- Bug in `SparseDataFrame` .isnull raises ValueError (GH8276)
- Bug in `SparseSeries` representation with bool dtype may raise IndexError (GH13110)
- Bug in `SparseSeries` and `SparseDataFrame` of bool or int64 dtype may display its values like float64 dtype (GH13110)
- Bug in sparse indexing using `SparseArray` with bool dtype may return incorrect result (GH13985)
- Bug in `SparseArray` created from `SparseSeries` may lose dtype (GH13999)
- Bug in `SparseSeries` comparison with dense returns normal Series rather than `SparseSeries` (GH13999)

Indexer dtype changes

**Note:** This change only affects 64 bit python running on Windows, and only affects relatively advanced indexing operations

Methods such as `Index.get_indexer` that return an indexer array, coerce that array to a “platform int”, so that it can be directly used in 3rd party library operations like `numpy.take`. Previously, a platform int was defined as `np.int_` which corresponds to a C integer, but the correct type, and what is being used now, is `np.intp`, which corresponds to the C integer size that can hold a pointer (GH3033, GH13972).

These types are the same on many platform, but for 64 bit python on Windows, `np.int_` is 32 bits, and `np.intp` is 64 bits. Changing this behavior improves performance for many operations on that platform.

**Previous behavior:**
In [1]: i = pd.Index(['a', 'b', 'c'])

In [2]: i.get_indexer(['b', 'b', 'c']).dtype
Out[2]: dtype('int32')

New behavior:

In [1]: i = pd.Index(['a', 'b', 'c'])

In [2]: i.get_indexer(['b', 'b', 'c']).dtype
Out[2]: dtype('int64')

Other API changes

- `Timestamp.to_pydatetime` will issue a `UserWarning` when `warn=True`, and the instance has a non-zero number of nanoseconds, previously this would print a message to stdout (GH14101).
- `Series.unique()` with datetime and timezone now returns return array of `Timestamp` with timezone (GH13565).
- `Panel.to_sparse()` will raise a `NotImplementedError` exception when called (GH13778).
- `Index.reshape()` will raise a `NotImplementedError` exception when called (GH12882).
- `.filter()` enforces mutual exclusion of the keyword arguments (GH12399).
- `eval`'s upcasting rules for `float32` types have been updated to be more consistent with NumPy's rules. New behavior will not upcast to `float64` if you multiply a pandas `float32` object by a scalar `float64` (GH12388).
- An `UnsupportedFunctionCall` error is now raised if NumPy ufuncs like `np.mean` are called on groupby or resample objects (GH12811).
- `__setitem__` will no longer apply a callable rhs as a function instead of storing it. Call where directly to get the previous behavior (GH13299).
- Calls to `.sample()` will respect the random seed set via `numpy.random.seed(n)` (GH13161)
- `Styler.apply` is now more strict about the outputs your function must return. For `axis=0` or `axis=1`, the output shape must be identical. For `axis=None`, the output must be a DataFrame with identical columns and index labels (GH13222).
- `Float64Index.astype(int)` will now raise `ValueError` if `Float64Index` contains NaN values (GH13149)
- `TimedeltaIndex.astype(int)` and `DatetimeIndex.astype(int)` will now return `Int64Index` instead of `np.array` (GH13209)
- Passing `Period` with multiple frequencies to normal `Index` now returns `Index` with object dtype (GH13664)
- `PeriodIndex.fillna` with `Period` has different freq now coerces to object dtype (GH13664)
- Faceted boxplots from `DataFrame.boxplot(by=col)` now return a `Series` when `return_type` is not None. Previously these returned an `OrderedDict`. Note that when `return_type=None`, the default, these still return a 2-D NumPy array (GH12216, GH7096).
- `pd.read_hdf` will now raise a `ValueError` instead of `KeyError`, if a mode other than `r`, `r+` and `a` is supplied. (GH13623)
• `pd.read_csv()`, `pd.read_table()`, and `pd.read_hdf()` raise the built-in `FileNotFoundError` exception for Python 3.x when called on a nonexistent file; this is back-ported as `IOError` in Python 2.x (GH14086)

• More informative exceptions are passed through the csv parser. The exception type would now be the original exception type instead of `CParserError` (GH13652).

• `pd.read_csv()` in the C engine will now issue a `ParserWarning` or raise a `ValueError` when `sep` encoded is more than one character long (GH14065)

• `DataFrame.values` will now return `float64` with a `DataFrame` of mixed `int64` and `uint64` dtypes, conforming to `np.find_common_type` (GH10364, GH13917)

• `.groupby.groups` will now return a dictionary of `Index` objects, rather than a dictionary of `np.ndarray` or lists (GH14293)

Deprecations

• `Series.reshape` and `Categorical.reshape` have been deprecated and will be removed in a subsequent release (GH12882, GH12882)

• `PeriodIndex.to_datetime` has been deprecated in favor of `PeriodIndex.to_timestamp` (GH8254)

• `Timestamp.to_datetime` has been deprecated in favor of `Timestamp.to_pydatetime` (GH8254)

• `Index.to_datetime` and `DatetimeIndex.to_datetime` have been deprecated in favor of `pd.to_datetime` (GH8254)

• `pandas.core.datetools` module has been deprecated and will be removed in a subsequent release (GH14094)

• `SparseList` has been deprecated and will be removed in a future version (GH13784)

• `DataFrame.to_html()` and `DataFrame.to_latex()` have dropped the `colSpace` parameter in favor of `col_space` (GH13857)

• `DataFrame.to_sql()` has deprecated the `flavor` parameter, as it is superfluous when SQLAlchemy is not installed (GH13611)

• Deprecated `read_csv` keywords:
  – `compact_ints` and `use_unsigned` have been deprecated and will be removed in a future version (GH13320)
  – `buffer_lines` has been deprecated and will be removed in a future version (GH13360)
  – `as_recarray` has been deprecated and will be removed in a future version (GH13373)
  – `skip_footer` has been deprecated in favor of `skipfooter` and will be removed in a future version (GH13349)

• top-level `pd.ordered_merge()` has been renamed to `pd.merge_ordered()` and the original name will be removed in a future version (GH13358)

• `Timestamp.offset` property (and named arg in the constructor), has been deprecated in favor of `freq` (GH12160)

• `pd.tseries.util.pivot_annual` is deprecated. Use `pivot_table` as alternative, an example is `here` (GH736)

• `pd.tseries.util.isleapyear` has been deprecated and will be removed in a subsequent release. Datetime-likes now have a `.is_leap_year` property (GH13727)
• Panel4D and PanelND constructors are deprecated and will be removed in a future version. The recommended way to represent these types of n-dimensional data are with the xarray package. pandas provides a to_xarray() method to automate this conversion (GH13564).

• pandas.tseries.frequencies.get_standard_freq is deprecated. Use pandas.tseries.frequencies.to_offset(freq).rule_code instead (GH13874)

• pandas.tseries.frequencies.to_offset's freqstr keyword is deprecated in favor of freq (GH13874)

• Categorical.from_array has been deprecated and will be removed in a future version (GH13854)

Removal of prior version deprecations/changes

• The SparsePanel class has been removed (GH13778)

• The pd.sandbox module has been removed in favor of the external library pandas-qt (GH13670)

• The pandas.io.data and pandas.io.wb modules are removed in favor of the pandas-datareader package (GH13724).

• The pandas.tools.rplot module has been removed in favor of the seaborn package (GH13855)

• DataFrame.to_csv() has dropped the engine parameter, as was deprecated in 0.17.1 (GH11274, GH13419)

• DataFrame.to_dict() has dropped the outtype parameter in favor of orient (GH13627, GH8486)

• pd.Categorical has dropped setting of the ordered attribute directly in favor of the set_ordered method (GH13671)

• pd.Categorical has dropped the levels attribute in favor of categories (GH8376)

• DataFrame.to_sql() has dropped the mysql option for the flavor parameter (GH13611)

• Panel.shift() has dropped the lags parameter in favor of periods (GH14041)

• pd.Index has dropped the diff method in favor of difference (GH13669)

• pd.DataFrame has dropped the to_wide method in favor of to_panel (GH14039)

• Series.to_csv has dropped the nanRep parameter in favor of na_rep (GH13804)

• Series.xs, DataFrame.xs, Panel.xs, Panel.major_xs, and Panel.minor_xs have dropped the copy parameter (GH13781)

• str.split has dropped the return_type parameter in favor of expand (GH13701)

• Removal of the legacy time rules (offset aliases), deprecated since 0.17.0 (this has been alias since 0.8.0) (GH13590, GH13868). Now legacy time rules raises ValueError. For the list of currently supported offsets, see here.

• The default value for the return_type parameter for DataFrame.plot.box and DataFrame.boxplot changed from None to "axes". These methods will now return a matplotlib axes by default instead of a dictionary of artists. See here (GH6581).

• The tquery and uquery functions in the pandas.io.sql module are removed (GH5950).
Performance improvements

- Improved performance of sparse `IntIndex.intersect` (GH13082)
- Improved performance of sparse arithmetic with `BlockIndex` when the number of blocks are large, though recommended to use `IntIndex` in such cases (GH13082)
- Improved performance of `DataFrame.quantile()` as it now operates per-block (GH11623)
- Improved performance of `DataFrameGroupBy.transform` (GH12737)
- Improved performance of `Index` and `Series.duplicated` (GH10235)
- Improved performance of `Index.difference` (GH12044)
- Improved performance of `RangeIndex.is_monotonic_increasing` and `is_monotonic_decreasing` (GH13749)
- Improved performance of datetime string parsing in `DatetimeIndex` (GH13692)
- Improved performance of hashing `Period` (GH12817)
- Improved performance of `factorize` of datetime with timezone (GH13750)
- Improved performance of by lazily creating indexing hashtables on larger Indexes (GH14266)
- Improved performance of `Index.difference` (GH12044)
- Unnecessary materializing of a MultiIndex when introspecting for memory usage (GH14308)

Bug fixes

- Bug in `groupby().shift()`, which could cause a segfault or corruption in rare circumstances when grouping by columns with missing values (GH13813)
- Bug in `groupby().cumsum()` calculating `cumprod` when `axis=1`. (GH13994)
- Bug in `pd.to_timedelta()` in which the `errors` parameter was not being respected (GH13613)
- Bug in `io.json.json_normalize()`, where non-ascii keys raised an exception (GH13213)
- Bug when passing a not-default-indexed `Series` as `xerr` or `yerr` in `.plot()` (GH11858)
- Bug in area plot draws legend incorrectly if subplot is enabled or legend is moved after plot (matplotlib 1.5.0 is required to draw area plot legend properly) (GH9161, GH13544)
- Bug in `DataFrame` assignment with an object-dtyped `Index` where the resultant column is mutable to the original object. (GH13522)
- Bug in matplotlib `AutoDataFormatter`; this restores the second scaled formatting and re-adds micro-second scaled formatting (GH13131)
- Bug in selection from a `HDFStore` with a fixed format and `start` and/or `stop` specified will now return the selected range (GH8287)
- Bug in `Categorical.from_codes()` where an unhelpful error was raised when an invalid `ordered` parameter was passed in (GH14058)
- Bug in `Series` construction from a tuple of integers on windows not returning default dtype (int64) (GH13646)
- Bug in `TimedeltaIndex` addition with a Datetime-like object where addition overflow was not being caught (GH14068)
• Bug in `.groupby(..).resample(..)` when the same object is called multiple times (GH13174)
• Bug in `.to_records()` when index name is a unicode string (GH13172)
• Bug in calling `.memory_usage()` on object which doesn’t implement (GH12924)
• Regression in `Series.quantile` with nans (also shows up in `.median()` and `.describe()`); furthermore now names the Series with the quantile (GH13098, GH13146)
• Bug in `SeriesGroupBy.transform` with datetime values and missing groups (GH13191)
• Bug where empty `Series` were incorrectly coerced in datetime-like numeric operations (GH13844)
• Bug in `Categorical` constructor when passed a `Categorical` containing datetimes with timezones (GH14190)
• Bug in `Series.str.extractall()` with str index raises `ValueError` (GH13156)
• Bug in `Series.str.extractall()` with single group and quantifier (GH13382)
• Bug in `DatetimeIndex` and `Period` subtraction raises `ValueError` or `AttributeError` rather than `TypeError` (GH13078)
• Bug in `Index` and `Series` created with `NaN` and `NaT` mixed data may not have `datetime64` dtype (GH13324)
• Bug in `Index` and `Series` may ignore `np.datetime64('nat')` and `np.timedelta64('nat')` to infer dtype (GH13324)
• Bug in `PeriodIndex` and `Period` subtraction raises `AttributeError` (GH13071)
• Bug in `PeriodIndex` construction returning a `float64` index in some circumstances (GH13067)
• Bug in `.resample(..)` with a `PeriodIndex` not changing its `freq` appropriately when empty (GH13067)
• Bug in `.resample(..)` with a `PeriodIndex` not retaining its type or name with an empty `DataFrame` appropriately when empty (GH13212)
• Bug in `groupby(..).apply(..)` when the passed function returns scalar values per group (GH13468).
• Bug in `groupby(..).resample(..)` where passing some keywords would raise an exception (GH13235)
• Bug in `.tz_convert` on a tz-aware `DateTimeIndex` that relied on index being sorted for correct results (GH13306)
• Bug in `.tz_localize` with `dateutil.tz.tzlocal` may return incorrect result (GH13583)
• Bug in `DatetimeTZDtype` `dtype` with `dateutil.tz.tzlocal` cannot be regarded as valid `dtype` (GH13583)
• Bug in `pd.read_hdf()` where attempting to load an HDF file with a single dataset, that had one or more categorical columns, failed unless the key argument was set to the name of the dataset. (GH13231)
• Bug in `.rolling()` that allowed a negative integer window in construction of the `Rolling()` object, but would later fail on aggregation (GH13383)
• Bug in `Series` indexing with tuple-valued data and a numeric index (GH13509)
• Bug in printing `pd.DataFrame` where unusual elements with the `object` dtype were causing segfaults (GH13717)
• Bug in ranking `Series` which could result in segfaults (GH13445)
• Bug in various index types, which did not propagate the name of passed index (GH12309)
• Bug in `DatetimeIndex`, which did not honour the `copy=True` (GH13205)
• Bug in `DatetimeIndex.is_normalized` returns incorrectly for normalized date_range in case of local timezones (GH13459)

• Bug in `pd.concat` and `.append` may coeecs `datetime64` and `timedelta` to object dtype containing python built-in `datetime` or `timedelta` rather than `Timestamp` or `Timedelta` (GH13626)

• Bug in `PeriodIndex.append` may raises `AttributeError` when the result is object dtype (GH13221)

• Bug in `CategoricalIndex.append` may accept normal list (GH13626)

• Bug in `pd.concat` and `.append` with the same timezone get reset to UTC (GH7795)

• Bug in `Series` and `DataFrame .append` raises `AmbiguousTimeError` if data contains datetime near DST boundary (GH13626)

• Bug in `DataFrame.to_csv()` in which float values were being quoted even though quotations were specified for non-numeric values only (GH12922, GH13259)

• Bug in `DataFrame.describe()` raising `ValueError` with only boolean columns (GH13898)

• Bug in `MultiIndex` slicing where extra elements were returned when level is non-unique (GH12896)

• Bug in `.str.replace` does not raise `TypeError` for invalid replacement (GH13438)

• Bug in `MultiIndex.from_arrays` which didn’t check for input array lengths matching (GH13599)

• Bug in `cartesian_product` and `MultiIndex.from_product` which may raise with empty input arrays (GH12258)

• Bug in `pd.read_csv()` which may cause a segfault or corruption when iterating in large chunks over a stream/file under rare circumstances (GH13703)

• Bug in `pd.read_csv()` which caused errors to be raised when a dictionary containing scalars is passed in for `na_values` (GH12224)

• Bug in `pd.read_csv()` which caused BOM files to be incorrectly parsed by not ignoring the BOM (GH4793)

• Bug in `pd.read_csv()` with engine='python' which raised errors when a numpy array was passed in for `usecols` (GH12546)

• Bug in `pd.read_csv()` where the index columns were being incorrectly parsed when parsed as dates with a thousands parameter (GH14066)

• Bug in `pd.read_csv()` with engine='python' in which NaN values weren’t being detected after data was converted to numeric values (GH13314)

• Bug in `pd.read_csv()` in which the `nrows` argument was not properly validated for both engines (GH10476)

• Bug in `pd.read_csv()` with engine='python' in which infinities of mixed-case forms were not being interpreted properly (GH13274)

• Bug in `pd.read_csv()` with engine='python' in which trailing NaN values were not being parsed (GH13320)

• Bug in `pd.read_csv()` with engine='python' when reading from a `tempfile.TemporaryFile` on Windows with Python 3 (GH13398)

• Bug in `pd.read_csv()` that prevents `usecols` kwarg from accepting single-byte unicode strings (GH13219)

• Bug in `pd.read_csv()` that prevents `usecols` from being an empty set (GH13402)

• Bug in `pd.read_csv()` in the C engine where the NULL character was not being parsed as NULL (GH14012)
- Bug in `pd.read_csv()` with engine='c' in which NULL quotechar was not accepted even though quoting was specified as None (GH13411)
- Bug in `pd.read_csv()` with engine='c' in which fields were not properly cast to float when quoting was specified as non-numeric (GH13411)
- Bug in `pd.read_csv()` in Python 2.x with non-UTF8 encoded, multi-character separated data (GH3404)
- Bug in `pd.read_csv()`, where aliases for utf-xx (e.g. UTF-xx, UTF_xx, utf_xx) raised UnicodeDecodeError (GH13549)
- Bug in `pd.read_csv`, `pd.read_table`, `pd.read_fwf`, `pd.read_stata` and `pd.read_sas` where files were opened by parsers but not closed if both chunksize and iterator were None. (GH13940)
- Bug in `StataReader`, `StataWriter`, `XportReader` and `SAS7BDATReader` where a file was not properly closed when an error was raised. (GH13940)
- Bug in `pd.pivot_table()` where margins_name is ignored when aggfunc is a list (GH13354)
- Bug in `pd.Series.str.zfill`, `center`, `ljust`, `rjust`, and `pad` when passing non-integers, did not raise TypeError (GH13598)
- Bug in checking for any null objects in a `TimedeltaIndex`, which always returned True (GH13603)
- Bug in `Series` arithmetic raises TypeError if it contains datetime-like as object dtype (GH13043)
- Bug `Series.isnull()` and `Series.notnull()` ignore Period('NaT') (GH13737)
- Bug `Series.fillna()` and `Series.dropna()` don't affect to Period('NaT') (GH13737)
- Bug in `.fillna(value=np.nan) incorrectly raises KeyError on a category dtyped Series (GH14021)
- Bug in extension dtype creation where the created types were not is/identical (GH13285)
- Bug in `.resample(..)` where incorrect warnings were triggered by IPython introspection (GH13618)
- Bug in `NaT`-`Period` raises AttributeError (GH13071)
- Bug in `Series` comparison may output incorrect result if rhs contains NaT (GH9005)
- Bug in `Series` and `Index` comparison may output incorrect result if it contains NaT with object dtype (GH13592)
- Bug in `Period` addition raises TypeError if Period is on right hand side (GH13069)
- Bug in `Period` and `Series` or `Index` comparison raises TypeError (GH13200)
- Bug in `pd.set_eng_float_format()` that would prevent NaN and Inf from formatting (GH11981)
- Bug in `.unstack with Categorical dtype resets .ordered to True (GH13249)
- Clean some compile time warnings in datetime parsing (GH13607)
- Bug in `factorize` raises AmbiguousTimeError if data contains datetime near DST boundary (GH13750)
- Bug in `.set_index` raises AmbiguousTimeError if new index contains DST boundary and multi levels (GH13200)
- Bug in `.shift` raises AmbiguousTimeError if data contains datetime near DST boundary (GH13926)
- Bug in `pd.read_hdf()` returns incorrect result when a DataFrame with a categorical column and a query which doesn’t match any values (GH13792)
- Bug in `.iloc when indexing with a non lexsorted MultiIndex (GH13797)
- Bug in `.loc when indexing with date strings in a reverse sorted DatetimeIndex (GH14316)
• Bug in Series comparison operators when dealing with zero dim NumPy arrays (GH13006)
• Bug in .combine_first may return incorrect dtype (GH7630, GH10567)
• Bug in groupby where apply returns different result depending on whether first result is None or not (GH12824)
• Bug in groupby(...).nths() where the group key is included inconsistently if called after .head()/.tail() (GH12839)
• Bug in .to_html, .to_latex and .to_string silently ignore custom datetime formatter passed through the formatkeys key word (GH10690)
• Bug in DataFrame.iterrows(), not yielding a Series subclass if defined (GH13977)
• Bug in pd.to_numeric when errors='coerce' and input contains non-hashable objects (GH13324)
• Bug in invalid Timedelta arithmetic and comparison may raise ValueError rather than TypeError (GH13624)
• Bug in invalid datetime parsing in to_datetime and DatetimeIndex may raise TypeError rather than ValueError (GH11169, GH11287)
• Bug in Index created with tz-aware Timestamp and mismatched tz option incorrectly coerces timezone (GH13692)
• Bug in DatetimeIndex with nanosecond frequency does not include timestamp specified with end (GH13672)
• Bug in `Series when setting a slice with a np.timedelta64 (GH14155)
• Bug in Index raises OutOfBoundsDatetim if datetime exceeds datetime64[ns] bounds, rather than coercing to object dtype (GH13663)
• Bug in Index may ignore specified datetime64 or timedelta64 passed as dtype (GH13981)
• Bug in RangeIndex can be created without no arguments rather than raises TypeError (GH13793)
• Bug in .value_counts() raises OutOfBoundsDatetim if data exceeds datetime64[ns] bounds (GH13663)
• Bug in DatetimeIndex may raise OutOfBoundsDatetim if input np.datetime64 has other unit than ns (GH9114)
• Bug in Series creation with np.datetime64 which has other unit than ns as object dtype results in incorrect values (GH13876)
• Bug in resample with timedelta data where data was casted to float (GH13119).
• Bug in pd.isnull() pd.notnull() raise TypeError if input datetime-like has other unit than ns (GH13389)
• Bug in pd.merge() may raise TypeError if input datetimelike has other unit than ns (GH13389)
• Bug in HDFStore/read_hdf() discarded DatetimeIndex.name if tz was set (GH13884)
• Bug in Categorical.remove_unused_categories() changes .codes dtype to platform int (GH13261)
• Bug in groupby with as_index=False returns all NaN’s when grouping on multiple columns including a categorical one (GH13204)
• Bug in df.groupby(...) [...] where getitem with Int64Index raised an error (GH13731)
• Bug in the CSS classes assigned to `DataFrame.style` for index names. Previously they were assigned "col_heading level<n> col<c>" where `n` was the number of levels + 1. Now they are assigned "index_name level<n>". where `n` is the correct level for that MultiIndex.

• Bug where `pd.read_gbq()` could throw `ImportError: No module named discovery` as a result of a naming conflict with another python package called apiclient (GH13454)

• Bug in `Index.union` returns an incorrect result with a named empty index (GH13432)

• Bugs in `Index.difference` and `DataFrame.join` raise in Python3 when using mixed-integer indexes (GH13432, GH12814)

• Bug in `subtract tz-aware datetime.datetime from tz-aware datetime64 series` (GH14088)

• Bug in `.to_excel()` when `DataFrame` contains a MultiIndex which contains a label with a NaN value (GH13511)

• Bug in invalid frequency offset string like “D1”, “-2-3H” may not raise ValueError (GH13930)

• Bug in `concat` and `groupby` for hierarchical frames with `RangeIndex` levels (GH13542).

• Bug in `Series.str.contains()` for `Series` containing only NaN values of object dtype (GH14171)

• Bug in `agg()` function on `groupby` dataframe changes dtype of `datetime64[ns]` column to `float64` (GH12821)

• Bug in using NumPy ufunc with `PeriodIndex` to add or subtract integer raise `IncompatibleFrequency`. Note that using standard operator like + or - is recommended, because standard operators use more efficient path (GH13980)

• Bug in operations on NaT returning `float` instead of `datetime64[ns]` (GH12941)

• Bug in `Series` flexible arithmetic methods (like `.add()`) raises ValueError when `axis=None` (GH13894)

• Bug in `DataFrame.to_csv()` with MultiIndex columns in which a stray empty line was added (GH6618)

• Bug in `DatetimeIndex, TimedeltaIndex and PeriodIndex.equals()` may return True when input isn’t `Index` but contains the same values (GH13107)

• Bug in assignment against datetime with timezone may not work if it contains datetime near DST boundary (GH14146)

• Bug in `pd.eval()` and `HDFStore` query truncating long float literals with python 2 (GH14241)

• Bug in `Index` raises `KeyError` displaying incorrect column when column is not in the df and columns contains duplicate values (GH13822)

• Bug in `Period` and `PeriodIndex` creating wrong dates when frequency has combined offset aliases (GH13874)

• Bug in `.to_string()` when called with an integer `line_width` and `index=False` raises an Unbound-LocalError exception because `idx` referenced before assignment.

• Bug in `eval()` where the `resolvers` argument would not accept a list (GH14095)

• Bugs in `stack`, `get_dummies`, `make_axis_dummies` which don’t preserve categorical dtypes in (multi)indexes (GH13854)

• `PeriodIndex` can now accept list and array which contains `pd.NaT` (GH13430)

• Bug in `df.groupby` where `.median()` returns arbitrary values if grouped dataframe contains empty bins (GH13629)

• Bug in `Index.copy()` where name parameter was ignored (GH14302)

5.12 Version 0.18

5.12.1 Version 0.18.1 (May 3, 2016)

This is a minor bug-fix release from 0.18.0 and includes a large number of bug fixes along with several new features, enhancements, and performance improvements. We recommend that all users upgrade to this version.

Highlights include:

• `.groupby(...)` has been enhanced to provide convenient syntax when working with `.rolling(...)`, `.expanding(...)` and `.resample(...)` per group, see here
• `pd.to_datetime()` has gained the ability to assemble dates from a `DataFrame`, see here
• Method chaining improvements, see here.
• Custom business hour offset, see here.
• Many bug fixes in the handling of `sparse`, see here
• Expanded the `Tutorials section` with a feature on modern pandas, courtesy of @TomAugsburger. (GH13045).

What’s new in v0.18.1

• New features
  – Custom business hour
  – Method `.groupby(...)` syntax with window and resample operations
  – Method chaining improvements
    * Methods `.where()` and `.mask()`
    * Methods `.loc[]`, `.iloc[]`, `.ix[]`
    * Indexing with `"["`
  – Partial string indexing on `DatetimeIndex` when part of a `MultiIndex`
New features

Custom business hour

The CustomBusinessHour is a mixture of BusinessHour and CustomBusinessDay which allows you to specify arbitrary holidays. For details, see Custom Business Hour (GH11514)

```python
In [1]: from pandas.tseries.offsets import CustomBusinessHour
In [2]: from pandas.tseries.holiday import USFederalHolidayCalendar
In [3]: bhour_us = CustomBusinessHour(calendar=USFederalHolidayCalendar())
```

Friday before MLK Day

```python
In [4]: import datetime
In [5]: dt = datetime.datetime(2014, 1, 17, 15)
In [6]: dt + bhour_us
Out[6]: Timestamp('2014-01-17 16:00:00')
```

Tuesday after MLK Day (Monday is skipped because it’s a holiday)

```python
In [7]: dt + bhour_us * 2
Out[7]: Timestamp('2014-01-20 09:00:00')
```
Method `.groupby()` syntax with window and resample operations

`.groupby()` has been enhanced to provide convenient syntax when working with `.rolling()`, `.expanding()` and `.resample()` per group, see (GH12486, GH12738).

You can now use `.rolling()` and `.expanding()` as methods on groupbys. These return another deferred object (similar to what `.rolling()` and `.expanding()` do on ungrouped pandas objects). You can then operate on these `RollingGroupby` objects in a similar manner.

Previously you would have to do this to get a rolling window mean per-group:

In [9]: df
Out[9]:
   A  B
0  1  0
1  1  1
2  2  2
3  2  3
4  3  4
   .. ..
35 3 35
36 3 36
37 3 37
38 3 38
39 3 39
[40 rows x 2 columns]

In [10]: df.groupby("A").apply(lambda x: x.rolling(4).B.mean())
Out[10]:
   A   
1  0  NaN
  1  NaN
  2  NaN
  3  1.5
  4  2.5
   ... 
3 35 33.5
36 34.5
37 35.5
38 36.5
39 37.5
Name: B, Length: 40, dtype: float64

Now you can do:

In [11]: df.groupby("A").rolling(4).B.mean()
Out[11]:
   A   
1  0  NaN
  1  NaN
  2  NaN
  3  1.5
  4  2.5
   ... 
3 35 33.5
(continues on next page)
For `.resample(.)` type of operations, previously you would have to:

```python
In [12]: df = pd.DataFrame(
    ....:     {
    ....:         "date": pd.date_range(start="2016-01-01", periods=4, freq="W"),
    ....:         "group": [1, 1, 2, 2],
    ....:         "val": [5, 6, 7, 8],
    ....:     }
    ....: ).set_index("date")
    ....:
In [13]: df
Out[13]:
    group  val
group date
1  2016-01-03  1  5
    2016-01-10  1  6
    2016-01-17  2  7
    2016-01-24  2  8
[4 rows x 2 columns]
```

```python
In [14]: df.groupby("group").apply(lambda x: x.resample("1D").ffill())
Out[14]:
    group  val
group date
1  2016-01-03  1  5
    2016-01-04  1  5
    2016-01-05  1  5
    2016-01-06  1  5
    2016-01-07  1  5
... ... ...
2  2016-01-20  2  7
    2016-01-21  2  7
    2016-01-22  2  7
    2016-01-23  2  7
    2016-01-24  2  8
[16 rows x 2 columns]
```

Now you can do:

```python
In [15]: df.groupby("group").resample("1D").ffill()
Out[15]:
    group  val
group date
1  2016-01-03  1  5
    2016-01-04  1  5
    2016-01-05  1  5
    2016-01-06  1  5
```
Method chaining improvements

The following methods / indexers now accept a callable. It is intended to make these more useful in method chains, see the documentation. (GH11485, GH12533)

- `.where()` and `.mask()`
- `.loc[]`, `.iloc[]` and `.ix[]`
- [] indexing

Methods `.where()` and `.mask()`

These can accept a callable for the condition and other arguments.

```
In [16]: df = pd.DataFrame({'A': [1, 2, 3], 'B': [4, 5, 6], 'C': [7, 8, 9]})

In [17]: df.where(lambda x: x > 4, lambda x: x + 10)
Out[17]:
   A  B  C
0 11 14  7
1 12  5  8
2 13  6  9
[3 rows x 3 columns]
```

Methods `.loc[]`, `.iloc[]`, `.ix[]`

These can accept a callable, and a tuple of callable as a slicer. The callable can return a valid boolean indexer or anything which is valid for these indexer’s input.

```
# callable returns bool indexer
In [18]: df.loc[lambda x: x.A >= 2, lambda x: x.sum() > 10]
Out[18]:
   B  C
0  11 14 7
1  12  5 8
2  13  6 9
[2 rows x 2 columns]

# callable returns list of labels
In [19]: df.loc[lambda x: [1, 2], lambda x: ['A', 'B']]
```

(continues on next page)
Indexing with `[]`

Finally, you can use a callable in `[]` indexing of Series, DataFrame and Panel. The callable must return a valid input for `[]` indexing depending on its class and index type.

```python
In [20]: df[lambda x: "A"]
Out[20]:
0    1
1    2
2    3
Name: A, Length: 3, dtype: int64
```

Using these methods / indexers, you can chain data selection operations without using temporary variable.

```python
In [21]: bb = pd.read_csv("data/baseball.csv", index_col="id")
In [22]: (bb.groupby(["year", "team"]).sum().loc[lambda df: df.r > 100])
Out[22]:
         stint  g  ab  r  h  X2b  X3b  hr  rbi  sb  cs  bb  so  ibb  hbp  sh  sf
year  team
2007 CIN  6   379  745  101  203  35   2   36  125.0  10.0  1.0  105  127.0  14.

```
Partial string indexing now matches on `DateTimeIndex` when part of a `MultiIndex` (GH10331)
2013-01-04 12:00:00 0.271860  
2013-01-05 00:00:00 0.567020  
2013-01-05 12:00:00 -1.087401  

[20 rows x 1 columns]

In [29]: `dft2.loc[:, "2013-01-05"], :]
Out[29]:

A
a 2013-01-05 00:00:00 -0.424972  
2013-01-05 12:00:00 0.276232  
b 2013-01-05 00:00:00 0.567020  
2013-01-05 12:00:00 -1.087401  

[4 rows x 1 columns]

Assembling datetimes

`pd.to_datetime()` has gained the ability to assemble datetimes from a passed in `DataFrame` or a dict. (GH8158).

In [30]: `df = pd.DataFrame(  
   ....:   {"year": [2015, 2016], "month": [2, 3], "day": [4, 5], "hour": [2, 3]}  
   ....: )  
   ....:`

In [31]: `df`
Out[31]:

year month day hour
0 2015   2   4   2
1 2016   3   5   3
[2 rows x 4 columns]

Assembling using the passed frame.

In [32]: `pd.to_datetime(df)`
Out[32]:

0 2015-02-04 02:00:00
1 2016-03-05 03:00:00
Length: 2, dtype: datetime64[ns]

You can pass only the columns that you need to assemble.

In [33]: `pd.to_datetime(df["year", "month", "day"])`  
Out[33]:

0 2015-02-04
1 2016-03-05
Length: 2, dtype: datetime64[ns]
Other enhancements

- `pd.read_csv()` now supports `delim_whitespace=True` for the Python engine (GH12958)
- `pd.read_csv()` now supports opening ZIP files that contains a single CSV, via extension inference or explicit `compression='zip'` (GH12175)
- `pd.read_csv()` now supports opening files using xz compression, via extension inference or explicit `compression='xz'` is specified; xz compressions is also supported by `DataFrame.to_csv` in the same way (GH11852)
- `pd.read_msgpack()` now always gives writeable ndarrays even when compression is used (GH12359).
- `pd.read_msgpack()` now supports serializing and de-serializing categoricals with msgpack (GH12573)
- `.to_json()` now supports NDFrames that contain categorical and sparse data (GH10778)
- `interpolate()` now supports method='akima' (GH7588).
- `pd.read_excel()` now accepts path objects (e.g. `pathlib.Path`, `py.path.local`) for the file path, in line with other `read_*` functions (GH12655)
- Added `.weekday_name` property as a component to `DatetimeIndex` and the `.dt` accessor. (GH11128)
- `Index.take` now handles `allow_fill` and `fill_value` consistently (GH12631)

```
In [34]: idx = pd.Index([1.0, 2.0, 3.0, 4.0], dtype="float")

# default, allow_fill=True, fill_value=None
In [35]: idx.take([2, -1])
Out[35]: Float64Index([3.0, 4.0], dtype='float64')

In [36]: idx.take([2, -1], fill_value=True)
Out[36]: Float64Index([3.0, nan], dtype='float64')
```

- `Index` now supports `.str.get_dummies()` which returns `MultiIndex`, see Creating Indicator Variables (GH10008, GH10103)

```
In [37]: idx = pd.Index(['a|b', 'a|c', 'b|c'])

In [38]: idx.str.get_dummies("|")
Out[38]: MultiIndex([(1, 1, 0),
                  (1, 0, 1),
                  (0, 1, 1)],
               names=['a', 'b', 'c'])
```

- `pd.crosstab()` has gained a `normalize` argument for normalizing frequency tables (GH12569). Examples in the updated docs [here](#).
- `.resample(..).interpolate()` is now supported (GH12925)
- `.isin()` now accepts passed sets (GH12988)
Sparse changes

These changes conform sparse handling to return the correct types and work to make a smoother experience with indexing.

`SparseArray.take` now returns a scalar for scalar input, `SparseArray` for others. Furthermore, it handles a negative indexer with the same rule as `Index` (GH10560, GH12796)

```
s = pd.SparseArray([np.nan, np.nan, 1, 2, 3, np.nan, 4, 5, np.nan, 6])
s.take(0)
s.take([1, 2, 3])
```

- Bug in `SparseSeries[]` indexing with Ellipsis raises `KeyError` (GH9467)
- Bug in `SparseArray[]` indexing with tuples are not handled properly (GH12966)
- Bug in `SparseSeries.loc[]` with list-like input raises `TypeError` (GH10560)
- Bug in `SparseSeries.iloc[]` with scalar input may raise `IndexError` (GH10560)
- Bug in `SparseSeries.loc[], .iloc[] with slice returns SparseArray, rather than SparseSeries` (GH10560)
- Bug in `SparseDataFrame.loc[], .iloc[] may results in dense Series, rather than SparseSeries` (GH12787)
- Bug in `SparseArray addition ignores fill_value of right hand side` (GH12910)
- Bug in `SparseArray mod raises AttributeError` (GH12910)
- Bug in `SparseArray pow calculates 1 ** np.nan as np.nan which must be 1` (GH12910)
- Bug in `SparseArray comparison output may incorrect result or raise ValueError` (GH12971)
- Bug in `SparseSeries.__repr__` raises `TypeError` when it is longer than `max_rows` (GH10560)
- Bug in `SparseSeries.shape ignores fill_value` (GH10452)
- Bug in `SparseSeries and SparseArray may have different dtype from its dense values` (GH12908)
- Bug in `SparseSeries.reindex incorrectly handle fill_value` (GH12797)
- Bug in `SparseArray.to_frame() results in DataFrame, rather than SparseDataFrame` (GH9850)
- Bug in `SparseSeries.value_counts() does not count fill_value` (GH6749)
- Bug in `SparseArray.to_dense() does not preserve dtype` (GH10648)
- Bug in `SparseArray.to_dense() incorrectly handle fill_value` (GH12797)
- Bug in `pd.concat() of SparseSeries results in dense` (GH10536)
- Bug in `pd.concat() of SparseDataFrame incorrectly handle fill_value` (GH9765)
- Bug in `pd.concat() of SparseDataFrame may raise AttributeError` (GH12174)
- Bug in `SparseArray.shift()` may raise `NameError` or `TypeError` (GH12908)
### API changes

#### Method `.groupby(..).nth()` changes

The index in `.groupby(..).nth()` output is now more consistent when the `as_index` argument is passed (GH11039):

**Previous behavior:**

```python
In [39]: df = pd.DataFrame({'A': ['a', 'b', 'a'], 'B': [1, 2, 3]})

In [40]: df
Out[40]:
   A  B
0  a  1
1  b  2
2  a  3
[3 rows x 2 columns]

In [3]: df.groupby('A', as_index=True)['B'].nth(0)
Out[3]:
   0  1
Name: B, dtype: int64

In [4]: df.groupby('A', as_index=False)['B'].nth(0)
Out[4]:
   0  1
Name: B, dtype: int64
```

**New behavior:**

```python
In [41]: df.groupby("A", as_index=True)["B"].(nth(0)
Out[41]:
   A
   a  1
   b  2
Name: B, Length: 2, dtype: int64

In [42]: df.groupby("A", as_index=False)["B"].(nth(0)
Out[42]:
   0  1
Name: B, Length: 2, dtype: int64
```

Furthermore, previously, a `.groupby` would always sort, regardless if `sort=False` was passed with `.nth()`.

```python
In [43]: np.random.seed(1234)

In [44]: df = pd.DataFrame(np.random.randn(100, 2), columns=['a', 'b'])

In [45]: df["c"] = np.random.randint(0, 4, 100)

Previous behavior:
```

5.12. Version 0.18
In [4]: df.groupby('c', sort=True).nth(1)
Out[4]:
    a     b
   c
0  -0.334077  0.002118
1   0.036142 -2.074978
2  -0.720589  0.887163
3   0.859588 -0.636524

In [5]: df.groupby('c', sort=False).nth(1)
Out[5]:
    a     b
   c
0  -0.334077  0.002118
1   0.036142 -2.074978
2  -0.720589  0.887163
3   0.859588 -0.636524

New behavior:

In [46]: df.groupby("c", sort=True).nth(1)
Out[46]:
    a     b
   c
0  -0.334077  0.002118
1   0.036142 -2.074978
2  -0.720589  0.887163
3   0.859588 -0.636524
[4 rows x 2 columns]

In [47]: df.groupby("c", sort=False).nth(1)
Out[47]:
    a     b
   c
2  -0.720589  0.887163
3   0.859588 -0.636524
0  -0.334077  0.002118
1   0.036142 -2.074978
[4 rows x 2 columns]

NumPy function compatibility

Compatibility between pandas array-like methods (e.g. sum and take) and their numpy counterparts has been greatly increased by augmenting the signatures of the pandas methods so as to accept arguments that can be passed in from numpy, even if they are not necessarily used in the pandas implementation (GH12644, GH12638, GH12687)

- .searchsorted() for Index and TimedeltaIndex now accept a sorter argument to maintain compatibility with numpy’s searchsorted function (GH12238)

- Bug in numpy compatibility of np.round() on a Series (GH12600)

An example of this signature augmentation is illustrated below:

```python
sp = pd.DataFrame([[1, 2, 3]])
sp
```

```python
3180 Chapter 5. Release notes
```
Previous behaviour:

```
In [2]: np.cumsum(sp, axis=0)
...
TypeError: cumsum() takes at most 2 arguments (4 given)
```

New behaviour:

```
np.cumsum(sp, axis=0)
```

**Using `.apply` on GroupBy resampling**

Using `apply` on resampling groupby operations (using a `pd.TimeGrouper`) now has the same output types as similar `apply` calls on other groupby operations. (GH11742).

```
In [48]: df = pd.DataFrame(
      ....:     {"date": pd.to_datetime(["10/10/2000", "11/10/2000"]), "value": [10, 13]}
      ....: )
      ....:
In [49]: df
Out[49]:
   date  value
  0  2000-10-10   10
  1  2000-11-10   13
[2 rows x 2 columns]
```

Previous behavior:

```
In [1]: df.groupby(pd.TimeGrouper(key='date',
      ....:     freq='M')).apply(lambda x: x.value.sum())
Out[1]:
...
TypeError: cannot concatenate a non-NDFrame object
```

# Output is a Series
```
In [2]: df.groupby(pd.TimeGrouper(key='date',
      ....:     freq='M')).apply(lambda x: x["value"].sum())
Out[2]:
   date  value
2000-10-31    10
2000-11-30    13
```

New behavior:

```
In [55]: df.groupby(pd.TimeGrouper(key='date',
      ....:     freq='M')).apply(lambda x: x.value.sum())
Out[55]:
   date  value
2000-10-31    10
2000-11-30    13
Freq: M, dtype: int64
```
# Output is a DataFrame

```python
In [56]: df.groupby(pd.TimeGrouper(key='date',
   ...: freq='M')).apply(lambda x: x[['value']].sum())
```

```
Out[56]:

<table>
<thead>
<tr>
<th>date</th>
<th>value</th>
</tr>
</thead>
<tbody>
<tr>
<td>2000-10-31</td>
<td>10</td>
</tr>
<tr>
<td>2000-11-30</td>
<td>13</td>
</tr>
</tbody>
</table>
```

## Changes in read_csv exceptions

In order to standardize the read_csv API for both the c and python engines, both will now raise an `EmptyDataError`, a subclass of `ValueError`, in response to empty columns or header (GH12493, GH12506)

Previous behaviour:

```python
In [1]: import io
In [2]: df = pd.read_csv(io.StringIO(''), engine='c')
...:
ValueError: No columns to parse from file
In [3]: df = pd.read_csv(io.StringIO(''), engine='python')
...:
StopIteration
```

New behaviour:

```python
In [1]: df = pd.read_csv(io.StringIO(''), engine='c')
...:
pandas.io.common.EmptyDataError: No columns to parse from file
In [2]: df = pd.read_csv(io.StringIO(''), engine='python')
...:
pandas.io.common.EmptyDataError: No columns to parse from file
```

In addition to this error change, several others have been made as well:

- CParseError now sub-classes `ValueError` instead of just a `Exception` (GH12551)
- A CParseError is now raised instead of a generic `Exception` in read_csv when the c engine cannot parse a column (GH12506)
- A `ValueError` is now raised instead of a generic `Exception` in read_csv when the c engine encounters a NaN value in an integer column (GH12506)
- A `ValueError` is now raised instead of a generic `Exception` in read_csv when true_values is specified, and the c engine encounters an element in a column containing unencodable bytes (GH12506)
- `pandas.parser.OverflowError` exception has been removed and has been replaced with Python’s built-in `OverflowError` exception (GH12506)
- `pd.read_csv()` no longer allows a combination of strings and integers for the usecols parameter (GH12678)
Method `to_datetime` error changes

Bugs in `pd.to_datetime()` when passing a unit with convertible entries and `errors='coerce'` or non-convertible with `errors='ignore'`. Furthermore, an `OutOfBoundsDatetime` exception will be raised when an out-of-range value is encountered for that unit when `errors='raise'`. (GH11758, GH13052, GH13059)

Previous behaviour:

```python
In [27]: pd.to_datetime(1420043460, unit='s', errors='coerce')
Out[27]: NaT

In [28]: pd.to_datetime(11111111, unit='D', errors='ignore')
OverflowError: Python int too large to convert to C long

In [29]: pd.to_datetime(11111111, unit='D', errors='raise')
OverflowError: Python int too large to convert to C long
```

New behaviour:

```python
In [2]: pd.to_datetime(1420043460, unit='s', errors='coerce')
Out[2]: Timestamp('2014-12-31 16:31:00')

In [3]: pd.to_datetime(11111111, unit='D', errors='ignore')
Out[3]: 11111111

In [4]: pd.to_datetime(11111111, unit='D', errors='raise')
OutOfBoundsDatetime: cannot convert input with unit 'D'
```

Other API changes

- `.swaplevel()` for `Series`, `DataFrame`, `Panel`, and `MultiIndex` now features defaults for its first two parameters `i` and `j` that swap the two innermost levels of the index. (GH12934)
- `.searchsorted()` for `Index` and `TimedeltaIndex` now accept a sorter argument to maintain compatibility with numpy’s `searchsorted` function (GH12238)
- `Period` and `PeriodIndex` now raises `IncompatibleFrequency` error which inherits `ValueError` rather than raw `ValueError` (GH12615)
- `Series.apply` for category dtypes now applies the passed function to each of the `.categories` (and not the `.codes`), and returns a category dtype if possible (GH12473)
- `read_csv` will now raise a `TypeError` if `parse_dates` is neither a boolean, list, or dictionary (matches the doc-string) (GH5636)
- The default for `.query()/.eval()` is now `engine=None`, which will use `numexpr` if it’s installed; otherwise it will fallback to the `python` engine. This mimics the pre-0.18.1 behavior if `numexpr` is installed (and which, previously, if `numexpr` was not installed, `.query()/.eval()` would raise). (GH12749)
- `pd.show_versions()` now includes `pandas_datareader` version (GH12740)
- Provide a proper `.name` and `.qualname` attributes for generic functions (GH12021)
- `pd.concat(ignore_index=True)` now uses `RangeIndex` as default (GH12695)
- `pd.merge()` and `DataFrame.join()` will show a `UserWarning` when merging/joining a single- with a multi-leveled dataframe (GH9455, GH12219)
• Compat with scipy > 0.17 for deprecated `piecewise_polynomial` interpolation method; support for the replacement `from_derivatives` method (GH12887)

Deprecations

• The method name `Index.sym_diff()` is deprecated and can be replaced by `Index.symetric_difference()` (GH12591)
• The method name `Categorical.sort()` is deprecated in favor of `Categorical.sort_values()` (GH12882)

Performance improvements

• Improved speed of SAS reader (GH12656, GH12961)
• Performance improvements in `.groupby(...)`.cumcount() (GH11039)
• Improved memory usage in `pd.read_csv()` when using `skiprows=an_integer` (GH13005)
• Improved performance of `DataFrame.to_sql` when checking case sensitivity for tables. Now only checks if table has been created correctly when table name is not lower case. (GH12876)
• Improved performance of `Period` construction and time series plotting (GH12903, GH11831).
• Improved performance of `.str.encode()` and `.str.decode()` methods (GH13008)
• Improved performance of `to_numeric` if input is numeric dtype (GH12777)
• Improved performance of sparse arithmetic with `IntIndex` (GH13036)

Bug fixes

• usecols parameter in `pd.read_csv` is now respected even when the lines of a CSV file are not even (GH12203)
• Bug in `groupby.transform(...)` when axis=1 is specified with a non-monotonic ordered index (GH12713)
• Bug in `Period` and `PeriodIndex` creation raises `KeyError` if `freq="Minute"` is specified. Note that “Minute” freq is deprecated in v0.17.0, and recommended to use `freq="T"` instead (GH11854)
• Bug in `.resample(...).count()` with a `PeriodIndex` always raising a `TypeError` (GH12774)
• Bug in `.resample(...) with a `PeriodIndex` casting to a `DatetimeIndex` when empty (GH12868)
• Bug in `.resample(...) with a `PeriodIndex` when resampling to an existing frequency (GH12770)
• Bug in printing data which contains `Period` with different `freq` raises `ValueError` (GH12615)
• Bug in `Series` construction with `Categorical and dtype='category'` is specified (GH12574)
• Bugs in concatenation with a coercible dtype was too aggressive, resulting in different dtypes in output formatting when an object was longer than `display.max_rows` (GH12411, GH12045, GH11594, GH10571, GH12211)
• Bug in `float_format` option with option not being validated as a callable. (GH12706)
• Bug in `GroupBy.filter` when dropna=False and no groups fulfilled the criteria (GH12768)
• Bug in `__name__ of .cum* functions` (GH12021)
• Bug in `.astype()` of a `Float64Inde/Int64Index` to an `Int64Index` (GH12881)
Bug in round tripping an integer based index in \texttt{.to_json()/.read_json()} when \texttt{orient='index'} (the default) (GH12866)

Bug in plotting \texttt{Categorical} dtypes cause error when attempting stacked bar plot (GH13019)

Compat with $\geq$ \texttt{numpy 1.11} for \texttt{NaT} comparisons (GH12969)

Bug in \texttt{.drop()} with a non-unique \texttt{MultiIndex}. (GH12701)

Bug in \texttt{.concat} of datetime tz-aware and naive DataFrames (GH12467)

Bug in correctly raising a \texttt{ValueError} in \texttt{.resample(..).fillna(..)} when passing a non-string (GH12952)

Bug fixes in various encoding and header processing issues in \texttt{pd.read_sas()} (GH12659, GH12654, GH12647, GH12809)

Bug in \texttt{pd.crosstab()} where would silently ignore \texttt{agfunc} if \texttt{values=None} (GH12569).

Potential segfault in \texttt{DataFrame.to_json} when serialising \texttt{datetime.time} (GH11473).

Potential segfault in \texttt{DataFrame.to_json} when attempting to serialise 0d array (GH11299).

Segfault in \texttt{to_json} when attempting to serialise a \texttt{DataFrame} or \texttt{Series} with non-ndarray values; now supports serialization of \texttt{category}, \texttt{sparse}, and \texttt{datetime64[ns, tz]} dtypes (GH10778).

Bug in \texttt{DataFrame.to_json} with unsupported dtype not passed to default handler (GH12554).

Bug in \texttt{.align} not returning the sub-class (GH12983)

Bug in aligning a \texttt{Series} with a \texttt{DataFrame} (GH13037)

Bug in \texttt{ABCPanel} in which \texttt{Panel4D} was not being considered as a valid instance of this generic type (GH12810)

Bug in consistency of \texttt{.name} on \texttt{.groupby(..).apply(..)} cases (GH12363)

Bug in \texttt{Timestamp.__repr__} that caused \texttt{pprint} to fail in nested structures (GH12622)

Bug in \texttt{Timedelta.min} and \texttt{Timedelta.max}, the properties now report the true minimum maximum timedeltas as recognized by pandas. See the documentation. (GH12727)

Bug in \texttt{.quantile()} with interpolation may coerce to float unexpectedly (GH12772)

Bug in \texttt{.quantile()} with empty \texttt{Series} may return scalar rather than empty \texttt{Series} (GH12772)

Bug in \texttt{.loc} with out-of-bounds in a large indexer would raise \texttt{IndexError} rather than \texttt{KeyError} (GH12527)

Bug in resampling when using a \texttt{TimedeltaIndex} and \texttt{.asfreq()}, would previously not include the final fencepost (GH12926)

Bug in equality testing with a \texttt{Categorical} in a \texttt{DataFrame} (GH12564)

Bug in \texttt{GroupBy.first()}, \texttt{.last()} returns incorrect row when \texttt{TimeGrouper} is used (GH7453)

Bug in \texttt{pd.read_csv()} with the \texttt{c} engine when specifying \texttt{skiprows} with newlines in quoted items (GH10911, GH12775)

Bug in \texttt{DataFrame timezone lost when assigning tz-aware datetime Series with alignment} (GH12981)

Bug in \texttt{.value_counts()} when normalize=True and dropna=True where nulls still contributed to the normalized count (GH12558)

Bug in \texttt{Series.value_counts()} loses name if its dtype is \texttt{category} (GH12835)

Bug in \texttt{Series.value_counts()} loses timezone info (GH12835)
• Bug in `Series.value_counts(normalize=True)` with `Categorical` raises `UnboundLocalError` (GH12835)
• Bug in `Panel.fillna()` ignoring `inplace=True` (GH12633)
• Bug in `pd.read_csv()` when specifying `names`, `usecols`, and `parse_dates` simultaneously with the `c` engine (GH9755)
• Bug in `pd.read_csv()` when specifying `delim_whitespace=True` and `lineterminator` simultaneously with the `c` engine (GH12912)
• Bug in `Series.rename, DataFrame.rename and DataFrame.rename_axis` not treating `Series` as mappings to relabel (GH12623).
• Clean in `.rolling.min` and `.rolling.max` to enhance `dtype` handling (GH12373)
• Bug in `.str` accessor methods may raise `ValueError` if input has `name` and the result is `DataFrame` or `MultiIndex` (GH12617)
• Bug in `DataFrame.last_valid_index()` and `DataFrame.first_valid_index()` on empty frames (GH12800)
• Bug in `CategoricalIndex.get_loc` returns different result from regular `Index` (GH12531)
• Bug in `PeriodIndex.resample` where name not propagated (GH12577)
• Bug in `pd.concat` raises `AttributeError` when input data contains `tz-aware` `datetime` and `timedelta` (GH12620)
• Bug in `pd.concat` did not handle empty `Series` properly (GH11082)
• Bug in `.plot.bar` alignment when `width` is specified with `int` (GH12979)
• Bug in `fill_value` is ignored if the argument to a binary operator is a constant (GH12723)
• Bug in `pd.read_html()` when using bs4 flavor and parsing table with a header and only one column (GH9178)
• Bug in `.pivot_table` when `margins=True` and `dropna=True` where nulls still contributed to margin count (GH12577)
• Bug in `.pivot_table` when `dropna=False` where table index/column names disappear (GH12133)
• Bug in `pd.crosstab()` when `margins=True` and `dropna=False` which raised (GH12642)
• Bug in `Series.name` when `name` attribute can be a hashable type (GH12610)
• Bug in `.describe()` resets categorical columns information (GH11558)
• Bug where `loffset` argument was not applied when calling `resample().count()` on a timeseries (GH12725)
• `pd.read_excel()` now accepts column names associated with keyword argument `names` (GH12870)
- Bug in `pd.to_numeric()` with `Index` returns `np.ndarray`, rather than `Index` (GH12777)
- Bug in `pd.to_numeric()` with datetime-like may raise `TypeError` (GH12777)
- Bug in `pd.to_numeric()` with scalar raises `ValueError` (GH12777)

5.12.2 Version 0.18.0 (March 13, 2016)

This is a major release from 0.17.1 and includes a small number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

**Warning:** pandas >= 0.18.0 no longer supports compatibility with Python version 2.6 and 3.3 (GH7718, GH11273)

**Warning:** numexpr version 2.4.4 will now show a warning and not be used as a computation back-end for pandas because of some buggy behavior. This does not affect other versions (>= 2.1 and >= 2.4.6). (GH12489)

Highlights include:

- Moving and expanding window functions are now methods on Series and DataFrame, similar to `.groupby`, see here.
- Adding support for a RangeIndex as a specialized form of the Int64Index for memory savings, see here.
- API breaking change to the `.resample` method to make it more `.groupby` like, see here.
- Removal of support for positional indexing with floats, which was deprecated since 0.14.0. This will now raise a TypeError, see here.
- The `.to_xarray()` function has been added for compatibility with the xarray package, see here.
- The `read_sas` function has been enhanced to read sas7bdat files, see here.
- Addition of the `.str.extractall()` method, and API changes to the `.str.extract()` method and `.str.cat()` method.
- `pd.test()` top-level nose test runner is available (GH4327).

Check the API Changes and deprecations before updating.

**What’s new in v0.18.0**

- **New features**
  - Window functions are now methods
  - Changes to rename
  - Range Index
  - Changes to `str.extract`
  - Addition of `str.extractall`
  - Changes to `str.cat`
  - Datetimelike rounding
  - Formatting of integers in `FloatIndex`
  - Changes to dtype assignment behaviors
  - Method to `xarray`
  - Latex representation
New features

Window functions are now methods

Window functions have been refactored to be methods on Series/DataFrame objects, rather than top-level functions, which are now deprecated. This allows these window-type functions to have a similar API to that of .groupby. See the full documentation here (GH11603, GH12373)

In [1]: np.random.seed(1234)

In [2]: df = pd.DataFrame({'A': range(10), 'B': np.random.randn(10)})

In [3]: df

   9  8.0 -0.954504 -0.954504  1.162285
[10 rows x 4 columns]
```

Changes to rename

Series.rename and NDFrame.rename_axis can now take a scalar or list-like argument for altering the Series or axis name, in addition to their old behaviors of altering labels. (GH9494, GH11965)

```python
In [9]: s = pd.Series(np.random.randn(5))

In [10]: s.rename('newname')
Out[10]:
0  1.150036
1  0.991946
2  0.953324
3 -2.021255
4 -0.334077
Name: newname, Length: 5, dtype: float64

In [11]: df = pd.DataFrame(np.random.randn(5, 2))

In [12]: (df.rename_axis("indexname")
(continues on next page)
The new functionality works well in method chains. Previously these methods only accepted functions or dicts mapping a *label* to a new label. This continues to work as before for function or dict-like values.

**Range Index**

A `RangeIndex` has been added to the `Int64Index` sub-classes to support a memory saving alternative for common use cases. This has a similar implementation to the python `range` object (`xrange` in python 2), in that it only stores the start, stop, and step values for the index. It will transparently interact with the user API, converting to `Int64Index` if needed.

This will now be the default constructed index for `NDFrame` objects, rather than previous an `Int64Index`. (GH939, GH12070, GH12071, GH12109, GH12888)

Previous behavior:

```
In [3]: s = pd.Series(range(1000))

In [4]: s.index
Out[4]:
Int64Index([ 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, ...
   ... 990, 991, 992, 993, 994, 995, 996, 997, 998, 999], dtype='int64',
   length=1000)

In [6]: s.index.nbytes
Out[6]: 8000
```

New behavior:

```
In [13]: s = pd.Series(range(1000))

In [14]: s.index
Out[14]: RangeIndex(start=0, stop=1000, step=1)

In [15]: s.index.nbytes
Out[15]: 128
```
Changes to \texttt{str.extract}

The \texttt{str.extract} method takes a regular expression with capture groups, finds the first match in each subject string, and returns the contents of the capture groups (GH11386).

In v0.18.0, the \texttt{expand} argument was added to \texttt{extract}.

- \texttt{expand=False}: it returns a \texttt{Series}, \texttt{Index}, or \texttt{DataFrame}, depending on the subject and regular expression pattern (same behavior as pre-0.18.0).
- \texttt{expand=True}: it always returns a \texttt{DataFrame}, which is more consistent and less confusing from the perspective of a user.

Currently the default is \texttt{expand=None} which gives a \texttt{FutureWarning} and uses \texttt{expand=False}. To avoid this warning, please explicitly specify \texttt{expand}.

```python
In [1]: pd.Series(['a1', 'b2', 'c3']).str.extract(r'\[ab\](\d)', expand=None)
FutureWarning: currently extract(expand=None) means expand=False (return Index/Series/DataFrame)
but in a future version of pandas this will be changed to expand=True (return DataFrame)
Out[1]:
     0  1
0   1
1   2
2  NaN
Length: 3, dtype: object
```

Extracting a regular expression with one group returns a \texttt{Series} if \texttt{expand=False}.

```python
In [16]: pd.Series(['a1', 'b2', 'c3']).str.extract(r'\[ab\](\d)', expand=False)
Out[16]:
     0  1
0   1
1   2
2  NaN
Length: 3, dtype: object
```

It returns a \texttt{DataFrame} with one column if \texttt{expand=True}.

```python
In [17]: pd.Series(['a1', 'b2', 'c3']).str.extract(r'\[ab\](\d)', expand=True)
Out[17]:
     0  1
0   1
1   2
2  NaN
[3 rows x 1 columns]
```

Calling on an \texttt{Index} with a regex with exactly one capture group returns an \texttt{Index} if \texttt{expand=False}.

```python
In [18]: s = pd.Series(['al', 'b2', 'c3'], ['A11', 'B22', 'C33'])
In [19]: s.index
Out[19]: Index(['A11', 'B22', 'C33'], dtype='object')
In [20]: s.index.str.extract("(?P<letter>[a-zA-Z])", expand=False)
Out[20]: Index(['A', 'B', 'C'], dtype='object', name='letter')
```

It returns a \texttt{DataFrame} with one column if \texttt{expand=True}.
In [21]: s.index.str.extract("(?P<letter>[a-zA-Z])", expand=True)
Out[21]:
    letter
0    A
1    B
2    C
[3 rows x 1 columns]

Calling on an Index with a regex with more than one capture group raises ValueError if expand=False.

```python
In [21]:
   >>> s.index.str.extract("(?P<letter>[a-zA-Z])([0-9]+)", expand=False)
   ValueError: only one regex group is supported with Index
```

It returns a DataFrame if expand=True.

```python
In [22]: s.index.str.extract("(?P<letter>[a-zA-Z])([0-9]+)", expand=True)
Out[22]:
    letter 1
   0    A 11
   1    B 22
   2    C 33
[3 rows x 2 columns]
```

In summary, extract(expand=True) always returns a DataFrame with a row for every subject string, and a column for every capture group.

**Addition of str.extractall**

The .str.extractall method was added (GH11386). Unlike extract, which returns only the first match.

```python
In [23]: s = pd.Series(
"a1a2",
"b1",
"c1")
In [24]: s
Out [24]:
   A a1a2
   B b1
   C c1
Length: 3, dtype: object
In [25]: s.str.extract(r"(?P<letter>[ab])(?P<digit>[0-9]+)\", expand=False)
Out[25]:
    letter digit
   A   a  1
   B   b  1
   C  NaN NaN
[3 rows x 2 columns]
```

The extractall method returns all matches.

```python
In [26]: s.str.extractall(r"(?P<letter>[ab])(?P<digit>[0-9]+)\")
```

(continues on next page)
Changes to str.cat

The method `.str.cat()` concatenates the members of a Series. Before, if NaN values were present in the Series, calling `.str.cat()` on it would return NaN, unlike the rest of the Series.str.* API. This behavior has been amended to ignore NaN values by default. (GH11435).

A new, friendlier `ValueError` is added to protect against the mistake of supplying the `sep` as an arg, rather than as a kwarg. (GH11334).

```
In [27]: pd.Series(['a', 'b', np.nan, 'c']).str.cat(sep=' ')
Out[27]: 'a b c'

In [28]: pd.Series(['a', 'b', np.nan, 'c']).str.cat(sep=' ', na_rep='?')
Out[28]: 'a b ? c'
```

Datetimelike rounding

`DatetimeIndex`, `Timestamp`, `TimedeltaIndex`, `Timedelta` have gained the `.round()`, `.floor()` and `.ceil()` method for datetimelike rounding, flooring and ceiling. (GH4314, GH11963)

Naive datetimes

```
In [29]: dr = pd.date_range('20130101 09:12:56.1234', periods=3)
In [30]: dr
Out[30]: DatetimeIndex(['2013-01-01 09:12:56.123400', '2013-01-02 09:12:56.123400',
                      '2013-01-03 09:12:56.123400'],
                    dtype='datetime64[ns]', freq='D')

In [31]: dr.round('s')
Out[31]: DatetimeIndex(['2013-01-01 09:12:56', '2013-01-02 09:12:56',
                        '2013-01-03 09:12:56'],
                      dtype='datetime64[ns]', freq=None)

# Timestamp scalar
In [32]: dr[0]
Out[32]: Timestamp('2013-01-01 09:12:56.123400', freq='D')

In [33]: dr[0].round('10s')
Out[33]: Timestamp('2013-01-01 09:13:00')
```

Tz-aware are rounded, floored and ceiled in local times
In [34]: dr = dr.tz_localize('US/Eastern')

In [35]: dr
Out[35]:
DatetimeIndex(['2013-01-01 09:12:56.123400-05:00',
               '2013-01-02 09:12:56.123400-05:00',
               '2013-01-03 09:12:56.123400-05:00'],
       dtype='datetime64[ns, US/Eastern]', freq=None)

In [36]: dr.round('s')
Out[36]:
DatetimeIndex(['2013-01-01 09:12:56-05:00', '2013-01-02 09:12:56-05:00',
               '2013-01-03 09:12:56-05:00'],
       dtype='datetime64[ns, US/Eastern]', freq=None)

Timedeltas

In [37]: t = pd.timedelta_range('1 days 2 hr 13 min 45 us', periods=3, freq='d')

In [38]: t
Out[38]:
TimedeltaIndex(['1 days 02:13:00.000045', '2 days 02:13:00.000045',
               '3 days 02:13:00.000045'],
       dtype='timedelta64[ns]', freq='D')

In [39]: t.round('10min')
Out[39]: TimedeltaIndex(['1 days 02:10:00', '2 days 02:10:00', '3 days 02:10:00'],
       dtype='timedelta64[ns]', freq=None)

# Timedelta scalar
In [40]: t[0]
Out[40]: Timedelta('1 days 02:13:00.000045')

In [41]: t[0].round('2h')
Out[41]: Timedelta('1 days 02:00:00')

In addition, `.round()`, `.floor()` and `.ceil()` will be available through the `.dt` accessor of Series.

In [42]: s = pd.Series(dr)

In [43]: s
Out[43]:
0  2013-01-01 09:12:56.123400-05:00
1  2013-01-02 09:12:56.123400-05:00
2  2013-01-03 09:12:56.123400-05:00
Length: 3, dtype: datetime64[ns, US/Eastern]

In [44]: s.dt.round('D')
Out[44]:
0  2013-01-01 00:00:00-05:00
1  2013-01-02 00:00:00-05:00
2  2013-01-03 00:00:00-05:00
Length: 3, dtype: datetime64[ns, US/Eastern]
Formatting of integers in FloatIndex

Integers in FloatIndex, e.g. 1., are now formatted with a decimal point and a 0 digit, e.g. 1.0 (GH11713) This change not only affects the display to the console, but also the output of IO methods like .to_csv or .to_html.

Previous behavior:

```
In [2]: s = pd.Series([1, 2, 3], index=np.arange(3.))
In [3]: s
Out[3]:
   0  1
   1  2
   2  3
dtype: int64
In [4]: s.index
Out[4]: Float64Index([0.0, 1.0, 2.0], dtype='float64')
In [5]: print(s.to_csv(path=None))
0,1
1,2
2,3
```

New behavior:

```
In [45]: s = pd.Series([1, 2, 3], index=np.arange(3.))
In [46]: s
Out[46]:
   0.0  1
   1.0  2
   2.0  3
Length: 3, dtype: int64
In [47]: s.index
Out[47]: Float64Index([0.0, 1.0, 2.0], dtype='float64')
In [48]: print(s.to_csv(path_or_buf=None, header=False))
0.0,1
1.0,2
2.0,3
```

Changes to dtype assignment behaviors

When a DataFrame’s slice is updated with a new slice of the same dtype, the dtype of the DataFrame will now remain the same. (GH10503)

Previous behavior:

```
In [5]: df = pd.DataFrame({'a': [0, 1, 1],
                         'b': pd.Series([100, 200, 300], dtype='uint32')})
In [7]: df.dtypes
Out[7]:
a    int64
b    uint32
```

(continues on next page)
When a DataFrame’s integer slice is partially updated with a new slice of floats that could potentially be down-casted to integer without losing precision, the dtype of the slice will be set to float instead of integer.

Previous behavior:

```
In [4]: df = pd.DataFrame(np.array(range(1,10)).reshape(3,3),
       columns=list('abc'),
       index=[[4,4,8], [8,10,12]])

In [5]: df
Out[5]:
   a b c
  4 8 1 2 3
  10 4 5 6
  8 12 7 8 9

In [7]: df.ix[4, 'c'] = np.array([0., 1.])

In [8]: df
Out[8]:
   a b c
  4 8 1 2 0
```

New behavior:

```
In [49]: df = pd.DataFrame({'a': [0, 1, 1],
       ....:    'b': pd.Series([100, 200, 300], dtype='uint32')})
       ....:

In [50]: df.dtypes
Out[50]:
   a   int64
   b  uint32
Length: 2, dtype: object

In [51]: ix = df['a'] == 1

In [52]: df.loc[ix, 'b'] = df.loc[ix, 'b']

In [53]: df.dtypes
Out[53]:
   a   int64
   b  uint32
Length: 2, dtype: object
```
New behavior:

```python
In [54]: df = pd.DataFrame(np.array(range(1,10)).reshape(3,3),
    ....:                   columns=list('abc'),
    ....:                   index=[[4,4,8], [8,10,12]])

In [55]: df
Out[55]:
   a  b  c
0  1  2  3
1  4  5  6
2  8  9  10

[3 rows x 3 columns]

In [56]: df.loc[4, 'c'] = np.array([0., 1.])

In [57]: df
Out[57]:
   a   b  c
0  1  2  3
1  4  5  6
2  8  9  10

[3 rows x 3 columns]
```

**Method to_xarray**

In a future version of pandas, we will be deprecating `Panel` and other > 2 ndim objects. In order to provide for continuity, all `NDFrame` objects have gained the `.to_xarray()` method in order to convert to `xarray` objects, which has a pandas-like interface for > 2 ndim. (GH11972)

See the `xarray` full-documentation here.
**Latex representation**

DataFrame has gained a `._repr_latex_()` method in order to allow for conversion to latex in a ipython/jupyter notebook using nbconvert. (GH11778)

Note that this must be activated by setting the option `pd.display.latex.repr=True` (GH12182)

For example, if you have a jupyter notebook you plan to convert to latex using nbconvert, place the statement `pd.display.latex.repr=True` in the first cell to have the contained DataFrame output also stored as latex.

The options `display.latex.escape` and `display.latex.longtable` have also been added to the configuration and are used automatically by the `to_latex` method. See the available options docs for more info.

**pd.read_sas() changes**

`read_sas` has gained the ability to read SAS7BDAT files, including compressed files. The files can be read in entirety, or incrementally. For full details see here. (GH4052)

**Other enhancements**

- Handle truncated floats in SAS xport files (GH11713)
- Added option to hide index in `Series.to_string` (GH11729)
- `read_excel` now supports s3 urls of the format s3://bucketname/filename (GH11447)
- add support for `AWS_S3_HOST` env variable when reading from s3 (GH12198)
- A simple version of `Panel.round()` is now implemented (GH11763)
- For Python 3.x, `round(DataFrame), round(Series), round(Panel)` will work (GH11763)
- `sys.getsizeof(obj)` returns the memory usage of a pandas object, including the values it contains (GH11597)
- `Series` gained an `is_unique` attribute (GH11946)
- `DataFrame.quantile` and `Series.quantile` now accept interpolation keyword (GH10174).
- Added `DataFrame.style.format` for more flexible formatting of cell values (GH11692)
- `DataFrame.select_dtypes` now allows the `np.float16` type code (GH11990)
- `pivot_table()` now accepts most iterables for the values parameter (GH12017)
- Added Google BigQuery service account authentication support, which enables authentication on remote servers. (GH11881, GH12572). For further details see here
- `HDFStore` is now iterable: for k in store is equivalent to for k in store.keys() (GH12221).
- Add missing methods/fields to .dt for `Period` (GH8848)
- The entire code base has been PEP-ified (GH12096)
Backwards incompatible API changes

- the leading white spaces have been removed from the output of .to_string(index=False) method (GH11833)
- the `out` parameter has been removed from the `Series.round()` method. (GH11763)
- `DataFrame.round()` leaves non-numeric columns unchanged in its return, rather than raises. (GH11885)
- `DataFrame.head(0)` and `DataFrame.tail(0)` return empty frames, rather than self. (GH11937)
- `Series.head(0)` and `Series.tail(0)` return empty series, rather than self. (GH11937)
- `to_msgpack` and `read_msgpack` encoding now defaults to 'utf-8'. (GH12170)
- the order of keyword arguments to text file parsing functions (.read_csv(), .read_table(), .read_fwf()) changed to group related arguments. (GH11555)
- `NaTType.isoformat` now returns the string 'NaT' to allow the result to be passed to the constructor of `Timestamp`. (GH12300)

NaT and Timedelta operations

NaT and Timedelta have expanded arithmetic operations, which are extended to Series arithmetic where applicable. Operations defined for `datetime64[ns]` or `timedelta64[ns]` are now also defined for NaT (GH11564).

NaT now supports arithmetic operations with integers and floats.

```python
In [58]: pd.NaT * 1
Out[58]: NaT

In [59]: pd.NaT * 1.5
Out[59]: NaT

In [60]: pd.NaT / 2
Out[60]: NaT

In [61]: pd.NaT * np.nan
Out[61]: NaT
```

NaT defines more arithmetic operations with `datetime64[ns]` and `timedelta64[ns]`.

```python
In [62]: pd.NaT / pd.NaT
Out[62]: nan

In [63]: pd.Timedelta('1s') / pd.NaT
Out[63]: nan
```

NaT may represent either a `datetime64[ns]` null or a `timedelta64[ns]` null. Given the ambiguity, it is treated as a `timedelta64[ns]`, which allows more operations to succeed.

```python
In [64]: pd.NaT + pd.NaT
Out[64]: NaT

# same as
In [65]: pd.Timedelta('1s') + pd.Timedelta('1s')
Out[65]: Timedelta('0 days 00:00:02')
```

as opposed to
However, when wrapped in a `Series` whose `dtype` is `datetime64[ns]` or `timedelta64[ns]`, the `dtype` information is respected.

Timedelta division by floats now works.

Subtraction by `Timedelta` in a `Series` by a `Timestamp` works (GH11925)

Changes to msgpack

Forward incompatible changes in `msgpack` writing format were made over 0.17.0 and 0.18.0; older versions of pandas cannot read files packed by newer versions (GH12129, GH10527)

Bugs in `to_msgpack` and `read_msgpack` introduced in 0.17.0 and fixed in 0.18.0, caused files packed in Python 2 unreadable by Python 3 (GH12142). The following table describes the backward and forward compat of msgpacks.

<table>
<thead>
<tr>
<th>Packed with</th>
<th>Can be unpacked with</th>
</tr>
</thead>
<tbody>
<tr>
<td>pre-0.17 / Python 2</td>
<td>any</td>
</tr>
<tr>
<td>pre-0.17 / Python 3</td>
<td>any</td>
</tr>
<tr>
<td>0.17 / Python 2</td>
<td>• ==0.17 / Python 2</td>
</tr>
<tr>
<td></td>
<td>• &gt;=0.18 / any Python</td>
</tr>
<tr>
<td>0.17 / Python 3</td>
<td>&gt;=0.18 / any Python</td>
</tr>
<tr>
<td>0.18</td>
<td>&gt;= 0.18</td>
</tr>
</tbody>
</table>
0.18.0 is backward-compatible for reading files packed by older versions, except for files packed with 0.17 in Python 2, in which case only they can only be unpacked in Python 2.

**Signature change for .rank**

Series.rank and DataFrame.rank now have the same signature (GH11759)

Previous signature

```
In [3]: pd.Series([0,1]).rank(method='average', na_option='keep',
                    ascending=True, pct=False)
Out[3]:
   0  1
   1  2
dtype: float64

In [4]: pd.DataFrame([0,1]).rank(axis=0, numeric_only=None,
                    method='average', na_option='keep',
                    ascending=True, pct=False)
Out[4]:
    0  1  2
0  0  1  2
[2 rows x 1 columns]
```

New signature

```
In [71]: pd.Series([0,1]).rank(axis=0, method='average', numeric_only=None,
                            na_option='keep', ascending=True, pct=False)
   ....:
   ....:
Out[71]:
    0  1.0  2.0
   Length: 2, dtype: float64

In [72]: pd.DataFrame([0,1]).rank(axis=0, method='average', numeric_only=None,
                            na_option='keep', ascending=True, pct=False)
   ....:
   ....:
Out[72]:
    0  1.0  2.0
   [2 rows x 1 columns]
```

**Bug in QuarterBegin with n=0**

In previous versions, the behavior of the QuarterBegin offset was inconsistent depending on the date when the n parameter was 0. (GH11406)

The general semantics of anchored offsets for n=0 is to not move the date when it is an anchor point (e.g., a quarter start date), and otherwise roll forward to the next anchor point.
For the `QuarterBegin` offset in previous versions, the date would be rolled *backwards* if date was in the same month as the quarter start date.

This behavior has been corrected in version 0.18.0, which is consistent with other anchored offsets like `MonthBegin` and `YearBegin`.

**Resample API**

Like the change in the window functions API *above*, `.resample(...)` is changing to have a more groupby-like API. (GH11732, GH12702, GH12202, GH12332, GH12334, GH12348, GH12448).
Previous API:

You would write a resampling operation that immediately evaluates. If a `how` parameter was not provided, it would default to `how='mean'`.

```
In [6]: df.resample('2s')
Out[6]:
          A     B     C     D
2010-01-01 09:00:00 0.485748 0.447351 0.357096 0.793615
2010-01-01 09:00:02 0.820801 0.794317 0.364034 0.531096
2010-01-01 09:00:04 0.433985 0.314582 0.424104 0.625733
2010-01-01 09:00:06 0.624988 0.609738 0.633165 0.612452
2010-01-01 09:00:08 0.510470 0.534317 0.573201 0.806949
```

You could also specify a `how` directly

```
In [7]: df.resample('2s', how='sum')
Out[7]:
          A     B     C     D
2010-01-01 09:00:00 0.971495 0.894701 0.714192 1.587231
2010-01-01 09:00:02 1.641602 1.588635 0.728068 1.062191
2010-01-01 09:00:04 0.867969 0.629165 0.848208 1.251465
2010-01-01 09:00:06 1.249976 1.219477 1.266330 1.224904
2010-01-01 09:00:08 1.020940 1.068634 1.146402 1.613897
```

New API:

Now, you can write `.resample(..)` as a 2-stage operation like `.groupby(...), which yields a Resampler.

```
In [82]: r = df.resample('2s')
In [83]: r
Out[83]: <pandas.core.resample.DatetimeIndexResampler object at 0x7f1e409d22b0>
```

Downsampling

You can then use this object to perform operations. These are downsampling operations (going from a higher frequency to a lower one).

```
In [84]: r.mean()
Out[84]:
          A     B     C     D
2010-01-01 09:00:00 0.485748 0.447351 0.357096 0.793615
2010-01-01 09:00:02 0.820801 0.794317 0.364034 0.531096
2010-01-01 09:00:04 0.433985 0.314582 0.424104 0.625733
2010-01-01 09:00:06 0.624988 0.609738 0.633165 0.612452
2010-01-01 09:00:08 0.510470 0.534317 0.573201 0.806949
[5 rows x 4 columns]
```

```
In [85]: r.sum()
Out[85]:
          A     B     C     D
2010-01-01 09:00:00 0.971495 0.894701 0.714192 1.587231
2010-01-01 09:00:02 1.641602 1.588635 0.728068 1.062191
2010-01-01 09:00:04 0.867969 0.629165 0.848208 1.251465
2010-01-01 09:00:06 1.249976 1.219477 1.266330 1.224904
2010-01-01 09:00:08 1.020940 1.068634 1.146402 1.613897
```
(continues on next page)
Furthermore, resample now supports `getitem` operations to perform the resample on specific columns.

```python
In [86]: r[['A','C']].mean()
Out[86]:
          A     C
2010-01-01 09:00:00  0.485748  0.357096
2010-01-01 09:00:02  0.820801  0.364034
2010-01-01 09:00:04  0.433985  0.424104
2010-01-01 09:00:06  0.624988  0.633165
2010-01-01 09:00:08  0.510470  0.573201
[5 rows x 2 columns]
```

...and `.aggregate` type operations.

```python
In [87]: r.agg({'A' : 'mean', 'B' : 'sum'})
Out[87]:
          A     B
2010-01-01 09:00:00  0.485748  0.894701
2010-01-01 09:00:02  0.820801  1.588635
2010-01-01 09:00:04  0.433985  0.629165
2010-01-01 09:00:06  0.624988  1.219477
2010-01-01 09:00:08  0.510470  1.068634
[5 rows x 2 columns]
```

These accessors can of course, be combined

```python
In [88]: r[['A','B']].agg(['mean','sum'])
Out[88]:
          A     B
mean  sum  mean  sum
2010-01-01 09:00:00  0.485748  0.971495  0.447351  0.894701
2010-01-01 09:00:02  0.820801  1.641602  0.794317  1.588635
2010-01-01 09:00:04  0.433985  0.867969  0.314582  0.629165
2010-01-01 09:00:06  0.624988  1.249976  0.609738  1.219477
2010-01-01 09:00:08  0.510470  1.020940  0.534317  1.068634
[5 rows x 4 columns]
```

### Upsampling

Upsampling operations take you from a lower frequency to a higher frequency. These are now performed with the `Resampler` objects with `backfill()`, `ffill()`, `fillna()` and `asfreq()` methods.

```python
In [89]: s = pd.Series(np.arange(5, dtype='int64'),
               index=pd.date_range('2010-01-01', periods=5, freq='Q'))

In [90]: s
```
Previously

```python
In [6]: s.resample('M', fill_method='ffill')
Out[6]:
2010-03-31  0
2010-04-30  0
2010-05-31  0
2010-06-30  1
2010-07-31  1
2010-08-31  1
2010-09-30  2
2010-10-31  2
2010-11-30  2
2010-12-31  3
2011-01-31  3
2011-02-28  3
2011-03-31  4
Freq: M, dtype: int64
```

New API

```python
In [91]: s.resample('M').ffill()
Out[91]:
2010-03-31  0
2010-04-30  0
2010-05-31  0
2010-06-30  1
2010-07-31  1
2010-08-31  1
2010-09-30  2
2010-10-31  2
2010-11-30  2
2010-12-31  3
2011-01-31  3
2011-02-28  3
2011-03-31  4
Freq: M, Length: 13, dtype: int64
```

Note: In the new API, you can either downsample OR upsample. The prior implementation would allow you to pass an aggregator function (like `mean`) even though you were upsampling, providing a bit of confusion.
Previous API will work but with deprecations

**Warning:** This new API for resample includes some internal changes for the prior-to-0.18.0 API, to work with a deprecation warning in most cases, as the resample operation returns a deferred object. We can intercept operations and just do what the (pre 0.18.0) API did (with a warning). Here is a typical use case:

In [4]: `r = df.resample('2s')`

In [6]: `r*10`

```
pandas/tseries/resample.py:80: FutureWarning: .resample() is now a deferred operation
use .resample(...).mean() instead of .resample(...)
```

```
Out[6]:
A     B      C      D
2010-01-01 09:00:00  4.857476  4.473507  3.570960  7.936154
2010-01-01 09:00:02  8.208011  7.943173  3.640340  5.310957
2010-01-01 09:00:04  4.339846  3.145823  4.241039  6.257326
2010-01-01 09:00:06  6.249881  6.097384  6.331650  6.124518
2010-01-01 09:00:08  5.104699  5.343172  5.732009  8.069486
```

However, getting and assignment operations directly on a Resampler will raise a `ValueError`:

In [7]: `r.iloc[0] = 5`

```
ValueError: .resample() is now a deferred operation
use .resample(...).mean() instead of .resample(...)
```

There is a situation where the new API can not perform all the operations when using original code. This code is intending to resample every 2s, take the mean AND then take the min of those results.

In [4]: `df.resample('2s').min()`

```
Out[4]:
A     B      C      D
2010-01-01 09:00:00  0.191519  0.272593  0.276464  0.785359
2010-01-01 09:00:02  0.683463  0.712702  0.357817  0.500995
2010-01-01 09:00:04  0.364886  0.013768  0.075381  0.368824
2010-01-01 09:00:06  0.316836  0.568099  0.397203  0.436173
2010-01-01 09:00:08  0.218792  0.143767  0.442141  0.704581
```

The good news is the return dimensions will differ between the new API and the old API, so this should loudly raise an exception.

To replicate the original operation

In [93]: `df.resample('2s').mean().min()`

```
Out [93]:
A   0.433985
B   0.314582
C   0.357096
D   0.531096
Length: 4, dtype: float64
```

[5 rows x 4 columns]
Changes to eval

In prior versions, new columns assignments in an eval expression resulted in an inplace change to the DataFrame. (GH9297, GH8664, GH10486)

In [94]: df = pd.DataFrame({'a': np.linspace(0, 10, 5), 'b': range(5)})

In [95]: df
Out[95]:
   a  b
0  0  0
1  2.5 1
2  5.0 2
3  7.5 3
4  10.0 4

[5 rows x 2 columns]

In [12]: df.eval('c = a + b')
FutureWarning: eval expressions containing an assignment currently default to operating inplace. This will change in a future version of pandas, use inplace=True to avoid this warning.

In [13]: df
Out[13]:
   a  b  c
0  0  0  0.0
1  2.5 1  3.5
2  5.0 2  7.0
3  7.5 3 10.5
4  10.0 4 14.0

[5 rows x 3 columns]

In version 0.18.0, a new inplace keyword was added to choose whether the assignment should be done inplace or return a copy.

In [96]: df
Out[96]:
   a  b  c
0  0  0  0.0
1  2.5 1  3.5
2  5.0 2  7.0
3  7.5 3 10.5
4  10.0 4 14.0

[5 rows x 3 columns]

In [97]: df.eval('d = c - b', inplace=False)
Out[97]:
   a  b  c  d
0  0  0  0.0  0.0
1  2.5 1  3.5  2.5
2  5.0 2  7.0  5.0

(continues on next page)
In [98]: df
Out[98]:
   a  b  c
0  0.0 0.0 0.0
1  2.5 1.0 3.5
2  5.0 2.0 7.0
3  7.5 3.0 10.5
4 10.0 4.0 14.0

[5 rows x 3 columns]

In [99]: df.eval('d = c - b', inplace=True)
In [100]: df
Out[100]:
   a  b  c  d
0  0.0 0.0 0.0 0.0
1  2.5 1.0 3.5  2.5
2  5.0 2.0 7.0  5.0
3  7.5 3.0 10.5  7.5
4 10.0 4.0 14.0 10.0

[5 rows x 4 columns]

**Warning:** For backwards compatibility, `inplace` defaults to `True` if not specified. This will change in a future version of pandas. If your code depends on an inplace assignment you should update to explicitly set `inplace=True`.

The `inplace` keyword parameter was also added the `query` method.

In [101]: df.query('a > 5')
Out[101]:
   a  b  c  d
3  7.5 3.0 10.5  7.5
4 10.0 4.0 14.0 10.0

[2 rows x 4 columns]

In [102]: df.query('a > 5', inplace=True)
In [103]: df
Out[103]:
   a  b  c  d
3  7.5 3.0 10.5  7.5
4 10.0 4.0 14.0 10.0

[2 rows x 4 columns]
eval has also been updated to allow multi-line expressions for multiple assignments. These expressions will be evaluated one at a time in order. Only assignments are valid for multi-line expressions.

```
In [104]: df
Out[104]:
    a   b   c   d
  3  7.5  3.5  7.5
  4 10.0  4.0 10.0
[2 rows x 4 columns]

In [105]: df.eval('''
.....:
.....: e = d + a
.....: f = e - 22
.....: g = f / 2.0'''', inplace=True)

In [106]: df
Out[106]:
    a   b   c   d   e   f   g
  3  7.5  3.5  7.5 15.0 -7.0 -3.5
  4 10.0  4.0 10.0 20.0 -2.0 -1.0
[2 rows x 7 columns]
```

**Other API changes**

- `DataFrame.between_time` and `Series.between_time` now only parse a fixed set of time strings. Parsing of date strings is no longer supported and raises a `ValueError`. (GH11818)

```
In [107]: s = pd.Series(range(10), pd.date_range('2015-01-01', freq='H', periods=10))

In [108]: s.between_time("7:00am", "9:00am")
Out[108]:
2015-01-01 07:00:00    7
2015-01-01 08:00:00    8
2015-01-01 09:00:00    9
Freq: H, Length: 3, dtype: int64
```

This will now raise.

```
In [2]: s.between_time('20150101 07:00:00', '20150101 09:00:00')
ValueError: Cannot convert arg ['20150101 07:00:00'] to a time.
```

- `.memory_usage()` now includes values in the index, as does memory_usage in `.info()` (GH11597)
- `DataFrame.to_latex()` now supports non-ascii encodings (eg `utf-8`) in Python 2 with the parameter `encoding` (GH7061)
- `pandas.merge()` and `DataFrame.merge()` will show a specific error message when trying to merge with an object that is not of type `DataFrame` or a subclass (GH12081)
- DataFrame.unstack and Series.unstack now take fill_value keyword to allow direct replacement of missing values when an unstack results in missing values in the resulting DataFrame. As an added benefit, specifying fill_value will preserve the data type of the original stacked data. (GH9746)

- As part of the new API for window functions and resampling, aggregation functions have been clarified, raising more informative error messages on invalid aggregations. (GH9052). A full set of examples are presented in groupby.

- Statistical functions for NDFrame objects (like sum(), mean(), min()) will now raise if non-numpy-compatible arguments are passed in for **kwargs (GH12301)

- .to_latex and .to_html gain a decimal parameter like .to_csv; the default is '. ' (GH12031)

- More helpful error message when constructing a DataFrame with empty data but with indices (GH8020)

- .describe() will now properly handle bool dtype as a categorical (GH6625)

- More helpful error message with an invalid .transform with user defined input (GH10165)

- Exponentially weighted functions now allow specifying alpha directly (GH10789) and raise ValueError if parameters violate 0 < alpha <= 1 (GH12492)

**Deprecations**

- The functions pd.rolling_*, pd.expanding_* and pd.ewm* are deprecated and replaced by the corresponding method call. Note that the new suggested syntax includes all of the arguments (even if default) (GH11603)

```
In [1]: s = pd.Series(range(3))

In [2]: pd.rolling_mean(s,window=2,min_periods=1)
   FutureWarning: pd.rolling_mean is deprecated for Series and
       will be removed in a future version, replace with
       Series.rolling(min_periods=1,window=2,center=False).mean()

Out[2]:
      0  0.0
      1  0.5
      2  1.5
dtype: float64

In [3]: pd.rolling_cov(s, s, window=2)
   FutureWarning: pd.rolling_cov is deprecated for Series and
       will be removed in a future version, replace with
       Series.rolling(window=2).cov(other=<Series>)

Out[3]:
      0   NaN
      1  0.5
      2  0.5
dtype: float64
```

- The freq and how arguments to the .rolling, .expanding, and .ewm (new) functions are deprecated, and will be removed in a future version. You can simply resample the input prior to creating a window function. (GH11603).

For example, instead of s.rolling(window=5,freq='D').max() to get the max value on a rolling 5 Day window, one could use s.resample('D').mean().rolling(window=5).max(), which first resamples the data to daily data, then provides a rolling 5 day window.
pandas: powerful Python data analysis toolkit, Release 1.3.1

- `pd.tseries.frequencies.get_offset_name` function is deprecated. Use offset’s `.freqstr` property as alternative (GH11192)
- `pandas.stats.fama_macbeth` routines are deprecated and will be removed in a future version (GH6077)
- `pandas.stats.ols`, `pandas.stats.plm` and `pandas.stats.var` routines are deprecated and will be removed in a future version (GH6077)
- show a `FutureWarning` rather than a `DeprecationWarning` on using long-time deprecated syntax in `HDFStore.select`, where the `where` clause is not a string-like (GH12027)
- The `pandas.options.display.mpl_style` configuration has been deprecated and will be removed in a future version of pandas. This functionality is better handled by matplotlib’s `style` sheets (GH11783).

Removal of deprecated float indexers

In GH4892 indexing with floating point numbers on a non-`Float64Index` was deprecated (in version 0.14.0). In 0.18.0, this deprecation warning is removed and these will now raise a `TypeError` (GH12165, GH12333)

```python
In [109]: s = pd.Series([1, 2, 3], index=[4, 5, 6])
In [110]: s
Out[110]:
4  1
5  2
6  3
Length: 3, dtype: int64
In [111]: s2 = pd.Series([1, 2, 3], index=list('abc'))
In [112]: s2
Out[112]:
a  1
b  2
c  3
Length: 3, dtype: int64
```

Previous behavior:

```python
# this is label indexing
In [2]: s[5.0]
FutureWarning: scalar indexers for index type Int64Index should be integers and not floating point
Out[2]:

# this is positional indexing
In [3]: s.iloc[1.0]
FutureWarning: scalar indexers for index type Int64Index should be integers and not floating point
Out[3]:

# this is label indexing
In [4]: s.loc[5.0]
FutureWarning: scalar indexers for index type Int64Index should be integers and not floating point
Out[4]:

# .ix would coerce 1.0 to the positional 1, and index
(continues on next page)```
FutureWarning: scalar indexers for index type Index should be integers and not floating point

FutureWarning has been dropped for .loc, .ix and [].

Positional setting with .ix and a float indexer will ADD this value to the index, rather than previously setting the value by position.
Slicing will also coerce integer-like floats to integers for a non-Float64Index.

Note that for floats that are NOT coercible to ints, the label based bounds will be excluded

Float indexing on a Float64Index is unchanged.

Removal of prior version deprecations/changes

- Removal of `rolling_corr_pairwise` in favor of `.rolling().corr(pairwise=True)` (GH4950)
- Removal of `expanding_corr_pairwise` in favor of `.expanding().corr(pairwise=True)` (GH4950)
- Removal of DataMatrix module. This was not imported into the pandas namespace in any event (GH12111)
- Removal of `cols` keyword in favor of `subset` in DataFrame.duplicated() and DataFrame.drop_duplicates() (GH6680)
- Removal of the read_frame and frame_query (both aliases for pd.read_sql) and write_frame (alias of to_sql) functions in the pd.io.sql namespace, deprecated since 0.14.0 (GH6292).
- Removal of the order keyword from .factorize() (GH6930)
Performance improvements

- Improved performance of `andrews_curves` (GH11534)
- Improved huge `DatetimeIndex`, `PeriodIndex` and `TimedeltaIndex`’s ops performance including `NaT` (GH10277)
- Improved performance of `pandas.concat` (GH11958)
- Improved performance of `StataReader` (GH11591)
- Improved performance in construction of `Categoricals` with `Series` of datetimes containing `NaT` (GH12077)
- Improved performance of ISO 8601 date parsing for dates without separators (GH11899), leading zeros (GH11871) and with white space preceding the time zone (GH9714)

Bug fixes

- Bug in `GroupBy.size` when data-frame is empty. (GH11699)
- Bug in `Period.end_time` when a multiple of time period is requested (GH11738)
- Regression in `.clip` with tz-aware datetimes (GH11838)
- Bug in `date_range` when the boundaries fell on the frequency (GH11804, GH12409)
- Bug in consistency of passing nested dicts to `.groupby(...)`.agg(...) (GH9052)
- Accept unicode in `Timedelta` constructor (GH11995)
- Bug in value label reading for `StataReader` when reading incrementally (GH12014)
- Bug in vectorized `DateOffset` when `n` parameter is 0 (GH11370)
- Compat for numpy 1.11 w.r.t. `NaT` comparison changes (GH12049)
- Bug in `read_csv` when reading from a `StringIO` in threads (GH11790)
- Bug in not treating `NaT` as a missing value in datetimelikes when factorizing & with `Categoricals` (GH12077)
- Bug in `getitem` when the values of a `Series` were tz-aware (GH12089)
- Bug in `Series.str.get_dummies` when one of the variables was ‘name’ (GH12180)
- Bug in `pd.concat` while concatenating tz-aware `NaT` series. (GH11693, GH11755, GH12217)
- Bug in `pd.read_stata` with version <= 108 files (GH12232)
- Bug in `Series.resample` using a frequency of `Nano` when the index is a `DatetimeIndex` and contains non-zero nanosecond parts (GH12037)
- Bug in resampling with `.nunique` and a sparse index (GH12352)
- Removed some compiler warnings (GH12471)
- Work around compat issues with `boto` in python 3.5 (GH11915)
- Bug in `NaT` subtraction from `Timestamp` or `DatetimeIndex` with timezones (GH11718)
- Bug in subtraction of `Series` of a single tz-aware `Timestamp` (GH12290)
- Use compat iterators in PY2 to support `.next()` (GH12299)
- Bug in `Timedelta.round` with negative values (GH11690)
• Bug in .loc against CategoricalIndex may result in normal Index (GH11586)
• Bug in DataFrame.info when duplicated column names exist (GH11761)
• Bug in .copy of datetime tz-aware objects (GH11794)
• Bug in Series.apply and Series.map where timedelta64 was not boxed (GH11349)
• Bug in DataFrame.set_index() with tz-aware Series (GH12358)
• Bug in subclasses of DataFrame where AttributeError did not propagate (GH11808)
• Bug groupby on tz-aware data where selection not returning Timestamp (GH11616)
• Bug in pd.read_clipboard and pd.to_clipboard functions not supporting Unicode; upgrade included pyperclip to v1.5.15 (GH9263)
• Bug in DataFrame.query containing an assignment (GH8664)
• Bug in from_msgpack where __contains__() fails for columns of the unpacked DataFrame, if the DataFrame has object columns. (GH11880)
• Bug in .resample on categorical data with TimedeltaIndex (GH12169)
• Bug in timezone info lost when broadcasting scalar datetime to DataFrame (GH11682)
• Bug in Index creation from Timestamp with mixed tz coerces to UTC (GH11488)
• Bug in to_numeric where it does not raise if input is more than one dimension (GH11776)
• Bug in parsing timezone offset strings with non-zero minutes (GH11708)
• Bug in df.plot using incorrect colors for bar plots under matplotlib 1.5+ (GH11614)
• Bug in the groupby plot method when using keyword arguments (GH11805).
• Bug in DataFrame.duplicated and drop_duplicates causing spurious matches when setting keep=False (GH11864)
• Bug in .loc result with duplicated key may have Index with incorrect dtype (GH11497)
• Bug in pd.rolling_median where memory allocation failed even with sufficient memory (GH11696)
• Bug in DataFrame.style with spurious zeros (GH12134)
• Bug in DataFrame.style with integer columns not starting at 0 (GH12125)
• Bug in .style.bar may not rendered properly using specific browser (GH11678)
• Bug in rich comparison of Timedelta with a numpy.array of Timedelta that caused an infinite recursion (GH11835)
• Bug in DataFrame.round dropping column index name (GH11986)
• Bug in df.replace while replacing value in mixed dtype DataFrame (GH11698)
• Bug in Index prevents copying name of passed Index, when a new name is not provided (GH1193)
• Bug in read_excel failing to read any non-empty sheets when empty sheets exist and sheetname=None (GH11711)
• Bug in read_excel failing to raise NotImplemented error when keywords parse_dates and date_parser are provided (GH11544)
• Bug in read_sql with pymysql connections failing to return chunked data (GH11522)
• Bug in .to_csv ignoring formatting parameters decimal, na_rep, float_format for float indexes (GH11553)
• Bug in `Int64Index` and `Float64Index` preventing the use of the modulo operator (GH9244)
• Bug in `MultiIndex.drop` for not lexsorted MultiIndexes (GH12078)
• Bug in `DataFrame` when masking an empty `DataFrame` (GH11859)
• Bug in `.plot` potentially modifying the `colors` input when the number of columns didn’t match the number of series provided (GH12039).
• Bug in `Series.plot` failing when index has a `CustomBusinessDay` frequency (GH7222).
• Bug in `.to_sql` for `datetime.time` values with sqlite fallback (GH8341)
• Bug in `read_excel` failing to read data with one column when `squeeze=True` (GH12157)
• Bug in `read_excel` failing to read one empty column (GH12292, GH9002)
• Bug in `.groupby` where a `KeyError` was not raised for a wrong column if there was only one row in the dataframe (GH11741)
• Bug in `.read_csv` with dtype specified on empty data producing an error (GH12048)
• Bug in `.read_csv` where strings like ‘2E’ are treated as valid floats (GH12237)
• Bug in building `pandas` with debugging symbols (GH12123)
• Removed millisecond property of `DatetimeIndex`. This would always raise a `ValueError` (GH12019).
• Bug in `Series` constructor with read-only data (GH11502)
• Removed `pandas._testing.choice()`. Should use `np.random.choice()`, instead. (GH12386)
• Bug in `.loc` setitem indexers preventing the use of a TZ-aware DatetimeIndex (GH12050)
• Bug in `.style` indexes and MultiIndexes not appearing (GH11655)
• Bug in `to_msgpack` and `from_msgpack` which did not correctly serialize or deserialize `NaT` (GH12307).
• Bug in `.skew` and `.kurt` due to roundoff error for highly similar values (GH11974)
• Bug in `Timestamp` constructor where microsecond resolution was lost if HHMMSS were not separated with ‘:’ (GH10041)
• Bug in `buffer_rd_bytes` src->buffer could be freed more than once if reading failed, causing a segfault (GH12098)
• Bug in `crosstab` where arguments with non-overlapping indexes would return a `KeyError` (GH10291)
• Bug in `DataFrame.apply` in which reduction was not being prevented for cases in which `dtype` was not a numpy `dtype` (GH12244)
• Bug when initializing categorical series with a scalar value. (GH12336)
• Bug when specifying a UTC `DatetimeIndex` by setting `utc=True` in `.to_datetime` (GH11934)
• Bug when increasing the buffer size of CSV reader in `read_csv` (GH12494)
• Bug when setting columns of a `DataFrame` with duplicate column names (GH12344)

5.13 Version 0.17

5.13.1 Version 0.17.1 (November 21, 2015)

Note: We are proud to announce that pandas has become a sponsored project of the (NumFOCUS organization). This will help ensure the success of development of pandas as a world-class open-source project.

This is a minor bug-fix release from 0.17.0 and includes a large number of bug fixes along several new features, enhancements, and performance improvements. We recommend that all users upgrade to this version.

Highlights include:

• Support for Conditional HTML Formatting, see here
• Releasing the GIL on the csv reader & other ops, see here
• Fixed regression in DataFrame.drop_duplicates from 0.16.2, causing incorrect results on integer values (GH11376)

What’s new in v0.17.1

• New features
  – Conditional HTML formatting
• Enhancements
• API changes
  – Deprecations
• Performance improvements
• Bug fixes
• Contributors

New features

Conditional HTML formatting

Warning: This is a new feature and is under active development. We’ll be adding features an possibly making breaking changes in future releases. Feedback is welcome.

We’ve added experimental support for conditional HTML formatting: the visual styling of a DataFrame based on the data. The styling is accomplished with HTML and CSS. Accesses the styler class with the pandas.DataFrame.style, attribute, an instance of Styler with your data attached.

Here’s a quick example:

```python
In [1]: np.random.seed(123)
In [2]: df = pd.DataFrame(np.random.randn(10, 5), columns=list("abcde"))
```
In [3]: html = df.style.background_gradient(cmap="viridis", low=0.5)

We can render the HTML to get the following table.

Styler interacts nicely with the Jupyter Notebook. See the documentation for more.

Enhancements

- DatetimeIndex now supports conversion to strings with astype(str) (GH10442)
- Support for compression (gzip/bz2) in pandas.DataFrame.to_csv() (GH7615)
- pd.read_* functions can now also accept pathlib.Path, or py._path.local.LocalPath objects for the filepath_or_buffer argument. (GH11033) - The DataFrame and Series functions .to_csv(), .to_html() and .to_latex() can now handle paths beginning with tildes (e.g. ~/Documents/) (GH11438)
- DataFrame now uses the fields of a namedtuple as columns, if columns are not supplied (GH11181)
- DataFrame.itertuples() now returns namedtuple objects, when possible. (GH11269, GH11625)
- Added axvlines_kwds to parallel coordinates plot (GH10709)
- Option to .info() and .memory_usage() to provide for deep introspection of memory consumption. Note that this can be expensive to compute and therefore is an optional parameter. (GH11595)

In [4]: df = pd.DataFrame({"A": ["foo"] * 1000})  # noqa: F821

In [5]: df["B"] = df["A"].astype("category")

# shows the '+' as we have object dtypes
In [6]: df.info()
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 1000 entries, 0 to 999
Data columns (total 2 columns):
 # Column Non-Null Count Dtype
--- ------ -------------- ----- 
0 A 1000 non-null object
1 B 1000 non-null category
dtypes: category(1), object(1)
memory usage: 9.0+ KB

# we have an accurate memory assessment (but can be expensive to compute this)
In [7]: df.info(memory_usage="deep")
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 1000 entries, 0 to 999
Data columns (total 2 columns):
 # Column Non-Null Count Dtype
--- ------ -------------- ----- 
0 A 1000 non-null object
1 B 1000 non-null category
dtypes: category(1), object(1)
memory usage: 59.9 KB

- Index now has a fillna method (GH10089)
In [8]: pd.Index([1, np.nan, 3]).fillna(2)
Out[8]: Float64Index([1.0, 2.0, 3.0], dtype='float64')

- Series of type category now make .str.<...> and .dt.<...> accessor methods / properties available, if the categories are of that type. (GH10661)

In [9]: s = pd.Series(list("aabb")).astype("category")
In [10]: s
Out[10]:
0   a
1   a
2   b
3   b
Length: 4, dtype: category
Categories (2, object): ['a', 'b']

In [11]: s.str.contains("a")
Out[11]:
0   True
1   True
2  False
3  False
Length: 4, dtype: bool

In [12]: date = pd.Series(pd.date_range("1/1/2015", periods=5)).astype("category")
In [13]: date
Out[13]:
0 2015-01-01
1 2015-01-02
2 2015-01-03
3 2015-01-04
4 2015-01-05
Length: 5, dtype: category

In [14]: date.dt.day
Out[14]:
0   1
1   2
2   3
3   4
4   5
Length: 5, dtype: int64

- `pivot_table` now has a margins_name argument so you can use something other than the default of ‘All’ (GH3335)
- Implement export of datetime64[ns, tz] dtypes with a fixed HDF5 store (GH11411)
- Pretty printing sets (e.g. in DataFrame cells) now uses set literal syntax ({x, y}) instead of Legacy Python syntax (set([x, y])) (GH11215)
- Improve the error message in pandas.io.gbq.to_gbq() when a streaming insert fails (GH11285) and when the DataFrame does not match the schema of the destination table (GH11359)
pandas: powerful Python data analysis toolkit, Release 1.3.1

API changes

- raise NotImplementedError in Index.shift for non-supported index types (GH8038)
- min and max reductions on datetime64 and timedelta64 dtyped series now result in NaT and not nan (GH11245).
- Indexing with a null key will raise a TypeError, instead of a ValueError (GH11356)
- Series.ptp will now ignore missing values by default (GH11163)

Deprecations

- The pandas.io.ga module which implements google-analytics support is deprecated and will be removed in a future version (GH11308)
- Deprecate the engine keyword in .to_csv(), which will be removed in a future version (GH11274)

Performance improvements

- Checking monotonic-ness before sorting on an index (GH11080)
- Series.dropna performance improvement when its dtype can’t contain NaN (GH11159)
- Release the GIL on most datetime field operations (e.g. DatetimeIndex.year, Series.dt.year), normalization, and conversion to and from Period, DatetimeIndex.to_period and PeriodIndex.to_timestamp (GH11263)
- Release the GIL on some rolling algos: rolling_median, rolling_mean, rolling_max, rolling_min, rolling_var, rolling_kurt, rolling_skew (GH11450)
- Release the GIL when reading and parsing text files in read_csv, read_table (GH11272)
- Improved performance of rolling_median (GH11450)
- Improved performance of to_excel (GH11352)
- Performance bug in repr of Categorical categories, which was rendering the strings before chopping them for display (GH11305)
- Performance improvement in Categorical.remove_unused_categories, (GH11643).  
- Improved performance of Series constructor with no data and DatetimeIndex (GH11433)
- Improved performance of shift, cumprod, and cumsum with groupby (GH4095)

Bug fixes

- SparseArray.__iter__() now does not cause PendingDeprecationWarning in Python 3.5 (GH11622)
- Regression from 0.16.2 for output formatting of long floats/nan, restored in (GH11302)
- Series.sort_index() now correctly handles the inplace option (GH11402)
- Incorrectly distributed .c file in the build on PyPi when reading a csv of floats and passing na_values=<a scalar> would show an exception (GH11374)
- Bug in .to_latex() output broken when the index has a name (GH10660)
• Bug in `HDFStore.append` with strings whose encoded length exceeded the max unencoded length (GH11234)

• Bug in merging `datetime64[ns, tz]` dtypes (GH11405)

• Bug in `HDFStore.select` when comparing with a numpy scalar in a where clause (GH11283)

• Bug in using `DataFrame.ix` with a MultiIndex indexer (GH11372)

• Bug in `date_range` with ambiguous endpoints (GH11626)

• Prevent adding new attributes to the accessors `.str`, `.dt` and `.cat`. Retrieving such a value was not possible, so error out on setting it. (GH10673)

• Bug in tz-conversions with an ambiguous time and `.dt` accessors (GH11295)

• Bug in output formatting when using an index of ambiguous times (GH11619)

• Bug in comparisons of `Series` vs list-likes (GH11339)

• Bug in `DataFrame.replace` with a `datetime64[ns, tz]` and a non-compat to_replace (GH11326, GH11153)

• Bug in `isnull` where `numpy.datetime64('NaT')` in a `numpy.array` was not determined to be `null` (GH11206)

• Bug in list-like indexing with a mixed-integer Index (GH11320)

• Bug in `pivot_table` with margins=True when indexes are of `Categorical` dtype (GH10993)

• Bug in `DataFrame.plot` cannot use hex strings colors (GH10299)

• Regression in `DataFrame.drop_duplicates` from 0.16.2, causing incorrect results on integer values (GH11376)

• Bug in `pd.eval` where unary ops in a list error (GH11235)

• Bug in `squeeze()` with zero length arrays (GH11230, GH11899)

• Bug in `describe()` dropping column names for hierarchical indexes (GH11517)

• Bug in `DataFrame.pct_change()` not propagating `axis` keyword on `.fillna` method (GH11150)

• Bug in `.to_csv()` when a mix of integer and string column names are passed as the `columns` parameter (GH11637)

• Bug in indexing with a `range`, (GH11652)

• Bug in inference of `numpy` scalars and preserving dtype when setting columns (GH11638)

• Bug in `to_sql` using `unicode` column names giving `UnicodeEncodeError` with (GH11431).

• Fix regression in setting of `xticks` in `plot` (GH11529).

• Bug in `holiday.dates` where observance rules could not be applied to holiday and doc enhancement (GH11477, GH11533)

• Fix plotting issues when having plain `Axes` instances instead of `SubplotAxes` (GH11520, GH11556).

• Bug in `DataFrame.to_latex()` produces an extra rule when `header=False` (GH7124)

• Bug in `df.groupby(...).apply(func)` when a func returns a `Series` containing a new datetimelike column (GH11324)

• Bug in `pandas.json` when file to load is big (GH11344)

• Bugs in `to_excel` with duplicate columns (GH11007, GH10982, GH10970)

• Fixed a bug that prevented the construction of an empty series of dtype `datetime64[ns, tz]` (GH11245).
pandas: powerful Python data analysis toolkit, Release 1.3.1

- Bug in `read_excel` with MultiIndex containing integers (GH11317)
- Bug in `to_excel` with openpyxl 2.2+ and merging (GH11408)
- Bug in `DataFrame.to_dict()` produces a `np.datetime64` object instead of `Timestamp` when only datetime is present in data (GH11327)
- Bug in `DataFrame.corr()` raises exception when computes Kendall correlation for DataFrames with boolean and not boolean columns (GH11560)
- Bug in the link-time error caused by `C inline` functions on FreeBSD 10+ (with `clang`) (GH10510)
- Bug in `DataFrame.to_csv` in passing through arguments for formatting MultiIndexes, including `date_format` (GH7791)
- Bug in `DataFrame.join()` with `how='right'` producing a `TypeError` (GH11519)
- Bug in `Series.quantile` with empty list results has `Index` with `object` dtype (GH11588)
- Bug in `pd.merge` results in empty `Int64Index` rather than `Index`(`dtype=object`) when the merge result is empty (GH11588)
- Bug in `Categorical.remove_unused_categories` when having `NaN` values (GH11599)
- Bug in `DataFrame.to_sparse()` loses column names for MultiIndexes (GH11600)
- Bug in `DataFrame.round()` with non-unique column index producing a Fatal Python error (GH11611)
- Bug in `DataFrame.round()` with `decimals` being a non-unique indexed Series producing extra columns (GH11618)

5.13.2 Version 0.17.0 (October 9, 2015)

This is a major release from 0.16.2 and includes a small number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

**Warning:** pandas >= 0.17.0 will no longer support compatibility with Python version 3.2 (GH9118)

**Warning:** The pandas.io.data package is deprecated and will be replaced by the pandas-datareader package. This will allow the data modules to be independently updated to your pandas installation. The API for pandas-datareader v0.1.1 is exactly the same as in pandas v0.17.0 (GH8961, GH10861).

After installing pandas-datareader, you can easily change your imports:

```python
from pandas.io import data, wb
```

becomes

```python
from pandas_datareader import data, wb
```

Highlights include:

- Release the Global Interpreter Lock (GIL) on some cython operations, see [here](#)
- Plotting methods are now available as attributes of the `.plot` accessor, see [here](#)
- The sorting API has been revamped to remove some long-time inconsistencies, see [here](#)
- Support for a `datetime64[ns]` with timezones as a first-class dtype, see [here](#)
- The default for `to_datetime` will now be to raise when presented with unparsable formats, previously this would return the original input. Also, date parse functions now return consistent results. See [here](#)
- The default for `dropna` in HDFStore has changed to `False`, to store by default all rows even if they are all NaN, see [here](#)
- Datetime accessor (dt) now supports `Series.dt.strftime` to generate formatted strings for datetime-likes, and `Series.dt.total_seconds` to generate each duration of the timedelta in seconds. See [here](#)
Period and PeriodIndex can handle multiplied freq like 3D, which corresponding to 3 days span. See here

Development installed versions of pandas will now have PEP440 compliant version strings (GH9518)

Development support for benchmarking with the Air Speed Velocity library (GH8361)

Support for reading SAS xport files, see here

Documentation comparing SAS to pandas, see here

Removal of the automatic TimeSeries broadcasting, deprecated since 0.8.0, see here

Display format with plain text can optionally align with Unicode East Asian Width, see here

Compatibility with Python 3.5 (GH11097)

Compatibility with matplotlib 1.5.0 (GH11111)

Check the API Changes and deprecations before updating.

What’s new in v0.17.0

• New features
  – Datetime with TZ
  – Releasing the GIL
  – Plot submethods
  – Additional methods for dt accessor
    * Series.dt.strftime
    * Series.dt.total_seconds
  – Period frequency enhancement
  – Support for SAS XPORT files
  – Support for math functions in .eval()
  – Changes to Excel with MultiIndex
  – Google BigQuery enhancements
  – Display alignment with Unicode East Asian width
  – Other enhancements

• Backwards incompatible API changes
  – Changes to sorting API
  – Changes to to_datetime and to_timedelta
    * Error handling
    * Consistent parsing
  – Changes to Index comparisons
  – Changes to boolean comparisons vs. None
  – HDFStore dropna behavior
  – Changes to display.precision option
  – Changes to Categorical.unique
New features

Datetime with TZ

We are adding an implementation that natively supports datetime with timezones. A Series or a DataFrame column previously could be assigned a datetime with timezones, and would work as an object dtype. This had performance issues with a large number rows. See the docs for more details. (GH8260, GH10763, GH11034).

The new implementation allows for having a single-timezone across all rows, with operations in a performant manner.
This uses a new-dtype representation as well, that is very similar in look-and-feel to its numpy cousin `datetime64[ns]`

In [6]: `df['B'].dtype`
Out[6]: `datetime64[ns, US/Eastern]`

In [7]: `type(df['B'].dtype)`
Out[7]: `pandas.core.dtypes.dtypes.DatetimeTZDtype`

Note: There is a slightly different string repr for the underlying `DatetimeIndex` as a result of the dtype changes, but functionally these are the same.

Previous behavior:

In [1]: `pd.date_range('20130101', periods=3, tz='US/Eastern')`
Out[1]: `DatetimeIndex(['2013-01-01 00:00:00-05:00', '2013-01-02 00:00:00-05:00',
                     '2013-01-03 00:00:00-05:00'],
                     dtype='datetime64[ns]', freq='D', tz='US/Eastern')`

In [2]: `pd.date_range('20130101', periods=3, tz='US/Eastern').dtype`
Out[2]: `dtype('<M8[ns]')`

New behavior:

In [8]: `pd.date_range("20130101", periods=3, tz="US/Eastern")`
Out[8]: `DatetimeIndex(['2013-01-01 00:00:00-05:00', '2013-01-02 00:00:00-05:00',
                     '2013-01-03 00:00:00-05:00'],
                     dtype='datetime64[ns, US/Eastern]', freq='D')`

In [9]: `pd.date_range("20130101", periods=3, tz="US/Eastern").dtype`
Out[9]: `datetime64[ns, US/Eastern]`

Releasing the GIL

We are releasing the global-interpreter-lock (GIL) on some cython operations. This will allow other threads to run simultaneously during computation, potentially allowing performance improvements from multi-threading. Notably `groupby`, `nsmallest`, `value_counts` and some indexing operations benefit from this. (GH8882)

For example the groupby expression in the following code will have the GIL released during the factorization step, e.g. `df.groupby('key')` as well as the `.sum()` operation.

N = 1000000
ngroups = 10
df = DataFrame(
    {"key": np.random.randint(0, ngroups, size=N), "data": np.random.randn(N)}
)
Releasing of the GIL could benefit an application that uses threads for user interactions (e.g. QT), or performing multi-threaded computations. A nice example of a library that can handle these types of computation-in-parallel is the *dask* library.

### Plot submethods

The Series and DataFrame `.plot()` method allows for customizing *plot types* by supplying the `kind` keyword arguments. Unfortunately, many of these kinds of plots use different required and optional keyword arguments, which makes it difficult to discover what any given plot kind uses out of the dozens of possible arguments.

To alleviate this issue, we have added a new, optional plotting interface, which exposes each kind of plot as a method of the `.plot` attribute. Instead of writing `series.plot(kind=<kind>, ...)`, you can now also use `series.plot.<kind>(...)`:

```python
In [10]: df = pd.DataFrame(np.random.rand(10, 2), columns=['a', 'b'])
In [11]: df.plot.bar()
```

As a result of this change, these methods are now all discoverable via tab-completion:

```python
In [12]: df.plot.<TAB>  # noqa: E225, E999
df.plot.area    df.plot.barh    df.plot.density  df.plot.hist    df.plot.line
   =df.plot.scatter
df.plot.bar    df.plot.box    df.plot.hexbin  df.plot.kde    df.plot.pie
```

Each method signature only includes relevant arguments. Currently, these are limited to required arguments, but in the future these will include optional arguments, as well. For an overview, see the new *Plotting* API documentation.
Additional methods for dt accessor

Series.dt.strftime

We are now supporting a `Series.dt.strftime` method for datetime-likes to generate a formatted string (GH10110). Examples:

```
# DatetimeIndex
In [13]: s = pd.Series(pd.date_range("20130101", periods=4))

In [14]: s
Out[14]:
0  2013-01-01
1  2013-01-02
2  2013-01-03
3  2013-01-04
Length: 4, dtype: datetime64[ns]

In [15]: s.dt.strftime("%Y/%m/%d")
Out[15]:
0  2013/01/01
1  2013/01/02
2  2013/01/03
3  2013/01/04
Length: 4, dtype: object

# PeriodIndex
In [16]: s = pd.Series(pd.period_range("20130101", periods=4))

In [17]: s
Out[17]:
0  2013-01-01
1  2013-01-02
2  2013-01-03
3  2013-01-04
Length: 4, dtype: period[D]

In [18]: s.dt.strftime("%Y/%m/%d")
Out[18]:
0  2013/01/01
1  2013/01/02
2  2013/01/03
3  2013/01/04
Length: 4, dtype: object
```

The string format is as the python standard library and details can be found here.
Series.dt.total_seconds

pd.Series of type timedelta64 has new method .dt.total_seconds() returning the duration of the timedelta in seconds (GH10817)

```
In [19]: s = pd.Series(pd.timedelta_range("1 minutes", periods=4))

In [20]: s
Out[20]:
0    0 days 00:01:00
1    1 days 00:01:00
2    2 days 00:01:00
3    3 days 00:01:00
Length: 4, dtype: timedelta64[ns]

In [21]: s.dt.total_seconds()
Out[21]:
0    60.0
1  86460.0
2 172860.0
3 259260.0
Length: 4, dtype: float64
```

Period frequency enhancement

Period, PeriodIndex and period_range can now accept multiplied freq. Also, Period.freq and PeriodIndex.freq are now stored as a DateOffset instance like DatetimeIndex, and not as str (GH7811)

A multiplied freq represents a span of corresponding length. The example below creates a period of 3 days. Addition and subtraction will shift the period by its span.

```
In [22]: p = pd.Period("2015-08-01", freq="3D")

In [23]: p
Out[23]: Period('2015-08-01', '3D')

In [24]: p + 1
Out[24]: Period('2015-08-04', '3D')

In [25]: p - 2
Out[25]: Period('2015-07-26', '3D')

In [26]: p.to_timestamp()
Out[26]: Timestamp('2015-08-01 00:00:00')

In [27]: p.to_timestamp(how="E")
Out[27]: Timestamp('2015-08-03 23:59:59.999999999')
```

You can use the multiplied freq in PeriodIndex and period_range.

```
In [28]: idx = pd.period_range("2015-08-01", periods=4, freq="2D")

In [29]: idx
Out[29]: PeriodIndex(['2015-08-01', '2015-08-03', '2015-08-05', '2015-08-07'], dtype=˓→'period[2D]')
```
Support for SAS XPORT files

`read_sas()` provides support for reading SAS XPORT format files. (GH4052).

```python
df = pd.read_sas("sas_xport.xpt")
```

It is also possible to obtain an iterator and read an XPORT file incrementally.

```python
for df in pd.read_sas("sas_xport.xpt", chunksize=10000):
    do_something(df)
```

See the docs for more details.

Support for math functions in `.eval()`

`eval()` now supports calling math functions (GH4893)

```python
df = pd.DataFrame({"a": np.random.randn(10)})
df.eval("b = sin(a)")
```

The support math functions are `sin`, `cos`, `exp`, `expm1`, `log`, `log1p`, `sqrt`, `sinh`, `cosh`, `tanh`, `arcsin`, `arccos`, `arctan`, `arccosh`, `arctanh`, `abs` and `arctan2`.

These functions map to the intrinsics for the NumExpr engine. For the Python engine, they are mapped to NumPy calls.

Changes to Excel with MultiIndex

In version 0.16.2 a DataFrame with MultiIndex columns could not be written to Excel via `to_excel`. That functionality has been added (GH10564), along with updating `read_excel` so that the data can be read back with, no loss of information, by specifying which columns/rows make up the MultiIndex in the header and index_col parameters (GH4679)

See the documentation for more details.

```python
In [31]: df = pd.DataFrame(  
....:     [[1, 2, 3, 4], [5, 6, 7, 8]],  
....:     columns=pd.MultiIndex.from_product(  
....:         [['foo', 'bar'], ['a', 'b']], names=['coll', 'col2'])  
....: ),  
....:     index=pd.MultiIndex.from_product([['j'], ['l', 'k']], names=['il', 'i2  
....:     -> '])  
....: )

In [32]: df
Out[32]:
```
Previously, it was necessary to specify the `has_index_names` argument in `read_excel`, if the serialized data had index names. For version 0.17.0 the output format of `to_excel` has been changed to make this keyword unnecessary - the change is shown below.

**Old**

</table>

**New**
Warning: Excel files saved in version 0.16.2 or prior that had index names will still able to be read in, but the `has_index_names` argument must specified to `True`.

Google BigQuery enhancements

- Added ability to automatically create a table/dataset using the `pandas.io.gbq.to_gbq()` function if the destination table/dataset does not exist. (GH8325, GH11121).
- Added ability to replace an existing table and schema when calling the `pandas.io.gbq.to_gbq()` function via the `if_exists` argument. See the docs for more details (GH8325).
- `InvalidColumnOrder` and `InvalidPageToken` in the `gbq` module will raise `ValueError` instead of `IOError`.
- The `generate_bq_schema()` function is now deprecated and will be removed in a future version (GH11121)
- The `gbq` module will now support Python 3 (GH11094).

Display alignment with Unicode East Asian width

Warning: Enabling this option will affect the performance for printing of `DataFrame` and `Series` (about 2 times slower). Use only when it is actually required.

Some East Asian countries use Unicode characters its width is corresponding to 2 alphabets. If a `DataFrame` or `Series` contains these characters, the default output cannot be aligned properly. The following options are added to enable precise handling for these characters.

- `display.unicode.east_asian_width`: Whether to use the Unicode East Asian Width to calculate the display text width. (GH2612)
- `display.unicode.ambiguous_as_wide`: Whether to handle Unicode characters belong to Ambiguous as Wide. (GH11102)

```
In [36]: df = pd.DataFrame({u"": ["UK", u""], u"": ["Alice", u""]})
In [37]: df;
```
pandas: powerful Python data analysis toolkit, Release 1.3.1

>>> df = pd.DataFrame({u'国籍': ['UK', u'日本'], u'名前': ['Alice', u'しのぶ']})
>>> df
      国籍  名前  
0     UK    Alice
1  日本    しのぶ

In [38]: pd.set_option("display.unicode.east_asian_width", True)
In [39]: df

For further details, see here

Other enhancements

- Support for openpyxl >= 2.2. The API for style support is now stable (GH10125)
- merge now accepts the argument indicator which adds a Categorical-type column (by default called _merge) to the output object that takes on the values (GH8790)

<table>
<thead>
<tr>
<th>Observation Origin</th>
<th>_merge value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Merge key only in 'left' frame</td>
<td>left_only</td>
</tr>
<tr>
<td>Merge key only in 'right' frame</td>
<td>right_only</td>
</tr>
<tr>
<td>Merge key in both frames</td>
<td>both</td>
</tr>
</tbody>
</table>

In [40]: df1 = pd.DataFrame({"col1": [0, 1], "col_left": ["a", "b"]})
In [41]: df2 = pd.DataFrame({"col1": [1, 2, 2], "col_right": [2, 2, 2]})
In [42]: pd.merge(df1, df2, on="col1", how="outer", indicator=True)
Out[42]:

<table>
<thead>
<tr>
<th>col1</th>
<th>col_left</th>
<th>col_right</th>
<th>_merge</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>a</td>
<td>NaN</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>b</td>
<td>NaN</td>
</tr>
<tr>
<td>2</td>
<td>2</td>
<td>NaN</td>
<td>2.0</td>
</tr>
<tr>
<td>3</td>
<td>2</td>
<td>NaN</td>
<td>2.0</td>
</tr>
</tbody>
</table>

[4 rows x 4 columns]

For more, see the updated docs

- pd.to_numeric is a new function to coerce strings to numbers (possibly with coercion) (GH11133)
- pd.merge will now allow duplicate column names if they are not merged upon (GH10639).
- pd.pivot will now allow passing index as None (GH3962).
- pd.concat will now use existing Series names if provided (GH10698).

In [43]: foo = pd.Series([1, 2], name="foo")
In [44]: bar = pd.Series([1, 2])

(continues on next page)
In [45]: baz = pd.Series([4, 5])

Previous behavior:

In [1]: pd.concat([foo, bar, baz], axis=1)
Out[1]:
       0  1  2
0   1  1  4
1   2  2  5

New behavior:

In [46]: pd.concat([foo, bar, baz], axis=1)
Out[46]:
foo  0  1
0   1  1  4
1   2  2  5
[2 rows x 3 columns]

- DataFrame has gained the `nlargest` and `nsmallest` methods (GH10393)
- Add a `limit_direction` keyword argument that works with `limit` to enable `interpolate` to fill NaN values forward, backward, or both (GH9218, GH10420, GH11115)

In [47]: ser = pd.Series([np.nan, np.nan, 5, np.nan, np.nan, np.nan, 13])

In [48]: ser.interpolate(limit=1, limit_direction="both")
Out[48]:
     0  NaN
     1   5.0
     2   5.0
     3   7.0
     4  NaN
     5  11.0
     6  13.0
Length: 7, dtype: float64

- Added a DataFrame.round method to round the values to a variable number of decimal places (GH10568).

In [49]: df = pd.DataFrame(
        ....:     np.random.random([3, 3]),
        ....:     columns=["A", "B", "C"],
        ....:     index=["first", "second", "third"],
        ....:     )
        ....:
        ....:

In [50]: df
Out[50]:
     A      B      C
first  0.126970  0.966718  0.260476
second 0.897237  0.376750  0.336222
third  0.451376  0.840255  0.123102
[3 rows x 3 columns]
• `drop_duplicates` and `duplicated` now accept a `keep` keyword to target first, last, and all duplicates. The `take_last` keyword is deprecated, see [here](GH6511, GH8505)

```python

In [54]: s.drop_duplicates()
Out[54]:
0   A
1   B
2   C
3   A
4   B
5   D
Length: 4, dtype: object

In [55]: s.drop_duplicates(keep="last")
Out[55]:
2   C
3   A
4   B
5   D
Length: 4, dtype: object

In [56]: s.drop_duplicates(keep=False)
Out[56]:
2   C
5   D
Length: 2, dtype: object
```

• Reindex now has a `tolerance` argument that allows for finer control of *Limits on filling while reindexing* (GH10411):

```python
In [57]: df = pd.DataFrame({"x": range(5), "t": pd.date_range("2000-01-01", periods=5)})

In [58]: df.reindex([0.1, 1.9, 3.5], method="nearest", tolerance=0.2)
Out[58]:
     x         t
0.1  0.0  2000-01-01
1.9  2.0  2000-01-03
```
When used on a DatetimeIndex, TimedeltaIndex or PeriodIndex, tolerance will coerced into a Timedelta if possible. This allows you to specify tolerance with a string:

```
In [59]: df = df.set_index("t")
In [60]: df.reindex(pd.to_datetime(["1999-12-31"]), method="nearest", tolerance="1 day")
Out[60]:
1999-12-31 0
```

tolerance is also exposed by the lower level Index.get_indexer and Index.get_loc methods.

- Added functionality to use the `base` argument when resampling a TimeDeltaIndex (GH10530)
- DatetimeIndex can be instantiated using strings contains NaT (GH7599)
- `to_datetime` can now accept the `yearfirst` keyword (GH7599)
- `pandas.tseries.offsets` larger than the Day offset can now be used with a Series for addition/subtraction (GH10699). See the docs for more details.
- `pd.Timedelta.total_seconds()` now returns Timedelta duration to ns precision (previously microsecond precision) (GH10939)
- `PeriodIndex` now supports arithmetic with np.ndarray (GH10638)
- Support pickling of Period objects (GH10439)
- `.as_blocks` will now take a `copy` optional argument to return a copy of the data, default is to copy (no change in behavior from prior versions) (GH9607)
- `regex` argument to DataFrame.filter now handles numeric column names instead of raising ValueError (GH10384).
- Enable reading gzip compressed files via URL, either by explicitly setting the compression parameter or by inferring from the presence of the HTTP Content-Encoding header in the response (GH8685)
- Enable writing Excel files in memory using StringIO/BytesIO (GH7074)
- Enable serialization of lists and dicts to strings in ExcelWriter (GH8188)
- SQL io functions now accept a SQLAlchemy connectable. (GH7877)
- `pd.read_sql` and `to_sql` can accept database URI as `con` parameter (GH10214)
- `read_sql_table` will now allow reading from views (GH10750).
- Enable writing complex values to HDFStores when using the `table` format (GH10447)
- Enable `pd.read_hdf` to be used without specifying a key when the HDF file contains a single dataset (GH10443)
- `pd.read_stata` will now read Stata 118 type files. (GH9882)
- msgpack submodule has been updated to 0.4.6 with backward compatibility (GH10581)
- `DataFrame.to_dict` now accepts `orient='index'` keyword argument (GH10844).
• DataFrame.apply will return a Series of dicts if the passed function returns a dict and reduce=True (GH8735).
• Allow passing kwargs to the interpolation methods (GH10378).
• Improved error message when concatenating an empty iterable of DataFrame objects (GH9157)
• pd.read_csv can now read bz2-compressed files incrementally, and the C parser can read bz2-compressed files from AWS S3 (GH11070, GH11072).
• In pd.read_csv, recognize s3n:// and s3a:// URLs as designating S3 file storage (GH11070, GH11071).
• Read CSV files from AWS S3 incrementally, instead of first downloading the entire file. (Full file download still required for compressed files in Python 2.) (GH11070, GH11073)
• pd.read_csv is now able to infer compression type for files read from AWS S3 storage (GH11070, GH11074).

Backwards incompatible API changes

Changes to sorting API

The sorting API has had some longtime inconsistencies. (GH9816, GH8239).

Here is a summary of the API PRIOR to 0.17.0:
• Series.sort is INPLACE while DataFrame.sort returns a new object.
• Series.order returns a new object
• It was possible to use Series/DataFrame.sort_index to sort by values by passing the by keyword.
• Series/DataFrame.sortlevel worked only on a MultiIndex for sorting by index.

To address these issues, we have revamped the API:
• We have introduced a new method, DataFrame.sort_values(), which is the merger of DataFrame.sort(), Series.sort(), and Series.order(), to handle sorting of values.
• The existing methods Series.sort(), Series.order(), and DataFrame.sort() have been deprecated and will be removed in a future version.
• The by argument of DataFrame.sort_index() has been deprecated and will be removed in a future version.
• The existing method .sort_index() will gain the level keyword to enable level sorting.

We now have two distinct and non-overlapping methods of sorting. A * marks items that will show a FutureWarning.

To sort by the values:

<table>
<thead>
<tr>
<th>Previous</th>
<th>Replacement</th>
</tr>
</thead>
<tbody>
<tr>
<td>* Series.order()</td>
<td>Series.sort_values()</td>
</tr>
<tr>
<td>* Series.sort()</td>
<td>Series.sort_values(inplace=True)</td>
</tr>
<tr>
<td>* DataFrame.sort(columns=...)</td>
<td>DataFrame.sort_values(by=...)</td>
</tr>
</tbody>
</table>

To sort by the index:
We have also deprecated and changed similar methods in two Series-like classes, Index and Categorical.

<table>
<thead>
<tr>
<th>Previous</th>
<th>Replacement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Series.sort_index()</td>
<td>Series.sort_index()</td>
</tr>
<tr>
<td>Series.sortlevel(level=...)</td>
<td>Series.sort_index(level=...)</td>
</tr>
<tr>
<td>DataFrame.sort_index()</td>
<td>DataFrame.sort_index()</td>
</tr>
<tr>
<td>DataFrame.sortlevel(level=...)</td>
<td>DataFrame.sort_index(level=...)</td>
</tr>
<tr>
<td>*DataFrame.sort()</td>
<td>DataFrame.sort_index()</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Previous</th>
<th>Replacement</th>
</tr>
</thead>
<tbody>
<tr>
<td>*Index.order()</td>
<td>Index.sort_values()</td>
</tr>
<tr>
<td>*Categorical.order()</td>
<td>Categorical.sort_values()</td>
</tr>
</tbody>
</table>

Changes to to_datetime and to_timedelta

Error handling

The default for pd.to_datetime error handling has changed to errors='raise'. In prior versions it was errors='ignore'. Furthermore, the coerce argument has been deprecated in favor of errors='coerce'. This means that invalid parsing will raise rather that return the original input as in previous versions. (GH10636)

Previous behavior:

```python
In [2]: pd.to_datetime(['2009-07-31', 'asd'])
Out[2]: array(['2009-07-31', 'asd'], dtype=object)
```

New behavior:

```python
In [3]: pd.to_datetime(['2009-07-31', 'asd'])
ValueError: Unknown string format
```

Of course you can coerce this as well.

```python
In [61]: pd.to_datetime(['2009-07-31', 'asd'], errors='coerce')
Out[61]: DatetimeIndex(['2009-07-31', 'NaT'], dtype='datetime64[ns]', freq=None)
```

To keep the previous behavior, you can use errors='ignore':

```python
In [62]: pd.to_datetime(['2009-07-31', 'asd'], errors='ignore')
Out[62]: Index(['2009-07-31', 'asd'], dtype='object')
```

Furthermore, pd.to_timedelta has gained a similar API, of errors='raise'|'ignore'|'coerce', and the coerce keyword has been deprecated in favor of errors='coerce'.

5.13. Version 0.17

3245
Consistent parsing

The string parsing of `to_datetime`, `Timestamp` and `DatetimeIndex` has been made consistent. (GH7599)

Prior to v0.17.0, `Timestamp` and `to_datetime` may parse year-only datetime-string incorrectly using today's date, otherwise DatetimeIndex uses the beginning of the year. `Timestamp` and `to_datetime` may raise `ValueError` in some types of datetime-string which DatetimeIndex can parse, such as a quarterly string.

Previous behavior:

```python
In [1]: pd.Timestamp('2012Q2')
Traceback...
ValueError: Unable to parse 2012Q2
# Results in today's date.
In [2]: pd.Timestamp('2014')
Out [2]: 2014-08-12 00:00:00
```

v0.17.0 can parse them as below. It works on `DatetimeIndex` also.

New behavior:

```python
In [63]: pd.Timestamp("2012Q2")
Out[63]: Timestamp('2012-04-01 00:00:00')

In [64]: pd.Timestamp("2014")
Out[64]: Timestamp('2014-01-01 00:00:00')

In [65]: pd.DatetimeIndex(["2012Q2", "2014"])
Out[65]: DatetimeIndex(['2012-04-01', '2014-01-01'], dtype='datetime64[ns]', ...)" freq=None)
```

Note: If you want to perform calculations based on today's date, use `Timestamp.now()` and pandas.tseries.offsets.

```python
In [66]: import pandas.tseries.offsets as offsets
In [67]: pd.Timestamp.now()
Out[67]: Timestamp('2021-07-25 09:37:54.062593')

In [68]: pd.Timestamp.now() + offsets.DateOffset(years=1)
Out[68]: Timestamp('2022-07-25 09:37:54.063377')
```

Changes to Index comparisons

Operator equal on `Index` should behavior similarly to `Series` (GH9947, GH10637)

Starting in v0.17.0, comparing `Index` objects of different lengths will raise a `ValueError`. This is to be consistent with the behavior of `Series`.

Previous behavior:

```python
In [2]: pd.Index([1, 2, 3]) == pd.Index([1, 4, 5])
Out[2]: array([ True, False, False], dtype=bool)
```
In [3]: pd.Index([1, 2, 3]) == pd.Index([2])
Out[3]: array([False, True, False], dtype=bool)

In [4]: pd.Index([1, 2, 3]) == pd.Index([1, 2])
Out[4]: False

New behavior:

In [8]: pd.Index([1, 2, 3]) == pd.Index([1, 4, 5])
Out[8]: array([ True, False, False], dtype=bool)

In [9]: pd.Index([1, 2, 3]) == pd.Index([2])
ValueError: Lengths must match to compare

In [10]: pd.Index([1, 2, 3]) == pd.Index([1, 2])
ValueError: Lengths must match to compare

Note that this is different from the numpy behavior where a comparison can be broadcast:

In [69]: np.array([1, 2, 3]) == np.array([1])
Out[69]: array([ True, False, False])

or it can return False if broadcasting can not be done:

In [70]: np.array([1, 2, 3]) == np.array([1, 2])
Out[70]: False

Changes to boolean comparisons vs. None

Boolean comparisons of a Series vs None will now be equivalent to comparing with np.nan, rather than raise TypeError. (GH1079).

In [71]: s = pd.Series(range(3))
In [72]: s.iloc[1] = None
In [73]: s
Out[73]:
0 0.0
1 NaN
2 2.0
Length: 3, dtype: float64

Previous behavior:

In [5]: s == None
TypeError: Could not compare <type 'NoneType'> type with Series

New behavior:

In [74]: s == None
Out[74]:
0   False

(continues on next page)
Usually you simply want to know which values are null.

```python
In [75]: s.isnull()
Out[75]:
0   False
1    True
2   False
Length: 3, dtype: bool
```

**Warning:** You generally will want to use `isnull/notnull` for these types of comparisons, as `isnull/notnull` tells you which elements are null. One has to be mindful that `nan's` don’t compare equal, but `None's` do. Note that pandas/numpy uses the fact that `np.nan != np.nan`, and treats `None` like `np.nan`.

```python
In [76]: None == None
Out[76]: True
In [77]: np.nan == np.nan
Out[77]: False
```

### HDFStore dropna behavior

The default behavior for HDFStore write functions with `format='table'` is now to keep rows that are all missing. Previously, the behavior was to drop rows that were all missing save the index. The previous behavior can be replicated using the `dropna=True` option. (GH9382)

Previous behavior:

```python
In [78]: df_with_missing = pd.DataFrame(
   ....:   {"col1": [0, np.nan, 2], "col2": [1, np.nan, np.nan]}
   ....: )
In [79]: df_with_missing
Out[79]:
   col1  col2
0   0.0   1.0
1   NaN   NaN
2   2.0   NaN
[3 rows x 2 columns]
```

```python
In [27]:
df_with_missing.to_hdf('file.h5',
   ....:   'df_with_missing',
   ....:   format='table',
   ....:   mode='w')
In [28]: pd.read_hdf('file.h5', 'df_with_missing')
(continues on next page)
```
Out [28]:
    col1  col2
0     0    1
2     2  NaN

New behavior:

In [80]: df_with_missing.to_hdf("file.h5", "df_with_missing", format="table", mode="w_
→")

In [81]: pd.read_hdf("file.h5", "df_with_missing")
Out[81]:
    col1  col2
0  0.0    1.0
1  NaN  NaN
2  2.0  NaN

[3 rows x 2 columns]

See the docs for more details.

**Changes to display.precision option**

The `display.precision` option has been clarified to refer to decimal places (GH10451).

Earlier versions of pandas would format floating point numbers to have one less decimal place than the value in `display.precision`.

In [1]: pd.set_option('display.precision', 2)
In [2]: pd.DataFrame({'x': [123.456789]})
Out[2]:
    x
0  123.5

If interpreting precision as “significant figures” this did work for scientific notation but that same interpretation did not work for values with standard formatting. It was also out of step with how numpy handles formatting.

Going forward the value of `display.precision` will directly control the number of places after the decimal, for regular formatting as well as scientific notation, similar to how numpy’s `precision` print option works.

In [82]: pd.set_option("display.precision", 2)
In [83]: pd.DataFrame({"x": [123.456789]})
Out[83]:
    x
0  123.46

[1 rows x 1 columns]

To preserve output behavior with prior versions the default value of `display.precision` has been reduced to 6 from 7.
Changes to Categorical.unique

Categorical.unique now returns new Categoricals with categories and codes that are unique, rather than returning np.array (GH10508)

- unordered category: values and categories are sorted by appearance order.
- ordered category: values are sorted by appearance order, categories keep existing order.

```python
In [84]: cat = pd.Categorical(['C', 'A', 'B', 'C'], categories=['A', 'B', 'C'], ordered=True)

In [85]: cat
Out[85]:
['C', 'A', 'B', 'C']
Categories (3, object): ['A' < 'B' < 'C']

In [86]: cat.unique()
Out[86]:
['C', 'A', 'B']
Categories (3, object): ['A' < 'B' < 'C']

In [87]: cat = pd.Categorical(['C', 'A', 'B', 'C'], categories=['A', 'B', 'C'])

In [88]: cat
Out[88]:
['C', 'A', 'B', 'C']
Categories (3, object): ['A', 'B', 'C']

In [89]: cat.unique()
Out[89]:
['C', 'A', 'B']
Categories (3, object): ['A', 'B', 'C']
```

Changes to bool passed as header in parsers

In earlier versions of pandas, if a bool was passed the header argument of read_csv, read_excel, or read_html it was implicitly converted to an integer, resulting in header=0 for False and header=1 for True (GH6113)

A bool input to header will now raise a TypeError.

```python
In [29]: df = pd.read_csv('data.csv', header=False)
TypeError: Passing a bool to header is invalid. Use header=None for no header or header=int or list-like of ints to specify the row(s) making up the column names
```
Other API changes

- Line and kde plot with subplots=True now uses default colors, not all black. Specify color='k' to draw all lines in black (GH9894)
- Calling the .value_counts() method on a Series with a categorical dtype now returns a Series with a CategoricalIndex (GH10704)
- The metadata properties of subclasses of pandas objects will now be serialized (GH10553).
- groupby using Categorical follows the same rule as Categorical.unique described above (GH10508)
- When constructing DataFrame with an array of complex64 dtype previously meant the corresponding column was automatically promoted to the complex128 dtype. pandas will now preserve the itemsize of the input for complex data (GH10952)
- some numeric reduction operators would return ValueError, rather than TypeError on object types that includes strings and numbers (GH11131)
- Passing currently unsupported chunksize argument to read_excel or ExcelFile.parse will now raise NotImplementedError (GH8011)
- Allow an ExcelFile object to be passed into read_excel (GH11198)
- DatetimeIndex.union does not infer freq if self and the input have None as freq (GH11086)
- NaT's methods now either raise ValueError, or return np.nan or NaT (GH9513)

<table>
<thead>
<tr>
<th>Behavior</th>
<th>Methods</th>
</tr>
</thead>
<tbody>
<tr>
<td>return np.nan</td>
<td>weekday, isoweekday</td>
</tr>
<tr>
<td>return NaT</td>
<td>date, now, replace, to_datetime, today</td>
</tr>
<tr>
<td>return np.datetime64('NaT')</td>
<td>to_datetime64 (unchanged)</td>
</tr>
<tr>
<td>raise ValueError</td>
<td>All other public methods (names not beginning with underscores)</td>
</tr>
</tbody>
</table>

Deprecations

- For Series the following indexing functions are deprecated (GH10177).

<table>
<thead>
<tr>
<th>Deprecated Function</th>
<th>Replacement</th>
</tr>
</thead>
<tbody>
<tr>
<td>.irow(i)</td>
<td>.iloc[i] or .iat[i]</td>
</tr>
<tr>
<td>.iget(i)</td>
<td>.iloc[i] or .iat[i]</td>
</tr>
<tr>
<td>.iget_value(i)</td>
<td>.iloc[i] or .iat[i]</td>
</tr>
</tbody>
</table>

- For DataFrame the following indexing functions are deprecated (GH10177).

<table>
<thead>
<tr>
<th>Deprecated Function</th>
<th>Replacement</th>
</tr>
</thead>
<tbody>
<tr>
<td>.irow(i)</td>
<td>.iloc[i]</td>
</tr>
<tr>
<td>.iget_value(i, j)</td>
<td>.iloc[i, j] or .iat[i, j]</td>
</tr>
<tr>
<td>.icol(j)</td>
<td>.iloc[:, j]</td>
</tr>
</tbody>
</table>

Note: These indexing function have been deprecated in the documentation since 0.11.0.
pandas: powerful Python data analysis toolkit, Release 1.3.1

- **Categorical.name** was deprecated to make **Categorical** more **numpy.ndarray** like. Use **Series(cat, name="whatever")** instead (GH10482).
- Setting missing values (NaN) in a Categorical’s categories will issue a warning (GH10748). You can still have missing values in the values.
- **drop_duplicates** and **duplicated**’s **take_last** keyword was deprecated in favor of keep. (GH6511, GH8505)
- **Series.nsmallest** and **nlargest**’s **take_last** keyword was deprecated in favor of keep. (GH10792)
- **DataFrame.combineAdd** and **DataFrame.combineMult** are deprecated. They can easily be replaced by using the **add** and **mul** methods: **DataFrame.add(other, fill_value=0)** and **DataFrame.mul(other, fill_value=1.)** (GH10735).
- **TimeSeries** deprecated in favor of **Series** (note that this has been an alias since 0.13.0), (GH10890)
- **SparsePanel** deprecated and will be removed in a future version (GH11157).
- **Series.is_time_series** deprecated in favor of **Series.index.is_all_dates** (GH11135)
- **Legacy offsets** (like 'A@JAN') are deprecated (note that this has been alias since 0.8.0) (GH10878)
- **WidePanel** deprecated in favor of **Panel, LongPanel** in favor of **DataFrame** (note these have been aliases since < 0.11.0), (GH10892)
- **DataFrame.convert_objects** has been deprecated in favor of type-specific functions **pd.to_datetime**, **pd.to_timestamp** and **pd.to_numeric** (new in 0.17.0) (GH11133).

**Removal of prior version deprecations/changes**

- Removal of **na_last** parameters from **Series.order()** and **Series.sort()**, in favor of **na_position**. (GH5231)
- Remove of **percentile_width** from **.describe()**, in favor of **percentiles**. (GH7088)
- Removal of **colSpace** parameter from **DataFrame.to_string()**, in favor of **col_space**, circa 0.8.0 version.
- Removal of automatic time-series broadcasting (GH2304)

```python
In [90]: np.random.seed(1234)

In [91]: df = pd.DataFrame(  
.....: np.random.randn(5, 2),  
.....: columns=list("AB"),  
.....: index=pd.date_range("2013-01-01", periods=5),  
.....: )  
.....:

In [92]: df

```

- Remove table keyword in HDFStore.put/append, in favor of using format= (GH4645)
- Remove kind in read_excel/ExcelFile as its unused (GH4712)
- Remove infer_type keyword from pd.read_html as its unused (GH4770, GH7032)
- Remove offset and timeRule keywords from Series.tshift/shift, in favor of freq (GH4853, GH4864)
- Remove pd.load/pd.save aliases in favor of pd.to_pickle/pd.read_pickle (GH3787)

Performance improvements

- Development support for benchmarking with the Air Speed Velocity library (GH8361)
- Added vbench benchmarks for alternative ExcelWriter engines and reading Excel files (GH7171)
- Performance improvements in Categorical.value_counts (GH10804)
- Performance improvements in SeriesGroupBy.nunique and SeriesGroupBy.value_counts and SeriesGroupby.transform (GH10820, GH11077)
- Performance improvements in DataFrame.drop_duplicates with integer dtypes (GH10917)
- Performance improvements in DataFrame.duplicated with wide frames. (GH10161, GH11180)
- 4x improvement in timedelta string parsing (GH6755, GH10426)
- 8x improvement in timedelta64 and datetime64 ops (GH6755)
- Significantly improved performance of indexing MultiIndex with slicers (GH10287)
- 8x improvement in iloc using list-like input (GH10791)
• Improved performance of `Series.isin` for datetimelike/integer Series (GH10287)
• 20x improvement in `concat` of Categoricals when categories are identical (GH10587)
• Improved performance of `to_datetime` when specified format string is ISO8601 (GH10178)
• 2x improvement of `Series.value_counts` for float dtype (GH10821)
• Enable `infer_datetime_format` in `to_datetime` when date components do not have 0 padding (GH11142)
• Regression from 0.16.1 in constructing `DataFrame` from nested dictionary (GH11084)
• Performance improvements in addition/subtraction operations for `DateOffset` with `Series` or `DatetimeIndex` (GH10744, GH11205)

**Bug fixes**

• Bug in incorrect computation of `.mean()` on `timedelta64[ns]` because of overflow (GH9442)
• Bug in `.isin` on older numpies (GH11232)
• Bug in `DataFrame.to_html` (index=False) renders unnecessary `name` row (GH10344)
• Bug in `DataFrame.to_latex()` the `column_format` argument could not be passed (GH9402)
• Bug in `DatetimeIndex` when localizing with NaT (GH10477)
• Bug in `Series.dt` ops in preserving meta-data (GH10477)
• Bug in preserving NaT when passed in an otherwise invalid `to_datetime` construction (GH10477)
• Bug in `DataFrame.apply` when function returns categorical series. (GH9573)
• Bug in `to_datetime` with invalid dates and formats supplied (GH10154)
• Bug in `Index.drop_duplicates` dropping name(s) (GH10115)
• Bug in `Series.quantile` dropping name (GH10881)
• Bug in `pd.Series` when setting a value on an empty `Series` whose index has a frequency. (GH10193)
• Bug in `pd.Series.interpolate` with invalid order keyword values. (GH10633)
• Bug in `DataFrame.plot` raises `ValueError` when color name is specified by multiple characters (GH10387)
• Bug in `Index` construction with a mixed list of tuples (GH10697)
• Bug in `DataFrame.reset_index` when index contains NaT. (GH10388)
• Bug in `ExcelReader` when worksheet is empty (GH6403)
• Bug in `BinGrouper.group_info` where returned values are not compatible with base class (GH10914)
• Bug in clearing the cache on `DataFrame.pop` and a subsequent inplace op (GH10912)
• Bug in indexing with a mixed-integer `Index` causing an `ImportError` (GH10610)
• Bug in `Series.count` when index has nulls (GH10946)
• Bug in picking of a non-regular freq `DatetimeIndex` (GH11002)
• Bug causing `DataFrame.where` to not respect the `axis` parameter when the frame has a symmetric shape. (GH9736)
• Bug in `Table.select_column` where name is not preserved (GH10392)
• Bug in `offsets.generate_range` where `start` and `end` have finer precision than `offset` (GH9907)
• Bug in `pd.rolling_*` where `Series.name` would be lost in the output (GH10565)
• Bug in `stack` when `index` or columns are not unique. (GH10417)
• Bug in setting a `Panel` when an axis has a `MultiIndex` (GH10360)
• Bug in `USFederalHolidayCalendar` where `USMemorialDay` and `USMartinLutherKingJr` were incorrect (GH10278 and GH9760)
• Bug in `.sample()` where returned object, if `set`, gives unnecessary `SettingWithCopyWarning` (GH10738)
• Bug in `.sample()` where weights passed as `Series` were not aligned along `axis` before being treated positionally, potentially causing problems if weight indices were not aligned with sampled object. (GH10738)
• Regression fixed in (GH9311, GH6620, GH9345), where `groupby` with a datetime-like converting to float with certain aggregators (GH10979)
• Bug in `DataFrame.interpolate` with `axis=1` and `inplace=True` (GH10395)
• Bug in `io.sql.get_schema` when specifying multiple columns as primary key (GH10385).
• Bug in `groupby(sort=False)` with datetime-like `Categorical` raises `ValueError` (GH10505)
• Bug in `groupby(axis=1)` with `filter()` throws `IndexError` (GH11041)
• Bug in `test_categorical` on big-endian builds (GH10425)
• Bug in `Series.shift` and `DataFrame.shift` not supporting categorical data (GH9416)
• Bug in `Series.map` using `categorical Series` raises `AttributeError` (GH10324)
• Bug in `MultiIndex.get_level_values` including `Categorical` raises `AttributeError` (GH10460)
• Bug in `pd.get_dummies` with `sparse=True` not returning `SparseDataFrame` (GH10531)
• Bug in `Index subtypes` (such as `PeriodIndex`) not returning their own type for `.drop` and `.insert` methods (GH10620)
• Bug in `algos.outer_join_indexer` when right `array` is empty (GH10618)
• Bug in `filter` (regression from 0.16.0) and `transform` when grouping on multiple keys, one of which is datetime-like (GH10114)
• Bug in `to_datetime` and `to_timedelta` causing `Index name` to be lost (GH10875)
• Bug in `len(DataFrame.groupby)` causing `IndexError` when there’s a column containing only NaNs (GH11016)
• Bug that caused segfault when resampling an empty `Series` (GH10228)
• Bug in `DatetimeIndex` and `PeriodIndex.value_counts` resets name from its result, but retains in result’s `Index`. (GH10150)
• Bug in `pd.eval` using `numexpr` engine coerces 1 element numpy array to scalar (GH10546)
• Bug in `pd.concat` with `axis=0` when column is of `dtype category` (GH10177)
• Bug in `read_msgpack` where `input type` is not always checked (GH10369, GH10630)
• Bug in `pd.read_csv` with `kwargs` `index_col=False, index_col=['a', 'b']` or `dtype` (GH10413, GH10467, GH10577)
• Bug in `Series.from_csv` with `header kwarg` not setting the `Series.name` or the `Series.index.name` (GH10483)
• Bug in `groupby.var` which caused variance to be inaccurate for small float values (GH10448)
• Bug in `Series.plot(kind='hist')` Y Label not informative (GH10485)
• Bug in `read_csv` when using a converter which generates a `uint8` type (GH9266)
• Bug causes memory leak in time-series line and area plot (GH9003)
• Bug when setting a `Panel` sliced along the major or minor axes when the right-hand side is a `DataFrame` (GH11014)
• Bug that returns `None` and does not raise `NotImplementedError` when operator functions (e.g., `.add`) of `Panel` are not implemented (GH7692)
• Bug in line and kde plot cannot accept multiple colors when `subplots=True` (GH9894)
• Bug in `DataFrame.plot` raises `ValueError` when color name is specified by multiple characters (GH10387)
• Bug in left and right `align` of `Series` with `MultiIndex` may be inverted (GH10665)
• Bug in left and right `join` of with `MultiIndex` may be inverted (GH10741)
• Bug in `read_stata` when reading a file with a different order set in columns (GH10757)
• Bug in `Categorical` may not representing properly when category contains `tz` or `Period` (GH10713)
• Bug in `Categorical.__iter__` may not returning correct `datetime` and `Period` (GH10713)
• Bug in indexing with a `PeriodIndex` on an object with a `PeriodIndex` (GH4125)
• Bug in `read_csv` with `engine='c'`: EOF preceded by a comment, blank line, etc. was not handled correctly (GH10728, GH10548)
• Reading “famafrench” data via `DataReader` results in HTTP 404 error because of the website url is changed (GH10591).
• Bug in `read_msgpack` where `DataFrame` to decode has duplicate column names (GH9618)
• Bug in `io.common.get_filepath_or_buffer` which caused reading of valid S3 files to fail if the bucket also contained keys for which the user does not have read permission (GH10604)
• Bug in vectorised setting of timestamp columns with python `datetime.date` and numpy `datetime64` (GH10408, GH10412)
• Bug in `Index.take` may add unnecessary `freq` attribute (GH10791)
• Bug in `merge` with empty `DataFrame` may raise `IndexError` (GH10824)
• Bug in `to_latex` where unexpected keyword argument for some documented arguments (GH10888)
• Bug in indexing of large `DataFrame` where `IndexError` is uncaught (GH10645 and GH10692)
• Bug in `read_csv` when using the `nrows` or `chunksize` parameters if file contains only a header line (GH9535)
• Bug in serialization of `category` types in HDF5 in presence of alternate encodings. (GH10366)
• Bug in `pd.DataFrame` when constructing an empty `DataFrame` with a string dtype (GH9428)
• Bug in `pd.DataFrame.diff` when `DataFrame` is not consolidated (GH10907)
• Bug in `pd.unique` for arrays with the `datetime64` or `timedelta64` dtype that meant an array with object dtype was returned instead the original dtype (GH9431)
• Bug in `Timedelta` raising error when slicing from 0s (GH10583)
• Bug in DatetimeIndex.take and TimedeltaIndex.take may not raise IndexError against invalid index (GH10295)
• Bug in Series([np.nan]).astype('M8[ms]'), which now returns Series([pd.NaT]) (GH10747)
• Bug in PeriodIndex.order reset freq (GH10295)
• Bug in date_range when freq divides end as nanos (GH10885)
• Bug in iloc allowing memory outside bounds of a Series to be accessed with negative integers (GH10779)
• Bug in read_msgpack where encoding is not respected (GH10581)
• Bug preventing access to the first index when using iloc with a list containing the appropriate negative integer (GH10547, GH10779)
• Bug in TimedeltaIndex formatter causing error while trying to save DataFrame with TimedeltaIndex using to_csv (GH10833)
• Bug in DataFrame.where when handling Series slicing (GH10218, GH9558)
• Bug where pd.read_gbq throws ValueError when Bigquery returns zero rows (GH10273)
• Bug in to_json which was causing segmentation fault when serializing 0-rank ndarray (GH9576)
• Bug in plotting functions may raise IndexError when plotted on GridSpec (GH10819)
• Bug in plot result may show unnecessary minor ticklabels (GH10657)
• Bug in groupby incorrect computation for aggregation on DataFrame with NaT (E.g first, last, min). (GH10590, GH11010)
• Bug when constructing DataFrame where passing a dictionary with only scalar values and specifying columns did not raise an error (GH10856)
• Bug in .var() causing roundoff errors for highly similar values (GH10242)
• Bug in DataFrame.plot(subplots=True) with duplicated columns outputs incorrect result (GH10962)
• Bug in Index arithmetic may result in incorrect class (GH10638)
• Bug in date_range results in empty if freq is negative annually, quarterly and monthly (GH11018)
• Bug in DatetimeIndex cannot infer negative freq (GH11018)
• Remove use of some deprecated numpy comparison operations, mainly in tests. (GH10569)
• Bug in Index dtype may not applied properly (GH11017)
• Bug in io.gbq when testing for minimum google api client version (GH10652)
• Bug in DataFrame construction from nested dict with timedelta keys (GH11129)
• Bug in .fillna against may raise TypeError when data contains datetime dtype (GH7095, GH11153)
• Bug in .groupby when number of keys to group by is same as length of index (GH11185)
• Bug in convert_objects where converted values might not be returned if all null and coerce (GH9589)
• Bug in convert_objects where copy keyword was not respected (GH9589)

5.14 Version 0.16

5.14.1 Version 0.16.2 (June 12, 2015)

This is a minor bug-fix release from 0.16.1 and includes a large number of bug fixes along some new features (pipe() method), enhancements, and performance improvements.

We recommend that all users upgrade to this version.

Highlights include:

- A new pipe method, see here
- Documentation on how to use numba with pandas, see here

What’s new in v0.16.2

• New features
  - Pipe
  - Other enhancements
• API changes
• Performance improvements
• Bug fixes
• Contributors

New features

Pipe

We’ve introduced a new method DataFrame.pipe(). As suggested by the name, pipe should be used to pipe data through a chain of function calls. The goal is to avoid confusing nested function calls like

```python
# df is a DataFrame
# f, g, and h are functions that take and return DataFrames
f(g(h(df), arg1=1), arg2=2, arg3=3) # noqa F821
```

The logic flows from inside out, and function names are separated from their keyword arguments. This can be rewritten as
Now both the code and the logic flow from top to bottom. Keyword arguments are next to their functions. Overall the code is much more readable.

In the example above, the functions \( f \), \( g \), and \( h \) each expected the DataFrame as the first positional argument. When the function you wish to apply takes its data anywhere other than the first argument, pass a tuple of \((\text{function}, \text{keyword})\) indicating where the DataFrame should flow. For example:

```python
In [1]: import statsmodels.formula.api as sm
In [2]: bb = pd.read_csv("data/baseball.csv", index_col="id")
# sm.ols takes (formula, data)
In [3]: (  
    ...:     bb.query("h > 0")  
    ...:     .assign(ln_h=lambda df: np.log(df.h))  
    ...:     .pipe((sm.ols, "data"), "hr ~ ln_h + year + g + C(lg)")  
    ...:     .fit()  
    ...:     .summary()  
    ...: )
Out[3]:  
```

```
<class 'statsmodels.iolib.summary.Summary'>
```

```

Kurtosis: 5.225 Cond. No. 1.49e+07
```

Notes:
[1] Standard Errors assume that the covariance matrix of the errors is correctly
specified.

(continues on next page)
The condition number is large, $1.49e+07$. This might indicate that there are strong multicollinearity or other numerical problems.

The pipe method is inspired by unix pipes, which stream text through processes. More recently dplyr and magrittr have introduced the popular (%>%) pipe operator for R. See the documentation for more. (GH10129)

Other enhancements

- Added **rsplit** to Index/Series StringMethods (GH10303)
- Removed the hard-coded size limits on the **DataFrame** HTML representation in the IPython notebook, and leave this to IPython itself (only for IPython v3.0 or greater). This eliminates the duplicate scroll bars that appeared in the notebook with large frames (GH10231).
  
  Note that the notebook has a toggle output scrolling feature to limit the display of very large frames (by clicking left of the output). You can also configure the way DataFrames are displayed using the pandas options, see here.

  - **axis** parameter of **DataFrame.quantile** now accepts also index and column. (GH9543)

API changes

- **Holiday** now raises **NotImplementedError** if both **offset** and **observance** are used in the constructor instead of returning an incorrect result (GH10217).

Performance improvements

- **Improved** **Series.resample** performance with **dtype=datetime64[ns]** (GH7754)
- **Increase performance of** **str.split** **when expand=True** (GH10081)

Bug fixes

- **Bug in** **Series.hist** raises an error when a one row **Series** was given (GH10214)
- **Bug where** **HDFStore.select** **modifies the passed columns list** (GH7212)
- **Bug in** **Categorical repr with display.width** **of None in Python 3** (GH10087)
- **Bug in** **to_json** **with certain orients and a CategoricalIndex would segfault** (GH10317)
- **Bug where some of the nan functions do not have consistent return dtypes** (GH10251)
- **Bug in** **DataFrame.quantile** **on checking that a valid axis was passed** (GH9543)
- **Bug in** **groupby.apply aggregation for Categorical not preserving categories** (GH10138)
- **Bug in** **to_csv** **where date_format is ignored if the datetime is fractional** (GH10209)
- **Bug in** **DataFrame.to_json** **with mixed data types** (GH10289)
- **Bug in** **cache updating when consolidating** (GH10264)
- **Bug in** **mean()** **where integer dtypes can overflow** (GH10172)
• Bug where Panel.from_dict does not set dtype when specified (GH10058)
• Bug in Index.union raises AttributeError when passing array-likes. (GH10149)
• Bug in Timestamp’s microsecond, quarter, dayofyear, week and daysinmonth properties return np.int type, not built-in int. (GH10050)
• Bug in NaT raises AttributeError when accessing to daysinmonth, dayofweek properties. (GH10096)
• Bug in Index repr when using the max_seq_items=None setting (GH10182).
• Bug in getting timezone data with dateutil on various platforms (GH9059, GH8639, GH9663, GH10121)
• Bug in displaying datetimes with mixed frequencies; display ‘ms’ datetimes to the proper precision. (GH10170)
• Bug in setitem where type promotion is applied to the entire block (GH10280)
• Bug in Series arithmetic methods may incorrectly hold names (GH10068)
• Bug in GroupBy.get_group when grouping on multiple keys, one of which is categorical. (GH10132)
• Bug in DatetimeIndex and TimedeltaIndex names are lost after timedelta arithmetic (GH9926)
• Bug in DataFrame construction from nested dict with datetime64 (GH10160)
• Bug in Series construction from dict with datetime64 keys (GH9456)
• Bug in Series.plot (label="LABEL") not correctly setting the label (GH10119)
• Bug in plot not defaulting to matplotlib axes.grid setting (GH9792)
• Bug causing strings containing an exponent, but no decimal to be parsed as int instead of float in engine='python' for the read_csv parser (GH9565)
• Bug in Series.align resets name when fill_value is specified (GH10067)
• Bug in read_csv causing index name not to be set on an empty DataFrame (GH10184)
• Bug in SparseSeries.abs resets name (GH10241)
• Bug in TimedeltaIndex slicing may reset freq (GH10292)
• Bug in GroupBy.get_group raises ValueError when group key contains NaT (GH6992)
• Bug in SparseSeries constructor ignores input data name (GH10258)
• Bug in Categorical.remove_categories causing a ValueError when removing the NaN category if underlying dtype is floating-point (GH10156)
• Bug where infer_freq infers time rule (WOM-5XXX) unsupported by to_offset (GH9425)
• Bug in DataFrame.to_hdf() where table format would raise a seemingly unrelated error for invalid (non-string) column names. This is now explicitly forbidden. (GH9057)
• Bug to handle masking empty DataFrame (GH10126).
• Bug where MySQL interface could not handle numeric table/column names (GH10255)
• Bug in read_csv with a date_parser that returned a datetime64 array of other time resolution than [ns] (GH10245)
• Bug in Panel.apply when the result has ndim=0 (GH10332)
• Bug in read_hdf where auto_close could not be passed (GH9327).
• Bug in read_hdf where open stores could not be used (GH10330).
• Bug in adding empty `DataFrame`, now results in a `DataFrame` that `.equals` an empty `DataFrame` (GH10181).
• Bug in `to_hdf` and `HDFStore` which did not check that complib choices were valid (GH4582, GH8874).

5.14.2 Version 0.16.1 (May 11, 2015)

This is a minor bug-fix release from 0.16.0 and includes a large number of bug fixes along several new features, enhancements, and performance improvements. We recommend that all users upgrade to this version.

Highlights include:

- Support for a `CategoricalIndex`, a category based index, see [here](#)
- New section on how-to-contribute to `pandas`, see [here](#)
- Revised “Merge, join, and concatenate” documentation, including graphical examples to make it easier to understand each operations, see [here](#)
- New method `sample` for drawing random samples from Series, DataFrames and Panels. See [here](#)
- The default `Index` printing has changed to a more uniform format, see [here](#)
- `BusinessHour` datetime-offset is now supported, see [here](#)
- Further enhancement to the `.str` accessor to make string operations easier, see [here](#)

What’s new in v0.16.1

- **Enhancements**
  - `CategoricalIndex`
  - `Sample`
  - `String methods enhancements`
  - `Other enhancements`
- **API changes**
  - `Deprecations`
- **Index representation**
- **Performance improvements**
- **Bug fixes**
- **Contributors**

**Warning:** In pandas 0.17.0, the sub-package `pandas.io.data` will be removed in favor of a separately installable package (GH8961).
Enhancements

CategoricalIndex

We introduce a CategoricalIndex, a new type of index object that is useful for supporting indexing with duplicates. This is a container around a Categorical (introduced in v0.15.0) and allows efficient indexing and storage of an index with a large number of duplicated elements. Prior to 0.16.1, setting the index of a DataFrame/Series with a category dtype would convert this to regular object-based Index.

```
In [1]: df = pd.DataFrame({'A': np.arange(6),
                         'B': pd.Series(list('aabbca'))
                         .astype('category', categories=list('cab'))})

In [2]: df
Out[2]:
     A B
0   0 a
1   1 a
2   2 b
3   3 b
4   4 c
5   5 a

In [3]: df.dtypes
Out[3]:
A    int64
B  category
dtype: object

In [4]: df.B.cat.categories
Out[4]: Index([c', 'a', 'b'], dtype='object')
```

setting the index, will create a CategoricalIndex

```
In [5]: df2 = df.set_index('B')

In [6]: df2.index
Out[6]: CategoricalIndex(['a', 'a', 'a'], categories=['c', 'a', 'b'], ordered=False, name='B', dtype='category')
```

indexing with __getitem__/iloc/.loc/.ix works similarly to an Index with duplicates. The indexers MUST be in the category or the operation will raise.

```
In [7]: df2.loc['a']
Out[7]:
     A
B    
a   0
 a  1
 a  5

In [8]: df2.loc['a'].index
Out[8]: CategoricalIndex(['a', 'a', 'a'], categories=['c', 'a', 'b'], ordered=False, name='B', dtype='category')
```

and preserves the CategoricalIndex

(continues on next page)
sorting will order by the order of the categories

In [9]: df2.sort_index()
Out[9]:
   A  
   B  
c  4
a  0
a  1
a  5
b  2
b  3

groupby operations on the index will preserve the index nature as well

In [10]: df2.groupby(level=0).sum()
Out[10]:
   A  
   B  
c  4
a  6
b  5

In [11]: df2.groupby(level=0).sum().index
Out[11]: CategoricalIndex(['c', 'a', 'b'], categories=['c', 'a', 'b'], ordered=False,
name='B', dtype='category')

reindexing operations, will return a resulting index based on the type of the passed indexer, meaning that passing a list will return a plain-old-Index; indexing with a Categorical will return a CategoricalIndex, indexed according to the categories of the PASSED Categorical dtype. This allows one to arbitrarily index these even with values NOT in the categories, similarly to how you can reindex ANY pandas index.

In [12]: df2.reindex(['a', 'e'])
Out[12]:
   A  
   B  
a  0.0
a  1.0
a  5.0
e  NaN

In [13]: df2.reindex(['a', 'e']).index
Out[13]: pd.Index(['a', 'a', 'a', 'e'], dtype='object', name='B')

In [14]: df2.reindex(pd.Categorical(['a', 'e'], categories=list('abcde')))
Out[14]:
   A  
   B  
a  0.0
a  1.0
a  5.0
e  NaN

In [15]: df2.reindex(pd.Categorical(['a', 'e'], categories=list('abcde'))).index
Out[15]: pd.CategoricalIndex(['a', 'a', 'a', 'e'],
categories=["a", 'b', 'c', 'd', 'e'], ordered=False, name='B', dtype='category')

See the documentation for more. (GH7629, GH10038, GH10039)

Sample

Series, DataFrames, and Panels now have a new method: `sample()`. The method accepts a specific number of rows or columns to return, or a fraction of the total number or rows or columns. It also has options for sampling with or without replacement, for passing in a column for weights for non-uniform sampling, and for setting seed values to facilitate replication. (GH2419)

```python
In [1]: example_series = pd.Series([0, 1, 2, 3, 4, 5])

# When no arguments are passed, returns 1
In [2]: example_series.sample()
Out[2]:
3
Length: 1, dtype: int64

# One may specify either a number of rows:
In [3]: example_series.sample(n=3)
Out[3]:
2
1
0
Length: 3, dtype: int64

# Or a fraction of the rows:
In [4]: example_series.sample(frac=0.5)
Out[4]:
1
5
3
Length: 3, dtype: int64

# weights are accepted.
In [5]: example_weights = [0, 0, 0.2, 0.2, 0.2, 0.4]

In [6]: example_series.sample(n=3, weights=example_weights)
Out[6]:
2
4
3
Length: 3, dtype: int64

# weights will also be normalized if they do not sum to one, and missing values will be treated as zeros.
In [7]: example_weights2 = [0.5, 0, 0, None, np.nan]

In [8]: example_series.sample(n=1, weights=example_weights2)
Out[8]:
0
Length: 1, dtype: int64
```
When applied to a DataFrame, one may pass the name of a column to specify sampling weights when sampling from rows.

```
In [9]: df = pd.DataFrame({"col1": [9, 8, 7, 6], "weight_column": [0.5, 0.4, 0.1, 0]})
In [10]: df.sample(n=3, weights="weight_column")
Out[10]:
     col1  weight_column
0      9           0.5
1      8           0.4
2      7           0.1
[3 rows x 2 columns]
```

### String methods enhancements

*Continuing from v0.16.0*, the following enhancements make string operations easier and more consistent with standard python string operations.

- Added `StringMethods (.str accessor)` to `Index` (GH9068)

  The `.str` accessor is now available for both `Series` and `Index`.

```
In [11]: idx = pd.Index([" jack", " jill ", " jesse ", " frank"])
In [12]: idx.str.strip()
Out[12]: Index(["jack", "jill", "jesse", "frank"], dtype='object')
```

One special case for the `.str` accessor on `Index` is that if a string method returns `bool`, the `.str` accessor will return a `np.array` instead of a boolean `Index` (GH8875). This enables the following expression to work naturally:

```
In [13]: idx = pd.Index(["a1", "a2", "b1", "b2"])
In [14]: s = pd.Series(range(4), index=idx)
In [15]: s
Out[15]:
   a1    0
   a2    1
   b1    2
   b2    3
Length: 4, dtype: int64
In [16]: idx.str.startswith("a")
Out[16]: array([ True, True, False, False])
In [17]: s[s.index.str.startswith("a")]
Out[17]:
   a1    0
   a2    1
Length: 2, dtype: int64
```

- The following new methods are accessible via `.str` accessor to apply the function to each values. (GH9766, GH9773, GH10031, GH10045, GH10052)
**Methods**

<table>
<thead>
<tr>
<th>capitalize()</th>
<th>swapcase()</th>
<th>normalize()</th>
<th>partition()</th>
<th>rpartition()</th>
</tr>
</thead>
<tbody>
<tr>
<td>index()</td>
<td>rindex()</td>
<td>translate()</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- `split` now takes the `expand` keyword to specify whether to expand dimensionality. `return_type` is deprecated. (GH9847)

```
In [18]: s = pd.Series(['a,b', 'a,c', 'b,c'])

# return Series
In [19]: s.str.split(',')
Out[19]:
0    ['a', 'b']
1    ['a', 'c']
2    ['b', 'c']
Length: 3, dtype: object

# return DataFrame
In [20]: s.str.split(',', expand=True)
Out[20]:
    0  1
 0  a  b
 1  a  c
 2  b  c

[3 rows x 2 columns]
```

```
In [21]: idx = pd.Index(['a,b', 'a,c', 'b,c'])

# return Index
In [22]: idx.str.split(',')
Out[22]:
Index([['a', 'b'], ['a', 'c'], ['b', 'c']], dtype='object')

# return MultiIndex
In [23]: idx.str.split(',', expand=True)
Out[23]:
MultiIndex([('a', 'b'), ('a', 'c'), ('b', 'c')])
```

- Improved `extract` and `get_dummies` methods for `Index.str` (GH9980)

**Other enhancements**

- `BusinessHour` offset is now supported, which represents business hours starting from 09:00 - 17:00 on `BusinessDay` by default. See `Here` for details. (GH7905)

```
In [24]: pd.Timestamp('2014-08-01 09:00') + pd.tseries.offsets.BusinessHour()
Out[24]: Timestamp('2014-08-01 10:00:00')

In [25]: pd.Timestamp('2014-08-01 07:00') + pd.tseries.offsets.BusinessHour()
Out[25]: Timestamp('2014-08-01 10:00:00')
```
In [26]: pd.Timestamp("2014-08-01 16:30") + pd.tseries.offsets.BusinessHour()
Out[26]: Timestamp('2014-08-04 09:30:00')

• DataFrame.diff now takes an axis parameter that determines the direction of differencing (GH9727)
• Allow clip, clip_lower, and clip_upper to accept array-like arguments as thresholds (This is a regression from 0.11.0). These methods now have an axis parameter which determines how the Series or DataFrame will be aligned with the threshold(s). (GH6966)
• DataFrame.mask() and Series.mask() now support same keywords as where (GH8801)
• drop function can now accept errors keyword to suppress ValueError raised when any of label does not exist in the target data. (GH6736)

In [27]: df = pd.DataFrame(np.random.randn(3, 3), columns=["A", "B", "C"])
In [28]: df.drop(["A", "X"], axis=1, errors="ignore")
Out[28]:
   B   C
0 -0.706771 -1.039575
1 -0.424972  0.567020
2 -1.087401 -0.673690

[3 rows x 2 columns]

• Add support for separating years and quarters using dashes, for example 2014-Q1. (GH9688)
• Allow conversion of values with dtype datetime64 or timedelta64 to strings using astype(str) (GH9757)
• get_dummies function now accepts sparse keyword. If set to True, the return DataFrame is sparse, e.g. SparseDataFrame. (GH8823)
• Period now accepts datetime64 as value input. (GH9054)
• Allow timedelta string conversion when leading zero is missing from time definition, ie 0:00:00 vs 00:00:00. (GH9570)
• Allow Panel.shift with axis='items' (GH9890)
• Trying to write an excel file now raises NotImplementedError if the DataFrame has a MultiIndex instead of writing a broken Excel file. (GH9794)
• Allow Categorical.add_categories to accept Series or np.array. (GH9927)
• Add/delete str/dt/cat accessors dynamically from __dir__. (GH9910)
• Add normalize as a dt accessor method. (GH10047)
• DataFrame and Series now have _constructor_expanddim property as overridable constructor for one higher dimensionality data. This should be used only when it is really needed, see here
• pd.lib.infer_dtype now returns 'bytes' in Python 3 where appropriate. (GH10032)
API changes

• When passing in an ax to df.plot(..., ax=ax), the sharex kwarg will now default to False. The result is that the visibility of xlabels and xticklabels will not anymore be changed. You have to do that by yourself for the right axes in your figure or set sharex=True explicitly (but this changes the visible for all axes in the figure, not only the one which is passed in!). If pandas creates the subplots itself (e.g. no passed in ax kwarg), then the default is still sharex=True and the visibility changes are applied.

• assign() now inserts new columns in alphabetical order. Previously the order was arbitrary. (GH9777)

• By default, read_csv and read_table will now try to infer the compression type based on the file extension. Set compression=None to restore the previous behavior (no decompression). (GH9770)

Deprecations

• Series.str.split’s return_type keyword was removed in favor of expand (GH9847)

Index representation

The string representation of Index and its sub-classes have now been unified. These will show a single-line display if there are few values; a wrapped multi-line display for a lot of values (but less than display.max_seq_items; if lots of items (> display.max_seq_items) will show a truncated display (the head and tail of the data). The formatting for MultiIndex is unchanged (a multi-line wrapped display). The display width responds to the option display.max_seq_items, which is defaulted to 100. (GH6482)

Previous behavior

| In 2 | pd.Index(range(4), name='foo') |
| Out 2 | Int64Index([0, 1, 2, 3], dtype='int64') |

| In 3 | pd.Index(range(104), name='foo') |
| Out 3 | Int64Index([0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99, ...], dtype='int64') |

| In 4 | pd.date_range('20130101', periods=4, name='foo', tz='US/Eastern') |
| Out 4 | <class 'pandas.tseries.index.DatetimeIndex'> [2013-01-01 00:00:00-05:00, ..., 2013-01-04 00:00:00-05:00] Length: 4, Freq: D, Timezone: US/Eastern |

| In 5 | pd.date_range('20130101', periods=104, name='foo', tz='US/Eastern') |
| Out 5 | <class 'pandas.tseries.index.DatetimeIndex'> [2013-01-01 00:00:00-05:00, ..., 2013-04-14 00:00:00-04:00] Length: 104, Freq: D, Timezone: US/Eastern |

New behavior

| In 29 | pd.set_option("display.width", 80) |
| In 30 | pd.Index(range(4), name='foo') | (continues on next page) |
Out[30]: RangeIndex(start=0, stop=4, step=1, name='foo')

In [31]: pd.Index(range(30), name="foo")
Out[31]: RangeIndex(start=0, stop=30, step=1, name='foo')

In [32]: pd.Index(range(104), name="foo")
Out[32]: RangeIndex(start=0, stop=104, step=1, name='foo')

In [33]: pd.CategoricalIndex(['a', 'bb', 'ccc', 'dddd'], ordered=True, name='foobar')
Out[33]: CategoricalIndex(['a', 'bb', 'ccc', 'dddd'], categories=['a', 'bb', 'ccc', 'dd','ddd'], ordered=True, dtype='category', name='foobar')

In [34]: pd.CategoricalIndex(['a', 'bb', 'ccc', 'dddd'] * 10, ordered=True, name="foobar")
Out[34]: CategoricalIndex(['a', 'bb', 'ccc', 'dddd', 'a', 'bb', 'ccc', 'dddd', 'a', 'bb', 'ccc', 'dddd', 'a', 'bb', 'ccc', 'dddd', 'a', 'bb', 'ccc', 'dddd', 'a', 'bb', 'ccc', 'dddd', 'a', 'bb', 'ccc', 'dddd', 'a', 'bb', 'ccc', 'dddd', 'a', 'bb', 'ccc', 'dddd'], categories=['a', 'bb', 'ccc', 'dddd'], ordered=True, dtype='category', name='foobar')

In [35]: pd.CategoricalIndex(['a', 'bb', 'ccc', 'dddd'] * 100, ordered=True, name="foobar")
Out[35]: CategoricalIndex(['a', 'bb', 'ccc', 'dddd', 'a', 'bb', 'ccc', 'dddd', ... 'ccc', 'dddd', 'a', 'bb', 'ccc', 'dddd', 'a', 'bb', 'ccc', 'dddd'], categories=['a', 'bb', 'ccc', 'dddd'], ordered=True, dtype='category', name='foobar', length=400)

In [36]: pd.date_range("20130101", periods=4, name="foo", tz="US/Eastern")
Out[36]: DatetimeIndex(['2013-01-01 00:00:00-05:00', '2013-01-02 00:00:00-05:00', '2013-01-03 00:00:00-05:00', '2013-01-04 00:00:00-05:00'], dtype='datetime64[ns, US/Eastern]', name='foo', freq='D')

In [37]: pd.date_range("20130101", periods=25, freq="D")

In [38]: pd.date_range("20130101", periods=104, name="foo", tz="US/Eastern")
Out[38]: DatetimeIndex(['2013-01-01 00:00:00-05:00', '2013-01-02 00:00:00-05:00', '2013-01-03 00:00:00-05:00', '2013-01-04 00:00:00-05:00', '2013-01-05 00:00:00-05:00', '2013-01-06 00:00:00-05:00', '2013-01-07 00:00:00-05:00', '2013-01-08 00:00:00-05:00'],
Performance improvements

- Improved csv write performance with mixed dtypes, including datetimes by up to 5x (GH9940)
- Improved csv write performance generally by 2x (GH9940)
- Improved the performance of `pd.lib.max_len_string_array` by 5-7x (GH10024)

Bug fixes

- Bug where labels did not appear properly in the legend of `DataFrame.plot()`, passing `label=` arguments works, and Series indices are no longer mutated. (GH9542)
- Bug in json serialization causing a segfault when a frame had zero length. (GH9805)
- Bug in `read_csv` where missing trailing delimiters would cause segfault. (GH5664)
- Bug in retaining index name on appending (GH9862)
- Bug in `scatter_matrix` draws unexpected axis ticklabels (GH5662)
- Fixed bug in `StataWriter` resulting in changes to input `DataFrame` upon save (GH9795).
- Bug in `transform` causing length mismatch when null entries were present and a fast aggregator was being used (GH9697)
- Bug in `equals` causing false negatives when block order differed (GH9330)
- Bug in grouping with multiple `pd.Grouper` where one is non-time based (GH10063)
- Bug in `read_sql_table` error when reading postgres table with timezone (GH7139)
- Bug in `DataFrame` slicing may not retain metadata (GH9776)
- Bug where `TimedeltaIndex` were not properly serialized in fixed `HDFStore` (GH9635)
- Bug with `TimedeltaIndex` constructor ignoring name when given another `TimedeltaIndex` as data (GH10025).
- Bug in `DataFrameFormatter._get_formatted_index` with not applying `max_colwidth` to the `DataFrame` index (GH7856)
- Bug in `.loc` with a read-only ndarray data source (GH10043)
- Bug in `groupby.apply()` that would raise if a passed user defined function either returned only `None` (for all input). (GH9685)
- Always use temporary files in pytables tests (GH9992)
- Bug in plotting continuously using `secondary_y` may not show legend properly. (GH9610, GH9779)
• Bug in `DataFrame.plot(kind="hist")` results in `TypeError` when `DataFrame` contains non-numeric columns (GH9853)

• Bug where repeated plotting of `DataFrame` with a `DatetimeIndex` may raise `TypeError` (GH9852)

• Bug in `setup.py` that would allow an incompat cython version to build (GH9827)

• Bug in plotting `secondary_y` incorrectly attaches `right_ax` property to secondary axes specifying itself recursively. (GH9861)

• Bug in `Series.quantile` on empty `Series` of type `Datetime` or `Timedelta` (GH9675)

• Bug in `where` causing incorrect results when upcasting was required (GH9731)

• Bug in `FloatArrayFormatter` where decision boundary for displaying “small” floats in decimal format is off by one order of magnitude for a given display.precision (GH9764)

• Fixed bug where `DataFrame.plot()` raised an error when both `color` and `style` keywords were passed and there was no color symbol in the style strings (GH9671)

• Not showing a `DeprecationWarning` on combining list-likes with an `Index` (GH10083)

• Bug in `read_csv` and `read_table` when using `skip_rows` parameter if blank lines are present. (GH9832)

• Bug in `read_csv()` interprets `index_col=True` as 1 (GH9798)

• Bug in index equality comparisons using `==` failing on `Index/MultiIndex` type incompatibility (GH9785)

• Bug in which `SparseDataFrame` could not take `nan` as a column name (GH8822)

• Bug in `to_msgpack` and `read_msgpack` zlib and blosc compression support (GH9783)

• Bug `GroupBy.size` doesn’t attach index name properly if grouped by `TimeGrouper` (GH9925)

• Bug causing an exception in slice assignments because `length_of_indexer` returns wrong results (GH9995)

• Bug in csv parser causing lines with initial white space plus one non-space character to be skipped. (GH9710)

• Bug in C csv parser causing spurious NaNs when data started with newline followed by white space. (GH10022)

• Bug causing elements with a null group to spill into the final group when grouping by a `Categorical` (GH9603)

• Bug where `.iloc` and `.loc` behavior is not consistent on empty dataframes (GH9964)

• Bug in invalid attribute access on a `TimedeltaIndex` incorrectly raised `ValueError` instead of `AttributeError` (GH9680)

• Bug in unequal comparisons between categorical data and a scalar, which was not in the categories (e.g. `Series(Categorical(list("abc"), ordered=True)) > "d"`). This returned `False` for all elements, but now raises a `TypeError`. Equality comparisons also now return `False` for `==` and `True` for `!=`. (GH9848)

• Bug in `DataFrame __setitem__` when right hand side is a dictionary (GH9874)

• Bug in where when `dtype` is `datetime64/timedelta64`, but `dtype` of other is not (GH9804)

• Bug in `MultiIndex.sortlevel()` results in `unicode level name breaks` (GH9856)

• Bug in which `groupby.transform` incorrectly enforced output dtypes to match input dtypes. (GH9807)

• Bug in `DataFrame` constructor when `columns` parameter is set, and `data` is an empty list (GH9939)

• Bug in bar plot with `log=True` raises `TypeError` if all values are less than 1 (GH9905)

• Bug in horizontal bar plot ignores `log=True` (GH9905)
• Bug in PyTables queries that did not return proper results using the index (GH8265, GH9676)
• Bug where dividing a dataframe containing values of type Decimal by another Decimal would raise. (GH9787)
• Bug where using DataFrames asfreq would remove the name of the index. (GH9885)
• Bug causing extra index point when resample BM/BQ (GH9756)
• Changed caching in AbstractHolidayCalendar to be at the instance level rather than at the class level as the latter can result in unexpected behaviour. (GH9552)
• Fixed latex output for MultiIndexed dataframes (GH9778)
• Bug causing an exception when setting an empty range using DataFrame.loc (GH9596)
• Bug in hiding ticklabels with subplots and shared axes when adding a new plot to an existing grid of axes (GH9158)
• Bug in transform and filter when grouping on a categorical variable (GH9921)
• Bug in transform when groups are equal in number and dtype to the input index (GH9700)
• Google BigQuery connector now imports dependencies on a per-method basis. (GH9713)
• Updated BigQuery connector to no longer use deprecated oauth2client.tools.run() (GH8327)
• Bug in subclassed DataFrame. It may not return the correct class, when slicing or subsetting it. (GH9632)
• Bug in .median() where non-float null values are not handled correctly (GH10040)
• Bug in Series.fillna() where it raises if a numerically convertible string is given (GH10092)

5.14.3 Version 0.16.0 (March 22, 2015)

This is a major release from 0.15.2 and includes a small number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

Highlights include:

- DataFrame.assign method, see here
- Series.to_coo/from_coo methods to interact with scipy.sparse, see here
- Backwards incompatible change to Timedelta to conform the .seconds attribute with datetime.timedelta, see here
- Changes to the .loc slicing API to conform with the behavior of .ix see here
- Changes to the default for ordering in the Categorical constructor, see here
- Enhancement to the .str accessor to make string operations easier, see here
- The pandas.tools.rplot, pandas.sandbox.qtpandas and pandas.rpy modules are depreciated. We refer users to external packages like seaborn, pandas-qt and rpy2 for similar or equivalent functionality, see here

Check the API Changes and deprecations before updating.

What’s new in v0.16.0

- New features
  - DataFrame assign
  - Interaction with scipy.sparse
  - String methods enhancements
  - Other enhancements
- Backwards incompatible API changes
  - Changes in timedelta
  - Indexing changes
  - Categorical changes
  - Other API changes
  - Deprecations
New features

Dataframe assign

Inspired by `dplyr`'s `mutate` verb, DataFrame has a new `assign()` method. The function signature for `assign` is simply `**kwargs`. The keys are the column names for the new fields, and the values are either a value to be inserted (for example, a Series or NumPy array), or a function of one argument to be called on the DataFrame. The new values are inserted, and the entire DataFrame (with all original and new columns) is returned.

```
In [1]: iris = pd.read_csv('data/iris.data')
In [2]: iris.head()
Out[2]:
    SepalLength  SepalWidth  PetalLength  PetalWidth  Name
0      5.1        3.5         1.4          0.2  Iris-setosa
1      4.9        3.0         1.4          0.2  Iris-setosa
2      4.7        3.2         1.3          0.2  Iris-setosa
3      4.6        3.1         1.5          0.2  Iris-setosa
4      5.0        3.6         1.4          0.2  Iris-setosa
```

Above was an example of inserting a precomputed value. We can also pass in a function to be evaluated.

```
In [4]: iris.assign(sepal_ratio=lambda x: (x['SepalWidth'] / x['SepalLength'])).head()
Out[4]:
        SepalLength  SepalWidth  PetalLength  PetalWidth Name  sepal_ratio
0  5.100000    3.500000     1.400000    0.200000  Iris-setosa   0.686275
1  4.900000    3.000000     1.400000    0.200000  Iris-setosa   0.612245
2  4.700000    3.200000     1.300000    0.200000  Iris-setosa   0.680851
3  4.600000    3.100000     1.500000    0.200000  Iris-setosa   0.673913
4  5.000000    3.600000     1.400000    0.200000  Iris-setosa   0.720000
```

Above was an example of inserting a precomputed value. We can also pass in a function to be evaluated.
The power of `assign` comes when used in chains of operations. For example, we can limit the DataFrame to just those with a Sepal Length greater than 5, calculate the ratio, and plot

```python
In [5]: iris = pd.read_csv('data/iris.data')
In [6]: (iris.query('SepalLength > 5')
   ...:   .assign(SepalRatio=lambda x: x.SepalWidth / x.SepalLength,
   ...:            PetalRatio=lambda x: x.PetalWidth / x.PetalLength)
   ...:   .plot(kind='scatter', x='SepalRatio', y='PetalRatio'))
```

See the documentation for more. (GH9229)

**Interaction with scipy.sparse**

Added `SparseSeries.to_coo()` and `SparseSeries.from_coo()` methods (GH8048) for converting to and from `scipy.sparse.coo_matrix` instances (see [here](https://docs.scipy.org/doc/scipy/reference/sparse.html)). For example, given a SparseSeries with MultiIndex we can convert to a `scipy.sparse.coo_matrix` by specifying the row and column labels as index levels:

```python
import pandas as pd
import numpy as np

# SparseSeries
s = pd.Series([3.0, np.nan, 1.0, 3.0, np.nan, np.nan])
s.index = pd.MultiIndex.from_tuples([(1, 2, 'a', 0),
                                     (1, 2, 'a', 1),
                                     (1, 1, 'b', 0),
                                     (1, 1, 'b', 1),
                                     (2, 1, 'b', 0),
                                     (2, 1, 'b', 1)],
                        names=['A', 'B', 'C', 'D'])

s

# SparseSeries
ss = s.to_sparse()
ss

A, rows, columns = ss.to_coo(row_levels=['A', 'B'],
                             column_levels=['C', 'D'],
                             sort_labels=False)

A
A.todense()
rows
columns
```
The from_coo method is a convenience method for creating a SparseSeries from a scipy.sparse.coo_matrix:

```python
from scipy import sparse
A = sparse.coo_matrix(((3.0, 1.0, 2.0), ([1, 0, 0], [0, 2, 3])),
                       shape=(3, 4))
A
A.todense()
ss = pd.SparseSeries.from_coo(A)
ss
```

### String methods enhancements

- Following new methods are accessible via `.str` accessor to apply the function to each values. This is intended to make it more consistent with standard methods on strings. (GH9282, GH9352, GH9386, GH9387, GH9439)

<table>
<thead>
<tr>
<th>Methods</th>
<th>isalnum</th>
<th>isalpha</th>
<th>isdigit</th>
<th>isdigit</th>
<th>isspace</th>
<th>islower</th>
<th>isupper</th>
<th>istitle</th>
<th>isnumeric</th>
<th>isdecimal</th>
</tr>
</thead>
<tbody>
<tr>

<td>isdecimal</td>
</tr>
<tr>
<td></td>
<td>find</td>
<td>rfind</td>
<td>ljust</td>
<td>rjust</td>
<td>zfill</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

```python
In [7]: s = pd.Series(['abcd', '3456', 'EFGH'])

In [8]: s.str.isalpha()
Out[8]:
0 True
1 False
2 True
Length: 3, dtype: bool

In [9]: s.str.find('ab')
Out[9]:
0   0
1   -1
2   -1
Length: 3, dtype: int64
```

- `Series.str.pad()` and `Series.str.center()` now accept `fillchar` option to specify filling character (GH9352)

```python
In [10]: s = pd.Series(['12', '300', '25'])

In [11]: s.str.pad(5, fillchar='_')
Out[11]:
0   ___12
1  __300
2  ___25
Length: 3, dtype: object
```

- Added `Series.str.slice_replace()`, which previously raised `NotImplementedError` (GH8888)

```python
In [12]: s = pd.Series(['ABCD', 'EFGH', 'IJK'])
```

(continues on next page)
In [13]: s.str.slice_replace(1, 3, 'X')
Out[13]:
0 AXD
1 EXH
2 IX
Length: 3, dtype: object

# replaced with empty char
In [14]: s.str.slice_replace(0, 1)
Out[14]:
0 BCD
1 FGH
2 JK
Length: 3, dtype: object

Other enhancements

- Reindex now supports method='nearest' for frames or series with a monotonic increasing or decreasing index (GH9258):

  In [15]: df = pd.DataFrame({'x': range(5)})
  In [16]: df.reindex([0.2, 1.8, 3.5], method='nearest')
  Out[16]:
      x
  0.2  0
  1.8  2
  3.5  4
  [3 rows x 1 columns]

  This method is also exposed by the lower level Index.get_indexer and Index.get_loc methods.

- The read_excel() function’s sheetname argument now accepts a list and None, to get multiple or all sheets respectively. If more than one sheet is specified, a dictionary is returned. (GH9450)

  # Returns the 1st and 4th sheet, as a dictionary of DataFrames.
  pd.read_excel('path_to_file.xls', sheetname=['Sheet1', 3])

  • Allow Stata files to be read incrementally with an iterator; support for long strings in Stata files. See the docs here (GH9493):

  • Paths beginning with ~ will now be expanded to begin with the user’s home directory (GH9066)

  • Added time interval selection in get_data_yahoo (GH9071)

  • Added Timestamp.to_datetime64() to complement Timedelta.to_timedelta64() (GH9255)

  • tseries.frequencies.to_offset() now accepts Timedelta as input (GH9064)

  • Lag parameter was added to the autocorrelation method of Series, defaults to lag-1 autocorrelation (GH9192)

  • Timedelta will now accept nanoseconds keyword in constructor (GH9273)

  • SQL code now safely escapes table and column names (GH8986)

  • Added auto-complete for Series.str.<tab>, Series.dt.<tab> and Series.cat.<tab> (GH9322)
- Index.get_indexer now supports method='pad' and method='backfill' even for any target array, not just monotonic targets. These methods also work for monotonic decreasing as well as monotonic increasing indexes (GH9258).

- Index.asof now works on all index types (GH9258).

- A verbose argument has been augmented in io.read_excel(), defaults to False. Set to True to print sheet names as they are parsed. (GH9450)

- Added days_in_month (compatibility alias daysinmonth) property to Timestamp, DatetimeIndex, Period, PeriodIndex, and Series.dt (GH9572)

- Added decimal option in to_csv to provide formatting for non-‘.’ decimal separators (GH781)

- Added normalize option for Timestamp to normalized to midnight (GH8794)

- Added example for DataFrame import to R using HDF5 file and rhdf5 library. See the documentation for more (GH9636).

Backwards incompatible API changes

Changes in timedelta

In v0.15.0 a new scalar type Timedelta was introduced, that is a sub-class of datetime.timedelta. Mentioned here was a notice of an API change w.r.t. the .seconds accessor. The intent was to provide a user-friendly set of accessors that give the 'natural' value for that unit, e.g. if you had a Timedelta('1 day, 10:11:12'), then .seconds would return 12. However, this is at odds with the definition of datetime.timedelta, which defines .seconds as 10 * 3600 + 11 * 60 + 12 == 36672.

So in v0.16.0, we are restoring the API to match that of datetime.timedelta. Further, the component values are still available through the .components accessor. This affects the .seconds and .microseconds accessors, and removes the .hours, .minutes, .milliseconds accessors. These changes affect TimedeltaIndex and the Series .dt accessor as well. (GH9185, GH9139)

Previous behavior

```
In [2]: t = pd.Timedelta('1 day, 10:11:12.100123')

In [3]: t.days
Out[3]: 1

In [4]: t.seconds
Out[4]: 12

In [5]: t.microseconds
Out[5]: 123
```

New behavior

```
In [17]: t = pd.Timedelta('1 day, 10:11:12.100123')

In [18]: t.days
Out[18]: 1

In [19]: t.seconds
Out[19]: 36672

In [20]: t.microseconds
Out[20]: 100123
```
Using `.components` allows the full component access

```
In [21]: t.components
Out[21]: Components(days=1, hours=10, minutes=11, seconds=12, milliseconds=100,
               microseconds=123, nanoseconds=0)
In [22]: t.components.seconds
Out[22]: 12
```

**Indexing changes**

The behavior of a small sub-set of edge cases for using `.loc` have changed (GH8613). Furthermore we have improved the content of the error messages that are raised:

- Slicing with `.loc` where the start and/or stop bound is not found in the index is now allowed; this previously would raise a `KeyError`. This makes the behavior the same as `.ix` in this case. This change is only for slicing, not when indexing with a single label.

```
In [23]: df = pd.DataFrame(np.random.randn(5, 4),
                    columns=list('ABCD'),
                    index=pd.date_range('20130101', periods=5))
In [24]: df
Out[24]:
   A       B       C       D
2013-01-01  0.469112 -0.282863 -1.509059 -1.135632
2013-01-02  1.212112 -0.173215  0.119209 -1.044236
2013-01-03 -0.861849 -2.104569 -0.494929  1.071804
2013-01-04  0.721555 -0.706771 -1.039575  0.271860
2013-01-05 -0.424972  0.567020  0.276232 -1.087401
   [5 rows x 4 columns]
In [25]: s = pd.Series(range(5), [-2, -1, 1, 2, 3])
In [26]: s
Out[26]:
-2  0
-1  1
 1  2
 2  3
 3  4
Length: 5, dtype: int64
```

**Previous behavior**

```
In [4]: df.loc['2013-01-02':'2013-01-10']
KeyError: 'stop bound [2013-01-10] is not in the [index]'
In [6]: s.loc[-10:3]
KeyError: 'start bound [-10] is not the [index]'
```

**New behavior**
In [27]: df.loc['2013-01-02':'2013-01-10']
Out[27]:
<table>

</tr>
</tbody>
</table>

Length: 5, dtype: int64

- Allow slicing with float-like values on an integer index for .ix. Previously this was only enabled for .loc:

Previous behavior

In [8]: s.ix[-1.0:2]
```
TypeError: the slice start value [-1.0] is not a proper indexer for this index,
 Attribute('Int64Index')
```

New behavior

In [2]: s.ix[-1.0:2]
Out[2]:
<p>| | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>-1</td>
<td>1</td>
<td></td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>2</td>
<td></td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>3</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

dtype: int64

- Provide a useful exception for indexing with an invalid type for that index when using .loc. For example trying to use .loc on an index of type DatetimeIndex or PeriodIndex or TimedeltaIndex, with an integer (or a float).

Previous behavior

In [4]: df.loc[2:3]
```
KeyError: 'start bound [2] is not the [index]'`
```

New behavior

In [4]: df.loc[2:3]
```
TypeError: Cannot do slice indexing on <class 'pandas.tseries.index.DatetimeIndex'> with <type 'int'> keys`
Categorical changes

In prior versions, Categoricals that had an unspecified ordering (meaning no ordered keyword was passed) were defaulted as ordered Categoricals. Going forward, the ordered keyword in the Categorical constructor will default to False. Ordering must now be explicit.

Furthermore, previously you could change the ordered attribute of a Categorical by just setting the attribute, e.g. cat.ordered=True; This is now deprecated and you should use cat.as_ordered() or cat.as_unordered(). These will by default return a new object and not modify the existing object. (GH9347, GH9190)

Previous behavior

```python
In [3]: s = pd.Series([0, 1, 2], dtype='category')

In [4]: s
Out[4]:
0 0
1 1
2 2
dtype: category
Categories (3, int64): [0 < 1 < 2]

In [5]: s.cat.ordered
Out[5]: True

In [6]: s.cat.ordered = False

In [7]: s
Out[7]:
0 0
1 1
2 2
dtype: category
Categories (3, int64): [0, 1, 2]
```

New behavior

```python
In [29]: s = pd.Series([0, 1, 2], dtype='category')

In [30]: s
Out[30]:
0 0
1 1
2 2
Length: 3, dtype: category
Categories (3, int64): [0, 1, 2]

In [31]: s.cat.ordered
Out[31]: False

In [32]: s = s.cat.as_ordered()  

In [33]: s
Out[33]:
0 0
1 1
2 2
```

(continues on next page)
Length: 3, dtype: category
Categories (3, int64): [0 < 1 < 2]

In [34]: s.cat.ordered
Out[34]: True

# you can set in the constructor of the Categorical
In [35]: s = pd.Series(pd.Categorical([0, 1, 2], ordered=True))

In [36]: s
Out[36]:
0  0
1  1
2  2
Length: 3, dtype: category
Categories (3, int64): [0 < 1 < 2]

In [37]: s.cat.ordered
Out[37]: True

For ease of creation of series of categorical data, we have added the ability to pass keywords when calling .
astype(). These are passed directly to the constructor.

In [54]: s = pd.Series(["a", "b", "c", "a"]).astype('category', ordered=True)

In [55]: s
Out[55]:
0  a
1  b
2  c
3  a
dtype: category
Categories (3, object): [a < b < c]

In [56]: s = (pd.Series(["a", "b", "c", "a"])
      ....: .astype('category', categories=list('abcdef'), ordered=False))

In [57]: s
Out[57]:
0  a
1  b
2  c
3  a
dtype: category
Categories (6, object): [a, b, c, d, e, f]
Other API changes

- `Index.duplicated` now returns `np.array(dtype=bool)` rather than `Index(dtype=object)` containing bool values. (GH8875)

- `DataFrame.to_json` now returns accurate type serialisation for each column for frames of mixed dtype (GH9037)

  Previously data was coerced to a common dtype before serialisation, which for example resulted in integers being serialised to floats:

  ```python
  In [2]: pd.DataFrame({'i': [1,2], 'f': [3.0, 4.2]}).to_json()
  Out[2]: {'f':{"0":3.0,"1":4.2},"i":{"0":1.0,"1":2.0}}
  ```

  Now each column is serialised using its correct dtype:

  ```python
  In [2]: pd.DataFrame({'i': [1,2], 'f': [3.0, 4.2]}).to_json()
  Out[2]: {'f':{"0":3.0,"1":4.2},"i":{"0":1,"1":2}}
  ```

- `DatetimeIndex`, `PeriodIndex` and `TimedeltaIndex.summary` now output the same format. (GH9116)

- `TimedeltaIndex.freqstr` now output the same string format as `DatetimeIndex`. (GH9116)

- Bar and horizontal bar plots no longer add a dashed line along the info axis. The prior style can be achieved with matplotlib’s `axhline` or `axvline` methods (GH9088).

- `Series` accessors `.dt`, `.cat` and `.str` now raise `AttributeError` instead of `TypeError` if the series does not contain the appropriate type of data (GH9617). This follows Python’s built-in exception hierarchy more closely and ensures that tests like `hasattr(s, 'cat')` are consistent on both Python 2 and 3.

- `Series` now supports bitwise operation for integral types (GH9016). Previously even if the input dtypes were integral, the output dtype was coerced to boolean.

  Previous behavior

  ```python
  In [2]: pd.Series([0, 1, 2, 3], list('abcd')) | pd.Series([4, 4, 4, 4], list('abcd'))
  Out[2]:
  a   True
  b   True
  c   True
  d   True
dtype: bool
  ```

  New behavior. If the input dtypes are integral, the output dtype is also integral and the output values are the result of the bitwise operation.

  ```python
  In [2]: pd.Series([0, 1, 2, 3], list('abcd')) | pd.Series([4, 4, 4, 4], list('abcd'))
  Out[2]:
  a   4
  b   5
  c   6
  d   7
dtype: int64
  ```

- During division involving a `Series` or `DataFrame`, `0/0` and `0//0` now give `np.nan` instead of `np.inf`. (GH9144, GH8445)
Previous behavior

In [2]: p = pd.Series([0, 1])

In [3]: p / 0
Out[3]:
0   inf
1   inf
dtype: float64

In [4]: p // 0
Out[4]:
0   inf
1   inf
dtype: float64

New behavior

In [38]: p = pd.Series([0, 1])

In [39]: p / 0
Out[39]:
0   NaN
1   inf
Length: 2, dtype: float64

In [40]: p // 0
Out[40]:
0   NaN
1   inf
Length: 2, dtype: float64

• Series.values_counts and Series.describe for categorical data will now put NaN entries at the end. (GH9443)

• Series.describe for categorical data will now give counts and frequencies of 0, not NaN, for unused categories (GH9443)

• Due to a bug fix, looking up a partial string label with DatetimeIndex.asof now includes values that match the string, even if they are after the start of the partial string label (GH9258).

Old behavior:

In [4]: pd.to_datetime(['2000-01-31', '2000-02-28']).asof('2000-02')
Out[4]: Timestamp('2000-01-31 00:00:00')

Fixed behavior:

In [41]: pd.to_datetime(['2000-01-31', '2000-02-28']).asof('2000-02')
Out[41]: Timestamp('2000-02-28 00:00:00')

To reproduce the old behavior, simply add more precision to the label (e.g., use 2000-02-01 instead of 2000-02).
Deprecations

- The `rplot` trellis plotting interface is deprecated and will be removed in a future version. We refer to external packages like `seaborn` for similar but more refined functionality (GH3445). The documentation includes some examples how to convert your existing code from `rplot` to `seaborn` here.

- The `pandas.sandbox.qtpandas` interface is deprecated and will be removed in a future version. We refer users to the external package `pandas-qt` (GH9615).

- The `pandas.rpy` interface is deprecated and will be removed in a future version. Similar functionality can be accessed through the `rpy2` project (GH9602).

- Adding `DatetimeIndex/PeriodIndex` to another `DatetimeIndex/PeriodIndex` is being deprecated as a set-operation. This will be changed to a `TypeError` in a future version. `.union()` should be used for the union set operation. (GH9094)

- Subtracting `DatetimeIndex/PeriodIndex` from another `DatetimeIndex/PeriodIndex` is being deprecated as a set-operation. This will be changed to an actual numeric subtraction yielding a `TimeDeltaIndex` in a future version. `.difference()` should be used for the differencing set operation. (GH9094)

Removal of prior version deprecations/changes

- `Dataframe.pivot_table` and `crosstab`'s `rows` and `cols` keyword arguments were removed in favor of `index` and `columns` (GH6581)

- `Dataframe.to_excel` and `Dataframe.to_csv` `cols` keyword argument was removed in favor of `columns` (GH6581)

- Removed `convert_dummies` in favor of `get_dummies` (GH6581)

- Removed `value_range` in favor of `describe` (GH6581)

Performance improvements

- Fixed a performance regression for `.loc` indexing with an array or list-like (GH9126).

- `Dataframe.to_json` 30x performance improvement for mixed dtype frames. (GH9037)

- Performance improvements in `MultiIndex.duplicated` by working with labels instead of values (GH9125)

- Improved the speed of `nunique` by calling `unique` instead of `value_counts` (GH9129, GH7771)

- Performance improvement of up to 10x in `Dataframe.count` and `Dataframe.dropna` by taking advantage of homogeneous/heterogeneous dtypes appropriately (GH9136)

- Performance improvement of up to 20x in `Dataframe.count` when using a `MultiIndex` and the `level` keyword argument (GH9163)

- Performance and memory usage improvements in `merge` when key space exceeds int64 bounds (GH9151)

- Performance improvements in multi-key `groupby` (GH9429)

- Performance improvements in `MultiIndex.sortlevel` (GH9445)

- Performance and memory usage improvements in `Dataframe.duplicated` (GH9398)

- Cythonized `Period` (GH9440)

- Decreased memory usage on `to_hdf` (GH9648)
Bug fixes

- Changed `.to_html` to remove leading/trailing spaces in table body (GH4987)
- Fixed issue using `read_csv` on s3 with Python 3 (GH9452)
- Fixed compatibility issue in `DatetimeIndex` affecting architectures where `numpy.int_` defaults to `numpy.int32` (GH8943)
- Bug in `Panel` indexing with an object-like (GH9140)
- Bug in the returned `Series.dt.components` index was reset to the default index (GH9247)
- Bug in `Categorical.__getitem__/__setitem__` with listlike input getting incorrect results from indexer coercion (GH9469)
- Bug in partial setting with a `DatetimeIndex` (GH9478)
- Bug in `groupby` for integer and `datetime64` columns when applying an aggregator that caused the value to be changed when the number was sufficiently large (GH9311, GH6620)
- Fixed bug in `to_sql` when mapping a `Timestamp` object column (datetime column with timezone info) to the appropriate sqlalchemy type (GH9085).
- Fixed bug in `to_sql` `dtype` argument not accepting an instantiated SQLAlchemy type (GH9083).
- Bug in `.loc` partial setting with a `np.datetime64` (GH9516)
- Incorrect dtypes inferred on `datetimelike` looking `Series` & on `.xs` slices (GH9477)
- Items in `Categorical.unique()` (and `s.unique()` if `s` is of dtype `category`) now appear in the order in which they are originally found, not in sorted order (GH9331). This is now consistent with the behavior for other dtypes in pandas.
- Fixed bug on big endian platforms which produced incorrect results in `StataReader` (GH8688).
- Bug in `MultiIndex.has_duplicates` when having many levels causes an indexer overflow (GH9075, GH5873)
- Bug in `pivot` and `unstack` where `nan` values would break index alignment (GH4862, GH7401, GH7403, GH7405, GH7466, GH9497)
- Bug in `left join` on `MultiIndex` with `sort=True` or null values (GH9210).
- Bug in `MultiIndex` where inserting new keys would fail (GH9250).
- Bug in `groupby` when key space exceeds `int64` bounds (GH9096).
- Bug in `unstack` with `TimedeltaIndex` or `DatetimeIndex` and nulls (GH9491).
- Bug in `rank` where comparing floats with tolerance will cause inconsistent behaviour (GH8365).
- Fixed character encoding bug in `read_stata` and `StataReader` when loading data from a URL (GH9231).
- Bug in adding offsets.Nano to other offsets raises `TypeError` (GH9284)
- Bug in `DatetimeIndex` iteration, related to (GH8890), fixed in (GH9100)
- Bugs in `resample` around DST transitions. This required fixing offset classes so they behave correctly on DST transitions. (GH5172, GH8744, GH8653, GH9173, GH9468).
- Bug in binary operator method (eg `.mul()`) alignment with integer levels (GH9463).
- Bug in boxplot, scatter and hexbin plot may show an unnecessary warning (GH8877)
- Bug in subplot with `layout` kw may show unnecessary warning (GH9464)
• Bug in using grouper functions that need passed through arguments (e.g. axis), when using wrapped function (e.g. fillna), (GH9221)

• DataFrame now properly supports simultaneous copy and dtype arguments in constructor (GH9099)

• Bug in read_csv when using skiprows on a file with CR line endings with the c engine. (GH9079)

• isnull now detects NaT in PeriodIndex (GH9129)

• Bug in groupby .nth() with a multiple column groupby (GH8979)

• Bug in DataFrame.where and Series.where coerce numerics to string incorrectly (GH9280)

• Bug in DataFrame.where and Series.where raise ValueError when string list-like is passed. (GH9280)

• Accessing Series.str methods on with non-string values now raises TypeError instead of producing incorrect results (GH9184)

• Bug in DatetimeIndex.__contains__ when index has duplicates and is not monotonic increasing (GH9512)

• Fixed division by zero error for Series.kurt() when all values are equal (GH9197)

• Fixed issue in the xllaxwriter engine where it added a default ‘General’ format to cells if no other format was applied. This prevented other row or column formatting being applied. (GH9167)

• Fixes issue with index_col=False when usecols is also specified in read_csv. (GH9082)

• Bug where wide_to_long would modify the input stub names list (GH9204)

• Bug in to_sql not storing float64 values using double precision. (GH9009)

• SparseSeries and SparsePanel now accept zero argument constructors (same as their non-sparse counterparts) (GH9272).

• Regression in merging Categorical and object dtypes (GH9426)

• Bug in read_csv with buffer overflows with certain malformed input files (GH9205)

• Bug in groupby MultiIndex with missing pair (GH9049, GH9344)

• Fixed bug in Series.groupby where grouping on MultiIndex levels would ignore the sort argument (GH9444)

• Fix bug in DataFrame.Groupby where sort=False is ignored in the case of Categorical columns. (GH8868)

• Fixed bug with reading CSV files from Amazon S3 on python 3 raising a TypeError (GH9452)

• Bug in the Google BigQuery reader where the ‘jobComplete’ key may be present but False in the query results (GH8728)

• Bug in Series.values_counts with excluding NaN for categorical type Series with dropna=True (GH9443)

• Fixed missing numeric_only option for DataFrame.std/var/sem (GH9201)

• Support constructing Panel or Panel4D with scalar data (GH8285)

• Series text representation disconnected from max_rows/max_columns (GH7508).

• Series number formatting inconsistent when truncated (GH8532).

Previous behavior
In [2]: pd.options.display.max_rows = 10
In [3]: s = pd.Series([1,1,1,1,1,1,1,1,1,1,0.9999,1,1]*10)
In [4]: s
Out[4]:
0  1
1  1
2  1
... 
127 0.9999
128 1.0000
129 1.0000
Length: 130, dtype: float64

New behavior

128 1.0000
129 1.0000
dtype: float64

• A Spurious SettingWithCopy Warning was generated when setting a new item in a frame in some cases (GH8730)

The following would previously report a SettingWithCopy Warning.

In [42]: df1 = pd.DataFrame({'x': pd.Series(['a', 'b', 'c']),
                      'y': pd.Series(['d', 'e', 'f'])})
...:
In [43]: df2 = df1['x']
In [44]: df2['y'] = ['g', 'h', 'i']

5.15 Version 0.15

5.15.1 Version 0.15.2 (December 12, 2014)

This is a minor release from 0.15.1 and includes a large number of bug fixes along with several new features, enhancements, and performance improvements. A small number of API changes were necessary to fix existing bugs. We recommend that all users upgrade to this version.

- Enhancements
- API Changes
- Performance Improvements
- Bug Fixes

API changes

- Indexing in MultiIndex beyond lex-sort depth is now supported, though a lexically sorted index will have a better performance. (GH2646)

```python
In [1]: df = pd.DataFrame({'jim': [0, 0, 1, 1],
                      'joe': ['x', 'x', 'z', 'y'],
                      'jolie': np.random.rand(4))
   ...: .set_index(['jim', 'joe'])
   ...:

In [2]: df
```
Out[2]:

<p>| | | |</p>
<table>
<thead>
<tr>

[1 rows x 1 columns]

- Bug in unique of Series with category dtype, which returned all categories regardless whether they were “used” or not (see GH8559 for the discussion). Previous behaviour was to return all categories:

In [3]: cat = pd.Categorical(['a', 'b', 'a'], categories=['a', 'b', 'c'])

In [4]: cat
Out[4]:

[a, b, a]
Categories (3, object): [a < b < c]

In [5]: cat.unique()
Out[5]: array(['a', 'b', 'c'], dtype=object)

Now, only the categories that do effectively occur in the array are returned:

In [9]: cat = pd.Categorical(['a', 'b', 'a'], categories=['a', 'b', 'c'])
In [10]: cat.unique()
Out[10]:
['a', 'b']
Categories (3, object): ['a', 'b', 'c']

• Series.all and Series.any now support the level and skipna parameters. Series.all, Series.any, Index.all, and Index.any no longer support the out and keepdims parameters, which existed for compatibility with ndarray. Various index types no longer support the all and any aggregation functions and will now raise TypeError. (GH8302).

• Allow equality comparisons of Series with a categorical dtype and object dtype; previously these would raise TypeError. (GH8938)

• Bug in NDFrame: conflicting attribute/column names now behave consistently between getting and setting. Previously, when both a column and attribute named y existed, data.y would return the attribute, while data.y = z would update the column. (GH8994)

In [11]: data = pd.DataFrame({'x': [1, 2, 3]})
In [12]: data.y = 2
In [13]: data['y'] = [2, 4, 6]
In [14]: data
Out[14]:
    x  y
0  1  2
1  2  4
2  3  6
[3 rows x 2 columns]
# this assignment was inconsistent
In [15]: data.y = 5

Old behavior:

In [6]: data.y
Out[6]: 2

In [7]: data['y'].values
Out[7]: array([5, 5, 5])

New behavior:

In [16]: data.y
Out[16]: 5
In [17]: data['y'].values
Out[17]: array([2, 4, 6])

• Timestamp('now') is now equivalent to Timestamp.now() in that it returns the local time rather than UTC. Also, Timestamp('today') is now equivalent to Timestamp.today() and both have tz as a possible argument. (GH9000)

• Fix negative step support for label-based slices (GH8753)

Old behavior:

In [1]: s = pd.Series(np.arange(3), ['a', 'b', 'c'])
Out[1]:
a 0
b 1
c 2
dtype: int64
In [2]: s.loc['c':'a':-1]
Out[2]:
c 2
dtype: int64

New behavior:

In [18]: s = pd.Series(np.arange(3), ['a', 'b', 'c'])

In [19]: s.loc['c':'a':-1]
Out[19]:
c 2
b 1
a 0
Length: 3, dtype: int64

Enhancements

Categorical enhancements:

• Added ability to export Categorical data to Stata (GH8633). See here for limitations of categorical variables exported to Stata data files.

• Added flag order_categoricals to StataReader and read_stata to select whether to order imported categorical data (GH8836). See here for more information on importing categorical variables from Stata data files.

• Added ability to export Categorical data to/from HDF5 (GH7621). Queries work the same as if it was an object array. However, the category dtype data is stored in a more efficient manner. See here for an example and caveats w.r.t. prior versions of pandas.

• Added support for searchsorted() on Categorical class (GH8420).

Other enhancements:

• Added the ability to specify the SQL type of columns when writing a DataFrame to a database (GH8778). For example, specifying to use the sqlalchemy String type instead of the default Text type for string columns:

```python
from sqlalchemy.types import String
data.to_sql('data_dtype', engine, dtype={'Col_1': String})  # noqa F821
```
- **Series.all** and **Series.any** now support the **level** and **skipna** parameters (GH8302):

```python
In [20]: s = pd.Series([False, True, False], index=[0, 0, 1])
In [21]: s.any(level=0)
Out[21]:
0    True
1    False
Length: 2, dtype: bool
```

- **Panel** now supports the **all** and **any** aggregation functions. (GH8302):

```python
>>> p = pd.Panel(np.random.rand(2, 5, 4) > 0.1)
>>> p.all()
   0   1   2   3
0  True  True  True  True
1  True  False  True  True
2  True  True  True  True
3  False  True  False  True
4  True  True  True  True
```

- Added support for **utcfromtimestamp()**, **fromtimestamp()**, and **combine()** on **Timestamp** class (GH5351).

- Added Google Analytics (**pandas.io.ga**) basic documentation (GH8835). See here.

- **Timedelta** arithmetic returns **NotImplemented** in unknown cases, allowing extensions by custom classes (GH8813).

- **Timedelta** now supports arithmetic with **numpy.ndarray** objects of the appropriate dtype (**numpy** 1.8 or newer only) (GH8884).

- Added **Timedelta.to_timedelta64()** method to the public API (GH8884).

- Added **gbq.generate_bq_schema()** function to the **gbq** module (GH8325).

- **Series** now works with map objects the same way as generators (GH8909).

- Added context manager to **HDFStore** for automatic closing (GH8791).

- **to_datetime** gains an **exact** keyword to allow for a format to not require an exact match for a provided format string (if its False, exact defaults to True (meaning that exact matching is still the default)) (GH8904)

- Added **axvlines** boolean option to **parallel_coordinates** plot function, determines whether vertical lines will be printed, default is True

- Added ability to read table footers to **read_html** (GH8552)

- **to_sql** now infers data types of non-NA values for columns that contain NA values and have dtype **object** (GH8778).
Performance

• Reduce memory usage when skiprows is an integer in read_csv (GH8681)
• Performance boost for to_datetime conversions with a passed format=, and the exact=False (GH8904)

Bug fixes

• Bug in concat of Series with category dtype which were coercing to object. (GH8641)
• Bug in Timestamp-Timestamp not returning a Timedelta type and datelike-datelike ops with timezones (GH8865)
• Made consistent a timezone mismatch exception (either tz operated with None or incompatible timezone), will now return TypeError rather than ValueError (a couple of edge cases only), (GH8865)
• Bug in using a pd.Grouper(key=...) with no level-axis or level only (GH8795, GH8866)
• Report a TypeError when invalid/no parameters are passed in a groupby (GH8015)
• Bug in packaging pandas with py2app/cx_Freeze (GH8602, GH8831)
• Bug in groupby signatures that didn’t include *args or **kwargs (GH8733).
• io.data.Options now raises RemoteDataError when no expiry dates are available from Yahoo and when it receives no data from Yahoo (GH761), (GH8783).
• Unclear error message in csv parsing when passing dtype and names and the parsed data is a different data type (GH8833)
• Bug in slicing a MultiIndex with an empty list and at least one boolean indexer (GH8781)
• io.data.Options now raises RemoteDataError when no expiry dates are available from Yahoo (GH761).
• Timedelta kwars may now be numpy ints and floats (GH8757).
• Fixed several outstanding bugs for Timedelta arithmetic and comparisons (GH8813, GH5963, GH5436).
• sql_schema now generates dialect appropriate CREATE TABLE statements (GH8697)
• slice string method now takes step into account (GH8754)
• Bug in BlockManager where setting values with different type would break block integrity (GH8850)
• Bug in DatetimeIndex when using time object as key (GH8667)
• Bug in merge where how='left' and sort=False would not preserve left frame order (GH7331)
• Bug in MultiIndex.reindex where reindexing at level would not reorder labels (GH4088)
• Bug in certain operations with dateutil timezones, manifesting with dateutil 2.3 (GH8639)
• Regression in DatetimeIndex iteration with a Fixed/Local offset timezone (GH8890)
• Bug in to_datetime when parsing a nanoseconds using the %f format (GH8989)
• io.data.Options now raises RemoteDataError when no expiry dates are available from Yahoo and when it receives no data from Yahoo (GH761), (GH8783).
• Fix: The font size was only set on x axis if vertical or the y axis if horizontal. (GH8765)
• Fixed division by 0 when reading big csv files in python 3 (GH8621)
• Bug in outputting a MultiIndex with to_html, index=False which would add an extra column (GH8452)
• Imported categorical variables from Stata files retain the ordinal information in the underlying data (GH8836).

• Defined `size` attribute across NDFrame objects to provide compat with numpy >= 1.9.1; buggy with np. array_split (GH8846)

• Skip testing of histogram plots for matplotlib <= 1.2 (GH8648).

• Bug where `get_data_google` returned object dtypes (GH3995)

• Bug in DataFrame.stack(..., dropna=False) when the DataFrame’s columns is a MultiIndex whose labels do not reference all its levels. (GH8844)

• Bug in that Option context applied on __enter__ (GH8514)

• Bug in resample that causes a ValueError when resampling across multiple days and the last offset is not calculated from the start of the range (GH8683)

• Bug where DataFrame.plot(kind='scatter') fails when checking if an np.array is in the DataFrame (GH8852)

• Bug in pd.infer_freq/DataFrame.inferred_freq that prevented proper sub-daily frequency inference when the index contained DST days (GH8772).

• Bug where index name was still used when plotting a series with use_index=False (GH8558).

• Bugs when trying to stack multiple columns, when some (or all) of the level names are numbers (GH8584).

• Bug in MultiIndex where __contains__ returns wrong result if index is not lexically sorted or unique (GH7724)

• BUG CSV: fix problem with trailing white space in skipped rows, (GH8679), (GH8661), (GH8983)

• Regression in Timestamp does not parse ‘Z’ zone designator for UTC (GH8771)

• Bug in StataWriter the produces writes strings with 244 characters irrespective of actual size (GH8969)

• Fixed ValueError raised by cummin/cummax when datetime64 Series contains NaT. (GH8965)

• Bug in DataReader returns object dtype if there are missing values (GH8980)

• Bug in plotting if sharex was enabled and index was a timeseries, would show labels on multiple axes (GH3964).

• Bug where passing a unit to the TimedeltaIndex constructor applied the to nano-second conversion twice. (GH9011).

• Bug in plotting of a period-like array (GH9012)

5.15.2 Version 0.15.1 (November 9, 2014)

This is a minor bug-fix release from 0.15.0 and includes a small number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

- **Enhancements**
- **API Changes**
- **Bug Fixes**

API changes

- `s.dt.hour` and other `.dt` accessors will now return `np.nan` for missing values (rather than previously `-1`), (GH8689)

```
In [1]: s = pd.Series(pd.date_range("20130101", periods=5, freq="D"))
In [2]: s.iloc[2] = np.nan
In [3]: s
Out[3]:
0  2013-01-01
1  2013-01-02
2  NaT
3  2013-01-04
4  2013-01-05
Length: 5, dtype: datetime64[ns]
```

previous behavior:

```
In [6]: s.dt.hour
Out[6]:
0   0
1   0
2  -1
3   0
4   0
dtype: int64
```

current behavior:

```
In [4]: s.dt.hour
Out[4]:
0   0.0
1   0.0
2  NaN
```

(continues on next page)
• `groupby` with `as_index=False` will not add erroneous extra columns to result (GH8582):

```python
In [5]: np.random.seed(2718281)
In [6]: df = pd.DataFrame(np.random.randint(0, 100, (10, 2)), columns=['jim', 'joe'])
In [7]: df.head()
Out[7]:
   jim  joe
0     61    81
1     96    49
2     55    65
3     72    51
4     77    12

In [8]: ts = pd.Series(5 * np.random.randint(0, 3, 10))
previous behavior:
In [4]: df.groupby(ts, as_index=False).max()
Out[4]:
   NaN  jim  joe
0     0   72   83
1     5   77   84
2    10   96   65

current behavior:
In [9]: df.groupby(ts, as_index=False).max()
Out[9]:
   jim  joe
0     72   83
1     77   84
2     96   65
```

• `groupby` will not erroneously exclude columns if the column name conflicts with the grouper name (GH8112):

```python
In [10]: df = pd.DataFrame({'jim': range(5), 'joe': range(5, 10)})
In [11]: df
Out[11]:
   jim  joe
0     0    5
1     1    6
2     2    7
3     3    8
4     4    9
```

(continues on next page)
previous behavior (excludes 1st column from output):

```python
In [4]: gr.apply(sum)
Out[4]:
   jim  joe
   False 24
   True  1
```

current behavior:

```python
In [13]: gr.apply(sum)
Out[13]:
   jim  joe
   False 9  24
   True  1  11
```

- Support for slicing with monotonic decreasing indexes, even if `start` or `stop` is not found in the index (GH7860):

```python
In [14]: s = pd.Series(["a", "b", "c", "d"], [4, 3, 2, 1])
In [15]: s
Out[15]:
   4  a
   3  b
   2  c
   1  d
Length: 4, dtype: object
```

previous behavior:

```python
In [8]: s.loc[3.5:1.5]
KeyError: 3.5
```

current behavior:

```python
In [16]: s.loc[3.5:1.5]
Out[16]:
   3  b
   2  c
Length: 2, dtype: object
```

- `io.data.Options` has been fixed for a change in the format of the Yahoo Options page (GH8612), (GH8741)

**Note:** As a result of a change in Yahoo’s option page layout, when an expiry date is given, `Options` methods
now return data for a single expiry date. Previously, methods returned all data for the selected month.

The month and year parameters have been undeprecated and can be used to get all options data for a given month.

If an expiry date that is not valid is given, data for the next expiry after the given date is returned.

Option data frames are now saved on the instance as callsYYMMDD or putsYYMMDD. Previously they were saved as callsMMYY and putsMMYY. The next expiry is saved as calls and puts.

New features:

- The expiry parameter can now be a single date or a list-like object containing dates.
- A new property expiry_dates was added, which returns all available expiry dates.

Current behavior:

```python
In [17]: from pandas.io.data import Options
In [18]: aapl = Options('aapl', 'yahoo')
In [19]: aapl.get_call_data().iloc[0:5, 0:1]
Out[19]:
<table>

- pandas now also registers the datetime64 dtype in matplotlib’s units registry to plot such values as datetimes. This is activated once pandas is imported. In previous versions, plotting an array of datetime64 values will
have resulted in plotted integer values. To keep the previous behaviour, you can do `del matplotlib.units.registry[np.datetime64]` (GH8614).

Enhancements

• `concat` permits a wider variety of iterables of pandas objects to be passed as the first parameter (GH8645):

```python
In [17]: from collections import deque
In [18]: df1 = pd.DataFrame([1, 2, 3])
In [19]: df2 = pd.DataFrame([4, 5, 6])

binding to matplotlib units.registry[np.datetime64] (GH8614).

Enhancements

• `concat` permits a wider variety of iterables of pandas objects to be passed as the first parameter (GH8645):

```python
In [17]: from collections import deque
In [18]: df1 = pd.DataFrame([1, 2, 3])
In [19]: df2 = pd.DataFrame([4, 5, 6])

previous behavior:

```python
In [7]: pd.concat(deque((df1, df2)))
```

```python
TypeError: first argument must be a list-like of pandas objects, you passed an object of type "deque"
``` current behavior:

```python
In [20]: pd.concat(deque((df1, df2)))
```

```python
Out[20]:
   0  1  2
0  0  1  2
1  2  3
2  4  5
3  6

[6 rows x 1 columns]
```  

• Represent `MultiIndex` labels with a dtype that utilizes memory based on the level size. In prior versions, the memory usage was a constant 8 bytes per element in each level. In addition, in prior versions, the reported memory usage was incorrect as it didn’t show the usage for the memory occupied by the underlying data array. (GH8456)

```python
In [21]: dfi = pd.DataFrame(
    ...:     1, index=pd.MultiIndex.from_product([["a"], range(1000)]), columns=["A"]
    ...:)
``` previous behavior:

```python
In [1]: dfi.memory_usage(index=True)
Out[1]:
Index   8000 # took about 24008 bytes in < 0.15.1
A       8000
dtype: int64
``` current behavior:
In [22]: dfi.memory_usage(index=True)
Out [22]:
    Index 44212
    A    8000
Length: 2, dtype: int64

- Added Index properties `is_monotonic_increasing` and `is_monotonic_decreasing` (GH8680).
- Added option to select columns when importing Stata files (GH7935).
- Qualify memory usage in `DataFrame.info()` by adding `+` if it is a lower bound (GH8578).
- Raise errors in certain aggregation cases where an argument such as `numeric_only` is not handled (GH8592).
- Added support for 3-character ISO and non-standard country codes in `io.wb.download()` (GH8482).
- World Bank data requests now will warn/raise based on an `errors` argument, as well as a list of hard-coded country codes and the World Bank’s JSON response. In prior versions, the error messages didn’t look at the World Bank’s JSON response. Problem-inducing input were simply dropped prior to the request. The issue was that many good countries were cropped in the hard-coded approach. All countries will work now, but some bad countries will raise exceptions because some edge cases break the entire response. (GH8482)
- Added option to `Series.str.split()` to return a `DataFrame` rather than a `Series` (GH8428).
- Added option to `df.info(null_counts=None|True|False)` to override the default display options and force showing of the null-counts (GH8701).

**Bug fixes**

- Bug in unpickling of a `CustomBusinessDay` object (GH8591).
- Bug in coercing `Categorical` to a records array, e.g. `df.to_records()` (GH8626).
- Bug in `Categorical` not created properly with `Series.to_frame()` (GH8626).
- Bug in coercing in `astype` of a `Categorical` of a passed `pd.Categorical` (this now raises `TypeError` correctly), (GH8626).
- Bug in `cut/qcut` when using `Series` and `retbins=True` (GH8589).
- Bug in writing `Categorical` columns to an SQL database with `to_sql` (GH8624).
- Bug in comparing `Categorical` of datetime raising when being compared to a scalar datetime (GH8687).
- Bug in selecting from a `Categorical` with `.iloc` (GH8623).
- Bug in `groupby-transform` with a `Categorical` (GH8623).
- Bug in `duplicated/drop_duplicates` with a `Categorical` (GH8623).
- Bug in `Categorical` reflected comparison operator raising if the first argument was a numpy array scalar (e.g. `np.int64`) (GH8658).
- Bug in Panel indexing with a list-like (GH8710).
- Compat issue is `DataFrame.dtypes` when `options.mode.use_inf_as_null` is `True` (GH8722).
- Bug in `read_csv`, `dialect` parameter would not take a string (GH8703).
- Bug in slicing a `MultiIndex` level with an empty-list (GH8737).
- Bug in numeric index operations of add/sub with Float/Index Index with numpy arrays (GH8608).
- Bug in `setitem` with empty indexer and unwanted coercion of dtypes (GH8669).
• Bug in ix/loc block splitting on setitem (manifests with integer-like dtypes, e.g. datetime64) (GH8607)
• Bug when doing label based indexing with integers not found in the index for non-unique but monotonic indexes (GH8680).
• Bug when indexing a Float64Index with np.nan on numpy 1.7 (GH8980).
• Fix shape attribute for MultiIndex (GH8609)
• Bug in GroupBy where a name conflict between the grouper and columns would break groupby operations (GH7115, GH8112)
• Fixed a bug where plotting a column y and specifying a label would mutate the index name of the original DataFrame (GH8494)
• Fix regression in plotting of a DatetimeIndex directly with matplotlib (GH8614).
• Bug in date_range where partially-specified dates would incorporate current date (GH6961)
• Bug in Setting by indexer to a scalar value with a mixed-dtype Panel4d was failing (GH8702)
• Bug whereDataReader’s would fail if one of the symbols passed was invalid. Now returns data for valid symbols and np.nan for invalid (GH8494)
• Bug in get_quote_yahoo that wouldn’t allow non-float return values (GH5229).

5.15.3 Version 0.15.0 (October 18, 2014)

This is a major release from 0.14.1 and includes a small number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

**Warning:** pandas >= 0.15.0 will no longer support compatibility with NumPy versions < 1.7.0. If you want to use the latest versions of pandas, please upgrade to NumPy >= 1.7.0 (GH7711)

• Highlights include:
  – The **Categorical** type was integrated as a first-class pandas type, see [here](#)
  – New scalar type **Timedelta**, and a new index type **TimedeltaIndex**, see [here](#)
  – New datetimelike properties accessor .dt for Series, see **Datetimelike Properties**
  – New DataFrame default display for df.info() to include memory usage, see **Memory Usage**
  – read_csv will now by default ignore blank lines when parsing, see [here](#)
  – API change in using Indexes in set operations, see [here](#)
  – Enhancements in the handling of timezones, see [here](#)
  – A lot of improvements to the rolling and expanding moment functions, see [here](#)
  – Internal refactoring of the Index class to no longer sub-class ndarray, see **Internal Refactoring**
  – dropping support for PyTables less than version 3.0.0, and numexpr less than version 2.1 (GH7990)
  – Split indexing documentation into **Indexing and Selecting Data** and **MultiIndex / Advanced Indexing**
  – Split out string methods documentation into **Working with Text Data**

• Check the **API Changes** and **deprecations** before updating

• Other Enhancements

• **Performance Improvements**

• **Bug Fixes**

**Warning:** In 0.15.0 Index has internally been refactored to no longer sub-class ndarray but instead subclass **PandasObject**, similarly to the rest of the pandas objects. This change allows very easy sub-classing and creation of new index types. This should be a transparent change with only very limited API implications (See the **Internal Refactoring**)

| 5.15. Version 0.15 | 3311 |
Warning: The refactoring in `Categorical` changed the two argument constructor from “codes/labels and levels” to “values and levels (now called ‘categories’)”. This can lead to subtle bugs. If you use `Categorical` directly, please audit your code before updating to this pandas version and change it to use the `from_codes()` constructor. See more on `Categorical` here.

New features

Categoricals in Series/DataFrame

`Categorical` can now be included in `Series` and `DataFrames` and gained new methods to manipulate. Thanks to Jan Schulz for much of this API/implementation. (GH3943, GH5313, GH5314, GH7444, GH7839, GH7848, GH7864, GH7914, GH7768, GH8006, GH8075, GH8076, GH8143, GH8453, GH8518).

For full docs, see the categorical introduction and the API documentation.

```python
In [1]: df = pd.DataFrame({"id": [1, 2, 3, 4, 5, 6],
                   "raw_grade": ['a', 'b', 'b', 'a', 'a', 'e']})

In [2]: df["grade"] = df["raw_grade"].astype("category")

In [3]: df["grade"]
Out[3]:
0 a
1 b
2 b
3 a
4 a
5 e
Name: grade, Length: 6, dtype: category
Categories (3, object): ['a', 'b', 'e']

# Rename the categories
In [4]: df["grade"].cat.categories = ["very good", "good", "very bad"]

# Reorder the categories and simultaneously add the missing categories
In [5]: df["grade"] = df["grade"].cat.set_categories(["very bad", "bad", "medium", "good", "very good"])

In [6]: df["grade"]
Out[6]:
0  very good
1   good
2   good
3  very good
4   very good
5   very bad
Name: grade, Length: 6, dtype: category
Categories (5, object): ['very bad', 'bad', 'medium', 'good', 'very good']

In [7]: df.sort_values("grade")
Out[7]:
   id  raw_grade  grade
0   1        a    a
1   2        b    b
2   3        b    b
3   4        a    a
4   5        e    e
5   6        e    e
```

(continues on next page)
1  2   b   good
2  3   b   good
0  1   a  very good
3  4   a  very good
4  5   a  very good
[6 rows x 3 columns]

In [8]: df.groupby("grade").size()
Out[8]:
grade
   very bad   1
    bad       0
   medium     0
     good     2
  very good   3
Length: 5, dtype: int64

- pandas.core.group_agg and pandas.core.factor_agg were removed. As an alternative, construct a dataframe and use df.groupby(<group>).agg(<func>).

- Supplying “codes/labels and levels” to the Categorical constructor is not supported anymore. Supplying two arguments to the constructor is now interpreted as “values and levels (now called ‘categories’)”. Please change your code to use the from_codes() constructor.

- The Categorical.labels attribute was renamed to Categorical.codes and is read only. If you want to manipulate codes, please use one of the API methods on Categoricals.

- The Categorical.levels attribute is renamed to Categorical.categories.

TimedeltaIndex/scalar

We introduce a new scalar type Timedelta, which is a subclass of datetime.timedelta, and behaves in a similar manner, but allows compatibility with np.timedelta64 types as well as a host of custom representation, parsing, and attributes. This type is very similar to how Timestamp works for datetimes. It is a nice-API box for the type. See the docs. (GH3009, GH4533, GH8209, GH8187, GH8190, GH7869, GH7661, GH8345, GH8471)

Warning: Timedelta scalars (and TimedeltaIndex) component fields are not the same as the component fields on a datetime.timedelta object. For example, .seconds on a datetime.timedelta object returns the total number of seconds combined between hours, minutes and seconds. In contrast, the pandas Timedelta breaks out hours, minutes, microseconds and nanoseconds separately.

```python
# Timedelta accessor
In [9]: tds = pd.Timedelta('31 days 5 min 3 sec')

In [10]: tds.minutes
Out[10]: 5L

In [11]: tds.seconds
Out[11]: 3L

# datetime.timedelta accessor
# this is 5 minutes * 60 + 3 seconds
In [12]: tds.to_pytimedelta().seconds
Out[12]: 303
```
Note: this is no longer true starting from v0.16.0, where full compatibility with datetime.timedelta is introduced. See the 0.16.0 whatsnew entry

Warning: Prior to 0.15.0 pd.to_timedelta would return a Series for list-like/Series input, and a np.timedelta64 for scalar input. It will now return a TimedeltaIndex for list-like input, Series for Series input, and Timedelta for scalar input.

The arguments to pd.to_timedelta are now (arg,unit='ns',box=True,coerce=False), previously were (arg,box=True,unit='ns') as these are more logical.

Construct a scalar

```python
In [9]: pd.Timedelta('1 days 06:05:01.00003')
Out[9]: Timedelta('1 days 06:05:01.000030')

In [10]: pd.Timedelta('15.5us')
Out[10]: Timedelta('0 days 00:00:00.000015500')

In [11]: pd.Timedelta('1 hour 15.5us')
Out[11]: Timedelta('0 days 01:00:00.000015500')

# negative Timedeltas have this string repr
# to be more consistent with datetime.timedelta conventions
In [12]: pd.Timedelta('-1us')
Out[12]: Timedelta('-1 days +23:59:59.999999')

# a NaT
In [13]: pd.Timedelta('nan')
Out[13]: NaT
```

Access fields for a Timedelta

```python
In [14]: td = pd.Timedelta('1 hour 3m 15.5us')

In [15]: td.seconds
Out[15]: 3780

In [16]: td.microseconds
Out[16]: 15

In [17]: td.nanoseconds
Out[17]: 500
```

Construct a TimedeltaIndex

```python
In [18]: pd.TimedeltaIndex(
    ....:     ['1 days', '1 days, 00:00:05',
    ....:      np.timedelta64(2, 'D'),
    ....:      datetime.timedelta(days=2, seconds=2))
    ....:

Out[18]: TimedeltaIndex([ '1 days 00:00:00', '1 days 00:00:05', '2 days 00:00:00',
    ....:    '2 days 00:00:02'],
    ....:   dtype='timedelta64[ns]', freq=None)
```

Constructing a TimedeltaIndex with a regular range
In [19]: pd.timedelta_range('1 days', periods=5, freq='D')
Out[19]: TimedeltaIndex(['1 days', '2 days', '3 days', '4 days', '5 days'], dtype='timedelta64[ns]', freq='D')

In [20]: pd.timedelta_range(start='1 days', end='2 days', freq='30T')
Out[20]: TimedeltaIndex(['1 days 00:00:00', '1 days 00:30:00', '1 days 01:00:00', '1 days 01:30:00', '1 days 02:00:00', '1 days 02:30:00', '1 days 03:00:00', '1 days 03:30:00', '1 days 04:00:00', '1 days 04:30:00', '1 days 05:00:00', '1 days 05:30:00', '1 days 06:00:00', '1 days 06:30:00', '1 days 07:00:00', '1 days 07:30:00', '1 days 08:00:00', '1 days 08:30:00', '1 days 09:00:00', '1 days 09:30:00', '1 days 10:00:00', '1 days 10:30:00', '1 days 11:00:00', '1 days 11:30:00', '1 days 12:00:00', '1 days 12:30:00', '1 days 13:00:00', '1 days 13:30:00', '1 days 14:00:00', '1 days 14:30:00', '1 days 15:00:00', '1 days 15:30:00', '1 days 16:00:00', '1 days 16:30:00', '1 days 17:00:00', '1 days 17:30:00', '1 days 18:00:00', '1 days 18:30:00', '1 days 19:00:00', '1 days 19:30:00', '1 days 20:00:00', '1 days 20:30:00', '1 days 21:00:00', '1 days 21:30:00', '1 days 22:00:00', '1 days 22:30:00', '1 days 23:00:00', '1 days 23:30:00', '2 days 00:00:00'], dtype='timedelta64[ns]', freq='30T')

You can now use a TimedeltaIndex as the index of a pandas object

In [21]: s = pd.Series(np.arange(5),
   ....: index=pd.timedelta_range('1 days', periods=5, freq='s'))
   ....:
In [22]: s
Out[22]:
1 days 00:00:00  0
1 days 00:00:01  1
1 days 00:00:02  2
1 days 00:00:03  3
1 days 00:00:04  4
Freq: S, Length: 5, dtype: int64

You can select with partial string selections

In [23]: s['1 day 00:00:02']
Out[23]: 2

In [24]: s['1 day':'1 day 00:00:02']
Out[24]:
1 days 00:00:00  0
1 days 00:00:01  1
1 days 00:00:02  2
Freq: S, Length: 3, dtype: int64

Finally, the combination of TimedeltaIndex with DatetimeIndex allow certain combination operations that are NaT preserving:

In [25]: tdi = pd.TimedeltaIndex(['1 days', pd.NaT, '2 days'])

(continues on next page)
In [26]: tdi.tolist()
Out[26]: [Timedelta('1 days 00:00:00'), NaT, Timedelta('2 days 00:00:00')]

In [27]: dti = pd.date_range('20130101', periods=3)
In [28]: dti.tolist()
Out[28]: [Timestamp('2013-01-01 00:00:00', freq='D'),
    Timestamp('2013-01-02 00:00:00', freq='D'),
    Timestamp('2013-01-03 00:00:00', freq='D')]

In [29]: (dti + tdi).tolist()
Out[29]: [Timestamp('2013-01-02 00:00:00'), NaT, Timestamp('2013-01-05 00:00:00')]

In [30]: (dti - tdi).tolist()
Out[30]: [Timestamp('2012-12-31 00:00:00'), NaT, Timestamp('2013-01-01 00:00:00')]

- iteration of a Series e.g. list(Series(...)) of timedelta64[ns] would prior to v0.15.0 return np.timedelta64 for each element. These will now be wrapped in Timedelta.

**Memory usage**

Implemented methods to find memory usage of a DataFrame. See the FAQ for more. (GH6852).

A new display option display.memory_usage (see Options and settings) sets the default behavior of the memory_usage argument in the df.info() method. By default display.memory_usage is True.
Additionally `memory_usage()` is an available method for a dataframe object which returns the memory usage of each column.

```
In [37]: df.memory_usage(index=True)
Out[37]:
Index    128
int64   40000
float64 40000
datetime64[ns]  40000
timedelta64[ns] 40000
complex128  80000
object    40000
bool      5000
categorical 9968
Length: 9, dtype: int64
```

**Series.dt accessor**

Series has gained an accessor to succinctly return datetime like properties for the *values* of the Series, if its a datetime/period like Series. *(GH7207)* This will return a Series, indexed like the existing Series. See the *docs*

```
# datetime
In [38]: s = pd.Series(pd.date_range('20130101 09:10:12', periods=4))

In [39]: s
Out[39]:
0 2013-01-01 09:10:12
1 2013-01-02 09:10:12
2 2013-01-03 09:10:12
3 2013-01-04 09:10:12
Length: 4, dtype: datetime64[ns]

In [40]: s.dt.hour
Out[40]:
0 9
1 9
2 9
3 9
Length: 4, dtype: int64

In [41]: s.dt.second
Out[41]:
0 12
1 12
2 12
3 12
Length: 4, dtype: int64

In [42]: s.dt.day
Out[42]:
0 1
1 2
2 3
3 4
Length: 4, dtype: int64
```

(continues on next page)
This enables nice expressions like this:

```
In [44]: s[s.dt.day == 2]
Out[44]:
   0  2013-01-02 09:10:12
Length: 1, dtype: datetime64[ns]
```

You can easily produce tz aware transformations:

```
In [45]: stz = s.dt.tz_localize('US/Eastern')
In [46]: stz
Out[46]:
  0  2013-01-01 09:10:12-05:00
  1  2013-01-02 09:10:12-05:00
  2  2013-01-03 09:10:12-05:00
  3  2013-01-04 09:10:12-05:00
Length: 4, dtype: datetime64[ns, US/Eastern]
```

You can also chain these types of operations:

```
In [48]: s.dt.tz_localize('UTC').dt.tz_convert('US/Eastern')
Out[48]:
  0  2013-01-01 04:10:12-05:00
  1  2013-01-02 04:10:12-05:00
  2  2013-01-03 04:10:12-05:00
  3  2013-01-04 04:10:12-05:00
Length: 4, dtype: datetime64[ns, US/Eastern]
```

The `.dt` accessor works for period and timedelta dtypes.

```
# period
In [49]: s = pd.Series(pd.period_range('20130101', periods=4, freq='D'))

In [50]: s
Out[50]:
  0  2013-01-01
  1  2013-01-02
  2  2013-01-03
  3  2013-01-04
Length: 4, dtype: period[D]
```

```
In [51]: s.dt.year
Out[51]:
  0  2013
  1  2013
  2  2013
  3  2013
Length: 4, dtype: int64
```
In [52]: s.dt.day
Out[52]:
0 1
1 2
2 3
3 4
Length: 4, dtype: int64

# timedelta
In [53]: s = pd.Series(pd.timedelta_range('1 day 00:00:05', periods=4, freq='s'))

In [54]: s
Out[54]:
0 1 days 00:00:05
1 1 days 00:00:06
2 1 days 00:00:07
3 1 days 00:00:08
Length: 4, dtype: timedelta64[ns]

In [55]: s.dt.days
Out[55]:
0 1
1 1
2 1
3 1
Length: 4, dtype: int64

In [56]: s.dt.seconds
Out[56]:
0 5
1 6
2 7
3 8
Length: 4, dtype: int64

In [57]: s.dt.components
Out[57]:

[4 rows x 7 columns]

**Timezone handling improvements**

- `tz_localize(None)` for tz-aware `Timestamp` and `DatetimeIndex` now removes timezone holding local time, previously this resulted in `Exception` or `TypeError` (GH7812)

In [58]: ts = pd.Timestamp('2014-08-01 09:00', tz='US/Eastern')

In [59]: ts
Out[59]: Timestamp('2014-08-01 09:00:00-0400', tz='US/Eastern')
• `tz_localize` now accepts the ambiguous keyword which allows for passing an array of bools indicating whether the date belongs in DST or not, ‘NaT’ for setting transition times to NaT, ‘infer’ for inferring DST/non-DST, and ‘raise’ (default) for an AmbiguousTimeError to be raised. See the docs for more details (GH7943)

• DataFrame.tz_localize and DataFrame.tz_convert now accepts an optional level argument for localizing a specific level of a MultiIndex (GH7846)

• Timestamp.tz_localize and Timestamp.tz_convert now raise TypeError in error cases, rather than Exception (GH8025)

• A timeseries/index localized to UTC when inserted into a Series/DataFrame will preserve the UTC timezone (rather than being a naive datetime64[ns]) as object dtype (GH8411)

• Timestamp.__repr__ displays dateutil.tz.tzoffset info (GH7907)

Rolling/expanding moments improvements

• `rolling_min()`, `rolling_max()`, `rolling_cov()`, and `rolling_corr()` now return objects with all NaN when `len(arg) < min_periods <= window` rather than raising. (This makes all rolling functions consistent in this behavior). (GH7766)

Prior to 0.15.0

• **New behavior**
• `rolling_max()`, `rolling_min()`, `rolling_sum()`, `rolling_mean()`, `rolling_median()`, `rolling_std()`, `rolling_var()`, `rolling_skew()`, `rolling_kurt()`, `rolling_quantile()`, `rolling_cov()`, `rolling_corr()`, `rolling_corr_pairwise()`, `rolling_window()` and `rolling_apply()` with `center=True` previously would return a result of the same structure as the input arg with NaN in the final \((window-1)/2\) entries.

Now the final \((window-1)/2\) entries of the result are calculated as if the input arg were followed by \((window-1)/2\) NaN values (or with shrinking windows, in the case of `rolling_apply()`). (GH7925, GH8269)

Prior behavior (note final value is NaN):

```python
In [7]: pd.rolling_sum(Series(range(4)), window=3, min_periods=0, center=True)
Out[7]:
0  1
1  3
2  6
3   NaN
dtype: float64
```

New behavior (note final value is \(5 = sum([2, 3, NaN])\)):

```python
In [7]: pd.rolling_sum(pd.Series(range(4)), window=3,...: min_periods=0, center=True)
Out[7]:
0  1
1  3
2  6
3   5
dtype: float64
```

• `rolling_window()` now normalizes the weights properly in rolling mean mode (`mean=True`) so that the calculated weighted means (e.g. ‘triang’, ‘gaussian’) are distributed about the same means as those calculated without weighting (i.e. ‘boxcar’). See the note on normalization for further details. (GH7618)

Behavior prior to 0.15.0:

```python
In [39]: pd.rolling_window(s, window=3, win_type='triang', center=True)
Out[39]:
0   NaN
1  6.583333
2  6.883333
3  6.683333
4   NaN
dtype: float64
```

New behavior
In [10]: pd.rolling_window(s, window=3, win_type='triang', center=True)
Out[10]:
0    NaN
1    9.875
2   10.325
3   10.025
4    NaN
dtype: float64

- Removed center argument from all expanding_ functions (see list), as the results produced when center=True did not make much sense. (GH7925)

- Added optional ddof argument to expanding_cov() and rolling_cov(). The default value of 1 is backwards-compatible. (GH8279)

- Documented the ddof argument to expanding_var(), expanding_std(), rolling_var(), and rolling_std(). These functions’ support of a ddof argument (with a default value of 1) was previously undocumented. (GH8064)

- ewma(), ewmstd(), ewmvol(), ewmvar(), ewmcov(), and ewmcorr() now interpret min_periods in the same manner that the rolling_*() and expanding_*() functions do: a given result entry will be NaN if the (expanding, in this case) window does not contain at least min_periods values. The previous behavior was to set to NaN the min_periods entries starting with the first non-NaN value. (GH7977)

  Prior behavior (note values start at index 2, which is min_periods after index 0 (the index of the first non-empty value)):

In [66]: s = pd.Series([1, None, None, None, 2, 3])

In [51]: ewma(s, com=3., min_periods=2)
Out[51]:
0    NaN
1    NaN
2   1.000000
3   1.000000
4   1.571429
5   2.189189
dtype: float64

New behavior (note values start at index 4, the location of the 2nd (since min_periods=2) non-empty value):

In [2]: pd.ewma(s, com=3., min_periods=2)
Out[2]:
0    NaN
1    NaN
2    NaN
3    NaN
4   1.759644
5   2.383784
dtype: float64

- ewmstd(), ewmvol(), ewmvar(), ewmcov(), and ewmcorr() now have an optional adjust argument, just like ewma() does, affecting how the weights are calculated. The default value of adjust is True, which is backwards-compatible. See Exponentially weighted moment functions for details. (GH7911)

- ewma(), ewmstd(), ewmvol(), ewmvar(), ewmcov(), and ewmcorr() now have an optional ignore_na argument. When ignore_na=False (the default), missing values are taken into account in
the weights calculation. When `ignore_na=True` (which reproduces the pre-0.15.0 behavior), missing values are ignored in the weights calculation. (GH7543)

```
In [7]: pd.ewma(pd.Series([None, 1., 8.]), com=2.)
Out[7]:
0  NaN
1  1.0
2  5.2
dtype: float64

In [8]: pd.ewma(pd.Series([1., None, 8.]), com=2.,
      ....: ignore_na=True)  # pre-0.15.0 behavior
Out[8]:
0  1.0
1  1.0
2  5.2
dtype: float64

In [9]: pd.ewma(pd.Series([1., None, 8.]), com=2.,
      ....: ignore_na=False)  # new default
Out[9]:
0  1.000000
1  1.000000
2  5.846154
dtype: float64
```

**Warning:** By default (`ignore_na=False`) the `ewm*()` functions’ weights calculation in the presence of missing values is different than in pre-0.15.0 versions. To reproduce the pre-0.15.0 calculation of weights in the presence of missing values one must specify explicitly `ignore_na=True`.

- Bug in `expanding_cov()`, `expanding_corr()`, `rolling_cov()`, `rolling_cor()`, `ewmcov()`, and `ewmcorr()` returning results with columns sorted by name and producing an error for non-unique columns; now handles non-unique columns and returns columns in original order (except for the case of two DataFrames with `pairwise=False`, where behavior is unchanged) (GH7542)
- Bug in `rolling_count()` and `expanding_*()` functions unnecessarily producing error message for zero-length data (GH8056)
- Bug in `rolling_apply()` and `expanding_apply()` interpreting `min_periods=0` as `min_periods=1` (GH8080)
- Bug in `expanding_std()` and `expanding_var()` for a single value producing a confusing error message (GH7900)
- Bug in `rolling_std()` and `rolling_var()` for a single value producing 0 rather than NaN (GH7900)
- Bug in `ewmstd()`, `ewmvol()`, `ewmvar()`, and `ewmcov()` calculation of de-biasing factors when `bias=False` (the default). Previously an incorrect constant factor was used, based on `adjust=True`, `ignore_na=True`, and an infinite number of observations. Now a different factor is used for each entry, based on the actual weights (analogous to the usual \( N/(N-1) \) factor). In particular, for a single point a value of NaNs is returned when `bias=False`, whereas previously a value of (approximately) 0 was returned.

For example, consider the following pre-0.15.0 results for `ewmvar(..., bias=False)`, and the corresponding debiasing factors:

```
In [67]: s = pd.Series([1., 2., 0., 4.])
```
Note that entry 0 is approximately 0, and the debiasing factors are a constant 1.25. By comparison, the following 0.15.0 results have a NaN for entry 0, and the debiasing factors are decreasing (towards 1.25):

```
In [14]: pd.ewmvar(s, com=2., bias=False)
Out[14]:
   0    NaN
   1  0.50000
   2  1.21052
   3  4.08969
dtype: float64

In [15]: pd.ewmvar(s, com=2., bias=False) / pd.ewmvar(s, com=2., bias=True)
Out[15]:
   0    NaN
   1  2.08333
   2  1.58333
   3  1.42544
dtype: float64
```

See *Exponentially weighted moment functions* for details. (GH7912)

### Improvements in the SQL IO module

- Added support for a `chunksize` parameter to `to_sql` function. This allows DataFrame to be written in chunks and avoid packet-size overflow errors (GH8062).
- Added support for a `chunksize` parameter to `read_sql` function. Specifying this argument will return an iterator through chunks of the query result (GH2908).
- Added support for writing `datetime.date` and `datetime.time` object columns with `to_sql` (GH6932).
- Added support for specifying a `schema` to read from/write to with `read_sql_table` and `to_sql` (GH7441, GH7952). For example:

  ```python
df.to_sql('table', engine, schema='other_schema') # noga F821
pd.read_sql_table('table', engine, schema='other_schema') # noga F821
```

- Added support for writing `NaN` values with `to_sql` (GH2754).
- Added support for writing `datetime64` columns with `to_sql` for all database flavors (GH7103).
Backwards incompatible API changes

Breaking changes

API changes related to Categorical (see [here](#) for more details):

- The Categorical constructor with two arguments changed from “codes/labels and levels” to “values and levels (now called ‘categories’)”. This can lead to subtle bugs. If you use Categorical directly, please audit your code by changing it to use the from_codes() constructor.

An old function call like (prior to 0.15.0):

```python
pd.Categorical([0,1,0,2,1], levels=['a', 'b', 'c'])
```

will have to adapted to the following to keep the same behaviour:

```python
pd.Categorical.from_codes([0,1,0,2,1], categories=['a', 'b', 'c'])
```

API changes related to the introduction of the Timedelta scalar (see above for more details):

- Prior to 0.15.0 to_timedelta() would return a Series for list-like/Series input, and a np.timedelta64 for scalar input. It will now return a TimedeltaIndex for list-like input, Series for Series input, and Timedelta for scalar input.

For API changes related to the rolling and expanding functions, see detailed overview above.

Other notable API changes:

- Consistency when indexing with .loc and a list-like indexer when no values are found.

```python
In [68]: df = pd.DataFrame([['a'], ['b']], index=[1, 2])
In [69]: df
Out[69]:
   0  1
0  a  
1  b  
[2 rows x 1 columns]
```

In prior versions there was a difference in these two constructs:

- `df.loc[[3]]` would return a frame reindexed by 3 (with all np.nan values)
- `df.loc[[3],:]` would raise KeyError.

Both will now raise a KeyError. The rule is that at least 1 indexer must be found when using a list-like and .loc (GH7999)

Furthermore in prior versions these were also different:

- `df.loc[[1,3]]` would return a frame reindexed by [1,3]
- `df.loc[[1,3],:]` would raise KeyError.

Both will now return a frame reindex by [1,3]. E.g.
In [3]: df.loc[[1, 3]]
Out[3]:
  0
  1   a
  3   NaN

In [4]: df.loc[[1, 3], :]
Out[4]:
  0
  1   a
  3   NaN

This can also be seen in multi-axis indexing with a Panel.

```python
>>> p = pd.Panel(np.arange(2 * 3 * 4).reshape(2, 3, 4),
...               items=['ItemA', 'ItemB'],
...               major_axis=[1, 2, 3],
...               minor_axis=['A', 'B', 'C', 'D'])
```
```
<class 'pandas.core.panel.Panel'>
Dimensions: 2 (items) x 3 (major_axis) x 4 (minor_axis)
Items axis: ItemA to ItemB
Major_axis axis: 1 to 3
Minor_axis axis: A to D
```

The following would raise KeyError prior to 0.15.0:

```python
In [5]:
Out[5]:
  ItemA  ItemD
  1      3   NaN
  2      7   NaN
  3     11   NaN
```

Furthermore, `.loc` will raise If no values are found in a MultiIndex with a list-like indexer:

```python
In [70]: s = pd.Series(np.arange(3, dtype='int64'),
...               index=pd.MultiIndex.from_product([['A'],
...                                                   ['foo', 'bar', 'baz']],
...                                                   names=['one', 'two'])).sort_index()
```
```
In [71]:
```
```python
    try:
        s.loc[['D']]
    except KeyError as e:
        print("KeyError: " + str(e))
```
```
    KeyError: "['D'] not in index"
```
• Assigning values to None now considers the dtype when choosing an ‘empty’ value (GH7941).

Previously, assigning to None in numeric containers changed the dtype to object (or errored, depending on the call). It now uses NaN:

```python
In [73]: s = pd.Series([1, 2, 3])
In [74]: s.loc[0] = None
In [75]: s
Out[75]:
   0     NaN
   1  2.0
   2  3.0
Length: 3, dtype: float64
```

NaT is now used similarly for datetime containers.

For object containers, we now preserve None values (previously these were converted to NaN values).

```python
In [76]: s = pd.Series(["a", "b", "c"])
In [77]: s.loc[0] = None
In [78]: s
Out[78]:
   0     None
   1     b
   2     c
Length: 3, dtype: object
```

To insert a NaN, you must explicitly use np.nan. See the docs.

• In prior versions, updating a pandas object in place would not reflect in other python references to this object. (GH8511, GH5104)

```python
In [79]: s = pd.Series([1, 2, 3])
In [80]: s2 = s
In [81]: s += 1.5
```

Behavior prior to v0.15.0

```python
# the original object
In [5]: s
Out[5]:
   0  2.5
   1  3.5
   2  4.5
dtype: float64

# a reference to the original object
In [7]: s2
Out[7]:
   0  1
   1  2
```

(continues on next page)
This is now the correct behavior

```python
# the original object
In [82]: s
Out[82]:
0    2.5
1    3.5
2    4.5
Length: 3, dtype: float64

# a reference to the original object
In [83]: s2
Out[83]:
0    2.5
1    3.5
2    4.5
Length: 3, dtype: float64
```

- Made both the C-based and Python engines for `read_csv` and `read_table` ignore empty lines in input as well as white space-filled lines, as long as `sep` is not white space. This is an API change that can be controlled by the keyword parameter `skip_blank_lines`. See the docs (GH4466)

- A timeseries/index localized to UTC when inserted into a Series/DataFrame will preserve the UTC timezone and inserted as object dtype rather than being converted to a naive `datetime64[ns]` (GH8411).

- Bug in passing a `DatetimeIndex` with a timezone that was not being retained in DataFrame construction from a dict (GH7822)

In prior versions this would drop the timezone, now it retains the timezone, but gives a column of object dtype:

```python
In [84]: i = pd.date_range('1/1/2011', periods=3, freq='10s', tz='US/Eastern')
In [85]: i
Out[85]: DatetimeIndex(['2011-01-01 00:00:00-05:00', '2011-01-01 00:00:10-05:00',
                      '2011-01-01 00:00:20-05:00'],
                      dtype='datetime64[ns, US/Eastern]', freq='10S')
In [86]: df = pd.DataFrame({'a': i})
In [87]: df
Out[87]:
   a
0  2011-01-01 00:00:00-05:00
1  2011-01-01 00:00:10-05:00
2  2011-01-01 00:00:20-05:00
[3 rows x 1 columns]
In [88]: df.dtypes
Out[88]:
a  datetime64[ns, US/Eastern]
Length: 1, dtype: object
```
Previously this would have yielded a column of `datetime64` dtype, but without timezone info.

The behaviour of assigning a column to an existing dataframe as `df['a'] = i` remains unchanged (this already returned an `object` column with a timezone).

- When passing multiple levels to `stack()`, it will now raise a `ValueError` when the levels aren’t all level names or all level numbers (GH7660). See Reshaping by stacking and unstacking.

- Raise a `ValueError` in `df.to_hdf` with ‘fixed’ format, if `df` has non-unique columns as the resulting file will be broken (GH7761)

- SettingWithCopy raise/warnings (according to the option `mode.chained_assignment`) will now be issued when setting a value on a sliced mixed-dtype DataFrame using chained-assignment. (GH7845, GH7950)

```python
In [1]: df = pd.DataFrame(np.arange(0, 9), columns=['count'])
In [2]: df['group'] = 'b'
In [3]: df.iloc[0:5]['group'] = 'a'
/usr/local/bin/ipython:1: SettingWithCopyWarning:
A value is trying to be set on a copy of a slice from a DataFrame.
Try using .loc[row_indexer,col_indexer] = value instead
See the caveats in the documentation: https://pandas.pydata.org/pandas-docs/stable/indexing.html#indexing-view-versus-copy
```

- `merge`, `DataFrame.merge`, and `ordered_merge` now return the same type as the left argument (GH737).

- Previously an enlargement with a mixed-dtype frame would act unlike `.append` which will preserve dtypes (related GH2578, GH8176):

```python
In [89]: df = pd.DataFrame([[True, 1], [False, 2]], columns=['female', 'fitness'])
In [90]: df
Out[90]:
   female  fitness
0   True     1
1  False     2
[2 rows x 2 columns]
In [91]: df.dtypes
Out[91]:
female    bool
fitness   int64
Length: 2, dtype: object
# dtypes are now preserved
In [93]: df
Out[93]:
   female  fitness
0   True     1
1  False     2
2  False     2
(continues on next page)
In [94]: df.dtypes
Out[94]:
female  bool
fitness  int64
Length: 2, dtype: object

Series.to_csv() now returns a string when path=None, matching the behaviour of DataFrame.to_csv() (GH8215).

read_hdf now raises IOError when a file that doesn’t exist is passed in. Previously, a new, empty file was created, and a KeyError raised (GH7715).

DataFrame.info() now ends its output with a newline character (GH8114)

Concatenating no objects will now raise a ValueError rather than a bare Exception.

Merge errors will now be sub-classes of ValueError rather than raw Exception (GH8501)

DataFrame.plot and Series.plot keywords are now have consistent orders (GH8037)

Internal refactoring

In 0.15.0 Index has internally been refactored to no longer sub-class ndarray but instead subclass PandasObject, similarly to the rest of the pandas objects. This change allows very easy sub-classing and creation of new index types. This should be a transparent change with only very limited API implications (GH5080, GH7439, GH7796, GH8024, GH8367, GH7997, GH8522):

• you may need to unpickle pandas version < 0.15.0 pickles using pd.read_pickle rather than pickle.load. See pickle docs

• when plotting with a PeriodIndex, the matplotlib internal axes will now be arrays of Period rather than a PeriodIndex (this is similar to how a DatetimeIndex passes arrays of datetimes now)

• MultiIndexes will now raise similarly to other pandas objects w.r.t. truth testing, see here (GH7897).

• When plotting a DatetimeIndex directly with matplotlib’s plot function, the axis labels will no longer be formatted as dates but as integers (the internal representation of a datetime64). UPDATE This is fixed in 0.15.1, see here.

Deprecations

• The attributes Categorical labels and levels attributes are deprecated and renamed to codes and categories.

• The outtype argument to pd.DataFrame.to_dict has been deprecated in favor of orient. (GH7840)

• The convert_dummies method has been deprecated in favor of get_dummies (GH8140)

• The infer_dst argument in tz_localize will be deprecated in favor of ambiguous to allow for more flexibility in dealing with DST transitions. Replace infer_dst=True with ambiguous='infer' for the same behavior (GH7943). See the docs for more details.

• The top-level pd.value_range has been deprecated and can be replaced by .describe() (GH8481)
• The Index set operations + and − were deprecated in order to provide these for numeric type operations on certain index types. + can be replaced by .union() or |, and − by .difference(). Further the method name Index.diff() is deprecated and can be replaced by Index.difference() (GH8226)

```python
# +
pd.Index(['a', 'b', 'c']) + pd.Index(['b', 'c', 'd'])

# should be replaced by
pd.Index(['a', 'b', 'c']).union(pd.Index(['b', 'c', 'd']))
```

```python
# −
pd.Index(['a', 'b', 'c']) - pd.Index(['b', 'c', 'd'])

# should be replaced by
pd.Index(['a', 'b', 'c']).difference(pd.Index(['b', 'c', 'd']))
```

• The infer_types argument to read_html() now has no effect and is deprecated (GH7762, GH7032).

Removal of prior version deprecations/changes

• Remove DataFrame.delevel method in favor of DataFrame.reset_index

Enhancements

Enhancements in the importing/exporting of Stata files:

• Added support for bool, uint8, uint16 and uint32 data types in to_stata (GH7097, GH7365)
• Added conversion option when importing Stata files (GH8527)
• DataFrame.to_stata and StataWriter check string length for compatibility with limitations imposed in dta files where fixed-width strings must contain 244 or fewer characters. Attempting to write Stata dta files with strings longer than 244 characters raises a ValueError. (GH7858)
• read_stata and StataReader can import missing data information into a DataFrame by setting the argument convert_missing to True. When using this options, missing values are returned as StataMissingValue objects and columns containing missing values have object data type. (GH8045)

Enhancements in the plotting functions:

• Added layout keyword to DataFrame.plot. You can pass a tuple of (rows, columns), one of which can be −1 to automatically infer (GH6667, GH8071).
• Allow to pass multiple axes to DataFrame.plot.hist and boxplot (GH5353, GH6970, GH7069)
• Added support for c, colormap and colorbar arguments for DataFrame.plot with kind='scatter' (GH7780)
• Histogram from DataFrame.plot with kind='hist' (GH7809), See the docs.
• Boxplot from DataFrame.plot with kind='box' (GH7998), See the docs.

Other:

• read_csv now has a keyword parameter float_precision which specifies which floating-point converter the C engine should use during parsing, see here (GH8002, GH8044)
• Added searchsorted method to Series objects (GH7447)
• `describe()` on mixed-types DataFrames is more flexible. Type-based column filtering is now possible via the include/exclude arguments. See the docs (GH8164).

```python
In [95]: df = pd.DataFrame({'catA': ['foo', 'foo', 'bar'] * 8,
                           'catB': ['a', 'b', 'c', 'd'] * 6,
                           'numC': np.arange(24),
                           'numD': np.arange(24.) + .5})

In [96]: df.describe(include=['object'])
Out[96]:
    catA  catB
   count  24  24
   unique  2  4
   top    foo  a
   freq  16  6

[4 rows x 2 columns]

In [97]: df.describe(include=['number', 'object'], exclude=['float'])
Out[97]:
    catA  catB  numC
   count  24  24 24.000000
   unique  2  4  NaN
   top    foo  a  NaN
   freq  16  6  NaN
   mean   NaN  NaN 11.500000
   std    NaN  NaN 11.500000
   min    NaN  NaN  0.000000
   25%   NaN  NaN  5.750000
   50%   NaN  NaN 11.500000
   75%   NaN  NaN 17.250000
   max   NaN  NaN 23.000000

[11 rows x 3 columns]

Requesting all columns is possible with the shorthand ‘all’

```python
In [98]: df.describe(include='all')
Out[98]:
    catA  catB  numC  numD
   count  24  24 24.000000 24.000000
   unique  2  4  NaN  NaN
   top    foo  a  NaN  NaN
   freq  16  6  NaN  NaN
   mean   NaN  NaN 11.500000 12.000000
   std    NaN  NaN 11.500000 11.500000
   min    NaN  NaN  0.000000  0.500000
   25%   NaN  NaN  5.750000  6.250000
   50%   NaN  NaN 11.500000 12.000000
   75%   NaN  NaN 17.250000 17.750000
   max   NaN  NaN 23.000000 23.500000

[11 rows x 4 columns]
```

Without those arguments, `describe` will behave as before, including only numerical columns or, if none are, only categorical columns. See also the docs

• Added `split` as an option to the `orient` argument in `pd.DataFrame.to_dict`. (GH7840)
• The `get_dummies` method can now be used on DataFrames. By default only categorical columns are encoded as 0’s and 1’s, while other columns are left untouched.

```python
In [99]: df = pd.DataFrame({'A': ['a', 'b', 'a'], 'B': ['c', 'c', 'b'],
                      'C': [1, 2, 3]})

In [100]: pd.get_dummies(df)
Out[100]:
        C  A_a  A_b  B_b  B_c
0     1    1    0    0    1
1     2    0    1    0    1
2     3    1    0    1    0
[3 rows x 5 columns]
```

• `PeriodIndex` supports resolution as the same as `DatetimeIndex` (GH7708)

• `pandas.tseries.holiday` has added support for additional holidays and ways to observe holidays (GH7070)

• `pandas.tseries.holiday.Holiday` now supports a list of offsets in Python3 (GH7070)

• `pandas.tseries.holiday.Holiday` now supports a `days_of_week` parameter (GH7070)

• `GroupBy.nth()` now supports selecting multiple nth values (GH7910)

```python
In [101]: business_dates = pd.date_range(start='4/1/2014', end='6/30/2014', freq='B')

In [102]: df = pd.DataFrame(1, index=business_dates, columns=['a', 'b'])

# get the first, 4th, and last date index for each month
In [103]: df.groupby([df.index.year, df.index.month]).nth([0, 3, -1])
Out[103]:
    a    b
2014 4 1 1
    4 1 1
    4 1 1
    5 1 1
    5 1 1
    5 1 1
    6 1 1
    6 1 1
    6 1 1
[9 rows x 2 columns]
```

• `Period` and `PeriodIndex` supports addition/subtraction with timedelta-likes (GH7966)

If `Period` freq is D, H, T, S, L, U, N, Timedelta-like can be added if the result can have same freq. Otherwise, only the same offsets can be added.

```python
In [104]: idx = pd.period_range('2014-07-01 09:00', periods=5, freq='H')

In [105]: idx
Out[105]:
PeriodIndex(['2014-07-01 09:00', '2014-07-01 10:00', '2014-07-01 11:00',
            '2014-07-01 12:00', '2014-07-01 13:00'],
Freq='H')
```

(continues on next page)
In [106]: idx + pd.offsets.Hour(2)
Out[106]:
PeriodIndex(['2014-07-01 11:00', '2014-07-01 12:00', '2014-07-01 13:00',
           '2014-07-01 14:00', '2014-07-01 15:00'],
dtype='period[H]')

In [107]: idx + pd.Timedelta('120m')
Out[107]:
PeriodIndex(['2014-07-01 11:00', '2014-07-01 12:00', '2014-07-01 13:00',
           '2014-07-01 14:00', '2014-07-01 15:00'],
dtype='period[H]')

In [108]: idx = pd.period_range('2014-07', periods=5, freq='M')
In [109]: idx
Out[109]:
dtype='period[M]')

In [110]: idx + pd.offsets.MonthEnd(3)
Out[110]:
dtype='period[M]')

- Added experimental compatibility with openpyxl for versions >= 2.0. The DataFrame.to_excel method engine keyword now recognizes openpyxl1 and openpyxl2 which will explicitly require openpyxl v1 and v2 respectively, failing if the requested version is not available. The openpyxl engine is a now a meta-engine that automatically uses whichever version of openpyxl is installed. (GH7177)

- DataFrame.fillna can now accept a DataFrame as a fill value (GH8377)

- Passing multiple levels to stack() will now work when multiple level numbers are passed (GH7660). See Reshaping by stacking and unstacking.

- set_names(), set_labels(), and set_levels() methods now take an optional level keyword argument to all modification of specific level(s) of a MultiIndex. Additionally set_names() now accepts a scalar string value when operating on an Index or on a specific level of a MultiIndex (GH7792)
MultiIndex([('a', 0, 'p'), ('a', 0, 'q'), ('a', 0, 'r'), ('a', 1, 'p'), ('a', 1, 'q'), ('a', 1, 'r'), ('a', 2, 'p'), ('a', 2, 'q'), ('a', 2, 'r')], names=['qux', 'corge', 'baz'])

In [114]: idx.set_levels(['a', 'b', 'c'], level='bar')
Out[114]:
MultiIndex([('a', 'a', 'p'), ('a', 'a', 'q'), ('a', 'a', 'r'), ('a', 'b', 'p'), ('a', 'b', 'q'), ('a', 'b', 'r'), ('a', 'c', 'p'), ('a', 'c', 'q'), ('a', 'c', 'r')], names=['foo', 'bar', 'baz'])

In [115]: idx.set_levels([[a, b, c], [1, 2, 3]], level=[1, 2])
Out[115]:
MultiIndex([('a', 'a', 1), ('a', 'a', 2), ('a', 'a', 3), ('a', 'b', 1), ('a', 'b', 2), ('a', 'b', 3), ('a', 'c', 1), ('a', 'c', 2), ('a', 'c', 3)], names=['foo', 'bar', 'baz'])

• Index.isin now supports a level argument to specify which index level to use for membership tests (GH7892, GH7890)

In [1]: idx = pd.MultiIndex.from_product([0, 1, [a, b, c]])

In [2]: idx.values
Out[2]: array([(0, 'a'), (0, 'b'), (0, 'c'), (1, 'a'), (1, 'b'), (1, 'c')], _
          dtype=object)

In [3]: idx.isin(['a', 'c', 'e'], level=1)
Out[3]: array([ True, False, True, True, False, True], dtype=bool)

• Index now supports duplicated and drop_duplicates. (GH4060)

In [116]: idx = pd.Index([1, 2, 3, 4, 1, 2])

In [117]: id
Out[117]: Int64Index([1, 2, 3, 4, 1, 2], dtype='int64')

(continues on next page)
pandas: powerful Python data analysis toolkit, Release 1.3.1

In [118]: idx.duplicated()
Out[118]: array([False, False, False, False, True, True])

In [119]: idx.drop_duplicates()
Out[119]: Int64Index([1, 2, 3, 4], dtype='int64')

- add copy=True argument to pd.concat to enable pass through of complete blocks (GH8252)
- Added support for numpy 1.8+ data types (bool_, int_, float_, string_) for conversion to R dataframe (GH8400)

Performance

- Performance improvements in DatetimeIndex.__iter__ to allow faster iteration (GH7683)
- Performance improvements in Period creation (and PeriodIndex setitem) (GH5155)
- Improvements in Series.transform for significant performance gains (revised) (GH6496)
- Performance improvements in StataReader when reading large files (GH8040, GH8073)
- Performance improvements in StataWriter when writing large files (GH8079)
- Performance and memory usage improvements in multi-key groupby (GH8128)
- Performance improvements in groupby .agg and .apply where builtins max/min were not mapped to numpy/cythonized versions (GH7722)
- Performance improvement in writing to sql (to_sql) of up to 50% (GH8208).
- Performance benchmarking of groupby for large value of ngroups (GH6787)
- Performance improvement in CustomBusinessDay,CustomBusinessMonth (GH8236)
- Performance improvement for MultiIndex.values for multi-level indexes containing datetimes (GH8543)

Bug fixes

- Bug in pivot_table, when using margins and a dict aggfunc (GH8349)
- Bug in read_csv where squeeze=True would return a view (GH8217)
- Bug in checking of table name in read_sql in certain cases (GH7826).
- Bug in DataFrame.groupby where Grouper does not recognize level when frequency is specified (GH7885)
- Bug in multiindexes dtypes getting mixed up when DataFrame is saved to SQL table (GH8021)
- Bug in Series 0-division with a float and integer operand dtypes (GH7785)
- Bug in Series.astype("unicode") not calling unicode on the values correctly (GH7758)
- Bug in DataFrame.as_matrix() with mixed datetime64[ns] and timedelta64[ns] dtypes (GH7778)
- Bug in HDFStore.select_column() not preserving UTC timezone info when selecting a DatetimeIndex (GH7777)
- Bug in to_datetime when format='Y%m%d' and coerce=True are specified, where previously an object array was returned (rather than a coerced time-series with NaT), (GH7930)
• Bug in DatetimeIndex and PeriodIndex in-place addition and subtraction cause different result from normal one (GH6527)
• Bug in adding and subtracting PeriodIndex with PeriodIndex raise TypeError (GH7741)
• Bug in combine_first with PeriodIndex data raises TypeError (GH3367)
• Bug in MultiIndex slicing with missing indexers (GH7866)
• Bug in MultiIndex slicing with various edge cases (GH8132)
• Regression in MultiIndex indexing with a non-scalar type object (GH7914)
• Bug in Timestamp comparisons with == and int64 dtype (GH8058)
• Bug in pickles contains DateOffset may raise AttributeError when normalize attribute is referred internally (GH7748)
• Bug in Panel when using major_xs and copy=False is passed (deprecation warning fails because of missing warnings) (GH8152).
• Bug in pickle deserialization that failed for pre-0.14.1 containers with dup items trying to avoid ambiguity when matching block and manager items, when there’s only one block there’s no ambiguity (GH7794)
• Bug in putting a PeriodIndex into a Series would convert to int64 dtype, rather than object of Periods (GH7932)
• Bug in HDFStore iteration when passing a where (GH8014)
• Bug in DataFrameGroupby.transform when transforming with a passed non-sorted key (GH8046, GH8430)
• Bug in repeated timeseries line and area plot may result in ValueError or incorrect kind (GH7733)
• Bug in inference in a MultiIndex with datetime.date inputs (GH7788)
• Bug in get where an IndexError would not cause the default value to be returned (GH7725)
• Bug in offsets.apply, rollforward and rollback may reset nanosecond (GH7697)
• Bug in offsets.apply, rollforward and rollback may raise AttributeError if Timestamp has dateutil tzinfo (GH7697)
• Bug in sorting a MultiIndex frame with a Float64Index (GH8017)
• Bug in inconsistent panel setitem with a rhs of a DataFrame for alignment (GH7763)
• Bug in is_superperiod and is_subperiod cannot handle higher frequencies than S (GH7760, GH7772, GH7803)
• Bug in 32-bit platforms with Series.shift (GH8129)
• Bug in PeriodIndex.unique returns int64 np.ndarray (GH7540)
• Bug in groupby.apply with a non-affecting mutation in the function (GH8467)
• Bug in DataFrame.reset_index which has MultiIndex contains PeriodIndex or DatetimeIndex with tz raises ValueError (GH7746, GH7793)
• Bug in DataFrame.plot with subplots=True may draw unnecessary minor xticks and yticks (GH7801)
• Bug in StataReader which did not read variable labels in 117 files due to difference between Stata documentation and implementation (GH7816)
• Bug in StataReader where strings were always converted to 244 characters-fixed width irrespective of underlying string size (GH7858)
• Bug in DataFrame.plot and Series.plot may ignore rot and fontsize keywords (GH7844)
- Bug in `DatetimeIndex.value_counts` doesn’t preserve tz (GH7735)
- Bug in `PeriodIndex.value_counts` results in `Int64Index` (GH7735)
- Bug in `DataFrame.join` when doing left join on index and there are multiple matches (GH5391)
- Bug in `GroupBy.transform()` where int groups with a transform that didn’t preserve the index were incorrectly truncated (GH7972).
- Bug in `groupby` where callable objects without name attributes would take the wrong path, and produce a `DataFrame` instead of a `Series` (GH7929)
- Bug in `groupby` error message when a DataFrame grouping column is duplicated (GH7511)
- Bug in `read_html` where the `infer_types` argument forced coercion of date-likes incorrectly (GH7762, GH7032).
- Bug in `Series.str.cat` with an index which was filtered as to not include the first item (GH7857)
- Bug in `Timestamp` cannot parse nanosecond from string (GH7878)
- Bug in `Timestamp` with string offset and tz results incorrect (GH7833)
- Bug in `tslib.tz_convert` and `tslib.tz_convert_single` may return different results (GH7798)
- Bug in `DatetimeIndex.intersection` of non-overlapping timestamps with tz raises `IndexError` (GH7880)
- Bug in alignment with TimeOps and non-unique indexes (GH8363)
- Bug in `GroupBy.filter()` where fast path vs. slow path made the filter return a non scalar value that appeared valid but wasn’t (GH7870).
- Bug in `date_range()`/`DatetimeIndex()` when the timezone was inferred from input dates yet incorrect times were returned when crossing DST boundaries (GH7835, GH7901).
- Bug in `to_excel()` where a negative sign was being prepended to positive infinity and was absent for negative infinity (GH7949)
- Bug in area plot draws legend with incorrect alpha when `stacked=True` (GH8027)
- `Period` and `PeriodIndex` addition/subtraction with `np.timedelta64` results in incorrect internal representations (GH7740)
- Bug in `Holiday` with no offset or observance (GH7987)
- Bug in `DataFrame.to_latex` formatting when columns or index is a `MultiIndex` (GH7982).
- Bug in `DateOffset` around Daylight Savings Time produces unexpected results (GH5175).
- Bug in `DataFrame.shift` where empty columns would throw `ZeroDivisionError` on numpy 1.7 (GH8019)
- Bug in installation where `html_encoding/*.html` wasn’t installed and therefore some tests were not running correctly (GH7927).
- Bug in `read_html` where bytes objects were not tested for in `_read` (GH7927).
- Bug in `DataFrame.stack()` when one of the column levels was a datelike (GH8039)
- Bug in broadcasting numpy scalars with `DataFrame` (GH8116)
- Bug in `pivot_table` performed with nameless index and columns raises `KeyError` (GH8103)
- Bug in `DataFrame.plot(kind='scatter')` draws points and errorbars with different colors when the color is specified by `c` keyword (GH8081)
- Bug in `Float64Index` where `iat` and `at` were not testing and were failing (GH8092).
- Bug in `DataFrame.boxplot()` where y-limits were not set correctly when producing multiple axes (GH7528, GH5517).
- Bug in `read_csv` where line comments were not handled correctly given a custom line terminator or `delim_whitespace=True` (GH8122).
- Bug in `read_html` where empty tables caused a `StopIteration` (GH7575).
- Bug in casting when setting a column in a same-dtype block (GH7704).
- Bug in accessing groups from a `GroupBy` when the original grouper was a tuple (GH8121).
- Bug in `.at` that would accept integer indexers on a non-integer index and do fallback (GH7814).
- Bug with `kde` plot and NaNs (GH8182).
- Bug in `GroupBy.count` with float32 data type were nan values were not excluded (GH8169).
- Bug with stacked barplots and NaNs (GH8175).
- Bug in resample with non evenly divisible offsets (e.g. ‘7s’) (GH8371).
- Bug in interpolation methods with the `limit` keyword when no values needed interpolating (GH7173).
- Bug where `col_space` was ignored in `DataFrame.to_string()` when `header=False` (GH8230).
- Bug with `DatetimeIndex.asof` incorrectly matching partial strings and returning the wrong date (GH8245).
- Bug in plotting methods modifying the global matplotlib rcParams (GH8242).
- Bug in `DataFrame.__setitem__` that caused errors when setting a dataframe column to a sparse array (GH8131).
- Bug where `Dataframe.boxplot()` failed when entire column was empty (GH8181).
- Bug with messed variables in `radviz` visualization (GH8199).
- Bug in interpolation methods with the `limit` keyword when no values needed interpolating (GH7173).
- Bug where `col_space` was ignored in `DataFrame.to_string()` when `header=False` (GH8230).
- Bug in `to_clipboard` that would clip long column data (GH8305).
- Bug in `DataFrame` terminal display: Setting `max_column/max_rows` to zero did not trigger auto-resizing of dfs to fit terminal width/height (GH7180).
- Bug in OLS where running with “cluster” and “nw_lags” parameters did not work correctly, but also did not throw an error (GH8584).
- Bug in `DataFrame.dropna` that interpreted non-existent columns in the subset argument as the ‘last column’ (GH8303).
- Bug in `Index.intersection` on non-monotonic non-unique indexes (GH8362).
- Bug in masked series assignment where mismatching types would break alignment (GH8387).
- Bug in `NDFrame.equals` gives false negatives with `dtype=object` (GH8437).
- Bug in assignment with indexer where type diversity would break alignment (GH8258).
- Bug in `NDFrame.loc` indexing when row/column names were lost when target was a list/ndarray (GH6552).
- Regression in `NDFrame.loc` indexing when rows/columns were converted to Float64Index if target was an empty list/ndarray (GH7774).
- Bug in `Series` that allows it to be indexed by a `DataFrame` which has unexpected results. Such indexing is no longer permitted (GH8444).
• Bug in item assignment of a DataFrame with MultiIndex columns where right-hand-side columns were not aligned (GH7655)

• Suppress FutureWarning generated by NumPy when comparing object arrays containing NaN for equality (GH7065)

• Bug in DataFrame.eval() where the dtype of the not operator (~) was not correctly inferred as bool.

5.16 Version 0.14

5.16.1 Version 0.14.1 (July 11, 2014)

This is a minor release from 0.14.0 and includes a small number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

- Highlights include:
  - New methods `select_dtypes()` to select columns based on the dtype and `sem()` to calculate the standard error of the mean.
  - Support for dateutil timezones (see `docs`).
  - Support for ignoring full line comments in the `read_csv()` text parser.
  - New documentation section on `Options and Settings`.
  - Lots of bug fixes.

- Enhancements
- API Changes
- Performance Improvements
- Experimental Changes
- Bug Fixes
API changes

- Openpyxl now raises a ValueError on construction of the openpyxl writer instead of warning on pandas import (GH7284).

- For `StringMethods.extract`, when no match is found, the result - only containing `NaN` values - now also has `dtype=object` instead of `float` (GH7242).

- Period objects no longer raise a `TypeError` when compared using `==` with another object that isn’t a Period. Instead when comparing a Period with another object using `==` if the other object isn’t a Period False is returned. (GH7376)

- Previously, the behaviour on resetting the time or not in `offsets.apply`, `rollforward` and `rollback` operations differed between offsets. With the support of the `normalize` keyword for all offsets(see below) with a default value of False (preserve time), the behaviour changed for certain offsets (BusinessMonthBegin, MonthEnd, BusinessMonthEnd, CustomBusinessMonthEnd, BusinessYearBegin, LastWeekOfMonth, FY5253Quarter, LastWeekOfMonth, Easter):

```python
In [6]: from pandas.tseries import offsets

In [7]: d = pd.Timestamp('2014-01-01 09:00')

# old behaviour < 0.14.1
In [8]: d + offsets.MonthEnd()
Out[8]: pd.Timestamp('2014-01-31 00:00:00')

Starting from 0.14.1 all offsets preserve time by default. The old behaviour can be obtained with `normalize=True`

```python
# new behaviour
In [1]: d + offsets.MonthEnd()
Out[1]: Timestamp('2014-01-31 09:00:00')

In [2]: d + offsets.MonthEnd(normalize=True)
Out[2]: Timestamp('2014-01-31 00:00:00')
```

Note that for the other offsets the default behaviour did not change.

- Add back `#N/A N/A` as a default NA value in text parsing. (regression from 0.12) (GH5521)

- Raise a `TypeError` on inplace-setting with a `.where` and a non `np.nan` value as this is inconsistent with a set-item expression like `df[mask] = None` (GH7656)

Enhancements

- Add `dropna` argument to `value_counts` and `nunique` (GH5569).

- Add `select_dtypes()` method to allow selection of columns based on dtype (GH7316). See the docs.

- All offsets supports the `normalize` keyword to specify whether `offsets.apply`, `rollforward` and `rollback` resets the time (hour, minute, etc) or not (default `False`, preserves time) (GH7156):

```python
import pandas.tseries.offsets as offsets
day = offsets.Day()
day.apply(pd.Timestamp("2014-01-01 09:00"))

day = offsets.Day(normalize=True)
day.apply(pd.Timestamp("2014-01-01 09:00"))
```
• PeriodIndex is represented as the same format as DatetimeIndex (GH7601)

• StringMethods now work on empty Series (GH7242)

• The file parsers read_csv and read_table now ignore line comments provided by the parameter comment, which accepts only a single character for the C reader. In particular, they allow for comments before file data begins (GH2685)

• Add NotImplementedError for simultaneous use of chunksize and nrows for read_csv() (GH6774).

• Tests for basic reading of public S3 buckets now exist (GH7281).

• read_html now sports an encoding argument that is passed to the underlying parser library. You can use this to read non-ascii encoded web pages (GH7323).

• read_excel now supports reading from URLs in the same way that read_csv does. (GH6809)

• Support for dateutil timezones, which can now be used in the same way as pytz timezones across pandas. (GH4688)

```
In [3]: rng = pd.date_range(
...:     "3/6/2012 00:00", periods=10, freq="D", tz="dateutil/Europe/London"
...:     )
...:

In [4]: rng.tz
Out[4]: tzfile('/usr/share/zoneinfo/Europe/London')
```

See the docs.

• Implemented sem (standard error of the mean) operation for Series, DataFrame, Panel, and Groupby (GH6897)

• Add nlargest and nsmallest to the Series groupby allowlist, which means you can now use these methods on a SeriesGroupBy object (GH7053).

• All offsets apply, rollforward and rollback can now handle np.datetime64, previously results in ApplyTypeError (GH7452)

• Period and PeriodIndex can contain NaT in its values (GH7485)

• Support pickling Series, DataFrame and Panel objects with non-unique labels along item axis (index, columns and items respectively) (GH7370).

• Improved inference of datetime/timedelta with mixed null objects. Regression from 0.13.1 in interpretation of an object Index with all null elements (GH7431)

**Performance**

• Improvements in dtype inference for numeric operations involving yielding performance gains for dtypes: int64, timedelta64, datetime64 (GH7223)

• Improvements in Series.transform for significant performance gains (GH6496)

• Improvements in DataFrame.transform with ufuncs and built-in grouper functions for significant performance gains (GH7383)

• Regression in groupby aggregation of datetime64 dtypes (GH7555)

• Improvements in MultiIndex.from_product for large iterables (GH7627)
Experimental

- `pandas.io.data.Options` has a new method, `get_all_data` method, and now consistently returns a `MultiIndexed DataFrame` (GH5602)

- `io.gbq.read_gbq` and `io.gbq.to_gbq` were refactored to remove the dependency on the Google `bq.py` command line client. This submodule now uses `httplib2` and the Google `apiclient` and `oauth2client` API client libraries which should be more stable and, therefore, reliable than `bq.py`. See the docs. (GH6937).

Bug fixes

- Bug in `DataFrame.where` with a symmetric shaped frame and a passed other of a DataFrame (GH7506)
- Bug in Panel indexing with a MultiIndex axis (GH7516)
- Regression in datetimelike slice indexing with a duplicated index and non-exact end-points (GH7523)
- Bug in setitem with list-of-lists and single vs mixed types (GH7551)
- Bug in time ops with non-aligned Series (GH7500)
- Bug in timedelta inference when assigning an incomplete Series (GH7592)
- Bug in groupby `.nth` with a Series and integer-like column name (GH7559)
- Bug in `Series.get` with a boolean accessor (GH7407)
- Bug in `value_counts` where `NaT` did not qualify as missing (`NaN`) (GH7423)
- Bug in `to_timedelta` that accepted invalid units and misinterpreted ‘m/h’ (GH7611, GH6423)
- Bug in line plot doesn’t set correct `xlim` if `secondary_y=True` (GH7459)
- Bug in grouped `hist` and `scatter` plots use old `figsize` default (GH7394)
- Bug in plotting subplots with `DataFrame.plot.hist` clears passed `ax` even if the number of subplots is one (GH7391).
- Bug in plotting subplots with `DataFrame.boxplot` with `by` kw raises `ValueError` if the number of subplots exceeds 1 (GH7391).
- Bug in subplots displays `ticklabels` and `labels` in different rule (GH5897)
- Bug in `Panel.apply` with a MultiIndex as an axis (GH7469)
- Bug in `DatetimeIndex.insert` doesn’t preserve name and `tz` (GH7299)
- Bug in `DatetimeIndex.asobject` doesn’t preserve name (GH7299)
- Bug in MultiIndex slicing with datetimelike ranges (strings and Timestamps), (GH7429)
- Bug in `Index.min` and `max` doesn’t handle `nan` and `NaT` properly (GH7261)
- Bug in `PeriodIndex.min/max` results in `int` (GH7609)
- Bug in `resample` where `fill_method` was ignored if you passed `how` (GH2073)
- Bug in `TimeGrouper` doesn’t exclude column specified by `key` (GH7227)
- Bug in `DataFrame` and `Series` `bar` and `barh` plot raises `TypeError` when `bottom` and `left` keyword is specified (GH7226)
- Bug in `DataFrame.hist` raises `TypeError` when it contains non numeric column (GH7277)
- Bug in `Index.delete` does not preserve `name` and `freq` attributes (GH7302)
pandas: powerful Python data analysis toolkit, Release 1.3.1

- Bug in DataFrame.query() where local string variables with the @ sign were being treated as temporaries attempting to be deleted (GH7300).
- Bug in Float64Index which didn’t allow duplicates (GH7149).
- Bug in DataFrame.replace() where truthy values were being replaced (GH7140).
- Bug in StringMethods.extract() where a single match group Series would use the matcher’s name instead of the group name (GH7313).
- Bug in isnull() when mode.use_inf_as_null == True where isnull wouldn’t test True when it encountered an inf/-inf (GH7315).
- Bug in inferred_freq results in None for eastern hemisphere timezones (GH7310)
- Bug in Easter returns incorrect date when offset is negative (GH7195)
- Bug in broadcasting with .div. integer dtypes and divide-by-zero (GH7325)
- Bug in CustomBusinessDay.apply raises NameError when np.datetime64 object is passed (GH7196)
- Bug in MultiIndex.append, concat and pivot_table don’t preserve timezone (GH6606)
- Bug in .loc with a list of indexers on a single-multi index level (that is not nested) (GH7349)
- Bug in Series.map when mapping a dict with tuple keys of different lengths (GH7333)
- Bug all StringMethods now work on empty Series (GH7242)
- Fix delegation of read_sql to read_sql_query when query does not contain `select` (GH7324).
- Bug where a string column name assignment to a DataFrame with a Float64Index raised a TypeError during a call to np.isnan (GH7366).
- Bug where NDFrame.replace() didn’t correctly replace objects with Period values (GH7379).
- Bug in .ix getitem should always return a Series (GH7150)
- Bug in MultiIndex slicing with incomplete indexers (GH7399)
- Bug in MultiIndex slicing with a step in a sliced level (GH7400)
- Bug where negative indexers in DatetimeIndex were not correctly sliced (GH7408)
- Bug where NaT wasn’t repr’d correctly in a MultiIndex (GH7406, GH7409).
- Bug where bool objects were converted to nan in convert_objects (GH7416).
- Bug in quantile ignoring the axis keyword argument (GH7306)
- Bug where nanops._maybe_null_out doesn’t work with complex numbers (GH7353)
- Bug in several nanops functions when axis==0 for 1-dimensional nan arrays (GH7354)
- Bug where nanops.nanmedian doesn’t work when axis==None (GH7352)
- Bug where nanops._has_infs doesn’t work with many dtypes (GH7357)
- Bug in StataReader.data where reading a 0-observation dta failed (GH7369)
- Bug in StataReader when reading Stata 13 (117) files containing fixed width strings (GH7360)
- Bug in StataWriter where encoding was ignored (GH7286)
- Bug in DatetimeIndex comparison doesn’t handle NaT properly (GH7529)
- Bug in passing input with tzinfo to some offsets apply, rollforward or rollback resets tzinfo or raises ValueError (GH7465)
• Bug in `DatetimeIndex.to_period`, `PeriodIndex.asobject`, `PeriodIndex.to_timestamp` 
doesn’t preserve name (GH7485)
• Bug in `DatetimeIndex.to_period` and `PeriodIndex.to_timestamp` handle NaT incorrectly 
(GH7228)
• Bug in `offsets.apply`, `rollforward` and `rollback` may return normal datetime (GH7502)
• Bug in `resample` raises `ValueError` when target contains NaT (GH7227)
• Bug in `Timestamp.tz_localize` resets nanosecond info (GH7534)
• Bug in `DatetimeIndex.asobject` raises `ValueError` when it contains NaT (GH7539)
• Bug in `Timestamp.__new__` doesn’t preserve nanosecond properly (GH7610)
• Bug in `Index.astype(float)` where it would return an object dtype Index (GH7464).
• Bug in `DataFrame.reset_index` loses tz (GH3950)
• Bug in `DatetimeIndex.freqstr` raises `AttributeError` when `freq` is `None` (GH7606)
• Bug in `GroupBy.size` created by `TimeGrouper` raises `AttributeError` (GH7453)
• Bug in single column bar plot is misaligned (GH7498).
• Bug in area plot with tz-aware time series raises `ValueError` (GH7471)
• Bug in non-monotonic `Index.union` may preserve name incorrectly (GH7458)
• Bug in `DatetimeIndex.intersection` doesn’t preserve timezone (GH4690)
• Bug in `rolling_var` where a window larger than the array would raise an error (GH7297)
• Bug with last plotted timeseries dictating `xlim` (GH2960)
• Bug with `secondary_y` axis not being considered for timeseries `xlim` (GH3490)
• Bug in `Float64Index` assignment with a non scalar indexer (GH7586)
• Bug in `pandas.core.strings.str_contains` does not properly match in a case insensitive fashion 
when `regex=False` and `case=False` (GH7505)
• Bug in `expanding_cov`, `expanding_corr`, `rolling_cov`, and `rolling_corr` for two arguments 
with mismatched index (GH7512)
• Bug in `to_sql` taking the boolean column as text column (GH7678)
• Bug in grouped `hist` doesn’t handle `rot` kw and `sharex` kw properly (GH7234)
• Bug in `.loc` performing fallback integer indexing with object dtype indices (GH7496)
• Bug (regression) in `PeriodIndex constructor` when passed `Series` objects (GH7701).

5.16.2 Version 0.14.0 (May 31, 2014)

This is a major release from 0.13.1 and includes a small number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

- Highlights include:
  - Officially support Python 3.4
  - SQL interfaces updated to use SQLAlchemy, See Here.
  - Display interface changes, See Here
  - MultiIndexing Using Slicers, See Here.
  - Ability to join a singly-indexed DataFrame with a MultiIndexed DataFrame, see Here
  - More consistency in groupby results and more flexible groupby specifications, See Here
  - Holiday calendars are now supported in CustomBusinessDay, see Here
  - Several improvements in plotting functions, including: hexbin, area and pie plots, see Here.
  - Performance doc section on I/O operations, See Here

- Other Enhancements
- API Changes
- Text Parsing API Changes
- Groupby API Changes
- Performance Improvements
- Prior Deprecations
- Deprecations
- Known Issues
- Bug Fixes

**Warning:** In 0.14.0 all NDFrame based containers have undergone significant internal refactoring. Before that each block of homogeneous data had its own labels and extra care was necessary to keep those in sync with the parent container’s labels. This should not have any visible user/API behavior changes (GH6745)
API changes

- **read_excel** uses 0 as the default sheet (GH6573)

- **iloc** will now accept out-of-bounds indexers for slices, e.g. a value that exceeds the length of the object being indexed. These will be excluded. This will make pandas conform more with python/numpy indexing of out-of-bounds values. A single indexer that is out-of-bounds and drops the dimensions of the object will still raise IndexError (GH6296, GH6299). This could result in an empty axis (e.g. an empty DataFrame being returned).

```
In [1]: dfl = pd.DataFrame(np.random.randn(5, 2), columns=list('AB'))
In [2]: dfl
Out[2]:
      A         B
0  0.469112 -0.282863
1 -1.509059 -1.135632
2  1.212112 -0.173215
3  0.119209 -1.044236
4 -0.861849 -2.104569
[5 rows x 2 columns]
In [3]: dfl.iloc[:, 2:3]
Out[3]:
Empty DataFrame
Columns: []
Index: [0, 1, 2, 3, 4]
[5 rows x 0 columns]
In [4]: dfl.iloc[:, 1:3]
Out[4]:
    B
0  -0.282863
1  -1.135632
2  -0.173215
3  -1.044236
4   -2.104569
[5 rows x 1 columns]
In [5]: dfl.iloc[4:6]
Out[5]:
       A         B
4  0.861849 -2.104569
[1 rows x 2 columns]
```

These are out-of-bounds selections

```
>>> dfl.iloc[[4, 5, 6]]
IndexError: positional indexers are out-of-bounds

>>> dfl.iloc[:, 4]
IndexError: single positional indexer is out-of-bounds
```

- Slicing with negative start, stop & step values handles corner cases better (GH6531):
- `df.iloc[:-len(df)]` is now empty
- `df.iloc[len(df)::-1]` now enumerates all elements in reverse

- The `DataFrame.interpolate()` keyword `downcast` default has been changed from `infer` to `None`. This is to preserve the original dtype unless explicitly requested otherwise (GH6290).

- When converting a dataframe to HTML it used to return `Empty DataFrame`. This special case has been removed, instead a header with the column names is returned (GH6062).

- Series and Index now internally share more common operations, e.g. `factorize()`, `nunique()`, `value_counts()` are now supported on Index types as well. The `Series.weekday` property from is removed from Series for API consistency. Using a `DatetimeIndex/PeriodIndex` method on a Series will now raise a `TypeError` (GH4551, GH4056, GH5519, GH6380, GH7206).

- Add `is_month_start`, `is_month_end`, `is_quarter_start`, `is_quarter_end`, `is_year_start`, `is_year_end` accessors for `DateTimeIndex/Timestamp` which return a boolean array of whether the timestamp(s) are at the start/end of the month/quarter/year defined by the frequency of the `DateTimeIndex/Timestamp` (GH4565, GH6998)

- Local variable usage has changed in `pandas.eval() / DataFrame.eval() / DataFrame.query()` (GH5987). For the `DataFrame` methods, two things have changed
  - Column names are now given precedence over locals
  - Local variables must be referred to explicitly. This means that even if you have a local variable that is not a column you must still refer to it with the '@' prefix.
  - You can have an expression like `df.query('@a < a')` with no complaints from pandas about ambiguity of the name `a`.
  - The top-level `pandas.eval()` function does not allow you use the '@' prefix and provides you with an error message telling you so.
  - `NameResolutionError` was removed because it isn’t necessary anymore.

- Define and document the order of column vs index names in query/eval (GH6676)

- `concat` will now concatenate mixed Series and DataFrames using the Series name or numbering columns as needed (GH2385). See the docs

- Slicing and advanced/boolean indexing operations on Index classes as well as `Index.delete()` and `Index.drop()` methods will no longer change the type of the resulting index (GH6440, GH7040)

```python
In [6]: i = pd.Index([1, 2, 3, 'a', 'b', 'c'])

In [7]: i[[0, 1, 2]]
Out[7]: Index([1, 2, 3], dtype='object')

In [8]: i.drop(['a', 'b', 'c'])
Out[8]: Index([1, 2, 3], dtype='object')
```

Previously, the above operation would return `Int64Index`. If you’d like to do this manually, use `Index.astype()`

```python
In [9]: i[[0, 1, 2]].astype(np.int_)
Out[9]: Int64Index([1, 2, 3], dtype='int64')
```

- `set_index` no longer converts MultiIndexes to an Index of tuples. For example, the old behavior returned an Index in this case (GH6459):
# Old behavior, casted MultiIndex to an Index
In[10]: tuple_ind
Out[10]: Index([('a', 'c'), ('a', 'd'), ('b', 'c'), ('b', 'd')], dtype='object')

In[11]: df_multi.set_index(tuple_ind)
Out[11]:
   0     1
(a, c) 0.471435 -1.190976
(a, d) 1.432707  0.312652
(b, c) 0.720589  0.887163
(b, d) 0.859588 -0.636524

[4 rows x 2 columns]

# New behavior
In[12]: mi
Out[12]: MultiIndex([('a', 'c'), ('a', 'd'), ('b', 'c'), ('b', 'd')],
                   dtype='object')

In[13]: df_multi.set_index(mi)
Out[13]:
   0     1
a  c  0.471435 -1.190976
d  d  1.432707  0.312652
b  c -0.720589  0.887163
d  d  0.859588 -0.636524

[4 rows x 2 columns]

This also applies when passing multiple indices to **set_index**:

# Old output, 2-level MultiIndex of tuples
In[14]: df_multi.set_index([df_multi.index, df_multi.index])
Out[14]:
   0     1
(a, c) (a, c) 0.471435 -1.190976
(a, d) (a, d) 1.432707  0.312652
(b, c) (b, c) 0.720589  0.887163
(b, d) (b, d) 0.859588 -0.636524

[4 rows x 2 columns]

# New output, 4-level MultiIndex
In[15]: df_multi.set_index([df_multi.index, df_multi.index])
Out[15]:
   0     1
a  c  a  c  0.471435 -1.190976
da  d  1.432707  0.312652
b  c  b  c -0.720589  0.887163
d  d  0.859588 -0.636524

[4 rows x 2 columns]

• **pairwise** keyword was added to the statistical moment functions rolling_cov, rolling_corr,
ewmcov, ewmcorr, expanding_cov, expanding_corr to allow the calculation of moving window covariance and correlation matrices (GH4950). See Computing rolling pairwise covariances and correlations in the docs.

```
In [1]: df = pd.DataFrame(np.random.randn(10, 4), columns=list('ABCD'))

In [4]: covs = pd.rolling_cov(df[['A', 'B', 'C']],
                           df[['B', 'C', 'D']],
                           5,
                           pairwise=True)

In [5]: covs[df.index[-1]]
Out [5]:
            B       C       D
      A  0.035310  0.326593 -0.505430
      B  0.137748 -0.006888 -0.005383
      C -0.006888  0.861040  0.020762
```

- Series.iteritems() is now lazy (returns an iterator rather than a list). This was the documented behavior prior to 0.14. (GH6760)
- Added `nunique` and `value_counts` functions to Index for counting unique elements. (GH6734)
- `stack` and `unstack` now raise a `ValueError` when the `level` keyword refers to a non-unique item in the Index (previously raised a `KeyError`). (GH6738)
- drop unused order argument from Series.sort; args now are in the same order as Series.order; add `na_position` arg to conform to Series.order (GH6847)
- default sorting algorithm for Series.sort is now quicksort, to conform with Series.sort (and numpy defaults)
- add `inplace` keyword to Series.order/sort to make them inverses (GH6859)
- DataFrame.sort now places NaNs at the beginning or end of the sort according to the na_position parameter. (GH3917)
- accept TextFileReader in concat, which was affecting a common user idiom (GH6583), this was a regression from 0.13.1
- Added `factorize` functions to Index and Series to get indexer and unique values (GH7090)
- describe on a DataFrame with a mix of Timestamp and string like objects returns a different Index (GH7088). Previously the index was unintentionally sorted.
- Arithmetic operations with only `bool` dtypes now give a warning indicating that they are evaluated in Python space for `+`, `−`, and `*` operations and raise for all others (GH7011, GH6762, GH7015, GH7210)

```
>>> x = pd.Series(np.random.rand(10) > 0.5)
>>> y = True
>>> x + y  # warning generated: should do x | y instead
UserWarning: evaluating in Python space because the '+' operator is not supported by numexpr for the bool dtype, use '|' instead
```

- In HDFStore, select_as_multiple will always raise a KeyError, when a key or the selector is not found (GH6177)
- df['col'] = value and df.loc[:, 'col'] = value are now completely equivalent; previously the .loc would not necessarily coerce the dtype of the resultant series (GH6149)
• dtypes and ftypes now return a series with dtype=object on empty containers (GH5740)
• df.to_csv will now return a string of the CSV data if neither a target path nor a buffer is provided (GH6061)
• pd.infer_freq() will now raise a TypeError if given an invalid Series/Index type (GH6407, GH6463)
• A tuple passed to DataFrame.sort_index will be interpreted as the levels of the index, rather than requiring a list of tuple (GH4370)
• all offset operations now return Timestamp types (rather than datetime), Business/Week frequencies were incorrect (GH4069)
• to_excel now converts np.inf into a string representation, customizable by the inf_rep keyword argument (Excel has no native inf representation) (GH6782)
• Replace pandas.compat.scipy.scoreatpercentile with numpy.percentile (GH6810)
• .quantile on a datetime[ns] series now returns Timestamp instead of np.datetime64 objects (GH6810)
• change AssertionError to TypeError for invalid types passed to concat (GH6583)
• Raise a TypeError when DataFrame is passed an iterator as the data argument (GH5357)

Display changes

• The default way of printing large DataFrames has changed. DataFrames exceeding max_rows and/or max_columns are now displayed in a centrally truncated view, consistent with the printing of a pandas.Series (GH5603).
In previous versions, a DataFrame was truncated once the dimension constraints were reached and an ellipse (...) signaled that part of the data was cut off.

```python
In [1]: import pandas as pd
In [2]: import numpy as np
In [3]: pd.options.display.max_rows = 6
In [4]: pd.options.display.max_columns = 6
In [5]: index = pd.DatetimeIndex(start='20010101',freq='D',periods=10)
In [6]: pd.DataFrame(np.arange(10*10).reshape((10,10)),index=index)
Out[6]:
       0  1  2  3  4  5
2001-01-01  0  1  2  3  4  5
2001-01-02 10 11 12 13 14 15
2001-01-03 20 21 22 23 24 25
2001-01-04 30 31 32 33 34 35
2001-01-05 40 41 42 43 44 45
2001-01-06 50 51 52 53 54 55
...  ...  ...  ...  ...  ...
[10 rows x 10 columns]
```
In the current version, large DataFrames are centrally truncated, showing a preview of head and tail in both dimensions.

```
In [24]: pd.DataFrame(np.arange(10*10).reshape((10,10)),index=index)
Out[24]:
   0  1  2 ...  7  8  9
2001-01-01  0  1  2 ...  7  8  9
2001-01-02 10 11 12 ... 17 18 19
2001-01-03 20 21 22 ... 27 28 29
... ... ... ... ... ... ...
2001-01-08 70 71 72 ... 77 78 79
2001-01-09 80 81 82 ... 87 88 89
2001-01-10 90 91 92 ... 97 98 99
[10 rows x 10 columns]
```

- allow option 'truncate' for `display.show_dimensions` to only show the dimensions if the frame is truncated (GH6547).

The default for `display.show_dimensions` will now be `truncate`. This is consistent with how Series display length.

```
In [16]: dfd = pd.DataFrame(np.arange(25).reshape(-1, 5),
                      index=[0, 1, 2, 3, 4],
                      columns=[0, 1, 2, 3, 4])

    # show dimensions since this is truncated
In [17]: with pd.option_context('display.max_rows', 2, 'display.max_columns', 2,
                           'display.show_dimensions', 'truncate'):
    ....:     print(dfd)
     ....:
      0 ... 4
0 0 ... 4
... ... ...
4 20 ... 24
[5 rows x 5 columns]

    # will not show dimensions since it is not truncated
In [18]: with pd.option_context('display.max_rows', 10, 'display.max_columns', 40,
                           'display.show_dimensions', 'truncate'):
    ....:     print(dfd)
     ....:
      0  1  2  3  4
0  0  1  2  3  4
1  5  6  7  8  9
2 10 11 12 13 14
3 15 16 17 18 19
4 20 21 22 23 24
```

- Regression in the display of a MultiIndexed Series with `display.max_rows` is less than the length of the series (GH7101)

- Fixed a bug in the HTML repr of a truncated Series or DataFrame not showing the class name with the `large_repr` set to 'info' (GH7105)
• The verbose keyword in `DataFrame.info()`, which controls whether to shorten the info representation, is now `None` by default. This will follow the global setting in `display.max_info_columns`. The global setting can be overridden with `verbose=True` or `verbose=False`.

• Fixed a bug with the `info` repr not honoring the `display.max_info_columns` setting (GH6939)

• Offset/freq info now in Timestamp `__repr__` (GH4553)

Text parsing API changes

`read_csv() / read_table()` will now be noisier w.r.t invalid options rather than falling back to the PythonParser.

• Raise `ValueError` when `sep` specified with `delim_whitespace=True` in `read_csv() / read_table()` (GH6607)

• Raise `ValueError` when `engine='c'` specified with unsupported options in `read_csv() / read_table()` (GH6607)

• Raise `ValueError` when fallback to python parser causes options to be ignored (GH6607)

• Produce `ParserWarning` on fallback to python parser when no options are ignored (GH6607)

• Translate `sep='\s+'` to `delim_whitespace=True` in `read_csv() / read_table()` if no other C-unsupported options specified (GH6607)

GroupBy API changes

More consistent behavior for some groupby methods:

• groupby `head` and `tail` now act more like `filter` rather than an aggregation:

```
In [19]: df = pd.DataFrame([[1, 2], [1, 4], [5, 6]], columns=['A', 'B'])
In [20]: g = df.groupby('A')
In [21]: g.head(1)  # filters DataFrame
Out[21]:
         A  B
0      1  2
2      5  6
[2 rows x 2 columns]
In [22]: g.apply(lambda x: x.head(1))  # used to simply fall-through
Out[22]:
         A  B
A     0  1  2
5  5  2  6
[2 rows x 2 columns]
```

• groupby `head` and `tail` respect column selection:

```
In [23]: g[['B']].head(1)
Out[23]:
         B
0
```

(continues on next page)
• `groupby` nth now reduces by default; filtering can be achieved by passing `as_index=False`. With an optional `dropna` argument to ignore NaN. See the docs.

Reducing

```python
In [24]: df = pd.DataFrame([[1, np.nan], [1, 4], [5, 6]], columns=['A', 'B'])
In [25]: g = df.groupby('A')
In [26]: g.nth(0)
Out[26]:
   B
A  
1  NaN
5  6.0
[2 rows x 1 columns]

# this is equivalent to g.first()
In [27]: g.nth(0, dropna='any')
Out[27]:
   B
A  
1  4.0
5  6.0
[2 rows x 1 columns]

# this is equivalent to g.last()
In [28]: g.nth(-1, dropna='any')
Out[28]:
   B
A  
1  4.0
5  6.0
[2 rows x 1 columns]
```

Filtering

```python
In [29]: gf = df.groupby('A', as_index=False)
In [30]: gf.nth(0)
Out[30]:
   A   B
0  1  NaN
2  5  6.0
[2 rows x 2 columns]
In [31]: gf.nth(0, dropna='any')
Out[31]:
   A   B
0  1  NaN
2  5  6.0
[2 rows x 2 columns]
```
pandas: powerful Python data analysis toolkit, Release 1.3.1

A B
A 1 1 4.0
  5 5 6.0
[2 rows x 2 columns]

• groupby will now not return the grouped column for non-cython functions (GH5610, GH5614, GH6732), as its already the index

In [32]: df = pd.DataFrame([[1, np.nan], [1, 4], [5, 6], [5, 8]], columns=['A', 'B'])
In [33]: g = df.groupby('A')
In [34]: g.count()
Out[34]:
   B
  A
  1 1
  5 2
[2 rows x 1 columns]
In [35]: g.describe()
Out[35]:
   B
   count mean    std  min  25%  50%  75%  max
  A
  1  1.0  4.0 NaN  4.0  4.0  4.0  4.0
  5  2.0  7.0  1.414214  6.0  6.5  7.0  7.5  8.0
[2 rows x 8 columns]

• passing as_index will leave the grouped column in-place (this is not change in 0.14.0)

In [36]: df = pd.DataFrame([[1, np.nan], [1, 4], [5, 6], [5, 8]], columns=['A', 'B'])
In [37]: g = df.groupby('A', as_index=False)
In [38]: g.count()
Out[38]:
   A B
  0 1 1
  1 5 2
[2 rows x 2 columns]
In [39]: g.describe()
Out[39]:
   A B
   count mean    std  min  25%  50%  75%  max
  0  2.0  1.0  0.0  1.0  1.0  1.0  NaN
  1  0  4.0
(continues on next page)
• Allow specification of a more complex groupby via pd.Grouper, such as grouping by a Time and a string field simultaneously. See the docs. (GH3794)

• Better propagation/preservation of Series names when performing groupby operations:
  – SeriesGroupBy.agg will ensure that the name attribute of the original series is propagated to the result (GH6265).
  – If the function provided to GroupBy.apply returns a named series, the name of the series will be kept as the name of the column index of the DataFrame returned by GroupBy.apply (GH6124). This facilitates DataFrame.stack operations where the name of the column index is used as the name of the inserted column containing the pivoted data.

SQL

The SQL reading and writing functions now support more database flavors through SQLAlchemy (GH2717, GH4163, GH5950, GH6292). All databases supported by SQLAlchemy can be used, such as PostgreSQL, MySQL, Oracle, Microsoft SQL server (see documentation of SQLAlchemy on included dialects).

The functionality of providing DBAPI connection objects will only be supported for sqlite3 in the future. The 'mysql' flavor is deprecated.

The new functions read_sql_query() and read_sql_table() are introduced. The function read_sql() is kept as a convenience wrapper around the other two and will delegate to specific function depending on the provided input (database table name or sql query).

In practice, you have to provide a SQLAlchemy engine to the sql functions. To connect with SQLAlchemy you use the create_engine() function to create an engine object from database URI. You only need to create the engine once per database you are connecting to. For an in-memory sqlite database:

```python
In [40]: from sqlalchemy import create_engine
# Create your connection.
In [41]: engine = create_engine('sqlite:///':memory:')
```

This engine can then be used to write or read data to/from this database:

```python
In [42]: df = pd.DataFrame({'A': [1, 2, 3], 'B': ['a', 'b', 'c']})
In [43]: df.to_sql('db_table', engine, index=False)
```

You can read data from a database by specifying the table name:

```python
In [44]: pd.read_sql_table('db_table', engine)
Out[44]:
   A   B
0  a   a
1  b   b
2  c   c
```

[3 rows x 2 columns]
or by specifying a SQL query:

```
In [45]: pd.read_sql_query('SELECT * FROM db_table', engine)
Out[45]:
   A  B
0  1  a
1  2  b
2  3  c
```

[3 rows x 2 columns]

Some other enhancements to the SQL functions include:

- support for writing the index. This can be controlled with the `index` keyword (default is True).
- specify the column label to use when writing the index with `index_label`.
- specify string columns to parse as datetimes with the `parse_dates` keyword in `read_sql_query()` and `read_sql_table()`.

**Warning:** Some of the existing functions or function aliases have been deprecated and will be removed in future versions. This includes: `tquery`, `uquery`, `read_frame`, `frame_query`, `write_frame`.

**Warning:** The support for the ‘mysql’ flavor when using DBAPI connection objects has been deprecated. MySQL will be further supported with SQLAlchemy engines (GH6900).

**Multi-indexing using slicers**

In 0.14.0 we added a new way to slice MultiIndexed objects. You can slice a MultiIndex by providing multiple indexers.

You can provide any of the selectors as if you are indexing by label, see Selection by Label, including slices, lists of labels, labels, and boolean indexers.

You can use `slice(None)` to select all the contents of that level. You do not need to specify all the deeper levels, they will be implied as `slice(None)`.

As usual, **both sides** of the slicers are included as this is label indexing.

See the docs See also issues (GH6134, GH4036, GH3057, GH2598, GH5641, GH7106)

**Warning:**

You should specify all axes in the `.loc` specifier, meaning the indexer for the `index` and for the `columns`. Their are some ambiguous cases where the passed indexer could be mis-interpreted as indexing both axes, rather than into say the MultiIndex for the rows.

You should do this:

```python
>>> df.loc[(slice('A1', 'A3'), ...), :]  # noqa: E901
```

rather than this:

```python
>>> df.loc[(slice('A1', 'A3'), ...)]  # noqa: E901
```
Warning: You will need to make sure that the selection axes are fully lexsorted!

```
In [46]: def mklbl(prefix, n):
    ...:     return ["%s%s" % (prefix, i) for i in range(n)]
    ...:

In [47]: index = pd.MultiIndex.from_product([mklbl('A', 4),
                                         mklbl('B', 2),
                                         mklbl('C', 4),
                                         mklbl('D', 2)])
    ...

In [48]: columns = pd.MultiIndex.from_tuples([('a', 'foo'), ('a', 'bar'),
                                          ('b', 'foo'), ('b', 'bah')],
                                          names=['lvl0', 'lvl1'])
    ...

In [49]: df = pd.DataFrame(np.arange(len(index) * len(columns)).reshape((len(index),
                                len(columns))), index=index, columns=columns).sort_index().sort_index(axis=1)
    ...

In [50]: df
Out[50]:
fold0        a    b
lvl0  lvl1     bar  foo  bah  foo
A0     B0  C0  D0  1   0   3   2
   D1  5   4   7   6
   C1  9   8  11  10
   D1 13  12  15  14
   C2  17  16  19  18
   ...        ...  ...  ...  ...
   A3  B1  C1  D1  237 236 239 238
   C2  D0  241 240 243 242
   D1 245 244 247 246
   C3  D0  249 248 251 250
   D1 253 252 255 254

[64 rows x 4 columns]
```

Basic MultiIndex slicing using slices, lists, and labels.

```
In [51]: df.loc[(slice('A1', 'A3'), slice(None), ['C1', 'C3']), :]
Out[51]:
fold0        a    b
lvl0  lvl1     bar  foo  bah  foo
A1     B0  C1  D0  73  72  75  74
   D1  77  76  79  78
   C3  D0  89  88  91  90
   D1  93  92  95  94
   B1  C1  D0 105 104 107 106
   ...        ...  ...  ...  ...
   A3  B0  C3  D1  221 220 223 222
   B1  C1  D0  233 232 235 234
   D1 237 236 239 238
```

(continues on next page)
You can use a `pd.IndexSlice` to shortcut the creation of these slices

In [52]: idx = pd.IndexSlice

In [53]: df.loc[idx[:, :, ['C1', 'C3']], idx[:, 'foo']]

Out[53]:

```
  lvl0  a  b
  lvl1     foo  foo
  A0  B0  C1  D0  8  10
       D1  12  14
       C3  D0  24  26
       D1  28  30
       B1  C1  D0  40  42
         ... ... ...
  A3  B0  C3  D1  220 222
       B1  C1  D0  232 234
       D1  236 238
       C3  D0  248 250
       D1  252 254

[32 rows x 2 columns]
```

It is possible to perform quite complicated selections using this method on multiple axes at the same time.

In [54]: df.loc['A1', (slice(None), 'foo')]

Out[54]:

```
  lvl0  a  b
  lvl1  foo  foo
  B0  C0  D0  64  66
       D1  68  70
       C1  D0  72  74
       D1  76  78
       C2  D0  80  82
         ... ... ...
  B1  C1  D1  108 110
       C2  D0  112 114
       D1  116 118
       C3  D0  120 122
       D1  124 126

[16 rows x 2 columns]
```

In [55]: df.loc[idx[:, :, ['C1', 'C3']], idx[:, 'foo']]

Out[55]:

```
  lvl0  a  b
  lvl1  foo  foo
  A0  B0  C1  D0  8  10
       D1  12  14
       C3  D0  24  26
       D1  28  30
       B1  C1  D0  40  42
         ... ... ...
```

(continues on next page)
Using a boolean indexer you can provide selection related to the `values`.

```python
In [56]: mask = df[('a', 'foo')] > 200
In [57]: df.loc[idx[mask, :, ['C1', 'C3']], idx[:, 'foo']]
Out[57]:
     lvl0  a  b
A3  B0  C1  204  206
B1  C1  D0  216  218
    D1  220  222
C3  D0  232  234
    D1  236  238
D1  248  250
    D1  252  254
[7 rows x 2 columns]
```

You can also specify the `axis` argument to `.loc` to interpret the passed slicers on a single axis.

```python
In [58]: df.loc(axis=0)[; :, ['C1', 'C3']]
Out[58]:
     lvl0   a   b
     lvl1  bar  foo  bah  foo
A0  B0  C0  9  8  11  10
    D0  13  12  15  14
C3  D0  25  24  27  26
    D1  29  28  31  30
B1  C1  D0  41  40  43  42
    D1  55  54  57  56
...  ...  ...  ...  ...
A3  B0  C3  D1  221  220  223  222
B1  C1  D0  233  232  235  234
    D1  237  236  239  238
C3  D0  249  248  251  250
    D1  253  252  255  254
[32 rows x 4 columns]
```

Furthermore you can set the values using these methods

```python
In [59]: df2 = df.copy()
In [60]: df2.loc(axis=0)[; :, ['C1', 'C3']] = -10
In [61]: df2
Out[61]:
     lvl0   a   b
     lvl1  bar  foo  bah  foo
A0  B0  C0  1  0  3  2
    D0  13  12  15  14
C3  D0  25  24  27  26
    D1  29  28  31  30
B1  C1  D0  233  232  235  234
    D1  237  236  239  238
C3  D0  249  248  251  250
    D1  253  252  255  254
```

(continues on next page)
You can use a right-hand-side of an alignable object as well.

```
in[62]: df2 = df.copy()
```

```
in[63]: df2.loc[idx[:, :, ['C1', 'C3']], :] = df2 * 1000
```

```
in[64]: df2
Out[64]:
   lvl1         a         b
     bar       foo     bah     foo
   A0  B0  C0  D0         1         0         3         2
   D1         5         4         7         6
   C1  D0   9000     8000    11000    10000
   D1    13000    12000    15000    14000
   C2  D0         17        16        19        18
   D0         54        47        56
   C3  D0   249000    248000    251000    250000
   D0    253000    252000    255000    254000
```

[64 rows x 4 columns]

**Plotting**

- Hexagonal bin plots from `DataFrame.plot` with `kind='hexbin'` (GH5478), See the docs.
- `DataFrame.plot` and `Series.plot` now supports area plot with specifying `kind='area'` (GH6656), See the docs
- Pie plots from `Series.plot` and `DataFrame.plot` with `kind='pie'` (GH6976), See the docs.
- Plotting with Error Bars is now supported in the `.plot` method of `DataFrame` and `Series` objects (GH3796, GH6834), See the docs.
- `DataFrame.plot` and `Series.plot` now support a `table` keyword for plotting `matplotlib.Table`, See the docs. The table keyword can receive the following values.
  - False: Do nothing (default).
  - True: Draw a table using the `DataFrame` or `Series` called `plot` method. Data will be transposed to meet `matplotlib`’s default layout.
DataFrame or Series: Draw matplotlib.table using the passed data. The data will be drawn as displayed in print method (not transposed automatically). Also, helper function pandas.plotting.table is added to create a table from DataFrame and Series, and add it to an matplotlib.Axes.

- plot(legend='reverse') will now reverse the order of legend labels for most plot kinds. (GH6014)
- Line plot and area plot can be stacked by stacked=True (GH6656)
- Following keywords are now acceptable for DataFrame.plot() with kind='bar' and kind='barh':
  - width: Specify the bar width. In previous versions, static value 0.5 was passed to matplotlib and it cannot be overwritten. (GH6604)
  - align: Specify the bar alignment. Default is center (different from matplotlib). In previous versions, pandas passes align='edge' to matplotlib and adjust the location to center by itself, and it results align keyword is not applied as expected. (GH4525)
  - position: Specify relative alignments for bar plot layout. From 0 (left/bottom-end) to 1(right/top-end). Default is 0.5 (center). (GH6604)

Because of the default align value changes, coordinates of bar plots are now located on integer values (0.0, 1.0, 2.0...). This is intended to make bar plot be located on the same coordinates as line plot. However, bar plot may differs unexpectedly when you manually adjust the bar location or drawing area, such as using set_xlim, set_ylim, etc. In this cases, please modify your script to meet with new coordinates.

- The parallel_coordinates() function now takes argument color instead of colors. A FutureWarning is raised to alert that the old colors argument will not be supported in a future release. (GH6956)
- The parallel_coordinates() and andrews_curves() functions now take positional argument frame instead of data. A FutureWarning is raised if the old data argument is used by name. (GH6956)
- DataFrame.boxplot() now supports layout keyword (GH7679)
- DataFrame.boxplot() has a new keyword argument, return_type. It accepts 'dict', 'axes', or 'both', in which case a namedtuple with the matplotlib axes and a dict of matplotlib Lines is returned.

Prior version deprecations/changes

There are prior version deprecations that are taking effect as of 0.14.0.

- Remove DateRange in favor of DatetimeIndex (GH6816)
- Remove column keyword from DataFrame.sort (GH4370)
- Remove precision keyword from set_eng_float_format() (GH395)
- Remove force_unicode keyword from DataFrame.to_string(), DataFrame.to_latex(), and DataFrame.to_html(); these function encode in unicode by default (GH2224, GH2225)
- Remove nanRep keyword from DataFrame.to_csv() and DataFrame.to_string() (GH275)
- Remove unique keyword from HDFStore.select_column() (GH3256)
- Remove inferTimeRule keyword from Timestamp.offset() (GH391)
- Remove name keyword from get_data_yahoo() and get_data_google() (commit b921d1a)
- Remove offset keyword from DatetimeIndex constructor (commit 3136390)
- Remove time_rule from several rolling-moment statistical functions, such as rolling_sum() (GH1042)
• Removed neg – boolean operations on numpy arrays in favor of inv ~, as this is going to be deprecated in numpy 1.9 (GH6960)

Deprecations

• The `pivot_table()`/`DataFrame.pivot_table()` and `crosstab()` functions now take arguments `index` and `columns` instead of `rows` and `cols`. A `FutureWarning` is raised to alert that the old `rows` and `cols` arguments will not be supported in a future release (GH5505)

• The `DataFrame.drop_duplicates()` and `DataFrame.duplicated()` methods now take argument `subset` instead of `cols` to better align with `DataFrame.dropna()`. A `FutureWarning` is raised to alert that the old `cols` arguments will not be supported in a future release (GH6680)

• The `DataFrame.to_csv()` and `DataFrame.to_excel()` functions now take argument `columns` instead of `cols`. A `FutureWarning` is raised to alert that the old `cols` arguments will not be supported in a future release (GH6645)

• Indexers will warn `FutureWarning` when used with a scalar indexer and a non-floating point Index (GH4892, GH6960)

```
# non-floating point indexes can only be indexed by integers / labels
In [1]: pd.Series(1, np.arange(5))[3.0]
   pandas/core/index.py:469: FutureWarning: scalar indexers for index type Int64Index should be integers and not floating point
   Int64Index should be integers and not floating point
Out[1]: 1

In [2]: pd.Series(1, np.arange(5)).iloc[3.0]
   pandas/core/index.py:469: FutureWarning: scalar indexers for index type Int64Index should be integers and not floating point
   Int64Index should be integers and not floating point
Out[2]: 1

In [3]: pd.Series(1, np.arange(5)).iloc[3:0:4]
   pandas/core/index.py:527: FutureWarning: slice indexers when using iloc should be integers and not floating point
   Int64Index should be integers and not floating point
Out[3]:
   3 1
   dtype: int64

# these are Float64Indexes, so integer or floating point is acceptable
In [4]: pd.Series(1, np.arange(5.))[3]
Out[4]: 1

In [5]: pd.Series(1, np.arange(5.))[3.0]
Out[6]: 1
```

• Numpy 1.9 compat w.r.t. deprecation warnings (GH6960)

• `Panel.shift()` now has a function signature that matches `DataFrame.shift()`. The old positional argument `lags` has been changed to a keyword argument `periods` with a default value of 1. A `FutureWarning` is raised if the old argument `lags` is used by name. (GH6910)

• The `order` keyword argument of `factorize()` will be removed. (GH6926)

• Remove the `copy` keyword from `DataFrame.xs()`, `Panel.major_xs()`, `Panel.minor_xs()`. A view will be returned if possible, otherwise a copy will be made. Previously the user could think that `copy=False` would ALWAYS return a view. (GH6894)

• The `parallel_coordinates()` function now takes argument `color` instead of `colors`. A `FutureWarning` is raised to alert that the old `colors` argument will not be supported in a future release.
pandas: powerful Python data analysis toolkit, Release 1.3.1

(GH6956)

- The `parallel_coordinates()` and `andrews_curves()` functions now take positional argument `frame` instead of `data`. A `FutureWarning` is raised if the old `data` argument is used by name. (GH6956)

- The support for the `mysql` flavor when using DBAPI connection objects has been deprecated. MySQL will be further supported with SQLAlchemy engines (GH6900).

- The following `io.sql` functions have been deprecated: `tquery`, `uquery`, `read_frame`, `frame_query`, `write_frame`.

- The `percentile_width` keyword argument in `describe()` has been deprecated. Use the `percentiles` keyword instead, which takes a list of percentiles to display. The default output is unchanged.

- The default return type of `boxplot()` will change from a dict to a matplotlib Axes in a future release. You can use the future behavior now by passing `return_type='axes'` to boxplot.

Known issues

- OpenPyXL 2.0.0 breaks backwards compatibility (GH7169)

Enhancements

- DataFrame and Series will create a MultiIndex object if passed a tuples dict, See the docs (GH3323)

```
In [65]: pd.Series({('a', 'b'): 1, ('a', 'a'): 0,
.....:    ('a', 'c'): 2, ('b', 'a'): 3, ('b', 'b'): 4})
.....:
Out[65]:
     a b
a  1
b  2

In [66]: pd.DataFrame({('a', 'b'): {('A', 'B'): 1, ('A', 'C'): 2},
.....:    ('a', 'a'): {('A', 'C'): 3, ('A', 'B'): 4},
.....:    ('b', 'a'): {('A', 'C'): 7, ('A', 'B'): 8},
.....:    ('b', 'b'): {('A', 'D'): 9, ('A', 'B'): 10}})
.....:
Out[66]:
       a b
      b a c a b
A   1.0 4.0 5.0 8.0 10.0
B   2.0 3.0 6.0 7.0 NaN
C   NaN NaN NaN  NaN  NaN
D   NaN NaN NaN  NaN  9.0

[3 rows x 5 columns]
```

- Added the `sym_diff` method to `Index` (GH5543)

- `DataFrame.to_latex` now takes a longtable keyword, which if `True` will return a table in a longtable environment. (GH6617)

- Add option to turn off escaping in `DataFrame.to_latex` (GH6472)

5.16. Version 0.14
• `pd.read_clipboard` will, if the keyword `sep` is unspecified, try to detect data copied from a spreadsheet and parse accordingly. (GH6223)

• Joining a singly-indexed DataFrame with a MultiIndexed DataFrame (GH3662)

See the docs. Joining MultiIndex DataFrames on both the left and right is not yet supported ATM.

```
In [67]: household = pd.DataFrame({'household_id': [1, 2, 3],
          ...:     'male': [0, 1, 0],
          ...:     'wealth': [196087.3, 316478.7, 294750]
          ...:     },
          ...:     columns=['household_id', 'male', 'wealth'])
          ...:     ).set_index('household_id')
          ...:

</table>

- `quotechar`, `doublequote`, and `escapechar` can now be specified when using `DataFrame.to_csv` (GH5414, GH4528)
- Partially sort by only the specified levels of a MultiIndex with the `sort_remaining` boolean kwarg. (GH3984)
- Added `to_julian_date` to `TimeStamp` and `DatetimeIndex`. The Julian Date is used primarily in astronomy and represents the number of days from noon, January 1, 4713 BC. Because nanoseconds are used to define the time in pandas the actual range of dates that you can use is 1678 AD to 2262 AD. (GH4041)
- `DataFrame.to_stata` will now check data for compatibility with Stata data types and will upcast when needed. When it is not possible to losslessly upcast, a warning is issued (GH6327)
- `DataFrame.to_stata` and `StataWriter` will accept keyword arguments `time_stamp` and `data_label` which allow the time stamp and dataset label to be set when creating a file. (GH6545)
- `pandas.io.gbq` now handles reading unicode strings properly. (GH5940)
- `Holidays Calendars` are now available and can be used with the `CustomBusinessDay` offset (GH6719)
- `Float64Index` is now backed by a `float64` dtype ndarray instead of an `object` dtype array (GH6471).
- Implemented `Panel.pct_change` (GH6904)
- Added `how` option to rolling-moment functions to dictate how to handle resampling: `rolling_max()` defaults to max, `rolling_min()` defaults to min, and all others default to mean (GH6297)
- `CustomBusinessMonthBegin` and `CustomBusinessMonthEnd` are now available (GH6866)
- `Series.quantile()` and `DataFrame.quantile()` now accept an array of quantiles.
- `describe()` now accepts an array of percentiles to include in the summary statistics (GH4196)
- `pivot_table` can now accept `Grouper` by `index` and `columns` keywords (GH6913)

```
In [72]: import datetime

In [73]: df = pd.DataFrame({
                      'Branch': 'A A A A A B'.split(),
                      'Buyer': 'Carl Mark Carl Carl Joe Joe'.split(),
                      'Quantity': [1, 3, 5, 1, 8, 1],
                      'Date': [datetime.datetime(2013, 11, 1, 13, 0),
                                datetime.datetime(2013, 9, 1, 13, 5),
                                datetime.datetime(2013, 10, 1, 20, 0),
                                datetime.datetime(2013, 10, 2, 10, 0),

[3 rows x 3 columns]

- Arrays of strings can be wrapped to a specified width (str.wrap) (GH6999)
- Add `nsmallest()` and `Series.nlargest()` methods to Series, See the docs (GH3960)
- `PeriodIndex` fully supports partial string indexing like `DatetimeIndex` (GH7043)
read_excel can now read milliseconds in Excel dates and times with xlrd >= 0.9.3. (GH5945)

pd.stats.moments.rolling_var now uses Welford’s method for increased numerical stability (GH6817)

pd.expanding_apply and pd.rolling_apply now take args and kwargs that are passed on to the func (GH6289)

DataFrame.rank() now has a percentage rank option (GH5971)

Series.rank() now has a percentage rank option (GH5971)

Series.rank() and DataFrame.rank() now accept method='dense' for ranks without gaps (GH6514)

Support passing encoding with xlwt (GH3710)

Refactor Block classes removing Block.items attributes to avoid duplication in item handling (GH6745, GH6988).

Testing statements updated to use specialized asserts (GH6175)

Performance

• Performance improvement when converting DatetimeIndex to floating ordinals using DatetimeConverter (GH6636)

• Performance improvement for DataFrame.shift (GH5609)

• Performance improvement in indexing into a MultiIndexed Series (GH5567)

• Performance improvements in single-dtyped indexing (GH6484)

• Improve performance of DataFrame construction with certain offsets, by removing faulty caching (e.g. MonthEnd,BusinessMonthEnd), (GH6479)

• Improve performance of CustomBusinessDay (GH6584)

• improve performance of slice indexing on Series with string keys (GH6341, GH6372)

• Performance improvement for DataFrame.from_records when reading a specified number of rows from an iterable (GH6700)

• Performance improvements in timedelta conversions for integer dtypes (GH6754)
pandas: powerful Python data analysis toolkit, Release 1.3.1

- Improved performance of compatible pickles (GH6899)
- Improve performance in certain reindexing operations by optimizing take_2d (GH6749)
- GroupBy.count() is now implemented in Cython and is much faster for large numbers of groups (GH7016).

Experimental

There are no experimental changes in 0.14.0

Bug fixes

- Bug in Series ValueError when index doesn’t match data (GH6532)
- Prevent segfault due to MultiIndex not being supported in HDFStore table format (GH1848)
- Bug in pd.DataFrame.sort_index where mergesort wasn’t stable when ascending=False (GH6399)
- Bug in pd.tseries.frequencies.to_offset when argument has leading zeros (GH6391)
- Bug in version string gen. for dev versions with shallow clones / install from tarball (GH6127)
- Inconsistent tz parsing Timestamp/to_datetime for current year (GH5958)
- Indexing bugs with reordered indexes (GH6252, GH6254)
- Bug in .xs with a Series multiindex (GH6258, GH5684)
- Bug in conversion of a string types to a DatetimeIndex with a specified frequency (GH6273, GH6274)
- Bug in eval where type-promotion failed for large expressions (GH6205)
- Bug in interpolate with inplace=True (GH6281)
- HDFStore.remove now handles start and stop (GH6177)
- HDFStore.select_as_multiple handles start and stop the same way as select (GH6177)
- HDFStore.select_as_coordinates and select_column works with a where clause that results in filters (GH6177)
- Regression in join of non_unique_indexes (GH6329)
- Issue with groupby agg with a single function and a mixed-type frame (GH6337)
- Bug in DataFrame.replace() when passing a non-bool to_replace argument (GH6332)
- Raise when trying to align on different levels of a MultiIndex assignment (GH3738)
- Bug in setting complex dtypes via boolean indexing (GH6345)
- Bug in TimeGrouper/resample when presented with a non-monotonic DatetimeIndex that would return invalid results. (GH4161)
- Bug in index name propagation in TimeGrouper/resample (GH4161)
- TimeGrouper has a more compatible API to the rest of the groupers (e.g. groups was missing) (GH3881)
- Bug in multiple grouping with a TimeGrouper depending on target column order (GH6764)
- Bug in pd.eval when parsing strings with possible tokens like '& ' (GH6351)
- Bug correctly handle placements of -inf in Panels when dividing by integer 0 (GH6178)
- DataFrame.shift with axis=1 was raising (GH6371)
- Disabled clipboard tests until release time (run locally with nosetests -A disabled) (GH6048).
- Bug in DataFrame.replace() when passing a nested dict that contained keys not in the values to be replaced (GH6342)
- str.match ignored the na flag (GH6609).
- Bug in take with duplicate columns that were not consolidated (GH6240)
- Bug in interpolate changing dtypes (GH6290)
- Bug in Series.get, was using a buggy access method (GH6383)
- Bug in hdfstore queries of the form where=[('date', '>=', datetime(2013,1,1)), ('date', '<=', datetime(2014,1,1))] (GH6313)
- Bug in DataFrame.dropna with duplicate indices (GH6355)
- Regression in chained getitem indexing with embedded list-like from 0.12 (GH6394)
- Float64Index with nans not comparing correctly (GH6401)
- eval/query expressions with strings containing the @ character will now work (GH6366).
- Bug in Series.reindex when specifying a method with some nan values was inconsistent (noted on a resample) (GH6418)
- Bug in DataFrame.replace() where nested dicts were erroneously depending on the order of dictionary keys and values (GH5338).
- Performance issue in concatenating with empty objects (GH3259)
- Clarify sorting of sym_diff on Index objects with NaN values (GH6444)
- Regression in MultiIndex.from_product with a DatetimeIndex as input (GH6439)
- Bug in str.extract when passed a non-default index (GH6348)
- Bug in str.split when passed pat=None and n=1 (GH6466)
- Bug in io.data.DataReader when passed "F-F_Momentum_Factor" and data_source= "famafrench" (GH6460)
- Bug in sum of a timedelta64[ns] series (GH6462)
- Bug in resample with a timezone and certain offsets (GH6397)
- Bug in iat/iloc with duplicate indices on a Series (GH6493)
- Bug in read_html where nan’s were incorrectly being used to indicate missing values in text. Should use the empty string for consistency with the rest of pandas (GH5129).
- Bug in read_html tests where redirected invalid URLs would make one test fail (GH6445).
- Bug in multi-axis indexing using .loc on non-unique indices (GH6504)
- Bug that caused _ref_locs corruption when slice indexing across columns axis of a DataFrame (GH6525)
- Regression from 0.13 in the treatment of numpy datetime64 non-ns dtypes in Series creation (GH6529)
- .names attribute of MultiIndexes passed to set_index are now preserved (GH6459).
- Bug in setitem with a duplicate index and an alignable rhs (GH6541)
- Bug in setitem with .loc on mixed integer Indexes (GH6546)
- Bug in pd.read_stata which would use the wrong data types and missing values (GH6327)
- Bug in `DataFrame.to_stata` that lead to data loss in certain cases, and could be exported using the wrong data types and missing values (GH6335)
- StataWriter replaces missing values in string columns by empty string (GH6802)
- Inconsistent types in `Timestamp` addition/subtraction (GH6543)
- Bug in preserving frequency across `Timestamp` addition/subtraction (GH4547)
- Bug in empty list lookup caused `IndexError` exceptions (GH6536, GH6551)
- `Series.quantile` raising on an `object` dtype (GH6555)
- Bug in `.xs` with a `nan` in level when dropped (GH6574)
- Bug in `fillna` with `method='bfill/ffill'` and `datetime64[ns]` dtype (GH6587)
- Bug in sql writing with mixed dtypes possibly leading to data loss (GH6509)
- Bug in `Series.pop` (GH6600)
- Bug in `iloc` indexing when positional indexer matched `Int64Index` of the corresponding axis and no re-ordering happened (GH6612)
- Bug in `fillna` with `limit` and `value` specified
- Bug in `DataFrame.to_stata` when columns have non-string names (GH4558)
- Bug in `compat` with `np.compress`, surfaced in (GH6658)
- Bug in binary operations with a rhs of a `Series` not aligning (GH6681)
- Bug in `DataFrame.to_stata` which incorrectly handles `nan` values and ignores `with_index` keyword argument (GH6685)
- Bug in resample with extra bins when using an evenly divisible frequency (GH4076)
- Bug in consistency of groupby aggregation when passing a custom function (GH6715)
- Bug in resample when `how=None` resample freq is the same as the axis frequency (GH5955)
- Bug in downcasting inference with empty arrays (GH6733)
- Bug in `obj.blocks` on sparse containers dropping all but the last items of same for dtype (GH6748)
- Bug in unpickling `NaT` (NaTType) (GH4606)
- Bug in `DataFrame.replace()` where regex meta characters were being treated as regex even when `regex=False` (GH6777).
- Bug in timedelta ops on 32-bit platforms (GH6808)
- Bug in setting a tz-aware index directly via `.index` (GH6785)
- Bug in expressions.py where numexpr would try to evaluate arithmetic ops (GH6762).
- Bug in Makefile where it didn’t remove Cython generated C files with `make clean` (GH6768)
- Bug with `numpy < 1.7.2` when reading long strings from `HDFStore` (GH6166)
- Bug in `DataFrame._reduce` where non bool-like (0/1) integers were being converted into bools. (GH6806)
- Regression from 0.13 with `fillna` and a `Series` on datetime-like (GH6344)
- Bug in adding `np.timedelta64` to `DatetimeIndex` with timezone outputs incorrect results (GH6818)
- Bug in `DataFrame.replace()` where changing a dtype through replacement would only replace the first occurrence of a value (GH6689)
- Better error message when passing a frequency of ‘MS’ in `Period` construction (GH5332)
• Bug in `Series.__unicode__` when `max_rows=None` and the Series has more than 1000 rows. (GH6863)
• Bug in `groupby.get_group` where a datelike wasn’t always accepted (GH5267)
• Bug in `groupBy.get_group` created by `TimeGrouper` raises `AttributeError` (GH6914)
• Bug in `DatetimeIndex.tz_localize` and `DatetimeIndex.tz_convert` converting `NaT` incorrectly (GH5546)
• Bug in arithmetic operations affecting `NaT` (GH6873)
• Bug in `Series.str.extract` where the resulting `Series` from a single group match wasn’t renamed to the group name
• Bug in `DataFrame.to_csv` where setting `index=False` ignored the `header` kwarg (GH6186)
• Bug in `DataFrame.plot` and `Series.plot`, where the legend behave inconsistently when plotting to the same axes repeatedly (GH6678)
• Internal tests for patching `__finalize__` / bug in merge not finalizing (GH6923, GH6927)
• accept `TextFileReader` in `concat`, which was affecting a common user idiom (GH6583)
• Bug in C parser with leading white space (GH3374)
• Bug in C parser with `delim_whitespace=True` and \r-delimited lines
• Bug in python parser with explicit MultiIndex in row following column header (GH6893)
• Bug in `Series.rank` and `DataFrame.rank` that caused small floats (<1e-13) to all receive the same rank (GH6886)
• Bug in `DataFrame.apply` with functions that used `*args` or `**kwargs` and returned an empty result (GH6952)
• Bug in `sum/mean` on 32-bit platforms on overflows (GH6915)
• Moved `Panel.shift` to `NDFrame.slice_shift` and fixed to respect multiple dtypes. (GH6959)
• Bug in enabling `subplots=True` in `DataFrame.plot` only has single column raises `TypeError`, and `Series.plot` raises `AttributeError` (GH6951)
• Bug in `DataFrame.plot` draws unnecessary axes when enabling `subplots` and `kind=scatter` (GH6951)
• Bug in `read_csv` from a filesystem with non-utf-8 encoding (GH6807)
• Bug in `iloc` when setting / aligning (GH6766)
• Bug causing `UnicodeEncodeError` when `get_dummies` called with unicode values and a prefix (GH6885)
• Bug in timeseries-with-frequency plot cursor display (GH5453)
• Bug surfaced in `groupby.plot` when using a `Float64Index` (GH7025)
• Stopped tests from failing if options data isn’t able to be downloaded from Yahoo (GH7034)
• Bug in `parallel_coordinates` and `radviz` where reordering of class column caused possible color/class mismatch (GH6956)
• Bug in `radviz` and `andrews_curves` where multiple values of ‘color’ were being passed to plotting method (GH6956)
• Bug in `Float64Index.isin()` where containing `nans` would make indices claim that they contained all the things (GH7066).
• Bug in `DataFrame.boxplot` where it failed to use the axis passed as the `ax` argument (GH3578)
• Bug in the XlsxWriter and XlwtWriter implementations that resulted in datetime columns being formatted without the time (GH7075) were being passed to plotting method
• read_fwf() treats None in colspec like regular python slices. It now reads from the beginning or until the end of the line when colspec contains a None (previously raised a TypeError)
• Bug in cache coherence with chained indexing and slicing; add _is_view property to NDFrame to correctly predict views; mark is_copy on xs only if its an actual copy (and not a view) (GH7084)
• Bug in DatetimeIndex creation from string ndarray with dayfirst=True (GH5917)
• Bug in MultiIndex.from_arrays created from DatetimeIndex doesn’t preserve freq and tz (GH7090)
• Bug in unstack raises ValueError when MultiIndex contains PeriodIndex (GH4342)
• Bug in boxplot and hist draws unnecessary axes (GH6769)
• Regression in groupby.nth() for out-of-bounds indexers (GH6621)
• Bug in quantile with datetime values (GH6965)
• Bug in Dataframe.set_index, reindex and pivot don’t preserve DatetimeIndex and PeriodIndex attributes (GH3950, GH5878, GH6631)
• Bug in MultiIndex.get_level_values doesn’t preserve DatetimeIndex and PeriodIndex attributes (GH7092)
• Bug in Groupby doesn’t preserve tz (GH3950)
• Bug in PeriodIndex partial string slicing (GH6716)
• Bug in the HTML repr of a truncated Series or DataFrame not showing the class name with the large_repr set to ‘info’ (GH7105)
• Bug in DatetimeIndex specifying freq raises ValueError when passed value is too short (GH7098)
• Fixed a bug with the info repr not honoring the display.max_info_columns setting (GH6939)
• Bug PeriodIndex string slicing with out of bounds values (GH5407)
• Fixed a memory error in the hashtable implementation/factorizer on resizing of large tables (GH7157)
• Bug in isnull when applied to 0-dimensional object arrays (GH7176)
• Bug in query/eval where global constants were not looked up correctly (GH7178)
• Bug in recognizing out-of-bounds positional list indexers with iloc and a multi-axis tuple indexer (GH7189)
• Bug in setitem with a single value, MultiIndex and integer indices (GH7190, GH7218)
• Bug in expressions evaluation with reversed ops, showing in series-dataframe ops (GH7198, GH7192)
• Bug in multi-axis indexing with > 2 ndim and a MultiIndex (GH7199)
• Fix a bug where invalid eval/query operations would blow the stack (GH5198)

5.17 Version 0.13

5.17.1 Version 0.13.1 (February 3, 2014)

This is a minor release from 0.13.0 and includes a small number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

Highlights include:
• Added `infer_datetime_format` keyword to `read_csv/to_datetime` to allow speedups for homogeneously formatted datetimes.
• Will intelligently limit display precision for datetime/timedelta formats.
• Enhanced Panel `apply()` method.
pandas: powerful Python data analysis toolkit, Release 1.3.1

- Suggested tutorials in new Tutorials section.
- Our pandas ecosystem is growing. We now feature related projects in a new Pandas Ecosystem section.
- Much work has been taking place on improving the docs, and a new Contributing section has been added.
- Even though it may only be of interest to devs, we <3 our new CI status page: ScatterCI.

**Warning:** 0.13.1 fixes a bug that was caused by a combination of having numpy < 1.8, and doing chained assignment on a string-like array. Please review the docs, chained indexing can have unexpected results and should generally be avoided.

This would previously segfault:

```
In [1]: df = pd.DataFrame({"A": np.array(['foo', "bar", "bah", "foo", "bar"])})
In [2]: df['A'].iloc[0] = np.nan
In [3]: df
Out[3]:
   A
0  NaN
1  bar
2  bah
3  foo
4  bar
```

The recommended way to do this type of assignment is:

```
In [4]: df = pd.DataFrame({"A": np.array(['foo', "bar", "bah", "foo", "bar"])})
In [5]: df.loc[0, "A"] = np.nan
In [6]: df
Out[6]:
   A
0  NaN
1  bar
2  bah
3  foo
4  bar
```

**Output formatting enhancements**

- df.info() view now display dtype info per column (GH5682)
- df.info() now honors the option max_info_rows, to disable null counts for large frames (GH5974)

```
In [7]: max_info_rows = pd.get_option("max_info_rows")
In [8]: df = pd.DataFrame(
      ...:     {  
      ...:         "A": np.random.randn(10),
      ...:         "B": np.random.randn(10),
      ...:         "C": pd.date_range("20130101", periods=10),
      ...:     })
```

(continues on next page)
...:

In [9]: df.iloc[3:6, [0, 2]] = np.nan

# set to not display the null counts
In [10]: pd.set_option("max_info_rows", 0)

In [11]: df.info()
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 10 entries, 0 to 9
Data columns (total 3 columns):
# Column Dtype
--- ------ -----
0 A float64
1 B float64
2 C datetime64[ns]
dtypes: datetime64[ns](1), float64(2)
memory usage: 368.0 bytes

# this is the default (same as in 0.13.0)
In [12]: pd.set_option("max_info_rows", max_info_rows)

In [13]: df.info()
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 10 entries, 0 to 9
Data columns (total 3 columns):
# Column Non-Null Count Dtype
--- ------ -------------- -----
0 A 7 non-null float64
1 B 10 non-null float64
2 C 7 non-null datetime64[ns]
dtypes: datetime64[ns](1), float64(2)
memory usage: 368.0 bytes

• Add show_dimensions display option for the new DataFrame repr to control whether the dimensions print.

In [14]: df = pd.DataFrame([[1, 2], [3, 4]])

In [15]: pd.set_option("show_dimensions", False)

In [16]: df
Out[16]:
0 1
0 1 2
1 3 4

In [17]: pd.set_option("show_dimensions", True)

In [18]: df
Out[18]:
0 1
0 1 2
1 3 4

[2 rows x 2 columns]

• The ArrayFormatter for datetime and timedelta64 now intelligently limit precision based on the
values in the array (GH3401)

Previously output might look like:

<table>
<thead>
<tr>
<th>age</th>
<th>today</th>
<th>diff</th>
</tr>
</thead>
<tbody>
<tr>
<td>2001-01-01</td>
<td>2013-04-19</td>
<td>4491 days, 00:00:00</td>
</tr>
<tr>
<td>2004-06-01</td>
<td>2013-04-19</td>
<td>3244 days, 00:00:00</td>
</tr>
</tbody>
</table>

Now the output looks like:

```python
In [19]: df = pd.DataFrame(
           ....: [pd.Timestamp("20010101"), pd.Timestamp("20040601")], columns=["age"]
           ....: )
           ....:
In [20]: df["today"] = pd.Timestamp("20130419")
In [21]: df["diff"] = df["today"] - df["age"]
In [22]: df
```

```
Out[22]:
<table>
<thead>
<tr>
<th>age</th>
<th>today</th>
<th>diff</th>
</tr>
</thead>
<tbody>
<tr>
<td>2001-01-01</td>
<td>2013-04-19</td>
<td>4491 days</td>
</tr>
<tr>
<td>2004-06-01</td>
<td>2013-04-19</td>
<td>3244 days</td>
</tr>
</tbody>
</table>
```

API changes

- Add `-NaN` and `-nan` to the default set of NA values (GH5952). See NA Values.
- Added `Series.str.get_dummies` vectorized string method (GH6021), to extract dummy/indicator variables for separated string columns:

```python
In [23]: s = pd.Series(["a", "a|b", np.nan, "a|c")
In [24]: s.str.get_dummies(sep="|")
```

```
a  b
0 1 0 0
1 1 1 0
2 0 0 0
3 1 0 1
```

- Added the `NDFrame.equals()` method to compare if two NDFrames are equal have equal axes, dtypes, and values. Added the `array_equivalent` function to compare if two ndarrays are equal. NaNs in identical locations are treated as equal. (GH5283) See also the docs for a motivating example.

```python
df = pd.DataFrame({"col": ["foo", 0, np.nan]})
df2 = pd.DataFrame({"col": [np.nan, 0, "foo"]}, index=[2, 1, 0])
df.equals(df2)
df.equals(df2.sort_index())
```

- `DataFrame.apply` will use the reduce argument to determine whether a Series or a DataFrame should be returned when the DataFrame is empty (GH6007).
Previously, calling `DataFrame.apply` on an empty `DataFrame` would return either a `DataFrame` if there were no columns, or the function being applied would be called with an empty `Series` to guess whether a `Series` or `DataFrame` should be returned:

```python
In [32]: def applied_func(col):
    ....:     print("Apply function being called with: ", col)
    ....:     return col.sum()
    ....:

In [33]: empty = DataFrame(columns=['a', 'b'])

In [34]: empty.apply(applied_func)
Apply function being called with: Series([], Length: 0, dtype: float64)
Out[34]:
a  NaN
b  NaN
Length: 2, dtype: float64
```

Now, when `apply` is called on an empty `DataFrame`: if the `reduce` argument is `True` a `Series` will returned, if it is `False` a `DataFrame` will be returned, and if it is `None` (the default) the function being applied will be called with an empty series to try and guess the return type.

```python
In [35]: empty.apply(applied_func, reduce=True)
Out[35]:
a  NaN
b  NaN
Length: 2, dtype: float64

In [36]: empty.apply(applied_func, reduce=False)
Out[36]: Empty DataFrame
Columns: [a, b]
Index: []
[0 rows x 2 columns]
```

**Prior version deprecations/changes**

There are no announced changes in 0.13 or prior that are taking effect as of 0.13.1

**Deprecations**

There are no deprecations of prior behavior in 0.13.1

**Enhancements**

- `pd.read_csv` and `pd.to_datetime` learned a new `infer_datetime_format` keyword which greatly improves parsing perf in many cases. Thanks to @lexual for suggesting and @danbirken for rapidly implementing. (GH5490, GH6021)

  If `parse_dates` is enabled and this flag is set, pandas will attempt to infer the format of the datetime strings in the columns, and if it can be inferred, switch to a faster method of parsing them. In some cases this can increase the parsing speed by ~5-10x.
# Try to infer the format for the index column
def = pd.read_csv(  
    "foo.csv", index_col=0, parse_dates=True, infer_datetime_format=True  
)

- `date_format` and `datetime_format` keywords can now be specified when writing to excel files (GH4133)
- `MultiIndex.from_product` convenience function for creating a MultiIndex from the cartesian product of a set of iterables (GH6055):

```python
In [25]: shades = ["light", "dark"]
In [26]: colors = ["red", "green", "blue"]
In [27]: pd.MultiIndex.from_product([shades, colors], names=["shade", "color"])
Out[27]:
MultiIndex([('light', 'red'),
             ('light', 'green'),
             ('light', 'blue'),
             ('dark', 'red'),
             ('dark', 'green'),
             ('dark', 'blue')],
            names=['shade', 'color'])
```

- `Panel apply()` will work on non-ufuncs. See the docs.

```python
In [28]: import pandas._testing as tm
In [29]: panel = tm.makePanel(5)
In [30]: panel
Out[30]:
<class 'pandas.core.panel.Panel'>
Dimensions: 3 (items) x 5 (major_axis) x 4 (minor_axis)
Items axis: ItemA to ItemC
Major_axis axis: 2000-01-03 00:00:00 to 2000-01-07 00:00:00
Minor_axis axis: A to D
In [31]: panel['ItemA']
Out[31]:
     A   B   C   D
2000-01-03 -0.673690 0.577046 -1.344312 -1.469388
2000-01-04 0.113648 -1.715002 0.844885 0.357021
2000-01-05 -1.478427 -1.039268 1.075770 -0.674600
2000-01-06 0.524988 -0.370647 -0.109050 -1.776904
2000-01-07 0.404705 -1.157892 1.643563 -0.968914
[5 rows x 4 columns]
```

Specifying an apply that operates on a Series (to return a single element)

```python
In [32]: panel.apply(lambda x: x.dtype, axis='items')
Out[32]:
     A   B   C   D
2000-01-03 float64 float64 float64 float64
2000-01-04 float64 float64 float64 float64
```
(continues on next page)
2000-01-05 float64 float64 float64 float64
2000-01-06 float64 float64 float64 float64
2000-01-07 float64 float64 float64 float64

[5 rows x 4 columns]

A similar reduction type operation

```python
In [33]: panel.apply(lambda x: x.sum(), axis='major_axis')
Out[33]:
         ItemA     ItemB     ItemC
A -1.108775 -1.090118 -2.984435
B -3.705764  0.409204  1.866240
C  2.110856  2.960500 -0.974967
D -4.532785  0.303202 -3.685193

[4 rows x 3 columns]
```

This is equivalent to

```python
In [34]: panel.sum('major_axis')
Out[34]:
         ItemA     ItemB     ItemC
A -1.108775 -1.090118 -2.984435
B -3.705764  0.409204  1.866240
C  2.110856  2.960500 -0.974967
D -4.532785  0.303202 -3.685193

[4 rows x 3 columns]
```

A transformation operation that returns a Panel, but is computing the z-score across the major_axis

```python
In [35]: result = panel.apply(lambda x: (x - x.mean()) / x.std(), axis='major_axis')

In [36]: result['ItemA']
# noqa E999
Out[36]:
         A         B         C         D
2000-01-03 -0.535778  1.500802 -1.506416 -0.681456
2000-01-04  0.397628 -1.108752  0.360481  1.529895
2000-01-05 -1.489811 -0.339412  0.557374  0.280845
2000-01-06  0.885279  0.421830 -0.453013 -1.053785
2000-01-07  0.742682 -0.474468  1.041575 -0.075499

[5 rows x 4 columns]
```

- Panel `apply()` operating on cross-sectional slabs. (GH1148)
In [38]: def f(x):
    ....:     return ((x.T - x.mean(1)) / x.std(1)).T
    ....:

In [39]: result = panel.apply(f, axis=['items', 'major_axis'])

In [40]: result
Out[40]:
<class 'pandas.core.panel.Panel'>
Dimensions: 4 (items) x 5 (major_axis) x 3 (minor_axis)
Items axis: A to D
Major_axis axis: 2000-01-03 00:00:00 to 2000-01-07 00:00:00
Minor_axis axis: ItemA to ItemC

In [41]: result.loc[:, :, 'ItemA']
Out[41]:
      A     B     C     D
2000-01-03  0.012922 -0.030874 -0.629546 -0.757034
2000-01-04  0.392053 -1.071665  0.163228  0.548188
2000-01-05 -1.093650 -0.640898  0.385734 -1.154310
2000-01-06  1.005446 -1.154593 -0.595615 -0.809185
2000-01-07  0.783051 -0.198053  0.919339 -1.052721
[5 rows x 4 columns]

This is equivalent to the following

In [42]: result = pd.Panel({ax: f(panel.loc[:, :, ax]) for ax in panel.minor_axis})

In [43]: result
Out[43]:
<class 'pandas.core.panel.Panel'>
Dimensions: 4 (items) x 5 (major_axis) x 3 (minor_axis)
Items axis: A to D
Major_axis axis: 2000-01-03 00:00:00 to 2000-01-07 00:00:00
Minor_axis axis: ItemA to ItemC

In [44]: result.loc[:, :, 'ItemA']
Out[44]:
      A     B     C     D
2000-01-03  0.012922 -0.030874 -0.629546 -0.757034
2000-01-04  0.392053 -1.071665  0.163228  0.548188
2000-01-05 -1.093650 -0.640898  0.385734 -1.154310

Performance

Performance improvements for 0.13.1

- Series datetime/timedelta binary operations (GH5801)
- DataFrame `count/dropna` for `axis=1`
- Series `str.contains` now has a `regex=False` keyword which can be faster for plain (non-regex) string patterns. (GH5879)
- Series `str.extract` (GH5944)
- `dtypes/ftypes` methods (GH5968)
- Indexing with object dtypes (GH5968)
- DataFrame `apply` (GH6013)
- Regression in JSON IO (GH5765)
- Index construction from Series (GH6150)

Experimental

There are no experimental changes in 0.13.1

Bug fixes

- Bug in `io.wb.get_countries` not including all countries (GH6008)
- Bug in Series replace with timestamp dict (GH5797)
- `read_csv/read_table` now respects the `prefix` kwarg (GH5732).
- Bug in selection with missing values via `.ix` from a duplicate indexed DataFrame failing (GH5835)
- Fix issue of boolean comparison on empty DataFrames (GH5808)
- Bug in isnull handling `NaT` in an object array (GH5443)
- Bug in `to_datetime` when passed a `np.nan` or integer datelike and a format string (GH5863)
- Bug in groupby dtype conversion with datetimelike (GH5869)
- Regression in handling of empty Series as indexers to Series (GH5877)
- Bug in internal caching, related to (GH5727)
- Testing bug in reading JSON/msgpack from a non-filepath on windows under py3 (GH5874)
- Bug when assigning to `.ix[tuple(...)]]` (GH5896)
- Bug in fully reindexing a Panel (GH5905)
- Bug in `idxmin/max` with object dtypes (GH5914)
- Bug in `BusinessDay` when adding n days to a date not on offset when n>5 and n%5==0 (GH5890)
- Bug in assigning to chained series with a series via ix (GH5928)
- Bug in creating an empty DataFrame, copying, then assigning (GH5932)
- Bug in DataFrame `tail` with empty frame (GH5846)
- Bug in propagating metadata on `resample` (GH5862)
• Fixed string-representation of NaT to be “NaT” (GH5708)
• Fixed string-representation for Timestamp to show nanoseconds if present (GH5912)
• pd.match not returning passed sentinel
• Panel.to_frame() no longer fails when major_axis is a MultiIndex (GH5402).
• Bug in pd.read_msgpack with inferring a DateTimeIndex frequency incorrectly (GH5947)
• Fixed to_datetime for array with both Tz-aware datetimes and NaT’s (GH5961)
• Bug in rolling skew/kurtosis when passed a Series with bad data (GH5749)
• Bug in scipy interpolate methods with a datetime index (GH5975)
• Bug in NaT comparison if a mixed datetime/np.datetime64 with NaT were passed (GH5968)
• Fixed bug with pd.concat losing dtype information if all inputs are empty (GH5742)
• Recent changes in IPython cause warnings to be emitted when using previous versions of pandas in QTConsole, now fixed. If you’re using an older version and need to suppress the warnings, see (GH5922).
• Bug in merging timedelta dtypes (GH5695)
• Bug in plotting.scatter_matrix function. Wrong alignment among diagonal and off-diagonal plots, see (GH5497).
• Regression in Series with a MultiIndex via ix (GH6018)
• Bug in Series.xs with a MultiIndex (GH6018)
• Bug in Series construction of mixed type with datelike and an integer (which should result in object type and not automatic conversion) (GH6028)
• Possible segfault when chained indexing with an object array under NumPy 1.7.1 (GH6026, GH6056)
• Bug in setting using fancy indexing a single element with a non-scalar (e.g. a list) (GH6043)
• to_sql did not respect if_exists (GH4110 GH4304)
• Regression in .get(None) indexing from 0.12 (GH5652)
• Subtle iloc indexing bug, surfaced in (GH6059)
• Bug with insert of strings into DatetimeIndex (GH5818)
• Fixed unicode bug in to_html/HTML repr (GH6098)
• Fixed missing arg validation in get_options_data (GH6105)
• Bug in assignment with duplicate columns in a frame where the locations are a slice (e.g. next to each other) (GH6120)
• Bug in propagating _ref_locs during construction of a DataFrame with dups index/columns (GH6121)
• Bug in DataFrame.apply when using mixed datelike reductions (GH6125)
• Bug in DataFrame.append when appending a row with different columns (GH6129)
• Bug in DataFrame construction with recarray and non-ns datetime dtype (GH6140)
• Bug in .loc setitem indexing with a dataframe on rhs, multiple item setting, and a datetimelike (GH6152)
• Fixed a bug in query/eval during lexicographic string comparisons (GH6155).
• Fixed a bug in query where the index of a single-element Series was being thrown away (GH6148).
• Bug in HDFStore on appending a dataframe with MultiIndexed columns to an existing table (GH6167)
• Consistency with dtypes in setting an empty DataFrame (GH6171)
• Bug in selecting on a MultiIndex HDFStore even in the presence of under specified column spec (GH6169)
• Bug in nanops.var with ddof=1 and 1 elements would sometimes return inf rather than nan on some platforms (GH6136)
• Bug in Series and DataFrame bar plots ignoring the use_index keyword (GH6209)
• Bug in groupby with mixed str/int under python3 fixed; argsort was failing (GH6212)

5.17.2 Version 0.13.0 (January 3, 2014)

This is a major release from 0.12.0 and includes a number of API changes, several new features and enhancements along with a large number of bug fixes.

Highlights include:

• support for a new index type Float64Index, and other Indexing enhancements
• HDFStore has a new string based syntax for query specification
• support for new methods of interpolation
• updated timedelta operations
• a new string manipulation method extract
• Nanosecond support for Offsets
- `isin` for DataFrames

Several experimental features are added, including:

- new `eval/query` methods for expression evaluation
- support for `msgpack` serialization
- an i/o interface to Google’s BigQuery

Their are several new or updated docs sections including:

- *Comparison with SQL*, which should be useful for those familiar with SQL but still learning pandas.
- *Comparison with R*, idiom translations from R to pandas.
- *Enhancing Performance*, ways to enhance pandas performance with `eval/query`.

**Warning:** In 0.13.0 `Series` has internally been refactored to no longer sub-class `ndarray` but instead subclass `NDFrame`, similar to the rest of the pandas containers. This should be a transparent change with only very limited API implications. See *Internal Refactoring*

### API changes

- `read_excel` now supports an integer in its `sheetname` argument giving the index of the sheet to read in (GH4301).
- Text parser now treats anything that reads like inf (“inf”, “Inf”, “-Inf”, “iNf”, etc.) as infinity. (GH4220, GH4219), affecting `read_table, read_csv`, etc.
- `pandas` now is Python 2/3 compatible without the need for `2to3` thanks to @jratner. As a result, `pandas` now uses iterators more extensively. This also led to the introduction of substantive parts of the Benjamin Peterson’s `six` library into `compat`. (GH4384, GH4375, GH4372)
- `pandas.util.compat` and `pandas.util.py3compat` have been merged into `pandas.compat`. `pandas.compat` now includes many functions allowing 2/3 compatibility. It contains both list and iterator versions of range, filter, map and zip, plus other necessary elements for Python 3 compatibility. `lmap, lzip, lrange and lfilter` all produce lists instead of iterators, for compatibility with `numpy, subscripting` and `pandas constructors. (GH4384, GH4375, GH4372)
- `Series.get` with negative indexers now returns the same as `[]` (GH4390)
- Changes to how `Index` and `MultiIndex` handle metadata (levels, labels, and names) (GH4039):

```python
# previously, you would have set levels or labels directly
>>> pd.index.levels = [[1, 2, 3, 4], [1, 2, 4, 4]]

# now, you use the set_levels or set_labels methods
>>> index = pd.index.set_levels([[1, 2, 3, 4], [1, 2, 4, 4]])

# similarly, for names, you can rename the object
# but setting names is not deprecated
>>> index = pd.index.set_names(["bob", "cranberry"])

# and all methods take an inplace kwarg - but return None
>>> pd.index.set_names(["bob", "cranberry"], inplace=True)
```

- All division with `NDFrame` objects is now `truedivision`, regardless of the future import. This means that operating on pandas objects will by default use `floating point` division, and return a floating point dtype. You can use `//` and `floordiv` to do integer division.
Integer division

```python
In [3]: arr = np.array([1, 2, 3, 4])
In [4]: arr2 = np.array([5, 3, 2, 1])
In [5]: arr / arr2
Out[5]: array([0, 0, 1, 4])
```

```python
In [6]: pd.Series(arr) // pd.Series(arr2)
Out[6]:
0   0
1   0
2   1
3   4
dtype: int64
```

True Division

```python
In [7]: pd.Series(arr) / pd.Series(arr2)  # no future import required
Out[7]:
0    0.200000
1    0.666667
2    1.500000
3    4.000000
dtype: float64
```

- Infer and downcast dtype if downcast='infer' is passed to fillna/ffill/bfill (GH4604)
- __nonzero__ for all NDFrame objects, will now raise a ValueError, this reverts back to (GH1073, GH4633) behavior. See gotchas for a more detailed discussion.

This prevents doing boolean comparison on entire pandas objects, which is inherently ambiguous. These all will raise a ValueError.

```python
>>> df = pd.DataFrame({'A': np.random.randn(10),
...                     'B': np.random.randn(10),
...                     'C': pd.date_range('20130101', periods=10))

>>> if df:
...     pass
...
Traceback (most recent call last):
...
ValueError: The truth value of a DataFrame is ambiguous. Use a.empty,
a.bool(), a.item(), a.any() or a.all().
```

```python
>>> df1 = df
>>> df2 = df
>>> df1 and df2
Traceback (most recent call last):
...
ValueError: The truth value of a DataFrame is ambiguous. Use a.empty,
a.bool(), a.item(), a.any() or a.all().
```

```python
>>> d = [1, 2, 3]
>>> s1 = pd.Series(d)
>>> s2 = pd.Series(d)
```
**pandas:** powerful Python data analysis toolkit, Release 1.3.1

```python
>>> s1 and s2
Traceback (most recent call last):
...  
ValueError: The truth value of a DataFrame is ambiguous. Use a.empty, a.bool(), a.item(), a.any() or a.all().
```

Added the `.bool()` method to `NDFrame` objects to facilitate evaluating of single-element boolean Series:

```python
In [1]: pd.Series([True]).bool()
Out[1]: True

In [2]: pd.Series([False]).bool()
Out[2]: False

In [3]: pd.DataFrame([[True]]).bool()
Out[3]: True

In [4]: pd.DataFrame([[False]]).bool()
Out[4]: False
```

- All non-Index `NDFrames` (`Series`, `DataFrame`, `Panel`, `Panel4D`, `SparsePanel`, etc.) now support the entire set of arithmetic operators and arithmetic flex methods (add, sub, mul, etc.). `SparsePanel` does not support `pow` or `mod` with non-scalars. (GH3765)

- `Series` and `DataFrame` now have a `mode()` method to calculate the statistical mode(s) by axis/Series. (GH3673)

- Chained assignment will now by default warn if the user is assigning to a copy. This can be changed with the option `mode.chained_assignment`, allowed options are `raise/warn/None`. See the docs.

```python
In [5]: dfc = pd.DataFrame({'A': ['aaa', 'bbb', 'ccc'], 'B': [1, 2, 3]})

In [6]: pd.set_option('chained_assignment', 'warn')

In [7]: dfc.loc[0]['A'] = 1111
```

The following warning / exception will show if this is attempted.

```python
Traceback (most recent call last)
...  
SettingWithCopyWarning:
  A value is trying to be set on a copy of a slice from a DataFrame. Try using .loc[row_index,col_indexer] = value instead
```

Here is the correct method of assignment.

```python
In [8]: dfc.loc[0, 'A'] = 11

In [9]: dfc
Out[9]:
   A  B
0  11 1
1  bbb 2
2  ccc 3
```

- `Panel.reindex` has the following call signature `Panel.reindex(items=None, major_axis=None, minor_axis=None, **kwargs)` to conform with other `NDFrame` objects. See Internal Refactoring for more information.
• **Series.argmin** and **Series.argmax** are now aliased to **Series.idxmin** and **Series.idxmax**. These return the index of the min or max element respectively. Prior to 0.13.0 these would return the position of the min / max element. (GH6214)

Prior version deprecations/changes

These were announced changes in 0.12 or prior that are taking effect as of 0.13.0

• Remove deprecated **Factor** (GH3650)
• Remove deprecated **set_printoptions/reset_printoptions** (GH3046)
• Remove deprecated **_verbose_info** (GH3215)
• Remove deprecated **read_clipboard/to_clipboard/ExcelFile/ExcelWriter** from **pandas.io.parsers** (GH3717) These are available as functions in the main pandas namespace (e.g. pd.read_clipboard)
• default for **tupleize_cols** is now **False** for both **to_csv** and **read_csv**. Fair warning in 0.12 (GH3604)
• default for **display.max_seq_len** is now 100 rather than None. This activates truncated display (“…”)
of long sequences in various places. (GH3391)

Deprecations

Deprecated in 0.13.0

• deprecated **iterkv**, which will be removed in a future release (this was an alias of **iteritems** used to bypass 2to3’s changes). (GH4384, GH4375, GH4372)
• deprecated the string method **match**, whose role is now performed more idiomatically by **extract**. In a future release, the default behavior of **match** will change to become analogous to **contains**, which returns a boolean indexer. (Their distinction is strictness: **match** relies on **re.match** while **contains** relies on **re.search**.) In this release, the deprecated behavior is the default, but the new behavior is available through the keyword argument **as_indexer=True**.

Indexing API changes

Prior to 0.13, it was impossible to use a label indexer (**.loc/.ix**) to set a value that was not contained in the index
of a particular axis. (GH2578). See the docs

In the **Series** case this is effectively an appending operation

| In [10]: s = pd.Series([1, 2, 3])      |
| In [11]: s                           |
| Out[11]:                               |
| 0 1                                     |
| 1 2                                     |
| 2 3                                     |
| dtype: int64                            |

| In [13]: s                        |
| Out[13]:                           |
In [14]: dfi = pd.DataFrame(np.arange(6).reshape(3, 2),
   ....:                 columns=['A', 'B'])
   ....:
In [15]: dfi
Out[15]:
   A  B
  0  0  1
  1  2  3
  2  4  5

This would previously KeyError

In [16]: dfi.loc[:, 'C'] = dfi.loc[:, 'A']

In [17]: dfi
Out[17]:
   A  B  C
  0  0  1  0
  1  2  3  2
  2  4  5  4

This is like an append operation.

In [18]: dfi.loc[3] = 5

In [19]: dfi
Out[19]:
   A  B  C
  0  0  1  0
  1  2  3  2
  2  4  5  4
  3  5  5  5

A Panel setting operation on an arbitrary axis aligns the input to the Panel

In [20]: p = pd.Panel(np.arange(16).reshape(2, 4, 2),
   ....:                 items=['Item1', 'Item2'],
   ....:                 major_axis=pd.date_range('2001/1/12', periods=4),
   ....:                 minor_axis=['A', 'B'], dtype='float64')
   ....:
In [21]: p
Out[21]:
<class 'pandas.core.panel.Panel'>
Dimensions: 2 (items) x 4 (major_axis) x 2 (minor_axis)
Items axis: Item1 to Item2
Major_axis axis: 2001-01-12 00:00:00 to 2001-01-15 00:00:00
Minor_axis axis: A to B
In [22]: p.loc[:, :, 'C'] = pd.Series([30, 32], index=p.items)

In [23]: p
Out[23]:
<class 'pandas.core.panel.Panel'>
Dimensions: 2 (items) x 4 (major_axis) x 3 (minor_axis)
Items axis: Item1 to Item2
Major_axis axis: 2001-01-12 00:00:00 to 2001-01-15 00:00:00
Minor_axis axis: A to C

In [24]: p.loc[:, :, 'C']
Out[24]:
      Item1  Item2
2001-01-12  30.0  32.0
2001-01-13  30.0  32.0
2001-01-14  30.0  32.0
2001-01-15  30.0  32.0

Float64Index API change

- Added a new index type, Float64Index. This will be automatically created when passing floating values in index creation. This enables a pure label-based slicing paradigm that makes [], .ix, .loc for scalar indexing and slicing work exactly the same. See the docs, (GH263)

Construction is by default for floating type values.

In [20]: index = pd.Index([1.5, 2, 3, 4.5, 5])

In [21]: index
Out[21]: Float64Index([1.5, 2.0, 3.0, 4.5, 5.0], dtype='float64')

In [22]: s = pd.Series(range(5), index=index)

In [23]: s
Out[23]:
1.5 0
2.0 1
3.0 2
4.5 3
5.0 4
dtype: int64

Scalar selection for [], .ix, .loc will always be label based. An integer will match an equal float index (e.g. 3 is equivalent to 3.0)

In [24]: s[3]
Out[24]: 2

In [25]: s.loc[3]
Out[25]: 2

The only positional indexing is via iloc

In [26]: s.iloc[3]
Out[26]: 3
A scalar index that is not found will raise `KeyError`.

Slicing is ALWAYS on the values of the index, for `[]`, `ix`, `loc` and ALWAYS positional with `iloc`.

```python
In [27]: s[2:4]
Out [27]:
2.0  1
3.0  2
dtype: int64

In [28]: s.loc[2:4]
Out [28]:
2.0  1
3.0  2
dtype: int64

In [29]: s.iloc[2:4]
Out [29]:
3.0  2
4.5  3
dtype: int64
```

In float indexes, slicing using floats are allowed.

```python
In [30]: s[2.1:4.6]
Out [30]:
3.0  2
4.5  3
dtype: int64

In [31]: s.loc[2.1:4.6]
Out [31]:
3.0  2
4.5  3
dtype: int64
```

- Indexing on other index types are preserved (and positional fallback for `[]`, `ix`), with the exception, that floating point slicing on indexes on non `Float64Index` will now raise a `TypeError`.

```python
In [1]: pd.Series(range(5))[3.5]
TypeError: the label [3.5] is not a proper indexer for this index type
→(Int64Index)

In [1]: pd.Series(range(5))[3.5:4.5]
TypeError: the slice start [3.5] is not a proper indexer for this index type
→(Int64Index)
```

Using a scalar float indexer will be deprecated in a future version, but is allowed for now.

```python
In [3]: pd.Series(range(5))[3.0]
Out [3]: 3
```
**HDFStore API changes**

- **Query Format Changes.** A much more string-like query format is now supported. See [the docs](#).

```python
In [32]: path = 'test.h5'

In [33]: dfq = pd.DataFrame(np.random.randn(10, 4),
   ....:                     columns=list('ABCD'),
   ....:                     index=pd.date_range('20130101', periods=10))
   ....:

In [34]: dfq.to_hdf(path, 'dfq', format='table', data_columns=True)
```

Use boolean expressions, with in-line function evaluation.

```python
In [35]: pd.read_hdf(path, 'dfq',
   ....:                  where="index>Timestamp('20130104') & columns=['A', 'B']")
   ....:
Out[35]:
   A    B
2013-01-05 -0.424972 0.567020
2013-01-06 -0.673690 0.113648
2013-01-07  0.404705 0.577046
2013-01-08 -0.370647 -1.157892
2013-01-09  1.075770 -0.109050
2013-01-10  0.357021 -0.674600
```

Use an inline column reference.

```python
In [36]: pd.read_hdf(path, 'dfq',
   ....:                  where="A>0 or C>0")
   ....:
Out[36]:
   A    B    C    D
2013-01-01  0.469112 -0.282863 -1.509059 -1.135632
2013-01-02  1.212112 -0.173215  0.119209 -1.044236
2013-01-04  0.721555 -0.706771 -1.039575  0.271860
2013-01-05 -0.424972  0.567020  0.276232 -1.087401
2013-01-07  0.404705  0.577046 -1.715002 -1.039268
2013-01-09  1.075770 -0.109050  1.643563 -1.469388
2013-01-10  0.357021 -0.674600 -1.776904 -0.968914
```

- **the format keyword now replaces the table keyword; allowed values are fixed(f) or table(t) the same defaults as prior < 0.13.0 remain, e.g. put implies fixed format and append implies table format. This default format can be set as an option by setting io.hdf.default_format.**

```python
In [37]: path = 'test.h5'

In [38]: df = pd.DataFrame(np.random.randn(10, 2))

In [39]: df.to_hdf(path, 'df_table', format='table')

In [40]: df.to_hdf(path, 'df_table2', append=True)

In [41]: df.to_hdf(path, 'df_fixed')

In [42]: with pd.HDFStore(path) as store:
   ....:     print(store)
```

(continues on next page)
- Significant table writing performance improvements
- handle a passed Series in table format [GH4330]
- can now serialize a timedelta64[ns] dtype in a table [GH3577], See the docs.
- added an is_open property to indicate if the underlying file handle is_open; a closed store will now report 'CLOSED' when viewing the store (rather than raising an error) [GH4409]
- a close of a HDFStore now will close that instance of the HDFStore but will only close the actual file if the ref count (by PyTables) w.r.t. all of the open handles are 0. Essentially you have a local instance of HDFStore referenced by a variable. Once you close it, it will report closed. Other references (to the same file) will continue to operate until they themselves are closed. Performing an action on a closed file will raise ClosedFileError

```python
In [43]: path = 'test.h5'
In [44]: df = pd.DataFrame(np.random.randn(10, 2))
In [45]: store1 = pd.HDFStore(path)
In [46]: store2 = pd.HDFStore(path)
In [47]: store1.append('df', df)
In [48]: store2.append('df2', df)
In [49]: store1
Out[49]: <class 'pandas.io.pytables.HDFStore'>
File path: test.h5
In [50]: store2
Out[50]: <class 'pandas.io.pytables.HDFStore'>
File path: test.h5
In [51]: store1.close()
In [52]: store2
Out[52]: <class 'pandas.io.pytables.HDFStore'>
File path: test.h5
In [53]: store2.close()
In [54]: store2
Out[54]: <class 'pandas.io.pytables.HDFStore'>
File path: test.h5
```

- removed the _quiet attribute, replace by a DuplicateWarning if retrieving duplicate rows from a table [GH4367]
• removed the warn argument from open. Instead a PossibleDataLossError exception will be raised if you try to use mode='w' with an OPEN file handle (GH4367)
• allow a passed locations array or mask as a where condition (GH4467). See the docs for an example.
• add the keyword dropna=True to append to change whether ALL nan rows are not written to the store (default is True, ALL nan rows are NOT written), also settable via the option io.hdf.dropna_table (GH4625)
• pass through store creation arguments; can be used to support in-memory stores

DataFrame repr changes

The HTML and plain text representations of DataFrame now show a truncated view of the table once it exceeds a certain size, rather than switching to the short info view (GH4886, GH5550). This makes the representation more consistent as small DataFrames get larger.

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>2010-03-30</td>
<td>13.55</td>
<td>13.64</td>
<td>13.18</td>
<td>13.28</td>
<td>142055200</td>
<td>12.70</td>
</tr>
</tbody>
</table>

771 rows × 6 columns

To get the info view, call DataFrame.info(). If you prefer the info view as the repr for large DataFrames, you can set this by running set_option('display.large_repr', 'info').

Enhancements

• df.to_clipboard() learned a new excel keyword that let's you paste df data directly into excel (enabled by default). (GH5070).
• read_html now raises a URLError instead of catching and raising a ValueError (GH4303, GH4305)
• Added a test for read_clipboard() and to_clipboard() (GH4282)
• Clipboard functionality now works with PySide (GH4282)
• Added a more informative error message when plot arguments contain overlapping color and style arguments (GH4402)
• to_dict now takes records as a possible out type. Returns an array of column-keyed dictionaries. (GH4936)
• NaN handing in get_dummies (GH4446) with dummy_na

```python
# previously, nan was erroneously counted as 2 here
# now it is not counted at all
In [55]: pd.get_dummies([1, 2, np.nan])
Out[55]:
   1.0  2.0
0  1  0
1  0  1
2  0  0
```

(continues on next page)
In [56]: pd.get_dummies([1, 2, np.nan], dummy_na=True)
Out[56]:
   1.0  2.0  NaN
0    1    0   0
1    0    1    0
2    0    0    1

- timedelta64[ns] operations. See the docs.

Warning: Most of these operations require numpy >= 1.7

Using the new top-level to_timedelta, you can convert a scalar or array from the standard timedelta format (produced by to_csv) into a timedelta type (np.timedelta64 in nanoseconds).

In [57]: pd.to_timedelta('1 days 06:05:01.00003')
Out[57]: Timedelta('1 days 06:05:01.000030')

In [58]: pd.to_timedelta('15.5us')
Out[58]: Timedelta('0 days 00:00:00.000015500')

In [59]: pd.to_timedelta(['1 days 06:05:01.00003', '15.5us', 'nan'])
Out[59]: TimedeltaIndex(['1 days 06:05:01.000030', '0 days 00:00:00.000015500', 'NaT'], dtype='timedelta64[ns]', freq=None)

In [60]: pd.to_timedelta(np.arange(5), unit='s')
Out[60]: TimedeltaIndex(['0 days 00:00:00', '0 days 00:00:01', '0 days 00:00:02', '0 days 00:00:03', '0 days 00:00:04'], dtype='timedelta64[ns]', freq=None)

In [61]: pd.to_timedelta(np.arange(5), unit='d')
Out[61]: TimedeltaIndex(['0 days', '1 days', '2 days', '3 days', '4 days'], dtype='timedelta64[ns]', freq=None)

A Series of dtype timedelta64[ns] can now be divided by another timedelta64[ns] object, or astyped to yield a float64 dttyped Series. This is frequency conversion. See the docs for the docs.

In [62]: import datetime

In [63]: td = pd.Series(pd.date_range('20130101', periods=4)) - pd.Series(pd.date_range('20121201', periods=4))

In [64]: td[2] += np.timedelta64(datetime.timedelta(minutes=5, seconds=3))

In [65]: td[3] = np.nan

In [66]: td
Out[66]:
   0    31 days 00:00:00
   1    31 days 00:00:00
   2    31 days 00:05:03
   3     NaT
dtype: timedelta64[ns]
# to days
In [67]: td / np.timedelta64(1, 'D')
Out[67]:
0  31.000000
1  31.000000
2  31.003507
3  NaN
dtype: float64

In [68]: td.astype('timedelta64[D]')
Out[68]:
0  31.0
1  31.0
2  31.0
3  NaN
dtype: float64

# to seconds
In [69]: td / np.timedelta64(1, 's')
Out[69]:
0  2678400.0
1  2678400.0
2  2678703.0
3  NaN
dtype: float64

In [70]: td.astype('timedelta64[s]')
Out[70]:
0  2678400.0
1  2678400.0
2  2678703.0
3  NaN
dtype: float64

Dividing or multiplying a timedelta64[ns] Series by an integer or integer Series

In [71]: td * -1
Out[71]:
0  -31 days +00:00:00
1  -31 days +00:00:00
2  -32 days +23:54:57
3  NaT
dtype: timedelta64[ns]

In [72]: td * pd.Series([1, 2, 3, 4])
Out[72]:
0  31 days 00:00:00
1  62 days 00:00:00
2  93 days 00:15:09
3  NaN
dtype: timedelta64[ns]

Absolute DateOffset objects can act equivalently to timedelta

In [73]: from pandas import offsets

In [74]: td + offsets.Minute(5) + offsets.Milli(5)
Fillna is now supported for timedeltas

In [75]: td.fillna(pd.Timedelta(0))
Out[75]:
0 31 days 00:00:00
1 31 days 00:00:00
2 31 days 00:05:03
3 0 days 00:00:00
dtype: timedelta64[ns]

In [76]: td.fillna(datetime.timedelta(days=1, seconds=5))
Out[76]:
0 31 days 00:00:00
1 31 days 00:00:00
2 31 days 00:05:03
3 1 days 00:00:05
dtype: timedelta64[ns]

You can do numeric reduction operations on timedeltas.

In [77]: td.mean()
Out[77]: Timedelta('31 days 00:01:41')

In [78]: td.quantile(.1)
Out[78]: Timedelta('31 days 00:00:00')

• plot(kind='kde') now accepts the optional parameters bw_method and ind, passed to scipy.stats.gaussian_kde() (for scipy >= 0.11.0) to set the bandwidth, and to gkde.evaluate() to specify the indices at which it is evaluated, respectively. See scipy docs. (GH4298)

• DataFrame constructor now accepts a numpy masked record array (GH3478)

• The new vectorized string method extract return regular expression matches more conveniently.

In [79]: pd.Series(['a1', 'b2', 'c3']).str.extract('[ab](\d)')
Out[79]:
0  a  1
1  b  2
2  NaN

Elements that do not match return NaN. Extracting a regular expression with more than one group returns a DataFrame with one column per group.

In [80]: pd.Series(['a1', 'b2', 'c3']).str.extract('([ab])(\d)')
Out[80]:
0  a  1
1  b  2
2  NaN  NaN
Elements that do not match return a row of NaN. Thus, a Series of messy strings can be converted into a like-indexed Series or DataFrame of cleaned-up or more useful strings, without necessitating get() to access tuples or re.match objects.

Named groups like

```python
In [81]: pd.Series(['a1', 'b2', 'c3']).str.extract(
    ....:   '(?P<letter>[ab])(?P<digit>\d)')
Out[81]:
   letter  digit
0     a      1
1     b      2
2    NaN    NaN
```

and optional groups can also be used.

```python
In [82]: pd.Series(['a1', 'b2', '3']).str.extract(
    ....:   '(?P<letter>[ab])?(?P<digit>\d)')
Out[82]:
   letter  digit
0     a      1
1     b      2
2    NaN      3
```

- `read_stata` now accepts Stata 13 format (GH4291)
- `read_fwf` now infers the column specifications from the first 100 rows of the file if the data has correctly separated and properly aligned columns using the delimiter provided to the function (GH4488).
- support for nanosecond times as an offset

**Warning:** These operations require numpy >= 1.7

Period conversions in the range of seconds and below were reworked and extended up to nanoseconds. Periods in the nanosecond range are now available.

```python
In [83]: pd.date_range('2013-01-01', periods=5, freq='5N')
Out[83]:
```

```python
In [84]: pd.date_range('2013-01-01', periods=5, freq=pd.offsets.Nano(5))
Out[84]:
```
Timestamps can be modified in the nanosecond range

```
In [85]: t = pd.Timestamp('20130101 09:01:02')
In [86]: t + pd.tseries.offsets.Nano(123)
Out[86]: Timestamp('2013-01-01 09:01:02.000000123')
```

- A new method, `isin` for DataFrames, which plays nicely with boolean indexing. The argument to `isin`, what we're comparing the DataFrame to, can be a DataFrame, Series, dict, or array of values. See the docs for more.

To get the rows where any of the conditions are met:

```
In [87]: dfi = pd.DataFrame({'A': [1, 2, 3, 4], 'B': ['a', 'b', 'f', 'n']})
In [88]: dfi
Out[88]:
   A  B
0  1  a
1  2  b
2  3  f
3  4  n
In [89]: other = pd.DataFrame({'A': [1, 3, 3, 7], 'B': ['e', 'f', 'f', 'e']})
In [90]: mask = dfi.isin(other)
In [91]: mask
Out[91]:
   A  B
0  True False
1 False False
2  True  True
3 False False
In [92]: dfi[mask.any(1)]
Out[92]:
   A  B
0  1  a
2  3  f
```

- Series now supports a `to_frame` method to convert it to a single-column DataFrame (GH5164)

- All R datasets listed here http://stat.ethz.ch/R-manual/R-devel/library/datasets/html/00Index.html can now be loaded into pandas objects

  ```
  # note that pandas.rpy was deprecated in v0.16.0
  import pandas.rpy.common as com
  com.load_data('Titanic')
  ```

- `tz_localize` can infer a fall daylight savings transition based on the structure of the unlocalized data (GH4230), see the docs

- `DatetimeIndex` is now in the API documentation, see the docs

- `json_normalize()` is a new method to allow you to create a flat table from semi-structured JSON data. See the docs (GH1067)

- Added PySide support for the qtpandas DataFrameModel and DataFrameWidget.

- Python csv parser now supports usecols (GH4335)
- Frequencies gained several new offsets:
  - LastWeekOfMonth (GH4637)
  - FY5253, and FY5253Quarter (GH4511)

- DataFrame has a new `interpolate` method, similar to Series (GH4434, GH1892)

```python
In [93]: df = pd.DataFrame({
    ...:'A': [1, 2.1, np.nan, 4.7, 5.6, 6.8],
    ...:'B': [.25, np.nan, np.nan, 4, 12.2, 14.4]})

In [94]: df.interpolate()
Out[94]:
A   B
0  1.0  0.25
1  2.1  1.50
2  3.4  2.75
3  4.7  4.00
4  5.6  12.20
5  6.8  14.40
```

Additionally, the `method` argument to `interpolate` has been expanded to include 'nearest', 'zero', 'slinear', 'quadratic', 'cubic', 'barycentric', 'krogh', 'piecewise_polynomial', 'pchip', 'polynomial', 'spline'. The new methods require scipy. Consult the Scipy reference guide and documentation for more information about when the various methods are appropriate. See the docs.

Interpolate now also accepts a `limit` keyword argument. This works similar to `fillna`'s limit:

```python
In [95]: ser = pd.Series([1, 3, np.nan, np.nan, np.nan, 11])

In [96]: ser.interpolate(limit=2)
Out[96]:
0  1.0
1  3.0
2  5.0
3  7.0
4  NaN
5  11.0
dtype: float64
```

- Added `wide_to_long` panel data convenience function. See the docs.

```python
In [97]: np.random.seed(123)

In [98]: df = pd.DataFrame({
    ...:'A1970': {0: 'a', 1: 'b', 2: 'c'},
    ...:'A1980': {0: 'd', 1: 'e', 2: 'f'},
    ...:'B1970': {0: 2.5, 1: 1.2, 2: .7},
    ...:'B1980': {0: 3.2, 1: 1.3, 2: .1},
    ...:'X': dict(zip(range(3), np.random.randn(3)))
    ...
    })

In [99]: df['id'] = df.index

In [100]: df
Out[100]:
```

(continues on next page)
...to_csv now takes a date_format keyword argument that specifies how output datetime objects should be formatted. Datetimes encountered in the index, columns, and values will all have this formatting applied. (GH4313)

• DataFrame.plot will scatter plot x versus y by passing kind='scatter' (GH2215)

• Added support for Google Analytics v3 API segment IDs that also supports v2 IDs. (GH5271)

**Experimental**

• The new eval() function implements expression evaluation using numexpr behind the scenes. This results in large speedups for complicated expressions involving large DataFrames/Series. For example,

```python
In [102]: nrows, ncols = 20000, 100
In [103]: df1, df2, df3, df4 = [pd.DataFrame(np.random.randn(nrows, ncols)) for _ in range(4)]

# eval with NumExpr backend
In [104]: %timeit pd.eval('df1 + df2 + df3 + df4')
4.17 ms +- 62.4 us per loop (mean +- std. dev. of 7 runs, 100 loops each)

# pure Python evaluation
In [105]: %timeit df1 + df2 + df3 + df4
6.01 ms +- 79.5 us per loop (mean +- std. dev. of 7 runs, 100 loops each)
```

For more details, see the [docs](https://pandas.pydata.org/docs/).

• Similar to pandas.eval, DataFrame has a new DataFrame.eval method that evaluates an expression in the context of the DataFrame. For example,

```python
In [106]: df = pd.DataFrame(np.random.randn(10, 2), columns=['a', 'b'])
In [107]: df.eval('a + b')
Out[107]:
   0  -0.685204
   1   1.589745
   2   0.325441
   3  -1.784153
```

(continues on next page)
• query() method has been added that allows you to select elements of a DataFrame using a natural query syntax nearly identical to Python syntax. For example,

```python
In [108]: n = 20
In [109]: df = pd.DataFrame(np.random.randint(n, size=(n, 3)), columns=['a', 'b', 'c'])
In [110]: df.query('a < b < c')
Out[110]:
   a  b  c
11  1  5  8
15  8 16 19
```
selects all the rows of df where a < b < c evaluates to True. For more details see the docs.

• pd.read_msgpack() and pd.to_msgpack() are now a supported method of serialization of arbitrary pandas (and python objects) in a lightweight portable binary format. See the docs.

Warning: Since this is an EXPERIMENTAL LIBRARY, the storage format may not be stable until a future release.

```python
df = pd.DataFrame(np.random.rand(5, 2), columns=list('AB'))
df.to_msgpack('foo.msg')
pd.read_msgpack('foo.msg')

s = pd.Series(np.random.rand(5), index=pd.date_range('20130101', periods=5))
pd.to_msgpack('foo.msg', df, s)
pd.read_msgpack('foo.msg')
```

You can pass iterator=True to iterator over the unpacked results

```python
for o in pd.read_msgpack('foo.msg', iterator=True):
    print(o)
```

• pandas.io.gbq provides a simple way to extract from, and load data into, Google’s BigQuery Data Sets by way of pandas DataFrames. BigQuery is a high performance SQL-like database service, useful for performing ad-hoc queries against extremely large datasets. See the docs

```python
from pandas.io import gbq

# A query to select the average monthly temperatures in the
# in the year 2000 across the USA. The dataset,
# publicata:samples.gsod, is available on all BigQuery accounts,
# and is based on NOAA gsod data.
```
```python
query = """SELECT station_number as STATION,
month as MONTH, AVG(mean_temp) as MEAN_TEMP
FROM publicdata:samples.gsod
WHERE YEAR = 2000
GROUP BY STATION, MONTH
ORDER BY STATION, MONTH ASC""

# Fetch the result set for this query

# Your Google BigQuery Project ID
# To find this, see your dashboard:
# https://console.developers.google.com/iam-admin/projects?authuser=0
projectid = 'xxxxxxxxx'
df = gbq.read_gbq(query, project_id=projectid)

# Use pandas to process and reshape the dataset
df2 = df.pivot(index='STATION', columns='MONTH', values='MEAN_TEMP')
df3 = pd.concat(
    [df2.min(), df2.mean(), df2.max()],
    axis=1, keys=['Min Tem', 'Mean Temp', 'Max Temp'])
```

The resulting DataFrame is:

```plaintext
> df3

<table>
<thead>
<tr>
<th>MONTH</th>
<th>Min Tem</th>
<th>Mean Temp</th>
<th>Max Temp</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>-53.336667</td>
<td>39.827892</td>
<td>89.770968</td>
</tr>
<tr>

<td>94.396774</td>
</tr>
</tbody>
</table>
```

**Warning:** To use this module, you will need a BigQuery account. See <https://cloud.google.com/products/big-query> for details.

As of 10/10/13, there is a bug in Google’s API preventing result sets from being larger than 100,000 rows. A patch is scheduled for the week of 10/14/13.
Internal refactoring

In 0.13.0 there is a major refactor primarily to subclass `Series` from `NDFrame`, which is the base class currently for `DataFrame` and `Panel`, to unify methods and behaviors. `Series` formerly subclassed directly from `ndarray`. (GH4080, GH3862, GH816)

**Warning:** There are two potential incompatibilities from < 0.13.0

- Using certain numpy functions would previously return a `Series` if passed a `Series` as an argument. This seems only to affect `np.ones_like`, `np.empty_like`, `np.diff` and `np.where`. These now return `ndarrays`.

```python
In [111]: s = pd.Series([1, 2, 3, 4])
```

Numpy Usage

```python
In [112]: np.ones_like(s)
Out[112]: array([1, 1, 1, 1])

In [113]: np.diff(s)
Out[113]: array([1, 1, 1])

In [114]: np.where(s > 1, s, np.nan)
Out[114]: array([nan, 2., 3., 4.])
```

Pandonic Usage

```python
In [115]: pd.Series(1, index=s.index)
Out[115]:
0  1
1  1
2  1
3  1
dtype: int64

In [116]: s.diff()
Out[116]:
0  NaN
1  1.0
2  1.0
3  1.0
dtype: float64

In [117]: s.where(s > 1)
Out[117]:
0  NaN
1  2.0
2  3.0
3  4.0
dtype: float64
```

- Passing a `Series` directly to a cython function expecting an `ndarray` type will no long work directly, you must pass `Series.values`, See Enhancing Performance
- `Series(0.5)` would previously return the scalar 0.5, instead this will return a 1-element `Series`
- This change breaks `rpy2<=2.3.8`. An Issue has been opened against rpy2 and a workaround is detailed in GH5698. Thanks @JanSchulz.

- Pickle compatibility is preserved for pickles created prior to 0.13. These must be unpickled with `pd.`
read_pickle, see *Pickling*.

- Refactor of series.py/frame.py/panel.py to move common code to generic.py
  - added `__setup_axes` to created generic NDFrame structures
  - moved methods
    - `from_axes, _wrap_array, axes, ix, loc, iloc, shape, empty, swapaxes, transpose, pop`  
    - `__iter__, keys, __contains__, __len__, __neg__, __invert__`  
    - `convert_objects, as_blocks, as_matrix, values`  
    - `__getstate__, __setstate__` (compat remains in frame/panel)
    - `__getattr__, __setattr__`  
    - `_indexed_same, reindex_like, align, where, mask`  
    - `fillna, replace (Series replace is now consistent with DataFrame)`  
    - `filter (also added axis argument to selectively filter on a different axis)`  
    - `reindex, reindex_axis, take`  
    - `truncate (moved to become part of NDFrame)`

- These are API changes which make *Panel* more consistent with *DataFrame*
  - `swapaxes` on a *Panel* with the same axes specified now return a copy
  - support attribute access for setting
  - `filter` supports the same API as the original *DataFrame* filter

- Reindex called with no arguments will now return a copy of the input object

- *TimeSeries* is now an alias for *Series*. the property `is_time_series` can be used to distinguish (if desired)

- Refactor of Sparse objects to use BlockManager
  - Created a new block type in internals, *SparseBlock*, which can hold multi-dtypes and is non-consolidatable. *SparseSeries* and *SparseDataFrame* now inherit more methods from there hierarchy (*Series/DataFrame*), and no longer inherit from *SparseArray* (which instead is the object of the *SparseBlock*)
  - Sparse suite now supports integration with non-sparse data. Non-float sparse data is supportable (partially implemented)
  - Operations on sparse structures within DataFrames should preserve sparseness, merging type operations will convert to dense (and back to sparse), so might be somewhat inefficient
  - enable setitem on *SparseSeries* for boolean/integer/slices
  - *SparsePanels* implementation is unchanged (e.g. not using BlockManager, needs work)

- added `ftypes` method to *Series/DataFrame*, similar to `dtypes`, but indicates if the underlying is sparse/dense (as well as the dtype)

- All NDFrame objects can now use `__finalize__()` to specify various values to propagate to new objects from an existing one (e.g. name in *Series* will follow more automatically now)

- Internal type checking is now done via a suite of generated classes, allowing `isinstance(value, klass)` without having to directly import the klass, courtesy of @jtratner
• Bug in Series update where the parent frame is not updating its cache based on changes (GH4080) or types (GH3217), fillna (GH3386)
• Indexing with dtype conversions fixed (GH4463, GH4204)
• Refactor Series.reindex to core/generic.py (GH4604, GH4618), allow method= in reindexing on a Series to work
• Series.copy no longer accepts the order parameter and is now consistent with NDFrame copy
• Refactor rename methods to core/generic.py; fixes Series.rename for (GH4605), and adds rename with the same signature for Panel
• Refactor clip methods to core/generic.py (GH4798)
• Refactor of _get_numeric_data/_get_bool_data to core/generic.py, allowing Series/Panel functionality
• Series (for index)/Panel (for items) now allow attribute access to its elements (GH1903)

```python
In [118]: s = pd.Series([1, 2, 3], index=list('abc'))

In [119]: s.b
Out[119]: 2

In [120]: s.a = 5

In [121]: s
Out[121]:
          a 5
          b 2
          c 3
dtype: int64
```

Bug fixes

• HDFStore
  – raising an invalid TypeError rather than ValueError when appending with a different block ordering (GH4096)
  – read_hdf was not respecting as passed mode (GH4504)
  – appending a 0-len table will work correctly (GH4273)
  – to_hdf was raising when passing both arguments append and table (GH4584)
  – reading from a store with duplicate columns across dtypes would raise (GH4767)
  – Fixed a bug where ValueError wasn’t correctly raised when column names weren’t strings (GH4956)
  – A zero length series written in Fixed format not deserializing properly. (GH4708)
  – Fixed decoding perf issue on pyt3 (GH5441)
  – Validate levels in a MultiIndex before storing (GH5527)
  – Correctly handle data_columns with a Panel (GH5717)
• Fixed bug in tslib.tz_convert(vals, tz1, tz2): it could raise IndexError exception while trying to access trans[pos + 1] (GH4496)
• The by argument now works correctly with the layout argument (GH4102, GH4014) in * . hist plotting methods
• Fixed bug in PeriodIndex.map where using str would return the str representation of the index (GH4136)
• Fixed test failure test_time_series_plot_color_with_empty_kwargs when using custom matplotlib default colors (GH4345)
• Fix running of stata IO tests. Now uses temporary files to write (GH4353)
• Fixed an issue where DataFrame.sum was slower than DataFrame.mean for integer valued frames (GH4365)
• read_html tests now work with Python 2.6 (GH4351)
• Fixed bug where network testing was throwing NameError because a local variable was undefined (GH4381)
• In to_json, raise if a passed orient would cause loss of data because of a duplicate index (GH4359)
• In to_json, fix date handling so milliseconds are the default timestamp as the docstring says (GH4362).
• as_index is no longer ignored when doing groupby apply (GH4648, GH3417)
• JSON NaT handling fixed, NaTs are now serialized to null (GH4998)
• Fixed JSON handling of escapable characters in JSON object keys (GH4593)
• Fixed passing keep_default_na=False when na_values=None (GH4318)
• Fixed bug with values raising an error on a DataFrame with duplicate columns and mixed dtypes, surfaced in (GH4377)
• Fixed bug with duplicate columns and type conversion in read_json when orient='split' (GH4377)
• Fixed JSON bug where locales with decimal separators other than ‘.’ threw exceptions when encoding / decoding certain values. (GH4918)
• Fix .iat indexing with a PeriodIndex (GH4390)
• Fixed an issue where PeriodIndex joining with self was returning a new instance rather than the same instance (GH4379); also adds a test for this for the other index types
• Fixed a bug with all the dtypes being converted to object when using the CSV parser with the usecols parameter (GH3192)
• Fix an issue in merging blocks where the resulting DataFrame had partially set _ref_locs (GH4403)
• Fixed an issue where hist subplots were being overwritten when they were called using the top level matplotlib API (GH4408)
• Fixed a bug where calling Series.astype(str) would truncate the string (GH4405, GH4437)
• Fixed a py3 compat issue where bytes were being repr’d as tuples (GH4455)
• Fixed Panel attribute naming conflict if item is named ‘a’ (GH3440)
• Fixed an issue where duplicate indexes were raising when plotting (GH4486)
• Fixed an issue where cumsum and cumprod didn’t work with bool dtypes (GH4170, GH4440)
• Fixed Panel slicing issued in xs that was returning an incorrect dimmed object (GH4016)
• Fix resampling bug where custom reduce function not used if only one group (GH3849, GH4494)
• Fixed Panel assignment with a transposed frame (GH3830)
• Raise on set indexing with a Panel and a Panel as a value which needs alignment (GH3777)
• frozenset objects now raise in the Series constructor (GH4482, GH4480)
• Fixed issue with sorting a duplicate MultiIndex that has multiple dtypes (GH4516)
- Fixed bug in `DataFrame.set_values` which was causing name attributes to be lost when expanding the index. (GH3742, GH4039)
- Fixed issue where individual names, levels and labels could be set on `MultiIndex` without validation (GH3714, GH4039)
- Fixed (GH3334) in `pivot_table`. Margins did not compute if values is the index.
- Fix bug in having a rhs of `np.timedelta64` or `np.offsets.DateOffset` when operating with date-times (GH4532)
- Fix arithmetic with series/datetimeindex and `np.timedelta64` not working the same (GH4134) and buggy timedelta in NumPy 1.6 (GH4135)
- Fix bug in `pd.read_clipboard` on windows with PY3 (GH4561); not decoding properly
- `tslib.get_period_field()` and `tslib.get_period_field_arr()` now raise if code argument out of range (GH4519, GH4520)
- Fix boolean indexing on an empty series loses index names (GH4235), `infer_dtype` works with empty arrays.
- Fix reindexing with multiple axes; if an axes match was not replacing the current axes, leading to a possible lazy frequency inference issue (GH3317)
- Fixed issue where `DataFrame.apply` was reraising exceptions incorrectly (causing the original stack trace to be truncated).
- Fix selection with `ix/loc` and non_unique selectors (GH4619)
- Fix assignment with `iloc/loc` involving a dtype change in an existing column (GH4312, GH5702) have internal `setitem_with_indexer` in core/indexing to use Block.setitem
- Fixed bug where thousands operator was not handled correctly for floating point numbers in `csv_import` (GH4322)
- Fix an issue with `CacheableOffset` not properly being used by many `DateOffset`; this prevented the `DateOffset` from being cached (GH4609)
- Fix boolean comparison with a `DataFrame` on the lhs, and a list/tuple on the rhs (GH4576)
- Fix error/dtype conversion with `setitem` of `None` on `Series/DataFrame` (GH4667)
- Fix decoding based on a passed in non-default encoding in `pd.read_stata` (GH4626)
- Fix `DataFrame.from_records` with a plain-vanilla `ndarray` (GH4727)
- Fix some inconsistencies with `Index.rename` and `MultiIndex.rename`, etc. (GH4718, GH4628)
- Bug in using `iloc/loc` with a cross-sectional and duplicate indices (GH4726)
- Bug with using `QUOTE_NONE` with `to_csv` causing `Exception`. (GH4328)
- Bug with Series indexing not raising an error when the right-hand-side has an incorrect length (GH2702)
- Bug in `MultiIndexing` with a partial string selection as one part of a `MultiIndex` (GH4758)
- Bug with reindexing on the index with a non-unique index will now raise `ValueError` (GH4746)
- Bug in setting with `loc/ix` a single indexer with a `MultiIndex` axis and a NumPy array, related to failing (GH3777)
- Bug in concatenation with duplicate columns across dtypes not merging with axis=0 (GH4771, GH4975)
- Bug in `iloc` with a slice index failing (GH4771)
- Incorrect error message with no colspecs or width in `read_fwf`. (GH4774)
- Fix bugs in indexing in a Series with a duplicate index (GH4548, GH4550)
• Fixed bug with reading compressed files with read_fwf in Python 3. (GH3963)
• Fixed an issue with a duplicate index and assignment with a dtype change (GH4686)
• Fixed an issue related to ticklocs/ticklabels with log scale bar plots across different versions of matplotlib (GH4789)
• Suppressed DeprecationWarning associated with internal calls issued by repr() (GH4391)
• Fixed an issue with a duplicate index and duplicate selector with .loc (GH4825)
• Fixed an issue with DataFrame.sort_index where, when sorting by a single column and passing a list for ascending, the argument for ascending was being interpreted as True (GH4839, GH4846)
• Fixed Panel.tshift not working. Added freq support to Panel.shift (GH4853)
• Fix an issue in TextFileReader w/ Python engine (i.e. PythonParser) with thousands != “,” (GH4596)
• Bug in getitem with a duplicate index when using where (GH4879)
• Fix Type inference code coerces float column into datetime (GH4601)
• Fixed _ensure_numeric does not check for complex numbers (GH4902)
• Fixed a bug in Series.hist where two figures were being created when the by argument was passed (GH4112, GH4113).
• Fixed a bug in convert_objects for > 2 ndims (GH4937)
• Fixed a bug in DataFrame/Panel cache insertion and subsequent indexing (GH4939, GH5424)
• Fixed string methods for FrozenNDArray and FrozenList (GH4929)
• Fixed a bug with setting invalid or out-of-range values in indexing enlargement scenarios (GH4940)
• Tests for fillna on empty Series (GH4346), thanks @immerrr
• Fixed copy() to shallow copy axes/indices as well and thereby keep separate metadata. (GH4202, GH4830)
• Fixed skiprows option in Python parser for read_csv (GH4382)
• Fixed bug preventing cut from working with np.inf levels without explicitly passing labels (GH3415)
• Fixed wrong check for overlapping in DatetimeIndex.union (GH4564)
• Fixed conflict between thousands separator and date parser in csv_parser (GH4678)
• Fix appending when dtypes are not the same (error showing mixing float/np.datetime64) (GH4993)
• Fix repr for DateOffset. No longer show duplicate entries in kwds. Removed unused offset fields. (GH4638)
• Fixed wrong index name during read_csv if using usecols. Applies to c parser only. (GH4201)
• Timestamp objects can now appear in the left hand side of a comparison operation with a Series or DataFrame object (GH4982).
• Fix a bug when indexing with np.nan via iloc/loc (GH5016)
• Fixed a bug where low memory c parser could create different types in different chunks of the same file. Now coerces to numerical type or raises warning. (GH3866)
• Fix a bug where reshaping a Series to its own shape raised TypeError (GH4554) and other reshaping issues.
• Bug in setting with ix/loc and a mixed int/string index (GH4544)
• Make sure series-series boolean comparisons are label based (GH4947)
• Bug in multi-level indexing with a Timestamp partial indexer (GH4294)
• Tests/fix for MultiIndex construction of an all-nan frame (GH4078)
• Fixed a bug where `read_html()` wasn’t correctly inferring values of tables with commas (GH5029)
• Fixed a bug where `read_html()` wasn’t providing a stable ordering of returned tables (GH4770, GH5029).
• Fixed a bug where `read_html()` was incorrectly parsing when passed `index_col=0` (GH5066).
• Fixed a bug where `read_html()` was incorrectly inferring the type of headers (GH5048).
• Fixed a bug where `DatetimeIndex` joins with `PeriodIndex` caused a stack overflow (GH3899).
• Fixed a bug where `groupby` objects didn’t allow plots (GH5102).
• Fixed a bug where `groupby` objects weren’t tab-completing column names (GH5102).
• Fixed a bug where `groupby.plot()` and friends were duplicating figures multiple times (GH5102).
• Provide automatic conversion of `object` dtypes on fillna, related (GH5103)
• Fixed a bug where default options were being overwritten in the option parser cleaning (GH5121).
• Treat a list/ndarray identically for `iloc` indexing with list-like (GH5006)
• Fix `MultiIndex.get_level_values()` with missing values (GH5074)
• Fix bound checking for Timestamp() with datetime64 input (GH4065)
• Fix a bug where `TestReadHtml` wasn’t calling the correct `read_html()` function (GH5150).
• Fix a bug with `NDFrame.replace()` which made replacement appear as though it was (incorrectly) using regular expressions (GH5143).
• Fix better error message for `to_datetime` (GH4928)
• Made sure different locales are tested on travis-ci (GH4918). Also adds a couple of utilities for getting locales and setting locales with a context manager.
• Fixed segfault on `isnull(MultiIndex)` (now raises an error instead) (GH5123, GH5125)
• Allow duplicate indices when performing operations that align (GH5185, GH5639)
• Compound dtypes in a constructor raise `NotImplementedError` (GH5191)
• Bug in comparing duplicate frames (GH4421) related
• Bug in `describe` on duplicate frames
• Bug in `to_datetime` with a format and `coerce=True` not raising (GH5195)
• Bug in `loc` setting with multiple indexers and a rhs of a Series that needs broadcasting (GH5206)
• Fixed bug where inplace setting of levels or labels on `MultiIndex` would not clear cached `values` property and therefore return wrong values. (GH5215)
• Fixed bug where filtering a grouped DataFrame or Series did not maintain the original ordering (GH4621).
• Fixed `Period` with a business date freq to always roll-forward if on a non-business date. (GH5203)
• Fixed bug in Excel writers where frames with duplicate column names weren’t written correctly. (GH5235)
• Fixed issue with `drop` and a non-unique index on Series (GH5248)
• Fixed segfault in C parser caused by passing more names than columns in the file. (GH5156)
• Fix `Series.isin` with date/time-like dtypes (GH5021)
C and Python Parser can now handle the more common MultiIndex column format which doesn’t have a row for index names (GH4702)

• Bug when trying to use an out-of-bounds date as an object dtype (GH5312)
• Bug when trying to display an embedded PandasObject (GH5324)
• Allows operating of Timestamps to return a datetime if the result is out-of-bounds related (GH5312)
• Fix return value/type signature of initObjToJSON() to be compatible with numpy’s import_array() (GH5334, GH5326)
• Bug when renaming then set_index on a DataFrame (GH5344)
• Test suite no longer leaves around temporary files when testing graphics. (GH5347) (thanks for catching this @yarikoptic!)
• Fixed html tests on win32. (GH4580)
• Make sure that head/tail are iloc based, (GH5370)
• Fixed bug for PeriodIndex string representation if there are 1 or 2 elements. (GH5372)
• The GroupBy methods transform and filter can be used on Series and DataFrames that have repeated (non-unique) indices. (GH4620)
• Fix empty series not printing name in repr (GH4651)
• Make tests create temp files in temp directory by default. (GH5419)
• pd.to_timedelta of a scalar returns a scalar (GH5410)
• pd.to_timedelta accepts NaN and NaT, returning NaT instead of raising (GH5437)
• performance improvements in isnull on larger size pandas objects
• Fixed various setitem with 1d ndarray that does not have a matching length to the indexer (GH5508)
• Bug in getitem with a MultiIndex and iloc (GH5528)
• Bug in delitem on a Series (GH5542)
• Bug fix in apply when using custom function and objects are not mutated (GH5545)
• Bug in selecting from a non-unique index with loc (GH5553)
• Bug in groupby returning non-consistent types when user function returns a None, (GH5592)
• Work around regression in numpy 1.7.0 which erroneously raises IndexError from ndarray.item (GH5666)
• Bug in repeated indexing of object with resultant non-unique index (GH5678)
• Bug in fillna with Series and a passed series/dict (GH5703)
• Bug in groupby transform with a datetime-like grouper (GH5712)
• Bug in MultiIndex selection in PY3 when using certain keys (GH5725)
• Row-wise concat of differing dtypes failing in certain cases (GH5754)

This is a major release from 0.11.0 and includes several new features and enhancements along with a large number of bug fixes.

Highlights include a consistent I/O API naming scheme, routines to read html, write MultiIndexes to csv files, read & write STATA data files, read & write JSON format files, Python 3 support for HDFStore, filtering of groupby expressions via filter, and a revamped replace routine that accepts regular expressions.

API changes

- The I/O API is now much more consistent with a set of top level reader functions accessed like pd.read_csv() that generally return a pandas object.
  - read_csv
  - read_excel
  - read_hdf
  - read_sql
  - read_json
  - read_html
  - read_stata
  - read_clipboard

The corresponding writer functions are object methods that are accessed like df.to_csv()
- to_clipboard

- Fix modulo and integer division on Series, DataFrames to act similarly to float dtypes to return np.nan or np.inf as appropriate (GH3590). This correct a numpy bug that treats integer and float dtypes differently.

```python
In [1]: p = pd.DataFrame({"first": [4, 5, 8], "second": [0, 0, 3]})

In [2]: p % 0
Out[2]:
     first  second
0      NaN      NaN
1      NaN      NaN
2      NaN      NaN

In [3]: p % p
Out[3]:
     first  second
0  0.0000   NaN
1  0.0000   NaN
2  0.0000   0.00

In [4]: p / p
Out[4]:
     first  second
0  1.0000   NaN
1  1.0000   NaN
2  1.0000   1.00

In [5]: p / 0
Out[5]:
     first  second
0    inf      NaN
1    inf      NaN
2    inf      inf
```

- Add squeeze keyword to groupby to allow reduction from DataFrame -> Series if groups are unique. This is a Regression from 0.10.1. We are reverting back to the prior behavior. This means groupby will return the same shaped objects whether the groups are unique or not. Revert this issue (GH2893) with (GH3596).

```python
In [2]: df2 = pd.DataFrame([
                                  {"val1": 1, "val2": 20},
                                  {"val1": 1, "val2": 19},
                                  {"val1": 1, "val2": 27},
                                  {"val1": 1, "val2": 12}])

In [3]: def func(dataf):
    return dataf["val2"] - dataf["val2"].mean()

In [4]: # squeezing the result frame to a series (because we have unique groups)
    ...: df2.groupby("val1", squeeze=True).apply(func)
Out[4]:
    0       0.5
    1      -0.5
    2       7.5
    3      -7.5
Name: 1, dtype: float64
```

(continues on next page)
In [5]: # no squeezing (the default, and behavior in 0.10.1)
...: df2.groupby("val1").apply(func)
Out[5]:
+----+------+
| val2 |   0   |
|      | 1    |
|      | 2    |
|      | 3    |
| val1 | 1    |
|      | 0.5  |
|      | -0.5 |
|      | 7.5  |
|      | -7.5 |
+----+------+

- Raise on iloc when boolean indexing with a label based indexer mask e.g. a boolean Series, even with integer labels, will raise. Since iloc is purely positional based, the labels on the Series are not alignable (GH3631)

This case is rarely used, and there are plenty of alternatives. This preserves the iloc API to be purely positional based.

Suppose:

In [6]: df = pd.DataFrame(range(5), index=list("ABCDE"), columns=["a"])
In [7]: mask = df.a % 2 == 0
In [8]: mask
Out[8]:
A   True
B  False
C   True
D  False
E   True
Name: a, dtype: bool

# this is what you should use
In [9]: df.loc[mask]
Out[9]:
a
A   0
C   2
E   4

# this will work as well
In [10]: df.iloc[mask.values]
Out[10]:
a
A   0
C   2
E   4

df.iloc[mask] will raise a ValueError

- The raise_on_error argument to plotting functions is removed. Instead, plotting functions raise a TypeError when the dtype of the object is object to remind you to avoid object arrays whenever possible and thus you should cast to an appropriate numeric dtype if you need to plot something.

- Add colormap keyword to DataFrame plotting methods. Accepts either a matplotlib colormap object (ie, matplotlib.cm.jet) or a string name of such an object (ie, 'jet'). The colormap is sampled to select the color for each column. Please see Colormaps for more information. (GH3860)

- DataFrame.interpolate() is now deprecated. Please use DataFrame.fillna() and DataFrame.replace() instead. (GH3582, GH3675, GH3676)

- the method and axis arguments of DataFrame.replace() are deprecated

- DataFrame.replace’s infer_types parameter is removed and now performs conversion by default. (GH3907)
• Add the keyword `allow_duplicates` to `DataFrame.insert` to allow a duplicate column to be inserted if `True`, default is `False` (same as prior to 0.12) (GH3679)

• Implement `__nonzero__` for `NDFrame` objects (GH3691, GH3696)

• IO api
  – added top-level function `read_excel` to replace the following. The original API is deprecated and will be removed in a future version
    ```python
    from pandas.io.parsers import ExcelFile
    xls = ExcelFile("path_to_file.xls")
    xls.parse("Sheet1", index_col=None, na_values=["NA"])
    
    With
    ```
    ```python
    import pandas as pd
    pd.read_excel("path_to_file.xls", "Sheet1", index_col=None, na_values=["NA"])
    ```
  – added top-level function `read_sql` that is equivalent to the following
    ```python
    from pandas.io.sql import read_frame
    read_frame(...)  
    ```

• `DataFrame.to_html` and `DataFrame.to_latex` now accept a path for their first argument (GH3702)

• Do not allow astypes on `datetime64[ns]` except to `object`, and `timedelta64[ns]` to `object/int` (GH3425)

• The behavior of `datetime64` dtypes has changed with respect to certain so-called reduction operations (GH3726). The following operations now raise a `TypeError` when performed on a `Series` and return an empty `Series` when performed on a `DataFrame` similar to performing these operations on, for example, a DataFrame of slice objects:
  – sum, prod, mean, std, var, skew, kurt, corr, and cov

• `read_html` now defaults to `None` when reading, and falls back on `bs4 + html5lib` when lxml fails to parse. a list of parsers to try until success is also valid

• The internal `pandas` class hierarchy has changed (slightly). The previous `PandasObject` now is called `PandasContainer` and a new `PandasObject` has become the base class for `PandasContainer` as well as `Index`, `Categorical`, `GroupBy`, `SparseList`, and `SparseArray` (+ their base classes). Currently, `PandasObject` provides string methods (from `StringMixin`). (GH4090, GH4092)

• New `StringMixin` that, given a `__unicode__` method, gets python 2 and python 3 compatible string methods (`__str__`, `__bytes__`, and `__repr__`). Plus string safety throughout. Now employed in many places throughout the `pandas` library. (GH4090, GH4092)
IO enhancements

- `pd.read_html()` can now parse HTML strings, files or urls and return DataFrames, courtesy of @cpcloud. (GH3477, GH3605, GH3606, GH3616). It works with a single parser backend: BeautifulSoup4 + html5lib. See the docs

You can use `pd.read_html()` to read the output from `DataFrame.to_html()` like so

```
In [11]: df = pd.DataFrame({"a": range(3), "b": list("abc"))

In [12]: print(df)
a b
0 0 a
1 1 b
2 2 c

In [13]: html = df.to_html()

In [14]: alist = pd.read_html(html, index_col=0)

In [15]: print(df == alist[0])
a b
0 True True
1 True True
2 True True
```

Note that `alist` here is a Python list so `pd.read_html()` and `DataFrame.to_html()` are not inverses.

- `pd.read_html()` no longer performs hard conversion of date strings (GH3656).

**Warning:** You may have to install an older version of BeautifulSoup4. See the installation docs

- Added module for reading and writing Stata files: `pandas.io.stata` (GH1512) accessible via `read_stata` top-level function for reading, and `to_stata` DataFrame method for writing. See the docs

- Added module for reading and writing json format files: `pandas.io.json` accessible via `read_json` top-level function for reading, and `to_json` DataFrame method for writing. See the docs various issues (GH1226, GH3804, GH3876, GH3867, GH1305)

- MultiIndex column support for reading and writing csv format files
  - The header option in `read_csv` now accepts a list of the rows from which to read the index.
  - The option, `tupleize_cols` can now be specified in both `to_csv` and `read_csv`, to provide compatibility for the pre 0.12 behavior of writing and reading MultiIndex columns via a list of tuples. The default in 0.12 is to write lists of tuples and not interpret list of tuples as a MultiIndex column.

  Note: The default behavior in 0.12 remains unchanged from prior versions, but starting with 0.13, the default to write and read MultiIndex columns will be in the new format. (GH3571, GH1651, GH3141)

  - If an `index_col` is not specified (e.g. you don’t have an index, or wrote it with `df.to_csv(..., index=False)`, then any names on the columns index will be lost.

```
In [16]: from pandas._testing import makeCustomDataframe as mkdf

In [17]: df = mkdf(5, 3, r_idx_nlevels=2, c_idx_nlevels=4)
```
In [18]: df.to_csv("mi.csv")

In [19]: print(open("mi.csv").read())

- Support for HDFStore (via PyTables 3.0.0) on Python3
- Iterator support via read_hdf that automatically opens and closes the store when iteration is finished. This is only for tables

In [25]: path = 'store_iterator.h5'

In [26]: pd.DataFrame(np.random.randn(10, 2)).to_hdf(path, 'df', table=True)

In [27]: for df in pd.read_hdf(path, 'df', chunksize=3):
   ....:     print(df)
   ....:
   0   1
  0  0.713216 -0.778461
  1 -0.661062  0.862877
  2  0.344342  0.149565
  0   1
  3 -0.626968 -0.875772
  4 -0.930687 -0.218983
  5  0.949965 -0.442354
  0   1
  6 -0.402985  1.111358
  7 -0.241527 -0.670477
  8  0.049355  0.632633
  0   1
  9 -1.502767 -1.225492

- read_csv will now throw a more informative error message when a file contains no columns, e.g., all newline characters
Other enhancements

- `DataFrame.replace()` now allows regular expressions on contained `Series` with object dtype. See the examples section in the regular docs *Replacing via String Expression*

For example you can do

```python
In [21]: df = pd.DataFrame({"a": list("ab.."), "b": [1, 2, 3, 4]})

In [22]: df.replace(regex=r"\s*\s*", value=np.nan)
```

Out[22]:
```
    a  b
0  a  1
1  b  2
2  NaN 3
3  NaN 4
```

to replace all occurrences of the string ' .' with zero or more instances of surrounding white space with `NaN`. Regular string replacement still works as expected. For example, you can do

```python
In [23]: df.replace('.', np.nan)
```

Out[23]:
```
    a  b
0  a  1
1  b  2
2  NaN 3
3  NaN 4
```

to replace all occurrences of the string ' .' with `NaN`.

- `pd.melt()` now accepts the optional parameters `var_name` and `value_name` to specify custom column names of the returned DataFrame.

- `pd.set_option()` now allows N option, value pairs (GH3667).

  Let's say that we had an option 'a.b' and another option 'b.c'. We can set them at the same time:

```python
In [31]: pd.get_option('a.b')
Out[31]: 2

In [32]: pd.get_option('b.c')
Out[32]: 3

In [33]: pd.set_option('a.b', 1, 'b.c', 4)

In [34]: pd.get_option('a.b')
Out[34]: 1

In [35]: pd.get_option('b.c')
Out[35]: 4
```

- The `filter` method for group objects returns a subset of the original object. Suppose we want to take only elements that belong to groups with a group sum greater than 2.

```python
In [24]: sf = pd.Series([1, 1, 2, 3, 3, 3])

In [25]: sf.groupby(sf).filter(lambda x: x.sum() > 2)
```

(continues on next page)
The argument of `filter` must a function that, applied to the group as a whole, returns `True` or `False`. Another useful operation is filtering out elements that belong to groups with only a couple members.

```python
In [26]: dff = pd.DataFrame({"A": np.arange(8), "B": list("aabbbbcc"))
In [27]: dff.groupby("B").filter(lambda x: len(x) > 2)
Out[27]:
   A  B
2  2 b
3  3 b
4  4 b
5  5 b
```

Alternatively, instead of dropping the offending groups, we can return a like-indexed objects where the groups that do not pass the filter are filled with NaNs.

```python
In [28]: dff.groupby("B").filter(lambda x: len(x) > 2, dropna=False)
Out[28]:
   A  B
0 NaN NaN
1 NaN NaN
2 2.0 b
3 3.0 b
4 4.0 b
5 5.0 b
6 NaN NaN
7 NaN NaN
```

- Series and DataFrame hist methods now take a `figsize` argument (GH3834)
- DatetimeIndexes no longer try to convert mixed-integer indexes during join operations (GH3877)
- Timestamp.min and Timestamp.max now represent valid Timestamp instances instead of the default date-time.min and datetime.max (respectively), thanks @SleepingPills
- `read_html` now raises when no tables are found and BeautifulSoup==4.2.0 is detected (GH4214)

**Experimental features**

- Added experimental `CustomBusinessDay` class to support DateOffsets with custom holiday calendars and custom weekmasks. (GH2301)

**Note:** This uses the `numpy.busdaycalendar` API introduced in Numpy 1.7 and therefore requires Numpy 1.7.0 or newer.

```python
In [29]: from pandas.tseries.offsets import CustomBusinessDay
In [30]: from datetime import datetime
```

(continues on next page)
# As an interesting example, let's look at Egypt where
# a Friday-Saturday weekend is observed.
In [31]: weekmask_egypt = "Sun Mon Tue Wed Thu"

# They also observe International Workers' Day so let's
# add that for a couple of years
In [32]: holidays = ["2012-05-01", datetime(2013, 5, 1), np.datetime64("2014-05-01")]

In [33]: bday_egypt = CustomBusinessDay(holidays=holidays, weekmask=weekmask_egypt)

In [34]: dt = datetime(2013, 4, 30)
In [35]: print(dt + 2 * bday_egypt)
2013-05-05 00:00:00
In [36]: dts = pd.date_range(dt, periods=5, freq=bday_egypt)
In [37]: print(pd.Series(dts.weekday, dts).map(pd.Series("Mon Tue Wed Thu Fri Sat Sun".split())))
2013-04-30 Tue
2013-05-02 Thu
2013-05-05 Sun
2013-05-06 Mon
2013-05-07 Tue
Freq: C, dtype: object

Bug fixes

- Plotting functions now raise a TypeError before trying to plot anything if the associated objects have a dtype of object (GH1818, GH3572, GH3911, GH3912), but they will try to convert object arrays to numeric arrays if possible so that you can still plot, for example, an object array with floats. This happens before any drawing takes place which eliminates any spurious plots from showing up.
- fillna methods now raise a TypeError if the value parameter is a list or tuple.
- Series.str now supports iteration (GH3638). You can iterate over the individual elements of each string in the Series. Each iteration yields a Series with either a single character at each index of the original Series or NaN. For example,
The last element yielded by the iterator will be a Series containing the last element of the longest string in the Series with all other elements being NaN. Here since 'slow' is the longest string and there are no other strings with the same length 'w' is the only non-null string in the yielded Series.

- HDFStore
  - will retain index attributes (freq,tz,name) on recreation (GH3499)
  - will warn with an AttributeConflictWarning if you are attempting to append an index with a different frequency than the existing, or attempting to append an index with a different name than the existing
  - support datelike columns with a timezone as data_columns (GH2852)

- Non-unique index support clarified (GH3468).
  - Fix assigning a new index to a duplicate index in a DataFrame would fail (GH3468)
  - Fix construction of a DataFrame with a duplicate index
  - ref_locs support to allow duplicative indices across dtypes, allows iget support to always find the index (even across dtypes) (GH2194)
  - applymap on a DataFrame with a non-unique index now works (removed warning) (GH2786), and fix (GH3230)
  - Fix to_csv to handle non-unique columns (GH3495)
  - Duplicate indexes with getitem will return items in the correct order (GH3455, GH3457) and handle missing elements like unique indices (GH3561)
  - Duplicate indexes with and empty DataFrame.from_records will return a correct frame (GH3562)
  - Concat to produce a non-unique columns when duplicates are across dtypes is fixed (GH3602)
  - Allow insert/delete to non-unique columns (GH3679)
- Non-unique indexing with a slice via loc and friends fixed (GH3659)
- Allow insert/delete to non-unique columns (GH3679)
- Extend reindex to correctly deal with non-unique indices (GH3679)
- DataFrame.itertuples() now works with frames with duplicate column names (GH3873)
- Bug in non-unique indexing via iloc (GH4017); added takeable argument to reindex for location-based taking
- Allow non-unique indexing in series via .ix/.loc and __getitem__ (GH4246)
- Fixed non-unique indexing memory allocation issue with .ix/.loc (GH4280)
- DataFrame.from_records did not accept empty recarrays (GH3682)
- read_html now correctly skips tests (GH3741)
- Fixed a bug where DataFrame.replace with a compiled regular expression in the to_replace argument wasn’t working (GH3907)
- Improved network test decorator to catch IOError (and therefore URLError as well). Added with_connectivity_check decorator to allow explicitly checking a website as a proxy for seeing if there is network connectivity. Plus, new optional_args decorator factory for decorators. (GH3910, GH3914)
- Fixed testing issue where too many sockets where open thus leading to a connection reset issue (GH3982, GH3985, GH4028, GH4054)
- Fixed failing tests in test_yahoo, test_google where symbols were not retrieved but were being accessed (GH3982, GH3985, GH4028, GH4054)
- Series.hist will now take the figure from the current environment if one is not passed
- Fixed bug where a 1xN DataFrame would barf on a 1xN mask (GH4071)
- Fixed running of tox under python3 where the pickle import was getting rewritten in an incompatible way (GH4062, GH4063)
- Fixed bug where sharex and sharey were not being passed to grouped_hist (GH4089)
- Fixed bug in DataFrame.replace where a nested dict wasn’t being iterated over when regex=False (GH4115)
- Fixed bug in the parsing of microseconds when using the format argument in to_datetime (GH4152)
- Fixed bug in PandasAutoDateLocator where invert_xaxis triggered incorrectly MilliSecondLocator (GH3990)
- Fixed bug in plotting that wasn’t raising on invalid colormap for matplotlib 1.1.1 (GH4215)
- Fixed the legend displaying in DataFrame.plot(kind='kde') (GH4216)
- Fixed bug where Index slices weren’t carrying the name attribute (GH4226)
- Fixed bug in initializing DatetimeIndex with an array of strings in a certain time zone (GH4229)
- Fixed bug where html5lib wasn’t being properly skipped (GH4265)
- Fixed bug where get_data_famafrench wasn’t using the correct file edges (GH4281)

See the full release notes or issue tracker on GitHub for a complete list.

5.19 Version 0.11

5.19.1 Version 0.11.0 (April 22, 2013)

This is a major release from 0.10.1 and includes many new features and enhancements along with a large number of
bug fixes. The methods of Selecting Data have had quite a number of additions, and Dtype support is now full-fledged.
There are also a number of important API changes that long-time pandas users should pay close attention to.

There is a new section in the documentation, 10 Minutes to Pandas, primarily geared to new users.

There is a new section in the documentation, Cookbook, a collection of useful recipes in pandas (and that we want
contributions!).

There are several libraries that are now Recommended Dependencies

Selection choices

Starting in 0.11.0, object selection has had a number of user-requested additions in order to support more explicit
location based indexing. pandas now supports three types of multi-axis indexing.

• .loc is strictly label based, will raise KeyError when the items are not found, allowed inputs are:
  – A single label, e.g. 5 or 'a', (note that 5 is interpreted as a label of the index. This use is not an integer
    position along the index)
  – A list or array of labels ['a', 'b', 'c']
  – A slice object with labels 'a' : 'f', (note that contrary to usual python slices, both the start and the stop
    are included!)
– A boolean array

See more at Selection by Label

• .iloc is strictly integer position based (from 0 to length-1 of the axis), will raise IndexError when the requested indices are out of bounds. Allowed inputs are:
  - An integer e.g. 5
  - A list or array of integers [4, 3, 0]
  - A slice object with ints 1:7
  - A boolean array

See more at Selection by Position

• .ix supports mixed integer and label based access. It is primarily label based, but will fallback to integer positional access. .ix is the most general and will support any of the inputs to .loc and .iloc, as well as support for floating point label schemes. .ix is especially useful when dealing with mixed positional and label based hierarchical indexes.

  As using integer slices with .ix have different behavior depending on whether the slice is interpreted as position based or label based, it’s usually better to be explicit and use .iloc or .loc.

  See more at Advanced Indexing and Advanced Hierarchical.

Selection deprecations

Starting in version 0.11.0, these methods may be deprecated in future versions.

• irow
• icol
• iget_value

See the section Selection by Position for substitutes.

Dtypes

Numeric dtypes will propagate and can coexist in DataFrames. If a dtype is passed (either directly via the dtype keyword, a passed ndarray, or a passed Series, then it will be preserved in DataFrame operations. Furthermore, different numeric dtypes will NOT be combined. The following example will give you a taste.

```
In [1]: df1 = pd.DataFrame(np.random.randn(8, 1), columns=['A'], dtype='float32')
In [2]: df1
Out[2]:
   A
0  0.469112
1 -0.282863
2 -1.509058
3 -1.135632
4  1.212112
5 -0.173215
6  0.119209
7 -1.044236
```

(continues on next page)
Out[3]:
A  float32
dtype: object

In [4]: df2 = pd.DataFrame({'A': pd.Series(np.random.randn(8), dtype='float16'),
                         'B': pd.Series(np.random.randn(8)),
                         'C': pd.Series(range(8), dtype='uint8')})

In [5]: df2
Out[5]:
   A        B       C
0  0.920034 -0.567444  0
1  0.703374 -0.024686  1
2 -0.782497  0.611312  2
3  0.299482 -2.001400  3
4 -0.046255  0.485670  4
5  0.755461  0.859874  5
6  0.440511 -0.667114  6
7 -0.636833  0.145444  7

In [6]: df2.dtypes
Out[6]:
A  float16  
B  float64  
C  uint8    
dtype: object

# here you get some upcasting
In [7]: df3 = df1.reindex_like(df2).fillna(value=0.0) + df2

In [8]: df3
Out[8]:
   A         B       C
0 -0.058080  0.424972  0.0
1 -2.707840  0.567020  1.0
2 -0.413167  0.276232  2.0
3  1.060037 -1.087401  3.0
4  0.215781 -0.673690  4.0
5 -0.723021  0.113648  5.0
6 -0.944613 -1.478427  6.0
7  0.257205  0.524988  7.0

In [9]: df3.dtypes
Out[9]:
A  float32  
B  float64  
C  float64  
dtype: object
Dtype conversion

This is lower-common-denominator upcasting, meaning you get the dtype which can accommodate all of the types

```
In [10]: df3.values.dtype
Out[10]: dtype('float64')
```

Conversion

```
In [11]: df3.astype('float32').dtypes
Out[11]:
A    float32
B    float32
C    float32
dtype: object
```

Mixed conversion

```
In [12]: df3['D'] = '1.'
In [13]: df3['E'] = '1'

In [14]: df3.convert_objects(convert_numeric=True).dtypes
Out[14]:
A    float32
B    float64
C    float64
D    float64
E    int64
dtype: object
```

Forcing date coercion (and setting NaT when not datelike)

```
In [18]: import datetime
In [19]: s = pd.Series([datetime.datetime(2001, 1, 1, 0, 0), 'foo', 1.0, 1,
    ....:              pd.Timestamp('20010104'), '20010105'], dtype='O')

In [20]: s.convert_objects(convert_dates='coerce')
Out[20]:
0   2001-01-01
1    NaT
2    NaT
```
Dtype gotchas

Platform gotchas

Starting in 0.11.0, construction of DataFrame/Series will use default dtypes of int64 and float64, regardless of platform. This is not an apparent change from earlier versions of pandas. If you specify dtypes, they WILL be respected, however (GH2837)

The following will all result in int64 dtypes

```
in [21]: pd.DataFrame([1, 2], columns=['a']).dtypes
Out[21]:
a   int64
dtype: object
```

```
in [22]: pd.DataFrame({'a': [1, 2]}).dtypes
Out[22]:
a   int64
dtype: object
```

```
in [23]: pd.DataFrame({'a': 1}, index=range(2)).dtypes
Out[23]:
a   int64
dtype: object
```

Keep in mind that DataFrame(np.array([1, 2])) WILL result in int32 on 32-bit platforms!

Upcasting gotchas

Performing indexing operations on integer type data can easily upcast the data. The dtype of the input data will be preserved in cases where nans are not introduced.

```
in [24]: dfi = df3.astype('int32')
in [25]: dfi['D'] = dfi['D'].astype('int64')
in [26]: dfi
Out[26]:
   A  B  C  D  E
0  0  0  0  1  1
1 -2  0  1  1  1
2 -2  0  2  1  1
3  0 -1  3  1  1
4  1  0  4  1  1
5  0  0  5  1  1
6  0 -1  6  1  1
7  0  0  7  1  1
```

```
in [27]: dfi.dtypes
Out[27]:
A    int32
```

(continues on next page)
Datetimes conversion

Datetime64[ns] columns in a DataFrame (or a Series) allow the use of np.nan to indicate a nan value, in addition to the traditional NaT, or not-a-time. This allows convenient nan setting in a generic way. Furthermore datetime64[ns] columns are created by default, when passed datetimelike objects (this change was introduced in 0.10.1) (GH2809, GH2810)

In [12]: df = pd.DataFrame(np.random.randn(6, 2), pd.date_range('20010102', periods=6), columns=['A', 'B'])

In [13]: df['timestamp'] = pd.Timestamp('20010103')

In [14]: df

Out[14]:
   A          B      timestamp
0  0.404705  0.577046   2001-01-03
1 -1.715002 -1.039268   2001-01-03
2 -0.370647 -1.157892   2001-01-03
3 -1.344312  0.844885   2001-01-03
4  1.075770 -0.109050   2001-01-03
5  1.643563 -1.469388   2001-01-03

# datetime64[ns] out of the box
In [15]: df.dtypes.value_counts()

Out[15]:
float64    2
datetime64[ns]  1
dtype: int64

# use the traditional nan, which is mapped to NaT internally
In [16]: df.loc[df.index[2:4], ['A', 'timestamp']] = np.nan

In [17]: df

Out[17]:
   A          B      timestamp
0  0.404705  0.577046   2001-01-03
1 -1.715002 -1.039268   2001-01-03
2  NaN -1.157892    NaT
3  NaN  0.844885    NaT
4  1.075770 -0.109050   2001-01-03
5  1.643563 -1.469388   2001-01-03

Astype conversion on datetime64[ns] to object, implicitly converts NaT to np.nan
In [18]: import datetime

In [19]: s = pd.Series([datetime.datetime(2001, 1, 2, 0, 0) for i in range(3)])

In [20]: s.dtype
Out[20]: dtype('<M8[ns]')

In [21]: s[1] = np.nan

In [22]: s
Out[22]:
0 2001-01-02
1 NaT
2 2001-01-02
dtype: datetime64[ns]

In [23]: s.dtype
Out[23]: dtype('<M8[ns]')

In [24]: s = s.astype('O')

In [25]: s
Out[25]:
0 2001-01-02 00:00:00
1 NaT
2 2001-01-02 00:00:00
dtype: object

In [26]: s.dtype
Out[26]: dtype('O')

API changes

• Added to_series() method to indices, to facilitate the creation of indexers (GH3275)
  
• HDFStore
  — added the method select_column to select a single column from a table as a Series.
  — deprecated the unique method, can be replicated by select_column(key, column).unique()
  — min_itemsize parameter to append will now automatically create data_columns for passed keys

Enhancements

• Improved performance of df.to_csv() by up to 10x in some cases. (GH3059)
  
• Numexpr is now a Recommended Dependencies, to accelerate certain types of numerical and boolean operations

• Bottleneck is now a Recommended Dependencies, to accelerate certain types of nan operations
  
• HDFStore
  — support read_hdf/to_hdf API similar to read_csv/to_csv

In [27]: df = pd.DataFrame({'A': range(5), 'B': range(5)})

In [28]: df.to_hdf('store.h5', 'table', append=True)
- provide dotted attribute access to \texttt{get} from stores, e.g. \texttt{store.df == store['df']}
- new keywords \texttt{iterator=boolean, and chunksize=number\_in\_a\_chunk} are provided to support iteration on \texttt{select and select\_as\_multiple} (GH3076)

- You can now select timestamps from an unordered timeseries similarly to an ordered timeseries (GH2437)
- You can now select with a string from a DataFrame with a datelike index, in a similar way to a Series (GH3070)

\begin{verbatim}
In [30]: idx = pd.date_range("2001-10-1", periods=5, freq='M')
In [31]: ts = pd.Series(np.random.rand(len(idx)), index=idx)
In [32]: ts['2001']
Out[32]:
                2001-10-31  0.117967
                2001-11-30  0.702184
                2001-12-31  0.414034
Freq: M, dtype: float64
In [33]: df = pd.DataFrame({'A': ts})
In [34]: df['2001']
Out[34]:
            A
2001-10-31  0.117967
2001-11-30  0.702184
2001-12-31  0.414034
\end{verbatim}

- **Squeeze** to possibly remove length 1 dimensions from an object.

\begin{verbatim}
>>> p = pd.Panel(np.random.randn(3, 4, 4), items=['ItemA', 'ItemB', 'ItemC'],
...               major_axis=pd.date_range('20010102', periods=4),
...               minor_axis=['A', 'B', 'C', 'D'])
>>> p
<class 'pandas.core.panel.Panel'>
Dimensions: 3 (items) x 4 (major_axis) x 4 (minor_axis)
Items axis: ItemA to ItemC
Major_axis axis: 2001-01-02 00:00:00 to 2001-01-05 00:00:00
Minor_axis axis: A to D

>>> p.reindex(items=['ItemA']).squeeze()
          A  B  C  D
2001-01-02  0.926089 -2.026458 0.501277 -0.204683
2001-01-03  0.076524  1.081161 1.141361  0.479243
2001-01-04  0.641817 -0.185352 1.824568  0.809152
2001-01-05  0.575237  0.669934 1.398014 -0.399338

>>> p.reindex(items=['ItemA'], minor=['B']).squeeze()
2001-01-02 -2.026458
2001-01-03  1.081161
\end{verbatim}
• In `pd.io.data.Options`,
  - Fix bug when trying to fetch data for the current month when already past expiry.
  - Now using lxml to scrape html instead of BeautifulSoup (lxml was faster).
  - New instance variables for calls and puts are automatically created when a method that creates them is called. This works for current month where the instance variables are simply `calls` and `puts`. Also works for future expiry months and save the instance variable as `callsMMYY` or `putsMMYY`, where `MMYY` are, respectively, the month and year of the option's expiry.
  - `Options.get_near_stock_price` now allows the user to specify the month for which to get relevant options data.
  - `Options.get_forward_data` now has optional kwargs `near` and `above_below`. This allows the user to specify if they would like to only return forward looking data for options near the current stock price. This just obtains the data from `Options.get_near_stock_price` instead of `Options.get_xxx_data()` (GH2758).

• Cursor coordinate information is now displayed in time-series plots.
• added option `display.max_seq_items` to control the number of elements printed per sequence pprinting it. (GH2979)
• added option `display.chop_threshold` to control display of small numerical values. (GH2739)
• added option `display.max_info_rows` to prevent verbose_info from being calculated for frames above 1M rows (configurable). (GH2807, GH2918)
• `value_counts()` now accepts a “normalize” argument, for normalized histograms. (GH2710).
• `DataFrame.from_records` now accepts not only dicts but any instance of the collections.Mapping ABC.
• added option `display.mpl_style` providing a sleeker visual style for plots. Based on https://gist.github.com/huyng/816622 (GH3075).
• Treat boolean values as integers (values 1 and 0) for numeric operations. (GH2641)
• `to_html()` now accepts an optional “escape” argument to control reserved HTML character escaping (enabled by default) and escapes &, in addition to < and >. (GH2919)

See the full release notes or issue tracker on GitHub for a complete list.

5.20 Version 0.10

5.20.1 Version 0.10.1 (January 22, 2013)

This is a minor release from 0.10.0 and includes new features, enhancements, and bug fixes. In particular, there is substantial new HDFStore functionality contributed by Jeff Reback.

An undesired API breakage with functions taking the `inplace` option has been reverted and deprecation warnings added.

API changes

- Functions taking an `inplace` option return the calling object as before. A deprecation message has been added
- Groupby aggregations Max/Min no longer exclude non-numeric data (GH2700)
- Resampling an empty DataFrame now returns an empty DataFrame instead of raising an exception (GH2640)
- The file reader will now raise an exception when NA values are found in an explicitly specified integer column instead of converting the column to float (GH2631)
- `DatetimeIndex.unique` now returns a `DatetimeIndex` with the same name and
- `timezone` instead of an array (GH2563)

New features

- MySQL support for database (contribution from Dan Allan)

HDFStore

You may need to upgrade your existing data files. Please visit the compatibility section in the main docs.

You can designate (and index) certain columns that you want to be able to perform queries on a table, by passing a list to `data_columns`

```python
In [1]: store = pd.HDFStore("store.h5")
```

```python
In [2]: df = pd.DataFrame(
   ...:     np.random.randn(8, 3),
   ...:     index=pd.date_range("1/1/2000", periods=8),
)
```

(continues on next page)
columns=\["A", "B", "C"]
... )
...
In [3]: df["string"] = "foo"
In [4]: df.loc[df.index[4:6], "string"] = np.nan
In [5]: df.loc[df.index[7:9], "string"] = "bar"
In [6]: df["string2"] = "cool"
In [7]: df
Out[7]:
       A    B    C    string    string2
0  2000-01-01  0.469112 -0.282863 -1.509059  foo        cool
1  2000-01-02 -1.135632  1.212112 -0.173215  foo        cool
2  2000-01-03  0.119209 -1.044236 -0.861849  foo        cool
3  2000-01-04 -2.104569 -0.494929  1.071804  foo        cool
4  2000-01-05  0.721555 -0.706771 -1.039575  NaN        cool
5  2000-01-06  0.271860 -0.424972  0.567020  NaN        cool
6  2000-01-07  0.276232 -1.087401 -0.673690  foo        cool
7  2000-01-08  0.113648 -1.478427  0.524988  bar        cool

# on-disk operations
In [8]: store.append("df", df, data_columns=\["B", "C", "string", "string2"]
In [9]: store.select("df", "B>0 and string=='foo'")
Out[9]:
       A   B   C    string    string2
0  2000-01-02 -1.135632  1.212112 -0.173215  foo        cool

# this is in-memory version of this type of selection
In [10]: df[(df.B > 0) & (df.string == "foo")]
Out[10]:
       A   B   C    string    string2
0  2000-01-02 -1.135632  1.212112 -0.173215  foo        cool

Retrieving unique values in an indexable or data column.

# note that this is deprecated as of 0.14.0
# can be replicated by: store.select_column('df','index').unique()
store.unique("df", "index")
store.unique("df", "string")

You can now store datetime64 in data columns

In [11]: df_mixed = df.copy()
In [12]: df_mixed["datetime64"] = pd.Timestamp("20010102")
In [13]: df_mixed.loc[df_mixed.index[3:4], ["A", "B"]]) = np.nan
In [14]: store.append("df_mixed", df_mixed)
In [15]: df_mixed1 = store.select("df_mixed")
In [16]: df_mixed1

Out[16]:

Multi-table creation via `append_to_multiple` and selection via `select_as_multiple` can create/select from multiple tables and return a combined result, by using `where` on a selector table.

```py
In [19]: df_mt = pd.DataFrame(
    ...:     np.random.randn(8, 6),
    ...:     index=pd.date_range("1/1/2000", periods=8),
    ...:     columns=["A", "B", "C", "D", "E", "F"],
    ...:     )
    ...

In [20]: df_mt["foo"] = "bar"

# you can also create the tables individually
In [21]: store.append_to_multiple(
    ...:     {"df1_mt": ["A", "B"], "df2_mt": None}, df_mt, selector="df1_mt"
    ...:     )
    ...

In [22]: store
Out[22]:
<class 'pandas.io.pytables.HDFStore'>
File path: store.h5

# individual tables were created
In [23]: store.select("df1_mt")
```
Out[23]:

<table>

Enhancements

- HDFStore now can read native PyTables table format tables
- You can pass nan_rep = 'my_nan_rep' to append, to change the default nan representation on disk (which converts to/from np.nan), this defaults to nan.
- You can pass index to append. This defaults to True. This will automatically create indices on the indexables and data columns of the table
- You can pass chunksize=an integer to append, to change the writing chunksize (default is 50000). This will significantly lower your memory usage on writing.
- You can pass expectedrows=an integer to the first append, to set the TOTAL number of expected rows that PyTables will expected. This will optimize read/write performance.
- Select now supports passing start and stop to provide selection space limiting in selection.
- Greatly improved ISO8601 (e.g., yyyy-mm-dd) date parsing for file parsers (GH2698)
- Allow DataFrame.merge to handle combinatorial sizes too large for 64-bit integer (GH2690)
- Series now has unary negation (-series) and inversion (~series) operators (GH2686)
- DataFrame.plot now includes a logx parameter to change the x-axis to log scale (GH2327)
- Series arithmetic operators can now handle constant and ndarray input (GH2574)
pandas: powerful Python data analysis toolkit, Release 1.3.1

• ExcelFile now takes a kind argument to specify the file type (GH2613)
• A faster implementation for Series.str methods (GH2602)

Bug Fixes
• HDFStore tables can now store float32 types correctly (cannot be mixed with float64 however)
• Fixed Google Analytics prefix when specifying request segment (GH2713).
• Function to reset Google Analytics token store so users can recover from improperly setup client secrets (GH2687).
• Fixed groupby bug resulting in segfault when passing in MultiIndex (GH2706)
• Fixed bug where passing a Series with datetime64 values into to_datetime results in bogus output values (GH2699)
• Fixed bug in pattern in HDFStore expressions when pattern is not a valid regex (GH2694)
• Fixed performance issues while aggregating boolean data (GH2692)
• When given a boolean mask key and a Series of new values, Series __setitem__ will now align the incoming values with the original Series (GH2686)
• Fixed MemoryError caused by performing counting sort on sorting MultiIndex levels with a very large number of combinatorial values (GH2684)
• Fixed bug that causes plotting to fail when the index is a DatetimeIndex with a fixed-offset timezone (GH2683)
• Corrected business day subtraction logic when the offset is more than 5 bdays and the starting date is on a weekend (GH2680)
• Fixed C file parser behavior when the file has more columns than data (GH2668)
• Fixed file reader bug that misaligned columns with data in the presence of an implicit column and a specified usecols value
• DataFrames with numerical or datetime indices are now sorted prior to plotting (GH2609)
• Fixed DataFrame.from_records error when passed columns, index, but empty records (GH2633)
• Several bug fixed for Series operations when dtype is datetime64 (GH2689, GH2629, GH2626)

See the full release notes or issue tracker on GitHub for a complete list.

5.20.2 Version 0.10.0 (December 17, 2012)

This is a major release from 0.9.1 and includes many new features and enhancements along with a large number of bug fixes. There are also a number of important API changes that long-time pandas users should pay close attention to.

File parsing new features

The delimited file parsing engine (the guts of `read_csv` and `read_table`) has been rewritten from the ground up and now uses a fraction the amount of memory while parsing, while being 40% or more faster in most use cases (in some cases much faster).

There are also many new features:

- Much-improved Unicode handling via the `encoding` option.
- Column filtering (`usecols`)
- Dtype specification (`dtype` argument)
- Ability to specify strings to be recognized as True/False
- Ability to yield NumPy record arrays (`as_recarray`)
- High performance `delim_whitespace` option
- Decimal format (e.g. European format) specification
- Easier CSV dialect options: `escapechar`, `lineterminator`, `quotechar`, etc.
- More robust handling of many exceptional kinds of files observed in the wild

API changes

Deprecated DataFrame BINOP TimeSeries special case behavior

The default behavior of binary operations between a DataFrame and a Series has always been to align on the DataFrame’s columns and broadcast down the rows, except in the special case that the DataFrame contains time series. Since there are now method for each binary operator enabling you to specify how you want to broadcast, we are phasing out this special case (Zen of Python: Specia...

You will get a deprecation warning in the 0.10.x series, and the deprecated functionality will be removed in 0.11 or later.

Altered resample default behavior

The default time series resample binning behavior of daily D and higher frequencies has been changed to closed='left', label='left'. Lower nFrequencies are unaffected. The prior defaults were causing a great deal of confusion for users, especially resampling data to daily frequency (which labeled the aggregated group with the end of the interval: the next day).

- Infinity and negative infinity are no longer treated as NA by isnull and notnull. That they ever were was a relic of early pandas. This behavior can be re-enabled globally by the mode.use_inf_as_null option:

In [6]: s = pd.Series([1.5, np.inf, 3.4, -np.inf])
In [7]: pd.isnull(s)
Out[7]:
0   False
1  False
2  False
3  False
Length: 4, dtype: bool

In [8]: s.fillna(0)
Out[8]:
0  1.500000
1   inf
2  3.400000
3  -inf
Length: 4, dtype: float64

In [9]: pd.set_option('use_inf_as_null', True)

In [10]: pd.isnull(s)
Out[10]:
0  False
1   True
2  False
3   True
Length: 4, dtype: bool

In [11]: s.fillna(0)
Out[11]:
0  1.5
1  0.0
2  3.4
3  0.0
Length: 4, dtype: float64

In [12]: pd.reset_option('use_inf_as_null')

• Methods with the inplace option now all return None instead of the calling object. E.g. code written like
df = df.fillna(0, inplace=True) may stop working. To fix, simply delete the unnecessary variable
assignment.

• pandas.merge no longer sorts the group keys (sort=False) by default. This was done for performance
reasons: the group-key sorting is often one of the more expensive parts of the computation and is often unnec-
essary.

• The default column names for a file with no header have been changed to the integers 0 through N - 1. This
is to create consistency with the DataFrame constructor with no columns specified. The v0.9.0 behavior (names
X0, X1, ...) can be reproduced by specifying prefix='X':

In [6]: import io

In [7]: data = """
...: a,b,c
...: 1,Yes,2
...: 3,No,4
...: """

In [8]: print(data)
a,b,c
In [9]: pd.read_csv(io.StringIO(data), header=None)
Out[9]:
   0  1  2
0  a  b  c
1  1  Yes  2
2  3  No  4

In [10]: pd.read_csv(io.StringIO(data), header=None, prefix="X")
Out[10]:
   X0  X1  X2
0  a  b  c
1  1  Yes  2
2  3  No  4

• Values like 'Yes' and 'No' are not interpreted as boolean by default, though this can be controlled by new true_values and false_values arguments:

In [11]: print(data)

a,b,c
1,Yes,2
3,No,4

In [12]: pd.read_csv(io.StringIO(data))
Out[12]:
   a  b  c
0  1  Yes  2
1  3  No  4

In [13]: pd.read_csv(io.StringIO(data), true_values=["Yes"], false_values=["No"])
Out[13]:
   a  b  c
0  1  True  2
1  3  False  4

• The file parsers will not recognize non-string values arising from a converter function as NA if passed in the na_values argument. It’s better to do post-processing using the replace function instead.

• Calling fillna on Series or DataFrame with no arguments is no longer valid code. You must either specify a fill value or an interpolation method:

In [14]: s = pd.Series([np.nan, 1.0, 2.0, np.nan, 4])

In [15]: s
Out[15]:
   0   NaN
   1   1.0
   2   2.0
   3   NaN
   4   4.0
dtype: float64

(continues on next page)
Convenience methods `ffill` and `bfill` have been added:

In [18]: s.ffill()
Out[18]:
0  NaN
1  1.0
2  2.0
3  2.0
4  4.0
dtype: float64

Series.apply will now operate on a returned value from the applied function, that is itself a series, and possibly upcast the result to a DataFrame

In [19]: def f(x):
    ....:     return pd.Series([x, x ** 2], index=['x', 'x^2'])
    ....:
In [20]: s = pd.Series(np.random.rand(5))
In [21]: s
Out[21]:
0  0.340445
1  0.984729
2  0.919540
3  0.037772
4  0.861549
dtype: float64

In [22]: s.apply(f)
Out[22]:
x    x^2
0  0.340445  0.115903
1  0.984729  0.969691
2  0.919540  0.845555
3  0.037772  0.001427
4  0.861549  0.742267

New API functions for working with pandas options (GH2097):
- `get_option` / `set_option` - get/set the value of an option. Partial names are accepted.
- `reset_option` - reset one or more options to their default value. Partial names are accepted.
- `describe_option` - print a description of one or more options. When called with no arguments, print all registered options.

Note: `set_printoptions` / `reset_printoptions` are now deprecated (but functioning), the print options now live under “display.XYZ”. For example:

```python
In [23]: pd.get_option("display.max_rows")
Out[23]: 15
```

- `to_string()` methods now always return unicode strings (GH2224).

New features

Wide DataFrame printing

Instead of printing the summary information, pandas now splits the string representation across multiple rows by default:

```python
In [24]: wide_frame = pd.DataFrame(np.random.randn(5, 16))
In [25]: wide_frame
Out[25]:
       0      1      2      3      4      5      6      7      8      9     10     11     12     13     14     15
0  0.857485  0.187634 -1.223651 -0.897780 -1.312224  0.387978  1.807067 -1.064118
1 -0.919854 -0.042379  1.247642 -0.009920  0.290213  0.495767  0.362949 -0.745505
2 -0.575247  0.254161 -1.143704  0.215897  1.913555 -0.077118 -0.408530
3 -1.577585  0.396823 -0.105931 -0.532532  1.453749  1.208843 -0.080952
4  0.141809  0.220390  0.435589  0.192451 -0.096701  0.337863 -0.945867
5  0.151176  1.627081 -0.990582 -0.441652  1.211526  0.268520  0.024580
6 -1.577585  0.396823 -0.105931 -0.532532  1.453749  1.208843 -0.080952
7  0.141809  0.220390  0.435589  0.192451 -0.096701  0.337863 -0.945867
8  0.151176  1.627081 -0.990582 -0.441652  1.211526  0.268520  0.024580
9 -1.577585  0.396823 -0.105931 -0.532532  1.453749  1.208843 -0.080952
```

The old behavior of printing out summary information can be achieved via the `expand_frame_repr` print option:

```python
In [26]: pd.set_option("expand_frame_repr", False)
In [27]: wide_frame
Out[27]:
       0      1      2      3      4      5      6      7      8      9     10     11     12     13     14     15
0 -0.548702  1.467327 -1.015962 -0.483075  1.637550 -1.217659 -0.291519
1 -0.919604  0.266066 -0.709661  1.669052  1.037882 -1.705775
2 -0.919854 -0.042379  1.247642 -0.009920  0.290213  0.495767  0.362949
3 -0.893299  0.337863 -0.945867 -0.932132  1.956030  0.017587 -0.016692
4 -0.575247  0.254161 -1.143704  0.215897  1.913555 -0.077118 -0.408530
5 -1.577585  0.396823 -0.105931 -0.532532  1.453749  1.208843 -0.080952
6  0.141809  0.220390  0.435589  0.192451 -0.096701  0.337863 -0.945867
7  0.151176  1.627081 -0.990582 -0.441652  1.211526  0.268520  0.024580

10 0.151176  1.627081 -0.990582 -0.441652  1.211526  0.268520  0.024580
11-1.577585  0.396823 -0.105931 -0.532532  1.453749  1.208843 -0.080952
12-0.575247  0.254161 -1.143704  0.215897  1.913555 -0.077118 -0.408530
13-1.577585  0.396823 -0.105931 -0.532532  1.453749  1.208843 -0.080952
14 0.141809  0.220390  0.435589  0.192451 -0.096701  0.337863 -0.945867
15 0.151176  1.627081 -0.990582 -0.441652  1.211526  0.268520  0.024580
[5 rows x 16 columns]
The width of each line can be changed via ‘line_width’ (80 by default):

```python
pd.set_option("line_width", 40)
wide_frame
```

**Updated PyTables support**

Docs for PyTables Table format & several enhancements to the api. Here is a taste of what to expect.

```python
In [41]: store = pd.HDFStore('store.h5')

In [42]: df = pd.DataFrame(np.random.randn(8, 3),

[8 rows x 5 columns]

In [69]: df1.get_dtype_counts()
Out[69]:
float64 3
int64   1
object  1
dtype: int64
• performance improvements on table writing
• support for arbitrarily indexed dimensions
• SparseSeries now has a density property (GH2384)
• enable Series.str.strip/lstrip/rstrip methods to take an input argument to strip arbitrary characters (GH2411)
• implement value_vars in melt to limit values to certain columns and add melt to pandas namespace (GH2412)

**Bug Fixes**
• added Term method of specifying where conditions (GH1996).
• del store['df'] now call store.remove('df') for store deletion
• deleting of consecutive rows is much faster than before
• min_itemsize parameter can be specified in table creation to force a minimum size for indexing columns (the previous implementation would set the column size based on the first append)
• indexing support via create_table_index (requires PyTables >= 2.3) (GH698).
• appending on a store would fail if the table was not first created via put
• fixed issue with missing attributes after loading a pickled dataframe (GH2431)
• minor change to select and remove: require a table ONLY if where is also provided (and not None)

**Compatibility**
0.10 of HDFStore is backwards compatible for reading tables created in a prior version of pandas, however, query terms using the prior (undocumented) methodology are unsupported. You must read in the entire file and write it out using the new format to take advantage of the updates.

### N dimensional panels (experimental)

Adding experimental support for Panel4D and factory functions to create n-dimensional named panels. Here is a taste of what to expect.

```
In [58]: p4d = Panel4D(np.random.randn(2, 2, 5, 4),
   ....:     labels=['Label1','Label2'],
   ....:     items=['Item1', 'Item2'],
   ....:     major_axis=date_range('1/1/2000', periods=5),
   ....:     minor_axis=['A', 'B', 'C', 'D'])
   ....:
In [59]: p4d
Out[59]:
<class 'pandas.core.panelnd.Panel4D'>
Dimensions: 2 (labels) x 2 (items) x 5 (major_axis) x 4 (minor_axis)
Labels axis: Label1 to Label2
Items axis: Item1 to Item2
Major_axis axis: 2000-01-01 00:00:00 to 2000-01-05 00:00:00
Minor_axis axis: A to D
```

See the [full release notes](https://github.com/pandas-dev/pandas) or issue tracker on GitHub for a complete list.

5.21 Version 0.9

5.21.1 Version 0.9.1 (November 14, 2012)

This is a bug fix release from 0.9.0 and includes several new features and enhancements along with a large number of bug fixes. The new features include by-column sort order for DataFrame and Series, improved NA handling for the rank method, masking functions for DataFrame, and intraday time-series filtering for DataFrame.

New features

- **Series.sort, DataFrame.sort, and DataFrame.sort_index** can now be specified in a per-column manner to support multiple sort orders (GH928)

  ```python
  In [2]: df = pd.DataFrame(np.random.randint(0, 2, (6, 3)),
                         columns=['A', 'B', 'C'])
  In [3]: df.sort(['A', 'B'], ascending=[1, 0])
  Out[3]:
          A  B  C
    0   1  0  0
    1   0  1  1
    2   0  0  1
    3   1  0  0
    4   1  0  0
    5   0  0  0
  ```

- **DataFrame.rank** now supports additional argument values for the `na_option` parameter so missing values can be assigned either the largest or the smallest rank (GH1508, GH2159)

  ```python
  In [1]: df = pd.DataFrame(np.random.randn(6, 3), columns=['A', 'B', 'C'])
  In [3]: df.rank()
  Out[3]:
          A  B  C
    0  3.0  2.0  1.0
    1  1.0  3.0  2.0
    2  NaN  NaN  NaN
    3  NaN  NaN  NaN
    4  NaN  NaN  NaN
    5  2.0  1.0  3.0
  In [4]: df.rank(na_option='top')
  Out[4]:
          A  B  C
    0  6.0  5.0  4.0
    1  4.0  6.0  5.0
    2  2.0  2.0  2.0
    3  2.0  2.0  2.0
    4  2.0  2.0  2.0
    5  5.0  4.0  6.0
  In [5]: df.rank(na_option='bottom')
  ```
- DataFrame has new `where` and `mask` methods to select values according to a given boolean mask (GH2109, GH2151)

DataFrame currently supports slicing via a boolean vector the same length as the DataFrame (inside the []). The returned DataFrame has the same number of columns as the original, but is sliced on its index.

```python
In [6]: df = DataFrame(np.random.randn(5, 3), columns = ['A','B','C'])

-------------------------------------------------------------------------
˓→ NameError Traceback (most recent call last)
<ipython-input-6-b548a30a7bce> in <module>
----> 1 df = DataFrame(np.random.randn(5, 3), columns = ['A','B','C'])

NameError: name 'DataFrame' is not defined
```

```python
In [7]: df
Out[7]:
   A        B        C
0 0.469112 -0.282863 -1.509059
1-1.135632  1.212112 -0.173215
2  NaN       NaN       NaN
3  NaN       NaN       NaN
4  NaN       NaN       NaN
5 0.271860 -0.424972  0.567020
```

```python
In [8]: df[df['A'] > 0]
Out[8]:
   A        B        C
0 0.469112 -0.282863 -1.509059
1-1.135632  1.212112 -0.173215
2  NaN       NaN       NaN
3  NaN       NaN       NaN
4  NaN       NaN       NaN
5 0.271860 -0.424972  0.567020
```

If a DataFrame is sliced with a DataFrame based boolean condition (with the same size as the original DataFrame), then a DataFrame the same size (index and columns) as the original is returned, with elements that do not meet the boolean condition as NaN. This is accomplished via the new method `DataFrame.where`. In addition, `where` takes an optional `other` argument for replacement.

```python
In [9]: df[df>0]
Out[9]:
   A        B        C
0 0.469112  NaN       NaN
1  NaN       1.212112  NaN
2  NaN       NaN       NaN
3  NaN       NaN       NaN
4  NaN       NaN       NaN
```
pandas: powerful Python data analysis toolkit, Release 1.3.1

In [10]: df.where(df>0)
Out[10]:
   A     B    C
0  0.469  NaN  NaN
1  NaN  1.21  NaN
2  NaN  NaN  NaN
3  NaN  NaN  NaN
4  NaN  NaN  NaN
5  0.272  NaN  0.567

In [11]: df.where(df>0,-df)
Out[11]:
   A     B    C
0  0.47   0.28  1.51
1  1.14   1.21  0.17
2  NaN   NaN  NaN
3  NaN   NaN  NaN
4  NaN   NaN  NaN
5  0.27   0.42  0.57

Furthermore, `where` now aligns the input boolean condition (ndarray or DataFrame), such that partial selection with setting is possible. This is analogous to partial setting via `.ix` (but on the contents rather than the axis labels)

In [12]: df2 = df.copy()
In [13]: df2[ df2[1:4] > 0 ] = 3
In [14]: df2
Out[14]:
   A     B    C
0  0.47  -0.28  -1.51
1 -1.14   3.00  -0.17
2  NaN   NaN  NaN
3  NaN   NaN  NaN
4  NaN   NaN  NaN
5  0.27   0.42  0.57

`DataFrame.mask` is the inverse boolean operation of `where`.

In [15]: df.mask(df<=0)
Out[15]:
   A     B    C
0  0.47   NaN  NaN
1  NaN  1.21  NaN
2  NaN  NaN  NaN
3  NaN  NaN  NaN
4  NaN  NaN  NaN
5  0.27   NaN  0.567

• Enable referencing of Excel columns by their column names (GH1936)

In [16]: xl = pd.ExcelFile('data/test.xls')

...
In [17]: xl.parse('Sheet1', index_col=0, parse_dates=True, 
.....:       parse_cols='A:D')
.....:
Out[17]:
A   B   C   D
2000-01-03 0.980269 3.685731 -0.364217 -1.159738
2000-01-04 1.047916 -0.041232 -0.161812  0.212549
2000-01-05 0.498581 0.731168 -0.537677  1.346270
2000-01-06 1.120202 1.567621  0.003641  0.675253
2000-01-07 -0.487094 0.571455 -1.611639  0.103469
2000-01-10 0.836649 0.246462  0.588543  1.062782
2000-01-11 -0.157161 1.340307  1.195778 -1.097007

• Added option to disable pandas-style tick locators and formatters using `series.plot(x_compat=True)`
or `pandas.plot_params['x_compat'] = True` (GH2205)
• Existing TimeSeries methods `at_time` and `between_time` were added to DataFrame (GH2149)
• DataFrame.dot can now accept ndarrays (GH2042)
• DataFrame.drop now supports non-unique indexes (GH2101)
• Panel.shift now supports negative periods (GH2164)
• DataFrame now support unary ~ operator (GH2110)

**API changes**

• Upsampling data with a PeriodIndex will result in a higher frequency TimeSeries that spans the original time window

In [1]: prng = pd.period_range('2012Q1', periods=2, freq='Q')
In [2]: s = pd.Series(np.random.randn(len(prng)), prng)
In [4]: s.resample('M')
Out[4]:
2012-01  -1.471992
2012-02   NaN
2012-03   NaN
2012-04  -0.493593
2012-05   NaN
2012-06   NaN
Freq: M, dtype: float64

• Period.end_time now returns the last nanosecond in the time interval (GH2124, GH2125, GH1764)

In [18]: p = pd.Period('2012')
In [19]: p.end_time
Out[19]: Timestamp('2012-12-31 23:59:59.999999999')

• File parsers no longer coerce to float or bool for columns that have custom converters specified (GH2184)

In [20]: import io
In [21]: data = ('A,B,C

(continues on next page)
In [22]: pd.read_csv(io.StringIO(data), converters={'A': lambda x: x.strip()})
Out[22]:
   A  B  C
0  0  1  5
1  1  2  6

5.21.2 Version 0.9.0 (October 7, 2012)

This is a major release from 0.8.1 and includes several new features and enhancements along with a large number of bug fixes. New features include vectorized unicode encoding/decoding for \texttt{Series.str.to\_latex} method to \texttt{DataFrame}, more flexible parsing of boolean values, and enabling the download of options data from Yahoo! Finance.

New features

- Add \texttt{encode} and \texttt{decode} for unicode handling to \texttt{vectorized string processing methods} in \texttt{Series.str} (GH1706)
- Add \texttt{DataFrame.to\_latex} method (GH1735)
- Add convenient expanding window equivalents of all rolling\_* ops (GH1785)
- Add Options class to pandas.io.data for fetching options data from Yahoo! Finance (GH1748, GH1739)
- More flexible parsing of boolean values (Yes, No, TRUE, FALSE, etc) (GH1691, GH1295)
- Add \texttt{level} parameter to \texttt{Series.reset\_index}
- \texttt{TimeSeries.between\_time} can now select times across midnight (GH1871)
• Series constructor can now handle generator as input (GH1679)
• DataFrame.dropna can now take multiple axes (tuple/list) as input (GH924)
• Enable skip_footer parameter in ExcelFile.parse (GH1843)

API changes

• The default column names when header=None and no columns names passed to functions like read_csv
  has changed to be more Pythonic and amenable to attribute access:

```python
In [1]: import io
In [2]: data = ""
   ...: 0,0,1
   ...: 1,1,0
   ...: 0,1,0
   ...: ***
   ...:
In [3]: df = pd.read_csv(io.StringIO(data), header=None)
In [4]: df
Out[4]:
0 1 2
0 0 1
1 1 0
2 0 1
```

• Creating a Series from another Series, passing an index, will cause reindexing to happen inside rather than treat-
  ing the Series like an ndarray. Technically improper usages like Series(df[col1], index=df[col2])
  that worked before “by accident” (this was never intended) will lead to all NA Series in some cases. To be per-
  fectly clear:

```python
In [5]: s1 = pd.Series([1, 2, 3])
In [6]: s1
Out[6]:
0 1
1 2
2 3
dtype: int64
In [7]: s2 = pd.Series(s1, index=["foo", "bar", "baz"])  
In [8]: s2
Out[8]:
foo  NaN
bar  NaN
baz  NaN
dtype: float64
```

• Deprecated day_of_year API removed from PeriodIndex, use dayofyear (GH1723)
• Don’t modify NumPy suppress printoption to True at import time
• The internal HDF5 data arrangement for DataFrames has been transposed. Legacy files will still be readable by
  HDFStore (GH1834, GH1824)
• Legacy cruft removed: pandas.stats.misc.quantileTS
• Use ISO8601 format for Period repr: monthly, daily, and on down (GH1776)
• Empty DataFrame columns are now created as object dtype. This will prevent a class of TypeErrors that was occurring in code where the dtype of a column would depend on the presence of data or not (e.g. a SQL query having results) (GH1783)
• Setting parts of DataFrame/Panel using ix now aligns input Series/DataFrame (GH1630)
• first and last methods in GroupBy no longer drop non-numeric columns (GH1809)
• Resolved inconsistencies in specifying custom NA values in text parser. na_values of type dict no longer override default NAs unless keep_default_na is set to false explicitly (GH1657)
• DataFrame.dot will not do data alignment, and also work with Series (GH1915)

See the full release notes or issue tracker on GitHub for a complete list.

5.22 Version 0.8

5.22.1 Version 0.8.1 (July 22, 2012)

This release includes a few new features, performance enhancements, and over 30 bug fixes from 0.8.0. New features include notably NA friendly string processing functionality and a series of new plot types and options.

New features

- Add vectorized string processing methods accessible via Series.str (GH620)
- Add option to disable adjustment in EWMA (GH1584)
- Radviz plot (GH1566)
- Parallel coordinates plot
- Bootstrap plot
- Per column styles and secondary y-axis plotting (GH1559)
- New datetime converters millisecond plotting (GH1599)
- Add option to disable “sparse” display of hierarchical indexes (GH1538)
- Series/DataFrame’s set_index method can append levels to an existing Index/MultiIndex (GH1569, GH1577)

Performance improvements

- Improved implementation of rolling min and max (thanks to Bottleneck !)
- Add accelerated 'median' GroupBy option (GH1358)
- Significantly improve the performance of parsing ISO8601-format date strings with DatetimeIndex or to_datetime (GH1571)
- Improve the performance of GroupBy on single-key aggregations and use with Categorical types
- Significant datetime parsing performance improvements

Contributors

A total of 5 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

- Wes McKinney

pandas: powerful Python data analysis toolkit, Release 1.3.1
5.22.2 Version 0.8.0 (June 29, 2012)

This is a major release from 0.7.3 and includes extensive work on the time series handling and processing infrastructure as well as a great deal of new functionality throughout the library. It includes over 700 commits from more than 20 distinct authors. Most pandas 0.7.3 and earlier users should not experience any issues upgrading, but due to the migration to the NumPy datetime64 dtype, there may be a number of bugs and incompatibilities lurking. Lingering incompatibilities will be fixed ASAP in a 0.8.1 release if necessary. See the full release notes or issue tracker on GitHub for a complete list.

Support for non-unique indexes

All objects can now work with non-unique indexes. Data alignment / join operations work according to SQL join semantics (including, if application, index duplication in many-to-many joins)

NumPy datetime64 dtype and 1.6 dependency

Time series data are now represented using NumPy’s datetime64 dtype; thus, pandas 0.8.0 now requires at least NumPy 1.6. It has been tested and verified to work with the development version (1.7+) of NumPy as well which includes some significant user-facing API changes. NumPy 1.6 also has a number of bugs having to do with nanosecond resolution data, so I recommend that you steer clear of NumPy 1.6’s datetime64 API functions (though limited as they are) and only interact with this data using the interface that pandas provides.

See the end of the 0.8.0 section for a “porting” guide listing potential issues for users migrating legacy code bases from pandas 0.7 or earlier to 0.8.0.

Bug fixes to the 0.7.x series for legacy NumPy < 1.6 users will be provided as they arise. There will be no more further development in 0.7.x beyond bug fixes.

Time Series changes and improvements

Note: With this release, legacy scikits.timeseries users should be able to port their code to use pandas.

Note: See documentation for overview of pandas timeseries API.

- New datetime64 representation speeds up join operations and data alignment, reduces memory usage, and improve serialization / deserialization performance significantly over datetime.datetime
- High performance and flexible resample method for converting from high-to-low and low-to-high frequency. Supports interpolation, user-defined aggregation functions, and control over how the intervals and result labeling are defined. A suite of high performance Cython/C-based resampling functions (including Open-High-Low-Close) have also been implemented.
- Revamp of frequency aliases and support for frequency shortcuts like ‘15min’, or ‘1h30min’
- New DatetimeIndex class supports both fixed frequency and irregular time series. Replaces now deprecated DateRange class
- New PeriodIndex and Period classes for representing time spans and performing calendar logic, including the 12 fiscal quarterly frequencies <timeseries.quarterly>. This is a partial port of, and a substantial enhancement to, elements of the scikits.timeseries code base. Support for conversion between PeriodIndex and DatetimeIndex
• New Timestamp data type subclasses `datetime.datetime`, providing the same interface while enabling working with nanosecond-resolution data. Also provides `easy time zone conversions`.

• Enhanced support for time zones. Add `tz_convert` and `tz_localize` methods to TimeSeries and DataFrame. All timestamps are stored as UTC; Timestamps from DatetimeIndex objects with time zone set will be localized to local time. Time zone conversions are therefore essentially free. User needs to know very little about pytz library now; only time zone names as strings are required. Time zone-aware timestamps are equal if and only if their UTC timestamps match. Operations between time zone-aware time series with different time zones will result in a UTC-indexed time series.

• Time series string indexing conveniences / shortcuts: slice years, year and month, and index values with strings

• Enhanced time series plotting; adaptation of scikits.timeseries matplotlib-based plotting code

• New `date_range`, `bdate_range`, and `period_range` factory functions

• Robust frequency inference function `infer_freq` and `inferred_freq` property of DatetimeIndex, with option to infer frequency on construction of DatetimeIndex

• `to_datetime` function efficiently parses array of strings to DatetimeIndex. DatetimeIndex will parse array or list of strings to datetime64

• Optimized support for datetime64-dtype data in Series and DataFrame columns

• New NaT (Not-a-Time) type to represent NA in timestamp arrays

• Optimize Series.asof for looking up “as of” values for arrays of timestamps

• Milli, Micro, Nano date offset objects

• Can index time series with datetime.time objects to select all data at particular time of day (`TimeSeries.at_time`) or between two times (`TimeSeries.between_time`)

• Add `tshift` method for leading/lagging using the frequency (if any) of the index, as opposed to a naive lead/lag using shift

Other new features

• New `cut` and `qcut` functions (like R’s cut function) for computing a categorical variable from a continuous variable by binning values either into value-based (`cut`) or quantile-based (`qcut`) bins

• Rename `Factor` to `Categorical` and add a number of usability features

• Add `limit` argument to fillna/reindex

• More flexible multiple function application in GroupBy, and can pass list (name, function) tuples to get result in particular order with given names

• Add flexible `replace` method for efficiently substituting values

• Enhanced `read_csv/read_table` for reading time series data and converting multiple columns to dates

• Add `comments` option to parser functions: `read_csv`, etc.

• Add `dayfirst` option to parser functions for parsing international DD/MM/YYYY dates

• Allow the user to specify the CSV reader `dialect` to control quoting etc.

• Handling thousands separators in read_csv to improve integer parsing.

• Enable unstacking of multiple levels in one shot. Alleviate `pivot_table` bugs (empty columns being introduced)

• Move to klib-based hash tables for indexing; better performance and less memory usage than Python’s dict
• Add first, last, min, max, and prod optimized GroupBy functions
• New ordered_merge function
• Add flexible comparison instance methods eq, ne, lt, gt, etc. to DataFrame, Series
• Improve scatter_matrix plotting function and add histogram or kernel density estimates to diagonal
• Add \textit{kde} plot option for density plots
• Support for converting DataFrame to R data.frame through rpy2
• Improved support for complex numbers in Series and DataFrame
• Add \textit{pct_change} method to all data structures
• Add max_colwidth configuration option for DataFrame console output
• \textit{Interpolate} Series values using index values
• Can select multiple columns from GroupBy
• Add update methods to Series/DataFrame for updating values in place
• Add \textit{any} and \textit{all} method to DataFrame

\textbf{New plotting methods}

```python
import pandas as pd
fx = pd.read_pickle("data/fx_prices")
import matplotlib.pyplot as plt

Series.plot now supports a secondary_y option:
```

```python
plt.figure()
fx["FR"].plot(style="g")
fx["IT"].plot(style="k--", secondary_y=True)
```

Vytautas Jancauskas, the 2012 GSOC participant, has added many new plot types. For example, \textquote{kde}' is a new option:

```python
s = pd.Series(np.concatenate((np.random.randn(1000), np.random.randn(1000) * 0.5 + 3)))
plt.figure()
s.hist(density=True, alpha=0.2)
s.plot(kind="kde")
```

See the plotting page for much more.
Other API changes

- Deprecation of offset, time_rule, and timeRule arguments names in time series functions. Warnings will be printed until pandas 0.9 or 1.0.

Potential porting issues for pandas <= 0.7.3 users

The major change that may affect you in pandas 0.8.0 is that time series indexes use NumPy’s datetime64 data type instead of dtype=object arrays of Python’s built-in datetime.datetime objects. DateRange has been replaced by DatetimeIndex but otherwise behaved identically. But, if you have code that converts DateRange or Index objects that used to contain datetime.datetime values to plain NumPy arrays, you may have bugs lurking with code using scalar values because you are handing control over to NumPy:

```python
In [1]: import datetime
In [2]: rng = pd.date_range("1/1/2000", periods=10)
In [3]: rng[5]
Out[3]: Timestamp('2000-01-06 00:00:00', freq='D')
In [4]: isinstance(rng[5], datetime.datetime)
Out[4]: True
In [5]: rng_asarray = np.asarray(rng)
In [6]: scalar_val = rng_asarray[5]
In [7]: type(scalar_val)
Out[7]: numpy.datetime64
```

pandas’s Timestamp object is a subclass of datetime.datetime that has nanosecond support (the nanosecond field store the nanosecond value between 0 and 999). It should substitute directly into any code that used datetime.datetime values before. Thus, I recommend not casting DatetimeIndex to regular NumPy arrays.

If you have code that requires an array of datetime.datetime objects, you have a couple of options. First, the astype(object) method of DatetimeIndex produces an array of Timestamp objects:

```python
In [8]: stamp_array = rng.astype(object)
In [9]: stamp_array
Out[9]:
Index([2000-01-01 00:00:00, 2000-01-02 00:00:00, 2000-01-03 00:00:00,
      2000-01-04 00:00:00, 2000-01-05 00:00:00, 2000-01-06 00:00:00,
      2000-01-07 00:00:00, 2000-01-08 00:00:00, 2000-01-09 00:00:00,
      2000-01-10 00:00:00], dtype='object')
In [10]: stamp_array[5]
Out[10]: Timestamp('2000-01-06 00:00:00', freq='D')
```

To get an array of proper datetime.datetime objects, use the to_pydatetime method:

```python
In [11]: dt_array = rng.to_pydatetime()
In [12]: dt_array
```

(continues on next page)
Out[12]:
array([datetime.datetime(2000, 1, 1, 0, 0),
       datetime.datetime(2000, 1, 2, 0, 0),
       datetime.datetime(2000, 1, 3, 0, 0),
       datetime.datetime(2000, 1, 4, 0, 0),
       datetime.datetime(2000, 1, 5, 0, 0),
       datetime.datetime(2000, 1, 6, 0, 0),
       datetime.datetime(2000, 1, 7, 0, 0),
       datetime.datetime(2000, 1, 8, 0, 0),
       datetime.datetime(2000, 1, 9, 0, 0),
       datetime.datetime(2000, 1, 10, 0, 0)], dtype=object)

In [13]: dt_array[5]
Out[13]:
datetime.datetime(2000, 1, 6, 0, 0)

matplotlib knows how to handle `datetime.datetime` but not `Timestamp` objects. While I recommend that you plot time series using `TimeSeries.plot`, you can either use `to_pydatetime` or register a converter for the `Timestamp` type. See matplotlib documentation for more on this.

**Warning:** There are bugs in the user-facing API with the nanosecond `datetime64` unit in NumPy 1.6. In particular, the string version of the array shows garbage values, and conversion to `dtype=object` is similarly broken.

In [14]: rng = pd.date_range("1/1/2000", periods=10)

In [15]: rng
Out[15]:
               "2000-01-09", "2000-01-10"],
dtype='datetime64[ns]', freq='D')

In [16]: np.asarray(rng)
Out[16]:
array(['2000-01-01T00:00:00.000000000', '2000-01-02T00:00:00.000000000',
       '2000-01-03T00:00:00.000000000', '2000-01-04T00:00:00.000000000',
       '2000-01-05T00:00:00.000000000', '2000-01-06T00:00:00.000000000',
       '2000-01-07T00:00:00.000000000', '2000-01-08T00:00:00.000000000',
       '2000-01-09T00:00:00.000000000', '2000-01-10T00:00:00.000000000'],
dtype='datetime64[ns]')

In [17]: converted = np.asarray(rng, dtype=object)

In [18]: converted[5]
Out[18]:
Timestamp('2000-01-06 00:00:00', freq='D')

Trust me: don't panic. If you are using NumPy 1.6 and restrict your interaction with `datetime64` values to pandas's API you will be just fine. There is nothing wrong with the data-type (a 64-bit integer internally); all of the important data processing happens in pandas and is heavily tested. I strongly recommend that you **do not work directly with `datetime64` arrays in NumPy 1.6** and only use the pandas API.

Support for non-unique indexes: In the latter case, you may have code inside a `try:... catch:` block that failed due to the index not being unique. In many cases it will no longer fail (some method like `append` still check for uniqueness unless disabled). However, all is not lost: you can inspect `index.is_unique` and raise an exception explicitly if it is `False` or go to a different code branch.

5.23 Version 0.7

5.23.1 Version 0.7.3 (April 12, 2012)

This is a minor release from 0.7.2 and fixes many minor bugs and adds a number of nice new features. There are also a couple of API changes to note; these should not affect very many users, and we are inclined to call them “bug fixes” even though they do constitute a change in behavior. See the full release notes or issue tracker on GitHub for a complete list.

New features

- New fixed width file reader, read_fwf
- New scatter_matrix function for making a scatter plot matrix

```python
from pandas.tools.plotting import scatter_matrix
scatter_matrix(df, alpha=0.2) # noqa F821
```

- Add stacked argument to Series and DataFrame’s plot method for stacked bar plots.

```python
df.plot(kind="bar", stacked=True) # noqa F821

df.plot(kind="barh", stacked=True) # noqa F821
```

- Add log x and y scaling options to DataFrame.plot and Series.plot
- Add kurt methods to Series and DataFrame for computing kurtosis

NA boolean comparison API change

Reverted some changes to how NA values (represented typically as NaN or None) are handled in non-numeric Series:

```python
In [1]: series = pd.Series(["Steve", np.nan, "Joe"])

In [2]: series == "Steve"
Out[2]:
0  True
1  False
2  False
Length: 3, dtype: bool

In [3]: series != "Steve"
Out[3]:
0  False
1  True
2  True
Length: 3, dtype: bool
```

In comparisons, NA / NaN will always come through as False except with != which is True. Be very careful with boolean arithmetic, especially negation, in the presence of NA data. You may wish to add an explicit NA filter into boolean array operations if you are worried about this:
In [4]: mask = series == "Steve"
In [5]: series[mask & series.notnull()]
Out[5]:
0   Steve
Length: 1, dtype: object

While propagating NA in comparisons may seem like the right behavior to some users (and you could argue on purely technical grounds that this is the right thing to do), the evaluation was made that propagating NA everywhere, including in numerical arrays, would cause a large amount of problems for users. Thus, a “practicality beats purity” approach was taken. This issue may be revisited at some point in the future.

Other API changes

When calling apply on a grouped Series, the return value will also be a Series, to be more consistent with the groupby behavior with DataFrame:

In [6]: df = pd.DataFrame(
    ...:   {  
    ...:     "A": ["foo", "bar", "foo", "bar", "foo", "foo"],  
    ...:     "B": ["one", "one", "two", "three", "two", "one"],  
    ...:     "C": np.random.randn(8),  
    ...:     "D": np.random.randn(8),  
    ...:   })
In [7]: df
Out[7]:
   A     B        C        D
 0 foo   one  0.469112 -0.861849
 1 bar   one -0.282863 -2.104569
 2 foo   two -1.509059  0.494929
 3 bar  three -1.135632  1.071804
 4 foo   two  1.212112  0.721555
 5 bar   two -0.173215 -0.706771
 6 foo   one  0.119209 -1.039575
 7 foo  three -1.044236  0.271860

[8 rows x 4 columns]
In [8]: grouped = df.groupby("A")["C"]
In [9]: grouped.describe()
Out[9]:
        count      mean      std       min       25%       50%       75%       max
      A
    bar  3.0 -0.530570  0.526860 -1.135632 -0.709248 -0.282863 -0.228039 -0.173215
    foo  5.0 -0.150572  1.113308 -1.509059 -1.044236  0.119209  0.469112  1.212112

[2 rows x 8 columns]
In [10]: grouped.apply(lambda x: x.sort_values()[-2:]) # top 2 values
Out[10]:
   A
 0 bar 1 -0.282863

5.23.2 Version 0.7.2 (March 16, 2012)

This release targets bugs in 0.7.1, and adds a few minor features.

New features

- Add additional tie-breaking methods in DataFrame.rank (GH874)
- Add ascending parameter to rank in Series, DataFrame (GH875)
- Add coerce_float option to DataFrame.from_records (GH893)
- Add sort_columns parameter to allow unsorted plots (GH918)
- Enable column access via attributes on GroupBy (GH882)
- Can pass dict of values to DataFrame.fillna (GH661)
- Can select multiple hierarchical groups by passing list of values in .ix (GH134)
- Add axis option to DataFrame.fillna (GH174)
• Add level keyword to drop for dropping values from a level (GH159)

Performance improvements

• Use khash for Series.value_counts, add raw function to algorithms.py (GH861)
• Intercept __builtin__.sum in groupby (GH885)

Contributors

A total of 12 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

5.23.3 Version 0.7.1 (February 29, 2012)

This release includes a few new features and addresses over a dozen bugs in 0.7.0.

New features

• Add to_clipboard function to pandas namespace for writing objects to the system clipboard (GH774)
• Add itertuples method to DataFrame for iterating through the rows of a dataframe as tuples (GH818)
• Add ability to pass fill_value and method to DataFrame and Series align method (GH806, GH807)
• Add fill_value option to reindex, align methods (GH784)
• Enable concat to produce DataFrame from Series (GH787)
• Add between method to Series (GH802)
• Add HTML representation hook to DataFrame for the IPython HTML notebook (GH773)
• Support for reading Excel 2007 XML documents using openpyxl
Performance improvements

- Improve performance and memory usage of fillna on DataFrame
- Can concatenate a list of Series along axis=1 to obtain a DataFrame (GH787)

Contributors

A total of 9 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

- Adam Klein
- Brian Granger +
- Chang She
- Dieter Vandenbussche
- Josh Klein
- Steve +

- Yaroslav Halchenko

5.23.4 Version 0.7.0 (February 9, 2012)

New features

- New unified *merge function* for efficiently performing full gamut of database / relational-algebra operations. Refactored existing join methods to use the new infrastructure, resulting in substantial performance gains (GH220, GH249, GH267)
- New *unified concatenation function* for concatenating Series, DataFrame or Panel objects along an axis. Can form union or intersection of the other axes. Improves performance of `Series.append` and `DataFrame.append` (GH468, GH479, GH273)
- *Can* pass multiple DataFrames to `DataFrame.append` to concatenate (stack) and multiple Series to `Series.append` too
- *Can* pass list of dicts (e.g., a list of JSON objects) to DataFrame constructor (GH526)
- You can now *set multiple columns* in a DataFrame via `__getitem__`, useful for transformation (GH342)
- Handle differently-indexed output values in `DataFrame.apply` (GH498)

```python
In [1]: df = pd.DataFrame(np.random.randn(10, 4))
In [2]: df.apply(lambda x: x.describe())
Out[2]:
       0         1         2         3
0  10.000000  10.000000  10.000000  10.000000
1  0.190912  -0.395125  -0.731920  -0.403130
2  0.730951   0.813266  1.112016   0.961912
3 -0.861849  -2.104569  -1.776904  -1.469388
4  0.411391  -0.698728  -1.501401  -1.076610
5  0.380863  -0.228039  -1.191943  -1.004091
```

(continues on next page)
• Add reorder_levels method to Series and DataFrame (GH534)
• Add dict-like get function to DataFrame and Panel (GH521)
• Add DataFrame.iterrows method for efficiently iterating through the rows of a DataFrame
• Add DataFrame.to_panel with code adapted from LongPanel.to_long
• Add reindex_axis method added to DataFrame
• Add level option to binary arithmetic functions on DataFrame and Series
• Add level option to the reindex and align methods on Series and DataFrame for broadcasting values across a level (GH542, GH552, others)
• Add attribute-based item access to Panel and add IPython completion (GH563)
• Add logy option to Series.plot for log-scaling on the Y axis
• Add index and header options to DataFrame.to_string
• Can pass multiple DataFrames to DataFrame.join to join on index (GH115)
• Can pass multiple Panels to Panel.join (GH115)
• Added justify argument to DataFrame.to_string to allow different alignment of column headers
• Add sort option to GroupBy to allow disabling sorting of the group keys for potential speedups (GH595)
• Can pass MaskedArray to Series constructor (GH563)
• Add Panel item access via attributes and IPython completion (GH554)
• Implement DataFrame.lookup, fancy-indexing analogue for retrieving values given a sequence of row and column labels (GH338)
• Can pass a list of functions to aggregate with groupby on a DataFrame, yielding an aggregated result with hierarchical columns (GH166)
• Can call cummin and cummax on Series and DataFrame to get cumulative minimum and maximum, respectively (GH647)
• value_range added as utility function to get min and max of a dataframe (GH288)
• Added encoding argument to read_csv, read_table, to_csv and from_csv for non-ascii text (GH717)
• Added abs method to pandas objects
• Added crosstab function for easily computing frequency tables
• Added isin method to index objects
• Added level argument to xs method of DataFrame.
### API changes to integer indexing

One of the potentially riskiest API changes in 0.7.0, but also one of the most important, was a complete review of how integer indexes are handled with regard to label-based indexing. Here is an example:

```python
In [3]: s = pd.Series(np.random.randn(10), index=range(0, 20, 2))
In [4]: s
Out[4]:
0   -1.294524
2    0.413738
4    0.276662
6   -0.472035
8   -0.013960
10  -0.362543
12  -0.006154
14  -0.923061
16   0.895717
18   0.805244
Length: 10, dtype: float64
```

This is all exactly identical to the behavior before. However, if you ask for a key not contained in the Series, in versions 0.6.1 and prior, Series would fall back on a location-based lookup. This now raises a `KeyError`:

```python
In [2]: s[1]
KeyError: 1
```

This change also has the same impact on DataFrame:

```python
In [3]: df = pd.DataFrame(np.random.randn(8, 4), index=range(0, 16, 2))
In [4]: df
```

```plaintext
0    1    2    3  
0  0.88427  0.3363 -0.1787  0.03162  
2  0.14451 -0.1415  0.2504  0.58374  
4  1.44779 -0.9186 -1.4996  0.27163  
6  0.26598 -2.4184 -0.2658  0.11503  
8 -0.58776  0.3144 -0.8566  0.61941  
10 0.10940 -0.7175 -1.0108  0.47990  
12 1.16919 -0.3087 -0.6049  0.43544  
14 -0.07337  0.3410  0.0424 -0.16037  
```

```python
In [5]: df.ix[3]
KeyError: 3
```

In order to support purely integer-based indexing, the following methods have been added:
### Method Description

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Series.iget_value(i)</td>
<td>Retrieve value stored at location i</td>
</tr>
<tr>
<td>Series.iget(i)</td>
<td>Alias for iget_value</td>
</tr>
<tr>
<td>DataFrame.irow(i)</td>
<td>Retrieve the i-th row</td>
</tr>
<tr>
<td>DataFrame.icol(j)</td>
<td>Retrieve the j-th column</td>
</tr>
<tr>
<td>DataFrame.iget_value(i, j)</td>
<td>Retrieve the value at row i and column j</td>
</tr>
</tbody>
</table>

### API tweaks regarding label-based slicing

Label-based slicing using `ix` now requires that the index be sorted (monotonic) unless both the start and endpoint are contained in the index:

```
In [1]: s = pd.Series(np.random.randn(6), index=list('gmkaec'))
In [2]: s
Out[2]:
     g -1.182230
     m -0.276183
     k -0.243550
     a  1.628992
     e  0.073308
     c -0.539890
dtype: float64
```

Then this is OK:

```
In [3]: s.ix['k':'e']
Out[3]:
     k -0.243550
     a  1.628992
     e  0.073308
dtype: float64
```

But this is not:

```
In [12]: s.ix['b':'h']
KeyError 'b'
```

If the index had been sorted, the “range selection” would have been possible:

```
In [4]: s2 = s.sort_index()
In [5]: s2
Out[5]:
     a  1.628992
     c -0.539890
     e  0.073308
     g -1.182230
     k -0.243550
     m -0.276183
dtype: float64
```

```
In [6]: s2.ix['b':'h']
Out[6]:
     c -0.539890
```
Changes to Series [] operator

As as notational convenience, you can pass a sequence of labels or a label slice to a Series when getting and setting values via [] (i.e. the __getitem__ and __setitem__ methods). The behavior will be the same as passing similar input to ix except in the case of integer indexing:

```
In [8]: s = pd.Series(np.random.randn(6), index=list('acegkm'))

In [9]: s
Out[9]:
  a    -1.206412
  c     2.565646
  e     1.431256
  g     1.340309
  k    -1.170299
  m    -0.226169
Length: 6, dtype: float64

In [10]: s[['m', 'a', 'c', 'e']]
Out[10]:
  m    -0.226169
  a    -1.206412
  c     2.565646
  e     1.431256
Length: 4, dtype: float64

In [11]: s['b':'l']
Out[11]:
  c     2.565646
  e     1.431256
  g     1.340309
  k    -1.170299
Length: 4, dtype: float64

In [12]: s['c':'k']
Out[12]:
  c     2.565646
  e     1.431256
  g     1.340309
  k    -1.170299
Length: 4, dtype: float64
```

In the case of integer indexes, the behavior will be exactly as before (shadowing ndarray):

```
In [13]: s = pd.Series(np.random.randn(6), index=range(0, 12, 2))

In [14]: s[[4, 0, 2]]
Out[14]:
  4     0.132003
  0     0.410835
  2     0.813850
```
If you wish to do indexing with sequences and slicing on an integer index with label semantics, use `ix`.

### Other API changes

- The deprecated `LongPanel` class has been completely removed
- If `Series.sort` is called on a column of a DataFrame, an exception will now be raised. Before it was possible to accidentally mutate a DataFrame's column by doing `df[col].sort()` instead of the side-effect free method `df[col].order()` (GH316)
- Miscellaneous renames and deprecations which will (harmlessly) raise `FutureWarning`
- `drop` added as an optional parameter to `DataFrame.reset_index` (GH699)

### Performance improvements

- **Cythonized GroupBy aggregations** no longer presort the data, thus achieving a significant speedup (GH93). GroupBy aggregations with Python functions significantly sped up by clever manipulation of the ndarray data type in Cython (GH496).
- Better error message in DataFrame constructor when passed column labels don’t match data (GH497)
- Substantially improve performance of multi-GroupBy aggregation when a Python function is passed, reuse ndarray object in Cython (GH496)
- Can store objects indexed by tuples and floats in HDFStore (GH492)
- Don’t print length by default in `Series.to_string`, add `length` option (GH489)
- Improve Cython code for multi-groupby to aggregate without having to sort the data (GH93)
- Improve MultiIndex reindexing speed by storing tuples in the MultiIndex, test for backwards unpickling compatibility
- Improve column reindexing performance by using specialized Cython take function
- Further performance tweaking of `Series.__getitem__` for standard use cases
- Avoid Index dict creation in some cases (i.e. when getting slices, etc.), regression from prior versions
- Friendlier error message in `setup.py` if NumPy not installed
- Use common set of NA-handling operations (sum, mean, etc.) in Panel class also (GH536)
- Default name assignment when calling `reset_index` on DataFrame with a regular (non-hierarchical) index (GH476)
- Use Cythonized groupers when possible in Series/DataFrame stat ops with `level` parameter passed (GH545)
- Ported skiplist data structure to C to speed up `rolling_median` by about 5-10x in most typical use cases (GH374)

5.24 Version 0.6

5.24.1 Version 0.6.1 (December 13, 2011)

New features

- Can append single rows (as Series) to a DataFrame
- Add Spearman and Kendall rank correlation options to Series.corr and DataFrame.corr (GH428)
- Added get_value and set_value methods to Series, DataFrame, and Panel for very low-overhead access (>2x faster in many cases) to scalar elements (GH437, GH438). set_value is capable of producing an enlarged object.
- Add PyQt table widget to sandbox (GH435)
- DataFrame.align can accept Series arguments and an axis option (GH461)
- Implement new SparseArray and SparseList data structures. SparseSeries now derives from SparseArray (GH463)
- Better console printing options (GH453)
• Implement fast *data ranking* for Series and DataFrame, fast versions of scipy.stats.rankdata (GH428)
• Implement `DataFrame.from_items` alternate constructor (GH444)
• `DataFrame.convert_objects` method for *inferring better dtypes* for object columns (GH302)
• Add `rolling_corr_pairwise` function for computing Panel of correlation matrices (GH189)
• Add `margins` option to `pivot_table` for computing subgroup aggregates (GH114)
• Add `Series.from_csv` function (GH482)
• *Can pass* DataFrame/DataFrame and DataFrame/Series to `rolling_corr/rolling_cov` (GH #462)
• CMultiIndex.get_level_values can *accept the level name*

**Performance improvements**

• Improve memory usage of `DataFrame.describe` (do not copy data unnecessarily) (PR #425)
• Optimize scalar value lookups in the general case by 25% or more in Series and DataFrame
• Fix performance regression in cross-sectional count in DataFrame, affecting DataFrame.dropna speed
• Column deletion in DataFrame copies no data (computes views on blocks) (GH #158)

**Contributors**

A total of 7 people contributed patches to this release. People with a “+” by their names contributed a patch for the first time.

• Wouter Overmeire

**5.24.2 Version 0.6.0 (November 25, 2011)**

**New features**

• *Added* `melt` function to `pandas.core.reshape`
• *Added* `level` parameter to group by level in Series and DataFrame descriptive statistics (GH313)
• *Added* `head` and `tail` methods to Series, analogous to DataFrame (GH296)
• *Added* `Series.isin` function which checks if each value is contained in a passed sequence (GH289)
• *Added* `float_format` option to `Series.to_string`
• *Added* `skip_footer` (GH291) and `converters` (GH343) options to `read_csv` and `read_table`
• *Added* `drop_duplicates` and `duplicated` functions for removing duplicate DataFrame rows and checking for duplicate rows, respectively (GH319)
• *Implemented* operators `&`, `|`, `^`, `-` on DataFrame (GH347)

• *Added* `Series.mad`, mean absolute deviation

• *Added* `QuarterEnd` DateOffset (GH321)

• *Added* `dot` to DataFrame (GH65)

• *Added* `orient` option to `Panel.from_dict` (GH359, GH301)

• *Added* `orient` option to `DataFrame.from_dict`

• *Added* passing list of tuples or list of lists to `DataFrame.from_records` (GH357)

• *Added* multiple levels to groupby (GH103)

• *Allow* multiple columns in `by` argument of `DataFrame.sort_index` (GH92, GH362)

• *Added* fast `get_value` and `put_value` methods to DataFrame (GH360)

• *Added* `cov` instance methods to Series and DataFrame (GH194, GH362)

• *Added* `kind='bar'` option to `DataFrame.plot` (GH348)

• *Added* `idxmin` and `idxmax` to Series and DataFrame (GH286)

• *Added* `read_clipboard` function to parse DataFrame from clipboard (GH300)

• *Added* `nunique` function to Series for counting unique elements (GH297)

• *Made* DataFrame constructor use Series name if no columns passed (GH373)

• *Support* regular expressions in `read_table/read_csv` (GH364)

• *Added* `DataFrame.to_html` for writing DataFrame to HTML (GH387)

• *Added* support for `MaskedArray` data in DataFrame, masked values converted to NaN (GH396)

• *Added* `DataFrame.boxplot` function (GH368)

• *Can* pass extra args, kwds to `DataFrame.apply` (GH376)

• *Implemented* `DataFrame.join` with vector on argument (GH312)

• *Added* `legend` boolean flag to `DataFrame.plot` (GH324)

• *Can* pass multiple levels to `stack` and `unstack` (GH370)

• *Can* pass multiple values columns to `pivot_table` (GH381)

• *Use* Series name in GroupBy for result index (GH363)

• *Added* `raw` option to `DataFrame.apply` for performance if only need ndarray (GH309)

• Added proper, tested weighted least squares to standard and panel OLS (GH303)

**Performance enhancements**

• VBENCH Cythonized `cache_readonly`, resulting in substantial micro-performance enhancements throughout the code base (GH361)

• VBENCH Special Cython matrix iterator for applying arbitrary reduction operations with 3-5x better performance than `np.apply_along_axis` (GH309)

• VBENCH Improved performance of `MultiIndex.from_tuples`

• VBENCH Special Cython matrix iterator for applying arbitrary reduction operations

• VBENCH + DOCUMENT Add `raw` option to `DataFrame.apply` for getting better performance when
• **VBENCH** Faster cythonized count by level in Series and DataFrame (GH341)

• **VBENCH** Significant GroupBy performance enhancement with multiple keys with many “empty” combinations

• **VBENCH** New Cython vectorized function `map_infer` speeds up `Series.apply` and `Series.map` significantly when passed elementwise Python function, motivated by (GH355)

• **VBENCH** Significantly improved performance of `Series.order`, which also makes `np.unique` called on a Series faster (GH327)

• **VBENCH** Vastly improved performance of GroupBy on axes with a MultiIndex (GH299)

**Contributors**

**5.25 Version 0.5**

**5.25.1 Version 0.5.0 (October 24, 2011)**

**New features**

• *Added* `DataFrame.align` method with standard join options

• *Added* `parse_dates` option to `read_csv` and `read_table` methods to optionally try to parse dates in the index columns

• *Added* `nrows`, `chunksize`, and `iterator` arguments to `read_csv` and `read_table`. The last two return a new `TextParser` class capable of lazily iterating through chunks of a flat file (GH242)

• *Added* ability to join on multiple columns in `DataFrame.join` (GH214)

• *Added* private `_get_duplicates` function to `Index` for identifying duplicate values more easily (ENH5c)

• *Added* column attribute access to `DataFrame`.

• *Added* Python tab completion hook for `DataFrame` columns. (GH233, GH230)

• *Implemented* `Series.describe` for Series containing objects (GH241)

• *Added* inner join option to `DataFrame.join` when joining on key(s) (GH248)

• *Implemented* selecting `DataFrame` columns by passing a list to `__getitem__` (GH253)
• Implemented & and | to intersect/union Index objects, respectively (GH261)
• Added pivot_table convenience function to pandas namespace (GH234)
• Implemented Panel.rename_axis function (GH243)
• DataFrame will show index level names in console output (GH334)
• Implemented Panel.take
• Added set_eng_float_format for alternate DataFrame floating point string formatting (ENH61)
• Added convenience set_index function for creating a DataFrame index from its existing columns
• Implemented groupby hierarchical index level name (GH223)
• Added support for different delimiters in DataFrame.to_csv (GH244)
• TODO: DOCS ABOUT TAKE METHODS

Performance enhancements
• VBENCH Major performance improvements in file parsing functions read_csv and read_table
• VBENCH Added Cython function for converting tuples to ndarray very fast. Speeds up many MultiIndex-related operations
• VBENCH Refactored merging/joining code into a tidy class and disabled unnecessary computations in the float/object case, thus getting about 10% better performance (GH211)
• VBENCH Improved speed of DataFrame.xs on mixed-type DataFrame objects by about 5x, regression from 0.3.0 (GH215)
• VBENCH With new DataFrame.align method, speeding up binary operations between differently-indexed DataFrame objects by 10-25%.
• VBENCH Significantly sped up conversion of nested dict into DataFrame (GH212)
• VBENCH Significantly speed up DataFrame __repr__ and count on large mixed-type DataFrame objects

5.26 Version 0.4

5.26.1 Versions 0.4.1 through 0.4.3 (September 25 - October 9, 2011)

New features

- Added Python 3 support using 2to3 (GH200)
- Added name attribute to Series, now prints as part of Series.__repr__
- Added instance methods isnull and notnull to Series (GH209, GH203)
- Added Series.align method for aligning two series with choice of join method (ENH56)
- Added method get_level_values to MultiIndex (GH188)
- Set values in mixed-type DataFrame objects via .ix indexing attribute (GH135)
- Added new DataFrame methods get_dtype_counts and property dtypes (ENHdc)
- Added ignore_index option to DataFrame.append to stack DataFrames (ENH1b)
- read_csv tries to sniff delimiters using csv.Sniffer (GH146)
- read_csv can read multiple columns into a MultiIndex; DataFrame’s to_csv method writes out a corresponding MultiIndex (GH151)
- DataFrame.rename has a new copy parameter to rename a DataFrame in place (ENHed)
- Enable unstacking by name (GH142)
- Enable sortlevel to work by level (GH141)

Performance enhancements

- Altered binary operations on differently-indexed SparseSeries objects to use the integer-based (dense) alignment logic which is faster with a larger number of blocks (GH205)
- Wrote faster Cython data alignment / merging routines resulting in substantial speed increases
- Improved performance of isnull and notnull, a regression from v0.3.0 (GH187)
- Refactored code related to DataFrame.join so that intermediate aligned copies of the data in each DataFrame argument do not need to be created. Substantial performance increases result (GH176)
- Substantially improved performance of generic Index.intersection and Index.union
- Implemented BlockManager.take resulting in significantly faster take performance on mixed-type DataFrame objects (GH104)
- Improved performance of Series.sort_index
- Significant groupby performance enhancement: removed unnecessary integrity checks in DataFrame internals that were slowing down slicing operations to retrieve groups
- Optimized _ensure_index function resulting in performance savings in type-checking Index objects
- Wrote fast time series merging / joining methods in Cython. Will be integrated later into DataFrame.join and related functions
Contributors

A total of 2 people contributed patches to this release. People with a "+" by their names contributed a patch for the first time.
