                                                                     width=100).render()) #testn['wid

             row += '</tr>'
             head += row

         head+= """
         </tbody>
         </table>"""

         HTML(head)

Out[25]: <IPython.core.display.HTML object>
```

## 23.5 Sharing Styles

Say you have a lovely style built up for a `DataFrame`, and now you want to apply the same style to a second `DataFrame`. Export the style with `df1.style.export`, and import it on the second `DataFrame` with `df1.style.set`

```
In [26]: df2 = -df
         style1 = df.style.applymap(color_negative_red)
         style1

Out[26]: <pandas.io.formats.style.Styler at 0x1a15aea6d8>

In [27]: style2 = df2.style
         style2.use(style1.export())
         style2

Out[27]: <pandas.io.formats.style.Styler at 0x1a15be6978>
```

Notice that you're able share the styles even though they're data aware. The styles are re-evaluated on the new `DataFrame` they've been used upon.

## 23.6 Other Options

You've seen a few methods for data-driven styling. `Styler` also provides a few other options for styles that don't depend on the data.

- precision
- captions
- table-wide styles
- hiding the index or columns

Each of these can be specified in two ways:

- A keyword argument to `Styler.__init__`
- A call to one of the `.set_` or `.hide_` methods, e.g. `.set_caption` or `.hide_columns`

The best method to use depends on the context. Use the `Styler` constructor when building many styled `DataFrames` that should all share the same properties. For interactive use, the `.set_` and `.hide_` methods are more convenient.

### 23.6.1 Precision

You can control the precision of floats using pandas' regular `display.precision` option.

```
In [28]: with pd.option_context('display.precision', 2):
         html = (df.style
               .applymap(color_negative_red)
               .apply(highlight_max))

         html

Out[28]: <pandas.io.formats.style.Styler at 0x1a15aea518>
```

Or through a `set_precision` method.

```
In [29]: df.style\
         .applymap(color_negative_red)\
         .apply(highlight_max)\
         .set_precision(2)
```

```
Out[29]: <pandas.io.formats.style.Styler at 0x1a15bdf400>
```

Setting the precision only affects the printed number; the full-precision values are always passed to your style functions. You can always use `df.round(2).style` if you'd prefer to round from the start.

## 23.6.2 Captions

Regular table captions can be added in a few ways.

```
In [30]: df.style.set_caption('Colormaps, with a caption.')\
        .background_gradient(cmap=cm)
```

```
/Users/taugspurger/miniconda3/envs/travis-36-doc/lib/python3.6/site-packages/matplotlib/colors.py:50:
  xa[xa < 0] = -1
```

```
Out[30]: <pandas.io.formats.style.Styler at 0x1a15aea3c8>
```

## 23.6.3 Table Styles

The next option you have are “table styles”. These are styles that apply to the table as a whole, but don’t look at the data. Certain sytlings, including pseudo-selectors like `:hover` can only be used this way.

```
In [31]: from IPython.display import HTML
```

```
def hover(hover_color="#ffff99"):
    return dict(selector="tr:hover",
                props=[("background-color", "%s" % hover_color)])

styles = [
    hover(),
    dict(selector="th", props=[("font-size", "150%"),
                                ("text-align", "center")]),
    dict(selector="caption", props=[("caption-side", "bottom")])
]
html = (df.style.set_table_styles(styles)
        .set_caption("Hover to highlight.")).render()
html
```

```
Out[31]: <pandas.io.formats.style.Styler at 0x1a15bdfbe0>
```

`table_styles` should be a list of dictionaries. Each dictionary should have the `selector` and `props` keys. The value for `selector` should be a valid CSS selector. Recall that all the styles are already attached to an `id`, unique to each `Styler`. This selector is in addition to that `id`. The value for `props` should be a list of tuples of ('attribute', 'value').

`table_styles` are extremely flexible, but not as fun to type out by hand. We hope to collect some useful ones either in pandas, or preferable in a new package that *builds on top* the tools here.

## 23.6.4 Hiding the Index or Columns

The index can be hidden from rendering by calling `Styler.hide_index`. Columns can be hidden from rendering by calling `Styler.hide_columns` and passing in the name of a column, or a slice of columns.

```
In [32]: df.style.hide_index()
```

```
Out[32]: <pandas.io.formats.style.Styler at 0x1a15aea4a8>
```

```
In [33]: df.style.hide_columns(['C', 'D'])
```

```
Out[33]: <pandas.io.formats.style.Styler at 0x1a15be6b70>
```

### 23.6.5 CSS Classes

Certain CSS classes are attached to cells.

- Index and Column names include `index_name` and `level<k>` where `k` is its level in a `MultiIndex`
- Index label cells include
  - `row_heading`
  - `row<n>` where `n` is the numeric position of the row
  - `level<k>` where `k` is the level in a `MultiIndex`
- Column label cells include
  - `col_heading`
  - `col<n>` where `n` is the numeric position of the column
  - `level<k>` where `k` is the level in a `MultiIndex`
- Blank cells include `blank`
- Data cells include `data`

### 23.6.6 Limitations

- `DataFrame` only (use `Series.to_frame().style`)
- The index and columns must be unique
- No large repr, and performance isn't great; this is intended for summary `DataFrames`
- You can only style the *values*, not the index or columns
- You can only apply styles, you can't insert new HTML entities

Some of these will be addressed in the future.

### 23.6.7 Terms

- **Style function:** a function that's passed into `Styler.apply` or `Styler.applymap` and returns values like `'css attribute: value'`
- **Builtin style functions:** style functions that are methods on `Styler`
- **table style:** a dictionary with the two keys `selector` and `props`. `selector` is the CSS selector that `props` will apply to. `props` is a list of `(attribute, value)` tuples. A list of table styles passed into `Styler`.

## 23.7 Fun stuff

Here are a few interesting examples.

`Styler` interacts pretty well with widgets. If you're viewing this online instead of running the notebook yourself, you're missing out on interactively adjusting the color palette.

```
In [34]: from IPython.html import widgets
         @widgets.interact
         def f(h_neg=(0, 359, 1), h_pos=(0, 359), s=(0., 99.9), l=(0., 99.9)):
             return df.style.background_gradient(
                 cmap=sns.palettes.diverging_palette(h_neg=h_neg, h_pos=h_pos, s=s, l=l,
                                                    as_cmap=True)
             )

/Users/taugspurger/miniconda3/envs/travis-36-doc/lib/python3.6/site-packages/matplotlib/colors.py:504:
  xa[xa < 0] = -1

<pandas.io.formats.style.Styler at 0x1a15bdf8d0>

In [35]: def magnify():
         return [dict(selector="th",
                       props=[("font-size", "4pt")]),
                 dict(selector="td",
                       props=[('padding', "0em 0em")]),
                 dict(selector="th:hover",
                       props=[("font-size", "12pt")]),
                 dict(selector="tr:hover td:hover",
                       props=[('max-width', '200px'),
                              ('font-size', '12pt')])]

In [36]: np.random.seed(25)
         cmap = cmap=sns.diverging_palette(5, 250, as_cmap=True)
         bigdf = pd.DataFrame(np.random.randn(20, 25)).cumsum()

         bigdf.style.background_gradient(cmap, axis=1)\
             .set_properties(**{'max-width': '80px', 'font-size': '1pt'})\
             .set_caption("Hover to magnify")\
             .set_precision(2)\
             .set_table_styles(magnify())

Out[36]: <pandas.io.formats.style.Styler at 0x1a1d6d4978>
```

## 23.8 Export to Excel

*New in version 0.20.0*

*Experimental: This is a new feature and still under development. We'll be adding features and possibly making breaking changes in future releases. We'd love to hear your feedback.*

Some support is available for exporting styled DataFrames to Excel worksheets using the OpenPyXL or XlsxWriter engines. CSS2.2 properties handled include:

- background-color
- border-style, border-width, border-color and their {top, right, bottom, left variants}
- color
- font-family
- font-style
- font-weight
- text-align
- text-decoration

- vertical-align
- white-space: nowrap

Only CSS2 named colors and hex colors of the form #rgb or #rrggbb are currently supported.

```
In [37]: df.style.\
        applymap(color_negative_red).\
        apply(highlight_max).\
        to_excel('styled.xlsx', engine='openpyxl')
```

A screenshot of the output:

|    | A | B  | C         | D         | E         | F         |
|----|---|----|-----------|-----------|-----------|-----------|
| 1  |   | A  | B         | C         | D         | E         |
| 2  | 0 | 1  | 1.329212  |           | -0.31628  | -0.99081  |
| 3  | 1 | 2  | -1.070816 | -1.438713 | 0.564417  | 0.295722  |
| 4  | 2 | 3  | -1.626404 | 0.219565  | 0.678805  | 1.889273  |
| 5  | 3 | 4  | 0.961538  | 0.104011  | -0.481165 | 0.850229  |
| 6  | 4 | 5  | 1.453425  | 1.057737  | 0.165562  | 0.515018  |
| 7  | 5 | 6  | -1.336936 | 0.562861  | 1.392855  | -0.063328 |
| 8  | 6 | 7  | 0.121668  | 1.207603  | -0.00204  | 1.627796  |
| 9  | 7 | 8  | 0.354493  | 1.037528  | -0.385684 | 0.519818  |
| 10 | 8 | 9  | 1.686583  | -1.325963 | 1.428984  | -2.089354 |
| 11 | 9 | 10 | -0.12982  | 0.631523  | -0.586538 | 0.29072   |

Fig. 1: Excel spreadsheet with styled DataFrame

## 23.9 Extensibility

The core of pandas is, and will remain, its “high-performance, easy-to-use data structures”. With that in mind, we hope that `DataFrame.style` accomplishes two goals

- Provide an API that is pleasing to use interactively and is “good enough” for many tasks
- Provide the foundations for dedicated libraries to build on

If you build a great library on top of this, let us know and we’ll [link](#) to it.

### 23.9.1 Subclassing

If the default template doesn’t quite suit your needs, you can subclass `Styler` and extend or override the template. We’ll show an example of extending the default template to insert a custom header before each table.

```
In [38]: from jinja2 import Environment, ChoiceLoader, FileSystemLoader
        from IPython.display import HTML
        from pandas.io.formats.style import Styler
```

```
In [39]: %mkdir templates
```

This next cell writes the custom template. We extend the template `html.tpl`, which comes with pandas.

```
In [40]: %%file templates/myhtml.tpl
        {% extends "html.tpl" %}
        {% block table %}
        <h1>{{ table_title|default("My Table") }}</h1>
        {{ super() }}
        {% endblock table %}
```

Writing `templates/myhtml.tpl`

Now that we've created a template, we need to set up a subclass of `Styler` that knows about it.

```
In [41]: class MyStyler(Styler):
        env = Environment(
            loader=ChoiceLoader([
                FileSystemLoader("templates"), # contains ours
                Styler.loader, # the default
            ])
        )
        template = env.get_template("myhtml.tpl")
```

Notice that we include the original loader in our environment's loader. That's because we extend the original template, so the Jinja environment needs to be able to find it.

Now we can use that custom styler. It's `__init__` takes a `DataFrame`.

```
In [42]: MyStyler(df)
Out[42]: <__main__.MyStyler at 0x1a1d6d44e0>
```

Our custom template accepts a `table_title` keyword. We can provide the value in the `.render` method.

```
In [43]: HTML(MyStyler(df).render(table_title="Extending Example"))
Out[43]: <IPython.core.display.HTML object>
```

For convenience, we provide the `Styler.from_custom_template` method that does the same as the custom subclass.

```
In [44]: EasyStyler = Styler.from_custom_template("templates", "myhtml.tpl")
        EasyStyler(df)
Out[44]: <pandas.io.formats.style.Styler.from_custom_template.<locals>.MyStyler at 0x1a1fd934e0>
```

Here's the template structure:

```
In [45]: with open("template_structure.html") as f:
        structure = f.read()

        HTML(structure)
Out[45]: <IPython.core.display.HTML object>
```

See the template in the [GitHub repo](#) for more details.

## IO TOOLS (TEXT, CSV, HDF5, ...)

The pandas I/O API is a set of top level reader functions accessed like `pandas.read_csv()` that generally return a pandas object. The corresponding writer functions are object methods that are accessed like `DataFrame.to_csv()`. Below is a table containing available readers and writers.

| Format Type | Data Description     | Reader                      | Writer                    |
|-------------|----------------------|-----------------------------|---------------------------|
| text        | CSV                  | <code>read_csv</code>       | <code>to_csv</code>       |
| text        | JSON                 | <code>read_json</code>      | <code>to_json</code>      |
| text        | HTML                 | <code>read_html</code>      | <code>to_html</code>      |
| text        | Local clipboard      | <code>read_clipboard</code> | <code>to_clipboard</code> |
| binary      | MS Excel             | <code>read_excel</code>     | <code>to_excel</code>     |
| binary      | HDF5 Format          | <code>read_hdf</code>       | <code>to_hdf</code>       |
| binary      | Feather Format       | <code>read_feather</code>   | <code>to_feather</code>   |
| binary      | Parquet Format       | <code>read_parquet</code>   | <code>to_parquet</code>   |
| binary      | Msgpack              | <code>read_msgpack</code>   | <code>to_msgpack</code>   |
| binary      | Stata                | <code>read_stata</code>     | <code>to_stata</code>     |
| binary      | SAS                  | <code>read_sas</code>       |                           |
| binary      | Python Pickle Format | <code>read_pickle</code>    | <code>to_pickle</code>    |
| SQL         | SQL                  | <code>read_sql</code>       | <code>to_sql</code>       |
| SQL         | Google Big Query     | <code>read_gbq</code>       | <code>to_gbq</code>       |

*Here* is an informal performance comparison for some of these IO methods.

---

**Note:** For examples that use the `StringIO` class, make sure you import it according to your Python version, i.e. `from StringIO import StringIO` for Python 2 and `from io import StringIO` for Python 3.

---

### 24.1 CSV & Text files

The two workhorse functions for reading text files (a.k.a. flat files) are `read_csv()` and `read_table()`. They both use the same parsing code to intelligently convert tabular data into a `DataFrame` object. See the *cookbook* for some advanced strategies.

#### 24.1.1 Parsing options

The functions `read_csv()` and `read_table()` accept the following common arguments:

### 24.1.1.1 Basic

**filepath\_or\_buffer** [various] Either a path to a file (a `str`, `pathlib.Path`, or `py._path.local.LocalPath`), URL (including `http`, `ftp`, and `S3` locations), or any object with a `read()` method (such as an open file or `StringIO`).

**sep** [str, defaults to `,` for `read_csv()`, `\t` for `read_table()`] Delimiter to use. If `sep` is `None`, the C engine cannot automatically detect the separator, but the Python parsing engine can, meaning the latter will be used and automatically detect the separator by Python's builtin sniffer tool, `csv.Sniffer`. In addition, separators longer than 1 character and different from `'\s+'` will be interpreted as regular expressions and will also force the use of the Python parsing engine. Note that regex delimiters are prone to ignoring quoted data. Regex example: `'\\r\\t'`.

**delimiter** [str, default `None`] Alternative argument name for `sep`.

**delim\_whitespace** [boolean, default `False`] Specifies whether or not whitespace (e.g. `' '` or `'\t'`) will be used as the delimiter. Equivalent to setting `sep='\s+'`. If this option is set to `True`, nothing should be passed in for the `delimiter` parameter.

New in version 0.18.1: support for the Python parser.

### 24.1.1.2 Column and Index Locations and Names

**header** [int or list of ints, default `'infer'`] Row number(s) to use as the column names, and the start of the data. Default behavior is to infer the column names: if no names are passed the behavior is identical to `header=0` and column names are inferred from the first line of the file, if column names are passed explicitly then the behavior is identical to `header=None`. Explicitly pass `header=0` to be able to replace existing names.

The header can be a list of ints that specify row locations for a multi-index on the columns e.g. `[0, 1, 3]`. Intervening rows that are not specified will be skipped (e.g. 2 in this example is skipped). Note that this parameter ignores commented lines and empty lines if `skip_blank_lines=True`, so `header=0` denotes the first line of data rather than the first line of the file.

**names** [array-like, default `None`] List of column names to use. If file contains no header row, then you should explicitly pass `header=None`. Duplicates in this list will cause a `UserWarning` to be issued.

**index\_col** [int or sequence or `False`, default `None`] Column to use as the row labels of the `DataFrame`. If a sequence is given, a `MultiIndex` is used. If you have a malformed file with delimiters at the end of each line, you might consider `index_col=False` to force pandas to *not* use the first column as the index (row names).

**usecols** [list-like or callable, default `None`] Return a subset of the columns. If list-like, all elements must either be positional (i.e. integer indices into the document columns) or strings that correspond to column names provided either by the user in `names` or inferred from the document header row(s). For example, a valid list-like `usecols` parameter would be `[0, 1, 2]` or `['foo', 'bar', 'baz']`.

Element order is ignored, so `usecols=[0, 1]` is the same as `[1, 0]`. To instantiate a `DataFrame` from data with element order preserved use `pd.read_csv(data, usecols=['foo', 'bar'])[['foo', 'bar']]` for columns in `['foo', 'bar']` order or `pd.read_csv(data, usecols=['foo', 'bar'])[['bar', 'foo']]` for `['bar', 'foo']` order.

If callable, the callable function will be evaluated against the column names, returning names where the callable function evaluates to `True`:

```
In [1]: data = 'col1,col2,col3\na,b,1\na,b,2\nc,d,3'

In [2]: pd.read_csv(StringIO(data))
Out[2]:
   col1 col2 col3
```

(continues on next page)

(continued from previous page)

```

0    a    b    1
1    a    b    2
2    c    d    3

In [3]: pd.read_csv(StringIO(data), usecols=lambda x: x.upper() in ['COL1', 'COL3
Out [3]:
   col1  col3
0     a     1
1     a     2
2     c     3

```

Using this parameter results in much faster parsing time and lower memory usage.

**squeeze** [boolean, default False] If the parsed data only contains one column then return a Series.

**prefix** [str, default None] Prefix to add to column numbers when no header, e.g. 'X' for X0, X1, ...

**mangle\_dupe\_cols** [boolean, default True] Duplicate columns will be specified as 'X', 'X.1'... 'X.N', rather than 'X'... 'X'. Passing in False will cause data to be overwritten if there are duplicate names in the columns.

### 24.1.1.3 General Parsing Configuration

**dtype** [Type name or dict of column -> type, default None] Data type for data or columns. E.g. {'a': np.float64, 'b': np.int32} (unsupported with engine='python'). Use *str* or *object* together with suitable *na\_values* settings to preserve and not interpret dtype.

New in version 0.20.0: support for the Python parser.

**engine** [{'c', 'python'}] Parser engine to use. The C engine is faster while the Python engine is currently more feature-complete.

**converters** [dict, default None] Dict of functions for converting values in certain columns. Keys can either be integers or column labels.

**true\_values** [list, default None] Values to consider as True.

**false\_values** [list, default None] Values to consider as False.

**skipinitialspace** [boolean, default False] Skip spaces after delimiter.

**skiprows** [list-like or integer, default None] Line numbers to skip (0-indexed) or number of lines to skip (int) at the start of the file.

If callable, the callable function will be evaluated against the row indices, returning True if the row should be skipped and False otherwise:

```

In [4]: data = 'col1,col2,col3\na,b,1\na,b,2\nc,d,3'

In [5]: pd.read_csv(StringIO(data))
Out [5]:
   col1 col2 col3
0     a     b     1
1     a     b     2
2     c     d     3

In [6]: pd.read_csv(StringIO(data), skiprows=lambda x: x % 2 != 0)
Out [6]:

```

(continues on next page)

(continued from previous page)

|   | col1 | col2 | col3 |
|---|------|------|------|
| 0 | a    | b    | 2    |

**skipfooter** [int, default 0] Number of lines at bottom of file to skip (unsupported with engine='c').

**nrows** [int, default None] Number of rows of file to read. Useful for reading pieces of large files.

**low\_memory** [boolean, default True] Internally process the file in chunks, resulting in lower memory use while parsing, but possibly mixed type inference. To ensure no mixed types either set `False`, or specify the type with the `dtype` parameter. Note that the entire file is read into a single `DataFrame` regardless, use the `chunksize` or `iterator` parameter to return the data in chunks. (Only valid with C parser)

**memory\_map** [boolean, default False] If a filepath is provided for `filepath_or_buffer`, map the file object directly onto memory and access the data directly from there. Using this option can improve performance because there is no longer any I/O overhead.

#### 24.1.1.4 NA and Missing Data Handling

**na\_values** [scalar, str, list-like, or dict, default None] Additional strings to recognize as NA/NaN. If dict passed, specific per-column NA values. See [na\\_values const](#) below for a list of the values interpreted as NaN by default.

**keep\_default\_na** [boolean, default True] Whether or not to include the default NaN values when parsing the data. Depending on whether `na_values` is passed in, the behavior is as follows:

- If `keep_default_na` is `True`, and `na_values` are specified, `na_values` is appended to the default NaN values used for parsing.
- If `keep_default_na` is `True`, and `na_values` are not specified, only the default NaN values are used for parsing.
- If `keep_default_na` is `False`, and `na_values` are specified, only the NaN values specified `na_values` are used for parsing.
- If `keep_default_na` is `False`, and `na_values` are not specified, no strings will be parsed as NaN.

Note that if `na_filter` is passed in as `False`, the `keep_default_na` and `na_values` parameters will be ignored.

**na\_filter** [boolean, default True] Detect missing value markers (empty strings and the value of `na_values`). In data without any NAs, passing `na_filter=False` can improve the performance of reading a large file.

**verbose** [boolean, default False] Indicate number of NA values placed in non-numeric columns.

**skip\_blank\_lines** [boolean, default True] If `True`, skip over blank lines rather than interpreting as NaN values.

#### 24.1.1.5 Datetime Handling

**parse\_dates** [boolean or list of ints or names or list of lists or dict, default `False`.]

- If `True` -> try parsing the index.
- If `[1, 2, 3]` -> try parsing columns 1, 2, 3 each as a separate date column.
- If `[[1, 3]]` -> combine columns 1 and 3 and parse as a single date column.
- If `{'foo': [1, 3]}` -> parse columns 1, 3 as date and call result 'foo'. A fast-path exists for iso8601-formatted dates.

**infer\_datetime\_format** [boolean, default `False`] If `True` and `parse_dates` is enabled for a column, attempt to infer the datetime format to speed up the processing.

**keep\_date\_col** [boolean, default `False`] If `True` and `parse_dates` specifies combining multiple columns then keep the original columns.

**date\_parser** [function, default `None`] Function to use for converting a sequence of string columns to an array of datetime instances. The default uses `dateutil.parser.parser` to do the conversion. Pandas will try to call `date_parser` in three different ways, advancing to the next if an exception occurs: 1) Pass one or more arrays (as defined by `parse_dates`) as arguments; 2) concatenate (row-wise) the string values from the columns defined by `parse_dates` into a single array and pass that; and 3) call `date_parser` once for each row using one or more strings (corresponding to the columns defined by `parse_dates`) as arguments.

**dayfirst** [boolean, default `False`] DD/MM format dates, international and European format.

#### 24.1.1.6 Iteration

**iterator** [boolean, default `False`] Return *TextFileReader* object for iteration or getting chunks with `get_chunk()`.

**chunksize** [int, default `None`] Return *TextFileReader* object for iteration. See *iterating and chunking* below.

#### 24.1.1.7 Quoting, Compression, and File Format

**compression** [{`'infer'`, `'gzip'`, `'bz2'`, `'zip'`, `'xz'`, `None`}, default `'infer'`] For on-the-fly decompression of on-disk data. If `'infer'`, then use `gzip`, `bz2`, `zip`, or `xz` if `filepath_or_buffer` is a string ending in `'gz'`, `'bz2'`, `'zip'`, or `'xz'`, respectively, and no decompression otherwise. If using `'zip'`, the ZIP file must contain only one data file to be read in. Set to `None` for no decompression.

New in version 0.18.1: support for `'zip'` and `'xz'` compression.

**thousands** [str, default `None`] Thousands separator.

**decimal** [str, default `'.'`] Character to recognize as decimal point. E.g. use `'.'` for European data.

**float\_precision** [string, default `None`] Specifies which converter the C engine should use for floating-point values. The options are `None` for the ordinary converter, `high` for the high-precision converter, and `round_trip` for the round-trip converter.

**lineterminator** [str (length 1), default `None`] Character to break file into lines. Only valid with C parser.

**quotechar** [str (length 1)] The character used to denote the start and end of a quoted item. Quoted items can include the delimiter and it will be ignored.

**quoting** [int or `csv.QUOTE_*` instance, default 0] Control field quoting behavior per `csv.QUOTE_*` constants. Use one of `QUOTE_MINIMAL` (0), `QUOTE_ALL` (1), `QUOTE_NONNUMERIC` (2) or `QUOTE_NONE` (3).

**doublequote** [boolean, default `True`] When `quotechar` is specified and `quoting` is not `QUOTE_NONE`, indicate whether or not to interpret two consecutive `quotechar` elements **inside** a field as a single `quotechar` element.

**escapechar** [str (length 1), default `None`] One-character string used to escape delimiter when quoting is `QUOTE_NONE`.

**comment** [str, default `None`] Indicates remainder of line should not be parsed. If found at the beginning of a line, the line will be ignored altogether. This parameter must be a single character. Like empty lines (as long as `skip_blank_lines=True`), fully commented lines are ignored by the parameter `header` but not by `skiprows`. For example, if `comment='#'`, parsing `'#empty\na,b,c\n1,2,3'` with `header=0` will result in `'a,b,c'` being treated as the header.

**encoding** [str, default `None`] Encoding to use for UTF when reading/writing (e.g. `'utf-8'`). [List of Python standard encodings](#).

**dialect** [str or `csv.Dialect` instance, default `None`] If provided, this parameter will override values (default or not) for the following parameters: *delimiter*, *doublequote*, *escapechar*, *skipinitialspace*, *quotechar*, and *quoting*. If it is necessary to override values, a `ParserWarning` will be issued. See `csv.Dialect` documentation for more details.

**tupleize\_cols** [boolean, default `False`]

Deprecated since version 0.21.0.

This argument will be removed and will always convert to `MultiIndex`

Leave a list of tuples on columns as is (default is to convert to a `MultiIndex` on the columns).

#### 24.1.1.8 Error Handling

**error\_bad\_lines** [boolean, default `True`] Lines with too many fields (e.g. a csv line with too many commas) will by default cause an exception to be raised, and no `DataFrame` will be returned. If `False`, then these “bad lines” will be dropped from the `DataFrame` that is returned. See *bad lines* below.

**warn\_bad\_lines** [boolean, default `True`] If `error_bad_lines` is `False`, and `warn_bad_lines` is `True`, a warning for each “bad line” will be output.

### 24.1.2 Specifying column data types

You can indicate the data type for the whole `DataFrame` or individual columns:

```
In [7]: data = 'a,b,c\n1,2,3\n4,5,6\n7,8,9'

In [8]: print(data)
a,b,c
1,2,3
4,5,6
7,8,9

In [9]: df = pd.read_csv(StringIO(data), dtype=object)

In [10]: df
Out[10]:
   a  b  c
0  1  2  3
1  4  5  6
2  7  8  9

In [11]: df['a'][0]
Out[11]: '1'

In [12]: df = pd.read_csv(StringIO(data), dtype={'b': object, 'c': np.float64})

In [13]: df.dtypes
Out[13]:
a      int64
b      object
c      float64
dtype: object
```

Fortunately, pandas offers more than one way to ensure that your column(s) contain only one dtype. If you're unfamiliar with these concepts, you can see [here](#) to learn more about dtypes, and [here](#) to learn more about object conversion in pandas.

For instance, you can use the `converters` argument of `read_csv()`:

```
In [14]: data = "col_1\n1\n2\n'n'A'\n4.22"

In [15]: df = pd.read_csv(StringIO(data), converters={'col_1': str})

In [16]: df
Out[16]:
   col_1
0      1
1      2
2    'A'
3  4.22

In [17]: df['col_1'].apply(type).value_counts()
Out[17]:
<class 'str'>      4
Name: col_1, dtype: int64
```

Or you can use the `to_numeric()` function to coerce the dtypes after reading in the data,

```
In [18]: df2 = pd.read_csv(StringIO(data))

In [19]: df2['col_1'] = pd.to_numeric(df2['col_1'], errors='coerce')

In [20]: df2
Out[20]:
   col_1
0    1.00
1    2.00
2    NaN
3    4.22

In [21]: df2['col_1'].apply(type).value_counts()
Out[21]:
<class 'float'>      4
Name: col_1, dtype: int64
```

which will convert all valid parsing to floats, leaving the invalid parsing as NaN.

Ultimately, how you deal with reading in columns containing mixed dtypes depends on your specific needs. In the case above, if you wanted to NaN out the data anomalies, then `to_numeric()` is probably your best option. However, if you wanted for all the data to be coerced, no matter the type, then using the `converters` argument of `read_csv()` would certainly be worth trying.

New in version 0.20.0: support for the Python parser.

The `dtype` option is supported by the ‘python’ engine.

**Note:** In some cases, reading in abnormal data with columns containing mixed dtypes will result in an inconsistent dataset. If you rely on pandas to infer the dtypes of your columns, the parsing engine will go and infer the dtypes for different chunks of the data, rather than the whole dataset at once. Consequently, you can end up with column(s) with mixed dtypes. For example,

```
In [22]: df = pd.DataFrame({'col_1': list(range(500000)) + ['a', 'b'] +
↪ list(range(500000))})

In [23]: df.to_csv('foo.csv')
```

(continues on next page)

(continued from previous page)

```

In [24]: mixed_df = pd.read_csv('foo.csv')

In [25]: mixed_df['col_1'].apply(type).value_counts()
Out[25]:
<class 'int'>      737858
<class 'str'>      262144
Name: col_1, dtype: int64

In [26]: mixed_df['col_1'].dtype
Out[26]:
dtype('O')

```

will result with *mixed\_df* containing an `int` dtype for certain chunks of the column, and `str` for others due to the mixed dtypes from the data that was read in. It is important to note that the overall column will be marked with a dtype of `object`, which is used for columns with mixed dtypes.

### 24.1.3 Specifying Categorical dtype

New in version 0.19.0.

Categorical columns can be parsed directly by specifying `dtype='category'` or `dtype=CategoricalDtype(categories, ordered)`.

```

In [27]: data = 'col1,col2,col3\na,b,1\na,b,2\nc,d,3'

In [28]: pd.read_csv(StringIO(data))
Out[28]:
   col1 col2 col3
0     a    b    1
1     a    b    2
2     c    d    3

In [29]: pd.read_csv(StringIO(data)).dtypes
Out[29]:
col1    object
col2    object
col3    int64
dtype: object

In [30]: pd.read_csv(StringIO(data), dtype='category').dtypes
Out[30]:
col1    category
col2    category
col3    category
dtype: object

```

Individual columns can be parsed as a `Categorical` using a dict specification:

```

In [31]: pd.read_csv(StringIO(data), dtype={'col1': 'category'}).dtypes
Out[31]:
col1    category

```

(continues on next page)

(continued from previous page)

```
col2      object
col3      int64
dtype: object
```

New in version 0.21.0.

Specifying `dtype='category'` will result in an unordered `Categorical` whose categories are the unique values observed in the data. For more control on the categories and order, create a `CategoricalDtype` ahead of time, and pass that for that column's `dtype`.

```
In [32]: from pandas.api.types import CategoricalDtype

In [33]: dtype = CategoricalDtype(['d', 'c', 'b', 'a'], ordered=True)

In [34]: pd.read_csv(StringIO(data), dtype={'col1': dtype}).dtypes
Out[34]:
col1      category
col2      object
col3      int64
dtype: object
```

When using `dtype=CategoricalDtype`, “unexpected” values outside of `dtype.categories` are treated as missing values.

```
In [35]: dtype = CategoricalDtype(['a', 'b', 'd']) # No 'c'

In [36]: pd.read_csv(StringIO(data), dtype={'col1': dtype}).col1
Out[36]:
0      a
1      a
2     NaN
Name: col1, dtype: category
Categories (3, object): [a, b, d]
```

This matches the behavior of `Categorical.set_categories()`.

**Note:** With `dtype='category'`, the resulting categories will always be parsed as strings (object dtype). If the categories are numeric they can be converted using the `to_numeric()` function, or as appropriate, another converter such as `to_datetime()`.

When `dtype` is a `CategoricalDtype` with homogenous categories ( all numeric, all datetimes, etc.), the conversion is done automatically.

```
In [37]: df = pd.read_csv(StringIO(data), dtype='category')

In [38]: df.dtypes
Out[38]:
col1      category
col2      category
col3      category
dtype: object

In [39]: df['col3']
Out[39]:
0      1
1      2
```

(continues on next page)

(continued from previous page)

```
2      3
Name: col3, dtype: category
Categories (3, object): [1, 2, 3]

In [40]: df['col3'].cat.categories = pd.to_numeric(df['col3'].cat.categories)

In [41]: df['col3']
Out[41]:
0      1
1      2
2      3
Name: col3, dtype: category
Categories (3, int64): [1, 2, 3]
```

### 24.1.4 Naming and Using Columns

#### 24.1.4.1 Handling column names

A file may or may not have a header row. pandas assumes the first row should be used as the column names:

```
In [42]: data = 'a,b,c\n1,2,3\n4,5,6\n7,8,9'
```

```
In [43]: print(data)
```

```
a,b,c
1,2,3
4,5,6
7,8,9
```

```
In [44]: pd.read_csv(StringIO(data))
```

```
Out[44]:
```

|   | a | b | c |
|---|---|---|---|
| 0 | 1 | 2 | 3 |
| 1 | 4 | 5 | 6 |
| 2 | 7 | 8 | 9 |

By specifying the `names` argument in conjunction with `header` you can indicate other names to use and whether or not to throw away the header row (if any):

```
In [45]: print(data)
a,b,c
1,2,3
4,5,6
7,8,9

In [46]: pd.read_csv(StringIO(data), names=['foo', 'bar', 'baz'], header=0)
\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\Out[46]:
      foo  bar  baz
0      1    2    3
1      4    5    6
2      7    8    9

In [47]: pd.read_csv(StringIO(data), names=['foo', 'bar', 'baz'], header=None)
```

(continues on next page)

(continued from previous page)

```

foo bar baz
0    a    b    c
1    1    2    3
2    4    5    6
3    7    8    9

```

If the header is in a row other than the first, pass the row number to `header`. This will skip the preceding rows:

```

In [48]: data = 'skip this skip it\na,b,c\n1,2,3\n4,5,6\n7,8,9'

In [49]: pd.read_csv(StringIO(data), header=1)
Out[49]:
   a  b  c
0  1  2  3
1  4  5  6
2  7  8  9

```

**Note:** Default behavior is to infer the column names: if no names are passed the behavior is identical to `header=0` and column names are inferred from the first nonblank line of the file, if column names are passed explicitly then the behavior is identical to `header=None`.

### 24.1.5 Duplicate names parsing

If the file or header contains duplicate names, pandas will by default distinguish between them so as to prevent overwriting data:

```

In [50]: data = 'a,b,a\n0,1,2\n3,4,5'

In [51]: pd.read_csv(StringIO(data))
Out[51]:
   a  b  a.1
0  0  1     2
1  3  4     5

```

There is no more duplicate data because `mangle_dupe_cols=True` by default, which modifies a series of duplicate columns 'X', ..., 'X' to become 'X', 'X.1', ..., 'X.N'. If `mangle_dupe_cols=False`, duplicate data can arise:

```

In [2]: data = 'a,b,a\n0,1,2\n3,4,5'
In [3]: pd.read_csv(StringIO(data), mangle_dupe_cols=False)
Out[3]:
   a  b  a
0  2  1  2
1  5  4  5

```

To prevent users from encountering this problem with duplicate data, a `ValueError` exception is raised if `mangle_dupe_cols != True`:

```

In [2]: data = 'a,b,a\n0,1,2\n3,4,5'
In [3]: pd.read_csv(StringIO(data), mangle_dupe_cols=False)
...
ValueError: Setting mangle_dupe_cols=False is not supported yet

```

### 24.1.5.1 Filtering columns (*usecols*)

The *usecols* argument allows you to select any subset of the columns in a file, either using the column names, position numbers or a callable:

New in version 0.20.0: support for callable *usecols* arguments

```
In [52]: data = 'a,b,c,d\n1,2,3,foo\n4,5,6,bar\n7,8,9,baz'

In [53]: pd.read_csv(StringIO(data))
Out[53]:
   a  b  c  d
0  1  2  3  foo
1  4  5  6  bar
2  7  8  9  baz

In [54]: pd.read_csv(StringIO(data), usecols=['b', 'd'])
Out[54]:
   b  d
0  2  foo
1  5  bar
2  8  baz

In [55]: pd.read_csv(StringIO(data), usecols=[0, 2, 3])
Out[55]:
   a  c  d
0  1  3  foo
1  4  6  bar
2  7  9  baz

In [56]: pd.read_csv(StringIO(data), usecols=lambda x: x.upper() in ['A', 'C'])
Out[56]:
   a  c
0  1  3
1  4  6
2  7  9
```

The *usecols* argument can also be used to specify which columns not to use in the final result:

```
In [57]: pd.read_csv(StringIO(data), usecols=lambda x: x not in ['a', 'c'])
Out[57]:
   b  d
0  2  foo
1  5  bar
2  8  baz
```

In this case, the callable is specifying that we exclude the “a” and “c” columns from the output.

## 24.1.6 Comments and Empty Lines

### 24.1.6.1 Ignoring line comments and empty lines

If the *comment* parameter is specified, then completely commented lines will be ignored. By default, completely blank lines will be ignored as well.

```
In [58]: data = '\na,b,c\n \n# commented line\n1,2,3\n\n4,5,6'

In [59]: print(data)

a,b,c

# commented line
1,2,3

4,5,6

In [60]: pd.read_csv(StringIO(data), comment='#')
Out[60]:
   a  b  c
0  1  2  3
1  4  5  6
```

If `skip_blank_lines=False`, then `read_csv` will not ignore blank lines:

```
In [61]: data = 'a,b,c\n1,2,3\n\n4,5,6'

In [62]: pd.read_csv(StringIO(data), skip_blank_lines=False)
Out[62]:
   a  b  c
0 NaN NaN NaN
1 1.0 2.0 3.0
2 NaN NaN NaN
3 NaN NaN NaN
4 4.0 5.0 6.0
```

**Warning:** The presence of ignored lines might create ambiguities involving line numbers; the parameter `header` uses row numbers (ignoring commented/empty lines), while `skiprows` uses line numbers (including commented/empty lines):

```
In [63]: data = '#comment\na,b,c\nA,B,C\n1,2,3'

In [64]: pd.read_csv(StringIO(data), comment='#', header=1)
Out[64]:
   A  B  C
0  1  2  3

In [65]: data = 'A,B,C\n#comment\na,b,c\n1,2,3'

In [66]: pd.read_csv(StringIO(data), comment='#', skiprows=2)
Out[66]:
   a  b  c
0  1  2  3
```

If both `header` and `skiprows` are specified, `header` will be relative to the end of `skiprows`. For example:

```

In [67]: data = '# empty\n# second empty line\n# third empty' \
In [67]: 'line\nX,Y,Z\n1,2,3\nA,B,C\n1,2.,4.\n5.,NaN,10.0'

In [68]: print(data)
# empty
# second empty line
# third emptyline
X,Y,Z
1,2,3
A,B,C
1,2.,4.
5.,NaN,10.0

In [69]: pd.read_csv(StringIO(data), comment='#', skiprows=4, header=1)
Out[69]:
  A    B    C
0  1.0  2.0  4.0
1  5.0  NaN 10.0

```

### 24.1.6.2 Comments

Sometimes comments or meta data may be included in a file:

```

In [70]: print(open('tmp.csv').read())
ID,level,category
Patient1,123000,x # really unpleasant
Patient2,23000,y # wouldn't take his medicine
Patient3,1234018,z # awesome

```

By default, the parser includes the comments in the output:

```

In [71]: df = pd.read_csv('tmp.csv')

In [72]: df
Out[72]:
   ID    level category
0  Patient1  123000      x # really unpleasant
1  Patient2   23000      y # wouldn't take his medicine
2  Patient3 1234018      z # awesome

```

We can suppress the comments using the `comment` keyword:

```

In [73]: df = pd.read_csv('tmp.csv', comment='#')

In [74]: df
Out[74]:
   ID    level category
0  Patient1  123000      x
1  Patient2   23000      y
2  Patient3 1234018      z

```

### 24.1.7 Dealing with Unicode Data

The `encoding` argument should be used for encoded unicode data, which will result in byte strings being decoded to unicode in the result:

```
In [75]: data = b'word,length\nTr\x03\xa4umen,7\nGr\x03\xbc\x03\x9fe,5'.decode('utf8
↳').encode('latin-1')

In [76]: df = pd.read_csv(BytesIO(data), encoding='latin-1')

In [77]: df
Out[77]:
   word  length
0  Träumen      7
1   Grüße      5

In [78]: df['word'][1]
Out[78]: 'Größe'
```

Some formats which encode all characters as multiple bytes, like UTF-16, won't parse correctly at all without specifying the encoding. [Full list of Python standard encodings](#).

### 24.1.8 Index columns and trailing delimiters

If a file has one more column of data than the number of column names, the first column will be used as the `DataFrame`'s row names:

```
In [79]: data = 'a,b,c\n4,apple,bat,5.7\n8,orange,cow,10'

In [80]: pd.read_csv(StringIO(data))
Out[80]:
   a      b      c
4  apple bat   5.7
8  orange cow  10.0
```

```
In [81]: data = 'index,a,b,c\n4,apple,bat,5.7\n8,orange,cow,10'

In [82]: pd.read_csv(StringIO(data), index_col=0)
Out[82]:
   index      a      b      c
4      apple bat   5.7
8      orange cow  10.0
```

Ordinarily, you can achieve this behavior using the `index_col` option.

There are some exception cases when a file has been prepared with delimiters at the end of each data line, confusing the parser. To explicitly disable the index column inference and discard the last column, pass `index_col=False`:

```
In [83]: data = 'a,b,c\n4,apple,bat,\n8,orange,cow,'

In [84]: print(data)
a,b,c
4,apple,bat,
8,orange,cow,
```

(continues on next page)

(continued from previous page)

```
In [85]: pd.read_csv(StringIO(data))
\\Out [85]:
      a    b    c
4  apple bat NaN
8  orange cow NaN
```

```
In [86]: pd.read_csv(StringIO(data), index_col=False)
\\Out [86]:
      a    b    c
0  4  apple bat
1  8  orange cow
```

If a subset of data is being parsed using the `usecols` option, the `index_col` specification is based on that subset, not the original data.

```
In [87]: data = 'a,b,c\n4,apple,bat,\n8,orange,cow, '
```

```
In [88]: print(data)
a,b,c
4,apple,bat,
8,orange,cow,
```

```
In [89]: pd.read_csv(StringIO(data), usecols=['b', 'c'])
\\Out [89]:
      b    c
4  bat NaN
8  cow NaN
```

```
In [90]: pd.read_csv(StringIO(data), usecols=['b', 'c'], index_col=0)
\\Out [90]:
      b    c
4  bat NaN
8  cow NaN
```

## 24.1.9 Date Handling

### 24.1.9.1 Specifying Date Columns

To better facilitate working with datetime data, `read_csv()` and `read_table()` use the keyword arguments `parse_dates` and `date_parser` to allow users to specify a variety of columns and date/time formats to turn the input text data into datetime objects.

The simplest case is to just pass in `parse_dates=True`:

```
# Use a column as an index, and parse it as dates.
In [91]: df = pd.read_csv('foo.csv', index_col=0, parse_dates=True)

In [92]: df
Out [92]:
      A  B  C
date
2009-01-01  a  1  2
2009-01-02  b  3  4
2009-01-03  c  4  5
```

(continues on next page)

(continued from previous page)

# These are Python datetime objects

**In [93]:** df.index

```

DatetimeIndex(['2009-01-01', '2009-01-02', '2009-01-03'], dtype='datetime64[ns]',
              name='date', freq=None)

```

It is often the case that we may want to store date and time data separately, or store various date fields separately. the `parse_dates` keyword can be used to specify a combination of columns to parse the dates and/or times from.

You can specify a list of column lists to `parse_dates`, the resulting date columns will be prepended to the output (so as to not affect the existing column order) and the new column names will be the concatenation of the component column names:

**In [94]:** print(open('tmp.csv').read())

```

KORD,19990127, 19:00:00, 18:56:00, 0.8100
KORD,19990127, 20:00:00, 19:56:00, 0.0100
KORD,19990127, 21:00:00, 20:56:00, -0.5900
KORD,19990127, 21:00:00, 21:18:00, -0.9900
KORD,19990127, 22:00:00, 21:56:00, -0.5900
KORD,19990127, 23:00:00, 22:56:00, -0.5900

```

**In [95]:** df = pd.read\_csv('tmp.csv', header=None, parse\_dates=[[1, 2], [1, 3]])**In [96]:** df**Out[96]:**

|   | 1_2                 | 1_3                 | 0    | 4     |
|---|---------------------|---------------------|------|-------|
| 0 | 1999-01-27 19:00:00 | 1999-01-27 18:56:00 | KORD | 0.81  |
| 1 | 1999-01-27 20:00:00 | 1999-01-27 19:56:00 | KORD | 0.01  |
| 2 | 1999-01-27 21:00:00 | 1999-01-27 20:56:00 | KORD | -0.59 |
| 3 | 1999-01-27 21:00:00 | 1999-01-27 21:18:00 | KORD | -0.99 |
| 4 | 1999-01-27 22:00:00 | 1999-01-27 21:56:00 | KORD | -0.59 |
| 5 | 1999-01-27 23:00:00 | 1999-01-27 22:56:00 | KORD | -0.59 |

By default the parser removes the component date columns, but you can choose to retain them via the `keep_date_col` keyword:

```

In [97]: df = pd.read_csv('tmp.csv', header=None, parse_dates=[[1, 2], [1, 3]],
      ....:                  keep_date_col=True)
      ....:

```

**In [98]:** df**Out[98]:**

|   | 1_2                 | 1_3                 | 0    | 1        | 2        | 3        | 4     |
|---|---------------------|---------------------|------|----------|----------|----------|-------|
| 0 | 1999-01-27 19:00:00 | 1999-01-27 18:56:00 | KORD | 19990127 | 19:00:00 | 18:56:00 | 0.81  |
| 1 | 1999-01-27 20:00:00 | 1999-01-27 19:56:00 | KORD | 19990127 | 20:00:00 | 19:56:00 | 0.01  |
| 2 | 1999-01-27 21:00:00 | 1999-01-27 20:56:00 | KORD | 19990127 | 21:00:00 | 20:56:00 | -0.59 |
| 3 | 1999-01-27 21:00:00 | 1999-01-27 21:18:00 | KORD | 19990127 | 21:00:00 | 21:18:00 | -0.99 |
| 4 | 1999-01-27 22:00:00 | 1999-01-27 21:56:00 | KORD | 19990127 | 22:00:00 | 21:56:00 | -0.59 |
| 5 | 1999-01-27 23:00:00 | 1999-01-27 22:56:00 | KORD | 19990127 | 23:00:00 | 22:56:00 | -0.59 |

Note that if you wish to combine multiple columns into a single date column, a nested list must be used. In other words, `parse_dates=[1, 2]` indicates that the second and third columns should each be parsed as separate date columns while `parse_dates=[[1, 2]]` means the two columns should be parsed into a single column.

You can also use a dict to specify custom name columns:

```
In [99]: date_spec = {'nominal': [1, 2], 'actual': [1, 3]}

In [100]: df = pd.read_csv('tmp.csv', header=None, parse_dates=date_spec)

In [101]: df
Out[101]:
```

|   | nominal             | actual              | 0    | 4     |
|---|---------------------|---------------------|------|-------|
| 0 | 1999-01-27 19:00:00 | 1999-01-27 18:56:00 | KORD | 0.81  |
| 1 | 1999-01-27 20:00:00 | 1999-01-27 19:56:00 | KORD | 0.01  |
| 2 | 1999-01-27 21:00:00 | 1999-01-27 20:56:00 | KORD | -0.59 |
| 3 | 1999-01-27 21:00:00 | 1999-01-27 21:18:00 | KORD | -0.99 |
| 4 | 1999-01-27 22:00:00 | 1999-01-27 21:56:00 | KORD | -0.59 |
| 5 | 1999-01-27 23:00:00 | 1999-01-27 22:56:00 | KORD | -0.59 |

It is important to remember that if multiple text columns are to be parsed into a single date column, then a new column is prepended to the data. The `index_col` specification is based off of this new set of columns rather than the original data columns:

```
In [102]: date_spec = {'nominal': [1, 2], 'actual': [1, 3]}

In [103]: df = pd.read_csv('tmp.csv', header=None, parse_dates=date_spec,
.....:                    index_col=0) # index is the nominal column
.....:

In [104]: df
Out[104]:
```

|                     | actual              | 0    | 4     |
|---------------------|---------------------|------|-------|
| nominal             |                     |      |       |
| 1999-01-27 19:00:00 | 1999-01-27 18:56:00 | KORD | 0.81  |
| 1999-01-27 20:00:00 | 1999-01-27 19:56:00 | KORD | 0.01  |
| 1999-01-27 21:00:00 | 1999-01-27 20:56:00 | KORD | -0.59 |
| 1999-01-27 21:00:00 | 1999-01-27 21:18:00 | KORD | -0.99 |
| 1999-01-27 22:00:00 | 1999-01-27 21:56:00 | KORD | -0.59 |
| 1999-01-27 23:00:00 | 1999-01-27 22:56:00 | KORD | -0.59 |

---

**Note:** If a column or index contains an unparseable date, the entire column or index will be returned unaltered as an object data type. For non-standard datetime parsing, use `to_datetime()` after `pd.read_csv`.

---

---

**Note:** `read_csv` has a `fast_path` for parsing datetime strings in iso8601 format, e.g. “2000-01-01T00:01:02+00:00” and similar variations. If you can arrange for your data to store datetimes in this format, load times will be significantly faster, ~20x has been observed.

---

---

**Note:** When passing a dict as the `parse_dates` argument, the order of the columns prepended is not guaranteed, because *dict* objects do not impose an ordering on their keys. On Python 2.7+ you may use `collections.OrderedDict` instead of a regular *dict* if this matters to you. Because of this, when using a dict for ‘`parse_dates`’ in conjunction with the `index_col` argument, it’s best to specify `index_col` as a column label rather than as an index on the resulting frame.

---

### 24.1.9.2 Date Parsing Functions

Finally, the parser allows you to specify a custom `date_parser` function to take full advantage of the flexibility of the date parsing API:

```
In [105]: import pandas.io.date_converters as conv

In [106]: df = pd.read_csv('tmp.csv', header=None, parse_dates=date_spec,
.....:                    date_parser=conv.parse_date_time)
.....:

In [107]: df
Out[107]:
```

|   | nominal             | actual              | 0    | 4     |
|---|---------------------|---------------------|------|-------|
| 0 | 1999-01-27 19:00:00 | 1999-01-27 18:56:00 | KORD | 0.81  |
| 1 | 1999-01-27 20:00:00 | 1999-01-27 19:56:00 | KORD | 0.01  |
| 2 | 1999-01-27 21:00:00 | 1999-01-27 20:56:00 | KORD | -0.59 |
| 3 | 1999-01-27 21:00:00 | 1999-01-27 21:18:00 | KORD | -0.99 |
| 4 | 1999-01-27 22:00:00 | 1999-01-27 21:56:00 | KORD | -0.59 |
| 5 | 1999-01-27 23:00:00 | 1999-01-27 22:56:00 | KORD | -0.59 |

Pandas will try to call the `date_parser` function in three different ways. If an exception is raised, the next one is tried:

1. `date_parser` is first called with one or more arrays as arguments, as defined using *parse\_dates* (e.g., `date_parser(['2013', '2013'], ['1', '2'])`).
2. If #1 fails, `date_parser` is called with all the columns concatenated row-wise into a single array (e.g., `date_parser(['2013 1', '2013 2'])`).
3. If #2 fails, `date_parser` is called once for every row with one or more string arguments from the columns indicated with *parse\_dates* (e.g., `date_parser('2013', '1')` for the first row, `date_parser('2013', '2')` for the second, etc.).

Note that performance-wise, you should try these methods of parsing dates in order:

1. Try to infer the format using `infer_datetime_format=True` (see section below).
2. If you know the format, use `pd.to_datetime(): date_parser=lambda x: pd.to_datetime(x, format=...)`.
3. If you have a really non-standard format, use a custom `date_parser` function. For optimal performance, this should be vectorized, i.e., it should accept arrays as arguments.

You can explore the date parsing functionality in `date_converters.py` and add your own. We would love to turn this module into a community supported set of date/time parsers. To get you started, `date_converters.py` contains functions to parse dual date and time columns, year/month/day columns, and year/month/day/hour/minute/second columns. It also contains a `generic_parser` function so you can curry it with a function that deals with a single date rather than the entire array.

### 24.1.9.3 Inferring Datetime Format

If you have `parse_dates` enabled for some or all of your columns, and your datetime strings are all formatted the same way, you may get a large speed up by setting `infer_datetime_format=True`. If set, pandas will attempt to guess the format of your datetime strings, and then use a faster means of parsing the strings. 5-10x parsing speeds have been observed. pandas will fallback to the usual parsing if either the format cannot be guessed or the format that was guessed cannot properly parse the entire column of strings. So in general, `infer_datetime_format` should not have any negative consequences if enabled.

Here are some examples of datetime strings that can be guessed (All representing December 30th, 2011 at 00:00:00):

- “20111230”
- “2011/12/30”
- “20111230 00:00:00”
- “12/30/2011 00:00:00”
- “30/Dec/2011 00:00:00”
- “30/December/2011 00:00:00”

Note that `infer_datetime_format` is sensitive to `dayfirst`. With `dayfirst=True`, it will guess “01/12/2011” to be December 1st. With `dayfirst=False` (default) it will guess “01/12/2011” to be January 12th.

```
# Try to infer the format for the index column
In [108]: df = pd.read_csv('foo.csv', index_col=0, parse_dates=True,
.....:                    infer_datetime_format=True)
.....:

In [109]: df
Out[109]:
```

|            | A | B | C |
|------------|---|---|---|
| date       |   |   |   |
| 2009-01-01 | a | 1 | 2 |
| 2009-01-02 | b | 3 | 4 |
| 2009-01-03 | c | 4 | 5 |

#### 24.1.9.4 International Date Formats

While US date formats tend to be MM/DD/YYYY, many international formats use DD/MM/YYYY instead. For convenience, a `dayfirst` keyword is provided:

```
In [110]: print(open('tmp.csv').read())
date,value,cat
1/6/2000,5,a
2/6/2000,10,b
3/6/2000,15,c

In [111]: pd.read_csv('tmp.csv', parse_dates=[0])
Out[111]:
   date    value cat
0 2000-01-06      5  a
1 2000-02-06     10  b
2 2000-03-06     15  c

In [112]: pd.read_csv('tmp.csv', dayfirst=True, parse_dates=[0])
Out[112]:
   date    value cat
0 2000-06-01      5  a
1 2000-06-02     10  b
2 2000-06-03     15  c
```

### 24.1.10 Specifying method for floating-point conversion

The parameter `float_precision` can be specified in order to use a specific floating-point converter during parsing with the C engine. The options are the ordinary converter, the high-precision converter, and the round-trip converter (which is guaranteed to round-trip values after writing to a file). For example:

```
In [113]: val = '0.3066101993807095471566981359501369297504425048828125'

In [114]: data = 'a,b,c\n1,2,{0}'.format(val)

In [115]: abs(pd.read_csv(StringIO(data), engine='c', float_precision=None)['c'][0] -
↳ float(val))
Out[115]: 1.1102230246251565e-16

In [116]: abs(pd.read_csv(StringIO(data), engine='c', float_precision='high')['c'][0] -
↳ float(val))
Out[116]: 5.5511151231257827e-17

In [117]: abs(pd.read_csv(StringIO(data), engine='c', float_precision='round_trip')['c']
↳ [0] - float(val))
Out[117]: 0.0
```

### 24.1.11 Thousand Separators

For large numbers that have been written with a thousands separator, you can set the `thousands` keyword to a string of length 1 so that integers will be parsed correctly:

By default, numbers with a thousands separator will be parsed as strings:

```
In [118]: print(open('tmp.csv').read())
ID|level|category
Patient1|123,000|x
Patient2|23,000|y
Patient3|1,234,018|z

In [119]: df = pd.read_csv('tmp.csv', sep='|')

In [120]: df
Out[120]:
   ID    level category
0  Patient1   123,000      x
1  Patient2    23,000      y
2  Patient3  1,234,018      z

In [121]: df.level.dtype
Out[121]: dtype('O')
```

The `thousands` keyword allows integers to be parsed correctly:

```
In [122]: print(open('tmp.csv').read())
ID|level|category
Patient1|123,000|x
Patient2|23,000|y
Patient3|1,234,018|z
```

(continues on next page)

(continued from previous page)

```
In [123]: df = pd.read_csv('tmp.csv', sep='|', thousands=',')
```

```
In [124]: df
```

Out[124]:

|   | ID       | level   | category |
|---|----------|---------|----------|
| 0 | Patient1 | 123000  | x        |
| 1 | Patient2 | 23000   | y        |
| 2 | Patient3 | 1234018 | z        |

```
In [125]: df.level.dtype
```

```
dtype('int64')
```

### 24.1.12 NA Values

To control which values are parsed as missing values (which are signified by `NaN`), specify a string in `na_values`. If you specify a list of strings, then all values in it are considered to be missing values. If you specify a number (a `float`, like `5.0` or an `integer` like `5`), the corresponding equivalent values will also imply a missing value (in this case effectively `[5.0, 5]` are recognized as `NaN`).

To completely override the default values that are recognized as missing, specify `keep_default_na=False`.

The default NaN recognized values are ['-1.#IND', '1.#QNAN', '1.#IND', '-1.#QNAN', '#N/A N/A', '#N/A', 'N/A', 'n/a', 'NA', '#NA', 'NULL', 'null', 'NaN', '-NaN', 'nan', '-nan', ''].

Let us consider some examples:

```
read_csv(path, na_values=[5])
```

In the example above 5 and 5.0 will be recognized as NaN, in addition to the defaults. A string will first be interpreted as a numerical 5, then as a NaN.

```
read_csv(path, keep_default_na=False, na_values=[""])
```

Above, only an empty field will be recognized as NaN.

```
read_csv(path, keep_default_na=False, na_values=["NA", "0"])
```

Above, both NA and 0 as strings are NaN.

```
read_csv(path, na_values=["Nope"])
```

The default values, in addition to the string "Nope" are recognized as NaN.

### 24.1.13 Infinity

inf like values will be parsed as `np.inf` (positive infinity), and `-inf` as `-np.inf` (negative infinity). These will ignore the case of the value, meaning `Inf`, will also be parsed as `np.inf`.

### 24.1.14 Returning Series

Using the `squeeze` keyword, the parser will return output with a single column as a Series:

```

In [126]: print(open('tmp.csv').read())
level
Patient1,123000
Patient2,23000
Patient3,1234018

In [127]: output = pd.read_csv('tmp.csv', squeeze=True)

In [128]: output
Out[128]:
Patient1      123000
Patient2      23000
Patient3     1234018
Name: level, dtype: int64

In [129]: type(output)
////////////////////////////////////Out
↳pandas.core.series.Series

```

### 24.1.15 Boolean values

The common values `True`, `False`, `TRUE`, and `FALSE` are all recognized as boolean. Occasionally you might want to recognize other values as being boolean. To do this, use the `true_values` and `false_values` options as follows:

```

In [130]: data= 'a,b,c\n1,Yes,2\n3,No,4'

In [131]: print(data)
a,b,c
1,Yes,2
3,No,4

In [132]: pd.read_csv(StringIO(data))
Out[132]:
   a  b  c
0  1  Yes 2
1  3  No  4

In [133]: pd.read_csv(StringIO(data), true_values=['Yes'], false_values=['No'])
Out[133]:
   a    b  c
0  1  True 2
1  3 False 4

```

### 24.1.16 Handling “bad” lines

Some files may have malformed lines with too few fields or too many. Lines with too few fields will have NA values filled in the trailing fields. Lines with too many fields will raise an error by default:

```

In [27]: data = 'a,b,c\n1,2,3\n4,5,6,7\n8,9,10'

In [28]: pd.read_csv(StringIO(data))
-----
ParserError                                Traceback (most recent call last)
ParserError: Error tokenizing data. C error: Expected 3 fields in line 3, saw 4

```

You can elect to skip bad lines:

```
In [29]: pd.read_csv(StringIO(data), error_bad_lines=False)
Skipping line 3: expected 3 fields, saw 4

Out[29]:
   a  b  c
0  1  2  3
1  8  9 10
```

You can also use the `usecols` parameter to eliminate extraneous column data that appear in some lines but not others:

```
In [30]: pd.read_csv(StringIO(data), usecols=[0, 1, 2])

Out[30]:
   a  b  c
0  1  2  3
1  4  5  6
2  8  9 10
```

### 24.1.17 Dialect

The `dialect` keyword gives greater flexibility in specifying the file format. By default it uses the Excel dialect but you can specify either the dialect name or a `csv.Dialect` instance.

Suppose you had data with unenclosed quotes:

```
In [134]: print(data)
label1,label2,label3
index1,"a,c,e
index2,b,d,f
```

By default, `read_csv` uses the Excel dialect and treats the double quote as the quote character, which causes it to fail when it finds a newline before it finds the closing double quote.

We can get around this using `dialect`:

```
In [135]: dia = csv.excel()

In [136]: dia.quoting = csv.QUOTE_NONE

In [137]: pd.read_csv(StringIO(data), dialect=dia)
Out[137]:
      label1 label2 label3
index1      "a      c      e
index2      b      d      f
```

All of the dialect options can be specified separately by keyword arguments:

```
In [138]: data = 'a,b,c~1,2,3~4,5,6'

In [139]: pd.read_csv(StringIO(data), lineterminator='~')
Out[139]:
   a  b  c
0  1  2  3
1  4  5  6
```

Another common dialect option is `skipinitialspace`, to skip any whitespace after a delimiter:

```
In [140]: data = 'a, b, c\n1, 2, 3\n4, 5, 6'

In [141]: print(data)
a, b, c
1, 2, 3
4, 5, 6

In [142]: pd.read_csv(StringIO(data), skipinitialspace=True)
Out[142]:
   a  b  c
0  1  2  3
1  4  5  6
```

The parsers make every attempt to “do the right thing” and not be fragile. Type inference is a pretty big deal. If a column can be coerced to integer dtype without altering the contents, the parser will do so. Any non-numeric columns will come through as object dtype as with the rest of pandas objects.

### 24.1.18 Quoting and Escape Characters

Quotes (and other escape characters) in embedded fields can be handled in any number of ways. One way is to use backslashes; to properly parse this data, you should pass the `escapechar` option:

```
In [143]: data = 'a,b\n"hello, \\"Bob\\", nice to see you",5'

In [144]: print(data)
a,b
"hello, \\"Bob\\", nice to see you",5

In [145]: pd.read_csv(StringIO(data), escapechar='\\')
Out[145]:
```

|   | a                             | b |
|---|-------------------------------|---|
| 0 | hello, "Bob", nice to see you | 5 |

### 24.1.19 Files with Fixed Width Columns

While `read_csv()` reads delimited data, the `read_fwf()` function works with data files that have known and fixed column widths. The function parameters to `read_fwf` are largely the same as `read_csv` with two extra parameters, and a different usage of the `delimiter` parameter:

- **colspecs**: A list of pairs (tuples) giving the extents of the fixed-width fields of each line as half-open intervals (i.e., [from, to[ ). String value 'infer' can be used to instruct the parser to try detecting the column specifications from the first 100 rows of the data. Default behavior, if not specified, is to infer.
- **widths**: A list of field widths which can be used instead of 'colspecs' if the intervals are contiguous.
- **delimiter**: Characters to consider as filler characters in the fixed-width file. Can be used to specify the filler character of the fields if it is not spaces (e.g., '~').

Consider a typical fixed-width data file:

```
In [146]: print(open('bar.csv').read())
```

|        |            |            |         |
|--------|------------|------------|---------|
| id8141 | 360.242940 | 149.910199 | 11950.7 |
| id1594 | 444.953632 | 166.985655 | 11788.4 |
| id1849 | 364.136849 | 183.628767 | 11806.2 |
| id1230 | 413.836124 | 184.375703 | 11916.8 |
| id1948 | 502.953953 | 173.237159 | 12468.3 |

In order to parse this file into a DataFrame, we simply need to supply the column specifications to the `read_fwf` function along with the file name:

```
# Column specifications are a list of half-intervals
In [147]: colspecs = [(0, 6), (8, 20), (21, 33), (34, 43)]

In [148]: df = pd.read_fwf('bar.csv', colspecs=colspecs, header=None, index_col=0)

In [149]: df
Out[149]:
```

|        | 1          | 2          | 3       |
|--------|------------|------------|---------|
| 0      |            |            |         |
| id8141 | 360.242940 | 149.910199 | 11950.7 |
| id1594 | 444.953632 | 166.985655 | 11788.4 |
| id1849 | 364.136849 | 183.628767 | 11806.2 |
| id1230 | 413.836124 | 184.375703 | 11916.8 |
| id1948 | 502.953953 | 173.237159 | 12468.3 |

Note how the parser automatically picks column names `X.<column number>` when `header=None` argument is specified. Alternatively, you can supply just the column widths for contiguous columns:

```
# Widths are a list of integers
In [150]: widths = [6, 14, 13, 10]

In [151]: df = pd.read_fwf('bar.csv', widths=widths, header=None)

In [152]: df
Out[152]:
```

|   | 0      | 1          | 2          | 3       |
|---|--------|------------|------------|---------|
| 0 | id8141 | 360.242940 | 149.910199 | 11950.7 |
| 1 | id1594 | 444.953632 | 166.985655 | 11788.4 |
| 2 | id1849 | 364.136849 | 183.628767 | 11806.2 |
| 3 | id1230 | 413.836124 | 184.375703 | 11916.8 |
| 4 | id1948 | 502.953953 | 173.237159 | 12468.3 |

The parser will take care of extra white spaces around the columns so it's ok to have extra separation between the columns in the file.

By default, `read_fwf` will try to infer the file's `colspecs` by using the first 100 rows of the file. It can do it only in cases when the columns are aligned and correctly separated by the provided `delimiter` (default delimiter is whitespace).

```
In [153]: df = pd.read_fwf('bar.csv', header=None, index_col=0)

In [154]: df
Out[154]:
```

|        | 1          | 2          | 3       |
|--------|------------|------------|---------|
| 0      |            |            |         |
| id8141 | 360.242940 | 149.910199 | 11950.7 |
| id1594 | 444.953632 | 166.985655 | 11788.4 |
| id1849 | 364.136849 | 183.628767 | 11806.2 |
| id1230 | 413.836124 | 184.375703 | 11916.8 |
| id1948 | 502.953953 | 173.237159 | 12468.3 |

New in version 0.20.0.

`read_fwf` supports the `dtype` parameter for specifying the types of parsed columns to be different from the inferred type.

```
In [155]: pd.read_fwf('bar.csv', header=None, index_col=0).dtypes
Out[155]:
1    float64
2    float64
3    float64
dtype: object

In [156]: pd.read_fwf('bar.csv', header=None, dtype={2: 'object'}).dtypes
Out[156]:
0    object
1    float64
2    object
3    float64
dtype: object
```

## 24.1.20 Indexes

### 24.1.20.1 Files with an “implicit” index column

Consider a file with one less entry in the header than the number of data column:

```
In [157]: print(open('foo.csv').read())
A,B,C
20090101,a,1,2
20090102,b,3,4
20090103,c,4,5
```

In this special case, `read_csv` assumes that the first column is to be used as the index of the `DataFrame`:

```
In [158]: pd.read_csv('foo.csv')
Out[158]:
      A  B  C
20090101  a  1  2
20090102  b  3  4
20090103  c  4  5
```

Note that the dates weren’t automatically parsed. In that case you would need to do as before:

```
In [159]: df = pd.read_csv('foo.csv', parse_dates=True)

In [160]: df.index
Out[160]: DatetimeIndex(['2009-01-01', '2009-01-02', '2009-01-03'], dtype=
    <object> 'datetime64[ns]', freq=None)
```

### 24.1.20.2 Reading an index with a `MultiIndex`

Suppose you have data indexed by two columns:

```
In [161]: print(open('data/minindex_ex.csv').read())
year, indiv, zit, xit
1977, "A", 1.2, .6
1977, "B", 1.5, .5
1977, "C", 1.7, .8
1978, "A", .2, .06
```

(continues on next page)

(continued from previous page)

```

1978, "B", .7, .2
1978, "C", .8, .3
1978, "D", .9, .5
1978, "E", 1.4, .9
1979, "C", .2, .15
1979, "D", .14, .05
1979, "E", .5, .15
1979, "F", 1.2, .5
1979, "G", 3.4, 1.9
1979, "H", 5.4, 2.7
1979, "I", 6.4, 1.2

```

The `index_col` argument to `read_csv` and `read_table` can take a list of column numbers to turn multiple columns into a `MultiIndex` for the index of the returned object:

```
In [162]: df = pd.read_csv("data/minindex_ex.csv", index_col=[0,1])
```

```
In [163]: df
```

```
Out[163]:
```

|      |       | zit  | xit  |
|------|-------|------|------|
| year | indiv |      |      |
| 1977 | A     | 1.20 | 0.60 |
|      | B     | 1.50 | 0.50 |
|      | C     | 1.70 | 0.80 |
| 1978 | A     | 0.20 | 0.06 |
|      | B     | 0.70 | 0.20 |
|      | C     | 0.80 | 0.30 |
|      | D     | 0.90 | 0.50 |
|      | E     | 1.40 | 0.90 |
| 1979 | C     | 0.20 | 0.15 |
|      | D     | 0.14 | 0.05 |
|      | E     | 0.50 | 0.15 |
|      | F     | 1.20 | 0.50 |
|      | G     | 3.40 | 1.90 |
|      | H     | 5.40 | 2.70 |
|      | I     | 6.40 | 1.20 |

```
In [164]: df.loc[1978]
```

```

////////////////////////////////////
↪
      zit    xit
indiv
A      0.2  0.06
B      0.7  0.20
C      0.8  0.30
D      0.9  0.50
E      1.4  0.90

```

### 24.1.20.3 Reading columns with a `MultiIndex`

By specifying list of row locations for the `header` argument, you can read in a `MultiIndex` for the columns. Specifying non-consecutive rows will skip the intervening rows.

```
In [165]: from pandas.util.testing import makeCustomDataframe as mkdf
```

(continues on next page)

(continued from previous page)

```
In [166]: df = mkdf(5, 3, r_idx_nlevels=2, c_idx_nlevels=4)
```

```
In [167]: df.to_csv('mi.csv')
```

```
In [168]: print(open('mi.csv').read())
```

```
C0,,C_l0_g0,C_l0_g1,C_l0_g2
C1,,C_l1_g0,C_l1_g1,C_l1_g2
C2,,C_l2_g0,C_l2_g1,C_l2_g2
C3,,C_l3_g0,C_l3_g1,C_l3_g2
R0,R1,,,
R_l0_g0,R_l1_g0,R0C0,R0C1,R0C2
R_l0_g1,R_l1_g1,R1C0,R1C1,R1C2
R_l0_g2,R_l1_g2,R2C0,R2C1,R2C2
R_l0_g3,R_l1_g3,R3C0,R3C1,R3C2
R_l0_g4,R_l1_g4,R4C0,R4C1,R4C2
```

```
In [169]: pd.read_csv('mi.csv', header=[0, 1, 2, 3], index_col=[0, 1])
```

|         |         |         |         |         |
|---------|---------|---------|---------|---------|
|         |         |         |         |         |
| C0      |         | C_l0_g0 | C_l0_g1 | C_l0_g2 |
| C1      |         | C_l1_g0 | C_l1_g1 | C_l1_g2 |
| C2      |         | C_l2_g0 | C_l2_g1 | C_l2_g2 |
| C3      |         | C_l3_g0 | C_l3_g1 | C_l3_g2 |
| R0      | R1      |         |         |         |
| R_l0_g0 | R_l1_g0 | R0C0    | R0C1    | R0C2    |
| R_l0_g1 | R_l1_g1 | R1C0    | R1C1    | R1C2    |
| R_l0_g2 | R_l1_g2 | R2C0    | R2C1    | R2C2    |
| R_l0_g3 | R_l1_g3 | R3C0    | R3C1    | R3C2    |
| R_l0_g4 | R_l1_g4 | R4C0    | R4C1    | R4C2    |

`read_csv` is also able to interpret a more common format of multi-columns indices.

```
In [170]: print(open('mi2.csv').read())
```

```
,a,a,a,b,c,c
,q,r,s,t,u,v
one,1,2,3,4,5,6
two,7,8,9,10,11,12
```

```
In [171]: pd.read_csv('mi2.csv', header=[0, 1], index_col=0)
```

```

Out [171]:
      a      b      c
q  r  s  t  u  v
one 1 2 3 4 5 6
two 7 8 9 10 11 12

```

Note: If an `index_col` is not specified (e.g. you don't have an index, or wrote it with `df.to_csv(..., index=False)`), then any names on the columns index will be *lost*.

### 24.1.21 Automatically “sniffing” the delimiter

`read_csv` is capable of inferring delimited (not necessarily comma-separated) files, as `pandas` uses the `csv.Sniffer` class of the `csv` module. For this, you have to specify `sep=None`.

```
In [172]: print(open('tmp2.csv').read())
:0:1:2:3
0:0.4691122999071863:-0.2828633443286633:-1.5090585031735124:-1.1356323710171934

## 24.1.22 Reading multiple files to create a single DataFrame

It's best to use `concat()` to combine multiple files. See the [cookbook](#) for an example.

## 24.1.23 Iterating through files chunk by chunk

Suppose you wish to iterate through a (potentially very large) file lazily rather than reading the entire file into memory, such as the following:

```
In [174]: print(open('tmp.csv').read())
|0|1|2|3
0|0.4691122999071863|-0.2828633443286633|-1.5090585031735124|-1.1356323710171934
1|1.2121120250208506|-0.17321464905330858|0.11920871129693428|-1.0442359662799567
2|-0.8618489633477999|-2.1045692188948086|-0.4949292740687813|1.071803807037338
3|0.7215551622443669|-0.7067711336300845|-1.0395749851146963|0.27185988554282986
4|-0.42497232978883753|0.567020349793672|0.27623201927771873|-1.0874006912859915
5|-0.6736897080883706|0.1136484096888855|-1.4784265524372235|0.5249876671147047

```

```
In [175]: table = pd.read_table('tmp.csv', sep='|')
```

(continues on next page)

### 24.1.24 Specifying the parser engine

Under the hood pandas uses a fast and efficient parser implemented in C as well as a Python implementation which is currently more feature-complete. Where possible pandas uses the C parser (specified as `engine='c'`), but may fall back to Python if C-unsupported options are specified. Currently, C-unsupported options include:

- `sep` other than a single character (e.g. regex separators)
- `skipfooter`
- `sep=None` with `delim_whitespace=False`

Specifying any of the above options will produce a `ParserWarning` unless the python engine is selected explicitly using `engine='python'`.

### 24.1.25 Reading remote files

You can pass in a URL to a CSV file:

```
df = pd.read_csv('https://download.bls.gov/pub/time.series/cu/cu.item',
                 sep='\t')
```

S3 URLs are handled as well:

```
df = pd.read_csv('s3://pandas-test/tips.csv')
```

### 24.1.26 Writing out Data

#### 24.1.26.1 Writing to CSV format

The `Series` and `DataFrame` objects have an instance method `to_csv` which allows storing the contents of the object as a comma-separated-values file. The function takes a number of arguments. Only the first is required.

- `path_or_buf`: A string path to the file to write or a `StringIO`
- `sep`: Field delimiter for the output file (default `“,”`)
- `na_rep`: A string representation of a missing value (default `“”`)
- `float_format`: Format string for floating point numbers
- `cols`: Columns to write (default `None`)
- `header`: Whether to write out the column names (default `True`)
- `index`: whether to write row (index) names (default `True`)
- `index_label`: Column label(s) for index column(s) if desired. If `None` (default), and `header` and `index` are `True`, then the index names are used. (A sequence should be given if the `DataFrame` uses `MultiIndex`).
- `mode`: Python write mode, default `“w”`
- `encoding`: a string representing the encoding to use if the contents are non-ASCII, for Python versions prior to 3
- `line_terminator`: Character sequence denoting line end (default `“\n”`)
- `quoting`: Set quoting rules as in `csv` module (default `csv.QUOTE_MINIMAL`). Note that if you have set a `float_format` then floats are converted to strings and `csv.QUOTE_NONNUMERIC` will treat them as non-numeric

- `quotechar`: Character used to quote fields (default `'`)
- `doublequote`: Control quoting of `quotechar` in fields (default `True`)
- `escapechar`: Character used to escape `sep` and `quotechar` when appropriate (default `None`)
- `chunksize`: Number of rows to write at a time
- `tupleize_cols`: If `False` (default), write as a list of tuples, otherwise write in an expanded line format suitable for `read_csv`
- `date_format`: Format string for datetime objects

#### 24.1.26.2 Writing a formatted string

The `DataFrame` object has an instance method `to_string` which allows control over the string representation of the object. All arguments are optional:

- `buf` default `None`, for example a `StringIO` object
- `columns` default `None`, which columns to write
- `col_space` default `None`, minimum width of each column.
- `na_rep` default `NaN`, representation of NA value
- `formatters` default `None`, a dictionary (by column) of functions each of which takes a single argument and returns a formatted string
- `float_format` default `None`, a function which takes a single (float) argument and returns a formatted string; to be applied to floats in the `DataFrame`.
- `sparsify` default `True`, set to `False` for a `DataFrame` with a hierarchical index to print every multiindex key at each row.
- `index_names` default `True`, will print the names of the indices
- `index` default `True`, will print the index (ie, row labels)
- `header` default `True`, will print the column labels
- `justify` default `left`, will print column headers left- or right-justified

The `Series` object also has a `to_string` method, but with only the `buf`, `na_rep`, `float_format` arguments. There is also a `length` argument which, if set to `True`, will additionally output the length of the `Series`.

## 24.2 JSON

Read and write JSON format files and strings.

### 24.2.1 Writing JSON

A `Series` or `DataFrame` can be converted to a valid JSON string. Use `to_json` with optional parameters:

- `path_or_buf`: the pathname or buffer to write the output This can be `None` in which case a JSON string is returned
- `orient`:  
**Series:**

- default is index
- allowed values are {split, records, index}

**DataFrame:**

- default is columns
- allowed values are {split, records, index, columns, values, table}

The format of the JSON string

|         |  |
|---------|--|
| split   | dict like {index -> [index], columns -> [columns], data -> [values]} |
| records | list like [{column -> value}, ... , {column -> value}]               |
| index   | dict like {index -> {column -> value}}                               |
| columns | dict like {column -> {index -> value}}                               |
| values  | just the values array  |

- `date_format`: string, type of date conversion, 'epoch' for timestamp, 'iso' for ISO8601.
- `double_precision`: The number of decimal places to use when encoding floating point values, default 10.
- `force_ascii`: force encoded string to be ASCII, default True.
- `date_unit`: The time unit to encode to, governs timestamp and ISO8601 precision. One of 's', 'ms', 'us' or 'ns' for seconds, milliseconds, microseconds and nanoseconds respectively. Default 'ms'.
- `default_handler`: The handler to call if an object cannot otherwise be converted to a suitable format for JSON. Takes a single argument, which is the object to convert, and returns a serializable object.
- `lines`: If records orient, then will write each record per line as json.

Note NaN's, NaT's and None will be converted to null and datetime objects will be converted based on the `date_format` and `date_unit` parameters.

```
In [182]: dfj = pd.DataFrame(randn(5, 2), columns=list('AB'))

In [183]: json = dfj.to_json()

In [184]: json
Out[184]: '{"A":{"0":-1.2945235903,"1":0.2766617129,"2":-0.0139597524,"3":-0.
↪0061535699,"4":0.8957173022},"B":{"0":0.4137381054,"1":-0.472034511,"2":-0.
↪3625429925,"3":-0.923060654,"4":0.8052440254}}'
```

### 24.2.1.1 Orient Options

There are a number of different options for the format of the resulting JSON file / string. Consider the following DataFrame and Series:

```
In [185]: dfjo = pd.DataFrame(dict(A=range(1, 4), B=range(4, 7), C=range(7, 10)),
.....:                          columns=list('ABC'), index=list('xyz'))
.....:

In [186]: dfjo
Out[186]:
   A  B  C
x  1  4  7
y  2  5  8
z  3  6  9
```

(continues on next page)

(continued from previous page)

```
In [187]: sjo = pd.Series(dict(x=15, y=16, z=17), name='D')

In [188]: sjo
Out[188]:
x      15
y      16
z      17
Name: D, dtype: int64
```

**Column oriented** (the default for DataFrame) serializes the data as nested JSON objects with column labels acting as the primary index:

```
In [189]: dfjo.to_json(orient="columns")
Out[189]: '{"A":{"x":1,"y":2,"z":3},"B":{"x":4,"y":5,"z":6},"C":{"x":7,"y":8,"z":9}}'

# Not available for Series
```

**Index oriented** (the default for Series) similar to column oriented but the index labels are now primary:

```
In [190]: dfjo.to_json(orient="index")
Out[190]: '{"x":{"A":1,"B":4,"C":7},"y":{"A":2,"B":5,"C":8},"z":{"A":3,"B":6,"C":9}}'

In [191]: sjo.to_json(orient="index")
Out[191]:
\\Out[191]:
↪ '{"x":15,"y":16,"z":17}'
```

**Record oriented** serializes the data to a JSON array of column -> value records, index labels are not included. This is useful for passing DataFrame data to plotting libraries, for example the JavaScript library d3.js:

```
In [192]: dfjo.to_json(orient="records")
Out[192]: '[{"A":1,"B":4,"C":7}, {"A":2,"B":5,"C":8}, {"A":3,"B":6,"C":9}]'

In [193]: sjo.to_json(orient="records")
Out[193]:
↪ '[15,16,17]'
```

**Value oriented** is a bare-bones option which serializes to nested JSON arrays of values only, column and index labels are not included:

```
In [194]: dfjo.to_json(orient="values")
Out[194]: '[[1,4,7],[2,5,8],[3,6,9]]'

# Not available for Series
```

**Split oriented** serializes to a JSON object containing separate entries for values, index and columns. Name is also included for Series:

```
In [195]: dfjo.to_json(orient="split")
Out[195]: '{"columns":["A","B","C"],"index":["x","y","z"],"data":[[1,4,7],[2,5,8],[3,6,9]]}'

In [196]: sjo.to_json(orient="split")
Out[196]:
↪ '{"name":"D","index":["x","y","z"],"data":[15,16,17]}'
```

**Table oriented** serializes to the JSON [Table Schema](#), allowing for the preservation of metadata including but not limited to dtypes and index names.

---

**Note:** Any orient option that encodes to a JSON object will not preserve the ordering of index and column labels during round-trip serialization. If you wish to preserve label ordering use the *split* option as it uses ordered containers.

---

### 24.2.1.2 Date Handling

Writing in ISO date format:

```
In [197]: dfd = pd.DataFrame(randn(5, 2), columns=list('AB'))

In [198]: dfd['date'] = pd.Timestamp('20130101')

In [199]: dfd = dfd.sort_index(1, ascending=False)

In [200]: json = dfd.to_json(date_format='iso')

In [201]: json
Out[201]: '{"date":{"0":"2013-01-01T00:00:00.000Z","1":"2013-01-01T00:00:00.000Z","2":
↪ "2013-01-01T00:00:00.000Z","3":"2013-01-01T00:00:00.000Z","4":"2013-01-01T00:00:00.
↪ 000Z"},"B":{"0":2.5656459463,"1":1.3403088498,"2":-0.2261692849,"3":0.8138502857,"4
↪":-0.8273169356},"A":{"0":-1.2064117817,"1":1.4312559863,"2":-1.1702987971,"3":0.
↪ 4108345112,"4":0.1320031703}}'
```

Writing in ISO date format, with microseconds:

```
In [202]: json = dfd.to_json(date_format='iso', date_unit='us')

In [203]: json
Out[203]: '{"date":{"0":"2013-01-01T00:00:00.000000Z","1":"2013-01-01T00:00:00.000000Z
↪","2":"2013-01-01T00:00:00.000000Z","3":"2013-01-01T00:00:00.000000Z","4":"2013-01-
↪ 01T00:00:00.000000Z"},"B":{"0":2.5656459463,"1":1.3403088498,"2":-0.2261692849,"3
↪":0.8138502857,"4":-0.8273169356},"A":{"0":-1.2064117817,"1":1.4312559863,"2":-1.
↪ 1702987971,"3":0.4108345112,"4":0.1320031703}}'
```

Epoch timestamps, in seconds:

```
In [204]: json = dfd.to_json(date_format='epoch', date_unit='s')

In [205]: json
Out[205]: '{"date":{"0":1356998400,"1":1356998400,"2":1356998400,"3":1356998400,"4
↪":1356998400},"B":{"0":2.5656459463,"1":1.3403088498,"2":-0.2261692849,"3":0.
↪ 8138502857,"4":-0.8273169356},"A":{"0":-1.2064117817,"1":1.4312559863,"2":-1.
↪ 1702987971,"3":0.4108345112,"4":0.1320031703}}'
```

Writing to a file, with a date index and a date column:

```
In [206]: dfj2 = dfj.copy()

In [207]: dfj2['date'] = pd.Timestamp('20130101')

In [208]: dfj2['ints'] = list(range(5))

In [209]: dfj2['bools'] = True
```

(continues on next page)

(continued from previous page)

```

In [210]: dfj2.index = pd.date_range('20130101', periods=5)

In [211]: dfj2.to_json('test.json')

In [212]: open('test.json').read()
Out[212]: '{"A":{"1356998400000":-1.2945235903,"1357084800000":0.2766617129,
↪ "1357171200000":-0.0139597524,"1357257600000":-0.0061535699,"1357344000000":0.
↪ 8957173022},"B":{"1356998400000":0.4137381054,"1357084800000":-0.472034511,
↪ "1357171200000":-0.3625429925,"1357257600000":-0.923060654,"1357344000000":0.
↪ 8052440254},"date":{"1356998400000":1356998400000,"1357084800000":1356998400000,
↪ "1357171200000":1356998400000,"1357257600000":1356998400000,"1357344000000
↪ ":1356998400000},"ints":{"1356998400000":0,"1357084800000":1,"1357171200000":2,
↪ "1357257600000":3,"1357344000000":4},"bools":{"1356998400000":true,"1357084800000
↪ ":true,"1357171200000":true,"1357257600000":true,"1357344000000":true}}'

```

### 24.2.1.3 Fallback Behavior

If the JSON serializer cannot handle the container contents directly it will fall back in the following manner:

- if the dtype is unsupported (e.g. `np.complex`) then the `default_handler`, if provided, will be called for each value, otherwise an exception is raised.
- if an object is unsupported it will attempt the following:
  - check if the object has defined a `toDict` method and call it. A `toDict` method should return a dict which will then be JSON serialized.
  - invoke the `default_handler` if one was provided.
  - convert the object to a dict by traversing its contents. However this will often fail with an `OverflowError` or give unexpected results.

In general the best approach for unsupported objects or dtypes is to provide a `default_handler`. For example:

```

DataFrame([1.0, 2.0, complex(1.0, 2.0)]).to_json() # raises

RuntimeError: Unhandled numpy dtype 15

```

can be dealt with by specifying a simple `default_handler`:

```

In [213]: pd.DataFrame([1.0, 2.0, complex(1.0, 2.0)]).to_json(default_handler=str)
Out[213]: '{"0":{"0":"(1+0j)","1":"(2+0j)","2":"(1+2j)"}'

```

## 24.2.2 Reading JSON

Reading a JSON string to pandas object can take a number of parameters. The parser will try to parse a `DataFrame` if `typ` is not supplied or is `None`. To explicitly force `Series` parsing, pass `typ=series`

- `filepath_or_buffer`: a **VALID** JSON string or file handle / `StringIO`. The string could be a URL. Valid URL schemes include `http`, `ftp`, `S3`, and `file`. For file URLs, a host is expected. For instance, a local file could be `file://localhost/path/to/table.json`
- `typ`: type of object to recover (series or frame), default 'frame'
- `orient`:

**Series :**

- default is `index`
- allowed values are `{split, records, index}`

**DataFrame**

- default is `columns`
- allowed values are `{split, records, index, columns, values, table}`

The format of the JSON string

|                      |  |
|----------------------|--|
| <code>split</code>   | dict like <code>{index -&gt; [index], columns -&gt; [columns], data -&gt; [values]}</code> |
| <code>records</code> | list like <code>[{column -&gt; value}, ... , {column -&gt; value}]</code>                  |
| <code>index</code>   | dict like <code>{index -&gt; {column -&gt; value}}</code>                                  |
| <code>columns</code> | dict like <code>{column -&gt; {index -&gt; value}}</code>                                  |
| <code>values</code>  | just the values array  |
| <code>table</code>   | adhering to the JSON <a href="#">Table Schema</a>  |

- `dtype` : if `True`, infer dtypes, if a dict of column to dtype, then use those, if `False`, then don't infer dtypes at all, default is `True`, apply only to the data.
- `convert_axes` : boolean, try to convert the axes to the proper dtypes, default is `True`
- `convert_dates` : a list of columns to parse for dates; If `True`, then try to parse date-like columns, default is `True`.
- `keep_default_dates` : boolean, default `True`. If parsing dates, then parse the default date-like columns.
- `numpy` : direct decoding to NumPy arrays. default is `False`; Supports numeric data only, although labels may be non-numeric. Also note that the JSON ordering **MUST** be the same for each term if `numpy=True`.
- `precise_float` : boolean, default `False`. Set to enable usage of higher precision (`strtod`) function when decoding string to double values. Default (`False`) is to use fast but less precise builtin functionality.
- `date_unit` : string, the timestamp unit to detect if converting dates. Default `None`. By default the timestamp precision will be detected, if this is not desired then pass one of `'s'`, `'ms'`, `'us'` or `'ns'` to force timestamp precision to seconds, milliseconds, microseconds or nanoseconds respectively.
- `lines` : reads file as one json object per line.
- `encoding` : The encoding to use to decode py3 bytes.
- `chunksize` : when used in combination with `lines=True`, return a `JsonReader` which reads in `chunksize` lines per iteration.

The parser will raise one of `ValueError/TypeError/AssertionError` if the JSON is not parseable.

If a non-default `orient` was used when encoding to JSON be sure to pass the same option here so that decoding produces sensible results, see [Orient Options](#) for an overview.

### 24.2.2.1 Data Conversion

The default of `convert_axes=True`, `dtype=True`, and `convert_dates=True` will try to parse the axes, and all of the data into appropriate types, including dates. If you need to override specific dtypes, pass a dict to `dtype`. `convert_axes` should only be set to `False` if you need to preserve string-like numbers (e.g. `'1'`, `'2'`) in an axes.

**Note:** Large integer values may be converted to dates if `convert_dates=True` and the data and / or column labels appear ‘date-like’. The exact threshold depends on the `date_unit` specified. ‘date-like’ means that the column label meets one of the following criteria:

- it ends with ‘\_at’
- it ends with ‘\_time’
- it begins with ‘timestamp’
- it is ‘modified’
- it is ‘date’

**Warning:** When reading JSON data, automatic coercing into dtypes has some quirks:

- an index can be reconstructed in a different order from serialization, that is, the returned order is not guaranteed to be the same as before serialization
- a column that was `float` data will be converted to `integer` if it can be done safely, e.g. a column of 1.
- `bool` columns will be converted to `integer` on reconstruction

Thus there are times where you may want to specify specific dtypes via the `dtype` keyword argument.

Reading from a JSON string:

```
In [214]: pd.read_json(json)
```

```
Out [214]:
```

|   | date       | B         | A         |
|---|------------|-----------|-----------|
| 0 | 2013-01-01 | 2.565646  | -1.206412 |
| 1 | 2013-01-01 | 1.340309  | 1.431256  |
| 2 | 2013-01-01 | -0.226169 | -1.170299 |
| 3 | 2013-01-01 | 0.813850  | 0.410835  |
| 4 | 2013-01-01 | -0.827317 | 0.132003  |

Reading from a file:

```
In [215]: pd.read_json('test.json')
```

```
Out [215]:
```

|            | A         | B         | date       | ints | bools |
|------------|-----------|-----------|------------|------|-------|
| 2013-01-01 | -1.294524 | 0.413738  | 2013-01-01 | 0    | True  |
| 2013-01-02 | 0.276662  | -0.472035 | 2013-01-01 | 1    | True  |
| 2013-01-03 | -0.013960 | -0.362543 | 2013-01-01 | 2    | True  |
| 2013-01-04 | -0.006154 | -0.923061 | 2013-01-01 | 3    | True  |
| 2013-01-05 | 0.895717  | 0.805244  | 2013-01-01 | 4    | True  |

Don’t convert any data (but still convert axes and dates):

```
In [216]: pd.read_json('test.json', dtype=object).dtypes
```

```
Out [216]:
```

```
A      object
B      object
date    object
ints    object
bools   object
dtype: object
```

Specify dtypes for conversion:

```
In [217]: pd.read_json('test.json', dtype={'A': 'float32', 'bools': 'int8'}).dtypes
Out[217]:
A                float32
B                float64
date            datetime64[ns]

#### 24.2.2.2 The Numpy Parameter

---

**Note:** This supports numeric data only. Index and columns labels may be non-numeric, e.g. strings, dates etc.

---

If `numpy=True` is passed to `read_json` an attempt will be made to sniff an appropriate dtype during deserialization and to subsequently decode directly to NumPy arrays, bypassing the need for intermediate Python objects.

This can provide speedups if you are deserialising a large amount of numeric data:

```
In [234]: randfloats = np.random.uniform(-100, 1000, 10000)

In [235]: randfloats.shape = (1000, 10)

In [236]: dffloats = pd.DataFrame(randfloats, columns=list('ABCDEFGHIJ'))

In [237]: jsonfloats = dffloats.to_json()
```

```
In [238]: timeit pd.read_json(jsonfloats)
8.6 ms +- 165 us per loop (mean +- std. dev. of 7 runs, 100 loops each)
```

```
In [239]: timeit pd.read_json(jsonfloats, numpy=True)
6.39 ms +- 289 us per loop (mean +- std. dev. of 7 runs, 100 loops each)
```

The speedup is less noticeable for smaller datasets:

```
In [240]: jsonfloats = dffloats.head(100).to_json()
```

```
In [241]: timeit pd.read_json(jsonfloats)
6.05 ms +- 793 us per loop (mean +- std. dev. of 7 runs, 100 loops each)
```

```
In [242]: timeit pd.read_json(jsonfloats, numpy=True)
4.72 ms +- 159 us per loop (mean +- std. dev. of 7 runs, 100 loops each)
```

**Warning:** Direct NumPy decoding makes a number of assumptions and may fail or produce unexpected output if these assumptions are not satisfied:

- data is numeric.
- data is uniform. The dtype is sniffed from the first value decoded. A `ValueError` may be raised, or incorrect output may be produced if this condition is not satisfied.
- labels are ordered. Labels are only read from the first container, it is assumed that each subsequent row / column has been encoded in the same order. This should be satisfied if the data was encoded using `to_json` but may not be the case if the JSON is from another source.

### 24.2.3 Normalization

pandas provides a utility function to take a dict or list of dicts and *normalize* this semi-structured data into a flat table.

```
In [243]: from pandas.io.json import json_normalize
```

```
In [244]: data = [{'id': 1, 'name': {'first': 'Coleen', 'last': 'Volk'}},
.....:           {'name': {'given': 'Mose', 'family': 'Regner'}},
.....:           {'id': 2, 'name': 'Faye Raker'}]
.....:
```

```
In [245]: json_normalize(data)
```

```
Out[245]:
```

|   | id  | name       | name.family | name.first | name.given | name.last |
|---|-----|------------|-------------|------------|------------|-----------|
| 0 | 1.0 | NaN        | NaN         | Coleen     | NaN        | Volk      |
| 1 | NaN | NaN        | Regner      | NaN        | Mose       | NaN       |
| 2 | 2.0 | Faye Raker | NaN         | NaN        | NaN        | NaN       |

```
In [246]: data = [{'state': 'Florida',
.....:             'shortname': 'FL',
.....:             'info': {
.....:                 'governor': 'Rick Scott'
.....:             }},
.....:             {'counties': [{'name': 'Dade', 'population': 12345},
.....:                           {'name': 'Broward', 'population': 40000},
```

(continues on next page)

(continued from previous page)

```

.....:         {'name': 'Palm Beach', 'population': 60000}}],
.....:     {'state': 'Ohio',
.....:      'shortname': 'OH',
.....:      'info': {
.....:          'governor': 'John Kasich'
.....:      }},
.....:     'counties': [{'name': 'Summit', 'population': 1234},
.....:                  {'name': 'Cuyahoga', 'population': 1337}]]]
.....:
In [247]: json_normalize(data, 'counties', ['state', 'shortname', ['info', 'governor
↪']])
Out[247]:

```

|   | name       | population | state   | shortname | info.governor |
|---|------------|------------|---------|-----------|---------------|
| 0 | Dade       | 12345      | Florida | FL        | Rick Scott    |
| 1 | Broward    | 40000      | Florida | FL        | Rick Scott    |
| 2 | Palm Beach | 60000      | Florida | FL        | Rick Scott    |
| 3 | Summit     | 1234       | Ohio    | OH        | John Kasich   |
| 4 | Cuyahoga   | 1337       | Ohio    | OH        | John Kasich   |

## 24.2.4 Line delimited json

New in version 0.19.0.

pandas is able to read and write line-delimited json files that are common in data processing pipelines using Hadoop or Spark.

New in version 0.21.0.

For line-delimited json files, pandas can also return an iterator which reads in `chunksize` lines at a time. This can be useful for large files or to read from a stream.

```

In [248]: jsonl = '''
.....:     {"a": 1, "b": 2}
.....:     {"a": 3, "b": 4}
.....: '''
.....:

In [249]: df = pd.read_json(jsonl, lines=True)

In [250]: df
Out[250]:
   a  b
0  1  2
1  3  4

In [251]: df.to_json(orient='records', lines=True)
Out[251]: '{"a":1,"b":2}\n{"a":3,"b":4}'

# reader is an iterator that returns `chunksize` lines each iteration
In [252]: reader = pd.read_json(StringIO(jsonl), lines=True, chunksize=1)

In [253]: reader
Out[253]: <pandas.io.json.json.JsonReader at 0x1c3049f208>

In [254]: for chunk in reader:

```

(continues on next page)

(continued from previous page)

```
.....: print(chunk)
.....:
////////////////////////////////////\Empty DataFrame
Columns: []
Index: []
   a  b
0  1  2
   a  b
1  3  4
```

### 24.2.5 Table Schema

New in version 0.20.0.

**Table Schema** is a spec for describing tabular datasets as a JSON object. The JSON includes information on the field names, types, and other attributes. You can use the `orient table` to build a JSON string with two fields, `schema` and `data`.

```
In [255]: df = pd.DataFrame(
.....:     {'A': [1, 2, 3],
.....:      'B': ['a', 'b', 'c'],
.....:      'C': pd.date_range('2016-01-01', freq='d', periods=3),
.....:     }, index=pd.Index(range(3), name='idx'))
```

```
In [256]: df
```

```
Out [256]:
```

|     | A | B | C          |
|-----|---|---|------------|
| idx |   |   |            |
| 0   | 1 | a | 2016-01-01 |
| 1   | 2 | b | 2016-01-02 |
| 2   | 3 | c | 2016-01-03 |

```
In [257]: df.to_json(orient='table', date_format="iso")
\\////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////\\
↪ '{"schema": {"fields": [{"name": "idx", "type": "integer"}, {"name": "A", "type": "integer"}
↪ , {"name": "B", "type": "string"}, {"name": "C", "type": "datetime"}], "primaryKey": ["idx"],
↪ "pandas_version": "0.20.0"}, "data": [{"idx": 0, "A": 1, "B": "a", "C": "2016-01-
↪ 01T00:00:00.000Z"}, {"idx": 1, "A": 2, "B": "b", "C": "2016-01-02T00:00:00.000Z"}, {"idx": 2,
↪ "A": 3, "B": "c", "C": "2016-01-03T00:00:00.000Z"}]}'
```

The `schema` field contains the `fields` key, which itself contains a list of column name to type pairs, including the `Index` or `MultiIndex` (see below for a list of types). The `schema` field also contains a `primaryKey` field if the (Multi)index is unique.

The second field, `data`, contains the serialized data with the `records` orient. The index is included, and any datetimes are ISO 8601 formatted, as required by the Table Schema spec.

The full list of types supported are described in the Table Schema spec. This table shows the mapping from pandas types:

| Pandas type     | Table Schema type |
|-----------------|-------------------|
| int64           | integer           |
| float64         | number            |
| bool            | boolean           |
| datetime64[ns]  | datetime          |
| timedelta64[ns] | duration          |
| categorical     | any               |
| object          | str               |

A few notes on the generated table schema:

- The `schema` object contains a `pandas_version` field. This contains the version of pandas' dialect of the schema, and will be incremented with each revision.
- All dates are converted to UTC when serializing. Even timezone naïve values, which are treated as UTC with an offset of 0.

```
In [258]: from pandas.io.json import build_table_schema

In [259]: s = pd.Series(pd.date_range('2016', periods=4))

In [260]: build_table_schema(s)
Out[260]:
{'fields': [{'name': 'index', 'type': 'integer'},
             {'name': 'values', 'type': 'datetime'}],
 'primaryKey': ['index'],
 'pandas_version': '0.20.0'}
```

- datetimes with a timezone (before serializing), include an additional field `tz` with the time zone name (e.g. 'US/Central').

```
In [261]: s_tz = pd.Series(pd.date_range('2016', periods=12,
.....:                                     tz='US/Central'))
.....:

In [262]: build_table_schema(s_tz)
Out[262]:
{'fields': [{'name': 'index', 'type': 'integer'},
             {'name': 'values', 'type': 'datetime', 'tz': 'US/Central'}],
 'primaryKey': ['index'],
 'pandas_version': '0.20.0'}
```

- Periods are converted to timestamps before serialization, and so have the same behavior of being converted to UTC. In addition, periods will contain an additional field `freq` with the period's frequency, e.g. 'A-DEC'.

```
In [263]: s_per = pd.Series(1, index=pd.period_range('2016', freq='A-DEC',
.....:                                               periods=4))
.....:

In [264]: build_table_schema(s_per)
Out[264]:
{'fields': [{'name': 'index', 'type': 'datetime', 'freq': 'A-DEC'},
             {'name': 'values', 'type': 'integer'}],
 'primaryKey': ['index'],
 'pandas_version': '0.20.0'}
```

- Categoricals use the `any` type and an `enum` constraint listing the set of possible values. Additionally, an ordered field is included:

```
In [265]: s_cat = pd.Series(pd.Categorical(['a', 'b', 'a']))

In [266]: build_table_schema(s_cat)
Out[266]:
{'fields': [{'name': 'index', 'type': 'integer'},
             {'name': 'values',
              'type': 'any',
              'constraints': {'enum': ['a', 'b']},
              'ordered': False}],
 'primaryKey': ['index'],
 'pandas_version': '0.20.0'}
```

- A `primaryKey` field, containing an array of labels, is included *if the index is unique*:

```
In [267]: s_dupe = pd.Series([1, 2], index=[1, 1])

In [268]: build_table_schema(s_dupe)
Out[268]:
{'fields': [{'name': 'index', 'type': 'integer'},
             {'name': 'values', 'type': 'integer'}],
 'pandas_version': '0.20.0'}
```

- The `primaryKey` behavior is the same with `MultiIndexes`, but in this case the `primaryKey` is an array:

```
In [269]: s_multi = pd.Series(1, index=pd.MultiIndex.from_product([('a', 'b'),
.....:                                                             (0, 1)]))
.....:

In [270]: build_table_schema(s_multi)
Out[270]:
{'fields': [{'name': 'level_0', 'type': 'string'},
             {'name': 'level_1', 'type': 'integer'},
             {'name': 'values', 'type': 'integer'}],
 'primaryKey': FrozenList(['level_0', 'level_1']),
 'pandas_version': '0.20.0'}
```

- The default naming roughly follows these rules:
  - For series, the `object.name` is used. If that's none, then the name is `values`
  - For DataFrames, the stringified version of the column name is used
  - For Index (not `MultiIndex`), `index.name` is used, with a fallback to `index` if that is `None`.
  - For `MultiIndex`, `mi.names` is used. If any level has no name, then `level_<i>` is used.

New in version 0.23.0.

`read_json` also accepts `orient='table'` as an argument. This allows for the preservation of metadata such as dtypes and index names in a round-trippable manner.

```
In [271]: df = pd.DataFrame({'foo': [1, 2, 3, 4],
.....:                      'bar': ['a', 'b', 'c', 'd'],
.....:                      'baz': pd.date_range('2018-01-01', freq='d',
→ periods=4),
.....:                      'qux': pd.Categorical(['a', 'b', 'c', 'c'])
.....:                      }, index=pd.Index(range(4), name='idx'))
```

(continues on next page)

(continued from previous page)

```

.....:

In [272]: df
Out[272]:
   foo bar      baz qux
idx
0     1  a 2018-01-01  a
1     2  b 2018-01-02  b
2     3  c 2018-01-03  c
3     4  d 2018-01-04  c

In [273]: df.dtypes
////////////////////////////////////
↪
foo          int64
bar          object
baz  datetime64[ns]
qux          category
dtype: object

In [274]: df.to_json('test.json', orient='table')

In [275]: new_df = pd.read_json('test.json', orient='table')

In [276]: new_df
Out[276]:
   foo bar      baz qux
idx
0     1  a 2018-01-01  a
1     2  b 2018-01-02  b
2     3  c 2018-01-03  c
3     4  d 2018-01-04  c

In [277]: new_df.dtypes
////////////////////////////////////
↪
foo          int64
bar          object
baz  datetime64[ns]
qux          category
dtype: object

```

Please note that the literal string ‘index’ as the name of an *Index* is not round-trippable, nor are any names beginning with ‘level\_’ within a *MultiIndex*. These are used by default in *DataFrame.to\_json()* to indicate missing values and the subsequent read cannot distinguish the intent.

```

In [278]: df.index.name = 'index'

In [279]: df.to_json('test.json', orient='table')

In [280]: new_df = pd.read_json('test.json', orient='table')

In [281]: print(new_df.index.name)
None

```

## 24.3 HTML

### 24.3.1 Reading HTML Content

**Warning:** We **highly encourage** you to read the *HTML Table Parsing gotchas* below regarding the issues surrounding the BeautifulSoup4/html5lib/lxml parsers.

The top-level `read_html()` function can accept an HTML string/file/URL and will parse HTML tables into list of pandas DataFrames. Let's look at a few examples.

**Note:** `read_html` returns a list of DataFrame objects, even if there is only a single table contained in the HTML content.

Read a URL with no options:

```
In [282]: url = 'http://www.fdic.gov/bank/individual/failed/banklist.html'

In [283]: dfs = pd.read_html(url)

In [284]: dfs
Out[284]:
```

[505 rows x 7 columns]]
```

**Note:** The following examples are not run by the IPython evaluator due to the fact that having so many network-accessing functions slows down the documentation build. If you spot an error or an example that doesn't run, please do not hesitate to report it over on [pandas GitHub issues page](#).

Read a URL and match a table that contains specific text:

```
match = 'Metcalf Bank'
df_list = pd.read_html(url, match=match)
```

Specify a header row (by default <th> or <td> elements located within a <thead> are used to form the column index, if multiple rows are contained within <thead> then a multiindex is created); if specified, the header row is taken from the data minus the parsed header elements (<th> elements).

```
dfs = pd.read_html(url, header=0)
```

Specify an index column:

```
dfs = pd.read_html(url, index_col=0)
```

Specify a number of rows to skip:

```
dfs = pd.read_html(url, skiprows=0)
```

Specify a number of rows to skip using a list (`xrange` (Python 2 only) works as well):

```
dfs = pd.read_html(url, skiprows=range(2))
```

Specify an HTML attribute:

```
dfs1 = pd.read_html(url, attrs={'id': 'table'})
dfs2 = pd.read_html(url, attrs={'class': 'sortable'})
print(np.array_equal(dfs1[0], dfs2[0])) # Should be True
```

Specify values that should be converted to NaN:

```
dfs = pd.read_html(url, na_values=['No Acquirer'])
```

New in version 0.19.

Specify whether to keep the default set of NaN values:

```
dfs = pd.read_html(url, keep_default_na=False)
```

New in version 0.19.

Specify converters for columns. This is useful for numerical text data that has leading zeros. By default columns that are numerical are cast to numeric types and the leading zeros are lost. To avoid this, we can convert these columns to strings.

```
url_mcc = 'https://en.wikipedia.org/wiki/Mobile_country_code'
dfs = pd.read_html(url_mcc, match='Telekom Albania', header=0, converters={'MNC':
str})
```

New in version 0.19.

Use some combination of the above:

```
dfs = pd.read_html(url, match='Metcalfe Bank', index_col=0)
```

Read in pandas `to_html` output (with some loss of floating point precision):

```
df = pd.DataFrame(randn(2, 2))
s = df.to_html(float_format='{0:.40g}'.format)
dfin = pd.read_html(s, index_col=0)
```

The `lxml` backend will raise an error on a failed parse if that is the only parser you provide. If you only have a single parser you can provide just a string, but it is considered good practice to pass a list with one string if, for example, the function expects a sequence of strings. You may use:

```
dfs = pd.read_html(url, 'Metcalfe Bank', index_col=0, flavor=['lxml'])
```

Or you could pass `flavor='lxml'` without a list:

```
dfs = pd.read_html(url, 'Metcalfe Bank', index_col=0, flavor='lxml')
```

However, if you have `bs4` and `html5lib` installed and pass `None` or `['lxml', 'bs4']` then the parse will most likely succeed. Note that *as soon as a parse succeeds, the function will return*.

```
dfs = pd.read_html(url, 'Metcalf Bank', index_col=0, flavor=['lxml', 'bs4'])
```

### 24.3.2 Writing to HTML files

`DataFrame` objects have an instance method `to_html` which renders the contents of the `DataFrame` as an HTML table. The function arguments are as in the method `to_string` described above.

---

**Note:** Not all of the possible options for `DataFrame.to_html` are shown here for brevity's sake. See `to_html()` for the full set of options.

---

```
In [290]: df = pd.DataFrame(randn(2, 2))

In [291]: df
Out[291]:
```

|   | 0         | 1        |
|---|-----------|----------|
| 0 | -0.184744 | 0.496971 |
| 1 | -0.856240 | 1.857977 |

```
In [292]: print(df.to_html()) # raw html
\\////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////<table_
↪border="1" class="dataframe">
  <thead>
    <tr style="text-align: right;">
      <th></th>
      <th>0</th>
      <th>1</th>
    </tr>
  </thead>
  <tbody>
    <tr>
      <th>0</th>
      <td>-0.184744</td>
      <td>0.496971</td>
    </tr>
    <tr>
      <th>1</th>
      <td>-0.856240</td>
      <td>1.857977</td>
    </tr>
  </tbody>
</table>
```

HTML:

The `columns` argument will limit the columns shown:

```
In [293]: print(df.to_html(columns=[0]))
<table border="1" class="dataframe">
  <thead>
    <tr style="text-align: right;">
      <th></th>
      <th>0</th>
```

(continues on next page)

(continued from previous page)

```

    </tr>
</thead>
<tbody>
  <tr>
    <th>0</th>
    <td>-0.184744</td>
  </tr>
  <tr>
    <th>1</th>
    <td>-0.856240</td>
  </tr>
</tbody>
</table>

```

HTML:

`float_format` takes a Python callable to control the precision of floating point values:

```

In [294]: print(df.to_html(float_format='{0:.10f}'.format))
<table border="1" class="dataframe">
  <thead>
    <tr style="text-align: right;">
      <th></th>
      <th>0</th>
      <th>1</th>
    </tr>
  </thead>
  <tbody>
    <tr>
      <th>0</th>
      <td>-0.1847438576</td>
      <td>0.4969711327</td>
    </tr>
    <tr>
      <th>1</th>
      <td>-0.8562396763</td>
      <td>1.8579766508</td>
    </tr>
  </tbody>
</table>

```

HTML:

`bold_rows` will make the row labels bold by default, but you can turn that off:

```

In [295]: print(df.to_html(bold_rows=False))
<table border="1" class="dataframe">
  <thead>
    <tr style="text-align: right;">
      <th></th>
      <th>0</th>
      <th>1</th>
    </tr>
  </thead>
  <tbody>
    <tr>
      <td>0</td>

```

(continues on next page)

(continued from previous page)

```

        <td>-0.184744</td>
        <td>0.496971</td>
    </tr>
    <tr>
        <td>1</td>
        <td>-0.856240</td>
        <td>1.857977</td>
    </tr>
</tbody>
</table>

```

The `classes` argument provides the ability to give the resulting HTML table CSS classes. Note that these classes are *appended* to the existing 'dataframe' class.

```

In [296]: print(df.to_html(classes=['awesome_table_class', 'even_more_awesome_class
→']))
<table border="1" class="dataframe awesome_table_class even_more_awesome_class">
  <thead>
    <tr style="text-align: right;">
      <th></th>
      <th>0</th>
      <th>1</th>
    </tr>
  </thead>
  <tbody>
    <tr>
      <th>0</th>
      <td>-0.184744</td>
      <td>0.496971</td>
    </tr>
    <tr>
      <th>1</th>
      <td>-0.856240</td>
      <td>1.857977</td>
    </tr>
  </tbody>
</table>

```

Finally, the `escape` argument allows you to control whether the “<”, “>” and “&” characters escaped in the resulting HTML (by default it is `True`). So to get the HTML without escaped characters pass `escape=False`

```

In [297]: df = pd.DataFrame({'a': list('&<>'), 'b': randn(3)})

```

Escaped:

```

In [298]: print(df.to_html())
<table border="1" class="dataframe">
  <thead>
    <tr style="text-align: right;">
      <th></th>
      <th>a</th>
      <th>b</th>
    </tr>
  </thead>
  <tbody>
    <tr>

```

(continues on next page)

(continued from previous page)

```

        <th>0</th>
        <td>&lt;</td>
        <td>-0.474063</td>
    </tr>
    <tr>
        <th>1</th>
        <td>&lt;</td>
        <td>-0.230305</td>
    </tr>
    <tr>
        <th>2</th>
        <td>>></td>
        <td>-0.400654</td>
    </tr>
</tbody>
</table>

```

**Not escaped:**

```

In [299]: print(df.to_html(escape=False))
<table border="1" class="dataframe">
  <thead>
    <tr style="text-align: right;">
      <th></th>
      <th>a</th>
      <th>b</th>
    </tr>
  </thead>
  <tbody>
    <tr>
      <th>0</th>
      <td>&</td>
      <td>-0.474063</td>
    </tr>
    <tr>
      <th>1</th>
      <td><</td>
      <td>-0.230305</td>
    </tr>
    <tr>
      <th>2</th>
      <td>></td>
      <td>-0.400654</td>
    </tr>
  </tbody>
</table>

```

---

**Note:** Some browsers may not show a difference in the rendering of the previous two HTML tables.

---

### 24.3.3 HTML Table Parsing Gotchas

There are some versioning issues surrounding the libraries that are used to parse HTML tables in the top-level pandas `io` function `read_html`.

### Issues with `lxml`

- Benefits
  - `lxml` is very fast.
  - `lxml` requires Cython to install correctly.
- Drawbacks
  - `lxml` does *not* make any guarantees about the results of its parse *unless* it is given **strictly valid markup**.
  - In light of the above, we have chosen to allow you, the user, to use the `lxml` backend, but **this backend will use `html5lib` if `lxml` fails to parse**
  - It is therefore *highly recommended* that you install both **BeautifulSoup4** and **html5lib**, so that you will still get a valid result (provided everything else is valid) even if `lxml` fails.

### Issues with **BeautifulSoup4** using `lxml` as a backend

- The above issues hold here as well since **BeautifulSoup4** is essentially just a wrapper around a parser backend.

### Issues with **BeautifulSoup4** using `html5lib` as a backend

- Benefits
  - **html5lib** is far more lenient than `lxml` and consequently deals with *real-life markup* in a much saner way rather than just, e.g., dropping an element without notifying you.
  - **html5lib** *generates valid HTML5 markup from invalid markup automatically*. This is extremely important for parsing HTML tables, since it guarantees a valid document. However, that does NOT mean that it is “correct”, since the process of fixing markup does not have a single definition.
  - **html5lib** is pure Python and requires no additional build steps beyond its own installation.
- Drawbacks
  - The biggest drawback to using **html5lib** is that it is slow as molasses. However consider the fact that many tables on the web are not big enough for the parsing algorithm runtime to matter. It is more likely that the bottleneck will be in the process of reading the raw text from the URL over the web, i.e., IO (input-output). For very large tables, this might not be true.

## 24.4 Excel files

The `read_excel()` method can read Excel 2003 (`.xls`) and Excel 2007+ (`.xlsx`) files using the `xlrd` Python module. The `to_excel()` instance method is used for saving a `DataFrame` to Excel. Generally the semantics are similar to working with `csv` data. See the *cookbook* for some advanced strategies.

### 24.4.1 Reading Excel Files

In the most basic use-case, `read_excel` takes a path to an Excel file, and the `sheet_name` indicating which sheet to parse.

```
# Returns a DataFrame
read_excel('path_to_file.xls', sheet_name='Sheet1')
```

### 24.4.1.1 ExcelFile class

To facilitate working with multiple sheets from the same file, the `ExcelFile` class can be used to wrap the file and can be passed into `read_excel`. There will be a performance benefit for reading multiple sheets as the file is read into memory only once.

```
xlsx = pd.ExcelFile('path_to_file.xls')
df = pd.read_excel(xlsx, 'Sheet1')
```

The `ExcelFile` class can also be used as a context manager.

```
with pd.ExcelFile('path_to_file.xls') as xls:
    df1 = pd.read_excel(xls, 'Sheet1')
    df2 = pd.read_excel(xls, 'Sheet2')
```

The `sheet_names` property will generate a list of the sheet names in the file.

The primary use-case for an `ExcelFile` is parsing multiple sheets with different parameters:

```
data = {}
# For when Sheet1's format differs from Sheet2
with pd.ExcelFile('path_to_file.xls') as xls:
    data['Sheet1'] = pd.read_excel(xls, 'Sheet1', index_col=None, na_values=['NA'])
    data['Sheet2'] = pd.read_excel(xls, 'Sheet2', index_col=1)
```

Note that if the same parsing parameters are used for all sheets, a list of sheet names can simply be passed to `read_excel` with no loss in performance.

```
# using the ExcelFile class
data = {}
with pd.ExcelFile('path_to_file.xls') as xls:
    data['Sheet1'] = read_excel(xls, 'Sheet1', index_col=None, na_values=['NA'])
    data['Sheet2'] = read_excel(xls, 'Sheet2', index_col=None, na_values=['NA'])

# equivalent using the read_excel function
data = read_excel('path_to_file.xls', ['Sheet1', 'Sheet2'], index_col=None, na_
↪ values=['NA'])
```

### 24.4.1.2 Specifying Sheets

---

**Note:** The second argument is `sheet_name`, not to be confused with `ExcelFile.sheet_names`.

---

---

**Note:** An `ExcelFile`'s attribute `sheet_names` provides access to a list of sheets.

---

- The arguments `sheet_name` allows specifying the sheet or sheets to read.
- The default value for `sheet_name` is 0, indicating to read the first sheet
- Pass a string to refer to the name of a particular sheet in the workbook.
- Pass an integer to refer to the index of a sheet. Indices follow Python convention, beginning at 0.
- Pass a list of either strings or integers, to return a dictionary of specified sheets.
- Pass a `None` to return a dictionary of all available sheets.

```
# Returns a DataFrame
read_excel('path_to_file.xls', 'Sheet1', index_col=None, na_values=['NA'])
```

Using the sheet index:

```
# Returns a DataFrame
read_excel('path_to_file.xls', 0, index_col=None, na_values=['NA'])
```

Using all default values:

```
# Returns a DataFrame
read_excel('path_to_file.xls')
```

Using None to get all sheets:

```
# Returns a dictionary of DataFrames
read_excel('path_to_file.xls', sheet_name=None)
```

Using a list to get multiple sheets:

```
# Returns the 1st and 4th sheet, as a dictionary of DataFrames.
read_excel('path_to_file.xls', sheet_name=['Sheet1', 3])
```

`read_excel` can read more than one sheet, by setting `sheet_name` to either a list of sheet names, a list of sheet positions, or `None` to read all sheets. Sheets can be specified by sheet index or sheet name, using an integer or string, respectively.

#### 24.4.1.3 Reading a MultiIndex

`read_excel` can read a `MultiIndex` index, by passing a list of columns to `index_col` and a `MultiIndex` column by passing a list of rows to `header`. If either the index or columns have serialized level names those will be read in as well by specifying the rows/columns that make up the levels.

For example, to read in a `MultiIndex` index without names:

```
In [300]: df = pd.DataFrame({'a':[1, 2, 3, 4], 'b':[5, 6, 7, 8]},
.....:                      index=pd.MultiIndex.from_product([['a', 'b'], ['c', 'd']]))
.....:

In [301]: df.to_excel('path_to_file.xlsx')

In [302]: df = pd.read_excel('path_to_file.xlsx', index_col=[0, 1])

In [303]: df
Out[303]:
      a  b
a c   1  5
  d   2  6
b c   3  7
  d   4  8
```

If the index has level names, they will be parsed as well, using the same parameters.

```
In [304]: df.index = df.index.set_names(['lvl1', 'lvl2'])

In [305]: df.to_excel('path_to_file.xlsx')
```

(continues on next page)

(continued from previous page)

```
In [306]: df = pd.read_excel('path_to_file.xlsx', index_col=[0, 1])
```

```
In [307]: df
```

```
Out[307]:
```

```

      a  b
lvl1 lvl2
a     c   1  5
      d   2  6
b     c   3  7
      d   4  8

```

If the source file has both MultiIndex index and columns, lists specifying each should be passed to `index_col` and `header`:

```
In [308]: df.columns = pd.MultiIndex.from_product([['a'], ['b', 'd']], names=['c1',
→ 'c2'])
```

```
In [309]: df.to_excel('path_to_file.xlsx')
```

```
In [310]: df = pd.read_excel('path_to_file.xlsx', index_col=[0, 1], header=[0, 1])
```

```
In [311]: df
```

```
Out[311]:
```

```

c1      a
c2      b  d
lvl1 lvl2
a     c   1  5
      d   2  6
b     c   3  7
      d   4  8

```

#### 24.4.1.4 Parsing Specific Columns

It is often the case that users will insert columns to do temporary computations in Excel and you may not want to read in those columns. `read_excel` takes a `usecols` keyword to allow you to specify a subset of columns to parse.

If `usecols` is an integer, then it is assumed to indicate the last column to be parsed.

```
read_excel('path_to_file.xls', 'Sheet1', usecols=2)
```

If `usecols` is a list of integers, then it is assumed to be the file column indices to be parsed.

```
read_excel('path_to_file.xls', 'Sheet1', usecols=[0, 2, 3])
```

Element order is ignored, so `usecols=[0, 1]` is the same as `[1, 0]`.

#### 24.4.1.5 Parsing Dates

Datetime-like values are normally automatically converted to the appropriate dtype when reading the excel file. But if you have a column of strings that *look* like dates (but are not actually formatted as dates in excel), you can use the `parse_dates` keyword to parse those strings to datetimes:

```
read_excel('path_to_file.xls', 'Sheet1', parse_dates=['date_strings'])
```

#### 24.4.1.6 Cell Converters

It is possible to transform the contents of Excel cells via the `converters` option. For instance, to convert a column to boolean:

```
read_excel('path_to_file.xls', 'Sheet1', converters={'MyBools': bool})
```

This options handles missing values and treats exceptions in the converters as missing data. Transformations are applied cell by cell rather than to the column as a whole, so the array dtype is not guaranteed. For instance, a column of integers with missing values cannot be transformed to an array with integer dtype, because NaN is strictly a float. You can manually mask missing data to recover integer dtype:

```
cfun = lambda x: int(x) if x else -1
read_excel('path_to_file.xls', 'Sheet1', converters={'MyInts': cfun})
```

#### 24.4.1.7 dtype Specifications

New in version 0.20.

As an alternative to converters, the type for an entire column can be specified using the `dtype` keyword, which takes a dictionary mapping column names to types. To interpret data with no type inference, use the type `str` or `object`.

```
read_excel('path_to_file.xls', dtype={'MyInts': 'int64', 'MyText': str})
```

### 24.4.2 Writing Excel Files

#### 24.4.2.1 Writing Excel Files to Disk

To write a `DataFrame` object to a sheet of an Excel file, you can use the `to_excel` instance method. The arguments are largely the same as `to_csv` described above, the first argument being the name of the excel file, and the optional second argument the name of the sheet to which the `DataFrame` should be written. For example:

```
df.to_excel('path_to_file.xlsx', sheet_name='Sheet1')
```

Files with a `.xls` extension will be written using `xlwt` and those with a `.xlsx` extension will be written using `xlsxwriter` (if available) or `openpyxl`.

The `DataFrame` will be written in a way that tries to mimic the REPL output. The `index_label` will be placed in the second row instead of the first. You can place it in the first row by setting the `merge_cells` option in `to_excel()` to `False`:

```
df.to_excel('path_to_file.xlsx', index_label='label', merge_cells=False)
```

In order to write separate `DataFrames` to separate sheets in a single Excel file, one can pass an `ExcelWriter`.

```
with ExcelWriter('path_to_file.xlsx') as writer:
    df1.to_excel(writer, sheet_name='Sheet1')
    df2.to_excel(writer, sheet_name='Sheet2')
```

---

**Note:** Wringing a little more performance out of `read_excel` Internally, Excel stores all numeric data as floats. Because this can produce unexpected behavior when reading in data, pandas defaults to trying to convert integers to floats if it doesn't lose information (`1.0 --> 1`). You can pass `convert_float=False` to disable this behavior, which may give a slight performance improvement.

---

### 24.4.2.2 Writing Excel Files to Memory

Pandas supports writing Excel files to buffer-like objects such as `StringIO` or `BytesIO` using `ExcelWriter`.

```
# Safe import for either Python 2.x or 3.x
try:
    from io import BytesIO
except ImportError:
    from cStringIO import StringIO as BytesIO

bio = BytesIO()

# By setting the 'engine' in the ExcelWriter constructor.
writer = ExcelWriter(bio, engine='xlsxwriter')
df.to_excel(writer, sheet_name='Sheet1')

# Save the workbook
writer.save()

# Seek to the beginning and read to copy the workbook to a variable in memory
bio.seek(0)
workbook = bio.read()
```

---

**Note:** `engine` is optional but recommended. Setting the engine determines the version of workbook produced. Setting `engine='xlrd'` will produce an Excel 2003-format workbook (xls). Using either `'openpyxl'` or `'xlsxwriter'` will produce an Excel 2007-format workbook (xlsx). If omitted, an Excel 2007-formatted workbook is produced.

---

### 24.4.3 Excel writer engines

Pandas chooses an Excel writer via two methods:

1. the `engine` keyword argument
2. the filename extension (via the default specified in config options)

By default, pandas uses the `XlsxWriter` for `.xlsx`, `openpyxl` for `.xlsm`, and `xlwt` for `.xls` files. If you have multiple engines installed, you can set the default engine through *setting the config options* `io.excel.xlsx.writer` and `io.excel.xls.writer`. pandas will fall back on `openpyxl` for `.xlsx` files if `Xlsxwriter` is not available.

To specify which writer you want to use, you can pass an engine keyword argument to `to_excel` and to `ExcelWriter`. The built-in engines are:

- `openpyxl`: version 2.4 or higher is required
- `xlsxwriter`
- `xlwt`

```
# By setting the 'engine' in the DataFrame and Panel 'to_excel()' methods.
df.to_excel('path_to_file.xlsx', sheet_name='Sheet1', engine='xlsxwriter')

# By setting the 'engine' in the ExcelWriter constructor.
writer = ExcelWriter('path_to_file.xlsx', engine='xlsxwriter')

# Or via pandas configuration.
from pandas import options
options.io.excel.xlsx.writer = 'xlsxwriter'

df.to_excel('path_to_file.xlsx', sheet_name='Sheet1')
```

### 24.4.4 Style and Formatting

The look and feel of Excel worksheets created from pandas can be modified using the following parameters on the DataFrame's `to_excel` method.

- `float_format` : Format string for floating point numbers (default `None`).
- `freeze_panes` : A tuple of two integers representing the bottommost row and rightmost column to freeze. Each of these parameters is one-based, so (1, 1) will freeze the first row and first column (default `None`).

## 24.5 Clipboard

A handy way to grab data is to use the `read_clipboard()` method, which takes the contents of the clipboard buffer and passes them to the `read_table` method. For instance, you can copy the following text to the clipboard (CTRL-C on many operating systems):

```
A B C
x 1 4 p
y 2 5 q
z 3 6 r
```

And then import the data directly to a DataFrame by calling:

```
clipdf = pd.read_clipboard()
```

```
In [312]: clipdf
Out[312]:
   A  B  C
x  1  4  p
y  2  5  q
z  3  6  r
```

The `to_clipboard` method can be used to write the contents of a DataFrame to the clipboard. Following which you can paste the clipboard contents into other applications (CTRL-V on many operating systems). Here we illustrate writing a DataFrame into clipboard and reading it back.

```
In [313]: df = pd.DataFrame(randn(5, 3))

In [314]: df
Out[314]:
      0      1      2
```

(continues on next page)

(continued from previous page)

```

0 -0.288267 -0.084905  0.004772
1  1.382989  0.343635 -1.253994
2 -0.124925  0.212244  0.496654
3  0.525417  1.238640 -1.210543
4 -1.175743 -0.172372 -0.734129

```

```
In [315]: df.to_clipboard()
```

```
In [316]: pd.read_clipboard()
```

```

Out[316]:
      0      1      2
0 -0.288267 -0.084905  0.004772
1  1.382989  0.343635 -1.253994
2 -0.124925  0.212244  0.496654
3  0.525417  1.238640 -1.210543
4 -1.175743 -0.172372 -0.734129

```

We can see that we got the same content back, which we had earlier written to the clipboard.

---

**Note:** You may need to install `xclip` or `xsel` (with `gtk`, `PyQt5`, `PyQt4` or `qtpy`) on Linux to use these methods.

---

## 24.6 Pickling

All pandas objects are equipped with `to_pickle` methods which use Python's `cPickle` module to save data structures to disk using the pickle format.

```
In [317]: df
```

```

Out[317]:
      0      1      2
0 -0.288267 -0.084905  0.004772
1  1.382989  0.343635 -1.253994
2 -0.124925  0.212244  0.496654
3  0.525417  1.238640 -1.210543
4 -1.175743 -0.172372 -0.734129

```

```
In [318]: df.to_pickle('foo.pkl')
```

The `read_pickle` function in the pandas namespace can be used to load any pickled pandas object (or any other pickled object) from file:

```
In [319]: pd.read_pickle('foo.pkl')
```

```

Out[319]:
      0      1      2
0 -0.288267 -0.084905  0.004772
1  1.382989  0.343635 -1.253994
2 -0.124925  0.212244  0.496654
3  0.525417  1.238640 -1.210543
4 -1.175743 -0.172372 -0.734129

```

**Warning:** Loading pickled data received from untrusted sources can be unsafe.

See: <https://docs.python.org/3/library/pickle.html>

**Warning:** Several internal refactorings have been done while still preserving compatibility with pickles created with older versions of pandas. However, for such cases, pickled DataFrames, Series etc, must be read with `pd.read_pickle`, rather than `pickle.load`.

See [here](#) and [here](#) for some examples of compatibility-breaking changes. See [this question](#) for a detailed explanation.

### 24.6.1 Compressed pickle files

New in version 0.20.0.

`read_pickle()`, `DataFrame.to_pickle()` and `Series.to_pickle()` can read and write compressed pickle files. The compression types of `gzip`, `bz2`, `xz` are supported for reading and writing. The `zip` file format only supports reading and must contain only one data file to be read.

The compression type can be an explicit parameter or be inferred from the file extension. If ‘infer’, then use `gzip`, `bz2`, `zip`, or `xz` if filename ends in `'.gz'`, `'.bz2'`, `'.zip'`, or `'.xz'`, respectively.

```
In [320]: df = pd.DataFrame({
.....:     'A': np.random.randn(1000),
.....:     'B': 'foo',
.....:     'C': pd.date_range('20130101', periods=1000, freq='s')})
.....:

In [321]: df
Out[321]:
```

	A	B	C
0	0.478412	foo	2013-01-01 00:00:00
1	-0.783748	foo	2013-01-01 00:00:01
2	1.403558	foo	2013-01-01 00:00:02
3	-0.539282	foo	2013-01-01 00:00:03
4	-1.651012	foo	2013-01-01 00:00:04
5	0.692072	foo	2013-01-01 00:00:05
6	1.022171	foo	2013-01-01 00:00:06
..	...	...	...
993	-1.613932	foo	2013-01-01 00:16:33
994	1.088104	foo	2013-01-01 00:16:34
995	-0.632963	foo	2013-01-01 00:16:35
996	-0.585314	foo	2013-01-01 00:16:36
997	-0.275038	foo	2013-01-01 00:16:37
998	-0.937512	foo	2013-01-01 00:16:38
999	0.632369	foo	2013-01-01 00:16:39

[1000 rows x 3 columns]

Using an explicit compression type:

```
In [322]: df.to_pickle("data.pkl.compress", compression="gzip")

In [323]: rt = pd.read_pickle("data.pkl.compress", compression="gzip")

In [324]: rt
```

(continues on next page)

(continued from previous page)

```
Out [324]:
```

	A	B	C
0	0.478412	foo	2013-01-01 00:00:00
1	-0.783748	foo	2013-01-01 00:00:01
2	1.403558	foo	2013-01-01 00:00:02
3	-0.539282	foo	2013-01-01 00:00:03
4	-1.651012	foo	2013-01-01 00:00:04
5	0.692072	foo	2013-01-01 00:00:05
6	1.022171	foo	2013-01-01 00:00:06
..	...	...	...
993	-1.613932	foo	2013-01-01 00:16:33
994	1.088104	foo	2013-01-01 00:16:34
995	-0.632963	foo	2013-01-01 00:16:35
996	-0.585314	foo	2013-01-01 00:16:36
997	-0.275038	foo	2013-01-01 00:16:37
998	-0.937512	foo	2013-01-01 00:16:38
999	0.632369	foo	2013-01-01 00:16:39

[1000 rows x 3 columns]

Inferring compression type from the extension:

```
In [325]: df.to_pickle("data.pkl.xz", compression="infer")

In [326]: rt = pd.read_pickle("data.pkl.xz", compression="infer")

In [327]: rt
Out [327]:
```

	A	B	C
0	0.478412	foo	2013-01-01 00:00:00
1	-0.783748	foo	2013-01-01 00:00:01
2	1.403558	foo	2013-01-01 00:00:02
3	-0.539282	foo	2013-01-01 00:00:03
4	-1.651012	foo	2013-01-01 00:00:04
5	0.692072	foo	2013-01-01 00:00:05
6	1.022171	foo	2013-01-01 00:00:06
..	...	...	...
993	-1.613932	foo	2013-01-01 00:16:33
994	1.088104	foo	2013-01-01 00:16:34
995	-0.632963	foo	2013-01-01 00:16:35
996	-0.585314	foo	2013-01-01 00:16:36
997	-0.275038	foo	2013-01-01 00:16:37
998	-0.937512	foo	2013-01-01 00:16:38
999	0.632369	foo	2013-01-01 00:16:39

[1000 rows x 3 columns]

The default is to ‘infer’:

```
In [328]: df.to_pickle("data.pkl.gz")

In [329]: rt = pd.read_pickle("data.pkl.gz")

In [330]: rt
Out [330]:
```

	A	B	C
0	0.478412	foo	2013-01-01 00:00:00

(continues on next page)

(continued from previous page)

```

1   -0.783748   foo 2013-01-01 00:00:01
2    1.403558   foo 2013-01-01 00:00:02
3   -0.539282   foo 2013-01-01 00:00:03
4   -1.651012   foo 2013-01-01 00:00:04
5    0.692072   foo 2013-01-01 00:00:05

## 24.7 msgpack

pandas supports the msgpack format for object serialization. This is a lightweight portable binary format, similar to binary JSON, that is highly space efficient, and provides good performance both on the writing (serialization), and reading (deserialization).

**Warning:** This is a very new feature of pandas. We intend to provide certain optimizations in the io of the msgpack data. Since this is marked as an EXPERIMENTAL LIBRARY, the storage format may not be stable until a future release.

```
In [334]: df = pd.DataFrame(np.random.rand(5, 2), columns=list('AB'))
```

(continues on next page)

(continued from previous page)

```

In [335]: df.to_msgpack('foo.msg')

In [336]: pd.read_msgpack('foo.msg')
Out[336]:
      A      B
0  0.170801  0.895366
1  0.838238  0.052592
2  0.664140  0.289750
3  0.449593  0.872087
4  0.983618  0.744359

In [337]: s = pd.Series(np.random.rand(5), index=pd.date_range('20130101', periods=5))

```

You can pass a list of objects and you will receive them back on deserialization.

```

In [338]: pd.to_msgpack('foo.msg', df, 'foo', np.array([1, 2, 3]), s)

In [339]: pd.read_msgpack('foo.msg')
Out[339]:
[
      A      B
0  0.170801  0.895366
1  0.838238  0.052592
2  0.664140  0.289750
3  0.449593  0.872087
4  0.983618  0.744359, 'foo', array([1, 2, 3]), 2013-01-01    0.548134
2013-01-02    0.503447
2013-01-03    0.348438
2013-01-04    0.707267
2013-01-05    0.261656
Freq: D, dtype: float64]

```

You can pass `iterator=True` to iterate over the unpacked results:

```

In [340]: for o in pd.read_msgpack('foo.msg', iterator=True):
.....:     print(o)
.....:
      A      B
0  0.170801  0.895366
1  0.838238  0.052592
2  0.664140  0.289750
3  0.449593  0.872087
4  0.983618  0.744359
foo
[1 2 3]
2013-01-01    0.548134
2013-01-02    0.503447
2013-01-03    0.348438
2013-01-04    0.707267
2013-01-05    0.261656
Freq: D, dtype: float64

```

You can pass `append=True` to the writer to append to an existing pack:

```

In [341]: df.to_msgpack('foo.msg', append=True)

In [342]: pd.read_msgpack('foo.msg')
Out[342]:

```

(continues on next page)

(continued from previous page)

```
[
      A      B
0  0.170801  0.895366
1  0.838238  0.052592
2  0.664140  0.289750
3  0.449593  0.872087
4  0.983618  0.744359, 'foo', array([1, 2, 3]), 2013-01-01    0.548134
2013-01-02    0.503447
2013-01-03    0.348438
2013-01-04    0.707267
2013-01-05    0.261656
Freq: D, dtype: float64,      A      B
0  0.170801  0.895366
1  0.838238  0.052592
2  0.664140  0.289750
3  0.449593  0.872087
4  0.983618  0.744359]
```

Unlike other io methods, `to_msgpack` is available on both a per-object basis, `df.to_msgpack()` and using the top-level `pd.to_msgpack(...)` where you can pack arbitrary collections of Python lists, dicts, scalars, while intermixing pandas objects.

```
In [343]: pd.to_msgpack('foo2.msg', {'dict': [{ 'df': df }, {'string': 'foo'},
.....:                                     {'scalar': 1.}, {'s': s}])
.....:

In [344]: pd.read_msgpack('foo2.msg')
Out[344]:
{'dict': ({'df':      A      B
0  0.170801  0.895366
1  0.838238  0.052592
2  0.664140  0.289750
3  0.449593  0.872087
4  0.983618  0.744359},
{'string': 'foo'},
{'scalar': 1.0},
{'s': 2013-01-01    0.548134
2013-01-02    0.503447
2013-01-03    0.348438
2013-01-04    0.707267
2013-01-05    0.261656
Freq: D, dtype: float64})})
```

## 24.7.1 Read/Write API

Msgpacks can also be read from and written to strings.

```
In [345]: df.to_msgpack()
Out[345]: b'\x84\xa3typ\xadblock_
↪manager\xa5klass\xa9DataFrame\xa4axes\x92\x86\xa3typ\xa5index\xa5klass\xa5Index\xa4name\xc0\xa5dtype
↪index\xa5klass\xaaRangeIndex\xa4name\xc0\xa5start\x00\xa4stop\x05\xa4step\x01\xa6blocks\x91\x86\xa
↪<\xfd\xd2f\xcf\xdc\xc5?0\x15\xebN\xd9\xd2\xea?,\x9c\x16A\xa2@xe5?\xd8/\xdd\xfd
↪"\xc6\xdc?\x11\x1e\x97\x1b\xcdy\xef?&\x1e<\xee\xd6\xa6\xec?p\xd3;\xb2N\xed\xaa?
↪h\xcb\xb1\xbdB\x8b\xd2?\xaf4\x01r"\xe8\xeb?)G6\xd9\xc9\xd1\xe7?
↪\xa5shape\x92\x02\x05\xa5dtype\xa7float64\xa5klass\xaaFloatBlock\xa8compress\xc0'
```

Furthermore you can concatenate the strings to produce a list of the original objects.

```
In [346]: pd.read_msgpack(df.to_msgpack() + s.to_msgpack())
Out[346]:
[
      A      B
0  0.170801  0.895366
1  0.838238  0.052592
2  0.664140  0.289750
3  0.449593  0.872087
4  0.983618  0.744359, 2013-01-01    0.548134
2013-01-02    0.503447
2013-01-03    0.348438
2013-01-04    0.707267
2013-01-05    0.261656
Freq: D, dtype: float64]
```

## 24.8 HDF5 (PyTables)

`HDFStore` is a dict-like object which reads and writes pandas using the high performance HDF5 format using the excellent [PyTables](#) library. See the [cookbook](#) for some advanced strategies

**Warning:** pandas requires `PyTables >= 3.0.0`. There is a indexing bug in `PyTables < 3.2` which may appear when querying stores using an index. If you see a subset of results being returned, upgrade to `PyTables >= 3.2`. Stores created previously will need to be rewritten using the updated version.

```
In [347]: store = pd.HDFStore('store.h5')

In [348]: print(store)
<class 'pandas.io.pytables.HDFStore'>
File path: store.h5
```

Objects can be written to the file just like adding key-value pairs to a dict:

```
In [349]: np.random.seed(1234)

In [350]: index = pd.date_range('1/1/2000', periods=8)

In [351]: s = pd.Series(randn(5), index=['a', 'b', 'c', 'd', 'e'])

In [352]: df = pd.DataFrame(randn(8, 3), index=index,
.....:                      columns=['A', 'B', 'C'])
.....:

In [353]: wp = pd.Panel(randn(2, 5, 4), items=['Item1', 'Item2'],
.....:                      major_axis=pd.date_range('1/1/2000', periods=5),
.....:                      minor_axis=['A', 'B', 'C', 'D'])
.....:

# store.put('s', s) is an equivalent method
In [354]: store['s'] = s

In [355]: store['df'] = df

In [356]: store['wp'] = wp
```

(continues on next page)

(continued from previous page)

```
# the type of stored data
In [357]: store.root.wp._v_attrs.pandas_type
Out[357]: 'wide'

In [358]: store
\\Out[358]:
<class 'pandas.io.pytables.HDFStore'>
File path: store.h5
```

In a current or later Python session, you can retrieve stored objects:

```
# store.get('df') is an equivalent method
In [359]: store['df']
Out[359]:
```

	A	B	C
2000-01-01	0.887163	0.859588	-0.636524
2000-01-02	0.015696	-2.242685	1.150036
2000-01-03	0.991946	0.953324	-2.021255
2000-01-04	-0.334077	0.002118	0.405453
2000-01-05	0.289092	1.321158	-1.546906
2000-01-06	-0.202646	-0.655969	0.193421
2000-01-07	0.553439	1.318152	-0.469305
2000-01-08	0.675554	-1.817027	-0.183109

```
# dotted (attribute) access provides get as well
In [360]: store.df
\\
↪
```

	A	B	C
2000-01-01	0.887163	0.859588	-0.636524
2000-01-02	0.015696	-2.242685	1.150036
2000-01-03	0.991946	0.953324	-2.021255
2000-01-04	-0.334077	0.002118	0.405453
2000-01-05	0.289092	1.321158	-1.546906
2000-01-06	-0.202646	-0.655969	0.193421
2000-01-07	0.553439	1.318152	-0.469305
2000-01-08	0.675554	-1.817027	-0.183109

Deletion of the object specified by the key:

```
# store.remove('wp') is an equivalent method
In [361]: del store['wp']

In [362]: store
Out[362]:
<class 'pandas.io.pytables.HDFStore'>
File path: store.h5
```

Closing a Store and using a context manager:

```
In [363]: store.close()

In [364]: store
Out[364]:
<class 'pandas.io.pytables.HDFStore'>
File path: store.h5
```

(continues on next page)

(continued from previous page)

```

In [365]: store.is_open
\\Out[365]: False

# Working with, and automatically closing the store using a context manager
In [366]: with pd.HDFStore('store.h5') as store:
.....:     store.keys()
.....:

```

### 24.8.1 Read/Write API

HDFStore supports an top-level API using `read_hdf` for reading and `to_hdf` for writing, similar to how `read_csv` and `to_csv` work.

```

In [367]: df_t1 = pd.DataFrame(dict(A=list(range(5)), B=list(range(5))))

In [368]: df_t1.to_hdf('store_t1.h5', 'table', append=True)

In [369]: pd.read_hdf('store_t1.h5', 'table', where=['index>2'])
Out[369]:
   A  B
3  3  3
4  4  4

```

HDFStore will by default not drop rows that are all missing. This behavior can be changed by setting `dropna=True`.

```

In [370]: df_with_missing = pd.DataFrame({'col1': [0, np.nan, 2],
.....:                                     'col2': [1, np.nan, np.nan]})
.....:

In [371]: df_with_missing
Out[371]:
   col1  col2
0    0.0    1.0
1    NaN    NaN
2    2.0    NaN

In [372]: df_with_missing.to_hdf('file.h5', 'df_with_missing',
.....:                             format='table', mode='w')
.....:

In [373]: pd.read_hdf('file.h5', 'df_with_missing')
Out[373]:
   col1  col2
0    0.0    1.0
1    NaN    NaN
2    2.0    NaN

In [374]: df_with_missing.to_hdf('file.h5', 'df_with_missing',
.....:                             format='table', mode='w', dropna=True)
.....:

In [375]: pd.read_hdf('file.h5', 'df_with_missing')
Out[375]:
   col1  col2

```

(continues on next page)

(continued from previous page)

```
0    0.0    1.0
2    2.0    NaN
```

This is also true for the major axis of a Panel:

```
In [376]: matrix = [[np.nan, np.nan, np.nan], [1, np.nan, np.nan]],
.....:             [[np.nan, np.nan, np.nan], [np.nan, 5, 6]],
.....:             [[np.nan, np.nan, np.nan], [np.nan, 3, np.nan]]]
.....:

In [377]: panel_with_major_axis_all_missing=pd.Panel(matrix,
.....:        items=['Item1', 'Item2', 'Item3'],
.....:        major_axis=[1, 2],
.....:        minor_axis=['A', 'B', 'C'])
.....:

In [378]: panel_with_major_axis_all_missing
Out[378]:
<class 'pandas.core.panel.Panel'>
Dimensions: 3 (items) x 2 (major_axis) x 3 (minor_axis)
Items axis: Item1 to Item3
Major_axis axis: 1 to 2
Minor_axis axis: A to C

In [379]: panel_with_major_axis_all_missing.to_hdf('file.h5', 'panel',
.....:        dropna=True,
.....:        format='table',
.....:        mode='w')
.....:

In [380]: reloaded = pd.read_hdf('file.h5', 'panel')

In [381]: reloaded
Out[381]:
<class 'pandas.core.panel.Panel'>
Dimensions: 3 (items) x 1 (major_axis) x 3 (minor_axis)
Items axis: Item1 to Item3
Major_axis axis: 2 to 2
Minor_axis axis: A to C
```

## 24.8.2 Fixed Format

The examples above show storing using `put`, which write the HDF5 to PyTables in a fixed array format, called the *fixed* format. These types of stores are **not** appendable once written (though you can simply remove them and rewrite). Nor are they **queryable**; they must be retrieved in their entirety. They also do not support dataframes with non-unique column names. The *fixed* format stores offer very fast writing and slightly faster reading than *table* stores. This format is specified by default when using `put` or `to_hdf` or by `format='fixed'` or `format='f'`.

**Warning:** A fixed format will raise a `TypeError` if you try to retrieve using a `where`:

```
pd.DataFrame(randn(10, 2)).to_hdf('test_fixed.h5', 'df')

pd.read_hdf('test_fixed.h5', 'df', where='index>5')
TypeError: cannot pass a where specification when reading a fixed format.
this store must be selected in its entirety
```

### 24.8.3 Table Format

HDFStore supports another PyTables format on disk, the table format. Conceptually a table is shaped very much like a DataFrame, with rows and columns. A table may be appended to in the same or other sessions. In addition, delete and query type operations are supported. This format is specified by `format='table'` or `format='t'` to append or put or to\_hdf.

This format can be set as an option as well `pd.set_option('io.hdf.default_format', 'table')` to enable put/append/to\_hdf to by default store in the table format.

```
In [382]: store = pd.HDFStore('store.h5')

In [383]: df1 = df[0:4]

In [384]: df2 = df[4:]

# append data (creates a table automatically)
In [385]: store.append('df', df1)

In [386]: store.append('df', df2)

In [387]: store
Out[387]:
<class 'pandas.io.pytables.HDFStore'>
File path: store.h5

# select the entire object
In [388]: store.select('df')
\\Out[388]:
          A          B          C
2000-01-01  0.887163  0.859588 -0.636524
2000-01-02  0.015696 -2.242685  1.150036
2000-01-03  0.991946  0.953324 -2.021255
2000-01-04 -0.334077  0.002118  0.405453
2000-01-05  0.289092  1.321158 -1.546906
2000-01-06 -0.202646 -0.655969  0.193421
2000-01-07  0.553439  1.318152 -0.469305
2000-01-08  0.675554 -1.817027 -0.183109

# the type of stored data
In [389]: store.root.df._v_attrs.pandas_type
\\
↪ 'frame_table'
```

**Note:** You can also create a table by passing `format='table'` or `format='t'` to a put operation.

### 24.8.4 Hierarchical Keys

Keys to a store can be specified as a string. These can be in a hierarchical path-name like format (e.g. `foo/bar/bah`), which will generate a hierarchy of sub-stores (or Groups in PyTables parlance). Keys can be specified with

out the leading '/' and are **always** absolute (e.g. 'foo' refers to '/foo'). Removal operations can remove everything in the sub-store and **below**, so be *careful*.

```
In [390]: store.put('foo/bar/bah', df)

In [391]: store.append('food/orange', df)

In [392]: store.append('food/apple', df)

In [393]: store
Out[393]:
<class 'pandas.io.pytables.HDFStore'>
File path: store.h5

# a list of keys are returned
In [394]: store.keys()
\\Out[394]: ['/df',
↪ '/food/apple', '/food/orange', '/foo/bar/bah']

# remove all nodes under this level
In [395]: store.remove('food')

In [396]: store
Out[396]:
<class 'pandas.io.pytables.HDFStore'>
File path: store.h5
```

**Warning:** Hierarchical keys cannot be retrieved as dotted (attribute) access as described above for items stored under the root node.

```
In [8]: store.foo.bar.bah
AttributeError: 'HDFStore' object has no attribute 'foo'

# you can directly access the actual PyTables node but using the root node
In [9]: store.root.foo.bar.bah
Out[9]:
/foo/bar/bah (Group) ''
  children := ['block0_items' (Array), 'block0_values' (Array), 'axis0' (Array),
↪ 'axis1' (Array)]
```

Instead, use explicit string based keys:

```
In [397]: store['foo/bar/bah']
Out[397]:
```

	A	B	C
2000-01-01	0.887163	0.859588	-0.636524
2000-01-02	0.015696	-2.242685	1.150036
2000-01-03	0.991946	0.953324	-2.021255

### 24.8.5.2 Storing Multi-Index DataFrames

Storing multi-index DataFrames as tables is very similar to storing/selecting from homogeneous index DataFrames.

```

In [405]: index = pd.MultiIndex(levels=[['foo', 'bar', 'baz', 'qux'],
.....:                                ['one', 'two', 'three']],
.....:                           labels=[[0, 0, 0, 1, 1, 2, 2, 3, 3, 3],
.....:                                [0, 1, 2, 0, 1, 1, 2, 0, 1, 2]],
.....:                           names=['foo', 'bar'])
.....:

In [406]: df_mi = pd.DataFrame(np.random.randn(10, 3), index=index,
.....:                           columns=['A', 'B', 'C'])
.....:

In [407]: df_mi
Out[407]:
           A         B         C
foo bar
foo one  -0.584718  0.816594 -0.081947
      two  -0.344766  0.528288 -1.068989
      three -0.511881  0.291205  0.566534
bar one   0.503592  0.285296  0.484288
      two   1.363482 -0.781105 -0.468018
baz two   1.224574 -1.281108  0.875476
      three -1.710715 -0.450765  0.749164
qux one  -0.203933 -0.182175  0.680656
      two  -1.818499  0.047072  0.394844
      three -0.248432 -0.617707 -0.682884

In [408]: store.append('df_mi', df_mi)

In [409]: store.select('df_mi')
Out[409]:
           A         B         C
foo bar
foo one  -0.584718  0.816594 -0.081947
      two  -0.344766  0.528288 -1.068989
      three -0.511881  0.291205  0.566534

foo bar
bar one  0.503592  0.285296  0.484288
      two  1.363482 -0.781105 -0.468018

```

## 24.8.6 Querying

### 24.8.6.1 Querying a Table

`select` and `delete` operations have an optional criterion that can be specified to select/delete only a subset of the data. This allows one to have a very large on-disk table and retrieve only a portion of the data.

A query is specified using the `Term` class under the hood, as a boolean expression.

- `index` and `columns` are supported indexers of a `DataFrames`.
- `major_axis`, `minor_axis`, and `items` are supported indexers of the `Panel`.
- if `data_columns` are specified, these can be used as additional indexers.

Valid comparison operators are:

`=`, `==`, `!=`, `>`, `>=`, `<`, `<=`

Valid boolean expressions are combined with:

- `|` : or
- `&` : and
- `( and )` : for grouping

These rules are similar to how boolean expressions are used in pandas for indexing.

---

#### Note:

- `=` will be automatically expanded to the comparison operator `==`
  - `~` is the not operator, but can only be used in very limited circumstances
  - If a list/tuple of expressions is passed they will be combined via `&`
- 

The following are valid expressions:

- `'index >= date'`
- `"columns = ['A', 'D']"`
- `"columns in ['A', 'D']"`

- `'columns = A'`
- `'columns == A'`
- `" ~(columns = ['A', 'B']) "`
- `'index > df.index[3] & string = "bar"'`
- `'(index > df.index[3] & index <= df.index[6]) | string = "bar"'`
- `"ts >= Timestamp('2012-02-01')"`
- `"major_axis>=20130101"`

The indexers are on the left-hand side of the sub-expression:

`columns,major_axis,ts`

The right-hand side of the sub-expression (after a comparison operator) can be:

- functions that will be evaluated, e.g. `Timestamp('2012-02-01')`
- strings, e.g. `"bar"`
- date-like, e.g. `20130101`, or `"20130101"`
- lists, e.g. `"['A', 'B']"`
- variables that are defined in the local names space, e.g. `date`

---

**Note:** Passing a string to a query by interpolating it into the query expression is not recommended. Simply assign the string of interest to a variable and use that variable in an expression. For example, do this

```
string = "HolyMoly"
store.select('df', 'index == string')
```

instead of this

```
string = "HolyMoly"
store.select('df', 'index == %s' % string)
```

The latter will **not** work and will raise a `SyntaxError`. Note that there's a single quote followed by a double quote in the string variable.

If you *must* interpolate, use the `'%r'` format specifier

```
store.select('df', 'index == %r' % string)
```

which will quote string.

---

Here are some examples:

```
In [411]: dfq = pd.DataFrame(randn(10, 4), columns=list('ABCD'),
.....:                      index=pd.date_range('20130101', periods=10))
.....:
In [412]: store.append('dfq', dfq, format='table', data_columns=True)
```

Use boolean expressions, with in-line function evaluation.

```
In [413]: store.select('dfq', "index>pd.Timestamp('20130104') & columns=['A', 'B']")
Out[413]:
```

	A	B
2013-01-05	1.210384	0.797435
2013-01-06	-0.850346	1.176812
2013-01-07	0.984188	-0.121728
2013-01-08	0.796595	-0.474021
2013-01-09	-0.804834	-2.123620
2013-01-10	0.334198	0.536784

Use and inline column reference

```
In [414]: store.select('dfq', where="A>0 or C>0")
Out[414]:
```

	A	B	C	D
2013-01-01	0.436258	-1.703013	0.393711	-0.479324
2013-01-02	-0.299016	0.694103	0.678630	0.239556
2013-01-03	0.151227	0.816127	1.893534	0.639633
2013-01-04	-0.962029	-2.085266	1.930247	-1.735349
2013-01-05	1.210384	0.797435	-0.379811	0.702562
2013-01-07	0.984188	-0.121728	2.365769	0.496143
2013-01-08	0.796595	-0.474021	-0.056696	1.357797
2013-01-10	0.334198	0.536784	-0.743830	-0.320204

Works with a Panel as well.

```
In [415]: store.append('wp', wp)

In [416]: store
Out[416]:
<class 'pandas.io.pytables.HDFStore'>
File path: store.h5

In [417]: store.select('wp', "major_axis>pd.Timestamp('20000102') & minor_axis=['A',
↪ 'B']")
\\Out[417]:
<class 'pandas.core.panel.Panel'>
Dimensions: 2 (items) x 3 (major_axis) x 2 (minor_axis)
Items axis: Item1 to Item2
Major_axis axis: 2000-01-03 00:00:00 to 2000-01-05 00:00:00
Minor_axis axis: A to B
```

The columns keyword can be supplied to select a list of columns to be returned, this is equivalent to passing a 'columns=list\_of\_columns\_to\_filter':

```
In [418]: store.select('df', "columns=['A', 'B']")
Out[418]:
```

	A	B
2000-01-01	0.887163	0.859588
2000-01-02	0.015696	-2.242685
2000-01-03	0.991946	0.953324
2000-01-04	-0.334077	0.002118
2000-01-05	0.289092	1.321158
2000-01-06	-0.202646	-0.655969
2000-01-07	0.553439	1.318152
2000-01-08	0.675554	-1.817027

start and stop parameters can be specified to limit the total search space. These are in terms of the total number

of rows in a table.

```
# this is effectively what the storage of a Panel looks like
In [419]: wp.to_frame()
Out[419]:
```

		Item1	Item2
major	minor		
2000-01-01	A	1.058969	0.215269
	B	-0.397840	0.841009
	C	0.337438	-1.445810
	D	1.047579	-1.401973
2000-01-02	A	1.045938	-0.100918
	B	0.863717	-0.548242
	C	-0.122092	-0.144620
...		...	...
2000-01-04	B	0.036142	0.307969
	C	-2.074978	-0.208499
	D	0.247792	1.033801
2000-01-05	A	-0.897157	-2.400454
	B	-0.136795	2.030604
	C	0.018289	-1.142631
	D	0.755414	0.211883

```
[20 rows x 2 columns]

# limiting the search
In [420]: store.select('wp', "major_axis>20000102 & minor_axis=['A', 'B']",
.....:                  start=0, stop=10)
.....:
////////////////////////////////////
```

↩

```
<class 'pandas.core.panel.Panel'>
Dimensions: 2 (items) x 1 (major_axis) x 2 (minor_axis)
Items axis: Item1 to Item2
Major_axis axis: 2000-01-03 00:00:00 to 2000-01-03 00:00:00
Minor_axis axis: A to B
```

**Note:** `select` will raise a `ValueError` if the query expression has an unknown variable reference. Usually this means that you are trying to select on a column that is **not** a data column.

`select` will raise a `SyntaxError` if the query expression is not valid.

#### 24.8.6.2 Using timedelta64[ns]

You can store and query using the `timedelta64[ns]` type. Terms can be specified in the format: `<float>(<unit>)`, where `float` may be signed (and fractional), and `unit` can be `D`, `s`, `ms`, `us`, `ns` for the `timedelta`. Here's an example:

```
In [421]: from datetime import timedelta

In [422]: dftd = pd.DataFrame(dict(A = pd.Timestamp('20130101'), B = [ pd.Timestamp(
↳ '20130101') + timedelta(days=i, seconds=10) for i in range(10) ]))

In [423]: dftd['C'] = dftd['A'] - dftd['B']
```

(continues on next page)

(continued from previous page)

**In [424]:** dftd**Out [424]:**

	A	B	C
0	2013-01-01	2013-01-01 00:00:10	-1 days +23:59:50
1	2013-01-01	2013-01-02 00:00:10	-2 days +23:59:50
2	2013-01-01	2013-01-03 00:00:10	-3 days +23:59:50
3	2013-01-01	2013-01-04 00:00:10	-4 days +23:59:50
4	2013-01-01	2013-01-05 00:00:10	-5 days +23:59:50
5	2013-01-01	2013-01-06 00:00:10	-6 days +23:59:50
6	2013-01-01	2013-01-07 00:00:10	-7 days +23:59:50
7	2013-01-01	2013-01-08 00:00:10	-8 days +23:59:50
8	2013-01-01	2013-01-09 00:00:10	-9 days +23:59:50
9	2013-01-01	2013-01-10 00:00:10	-10 days +23:59:50

**In [425]:** store.append('dftd', dftd, data\_columns=True)**In [426]:** store.select('dftd', "C<'-3.5D'")**Out [426]:**

	A	B	C
4	2013-01-01	2013-01-05 00:00:10	-5 days +23:59:50
5	2013-01-01	2013-01-06 00:00:10	-6 days +23:59:50
6	2013-01-01	2013-01-07 00:00:10	-7 days +23:59:50
7	2013-01-01	2013-01-08 00:00:10	-8 days +23:59:50
8	2013-01-01	2013-01-09 00:00:10	-9 days +23:59:50
9	2013-01-01	2013-01-10 00:00:10	-10 days +23:59:50

### 24.8.6.3 Indexing

You can create/modify an index for a table with `create_table_index` after data is already in the table (after and append/put operation). Creating a table index is **highly** encouraged. This will speed your queries a great deal when you use a select with the indexed dimension as the where.

**Note:** Indexes are automatically created on the indexables and any data columns you specify. This behavior can be turned off by passing `index=False` to append.

# we have automatically already created an index (in the first section)

**In [427]:** i = store.root.df.table.cols.index.index**In [428]:** i.optlevel, i.kind**Out [428]:** (6, 'medium')

# change an index by passing new parameters

**In [429]:** store.create\_table\_index('df', optlevel=9, kind='full')**In [430]:** i = store.root.df.table.cols.index.index**In [431]:** i.optlevel, i.kind**Out [431]:** (9, 'full')

Oftentimes when appending large amounts of data to a store, it is useful to turn off index creation for each append, then recreate at the end.

```

In [432]: df_1 = pd.DataFrame(randn(10, 2), columns=list('AB'))

In [433]: df_2 = pd.DataFrame(randn(10, 2), columns=list('AB'))

In [434]: st = pd.HDFStore('appends.h5', mode='w')

In [435]: st.append('df', df_1, data_columns=['B'], index=False)

In [436]: st.append('df', df_2, data_columns=['B'], index=False)

In [437]: st.get_storer('df').table
Out[437]:
/df/table (Table(20,)) ''
description := {
  "index": Int64Col(shape=(), dflt=0, pos=0),
  "values_block_0": Float64Col(shape=(1,), dflt=0.0, pos=1),
  "B": Float64Col(shape=(), dflt=0.0, pos=2)}
byteorder := 'little'
chunkshape := (2730,)

```

Then create the index when finished appending.

```

In [438]: st.create_table_index('df', columns=['B'], optlevel=9, kind='full')

In [439]: st.get_storer('df').table
Out[439]:
/df/table (Table(20,)) ''
description := {
  "index": Int64Col(shape=(), dflt=0, pos=0),
  "values_block_0": Float64Col(shape=(1,), dflt=0.0, pos=1),
  "B": Float64Col(shape=(), dflt=0.0, pos=2)}
byteorder := 'little'
chunkshape := (2730,)
autoindex := True
colindexes := {
  "B": Index(9, full, shuffle, zlib(1)).is_csi=True}

In [440]: st.close()

```

See [here](#) for how to create a completely-sorted-index (CSI) on an existing store.

#### 24.8.6.4 Query via Data Columns

You can designate (and index) certain columns that you want to be able to perform queries (other than the *indexable* columns, which you can always query). For instance say you want to perform this common operation, on-disk, and return just the frame that matches this query. You can specify `data_columns = True` to force all columns to be `data_columns`.

```

In [441]: df_dc = df.copy()

In [442]: df_dc['string'] = 'foo'

In [443]: df_dc.loc[df_dc.index[4: 6], 'string'] = np.nan

In [444]: df_dc.loc[df_dc.index[7: 9], 'string'] = 'bar'

```

(continues on next page)

(continued from previous page)

```

In [445]: df_dc['string2'] = 'cool'

In [446]: df_dc.loc[df_dc.index[1: 3], ['B', 'C']] = 1.0

In [447]: df_dc
Out[447]:
           A           B           C string string2
2000-01-01  0.887163  0.859588 -0.636524    foo    cool
2000-01-02  0.015696  1.000000  1.000000    foo    cool
2000-01-03  0.991946  1.000000  1.000000    foo    cool
2000-01-04 -0.334077  0.002118  0.405453    foo    cool
2000-01-05  0.289092  1.321158 -1.546906   NaN    cool
2000-01-06 -0.202646 -0.655969  0.193421   NaN    cool
2000-01-07  0.553439  1.318152 -0.469305    foo    cool
2000-01-08  0.675554 -1.817027 -0.183109    bar    cool

# on-disk operations
In [448]: store.append('df_dc', df_dc, data_columns = ['B', 'C', 'string', 'string2'])

In [449]: store.select('df_dc', where='B > 0')
Out[449]:

```

(continues on next page)

(continued from previous page)

```

"C": Float64Col(shape=(), dflt=0.0, pos=3),
"string": StringCol(itemsizes=3, shape=(), dflt=b'', pos=4),
"string2": StringCol(itemsizes=4, shape=(), dflt=b'', pos=5)}
byteorder := 'little'
chunkshape := (1680,)
autoindex := True
colindexes := {
    "index": Index(6, medium, shuffle, zlib(1)).is_csi=False,
    "B": Index(6, medium, shuffle, zlib(1)).is_csi=False,
    "C": Index(6, medium, shuffle, zlib(1)).is_csi=False,
    "string": Index(6, medium, shuffle, zlib(1)).is_csi=False,
    "string2": Index(6, medium, shuffle, zlib(1)).is_csi=False}

```

There is some performance degradation by making lots of columns into *data columns*, so it is up to the user to designate these. In addition, you cannot change data columns (nor indexables) after the first append/put operation (Of course you can simply read in the data and create a new table!).

### 24.8.6.5 Iterator

You can pass `iterator=True` or `chunksize=number_in_a_chunk` to select and `select_as_multiple` to return an iterator on the results. The default is 50,000 rows returned in a chunk.

```

In [453]: for df in store.select('df', chunksize=3):
.....:     print(df)
.....:

```

	A	B	C
2000-01-01	0.887163	0.859588	-0.636524
2000-01-02	0.015696	-2.242685	1.150036
2000-01-03	0.991946	0.953324	-2.021255
	A	B	C
2000-01-04	-0.334077	0.002118	0.405453
2000-01-05	0.289092	1.321158	-1.546906
2000-01-06	-0.202646	-0.655969	0.193421
	A	B	C
2000-01-07	0.553439	1.318152	-0.469305
2000-01-08	0.675554	-1.817027	-0.183109

**Note:** You can also use the iterator with `read_hdf` which will open, then automatically close the store when finished iterating.

```

for df in pd.read_hdf('store.h5', 'df', chunksize=3):
    print(df)

```

Note, that the `chunksize` keyword applies to the **source** rows. So if you are doing a query, then the `chunksize` will subdivide the total rows in the table and the query applied, returning an iterator on potentially unequal sized chunks.

Here is a recipe for generating a query and using it to create equal sized return chunks.

```

In [454]: dfreq = pd.DataFrame({'number': np.arange(1, 11)})

In [455]: dfreq
Out[455]:
   number

```

(continues on next page)

(continued from previous page)

```

0      1
1      2
2      3
3      4
4      5
5      6
6      7
7      8
8      9
9     10

In [456]: store.append('dfeq', dfeq, data_columns=['number'])

In [457]: def chunks(l, n):
.....:     return [l[i: i+n] for i in range(0, len(l), n)]
.....:

In [458]: evens = [2, 4, 6, 8, 10]

In [459]: coordinates = store.select_as_coordinates('dfeq', 'number=evens')

In [460]: for c in chunks(coordinates, 2):
.....:     print(store.select('dfeq', where=c))
.....:
number
1      2
3      4
number
5      6
7      8
number
9     10

```

### 24.8.6.6 Advanced Queries

#### Select a Single Column

To retrieve a single indexable or data column, use the method `select_column`. This will, for example, enable you to get the index very quickly. These return a `Series` of the result, indexed by the row number. These do not currently accept the `where` selector.

```

In [461]: store.select_column('df_dc', 'index')
Out[461]:
0    2000-01-01
1    2000-01-02
2    2000-01-03
3    2000-01-04
4    2000-01-05
5    2000-01-06
6    2000-01-07
7    2000-01-08
Name: index, dtype: datetime64[ns]

In [462]: store.select_column('df_dc', 'string')

```

(continues on next page)

(continued from previous page)

```

////////////////////////////////////
↪
0    foo
1    foo
2    foo
3    foo
4    NaN
5    NaN
6    foo
7    bar
Name: string, dtype: object

```

## Selecting coordinates

Sometimes you want to get the coordinates (a.k.a the index locations) of your query. This returns an `Int64Index` of the resulting locations. These coordinates can also be passed to subsequent `where` operations.

```

In [463]: df_coord = pd.DataFrame(np.random.randn(1000, 2),
.....:                           index=pd.date_range('20000101', periods=1000))
.....:

```

```

In [464]: store.append('df_coord', df_coord)

```

```

In [465]: c = store.select_as_coordinates('df_coord', 'index > 20020101')

```

```

In [466]: c

```

```

Out[466]:
Int64Index([732, 733, 734, 735, 736, 737, 738, 739, 740, 741,
...
          990, 991, 992, 993, 994, 995, 996, 997, 998, 999],
          dtype='int64', length=268)

```

```

In [467]: store.select('df_coord', where=c)

```

```

////////////////////////////////////

2002-09-26 -1.324806  1.139269

[268 rows x 2 columns]

```

## Selecting using a where mask

Sometime your query can involve creating a list of rows to select. Usually this mask would be a resulting index from an indexing operation. This example selects the months of a datetimeindex which are 5.

```
In [468]: df_mask = pd.DataFrame(np.random.randn(1000, 2),
.....:                           index=pd.date_range('20000101', periods=1000))
.....:

In [469]: store.append('df_mask', df_mask)

In [470]: c = store.select_column('df_mask', 'index')

In [471]: where = c[pd.DatetimeIndex(c).month == 5].index

In [472]: store.select('df_mask', where=where)
Out[472]:
```

	0	1
2000-05-01	-1.006245	-0.616759
2000-05-02	0.218940	0.717838
2000-05-03	0.013333	1.348060
2000-05-04	0.662176	-1.050645
2000-05-05	-1.034870	-0.243242
2000-05-06	-0.753366	-1.454329
2000-05-07	-1.022920	-0.476989
...	...	...
2002-05-25	-0.509090	-0.389376
2002-05-26	0.150674	1.164337
2002-05-27	-0.332944	0.115181
2002-05-28	-1.048127	-0.605733
2002-05-29	1.418754	-0.442835
2002-05-30	-0.433200	0.835001
2002-05-31	-1.041278	1.401811

```
[93 rows x 2 columns]
```

## Storer Object

If you want to inspect the stored object, retrieve via `get_storer`. You could use this programmatically to say get the number of rows in an object.

```
In [473]: store.get_storer('df_dc').nrows
Out[473]: 8
```

### 24.8.6.7 Multiple Table Queries

The methods `append_to_multiple` and `select_as_multiple` can perform appending/selecting from multiple tables at once. The idea is to have one table (call it the selector table) that you index most/all of the columns, and perform your queries. The other table(s) are data tables with an index matching the selector table's index. You can then perform a very fast query on the selector table, yet get lots of data back. This method is similar to having a very wide table, but enables more efficient queries.

The `append_to_multiple` method splits a given single DataFrame into multiple tables according to `d`, a dictionary that maps the table names to a list of 'columns' you want in that table. If `None` is used in place of a list, that table will have the remaining unspecified columns of the given DataFrame. The argument `selector` defines which

table is the selector table (which you can make queries from). The argument `dropna` will drop rows from the input `DataFrame` to ensure tables are synchronized. This means that if a row for one of the tables being written to is entirely `np.NaN`, that row will be dropped from all tables.

If `dropna` is `False`, **THE USER IS RESPONSIBLE FOR SYNCHRONIZING THE TABLES**. Remember that entirely `np.NaN` rows are not written to the `HDFStore`, so if you choose to call `dropna=False`, some tables may have more rows than others, and therefore `select_as_multiple` may not work or it may return unexpected results.

```
In [474]: df_mt = pd.DataFrame(randn(8, 6), index=pd.date_range('1/1/2000',
↳ periods=8),
        .....:                                columns=['A', 'B', 'C', 'D', 'E', 'F'])
        .....:
```

```
In [475]: df_mt['foo'] = 'bar'
```

```
In [476]: df_mt.loc[df_mt.index[1], ('A', 'B')] = np.nan
```

```
# you can also create the tables individually
```

```
In [477]: store.append_to_multiple({'df1_mt': ['A', 'B'], 'df2_mt': None },
        .....:                    df_mt, selector='df1_mt')
        .....:
```

```
In [478]: store
```

```
Out[478]:

## 24.8.7 Delete from a Table

You can delete from a table selectively by specifying a `where`. In deleting rows, it is important to understand the `PyTables` deletes rows by erasing the rows, then **moving** the following data. Thus deleting can potentially be a very expensive operation depending on the orientation of your data. This is especially true in higher dimensional objects (`Panel` and `Panel4D`). To get optimal performance, it's worthwhile to have the dimension you are deleting be the first of the indexables.

Data is ordered (on the disk) in terms of the indexables. Here's a simple use case. You store panel-type data, with dates in the `major_axis` and ids in the `minor_axis`. The data is then interleaved like this:

- `date_1 - id_1 - id_2 - . - id_n`
- `date_2 - id_1 - . - id_n`

It should be clear that a delete operation on the `major_axis` will be fairly quick, as one chunk is removed, then the following data moved. On the other hand a delete operation on the `minor_axis` will be very expensive. In this case it would almost certainly be faster to rewrite the table using a `where` that selects all but the missing data.

```
# returns the number of rows deleted
In [482]: store.remove('wp', 'major_axis > 20000102' )
Out[482]: 12

In [483]: store.select('wp')
Out[483]:
<class 'pandas.core.panel.Panel'>
Dimensions: 2 (items) x 2 (major_axis) x 4 (minor_axis)
Items axis: Item1 to Item2
Major_axis axis: 2000-01-01 00:00:00 to 2000-01-02 00:00:00
Minor_axis axis: A to D
```

**Warning:** Please note that **HDF5 DOES NOT RECLAIM SPACE** in the h5 files automatically. Thus, repeatedly deleting (or removing nodes) and adding again, **WILL TEND TO INCREASE THE FILE SIZE**.

To *repack and clean* the file, use `ptrepack`.

## 24.8.8 Notes & Caveats

### 24.8.8.1 Compression

`PyTables` allows the stored data to be compressed. This applies to all kinds of stores, not just tables. Two parameters are used to control compression: `complevel` and `complib`.

**`complevel` specifies if and how hard data is to be compressed.** `complevel=0` and `complevel=None` disables compression and `0 < complevel < 10` enables compression.

`complib` specifies which compression library to use. If nothing is specified the default library `zlib` is used. A compression library usually optimizes for either good compression rates or speed and the results will depend on the type of data. Which type of compression to choose depends on your specific needs and data. The list of supported compression libraries:

- `zlib`: The default compression library. A classic in terms of compression, achieves good compression rates but is somewhat slow.
- `lzo`: Fast compression and decompression.
- `bzip2`: Good compression rates.
- `blosc`: Fast compression and decompression.

New in version 0.20.2: Support for alternative `blosc` compressors:

- `blosc:blosclz`: This is the default compressor for `blosc`
- `blosc:lz4`: A compact, very popular and fast compressor.
- `blosc:lz4hc`: A tweaked version of LZ4, produces better compression ratios at the expense of speed.
- `blosc:snappy`: A popular compressor used in many places.
- `blosc:zlib`: A classic; somewhat slower than the previous ones, but achieving better compression ratios.
- `blosc:zstd`: An extremely well balanced codec; it provides the best compression ratios among the others above, and at reasonably fast speed.

If `complib` is defined as something other than the listed libraries a `ValueError` exception is issued.

---

**Note:** If the library specified with the `complib` option is missing on your platform, compression defaults to `zlib` without further ado.

---

Enable compression for all objects within the file:

```
store_compressed = pd.HDFStore('store_compressed.h5', complevel=9,
                               complib='blosc:blosclz')
```

Or on-the-fly compression (this only applies to tables) in stores where compression is not enabled:

```
store.append('df', df, complib='zlib', complevel=5)
```

### 24.8.8.2 ptrepack

`PyTables` offers better write performance when tables are compressed after they are written, as opposed to turning on compression at the very beginning. You can use the supplied `PyTables` utility `ptrepack`. In addition, `ptrepack` can change compression levels after the fact.

```
ptrepack --chunkshape=auto --propindexes --complevel=9 --complib=blosc in.h5 out.h5
```

Furthermore `ptrepack in.h5 out.h5` will *repack* the file to allow you to reuse previously deleted space. Alternatively, one can simply remove the file and write again, or use the `copy` method.

### 24.8.8.3 Caveats

**Warning:** HDFStore is **not-threadsafe for writing**. The underlying PyTables only supports concurrent reads (via threading or processes). If you need reading and writing *at the same time*, you need to serialize these operations in a single thread in a single process. You will corrupt your data otherwise. See the (GH2397) for more information.

- If you use locks to manage write access between multiple processes, you may want to use `fsync()` before releasing write locks. For convenience you can use `store.flush(fsync=True)` to do this for you.
- Once a table is created its items (Panel) / columns (DataFrame) are fixed; only exactly the same columns can be appended
- Be aware that timezones (e.g., `pytz.timezone('US/Eastern')`) are not necessarily equal across time-zone versions. So if data is localized to a specific timezone in the HDFStore using one version of a timezone library and that data is updated with another version, the data will be converted to UTC since these timezones are not considered equal. Either use the same version of timezone library or use `tz_convert` with the updated timezone definition.

**Warning:** PyTables will show a `NaturalNameWarning` if a column name cannot be used as an attribute selector. *Natural* identifiers contain only letters, numbers, and underscores, and may not begin with a number. Other identifiers cannot be used in a `where` clause and are generally a bad idea.

### 24.8.9 DataTypes

HDFStore will map an object dtype to the PyTables underlying dtype. This means the following types are known to work:

Type	Represents missing values
floating: float64, float32, float16	np.nan
integer: int64, int32, int8, uint64, uint32, uint8	
boolean	
datetime64[ns]	NaT
timedelta64[ns]	NaT
categorical: see the section below	
object: strings	np.nan

unicode columns are not supported, and **WILL FAIL**.

#### 24.8.9.1 Categorical Data

You can write data that contains `category` dtypes to a HDFStore. Queries work the same as if it was an object array. However, the `category` typed data is stored in a more efficient manner.

```
In [484]: dfcat = pd.DataFrame({'A': pd.Series(list('aabbcdba')).astype('category'),
.....:                        'B': np.random.randn(8) })
.....:
In [485]: dfcat
```

(continues on next page)

(continued from previous page)

```

Out[485]:

dtype: object

```

### 24.8.9.2 String Columns

#### min\_itemsize

The underlying implementation of `HDFStore` uses a fixed column width (`itemsizes`) for string columns. A string column `itemsize` is calculated as the maximum of the length of data (for that column) that is passed to the `HDFStore`, **in the first append**. Subsequent appends, may introduce a string for a column **larger** than the column can hold, an `Exception` will be raised (otherwise you could have a silent truncation of these columns, leading to loss of information). In the future we may relax this and allow a user-specified truncation to occur.

Pass `min_itemsize` on the first table creation to a-priori specify the minimum length of a particular string column. `min_itemsize` can be an integer, or a dict mapping a column name to an integer. You can pass `values` as a key to allow all *indexables* or *data\_columns* to have this `min_itemsize`.

Passing a `min_itemsize` dict will cause all passed columns to be created as *data\_columns* automatically.

**Note:** If you are not passing any `data_columns`, then the `min_itemsize` will be the maximum of the length of

any string passed

```
In [492]: dfs = pd.DataFrame(dict(A='foo', B='bar'), index=list(range(5)))

In [493]: dfs
Out[493]:
   A  B
0  foo bar
1  foo bar
2  foo bar
3  foo bar
4  foo bar

# A and B have a size of 30
In [494]: store.append('dfs', dfs, min_itemsize=30)

In [495]: store.get_storer('dfs').table
Out[495]:
/dfs/table (Table(5,)) ''
  description := {
    "index": Int64Col(shape=(), dflt=0, pos=0),
    "values_block_0": StringCol(itemsize=30, shape=(2,), dflt=b'', pos=1)}
  byteorder := 'little'
  chunkshape := (963,)
  autoindex := True
  colindexes := {
    "index": Index(6, medium, shuffle, zlib(1)).is_csi=False}

# A is created as a data_column with a size of 30
# B is size is calculated
In [496]: store.append('dfs2', dfs, min_itemsize={'A': 30})

In [497]: store.get_storer('dfs2').table
Out[497]:
/dfs2/table (Table(5,)) ''
  description := {
    "index": Int64Col(shape=(), dflt=0, pos=0),
    "values_block_0": StringCol(itemsize=3, shape=(1,), dflt=b'', pos=1),
    "A": StringCol(itemsize=30, shape=(), dflt=b'', pos=2)}
  byteorder := 'little'
  chunkshape := (1598,)
  autoindex := True
  colindexes := {
    "index": Index(6, medium, shuffle, zlib(1)).is_csi=False,
    "A": Index(6, medium, shuffle, zlib(1)).is_csi=False}
```

### nan\_rep

String columns will serialize a `np.nan` (a missing value) with the `nan_rep` string representation. This defaults to the string value `nan`. You could inadvertently turn an actual `nan` value into a missing value.

```
In [498]: dfss = pd.DataFrame(dict(A=['foo', 'bar', 'nan']))

In [499]: dfss
Out[499]:
   A
0  foo
```

(continues on next page)

(continued from previous page)

```

1  bar
2  nan

In [500]: store.append('dfss', dfss)

In [501]: store.select('dfss')
Out[501]:
      A
0  foo
1  bar
2  NaN

# here you need to specify a different nan rep
In [502]: store.append('dfss2', dfss, nan_rep='_nan_')

In [503]: store.select('dfss2')
Out[503]:
      A
0  foo
1  bar
2  nan

```

## 24.8.10 External Compatibility

HDFStore writes table format objects in specific formats suitable for producing loss-less round trips to pandas objects. For external compatibility, HDFStore can read native PyTables format tables.

It is possible to write an HDFStore object that can easily be imported into R using the rhdf5 library ([Package website](#)). Create a table format store like this:

```

In [504]: np.random.seed(1)

In [505]: df_for_r = pd.DataFrame({"first": np.random.rand(100),
.....:                             "second": np.random.rand(100),
.....:                             "class": np.random.randint(0, 2, (100, ))},
.....:                             index=range(100))

In [506]: df_for_r.head()
Out[506]:
      first    second  class
0  0.417022  0.326645     0
1  0.720324  0.527058     0
2  0.000114  0.885942     1
3  0.302333  0.357270     1
4  0.146756  0.908535     1

In [507]: store_export = pd.HDFStore('export.h5')

In [508]: store_export.append('df_for_r', df_for_r, data_columns=df_dc.columns)

In [509]: store_export
Out[509]:
<class 'pandas.io.pytables.HDFStore'>
File path: export.h5

```

In R this file can be read into a `data.frame` object using the `rhdf5` library. The following example function reads the corresponding column names and data values from the values and assembles them into a `data.frame`:

```
# Load values and column names for all datasets from corresponding nodes and
# insert them into one data.frame object.

library(rhdf5)

loadhdf5data <- function(h5File) {

  listing <- h5ls(h5File)
  # Find all data nodes, values are stored in *_values and corresponding column
  # titles in *_items
  data_nodes <- grep("_values", listing$name)
  name_nodes <- grep("_items", listing$name)
  data_paths = paste(listing$group[data_nodes], listing$name[data_nodes], sep = "/")
  name_paths = paste(listing$group[name_nodes], listing$name[name_nodes], sep = "/")
  columns = list()
  for (idx in seq(data_paths)) {
    # NOTE: matrices returned by h5read have to be transposed to obtain
    # required Fortran order!
    data <- data.frame(t(h5read(h5File, data_paths[idx])))
    names <- t(h5read(h5File, name_paths[idx]))
    entry <- data.frame(data)
    colnames(entry) <- names
    columns <- append(columns, entry)
  }

  data <- data.frame(columns)

  return(data)
}
```

Now you can import the `DataFrame` into R:

```
> data = loadhdf5data("transfer.hdf5")
> head(data)
   first    second class
1 0.4170220047 0.3266449    0
2 0.7203244934 0.5270581    0
3 0.0001143748 0.8859421    1
4 0.3023325726 0.3572698    1
5 0.1467558908 0.9085352    1
6 0.0923385948 0.6233601    1
```

**Note:** The R function lists the entire HDF5 file's contents and assembles the `data.frame` object from all matching nodes, so use this only as a starting point if you have stored multiple `DataFrame` objects to a single HDF5 file.

### 24.8.11 Performance

- `tables` format come with a writing performance penalty as compared to `fixed` stores. The benefit is the ability to append/delete and query (potentially very large amounts of data). Write times are generally longer as compared with regular stores. Query times can be quite fast, especially on an indexed axis.
- You can pass `chunksize=<int>` to `append`, specifying the write chunksize (default is 50000). This will

significantly lower your memory usage on writing.

- You can pass `expectedrows=<int>` to the first `append`, to set the TOTAL number of expected rows that `PyTables` will expect. This will optimize read/write performance.
- Duplicate rows can be written to tables, but are filtered out in selection (with the last items being selected; thus a table is unique on major, minor pairs)
- A `PerformanceWarning` will be raised if you are attempting to store types that will be pickled by `PyTables` (rather than stored as endemic types). See [Here](#) for more information and some solutions.

## 24.9 Feather

New in version 0.20.0.

Feather provides binary columnar serialization for data frames. It is designed to make reading and writing data frames efficient, and to make sharing data across data analysis languages easy.

Feather is designed to faithfully serialize and de-serialize `DataFrames`, supporting all of the pandas dtypes, including extension dtypes such as categorical and datetime with tz.

Several caveats.

- This is a newer library, and the format, though stable, is not guaranteed to be backward compatible to the earlier versions.
- The format will NOT write an `Index`, or `MultiIndex` for the `DataFrame` and will raise an error if a non-default one is provided. You can `.reset_index()` to store the index or `.reset_index(drop=True)` to ignore it.
- Duplicate column names and non-string columns names are not supported
- Non supported types include `Period` and actual Python object types. These will raise a helpful error message on an attempt at serialization.

See the [Full Documentation](#).

```
In [510]: df = pd.DataFrame({'a': list('abc'),
.....:                      'b': list(range(1, 4)),
.....:                      'c': np.arange(3, 6).astype('u1'),
.....:                      'd': np.arange(4.0, 7.0, dtype='float64'),
.....:                      'e': [True, False, True],
.....:                      'f': pd.Categorical(list('abc')),
.....:                      'g': pd.date_range('20130101', periods=3),
.....:                      'h': pd.date_range('20130101', periods=3, tz='US/Eastern
↪'),
.....:                      'i': pd.date_range('20130101', periods=3, freq='ns')})

In [511]: df
Out[511]:
```

dtype: object

```

## 24.10 Parquet

New in version 0.21.0.

[Apache Parquet](#) provides a partitioned binary columnar serialization for data frames. It is designed to make reading and writing data frames efficient, and to make sharing data across data analysis languages easy. Parquet can use a variety of compression techniques to shrink the file size as much as possible while still maintaining good read performance.

Parquet is designed to faithfully serialize and de-serialize `DataFrame`s, supporting all of the pandas dtypes, including extension dtypes such as datetime with tz.

Several caveats.

- Duplicate column names and non-string columns names are not supported.
- Index level names, if specified, must be strings.
- Categorical dtypes can be serialized to parquet, but will de-serialize as `object` dtype.
- Non supported types include `Period` and actual Python object types. These will raise a helpful error message on an attempt at serialization.

You can specify an `engine` to direct the serialization. This can be one of `pyarrow`, or `fastparquet`, or `auto`. If the engine is NOT specified, then the `pd.options.io.parquet.engine` option is checked; if this is also `auto`, then `pyarrow` is tried, and falling back to `fastparquet`.

See the documentation for [pyarrow](#) and [fastparquet](#).

**Note:** These engines are very similar and should read/write nearly identical parquet format files. Currently `pyarrow` does not support `timedelta` data, `fastparquet`  $\geq 0.1.4$  supports timezone aware datetimes. These libraries differ by having different underlying dependencies (`fastparquet` by using `numba`, while `pyarrow` uses a c-library).

```
In [517]: df = pd.DataFrame({'a': list('abc'),
.....:                      'b': list(range(1, 4)),
.....:                      'c': np.arange(3, 6).astype('u1'),
.....:                      'd': np.arange(4.0, 7.0, dtype='float64'),
.....:                      'e': [True, False, True],
.....:                      'f': pd.date_range('20130101', periods=3),
.....:                      'g': pd.date_range('20130101', periods=3, tz='US/Eastern')})
```

```
In [518]: df

## 24.11 SQL Queries

The `pandas.io.sql` module provides a collection of query wrappers to both facilitate data retrieval and to reduce dependency on DB-specific API. Database abstraction is provided by SQLAlchemy if installed. In addition you will need a driver library for your database. Examples of such drivers are [psycopg2](#) for PostgreSQL or [pymysql](#) for MySQL. For [SQLite](#) this is included in Python's standard library by default. You can find an overview of supported drivers for each SQL dialect in the [SQLAlchemy docs](#).

If SQLAlchemy is not installed, a fallback is only provided for `sqlite` (and for `mysql` for backwards compatibility, but this is deprecated and will be removed in a future version). This mode requires a Python database adapter which respect the [Python DB-API](#).

See also some [cookbook examples](#) for some advanced strategies.

The key functions are:

<code>read_sql_table(table_name, con[, schema, ...])</code>	Read SQL database table into a DataFrame.
<code>read_sql_query(sql, con[, index_col, ...])</code>	Read SQL query into a DataFrame.
<code>read_sql(sql, con[, index_col, ...])</code>	Read SQL query or database table into a DataFrame.
<code>DataFrame.to_sql(name, con[, schema, ...])</code>	Write records stored in a DataFrame to a SQL database.

### 24.11.1 pandas.read\_sql\_table

`pandas.read_sql_table(table_name, con, schema=None, index_col=None, coerce_float=True, parse_dates=None, columns=None, chunksize=None)`

Read SQL database table into a DataFrame.

Given a table name and a SQLAlchemy connectable, returns a DataFrame. This function does not support DBAPI connections.

**Parameters** `table_name` : string

Name of SQL table in database.

`con` : SQLAlchemy connectable (or database string URI)

SQLite DBAPI connection mode not supported.

`schema` : string, default None

Name of SQL schema in database to query (if database flavor supports this). Uses default schema if None (default).

`index_col` : string or list of strings, optional, default: None

Column(s) to set as index(MultiIndex).

`coerce_float` : boolean, default True

Attempts to convert values of non-string, non-numeric objects (like decimal.Decimal) to floating point. Can result in loss of Precision.

`parse_dates` : list or dict, default: None

- List of column names to parse as dates.
- Dict of {column\_name: format string} where format string is strftime compatible in case of parsing string times or is one of (D, s, ns, ms, us) in case of parsing integer timestamps.
- Dict of {column\_name: arg dict}, where the arg dict corresponds to the keyword arguments of `pandas.to_datetime()` Especially useful with databases without native Datetime support, such as SQLite.

`columns` : list, default: None

List of column names to select from SQL table

`chunksize` : int, default None

If specified, returns an iterator where `chunksize` is the number of rows to include in each chunk.

**Returns**

**DataFrame**

See also:

`read_sql_query` Read SQL query into a DataFrame.

`read_sql`

## Notes

Any datetime values with time zone information will be converted to UTC.

### 24.11.2 pandas.read\_sql\_query

`pandas.read_sql_query(sql, con, index_col=None, coerce_float=True, params=None, parse_dates=None, chunksize=None)`

Read SQL query into a DataFrame.

Returns a DataFrame corresponding to the result set of the query string. Optionally provide an `index_col` parameter to use one of the columns as the index, otherwise default integer index will be used.

**Parameters** `sql` : string SQL query or SQLAlchemy Selectable (select or text object)

SQL query to be executed.

`con` : SQLAlchemy connectable(engine/connection), database string URI,

or sqlite3 DBAPI2 connection Using SQLAlchemy makes it possible to use any DB supported by that library. If a DBAPI2 object, only sqlite3 is supported.

`index_col` : string or list of strings, optional, default: None

Column(s) to set as index(MultiIndex).

`coerce_float` : boolean, default True

Attempts to convert values of non-string, non-numeric objects (like decimal.Decimal) to floating point. Useful for SQL result sets.

`params` : list, tuple or dict, optional, default: None

List of parameters to pass to execute method. The syntax used to pass parameters is database driver dependent. Check your database driver documentation for which of the five syntax styles, described in PEP 249's paramstyle, is supported. Eg. for psycopg2, uses %(name)s so use params={'name' : 'value'}

`parse_dates` : list or dict, default: None

- List of column names to parse as dates.
- Dict of {column\_name: format string} where format string is strftime compatible in case of parsing string times, or is one of (D, s, ns, ms, us) in case of parsing integer timestamps.
- Dict of {column\_name: arg dict}, where the arg dict corresponds to the keyword arguments of `pandas.to_datetime()` Especially useful with databases without native Datetime support, such as SQLite.

`chunksize` : int, default None

If specified, return an iterator where `chunksize` is the number of rows to include in each chunk.

## Returns

**DataFrame**

See also:

`read_sql_table` Read SQL database table into a DataFrame.

`read_sql`

## Notes

Any datetime values with time zone information parsed via the `parse_dates` parameter will be converted to UTC.

### 24.11.3 pandas.read\_sql

`pandas.read_sql(sql, con, index_col=None, coerce_float=True, params=None, parse_dates=None, columns=None, chunksize=None)`

Read SQL query or database table into a DataFrame.

This function is a convenience wrapper around `read_sql_table` and `read_sql_query` (for backward compatibility). It will delegate to the specific function depending on the provided input. A SQL query will be routed to `read_sql_query`, while a database table name will be routed to `read_sql_table`. Note that the delegated function might have more specific notes about their functionality not listed here.

**Parameters** `sql` : string or SQLAlchemy Selectable (select or text object)

SQL query to be executed or a table name.

**con** : SQLAlchemy connectable (engine/connection) or database string URI

or DBAPI2 connection (fallback mode)

Using SQLAlchemy makes it possible to use any DB supported by that library. If a DBAPI2 object, only sqlite3 is supported.

**index\_col** : string or list of strings, optional, default: None

Column(s) to set as index(MultiIndex).

**coerce\_float** : boolean, default True

Attempts to convert values of non-string, non-numeric objects (like decimal.Decimal) to floating point, useful for SQL result sets.

**params** : list, tuple or dict, optional, default: None

List of parameters to pass to execute method. The syntax used to pass parameters is database driver dependent. Check your database driver documentation for which of the five syntax styles, described in PEP 249's paramstyle, is supported. Eg. for psycopg2, uses `%(name)s` so use `params={'name': 'value'}`

**parse\_dates** : list or dict, default: None

- List of column names to parse as dates.
- Dict of {column\_name: format string} where format string is strftime compatible in case of parsing string times, or is one of (D, s, ns, ms, us) in case of parsing integer timestamps.
- Dict of {column\_name: arg dict}, where the arg dict corresponds to the keyword arguments of `pandas.to_datetime()` Especially useful with databases without native Datetime support, such as SQLite.

**columns** : list, default: None

List of column names to select from SQL table (only used when reading a table).

**chunksize** : int, default None

If specified, return an iterator where *chunksize* is the number of rows to include in each chunk.

#### Returns

**DataFrame**

See also:

[`read\_sql\_table`](#) Read SQL database table into a DataFrame.

[`read\_sql\_query`](#) Read SQL query into a DataFrame.

### 24.11.4 pandas.DataFrame.to\_sql

`DataFrame.to_sql` (*name*, *con*, *schema=None*, *if\_exists='fail'*, *index=True*, *index\_label=None*, *chunksize=None*, *dtype=None*)

Write records stored in a DataFrame to a SQL database.

Databases supported by SQLAlchemy [\[R16\]](#) are supported. Tables can be newly created, appended to, or overwritten.

**Parameters** **name** : string

Name of SQL table.

**con** : sqlalchemy.engine.Engine or sqlite3.Connection

Using SQLAlchemy makes it possible to use any DB supported by that library. Legacy support is provided for sqlite3.Connection objects.

**schema** : string, optional

Specify the schema (if database flavor supports this). If None, use default schema.

**if\_exists** : { 'fail', 'replace', 'append' }, default 'fail'

How to behave if the table already exists.

- fail: Raise a ValueError.
- replace: Drop the table before inserting new values.
- append: Insert new values to the existing table.

**index** : boolean, default True

Write DataFrame index as a column. Uses *index\_label* as the column name in the table.

**index\_label** : string or sequence, default None

Column label for index column(s). If None is given (default) and *index* is True, then the index names are used. A sequence should be given if the DataFrame uses MultiIndex.

**chunksize** : int, optional

Rows will be written in batches of this size at a time. By default, all rows will be written at once.

**dtype** : dict, optional

Specifying the datatype for columns. The keys should be the column names and the values should be the SQLAlchemy types or strings for the sqlite3 legacy mode.

### Raises `ValueError`

When the table already exists and *if\_exists* is 'fail' (the default).

`pandas.read_sql` read a DataFrame from a table

### References

[R16], [R17]

### Examples

Create an in-memory SQLite database.

```
>>> from sqlalchemy import create_engine
>>> engine = create_engine('sqlite://', echo=False)
```

Create a table from scratch with 3 rows.

```
>>> df = pd.DataFrame({'name' : ['User 1', 'User 2', 'User 3']})
>>> df
   name
0  User 1
1  User 2
2  User 3
```

```
>>> df.to_sql('users', con=engine)
>>> engine.execute("SELECT * FROM users").fetchall()
[(0, 'User 1'), (1, 'User 2'), (2, 'User 3')]
```

```
>>> df1 = pd.DataFrame({'name' : ['User 4', 'User 5']})
>>> df1.to_sql('users', con=engine, if_exists='append')
>>> engine.execute("SELECT * FROM users").fetchall()
[(0, 'User 1'), (1, 'User 2'), (2, 'User 3'),
 (0, 'User 4'), (1, 'User 5')]
```

Overwrite the table with just df1.

```
>>> df1.to_sql('users', con=engine, if_exists='replace',
...           index_label='id')
>>> engine.execute("SELECT * FROM users").fetchall()
[(0, 'User 4'), (1, 'User 5')]
```

Specify the dtype (especially useful for integers with missing values). Notice that while pandas is forced to store the data as floating point, the database supports nullable integers. When fetching the data with Python, we get back integer scalars.

```
>>> df = pd.DataFrame({"A": [1, None, 2]})
>>> df
   A
```

(continues on next page)

(continued from previous page)

```
0  1.0
1  NaN
2  2.0
```

```
>>> from sqlalchemy.types import Integer
>>> df.to_sql('integers', con=engine, index=False,
...          dtype={"A": Integer()})
```

```
>>> engine.execute("SELECT * FROM integers").fetchall()
[(1,), (None,), (2,)]
```

**Note:** The function `read_sql()` is a convenience wrapper around `read_sql_table()` and `read_sql_query()` (and for backward compatibility) and will delegate to specific function depending on the provided input (database table name or sql query). Table names do not need to be quoted if they have special characters.

In the following example, we use the [SQLite](#) SQL database engine. You can use a temporary SQLite database where data are stored in “memory”.

To connect with SQLAlchemy you use the `create_engine()` function to create an engine object from database URI. You only need to create the engine once per database you are connecting to. For more information on `create_engine()` and the URI formatting, see the examples below and the SQLAlchemy [documentation](#)

```
In [527]: from sqlalchemy import create_engine

# Create your engine.
In [528]: engine = create_engine('sqlite:///memory:')
```

If you want to manage your own connections you can pass one of those instead:

```
with engine.connect() as conn, conn.begin():
    data = pd.read_sql_table('data', conn)
```

### 24.11.5 Writing DataFrames

Assuming the following data is in a DataFrame `data`, we can insert it into the database using `to_sql()`.

id	Date	Col_1	Col_2	Col_3
26	2012-10-18	X	25.7	True
42	2012-10-19	Y	-12.4	False
63	2012-10-20	Z	5.73	True

```
In [529]: data.to_sql('data', engine)
```

With some databases, writing large DataFrames can result in errors due to packet size limitations being exceeded. This can be avoided by setting the `chunksize` parameter when calling `to_sql`. For example, the following writes data to the database in batches of 1000 rows at a time:

```
In [530]: data.to_sql('data_chunked', engine, chunksize=1000)
```

`to_sql()` will try to map your data to an appropriate SQL data type based on the dtype of the data. When you have columns of dtype object, pandas will try to infer the data type.

You can always override the default type by specifying the desired SQL type of any of the columns by using the `dtype` argument. This argument needs a dictionary mapping column names to SQLAlchemy types (or strings for the sqlite3 fallback mode). For example, specifying to use the sqlalchemy `String` type instead of the default `Text` type for string columns:

```
In [531]: from sqlalchemy.types import String
In [532]: data.to_sql('data_dtype', engine, dtype={'Col_1': String})
```

---

**Note:** Due to the limited support for `timedelta`'s in the different database flavors, columns with type `timedelta64` will be written as integer values as nanoseconds to the database and a warning will be raised.

---

---

**Note:** Columns of `category` dtype will be converted to the dense representation as you would get with `np.asarray(categorical)` (e.g. for string categories this gives an array of strings). Because of this, reading the database table back in does **not** generate a categorical.

---

## 24.11.6 Reading Tables

`read_sql_table()` will read a database table given the table name and optionally a subset of columns to read.

---

**Note:** In order to use `read_sql_table()`, you **must** have the SQLAlchemy optional dependency installed.

---

```
In [533]: pd.read_sql_table('data', engine)
Out[533]:
```

	index	id	Date	Col_1	Col_2	Col_3
0	0	26	2010-10-18	X	27.50	True
1	1	42	2010-10-19	Y	-12.50	False
2	2	63	2010-10-20	Z	5.73	True

You can also specify the name of the column as the `DataFrame` index, and specify a subset of columns to be read.

```
In [534]: pd.read_sql_table('data', engine, index_col='id')
Out[534]:
```

	index	Date	Col_1	Col_2	Col_3
id					
26	0	2010-10-18	X	27.50	True
42	1	2010-10-19	Y	-12.50	False
63	2	2010-10-20	Z	5.73	True

```
In [535]: pd.read_sql_table('data', engine, columns=['Col_1', 'Col_2'])
//////////
↪
Col_1 Col_2
0    X 27.50
1    Y -12.50
2    Z  5.73
```

And you can explicitly force columns to be parsed as dates:

```
In [536]: pd.read_sql_table('data', engine, parse_dates=['Date'])
Out[536]:
```

	index	id	Date	Col_1	Col_2	Col_3
0	0	26	2010-10-18	X	27.50	True
1	1	42	2010-10-19	Y	-12.50	False
2	2	63	2010-10-20	Z	5.73	True

If needed you can explicitly specify a format string, or a dict of arguments to pass to `pandas.to_datetime()`:

```
pd.read_sql_table('data', engine, parse_dates={'Date': '%Y-%m-%d'})
pd.read_sql_table('data', engine, parse_dates={'Date': {'format': '%Y-%m-%d %H:%M:%S'}}
→))
```

You can check if a table exists using `has_table()`

### 24.11.7 Schema support

Reading from and writing to different schema's is supported through the `schema` keyword in the `read_sql_table()` and `to_sql()` functions. Note however that this depends on the database flavor (sqlite does not have schema's). For example:

```
df.to_sql('table', engine, schema='other_schema')
pd.read_sql_table('table', engine, schema='other_schema')
```

### 24.11.8 Querying

You can query using raw SQL in the `read_sql_query()` function. In this case you must use the SQL variant appropriate for your database. When using SQLAlchemy, you can also pass SQLAlchemy Expression language constructs, which are database-agnostic.

```
In [537]: pd.read_sql_query('SELECT * FROM data', engine)
Out[537]:
```

	index	id	Date	Col_1	Col_2	Col_3
0	0	26	2010-10-18 00:00:00.000000	X	27.50	1
1	1	42	2010-10-19 00:00:00.000000	Y	-12.50	0
2	2	63	2010-10-20 00:00:00.000000	Z	5.73	1

Of course, you can specify a more “complex” query.

```
In [538]: pd.read_sql_query("SELECT id, Col_1, Col_2 FROM data WHERE id = 42;",
→engine)
Out[538]:
```

	id	Col_1	Col_2
0	42	Y	-12.5

The `read_sql_query()` function supports a `chunksize` argument. Specifying this will return an iterator through chunks of the query result:

```
In [539]: df = pd.DataFrame(np.random.randn(20, 3), columns=list('abc'))

In [540]: df.to_sql('data_chunks', engine, index=False)
```

```
In [541]: for chunk in pd.read_sql_query("SELECT * FROM data_chunks", engine,
↳ chunksize=5):
    .....:     print(chunk)
    .....:
           a          b          c
0  0.280665 -0.073113  1.160339
1  0.369493  1.904659  1.111057
2  0.659050 -1.627438  0.602319
3  0.420282  0.810952  1.044442
4 -0.400878  0.824006 -0.562305
           a          b          c
0  1.954878 -1.331952 -1.760689
1 -1.650721 -0.890556 -1.119115
2  1.956079 -0.326499 -1.342676
3  1.114383 -0.586524 -1.236853
4  0.875839  0.623362 -0.434957
           a          b          c
0  1.407540  0.129102  1.616950
1  0.502741  1.558806  0.109403
2 -1.219744  2.449369 -0.545774
3 -0.198838 -0.700399 -0.203394
4  0.242669  0.201830  0.661020
           a          b          c
0  1.792158 -0.120465 -1.233121
1 -1.182318 -0.665755 -1.674196
2  0.825030 -0.498214 -0.310985
3 -0.001891 -1.396620 -0.861316
4  0.674712  0.618539 -0.443172
```

You can also run a plain query without creating a DataFrame with `execute()`. This is useful for queries that don't return values, such as INSERT. This is functionally equivalent to calling `execute` on the SQLAlchemy engine or db connection object. Again, you must use the SQL syntax variant appropriate for your database.

```
from pandas.io import sql
sql.execute('SELECT * FROM table_name', engine)
sql.execute('INSERT INTO table_name VALUES(?, ?, ?)', engine,
            params=[('id', 1, 12.2, True)])
```

### 24.11.9 Engine connection examples

To connect with SQLAlchemy you use the `create_engine()` function to create an engine object from database URI. You only need to create the engine once per database you are connecting to.

```
from sqlalchemy import create_engine

engine = create_engine('postgresql://scott:tiger@localhost:5432/mydatabase')

engine = create_engine('mysql+mysqldb://scott:tiger@localhost/foo')

engine = create_engine('oracle://scott:tiger@127.0.0.1:1521/sidname')

engine = create_engine('mssql+pyodbc://mydsn')

# sqlite://<nohostname>/<path>
# where <path> is relative:
```

(continues on next page)

(continued from previous page)

```
engine = create_engine('sqlite:///foo.db')

# or absolute, starting with a slash:
engine = create_engine('sqlite:///absolute/path/to/foo.db')
```

For more information see the examples the [SQLAlchemy documentation](#)

### 24.11.10 Advanced SQLAlchemy queries

You can use SQLAlchemy constructs to describe your query.

Use `sqlalchemy.text()` to specify query parameters in a backend-neutral way

```
In [542]: import sqlalchemy as sa

In [543]: pd.read_sql(sa.text('SELECT * FROM data where Col_1=:coll'),
.....:               engine, params={'coll': 'X'})
.....:
Out[543]:
```

	index	id	Date	Col_1	Col_2	Col_3
0	0	26	2010-10-18 00:00:00.000000	X	27.5	1

If you have an SQLAlchemy description of your database you can express where conditions using SQLAlchemy expressions

```
In [544]: metadata = sa.MetaData()

In [545]: data_table = sa.Table('data', metadata,
.....:   sa.Column('index', sa.Integer),
.....:   sa.Column('Date', sa.DateTime),
.....:   sa.Column('Col_1', sa.String),
.....:   sa.Column('Col_2', sa.Float),
.....:   sa.Column('Col_3', sa.Boolean),
.....: )
.....:

In [546]: pd.read_sql(sa.select([data_table]).where(data_table.c.Col_3 == True),
↪engine)
Out[546]:
```

	index	Date	Col_1	Col_2	Col_3
0	0	2010-10-18	X	27.50	True
1	2	2010-10-20	Z	5.73	True

You can combine SQLAlchemy expressions with parameters passed to `read_sql()` using `sqlalchemy.bindparam()`

```
In [547]: import datetime as dt

In [548]: expr = sa.select([data_table]).where(data_table.c.Date > sa.bindparam('date
↪'))

In [549]: pd.read_sql(expr, engine, params={'date': dt.datetime(2010, 10, 18)})
Out[549]:
```

	index	Date	Col_1	Col_2	Col_3
0	1	2010-10-19	Y	-12.50	False
1	2	2010-10-20	Z	5.73	True

### 24.11.11 Sqlite fallback

The use of sqlite is supported without using SQLAlchemy. This mode requires a Python database adapter which respect the [Python DB-API](#).

You can create connections like so:

```
import sqlite3
con = sqlite3.connect(':memory:')
```

And then issue the following queries:

```
data.to_sql('data', cnx)
pd.read_sql_query("SELECT * FROM data", con)
```

## 24.12 Google BigQuery

**Warning:** Starting in 0.20.0, pandas has split off Google BigQuery support into the separate package `pandas-gbq`. You can `pip install pandas-gbq` to get it.

The `pandas-gbq` package provides functionality to read/write from Google BigQuery.

`pandas` integrates with this external package. if `pandas-gbq` is installed, you can use the `pandas` methods `pd.read_gbq` and `DataFrame.to_gbq`, which will call the respective functions from `pandas-gbq`.

Full documentation can be found [here](#).

## 24.13 Stata Format

### 24.13.1 Writing to Stata format

The method `to_stata()` will write a `DataFrame` into a `.dta` file. The format version of this file is always 115 (Stata 12).

```
In [550]: df = pd.DataFrame(randn(10, 2), columns=list('AB'))
In [551]: df.to_stata('stata.dta')
```

*Stata* data files have limited data type support; only strings with 244 or fewer characters, `int8`, `int16`, `int32`, `float32` and `float64` can be stored in `.dta` files. Additionally, *Stata* reserves certain values to represent missing data. Exporting a non-missing value that is outside of the permitted range in *Stata* for a particular data type will retype the variable to the next larger size. For example, `int8` values are restricted to lie between -127 and 100 in *Stata*, and so variables with values above 100 will trigger a conversion to `int16`. `nan` values in floating points data types are stored as the basic missing data type (`.` in *Stata*).

---

**Note:** It is not possible to export missing data values for integer data types.

---

The *Stata* writer gracefully handles other data types including `int64`, `bool`, `uint8`, `uint16`, `uint32` by casting to the smallest supported type that can represent the data. For example, data with a type of `uint8` will be cast to

`int8` if all values are less than 100 (the upper bound for non-missing `int8` data in *Stata*), or, if values are outside of this range, the variable is cast to `int16`.

**Warning:** Conversion from `int64` to `float64` may result in a loss of precision if `int64` values are larger than  $2^{**53}$ .

**Warning:** `StataWriter` and `to_stata()` only support fixed width strings containing up to 244 characters, a limitation imposed by the version 115 dta file format. Attempting to write *Stata* dta files with strings longer than 244 characters raises a `ValueError`.

### 24.13.2 Reading from Stata format

The top-level function `read_stata` will read a dta file and return either a `DataFrame` or a `StataReader` that can be used to read the file incrementally.

```
In [552]: pd.read_stata('stata.dta')
Out[552]:
```

	index	A	B
0	0	1.810535	-1.305727
1	1	-0.344987	-0.230840
2	2	-2.793085	1.937529
3	3	0.366332	-1.044589
4	4	2.051173	0.585662
5	5	0.429526	-0.606998
6	6	0.106223	-1.525680
7	7	0.795026	-0.374438
8	8	0.134048	1.202055
9	9	0.284748	0.262467

Specifying a `chunksize` yields a `StataReader` instance that can be used to read `chunksize` lines from the file at a time. The `StataReader` object can be used as an iterator.

```
In [553]: reader = pd.read_stata('stata.dta', chunksize=3)

In [554]: for df in reader:
.....:     print(df.shape)
.....:
(3, 3)
(3, 3)
(3, 3)
(1, 3)
```

For more fine-grained control, use `iterator=True` and specify `chunksize` with each call to `read()`.

```
In [555]: reader = pd.read_stata('stata.dta', iterator=True)

In [556]: chunk1 = reader.read(5)

In [557]: chunk2 = reader.read(5)
```

Currently the `index` is retrieved as a column.

The parameter `convert_categoricals` indicates whether value labels should be read and used to create a

Categorical variable from them. Value labels can also be retrieved by the function `value_labels`, which requires `read()` to be called before use.

The parameter `convert_missing` indicates whether missing value representations in Stata should be preserved. If `False` (the default), missing values are represented as `np.nan`. If `True`, missing values are represented using `StataMissingValue` objects, and columns containing missing values will have object data type.

---

**Note:** `read_stata()` and `StataReader` support .dta formats 113-115 (Stata 10-12), 117 (Stata 13), and 118 (Stata 14).

---

---

**Note:** Setting `preserve_dtypes=False` will upcast to the standard pandas data types: `int64` for all integer types and `float64` for floating point data. By default, the Stata data types are preserved when importing.

---

### 24.13.2.1 Categorical Data

Categorical data can be exported to *Stata* data files as value labeled data. The exported data consists of the underlying category codes as integer data values and the categories as value labels. *Stata* does not have an explicit equivalent to a `Categorical` and information about *whether* the variable is ordered is lost when exporting.

**Warning:** *Stata* only supports string value labels, and so `str` is called on the categories when exporting data. Exporting `Categorical` variables with non-string categories produces a warning, and can result a loss of information if the `str` representations of the categories are not unique.

Labeled data can similarly be imported from *Stata* data files as `Categorical` variables using the keyword argument `convert_categoricals` (`True` by default). The keyword argument `order_categoricals` (`True` by default) determines whether imported `Categorical` variables are ordered.

---

**Note:** When importing categorical data, the values of the variables in the *Stata* data file are not preserved since `Categorical` variables always use integer data types between `-1` and `n-1` where `n` is the number of categories. If the original values in the *Stata* data file are required, these can be imported by setting `convert_categoricals=False`, which will import original data (but not the variable labels). The original values can be matched to the imported categorical data since there is a simple mapping between the original *Stata* data values and the category codes of imported `Categorical` variables: missing values are assigned code `-1`, and the smallest original value is assigned `0`, the second smallest is assigned `1` and so on until the largest original value is assigned the code `n-1`.

---

---

**Note:** *Stata* supports partially labeled series. These series have value labels for some but not all data values. Importing a partially labeled series will produce a `Categorical` with string categories for the values that are labeled and numeric categories for values with no label.

---

## 24.14 SAS Formats

The top-level function `read_sas()` can read (but not write) SAS *xport* (.XPT) and (since v0.18.0) *SAS7BDAT* (.sas7bdat) format files.

SAS files only contain two value types: ASCII text and floating point values (usually 8 bytes but sometimes truncated). For xport files, there is no automatic type conversion to integers, dates, or categoricals. For SAS7BDAT files, the format codes may allow date variables to be automatically converted to dates. By default the whole file is read and returned as a `DataFrame`.

Specify a `chunksize` or use `iterator=True` to obtain reader objects (`XportReader` or `SAS7BDATReader`) for incrementally reading the file. The reader objects also have attributes that contain additional information about the file and its variables.

Read a SAS7BDAT file:

```
df = pd.read_sas('sas_data.sas7bdat')
```

Obtain an iterator and read an XPORT file 100,000 lines at a time:

```
rdr = pd.read_sas('sas_xport.xpt', chunk=100000)
for chunk in rdr:
    do_something(chunk)
```

The [specification](#) for the xport file format is available from the SAS web site.

No official documentation is available for the SAS7BDAT format.

## 24.15 Other file formats

pandas itself only supports IO with a limited set of file formats that map cleanly to its tabular data model. For reading and writing other file formats into and from pandas, we recommend these packages from the broader community.

### 24.15.1 netCDF

[xarray](#) provides data structures inspired by the pandas `DataFrame` for working with multi-dimensional datasets, with a focus on the netCDF file format and easy conversion to and from pandas.

## 24.16 Performance Considerations

This is an informal comparison of various IO methods, using pandas 0.20.3. Timings are machine dependent and small differences should be ignored.

```
In [1]: sz = 1000000
In [2]: df = pd.DataFrame({'A': randn(sz), 'B': [1] * sz})

In [3]: df.info()
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 1000000 entries, 0 to 999999
Data columns (total 2 columns):
A      1000000 non-null float64
B      1000000 non-null int64
dtypes: float64(1), int64(1)
memory usage: 15.3 MB
```

When writing, the top-three functions in terms of speed are `test_pickle_write`, `test_feather_write` and `test_hdf_fixed_write_compress`.

```
In [14]: %timeit test_sql_write(df)
2.37 s ± 36.6 ms per loop (mean ± std. dev. of 7 runs, 1 loop each)

In [15]: %timeit test_hdf_fixed_write(df)
194 ms ± 65.9 ms per loop (mean ± std. dev. of 7 runs, 10 loops each)

In [26]: %timeit test_hdf_fixed_write_compress(df)
119 ms ± 2.15 ms per loop (mean ± std. dev. of 7 runs, 10 loops each)

In [16]: %timeit test_hdf_table_write(df)
623 ms ± 125 ms per loop (mean ± std. dev. of 7 runs, 1 loop each)

In [27]: %timeit test_hdf_table_write_compress(df)
563 ms ± 23.7 ms per loop (mean ± std. dev. of 7 runs, 1 loop each)

In [17]: %timeit test_csv_write(df)
3.13 s ± 49.9 ms per loop (mean ± std. dev. of 7 runs, 1 loop each)

In [30]: %timeit test_feather_write(df)
103 ms ± 5.88 ms per loop (mean ± std. dev. of 7 runs, 10 loops each)

In [31]: %timeit test_pickle_write(df)
109 ms ± 3.72 ms per loop (mean ± std. dev. of 7 runs, 10 loops each)

In [32]: %timeit test_pickle_write_compress(df)
3.33 s ± 55.2 ms per loop (mean ± std. dev. of 7 runs, 1 loop each)
```

When reading, the top three are `test_feather_read`, `test_pickle_read` and `test_hdf_fixed_read`.

```
In [18]: %timeit test_sql_read()
1.35 s ± 14.7 ms per loop (mean ± std. dev. of 7 runs, 1 loop each)

In [19]: %timeit test_hdf_fixed_read()
14.3 ms ± 438 µs per loop (mean ± std. dev. of 7 runs, 100 loops each)

In [28]: %timeit test_hdf_fixed_read_compress()
23.5 ms ± 672 µs per loop (mean ± std. dev. of 7 runs, 10 loops each)

In [20]: %timeit test_hdf_table_read()
35.4 ms ± 314 µs per loop (mean ± std. dev. of 7 runs, 10 loops each)

In [29]: %timeit test_hdf_table_read_compress()
42.6 ms ± 2.1 ms per loop (mean ± std. dev. of 7 runs, 10 loops each)

In [22]: %timeit test_csv_read()
516 ms ± 27.1 ms per loop (mean ± std. dev. of 7 runs, 1 loop each)

In [33]: %timeit test_feather_read()
4.06 ms ± 115 µs per loop (mean ± std. dev. of 7 runs, 100 loops each)

In [34]: %timeit test_pickle_read()
6.5 ms ± 172 µs per loop (mean ± std. dev. of 7 runs, 100 loops each)

In [35]: %timeit test_pickle_read_compress()
588 ms ± 3.57 ms per loop (mean ± std. dev. of 7 runs, 1 loop each)
```

Space on disk (in bytes)

```

34816000 Aug 21 18:00 test.sql
24009240 Aug 21 18:00 test_fixed.hdf
 7919610 Aug 21 18:00 test_fixed_compress.hdf
24458892 Aug 21 18:00 test_table.hdf
 8657116 Aug 21 18:00 test_table_compress.hdf
28520770 Aug 21 18:00 test.csv

16000848 Aug 21 18:00 test.pkl
 7554108 Aug 21 18:00 test.pkl.compress

```

And here's the code:

```

import os
import pandas as pd
import sqlite3
from numpy.random import randn
from pandas.io import sql

sz = 1000000
df = pd.DataFrame({'A': randn(sz), 'B': [1] * sz})

def test_sql_write(df):
    if os.path.exists('test.sql'):
        os.remove('test.sql')
    sql_db = sqlite3.connect('test.sql')
    df.to_sql(name='test_table', con=sql_db)
    sql_db.close()

def test_sql_read():
    sql_db = sqlite3.connect('test.sql')
    pd.read_sql_query("select * from test_table", sql_db)
    sql_db.close()

def test_hdf_fixed_write(df):
    df.to_hdf('test_fixed.hdf', 'test', mode='w')

def test_hdf_fixed_read():
    pd.read_hdf('test_fixed.hdf', 'test')

def test_hdf_fixed_write_compress(df):
    df.to_hdf('test_fixed_compress.hdf', 'test', mode='w', complib='blosc')

def test_hdf_fixed_read_compress():
    pd.read_hdf('test_fixed_compress.hdf', 'test')

def test_hdf_table_write(df):
    df.to_hdf('test_table.hdf', 'test', mode='w', format='table')

def test_hdf_table_read():
    pd.read_hdf('test_table.hdf', 'test')

def test_hdf_table_write_compress(df):
    df.to_hdf('test_table_compress.hdf', 'test', mode='w', complib='blosc', format=
    ↪ 'table')

def test_hdf_table_read_compress():
    pd.read_hdf('test_table_compress.hdf', 'test')

```

(continues on next page)

(continued from previous page)

```
def test_csv_write(df):
    df.to_csv('test.csv', mode='w')

def test_csv_read():
    pd.read_csv('test.csv', index_col=0)

def test_feather_write(df):
    df.to_feather('test.feather')

def test_feather_read():
    pd.read_feather('test.feather')

def test_pickle_write(df):
    df.to_pickle('test.pkl')

def test_pickle_read():

def test_pickle_write_compress(df):
    df.to_pickle('test.pkl.compress', compression='xz')

def test_pickle_read_compress():
    pd.read_pickle('test.pkl.compress', compression='xz')
```

## ENHANCING PERFORMANCE

In this part of the tutorial, we will investigate how to speed up certain functions operating on pandas `DataFrames` using three different techniques: Cython, Numba and `pandas.eval()`. We will see a speed improvement of ~200 when we use Cython and Numba on a test function operating row-wise on the `DataFrame`. Using `pandas.eval()` we will speed up a sum by an order of ~2.

### 25.1 Cython (Writing C extensions for pandas)

For many use cases writing pandas in pure Python and NumPy is sufficient. In some computationally heavy applications however, it can be possible to achieve sizeable speed-ups by offloading work to [cython](#).

This tutorial assumes you have refactored as much as possible in Python, for example by trying to remove for-loops and making use of NumPy vectorization. It's always worth optimising in Python first.

This tutorial walks through a “typical” process of cythonizing a slow computation. We use an [example from the Cython documentation](#) but in the context of pandas. Our final cythonized solution is around 100 times faster than the pure Python solution.

#### 25.1.1 Pure python

We have a `DataFrame` to which we want to apply a function row-wise.

```
In [1]: df = pd.DataFrame({'a': np.random.randn(1000),
...:                      'b': np.random.randn(1000),
...:                      'N': np.random.randint(100, 1000, (1000)),
...:                      'x': 'x'})
...:

In [2]: df
Out[2]:
```

	a	b	N	x
0	0.469112	-0.218470	585	x
1	-0.282863	-0.061645	841	x
2	-1.509059	-0.723780	251	x
3	-1.135632	0.551225	972	x
4	1.212112	-0.497767	181	x
5	-0.173215	0.837519	458	x
6	0.119209	1.103245	159	x
..	...	...	...	..
993	0.131892	0.290162	190	x
994	0.342097	0.215341	931	x

(continues on next page)

(continued from previous page)

```

995 -1.512743  0.874737  374  x
996  0.933753  1.120790  246  x
997 -0.308013  0.198768  157  x
998 -0.079915  1.757555  977  x
999 -1.010589 -1.115680  770  x

```

```
[1000 rows x 4 columns]
```

Here's the function in pure Python:

```

In [3]: def f(x):
...:     return x * (x - 1)
...:

In [4]: def integrate_f(a, b, N):
...:     s = 0
...:     dx = (b - a) / N
...:     for i in range(N):
...:         s += f(a + i * dx)
...:     return s * dx
...:

```

We achieve our result by using `apply` (row-wise):

```

In [7]: %timeit df.apply(lambda x: integrate_f(x['a'], x['b'], x['N']), axis=1)
10 loops, best of 3: 174 ms per loop

```

But clearly this isn't fast enough for us. Let's take a look and see where the time is spent during this operation (limited to the most time consuming four calls) using the `prun` `ipython` magic function:

```

In [5]: %prun -l 4 df.apply(lambda x: integrate_f(x['a'], x['b'], x['N']), axis=1)
671713 function calls (666693 primitive calls) in 0.236 seconds

Ordered by: internal time
List reduced from 214 to 4 due to restriction <4>

ncalls  tottime  percall  cumtime  percall  filename:lineno(function)
   1000    0.117    0.000    0.173    0.000  <ipython-input-4-c2a74e076cf0>
->:1(integrate_f)
  552423    0.055    0.000    0.055    0.000  <ipython-input-3-c138bdd570e3>:1(f)
    3000    0.008    0.000    0.041    0.000  base.py:3090(get_value)
    3000    0.004    0.000    0.047    0.000  series.py:764(__getitem__)

```

By far the majority of time is spent inside either `integrate_f` or `f`, hence we'll concentrate our efforts cythonizing these two functions.

---

**Note:** In Python 2 replacing the `range` with its generator counterpart (`xrange`) would mean the `range` line would vanish. In Python 3 `range` is already a generator.

---

## 25.1.2 Plain Cython

First we're going to need to import the Cython magic function to `ipython`:

```
In [6]: %load_ext Cython
```

Now, let's simply copy our functions over to Cython as is (the suffix is here to distinguish between function versions):

```
In [7]: %%cython
...: def f_plain(x):
...:     return x * (x - 1)
...: def integrate_f_plain(a, b, N):
...:     s = 0
...:     dx = (b - a) / N
...:     for i in range(N):
...:         s += f_plain(a + i * dx)
...:     return s * dx
...:
```

**Note:** If you're having trouble pasting the above into your ipython, you may need to be using bleeding edge ipython for paste to play well with cell magics.

```
In [4]: %timeit df.apply(lambda x: integrate_f_plain(x['a'], x['b'], x['N']), axis=1)
10 loops, best of 3: 85.5 ms per loop
```

Already this has shaved a third off, not too bad for a simple copy and paste.

### 25.1.3 Adding type

We get another huge improvement simply by providing type information:

```
In [8]: %%cython
...: cdef double f_typed(double x) except? -2:
...:     return x * (x - 1)
...: cpdef double integrate_f_typed(double a, double b, int N):
...:     cdef int i
...:     cdef double s, dx
...:     s = 0
...:     dx = (b - a) / N
...:     for i in range(N):
...:         s += f_typed(a + i * dx)
...:     return s * dx
...:
```

```
In [4]: %timeit df.apply(lambda x: integrate_f_typed(x['a'], x['b'], x['N']), axis=1)
10 loops, best of 3: 20.3 ms per loop
```

Now, we're talking! It's now over ten times faster than the original python implementation, and we haven't *really* modified the code. Let's have another look at what's eating up time:

```
In [9]: %prun -l 4 df.apply(lambda x: integrate_f_typed(x['a'], x['b'], x['N']),
↪axis=1)
119288 function calls (114268 primitive calls) in 0.055 seconds

Ordered by: internal time
List reduced from 211 to 4 due to restriction <4>
```

(continues on next page)

(continued from previous page)

ncalls	totttime	percall	cumtime	percall	filename:lineno(function)
3000	0.007	0.000	0.036	0.000	base.py:3090(get_value)
3000	0.004	0.000	0.041	0.000	series.py:764(__getitem__)
9117	0.003	0.000	0.007	0.000	{built-in method builtins.getattr}
1	0.003	0.003	0.053	0.053	{pandas._libs.reduction.reduce}

### 25.1.4 Using ndarray

It's calling series... a lot! It's creating a Series from each row, and get-ting from both the index and the series (three times for each row). Function calls are expensive in Python, so maybe we could minimize these by cythonizing the apply part.

**Note:** We are now passing ndarrays into the Cython function, fortunately Cython plays very nicely with NumPy.

```
In [10]: %%cython
...: cimport numpy as np
...: import numpy as np
...: cdef double f_typed(double x) except? -2:
...:     return x * (x - 1)
...: cpdef double integrate_f_typed(double a, double b, int N):
...:     cdef int i
...:     cdef double s, dx
...:     s = 0
...:     dx = (b - a) / N
...:     for i in range(N):
...:         s += f_typed(a + i * dx)
...:     return s * dx
...: cpdef np.ndarray[double] apply_integrate_f(np.ndarray col_a, np.ndarray col_
↪ b, np.ndarray col_N):
...:     assert (col_a.dtype == np.float and col_b.dtype == np.float and col_N.
↪ dtype == np.int)
...:     cdef Py_ssize_t i, n = len(col_N)
...:     assert (len(col_a) == len(col_b) == n)
...:     cdef np.ndarray[double] res = np.empty(n)
...:     for i in range(len(col_a)):
...:         res[i] = integrate_f_typed(col_a[i], col_b[i], col_N[i])
...:     return res
...:
```

The implementation is simple, it creates an array of zeros and loops over the rows, applying our `integrate_f_typed`, and putting this in the zeros array.

**Warning:** You can **not** pass a Series directly as a ndarray typed parameter to a Cython function. Instead pass the actual ndarray using the `.values` attribute of the Series. The reason is that the Cython definition is specific to an ndarray and not the passed Series.

So, do not do this:

```
apply_integrate_f(df['a'], df['b'], df['N'])
```

But rather, use `.values` to get the underlying ndarray:

```
apply_integrate_f(df['a'].values, df['b'].values, df['N'].values)
```

**Note:** Loops like this would be *extremely* slow in Python, but in Cython looping over NumPy arrays is *fast*.

```
In [4]: %timeit apply_integrate_f(df['a'].values, df['b'].values, df['N'].values)
1000 loops, best of 3: 1.25 ms per loop
```

We've gotten another big improvement. Let's check again where the time is spent:

```
In [11]: %prun -l 4 apply_integrate_f(df['a'].values, df['b'].values, df['N'].values)
215 function calls in 0.001 seconds
```

Ordered by: internal time

List reduced from 55 to 4 due to restriction <4>

	ncalls	totttime	percall	cumtime	percall	filename:lineno(function)
	1	0.001	0.001	0.001	0.001	{built-in method _cython_magic_
→	039cb0af339d11610fbd07bd4033a1cf.					apply_integrate_f}
	1	0.000	0.000	0.001	0.001	{built-in method builtins.exec}
	3	0.000	0.000	0.000	0.000	internals.py:4137(iget)
	3	0.000	0.000	0.000	0.000	generic.py:2484(_get_item_cache)

As one might expect, the majority of the time is now spent in `apply_integrate_f`, so if we wanted to make anymore efficiencies we must continue to concentrate our efforts here.

### 25.1.5 More advanced techniques

There is still hope for improvement. Here's an example of using some more advanced Cython techniques:

```
In [12]: %%cython
....: cimport cython
....: cimport numpy as np
....: import numpy as np
....: cdef double f_typed(double x) except? -2:
....:     return x * (x - 1)
....: cpdef double integrate_f_typed(double a, double b, int N):
....:     cdef int i
....:     cdef double s, dx
....:     s = 0
....:     dx = (b - a) / N
....:     for i in range(N):
....:         s += f_typed(a + i * dx)
....:     return s * dx
....: @cython.boundscheck(False)
....: @cython.wraparound(False)
....: cpdef np.ndarray[double] apply_integrate_f_wrap(np.ndarray[double] col_a, np.
→ ndarray[double] col_b, np.ndarray[int] col_N):
....:     cdef int i, n = len(col_N)
....:     assert len(col_a) == len(col_b) == n
....:     cdef np.ndarray[double] res = np.empty(n)
....:     for i in range(n):
....:         res[i] = integrate_f_typed(col_a[i], col_b[i], col_N[i])
....:     return res
....:
```

```
In [4]: %timeit apply_integrate_f_wrap(df['a'].values, df['b'].values, df['N'].values)
1000 loops, best of 3: 987 us per loop
```

Even faster, with the caveat that a bug in our Cython code (an off-by-one error, for example) might cause a segfault because memory access isn't checked. For more about boundscheck and wraparound, see the Cython docs on [compiler directives](#).

## 25.2 Using Numba

A recent alternative to statically compiling Cython code, is to use a *dynamic jit-compiler*, Numba.

Numba gives you the power to speed up your applications with high performance functions written directly in Python. With a few annotations, array-oriented and math-heavy Python code can be just-in-time compiled to native machine instructions, similar in performance to C, C++ and Fortran, without having to switch languages or Python interpreters.

Numba works by generating optimized machine code using the LLVM compiler infrastructure at import time, runtime, or statically (using the included pycc tool). Numba supports compilation of Python to run on either CPU or GPU hardware, and is designed to integrate with the Python scientific software stack.

---

**Note:** You will need to install Numba. This is easy with conda, by using: `conda install numba`, see [installing using miniconda](#).

---

---

**Note:** As of Numba version 0.20, pandas objects cannot be passed directly to Numba-compiled functions. Instead, one must pass the NumPy array underlying the pandas object to the Numba-compiled function as demonstrated below.

---

### 25.2.1 Jit

We demonstrate how to use Numba to just-in-time compile our code. We simply take the plain Python code from above and annotate with the `@jit` decorator.

```
import numba

@numba.jit
def f_plain(x):
    return x * (x - 1)

@numba.jit
def integrate_f_numba(a, b, N):
    s = 0
    dx = (b - a) / N
    for i in range(N):
        s += f_plain(a + i * dx)
    return s * dx

@numba.jit
def apply_integrate_f_numba(col_a, col_b, col_N):
    n = len(col_N)
    result = np.empty(n, dtype='float64')
    assert len(col_a) == len(col_b) == n
    for i in range(n):
```

(continues on next page)

(continued from previous page)

```

        result[i] = integrate_f_numba(col_a[i], col_b[i], col_N[i])
    return result

def compute_numba(df):
    result = apply_integrate_f_numba(df['a'].values, df['b'].values, df['N'].values)
    return pd.Series(result, index=df.index, name='result')
```

Note that we directly pass NumPy arrays to the Numba function. `compute_numba` is just a wrapper that provides a nicer interface by passing/returning pandas objects.

```

In [4]: %timeit compute_numba(df)
1000 loops, best of 3: 798 us per loop
```

In this example, using Numba was faster than Cython.

## 25.2.2 Vectorize

Numba can also be used to write vectorized functions that do not require the user to explicitly loop over the observations of a vector; a vectorized function will be applied to each row automatically. Consider the following toy example of doubling each observation:

```

import numba

def double_every_value_nonumba(x):
    return x*2

@numba.vectorize
def double_every_value_withnumba(x):
    return x*2

# Custom function without numba
In [5]: %timeit df['coll_doubled'] = df.a.apply(double_every_value_nonumba)
1000 loops, best of 3: 797 us per loop

# Standard implementation (faster than a custom function)
In [6]: %timeit df['coll_doubled'] = df.a*2
1000 loops, best of 3: 233 us per loop

# Custom function with numba
In [7]: %timeit df['coll_doubled'] = double_every_value_withnumba(df.a.values)
1000 loops, best of 3: 145 us per loop
```

## 25.2.3 Caveats

---

**Note:** Numba will execute on any function, but can only accelerate certain classes of functions.

---

Numba is best at accelerating functions that apply numerical functions to NumPy arrays. When passed a function that only uses operations it knows how to accelerate, it will execute in `nopython` mode.

If Numba is passed a function that includes something it doesn't know how to work with – a category that currently includes sets, lists, dictionaries, or string functions – it will revert to `object` mode. In `object` mode, Numba

will execute but your code will not speed up significantly. If you would prefer that Numba throw an error if it cannot compile a function in a way that speeds up your code, pass Numba the argument `nopython=True` (e.g. `@numba.jit(nopython=True)`). For more on troubleshooting Numba modes, see the [Numba troubleshooting page](#).

Read more in the [Numba docs](#).

## 25.3 Expression Evaluation via `eval()`

The top-level function `pandas.eval()` implements expression evaluation of *Series* and *DataFrame* objects.

---

**Note:** To benefit from using `eval()` you need to install `numexpr`. See the [recommended dependencies section](#) for more details.

---

The point of using `eval()` for expression evaluation rather than plain Python is two-fold: 1) large *DataFrame* objects are evaluated more efficiently and 2) large arithmetic and boolean expressions are evaluated all at once by the underlying engine (by default `numexpr` is used for evaluation).

---

**Note:** You should not use `eval()` for simple expressions or for expressions involving small *DataFrames*. In fact, `eval()` is many orders of magnitude slower for smaller expressions/objects than plain ol' Python. A good rule of thumb is to only use `eval()` when you have a *DataFrame* with more than 10,000 rows.

---

`eval()` supports all arithmetic expressions supported by the engine in addition to some extensions available only in pandas.

---

**Note:** The larger the frame and the larger the expression the more speedup you will see from using `eval()`.

---

### 25.3.1 Supported Syntax

These operations are supported by `pandas.eval()`:

- Arithmetic operations except for the left shift (`<<`) and right shift (`>>`) operators, e.g., `df + 2 * pi / s ** 4 % 42 - the_golden_ratio`
- Comparison operations, including chained comparisons, e.g., `2 < df < df2`
- Boolean operations, e.g., `df < df2 and df3 < df4 or not df_bool`
- list and tuple literals, e.g., `[1, 2]` or `(1, 2)`
- Attribute access, e.g., `df.a`
- Subscript expressions, e.g., `df[0]`
- Simple variable evaluation, e.g., `pd.eval('df')` (this is not very useful)
- Math functions: `sin`, `cos`, `exp`, `log`, `expm1`, `log1p`, `sqrt`, `sinh`, `cosh`, `tanh`, `arcsin`, `arccos`, `arctan`, `arccosh`, `arcsinh`, `arctanh`, `abs` and `arctan2`.

This Python syntax is **not** allowed:

- Expressions
  - Function calls other than math functions.

- is/is not operations
- if expressions
- lambda expressions
- list/set/dict comprehensions
- Literal dict and set expressions
- yield expressions
- Generator expressions
- Boolean expressions consisting of only scalar values
- Statements
  - Neither `simple` nor `compound` statements are allowed. This includes things like `for`, `while`, and `if`.

### 25.3.2 `eval()` Examples

`pandas.eval()` works well with expressions containing large arrays.

First let's create a few decent-sized arrays to play with:

```
In [13]: nrows, ncols = 20000, 100

In [14]: df1, df2, df3, df4 = [pd.DataFrame(np.random.randn(nrows, ncols)) for _ in
↳ range(4)]
```

Now let's compare adding them together using plain ol' Python versus `eval()`:

```
In [15]: %timeit df1 + df2 + df3 + df4
11.5 ms +- 845 us per loop (mean +- std. dev. of 7 runs, 100 loops each)
```

```
In [16]: %timeit pd.eval('df1 + df2 + df3 + df4')
9.79 ms +- 612 us per loop (mean +- std. dev. of 7 runs, 100 loops each)
```

Now let's do the same thing but with comparisons:

```
In [17]: %timeit (df1 > 0) & (df2 > 0) & (df3 > 0) & (df4 > 0)
31.3 ms +- 4.21 ms per loop (mean +- std. dev. of 7 runs, 10 loops each)
```

```
In [18]: %timeit pd.eval('(df1 > 0) & (df2 > 0) & (df3 > 0) & (df4 > 0)')
10.4 ms +- 469 us per loop (mean +- std. dev. of 7 runs, 100 loops each)
```

`eval()` also works with unaligned pandas objects:

```
In [19]: s = pd.Series(np.random.randn(50))

In [20]: %timeit df1 + df2 + df3 + df4 + s
21.4 ms +- 2.16 ms per loop (mean +- std. dev. of 7 runs, 10 loops each)
```

```
In [21]: %timeit pd.eval('df1 + df2 + df3 + df4 + s')
9.26 ms +- 788 us per loop (mean +- std. dev. of 7 runs, 100 loops each)
```

**Note:** Operations such as

```
1 and 2 # would parse to 1 & 2, but should evaluate to 2
3 or 4 # would parse to 3 | 4, but should evaluate to 3
~1 # this is okay, but slower when using eval
```

should be performed in Python. An exception will be raised if you try to perform any boolean/bitwise operations with scalar operands that are not of type `bool` or `np.bool_`. Again, you should perform these kinds of operations in plain Python.

---

### 25.3.3 The `DataFrame.eval` method

In addition to the top level `pandas.eval()` function you can also evaluate an expression in the “context” of a `DataFrame`.

```
In [22]: df = pd.DataFrame(np.random.randn(5, 2), columns=['a', 'b'])

In [23]: df.eval('a + b')
Out[23]:
0    -0.246747
1     0.867786
2    -1.626063
3    -1.134978
4    -1.027798
dtype: float64
```

Any expression that is a valid `pandas.eval()` expression is also a valid `DataFrame.eval()` expression, with the added benefit that you don’t have to prefix the name of the `DataFrame` to the column(s) you’re interested in evaluating.

In addition, you can perform assignment of columns within an expression. This allows for *formulaic evaluation*. The assignment target can be a new column name or an existing column name, and it must be a valid Python identifier.

New in version 0.18.0.

The `inplace` keyword determines whether this assignment will be performed on the original `DataFrame` or return a copy with the new column.

**Warning:** For backwards compatibility, `inplace` defaults to `True` if not specified. This will change in a future version of pandas - if your code depends on an inplace assignment you should update to explicitly set `inplace=True`.

```
In [24]: df = pd.DataFrame(dict(a=range(5), b=range(5, 10)))

In [25]: df.eval('c = a + b', inplace=True)

In [26]: df.eval('d = a + b + c', inplace=True)

In [27]: df.eval('a = 1', inplace=True)

In [28]: df
Out[28]:
   a  b  c  d
0  1  5  5 10
1  1  6  7 14
```

(continues on next page)

(continued from previous page)

```
2  1  7   9  18
3  1  8  11  22
4  1  9  13  26
```

When `inplace` is set to `False`, a copy of the `DataFrame` with the new or modified columns is returned and the original frame is unchanged.

```
In [29]: df
```

```
Out[29]:
```

```
   a  b  c  d
0  1  5  5 10
1  1  6  7 14
2  1  7  9 18
3  1  8 11 22
4  1  9 13 26
```

```
In [30]: df.eval('e = a - c', inplace=False)
```

```

////////////////////////////////////
↪
   a  b  c  d  e
0  1  5  5 10 -4
1  1  6  7 14 -6
2  1  7  9 18 -8
3  1  8 11 22 -10
4  1  9 13 26 -12
```

```
In [31]: df
```

```

////////////////////////////////////
↪
   a  b  c  d
0  1  5  5 10
1  1  6  7 14
2  1  7  9 18
3  1  8 11 22
4  1  9 13 26
```

New in version 0.18.0.

As a convenience, multiple assignments can be performed by using a multi-line string.

```
In [32]: df.eval("""
.....: c = a + b
.....: d = a + b + c
.....: a = 1""", inplace=False)
.....:
```

```
Out[32]:
```

```
   a  b  c  d
0  1  5  6 12
1  1  6  7 14
2  1  7  8 16
3  1  8  9 18
4  1  9 10 20
```

The equivalent in standard Python would be

```
In [33]: df = pd.DataFrame(dict(a=range(5), b=range(5, 10)))
```

(continues on next page)

(continued from previous page)

```
In [34]: df['c'] = df.a + df.b
In [35]: df['d'] = df.a + df.b + df.c
In [36]: df['a'] = 1

In [37]: df
Out[37]:
```

	a	b	c	d
0	1	5	5	10
1	1	6	7	14
2	1	7	9	18
3	1	8	11	22
4	1	9	13	26

New in version 0.18.0.

The `query` method gained the `inplace` keyword which determines whether the query modifies the original frame.

```
In [38]: df = pd.DataFrame(dict(a=range(5), b=range(5, 10)))

In [39]: df.query('a > 2')
Out[39]:
```

	a	b
3	3	8
4	4	9

```
In [40]: df.query('a > 2', inplace=True)

In [41]: df
Out[41]:
```

	a	b
3	3	8
4	4	9

**Warning:** Unlike with `eval`, the default value for `inplace` for `query` is `False`. This is consistent with prior versions of pandas.

### 25.3.4 Local Variables

You must *explicitly reference* any local variable that you want to use in an expression by placing the `@` character in front of the name. For example,

```
In [42]: df = pd.DataFrame(np.random.randn(5, 2), columns=list('ab'))

In [43]: newcol = np.random.randn(len(df))

In [44]: df.eval('b + @newcol')
Out[44]:
```

0	-0.173926
1	2.493083
2	-0.881831
3	-0.691045

(continues on next page)

```
In [45]: df.query('b < @newcol')
```

If you don't prefix the local variable with @, pandas will raise an exception telling you the variable is undefined.

```
In [46]: a = np.random.randn()
```

Out [47] :

```
In [48]: df.loc[a < df.a] # same as the previous expression
```

	a	b
0	0.863987	-0.115998

```
In [49]: a, b = 1, 2
```

```
Traceback (most recent call last):
```

```
File "<ipython-input-50-af17947a194f>", line 1, in <module>
    pd.eval('@a + b')
```

```
File "/Users/taugspurger/sandbox/pandas-release/pandas-docs/pandas/core/computation/
→eval.py", line 150, in _check_for_locals
    raise SyntaxError(msg)
```

In this case, you should simply refer to the variables like you would in standard Python.

```
In [51]: pd.eval('a + b')
Out[51]: 3
```

### 25.3.5 pandas.eval() Parsers

There are two different parsers and two different engines you can use as the backend.

The default 'pandas' parser allows a more intuitive syntax for expressing query-like operations (comparisons, conjunctions and disjunctions). In particular, the precedence of the & and | operators is made equal to the precedence of the corresponding boolean operations and and or.

For example, the above conjunction can be written without parentheses. Alternatively, you can use the 'python' parser to enforce strict Python semantics.

```
In [52]: expr = '(df1 > 0) & (df2 > 0) & (df3 > 0) & (df4 > 0) '
In [53]: x = pd.eval(expr, parser='python')
In [54]: expr_no_parens = 'df1 > 0 & df2 > 0 & df3 > 0 & df4 > 0'
In [55]: y = pd.eval(expr_no_parens, parser='pandas')
In [56]: np.all(x == y)
Out[56]: True
```

The same expression can be “anded” together with the word `and` as well:

```
In [57]: expr = '(df1 > 0) & (df2 > 0) & (df3 > 0) & (df4 > 0) '
In [58]: x = pd.eval(expr, parser='python')
In [59]: expr_with_ands = 'df1 > 0 and df2 > 0 and df3 > 0 and df4 > 0'
In [60]: y = pd.eval(expr_with_ands, parser='pandas')
In [61]: np.all(x == y)
Out[61]: True
```

The `and` and `or` operators here have the same precedence that they would in vanilla Python.

### 25.3.6 pandas.eval() Backends

There's also the option to make `eval()` operate identical to plain ol' Python.

---

**Note:** Using the 'python' engine is generally *not* useful, except for testing other evaluation engines against it. You will achieve **no** performance benefits using `eval()` with `engine='python'` and in fact may incur a performance hit.

---

You can see this by using `pandas.eval()` with the 'python' engine. It is a bit slower (not by much) than evaluating the same expression in Python

```
In [62]: %timeit df1 + df2 + df3 + df4
11.7 ms +- 1e+03 us per loop (mean +- std. dev. of 7 runs, 100 loops each)
```

```
In [63]: %timeit pd.eval('df1 + df2 + df3 + df4', engine='python')
12.1 ms +- 811 us per loop (mean +- std. dev. of 7 runs, 100 loops each)
```

### 25.3.7 pandas.eval() Performance

`eval()` is intended to speed up certain kinds of operations. In particular, those operations involving complex expressions with large *DataFrame*/*Series* objects should see a significant performance benefit. Here is a plot showing the running time of `pandas.eval()` as function of the size of the frame involved in the computation. The two lines are two different engines.

**Note:** Operations with smallish objects (around 15k-20k rows) are faster using plain Python:

This plot was created using a *DataFrame* with 3 columns each containing floating point values generated using `numpy.random.randn()`.

### 25.3.8 Technical Minutia Regarding Expression Evaluation

Expressions that would result in an object dtype or involve datetime operations (because of NaT) must be evaluated in Python space. The main reason for this behavior is to maintain backwards compatibility with versions of NumPy < 1.7. In those versions of NumPy a call to `ndarray.astype(str)` will truncate any strings that are more than 60 characters in length. Second, we can't pass object arrays to `numexpr` thus string comparisons must be evaluated in Python space.

The upshot is that this *only* applies to object-dtype'd expressions. So, if you have an expression—for example

```
In [64]: df = pd.DataFrame({'strings': np.repeat(list('cba'), 3),
.....:                    'nums': np.repeat(range(3), 3)})
.....:
```

```
In [65]: df
```

```
Out[65]:
  strings  nums
0        c     0
1        c     0
2        c     0
3        b     1
4        b     1
5        b     1
6        a     2
7        a     2
8        a     2
```

```
In [66]: df.query('strings == "a" and nums == 1')
```

```

////////////////////////////////////
↪
Empty DataFrame
Columns: [strings, nums]
Index: []
```

the numeric part of the comparison (`nums == 1`) will be evaluated by `numexpr`.

In general, `DataFrame.query()`/`pandas.eval()` will evaluate the subexpressions that *can* be evaluated by `numexpr` and those that must be evaluated in Python space transparently to the user. This is done by inferring the result type of an expression from its arguments and operators.

## SPARSE DATA STRUCTURES

---

**Note:** The `SparsePanel` class has been removed in 0.19.0

---

We have implemented “sparse” versions of `Series` and `DataFrame`. These are not sparse in the typical “mostly 0”. Rather, you can view these objects as being “compressed” where any data matching a specific value (`NaN` / missing value, though any value can be chosen) is omitted. A special `SparseIndex` object tracks where data has been “sparsified”. This will make much more sense with an example. All of the standard pandas data structures have a `to_sparse` method:

```
In [1]: ts = pd.Series(randn(10))
In [2]: ts[2:-2] = np.nan
In [3]: sts = ts.to_sparse()
In [4]: sts
Out[4]:
0    0.469112
1   -0.282863
2         NaN
3         NaN
4         NaN
5         NaN
6         NaN
7         NaN
8   -0.861849
9   -2.104569
dtype: float64
BlockIndex
Block locations: array([0, 8], dtype=int32)
Block lengths: array([2, 2], dtype=int32)
```

The `to_sparse` method takes a `kind` argument (for the sparse index, see below) and a `fill_value`. So if we had a mostly zero `Series`, we could convert it to sparse with `fill_value=0`:

```
In [5]: ts.fillna(0).to_sparse(fill_value=0)
Out[5]:
0    0.469112
1   -0.282863
2    0.000000
3    0.000000
4    0.000000
5    0.000000
```

(continues on next page)

(continued from previous page)

```
6      0.000000
7      0.000000
8     -0.861849
9     -2.104569
dtype: float64
BlockIndex
Block locations: array([0, 8], dtype=int32)
Block lengths: array([2, 2], dtype=int32)
```

The sparse objects exist for memory efficiency reasons. Suppose you had a large, mostly NA `DataFrame`:

[illegible]

As you can see, the density (% of values that have not been “compressed”) is extremely low. This sparse object takes up much less memory on disk (pickled) and in the Python interpreter. Functionally, their behavior should be nearly identical to their dense counterparts.

Any sparse object can be converted back to the standard dense form by calling `to_dense`:

```
In [11]: sts.to_dense()
Out[11]:
```

0	0.469112
1	-0.282863
2	NaN
3	NaN
4	NaN
5	NaN
6	NaN

(continues on next page)

(continued from previous page)

```

7          NaN
8    -0.861849
9    -2.104569
dtype: float64

```

## 26.1 SparseArray

`SparseArray` is the base layer for all of the sparse indexed data structures. It is a 1-dimensional ndarray-like object storing only values distinct from the `fill_value`:

```

In [12]: arr = np.random.randn(10)

In [13]: arr[2:5] = np.nan; arr[7:8] = np.nan

In [14]: sparr = pd.SparseArray(arr)

In [15]: sparr
Out[15]:
[-1.9556635297215477, -1.6588664275960427, nan, nan, nan, 1.1589328886422277, 0.
↪14529711373305043, nan, 0.6060271905134522, 1.3342113401317768]
Fill: nan
IntIndex
Indices: array([0, 1, 5, 6, 8, 9], dtype=int32)

```

Like the indexed objects (`SparseSeries`, `SparseDataFrame`), a `SparseArray` can be converted back to a regular ndarray by calling `to_dense`:

```

In [16]: sparr.to_dense()
Out[16]:
array([-1.9557, -1.6589,      nan,      nan,      nan,  1.1589,  0.1453,
        nan,  0.606 ,  1.3342])

```

## 26.2 SparseIndex objects

Two kinds of `SparseIndex` are implemented, `block` and `integer`. We recommend using `block` as it's more memory efficient. The `integer` format keeps an arrays of all of the locations where the data are not equal to the fill value. The `block` format tracks only the locations and sizes of blocks of data.

## 26.3 Sparse Dtypes

Sparse data should have the same dtype as its dense representation. Currently, `float64`, `int64` and `bool` dtypes are supported. Depending on the original dtype, `fill_value` default changes:

- `float64`: `np.nan`
- `int64`: `0`
- `bool`: `False`

```

In [17]: s = pd.Series([1, np.nan, np.nan])

In [18]: s
Out[18]:
0      1.0
1      NaN
2      NaN
dtype: float64

In [19]: s.to_sparse()
Out[19]:
0      1.0
1      NaN
2      NaN
dtype: float64
BlockIndex
Block locations: array([0], dtype=int32)
Block lengths: array([1], dtype=int32)

In [20]: s = pd.Series([1, 0, 0])

In [21]: s
Out[21]:
0      1
1      0
2      0
dtype: int64

In [22]: s.to_sparse()
Out[22]:
0      1
1      0
2      0
dtype: int64
BlockIndex
Block locations: array([0], dtype=int32)
Block lengths: array([1], dtype=int32)

In [23]: s = pd.Series([True, False, True])

In [24]: s
Out[24]:
0      True
1     False
2      True
dtype: bool

In [25]: s.to_sparse()
Out[25]:
0      True
1     False
2      True
dtype: bool
BlockIndex
Block locations: array([0, 2], dtype=int32)
Block lengths: array([1, 1], dtype=int32)

```

You can change the dtype using `.astype()`, the result is also sparse. Note that `.astype()` also affects to the

## 26.4 Sparse Calculation

You can apply NumPy *ufuncs* to `SparseArray` and get a `SparseArray` as a result.

```
In [31]: arr = pd.SparseArray([1., np.nan, np.nan, -2., np.nan])

In [32]: np.abs(arr)
Out[32]:
[1.0, nan, nan, 2.0, nan]
Fill: nan
IntIndex
Indices: array([0, 3], dtype=int32)
```

The *ufunc* is also applied to `fill_value`. This is needed to get the correct dense result.

```
In [33]: arr = pd.SparseArray([1., -1, -1, -2., -1], fill_value=-1)

In [34]: np.abs(arr)
Out[34]:
[1.0, 1.0, 1.0, 2.0, 1.0]
Fill: 1
IntIndex
Indices: array([0, 3], dtype=int32)

In [35]: np.abs(arr).to_dense()
Out[35]:
array([ 1.,  1.,  1.,  2.,  1.])
```

## 26.5 Interaction with `scipy.sparse`

### 26.5.1 `SparseDataFrame`

New in version 0.20.0.

Pandas supports creating sparse dataframes directly from `scipy.sparse` matrices.

```
In [36]: from scipy.sparse import csr_matrix

In [37]: arr = np.random.random(size=(1000, 5))

In [38]: arr[arr < .9] = 0

In [39]: sp_arr = csr_matrix(arr)

In [40]: sp_arr
Out[40]:
<1000x5 sparse matrix of type '<class 'numpy.float64''>'
      with 517 stored elements in Compressed Sparse Row format>

In [41]: sdf = pd.SparseDataFrame(sp_arr)

In [42]: sdf
Out[42]:
      0      1      2      3      4
```

(continues on next page)

(continued from previous page)

```

0      0.956380 NaN      NaN      NaN NaN
1           NaN NaN      NaN      NaN NaN
2           NaN NaN      NaN      NaN NaN
3           NaN NaN      NaN      NaN NaN
4      0.999552 NaN      NaN  0.956153 NaN
5           NaN NaN      NaN      NaN NaN
6      0.913638 NaN      NaN      NaN NaN
..      ... ..      ...      ... ..
993      NaN NaN      NaN      NaN NaN
994      NaN NaN      NaN      NaN NaN
995      NaN NaN      NaN  0.998834 NaN
996      NaN NaN      NaN      NaN NaN
997      NaN NaN      NaN      NaN NaN
998      NaN NaN  0.95659      NaN NaN
999      NaN NaN      NaN      NaN NaN

[1000 rows x 5 columns]
```

All sparse formats are supported, but matrices that are not in `COOrdinate` format will be converted, copying data as needed. To convert a `SparseDataFrame` back to sparse SciPy matrix in COO format, you can use the `SparseDataFrame.to_coo()` method:

```

In [43]: sdf.to_coo()
Out[43]:
<1000x5 sparse matrix of type '<class 'numpy.float64'>'
      with 517 stored elements in COOrdinate format>
```

## 26.5.2 SparseSeries

A `SparseSeries.to_coo()` method is implemented for transforming a `SparseSeries` indexed by a `MultiIndex` to a `scipy.sparse.coo_matrix`.

The method requires a `MultiIndex` with two or more levels.

```

In [44]: s = pd.Series([3.0, np.nan, 1.0, 3.0, np.nan, np.nan])

In [45]: s.index = pd.MultiIndex.from_tuples([(1, 2, 'a', 0),
.....:                                     (1, 2, 'a', 1),
.....:                                     (1, 1, 'b', 0),
.....:                                     (1, 1, 'b', 1),
.....:                                     (2, 1, 'b', 0),
.....:                                     (2, 1, 'b', 1)],
.....:                                     names=['A', 'B', 'C', 'D'])

In [46]: s
Out[46]:
A  B  C  D
1  2  a  0    3.0
      1    NaN
      1  b  0    1.0
      1    3.0
2  1  b  0    NaN
      1    NaN
dtype: float64
```

(continues on next page)

(continued from previous page)

```
# SparseSeries
In [47]: ss = s.to_sparse()

In [48]: ss
Out[48]:
A  B  C  D
1  2  a  0    3.0
      1    NaN
      1  b  0    1.0
      1    3.0
2  1  b  0    NaN
      1    NaN

dtype: float64
BlockIndex
Block locations: array([0, 2], dtype=int32)
Block lengths: array([1, 2], dtype=int32)
```

In the example below, we transform the `SparseSeries` to a sparse representation of a 2-d array by specifying that the first and second `MultiIndex` levels define labels for the rows and the third and fourth levels define labels for the columns. We also specify that the column and row labels should be sorted in the final sparse representation.

```
In [49]: A, rows, columns = ss.to_coo(row_levels=['A', 'B'],
.....:                                column_levels=['C', 'D'],
.....:                                sort_labels=True)
.....:
```

```
In [50]: A
Out[50]:
<3x4 sparse matrix of type '<class 'numpy.float64''>'
      with 3 stored elements in COOrdinate format>
```

```
In [51]: A.todense()
//////////
↪
matrix([[ 0.,  0.,  1.,  3.],
        [ 3.,  0.,  0.,  0.],
        [ 0.,  0.,  0.,  0.]])
```

```
In [53]: columns
\\[('a', 0), ('a', 1), ('b', 0), ('b', 1)]
```

Specifying different row and column labels (and not sorting them) yields a different sparse matrix:

```
In [54]: A, rows, columns = ss.to_coo(row_levels=['A', 'B', 'C'],
....:                                column_levels=['D'],
....:                                sort_labels=False)
....:
```

```
In [55]: A
Out[55]:
```

(continues on next page)

(continued from previous page)

```
<3x2 sparse matrix of type '<class 'numpy.float64'>'
      with 3 stored elements in COOrdinate format>
```

```
In [56]: A.todense()
```

```
////////////////////////////////////
↪
matrix([[ 3.,  0.],
        [ 1.,  3.],
        [ 0.,  0.]])
```

```
In [57]: rows
```

```
////////////////////////////////////
↪ [(1, 2, 'a'), (1, 1, 'b'), (2, 1, 'b')]
```

```
In [58]: columns
```

```
////////////////////////////////////
↪ [0, 1]
```

A convenience method `SparseSeries.from_coo()` is implemented for creating a `SparseSeries` from a `scipy.sparse.coo_matrix`.

```
In [59]: from scipy import sparse
```

```
In [60]: A = sparse.coo_matrix(([3.0, 1.0, 2.0], ([1, 0, 0], [0, 2, 3])),
.....:                        shape=(3, 4))
.....:
```

```
In [61]: A
```

```
Out[61]:
```

```
<3x4 sparse matrix of type '<class 'numpy.float64'>'
      with 3 stored elements in COOrdinate format>
```

```
In [62]: A.todense()
```

```
////////////////////////////////////
↪
matrix([[ 0.,  0.,  1.,  2.],
        [ 3.,  0.,  0.,  0.],
        [ 0.,  0.,  0.,  0.]])
```

The default behaviour (with `dense_index=False`) simply returns a `SparseSeries` containing only the non-null entries.

```
In [63]: ss = pd.SparseSeries.from_coo(A)
```

```
In [64]: ss
```

```
Out[64]:
```

```
0 2    1.0
  3    2.0
1 0    3.0
dtype: float64
BlockIndex
Block locations: array([0], dtype=int32)
Block lengths: array([3], dtype=int32)
```

Specifying `dense_index=True` will result in an index that is the Cartesian product of the row and columns coordinates of the matrix. Note that this will consume a significant amount of memory (relative to `dense_index=False`) if the sparse matrix is large (and sparse) enough.

```
In [65]: ss_dense = pd.SparseSeries.from_coo(A, dense_index=True)
```

```
In [66]: ss_dense
```

```
Out[66]:
```

```
0  0    NaN
   1    NaN
   2    1.0
   3    2.0
1  0    3.0
   1    NaN
   2    NaN
   3    NaN
2  0    NaN
   1    NaN
   2    NaN
   3    NaN
```

```
dtype: float64
```

```
BlockIndex
```

```
Block locations: array([2], dtype=int32)
```

```
Block lengths: array([3], dtype=int32)
```

## FREQUENTLY ASKED QUESTIONS (FAQ)

### 27.1 DataFrame memory usage

The memory usage of a DataFrame (including the index) is shown when calling the `info()`. A configuration option, `display.memory_usage` (see *the list of options*), specifies if the DataFrame's memory usage will be displayed when invoking the `df.info()` method.

For example, the memory usage of the DataFrame below is shown when calling `info()`:

```
In [1]: dtypes = ['int64', 'float64', 'datetime64[ns]', 'timedelta64[ns]',
...:             'complex128', 'object', 'bool']
...:

In [2]: n = 5000

In [3]: data = dict([(t, np.random.randint(100, size=n).astype(t))
...:                 for t in dtypes])
...:

In [4]: df = pd.DataFrame(data)

In [5]: df['categorical'] = df['object'].astype('category')

In [6]: df.info()
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 5000 entries, 0 to 4999
Data columns (total 8 columns):
int64          5000 non-null int64
float64        5000 non-null float64
datetime64[ns] 5000 non-null datetime64[ns]
timedelta64[ns] 5000 non-null timedelta64[ns]
complex128     5000 non-null complex128
object         5000 non-null object
bool           5000 non-null bool
categorical    5000 non-null category
dtypes: bool(1), category(1), complex128(1), datetime64[ns](1), float64(1), int64(1),
↪object(1), timedelta64[ns](1)
memory usage: 289.1+ KB
```

The + symbol indicates that the true memory usage could be higher, because pandas does not count the memory used by values in columns with `dtype=object`.

Passing `memory_usage='deep'` will enable a more accurate memory usage report, accounting for the full usage of the contained objects. This is optional as it can be expensive to do this deeper introspection.

```
In [7]: df.info(memory_usage='deep')
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 5000 entries, 0 to 4999
Data columns (total 8 columns):
int64          5000 non-null int64
float64        5000 non-null float64
datetime64[ns] 5000 non-null datetime64[ns]
timedelta64[ns] 5000 non-null timedelta64[ns]
complex128      5000 non-null complex128
object         5000 non-null object
bool           5000 non-null bool
category       5000 non-null category
dtypes: bool(1), category(1), complex128(1), datetime64[ns](1), float64(1), int64(1),
↳ object(1), timedelta64[ns](1)
memory usage: 425.6 KB
```

By default the display option is set to `True` but can be explicitly overridden by passing the `memory_usage` argument when invoking `df.info()`.

The memory usage of each column can be found by calling the `memory_usage()` method. This returns a Series with an index represented by column names and memory usage of each column shown in bytes. For the DataFrame above, the memory usage of each column and the total memory usage can be found with the `memory_usage` method:

```
In [8]: df.memory_usage()
```

Out [8] :

Index	80
int64	40000
float64	40000
datetime64[ns]	40000
timedelta64[ns]	40000
complex128	80000
object	40000
bool	5000
categorical	10920
dtype: int64	

```
# total memory usage of dataframe
```

```
In [9]: df.memory_usage().sum()
```

$\backslash \backslash \backslash \backslash \backslash$   
→ 296000

By default the memory usage of the `DataFrame`'s index is shown in the returned `Series`, the memory usage of the index can be suppressed by passing the `index=False` argument:

```
In [10]: df.memory_usage(index=False)
```

Out [10] :

int64	40000
float64	40000
datetime64[ns]	40000
timedelta64[ns]	40000
complex128	80000
object	40000
bool	5000
categorical	10920
dtype: int64	

The memory usage displayed by the `info()` method utilizes the `memory_usage()` method to determine the memory usage of a `DataFrame` while also formatting the output in human-readable units (base-2 representation; i.e. 1KB

= 1024 bytes).

See also *Categorical Memory Usage*.

## 27.2 Using If/Truth Statements with pandas

pandas follows the NumPy convention of raising an error when you try to convert something to a `bool`. This happens in an `if`-statement or when using the boolean operations: `and`, `or`, and `not`. It is not clear what the result of the following code should be:

```
>>> if pd.Series([False, True, False]):
    ...
```

Should it be `True` because it's not zero-length, or `False` because there are `False` values? It is unclear, so instead, pandas raises a `ValueError`:

```
>>> if pd.Series([False, True, False]):
    print("I was true")
Traceback
...
ValueError: The truth value of an array is ambiguous. Use a.empty, a.any() or a.all().
```

You need to explicitly choose what you want to do with the `DataFrame`, e.g. use `any()`, `all()` or `empty()`. Alternatively, you might want to compare if the pandas object is `None`:

```
>>> if pd.Series([False, True, False]) is not None:
    print("I was not None")
>>> I was not None
```

Below is how to check if any of the values are `True`:

```
>>> if pd.Series([False, True, False]).any():
    print("I am any")
>>> I am any
```

To evaluate single-element pandas objects in a boolean context, use the method `bool()`:

```
In [11]: pd.Series([True]).bool()
Out[11]: True

In [12]: pd.Series([False]).bool()
Out[12]: False

In [13]: pd.DataFrame([True]).bool()
Out[13]: True

In [14]: pd.DataFrame([False]).bool()
Out[14]: False
```

### 27.2.1 Bitwise boolean

Bitwise boolean operators like `==` and `!=` return a boolean `Series`, which is almost always what you want anyways.

```
>>> s = pd.Series(range(5))
>>> s == 4
0    False
1    False
2    False
3    False
4     True
dtype: bool
```

See *boolean comparisons* for more examples.

### 27.2.2 Using the `in` operator

Using the Python `in` operator on a `Series` tests for membership in the index, not membership among the values.

```
In [15]: s = pd.Series(range(5), index=list('abcde'))

In [16]: 2 in s
Out[16]: False

In [17]: 'b' in s
\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\Out[17]: True
```

If this behavior is surprising, keep in mind that using `in` on a Python dictionary tests keys, not values, and `Series` are dict-like. To test for membership in the values, use the method `isin()`:

```
In [18]: s.isin([2])
Out[18]:
a    False
b    False
c     True
d    False
e    False
dtype: bool

In [19]: s.isin([2]).any()
Out[19]: True
```

For DataFrames, likewise, `in` applies to the column axis, testing for membership in the list of column names.

### 27.3 NaN, Integer NA values and NA type promotions

### 27.3.1 Choice of NA representation

For lack of NA (missing) support from the ground up in NumPy and Python in general, we were given the difficult choice between either:

- A *masked array* solution: an array of data and an array of boolean values indicating whether a value is there or is missing.
- Using a special sentinel value, bit pattern, or set of sentinel values to denote NA across the dtypes.

For many reasons we chose the latter. After years of production use it has proven, at least in my opinion, to be the best decision given the state of affairs in NumPy and Python in general. The special value `NaN` (Not-A-Number) is used

everywhere as the NA value, and there are API functions `isna` and `notna` which can be used across the dtypes to detect NA values.

However, it comes with it a couple of trade-offs which I most certainly have not ignored.

### 27.3.2 Support for integer NA

In the absence of high performance NA support being built into NumPy from the ground up, the primary casualty is the ability to represent NAs in integer arrays. For example:

```
In [20]: s = pd.Series([1, 2, 3, 4, 5], index=list('abcde'))

In [21]: s
Out[21]:
a      1
b      2
c      3
d      4
e      5
dtype: int64

In [22]: s.dtype
Out[22]: dtype('int64')

In [23]: s2 = s.reindex(['a', 'b', 'c', 'f', 'u'])

In [24]: s2
Out[24]:
a      1.0
b      2.0
c      3.0
f      NaN
u      NaN
dtype: float64

In [25]: s2.dtype
Out[25]: dtype('float64')
```

This trade-off is made largely for memory and performance reasons, and also so that the resulting `Series` continues to be “numeric”. One possibility is to use `dtype=object` arrays instead.

### 27.3.3 NA type promotions

When introducing NAs into an existing `Series` or `DataFrame` via `reindex()` or some other means, boolean and integer types will be promoted to a different dtype in order to store the NAs. The promotions are summarized in this table:

Typeclass	Promotion dtype for storing NAs
floating	no change
object	no change
integer	cast to float64
boolean	cast to object

While this may seem like a heavy trade-off, I have found very few cases where this is an issue in practice i.e. storing values greater than  $2^{53}$ . Some explanation for the motivation is in the next section.

### 27.3.4 Why not make NumPy like R?

Many people have suggested that NumPy should simply emulate the NA support present in the more domain-specific statistical programming language R. Part of the reason is the NumPy type hierarchy:

Typeclass	Dtypes
<code>numpy.floating</code>	<code>float16</code> , <code>float32</code> , <code>float64</code> , <code>float128</code>
<code>numpy.integer</code>	<code>int8</code> , <code>int16</code> , <code>int32</code> , <code>int64</code>
<code>numpy.unsignedinteger</code>	<code>uint8</code> , <code>uint16</code> , <code>uint32</code> , <code>uint64</code>
<code>numpy.object_</code>	<code>object_</code>
<code>numpy.bool_</code>	<code>bool_</code>
<code>numpy.character</code>	<code>string_</code> , <code>unicode_</code>

The R language, by contrast, only has a handful of built-in data types: `integer`, `numeric` (floating-point), `character`, and `boolean`. NA types are implemented by reserving special bit patterns for each type to be used as the missing value. While doing this with the full NumPy type hierarchy would be possible, it would be a more substantial trade-off (especially for the 8- and 16-bit data types) and implementation undertaking.

An alternate approach is that of using masked arrays. A masked array is an array of data with an associated boolean *mask* denoting whether each value should be considered NA or not. I am personally not in love with this approach as I feel that overall it places a fairly heavy burden on the user and the library implementer. Additionally, it exacts a fairly high performance cost when working with numerical data compared with the simple approach of using NaN. Thus, I have chosen the Pythonic “practicality beats purity” approach and traded integer NA capability for a much simpler approach of using a special value in float and object arrays to denote NA, and promoting integer arrays to floating when NAs must be introduced.

## 27.4 Differences with NumPy

For `Series` and `DataFrame` objects, `var()` normalizes by  $N-1$  to produce unbiased estimates of the sample variance, while NumPy’s `var` normalizes by  $N$ , which measures the variance of the sample. Note that `cov()` normalizes by  $N-1$  in both pandas and NumPy.

## 27.5 Thread-safety

As of pandas 0.11, pandas is not 100% thread safe. The known issues relate to the `copy()` method. If you are doing a lot of copying of `DataFrame` objects shared among threads, we recommend holding locks inside the threads where the data copying occurs.

See [this link](#) for more information.

## 27.6 Byte-Ordering Issues

Occasionally you may have to deal with data that were created on a machine with a different byte order than the one on which you are running Python. A common symptom of this issue is an error like:

```
Traceback
...
ValueError: Big-endian buffer not supported on little-endian compiler
```

To deal with this issue you should convert the underlying NumPy array to the native system byte order *before* passing it to Series or DataFrame constructors using something similar to the following:

```
In [26]: x = np.array(list(range(10)), '>i4') # big endian

In [27]: newx = x.byteswap().newbyteorder() # force native byteorder

In [28]: s = pd.Series(newx)
```

See [the NumPy documentation on byte order](#) for more details.

## RPY2 / R INTERFACE

**Warning:** Up to pandas 0.19, a `pandas.rpy` module existed with functionality to convert between pandas and rpy2 objects. This functionality now lives in the rpy2 project itself. See the [updating section](#) of the previous documentation for a guide to port your code from the removed `pandas.rpy` to rpy2 functions.

rpy2 is an interface to R running embedded in a Python process, and also includes functionality to deal with pandas DataFrames. Converting data frames back and forth between rpy2 and pandas should be largely automated (no need to convert explicitly, it will be done on the fly in most rpy2 functions). To convert explicitly, the functions are `pandas2ri.py2ri()` and `pandas2ri.ri2py()`.

See also the documentation of the rpy2 project: <https://rpy2.readthedocs.io>.

In the remainder of this page, a few examples of explicit conversion is given. The pandas conversion of rpy2 needs first to be activated:

```
In [1]: from rpy2.robjjects import r, pandas2ri
In [2]: pandas2ri.activate()
```

### 28.1 Transferring R data sets into Python

Once the pandas conversion is activated (`pandas2ri.activate()`), many conversions of R to pandas objects will be done automatically. For example, to obtain the ‘iris’ dataset as a pandas DataFrame:

```
In [3]: r.data('iris')
Out[3]:
R object with classes: ('character',) mapped to:
<StrVector - Python:0x1c3987a8c8 / R:0x7fb4bc93d8e8>
['iris']
```

```
In [4]: r['iris'].head()
```

```
=====
↪
   Sepal.Length  Sepal.Width  Petal.Length  Petal.Width Species
0             5.1           3.5           1.4           0.2  setosa
1             4.9           3.0           1.4           0.2  setosa
2             4.7           3.2           1.3           0.2  setosa
3             4.6           3.1           1.5           0.2  setosa
4             5.0           3.6           1.4           0.2  setosa
```

If the pandas conversion was not activated, the above could also be accomplished by explicitly converting it with the `pandas2ri.ri2py` function (`pandas2ri.ri2py(r['iris'])`).

## 28.2 Converting DataFrames into R objects

The `pandas2ri.py2ri` function support the reverse operation to convert DataFrames into the equivalent R object (that is, **data.frame**):

```
In [5]: df = pd.DataFrame({'A': [1, 2, 3], 'B': [4, 5, 6], 'C': [7, 8, 9]},
...:                      index=["one", "two", "three"])
...:

In [6]: r_dataframe = pandas2ri.py2ri(df)

In [7]: print(type(r_dataframe))
<class 'rpy2.robjects.vectors.DataFrame'>

In [8]: print(r_dataframe)
\\repeated backslashes\\           A B C
one    1 4 7
two     2 5 8
three   3 6 9
```

The DataFrame's index is stored as the `rownames` attribute of the `data.frame` instance.

## PANDAS ECOSYSTEM

Increasingly, packages are being built on top of pandas to address specific needs in data preparation, analysis and visualization. This is encouraging because it means pandas is not only helping users to handle their data tasks but also that it provides a better starting point for developers to build powerful and more focused data tools. The creation of libraries that complement pandas' functionality also allows pandas development to remain focused around its original requirements.

This is an in-exhaustive list of projects that build on pandas in order to provide tools in the PyData space.

We'd like to make it easier for users to find these project, if you know of other substantial projects that you feel should be on this list, please let us know.

### 29.1 Statistics and Machine Learning

#### 29.1.1 Statsmodels

Statsmodels is the prominent Python "statistics and econometrics library" and it has a long-standing special relationship with pandas. Statsmodels provides powerful statistics, econometrics, analysis and modeling functionality that is out of pandas' scope. Statsmodels leverages pandas objects as the underlying data container for computation.

#### 29.1.2 sklearn-pandas

Use pandas DataFrames in your [scikit-learn](#) ML pipeline.

#### 29.1.3 Featuretools

Featuretools is a Python library for automated feature engineering built on top of pandas. It excels at transforming temporal and relational datasets into feature matrices for machine learning using reusable feature engineering "primitives". Users can contribute their own primitives in Python and share them with the rest of the community.

### 29.2 Visualization

#### 29.2.1 Bokeh

Bokeh is a Python interactive visualization library for large datasets that natively uses the latest web technologies. Its goal is to provide elegant, concise construction of novel graphics in the style of Protovis/D3, while delivering high-performance interactivity over large data to thin clients.

## 29.2.2 seaborn

Seaborn is a Python visualization library based on [matplotlib](#). It provides a high-level, dataset-oriented interface for creating attractive statistical graphics. The plotting functions in seaborn understand pandas objects and leverage pandas grouping operations internally to support concise specification of complex visualizations. Seaborn also goes beyond matplotlib and pandas with the option to perform statistical estimation while plotting, aggregating across observations and visualizing the fit of statistical models to emphasize patterns in a dataset.

## 29.2.3 yhat/ggplot

Hadley Wickham's [ggplot2](#) is a foundational exploratory visualization package for the R language. Based on “[The Grammar of Graphics](#)” it provides a powerful, declarative and extremely general way to generate bespoke plots of any kind of data. It's really quite incredible. Various implementations to other languages are available, but a faithful implementation for Python users has long been missing. Although still young (as of Jan-2014), the [yhat/ggplot](#) project has been progressing quickly in that direction.

## 29.2.4 Vincent

The [Vincent](#) project leverages [Vega](#) (that in turn, leverages [d3](#)) to create plots. Although functional, as of Summer 2016 the Vincent project has not been updated in over two years and is [unlikely to receive further updates](#).

## 29.2.5 IPython Vega

Like Vincent, the [IPython Vega](#) project leverages [Vega](#) to create plots, but primarily targets the IPython Notebook environment.

## 29.2.6 Plotly

[Plotly's Python API](#) enables interactive figures and web shareability. Maps, 2D, 3D, and live-streaming graphs are rendered with WebGL and [D3.js](#). The library supports plotting directly from a pandas DataFrame and cloud-based collaboration. Users of [matplotlib](#), [ggplot for Python](#), and [Seaborn](#) can convert figures into interactive web-based plots. Plots can be drawn in [IPython Notebooks](#), edited with R or MATLAB, modified in a GUI, or embedded in apps and dashboards. Plotly is free for unlimited sharing, and has [cloud](#), [offline](#), or [on-premise](#) accounts for private use.

## 29.2.7 QtPandas

Spun off from the main pandas library, the [qtpandas](#) library enables DataFrame visualization and manipulation in PyQt4 and PySide applications.

# 29.3 IDE

## 29.3.1 IPython

IPython is an interactive command shell and distributed computing environment. IPython Notebook is a web application for creating IPython notebooks. An IPython notebook is a JSON document containing an ordered list of input/output cells which can contain code, text, mathematics, plots and rich media. IPython notebooks can be converted to a number of open standard output formats (HTML, HTML presentation slides, LaTeX, PDF, ReStructuredText, Markdown, Python) through ‘Download As’ in the web interface and `ipython nbconvert` in a shell.

Pandas DataFrames implement `_repr_html_` methods which are utilized by IPython Notebook for displaying (abbreviated) HTML tables. (Note: HTML tables may or may not be compatible with non-HTML IPython output formats.)

### 29.3.2 quantopian/qgrid

qgrid is “an interactive grid for sorting and filtering DataFrames in IPython Notebook” built with SlickGrid.

### 29.3.3 Spyder

Spyder is a cross-platform Qt-based open-source Python IDE with editing, testing, debugging, and introspection features. Spyder can now introspect and display Pandas DataFrames and show both “column wise min/max and global min/max coloring.”

## 29.4 API

### 29.4.1 pandas-datareader

`pandas-datareader` is a remote data access library for pandas (PyPI:`pandas-datareader`). It is based on functionality that was located in `pandas.io.data` and `pandas.io.wb` but was split off in v0.19. See more in the [pandas-datareader docs](#):

The following data feeds are available:

- Yahoo! Finance
- Google Finance
- FRED
- Fama/French
- World Bank
- OECD
- Eurostat
- EDGAR Index

### 29.4.2 quandl/Python

Quandl API for Python wraps the Quandl REST API to return Pandas DataFrames with timeseries indexes.

### 29.4.3 pydatastream

PyDatastream is a Python interface to the [Thomson Dataworks Enterprise \(DWE/Datastream\)](#) SOAP API to return indexed Pandas DataFrames or Panels with financial data. This package requires valid credentials for this API (non free).

## 29.4.4 pandaSDMX

pandaSDMX is a library to retrieve and acquire statistical data and metadata disseminated in [SDMX 2.1](#), an ISO-standard widely used by institutions such as statistics offices, central banks, and international organisations. pandaSDMX can expose datasets and related structural metadata including dataflows, code-lists, and datastructure definitions as pandas Series or multi-indexed DataFrames.

## 29.4.5 fredapi

fredapi is a Python interface to the [Federal Reserve Economic Data \(FRED\)](#) provided by the Federal Reserve Bank of St. Louis. It works with both the FRED database and ALFRED database that contains point-in-time data (i.e. historic data revisions). fredapi provides a wrapper in Python to the FRED HTTP API, and also provides several convenient methods for parsing and analyzing point-in-time data from ALFRED. fredapi makes use of pandas and returns data in a Series or DataFrame. This module requires a FRED API key that you can obtain for free on the FRED website.

# 29.5 Domain Specific

## 29.5.1 Geopandas

Geopandas extends pandas data objects to include geographic information which support geometric operations. If your work entails maps and geographical coordinates, and you love pandas, you should take a close look at Geopandas.

## 29.5.2 xarray

xarray brings the labeled data power of pandas to the physical sciences by providing N-dimensional variants of the core pandas data structures. It aims to provide a pandas-like and pandas-compatible toolkit for analytics on multi-dimensional arrays, rather than the tabular data for which pandas excels.

# 29.6 Out-of-core

## 29.6.1 Dask

Dask is a flexible parallel computing library for analytics. Dask provides a familiar `DataFrame` interface for out-of-core, parallel and distributed computing.

## 29.6.2 Dask-ML

Dask-ML enables parallel and distributed machine learning using Dask alongside existing machine learning libraries like Scikit-Learn, XGBoost, and TensorFlow.

## 29.6.3 Blaze

Blaze provides a standard API for doing computations with various in-memory and on-disk backends: NumPy, Pandas, SQLAlchemy, MongoDB, PyTables, PySpark.

### 29.6.4 Odo

Odo provides a uniform API for moving data between different formats. It uses pandas own `read_csv` for CSV IO and leverages many existing packages such as PyTables, h5py, and pymongo to move data between non pandas formats. Its graph based approach is also extensible by end users for custom formats that may be too specific for the core of odo.

## 29.7 Data validation

### 29.7.1 Engarde

Engarde is a lightweight library used to explicitly state your assumptions about your datasets and check that they're *actually* true.

## 29.8 Extension Data Types

Pandas provides an interface for defining *extension types* to extend NumPy's type system. The following libraries implement that interface to provide types not found in NumPy or pandas, which work well with pandas' data containers.

### 29.8.1 cyberpandas

Cyberpandas provides an extension type for storing arrays of IP Addresses. These arrays can be stored inside pandas' Series and DataFrame.

## 29.9 Accessors

A directory of projects providing *extension accessors*. This is for users to discover new accessors and for library authors to coordinate on the namespace.

Library	Accessor	Classes
<a href="#">cyberpandas</a>	ip	Series
<a href="#">pdvega</a>	vgplot	Series, DataFrame

## COMPARISON WITH R / R LIBRARIES

Since `pandas` aims to provide a lot of the data manipulation and analysis functionality that people use `R` for, this page was started to provide a more detailed look at the `R` language and its many third party libraries as they relate to `pandas`. In comparisons with `R` and CRAN libraries, we care about the following things:

- **Functionality / flexibility:** what can/cannot be done with each tool
- **Performance:** how fast are operations. Hard numbers/benchmarks are preferable
- **Ease-of-use:** Is one tool easier/harder to use (you may have to be the judge of this, given side-by-side code comparisons)

This page is also here to offer a bit of a translation guide for users of these `R` packages.

For transfer of `DataFrame` objects from `pandas` to `R`, one option is to use `HDF5` files, see [External Compatibility](#) for an example.

### 30.1 Quick Reference

We'll start off with a quick reference guide pairing some common `R` operations using `dplyr` with `pandas` equivalents.

#### 30.1.1 Querying, Filtering, Sampling

R	pandas
<code>dim(df)</code>	<code>df.shape</code>
<code>head(df)</code>	<code>df.head()</code>
<code>slice(df, 1:10)</code>	<code>df.iloc[:9]</code>
<code>filter(df, col1 == 1, col2 == 1)</code>	<code>df.query('col1 == 1 &amp; col2 == 1')</code>
<code>df[df\$col1 == 1 &amp; df\$col2 == 1,]</code>	<code>df[(df.col1 == 1) &amp; (df.col2 == 1)]</code>
<code>select(df, col1, col2)</code>	<code>df[['col1', 'col2']]</code>
<code>select(df, col1:col3)</code>	<code>df.loc[:, 'col1':'col3']</code>
<code>select(df, -(col1:col3))</code>	<code>df.drop(cols_to_drop, axis=1)</code> but see <sup>1</sup>
<code>distinct(select(df, col1))</code>	<code>df[['col1']].drop_duplicates()</code>
<code>distinct(select(df, col1, col2))</code>	<code>df[['col1', 'col2']].drop_duplicates()</code>
<code>sample_n(df, 10)</code>	<code>df.sample(n=10)</code>
<code>sample_frac(df, 0.01)</code>	<code>df.sample(frac=0.01)</code>

---

<sup>1</sup> `R`'s shorthand for a subrange of columns (`select(df, col1:col3)`) can be approached cleanly in `pandas`, if you have the list of columns, for example `df[cols[1:3]]` or `df.drop(cols[1:3])`, but doing this by column name is a bit messy.

### 30.1.2 Sorting

R	pandas
<code>arrange(df, col1, col2)</code>	<code>df.sort_values(['col1', 'col2'])</code>
<code>arrange(df, desc(col1))</code>	<code>df.sort_values('col1', ascending=False)</code>

### 30.1.3 Transforming

R	pandas
<code>select(df, col_one = col1)</code>	<code>df.rename(columns={'col1': 'col_one'})['col_one']</code>
<code>rename(df, col_one = col1)</code>	<code>df.rename(columns={'col1': 'col_one'})</code>
<code>mutate(df, c=a-b)</code>	<code>df.assign(c=df.a-df.b)</code>

### 30.1.4 Grouping and Summarizing

R	pandas
<code>summary(df)</code>	<code>df.describe()</code>
<code>gdf &lt;- group_by(df, col1)</code>	<code>gdf = df.groupby('col1')</code>
<code>summarise(gdf, avg=mean(col1, na.rm=TRUE))</code>	<code>df.groupby('col1').agg({'col1': 'mean'})</code>
<code>summarise(gdf, total=sum(col1))</code>	<code>df.groupby('col1').sum()</code>

## 30.2 Base R

### 30.2.1 Slicing with R's `c`

R makes it easy to access `data.frame` columns by name

```
df <- data.frame(a=rnorm(5), b=rnorm(5), c=rnorm(5), d=rnorm(5), e=rnorm(5))
df[, c("a", "c", "e")]
```

or by integer location

```
df <- data.frame(matrix(rnorm(1000), ncol=100))
df[, c(1:10, 25:30, 40, 50:100)]
```

Selecting multiple columns by name in pandas is straightforward

```
In [1]: df = pd.DataFrame(np.random.randn(10, 3), columns=list('abc'))

In [2]: df[['a', 'c']]
Out[2]:
```

	a	c
0	-1.039575	-0.424972
1	0.567020	-1.087401
2	-0.673690	-1.478427

(continues on next page)

(continued from previous page)

```

3  0.524988  0.577046
4 -1.715002 -0.370647
5 -1.157892  0.844885
6  1.075770  1.643563
7 -1.469388 -0.674600
8 -1.776904 -1.294524
9  0.413738 -0.472035

```

```
In [3]: df.loc[:, ['a', 'c']]
```

```

↪
      a      c
0 -1.039575 -0.424972
1  0.567020 -1.087401
2 -0.673690 -1.478427
3  0.524988  0.577046
4 -1.715002 -0.370647
5 -1.157892  0.844885
6  1.075770  1.643563
7 -1.469388 -0.674600
8 -1.776904 -1.294524
9  0.413738 -0.472035

```

Selecting multiple noncontiguous columns by integer location can be achieved with a combination of the `iloc` indexer attribute and `numpy.r_`.

```
In [4]: named = list('abcdefg')
```

```
In [5]: n = 30
```

```
In [6]: columns = named + np.arange(len(named), n).tolist()
```

```
In [7]: df = pd.DataFrame(np.random.randn(n, n), columns=columns)
```

```
In [8]: df.iloc[:, np.r_[10, 24:30]]
```

```

Out[8]:
      a      b      c      d      e      ...      25      26
↪      27      28      29

[30 rows x 16 columns]

```

### 30.2.2 aggregate

In R you may want to split data into subsets and compute the mean for each. Using a data.frame called `df` and splitting it into groups `by1` and `by2`:

```

df <- data.frame(
  v1 = c(1,3,5,7,8,3,5,NA,4,5,7,9),
  v2 = c(11,33,55,77,88,33,55,NA,44,55,77,99),
  by1 = c("red", "blue", 1, 2, NA, "big", 1, 2, "red", 1, NA, 12),
  by2 = c("wet", "dry", 99, 95, NA, "damp", 95, 99, "red", 99, NA, NA))
aggregate(x=df[, c("v1", "v2")], by=list(mydf2$by1, mydf2$by2), FUN = mean)

```

The `groupby()` method is similar to base R `aggregate` function.

```

In [9]: df = pd.DataFrame({
...:     'v1': [1,3,5,7,8,3,5,np.nan,4,5,7,9],
...:     'v2': [11,33,55,77,88,33,55,np.nan,44,55,77,99],
...:     'by1': ["red", "blue", 1, 2, np.nan, "big", 1, 2, "red", 1, np.nan, 12],
...:     'by2': ["wet", "dry", 99, 95, np.nan, "damp", 95, 99, "red", 99, np.nan,
...:             np.nan]
...: })
...:

In [10]: g = df.groupby(['by1', 'by2'])

In [11]: g[['v1', 'v2']].mean()
Out[11]:

```

		v1	v2
by1	by2		
1	95	5.0	55.0
	99	5.0	55.0
2	95	7.0	77.0
	99	NaN	NaN
big	damp	3.0	33.0
blue	dry	3.0	33.0
red	red	4.0	44.0
	wet	1.0	11.0

For more details and examples see [the groupby documentation](#).

### 30.2.3 match / %in%

A common way to select data in R is using `%in%` which is defined using the function `match`. The operator `%in%` is used to return a logical vector indicating if there is a match or not:

```
s <- 0:4
s %in% c(2,4)
```

The `isin()` method is similar to R `%in%` operator:

```
In [12]: s = pd.Series(np.arange(5), dtype=np.float32)

In [13]: s.isin([2, 4])
Out[13]:
0    False
1    False
2     True
3    False
4     True
dtype: bool
```

The `match` function returns a vector of the positions of matches of its first argument in its second:

```
s <- 0:4
match(s, c(2,4))
```

For more details and examples see [the reshaping documentation](#).

### 30.2.4 tapply

`tapply` is similar to `aggregate`, but data can be in a ragged array, since the subclass sizes are possibly irregular. Using a data.frame called `baseball`, and retrieving information based on the array `team`:

```
baseball <-
  data.frame(team = gl(5, 5,
    labels = paste("Team", LETTERS[1:5])),
    player = sample(letters, 25),
    batting.average = runif(25, .200, .400))

tapply(baseball$batting.average, baseball$team,
  max)
```

In pandas we may use `pivot_table()` method to handle this:

```
In [14]: import random

In [15]: import string

In [16]: baseball = pd.DataFrame({
....:     'team': ["team %d" % (x+1) for x in range(5)]*5,
....:     'player': random.sample(list(string.ascii_lowercase), 25),
....:     'batting avg': np.random.uniform(.200, .400, 25)
....: })

In [17]: baseball.pivot_table(values='batting avg', columns='team', aggfunc=np.max)
```

(continues on next page)

(continued from previous page)

```
Out[17]:
```

team	team 1	team 2	team 3	team 4	team 5
batting avg	0.394457	0.39573	0.343015	0.388863	0.377379

For more details and examples see [the reshaping documentation](#).

### 30.2.5 subset

The `query()` method is similar to the base R `subset` function. In R you might want to get the rows of a data frame where one column's values are less than another column's values:

```
df <- data.frame(a=rnorm(10), b=rnorm(10))
subset(df, a <= b)
df[df$a <= df$b,] # note the comma
```

In pandas, there are a few ways to perform subsetting. You can use `query()` or pass an expression as if it were an index/slice as well as standard boolean indexing:

```
In [18]: df = pd.DataFrame({'a': np.random.randn(10), 'b': np.random.randn(10)})
```

```
In [19]: df.query('a <= b')
```

```
Out [19]:
```

	a	b
0	-1.003455	-0.990738
1	0.083515	0.548796
3	-0.524392	0.904400
4	-0.837804	0.746374
8	-0.507219	0.245479

```
In [20]: df[df.a <= df.b]
```

	a	b
0	-1.003455	-0.990738
1	0.083515	0.548796
3	-0.524392	0.904400
4	-0.837804	0.746374
8	-0.507219	0.245479

```
In [21]: df.loc[df.a <= df.b]
```

	a	b
0	-1.003455	-0.990738
1	0.083515	0.548796
3	-0.524392	0.904400
4	-0.837804	0.746374
8	-0.507219	0.245479

For more details and examples see [the query documentation](#).

### 30.2.6 with

An expression using a data.frame called `df` in R with the columns `a` and `b` would be evaluated using `with` like so:

```
df <- data.frame(a=rnorm(10), b=rnorm(10))
with(df, a + b)
df$a + df$b # same as the previous expression
```

In pandas the equivalent expression, using the `eval()` method, would be:

```
In [22]: df = pd.DataFrame({'a': np.random.randn(10), 'b': np.random.randn(10)})

In [23]: df.eval('a + b')
Out[23]:
0    -0.920205
1    -0.860236
2     1.154370
3     0.188140
4    -1.163718
5     0.001397
6    -0.825694
7    -1.138198
8    -1.708034
9     1.148616
dtype: float64
```

```
In [24]: df.a + df.b # same as the previous expression
```

```
0 -0.920205
1 -0.860236
2  1.154370
3  0.188140
4 -1.163718
5  0.001397
6 -0.825694
7 -1.138198
8 -1.708034
9  1.148616
dtype: float64
```

In certain cases `eval()` will be much faster than evaluation in pure Python. For more details and examples see [the eval documentation](#).

### 30.3 plyr

`plyr` is an R library for the split-apply-combine strategy for data analysis. The functions revolve around three data structures in R, `a` for arrays, `l` for lists, and `d` for `data.frame`. The table below shows how these data structures could be mapped in Python.

R	Python
array	list
lists	dictionary or list of objects
data.frame	dataframe

### 30.3.1 ddply

An expression using a data.frame called `df` in R where you want to summarize `x` by month:

```
require(plyr)
df <- data.frame(
  x = runif(120, 1, 168),
  y = runif(120, 7, 334),
  z = runif(120, 1.7, 20.7),
  month = rep(c(5,6,7,8),30),
  week = sample(1:4, 120, TRUE)
)

ddply(df, .(month, week), summarize,
      mean = round(mean(x), 2),
      sd = round(sd(x), 2))
```

In pandas the equivalent expression, using the `groupby()` method, would be:

```
In [25]: df = pd.DataFrame({
.....:     'x': np.random.uniform(1., 168., 120),
.....:     'y': np.random.uniform(7., 334., 120),
.....:     'z': np.random.uniform(1.7, 20.7, 120),
.....:     'month': [5,6,7,8]*30,
.....:     'week': np.random.randint(1,4, 120)
.....: })

In [26]: grouped = df.groupby(['month','week'])

In [27]: grouped['x'].agg([np.mean, np.std])
Out[27]:
```

month	week	mean	std
5	1	71.840596	52.886392
	2	71.904794	55.786805
	3	89.845632	49.892367
6	1	97.730877	52.442172
	2	93.369836	47.178389
	3	96.592088	58.773744
7	1	59.255715	43.442336
	2	69.634012	28.607369
	3	84.510992	59.761096
8	1	104.787666	31.745437
	2	69.717872	53.747188
	3	79.892221	52.950459

For more details and examples see [the groupby documentation](#).

## 30.4 reshape / reshape2

### 30.4.1 melt.array

An expression using a 3 dimensional array called `a` in R where you want to melt it into a data.frame:

```
a <- array(c(1:23, NA), c(2,3,4))
data.frame(melt(a))
```

In Python, since `a` is a list, you can simply use list comprehension.

```
In [28]: a = np.array(list(range(1,24))+[np.NaN]).reshape(2,3,4)

In [29]: pd.DataFrame([tuple(list(x)+[val]) for x, val in np.ndenumerate(a)])
Out[29]:
```

	0	1	2	3
0	0	0	0	1.0
1	0	0	1	2.0
2	0	0	2	3.0
3	0	0	3	4.0
4	0	1	0	5.0
5	0	1	1	6.0
6	0	1	2	7.0
..	..	..	..	...
17	1	1	1	18.0
18	1	1	2	19.0
19	1	1	3	20.0
20	1	2	0	21.0
21	1	2	1	22.0
22	1	2	2	23.0
23	1	2	3	NaN

[24 rows x 4 columns]

### 30.4.2 melt.list

An expression using a list called `a` in R where you want to melt it into a data.frame:

```
a <- as.list(c(1:4, NA))
data.frame(melt(a))
```

In Python, this list would be a list of tuples, so `DataFrame()` method would convert it to a dataframe as required.

```
In [30]: a = list(enumerate(list(range(1,5))+[np.NaN]))

In [31]: pd.DataFrame(a)
Out[31]:
```

	0	1
0	0	1.0
1	1	2.0
2	2	3.0
3	3	4.0
4	4	NaN

For more details and examples see [the Into to Data Structures documentation](#).

### 30.4.3 melt.data.frame

An expression using a data.frame called `cheese` in R where you want to reshape the data.frame:

```
cheese <- data.frame(
  first = c('John', 'Mary'),
  last = c('Doe', 'Bo'),
  height = c(5.5, 6.0),
  weight = c(130, 150)
)
melt(cheese, id=c("first", "last"))
```

In Python, the `melt()` method is the R equivalent:

```
In [32]: cheese = pd.DataFrame({'first' : ['John', 'Mary'],
.....:                          'last' : ['Doe', 'Bo'],
.....:                          'height' : [5.5, 6.0],
.....:                          'weight' : [130, 150]})
.....:
```

```
In [33]: pd.melt(cheese, id_vars=['first', 'last'])
```

```
Out[33]:
```

	first	last	variable	value
0	John	Doe	height	5.5
1	Mary	Bo	height	6.0
2	John	Doe	weight	130.0
3	Mary	Bo	weight	150.0

```
In [34]: cheese.set_index(['first', 'last']).stack() # alternative way
//////////
↪
first  last
John   Doe    height      5.5
        weight    130.0
Mary   Bo     height      6.0
        weight    150.0
dtype: float64
```

For more details and examples see *the reshaping documentation*.

### 30.4.4 cast

In R `acast` is an expression using a `data.frame` called `df` in R to cast into a higher dimensional array:

```
df <- data.frame(
  x = runif(12, 1, 168),
  y = runif(12, 7, 334),
  z = runif(12, 1.7, 20.7),
  month = rep(c(5,6,7), 4),
  week = rep(c(1,2), 6)
)

mdf <- melt(df, id=c("month", "week"))
acast(mdf, week ~ month ~ variable, mean)
```

In Python the best way is to make use of `pivot_table()`:

```
In [35]: df = pd.DataFrame({
.....:     'x': np.random.uniform(1., 168., 12),
.....:     'y': np.random.uniform(7., 334., 12),
```

(continues on next page)

(continued from previous page)

```

.....:     'z': np.random.uniform(1.7, 20.7, 12),
.....:     'month': [5,6,7]*4,
.....:     'week': [1,2]*6
.....: })
.....:

In [36]: mdf = pd.melt(df, id_vars=['month', 'week'])

In [37]: pd.pivot_table(mdf, values='value', index=['variable', 'week'],
.....:                  columns=['month'], aggfunc=np.mean)
.....:
Out[37]:

```

		5	6	7
variable	week			
x	1	114.001700	132.227290	65.808204
	2	124.669553	147.495706	82.882820
y	1	225.636630	301.864228	91.706834
	2	57.692665	215.851669	218.004383
z	1	17.793871	7.124644	17.679823
	2	15.068355	13.873974	9.394966

Similarly for `dcast` which uses a data.frame called `df` in R to aggregate information based on `Animal` and `FeedType`:

```

df <- data.frame(
  Animal = c('Animal1', 'Animal2', 'Animal3', 'Animal2', 'Animal1',
            'Animal2', 'Animal3'),
  FeedType = c('A', 'B', 'A', 'A', 'B', 'B', 'A'),
  Amount = c(10, 7, 4, 2, 5, 6, 2)
)

dcast(df, Animal ~ FeedType, sum, fill=NaN)
# Alternative method using base R
with(df, tapply(Amount, list(Animal, FeedType), sum))

```

Python can approach this in two different ways. Firstly, similar to above using `pivot_table()`:

```

In [38]: df = pd.DataFrame({
.....:     'Animal': ['Animal1', 'Animal2', 'Animal3', 'Animal2', 'Animal1',
.....:               'Animal2', 'Animal3'],
.....:     'FeedType': ['A', 'B', 'A', 'A', 'B', 'B', 'A'],
.....:     'Amount': [10, 7, 4, 2, 5, 6, 2],
.....: })
.....:

In [39]: df.pivot_table(values='Amount', index='Animal', columns='FeedType', aggfunc=
↪ 'sum')
Out[39]:

```

	A	B
Animal		
Animal1	10.0	5.0
Animal2	2.0	13.0
Animal3	6.0	NaN

The second approach is to use the `groupby()` method:

```
In [40]: df.groupby(['Animal', 'FeedType'])['Amount'].sum()
Out[40]:
```

Animal	FeedType	Amount
Animal1	A	10
	B	5
Animal2	A	2
	B	13
Animal3	A	6

Name: Amount, dtype: int64

For more details and examples see [the reshaping documentation](#) or [the groupby documentation](#).

### 30.4.5 factor

pandas has a data type for categorical data.

```
cut(c(1, 2, 3, 4, 5, 6), 3)
factor(c(1, 2, 3, 2, 2, 3))
```

In pandas this is accomplished with `pd.cut` and `astype("category")`:

```
In [41]: pd.cut(pd.Series([1,2,3,4,5,6]), 3)
Out[41]:
0      (0.995, 2.667]
1      (0.995, 2.667]
2      (2.667, 4.333]
3      (2.667, 4.333]
4      (4.333, 6.0]
5      (4.333, 6.0]
dtype: category
Categories (3, interval[float64]): [(0.995, 2.667] < (2.667, 4.333] < (4.333, 6.0]]

In [42]: pd.Series([1,2,3,2,2,3]).astype("category")
=====
↪
0      1
1      2
2      3
3      2
4      2
5      3
dtype: category
Categories (3, int64): [1, 2, 3]
```

For more details and examples see *categorical introduction* and the *API documentation*. There is also a documentation regarding the *differences to R's factor*.

## COMPARISON WITH SQL

Since many potential pandas users have some familiarity with [SQL](#), this page is meant to provide some examples of how various SQL operations would be performed using pandas.

If you're new to pandas, you might want to first read through *10 Minutes to pandas* to familiarize yourself with the library.

As is customary, we import pandas and NumPy as follows:

```
In [1]: import pandas as pd
```

```
In [2]: import numpy as np
```

Most of the examples will utilize the `tips` dataset found within pandas tests. We'll read the data into a DataFrame called `tips` and assume we have a database table of the same name and structure.

```
In [3]: url = 'https://raw.githubusercontent.com/pandas-dev/pandas/master/pandas/tests/data/tips.
↳ csv'
```

```
In [4]: tips = pd.read_csv(url)
```

```
In [5]: tips.head()
```

```
Out[5]:
```

	total_bill	tip	sex	smoker	day	time	size
0	16.99	1.01	Female	No	Sun	Dinner	2
1	10.34	1.66	Male	No	Sun	Dinner	3
2	21.01	3.50	Male	No	Sun	Dinner	3
3	23.68	3.31	Male	No	Sun	Dinner	2
4	24.59	3.61	Female	No	Sun	Dinner	4

### 31.1 SELECT

In SQL, selection is done using a comma-separated list of columns you'd like to select (or a `*` to select all columns):

```
SELECT total_bill, tip, smoker, time
FROM tips
LIMIT 5;
```

With pandas, column selection is done by passing a list of column names to your DataFrame:

```
In [6]: tips[['total_bill', 'tip', 'smoker', 'time']].head(5)
```

```
Out[6]:
```

	total_bill	tip	smoker	time
--	------------	-----	--------	------

(continues on next page)

(continued from previous page)

0	16.99	1.01	No	Dinner
1	10.34	1.66	No	Dinner
2	21.01	3.50	No	Dinner
3	23.68	3.31	No	Dinner
4	24.59	3.61	No	Dinner

Calling the DataFrame without the list of column names would display all columns (akin to SQL's \*).

## 31.2 WHERE

Filtering in SQL is done via a WHERE clause.

```
SELECT *
FROM tips
WHERE time = 'Dinner'
LIMIT 5;
```

DataFrames can be filtered in multiple ways; the most intuitive of which is using [boolean indexing](#).

```
In [7]: tips[tips['time'] == 'Dinner'].head(5)
Out[7]:
```

	total_bill	tip	sex	smoker	day	time	size
0	16.99	1.01	Female	No	Sun	Dinner	2
1	10.34	1.66	Male	No	Sun	Dinner	3
2	21.01	3.50	Male	No	Sun	Dinner	3
3	23.68	3.31	Male	No	Sun	Dinner	2
4	24.59	3.61	Female	No	Sun	Dinner	4

The above statement is simply passing a Series of True/False objects to the DataFrame, returning all rows with True.

```
In [8]: is_dinner = tips['time'] == 'Dinner'

In [9]: is_dinner.value_counts()
Out[9]:
```

True	176
False	68

```
Name: time, dtype: int64

In [10]: tips[is_dinner].head(5)
Out[10]:
```

	total_bill	tip	sex	smoker	day	time	size
0	16.99	1.01	Female	No	Sun	Dinner	2
1	10.34	1.66	Male	No	Sun	Dinner	3
2	21.01	3.50	Male	No	Sun	Dinner	3
3	23.68	3.31	Male	No	Sun	Dinner	2
4	24.59	3.61	Female	No	Sun	Dinner	4

Just like SQL's OR and AND, multiple conditions can be passed to a DataFrame using | (OR) and & (AND).

```
-- tips of more than $5.00 at Dinner meals
SELECT *
FROM tips
WHERE time = 'Dinner' AND tip > 5.00;
```

```
# tips of more than $5.00 at Dinner meals
In [11]: tips[(tips['time'] == 'Dinner') & (tips['tip'] > 5.00)]
```

```
Out[11]:
```

	total_bill	tip	sex	smoker	day	time	size
23	39.42	7.58	Male	No	Sat	Dinner	4
44	30.40	5.60	Male	No	Sun	Dinner	4
47	32.40	6.00	Male	No	Sun	Dinner	4
52	34.81	5.20	Female	No	Sun	Dinner	4
59	48.27	6.73	Male	No	Sat	Dinner	4
116	29.93	5.07	Male	No	Sun	Dinner	4
155	29.85	5.14	Female	No	Sun	Dinner	5
170	50.81	10.00	Male	Yes	Sat	Dinner	3
172	7.25	5.15	Male	Yes	Sun	Dinner	2
181	23.33	5.65	Male	Yes	Sun	Dinner	2
183	23.17	6.50	Male	Yes	Sun	Dinner	4
211	25.89	5.16	Male	Yes	Sat	Dinner	4
212	48.33	9.00	Male	No	Sat	Dinner	4
214	28.17	6.50	Female	Yes	Sat	Dinner	3
239	29.03	5.92	Male	No	Sat	Dinner	3

```
-- tips by parties of at least 5 diners OR bill total was more than $45
SELECT *
FROM tips
WHERE size >= 5 OR total_bill > 45;
```

```
# tips by parties of at least 5 diners OR bill total was more than $45
```

```
In [12]: tips[(tips['size'] >= 5) | (tips['total_bill'] > 45)]
```

```
Out[12]:
```

	total_bill	tip	sex	smoker	day	time	size
59	48.27	6.73	Male	No	Sat	Dinner	4
125	29.80	4.20	Female	No	Thur	Lunch	6
141	34.30	6.70	Male	No	Thur	Lunch	6
142	41.19	5.00	Male	No	Thur	Lunch	5
143	27.05	5.00	Female	No	Thur	Lunch	6
155	29.85	5.14	Female	No	Sun	Dinner	5
156	48.17	5.00	Male	No	Sun	Dinner	6
170	50.81	10.00	Male	Yes	Sat	Dinner	3
182	45.35	3.50	Male	Yes	Sun	Dinner	3
185	20.69	5.00	Male	No	Sun	Dinner	5
187	30.46	2.00	Male	Yes	Sun	Dinner	5
212	48.33	9.00	Male	No	Sat	Dinner	4
216	28.15	3.00	Male	Yes	Sat	Dinner	5

NULL checking is done using the `notna()` and `isna()` methods.

```
In [13]: frame = pd.DataFrame({'col1': ['A', 'B', np.NaN, 'C', 'D'],
.....:                        'col2': ['F', np.NaN, 'G', 'H', 'I']})
.....:
```

```
In [14]: frame
```

```
Out[14]:
```

	col1	col2
0	A	F
1	B	NaN
2	NaN	G
3	C	H
4	D	I

Assume we have a table of the same structure as our DataFrame above. We can see only the records where `col2` IS NULL with the following query:

```
SELECT *
FROM frame
WHERE col2 IS NULL;
```

```
In [15]: frame[frame['col2'].isna()]
Out[15]:
   col1 col2
1     B  NaN
```

Getting items where `col1` IS NOT NULL can be done with `notna()`.

```
SELECT *
FROM frame
WHERE col1 IS NOT NULL;
```

```
In [16]: frame[frame['col1'].notna()]
Out[16]:
   col1 col2
0     A     F
1     B  NaN
3     C     H
4     D     I
```

## 31.3 GROUP BY

In pandas, SQL's GROUP BY operations are performed using the similarly named `groupby()` method. `groupby()` typically refers to a process where we'd like to split a dataset into groups, apply some function (typically aggregation), and then combine the groups together.

A common SQL operation would be getting the count of records in each group throughout a dataset. For instance, a query getting us the number of tips left by sex:

```
SELECT sex, count(*)
FROM tips
GROUP BY sex;
/*
Female      87
Male       157
*/
```

The pandas equivalent would be:

```
In [17]: tips.groupby('sex').size()
Out[17]:
sex
Female      87
Male       157
dtype: int64
```

Notice that in the pandas code we used `size()` and not `count()`. This is because `count()` applies the function to each column, returning the number of not null records within each.

```
In [18]: tips.groupby('sex').count()
Out[18]:
```

	total_bill	tip	smoker	day	time	size
sex						
Female	87	87	87	87	87	87
Male	157	157	157	157	157	157

Alternatively, we could have applied the `count()` method to an individual column:

```
In [19]: tips.groupby('sex')['total_bill'].count()
Out[19]:
```

sex	total_bill
Female	87
Male	157

Name: total\_bill, dtype: int64

Multiple functions can also be applied at once. For instance, say we'd like to see how tip amount differs by day of the week - `agg()` allows you to pass a dictionary to your grouped DataFrame, indicating which functions to apply to specific columns.

```
SELECT day, AVG(tip), COUNT(*)
FROM tips
GROUP BY day;
/*
Fri    2.734737    19
Sat    2.993103    87
Sun    3.255132    76
Thur   2.771452    62
*/
```

```
In [20]: tips.groupby('day').agg({'tip': np.mean, 'day': np.size})
Out[20]:
```

	tip	day
day		
Fri	2.734737	19
Sat	2.993103	87
Sun	3.255132	76
Thur	2.771452	62

Grouping by more than one column is done by passing a list of columns to the `groupby()` method.

```
SELECT smoker, day, COUNT(*), AVG(tip)
FROM tips
GROUP BY smoker, day;
/*
smoker day
No      Fri      4  2.812500
        Sat     45  3.102889
        Sun     57  3.167895
        Thur    45  2.673778
Yes     Fri     15  2.714000
        Sat     42  2.875476
        Sun     19  3.516842
        Thur    17  3.030000
*/
```

```
In [21]: tips.groupby(['smoker', 'day']).agg({'tip': [np.size, np.mean]})
Out[21]:
```

		tip	
		size	mean
smoker	day		
No	Fri	4.0	2.812500
	Sat	45.0	3.102889
	Sun	57.0	3.167895
	Thur	45.0	2.673778
Yes	Fri	15.0	2.714000
	Sat	42.0	2.875476
	Sun	19.0	3.516842
	Thur	17.0	3.030000

## 31.4 JOIN

JOINS can be performed with `join()` or `merge()`. By default, `join()` will join the DataFrames on their indices. Each method has parameters allowing you to specify the type of join to perform (LEFT, RIGHT, INNER, FULL) or the columns to join on (column names or indices).

```
In [22]: df1 = pd.DataFrame({'key': ['A', 'B', 'C', 'D'],
.....:                      'value': np.random.randn(4)})
.....:

In [23]: df2 = pd.DataFrame({'key': ['B', 'D', 'D', 'E'],
.....:                      'value': np.random.randn(4)})
.....:
```

Assume we have two database tables of the same name and structure as our DataFrames.

Now let's go over the various types of JOINS.

### 31.4.1 INNER JOIN

```
SELECT *
FROM df1
INNER JOIN df2
ON df1.key = df2.key;
```

```
# merge performs an INNER JOIN by default
```

```
In [24]: pd.merge(df1, df2, on='key')
```

```
Out[24]:
   key  value_x  value_y
0    B -0.318214  0.543581
1    D  2.169960 -0.426067
2    D  2.169960  1.138079
```

`merge()` also offers parameters for cases when you'd like to join one DataFrame's column with another DataFrame's index.

```
In [25]: indexed_df2 = df2.set_index('key')
```

```
In [26]: pd.merge(df1, indexed_df2, left_on='key', right_index=True)
```

(continues on next page)

(continued from previous page)

**Out [26]:**

	key	value_x	value_y
1	B	-0.318214	0.543581
3	D	2.169960	-0.426067
3	D	2.169960	1.138079

### 31.4.2 LEFT OUTER JOIN

```
-- show all records from df1
SELECT *
FROM df1
LEFT OUTER JOIN df2
  ON df1.key = df2.key;
```

```
# show all records from df1
In [27]: pd.merge(df1, df2, on='key', how='left')
Out [27]:
```

	key	value_x	value_y
0	A	0.116174	NaN
1	B	-0.318214	0.543581
2	C	0.285261	NaN
3	D	2.169960	-0.426067
4	D	2.169960	1.138079

### 31.4.3 RIGHT JOIN

```
-- show all records from df2
SELECT *
FROM df1
RIGHT OUTER JOIN df2
  ON df1.key = df2.key;
```

```
# show all records from df2
In [28]: pd.merge(df1, df2, on='key', how='right')
Out [28]:
```

	key	value_x	value_y
0	B	-0.318214	0.543581
1	D	2.169960	-0.426067
2	D	2.169960	1.138079
3	E	NaN	0.086073

### 31.4.4 FULL JOIN

pandas also allows for FULL JOINS, which display both sides of the dataset, whether or not the joined columns find a match. As of writing, FULL JOINS are not supported in all RDBMS (MySQL).

```
-- show all records from both tables
SELECT *
FROM df1
FULL OUTER JOIN df2
  ON df1.key = df2.key;
```

```
# show all records from both frames
In [29]: pd.merge(df1, df2, on='key', how='outer')
Out[29]:
```

	key	value_x	value_y
0	A	0.116174	NaN
1	B	-0.318214	0.543581
2	C	0.285261	NaN
3	D	2.169960	-0.426067
4	D	2.169960	1.138079
5	E	NaN	0.086073

## 31.5 UNION

UNION ALL can be performed using `concat()`.

```
In [30]: df1 = pd.DataFrame({'city': ['Chicago', 'San Francisco', 'New York City'],
.....:                      'rank': range(1, 4)})
.....:

In [31]: df2 = pd.DataFrame({'city': ['Chicago', 'Boston', 'Los Angeles'],
.....:                      'rank': [1, 4, 5]})
.....:
```

```
SELECT city, rank
FROM df1
UNION ALL
SELECT city, rank
FROM df2;
/*
      city  rank
0  Chicago    1
1 San Francisco  2
2 New York City  3
0  Chicago    1
1   Boston    4
2 Los Angeles  5
*/
```

```
In [32]: pd.concat([df1, df2])
Out[32]:
```

	city	rank
0	Chicago	1
1	San Francisco	2
2	New York City	3
0	Chicago	1
1	Boston	4
2	Los Angeles	5

SQL's UNION is similar to UNION ALL, however UNION will remove duplicate rows.

```
SELECT city, rank
FROM df1
UNION
SELECT city, rank
```

(continues on next page)

(continued from previous page)

```

FROM df2;
-- notice that there is only one Chicago record this time
/*
      city  rank
    Chicago    1
San Francisco    2
New York City    3
      Boston    4
    Los Angeles    5
*/

```

In pandas, you can use `concat()` in conjunction with `drop_duplicates()`.

```

In [33]: pd.concat([df1, df2]).drop_duplicates()
Out[33]:
      city  rank
0   Chicago    1
1 San Francisco    2
2 New York City    3
1    Boston    4
2  Los Angeles    5

```

## 31.6 Pandas equivalents for some SQL analytic and aggregate functions

### 31.6.1 Top N rows with offset

```

-- MySQL
SELECT * FROM tips
ORDER BY tip DESC
LIMIT 10 OFFSET 5;

```

```

In [34]: tips.nlargest(10+5, columns='tip').tail(10)
Out[34]:
   total_bill  tip  sex smoker  day  time  size
183      23.17  6.50  Male   Yes  Sun  Dinner    4
214      28.17  6.50  Female Yes  Sat  Dinner    3
47       32.40  6.00  Male   No  Sun  Dinner    4
239      29.03  5.92  Male   No  Sat  Dinner    3
88       24.71  5.85  Male   No  Thur  Lunch    2
181      23.33  5.65  Male  Yes  Sun  Dinner    2
44       30.40  5.60  Male   No  Sun  Dinner    4
52       34.81  5.20  Female  No  Sun  Dinner    4
85       34.83  5.17  Female  No  Thur  Lunch    4
211      25.89  5.16  Male  Yes  Sat  Dinner    4

```

### 31.6.2 Top N rows per group

```

-- Oracle's ROW_NUMBER() analytic function
SELECT * FROM (

```

(continues on next page)

(continued from previous page)

```

SELECT
    t.*,
    ROW_NUMBER() OVER(PARTITION BY day ORDER BY total_bill DESC) AS rn
FROM tips t
)
WHERE rn < 3
ORDER BY day, rn;

```

```

In [35]: (tips.assign(rn=tips.sort_values(['total_bill'], ascending=False)
.....:               .groupby(['day'])
.....:               .cumcount() + 1)
.....:   .query('rn < 3')
.....:   .sort_values(['day', 'rn'])
.....: )
.....:
Out[35]:

```

	total_bill	tip	sex	smoker	day	time	size	rn
95	40.17	4.73	Male	Yes	Fri	Dinner	4	1
90	28.97	3.00	Male	Yes	Fri	Dinner	2	2
170	50.81	10.00	Male	Yes	Sat	Dinner	3	1
212	48.33	9.00	Male	No	Sat	Dinner	4	2
156	48.17	5.00	Male	No	Sun	Dinner	6	1
182	45.35	3.50	Male	Yes	Sun	Dinner	3	2
197	43.11	5.00	Female	Yes	Thur	Lunch	4	1
142	41.19	5.00	Male	No	Thur	Lunch	5	2

the same using `rank(method='first')` function

```

In [36]: (tips.assign(rnk=tips.groupby(['day'])['total_bill']
.....:               .rank(method='first', ascending=False))
.....:   .query('rnk < 3')
.....:   .sort_values(['day', 'rnk'])
.....: )
.....:
Out[36]:

```

	total_bill	tip	sex	smoker	day	time	size	rnk
95	40.17	4.73	Male	Yes	Fri	Dinner	4	1.0
90	28.97	3.00	Male	Yes	Fri	Dinner	2	2.0
170	50.81	10.00	Male	Yes	Sat	Dinner	3	1.0
212	48.33	9.00	Male	No	Sat	Dinner	4	2.0
156	48.17	5.00	Male	No	Sun	Dinner	6	1.0
182	45.35	3.50	Male	Yes	Sun	Dinner	3	2.0
197	43.11	5.00	Female	Yes	Thur	Lunch	4	1.0
142	41.19	5.00	Male	No	Thur	Lunch	5	2.0

```

-- Oracle's RANK() analytic function
SELECT * FROM (
    SELECT
        t.*,
        RANK() OVER(PARTITION BY sex ORDER BY tip) AS rnk
    FROM tips t
    WHERE tip < 2
)
WHERE rnk < 3
ORDER BY sex, rnk;

```

Let's find tips with (rank < 3) per gender group for (tips < 2). Notice that when using `rank(method='min')`

function *rnk\_min* remains the same for the same *tip* (as Oracle's RANK() function)

```
In [37]: (tips[tips['tip'] < 2]
....:      .assign(rnk_min=tips.groupby(['sex'])['tip']
....:              .rank(method='min'))
....:      .query('rnk_min < 3')
....:      .sort_values(['sex', 'rnk_min'])
....: )
....:
Out[37]:
```

	total_bill	tip	sex	smoker	day	time	size	rnk_min
67	3.07	1.00	Female	Yes	Sat	Dinner	1	1.0
92	5.75	1.00	Female	Yes	Fri	Dinner	2	1.0
111	7.25	1.00	Female	No	Sat	Dinner	1	1.0
236	12.60	1.00	Male	Yes	Sat	Dinner	2	1.0
237	32.83	1.17	Male	Yes	Sat	Dinner	2	2.0

## 31.7 UPDATE

```
UPDATE tips
SET tip = tip*2
WHERE tip < 2;
```

```
In [38]: tips.loc[tips['tip'] < 2, 'tip'] *= 2
```

## 31.8 DELETE

```
DELETE FROM tips
WHERE tip > 9;
```

In pandas we select the rows that should remain, instead of deleting them

```
In [39]: tips = tips.loc[tips['tip'] <= 9]
```

## COMPARISON WITH SAS

For potential users coming from SAS this page is meant to demonstrate how different SAS operations would be performed in pandas.

If you're new to pandas, you might want to first read through *10 Minutes to pandas* to familiarize yourself with the library.

As is customary, we import pandas and NumPy as follows:

```
In [1]: import pandas as pd
In [2]: import numpy as np
```

**Note:** Throughout this tutorial, the pandas `DataFrame` will be displayed by calling `df.head()`, which displays the first N (default 5) rows of the `DataFrame`. This is often used in interactive work (e.g. [Jupyter notebook](#) or terminal) - the equivalent in SAS would be:

```
proc print data=df(obs=5);
run;
```

### 32.1 Data Structures

#### 32.1.1 General Terminology Translation

pandas	SAS
<code>DataFrame</code>	data set
column	variable
row	observation
<code>groupby</code>	BY-group
NaN	.

#### 32.1.2 `DataFrame` / `Series`

A `DataFrame` in pandas is analogous to a SAS data set - a two-dimensional data source with labeled columns that can be of different types. As will be shown in this document, almost any operation that can be applied to a data set using SAS's `DATA` step, can also be accomplished in pandas.

A `Series` is the data structure that represents one column of a `DataFrame`. SAS doesn't have a separate data structure for a single column, but in general, working with a `Series` is analogous to referencing a column in the `DATA` step.

### 32.1.3 Index

Every `DataFrame` and `Series` has an `Index` - which are labels on the *rows* of the data. SAS does not have an exactly analogous concept. A data set's rows are essentially unlabeled, other than an implicit integer index that can be accessed during the `DATA` step (`_N_`).

In pandas, if no index is specified, an integer index is also used by default (first row = 0, second row = 1, and so on). While using a labeled `Index` or `MultiIndex` can enable sophisticated analyses and is ultimately an important part of pandas to understand, for this comparison we will essentially ignore the `Index` and just treat the `DataFrame` as a collection of columns. Please see the [indexing documentation](#) for much more on how to use an `Index` effectively.

## 32.2 Data Input / Output

### 32.2.1 Constructing a DataFrame from Values

A SAS data set can be built from specified values by placing the data after a `datalines` statement and specifying the column names.

```
data df;
  input x y;
  datalines;
1 2
3 4
5 6
;
run;
```

A pandas `DataFrame` can be constructed in many different ways, but for a small number of values, it is often convenient to specify it as a Python dictionary, where the keys are the column names and the values are the data.

```
In [3]: df = pd.DataFrame({
...:     'x': [1, 3, 5],
...:     'y': [2, 4, 6]})
...:

In [4]: df
Out[4]:
   x  y
0  1  2
1  3  4
2  5  6
```

### 32.2.2 Reading External Data

Like SAS, pandas provides utilities for reading in data from many formats. The `tips` dataset, found within the pandas tests (`csv`) will be used in many of the following examples.

SAS provides `PROC IMPORT` to read csv data into a data set.

```
proc import datafile='tips.csv' dbms=csv out=tips replace;
    getnames=yes;
run;
```

The pandas method is `read_csv()`, which works similarly.

```
In [5]: url = 'https://raw.githubusercontent.com/pandas-dev/pandas/master/pandas/tests/data/tips.
↳ csv'

In [6]: tips = pd.read_csv(url)

In [7]: tips.head()
Out[7]:
```

	total_bill	tip	sex	smoker	day	time	size
0	16.99	1.01	Female	No	Sun	Dinner	2
1	10.34	1.66	Male	No	Sun	Dinner	3
2	21.01	3.50	Male	No	Sun	Dinner	3
3	23.68	3.31	Male	No	Sun	Dinner	2
4	24.59	3.61	Female	No	Sun	Dinner	4

Like PROC IMPORT, `read_csv` can take a number of parameters to specify how the data should be parsed. For example, if the data was instead tab delimited, and did not have column names, the pandas command would be:

```
tips = pd.read_csv('tips.csv', sep='\t', header=None)

# alternatively, read_table is an alias to read_csv with tab delimiter
tips = pd.read_table('tips.csv', header=None)
```

In addition to text/csv, pandas supports a variety of other data formats such as Excel, HDF5, and SQL databases. These are all read via a `pd.read_*` function. See the [IO documentation](#) for more details.

### 32.2.3 Exporting Data

The inverse of PROC IMPORT in SAS is PROC EXPORT

```
proc export data=tips outfile='tips2.csv' dbms=csv;
run;
```

Similarly in pandas, the opposite of `read_csv` is `to_csv()`, and other data formats follow a similar api.

```
tips.to_csv('tips2.csv')
```

## 32.3 Data Operations

### 32.3.1 Operations on Columns

In the DATA step, arbitrary math expressions can be used on new or existing columns.

```
data tips;
    set tips;
    total_bill = total_bill - 2;
    new_bill = total_bill / 2;
run;
```

pandas provides similar vectorized operations by specifying the individual Series in the DataFrame. New columns can be assigned in the same way.

```
In [8]: tips['total_bill'] = tips['total_bill'] - 2
In [9]: tips['new_bill'] = tips['total_bill'] / 2.0
In [10]: tips.head()
Out[10]:
```

	total_bill	tip	sex	smoker	day	time	size	new_bill
0	14.99	1.01	Female	No	Sun	Dinner	2	7.495
1	8.34	1.66	Male	No	Sun	Dinner	3	4.170
2	19.01	3.50	Male	No	Sun	Dinner	3	9.505
3	21.68	3.31	Male	No	Sun	Dinner	2	10.840
4	22.59	3.61	Female	No	Sun	Dinner	4	11.295

### 32.3.2 Filtering

Filtering in SAS is done with an `if` or `where` statement, on one or more columns.

```
data tips;
  set tips;
  if total_bill > 10;
run;

data tips;
  set tips;
  where total_bill > 10;
  /* equivalent in this case - where happens before the
     DATA step begins and can also be used in PROC statements */
run;
```

DataFrames can be filtered in multiple ways; the most intuitive of which is using *boolean indexing*

```
In [11]: tips[tips['total_bill'] > 10].head()
Out[11]:
```

	total_bill	tip	sex	smoker	day	time	size
0	14.99	1.01	Female	No	Sun	Dinner	2
2	19.01	3.50	Male	No	Sun	Dinner	3
3	21.68	3.31	Male	No	Sun	Dinner	2
4	22.59	3.61	Female	No	Sun	Dinner	4
5	23.29	4.71	Male	No	Sun	Dinner	4

### 32.3.3 If/Then Logic

In SAS, if/then logic can be used to create new columns.

```
data tips;
  set tips;
  format bucket $4.;

  if total_bill < 10 then bucket = 'low';
  else bucket = 'high';
run;
```

The same operation in pandas can be accomplished using the `where` method from `numpy`.

```
In [12]: tips['bucket'] = np.where(tips['total_bill'] < 10, 'low', 'high')

In [13]: tips.head()
Out[13]:
```

	total_bill	tip	sex	smoker	day	time	size	bucket
0	14.99	1.01	Female	No	Sun	Dinner	2	high
1	8.34	1.66	Male	No	Sun	Dinner	3	low
2	19.01	3.50	Male	No	Sun	Dinner	3	high
3	21.68	3.31	Male	No	Sun	Dinner	2	high
4	22.59	3.61	Female	No	Sun	Dinner	4	high

### 32.3.4 Date Functionality

SAS provides a variety of functions to do operations on date/datetime columns.

```
data tips;
  set tips;
  format date1 date2 date1_plusmonth mmddyy10.;
  date1 = mdy(1, 15, 2013);
  date2 = mdy(2, 15, 2015);
  date1_year = year(date1);
  date2_month = month(date2);
  * shift date to beginning of next interval;
  date1_next = intnx('MONTH', date1, 1);
  * count intervals between dates;
  months_between = intck('MONTH', date1, date2);
run;
```

The equivalent pandas operations are shown below. In addition to these functions pandas supports other Time Series features not available in Base SAS (such as resampling and custom offsets) - see the [timeseries documentation](#) for more details.

```
In [14]: tips['date1'] = pd.Timestamp('2013-01-15')

In [15]: tips['date2'] = pd.Timestamp('2015-02-15')

In [16]: tips['date1_year'] = tips['date1'].dt.year

In [17]: tips['date2_month'] = tips['date2'].dt.month

In [18]: tips['date1_next'] = tips['date1'] + pd.offsets.MonthBegin()

In [19]: tips['months_between'] = (tips['date2'].dt.to_period('M') -
....:                               tips['date1'].dt.to_period('M'))
....:

In [20]: tips[['date1', 'date2', 'date1_year', 'date2_month',
....:           'date1_next', 'months_between']].head()
....:
```

	date1	date2	date1_year	date2_month	date1_next	months_between
0	2013-01-15	2015-02-15	2013	2	2013-02-01	25
1	2013-01-15	2015-02-15	2013	2	2013-02-01	25
2	2013-01-15	2015-02-15	2013	2	2013-02-01	25

(continues on next page)

(continued from previous page)

3	2013-01-15	2015-02-15	2013	2	2013-02-01	25
4	2013-01-15	2015-02-15	2013	2	2013-02-01	25

### 32.3.5 Selection of Columns

SAS provides keywords in the DATA step to select, drop, and rename columns.

```
data tips;
    set tips;
    keep sex total_bill tip;
run;

data tips;
    set tips;
    drop sex;
run;

data tips;
    set tips;
    rename total_bill=total_bill_2;
run;
```

The same operations are expressed in pandas below.

```
# keep
In [21]: tips[['sex', 'total_bill', 'tip']].head()
Out[21]:
```

	sex	total_bill	tip
0	Female	14.99	1.01
1	Male	8.34	1.66
2	Male	19.01	3.50
3	Male	21.68	3.31
4	Female	22.59	3.61

```
# drop
In [22]: tips.drop('sex', axis=1).head()
```

```
Out[22]:
```

	total_bill	tip	smoker	day	time	size
0	14.99	1.01	No	Sun	Dinner	2
1	8.34	1.66	No	Sun	Dinner	3
2	19.01	3.50	No	Sun	Dinner	3
3	21.68	3.31	No	Sun	Dinner	2
4	22.59	3.61	No	Sun	Dinner	4

```
# rename
In [23]: tips.rename(columns={'total_bill': 'total_bill_2'}).head()
```

```
Out[23]:
```

	total_bill_2	tip	sex	smoker	day	time	size
0	14.99	1.01	Female	No	Sun	Dinner	2
1	8.34	1.66	Male	No	Sun	Dinner	3
2	19.01	3.50	Male	No	Sun	Dinner	3
3	21.68	3.31	Male	No	Sun	Dinner	2
4	22.59	3.61	Female	No	Sun	Dinner	4

### 32.3.6 Sorting by Values

Sorting in SAS is accomplished via PROC SORT

```
proc sort data=tips;
    by sex total_bill;
run;
```

pandas objects have a `sort_values()` method, which takes a list of columns to sort by.

```
In [24]: tips = tips.sort_values(['sex', 'total_bill'])

In [25]: tips.head()
Out[25]:
```

	total_bill	tip	sex	smoker	day	time	size
67	1.07	1.00	Female	Yes	Sat	Dinner	1
92	3.75	1.00	Female	Yes	Fri	Dinner	2
111	5.25	1.00	Female	No	Sat	Dinner	1
145	6.35	1.50	Female	No	Thur	Lunch	2
135	6.51	1.25	Female	No	Thur	Lunch	2

## 32.4 String Processing

### 32.4.1 Length

SAS determines the length of a character string with the `LENGTHN` and `LENGTHC` functions. `LENGTHN` excludes trailing blanks and `LENGTHC` includes trailing blanks.

```
data _null_;
set tips;
put (LENGTHN(time));
put (LENGTHC(time));
run;
```

Python determines the length of a character string with the `len` function. `len` includes trailing blanks. Use `len` and `rstrip` to exclude trailing blanks.

```
In [26]: tips['time'].str.len().head()
Out[26]:
```

67	6
92	6
111	6
145	5
135	5

Name: time, dtype: int64

```
In [27]: tips['time'].str.rstrip().str.len().head()
Out[27]:
```

67	6
92	6
111	6
145	5
135	5

Name: time, dtype: int64

### 32.4.2 Find

SAS determines the position of a character in a string with the **FINDW** function. **FINDW** takes the string defined by the first argument and searches for the first position of the substring you supply as the second argument.

```
data _null_;
set tips;
put (FINDW(sex, 'ale'));
run;
```

Python determines the position of a character in a string with the `find` function. `find` searches for the first position of the substring. If the substring is found, the function returns its position. Keep in mind that Python indexes are zero-based and the function will return -1 if it fails to find the substring.

```
In [28]: tips['sex'].str.find("ale").head()
Out[28]:
67      3
92      3
111     3
145     3
135     3
Name: sex, dtype: int64
```

### 32.4.3 Substring

SAS extracts a substring from a string based on its position with the **SUBSTR** function.

```
data _null_;
set tips;
put (substr(sex, 1, 1));
run;
```

With pandas you can use `[]` notation to extract a substring from a string by position locations. Keep in mind that Python indexes are zero-based.

```
In [29]: tips['sex'].str[0:1].head()
Out[29]:
67      F
92      F
111     F
145     F
135     F
Name: sex, dtype: object
```

### 32.4.4 Scan

The SAS **SCAN** function returns the *n*th word from a string. The first argument is the string you want to parse and the second argument specifies which word you want to extract.

```
data firstlast;
input String $60.;
First_Name = scan(string, 1);
Last_Name = scan(string, -1);
datalines2;
```

(continues on next page)

(continued from previous page)

```
John Smith;
Jane Cook;
;;;
run;
```

Python extracts a substring from a string based on its text by using regular expressions. There are much more powerful approaches, but this just shows a simple approach.

```
In [30]: firstlast = pd.DataFrame({'String': ['John Smith', 'Jane Cook']})

In [31]: firstlast['First_Name'] = firstlast['String'].str.split(" ", expand=True)[0]

In [32]: firstlast['Last_Name'] = firstlast['String'].str.rsplit(" ", expand=True)[0]

In [33]: firstlast
Out[33]:
```

	String	First_Name	Last_Name
0	John Smith	John	Smith
1	Jane Cook	Jane	Cook

### 32.4.5 Uppcase, Lowcase, and Propcase

The SAS `UPCASE` `LOWCASE` and `PROPCASE` functions change the case of the argument.

```
data firstlast;
input String $60.;
string_up = UPCASE(string);
string_low = LOWCASE(string);
string_prop = PROPCASE(string);
datalines2;
John Smith;
Jane Cook;
;;;
run;
```

The equivalent Python functions are `upper`, `lower`, and `title`.

```
In [34]: firstlast = pd.DataFrame({'String': ['John Smith', 'Jane Cook']})

In [35]: firstlast['string_up'] = firstlast['String'].str.upper()

In [36]: firstlast['string_low'] = firstlast['String'].str.lower()

In [37]: firstlast['string_prop'] = firstlast['String'].str.title()

In [38]: firstlast
Out[38]:
```

	String	string_up	string_low	string_prop
0	John Smith	JOHN SMITH	john smith	John Smith
1	Jane Cook	JANE COOK	jane cook	Jane Cook

## 32.5 Merging

The following tables will be used in the merge examples

```
In [39]: df1 = pd.DataFrame({'key': ['A', 'B', 'C', 'D'],
.....:                      'value': np.random.randn(4)})
.....:

In [40]: df1
Out[40]:
   key  value
0    A -0.857326
1    B  1.075416
2    C  0.371727
3    D  1.065735

In [41]: df2 = pd.DataFrame({'key': ['B', 'D', 'D', 'E'],
.....:                      'value': np.random.randn(4)})
.....:

In [42]: df2
Out[42]:
   key  value
0    B -0.227314
1    D  2.102726
2    D -0.092796
3    E  0.094694
```

In SAS, data must be explicitly sorted before merging. Different types of joins are accomplished using the `in=` dummy variables to track whether a match was found in one or both input frames.

```
proc sort data=df1;
  by key;
run;

proc sort data=df2;
  by key;
run;

data left_join inner_join right_join outer_join;
  merge df1(in=a) df2(in=b);

  if a and b then output inner_join;
  if a then output left_join;
  if b then output right_join;
  if a or b then output outer_join;
run;
```

pandas DataFrames have a `merge()` method, which provides similar functionality. Note that the data does not have to be sorted ahead of time, and different join types are accomplished via the `how` keyword.

```
In [43]: inner_join = df1.merge(df2, on='key', how='inner')

In [44]: inner_join
Out[44]:
   key  value_x  value_y
0    B  1.075416 -0.227314
```

(continues on next page)

(continued from previous page)

```
1  D  1.065735  2.102726
2  D  1.065735 -0.092796
```

```
In [45]: left_join = df1.merge(df2, on=['key'], how='left')
```

```
In [46]: left_join
```

```
Out[46]:
```

```
   key  value_x  value_y
0  A -0.857326      NaN
1  B  1.075416 -0.227314
2  C  0.371727      NaN
3  D  1.065735  2.102726
4  D  1.065735 -0.092796
```

```
In [47]: right_join = df1.merge(df2, on=['key'], how='right')
```

```
In [48]: right_join
```

```
Out[48]:
```

```
   key  value_x  value_y
0  B  1.075416 -0.227314
1  D  1.065735  2.102726
2  D  1.065735 -0.092796
3  E      NaN  0.094694
```

```
In [49]: outer_join = df1.merge(df2, on=['key'], how='outer')
```

```
In [50]: outer_join
```

```
Out[50]:
```

```
   key  value_x  value_y
0  A -0.857326      NaN
1  B  1.075416 -0.227314
2  C  0.371727      NaN
3  D  1.065735  2.102726
4  D  1.065735 -0.092796
5  E      NaN  0.094694
```

## 32.6 Missing Data

Like SAS, pandas has a representation for missing data - which is the special float value NaN (not a number). Many of the semantics are the same, for example missing data propagates through numeric operations, and is ignored by default for aggregations.

```
In [51]: outer_join
```

```
Out[51]:
```

```
   key  value_x  value_y
0  A -0.857326      NaN
1  B  1.075416 -0.227314
2  C  0.371727      NaN
3  D  1.065735  2.102726
4  D  1.065735 -0.092796
5  E      NaN  0.094694
```

```
In [52]: outer_join['value_x'] + outer_join['value_y']
```

```
////////////////////////////////////
```

(continues on next page)

(continued from previous page)

```

0      NaN
1    0.848102
2      NaN
3    3.168461
4    0.972939
5      NaN
dtype: float64

```

```
In [53]: outer_join['value_x'].sum()
```

```

////////////////////////////////////
↪ 2.7212865354426201

```

One difference is that missing data cannot be compared to its sentinel value. For example, in SAS you could do this to filter missing values.

```

data outer_join_nulls;
  set outer_join;
  if value_x = .;
run;

data outer_join_no_nulls;
  set outer_join;
  if value_x ^= .;
run;

```

Which doesn't work in pandas. Instead, the `pd.isna` or `pd.notna` functions should be used for comparisons.

```
In [54]: outer_join[pd.isna(outer_join['value_x'])]
```

```
Out[54]:
```

```

   key  value_x  value_y
5    E      NaN  0.094694

```

```
In [55]: outer_join[pd.notna(outer_join['value_x'])]
```

```

////////////////////////////////////Out[55]:

```

```

   key  value_x  value_y
0    A -0.857326      NaN
1    B  1.075416 -0.227314
2    C  0.371727      NaN
3    D  1.065735  2.102726
4    D  1.065735 -0.092796

```

pandas also provides a variety of methods to work with missing data - some of which would be challenging to express in SAS. For example, there are methods to drop all rows with any missing values, replacing missing values with a specified value, like the mean, or forward filling from previous rows. See the [missing data documentation](#) for more.

```
In [56]: outer_join.dropna()
```

```
Out[56]:
```

```

   key  value_x  value_y
1    B  1.075416 -0.227314
3    D  1.065735  2.102726
4    D  1.065735 -0.092796

```

```
In [57]: outer_join.fillna(method='ffill')
```

```

////////////////////////////////////
↪
   key  value_x  value_y

```

(continues on next page)

(continued from previous page)

```

0   A  -0.857326      NaN
1   B   1.075416  -0.227314
2   C   0.371727  -0.227314
3   D   1.065735   2.102726
4   D   1.065735  -0.092796
5   E   1.065735   0.094694

```

```
In [58]: outer_join['value_x'].fillna(outer_join['value_x'].mean())
```

```

////////////////////////////////////

```

```

→
0   -0.857326
1    1.075416

5    0.544257
Name: value_x, dtype: float64

```

## 32.7 GroupBy

### 32.7.1 Aggregation

SAS's PROC SUMMARY can be used to group by one or more key variables and compute aggregations on numeric columns.

```

proc summary data=tips nway;
  class sex smoker;
  var total_bill tip;
  output out=tips_summed sum=;
run;

```

pandas provides a flexible `groupby` mechanism that allows similar aggregations. See the [groupby documentation](#) for more details and examples.

```
In [59]: tips_summed = tips.groupby(['sex', 'smoker'])['total_bill', 'tip'].sum()
```

```
In [60]: tips_summed.head()
```

```
Out [60]:
```

		total_bill	tip
sex	smoker		
Female	No	869.68	149.77
	Yes	527.27	96.74
Male	No	1725.75	302.00
	Yes	1217.07	183.07

### 32.7.2 Transformation

In SAS, if the group aggregations need to be used with the original frame, it must be merged back together. For example, to subtract the mean for each observation by smoker group.

```

proc summary data=tips missing nway;
  class smoker;
  var total_bill;
  output out=smoker_means mean(total_bill)=group_bill;
run;

proc sort data=tips;
  by smoker;
run;

data tips;
  merge tips(in=a) smoker_means(in=b);
  by smoker;
  adj_total_bill = total_bill - group_bill;
  if a and b;
run;

```

pandas groupby provides a transform mechanism that allows these type of operations to be succinctly expressed in one operation.

```

In [61]: gb = tips.groupby('smoker')['total_bill']

In [62]: tips['adj_total_bill'] = tips['total_bill'] - gb.transform('mean')

In [63]: tips.head()
Out[63]:

```

	total_bill	tip	sex	smoker	day	time	size	adj_total_bill
67	1.07	1.00	Female	Yes	Sat	Dinner	1	-17.686344
92	3.75	1.00	Female	Yes	Fri	Dinner	2	-15.006344
111	5.25	1.00	Female	No	Sat	Dinner	1	-11.938278
145	6.35	1.50	Female	No	Thur	Lunch	2	-10.838278
135	6.51	1.25	Female	No	Thur	Lunch	2	-10.678278

### 32.7.3 By Group Processing

In addition to aggregation, pandas groupby can be used to replicate most other by group processing from SAS. For example, this DATA step reads the data by sex/smoker group and filters to the first entry for each.

```

proc sort data=tips;
  by sex smoker;
run;

data tips_first;
  set tips;
  by sex smoker;
  if FIRST.sex or FIRST.smoker then output;
run;

```

In pandas this would be written as:

```

In [64]: tips.groupby(['sex', 'smoker']).first()
Out[64]:

```

	total_bill	tip	day	time	size	adj_total_bill
sex smoker						
Female No	5.25	1.00	Sat	Dinner	1	-11.938278

(continues on next page)

(continued from previous page)

	Yes	1.07	1.00	Sat	Dinner	1	-17.686344
Male	No	5.51	2.00	Thur	Lunch	2	-11.678278
	Yes	5.25	5.15	Sun	Dinner	2	-13.506344

## 32.8 Other Considerations

### 32.8.1 Disk vs Memory

pandas operates exclusively in memory, where a SAS data set exists on disk. This means that the size of data able to be loaded in pandas is limited by your machine's memory, but also that the operations on that data may be faster.

If out of core processing is needed, one possibility is the [dask.dataframe](#) library (currently in development) which provides a subset of pandas functionality for an on-disk `DataFrame`

### 32.8.2 Data Interop

pandas provides a `read_sas()` method that can read SAS data saved in the XPORT or SAS7BDAT binary format.

```
libname xportout xport 'transport-file.xpt';
data xportout.tips;
    set tips(rename=(total_bill=tbill));
    * xport variable names limited to 6 characters;
run;
```

```
df = pd.read_sas('transport-file.xpt')
df = pd.read_sas('binary-file.sas7bdat')
```

You can also specify the file format directly. By default, pandas will try to infer the file format based on its extension.

```
df = pd.read_sas('transport-file.xpt', format='xport')
df = pd.read_sas('binary-file.sas7bdat', format='sas7bdat')
```

XPORT is a relatively limited format and the parsing of it is not as optimized as some of the other pandas readers. An alternative way to interop data between SAS and pandas is to serialize to csv.

```
# version 0.17, 10M rows

In [8]: %time df = pd.read_sas('big.xpt')
Wall time: 14.6 s

In [9]: %time df = pd.read_csv('big.csv')
Wall time: 4.86 s
```

## COMPARISON WITH STATA

For potential users coming from [Stata](#) this page is meant to demonstrate how different Stata operations would be performed in pandas.

If you're new to pandas, you might want to first read through [10 Minutes to pandas](#) to familiarize yourself with the library.

As is customary, we import pandas and NumPy as follows. This means that we can refer to the libraries as `pd` and `np`, respectively, for the rest of the document.

```
In [1]: import pandas as pd
```

```
In [2]: import numpy as np
```

---

**Note:** Throughout this tutorial, the pandas `DataFrame` will be displayed by calling `df.head()`, which displays the first N (default 5) rows of the `DataFrame`. This is often used in interactive work (e.g. [Jupyter notebook](#) or terminal) – the equivalent in Stata would be:

```
list in 1/5
```

---

### 33.1 Data Structures

#### 33.1.1 General Terminology Translation

pandas	Stata
<code>DataFrame</code>	data set
column	variable
row	observation
<code>groupby</code>	<code>bysort</code>
NaN	.

#### 33.1.2 `DataFrame` / `Series`

A `DataFrame` in pandas is analogous to a Stata data set – a two-dimensional data source with labeled columns that can be of different types. As will be shown in this document, almost any operation that can be applied to a data set in Stata can also be accomplished in pandas.

A `Series` is the data structure that represents one column of a `DataFrame`. Stata doesn't have a separate data structure for a single column, but in general, working with a `Series` is analogous to referencing a column of a data set in Stata.

### 33.1.3 Index

Every `DataFrame` and `Series` has an `Index` – labels on the *rows* of the data. Stata does not have an exactly analogous concept. In Stata, a data set's rows are essentially unlabeled, other than an implicit integer index that can be accessed with `_n`.

In pandas, if no index is specified, an integer index is also used by default (first row = 0, second row = 1, and so on). While using a labeled `Index` or `MultiIndex` can enable sophisticated analyses and is ultimately an important part of pandas to understand, for this comparison we will essentially ignore the `Index` and just treat the `DataFrame` as a collection of columns. Please see the [indexing documentation](#) for much more on how to use an `Index` effectively.

## 33.2 Data Input / Output

### 33.2.1 Constructing a DataFrame from Values

A Stata data set can be built from specified values by placing the data after an `input` statement and specifying the column names.

```
input x y
1 2
3 4
5 6
end
```

A pandas `DataFrame` can be constructed in many different ways, but for a small number of values, it is often convenient to specify it as a Python dictionary, where the keys are the column names and the values are the data.

```
In [3]: df = pd.DataFrame({
...:     'x': [1, 3, 5],
...:     'y': [2, 4, 6]})
...:

In [4]: df
Out[4]:
   x  y
0  1  2
1  3  4
2  5  6
```

### 33.2.2 Reading External Data

Like Stata, pandas provides utilities for reading in data from many formats. The `tips` data set, found within the pandas tests (`csv`) will be used in many of the following examples.

Stata provides `import delimited` to read `csv` data into a data set in memory. If the `tips.csv` file is in the current working directory, we can import it as follows.

```
import delimited tips.csv
```

The pandas method is `read_csv()`, which works similarly. Additionally, it will automatically download the data set if presented with a url.

```
In [5]: url = 'https://raw.githubusercontent.com/pandas-dev/pandas/master/pandas/tests/data/tips.
↳ csv'

In [6]: tips = pd.read_csv(url)

In [7]: tips.head()
Out[7]:
```

	total_bill	tip	sex	smoker	day	time	size
0	16.99	1.01	Female	No	Sun	Dinner	2
1	10.34	1.66	Male	No	Sun	Dinner	3
2	21.01	3.50	Male	No	Sun	Dinner	3
3	23.68	3.31	Male	No	Sun	Dinner	2
4	24.59	3.61	Female	No	Sun	Dinner	4

Like `import delimited`, `read_csv()` can take a number of parameters to specify how the data should be parsed. For example, if the data were instead tab delimited, did not have column names, and existed in the current working directory, the pandas command would be:

```
tips = pd.read_csv('tips.csv', sep='\t', header=None)

# alternatively, read_table is an alias to read_csv with tab delimiter
tips = pd.read_table('tips.csv', header=None)
```

Pandas can also read Stata data sets in `.dta` format with the `read_stata()` function.

```
df = pd.read_stata('data.dta')
```

In addition to text/csv and Stata files, pandas supports a variety of other data formats such as Excel, SAS, HDF5, Parquet, and SQL databases. These are all read via a `pd.read_*` function. See the [IO documentation](#) for more details.

### 33.2.3 Exporting Data

The inverse of `import delimited` in Stata is `export delimited`

```
export delimited tips2.csv
```

Similarly in pandas, the opposite of `read_csv` is `DataFrame.to_csv()`.

```
tips.to_csv('tips2.csv')
```

Pandas can also export to Stata file format with the `DataFrame.to_stata()` method.

```
tips.to_stata('tips2.dta')
```

## 33.3 Data Operations

### 33.3.1 Operations on Columns

In Stata, arbitrary math expressions can be used with the `generate` and `replace` commands on new or existing columns. The `drop` command drops the column from the data set.

```

replace total_bill = total_bill - 2
generate new_bill = total_bill / 2
drop new_bill

```

pandas provides similar vectorized operations by specifying the individual Series in the DataFrame. New columns can be assigned in the same way. The `DataFrame.drop()` method drops a column from the DataFrame.

```

In [8]: tips['total_bill'] = tips['total_bill'] - 2

In [9]: tips['new_bill'] = tips['total_bill'] / 2

In [10]: tips.head()
Out[10]:
   total_bill  tip  sex smoker  day  time  size  new_bill
0      14.99  1.01 Female    No  Sun  Dinner     2     7.495
1       8.34  1.66   Male    No  Sun  Dinner     3     4.170
2      19.01  3.50   Male    No  Sun  Dinner     3     9.505
3      21.68  3.31   Male    No  Sun  Dinner     2    10.840
4      22.59  3.61 Female    No  Sun  Dinner     4    11.295

In [11]: tips = tips.drop('new_bill', axis=1)

```

### 33.3.2 Filtering

Filtering in Stata is done with an `if` clause on one or more columns.

```

list if total_bill > 10

```

DataFrames can be filtered in multiple ways; the most intuitive of which is using *boolean indexing*.

```

In [12]: tips[tips['total_bill'] > 10].head()
Out[12]:
   total_bill  tip  sex smoker  day  time  size
0      14.99  1.01 Female    No  Sun  Dinner     2
2      19.01  3.50   Male    No  Sun  Dinner     3
3      21.68  3.31   Male    No  Sun  Dinner     2
4      22.59  3.61 Female    No  Sun  Dinner     4
5      23.29  4.71   Male    No  Sun  Dinner     4

```

### 33.3.3 If/Then Logic

In Stata, an `if` clause can also be used to create new columns.

```

generate bucket = "low" if total_bill < 10
replace bucket = "high" if total_bill >= 10

```

The same operation in pandas can be accomplished using the `where` method from numpy.

```

In [13]: tips['bucket'] = np.where(tips['total_bill'] < 10, 'low', 'high')

In [14]: tips.head()
Out[14]:
   total_bill  tip  sex smoker  day  time  size bucket
0      14.99  1.01 Female    No  Sun  Dinner     2   high

```

(continues on next page)

(continued from previous page)

1	8.34	1.66	Male	No	Sun	Dinner	3	low
2	19.01	3.50	Male	No	Sun	Dinner	3	high
3	21.68	3.31	Male	No	Sun	Dinner	2	high
4	22.59	3.61	Female	No	Sun	Dinner	4	high

### 33.3.4 Date Functionality

Stata provides a variety of functions to do operations on date/datetime columns.

```

generate date1 = mdy(1, 15, 2013)
generate date2 = date("Feb152015", "MDY")

generate date1_year = year(date1)
generate date2_month = month(date2)

* shift date to beginning of next month
generate date1_next = mdy(month(date1) + 1, 1, year(date1)) if month(date1) != 12
replace date1_next = mdy(1, 1, year(date1) + 1) if month(date1) == 12
generate months_between = mofd(date2) - mofd(date1)

list date1 date2 date1_year date2_month date1_next months_between

```

The equivalent pandas operations are shown below. In addition to these functions, pandas supports other Time Series features not available in Stata (such as time zone handling and custom offsets) – see the [timeseries documentation](#) for more details.

```

In [15]: tips['date1'] = pd.Timestamp('2013-01-15')

In [16]: tips['date2'] = pd.Timestamp('2015-02-15')

In [17]: tips['date1_year'] = tips['date1'].dt.year

In [18]: tips['date2_month'] = tips['date2'].dt.month

In [19]: tips['date1_next'] = tips['date1'] + pd.offsets.MonthBegin()

In [20]: tips['months_between'] = (tips['date2'].dt.to_period('M') -
....:                             tips['date1'].dt.to_period('M'))
....:

In [21]: tips[['date1', 'date2', 'date1_year', 'date2_month',
....:          'date1_next', 'months_between']].head()
....:

Out[21]:
   date1      date2  date1_year  date2_month  date1_next  months_between
0 2013-01-15 2015-02-15        2013          2 2013-02-01              25
1 2013-01-15 2015-02-15        2013          2 2013-02-01              25
2 2013-01-15 2015-02-15        2013          2 2013-02-01              25
3 2013-01-15 2015-02-15        2013          2 2013-02-01              25
4 2013-01-15 2015-02-15        2013          2 2013-02-01              25

```

### 33.3.5 Selection of Columns

Stata provides keywords to select, drop, and rename columns.

```

keep sex total_bill tip

drop sex

rename total_bill total_bill_2

```

The same operations are expressed in pandas below. Note that in contrast to Stata, these operations do not happen in place. To make these changes persist, assign the operation back to a variable.

```

# keep
In [22]: tips[['sex', 'total_bill', 'tip']].head()
Out[22]:
   sex  total_bill  tip
0  Female      14.99  1.01
1   Male       8.34  1.66
2   Male      19.01  3.50
3   Male      21.68  3.31
4  Female      22.59  3.61

# drop
In [23]: tips.drop('sex', axis=1).head()
Out[23]:
   total_bill  tip  smoker  day  time  size
0      14.99  1.01     No  Sun  Dinner    2
1       8.34  1.66     No  Sun  Dinner    3
2      19.01  3.50     No  Sun  Dinner    3
3      21.68  3.31     No  Sun  Dinner    2
4      22.59  3.61     No  Sun  Dinner    4

# rename
In [24]: tips.rename(columns={'total_bill': 'total_bill_2'}).head()
Out[24]:
   total_bill_2  tip  sex  smoker  day  time  size
0      14.99  1.01  Female     No  Sun  Dinner    2
1       8.34  1.66   Male     No  Sun  Dinner    3
2      19.01  3.50   Male     No  Sun  Dinner    3
3      21.68  3.31   Male     No  Sun  Dinner    2
4      22.59  3.61  Female     No  Sun  Dinner    4

```

### 33.3.6 Sorting by Values

Sorting in Stata is accomplished via `sort`

```
sort sex total_bill
```

pandas objects have a `DataFrame.sort_values()` method, which takes a list of columns to sort by.

```

In [25]: tips = tips.sort_values(['sex', 'total_bill'])
In [26]: tips.head()
Out[26]:
   total_bill  tip  sex  smoker  day  time  size
67       1.07  1.00  Female     Yes  Sat  Dinner    1

```

(continues on next page)

(continued from previous page)

92	3.75	1.00	Female	Yes	Fri	Dinner	2
111	5.25	1.00	Female	No	Sat	Dinner	1
145	6.35	1.50	Female	No	Thur	Lunch	2
135	6.51	1.25	Female	No	Thur	Lunch	2

```
generate strlen_time = strlen(time)
generate ustrlen_time = ustrlen(time)
```

---

```
In [27]: tips['time'].str.len().head()
Out[27]:
67      6
92      6
111     6
145     5
135     5
Name: time, dtype: int64

In [28]: tips['time'].str.rstrip().str.len().head()
Out[28]:
67      6
92      6
111     6
145     5
135     5
Name: time, dtype: int64
```

```
generate str_position = strpos(sex, "ale")
```

---

```
In [29]: tips['sex'].str.find("ale").head()
Out[29]:
67      3
```

(continues on next page)

(continued from previous page)

```
92      3
111     3
145     3
135     3
Name: sex, dtype: int64
```

### 33.4.3 Extracting Substring by Position

Stata extracts a substring from a string based on its position with the `substr()` function.

```
generate short_sex = substr(sex, 1, 1)
```

With pandas you can use `[]` notation to extract a substring from a string by position locations. Keep in mind that Python indexes are zero-based.

```
In [30]: tips['sex'].str[0:1].head()
Out[30]:
67      F
92      F
111     F
145     F
135     F
Name: sex, dtype: object
```

### 33.4.4 Extracting nth Word

The Stata `word()` function returns the *nth* word from a string. The first argument is the string you want to parse and the second argument specifies which word you want to extract.

```
clear
input str20 string
"John Smith"
"Jane Cook"
end

generate first_name = word(name, 1)
generate last_name = word(name, -1)
```

Python extracts a substring from a string based on its text by using regular expressions. There are much more powerful approaches, but this just shows a simple approach.

```
In [31]: firstlast = pd.DataFrame({'string': ['John Smith', 'Jane Cook']})

In [32]: firstlast['First_Name'] = firstlast['string'].str.split(" ", expand=True)[0]

In [33]: firstlast['Last_Name'] = firstlast['string'].str.rsplit(" ", expand=True)[0]

In [34]: firstlast
Out[34]:
      string First_Name Last_Name
0  John Smith      John      John
1  Jane Cook      Jane      Jane
```

### 33.4.5 Changing Case

The Stata `strupper()`, `strlower()`, `strproper()`, `ustrupper()`, `ustrlower()`, and `ustrtitle()` functions change the case of ASCII and Unicode strings, respectively.

```
clear
input str20 string
"John Smith"
"Jane Cook"
end

generate upper = strupper(string)
generate lower = strlower(string)
generate title = strproper(string)
list
```

The equivalent Python functions are `upper`, `lower`, and `title`.

```
In [35]: firstlast = pd.DataFrame({'string': ['John Smith', 'Jane Cook']})

In [36]: firstlast['upper'] = firstlast['string'].str.upper()

In [37]: firstlast['lower'] = firstlast['string'].str.lower()

In [38]: firstlast['title'] = firstlast['string'].str.title()

In [39]: firstlast
Out[39]:
```

	string	upper	lower	title
0	John Smith	JOHN SMITH	john smith	John Smith
1	Jane Cook	JANE COOK	jane cook	Jane Cook

## 33.5 Merging

The following tables will be used in the merge examples

```
In [40]: df1 = pd.DataFrame({'key': ['A', 'B', 'C', 'D'],
.....:                      'value': np.random.randn(4)})
.....:

In [41]: df1
Out[41]:
```

	key	value
0	A	0.885906
1	B	0.794848
2	C	-0.943848
3	D	0.328609

```
In [42]: df2 = pd.DataFrame({'key': ['B', 'D', 'D', 'E'],
.....:                      'value': np.random.randn(4)})
.....:

In [43]: df2
Out[43]:
```

	key	value
--	-----	-------

(continues on next page)

(continued from previous page)

0	B	-1.634931
1	D	2.197567
2	D	0.054695
3	E	0.283297

In Stata, to perform a merge, one data set must be in memory and the other must be referenced as a file name on disk. In contrast, Python must have both `DataFrames` already in memory.

By default, Stata performs an outer join, where all observations from both data sets are left in memory after the merge. One can keep only observations from the initial data set, the merged data set, or the intersection of the two by using the values created in the `_merge` variable.

```
* First create df2 and save to disk
clear
input str1 key
B
D
D
E
end
generate value = rnormal()
save df2.dta

* Now create df1 in memory
clear
input str1 key
A
B
C
D
end
generate value = rnormal()

preserve

* Left join
merge 1:n key using df2.dta
keep if _merge == 1

* Right join
restore, preserve
merge 1:n key using df2.dta
keep if _merge == 2

* Inner join
restore, preserve
merge 1:n key using df2.dta
keep if _merge == 3

* Outer join
restore
merge 1:n key using df2.dta
```

pandas `DataFrames` have a `DataFrame.merge()` method, which provides similar functionality. Note that different join types are accomplished via the `how` keyword.

```
In [44]: inner_join = df1.merge(df2, on=['key'], how='inner')
```

```
In [45]: inner_join
```

```
Out[45]:
```

	key	value_x	value_y
0	B	0.794848	-1.634931
1	D	0.328609	2.197567
2	D	0.328609	0.054695

```
In [46]: left_join = df1.merge(df2, on=['key'], how='left')
```

```
In [47]: left_join
```

```
Out[47]:
```

	key	value_x	value_y
0	A	0.885906	NaN
1	B	0.794848	-1.634931
2	C	-0.943848	NaN
3	D	0.328609	2.197567
4	D	0.328609	0.054695

```
In [48]: right_join = df1.merge(df2, on=['key'], how='right')
```

```
In [49]: right_join
```

```
Out[49]:
```

	key	value_x	value_y
0	B	0.794848	-1.634931
1	D	0.328609	2.197567
2	D	0.328609	0.054695
3	E	NaN	0.283297

```
In [50]: outer_join = df1.merge(df2, on=['key'], how='outer')
```

```
In [51]: outer_join
```

```
Out[51]:
```

	key	value_x	value_y
0	A	0.885906	NaN
1	B	0.794848	-1.634931
2	C	-0.943848	NaN
3	D	0.328609	2.197567
4	D	0.328609	0.054695
5	E	NaN	0.283297

## 33.6 Missing Data

Like Stata, pandas has a representation for missing data – the special float value NaN (not a number). Many of the semantics are the same; for example missing data propagates through numeric operations, and is ignored by default for aggregations.

```
In [52]: outer_join
```

```
Out[52]:
```

	key	value_x	value_y
0	A	0.885906	NaN
1	B	0.794848	-1.634931
2	C	-0.943848	NaN
3	D	0.328609	2.197567

(continues on next page)

(continued from previous page)

4	D	0.328609	0.054695
5	E	NaN	0.283297

```
In [53]: outer_join['value_x'] + outer_join['value_y']
```

```
0      NaN
1   -0.840083
2      NaN
3    2.526176
4    0.383304
5      NaN
dtype: float64
```

```
In [54]: outer_join['value_x'].sum()
```

---

→ 1.3941243310085349

One difference is that missing data cannot be compared to its sentinel value. For example, in Stata you could do this to filter missing values.

```
* Keep missing values
list if value_x == .
* Keep non-missing values
list if value_x != .
```

This doesn't work in pandas. Instead, the `pd.isna()` or `pd.notna()` functions should be used for comparisons.

```
In [55]: outer_join[pd.isna(outer_join['value_x'])]
```

Out [55]:

	key	value_x	value_y
5	E	NaN	0.283297

```
In [56]: outer_join(pd.notna(outer_join['value_x']))
```

```
Out[56]:
```

	key	value_x	value_y
0	A	0.885906	NaN
1	B	0.794848	-1.634931
2	C	-0.943848	NaN
3	D	0.328609	2.197567
4	D	0.328609	0.054695

Pandas also provides a variety of methods to work with missing data – some of which would be challenging to express in Stata. For example, there are methods to drop all rows with any missing values, replacing missing values with a specified value, like the mean, or forward filling from previous rows. See the [missing data documentation](#) for more.

```
# Drop rows with any missing value
```

```
In [57]: outer_join.dropna()
```

Out [57]:

	key	value_x	value_y
1	B	0.794848	-1.634931
3	D	0.328609	2.197567
4	D	0.328609	0.054695

```
# Fill forwards
```

```
In [58]: outer_join.fillna(method='ffill')
```

(continues on next page)

(continued from previous page)

```

////////////////////////////////////
↪
   key  value_x  value_y
0    A  0.885906      NaN
1    B  0.794848 -1.634931
2    C -0.943848 -1.634931
3    D  0.328609  2.197567

Name: value_x, dtype: float64

```

## 33.7 GroupBy

### 33.7.1 Aggregation

Stata's `collapse` can be used to group by one or more key variables and compute aggregations on numeric columns.

```
collapse (sum) total_bill tip, by(sex smoker)
```

pandas provides a flexible `groupby` mechanism that allows similar aggregations. See the [groupby documentation](#) for more details and examples.

```
In [60]: tips_summed = tips.groupby(['sex', 'smoker'])['total_bill', 'tip'].sum()
```

```
In [61]: tips_summed.head()
```

```
Out [61]:
```

		total_bill	tip
sex	smoker		
Female	No	869.68	149.77
	Yes	527.27	96.74
Male	No	1725.75	302.00
	Yes	1217.07	183.07

### 33.7.2 Transformation

In Stata, if the group aggregations need to be used with the original data set, one would usually use `bysort` with `egen()`. For example, to subtract the mean for each observation by smoker group.

```
bysort sex smoker: egen group_bill = mean(total_bill)
generate adj_total_bill = total_bill - group_bill
```

pandas `groupby` provides a `transform` mechanism that allows these type of operations to be succinctly expressed in one operation.

```
In [62]: gb = tips.groupby('smoker')['total_bill']

In [63]: tips['adj_total_bill'] = tips['total_bill'] - gb.transform('mean')

In [64]: tips.head()
Out[64]:
```

	total_bill	tip	sex	smoker	day	time	size	adj_total_bill
67	1.07	1.00	Female	Yes	Sat	Dinner	1	-17.686344
92	3.75	1.00	Female	Yes	Fri	Dinner	2	-15.006344
111	5.25	1.00	Female	No	Sat	Dinner	1	-11.938278
145	6.35	1.50	Female	No	Thur	Lunch	2	-10.838278
135	6.51	1.25	Female	No	Thur	Lunch	2	-10.678278

### 33.7.3 By Group Processing

In addition to aggregation, pandas `groupby` can be used to replicate most other `bysort` processing from Stata. For example, the following example lists the first observation in the current sort order by sex/smoker group.

```
bysort sex smoker: list if _n == 1
```

In pandas this would be written as:

```
In [65]: tips.groupby(['sex', 'smoker']).first()
Out[65]:
```

sex	smoker	total_bill	tip	day	time	size	adj_total_bill
Female	No	5.25	1.00	Sat	Dinner	1	-11.938278
	Yes	1.07	1.00	Sat	Dinner	1	-17.686344
Male	No	5.51	2.00	Thur	Lunch	2	-11.678278
	Yes	5.25	5.15	Sun	Dinner	2	-13.506344

## 33.8 Other Considerations

### 33.8.1 Disk vs Memory

Pandas and Stata both operate exclusively in memory. This means that the size of data able to be loaded in pandas is limited by your machine's memory. If out of core processing is needed, one possibility is the [dask.dataframe](#) library, which provides a subset of pandas functionality for an on-disk `DataFrame`.

## API REFERENCE

This page gives an overview of all public pandas objects, functions and methods. All classes and functions exposed in `pandas.*` namespace are public.

Some subpackages are public which include `pandas.errors`, `pandas.plotting`, and `pandas.testing`. Public functions in `pandas.io` and `pandas.tseries` submodules are mentioned in the documentation. `pandas.api.types` subpackage holds some public functions related to data types in pandas.

**Warning:** The `pandas.core`, `pandas.compat`, and `pandas.util` top-level modules are PRIVATE. Stable functionality in such modules is not guaranteed.

### 34.1 Input/Output

#### 34.1.1 Pickling

---

<code>read_pickle(path[, compression])</code>	Load pickled pandas object (or any object) from file.
---	---

---

##### 34.1.1.1 `pandas.read_pickle`

`pandas.read_pickle(path, compression='infer')`  
Load pickled pandas object (or any object) from file.

**Warning:** Loading pickled data received from untrusted sources can be unsafe. See [here](#).

**Parameters** `path` : str

File path where the pickled object will be loaded.

**compression** : {'infer', 'gzip', 'bz2', 'zip', 'xz', None}, default 'infer'

For on-the-fly decompression of on-disk data. If 'infer', then use gzip, bz2, xz or zip if path ends in '.gz', '.bz2', '.xz', or '.zip' respectively, and no decompression otherwise. Set to None for no decompression.

New in version 0.20.0.

**Returns**

**unpickled** [type of object stored in file]

See also:

`DataFrame.to_pickle` Pickle (serialize) DataFrame object to file.

`Series.to_pickle` Pickle (serialize) Series object to file.

`read_hdf` Read HDF5 file into a DataFrame.

`read_sql` Read SQL query or database table into a DataFrame.

`read_parquet` Load a parquet object, returning a DataFrame.

## Examples

```
>>> original_df = pd.DataFrame({"foo": range(5), "bar": range(5, 10)})
>>> original_df
   foo  bar
0    0    5
1    1    6
2    2    7
3    3    8
4    4    9
>>> pd.to_pickle(original_df, "./dummy.pkl")
```

```
>>> unpickled_df = pd.read_pickle("./dummy.pkl")
>>> unpickled_df
   foo  bar
0    0    5
1    1    6
2    2    7
3    3    8
4    4    9
```

```
>>> import os
>>> os.remove("./dummy.pkl")
```

### 34.1.2 Flat File

<code>read_table(filepath_or_buffer[, sep, ...])</code>	Read general delimited file into DataFrame
<code>read_csv(filepath_or_buffer[, sep, ...])</code>	Read CSV (comma-separated) file into DataFrame
<code>read_fwf(filepath_or_buffer[, colspecs, widths])</code>	Read a table of fixed-width formatted lines into DataFrame
<code>read_msgpack(path_or_buf[, encoding, iterator])</code>	Load msgpack pandas object from the specified file path

### 34.1.2.1 pandas.read\_table

```
pandas.read_table(filepath_or_buffer, sep='\t', delimiter=None, header='infer', names=None,
                  index_col=None, usecols=None, squeeze=False, prefix=None, man-
                  gle_dupe_cols=True, dtype=None, engine=None, converters=None,
                  true_values=None, false_values=None, skipinitialspace=False, skiprows=None,
                  nrows=None, na_values=None, keep_default_na=True, na_filter=True,
                  verbose=False, skip_blank_lines=True, parse_dates=False, infer-

                  footer=0, doublequote=True, delim_whitespace=False, low_memory=True,
                  memory_map=False, float_precision=None)
```

Read general delimited file into DataFrame

Also supports optionally iterating or breaking of the file into chunks.

Additional help can be found in the [online docs for IO Tools](#).

#### Parameters

**filepath\_or\_buffer** [str, pathlib.Path, py.\_path.local.LocalPath or any \]

**object with a read() method (such as a file handle or StringIO)**

The string could be a URL. Valid URL schemes include http, ftp, s3, and file. For file URLs, a host is expected. For instance, a local file could be `file://localhost/path/to/table.csv`

**sep** : str, default t (tab-stop)

Delimiter to use. If sep is None, the C engine cannot automatically detect the separator, but the Python parsing engine can, meaning the latter will be used and automatically detect the separator by Python's builtin sniffer tool, `csv.Sniffer`. In addition, separators longer than 1 character and different from `'\s+'` will be interpreted as regular expressions and will also force the use of the Python parsing engine. Note that regex delimiters are prone to ignoring quoted data. Regex example: `'\r\t'`

**delimiter** : str, default None

Alternative argument name for sep.

**delim\_whitespace** : boolean, default False

Specifies whether or not whitespace (e.g. `' '` or `'\t'`) will be used as the sep. Equivalent to setting `sep='\s+'`. If this option is set to True, nothing should be passed in for the `delimiter` parameter.

New in version 0.18.1: support for the Python parser.

**header** : int or list of ints, default 'infer'

Row number(s) to use as the column names, and the start of the data. Default behavior is to infer the column names: if no names are passed the behavior is identical to `header=0` and column names are inferred from the first line of the file, if column names are passed explicitly then the behavior is identical to `header=None`. Explicitly pass `header=0` to be able to replace existing names. The header can be a list of integers that specify row locations for a multi-index on the columns e.g. `[0,1,3]`. Intervening rows that are not specified will be skipped (e.g. 2 in this example is skipped). Note that this parameter ignores commented lines and empty lines if

`skip_blank_lines=True`, so `header=0` denotes the first line of data rather than the first line of the file.

**names** : array-like, default None

List of column names to use. If file contains no header row, then you should explicitly pass `header=None`. Duplicates in this list will cause a `UserWarning` to be issued.

**index\_col** : int or sequence or False, default None

Column to use as the row labels of the `DataFrame`. If a sequence is given, a `MultiIndex` is used. If you have a malformed file with delimiters at the end of each line, you might consider `index_col=False` to force pandas to *not* use the first column as the index (row names)

**usecols** : list-like or callable, default None

Return a subset of the columns. If list-like, all elements must either be positional (i.e. integer indices into the document columns) or strings that correspond to column names provided either by the user in *names* or inferred from the document header row(s). For example, a valid list-like *usecols* parameter would be `[0, 1, 2]` or `['foo', 'bar', 'baz']`. Element order is ignored, so `usecols=[0, 1]` is the same as `[1, 0]`. To instantiate a `DataFrame` from data with element order preserved use `pd.read_csv(data, usecols=['foo', 'bar'])[['foo', 'bar']]` for columns in `['foo', 'bar']` order or `pd.read_csv(data, usecols=['foo', 'bar'])[['bar', 'foo']]` for `['bar', 'foo']` order.

If callable, the callable function will be evaluated against the column names, returning names where the callable function evaluates to `True`. An example of a valid callable argument would be `lambda x: x.upper() in ['AAA', 'BBB', 'DDD']`. Using this parameter results in much faster parsing time and lower memory usage.

**squeeze** : boolean, default False

If the parsed data only contains one column then return a `Series`

**prefix** : str, default None

Prefix to add to column numbers when no header, e.g. 'X' for X0, X1, ...

**mangle\_dupe\_cols** : boolean, default True

Duplicate columns will be specified as 'X', 'X.1', ... 'X.N', rather than 'X'... 'X'. Passing in False will cause data to be overwritten if there are duplicate names in the columns.

**dtype** : Type name or dict of column -> type, default None

Data type for data or columns. E.g. `{ 'a': np.float64, 'b': np.int32 }` Use *str* or *object* together with suitable *na\_values* settings to preserve and not interpret dtype. If converters are specified, they will be applied INSTEAD of dtype conversion.

**engine** : { 'c', 'python' }, optional

Parser engine to use. The C engine is faster while the python engine is currently more feature-complete.

**converters** : dict, default None

Dict of functions for converting values in certain columns. Keys can either be integers or column labels

**true\_values** : list, default None

Values to consider as True

**false\_values** : list, default None

Values to consider as False

**skipinitialspace** : boolean, default False

Skip spaces after delimiter.

**skiprows** : list-like or integer or callable, default None

Line numbers to skip (0-indexed) or number of lines to skip (int) at the start of the file.

If callable, the callable function will be evaluated against the row indices, returning True if the row should be skipped and False otherwise. An example of a valid callable argument would be `lambda x: x in [0, 2]`.

**skipfooter** : int, default 0

Number of lines at bottom of file to skip (Unsupported with engine='c')

**nrows** : int, default None

Number of rows of file to read. Useful for reading pieces of large files

**na\_values** : scalar, str, list-like, or dict, default None

Additional strings to recognize as NA/NaN. If dict passed, specific per-column NA values. By default the following values are interpreted as NaN: `'', '#N/A', '#N/A N/A', '#NA', '-1.#IND', '-1.#QNAN', '-NaN', '-nan', '1.#IND', '1.#QNAN', 'N/A', 'NA', 'NULL', 'NaN', 'n/a', 'nan', 'null'`.

**keep\_default\_na** : bool, default True

Whether or not to include the default NaN values when parsing the data. Depending on whether *na\_values* is passed in, the behavior is as follows:

- If *keep\_default\_na* is True, and *na\_values* are specified, *na\_values* is appended to the default NaN values used for parsing.
- If *keep\_default\_na* is True, and *na\_values* are not specified, only the default NaN values are used for parsing.
- If *keep\_default\_na* is False, and *na\_values* are specified, only the NaN values specified *na\_values* are used for parsing.
- If *keep\_default\_na* is False, and *na\_values* are not specified, no strings will be parsed as NaN.

Note that if *na\_filter* is passed in as False, the *keep\_default\_na* and *na\_values* parameters will be ignored.

**na\_filter** : boolean, default True

Detect missing value markers (empty strings and the value of *na\_values*). In data without any NAs, passing *na\_filter=False* can improve the performance of reading a large file

**verbose** : boolean, default False

Indicate number of NA values placed in non-numeric columns

**skip\_blank\_lines** : boolean, default True

If True, skip over blank lines rather than interpreting as NaN values

**parse\_dates** : boolean or list of ints or names or list of lists or dict, default False

- boolean. If True -> try parsing the index.
- list of ints or names. e.g. If [1, 2, 3] -> try parsing columns 1, 2, 3 each as a separate date column.
- list of lists. e.g. If [[1, 3]] -> combine columns 1 and 3 and parse as a single date column.
- dict, e.g. { 'foo' : [1, 3]} -> parse columns 1, 3 as date and call result 'foo'

If a column or index contains an unparseable date, the entire column or index will be returned unaltered as an object data type. For non-standard datetime parsing, use `pd.to_datetime` after `pd.read_csv`

Note: A fast-path exists for iso8601-formatted dates.

**infer\_datetime\_format** : boolean, default False

If True and *parse\_dates* is enabled, pandas will attempt to infer the format of the date-time strings in the columns, and if it can be inferred, switch to a faster method of parsing them. In some cases this can increase the parsing speed by 5-10x.

**keep\_date\_col** : boolean, default False

If True and *parse\_dates* specifies combining multiple columns then keep the original columns.

**date\_parser** : function, default None

Function to use for converting a sequence of string columns to an array of datetime instances. The default uses `dateutil.parser.parser` to do the conversion. Pandas will try to call *date\_parser* in three different ways, advancing to the next if an exception occurs: 1) Pass one or more arrays (as defined by *parse\_dates*) as arguments; 2) concatenate (row-wise) the string values from the columns defined by *parse\_dates* into a single array and pass that; and 3) call *date\_parser* once for each row using one or more strings (corresponding to the columns defined by *parse\_dates*) as arguments.

**dayfirst** : boolean, default False

DD/MM format dates, international and European format

**iterator** : boolean, default False

Return `TextFileReader` object for iteration or getting chunks with `get_chunk()`.

**chunksize** : int, default None

Return `TextFileReader` object for iteration. See the [IO Tools docs](#) for more information on *iterator* and *chunksize*.

**compression** : { 'infer', 'gzip', 'bz2', 'zip', 'xz', None }, default 'infer'

For on-the-fly decompression of on-disk data. If 'infer' and *filepath\_or\_buffer* is path-like, then detect compression from the following extensions: '.gz', '.bz2', '.zip', or '.xz' (otherwise no decompression). If using 'zip', the ZIP file must contain only one data file to be read in. Set to None for no decompression.

New in version 0.18.1: support for 'zip' and 'xz' compression.

**thousands** : str, default None

Thousands separator

**decimal** : str, default '.'

Character to recognize as decimal point (e.g. use ‘,’ for European data).

**float\_precision** : string, default None

Specifies which converter the C engine should use for floating-point values. The options are *None* for the ordinary converter, *high* for the high-precision converter, and *round\_trip* for the round-trip converter.

**lineterminator** : str (length 1), default None

Character to break file into lines. Only valid with C parser.

**quotechar** : str (length 1), optional

The character used to denote the start and end of a quoted item. Quoted items can include the delimiter and it will be ignored.

**quoting** : int or csv.QUOTE\_\* instance, default 0

Control field quoting behavior per `csv.QUOTE_*` constants. Use one of `QUOTE_MINIMAL` (0), `QUOTE_ALL` (1), `QUOTE_NONNUMERIC` (2) or `QUOTE_NONE` (3).

**doublequote** : boolean, default True

When quotechar is specified and quoting is not `QUOTE_NONE`, indicate whether or not to interpret two consecutive quotechar elements *INSIDE* a field as a single quotechar element.

**escapechar** : str (length 1), default None

One-character string used to escape delimiter when quoting is `QUOTE_NONE`.

**comment** : str, default None

Indicates remainder of line should not be parsed. If found at the beginning of a line, the line will be ignored altogether. This parameter must be a single character. Like empty lines (as long as `skip_blank_lines=True`), fully commented lines are ignored by the parameter *header* but not by *skiprows*. For example, if `comment='#'`, parsing `#empty\na,b,c\n1,2,3` with `header=0` will result in ‘a,b,c’ being treated as the header.

**encoding** : str, default None

Encoding to use for UTF when reading/writing (ex. ‘utf-8’). [List of Python standard encodings](#)

**dialect** : str or csv.Dialect instance, default None

If provided, this parameter will override values (default or not) for the following parameters: *delimiter*, *doublequote*, *escapechar*, *skipinitialspace*, *quotechar*, and *quoting*. If it is necessary to override values, a `ParserWarning` will be issued. See `csv.Dialect` documentation for more details.

**tupleize\_cols** : boolean, default False

Deprecated since version 0.21.0: This argument will be removed and will always convert to `MultiIndex`

Leave a list of tuples on columns as is (default is to convert to a `MultiIndex` on the columns)

**error\_bad\_lines** : boolean, default True

Lines with too many fields (e.g. a csv line with too many commas) will by default cause an exception to be raised, and no DataFrame will be returned. If False, then these “bad lines” will be dropped from the DataFrame that is returned.

**warn\_bad\_lines** : boolean, default True

If error\_bad\_lines is False, and warn\_bad\_lines is True, a warning for each “bad line” will be output.

**low\_memory** : boolean, default True

Internally process the file in chunks, resulting in lower memory use while parsing, but possibly mixed type inference. To ensure no mixed types either set False, or specify the type with the *dtype* parameter. Note that the entire file is read into a single DataFrame regardless, use the *chunksize* or *iterator* parameter to return the data in chunks. (Only valid with C parser)

**memory\_map** : boolean, default False

If a filepath is provided for *filepath\_or\_buffer*, map the file object directly onto memory and access the data directly from there. Using this option can improve performance because there is no longer any I/O overhead.

### Returns

**result** [DataFrame or TextParser]

#### 34.1.2.2 pandas.read\_csv

`pandas.read_csv(filepath_or_buffer, sep=',', delimiter=None, header='infer', names=None, index_col=None, usecols=None, squeeze=False, prefix=None, mangle_dupe_cols=True, dtype=None, engine=None, converters=None, true_values=None, false_values=None, skipinitialspace=False, skiprows=None, nrows=None, na_values=None, keep_default_na=True, na_filter=True, verbose=False, skip_blank_lines=True, parse_dates=False, infer_datetime_format=False, keep_date_col=False, date_parser=None, dayfirst=False, iterator=False, chunksize=None, compression='infer', thousands=None, decimal=b'.', lineterminator=None, quotechar='"', quoting=0, escapechar=None, comment=None, encoding=None, dialect=None, tupleize_cols=None, error_bad_lines=True, warn_bad_lines=True, skipfooter=0, doublequote=True, delim_whitespace=False, low_memory=True, memory_map=False, float_precision=None)`

Read CSV (comma-separated) file into DataFrame

Also supports optionally iterating or breaking of the file into chunks.

Additional help can be found in the [online docs for IO Tools](#).

### Parameters

**filepath\_or\_buffer** [str, pathlib.Path, py.\_path.local.LocalPath or any \]

**object with a read() method (such as a file handle or StringIO)**

The string could be a URL. Valid URL schemes include http, ftp, s3, and file. For file URLs, a host is expected. For instance, a local file could be `file://localhost/path/to/table.csv`

**sep** : str, default ','

Delimiter to use. If sep is None, the C engine cannot automatically detect the separator, but the Python parsing engine can, meaning the latter will be used and automatically

detect the separator by Python's builtin sniffer tool, `csv.Sniffer`. In addition, separators longer than 1 character and different from `'\s+'` will be interpreted as regular expressions and will also force the use of the Python parsing engine. Note that regex delimiters are prone to ignoring quoted data. Regex example: `'\r\t'`

**delimiter** : str, default `None`

Alternative argument name for `sep`.

**delim\_whitespace** : boolean, default `False`

Specifies whether or not whitespace (e.g. `' '` or `'\t'`) will be used as the `sep`. Equivalent to setting `sep='\s+'`. If this option is set to `True`, nothing should be passed in for the `delimiter` parameter.

New in version 0.18.1: support for the Python parser.

**header** : int or list of ints, default `'infer'`

Row number(s) to use as the column names, and the start of the data. Default behavior is to infer the column names: if no names are passed the behavior is identical to `header=0` and column names are inferred from the first line of the file, if column names are passed explicitly then the behavior is identical to `header=None`. Explicitly pass `header=0` to be able to replace existing names. The header can be a list of integers that specify row locations for a multi-index on the columns e.g. `[0,1,3]`. Intervening rows that are not specified will be skipped (e.g. 2 in this example is skipped). Note that this parameter ignores commented lines and empty lines if `skip_blank_lines=True`, so `header=0` denotes the first line of data rather than the first line of the file.

**names** : array-like, default `None`

List of column names to use. If file contains no header row, then you should explicitly pass `header=None`. Duplicates in this list will cause a `UserWarning` to be issued.

**index\_col** : int or sequence or `False`, default `None`

Column to use as the row labels of the `DataFrame`. If a sequence is given, a `MultiIndex` is used. If you have a malformed file with delimiters at the end of each line, you might consider `index_col=False` to force pandas to `_not_` use the first column as the index (row names)

**usecols** : list-like or callable, default `None`

Return a subset of the columns. If list-like, all elements must either be positional (i.e. integer indices into the document columns) or strings that correspond to column names provided either by the user in `names` or inferred from the document header row(s). For example, a valid list-like `usecols` parameter would be `[0, 1, 2]` or `['foo', 'bar', 'baz']`. Element order is ignored, so `usecols=[0, 1]` is the same as `[1, 0]`. To instantiate a `DataFrame` from data with element order preserved use `pd.read_csv(data, usecols=['foo', 'bar'])[['foo', 'bar']]` for columns in `['foo', 'bar']` order or `pd.read_csv(data, usecols=['foo', 'bar'])[['bar', 'foo']]` for `['bar', 'foo']` order.

If callable, the callable function will be evaluated against the column names, returning names where the callable function evaluates to `True`. An example of a valid callable argument would be `lambda x: x.upper() in ['AAA', 'BBB', 'DDD']`. Using this parameter results in much faster parsing time and lower memory usage.

**squeeze** : boolean, default `False`

If the parsed data only contains one column then return a Series

**prefix** : str, default None

Prefix to add to column numbers when no header, e.g. 'X' for X0, X1, ...

**mangle\_dupe\_cols** : boolean, default True

Duplicate columns will be specified as 'X', 'X.1', ... 'X.N', rather than 'X'... 'X'. Passing in False will cause data to be overwritten if there are duplicate names in the columns.

**dtype** : Type name or dict of column -> type, default None

Data type for data or columns. E.g. {'a': np.float64, 'b': np.int32} Use *str* or *object* together with suitable *na\_values* settings to preserve and not interpret dtype. If converters are specified, they will be applied INSTEAD of dtype conversion.

**engine** : {'c', 'python'}, optional

Parser engine to use. The C engine is faster while the python engine is currently more feature-complete.

**converters** : dict, default None

Dict of functions for converting values in certain columns. Keys can either be integers or column labels

**true\_values** : list, default None

Values to consider as True

**false\_values** : list, default None

Values to consider as False

**skipinitialspace** : boolean, default False

Skip spaces after delimiter.

**skiprows** : list-like or integer or callable, default None

Line numbers to skip (0-indexed) or number of lines to skip (int) at the start of the file.

If callable, the callable function will be evaluated against the row indices, returning True if the row should be skipped and False otherwise. An example of a valid callable argument would be `lambda x: x in [0, 2]`.

**skipfooter** : int, default 0

Number of lines at bottom of file to skip (Unsupported with engine='c')

**nrows** : int, default None

Number of rows of file to read. Useful for reading pieces of large files

**na\_values** : scalar, str, list-like, or dict, default None

Additional strings to recognize as NA/NaN. If dict passed, specific per-column NA values. By default the following values are interpreted as NaN: ' ', '#N/A', '#N/A N/A', '#NA', '-1.#IND', '-1.#QNAN', '-NaN', '-nan', '1.#IND', '1.#QNAN', 'N/A', 'NA', 'NULL', 'NaN', 'n/a', 'nan', 'null'.

**keep\_default\_na** : bool, default True

Whether or not to include the default NaN values when parsing the data. Depending on whether *na\_values* is passed in, the behavior is as follows:

- If *keep\_default\_na* is True, and *na\_values* are specified, *na\_values* is appended to the default NaN values used for parsing.
- If *keep\_default\_na* is True, and *na\_values* are not specified, only the default NaN values are used for parsing.
- If *keep\_default\_na* is False, and *na\_values* are specified, only the NaN values specified *na\_values* are used for parsing.
- If *keep\_default\_na* is False, and *na\_values* are not specified, no strings will be parsed as NaN.

Note that if *na\_filter* is passed in as False, the *keep\_default\_na* and *na\_values* parameters will be ignored.

**na\_filter** : boolean, default True

Detect missing value markers (empty strings and the value of *na\_values*). In data without any NAs, passing *na\_filter*=False can improve the performance of reading a large file

**verbose** : boolean, default False

Indicate number of NA values placed in non-numeric columns

**skip\_blank\_lines** : boolean, default True

If True, skip over blank lines rather than interpreting as NaN values

**parse\_dates** : boolean or list of ints or names or list of lists or dict, default False

- boolean. If True -> try parsing the index.
- list of ints or names. e.g. If [1, 2, 3] -> try parsing columns 1, 2, 3 each as a separate date column.
- list of lists. e.g. If [[1, 3]] -> combine columns 1 and 3 and parse as a single date column.
- dict, e.g. { 'foo' : [1, 3] } -> parse columns 1, 3 as date and call result 'foo'

If a column or index contains an unparseable date, the entire column or index will be returned unaltered as an object data type. For non-standard datetime parsing, use `pd.to_datetime` after `pd.read_csv`

Note: A fast-path exists for iso8601-formatted dates.

**infer\_datetime\_format** : boolean, default False

If True and *parse\_dates* is enabled, pandas will attempt to infer the format of the datetime strings in the columns, and if it can be inferred, switch to a faster method of parsing them. In some cases this can increase the parsing speed by 5-10x.

**keep\_date\_col** : boolean, default False

If True and *parse\_dates* specifies combining multiple columns then keep the original columns.

**date\_parser** : function, default None

Function to use for converting a sequence of string columns to an array of datetime instances. The default uses `dateutil.parser.parser` to do the conversion. Pandas will try to call *date\_parser* in three different ways, advancing to the next if an exception occurs: 1) Pass one or more arrays (as defined by *parse\_dates*) as arguments; 2) concatenate (row-wise) the string values from the columns defined by *parse\_dates* into a

single array and pass that; and 3) call *date\_parser* once for each row using one or more strings (corresponding to the columns defined by *parse\_dates*) as arguments.

**dayfirst** : boolean, default False

DD/MM format dates, international and European format

**iterator** : boolean, default False

Return TextFileReader object for iteration or getting chunks with `get_chunk()`.

**chunksize** : int, default None

Return TextFileReader object for iteration. See the [IO Tools docs](#) for more information on `iterator` and `chunksize`.

**compression** : {'infer', 'gzip', 'bz2', 'zip', 'xz', None}, default 'infer'

For on-the-fly decompression of on-disk data. If 'infer' and *filepath\_or\_buffer* is path-like, then detect compression from the following extensions: '.gz', '.bz2', '.zip', or '.xz' (otherwise no decompression). If using 'zip', the ZIP file must contain only one data file to be read in. Set to None for no decompression.

New in version 0.18.1: support for 'zip' and 'xz' compression.

**thousands** : str, default None

Thousands separator

**decimal** : str, default '.'

Character to recognize as decimal point (e.g. use ',' for European data).

**float\_precision** : string, default None

Specifies which converter the C engine should use for floating-point values. The options are *None* for the ordinary converter, *high* for the high-precision converter, and *round\_trip* for the round-trip converter.

**lineterminator** : str (length 1), default None

Character to break file into lines. Only valid with C parser.

**quotechar** : str (length 1), optional

The character used to denote the start and end of a quoted item. Quoted items can include the delimiter and it will be ignored.

**quoting** : int or csv.QUOTE\_\* instance, default 0

Control field quoting behavior per `csv.QUOTE_*` constants. Use one of `QUOTE_MINIMAL` (0), `QUOTE_ALL` (1), `QUOTE_NONNUMERIC` (2) or `QUOTE_NONE` (3).

**doublequote** : boolean, default True

When `quotechar` is specified and `quoting` is not `QUOTE_NONE`, indicate whether or not to interpret two consecutive `quotechar` elements **INSIDE** a field as a single `quotechar` element.

**escapechar** : str (length 1), default None

One-character string used to escape delimiter when `quoting` is `QUOTE_NONE`.

**comment** : str, default None

Indicates remainder of line should not be parsed. If found at the beginning of a line, the line will be ignored altogether. This parameter must be a single character. Like empty lines (as long as `skip_blank_lines=True`), fully commented lines are ignored by the parameter *header* but not by *skiprows*. For example, if `comment='#'`, parsing `#empty\na,b,c\n1,2,3` with `header=0` will result in 'a,b,c' being treated as the header.

**encoding** : str, default None

Encoding to use for UTF when reading/writing (ex. 'utf-8'). [List of Python standard encodings](#)

**dialect** : str or csv.Dialect instance, default None

If provided, this parameter will override values (default or not) for the following parameters: *delimiter*, *doublequote*, *escapechar*, *skipinitialspace*, *quotechar*, and *quoting*. If it is necessary to override values, a `ParserWarning` will be issued. See `csv.Dialect` documentation for more details.

**tupleize\_cols** : boolean, default False

Deprecated since version 0.21.0: This argument will be removed and will always convert to `MultiIndex`

Leave a list of tuples on columns as is (default is to convert to a `MultiIndex` on the columns)

**error\_bad\_lines** : boolean, default True

Lines with too many fields (e.g. a csv line with too many commas) will by default cause an exception to be raised, and no `DataFrame` will be returned. If False, then these “bad lines” will be dropped from the `DataFrame` that is returned.

**warn\_bad\_lines** : boolean, default True

If `error_bad_lines` is False, and `warn_bad_lines` is True, a warning for each “bad line” will be output.

**low\_memory** : boolean, default True

Internally process the file in chunks, resulting in lower memory use while parsing, but possibly mixed type inference. To ensure no mixed types either set False, or specify the type with the *dtype* parameter. Note that the entire file is read into a single `DataFrame` regardless, use the *chunksize* or *iterator* parameter to return the data in chunks. (Only valid with C parser)

**memory\_map** : boolean, default False

If a filepath is provided for *filepath\_or\_buffer*, map the file object directly onto memory and access the data directly from there. Using this option can improve performance because there is no longer any I/O overhead.

## Returns

**result** [`DataFrame` or `TextParser`]

### 34.1.2.3 pandas.read\_fwf

`pandas.read_fwf(filepath_or_buffer, colspecs='infer', widths=None, **kws)`

Read a table of fixed-width formatted lines into `DataFrame`

Also supports optionally iterating or breaking of the file into chunks.

Additional help can be found in the [online docs for IO Tools](#).

### Parameters

**filepath\_or\_buffer** [str, pathlib.Path, py.\_path.local.LocalPath or any \]

**object with a read() method (such as a file handle or StringIO)**

The string could be a URL. Valid URL schemes include http, ftp, s3, and file. For file URLs, a host is expected. For instance, a local file could be `file://localhost/path/to/table.csv`.

**colspecs** : list of pairs (int, int) or 'infer'. optional

A list of pairs (tuples) giving the extents of the fixed-width fields of each line as half-open intervals (i.e., [from, to[ ). String value 'infer' can be used to instruct the parser to try detecting the column specifications from the first 100 rows of the data which are not being skipped via skiprows (default='infer').

**widths** : list of ints. optional

A list of field widths which can be used instead of 'colspecs' if the intervals are contiguous.

**delimiter** : str, default ' ' + ' '

Characters to consider as filler characters in the fixed-width file. Can be used to specify the filler character of the fields if it is not spaces (e.g., '~').

**delim\_whitespace** : boolean, default False

Specifies whether or not whitespace (e.g. ' ' or '\t') will be used as the sep. Equivalent to setting `sep='\s+'`. If this option is set to True, nothing should be passed in for the `delimiter` parameter.

New in version 0.18.1: support for the Python parser.

**header** : int or list of ints, default 'infer'

Row number(s) to use as the column names, and the start of the data. Default behavior is to infer the column names: if no names are passed the behavior is identical to `header=0` and column names are inferred from the first line of the file, if column names are passed explicitly then the behavior is identical to `header=None`. Explicitly pass `header=0` to be able to replace existing names. The header can be a list of integers that specify row locations for a multi-index on the columns e.g. `[0,1,3]`. Intervening rows that are not specified will be skipped (e.g. 2 in this example is skipped). Note that this parameter ignores commented lines and empty lines if `skip_blank_lines=True`, so `header=0` denotes the first line of data rather than the first line of the file.

**names** : array-like, default None

List of column names to use. If file contains no header row, then you should explicitly pass `header=None`. Duplicates in this list will cause a `UserWarning` to be issued.

**index\_col** : int or sequence or False, default None

Column to use as the row labels of the DataFrame. If a sequence is given, a `MultiIndex` is used. If you have a malformed file with delimiters at the end of each line, you might consider `index_col=False` to force pandas to `_not_` use the first column as the index (row names)

**usecols** : list-like or callable, default None

Return a subset of the columns. If list-like, all elements must either be positional (i.e. integer indices into the document columns) or strings that correspond to column names provided either by the user in *names* or inferred from the document header row(s). For example, a valid list-like *usecols* parameter would be `[0, 1, 2]` or `['foo', 'bar', 'baz']`. Element order is ignored, so `usecols=[0, 1]` is the same as `[1, 0]`. To instantiate a DataFrame from data with element order preserved use `pd.read_csv(data, usecols=['foo', 'bar'])[['foo', 'bar']]` for columns in `['foo', 'bar']` order or `pd.read_csv(data, usecols=['foo', 'bar'])[['bar', 'foo']]` for `['bar', 'foo']` order.

If callable, the callable function will be evaluated against the column names, returning names where the callable function evaluates to True. An example of a valid callable argument would be `lambda x: x.upper() in ['AAA', 'BBB', 'DDD']`. Using this parameter results in much faster parsing time and lower memory usage.

**squeeze** : boolean, default False

If the parsed data only contains one column then return a Series

**prefix** : str, default None

Prefix to add to column numbers when no header, e.g. 'X' for X0, X1, ...

**mangle\_dupe\_cols** : boolean, default True

Duplicate columns will be specified as 'X', 'X.1', ... 'X.N', rather than 'X'... 'X'. Passing in False will cause data to be overwritten if there are duplicate names in the columns.

**dtype** : Type name or dict of column -> type, default None

Data type for data or columns. E.g. `{ 'a': np.float64, 'b': np.int32 }` Use *str* or *object* together with suitable *na\_values* settings to preserve and not interpret dtype. If converters are specified, they will be applied INSTEAD of dtype conversion.

**converters** : dict, default None

Dict of functions for converting values in certain columns. Keys can either be integers or column labels

**true\_values** : list, default None

Values to consider as True

**false\_values** : list, default None

Values to consider as False

**skipinitialspace** : boolean, default False

Skip spaces after delimiter.

**skiprows** : list-like or integer or callable, default None

Line numbers to skip (0-indexed) or number of lines to skip (int) at the start of the file.

If callable, the callable function will be evaluated against the row indices, returning True if the row should be skipped and False otherwise. An example of a valid callable argument would be `lambda x: x in [0, 2]`.

**skipfooter** : int, default 0

Number of lines at bottom of file to skip (Unsupported with engine='c')

**nrows** : int, default None

Number of rows of file to read. Useful for reading pieces of large files

**na\_values** : scalar, str, list-like, or dict, default None

Additional strings to recognize as NA/NaN. If dict passed, specific per-column NA values. By default the following values are interpreted as NaN: ‘’, ‘#N/A’, ‘#N/A N/A’, ‘#NA’, ‘-1.#IND’, ‘-1.#QNAN’, ‘-NaN’, ‘-nan’, ‘1.#IND’, ‘1.#QNAN’, ‘N/A’, ‘NA’, ‘NULL’, ‘NaN’, ‘n/a’, ‘nan’, ‘null’.

**keep\_default\_na** : bool, default True

Whether or not to include the default NaN values when parsing the data. Depending on whether *na\_values* is passed in, the behavior is as follows:

- If *keep\_default\_na* is True, and *na\_values* are specified, *na\_values* is appended to the default NaN values used for parsing.
- If *keep\_default\_na* is True, and *na\_values* are not specified, only the default NaN values are used for parsing.
- If *keep\_default\_na* is False, and *na\_values* are specified, only the NaN values specified *na\_values* are used for parsing.
- If *keep\_default\_na* is False, and *na\_values* are not specified, no strings will be parsed as NaN.

Note that if *na\_filter* is passed in as False, the *keep\_default\_na* and *na\_values* parameters will be ignored.

**na\_filter** : boolean, default True

Detect missing value markers (empty strings and the value of *na\_values*). In data without any NAs, passing *na\_filter*=False can improve the performance of reading a large file

**verbose** : boolean, default False

Indicate number of NA values placed in non-numeric columns

**skip\_blank\_lines** : boolean, default True

If True, skip over blank lines rather than interpreting as NaN values

**parse\_dates** : boolean or list of ints or names or list of lists or dict, default False

- boolean. If True -> try parsing the index.
- list of ints or names. e.g. If [1, 2, 3] -> try parsing columns 1, 2, 3 each as a separate date column.
- list of lists. e.g. If [[1, 3]] -> combine columns 1 and 3 and parse as a single date column.
- dict, e.g. { ‘foo’ : [1, 3]} -> parse columns 1, 3 as date and call result ‘foo’

If a column or index contains an unparseable date, the entire column or index will be returned unaltered as an object data type. For non-standard datetime parsing, use `pd.to_datetime` after `pd.read_csv`

Note: A fast-path exists for iso8601-formatted dates.

**infer\_datetime\_format** : boolean, default False

If True and *parse\_dates* is enabled, pandas will attempt to infer the format of the datetime strings in the columns, and if it can be inferred, switch to a faster method of parsing them. In some cases this can increase the parsing speed by 5-10x.

**keep\_date\_col** : boolean, default False

If True and *parse\_dates* specifies combining multiple columns then keep the original columns.

**date\_parser** : function, default None

Function to use for converting a sequence of string columns to an array of datetime instances. The default uses `dateutil.parser.parser` to do the conversion. Pandas will try to call *date\_parser* in three different ways, advancing to the next if an exception occurs: 1) Pass one or more arrays (as defined by *parse\_dates*) as arguments; 2) concatenate (row-wise) the string values from the columns defined by *parse\_dates* into a single array and pass that; and 3) call *date\_parser* once for each row using one or more strings (corresponding to the columns defined by *parse\_dates*) as arguments.

**dayfirst** : boolean, default False

DD/MM format dates, international and European format

**iterator** : boolean, default False

Return TextFileReader object for iteration or getting chunks with `get_chunk()`.

**chunksize** : int, default None

Return TextFileReader object for iteration. See the [IO Tools docs](#) for more information on *iterator* and *chunksize*.

**compression** : {'infer', 'gzip', 'bz2', 'zip', 'xz', None}, default 'infer'

For on-the-fly decompression of on-disk data. If 'infer' and *filepath\_or\_buffer* is path-like, then detect compression from the following extensions: '.gz', '.bz2', '.zip', or '.xz' (otherwise no decompression). If using 'zip', the ZIP file must contain only one data file to be read in. Set to None for no decompression.

New in version 0.18.1: support for 'zip' and 'xz' compression.

**thousands** : str, default None

Thousands separator

**decimal** : str, default '.'

Character to recognize as decimal point (e.g. use ',' for European data).

**float\_precision** : string, default None

Specifies which converter the C engine should use for floating-point values. The options are *None* for the ordinary converter, *high* for the high-precision converter, and *round\_trip* for the round-trip converter.

**lineterminator** : str (length 1), default None

Character to break file into lines. Only valid with C parser.

**quotechar** : str (length 1), optional

The character used to denote the start and end of a quoted item. Quoted items can include the delimiter and it will be ignored.

**quoting** : int or csv.QUOTE\_\* instance, default 0

Control field quoting behavior per `csv.QUOTE_*` constants. Use one of `QUOTE_MINIMAL` (0), `QUOTE_ALL` (1), `QUOTE_NONNUMERIC` (2) or `QUOTE_NONE` (3).

**doublequote** : boolean, default `True`

When `quotechar` is specified and quoting is not `QUOTE_NONE`, indicate whether or not to interpret two consecutive `quotechar` elements `INSIDE` a field as a single `quotechar` element.

**escapechar** : str (length 1), default `None`

One-character string used to escape delimiter when quoting is `QUOTE_NONE`.

**comment** : str, default `None`

Indicates remainder of line should not be parsed. If found at the beginning of a line, the line will be ignored altogether. This parameter must be a single character. Like empty lines (as long as `skip_blank_lines=True`), fully commented lines are ignored by the parameter `header` but not by `skiprows`. For example, if `comment='#'`, parsing `#empty\na,b,c\n1,2,3` with `header=0` will result in `'a,b,c'` being treated as the header.

**encoding** : str, default `None`

Encoding to use for UTF when reading/writing (ex. `'utf-8'`). [List of Python standard encodings](#)

**dialect** : str or `csv.Dialect` instance, default `None`

If provided, this parameter will override values (default or not) for the following parameters: `delimiter`, `doublequote`, `escapechar`, `skipinitialspace`, `quotechar`, and `quoting`. If it is necessary to override values, a `ParserWarning` will be issued. See `csv.Dialect` documentation for more details.

**tupleize\_cols** : boolean, default `False`

Deprecated since version 0.21.0: This argument will be removed and will always convert to `MultiIndex`

Leave a list of tuples on columns as is (default is to convert to a `MultiIndex` on the columns)

**error\_bad\_lines** : boolean, default `True`

Lines with too many fields (e.g. a csv line with too many commas) will by default cause an exception to be raised, and no `DataFrame` will be returned. If `False`, then these “bad lines” will be dropped from the `DataFrame` that is returned.

**warn\_bad\_lines** : boolean, default `True`

If `error_bad_lines` is `False`, and `warn_bad_lines` is `True`, a warning for each “bad line” will be output.

**low\_memory** : boolean, default `True`

Internally process the file in chunks, resulting in lower memory use while parsing, but possibly mixed type inference. To ensure no mixed types either set `False`, or specify the type with the `dtype` parameter. Note that the entire file is read into a single `DataFrame` regardless, use the `chunksize` or `iterator` parameter to return the data in chunks. (Only valid with C parser)

**memory\_map** : boolean, default `False`

If a `filepath` is provided for `filepath_or_buffer`, map the file object directly onto memory and access the data directly from there. Using this option can improve performance because there is no longer any I/O overhead.

**Returns****result** [DataFrame or TextParser]**34.1.2.4 pandas.read\_msgpack**`pandas.read_msgpack(path_or_buf, encoding='utf-8', iterator=False, **kwargs)`

Load msgpack pandas object from the specified file path

THIS IS AN EXPERIMENTAL LIBRARY and the storage format may not be stable until a future release.

**Parameters****path\_or\_buf** [string File path, BytesIO like or string]**encoding:** Encoding for decoding msgpack str type**iterator** : boolean, if True, return an iterator to the unpacker  
(default is False)**Returns****obj** [type of object stored in file]**34.1.3 Clipboard**`read_clipboard([sep])`

Read text from clipboard and pass to read\_table.

**34.1.3.1 pandas.read\_clipboard**`pandas.read_clipboard(sep='\s+', **kwargs)`

Read text from clipboard and pass to read\_table. See read\_table for the full argument list

**Parameters** **sep** : str, default 's+'.

A string or regex delimiter. The default of 's+' denotes one or more whitespace characters.

**Returns****parsed** [DataFrame]**34.1.4 Excel**`read_excel(io[, sheet_name, header, names, ...])`

Read an Excel table into a pandas DataFrame

`ExcelFile.parse(sheet_name, header, names, ...)`

Parse specified sheet(s) into a DataFrame

### 34.1.4.1 pandas.read\_excel

```
pandas.read_excel(io, sheet_name=0, header=0, names=None, index_col=None, usecols=None,
                  squeeze=False, dtype=None, engine=None, converters=None, true_values=None,
                  false_values=None, skiprows=None, nrows=None, na_values=None,
                  parse_dates=False, date_parser=None, thousands=None, comment=None,
                  skipfooter=0, convert_float=True, **kwargs)
```

Read an Excel table into a pandas DataFrame

**Parameters** **io** : string, path object (pathlib.Path or py.\_path.local.LocalPath),

file-like object, pandas ExcelFile, or xlrd workbook. The string could be a URL. Valid URL schemes include http, ftp, s3, and file. For file URLs, a host is expected. For instance, a local file could be <file://localhost/path/to/workbook.xlsx>

**sheet\_name** : string, int, mixed list of strings/int, or None, default 0

Strings are used for sheet names, Integers are used in zero-indexed sheet positions.

Lists of strings/integers are used to request multiple sheets.

Specify None to get all sheets.

str/int -> DataFrame is returned. list/None -> Dict of DataFrames is returned, with keys representing sheets.

Available Cases

- Defaults to 0 -> 1st sheet as a DataFrame
- 1 -> 2nd sheet as a DataFrame
- "Sheet1" -> 1st sheet as a DataFrame
- [0,1,"Sheet5"] -> 1st, 2nd & 5th sheet as a dictionary of DataFrames
- None -> All sheets as a dictionary of DataFrames

**sheetname** : string, int, mixed list of strings/int, or None, default 0

Deprecated since version 0.21.0: Use *sheet\_name* instead

**header** : int, list of ints, default 0

Row (0-indexed) to use for the column labels of the parsed DataFrame. If a list of integers is passed those row positions will be combined into a `MultiIndex`. Use None if there is no header.

**names** : array-like, default None

List of column names to use. If file contains no header row, then you should explicitly pass `header=None`

**index\_col** : int, list of ints, default None

Column (0-indexed) to use as the row labels of the DataFrame. Pass None if there is no such column. If a list is passed, those columns will be combined into a `MultiIndex`. If a subset of data is selected with `usecols`, `index_col` is based on the subset.

**parse\_cols** : int or list, default None

Deprecated since version 0.21.0: Pass in *usecols* instead.

**usecols** : int or list, default None

- If None then parse all columns,

- If int then indicates last column to be parsed
- If list of ints then indicates list of column numbers to be parsed
- If string then indicates comma separated list of Excel column letters and column ranges (e.g. "A:E" or "A,C,E:F"). Ranges are inclusive of both sides.

**squeeze** : boolean, default False

If the parsed data only contains one column then return a Series

**dtype** : Type name or dict of column -> type, default None

Data type for data or columns. E.g. {'a': np.float64, 'b': np.int32} Use *object* to preserve data as stored in Excel and not interpret dtype. If converters are specified, they will be applied INSTEAD of dtype conversion.

New in version 0.20.0.

**engine**: string, default None

If io is not a buffer or path, this must be set to identify io. Acceptable values are None or xlrd

**converters** : dict, default None

Dict of functions for converting values in certain columns. Keys can either be integers or column labels, values are functions that take one input argument, the Excel cell content, and return the transformed content.

**true\_values** : list, default None

Values to consider as True

New in version 0.19.0.

**false\_values** : list, default None

Values to consider as False

New in version 0.19.0.

**skiprows** : list-like

Rows to skip at the beginning (0-indexed)

**nrows** : int, default None

Number of rows to parse

New in version 0.23.0.

**na\_values** : scalar, str, list-like, or dict, default None

Additional strings to recognize as NA/NaN. If dict passed, specific per-column NA values. By default the following values are interpreted as NaN: '', '#N/A', '#N/A N/A', '#NA', '-1.#IND', '-1.#QNAN', '-NaN', '-nan', '1.#IND', '1.#QNAN', 'N/A', 'NA', 'NULL', 'NaN', 'n/a', 'nan', 'null'.

**keep\_default\_na** : bool, default True

If na\_values are specified and keep\_default\_na is False the default NaN values are overridden, otherwise they're appended to.

**verbose** : boolean, default False

Indicate number of NA values placed in non-numeric columns

**thousands** : str, default None

Thousands separator for parsing string columns to numeric. Note that this parameter is only necessary for columns stored as TEXT in Excel, any numeric columns will automatically be parsed, regardless of display format.

**comment** : str, default None

Comments out remainder of line. Pass a character or characters to this argument to indicate comments in the input file. Any data between the comment string and the end of the current line is ignored.

**skip\_footer** : int, default 0

Deprecated since version 0.23.0: Pass in *skipfooter* instead.

**skipfooter** : int, default 0

Rows at the end to skip (0-indexed)

**convert\_float** : boolean, default True

convert integral floats to int (i.e., 1.0 → 1). If False, all numeric data will be read in as floats: Excel stores all numbers as floats internally

**Returns** **parsed** : DataFrame or Dict of DataFrames

DataFrame from the passed in Excel file. See notes in *sheet\_name* argument for more information on when a Dict of Dataframes is returned.

## Examples

An example DataFrame written to a local file

```
>>> df_out = pd.DataFrame([('string1', 1),
...                        ('string2', 2),
...                        ('string3', 3)],
...                        columns=['Name', 'Value'])
>>> df_out
   Name  Value
0 string1     1
1 string2     2
2 string3     3
>>> df_out.to_excel('tmp.xlsx')
```

The file can be read using the file name as string or an open file object:

```
>>> pd.read_excel('tmp.xlsx')
   Name  Value
0 string1     1
1 string2     2
2 string3     3
```

```
>>> pd.read_excel(open('tmp.xlsx', 'rb'))
   Name  Value
0 string1     1
1 string2     2
2 string3     3
```

Index and header can be specified via the *index\_col* and *header* arguments

```
>>> pd.read_excel('tmp.xlsx', index_col=None, header=None)
   0      1      2
0 NaN    Name  Value
1 0.0  string1     1
2 1.0  string2     2
3 2.0  string3     3
```

Column types are inferred but can be explicitly specified

```
>>> pd.read_excel('tmp.xlsx', dtype={'Name':str, 'Value':float})
   Name  Value
0 string1   1.0
1 string2   2.0
2 string3   3.0
```

True, False, and NA values, and thousands separators have defaults, but can be explicitly specified, too. Supply the values you would like as strings or lists of strings!

```
>>> pd.read_excel('tmp.xlsx',
...               na_values=['string1', 'string2'])
   Name  Value
0    NaN     1
1    NaN     2
2 string3     3
```

Comment lines in the excel input file can be skipped using the *comment* kwarg

```
>>> df = pd.DataFrame({'a': ['1', '#2'], 'b': ['2', '3']})
>>> df.to_excel('tmp.xlsx', index=False)
>>> pd.read_excel('tmp.xlsx')
   a  b
0  1  2
1 #2  3
```

```
>>> pd.read_excel('tmp.xlsx', comment='#')
   a  b
0  1  2
```

#### 34.1.4.2 pandas.ExcelFile.parse

`ExcelFile.parse(sheet_name=0, header=0, names=None, index_col=None, usecols=None, squeeze=False, converters=None, true_values=None, false_values=None, skiprows=None, nrows=None, na_values=None, parse_dates=False, date_parser=None, thousands=None, comment=None, skipfooter=0, convert_float=True, **kws)`

Parse specified sheet(s) into a DataFrame

Equivalent to `read_excel(ExcelFile, ...)` See the `read_excel` docstring for more info on accepted parameters

#### 34.1.5 JSON

---

<code>read_json([path_or_buf, orient, typ, dtype, ...])</code>	Convert a JSON string to pandas object
--	--

---

### 34.1.5.1 pandas.read\_json

`pandas.read_json` (*path\_or\_buf=None, orient=None, typ='frame', dtype=True, convert\_axes=True, convert\_dates=True, keep\_default\_dates=True, numpy=False, precise\_float=False, date\_unit=None, encoding=None, lines=False, chunksize=None, compression='infer'*)

Convert a JSON string to pandas object

**Parameters** `path_or_buf` : a valid JSON string or file-like, default: None

The string could be a URL. Valid URL schemes include http, ftp, s3, and file. For file URLs, a host is expected. For instance, a local file could be `file://localhost/path/to/table.json`

**orient** : string,

Indication of expected JSON string format. Compatible JSON strings can be produced by `to_json()` with a corresponding `orient` value. The set of possible orients is:

- `'split'` : dict like {index -> [index], columns -> [columns], data -> [values]}
- `'records'` : list like [{column -> value}, ... , {column -> value}]
- `'index'` : dict like {index -> {column -> value}}
- `'columns'` : dict like {column -> {index -> value}}
- `'values'` : just the values array

The allowed and default values depend on the value of the `typ` parameter.

- when `typ == 'series'`,
  - allowed orients are `{'split', 'records', 'index'}`
  - default is `'index'`
  - The Series index must be unique for orient `'index'`.
- when `typ == 'frame'`,
  - allowed orients are `{'split', 'records', 'index', 'columns', 'values', 'table'}`
  - default is `'columns'`
  - The DataFrame index must be unique for orients `'index'` and `'columns'`.
  - The DataFrame columns must be unique for orients `'index'`, `'columns'`, and `'records'`.

New in version 0.23.0: `'table'` as an allowed value for the `orient` argument

**typ** [type of object to recover (series or frame), default `'frame'`]

**dtype** : boolean or dict, default `True`

If `True`, infer dtypes, if a dict of column to dtype, then use those, if `False`, then don't infer dtypes at all, applies only to the data.

**convert\_axes** : boolean, default `True`

Try to convert the axes to the proper dtypes.

**convert\_dates** : boolean, default True

List of columns to parse for dates; If True, then try to parse datelike columns default is True; a column label is datelike if

- it ends with '`_at`',
- it ends with '`_time`',
- it begins with '`timestamp`',
- it is '`modified`', or
- it is '`date`'

**keep\_default\_dates** : boolean, default True

If parsing dates, then parse the default datelike columns

**numpy** : boolean, default False

Direct decoding to numpy arrays. Supports numeric data only, but non-numeric column and index labels are supported. Note also that the JSON ordering **MUST** be the same for each term if `numpy=True`.

**precise\_float** : boolean, default False

Set to enable usage of higher precision (`strtod`) function when decoding string to double values. Default (False) is to use fast but less precise builtin functionality

**date\_unit** : string, default None

The timestamp unit to detect if converting dates. The default behaviour is to try and detect the correct precision, but if this is not desired then pass one of '`s`', '`ms`', '`us`' or '`ns`' to force parsing only seconds, milliseconds, microseconds or nanoseconds respectively.

**lines** : boolean, default False

Read the file as a json object per line.

New in version 0.19.0.

**encoding** : str, default is '`utf-8`'

The encoding to use to decode py3 bytes.

New in version 0.19.0.

**chunksize**: integer, default None

Return `JsonReader` object for iteration. See the [line-delimited json docs](#) for more information on `chunksize`. This can only be passed if `lines=True`. If this is None, the file will be read into memory all at once.

New in version 0.21.0.

**compression** : {'infer', 'gzip', 'bz2', 'zip', 'xz', None}, default 'infer'

For on-the-fly decompression of on-disk data. If 'infer', then use `gzip`, `bz2`, `zip` or `xz` if `path_or_buf` is a string ending in '`.gz`', '`.bz2`', '`.zip`', or '`.xz`', respectively, and no decompression otherwise. If using 'zip', the ZIP file must contain only one data file to be read in. Set to None for no decompression.

New in version 0.21.0.

## Returns

**result** [Series or DataFrame, depending on the value of *typ*.]

**See also:**`DataFrame.to_json`**Notes**

Specific to `orient='table'`, if a `DataFrame` with a literal `Index` name of `index` gets written with `to_json()`, the subsequent read operation will incorrectly set the `Index` name to `None`. This is because `index` is also used by `DataFrame.to_json()` to denote a missing `Index` name, and the subsequent `read_json()` operation cannot distinguish between the two. The same limitation is encountered with a `MultiIndex` and any names beginning with `'level_'`.

**Examples**

```
>>> df = pd.DataFrame([[ 'a', 'b'], [ 'c', 'd']],
...                    index=[ 'row 1', 'row 2'],
...                    columns=[ 'col 1', 'col 2'])
```

Encoding/decoding a Dataframe using `'split'` formatted JSON:

```
>>> df.to_json(orient='split')
'{"columns":["col 1","col 2"],
  "index":["row 1","row 2"],
  "data":[["a","b"],["c","d"]}]}'
>>> pd.read_json(_, orient='split')
   col 1 col 2
row 1    a    b
row 2    c    d
```

Encoding/decoding a Dataframe using `'index'` formatted JSON:

```
>>> df.to_json(orient='index')
'{"row 1":{"col 1":"a","col 2":"b"},"row 2":{"col 1":"c","col 2":"d"}}'
>>> pd.read_json(_, orient='index')
   col 1 col 2
row 1    a    b
row 2    c    d
```

Encoding/decoding a Dataframe using `'records'` formatted JSON. Note that index labels are not preserved with this encoding.

```
>>> df.to_json(orient='records')
'[{"col 1":"a","col 2":"b"}, {"col 1":"c","col 2":"d"}]'
>>> pd.read_json(_, orient='records')
   col 1 col 2
0      a    b
1      c    d
```

Encoding with Table Schema

```
>>> df.to_json(orient='table')
'{"schema": {"fields": [{"name": "index", "type": "string"},
                        {"name": "col 1", "type": "string"},
                        {"name": "col 2", "type": "string"}],
```

(continues on next page)

(continued from previous page)

```

        "primaryKey": "index",
        "pandas_version": "0.20.0"},
    "data": [{ "index": "row 1", "col 1": "a", "col 2": "b"},
              { "index": "row 2", "col 1": "c", "col 2": "d"}]}'

```

<code>json_normalize(data[, record_path, meta, ...])</code>	“Normalize” semi-structured JSON data into a flat table
<code>build_table_schema(data[, index, ...])</code>	Create a Table schema from data.

### 34.1.5.2 pandas.io.json.json\_normalize

`pandas.io.json.json_normalize` (*data*, *record\_path*=None, *meta*=None, *meta\_prefix*=None, *record\_prefix*=None, *errors*='raise', *sep*='.')

“Normalize” semi-structured JSON data into a flat table

**Parameters** *data* : dict or list of dicts

Unserialized JSON objects

**record\_path** : string or list of strings, default None

Path in each object to list of records. If not passed, data will be assumed to be an array of records

**meta** : list of paths (string or list of strings), default None

Fields to use as metadata for each record in resulting table

**record\_prefix** : string, default None

If True, prefix records with dotted (?) path, e.g. foo.bar.field if path to records is ['foo', 'bar']

**meta\_prefix** [string, default None]

**errors** : {'raise', 'ignore'}, default 'raise'

- 'ignore' : will ignore KeyError if keys listed in meta are not always present
- 'raise' : will raise KeyError if keys listed in meta are not always present

New in version 0.20.0.

**sep** : string, default '.'

Nested records will generate names separated by sep, e.g., for sep='.', { 'foo' : { 'bar' : 0 } } -> foo.bar

New in version 0.20.0.

**Returns**

**frame** [DataFrame]

### Examples

```
>>> from pandas.io.json import json_normalize
>>> data = [{'id': 1, 'name': {'first': 'Coleen', 'last': 'Volk'}},
...         {'name': {'given': 'Mose', 'family': 'Regner'}},
...         {'id': 2, 'name': 'Faye Raker'}]
>>> json_normalize(data)
   id      name name.family name.first name.given name.last
0  1.0      NaN      NaN    Coleen      NaN    Volk
1  NaN      NaN    Regner      NaN    Mose      NaN
2  2.0  Faye Raker      NaN      NaN      NaN      NaN
```

```
>>> data = [{'state': 'Florida',
...         'shortname': 'FL',
...         'info': {
...             'governor': 'Rick Scott'
...         }},
...         {'counties': [{'name': 'Dade', 'population': 12345},
...                         {'name': 'Broward', 'population': 40000},
...                         {'name': 'Palm Beach', 'population': 60000}]}],
...         {'state': 'Ohio',
...         'shortname': 'OH',
...         'info': {
...             'governor': 'John Kasich'
...         }},
...         {'counties': [{'name': 'Summit', 'population': 1234},
...                         {'name': 'Cuyahoga', 'population': 1337}]}]
>>> result = json_normalize(data, 'counties', ['state', 'shortname',
...                                             ['info', 'governor']])
>>> result
   name  population info.governor  state shortname
0    Dade    12345    Rick Scott  Florida      FL
1  Broward    40000    Rick Scott  Florida      FL
2  Palm Beach    60000    Rick Scott  Florida      FL
3    Summit     1234    John Kasich   Ohio      OH
4  Cuyahoga     1337    John Kasich   Ohio      OH
```

```
>>> data = {'A': [1, 2]}
>>> json_normalize(data, 'A', record_prefix='Prefix.')
   Prefix.0
0         1
1         2
```

### 34.1.5.3 pandas.io.json.build\_table\_schema

`pandas.io.json.build_table_schema` (*data*, *index=True*, *primary\_key=None*, *version=True*)

Create a Table schema from data.

#### Parameters

**data** [Series, DataFrame]

**index** : bool, default True

Whether to include `data.index` in the schema.

**primary\_key** : bool or None, default True

column names to designate as the primary key. The default *None* will set *'primaryKey'* to the index level or levels if the index is unique.

**version** : bool, default True

Whether to include a field *pandas\_version* with the version of pandas that generated the schema.

### Returns

**schema** [dict]

### Notes

See *\_as\_json\_table\_type* for conversion types. Timedeltas as converted to ISO8601 duration format with 9 decimal places after the seconds field for nanosecond precision.

Categoricals are converted to the *any* dtype, and use the *enum* field constraint to list the allowed values. The *ordered* attribute is included in an *ordered* field.

### Examples

```
>>> df = pd.DataFrame(
...     {'A': [1, 2, 3],
...      'B': ['a', 'b', 'c'],
...      'C': pd.date_range('2016-01-01', freq='d', periods=3),
...     }, index=pd.Index(range(3), name='idx'))
>>> build_table_schema(df)
{'fields': [{'name': 'idx', 'type': 'integer'},
{'name': 'A', 'type': 'integer'},
{'name': 'B', 'type': 'string'},
{'name': 'C', 'type': 'datetime'}],
'pandas_version': '0.20.0',
'primaryKey': ['idx']}
```

## 34.1.6 HTML

---

<code>read_html(io[, match, flavor, header, ...])</code>	Read HTML tables into a list of DataFrame objects.
--	--

---

### 34.1.6.1 pandas.read\_html

`pandas.read_html(io, match='.+', flavor=None, header=None, index_col=None, skiprows=None, attrs=None, parse_dates=False, tupleize_cols=None, thousands=',', encoding=None, decimal='.', converters=None, na_values=None, keep_default_na=True, displayed_only=True)`

Read HTML tables into a list of DataFrame objects.

**Parameters** **io** : str or file-like

A URL, a file-like object, or a raw string containing HTML. Note that lxml only accepts the http, ftp and file url protocols. If you have a URL that starts with 'https' you might try removing the 's'.

**match** : str or compiled regular expression, optional

The set of tables containing text matching this regex or string will be returned. Unless

the HTML is extremely simple you will probably need to pass a non-empty string here. Defaults to `‘.+’` (match any non-empty string). The default value will return all tables contained on a page. This value is converted to a regular expression so that there is consistent behavior between BeautifulSoup and lxml.

**flavor** : str or None, container of strings

The parsing engine to use. `‘bs4’` and `‘html5lib’` are synonymous with each other, they are both there for backwards compatibility. The default of `None` tries to use `lxml` to parse and if that fails it falls back on `bs4 + html5lib`.

**header** : int or list-like or None, optional

The row (or list of rows for a *MultiIndex*) to use to make the columns headers.

**index\_col** : int or list-like or None, optional

The column (or list of columns) to use to create the index.

**skiprows** : int or list-like or slice or None, optional

0-based. Number of rows to skip after parsing the column integer. If a sequence of integers or a slice is given, will skip the rows indexed by that sequence. Note that a single element sequence means ‘skip the nth row’ whereas an integer means ‘skip n rows’.

**attrs** : dict or None, optional

This is a dictionary of attributes that you can pass to use to identify the table in the HTML. These are not checked for validity before being passed to lxml or BeautifulSoup. However, these attributes must be valid HTML table attributes to work correctly. For example,

```
attrs = {'id': 'table'}
```

is a valid attribute dictionary because the `‘id’` HTML tag attribute is a valid HTML attribute for *any* HTML tag as per [this document](#).

```
attrs = {'asdf': 'table'}
```

is *not* a valid attribute dictionary because `‘asdf’` is not a valid HTML attribute even if it is a valid XML attribute. Valid HTML 4.01 table attributes can be found [here](#). A working draft of the HTML 5 spec can be found [here](#). It contains the latest information on table attributes for the modern web.

**parse\_dates** : bool, optional

See `read_csv()` for more details.

**tupleize\_cols** : bool, optional

If `False` try to parse multiple header rows into a *MultiIndex*, otherwise return raw tuples. Defaults to `False`.

Deprecated since version 0.21.0: This argument will be removed and will always convert to *MultiIndex*

**thousands** : str, optional

Separator to use to parse thousands. Defaults to `‘,’`.

**encoding** : str or None, optional

The encoding used to decode the web page. Defaults to `None`. “None” preserves the previous encoding behavior, which depends on the underlying parser library (e.g., the parser library will try to use the encoding provided by the document).

**decimal** : str, default ‘.’

Character to recognize as decimal point (e.g. use ‘,’ for European data).

New in version 0.19.0.

**converters** : dict, default None

Dict of functions for converting values in certain columns. Keys can either be integers or column labels, values are functions that take one input argument, the cell (not column) content, and return the transformed content.

New in version 0.19.0.

**na\_values** : iterable, default None

Custom NA values

New in version 0.19.0.

**keep\_default\_na** : bool, default True

If `na_values` are specified and `keep_default_na` is `False` the default NaN values are overridden, otherwise they’re appended to

New in version 0.19.0.

**display\_only** : bool, default True

Whether elements with “display: none” should be parsed

New in version 0.23.0.

### Returns

**dfs** [list of DataFrames]

### See also:

[`pandas.read\_csv`](#)

### Notes

Before using this function you should read the [gotchas about the HTML parsing libraries](#).

Expect to do some cleanup after you call this function. For example, you might need to manually assign column names if the column names are converted to NaN when you pass the `header=0` argument. We try to assume as little as possible about the structure of the table and push the idiosyncrasies of the HTML contained in the table to the user.

This function searches for `<table>` elements and only for `<tr>` and `<th>` rows and `<td>` elements within each `<tr>` or `<th>` element in the table. `<td>` stands for “table data”.

Similar to [`read\_csv\(\)`](#) the `header` argument is applied **after** `skiprows` is applied.

This function will *always* return a list of [`DataFrame`](#) or it will fail, e.g., it will *not* return an empty list.

## Examples

See the [read\\_html documentation in the IO section of the docs](#) for some examples of reading in HTML tables.

### 34.1.7 HDFStore: PyTables (HDF5)

<code>read_hdf(path_or_buf[, key, mode])</code>	Read from the store, close it if we opened it.
<code>HDFStore.put(key, value[, format, append])</code>	Store object in HDFStore
<code>HDFStore.append(key, value[, format, ...])</code>	Append to Table in file.
<code>HDFStore.get(key)</code>	Retrieve pandas object stored in file
<code>HDFStore.select(key[, where, start, stop, ...])</code>	Retrieve pandas object stored in file, optionally based on where criteria
<code>HDFStore.info()</code>	print detailed information on the store
<code>HDFStore.keys()</code>	Return a (potentially unordered) list of the keys corresponding to the objects stored in the HDFStore.

#### 34.1.7.1 pandas.read\_hdf

`pandas.read_hdf(path_or_buf, key=None, mode='r', **kwargs)`

Read from the store, close it if we opened it.

Retrieve pandas object stored in file, optionally based on where criteria

**Parameters** `path_or_buf` : string, buffer or path object

Path to the file to open, or an open `pandas.HDFStore` object. Supports any object implementing the `__fspath__` protocol. This includes `pathlib.Path` and `py._path.local.LocalPath` objects.

New in version 0.19.0: support for `pathlib`, `py.path`.

New in version 0.21.0: support for `__fspath__` proptocol.

**key** : object, optional

The group identifier in the store. Can be omitted if the HDF file contains a single pandas object.

**mode** : {'r', 'r+', 'a'}, optional

Mode to use when opening the file. Ignored if `path_or_buf` is a `pandas.HDFStore`. Default is 'r'.

**where** : list, optional

A list of Term (or convertible) objects.

**start** : int, optional

Row number to start selection.

**stop** : int, optional

Row number to stop selection.

**columns** : list, optional

A list of columns names to return.

**iterator** : bool, optional

Return an iterator object.

**chunksize** : int, optional

Number of rows to include in an iteration when using an iterator.

**errors** : str, default 'strict'

Specifies how encoding and decoding errors are to be handled. See the errors argument for `open()` for a full list of options.

**\*\*kwargs**

Additional keyword arguments passed to HDFStore.

**Returns** **item** : object

The selected object. Return type depends on the object stored.

**See also:**

`pandas.DataFrame.to_hdf` write a HDF file from a DataFrame

`pandas.HDFStore` low-level access to HDF files

## Examples

```
>>> df = pd.DataFrame([[1, 1.0, 'a']], columns=['x', 'y', 'z'])
>>> df.to_hdf('./store.h5', 'data')
>>> reread = pd.read_hdf('./store.h5')
```

### 34.1.7.2 pandas.HDFStore.put

`HDFStore.put` (*key, value, format=None, append=False, \*\*kwargs*)  
Store object in HDFStore

#### Parameters

**key** [object]

**value** [{Series, DataFrame, Panel}]

**format** : 'fixed(f)|table(t)', default is 'fixed'

**fixed(f)** [Fixed format] Fast writing/reading. Not-appendable, nor searchable

**table(t)** [Table format] Write as a PyTables Table structure which may perform worse but allow more flexible operations like searching / selecting subsets of the data

**append** : boolean, default False

This will force Table format, append the input data to the existing.

**data\_columns** : list of columns to create as data columns, or True to use all columns. See [here](#) # noqa

**encoding** [default None, provide an encoding for strings]

**dropna** : boolean, default False, do not write an ALL nan row to the store settable by the option 'io.hdf.dropna\_table'

### 34.1.7.3 pandas.HDFStore.append

`HDFStore.append(key, value, format=None, append=True, columns=None, dropna=None, **kwargs)`  
Append to Table in file. Node must already exist and be Table format.

#### Parameters

**key** [object]

**value** [{Series, DataFrame, Panel}]

**format: ‘table’ is the default**

**table(t)** [table format] Write as a PyTables Table structure which may perform worse but allow more flexible operations like searching / selecting subsets of the data

**append** : boolean, default True, append the input data to the existing

**data\_columns** : list of columns, or True, default None

List of columns to create as indexed data columns for on-disk queries, or True to use all columns. By default only the axes of the object are indexed. See [here](#).

**min\_itemsize** [dict of columns that specify minimum string sizes]

**nan\_rep** [string to use as string nan representation]

**chunksize** [size to chunk the writing]

**expectedrows** [expected TOTAL row size of this table]

**encoding** [default None, provide an encoding for strings]

**dropna** : boolean, default False, do not write an ALL nan row to the store settable by the option ‘io.hdf.dropna\_table’

#### Notes

Does *not* check if data being appended overlaps with existing data in the table, so be careful

### 34.1.7.4 pandas.HDFStore.get

`HDFStore.get(key)`  
Retrieve pandas object stored in file

#### Parameters

**key** [object]

#### Returns

**obj** [type of object stored in file]

### 34.1.7.5 pandas.HDFStore.select

`HDFStore.select` (*key*, *where=None*, *start=None*, *stop=None*, *columns=None*, *iterator=False*, *chunk-size=None*, *auto\_close=False*, *\*\*kwargs*)

Retrieve pandas object stored in file, optionally based on where criteria

#### Parameters

**key** [object]

**where** [list of Term (or convertible) objects, optional]

**start** [integer (defaults to None), row number to start selection]

**stop** [integer (defaults to None), row number to stop selection]

**columns** : a list of columns that if not None, will limit the return columns

**iterator** [boolean, return an iterator, default False]

**chunksize** [nrows to include in iteration, return an iterator]

**auto\_close** : boolean, should automatically close the store when finished, default is False

#### Returns

The selected object

### 34.1.7.6 pandas.HDFStore.info

`HDFStore.info` ()

print detailed information on the store

New in version 0.21.0.

### 34.1.7.7 pandas.HDFStore.keys

`HDFStore.keys` ()

Return a (potentially unordered) list of the keys corresponding to the objects stored in the HDFStore. These are ABSOLUTE path-names (e.g. have the leading '/')

## 34.1.8 Feather

---

`read_feather`(*path*[, *nthreads*])

Load a feather-format object from the file path

---

### 34.1.8.1 pandas.read\_feather

`pandas.read_feather` (*path*, *nthreads=1*)

Load a feather-format object from the file path

#### Parameters

**path** [string file path, or file-like object]

**nthreads** : int, default 1

Number of CPU threads to use when reading to pandas.DataFrame

**Returns**

type of object stored in file

### 34.1.9 Parquet

---

<code>read_parquet(path[, engine, columns])</code>	Load a parquet object from the file path, returning a DataFrame.
--	--

---

#### 34.1.9.1 pandas.read\_parquet

`pandas.read_parquet(path, engine='auto', columns=None, **kwargs)`

Load a parquet object from the file path, returning a DataFrame.

**Parameters** **path** : string

File path

**columns**: list, default=None

If not None, only these columns will be read from the file.

**engine** : { 'auto', 'pyarrow', 'fastparquet' }, default 'auto'

Parquet library to use. If 'auto', then the option `io.parquet.engine` is used. The default `io.parquet.engine` behavior is to try 'pyarrow', falling back to 'fastparquet' if 'pyarrow' is unavailable.

**kwargs** are passed to the engine

**Returns**

DataFrame

### 34.1.10 SAS

---

<code>read_sas(filepath_or_buffer[, format, ...])</code>	Read SAS files stored as either XPORT or SAS7BDAT format files.
--	---

---

#### 34.1.10.1 pandas.read\_sas

`pandas.read_sas(filepath_or_buffer, format=None, index=None, encoding=None, chunksize=None, iterator=False)`

Read SAS files stored as either XPORT or SAS7BDAT format files.

**Parameters** **filepath\_or\_buffer** : string or file-like object

Path to the SAS file.

**format** : string { 'xport', 'sas7bdat' } or None

If None, file format is inferred. If 'xport' or 'sas7bdat', uses the corresponding format.

**index** : identifier of index column, defaults to None

Identifier of column that should be used as index of the DataFrame.

**encoding** : string, default is None

Encoding for text data. If None, text data are stored as raw bytes.

**chunksize** : int

Read file *chunksize* lines at a time, returns iterator.

**iterator** : bool, defaults to False

If True, returns an iterator for reading the file incrementally.

#### Returns

**DataFrame** if **iterator=False** and **chunksize=None**, else **SAS7BDATReader**  
or **XportReader**

### 34.1.11 SQL

<code>read_sql_table(table_name, con[, schema, ...])</code>	Read SQL database table into a DataFrame.
<code>read_sql_query(sql, con[, index_col, ...])</code>	Read SQL query into a DataFrame.
<code>read_sql(sql, con[, index_col, ...])</code>	Read SQL query or database table into a DataFrame.

### 34.1.12 Google BigQuery

<code>read_gbq(query[, project_id, index_col, ...])</code>	Load data from Google BigQuery.
--	---------------------------------

#### 34.1.12.1 pandas.read\_gbq

`pandas.read_gbq(query, project_id=None, index_col=None, col_order=None, reauth=False, verbose=None, private_key=None, dialect='legacy', **kwargs)`  
Load data from Google BigQuery.

This function requires the [pandas-gbq](#) package.

Authentication to the Google BigQuery service is via OAuth 2.0.

- If “private\_key” is not provided:

By default “application default credentials” are used.

If default application credentials are not found or are restrictive, user account credentials are used. In this case, you will be asked to grant permissions for product name ‘pandas GBQ’.

- If “private\_key” is provided:

Service account credentials will be used to authenticate.

**Parameters** **query** : str

SQL-Like Query to return data values.

**project\_id** : str

Google BigQuery Account project ID.

**index\_col** : str, optional

Name of result column to use for index in results DataFrame.

**col\_order** : list(str), optional

List of BigQuery column names in the desired order for results DataFrame.

**reauth** : boolean, default False

Force Google BigQuery to reauthenticate the user. This is useful if multiple accounts are used.

**private\_key** : str, optional

Service account private key in JSON format. Can be file path or string contents. This is useful for remote server authentication (eg. Jupyter/IPython notebook on remote host).

**dialect** : str, default 'legacy'

SQL syntax dialect to use. Value can be one of:

'**legacy**' Use BigQuery's legacy SQL dialect. For more information see [BigQuery Legacy SQL Reference](#).

'**standard**' Use BigQuery's standard SQL, which is compliant with the SQL 2011 standard. For more information see [BigQuery Standard SQL Reference](#).

**verbose** : boolean, deprecated

*Deprecated in Pandas-GBQ 0.4.0.* Use the [logging module](#) to adjust verbosity instead.

**kwargs** : dict

Arbitrary keyword arguments. configuration (dict): query config parameters for job processing. For example:

```
configuration = {'query': {'useQueryCache': False}}
```

For more information see [BigQuery SQL Reference](#)

**Returns df: DataFrame**

DataFrame representing results of query.

See also:

[`pandas\_gbq.read\_gbq`](#) This function in the pandas-gbq library.

[`pandas.DataFrame.to\_gbq`](#) Write a DataFrame to Google BigQuery.

### 34.1.13 STATA

---

<code>read_stata(filepath_or_buffer[, ...])</code>	Read Stata file into DataFrame.
--	---------------------------------

---

#### 34.1.13.1 pandas.read\_stata

`pandas.read_stata(filepath_or_buffer, convert_dates=True, convert_categoricals=True, encoding=None, index_col=None, convert_missing=False, preserve_dtypes=True, columns=None, order_categoricals=True, chunksize=None, iterator=False)`

Read Stata file into DataFrame.

**Parameters filepath\_or\_buffer** : string or file-like object

Path to .dta file or object implementing a binary read() functions.

**convert\_dates** : boolean, defaults to True

Convert date variables to DataFrame time values.

**convert\_categoricals** : boolean, defaults to True

Read value labels and convert columns to Categorical/Factor variables.

**encoding** : string, None or encoding

Encoding used to parse the files. None defaults to latin-1.

**index\_col** : string, optional, default: None

Column to set as index.

**convert\_missing** : boolean, defaults to False

Flag indicating whether to convert missing values to their Stata representations. If False, missing values are replaced with nan. If True, columns containing missing values are returned with object data types and missing values are represented by StataMissingValue objects.

**preserve\_dtypes** : boolean, defaults to True

Preserve Stata datatypes. If False, numeric data are upcast to pandas default types for foreign data (float64 or int64).

**columns** : list or None

Columns to retain. Columns will be returned in the given order. None returns all columns.

**order\_categoricals** : boolean, defaults to True

Flag indicating whether converted categorical data are ordered.

**chunksize** : int, default None

Return StataReader object for iterations, returns chunks with given number of lines.

**iterator** : boolean, default False

Return StataReader object.

## Returns

**DataFrame or StataReader**

See also:

**pandas.io.stata.StataReader** low-level reader for Stata data files

[\*pandas.DataFrame.to\\_stata\*](#) export Stata data files

## Examples

Read a Stata dta file:

```
>>> import pandas as pd
>>> df = pd.read_stata('filename.dta')
```

Read a Stata dta file in 10,000 line chunks:

```
>>> itr = pd.read_stata('filename.dta', chunksize=10000)
>>> for chunk in itr:
...     do_something(chunk)
```

<code>StataReader.data(**kwargs)</code>	(DEPRECATED) Reads observations from Stata file, converting them into a dataframe
<code>StataReader.data_label()</code>	Returns data label of Stata file
<code>StataReader.value_labels()</code>	Returns a dict, associating each variable name a dict, associating each value its corresponding label
<code>StataReader.variable_labels()</code>	Returns variable labels as a dict, associating each variable name with corresponding label
<code>StataWriter.write_file()</code>	

### 34.1.13.2 pandas.io.stata.StataReader.data

`StataReader.data(**kwargs)`

Reads observations from Stata file, converting them into a dataframe

Deprecated since version This: is a legacy method. Use *read* in new code.

**Parameters** `convert_dates` : boolean, defaults to True

Convert date variables to DataFrame time values.

`convert_categoricals` : boolean, defaults to True

Read value labels and convert columns to Categorical/Factor variables.

`index_col` : string, optional, default: None

Column to set as index.

`convert_missing` : boolean, defaults to False

Flag indicating whether to convert missing values to their Stata representations. If False, missing values are replaced with nan. If True, columns containing missing values are returned with object data types and missing values are represented by `StataMissingValue` objects.

`preserve_dtypes` : boolean, defaults to True

Preserve Stata datatypes. If False, numeric data are upcast to pandas default types for foreign data (float64 or int64).

`columns` : list or None

Columns to retain. Columns will be returned in the given order. None returns all columns.

`order_categoricals` : boolean, defaults to True

Flag indicating whether converted categorical data are ordered.

**Returns**

**DataFrame**

### 34.1.13.3 pandas.io.stata.StataReader.data\_label

`StataReader.data_label()`  
Returns data label of Stata file

### 34.1.13.4 pandas.io.stata.StataReader.value\_labels

`StataReader.value_labels()`  
Returns a dict, associating each variable name a dict, associating each value its corresponding label

### 34.1.13.5 pandas.io.stata.StataReader.variable\_labels

`StataReader.variable_labels()`  
Returns variable labels as a dict, associating each variable name with corresponding label

### 34.1.13.6 pandas.io.stata.StataWriter.write\_file

`StataWriter.write_file()`

## 34.2 General functions

### 34.2.1 Data manipulations

<code>melt(frame[, id_vars, value_vars, var_name, ...])</code>	“Unpivots” a DataFrame from wide format to long format, optionally leaving identifier variables set.
<code>pivot(index, columns, values)</code>	Produce ‘pivot’ table based on 3 columns of this DataFrame.
<code>pivot_table(data[, values, index, columns, ...])</code>	Create a spreadsheet-style pivot table as a DataFrame.
<code>crosstab(index, columns[, values, rownames, ...])</code>	Compute a simple cross-tabulation of two (or more) factors.
<code>cut(x, bins[, right, labels, retbins, ...])</code>	Bin values into discrete intervals.
<code>qcut(x, q[, labels, retbins, precision, ...])</code>	Quantile-based discretization function.
<code>merge(left, right[, how, on, left_on, ...])</code>	Merge DataFrame objects by performing a database-style join operation by columns or indexes.
<code>merge_ordered(left, right[, on, left_on, ...])</code>	Perform merge with optional filling/interpolation designed for ordered data like time series data.
<code>merge_asof(left, right[, on, left_on, ...])</code>	Perform an asof merge.
<code>concat(objs[, axis, join, join_axes, ...])</code>	Concatenate pandas objects along a particular axis with optional set logic along the other axes.
<code>get_dummies(data[, prefix, prefix_sep, ...])</code>	Convert categorical variable into dummy/indicator variables
<code>factorize(values[, sort, order, ...])</code>	Encode the object as an enumerated type or categorical variable.
<code>unique(values)</code>	Hash table-based unique.
<code>wide_to_long(df, stubnames, i, j[, sep, suffix])</code>	Wide panel to long format.

### 34.2.1.1 pandas.melt

`pandas.melt` (*frame*, *id\_vars=None*, *value\_vars=None*, *var\_name=None*, *value\_name='value'*, *col\_level=None*)

“Unpivots” a DataFrame from wide format to long format, optionally leaving identifier variables set.

This function is useful to massage a DataFrame into a format where one or more columns are identifier variables (*id\_vars*), while all other columns, considered measured variables (*value\_vars*), are “unpivoted” to the row axis, leaving just two non-identifier columns, ‘variable’ and ‘value’.

#### Parameters

**frame** [DataFrame]

**id\_vars** : tuple, list, or ndarray, optional

Column(s) to use as identifier variables.

**value\_vars** : tuple, list, or ndarray, optional

Column(s) to unpivot. If not specified, uses all columns that are not set as *id\_vars*.

**var\_name** : scalar

Name to use for the ‘variable’ column. If None it uses `frame.columns.name` or ‘variable’.

**value\_name** : scalar, default ‘value’

Name to use for the ‘value’ column.

**col\_level** : int or string, optional

If columns are a MultiIndex then use this level to melt.

See also:

`DataFrame.melt`, `pivot_table`, `DataFrame.pivot`

#### Examples

```
>>> import pandas as pd
>>> df = pd.DataFrame({'A': {0: 'a', 1: 'b', 2: 'c'},
...                   'B': {0: 1, 1: 3, 2: 5},
...                   'C': {0: 2, 1: 4, 2: 6}})
>>> df
   A  B  C
0  a  1  2
1  b  3  4
2  c  5  6
```

```
>>> pd.melt(df, id_vars=['A'], value_vars=['B'])
   A variable  value
0  a         B       1
1  b         B       3
2  c         B       5
```

```
>>> pd.melt(df, id_vars=['A'], value_vars=['B', 'C'])
   A variable  value
0  a         B       1
```

(continues on next page)

(continued from previous page)

1	b	B	3
2	c	B	5
3	a	C	2
4	b	C	4
5	c	C	6

The names of 'variable' and 'value' columns can be customized:

```
>>> pd.melt(df, id_vars=['A'], value_vars=['B'],
...         var_name='myVarname', value_name='myValname')
  A myVarname myValname
0  a         B         1
1  b         B         3
2  c         B         5
```

If you have multi-index columns:

```
>>> df.columns = [list('ABC'), list('DEF')]
>>> df
   A B C
   D E F
0  a 1 2
1  b 3 4
2  c 5 6
```

```
>>> pd.melt(df, col_level=0, id_vars=['A'], value_vars=['B'])
  A variable  value
0  a         B     1
1  b         B     3
2  c         B     5
```

```
>>> pd.melt(df, id_vars=[('A', 'D')], value_vars=[('B', 'E')])
  (A, D) variable_0 variable_1  value
0      a         B         E     1
1      b         B         E     3
2      c         B         E     5
```

### 34.2.1.2 pandas.pivot

pandas.**pivot** (*index, columns, values*)

Produce 'pivot' table based on 3 columns of this DataFrame. Uses unique values from index / columns and fills with values.

**Parameters** **index** : ndarray

Labels to use to make new frame's index

**columns** : ndarray

Labels to use to make new frame's columns

**values** : ndarray

Values to use for populating new frame's values

**Returns**

**DataFrame**

See also:

`DataFrame.pivot_table` generalization of pivot that can handle duplicate values for one index/column pair

## Notes

Obviously, all 3 of the input arguments must have the same length

### 34.2.1.3 pandas.pivot\_table

`pandas.pivot_table` (*data*, *values=None*, *index=None*, *columns=None*, *aggfunc='mean'*, *fill\_value=None*, *margins=False*, *dropna=True*, *margins\_name='All'*)

Create a spreadsheet-style pivot table as a DataFrame. The levels in the pivot table will be stored in MultiIndex objects (hierarchical indexes) on the index and columns of the result DataFrame

#### Parameters

**data** [DataFrame]

**values** [column to aggregate, optional]

**index** : column, Grouper, array, or list of the previous

If an array is passed, it must be the same length as the data. The list can contain any of the other types (except list). Keys to group by on the pivot table index. If an array is passed, it is being used as the same manner as column values.

**columns** : column, Grouper, array, or list of the previous

If an array is passed, it must be the same length as the data. The list can contain any of the other types (except list). Keys to group by on the pivot table column. If an array is passed, it is being used as the same manner as column values.

**aggfunc** : function, list of functions, dict, default `numpy.mean`

If list of functions passed, the resulting pivot table will have hierarchical columns whose top level are the function names (inferred from the function objects themselves) If dict is passed, the key is column to aggregate and value is function or list of functions

**fill\_value** : scalar, default `None`

Value to replace missing values with

**margins** : boolean, default `False`

Add all row / columns (e.g. for subtotal / grand totals)

**dropna** : boolean, default `True`

Do not include columns whose entries are all NaN

**margins\_name** : string, default `'All'`

Name of the row / column that will contain the totals when margins is `True`.

#### Returns

**table** [DataFrame]

See also:

`DataFrame.pivot` pivot without aggregation that can handle non-numeric data

## Examples

```
>>> df = pd.DataFrame({"A": ["foo", "foo", "foo", "foo", "foo",
...                           "bar", "bar", "bar", "bar"],
...                     "B": ["one", "one", "one", "two", "two",
...                           "one", "one", "two", "two"],
...                     "C": ["small", "large", "large", "small",
...                           "small", "large", "small", "small",
...                           "large"],
...                     "D": [1, 2, 2, 3, 3, 4, 5, 6, 7]})
>>> df
   A  B  C  D
0  foo one small 1
1  foo one large 2
2  foo one large 2
3  foo two small 3
4  foo two small 3
5  bar one large 4
6  bar one small 5
7  bar two small 6
8  bar two large 7
```

```
>>> table = pivot_table(df, values='D', index=['A', 'B'],
...                       columns=['C'], aggfunc=np.sum)
>>> table
C      large  small
A  B
bar one    4.0    5.0
   two    7.0    6.0
foo one    4.0    1.0
   two    NaN    6.0
```

```
>>> table = pivot_table(df, values='D', index=['A', 'B'],
...                       columns=['C'], aggfunc=np.sum)
>>> table
C      large  small
A  B
bar one    4.0    5.0
   two    7.0    6.0
foo one    4.0    1.0
   two    NaN    6.0
```

```
>>> table = pivot_table(df, values=['D', 'E'], index=['A', 'C'],
...                       aggfunc={'D': np.mean,
...                                  'E': [min, max, np.mean]})
>>> table
      D      E
      mean max median min
A  C
bar large  5.500000  16   14.5  13
   small  5.500000  15   14.5  14
foo large  2.000000  10    9.5   9
   small  2.333333  12   11.0   8
```

### 34.2.1.4 pandas.crosstab

`pandas.crosstab` (*index*, *columns*, *values=None*, *rownames=None*, *colnames=None*, *aggfunc=None*, *margins=False*, *margins\_name='All'*, *dropna=True*, *normalize=False*)

Compute a simple cross-tabulation of two (or more) factors. By default computes a frequency table of the factors unless an array of values and an aggregation function are passed

**Parameters** **index** : array-like, Series, or list of arrays/Series

Values to group by in the rows

**columns** : array-like, Series, or list of arrays/Series

Values to group by in the columns

**values** : array-like, optional

Array of values to aggregate according to the factors. Requires *aggfunc* be specified.

**aggfunc** : function, optional

If specified, requires *values* be specified as well

**rownames** : sequence, default None

If passed, must match number of row arrays passed

**colnames** : sequence, default None

If passed, must match number of column arrays passed

**margins** : boolean, default False

Add row/column margins (subtotals)

**margins\_name** : string, default 'All'

Name of the row / column that will contain the totals when margins is True.

New in version 0.21.0.

**dropna** : boolean, default True

Do not include columns whose entries are all NaN

**normalize** : boolean, {'all', 'index', 'columns'}, or {0,1}, default False

Normalize by dividing all values by the sum of values.

- If passed 'all' or *True*, will normalize over all values.
- If passed 'index' will normalize over each row.
- If passed 'columns' will normalize over each column.
- If margins is *True*, will also normalize margin values.

New in version 0.18.1.

**Returns**

**crosstab** [DataFrame]

## Notes

Any Series passed will have their name attributes used unless row or column names for the cross-tabulation are specified.

Any input passed containing Categorical data will have **all** of its categories included in the cross-tabulation, even if the actual data does not contain any instances of a particular category.

In the event that there aren't overlapping indexes an empty DataFrame will be returned.

## Examples

```
>>> a = np.array(["foo", "foo", "foo", "foo", "bar", "bar",
...              "bar", "bar", "foo", "foo", "foo"], dtype=object)
>>> b = np.array(["one", "one", "one", "two", "one", "one",
...              "one", "two", "two", "two", "one"], dtype=object)
>>> c = np.array(["dull", "dull", "shiny", "dull", "dull", "shiny",
...              "shiny", "dull", "shiny", "shiny", "shiny"],
...              dtype=object)
```

```
>>> pd.crosstab(a, [b, c], rownames=['a'], colnames=['b', 'c'])
...
b    one      two
c    dull shiny dull shiny
a
bar    1      2    1      0
foo    2      2    1      2
```

```
>>> foo = pd.Categorical(['a', 'b'], categories=['a', 'b', 'c'])
>>> bar = pd.Categorical(['d', 'e'], categories=['d', 'e', 'f'])
>>> crosstab(foo, bar) # 'c' and 'f' are not represented in the data,
...                   # but they still will be counted in the output
...
col_0  d  e  f
row_0
a      1  0  0
b      0  1  0
c      0  0  0
```

### 34.2.1.5 pandas.cut

`pandas.cut` (*x*, *bins*, *right=True*, *labels=None*, *retbins=False*, *precision=3*, *include\_lowest=False*, *duplicates='raise'*)

Bin values into discrete intervals.

Use *cut* when you need to segment and sort data values into bins. This function is also useful for going from a continuous variable to a categorical variable. For example, *cut* could convert ages to groups of age ranges. Supports binning into an equal number of bins, or a pre-specified array of bins.

**Parameters** *x* : array-like

The input array to be binned. Must be 1-dimensional.

**bins** : int, sequence of scalars, or `pandas.IntervalIndex`

The criteria to bin by.

- **int** : Defines the number of equal-width bins in the range of *x*. The range of *x* is extended by .1% on each side to include the minimum and maximum values of *x*.
- **sequence of scalars** : Defines the bin edges allowing for non-uniform width. No extension of the range of *x* is done.
- **IntervalIndex** : Defines the exact bins to be used.

**right** : bool, default True

Indicates whether *bins* includes the rightmost edge or not. If `right == True` (the default), then the *bins* `[1, 2, 3, 4]` indicate (1,2], (2,3], (3,4]. This argument is ignored when *bins* is an *IntervalIndex*.

**labels** : array or bool, optional

Specifies the labels for the returned bins. Must be the same length as the resulting bins. If False, returns only integer indicators of the bins. This affects the type of the output container (see below). This argument is ignored when *bins* is an *IntervalIndex*.

**retbins** : bool, default False

Whether to return the bins or not. Useful when bins is provided as a scalar.

**precision** : int, default 3

The precision at which to store and display the bins labels.

**include\_lowest** : bool, default False

Whether the first interval should be left-inclusive or not.

**duplicates** : {default 'raise', 'drop'}, optional

If bin edges are not unique, raise *ValueError* or drop non-uniques.

New in version 0.23.0.

**Returns out** : pandas.Categorical, Series, or ndarray

An array-like object representing the respective bin for each value of *x*. The type depends on the value of *labels*.

- True (default) : returns a Series for Series *x* or a pandas.Categorical for all other inputs. The values stored within are Interval dtype.
- sequence of scalars : returns a Series for Series *x* or a pandas.Categorical for all other inputs. The values stored within are whatever the type in the sequence is.
- False : returns an ndarray of integers.

**bins** : numpy.ndarray or IntervalIndex.

The computed or specified bins. Only returned when *retbins=True*. For scalar or sequence *bins*, this is an ndarray with the computed bins. If set *duplicates=drop*, *bins* will drop non-unique bin. For an *IntervalIndex bins*, this is equal to *bins*.

**See also:**

**qcut** Discretize variable into equal-sized buckets based on rank or based on sample quantiles.

**pandas.Categorical** Array type for storing data that come from a fixed set of values.

**Series** One-dimensional array with axis labels (including time series).

**pandas.IntervalIndex** Immutable Index implementing an ordered, sliceable set.

## Notes

Any NA values will be NA in the result. Out of bounds values will be NA in the resulting Series or pandas.Categorical object.

## Examples

Discretize into three equal-sized bins.

```
>>> pd.cut(np.array([1, 7, 5, 4, 6, 3]), 3)
...
[(0.994, 3.0], (5.0, 7.0], (3.0, 5.0], (3.0, 5.0], (5.0, 7.0], ...
Categories (3, interval[float64]): [(0.994, 3.0] < (3.0, 5.0] ...
```

```
>>> pd.cut(np.array([1, 7, 5, 4, 6, 3]), 3, retbins=True)
...
([(0.994, 3.0], (5.0, 7.0], (3.0, 5.0], (3.0, 5.0], (5.0, 7.0], ...
Categories (3, interval[float64]): [(0.994, 3.0] < (3.0, 5.0] ...
array([0.994, 3.    , 5.    , 7.    ]))
```

Discovers the same bins, but assign them specific labels. Notice that the returned Categorical's categories are *labels* and is ordered.

```
>>> pd.cut(np.array([1, 7, 5, 4, 6, 3]),
...         3, labels=["bad", "medium", "good"])
[bad, good, medium, medium, good, bad]
Categories (3, object): [bad < medium < good]
```

labels=False implies you just want the bins back.

```
>>> pd.cut([0, 1, 1, 2], bins=4, labels=False)
array([0, 1, 1, 3])
```

Passing a Series as an input returns a Series with categorical dtype:

```
>>> s = pd.Series(np.array([2, 4, 6, 8, 10]),
...               index=['a', 'b', 'c', 'd', 'e'])
>>> pd.cut(s, 3)
...
a    (1.992, 4.667]
b    (1.992, 4.667]
c    (4.667, 7.333]
d    (7.333, 10.0]
e    (7.333, 10.0]
dtype: category
Categories (3, interval[float64]): [(1.992, 4.667] < (4.667, ...
```

Passing a Series as an input returns a Series with mapping value. It is used to map numerically to intervals based on bins.

```
>>> s = pd.Series(np.array([2, 4, 6, 8, 10]),
...               index=['a', 'b', 'c', 'd', 'e'])
>>> pd.cut(s, [0, 2, 4, 6, 8, 10], labels=False, retbins=True, right=False)
...
(a    0.0
```

(continues on next page)

(continued from previous page)

```
b    1.0
c    2.0
d    3.0
e    4.0
dtype: float64, array([0, 2, 4, 6, 8]))
```

Use *drop* optional when bins is not unique

```
>>> pd.cut(s, [0, 2, 4, 6, 10, 10], labels=False, retbins=True,
...        right=False, duplicates='drop')
...
(a    0.0
b    1.0
c    2.0
d    3.0
e    3.0
dtype: float64, array([0, 2, 4, 6, 8]))
```

Passing an `IntervalIndex` for *bins* results in those categories exactly. Notice that values not covered by the `IntervalIndex` are set to `NaN`. 0 is to the left of the first bin (which is closed on the right), and 1.5 falls between two bins.

```
>>> bins = pd.IntervalIndex.from_tuples([(0, 1), (2, 3), (4, 5)])
>>> pd.cut([0, 0.5, 1.5, 2.5, 4.5], bins)
[NaN, (0, 1], NaN, (2, 3], (4, 5]]
Categories (3, interval[int64]): [(0, 1] < (2, 3] < (4, 5]]
```

### 34.2.1.6 pandas.qcut

`pandas.qcut(x, q, labels=None, retbins=False, precision=3, duplicates='raise')`

Quantile-based discretization function. Discretize variable into equal-sized buckets based on rank or based on sample quantiles. For example 1000 values for 10 quantiles would produce a Categorical object indicating quantile membership for each data point.

#### Parameters

**x** [1d ndarray or Series]

**q** : integer or array of quantiles

Number of quantiles. 10 for deciles, 4 for quartiles, etc. Alternately array of quantiles, e.g. [0, .25, .5, .75, 1.] for quartiles

**labels** : array or boolean, default None

Used as labels for the resulting bins. Must be of the same length as the resulting bins. If False, return only integer indicators of the bins.

**retbins** : bool, optional

Whether to return the (bins, labels) or not. Can be useful if bins is given as a scalar.

**precision** : int, optional

The precision at which to store and display the bins labels

**duplicates** : {default 'raise', 'drop'}, optional

If bin edges are not unique, raise ValueError or drop non-uniques.

New in version 0.20.0.

**Returns out** : Categorical or Series or array of integers if labels is False

The return type (Categorical or Series) depends on the input: a Series of type category if input is a Series else Categorical. Bins are represented as categories when categorical data is returned.

**bins** : ndarray of floats

Returned only if *retbins* is True.

## Notes

Out of bounds values will be NA in the resulting Categorical object

## Examples

```
>>> pd.qcut(range(5), 4)
...
[(-0.001, 1.0], (-0.001, 1.0], (1.0, 2.0], (2.0, 3.0], (3.0, 4.0]]
Categories (4, interval[float64]): [(-0.001, 1.0] < (1.0, 2.0] ...
```

```
>>> pd.qcut(range(5), 3, labels=["good", "medium", "bad"])
...
[good, good, medium, bad, bad]
Categories (3, object): [good < medium < bad]
```

```
>>> pd.qcut(range(5), 4, labels=False)
array([0, 0, 1, 2, 3])
```

### 34.2.1.7 pandas.merge

`pandas.merge(left, right, how='inner', on=None, left_on=None, right_on=None, left_index=False, right_index=False, sort=False, suffixes=('_x', '_y'), copy=True, indicator=False, validate=None)`

Merge DataFrame objects by performing a database-style join operation by columns or indexes.

If joining columns on columns, the DataFrame indexes *will be ignored*. Otherwise if joining indexes on indexes or indexes on a column or columns, the index will be passed on.

#### Parameters

**left** [DataFrame]

**right** [DataFrame]

**how** : {'left', 'right', 'outer', 'inner'}, default 'inner'

- left: use only keys from left frame, similar to a SQL left outer join; preserve key order
- right: use only keys from right frame, similar to a SQL right outer join; preserve key order
- outer: use union of keys from both frames, similar to a SQL full outer join; sort keys lexicographically

- **inner**: use intersection of keys from both frames, similar to a SQL inner join; preserve the order of the left keys

**on** : label or list

Column or index level names to join on. These must be found in both DataFrames. If *on* is None and not merging on indexes then this defaults to the intersection of the columns in both DataFrames.

**left\_on** : label or list, or array-like

Column or index level names to join on in the left DataFrame. Can also be an array or list of arrays of the length of the left DataFrame. These arrays are treated as if they are columns.

**right\_on** : label or list, or array-like

Column or index level names to join on in the right DataFrame. Can also be an array or list of arrays of the length of the right DataFrame. These arrays are treated as if they are columns.

**left\_index** : boolean, default False

Use the index from the left DataFrame as the join key(s). If it is a MultiIndex, the number of keys in the other DataFrame (either the index or a number of columns) must match the number of levels

**right\_index** : boolean, default False

Use the index from the right DataFrame as the join key. Same caveats as left\_index

**sort** : boolean, default False

Sort the join keys lexicographically in the result DataFrame. If False, the order of the join keys depends on the join type (how keyword)

**suffixes** : 2-length sequence (tuple, list, ...)

Suffix to apply to overlapping column names in the left and right side, respectively

**copy** : boolean, default True

If False, do not copy data unnecessarily

**indicator** : boolean or string, default False

If True, adds a column to output DataFrame called “\_merge” with information on the source of each row. If string, column with information on source of each row will be added to output DataFrame, and column will be named value of string. Information column is Categorical-type and takes on a value of “left\_only” for observations whose merge key only appears in ‘left’ DataFrame, “right\_only” for observations whose merge key only appears in ‘right’ DataFrame, and “both” if the observation’s merge key is found in both.

**validate** : string, default None

If specified, checks if merge is of specified type.

- “one\_to\_one” or “1:1”: check if merge keys are unique in both left and right datasets.
- “one\_to\_many” or “1:m”: check if merge keys are unique in left dataset.
- “many\_to\_one” or “m:1”: check if merge keys are unique in right dataset.
- “many\_to\_many” or “m:m”: allowed, but does not result in checks.

New in version 0.21.0.

**Returns** `merged` : DataFrame

The output type will be the same as 'left', if it is a subclass of DataFrame.

**See also:**

`merge_ordered`, `merge_asof`, `DataFrame.join`

## Notes

Support for specifying index levels as the `on`, `left_on`, and `right_on` parameters was added in version 0.23.0

## Examples

```
>>> A          >>> B
   lkey value    rkey value
0   foo    1      0   foo    5
1   bar    2      1   bar    6
2   baz    3      2   qux    7
3   foo    4      3   bar    8
```

```
>>> A.merge(B, left_on='lkey', right_on='rkey', how='outer')
   lkey  value_x  rkey  value_y
0   foo      1    foo      5
1   foo      4    foo      5
2   bar      2    bar      6
3   bar      2    bar      8
4   baz      3    NaN     NaN
5   NaN     NaN    qux      7
```

### 34.2.1.8 pandas.merge\_ordered

`pandas.merge_ordered(left, right, on=None, left_on=None, right_on=None, left_by=None, right_by=None, fill_method=None, suffixes=('_x', '_y'), how='outer')`

Perform merge with optional filling/interpolation designed for ordered data like time series data. Optionally perform group-wise merge (see examples)

#### Parameters

**left** [DataFrame]

**right** [DataFrame]

**on** : label or list

Field names to join on. Must be found in both DataFrames.

**left\_on** : label or list, or array-like

Field names to join on in left DataFrame. Can be a vector or list of vectors of the length of the DataFrame to use a particular vector as the join key instead of columns

**right\_on** : label or list, or array-like

Field names to join on in right DataFrame or vector/list of vectors per left\_on docs

**left\_by** : column name or list of column names

Group left DataFrame by group columns and merge piece by piece with right DataFrame

**right\_by** : column name or list of column names

Group right DataFrame by group columns and merge piece by piece with left DataFrame

**fill\_method** : { 'ffill', None }, default None

Interpolation method for data

**suffixes** : 2-length sequence (tuple, list, ...)

Suffix to apply to overlapping column names in the left and right side, respectively

**how** : { 'left', 'right', 'outer', 'inner' }, default 'outer'

- left: use only keys from left frame (SQL: left outer join)
- right: use only keys from right frame (SQL: right outer join)
- outer: use union of keys from both frames (SQL: full outer join)
- inner: use intersection of keys from both frames (SQL: inner join)

New in version 0.19.0.

**Returns** **merged** : DataFrame

The output type will be the same as 'left', if it is a subclass of DataFrame.

**See also:**

*merge, merge\_asof*

## Examples

```
>>> A
   key  lvalue group
0    a      1     a
1    c      2     a
2    e      3     a
3    a      1     b
4    c      2     b
5    e      3     b

>>> B
   key  rvalue
0    b      1
1    c      2
2    d      3
```

```
>>> merge_ordered(A, B, fill_method='ffill', left_by='group')
   group key  lvalue  rvalue
0     a   a      1     NaN
1     a   b      1     1.0
2     a   c      2     2.0
3     a   d      2     3.0
4     a   e      3     3.0
5     b   a      1     NaN
6     b   b      1     1.0
7     b   c      2     2.0
8     b   d      2     3.0
9     b   e      3     3.0
```

### 34.2.1.9 pandas.merge\_asof

`pandas.merge_asof` (*left*, *right*, *on=None*, *left\_on=None*, *right\_on=None*, *left\_index=False*, *right\_index=False*, *by=None*, *left\_by=None*, *right\_by=None*, *suffixes=('\_x', '\_y')*, *tolerance=None*, *allow\_exact\_matches=True*, *direction='backward'*)

Perform an asof merge. This is similar to a left-join except that we match on nearest key rather than equal keys.

Both DataFrames must be sorted by the key.

For each row in the left DataFrame:

- A “backward” search selects the last row in the right DataFrame whose ‘on’ key is less than or equal to the left’s key.
- A “forward” search selects the first row in the right DataFrame whose ‘on’ key is greater than or equal to the left’s key.
- A “nearest” search selects the row in the right DataFrame whose ‘on’ key is closest in absolute distance to the left’s key.

The default is “backward” and is compatible in versions below 0.20.0. The direction parameter was added in version 0.20.0 and introduces “forward” and “nearest”.

Optionally match on equivalent keys with ‘by’ before searching with ‘on’.

New in version 0.19.0.

#### Parameters

**left** [DataFrame]

**right** [DataFrame]

**on** : label

Field name to join on. Must be found in both DataFrames. The data MUST be ordered. Furthermore this must be a numeric column, such as datetimelike, integer, or float. On or left\_on/right\_on must be given.

**left\_on** : label

Field name to join on in left DataFrame.

**right\_on** : label

Field name to join on in right DataFrame.

**left\_index** : boolean

Use the index of the left DataFrame as the join key.

New in version 0.19.2.

**right\_index** : boolean

Use the index of the right DataFrame as the join key.

New in version 0.19.2.

**by** : column name or list of column names

Match on these columns before performing merge operation.

**left\_by** : column name

Field names to match on in the left DataFrame.

New in version 0.19.2.

**right\_by** : column name

Field names to match on in the right DataFrame.

New in version 0.19.2.

**suffixes** : 2-length sequence (tuple, list, ...)

Suffix to apply to overlapping column names in the left and right side, respectively.

**tolerance** : integer or Timedelta, optional, default None

Select asof tolerance within this range; must be compatible with the merge index.

**allow\_exact\_matches** : boolean, default True

- If True, allow matching with the same 'on' value (i.e. less-than-or-equal-to / greater-than-or-equal-to)
- If False, don't match the same 'on' value (i.e., strictly less-than / strictly greater-than)

**direction** : 'backward' (default), 'forward', or 'nearest'

Whether to search for prior, subsequent, or closest matches.

New in version 0.20.0.

### Returns

**merged** [DataFrame]

**See also:**

[\*merge\*](#), [\*merge\\_ordered\*](#)

### Examples

```
>>> left = pd.DataFrame({'a': [1, 5, 10], 'left_val': ['a', 'b', 'c']})
>>> left
   a left_val
0  1         a
1  5         b
2 10         c
```

```
>>> right = pd.DataFrame({'a': [1, 2, 3, 6, 7],
...                       'right_val': [1, 2, 3, 6, 7]})
>>> right
   a right_val
0  1          1
1  2          2
2  3          3
3  6          6
4  7          7
```

```
>>> pd.merge_asof(left, right, on='a')
   a left_val right_val
0  1         a         1
1  5         b         3
2 10         c         7
```

```
>>> pd.merge_asof(left, right, on='a', allow_exact_matches=False)
   a left_val right_val
0  1         a        NaN
1  5         b         3.0
2 10         c         7.0
```

```
>>> pd.merge_asof(left, right, on='a', direction='forward')
   a left_val right_val
0  1         a         1.0
1  5         b         6.0
2 10         c         NaN
```

```
>>> pd.merge_asof(left, right, on='a', direction='nearest')
   a left_val right_val
0  1         a         1
1  5         b         6
2 10         c         7
```

We can use indexed DataFrames as well.

```
>>> left = pd.DataFrame({'left_val': ['a', 'b', 'c']}, index=[1, 5, 10])
>>> left
   left_val
1         a
5         b
10        c
```

```
>>> right = pd.DataFrame({'right_val': [1, 2, 3, 6, 7]},
...                       index=[1, 2, 3, 6, 7])
>>> right
   right_val
1          1
2          2
3          3
6          6
7          7
```

```
>>> pd.merge_asof(left, right, left_index=True, right_index=True)
   left_val right_val
1         a         1
5         b         3
10        c         7
```

Here is a real-world times-series example

```
>>> quotes
      time ticker  bid  ask
0 2016-05-25 13:30:00.023  GOOG  720.50  720.93
1 2016-05-25 13:30:00.023  MSFT  51.95  51.96
2 2016-05-25 13:30:00.030  MSFT  51.97  51.98
3 2016-05-25 13:30:00.041  MSFT  51.99  52.00
4 2016-05-25 13:30:00.048  GOOG  720.50  720.93
5 2016-05-25 13:30:00.049  AAPL  97.99  98.01
6 2016-05-25 13:30:00.072  GOOG  720.50  720.88
7 2016-05-25 13:30:00.075  MSFT  52.01  52.03
```

```
>>> trades
```

	time	ticker	price	quantity
0	2016-05-25 13:30:00.023	MSFT	51.95	75
1	2016-05-25 13:30:00.038	MSFT	51.95	155
2	2016-05-25 13:30:00.048	GOOG	720.77	100
3	2016-05-25 13:30:00.048	GOOG	720.92	100
4	2016-05-25 13:30:00.048	AAPL	98.00	100

By default we are taking the asof of the quotes

```
>>> pd.merge_asof(trades, quotes,
...               on='time',
...               by='ticker')
```

	time	ticker	price	quantity	bid	ask
0	2016-05-25 13:30:00.023	MSFT	51.95	75	51.95	51.96
1	2016-05-25 13:30:00.038	MSFT	51.95	155	51.97	51.98
2	2016-05-25 13:30:00.048	GOOG	720.77	100	720.50	720.93
3	2016-05-25 13:30:00.048	GOOG	720.92	100	720.50	720.93
4	2016-05-25 13:30:00.048	AAPL	98.00	100	NaN	NaN

We only asof within 2ms between the quote time and the trade time

```
>>> pd.merge_asof(trades, quotes,
...               on='time',
...               by='ticker',
...               tolerance=pd.Timedelta('2ms'))
```

	time	ticker	price	quantity	bid	ask
0	2016-05-25 13:30:00.023	MSFT	51.95	75	51.95	51.96
1	2016-05-25 13:30:00.038	MSFT	51.95	155	NaN	NaN
2	2016-05-25 13:30:00.048	GOOG	720.77	100	720.50	720.93
3	2016-05-25 13:30:00.048	GOOG	720.92	100	720.50	720.93
4	2016-05-25 13:30:00.048	AAPL	98.00	100	NaN	NaN

We only asof within 10ms between the quote time and the trade time and we exclude exact matches on time. However *prior* data will propagate forward

```
>>> pd.merge_asof(trades, quotes,
...               on='time',
...               by='ticker',
...               tolerance=pd.Timedelta('10ms'),
...               allow_exact_matches=False)
```

	time	ticker	price	quantity	bid	ask
0	2016-05-25 13:30:00.023	MSFT	51.95	75	NaN	NaN
1	2016-05-25 13:30:00.038	MSFT	51.95	155	51.97	51.98
2	2016-05-25 13:30:00.048	GOOG	720.77	100	NaN	NaN
3	2016-05-25 13:30:00.048	GOOG	720.92	100	NaN	NaN
4	2016-05-25 13:30:00.048	AAPL	98.00	100	NaN	NaN

### 34.2.1.10 pandas.concat

`pandas.concat` (*objs*, *axis=0*, *join='outer'*, *join\_axes=None*, *ignore\_index=False*, *keys=None*, *levels=None*, *names=None*, *verify\_integrity=False*, *sort=None*, *copy=True*)

Concatenate pandas objects along a particular axis with optional set logic along the other axes.

Can also add a layer of hierarchical indexing on the concatenation axis, which may be useful if the labels are the same (or overlapping) on the passed axis number.

**Parameters** **objs** : a sequence or mapping of Series, DataFrame, or Panel objects

If a dict is passed, the sorted keys will be used as the *keys* argument, unless it is passed, in which case the values will be selected (see below). Any None objects will be dropped silently unless they are all None in which case a ValueError will be raised

**axis** : {0/'index', 1/'columns'}, default 0

The axis to concatenate along

**join** : {'inner', 'outer'}, default 'outer'

How to handle indexes on other axis(es)

**join\_axes** : list of Index objects

Specific indexes to use for the other  $n - 1$  axes instead of performing inner/outer set logic

**ignore\_index** : boolean, default False

If True, do not use the index values along the concatenation axis. The resulting axis will be labeled 0, ...,  $n - 1$ . This is useful if you are concatenating objects where the concatenation axis does not have meaningful indexing information. Note the index values on the other axes are still respected in the join.

**keys** : sequence, default None

If multiple levels passed, should contain tuples. Construct hierarchical index using the passed keys as the outermost level

**levels** : list of sequences, default None

Specific levels (unique values) to use for constructing a MultiIndex. Otherwise they will be inferred from the keys

**names** : list, default None

Names for the levels in the resulting hierarchical index

**verify\_integrity** : boolean, default False

Check whether the new concatenated axis contains duplicates. This can be very expensive relative to the actual data concatenation

**sort** : boolean, default None

Sort non-concatenation axis if it is not already aligned when *join* is 'outer'. The current default of sorting is deprecated and will change to not-sorting in a future version of pandas.

Explicitly pass `sort=True` to silence the warning and sort. Explicitly pass `sort=False` to silence the warning and not sort.

This has no effect when `join='inner'`, which already preserves the order of the non-concatenation axis.

New in version 0.23.0.

**copy** : boolean, default True

If False, do not copy data unnecessarily

**Returns** **concatenated** : object, type of objs

When concatenating all `Series` along the index (`axis=0`), a `Series` is returned. When `objs` contains at least one `DataFrame`, a `DataFrame` is returned. When concatenating along the columns (`axis=1`), a `DataFrame` is returned.

**See also:**

*`Series.append`, `DataFrame.append`, `DataFrame.join`, `DataFrame.merge`*

**Notes**

The `keys`, `levels`, and `names` arguments are all optional.

A walkthrough of how this method fits in with other tools for combining pandas objects can be found [here](#).

**Examples**

Combine two `Series`.

```
>>> s1 = pd.Series(['a', 'b'])
>>> s2 = pd.Series(['c', 'd'])
>>> pd.concat([s1, s2])
0    a
1    b
0    c
1    d
dtype: object
```

Clear the existing index and reset it in the result by setting the `ignore_index` option to `True`.

```
>>> pd.concat([s1, s2], ignore_index=True)
0    a
1    b
2    c
3    d
dtype: object
```

Add a hierarchical index at the outermost level of the data with the `keys` option.

```
>>> pd.concat([s1, s2], keys=['s1', 's2',])
s1 0    a
   1    b
s2 0    c
   1    d
dtype: object
```

Label the index keys you create with the `names` option.

```
>>> pd.concat([s1, s2], keys=['s1', 's2'],
...           names=['Series name', 'Row ID'])
Series name  Row ID
s1          0      a
           1      b
s2          0      c
           1      d
dtype: object
```

Combine two `DataFrame` objects with identical columns.

```

>>> df1 = pd.DataFrame([['a', 1], ['b', 2]],
...                     columns=['letter', 'number'])
>>> df1
  letter  number
0      a        1
1      b        2
>>> df2 = pd.DataFrame([['c', 3], ['d', 4]],
...                     columns=['letter', 'number'])
>>> df2
  letter  number
0      c        3
1      d        4
>>> pd.concat([df1, df2])
  letter  number
0      a        1
1      b        2
0      c        3
1      d        4

```

Combine DataFrame objects with overlapping columns and return everything. Columns outside the intersection will be filled with NaN values.

```

>>> df3 = pd.DataFrame([['c', 3, 'cat'], ['d', 4, 'dog']],
...                     columns=['letter', 'number', 'animal'])
>>> df3
  letter  number animal
0      c        3   cat
1      d        4   dog
>>> pd.concat([df1, df3])
  animal letter  number
0    NaN      a        1
1    NaN      b        2
0    cat      c        3
1    dog      d        4

```

Combine DataFrame objects with overlapping columns and return only those that are shared by passing inner to the join keyword argument.

```

>>> pd.concat([df1, df3], join="inner")
  letter  number
0      a        1
1      b        2
0      c        3
1      d        4

```

Combine DataFrame objects horizontally along the x axis by passing in axis=1.

```

>>> df4 = pd.DataFrame([['bird', 'polly'], ['monkey', 'george']],
...                     columns=['animal', 'name'])
>>> pd.concat([df1, df4], axis=1)
  letter  number animal   name
0      a        1   bird  polly
1      b        2 monkey george

```

Prevent the result from including duplicate index values with the verify\_integrity option.

```
>>> df5 = pd.DataFrame([1], index=['a'])
>>> df5
0
a 1
>>> df6 = pd.DataFrame([2], index=['a'])
>>> df6
0
a 2
>>> pd.concat([df5, df6], verify_integrity=True)
Traceback (most recent call last):
...
ValueError: Indexes have overlapping values: ['a']
```

### 34.2.1.11 pandas.get\_dummies

`pandas.get_dummies` (*data*, *prefix=None*, *prefix\_sep='\_'*, *dummy\_na=False*, *columns=None*,  
*sparse=False*, *drop\_first=False*, *dtype=None*)  
Convert categorical variable into dummy/indicator variables

#### Parameters

**data** [array-like, Series, or DataFrame]

**prefix** : string, list of strings, or dict of strings, default None

String to append DataFrame column names. Pass a list with length equal to the number of columns when calling `get_dummies` on a DataFrame. Alternatively, *prefix* can be a dictionary mapping column names to prefixes.

**prefix\_sep** : string, default '\_'

If appending prefix, separator/delimiter to use. Or pass a list or dictionary as with *prefix*.

**dummy\_na** : bool, default False

Add a column to indicate NaNs, if False NaNs are ignored.

**columns** : list-like, default None

Column names in the DataFrame to be encoded. If *columns* is None then all the columns with *object* or *category* dtype will be converted.

**sparse** : bool, default False

Whether the dummy columns should be sparse or not. Returns `SparseDataFrame` if *data* is a Series or if all columns are included. Otherwise returns a DataFrame with some `SparseBlocks`.

**drop\_first** : bool, default False

Whether to get k-1 dummies out of k categorical levels by removing the first level.

New in version 0.18.0.

**dtype** : dtype, default np.uint8

Data type for new columns. Only a single dtype is allowed.

New in version 0.23.0.

#### Returns

**dummies** [DataFrame or SparseDataFrame]

**See also:***Series.str.get\_dummies***Examples**

```
>>> import pandas as pd
>>> s = pd.Series(list('abca'))
```

```
>>> pd.get_dummies(s)
   a  b  c
0  1  0  0
1  0  1  0
2  0  0  1
3  1  0  0
```

```
>>> s1 = ['a', 'b', np.nan]
```

```
>>> pd.get_dummies(s1)
   a  b
0  1  0
1  0  1
2  0  0
```

```
>>> pd.get_dummies(s1, dummy_na=True)
   a  b  NaN
0  1  0    0
1  0  1    0
2  0  0    1
```

```
>>> df = pd.DataFrame({'A': ['a', 'b', 'a'], 'B': ['b', 'a', 'c'],
...                     'C': [1, 2, 3]})
```

```
>>> pd.get_dummies(df, prefix=['col1', 'col2'])
   C  col1_a  col1_b  col2_a  col2_b  col2_c
0  1         1         0         0         1         0
1  2         0         1         1         0         0
2  3         1         0         0         0         1
```

```
>>> pd.get_dummies(pd.Series(list('abcaa')))
   a  b  c
0  1  0  0
1  0  1  0
2  0  0  1
3  1  0  0
4  1  0  0
```

```
>>> pd.get_dummies(pd.Series(list('abcaa')), drop_first=True)
   b  c
0  0  0
1  1  0
2  0  1
3  0  0
4  0  0
```

```
>>> pd.get_dummies(pd.Series(list('abc')), dtype=float)
   a    b    c
0  1.0  0.0  0.0
1  0.0  1.0  0.0
2  0.0  0.0  1.0
```

### 34.2.1.12 pandas.factorize

pandas.**factorize** (*values*, *sort=False*, *order=None*, *na\_sentinel=-1*, *size\_hint=None*)

Encode the object as an enumerated type or categorical variable.

This method is useful for obtaining a numeric representation of an array when all that matters is identifying distinct values. *factorize* is available as both a top-level function `pandas.factorize()`, and as a method `Series.factorize()` and `Index.factorize()`.

**Parameters** *values* : sequence

A 1-D sequence. Sequences that aren't pandas objects are coerced to ndarrays before factorization.

**sort** : bool, default False

Sort *uniques* and shuffle *labels* to maintain the relationship.

**order**

Deprecated since version 0.23.0: This parameter has no effect and is deprecated.

**na\_sentinel** : int, default -1

Value to mark “not found”.

**size\_hint** : int, optional

Hint to the hashtable sizer.

**Returns** *labels* : ndarray

An integer ndarray that's an indexer into *uniques*. `uniques.take(labels)` will have the same values as *values*.

**uniques** : ndarray, Index, or Categorical

The unique valid values. When *values* is Categorical, *uniques* is a Categorical. When *values* is some other pandas object, an *Index* is returned. Otherwise, a 1-D ndarray is returned.

---

**Note:** Even if there's a missing value in *values*, *uniques* will *not* contain an entry for it.

---

**See also:**

`pandas.cut` Discretize continuous-valued array.

`pandas.unique` Find the unique valuse in an array.

## Examples

These examples all show `factorize` as a top-level method like `pd.factorize(values)`. The results are identical for methods like `Series.factorize()`.

```
>>> labels, uniques = pd.factorize(['b', 'b', 'a', 'c', 'b'])
>>> labels
array([0, 0, 1, 2, 0])
>>> uniques
array(['b', 'a', 'c'], dtype=object)
```

With `sort=True`, the *uniques* will be sorted, and *labels* will be shuffled so that the relationship is the maintained.

```
>>> labels, uniques = pd.factorize(['b', 'b', 'a', 'c', 'b'], sort=True)
>>> labels
array([1, 1, 0, 2, 1])
>>> uniques
array(['a', 'b', 'c'], dtype=object)
```

Missing values are indicated in *labels* with *na\_sentinel* (-1 by default). Note that missing values are never included in *uniques*.

```
>>> labels, uniques = pd.factorize(['b', None, 'a', 'c', 'b'])
>>> labels
array([ 0, -1,  1,  2,  0])
>>> uniques
array(['b', 'a', 'c'], dtype=object)
```

Thus far, we've only factorized lists (which are internally coerced to NumPy arrays). When factorizing pandas objects, the type of *uniques* will differ. For Categoricals, a *Categorical* is returned.

```
>>> cat = pd.Categorical(['a', 'a', 'c'], categories=['a', 'b', 'c'])
>>> labels, uniques = pd.factorize(cat)
>>> labels
array([0, 0, 1])
>>> uniques
[a, c]
Categories (3, object): [a, b, c]
```

Notice that 'b' is in `uniques.categories`, despite not being present in `cat.values`.

For all other pandas objects, an Index of the appropriate type is returned.

```
>>> cat = pd.Series(['a', 'a', 'c'])
>>> labels, uniques = pd.factorize(cat)
>>> labels
array([0, 0, 1])
>>> uniques
Index(['a', 'c'], dtype='object')
```

### 34.2.1.13 pandas.unique

`pandas.unique(values)`

Hash table-based unique. Uniques are returned in order of appearance. This does NOT sort.

Significantly faster than `numpy.unique`. Includes NA values.

**Parameters****values** [1d array-like]**Returns** unique values.

- If the input is an Index, the return is an Index
- If the input is a Categorical dtype, the return is a Categorical
- If the input is a Series/ndarray, the return will be an ndarray

**See also:***pandas.Index.unique, pandas.Series.unique***Examples**

```
>>> pd.unique(pd.Series([2, 1, 3, 3]))
array([2, 1, 3])
```

```
>>> pd.unique(pd.Series([2] + [1] * 5))
array([2, 1])
```

```
>>> pd.unique(Series([pd.Timestamp('20160101'),
...                   pd.Timestamp('20160101')]))
array(['2016-01-01T00:00:00.000000000'], dtype='datetime64[ns]')
```

```
>>> pd.unique(pd.Series([pd.Timestamp('20160101', tz='US/Eastern'),
...                   pd.Timestamp('20160101', tz='US/Eastern')]))
array([Timestamp('2016-01-01 00:00:00-0500', tz='US/Eastern')],
      dtype=object)
```

```
>>> pd.unique(pd.Index([pd.Timestamp('20160101', tz='US/Eastern'),
...                   pd.Timestamp('20160101', tz='US/Eastern')]))
DatetimeIndex(['2016-01-01 00:00:00-05:00'],
...          dtype='datetime64[ns, US/Eastern]', freq=None)
```

```
>>> pd.unique(list('baabc'))
array(['b', 'a', 'c'], dtype=object)
```

An unordered Categorical will return categories in the order of appearance.

```
>>> pd.unique(Series(pd.Categorical(list('baabc'))))
[b, a, c]
Categories (3, object): [b, a, c]
```

```
>>> pd.unique(Series(pd.Categorical(list('baabc'),
...                               categories=list('abc'))))
[b, a, c]
Categories (3, object): [b, a, c]
```

An ordered Categorical preserves the category ordering.

```
>>> pd.unique(Series(pd.Categorical(list('baabc'),
...                               categories=list('abc')),
```

(continues on next page)

(continued from previous page)

```
...                                ordered=True))
[b, a, c]
Categories (3, object): [a < b < c]
```

An array of tuples

```
>>> pd.unique([('a', 'b'), ('b', 'a'), ('a', 'c'), ('b', 'a')])
array([('a', 'b'), ('b', 'a'), ('a', 'c')], dtype=object)
```

### 34.2.1.14 pandas.wide\_to\_long

`pandas.wide_to_long(df, stubnames, i, j, sep=" ", suffix='\d+')`

Wide panel to long format. Less flexible but more user-friendly than melt.

With stubnames ['A', 'B'], this function expects to find one or more group of columns with format Asuffix1, Asuffix2,..., Bsufffix1, Bsufffix2,... You specify what you want to call this suffix in the resulting long format with *j* (for example *j*='year')

Each row of these wide variables are assumed to be uniquely identified by *i* (can be a single column name or a list of column names)

All remaining variables in the data frame are left intact.

**Parameters** **df** : DataFrame

The wide-format DataFrame

**stubnames** : str or list-like

The stub name(s). The wide format variables are assumed to start with the stub names.

**i** : str or list-like

Column(s) to use as id variable(s)

**j** : str

The name of the subobservation variable. What you wish to name your suffix in the long format.

**sep** : str, default ""

A character indicating the separation of the variable names in the wide format, to be stripped from the names in the long format. For example, if your column names are A-suffix1, A-suffix2, you can strip the hyphen by specifying *sep*='-'

New in version 0.20.0.

**suffix** : str, default '\d+'

A regular expression capturing the wanted suffixes. '\d+' captures numeric suffixes. Suffixes with no numbers could be specified with the negated character class '\D+'. You can also further disambiguate suffixes, for example, if your wide variables are of the form Aone, Btwo,..., and you have an unrelated column Arating, you can ignore the last one by specifying *suffix*='(!?one|two)'

New in version 0.20.0.

Changed in version 0.23.0: When all suffixes are numeric, they are cast to int64/float64.

**Returns** DataFrame

A DataFrame that contains each stub name as a variable, with new index (i, j)

## Notes

All extra variables are left untouched. This simply uses *pandas.melt* under the hood, but is hard-coded to “do the right thing” in a typical case.

## Examples

```
>>> import pandas as pd
>>> import numpy as np
>>> np.random.seed(123)
>>> df = pd.DataFrame({"A1970" : {0 : "a", 1 : "b", 2 : "c"},
...                     "A1980" : {0 : "d", 1 : "e", 2 : "f"},
...                     "B1970" : {0 : 2.5, 1 : 1.2, 2 : .7},
...                     "B1980" : {0 : 3.2, 1 : 1.3, 2 : .1},
...                     "X"      : dict(zip(range(3), np.random.randn(3)))
...                     })
>>> df["id"] = df.index
>>> df
   A1970 A1980  B1970  B1980      X  id
0      a      d    2.5    3.2 -1.085631  0
1      b      e    1.2    1.3  0.997345  1
2      c      f    0.7    0.1  0.282978  2
>>> pd.wide_to_long(df, ["A", "B"], i="id", j="year")
...
      X  A    B
id year
0  1970 -1.085631  a  2.5
1  1970  0.997345  b  1.2
2  1970  0.282978  c  0.7
0  1980 -1.085631  d  3.2
1  1980  0.997345  e  1.3
2  1980  0.282978  f  0.1
```

### With multiple id columns

```
>>> df = pd.DataFrame({
...     'famid': [1, 1, 1, 2, 2, 2, 3, 3, 3],
...     'birth': [1, 2, 3, 1, 2, 3, 1, 2, 3],
...     'ht1': [2.8, 2.9, 2.2, 2, 1.8, 1.9, 2.2, 2.3, 2.1],
...     'ht2': [3.4, 3.8, 2.9, 3.2, 2.8, 2.4, 3.3, 3.4, 2.9]
... })
>>> df
   birth  famid  ht1  ht2
0      1      1  2.8  3.4
1      2      1  2.9  3.8
2      3      1  2.2  2.9
3      1      2  2.0  3.2
4      2      2  1.8  2.8
5      3      2  1.9  2.4
6      1      3  2.2  3.3
7      2      3  2.3  3.4
8      3      3  2.1  2.9
>>> l = pd.wide_to_long(df, stubnames='ht', i=['famid', 'birth'], j='age')
```

(continues on next page)

(continued from previous page)

```
>>> l
...
      ht
famid birth age
1      1      1  2.8
      2      2  3.4
      2      1  2.9
      2      2  3.8
      3      1  2.2
      3      2  2.9
2      1      1  2.0
      2      2  3.2
      2      1  1.8
      2      2  2.8
      3      1  1.9
      3      2  2.4
3      1      1  2.2
      2      2  3.3
      2      1  2.3
      2      2  3.4
      3      1  2.1
      3      2  2.9
```

Going from long back to wide just takes some creative use of *unstack*

```
>>> w = l.unstack()
>>> w.columns = w.columns.map('{0[0]}{0[1]}'.format)
>>> w.reset_index()
   famid  birth  ht1  ht2
0      1      1  2.8  3.4
1      1      2  2.9  3.8
2      1      3  2.2  2.9
3      2      1  2.0  3.2
4      2      2  1.8  2.8
5      2      3  1.9  2.4
6      3      1  2.2  3.3
7      3      2  2.3  3.4
8      3      3  2.1  2.9
```

Less wieldy column names are also handled

```
>>> np.random.seed(0)
>>> df = pd.DataFrame({'A(quarterly)-2010': np.random.rand(3),
...                    'A(quarterly)-2011': np.random.rand(3),
...                    'B(quarterly)-2010': np.random.rand(3),
...                    'B(quarterly)-2011': np.random.rand(3),
...                    'X' : np.random.randint(3, size=3)})
>>> df['id'] = df.index
>>> df
   A(quarterly)-2010  A(quarterly)-2011  B(quarterly)-2010  ...
0          0.548814          0.544883          0.437587  ...
1          0.715189          0.423655          0.891773  ...
2          0.602763          0.645894          0.963663  ...
   X  id
0  0   0
1  1   1
2  1   2
```

```
>>> pd.wide_to_long(df, ['A(quarterly)', 'B(quarterly)'], i='id',
...                  j='year', sep='-')
...
      X  A(quarterly)  B(quarterly)
id year
0  2010    0      0.548814    0.437587
1  2010    1      0.715189    0.891773
2  2010    1      0.602763    0.963663
0  2011    0      0.544883    0.383442
1  2011    1      0.423655    0.791725
2  2011    1      0.645894    0.528895
```

If we have many columns, we could also use a regex to find our stubnames and pass that list on to `wide_to_long`

```
>>> stubnames = sorted(
...     set([match[0] for match in df.columns.str.findall(
...         r'[A-B]\(.*\)').values if match != [] ]))
... )
>>> list(stubnames)
['A(quarterly)', 'B(quarterly)']
```

All of the above examples have integers as suffixes. It is possible to have non-integers as suffixes.

```
>>> df = pd.DataFrame({
...     'famid': [1, 1, 1, 2, 2, 2, 3, 3, 3],
...     'birth': [1, 2, 3, 1, 2, 3, 1, 2, 3],
...     'ht_one': [2.8, 2.9, 2.2, 2, 1.8, 1.9, 2.2, 2.3, 2.1],
...     'ht_two': [3.4, 3.8, 2.9, 3.2, 2.8, 2.4, 3.3, 3.4, 2.9]
... })
>>> df
   birth  famid  ht_one  ht_two
0      1      1    2.8     3.4
1      2      1    2.9     3.8
2      3      1    2.2     2.9
3      1      2    2.0     3.2
4      2      2    1.8     2.8
5      3      2    1.9     2.4
6      1      3    2.2     3.3
7      2      3    2.3     3.4
8      3      3    2.1     2.9
```

```
>>> l = pd.wide_to_long(df, stubnames='ht', i=['famid', 'birth'], j='age',
...                      sep='_', suffix='\w')
>>> l
...
      ht
famid birth age
1      1    one 2.8
      two 3.4
      2    one 2.9
      two 3.8
      3    one 2.2
      two 2.9
2      1    one 2.0
      two 3.2
      2    one 1.8
      two 2.8
```

(continues on next page)

(continued from previous page)

	3	one	1.9
		two	2.4
3	1	one	2.2
		two	3.3
	2	one	2.3
		two	3.4
	3	one	2.1
		two	2.9

### 34.2.2 Top-level missing data

<code>isna(obj)</code>	Detect missing values for an array-like object.
<code>isnull(obj)</code>	Detect missing values for an array-like object.
<code>notna(obj)</code>	Detect non-missing values for an array-like object.
<code>notnull(obj)</code>	Detect non-missing values for an array-like object.

#### 34.2.2.1 pandas.isna

`pandas.isna(obj)`

Detect missing values for an array-like object.

This function takes a scalar or array-like object and indicates whether values are missing (NaN in numeric arrays, None or NaN in object arrays, NaT in datetimelike).

**Parameters** `obj` : scalar or array-like

Object to check for null or missing values.

**Returns** bool or array-like of bool

For scalar input, returns a scalar boolean. For array input, returns an array of boolean indicating whether each corresponding element is missing.

**See also:**

`notna` boolean inverse of `pandas.isna`.

`Series.isna` Detect missing values in a Series.

`DataFrame.isna` Detect missing values in a DataFrame.

`Index.isna` Detect missing values in an Index.

#### Examples

Scalar arguments (including strings) result in a scalar boolean.

```
>>> pd.isna('dog')
False
```

```
>>> pd.isna(np.nan)
True
```

ndarrays result in an ndarray of booleans.

```
>>> array = np.array([[1, np.nan, 3], [4, 5, np.nan]])
>>> array
array([[ 1., nan,  3.],
       [ 4.,  5., nan]])
>>> pd.isna(array)
array([[False,  True, False],
       [False, False,  True]])
```

For indexes, an ndarray of booleans is returned.

```
>>> index = pd.DatetimeIndex(["2017-07-05", "2017-07-06", None,
...                           "2017-07-08"])
>>> index
DatetimeIndex(['2017-07-05', '2017-07-06', 'NaT', '2017-07-08'],
              dtype='datetime64[ns]', freq=None)
>>> pd.isna(index)
array([False, False,  True, False])
```

For Series and DataFrame, the same type is returned, containing booleans.

```
>>> df = pd.DataFrame(['ant', 'bee', 'cat'], ['dog', None, 'fly'])
>>> df
   0    1    2
0  ant  bee  cat
1  dog None fly
>>> pd.isna(df)
   0    1    2
0 False False False
1 False  True False
```

```
>>> pd.isna(df[1])
0    False
1     True
Name: 1, dtype: bool
```

### 34.2.2.2 pandas.isnull

pandas.**isnull** (*obj*)

Detect missing values for an array-like object.

This function takes a scalar or array-like object and indicates whether values are missing (NaN in numeric arrays, None or NaN in object arrays, NaT in datetimelike).

**Parameters** *obj* : scalar or array-like

Object to check for null or missing values.

**Returns** bool or array-like of bool

For scalar input, returns a scalar boolean. For array input, returns an array of boolean indicating whether each corresponding element is missing.

**See also:**

[\*notna\*](#) boolean inverse of pandas.isna.

[\*Series.isna\*](#) Detect missing values in a Series.

[\*DataFrame.isna\*](#) Detect missing values in a DataFrame.

**Index.isna** Detect missing values in an Index.

## Examples

Scalar arguments (including strings) result in a scalar boolean.

```
>>> pd.isna('dog')
False
```

```
>>> pd.isna(np.nan)
True
```

ndarrays result in an ndarray of booleans.

```
>>> array = np.array([[1, np.nan, 3], [4, 5, np.nan]])
>>> array
array([[ 1., nan,  3.],
       [ 4.,  5., nan]])
>>> pd.isna(array)
array([[False,  True, False],
       [False, False,  True]])
```

For indexes, an ndarray of booleans is returned.

```
>>> index = pd.DatetimeIndex(["2017-07-05", "2017-07-06", None,
...                           "2017-07-08"])
>>> index
DatetimeIndex(['2017-07-05', '2017-07-06', 'NaT', '2017-07-08'],
              dtype='datetime64[ns]', freq=None)
>>> pd.isna(index)
array([False, False,  True, False])
```

For Series and DataFrame, the same type is returned, containing booleans.

```
>>> df = pd.DataFrame(['ant', 'bee', 'cat'], ['dog', None, 'fly'])
>>> df
   0    1    2
0  ant  bee  cat
1  dog None fly
>>> pd.isna(df)
   0    1    2
0 False False False
1 False  True False
```

```
>>> pd.isna(df[1])
0    False
1     True
Name: 1, dtype: bool
```

### 34.2.2.3 pandas.notna

pandas.**notna** (*obj*)

Detect non-missing values for an array-like object.

This function takes a scalar or array-like object and indicates whether values are valid (not missing, which is NaN in numeric arrays, None or NaN in object arrays, NaT in datetimelike).

**Parameters** `obj` : array-like or object value

Object to check for *not* null or *non*-missing values.

**Returns** bool or array-like of bool

For scalar input, returns a scalar boolean. For array input, returns an array of boolean indicating whether each corresponding element is valid.

**See also:**

[`isna`](#) boolean inverse of `pandas.notna`.

[`Series.notna`](#) Detect valid values in a Series.

[`DataFrame.notna`](#) Detect valid values in a DataFrame.

[`Index.notna`](#) Detect valid values in an Index.

## Examples

Scalar arguments (including strings) result in a scalar boolean.

```
>>> pd.notna('dog')
True
```

```
>>> pd.notna(np.nan)
False
```

ndarrays result in an ndarray of booleans.

```
>>> array = np.array([[1, np.nan, 3], [4, 5, np.nan]])
>>> array
array([[ 1., nan,  3.],
       [ 4.,  5., nan]])
>>> pd.notna(array)
array([[ True, False,  True],
       [ True,  True, False]])
```

For indexes, an ndarray of booleans is returned.

```
>>> index = pd.DatetimeIndex(["2017-07-05", "2017-07-06", None,
...                           "2017-07-08"])
>>> index
DatetimeIndex(['2017-07-05', '2017-07-06', 'NaT', '2017-07-08'],
              dtype='datetime64[ns]', freq=None)
>>> pd.notna(index)
array([ True,  True, False,  True])
```

For Series and DataFrame, the same type is returned, containing booleans.

```
>>> df = pd.DataFrame(['ant', 'bee', 'cat'], ['dog', None, 'fly'])
>>> df
   0    1    2
0 ant  bee cat
```

(continues on next page)

(continued from previous page)

```

1  dog  None  fly
>>> pd.isna(df)
      0      1      2
0  True   True   True
1  True  False   True

```

```

>>> pd.isna(df[1])
0      True
1     False
Name: 1, dtype: bool

```

### 34.2.2.4 pandas.isnull

`pandas.isnull(obj)`

Detect non-missing values for an array-like object.

This function takes a scalar or array-like object and indicates whether values are valid (not missing, which is NaN in numeric arrays, None or NaN in object arrays, NaT in datetimelike).

**Parameters** `obj` : array-like or object value

Object to check for *not* null or *non*-missing values.

**Returns** `bool` or `array-like of bool`

For scalar input, returns a scalar boolean. For array input, returns an array of boolean indicating whether each corresponding element is valid.

**See also:**

[`isna`](#) boolean inverse of `pandas.isna`.

[`Series.isna`](#) Detect valid values in a Series.

[`DataFrame.isna`](#) Detect valid values in a DataFrame.

[`Index.isna`](#) Detect valid values in an Index.

### Examples

Scalar arguments (including strings) result in a scalar boolean.

```

>>> pd.isna('dog')
True

```

```

>>> pd.isna(np.nan)
False

```

ndarrays result in an ndarray of booleans.

```

>>> array = np.array([[1, np.nan, 3], [4, 5, np.nan]])
>>> array
array([[ 1., nan,  3.],
       [ 4.,  5., nan]])
>>> pd.isna(array)

```

(continues on next page)

(continued from previous page)

```
array([[ True, False,  True],
       [ True,  True, False]])
```

For indexes, an ndarray of booleans is returned.

```
>>> index = pd.DatetimeIndex(["2017-07-05", "2017-07-06", None,
...                           "2017-07-08"])
>>> index
DatetimeIndex(['2017-07-05', '2017-07-06', 'NaT', '2017-07-08'],
              dtype='datetime64[ns]', freq=None)
>>> pd.notna(index)
array([ True,  True, False,  True])
```

For Series and DataFrame, the same type is returned, containing booleans.

```
>>> df = pd.DataFrame(['ant', 'bee', 'cat'], ['dog', None, 'fly'])
>>> df
   0    1    2
0  ant  bee  cat
1  dog None fly
>>> pd.notna(df)
   0    1    2
0  True  True  True
1  True False  True
```

```
>>> pd.notna(df[1])
0    True
1   False
Name: 1, dtype: bool
```

### 34.2.3 Top-level conversions

---

`to_numeric(arg[, errors, downcast])`

---

Convert argument to a numeric type.

#### 34.2.3.1 pandas.to\_numeric

`pandas.to_numeric(arg, errors='raise', downcast=None)`

Convert argument to a numeric type.

##### Parameters

**arg** [list, tuple, 1-d array, or Series]

**errors** : { 'ignore', 'raise', 'coerce' }, default 'raise'

- If 'raise', then invalid parsing will raise an exception
- If 'coerce', then invalid parsing will be set as NaN
- If 'ignore', then invalid parsing will return the input

**downcast** : { 'integer', 'signed', 'unsigned', 'float' }, default None

If not None, and if the data has been successfully cast to a numerical dtype (or if the data was numeric to begin with), downcast that resulting data to the smallest numerical dtype possible according to the following rules:

- ‘integer’ or ‘signed’: smallest signed int dtype (min.: np.int8)
- ‘unsigned’: smallest unsigned int dtype (min.: np.uint8)
- ‘float’: smallest float dtype (min.: np.float32)

As this behaviour is separate from the core conversion to numeric values, any errors raised during the downcasting will be surfaced regardless of the value of the ‘errors’ input.

In addition, downcasting will only occur if the size of the resulting data’s dtype is strictly larger than the dtype it is to be cast to, so if none of the dtypes checked satisfy that specification, no downcasting will be performed on the data.

New in version 0.19.0.

**Returns** `ret` : numeric if parsing succeeded.

Return type depends on input. Series if Series, otherwise ndarray

**See also:**

`pandas.DataFrame.astype` Cast argument to a specified dtype.

`pandas.to_datetime` Convert argument to datetime.

`pandas.to_timedelta` Convert argument to timedelta.

`numpy.ndarray.astype` Cast a numpy array to a specified type.

## Examples

Take separate series and convert to numeric, coercing when told to

```
>>> import pandas as pd
>>> s = pd.Series(['1.0', '2', -3])
>>> pd.to_numeric(s)
0    1.0
1    2.0
2   -3.0
dtype: float64
>>> pd.to_numeric(s, downcast='float')
0    1.0
1    2.0
2   -3.0
dtype: float32
>>> pd.to_numeric(s, downcast='signed')
0     1
1     2
2    -3
dtype: int8
>>> s = pd.Series(['apple', '1.0', '2', -3])
>>> pd.to_numeric(s, errors='ignore')
0    apple
1     1.0
2      2
3     -3
dtype: object
>>> pd.to_numeric(s, errors='coerce')
0     NaN
```

(continues on next page)

(continued from previous page)

```

1      1.0
2      2.0
3     -3.0
dtype: float64

```

### 34.2.4 Top-level dealing with datetimelike

<code>to_datetime(arg[, errors, dayfirst, ...])</code>	Convert argument to datetime.
<code>to_timedelta(arg[, unit, box, errors])</code>	Convert argument to timedelta
<code>date_range([start, end, periods, freq, tz, ...])</code>	Return a fixed frequency DatetimeIndex.
<code>bdate_range([start, end, periods, freq, tz, ...])</code>	Return a fixed frequency DatetimeIndex, with business day as the default frequency
<code>period_range([start, end, periods, freq, name])</code>	Return a fixed frequency PeriodIndex, with day (calendar) as the default frequency
<code>timedelta_range([start, end, periods, freq, ...])</code>	Return a fixed frequency TimedeltaIndex, with day as the default frequency
<code>infer_freq(index[, warn])</code>	Infer the most likely frequency given the input index.

#### 34.2.4.1 pandas.to\_datetime

`pandas.to_datetime` (*arg*, *errors*='raise', *dayfirst*=False, *yearfirst*=False, *utc*=None, *box*=True, *format*=None, *exact*=True, *unit*=None, *infer\_datetime\_format*=False, *origin*='unix', *cache*=False)

Convert argument to datetime.

**Parameters** *arg* : integer, float, string, datetime, list, tuple, 1-d array, Series

New in version 0.18.1: or DataFrame/dict-like

**errors** : { 'ignore', 'raise', 'coerce' }, default 'raise'

- If 'raise', then invalid parsing will raise an exception
- If 'coerce', then invalid parsing will be set as NaT
- If 'ignore', then invalid parsing will return the input

**dayfirst** : boolean, default False

Specify a date parse order if *arg* is str or its list-likes. If True, parses dates with the day first, eg 10/11/12 is parsed as 2012-11-10. Warning: dayfirst=True is not strict, but will prefer to parse with day first (this is a known bug, based on dateutil behavior).

**yearfirst** : boolean, default False

Specify a date parse order if *arg* is str or its list-likes.

- If True parses dates with the year first, eg 10/11/12 is parsed as 2010-11-12.
- If both dayfirst and yearfirst are True, yearfirst is preceded (same as dateutil).

Warning: yearfirst=True is not strict, but will prefer to parse with year first (this is a known bug, based on dateutil behavior).

New in version 0.16.1.

**utc** : boolean, default None

Return UTC DatetimeIndex if True (converting any tz-aware datetime.datetime objects as well).

**box** : boolean, default True

- If True returns a DatetimeIndex
- If False returns ndarray of values.

**format** : string, default None

strftime to parse time, eg “%d/%m/%Y”, note that “%f” will parse all the way up to nanoseconds.

**exact** : boolean, True by default

- If True, require an exact format match.
- If False, allow the format to match anywhere in the target string.

**unit** : string, default ‘ns’

unit of the arg (D,s,ms,us,ns) denote the unit, which is an integer or float number. This will be based off the origin. Example, with unit=‘ms’ and origin=‘unix’ (the default), this would calculate the number of milliseconds to the unix epoch start.

**infer\_datetime\_format** : boolean, default False

If True and no *format* is given, attempt to infer the format of the datetime strings, and if it can be inferred, switch to a faster method of parsing them. In some cases this can increase the parsing speed by ~5-10x.

**origin** : scalar, default is ‘unix’

Define the reference date. The numeric values would be parsed as number of units (defined by *unit*) since this reference date.

- If ‘unix’ (or POSIX) time; origin is set to 1970-01-01.
- If ‘julian’, unit must be ‘D’, and origin is set to beginning of Julian Calendar. Julian day number 0 is assigned to the day starting at noon on January 1, 4713 BC.
- If Timestamp convertible, origin is set to Timestamp identified by origin.

New in version 0.20.0.

**cache** : boolean, default False

If True, use a cache of unique, converted dates to apply the datetime conversion. May produce significant speed-up when parsing duplicate date strings, especially ones with timezone offsets.

New in version 0.23.0.

**Returns** **ret** : datetime if parsing succeeded.

Return type depends on input:

- list-like: DatetimeIndex
- Series: Series of datetime64 dtype
- scalar: Timestamp

In case when it is not possible to return designated types (e.g. when any element of input is before Timestamp.min or after Timestamp.max) return will have datetime.datetime type (or corresponding array/Series).

See also:

`pandas.DataFrame.astype` Cast argument to a specified dtype.

`pandas.to_timedelta` Convert argument to timedelta.

## Examples

Assembling a datetime from multiple columns of a DataFrame. The keys can be common abbreviations like ['year', 'month', 'day', 'minute', 'second', 'ms', 'us', 'ns']) or plurals of the same

```
>>> df = pd.DataFrame({'year': [2015, 2016],
                        'month': [2, 3],
                        'day': [4, 5]})
>>> pd.to_datetime(df)
0    2015-02-04
1    2016-03-05
dtype: datetime64[ns]
```

If a date does not meet the [timestamp limitations](#), passing `errors='ignore'` will return the original input instead of raising any exception.

Passing `errors='coerce'` will force an out-of-bounds date to NaT, in addition to forcing non-dates (or non-parseable dates) to NaT.

```
>>> pd.to_datetime('13000101', format='%Y%m%d', errors='ignore')
datetime.datetime(1300, 1, 1, 0, 0)
>>> pd.to_datetime('13000101', format='%Y%m%d', errors='coerce')
NaT
```

Passing `infer_datetime_format=True` can often-times speedup a parsing if its not an ISO8601 format exactly, but in a regular format.

```
>>> s = pd.Series(['3/11/2000', '3/12/2000', '3/13/2000']*1000)
```

```
>>> s.head()
0    3/11/2000
1    3/12/2000
2    3/13/2000
3    3/11/2000
4    3/12/2000
dtype: object
```

```
>>> %timeit pd.to_datetime(s,infer_datetime_format=True)
100 loops, best of 3: 10.4 ms per loop
```

```
>>> %timeit pd.to_datetime(s,infer_datetime_format=False)
1 loop, best of 3: 471 ms per loop
```

Using a unix epoch time

```
>>> pd.to_datetime(1490195805, unit='s')
Timestamp('2017-03-22 15:16:45')
>>> pd.to_datetime(1490195805433502912, unit='ns')
Timestamp('2017-03-22 15:16:45.433502912')
```

**Warning:** For float arg, precision rounding might happen. To prevent unexpected behavior use a fixed-width exact type.

Using a non-unix epoch origin

```
>>> pd.to_datetime([1, 2, 3], unit='D',
                    origin=pd.Timestamp('1960-01-01'))
0    1960-01-02
1    1960-01-03
2    1960-01-04
```

#### 34.2.4.2 pandas.to\_timedelta

`pandas.to_timedelta(arg, unit='ns', box=True, errors='raise')`

Convert argument to timedelta

##### Parameters

**arg** [string, timedelta, list, tuple, 1-d array, or Series]

**unit** : unit of the arg (D,h,m,s,ms,us,ns) denote the unit, which is an integer/float number

**box** : boolean, default True

- If True returns a Timedelta/TimedeltaIndex of the results
- if False returns a np.timedelta64 or ndarray of values of dtype timedelta64[ns]

**errors** : {'ignore', 'raise', 'coerce'}, default 'raise'

- If 'raise', then invalid parsing will raise an exception
- If 'coerce', then invalid parsing will be set as NaT
- If 'ignore', then invalid parsing will return the input

##### Returns

**ret** [timedelta64/arrays of timedelta64 if parsing succeeded]

See also:

[`pandas.DataFrame.astype`](#) Cast argument to a specified dtype.

[`pandas.to\_datetime`](#) Convert argument to datetime.

#### Examples

Parsing a single string to a Timedelta:

```
>>> pd.to_timedelta('1 days 06:05:01.00003')
Timedelta('1 days 06:05:01.000030')
>>> pd.to_timedelta('15.5us')
Timedelta('0 days 00:00:00.000015')
```

Parsing a list or array of strings:

```
>>> pd.to_timedelta(['1 days 06:05:01.00003', '15.5us', 'nan'])
TimedeltaIndex(['1 days 06:05:01.000030', '0 days 00:00:00.000015', NaT],
               dtype='timedelta64[ns]', freq=None)
```

Converting numbers by specifying the *unit* keyword argument:

```
>>> pd.to_timedelta(np.arange(5), unit='s')
TimedeltaIndex(['00:00:00', '00:00:01', '00:00:02',
               '00:00:03', '00:00:04'],
               dtype='timedelta64[ns]', freq=None)
>>> pd.to_timedelta(np.arange(5), unit='d')
TimedeltaIndex(['0 days', '1 days', '2 days', '3 days', '4 days'],
               dtype='timedelta64[ns]', freq=None)
```

### 34.2.4.3 pandas.date\_range

`pandas.date_range` (*start=None, end=None, periods=None, freq=None, tz=None, normalize=False, name=None, closed=None, \*\*kwargs*)

Return a fixed frequency DatetimeIndex.

**Parameters** **start** : str or datetime-like, optional

Left bound for generating dates.

**end** : str or datetime-like, optional

Right bound for generating dates.

**periods** : integer, optional

Number of periods to generate.

**freq** : str or DateOffset, default 'D' (calendar daily)

Frequency strings can have multiples, e.g. '5H'. See [here](#) for a list of frequency aliases.

**tz** : str or tzinfo, optional

Time zone name for returning localized DatetimeIndex, for example 'Asia/Hong\_Kong'. By default, the resulting DatetimeIndex is timezone-naive.

**normalize** : bool, default False

Normalize start/end dates to midnight before generating date range.

**name** : str, default None

Name of the resulting DatetimeIndex.

**closed** : {None, 'left', 'right'}, optional

Make the interval closed with respect to the given frequency to the 'left', 'right', or both sides (None, the default).

**\*\*kwargs**

For compatibility. Has no effect on the result.

**Returns**

**rng** [DatetimeIndex]

See also:

**`pandas.DatetimeIndex`** An immutable container for datetimes.

**`pandas.timedelta_range`** Return a fixed frequency TimedeltaIndex.

**`pandas.period_range`** Return a fixed frequency PeriodIndex.

**`pandas.interval_range`** Return a fixed frequency IntervalIndex.

## Notes

Of the four parameters `start`, `end`, `periods`, and `freq`, exactly three must be specified. If `freq` is omitted, the resulting `DatetimeIndex` will have periods linearly spaced elements between `start` and `end` (closed on both sides).

To learn more about the frequency strings, please see [this link](#).

## Examples

### Specifying the values

The next four examples generate the same `DatetimeIndex`, but vary the combination of `start`, `end` and `periods`.

Specify `start` and `end`, with the default daily frequency.

```
>>> pd.date_range(start='1/1/2018', end='1/08/2018')
DatetimeIndex(['2018-01-01', '2018-01-02', '2018-01-03', '2018-01-04',
               '2018-01-05', '2018-01-06', '2018-01-07', '2018-01-08'],
              dtype='datetime64[ns]', freq='D')
```

Specify `start` and `periods`, the number of periods (days).

```
>>> pd.date_range(start='1/1/2018', periods=8)
DatetimeIndex(['2018-01-01', '2018-01-02', '2018-01-03', '2018-01-04',
               '2018-01-05', '2018-01-06', '2018-01-07', '2018-01-08'],
              dtype='datetime64[ns]', freq='D')
```

Specify `end` and `periods`, the number of periods (days).

```
>>> pd.date_range(end='1/1/2018', periods=8)
DatetimeIndex(['2017-12-25', '2017-12-26', '2017-12-27', '2017-12-28',
               '2017-12-29', '2017-12-30', '2017-12-31', '2018-01-01'],
              dtype='datetime64[ns]', freq='D')
```

Specify `start`, `end`, and `periods`; the frequency is generated automatically (linearly spaced).

```
>>> pd.date_range(start='2018-04-24', end='2018-04-27', periods=3)
DatetimeIndex(['2018-04-24 00:00:00', '2018-04-25 12:00:00',
               '2018-04-27 00:00:00'], freq=None)
```

### Other Parameters

Changed the `freq` (frequency) to 'M' (month end frequency).

```
>>> pd.date_range(start='1/1/2018', periods=5, freq='M')
DatetimeIndex(['2018-01-31', '2018-02-28', '2018-03-31', '2018-04-30',
               '2018-05-31'],
              dtype='datetime64[ns]', freq='M')
```

Multiples are allowed

```
>>> pd.date_range(start='1/1/2018', periods=5, freq='3M')
DatetimeIndex(['2018-01-31', '2018-04-30', '2018-07-31', '2018-10-31',
              '2019-01-31'],
              dtype='datetime64[ns]', freq='3M')
```

*freq* can also be specified as an Offset object.

```
>>> pd.date_range(start='1/1/2018', periods=5, freq=pd.offsets.MonthEnd(3))
DatetimeIndex(['2018-01-31', '2018-04-30', '2018-07-31', '2018-10-31',
              '2019-01-31'],
              dtype='datetime64[ns]', freq='3M')
```

Specify *tz* to set the timezone.

```
>>> pd.date_range(start='1/1/2018', periods=5, tz='Asia/Tokyo')
DatetimeIndex(['2018-01-01 00:00:00+09:00', '2018-01-02 00:00:00+09:00',
              '2018-01-03 00:00:00+09:00', '2018-01-04 00:00:00+09:00',
              '2018-01-05 00:00:00+09:00'],
              dtype='datetime64[ns, Asia/Tokyo]', freq='D')
```

*closed* controls whether to include *start* and *end* that are on the boundary. The default includes boundary points on either end.

```
>>> pd.date_range(start='2017-01-01', end='2017-01-04', closed=None)
DatetimeIndex(['2017-01-01', '2017-01-02', '2017-01-03', '2017-01-04'],
              dtype='datetime64[ns]', freq='D')
```

Use *closed='left'* to exclude *end* if it falls on the boundary.

```
>>> pd.date_range(start='2017-01-01', end='2017-01-04', closed='left')
DatetimeIndex(['2017-01-01', '2017-01-02', '2017-01-03'],
              dtype='datetime64[ns]', freq='D')
```

Use *closed='right'* to exclude *start* if it falls on the boundary.

```
>>> pd.date_range(start='2017-01-01', end='2017-01-04', closed='right')
DatetimeIndex(['2017-01-02', '2017-01-03', '2017-01-04'],
              dtype='datetime64[ns]', freq='D')
```

#### 34.2.4.4 pandas.bdate\_range

`pandas.bdate_range` (*start=None, end=None, periods=None, freq='B', tz=None, normalize=True, name=None, weekmask=None, holidays=None, closed=None, \*\*kwargs*)

Return a fixed frequency DatetimeIndex, with business day as the default frequency

**Parameters** *start* : string or datetime-like, default None

Left bound for generating dates

*end* : string or datetime-like, default None

Right bound for generating dates

*periods* : integer, default None

Number of periods to generate

*freq* : string or DateOffset, default 'B' (business daily)

Frequency strings can have multiples, e.g. '5H'

**tz** : string or None

Time zone name for returning localized DatetimeIndex, for example Asia/Beijing

**normalize** : bool, default False

Normalize start/end dates to midnight before generating date range

**name** : string, default None

Name of the resulting DatetimeIndex

**weekmask** : string or None, default None

Weekmask of valid business days, passed to `numpy.busdaycalendar`, only used when custom frequency strings are passed. The default value None is equivalent to 'Mon Tue Wed Thu Fri'

New in version 0.21.0.

**holidays** : list-like or None, default None

Dates to exclude from the set of valid business days, passed to `numpy.busdaycalendar`, only used when custom frequency strings are passed

New in version 0.21.0.

**closed** : string, default None

Make the interval closed with respect to the given frequency to the 'left', 'right', or both sides (None)

#### Returns

**rng** [DatetimeIndex]

#### Notes

Of the four parameters: `start`, `end`, `periods`, and `freq`, exactly three must be specified. Specifying `freq` is a requirement for `bdate_range`. Use `date_range` if specifying `freq` is not desired.

To learn more about the frequency strings, please see [this link](#).

#### 34.2.4.5 pandas.period\_range

`pandas.period_range` (*start=None, end=None, periods=None, freq='D', name=None*)

Return a fixed frequency PeriodIndex, with day (calendar) as the default frequency

**Parameters** **start** : string or period-like, default None

Left bound for generating periods

**end** : string or period-like, default None

Right bound for generating periods

**periods** : integer, default None

Number of periods to generate

**freq** : string or DateOffset, default 'D' (calendar daily)

Frequency alias

**name** : string, default None

Name of the resulting PeriodIndex

#### Returns

**prng** [PeriodIndex]

#### Notes

Of the three parameters: start, end, and periods, exactly two must be specified.

To learn more about the frequency strings, please see [this link](#).

#### Examples

```
>>> pd.period_range(start='2017-01-01', end='2018-01-01', freq='M')
PeriodIndex(['2017-01', '2017-02', '2017-03', '2017-04', '2017-05',
            '2017-06', '2017-06', '2017-07', '2017-08', '2017-09',
            '2017-10', '2017-11', '2017-12', '2018-01'],
            dtype='period[M]', freq='M')
```

If start or end are Period objects, they will be used as anchor endpoints for a PeriodIndex with frequency matching that of the period\_range constructor.

```
>>> pd.period_range(start=pd.Period('2017Q1', freq='Q'),
...                 end=pd.Period('2017Q2', freq='Q'), freq='M')
PeriodIndex(['2017-03', '2017-04', '2017-05', '2017-06'],
            dtype='period[M]', freq='M')
```

#### 34.2.4.6 pandas.timedelta\_range

`pandas.timedelta_range` (*start=None, end=None, periods=None, freq=None, name=None, closed=None*)

Return a fixed frequency TimedeltaIndex, with day as the default frequency

**Parameters** **start** : string or timedelta-like, default None

Left bound for generating timedeltas

**end** : string or timedelta-like, default None

Right bound for generating timedeltas

**periods** : integer, default None

Number of periods to generate

**freq** : string or DateOffset, default 'D' (calendar daily)

Frequency strings can have multiples, e.g. '5H'

**name** : string, default None

Name of the resulting TimedeltaIndex

**closed** : string, default None

Make the interval closed with respect to the given frequency to the 'left', 'right', or both sides (None)

**Returns****rng** [TimedeltaIndex]**Notes**

Of the four parameters `start`, `end`, `periods`, and `freq`, exactly three must be specified. If `freq` is omitted, the resulting `TimedeltaIndex` will have periods linearly spaced elements between `start` and `end` (closed on both sides).

To learn more about the frequency strings, please see [this link](#).

**Examples**

```
>>> pd.timedelta_range(start='1 day', periods=4)
TimedeltaIndex(['1 days', '2 days', '3 days', '4 days'],
                dtype='timedelta64[ns]', freq='D')
```

The `closed` parameter specifies which endpoint is included. The default behavior is to include both endpoints.

```
>>> pd.timedelta_range(start='1 day', periods=4, closed='right')
TimedeltaIndex(['2 days', '3 days', '4 days'],
                dtype='timedelta64[ns]', freq='D')
```

The `freq` parameter specifies the frequency of the `TimedeltaIndex`. Only fixed frequencies can be passed, non-fixed frequencies such as 'M' (month end) will raise.

```
>>> pd.timedelta_range(start='1 day', end='2 days', freq='6H')
TimedeltaIndex(['1 days 00:00:00', '1 days 06:00:00', '1 days 12:00:00',
                '1 days 18:00:00', '2 days 00:00:00'],
                dtype='timedelta64[ns]', freq='6H')
```

Specify `start`, `end`, and `periods`; the frequency is generated automatically (linearly spaced).

```
>>> pd.timedelta_range(start='1 day', end='5 days', periods=4)
TimedeltaIndex(['1 days 00:00:00', '2 days 08:00:00', '3 days 16:00:00',
                '5 days 00:00:00'],
                dtype='timedelta64[ns]', freq=None)
```

**34.2.4.7 pandas.infer\_freq**

`pandas.infer_freq(index, warn=True)`

Infer the most likely frequency given the input index. If the frequency is uncertain, a warning will be printed.

**Parameters** `index` : DatetimeIndex or TimedeltaIndex

if passed a Series will use the values of the series (NOT THE INDEX)

**warn** [boolean, default True]

**Returns** `freq` : string or None

None if no discernible frequency  
 TypeError if the index is not datetime-like  
 ValueError if there are less than three values.

## 34.2.5 Top-level dealing with intervals

---

<code>interval_range([start, end, periods, freq, ...])</code>	Return a fixed frequency IntervalIndex
---	--

---

### 34.2.5.1 pandas.interval\_range

`pandas.interval_range` (*start=None, end=None, periods=None, freq=None, name=None, closed='right'*)

Return a fixed frequency IntervalIndex

**Parameters** **start** : numeric or datetime-like, default None

Left bound for generating intervals

**end** : numeric or datetime-like, default None

Right bound for generating intervals

**periods** : integer, default None

Number of periods to generate

**freq** : numeric, string, or DateOffset, default None

The length of each interval. Must be consistent with the type of start and end, e.g. 2 for numeric, or '5H' for datetime-like. Default is 1 for numeric and 'D' (calendar daily) for datetime-like.

**name** : string, default None

Name of the resulting IntervalIndex

**closed** : { 'left', 'right', 'both', 'neither' }, default 'right'

Whether the intervals are closed on the left-side, right-side, both or neither.

**Returns**

**rng** [IntervalIndex]

**See also:**

**IntervalIndex** an Index of intervals that are all closed on the same side.

### Notes

Of the four parameters `start`, `end`, `periods`, and `freq`, exactly three must be specified. If `freq` is omitted, the resulting `IntervalIndex` will have `periods` linearly spaced elements between `start` and `end`, inclusively.

To learn more about datetime-like frequency strings, please see [this link](#).

### Examples

Numeric `start` and `end` is supported.

```
>>> pd.interval_range(start=0, end=5)
IntervalIndex([(0, 1], (1, 2], (2, 3], (3, 4], (4, 5])
              closed='right', dtype='interval[int64]')
```

Additionally, datetime-like input is also supported.

```
>>> pd.interval_range(start=pd.Timestamp('2017-01-01'),
                      end=pd.Timestamp('2017-01-04'))
IntervalIndex([(2017-01-01, 2017-01-02], (2017-01-02, 2017-01-03],
              (2017-01-03, 2017-01-04]]
              closed='right', dtype='interval[datetime64[ns]]')
```

The `freq` parameter specifies the frequency between the left and right endpoints of the individual intervals within the `IntervalIndex`. For numeric start and end, the frequency must also be numeric.

```
>>> pd.interval_range(start=0, periods=4, freq=1.5)
IntervalIndex([(0.0, 1.5], (1.5, 3.0], (3.0, 4.5], (4.5, 6.0]]
              closed='right', dtype='interval[float64]')
```

Similarly, for datetime-like start and end, the frequency must be convertible to a `DateOffset`.

```
>>> pd.interval_range(start=pd.Timestamp('2017-01-01'),
                      periods=3, freq='MS')
IntervalIndex([(2017-01-01, 2017-02-01], (2017-02-01, 2017-03-01],
              (2017-03-01, 2017-04-01]]
              closed='right', dtype='interval[datetime64[ns]]')
```

Specify start, end, and periods; the frequency is generated automatically (linearly spaced).

```
>>> pd.interval_range(start=0, end=6, periods=4)
IntervalIndex([(0.0, 1.5], (1.5, 3.0], (3.0, 4.5], (4.5, 6.0]]
              closed='right',
              dtype='interval[float64]')
```

The `closed` parameter specifies which endpoints of the individual intervals within the `IntervalIndex` are closed.

```
>>> pd.interval_range(end=5, periods=4, closed='both')
IntervalIndex([[1, 2], [2, 3], [3, 4], [4, 5]]
              closed='both', dtype='interval[int64]')
```

## 34.2.6 Top-level evaluation

---

<code>eval(expr[, parser, engine, truediv, ...])</code>	Evaluate a Python expression as a string using various backends.
---	--

---

### 34.2.6.1 pandas.eval

`pandas.eval(expr, parser='pandas', engine=None, truediv=True, local_dict=None, global_dict=None, resolvers=(), level=0, target=None, inplace=False)`  
 Evaluate a Python expression as a string using various backends.

The following arithmetic operations are supported: `+`, `-`, `*`, `/`, `**`, `%`, `//` (python engine only) along with the following boolean operations: `|` (or), `&` (and), and `~` (not). Additionally, the 'pandas' parser allows the use of `and`, `or`, and `not` with the same semantics as the corresponding bitwise operators. *Series* and *DataFrame* objects are supported and behave as they would with plain ol' Python evaluation.

**Parameters** `expr` : str or unicode

The expression to evaluate. This string cannot contain any Python *statements*, only

Python [expressions](#).

**parser** : string, default 'pandas', {'pandas', 'python'}

The parser to use to construct the syntax tree from the expression. The default of 'pandas' parses code slightly different than standard Python. Alternatively, you can parse an expression using the 'python' parser to retain strict Python semantics. See the [enhancing performance](#) documentation for more details.

**engine** : string or None, default 'numexpr', {'python', 'numexpr'}

The engine used to evaluate the expression. Supported engines are

- **None** : tries to use `numexpr`, falls back to `python`
- **'numexpr'** : **This default engine evaluates pandas objects using `numexpr`** for large speed ups in complex expressions with large frames.
- **'python'** : **Performs operations as if you had `eval`'d in top** level python. This engine is generally not that useful.

More backends may be available in the future.

**truediv** : bool, optional

Whether to use true division, like in Python `>= 3`

**local\_dict** : dict or None, optional

A dictionary of local variables, taken from `locals()` by default.

**global\_dict** : dict or None, optional

A dictionary of global variables, taken from `globals()` by default.

**resolvers** : list of dict-like or None, optional

A list of objects implementing the `__getitem__` special method that you can use to inject an additional collection of namespaces to use for variable lookup. For example, this is used in the [query\(\)](#) method to inject the `DataFrame.index` and `DataFrame.columns` variables that refer to their respective [DataFrame](#) instance attributes.

**level** : int, optional

The number of prior stack frames to traverse and add to the current scope. Most users will **not** need to change this parameter.

**target** : object, optional, default None

This is the target object for assignment. It is used when there is variable assignment in the expression. If so, then *target* must support item assignment with string keys, and if a copy is being returned, it must also support `.copy()`.

**inplace** : bool, default False

If *target* is provided, and the expression mutates *target*, whether to modify *target* in-place. Otherwise, return a copy of *target* with the mutation.

## Returns

**ndarray, numeric scalar, DataFrame, Series**

## Raises ValueError

There are many instances where such an error can be raised:

- *target=None*, but the expression is multiline.
- The expression is multiline, but not all them have item assignment. An example of such an arrangement is this:  

$$a = b + 1 \quad a + 2$$

Here, there are expressions on different lines, making it multiline, but the last line has no variable assigned to the output of  $a + 2$ .
- *inplace=True*, but the expression is missing item assignment.
- Item assignment is provided, but the *target* does not support string item assignment.
- Item assignment is provided and *inplace=False*, but the *target* does not support the *.copy()* method

See also:

`pandas.DataFrame.query`, `pandas.DataFrame.eval`

## Notes

The `dtype` of any objects involved in an arithmetic `%` operation are recursively cast to `float64`.

See the [enhancing performance](#) documentation for more details.

## 34.2.7 Testing

---

```
test([extra_args])
```

---

### 34.2.7.1 pandas.test

`pandas.test` (*extra\_args=None*)

## 34.3 Series

### 34.3.1 Constructor

---

<code>Series([data, index, dtype, name, copy, ...])</code>	One-dimensional ndarray with axis labels (including time series).
--	---

---

#### 34.3.1.1 pandas.Series

**class** `pandas.Series` (*data=None, index=None, dtype=None, name=None, copy=False, fastpath=False*)

One-dimensional ndarray with axis labels (including time series).

Labels need not be unique but must be a hashable type. The object supports both integer- and label-based indexing and provides a host of methods for performing operations involving the index. Statistical methods from ndarray have been overridden to automatically exclude missing data (currently represented as NaN).

Operations between Series (+, -, /, \*) align values based on their associated index values— they need not be the

same length. The result index will be the sorted union of the two indexes.

**Parameters** **data** : array-like, dict, or scalar value

Contains data stored in Series

Changed in version 0.23.0: If data is a dict, argument order is maintained for Python 3.6 and later.

**index** : array-like or Index (1d)

Values must be hashable and have the same length as *data*. Non-unique index values are allowed. Will default to RangeIndex (0, 1, 2, ..., n) if not provided. If both a dict and index sequence are used, the index will override the keys found in the dict.

**dtype** : numpy.dtype or None

If None, dtype will be inferred

**copy** : boolean, default False

Copy input data

### Attributes

<i>T</i>	return the transpose, which is by definition self
<i>asobject</i>	Return object Series which contains boxed values.
<i>at</i>	Access a single value for a row/column label pair.
<i>axes</i>	Return a list of the row axis labels
<i>base</i>	return the base object if the memory of the underlying data is shared
<i>blocks</i>	(DEPRECATED) Internal property, property synonym for <i>as_blocks()</i>
<i>data</i>	return the data pointer of the underlying data
<i>dtype</i>	return the dtype object of the underlying data
<i>dtypes</i>	return the dtype object of the underlying data
<i>flags</i>	
<i>ftype</i>	return if the data is sparsedense
<i>ftypes</i>	return if the data is sparsedense
<i>hasnans</i>	return if I have any nans; enables various perf speedups
<i>iat</i>	Access a single value for a row/column pair by integer position.
<i>iloc</i>	Purely integer-location based indexing for selection by position.
<i>index</i>	The index (axis labels) of the Series.
<i>is_monotonic</i>	Return boolean if values in the object are monotonic_increasing
<i>is_monotonic_decreasing</i>	Return boolean if values in the object are monotonic_decreasing
<i>is_monotonic_increasing</i>	Return boolean if values in the object are monotonic_increasing
<i>is_unique</i>	Return boolean if values in the object are unique
<i>itemsize</i>	return the size of the dtype of the item of the underlying data

Continued on next page

Table 24 – continued from previous page

<code>ix</code>	A primarily label-location based indexer, with integer position fallback.
<code>loc</code>	Access a group of rows and columns by label(s) or a boolean array.
<code>nbytes</code>	return the number of bytes in the underlying data
<code>ndim</code>	return the number of dimensions of the underlying data, by definition 1
<code>shape</code>	return a tuple of the shape of the underlying data
<code>size</code>	return the number of elements in the underlying data
<code>strides</code>	return the strides of the underlying data
<code>values</code>	Return Series as ndarray or ndarray-like depending on the dtype

**pandas.Series.T**`Series.T`

return the transpose, which is by definition self

**pandas.Series.asobject**`Series.asobject`

Return object Series which contains boxed values.

Deprecated since version 0.23.0: Use `astype(object)` instead.*this is an internal non-public method***pandas.Series.at**`Series.at`

Access a single value for a row/column label pair.

Similar to `loc`, in that both provide label-based lookups. Use `at` if you only need to get or set a single value in a DataFrame or Series.**Raises KeyError**

When label does not exist in DataFrame

**See also:****`DataFrame.iat`** Access a single value for a row/column pair by integer position**`DataFrame.loc`** Access a group of rows and columns by label(s)**`Series.at`** Access a single value using a label**Examples**

```
>>> df = pd.DataFrame([[0, 2, 3], [0, 4, 1], [10, 20, 30]],
...                    index=[4, 5, 6], columns=['A', 'B', 'C'])
>>> df
```

(continues on next page)

(continued from previous page)

	A	B	C
4	0	2	3
5	0	4	1
6	10	20	30

Get value at specified row/column pair

```
>>> df.at[4, 'B']  
2
```

Set value at specified row/column pair

```
>>> df.at[4, 'B'] = 10  
>>> df.at[4, 'B']  
10
```

Get value within a Series

```
>>> df.loc[5].at['B']  
4
```

## pandas.Series.axes

**Series.axes**

Return a list of the row axis labels

## pandas.Series.base

**Series.base**

return the base object if the memory of the underlying data is shared

## pandas.Series.blocks

**Series.blocks**

Internal property, property synonym for `as_blocks()`

Deprecated since version 0.21.0.

## pandas.Series.data

**Series.data**

return the data pointer of the underlying data

## pandas.Series.dtype

**Series.dtype**

return the dtype object of the underlying data

### **pandas.Series.dtypes**

#### **Series.dtypes**

return the dtype object of the underlying data

### **pandas.Series.flags**

#### **Series.flags**

### **pandas.Series.ftype**

#### **Series.ftype**

return if the data is sparsedense

### **pandas.Series.ftypes**

#### **Series.ftypes**

return if the data is sparsedense

### **pandas.Series.hasnans**

#### **Series.hasnans**

return if I have any nans; enables various perf speedups

### **pandas.Series.iat**

#### **Series.iat**

Access a single value for a row/column pair by integer position.

Similar to `iloc`, in that both provide integer-based lookups. Use `iat` if you only need to get or set a single value in a DataFrame or Series.

#### **Raises IndexError**

When integer position is out of bounds

#### **See also:**

**DataFrame.at** Access a single value for a row/column label pair

**DataFrame.loc** Access a group of rows and columns by label(s)

**DataFrame.iloc** Access a group of rows and columns by integer position(s)

### **Examples**

```
>>> df = pd.DataFrame([[0, 2, 3], [0, 4, 1], [10, 20, 30]],
...                     columns=['A', 'B', 'C'])
>>> df
   A  B  C
0  0  2  3
1  0  4  1
2 10 20 30
```

Get value at specified row/column pair

```
>>> df.iat[1, 2]
1
```

Set value at specified row/column pair

```
>>> df.iat[1, 2] = 10
>>> df.iat[1, 2]
10
```

Get value within a series

```
>>> df.loc[0].iat[1]
2
```

## pandas.Series.iloc

### Series.iloc

Purely integer-location based indexing for selection by position.

.iloc[] is primarily integer position based (from 0 to length-1 of the axis), but may also be used with a boolean array.

Allowed inputs are:

- An integer, e.g. 5.
- A list or array of integers, e.g. [4, 3, 0].
- A slice object with ints, e.g. 1:7.
- A boolean array.
- A callable function with one argument (the calling Series, DataFrame or Panel) and that returns valid output for indexing (one of the above)

.iloc will raise `IndexError` if a requested indexer is out-of-bounds, except *slice* indexers which allow out-of-bounds indexing (this conforms with python/numpy *slice* semantics).

See more at [Selection by Position](#)

## pandas.Series.index

### Series.index

The index (axis labels) of the Series.

### **pandas.Series.is\_monotonic**

#### **Series.is\_monotonic**

Return boolean if values in the object are monotonic\_increasing

New in version 0.19.0.

#### **Returns**

**is\_monotonic** [boolean]

### **pandas.Series.is\_monotonic\_decreasing**

#### **Series.is\_monotonic\_decreasing**

Return boolean if values in the object are monotonic\_decreasing

New in version 0.19.0.

#### **Returns**

**is\_monotonic\_decreasing** [boolean]

### **pandas.Series.is\_monotonic\_increasing**

#### **Series.is\_monotonic\_increasing**

Return boolean if values in the object are monotonic\_increasing

New in version 0.19.0.

#### **Returns**

**is\_monotonic** [boolean]

### **pandas.Series.is\_unique**

#### **Series.is\_unique**

Return boolean if values in the object are unique

#### **Returns**

**is\_unique** [boolean]

### **pandas.Series.itemsize**

#### **Series.itemsize**

return the size of the dtype of the item of the underlying data

### **pandas.Series.ix**

#### **Series.ix**

A primarily label-location based indexer, with integer position fallback.

Warning: Starting in 0.20.0, the .ix indexer is deprecated, in favor of the more strict .iloc and .loc indexers.

`.ix[]` supports mixed integer and label based access. It is primarily label based, but will fall back to integer positional access unless the corresponding axis is of integer type.

`.ix` is the most general indexer and will support any of the inputs in `.loc` and `.iloc`. `.ix` also supports floating point label schemes. `.ix` is exceptionally useful when dealing with mixed positional and label based hierarchical indexes.

However, when an axis is integer based, **ONLY** label based access and not positional access is supported. Thus, in such cases, it's usually better to be explicit and use `.iloc` or `.loc`.

See more at [Advanced Indexing](#).

## pandas.Series.loc

### Series.loc

Access a group of rows and columns by label(s) or a boolean array.

`.loc[]` is primarily label based, but may also be used with a boolean array.

Allowed inputs are:

- A single label, e.g. 5 or 'a', (note that 5 is interpreted as a *label* of the index, and **never** as an integer position along the index).
- A list or array of labels, e.g. ['a', 'b', 'c'].
- A slice object with labels, e.g. 'a' : 'f'.

**Warning:** Note that contrary to usual python slices, **both** the start and the stop are included

- A boolean array of the same length as the axis being sliced, e.g. [True, False, True].
- A callable function with one argument (the calling Series, DataFrame or Panel) and that returns valid output for indexing (one of the above)

See more at [Selection by Label](#)

#### Raises **KeyError**:

when any items are not found

See also:

**DataFrame.at** Access a single value for a row/column label pair

**DataFrame.iloc** Access group of rows and columns by integer position(s)

**DataFrame.xs** Returns a cross-section (row(s) or column(s)) from the Series/DataFrame.

**Series.loc** Access group of values using labels

## Examples

### Getting values

```
>>> df = pd.DataFrame([[1, 2], [4, 5], [7, 8]],
...                    index=['cobra', 'viper', 'sidewinder'],
...                    columns=['max_speed', 'shield'])
>>> df
```

	max_speed	shield
cobra	1	2
viper	4	5
sidewinder	7	8

Single label. Note this returns the row as a Series.

```
>>> df.loc['viper']
max_speed    4
shield       5
Name: viper, dtype: int64
```

List of labels. Note using `[[]]` returns a DataFrame.

```
>>> df.loc[['viper', 'sidewinder']]
```

	max_speed	shield
viper	4	5
sidewinder	7	8

Single label for row and column

```
>>> df.loc['cobra', 'shield']
2
```

Slice with labels for row and single label for column. As mentioned above, note that both the start and stop of the slice are included.

```
>>> df.loc['cobra':'viper', 'max_speed']
cobra    1
viper    4
Name: max_speed, dtype: int64
```

Boolean list with the same length as the row axis

```
>>> df.loc[[False, False, True]]
```

	max_speed	shield
sidewinder	7	8

Conditional that returns a boolean Series

```
>>> df.loc[df['shield'] > 6]
```

	max_speed	shield
sidewinder	7	8

Conditional that returns a boolean Series with column labels specified

```
>>> df.loc[df['shield'] > 6, ['max_speed']]
```

	max_speed
sidewinder	7

Callable that returns a boolean Series

```
>>> df.loc[lambda df: df['shield'] == 8]
           max_speed  shield
sidewinder           7       8
```

### Setting values

Set value for all items matching the list of labels

```
>>> df.loc[['viper', 'sidewinder'], ['shield']] = 50
>>> df
           max_speed  shield
cobra                1       2
viper                4      50
sidewinder           7      50
```

Set value for an entire row

```
>>> df.loc['cobra'] = 10
>>> df
           max_speed  shield
cobra             10      10
viper              4      50
sidewinder         7      50
```

Set value for an entire column

```
>>> df.loc[:, 'max_speed'] = 30
>>> df
           max_speed  shield
cobra             30      10
viper             30      50
sidewinder        30      50
```

Set value for rows matching callable condition

```
>>> df.loc[df['shield'] > 35] = 0
>>> df
           max_speed  shield
cobra             30      10
viper              0       0
sidewinder         0       0
```

### Getting values on a DataFrame with an index that has integer labels

Another example using integers for the index

```
>>> df = pd.DataFrame([[1, 2], [4, 5], [7, 8]],
...                    index=[7, 8, 9], columns=['max_speed', 'shield'])
>>> df
           max_speed  shield
7                1       2
8                4       5
9                7       8
```

Slice with integer labels for rows. As mentioned above, note that both the start and stop of the slice are included.

```
>>> df.loc[7:9]
      max_speed  shield
7             1       2
8             4       5
9             7       8
```

### Getting values with a MultiIndex

A number of examples using a DataFrame with a MultiIndex

```
>>> tuples = [
...     ('cobra', 'mark i'), ('cobra', 'mark ii'),
...     ('sidewinder', 'mark i'), ('sidewinder', 'mark ii'),
...     ('viper', 'mark ii'), ('viper', 'mark iii')
... ]
>>> index = pd.MultiIndex.from_tuples(tuples)
>>> values = [[12, 2], [0, 4], [10, 20],
...           [1, 4], [7, 1], [16, 36]]
>>> df = pd.DataFrame(values, columns=['max_speed', 'shield'], index=index)
>>> df
```

		max_speed	shield
cobra	mark i	12	2
	mark ii	0	4
sidewinder	mark i	10	20
	mark ii	1	4
viper	mark ii	7	1
	mark iii	16	36

Single label. Note this returns a DataFrame with a single index.

```
>>> df.loc['cobra']
      max_speed  shield
mark i         12       2
mark ii        0       4
```

Single index tuple. Note this returns a Series.

```
>>> df.loc[('cobra', 'mark ii')]
max_speed    0
shield       4
Name: (cobra, mark ii), dtype: int64
```

Single label for row and column. Similar to passing in a tuple, this returns a Series.

```
>>> df.loc['cobra', 'mark i']
max_speed    12
shield       2
Name: (cobra, mark i), dtype: int64
```

Single tuple. Note using `[[]]` returns a DataFrame.

```
>>> df.loc[['cobra', 'mark ii']]
      max_speed  shield
cobra mark ii         0       4
```

Single tuple for the index with a single label for the column

```
>>> df.loc[('cobra', 'mark i'), 'shield']
2
```

Slice from index tuple to single label

```
>>> df.loc[('cobra', 'mark i'):'viper']
      max_speed  shield
cobra      mark i      12      2
           mark ii       0      4
sidewinder mark i      10     20
           mark ii       1      4
viper      mark ii       7      1
           mark iii     16     36
```

Slice from index tuple to index tuple

```
>>> df.loc[('cobra', 'mark i'):(('viper', 'mark ii'))]
      max_speed  shield
cobra      mark i      12      2
           mark ii       0      4
sidewinder mark i      10     20
           mark ii       1      4
viper      mark ii       7      1
```

## **pandas.Series.nbytes**

### **Series.nbytes**

return the number of bytes in the underlying data

## **pandas.Series.ndim**

### **Series.ndim**

return the number of dimensions of the underlying data, by definition 1

## **pandas.Series.shape**

### **Series.shape**

return a tuple of the shape of the underlying data

## **pandas.Series.size**

### **Series.size**

return the number of elements in the underlying data

## **pandas.Series.strides**

### **Series.strides**

return the strides of the underlying data

## pandas.Series.values

### Series.values

Return Series as ndarray or ndarray-like depending on the dtype

#### Returns

**arr** [numpy.ndarray or ndarray-like]

### Examples

```
>>> pd.Series([1, 2, 3]).values
array([1, 2, 3])
```

```
>>> pd.Series(list('aabc')).values
array(['a', 'a', 'b', 'c'], dtype=object)
```

```
>>> pd.Series(list('aabc')).astype('category').values
[a, a, b, c]
Categories (3, object): [a, b, c]
```

Timezone aware datetime data is converted to UTC:

```
>>> pd.Series(pd.date_range('20130101', periods=3,
...                          tz='US/Eastern')).values
array(['2013-01-01T05:00:00.000000000',
       '2013-01-02T05:00:00.000000000',
       '2013-01-03T05:00:00.000000000'], dtype='datetime64[ns]')
```

<b>empty</b>	
<b>imag</b>	
<b>is_copy</b>	
<b>name</b>	
<b>real</b>	

## Methods

<i>abs()</i>	Return a Series/DataFrame with absolute numeric value of each element.
<i>add</i> (other[, level, fill_value, axis])	Addition of series and other, element-wise (binary operator <i>add</i> ).
<i>add_prefix</i> (prefix)	Prefix labels with string <i>prefix</i> .
<i>add_suffix</i> (suffix)	Suffix labels with string <i>suffix</i> .
<i>agg</i> (func[, axis])	Aggregate using one or more operations over the specified axis.
<i>aggregate</i> (func[, axis])	Aggregate using one or more operations over the specified axis.
<i>align</i> (other[, join, axis, level, copy, ...])	Align two objects on their axes with the specified join method for each axis Index

Continued on next page

Table 25 – continued from previous page

<code>all([axis, bool_only, skipna, level])</code>	Return whether all elements are True, potentially over an axis.
<code>any([axis, bool_only, skipna, level])</code>	Return whether any element is True over requested axis.
<code>append(to_append[, ignore_index, ...])</code>	Concatenate two or more Series.
<code>apply(func[, convert_dtype, args])</code>	Invoke function on values of Series.
<code>argmax([axis, skipna])</code>	(DEPRECATED) ..
<code>argmin([axis, skipna])</code>	(DEPRECATED) ..
<code>argsort([axis, kind, order])</code>	Overrides ndarray.argsort.
<code>as_blocks([copy])</code>	(DEPRECATED) Convert the frame to a dict of dtype -> Constructor Types that each has a homogeneous dtype.
<code>as_matrix([columns])</code>	(DEPRECATED) Convert the frame to its Numpy-array representation.
<code>asfreq(freq[, method, how, normalize, ...])</code>	Convert TimeSeries to specified frequency.
<code>asof(when[, subset])</code>	The last row without any NaN is taken (or the last row without NaN considering only the subset of columns in the case of a DataFrame)
<code>astype(dtype[, copy, errors])</code>	Cast a pandas object to a specified dtype dtype.
<code>at_time(time[, asof])</code>	Select values at particular time of day (e.g.
<code>autocorr([lag])</code>	Lag-N autocorrelation
<code>between(left, right[, inclusive])</code>	Return boolean Series equivalent to left <= series <= right.
<code>between_time(start_time, end_time[, ...])</code>	Select values between particular times of the day (e.g., 9:00-9:30 AM).
<code>bfill([axis, inplace, limit, downcast])</code>	Synonym for <code>DataFrame.fillna(method='bfill')</code>
<code>bool()</code>	Return the bool of a single element PandasObject.
<code>cat</code>	alias of <code>pandas.core.arrays.categorical.CategoricalAccessor</code>
<code>clip([lower, upper, axis, inplace])</code>	Trim values at input threshold(s).
<code>clip_lower(threshold[, axis, inplace])</code>	Return copy of the input with values below a threshold truncated.
<code>clip_upper(threshold[, axis, inplace])</code>	Return copy of input with values above given value(s) truncated.
<code>combine(other, func[, fill_value])</code>	Perform elementwise binary operation on two Series using given function with optional fill value when an index is missing from one Series or the other
<code>combine_first(other)</code>	Combine Series values, choosing the calling Series's values first.
<code>compound([axis, skipna, level])</code>	Return the compound percentage of the values for the requested axis
<code>compress(condition, *args, **kwargs)</code>	Return selected slices of an array along given axis as a Series
<code>consolidate([inplace])</code>	(DEPRECATED) Compute NDFrame with “consolidated” internals (data of each dtype grouped together in a single ndarray).
<code>convert_objects([convert_dates, ...])</code>	(DEPRECATED) Attempt to infer better dtype for object columns.
<code>copy([deep])</code>	Make a copy of this object's indices and data.

Continued on next page

Table 25 – continued from previous page

<code>corr(other[, method, min_periods])</code>	Compute correlation with <i>other</i> Series, excluding missing values
<code>count([level])</code>	Return number of non-NA/null observations in the Series
<code>cov(other[, min_periods])</code>	Compute covariance with Series, excluding missing values
<code>cummax([axis, skipna])</code>	Return cumulative maximum over a DataFrame or Series axis.
<code>cummin([axis, skipna])</code>	Return cumulative minimum over a DataFrame or Series axis.
<code>cumprod([axis, skipna])</code>	Return cumulative product over a DataFrame or Series axis.
<code>cumsum([axis, skipna])</code>	Return cumulative sum over a DataFrame or Series axis.
<code>describe([percentiles, include, exclude])</code>	Generates descriptive statistics that summarize the central tendency, dispersion and shape of a dataset's distribution, excluding NaN values.
<code>diff([periods])</code>	First discrete difference of element.
<code>div(other[, level, fill_value, axis])</code>	Floating division of series and other, element-wise (binary operator <i>truediv</i> ).
<code>divide(other[, level, fill_value, axis])</code>	Floating division of series and other, element-wise (binary operator <i>truediv</i> ).
<code>divmod(other[, level, fill_value, axis])</code>	Integer division and modulo of series and other, element-wise (binary operator <i>divmod</i> ).
<code>dot(other)</code>	Matrix multiplication with DataFrame or inner-product with Series objects.
<code>drop([labels, axis, index, columns, level, ...])</code>	Return Series with specified index labels removed.
<code>drop_duplicates([keep, inplace])</code>	Return Series with duplicate values removed.
<code>dropna([axis, inplace])</code>	Return a new Series with missing values removed.
<code>dt</code>	alias of <code>pandas.core.indexes.accessors.CombinedDatetimelikeProperties</code>
<code>uplicated([keep])</code>	Indicate duplicate Series values.
<code>eq(other[, level, fill_value, axis])</code>	Equal to of series and other, element-wise (binary operator <i>eq</i> ).
<code>equals(other)</code>	Determines if two NDFrame objects contain the same elements.
<code>ewm([com, span, halflife, alpha, ...])</code>	Provides exponential weighted functions
<code>expanding([min_periods, center, axis])</code>	Provides expanding transformations.
<code>factorize([sort, na_sentinel])</code>	Encode the object as an enumerated type or categorical variable.
<code>ffill([axis, inplace, limit, downcast])</code>	Synonym for <code>DataFrame.fillna(method='ffill')</code>
<code>fillna([value, method, axis, inplace, ...])</code>	Fill NA/NaN values using the specified method
<code>filter([items, like, regex, axis])</code>	Subset rows or columns of dataframe according to labels in the specified index.
<code>first(offset)</code>	Convenience method for subsetting initial periods of time series data based on a date offset.
<code>first_valid_index()</code>	Return index for first non-NA/null value.
<code>floordiv(other[, level, fill_value, axis])</code>	Integer division of series and other, element-wise (binary operator <i>floordiv</i> ).

Continued on next page

Table 25 – continued from previous page

<code>from_array(arr[, index, name, dtype, copy, ...])</code>	Construct Series from array.
<code>from_csv(path[, sep, parse_dates, header, ...])</code>	(DEPRECATED) Read CSV file.
<code>ge(other[, level, fill_value, axis])</code>	Greater than or equal to of series and other, element-wise (binary operator <i>ge</i> ).
<code>get(key[, default])</code>	Get item from object for given key (DataFrame column, Panel slice, etc.).
<code>get_dtype_counts()</code>	Return counts of unique dtypes in this object.
<code>get_ftype_counts()</code>	(DEPRECATED) Return counts of unique ftypes in this object.
<code>get_value(label[, takeable])</code>	(DEPRECATED) Quickly retrieve single value at passed index label
<code>get_values()</code>	same as values (but handles sparseness conversions); is a view
<code>groupby([by, axis, level, as_index, sort, ...])</code>	Group series using mapper (dict or key function, apply given function to group, return result as series) or by a series of columns.
<code>gt(other[, level, fill_value, axis])</code>	Greater than of series and other, element-wise (binary operator <i>gt</i> ).
<code>head([n])</code>	Return the first <i>n</i> rows.
<code>hist([by, ax, grid, xlabelsize, xrot, ...])</code>	Draw histogram of the input series using matplotlib
<code>idxmax([axis, skipna])</code>	Return the row label of the maximum value.
<code>idxmin([axis, skipna])</code>	Return the row label of the minimum value.
<code>infer_objects()</code>	Attempt to infer better dtypes for object columns.
<code>interpolate([method, axis, limit, inplace, ...])</code>	Interpolate values according to different methods.
<code>isin(values)</code>	Check whether <i>values</i> are contained in Series.
<code>isna()</code>	Detect missing values.
<code>isnull()</code>	Detect missing values.
<code>item()</code>	return the first element of the underlying data as a python scalar
<code>items()</code>	Lazily iterate over (index, value) tuples
<code>iteritems()</code>	Lazily iterate over (index, value) tuples
<code>keys()</code>	Alias for index
<code>kurt([axis, skipna, level, numeric_only])</code>	Return unbiased kurtosis over requested axis using Fisher's definition of kurtosis (kurtosis of normal == 0.0).
<code>kurtosis([axis, skipna, level, numeric_only])</code>	Return unbiased kurtosis over requested axis using Fisher's definition of kurtosis (kurtosis of normal == 0.0).
<code>last(offset)</code>	Convenience method for subsetting final periods of time series data based on a date offset.
<code>last_valid_index()</code>	Return index for last non-NA/null value.
<code>le(other[, level, fill_value, axis])</code>	Less than or equal to of series and other, element-wise (binary operator <i>le</i> ).
<code>lt(other[, level, fill_value, axis])</code>	Less than of series and other, element-wise (binary operator <i>lt</i> ).
<code>mad([axis, skipna, level])</code>	Return the mean absolute deviation of the values for the requested axis
<code>map(arg[, na_action])</code>	Map values of Series using input correspondence (a dict, Series, or function).

Continued on next page

Table 25 – continued from previous page

<code>mask(cond[, other, inplace, axis, level, ...])</code>	Return an object of same shape as self and whose corresponding entries are from self where <i>cond</i> is False and otherwise are from <i>other</i> .
<code>max([axis, skipna, level, numeric_only])</code>	This method returns the maximum of the values in the object.
<code>mean([axis, skipna, level, numeric_only])</code>	Return the mean of the values for the requested axis
<code>median([axis, skipna, level, numeric_only])</code>	Return the median of the values for the requested axis
<code>memory_usage([index, deep])</code>	Return the memory usage of the Series.
<code>min([axis, skipna, level, numeric_only])</code>	This method returns the minimum of the values in the object.
<code>mod(other[, level, fill_value, axis])</code>	Modulo of series and other, element-wise (binary operator <i>mod</i> ).
<code>mode()</code>	Return the mode(s) of the dataset.
<code>mul(other[, level, fill_value, axis])</code>	Multiplication of series and other, element-wise (binary operator <i>mul</i> ).
<code>multiply(other[, level, fill_value, axis])</code>	Multiplication of series and other, element-wise (binary operator <i>mul</i> ).
<code>ne(other[, level, fill_value, axis])</code>	Not equal to of series and other, element-wise (binary operator <i>ne</i> ).
<code>nlargest([n, keep])</code>	Return the largest <i>n</i> elements.
<code>nonzero()</code>	Return the <i>integer</i> indices of the elements that are non-zero
<code>notna()</code>	Detect existing (non-missing) values.
<code>notnull()</code>	Detect existing (non-missing) values.
<code>nsmallest([n, keep])</code>	Return the smallest <i>n</i> elements.
<code>nunique([dropna])</code>	Return number of unique elements in the object.
<code>pct_change([periods, fill_method, limit, freq])</code>	Percentage change between the current and a prior element.
<code>pipe(func, *args, **kwargs)</code>	Apply <code>func(self, *args, **kwargs)</code>
<code>plot</code>	alias of <code>pandas.plotting._core.SeriesPlotMethods</code>
<code>pop(item)</code>	Return item and drop from frame.
<code>pow(other[, level, fill_value, axis])</code>	Exponential power of series and other, element-wise (binary operator <i>pow</i> ).
<code>prod([axis, skipna, level, numeric_only, ...])</code>	Return the product of the values for the requested axis
<code>product([axis, skipna, level, numeric_only, ...])</code>	Return the product of the values for the requested axis
<code>ptp([axis, skipna, level, numeric_only])</code>	Returns the difference between the maximum value and the minimum value in the object.
<code>put(*args, **kwargs)</code>	Applies the <i>put</i> method to its <i>values</i> attribute if it has one.
<code>quantile([q, interpolation])</code>	Return value at the given quantile, a la <code>numpy.percentile</code> .
<code>radd(other[, level, fill_value, axis])</code>	Addition of series and other, element-wise (binary operator <i>radd</i> ).
<code>rank([axis, method, numeric_only, ...])</code>	Compute numerical data ranks (1 through <i>n</i> ) along axis.
<code>ravel([order])</code>	Return the flattened underlying data as an ndarray

Continued on next page

Table 25 – continued from previous page

<code>rdiv(other[, level, fill_value, axis])</code>	Floating division of series and other, element-wise (binary operator <i>rtruediv</i> ).
<code>reindex([index])</code>	Conform Series to new index with optional filling logic, placing NA/NaN in locations having no value in the previous index.
<code>reindex_axis(labels[, axis])</code>	(DEPRECATED) Conform Series to new index with optional filling logic.
<code>reindex_like(other[, method, copy, limit, ...])</code>	Return an object with matching indices to myself.
<code>rename([index])</code>	Alter Series index labels or name
<code>rename_axis(mapper[, axis, copy, inplace])</code>	Alter the name of the index or columns.
<code>reorder_levels(order)</code>	Rearrange index levels using input order.
<code>repeat(repeats, *args, **kwargs)</code>	Repeat elements of an Series.
<code>replace([to_replace, value, inplace, limit, ...])</code>	Replace values given in <i>to_replace</i> with <i>value</i> .
<code>resample(rule[, how, axis, fill_method, ...])</code>	Convenience method for frequency conversion and resampling of time series.
<code>reset_index([level, drop, name, inplace])</code>	Generate a new DataFrame or Series with the index reset.
<code>rfloordiv(other[, level, fill_value, axis])</code>	Integer division of series and other, element-wise (binary operator <i>rfloordiv</i> ).
<code>rmod(other[, level, fill_value, axis])</code>	Modulo of series and other, element-wise (binary operator <i>rmod</i> ).
<code>rmul(other[, level, fill_value, axis])</code>	Multiplication of series and other, element-wise (binary operator <i>rmul</i> ).
<code>rolling(window[, min_periods, center, ...])</code>	Provides rolling window calculations.
<code>round([decimals])</code>	Round each value in a Series to the given number of decimals.
<code>rpow(other[, level, fill_value, axis])</code>	Exponential power of series and other, element-wise (binary operator <i>rpow</i> ).
<code>rsub(other[, level, fill_value, axis])</code>	Subtraction of series and other, element-wise (binary operator <i>rsub</i> ).
<code>rtruediv(other[, level, fill_value, axis])</code>	Floating division of series and other, element-wise (binary operator <i>rtruediv</i> ).
<code>sample([n, frac, replace, weights, ...])</code>	Return a random sample of items from an axis of object.
<code>searchsorted(value[, side, sorter])</code>	Find indices where elements should be inserted to maintain order.
<code>select(crit[, axis])</code>	(DEPRECATED) Return data corresponding to axis labels matching criteria
<code>sem([axis, skipna, level, ddof, numeric_only])</code>	Return unbiased standard error of the mean over requested axis.
<code>set_axis(labels[, axis, inplace])</code>	Assign desired index to given axis.
<code>set_value(label, value[, takeable])</code>	(DEPRECATED) Quickly set single value at passed label.
<code>shift([periods, freq, axis])</code>	Shift index by desired number of periods with an optional time freq
<code>skew([axis, skipna, level, numeric_only])</code>	Return unbiased skew over requested axis Normalized by N-1
<code>slice_shift([periods, axis])</code>	Equivalent to <i>shift</i> without copying data.
<code>sort_index([axis, level, ascending, ...])</code>	Sort Series by index labels.
<code>sort_values([axis, ascending, inplace, ...])</code>	Sort by the values.

Continued on next page

Table 25 – continued from previous page

<code>sortlevel([level, ascending, sort_remaining])</code>	(DEPRECATED) Sort Series with MultiIndex by chosen level.
<code>squeeze([axis])</code>	Squeeze length 1 dimensions.
<code>std([axis, skipna, level, ddof, numeric_only])</code>	Return sample standard deviation over requested axis.
<code>str</code>	alias of <code>pandas.core.strings.StringMethods</code>
<code>sub(other[, level, fill_value, axis])</code>	Subtraction of series and other, element-wise (binary operator <i>sub</i> ).
<code>subtract(other[, level, fill_value, axis])</code>	Subtraction of series and other, element-wise (binary operator <i>sub</i> ).
<code>sum([axis, skipna, level, numeric_only, ...])</code>	Return the sum of the values for the requested axis
<code>swapaxes(axis1, axis2[, copy])</code>	Interchange axes and swap values axes appropriately
<code>swaplevel([i, j, copy])</code>	Swap levels i and j in a MultiIndex
<code>tail([n])</code>	Return the last <i>n</i> rows.
<code>take(indices[, axis, convert, is_copy])</code>	Return the elements in the given <i>positional</i> indices along an axis.
<code>to_clipboard([excel, sep])</code>	Copy object to the system clipboard.
<code>to_csv([path, index, sep, na_rep, ...])</code>	Write Series to a comma-separated values (csv) file
<code>to_dense()</code>	Return dense representation of NDFrame (as opposed to sparse)
<code>to_dict([into])</code>	Convert Series to {label -> value} dict or dict-like object.
<code>to_excel(excel_writer[, sheet_name, na_rep, ...])</code>	Write Series to an excel sheet
<code>to_frame([name])</code>	Convert Series to DataFrame
<code>to_hdf(path_or_buf, key, **kwargs)</code>	Write the contained data to an HDF5 file using HDF-Store.
<code>to_json([path_or_buf, orient, date_format, ...])</code>	Convert the object to a JSON string.
<code>to_latex([buf, columns, col_space, header, ...])</code>	Render an object to a tabular environment table.
<code>to_msgpack([path_or_buf, encoding])</code>	msgpack (serialize) object to input file path
<code>to_period([freq, copy])</code>	Convert Series from DatetimeIndex to PeriodIndex with desired frequency (inferred from index if not passed)
<code>to_pickle(path[, compression, protocol])</code>	Pickle (serialize) object to file.
<code>to_sparse([kind, fill_value])</code>	Convert Series to SparseSeries
<code>to_sql(name, con[, schema, if_exists, ...])</code>	Write records stored in a DataFrame to a SQL database.
<code>to_string([buf, na_rep, float_format, ...])</code>	Render a string representation of the Series
<code>to_timestamp([freq, how, copy])</code>	Cast to datetimeindex of timestamps, at <i>beginning</i> of period
<code>to_xarray()</code>	Return an xarray object from the pandas object.
<code>tolist()</code>	Return a list of the values.
<code>transform(func, *args, **kwargs)</code>	Call function producing a like-indexed NDFrame and return a NDFrame with the transformed values
<code>transpose(*args, **kwargs)</code>	return the transpose, which is by definition self
<code>truediv(other[, level, fill_value, axis])</code>	Floating division of series and other, element-wise (binary operator <i>truediv</i> ).
<code>truncate([before, after, axis, copy])</code>	Truncate a Series or DataFrame before and after some index value.

Continued on next page

Table 25 – continued from previous page

<code>tshift([periods, freq, axis])</code>	Shift the time index, using the index's frequency if available.
<code>tz_convert(tz[, axis, level, copy])</code>	Convert tz-aware axis to target time zone.
<code>tz_localize(tz[, axis, level, copy, ambiguous])</code>	Localize tz-naive TimeSeries to target time zone.
<code>unique()</code>	Return unique values of Series object.
<code>unstack([level, fill_value])</code>	Unstack, a.k.a.
<code>update(other)</code>	Modify Series in place using non-NA values from passed Series.
<code>valid([inplace])</code>	(DEPRECATED) Return Series without null values.
<code>value_counts([normalize, sort, ascending, ...])</code>	Returns object containing counts of unique values.
<code>var([axis, skipna, level, ddof, numeric_only])</code>	Return unbiased variance over requested axis.
<code>view([dtype])</code>	Create a new view of the Series.
<code>where(cond[, other, inplace, axis, level, ...])</code>	Return an object of same shape as self and whose corresponding entries are from self where <i>cond</i> is True and otherwise are from <i>other</i> .
<code>xs(key[, axis, level, drop_level])</code>	Returns a cross-section (row(s) or column(s)) from the Series/DataFrame.

## pandas.Series.abs

`Series.abs()`

Return a Series/DataFrame with absolute numeric value of each element.

This function only applies to elements that are all numeric.

### Returns abs

Series/DataFrame containing the absolute value of each element.

### See also:

`numpy.absolute` calculate the absolute value element-wise.

### Notes

For complex inputs,  $1.2 + 1j$ , the absolute value is  $\sqrt{a^2 + b^2}$ .

### Examples

Absolute numeric values in a Series.

```

>>> s = pd.Series([-1.10, 2, -3.33, 4])
>>> s.abs()
0    1.10
1    2.00
2    3.33
3    4.00
dtype: float64

```

Absolute numeric values in a Series with complex numbers.

```
>>> s = pd.Series([1.2 + 1j])
>>> s.abs()
0    1.56205
dtype: float64
```

Absolute numeric values in a Series with a Timedelta element.

```
>>> s = pd.Series([pd.Timedelta('1 days')])
>>> s.abs()
0    1 days
dtype: timedelta64[ns]
```

Select rows with data closest to certain value using `argsort` (from [StackOverflow](#)).

```
>>> df = pd.DataFrame({
...     'a': [4, 5, 6, 7],
...     'b': [10, 20, 30, 40],
...     'c': [100, 50, -30, -50]
... })
>>> df
   a  b  c
0  4 10 100
1  5 20  50
2  6 30 -30
3  7 40 -50
>>> df.loc[(df.c - 43).abs().argsort()]
   a  b  c
1  5 20  50
0  4 10 100
2  6 30 -30
3  7 40 -50
```

## pandas.Series.add

`Series.add(other, level=None, fill_value=None, axis=0)`

Addition of series and other, element-wise (binary operator `add`).

Equivalent to `series + other`, but with support to substitute a `fill_value` for missing data in one of the inputs.

### Parameters

**other** [Series or scalar value]

**fill\_value** : None or float value, default None (NaN)

Fill existing missing (NaN) values, and any new element needed for successful Series alignment, with this value before computation. If data in both corresponding Series locations is missing the result will be missing

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

### Returns

**result** [Series]

**See also:***Series.radd***Examples**

```
>>> a = pd.Series([1, 1, 1, np.nan], index=['a', 'b', 'c', 'd'])
>>> a
a    1.0
b    1.0
c    1.0
d     NaN
dtype: float64
>>> b = pd.Series([1, np.nan, 1, np.nan], index=['a', 'b', 'd', 'e'])
>>> b
a    1.0
b     NaN
d    1.0
e     NaN
dtype: float64
>>> a.add(b, fill_value=0)
a    2.0
b    1.0
c    1.0
d    1.0
e     NaN
dtype: float64
```

**pandas.Series.add\_prefix****Series.add\_prefix** (*prefix*)Prefix labels with string *prefix*.

For Series, the row labels are prefixed. For DataFrame, the column labels are prefixed.

**Parameters prefix** : str

The string to add before each label.

**Returns Series or DataFrame**

New Series or DataFrame with updated labels.

**See also:***Series.add\_suffix* Suffix row labels with string *suffix*.*DataFrame.add\_suffix* Suffix column labels with string *suffix*.**Examples**

```
>>> s = pd.Series([1, 2, 3, 4])
>>> s
0    1
1    2
```

(continues on next page)

(continued from previous page)

```
2    3
3    4
dtype: int64
```

```
>>> s.add_prefix('item_')
item_0    1
item_1    2
item_2    3
item_3    4
dtype: int64
```

```
>>> df = pd.DataFrame({'A': [1, 2, 3, 4], 'B': [3, 4, 5, 6]})
>>> df
   A  B
0  1  3
1  2  4
2  3  5
3  4  6
```

```
>>> df.add_prefix('col_')
   col_A  col_B
0      1      3
1      2      4
2      3      5
3      4      6
```

### pandas.Series.add\_suffix

`Series.add_suffix(suffix)`  
 Suffix labels with string *suffix*.

For Series, the row labels are suffixed. For DataFrame, the column labels are suffixed.

**Parameters** `suffix` : str

The string to add after each label.

**Returns** **Series or DataFrame**

New Series or DataFrame with updated labels.

**See also:**

**`Series.add_prefix`** Prefix row labels with string *prefix*.

**`DataFrame.add_prefix`** Prefix column labels with string *prefix*.

### Examples

```
>>> s = pd.Series([1, 2, 3, 4])
>>> s
0    1
1    2
2    3
```

(continues on next page)

(continued from previous page)

```
3      4
dtype: int64
```

```
>>> s.add_suffix('_item')
0_item      1
1_item      2
2_item      3
3_item      4
dtype: int64
```

```
>>> df = pd.DataFrame({'A': [1, 2, 3, 4], 'B': [3, 4, 5, 6]})
>>> df
   A  B
0  1  3
1  2  4
2  3  5
3  4  6
```

```
>>> df.add_suffix('_col')
   A_col  B_col
0      1      3
1      2      4
2      3      5
3      4      6
```

## pandas.Series.agg

`Series.agg(func, axis=0, *args, **kwargs)`

Aggregate using one or more operations over the specified axis.

New in version 0.20.0.

**Parameters** **func** : function, string, dictionary, or list of string/functions

Function to use for aggregating the data. If a function, must either work when passed a Series or when passed to Series.apply. For a DataFrame, can pass a dict, if the keys are DataFrame column names.

Accepted combinations are:

- string function name.
- function.
- list of functions.
- dict of column names -> functions (or list of functions).

**axis** : {0 or 'index'}

Parameter needed for compatibility with DataFrame.

**\*args**

Positional arguments to pass to *func*.

**\*\*kwargs**

Keyword arguments to pass to *func*.

**Returns****aggregated** [Series]**See also:***pandas.Series.apply*, *pandas.Series.transform***Notes***agg* is an alias for *aggregate*. Use the alias.

A passed user-defined-function will be passed a Series for evaluation.

**Examples**

```
>>> s = Series(np.random.randn(10))
```

```
>>> s.agg('min')
-1.3018049988556679
```

```
>>> s.agg(['min', 'max'])
min    -1.301805
max     1.127688
dtype: float64
```

**pandas.Series.aggregate****Series.aggregate** (*func*, *axis=0*, *\*args*, *\*\*kwargs*)

Aggregate using one or more operations over the specified axis.

New in version 0.20.0.

**Parameters** **func** : function, string, dictionary, or list of string/functions

Function to use for aggregating the data. If a function, must either work when passed a Series or when passed to Series.apply. For a DataFrame, can pass a dict, if the keys are DataFrame column names.

Accepted combinations are:

- string function name.
- function.
- list of functions.
- dict of column names -> functions (or list of functions).

**axis** : {0 or 'index'}

Parameter needed for compatibility with DataFrame.

**\*args**Positional arguments to pass to *func*.**\*\*kwargs**

Keyword arguments to pass to *func*.

### Returns

**aggregated** [Series]

### See also:

[`pandas.Series.apply`](#), [`pandas.Series.transform`](#)

### Notes

*agg* is an alias for *aggregate*. Use the alias.

A passed user-defined-function will be passed a Series for evaluation.

### Examples

```
>>> s = Series(np.random.randn(10))
```

```
>>> s.agg('min')
-1.3018049988556679
```

```
>>> s.agg(['min', 'max'])
min    -1.301805
max     1.127688
dtype: float64
```

## pandas.Series.align

`Series.align(other, join='outer', axis=None, level=None, copy=True, fill_value=None, method=None, limit=None, fill_axis=0, broadcast_axis=None)`

Align two objects on their axes with the specified join method for each axis Index

### Parameters

**other** [DataFrame or Series]

**join** [{ 'outer', 'inner', 'left', 'right' }, default 'outer']

**axis** : allowed axis of the other object, default None

Align on index (0), columns (1), or both (None)

**level** : int or level name, default None

Broadcast across a level, matching Index values on the passed MultiIndex level

**copy** : boolean, default True

Always returns new objects. If copy=False and no reindexing is required then original objects are returned.

**fill\_value** : scalar, default np.NaN

Value to use for missing values. Defaults to NaN, but can be any “compatible” value

**method** [str, default None]

**limit** [int, default None]

**fill\_axis** : {0 or 'index'}, default 0

Filling axis, method and limit

**broadcast\_axis** : {0 or 'index'}, default None

Broadcast values along this axis, if aligning two objects of different dimensions

**Returns** (**left, right**) : (Series, type of other)

Aligned objects

## pandas.Series.all

`Series.all` (*axis=0, bool\_only=None, skipna=True, level=None, \*\*kwargs*)

Return whether all elements are True, potentially over an axis.

Returns True if all elements within a series or along a Dataframe axis are non-zero, not-empty or not-False.

**Parameters** **axis** : {0 or 'index', 1 or 'columns', None}, default 0

Indicate which axis or axes should be reduced.

- 0 / 'index' : reduce the index, return a Series whose index is the original column labels.
- 1 / 'columns' : reduce the columns, return a Series whose index is the original index.
- None : reduce all axes, return a scalar.

**skipna** : boolean, default True

Exclude NA/null values. If an entire row/column is NA, the result will be NA.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a scalar.

**bool\_only** : boolean, default None

Include only boolean columns. If None, will attempt to use everything, then use only boolean data. Not implemented for Series.

**\*\*kwargs** : any, default None

Additional keywords have no effect but might be accepted for compatibility with NumPy.

### Returns

**all** [scalar or Series (if level specified)]

**See also:**

[`pandas.Series.all`](#) Return True if all elements are True

[`pandas.DataFrame.any`](#) Return True if one (or more) elements are True

## Examples

### Series

```
>>> pd.Series([True, True]).all()
True
>>> pd.Series([True, False]).all()
False
```

### DataFrames

Create a dataframe from a dictionary.

```
>>> df = pd.DataFrame({'col1': [True, True], 'col2': [True, False]})
>>> df
   col1  col2
0  True   True
1  True  False
```

Default behaviour checks if column-wise values all return True.

```
>>> df.all()
col1    True
col2   False
dtype: bool
```

Specify `axis='columns'` to check if row-wise values all return True.

```
>>> df.all(axis='columns')
0     True
1    False
dtype: bool
```

Or `axis=None` for whether every value is True.

```
>>> df.all(axis=None)
False
```

## pandas.Series.any

`Series.any` (*axis=0, bool\_only=None, skipna=True, level=None, \*\*kwargs*)

Return whether any element is True over requested axis.

Unlike `DataFrame.all()`, this performs an *or* operation. If any of the values along the specified axis is True, this will return True.

**Parameters** `axis`: {0 or 'index', 1 or 'columns', None}, default 0

Indicate which axis or axes should be reduced.

- 0 / 'index' : reduce the index, return a Series whose index is the original column labels.
- 1 / 'columns' : reduce the columns, return a Series whose index is the original index.
- None : reduce all axes, return a scalar.

**skipna** : boolean, default True

Exclude NA/null values. If an entire row/column is NA, the result will be NA.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a scalar.

**bool\_only** : boolean, default None

Include only boolean columns. If None, will attempt to use everything, then use only boolean data. Not implemented for Series.

**\*\*kwargs** : any, default None

Additional keywords have no effect but might be accepted for compatibility with NumPy.

### Returns

**any** [scalar or Series (if level specified)]

### See also:

[`pandas.DataFrame.all`](#) Return whether all elements are True.

## Examples

### Series

For Series input, the output is a scalar indicating whether any element is True.

```
>>> pd.Series([True, False]).any()
True
```

### DataFrame

Whether each column contains at least one True element (the default).

```
>>> df = pd.DataFrame({"A": [1, 2], "B": [0, 2], "C": [0, 0]})
>>> df
   A  B  C
0  1  0  0
1  2  2  0
```

```
>>> df.any()
A      True
B      True
C     False
dtype: bool
```

Aggregating over the columns.

```
>>> df = pd.DataFrame({"A": [True, False], "B": [1, 2]})
>>> df
   A  B
0  True  1
1 False  2
```

```
>>> df.any(axis='columns')
0    True
1    True
dtype: bool
```

```
>>> df = pd.DataFrame({"A": [True, False], "B": [1, 0]})
>>> df
   A  B
0  True  1
1 False  0
```

```
>>> df.any(axis='columns')
0    True
1   False
dtype: bool
```

Aggregating over the entire DataFrame with `axis=None`.

```
>>> df.any(axis=None)
True
```

`any` for an empty DataFrame is an empty Series.

```
>>> pd.DataFrame([]).any()
Series([], dtype: bool)
```

## pandas.Series.append

`Series.append(to_append, ignore_index=False, verify_integrity=False)`  
Concatenate two or more Series.

### Parameters

**to\_append** [Series or list/tuple of Series]

**ignore\_index** : boolean, default False

If True, do not use the index labels.

New in version 0.19.0.

**verify\_integrity** : boolean, default False

If True, raise Exception on creating index with duplicates

### Returns

**appended** [Series]

**See also:**

[`pandas.concat`](#) General function to concatenate DataFrame, Series or Panel objects

### Notes

Iteratively appending to a Series can be more computationally intensive than a single concatenate. A better solution is to append values to a list and then concatenate the list with the original Series all at once.

## Examples

```
>>> s1 = pd.Series([1, 2, 3])
>>> s2 = pd.Series([4, 5, 6])
>>> s3 = pd.Series([4, 5, 6], index=[3,4,5])
>>> s1.append(s2)
0    1
1    2
2    3
0    4
1    5
2    6
dtype: int64
```

```
>>> s1.append(s3)
0    1
1    2
2    3
3    4
4    5
5    6
dtype: int64
```

With `ignore_index` set to `True`:

```
>>> s1.append(s2, ignore_index=True)
0    1
1    2
2    3
3    4
4    5
5    6
dtype: int64
```

With `verify_integrity` set to `True`:

```
>>> s1.append(s2, verify_integrity=True)
Traceback (most recent call last):
...
ValueError: Indexes have overlapping values: [0, 1, 2]
```

## pandas.Series.apply

`Series.apply(func, convert_dtype=True, args=(), **kwargs)`

Invoke function on values of Series. Can be ufunc (a NumPy function that applies to the entire Series) or a Python function that only works on single values

### Parameters

**func** [function]

**convert\_dtype** : boolean, default True

Try to find better dtype for elementwise function results. If False, leave as dtype=object

**args** : tuple

Positional arguments to pass to function in addition to the value

Additional keyword arguments will be passed as keywords to the function

### Returns

y [Series or DataFrame if func returns a Series]

### See also:

*Series.map* For element-wise operations

*Series.agg* only perform aggregating type operations

*Series.transform* only perform transforming type operations

### Examples

Create a series with typical summer temperatures for each city.

```
>>> import pandas as pd
>>> import numpy as np
>>> series = pd.Series([20, 21, 12], index=['London',
... 'New York', 'Helsinki'])
>>> series
London      20
New York    21
Helsinki    12
dtype: int64
```

Square the values by defining a function and passing it as an argument to `apply()`.

```
>>> def square(x):
...     return x**2
>>> series.apply(square)
London      400
New York    441
Helsinki    144
dtype: int64
```

Square the values by passing an anonymous function as an argument to `apply()`.

```
>>> series.apply(lambda x: x**2)
London      400
New York    441
Helsinki    144
dtype: int64
```

Define a custom function that needs additional positional arguments and pass these additional arguments using the `args` keyword.

```
>>> def subtract_custom_value(x, custom_value):
...     return x-custom_value
```

```
>>> series.apply(subtract_custom_value, args=(5,))
London      15
New York    16
Helsinki     7
dtype: int64
```

Define a custom function that takes keyword arguments and pass these arguments to `apply`.

```
>>> def add_custom_values(x, **kwargs):
...     for month in kwargs:
...         x+=kwargs[month]
...     return x
```

```
>>> series.apply(add_custom_values, june=30, july=20, august=25)
London      95
New York    96
Helsinki    87
dtype: int64
```

Use a function from the Numpy library.

```
>>> series.apply(np.log)
London      2.995732
New York    3.044522
Helsinki    2.484907
dtype: float64
```

## pandas.Series.argmax

`Series.argmax` (*axis=0, skipna=True, \*args, \*\*kwargs*)

Deprecated since version 0.21.0:

**‘argmax’ is deprecated, use ‘idxmax’ instead.** The behavior of ‘argmax’ will be corrected to return the positional maximum in the future. Use ‘`series.values.argmax`’ to get the position of the maximum now.

Return the row label of the maximum value.

If multiple values equal the maximum, the first row label with that value is returned.

**Parameters** `skipna` : boolean, default True

Exclude NA/null values. If the entire Series is NA, the result will be NA.

**axis** : int, default 0

For compatibility with `DataFrame.idxmax`. Redundant for application on Series.

**\*args, \*\*kwargs**

Additional keywords have no effect but might be accepted for compatibility with NumPy.

**Returns**

**idxmax** [Index of maximum of values.]

**Raises** `ValueError`

If the Series is empty.

**See also:**

**numpy.argmax** Return indices of the maximum values along the given axis.

**DataFrame.idxmax** Return index of first occurrence of maximum over requested axis.

**Series.idxmin** Return index *label* of the first occurrence of minimum of values.

## Notes

This method is the Series version of `ndarray.argmax`. This method returns the label of the maximum, while `ndarray.argmax` returns the position. To get the position, use `series.values.argmax()`.

## Examples

```
>>> s = pd.Series(data=[1, None, 4, 3, 4],
...               index=['A', 'B', 'C', 'D', 'E'])
>>> s
A    1.0
B     NaN
C     4.0
D     3.0
E     4.0
dtype: float64
```

```
>>> s.idxmax()
'C'
```

If `skipna` is `False` and there is an NA value in the data, the function returns `nan`.

```
>>> s.idxmax(skipna=False)
nan
```

## pandas.Series.argmin

`Series.argmax` (*axis=None, skipna=True, \*args, \*\*kwargs*)

Deprecated since version 0.21.0:

**‘argmin’ is deprecated, use ‘idxmin’ instead.** The behavior of **‘argmin’** will be corrected to return the positional minimum in the future. Use `‘series.values.argmin’` to get the position of the minimum now.

Return the row label of the minimum value.

If multiple values equal the minimum, the first row label with that value is returned.

**Parameters** `skipna` : boolean, default True

Exclude NA/null values. If the entire Series is NA, the result will be NA.

**axis** : int, default 0

For compatibility with `DataFrame.idxmin`. Redundant for application on Series.

**\*args, \*\*kwargs**

Additional keywords have no effect but might be accepted for compatibility with NumPy.

### Returns

**idxmin** [Index of minimum of values.]

### Raises

**ValueError**

If the Series is empty.

**See also:**

**numpy.argmax** Return indices of the minimum values along the given axis.

**DataFrame.idxmin** Return index of first occurrence of minimum over requested axis.

**Series.idxmax** Return index *label* of the first occurrence of maximum of values.

## Notes

This method is the Series version of `ndarray.argmax`. This method returns the label of the minimum, while `ndarray.argmax` returns the position. To get the position, use `series.values.argmax()`.

## Examples

```
>>> s = pd.Series(data=[1, None, 4, 1],
...                 index=['A', 'B', 'C', 'D'])
>>> s
A    1.0
B    NaN
C    4.0
D    1.0
dtype: float64
```

```
>>> s.idxmin()
'A'
```

If *skipna* is False and there is an NA value in the data, the function returns nan.

```
>>> s.idxmin(skipna=False)
nan
```

## pandas.Series.argsort

**Series.argsort** (*axis=0, kind='quicksort', order=None*)

Overrides `ndarray.argsort`. Argsorts the value, omitting NA/null values, and places the result in the same locations as the non-NA values

### Parameters

**axis** [int (can only be zero)]

**kind** : {'mergesort', 'quicksort', 'heapsort'}, default 'quicksort'

Choice of sorting algorithm. See `np.sort` for more information. 'mergesort' is the only stable algorithm

**order** [ignored]

### Returns

**argsorted** [Series, with -1 indicated where nan values are present]

### See also:

`numpy.ndarray.argsort`

### pandas.Series.as\_blocks

`Series.as_blocks (copy=True)`

Convert the frame to a dict of dtype -> Constructor Types that each has a homogeneous dtype.

Deprecated since version 0.21.0.

**NOTE: the dtypes of the blocks WILL BE PRESERVED HERE (unlike in `as_matrix`)**

#### Parameters

**copy** [boolean, default True]

#### Returns

**values** [a dict of dtype -> Constructor Types]

### pandas.Series.as\_matrix

`Series.as_matrix (columns=None)`

Convert the frame to its Numpy-array representation.

Deprecated since version 0.23.0: Use `DataFrame.values()` instead.

#### Parameters **columns: list, optional, default:None**

If None, return all columns, otherwise, returns specified columns.

#### Returns **values** : ndarray

If the caller is heterogeneous and contains booleans or objects, the result will be of dtype=object. See Notes.

#### See also:

`pandas.DataFrame.values`

#### Notes

Return is NOT a Numpy-matrix, rather, a Numpy-array.

The dtype will be a lower-common-denominator dtype (implicit upcasting); that is to say if the dtypes (even of numeric types) are mixed, the one that accommodates all will be chosen. Use this with care if you are not dealing with the blocks.

e.g. If the dtypes are float16 and float32, dtype will be upcast to float32. If dtypes are int32 and uint8, dtype will be upcase to int32. By `numpy.find_common_type` convention, mixing int64 and uint64 will result in a float64 dtype.

This method is provided for backwards compatibility. Generally, it is recommended to use `‘.values’`.

### pandas.Series.asfreq

`Series.asfreq (freq, method=None, how=None, normalize=False, fill_value=None)`

Convert TimeSeries to specified frequency.

Optionally provide filling method to pad/backfill missing values.

Returns the original data conformed to a new index with the specified frequency. `resample` is more appropriate if an operation, such as summarization, is necessary to represent the data at the new frequency.

### Parameters

**freq** [DateOffset object, or string]

**method** : { 'backfill'/'bfill', 'pad'/'ffill' }, default None

Method to use for filling holes in reindexed Series (note this does not fill NaNs that already were present):

- 'pad' / 'ffill': propagate last valid observation forward to next valid
- 'backfill' / 'bfill': use NEXT valid observation to fill

**how** : { 'start', 'end' }, default end

For PeriodIndex only, see PeriodIndex.asfreq

**normalize** : bool, default False

Whether to reset output index to midnight

**fill\_value**: scalar, optional

Value to use for missing values, applied during upsampling (note this does not fill NaNs that already were present).

New in version 0.20.0.

### Returns

**converted** [type of caller]

**See also:**

[`reindex`](#)

### Notes

To learn more about the frequency strings, please see [this link](#).

### Examples

Start by creating a series with 4 one minute timestamps.

```
>>> index = pd.date_range('1/1/2000', periods=4, freq='T')
>>> series = pd.Series([0.0, None, 2.0, 3.0], index=index)
>>> df = pd.DataFrame({'s':series})
>>> df
```

	s
2000-01-01 00:00:00	0.0
2000-01-01 00:01:00	NaN
2000-01-01 00:02:00	2.0
2000-01-01 00:03:00	3.0

Upsample the series into 30 second bins.

```
>>> df.iasfreq(freq='30S')
      S
2000-01-01 00:00:00    0.0
2000-01-01 00:00:30   NaN
2000-01-01 00:01:00   NaN
2000-01-01 00:01:30   NaN
2000-01-01 00:02:00    2.0
2000-01-01 00:02:30   NaN
2000-01-01 00:03:00    3.0
```

Upsample again, providing a fill value.

```
>>> df.iasfreq(freq='30S', fill_value=9.0)
      S
2000-01-01 00:00:00    0.0
2000-01-01 00:00:30    9.0
2000-01-01 00:01:00   NaN
2000-01-01 00:01:30    9.0
2000-01-01 00:02:00    2.0
2000-01-01 00:02:30    9.0
2000-01-01 00:03:00    3.0
```

Upsample again, providing a method.

```
>>> df.iasfreq(freq='30S', method='bfill')
      S
2000-01-01 00:00:00    0.0
2000-01-01 00:00:30   NaN
2000-01-01 00:01:00   NaN
2000-01-01 00:01:30    2.0
2000-01-01 00:02:00    2.0
2000-01-01 00:02:30    3.0
2000-01-01 00:03:00    3.0
```

## pandas.Series.asof

`Series.asof` (*where*, *subset=None*)

The last row without any NaN is taken (or the last row without NaN considering only the subset of columns in the case of a DataFrame)

New in version 0.19.0: For DataFrame

If there is no good value, NaN is returned for a Series a Series of NaN values for a DataFrame

### Parameters

**where** [date or array of dates]

**subset** : string or list of strings, default None

if not None use these columns for NaN propagation

### Returns where is scalar

- value or NaN if input is Series
- Series if input is DataFrame

**where is Index:** same shape object as input

See also:

`merge_asof`

## Notes

Dates are assumed to be sorted Raises if this is not the case

## pandas.Series.astype

`Series.astype(dtype, copy=True, errors='raise', **kwargs)`

Cast a pandas object to a specified dtype dtype.

**Parameters** `dtype` : data type, or dict of column name -> data type

Use a `numpy.dtype` or Python type to cast entire pandas object to the same type. Alternatively, use `{col: dtype, ...}`, where `col` is a column label and `dtype` is a `numpy.dtype` or Python type to cast one or more of the DataFrame's columns to column-specific types.

**copy** : bool, default True.

Return a copy when `copy=True` (be very careful setting `copy=False` as changes to values then may propagate to other pandas objects).

**errors** : { 'raise', 'ignore' }, default 'raise'.

Control raising of exceptions on invalid data for provided dtype.

- `raise` : allow exceptions to be raised
- `ignore` : suppress exceptions. On error return original object

New in version 0.20.0.

**raise\_on\_error** : raise on invalid input

Deprecated since version 0.20.0: Use `errors` instead

**kwargs** [keyword arguments to pass on to the constructor]

## Returns

**casted** [type of caller]

See also:

`pandas.to_datetime` Convert argument to datetime.

`pandas.to_timedelta` Convert argument to timedelta.

`pandas.to_numeric` Convert argument to a numeric type.

`numpy.ndarray.astype` Cast a numpy array to a specified type.

## Examples

```
>>> ser = pd.Series([1, 2], dtype='int32')
>>> ser
0    1
1    2
dtype: int32
>>> ser.astype('int64')
0    1
1    2
dtype: int64
```

Convert to categorical type:

```
>>> ser.astype('category')
0    1
1    2
dtype: category
Categories (2, int64): [1, 2]
```

Convert to ordered categorical type with custom ordering:

```
>>> ser.astype('category', ordered=True, categories=[2, 1])
0    1
1    2
dtype: category
Categories (2, int64): [2 < 1]
```

Note that using `copy=False` and changing data on a new pandas object may propagate changes:

```
>>> s1 = pd.Series([1,2])
>>> s2 = s1.astype('int64', copy=False)
>>> s2[0] = 10
>>> s1 # note that s1[0] has changed too
0    10
1     2
dtype: int64
```

## pandas.Series.at\_time

`Series.at_time(time, asof=False)`

Select values at particular time of day (e.g. 9:30AM).

### Parameters

**time** [datetime.time or string]

### Returns

**values\_at\_time** [type of caller]

### Raises `TypeError`

If the index is not a `DatetimeIndex`

**See also:**

**`between_time`** Select values between particular times of the day

**`first`** Select initial periods of time series based on a date offset

**last** Select final periods of time series based on a date offset

**DatetimeIndex.indexer\_at\_time** Get just the index locations for values at particular time of the day

## Examples

```
>>> i = pd.date_range('2018-04-09', periods=4, freq='12H')
>>> ts = pd.DataFrame({'A': [1,2,3,4]}, index=i)
>>> ts
```

	A
2018-04-09 00:00:00	1
2018-04-09 12:00:00	2
2018-04-10 00:00:00	3
2018-04-10 12:00:00	4

```
>>> ts.at_time('12:00')
```

	A
2018-04-09 12:00:00	2
2018-04-10 12:00:00	4

## pandas.Series.autocorr

**Series.autocorr** (*lag=1*)

Lag-N autocorrelation

**Parameters** **lag** : int, default 1

Number of lags to apply before performing autocorrelation.

**Returns**

**autocorr** [float]

## pandas.Series.between

**Series.between** (*left, right, inclusive=True*)

Return boolean Series equivalent to `left <= series <= right`.

This function returns a boolean vector containing *True* wherever the corresponding Series element is between the boundary values *left* and *right*. NA values are treated as *False*.

**Parameters** **left** : scalar

Left boundary.

**right** : scalar

Right boundary.

**inclusive** : bool, default True

Include boundaries.

**Returns** **Series**

Each element will be a boolean.

See also:

`pandas.Series.gt` Greater than of series and other

`pandas.Series.lt` Less than of series and other

## Notes

This function is equivalent to `(left <= ser) & (ser <= right)`

## Examples

```
>>> s = pd.Series([2, 0, 4, 8, np.nan])
```

Boundary values are included by default:

```
>>> s.between(1, 4)
0      True
1     False
2      True
3     False
4     False
dtype: bool
```

With *inclusive* set to `False` boundary values are excluded:

```
>>> s.between(1, 4, inclusive=False)
0      True
1     False
2     False
3     False
4     False
dtype: bool
```

*left* and *right* can be any scalar value:

```
>>> s = pd.Series(['Alice', 'Bob', 'Carol', 'Eve'])
>>> s.between('Anna', 'Daniel')
0     False
1      True
2      True
3     False
dtype: bool
```

## pandas.Series.between\_time

`Series.between_time` (*start\_time*, *end\_time*, *include\_start=True*, *include\_end=True*)

Select values between particular times of the day (e.g., 9:00-9:30 AM).

By setting *start\_time* to be later than *end\_time*, you can get the times that are *not* between the two times.

### Parameters

**start\_time** [datetime.time or string]

**end\_time** [datetime.time or string]  
**include\_start** [boolean, default True]  
**include\_end** [boolean, default True]

**Returns**

**values\_between\_time** [type of caller]

**Raises TypeError**

If the index is not a *DatetimeIndex*

**See also:**

**at\_time** Select values at a particular time of the day

**first** Select initial periods of time series based on a date offset

**last** Select final periods of time series based on a date offset

**DatetimeIndex.indexer\_between\_time** Get just the index locations for values between particular times of the day

**Examples**

```
>>> i = pd.date_range('2018-04-09', periods=4, freq='1D20min')
>>> ts = pd.DataFrame({'A': [1,2,3,4]}, index=i)
>>> ts
```

	A
2018-04-09 00:00:00	1
2018-04-10 00:20:00	2
2018-04-11 00:40:00	3
2018-04-12 01:00:00	4

```
>>> ts.between_time('0:15', '0:45')
```

	A
2018-04-10 00:20:00	2
2018-04-11 00:40:00	3

You get the times that are *not* between two times by setting start\_time later than end\_time:

```
>>> ts.between_time('0:45', '0:15')
```

	A
2018-04-09 00:00:00	1
2018-04-12 01:00:00	4

**pandas.Series.bfill**

**Series.bfill** (axis=None, inplace=False, limit=None, downcast=None)  
 Synonym for *DataFrame.fillna* (method='bfill')

**pandas.Series.bool**

**Series.bool** ()  
 Return the bool of a single element PandasObject.

This must be a boolean scalar value, either True or False. Raise a ValueError if the PandasObject does not have exactly 1 element, or that element is not boolean

## pandas.Series.cat

`Series.cat()`

Accessor object for categorical properties of the Series values.

Be aware that assigning to *categories* is an inplace operation, while all methods return new categorical data per default (but can be called with *inplace=True*).

### Parameters

**data** [Series or CategoricalIndex]

### Examples

```
>>> s.cat.categories
>>> s.cat.categories = list('abc')
>>> s.cat.rename_categories(list('cab'))
>>> s.cat.reorder_categories(list('cab'))
>>> s.cat.add_categories(['d', 'e'])
>>> s.cat.remove_categories(['d'])
>>> s.cat.remove_unused_categories()
>>> s.cat.set_categories(list('abcde'))
>>> s.cat.as_ordered()
>>> s.cat.as_unordered()
```

## pandas.Series.clip

`Series.clip(lower=None, upper=None, axis=None, inplace=False, *args, **kwargs)`

Trim values at input threshold(s).

Assigns values outside boundary to boundary values. Thresholds can be singular values or array like, and in the latter case the clipping is performed element-wise in the specified axis.

**Parameters** **lower** : float or array\_like, default None

Minimum threshold value. All values below this threshold will be set to it.

**upper** : float or array\_like, default None

Maximum threshold value. All values above this threshold will be set to it.

**axis** : int or string axis name, optional

Align object with lower and upper along the given axis.

**inplace** : boolean, default False

Whether to perform the operation in place on the data.

New in version 0.21.0.

**\*args, \*\*kwargs**

Additional keywords have no effect but might be accepted for compatibility with numpy.

**Returns** Series or DataFrame

Same type as calling object with the values outside the clip boundaries replaced

See also:

`clip_lower` Clip values below specified threshold(s).

`clip_upper` Clip values above specified threshold(s).

### Examples

```
>>> data = {'col_0': [9, -3, 0, -1, 5], 'col_1': [-2, -7, 6, 8, -5]}
>>> df = pd.DataFrame(data)
>>> df
   col_0  col_1
0      9    -2
1     -3    -7
2      0     6
3     -1     8
4      5    -5
```

Clips per column using lower and upper thresholds:

```
>>> df.clip(-4, 6)
   col_0  col_1
0      6    -2
1     -3    -4
2      0     6
3     -1     6
4      5    -4
```

Clips using specific lower and upper thresholds per column element:

```
>>> t = pd.Series([2, -4, -1, 6, 3])
>>> t
0      2
1     -4
2     -1
3      6
4      3
dtype: int64
```

```
>>> df.clip(t, t + 4, axis=0)
   col_0  col_1
0      6     2
1     -3    -4
2      0     3
3      6     8
4      5     3
```

### pandas.Series.clip\_lower

`Series.clip_lower(threshold, axis=None, inplace=False)`

Return copy of the input with values below a threshold truncated.

**Parameters** `threshold` : numeric or array-like

Minimum value allowed. All values below threshold will be set to this value.

- **float** : every value is compared to *threshold*.
- **array-like** : The shape of *threshold* should match the object it's compared to. When *self* is a Series, *threshold* should be the length. When *self* is a DataFrame, *threshold* should 2-D and the same shape as *self* for *axis=None*, or 1-D and the same length as the axis being compared.

**axis** : {0 or 'index', 1 or 'columns'}, default 0

Align *self* with *threshold* along the given axis.

**inplace** : boolean, default False

Whether to perform the operation in place on the data.

New in version 0.21.0.

### Returns

**clipped** [same type as input]

### See also:

***Series.clip*** Return copy of input with values below and above thresholds truncated.

***Series.clip\_upper*** Return copy of input with values above threshold truncated.

### Examples

Series single threshold clipping:

```
>>> s = pd.Series([5, 6, 7, 8, 9])
>>> s.clip_lower(8)
0      8
1      8
2      8
3      8
4      9
dtype: int64
```

Series clipping element-wise using an array of thresholds. *threshold* should be the same length as the Series.

```
>>> elemwise_thresholds = [4, 8, 7, 2, 5]
>>> s.clip_lower(elemwise_thresholds)
0      5
1      8
2      7
3      8
4      9
dtype: int64
```

DataFrames can be compared to a scalar.

```
>>> df = pd.DataFrame({"A": [1, 3, 5], "B": [2, 4, 6]})
>>> df
   A  B
0  1  2
```

(continues on next page)

(continued from previous page)

```
1  3  4
2  5  6
```

```
>>> df.clip_lower(3)
   A  B
0  3  3
1  3  4
2  5  6
```

Or to an array of values. By default, *threshold* should be the same shape as the DataFrame.

```
>>> df.clip_lower(np.array([[3, 4], [2, 2], [6, 2]]))
   A  B
0  3  4
1  3  4
2  6  6
```

Control how *threshold* is broadcast with *axis*. In this case *threshold* should be the same length as the axis specified by *axis*.

```
>>> df.clip_lower(np.array([3, 3, 5]), axis='index')
   A  B
0  3  3
1  3  4
2  5  6
```

```
>>> df.clip_lower(np.array([4, 5]), axis='columns')
   A  B
0  4  5
1  4  5
2  5  6
```

### pandas.Series.clip\_upper

`Series.clip_upper(threshold, axis=None, inplace=False)`

Return copy of input with values above given value(s) truncated.

#### Parameters

**threshold** [float or array\_like]

**axis** : int or string axis name, optional

Align object with threshold along the given axis.

**inplace** : boolean, default False

Whether to perform the operation in place on the data

New in version 0.21.0.

#### Returns

**clipped** [same type as input]

See also:

`clip`

## pandas.Series.combine

`Series.combine` (*other*, *func*, *fill\_value*=nan)

Perform elementwise binary operation on two Series using given function with optional fill value when an index is missing from one Series or the other

### Parameters

**other** [Series or scalar value]

**func** : function

Function that takes two scalars as inputs and return a scalar

**fill\_value** [scalar value]

### Returns

**result** [Series]

See also:

[`Series.combine\_first`](#) Combine Series values, choosing the calling Series's values first

## Examples

```
>>> s1 = Series([1, 2])
>>> s2 = Series([0, 3])
>>> s1.combine(s2, lambda x1, x2: x1 if x1 < x2 else x2)
0    0
1    2
dtype: int64
```

## pandas.Series.combine\_first

`Series.combine_first` (*other*)

Combine Series values, choosing the calling Series's values first. Result index will be the union of the two indexes

### Parameters

**other** [Series]

### Returns

**combined** [Series]

See also:

[`Series.combine`](#) Perform elementwise operation on two Series using a given function

## Examples

```

>>> s1 = pd.Series([1, np.nan])
>>> s2 = pd.Series([3, 4])
>>> s1.combine_first(s2)
0    1.0
1    4.0
dtype: float64

```

### pandas.Series.compound

**Series.compound** (*axis=None, skipna=None, level=None*)

Return the compound percentage of the values for the requested axis

#### Parameters

**axis** [{index (0)}]

**skipna** : boolean, default True

Exclude NA/null values when computing the result.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a scalar

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

#### Returns

**compounded** [scalar or Series (if level specified)]

### pandas.Series.compress

**Series.compress** (*condition, \*args, \*\*kwargs*)

Return selected slices of an array along given axis as a Series

#### See also:

`numpy.ndarray.compress`

### pandas.Series consolidate

**Series consolidate** (*inplace=False*)

Compute NDFrame with “consolidated” internals (data of each dtype grouped together in a single ndarray).

Deprecated since version 0.20.0: Consolidate will be an internal implementation only.

### pandas.Series.convert\_objects

**Series.convert\_objects** (*convert\_dates=True, convert\_numeric=False, convert\_timedeltas=True, copy=True*)

Attempt to infer better dtype for object columns.

Deprecated since version 0.21.0.

**Parameters** `convert_dates` : boolean, default True

If True, convert to date where possible. If 'coerce', force conversion, with unconvertible values becoming NaT.

**convert\_numeric** : boolean, default False

If True, attempt to coerce to numbers (including strings), with unconvertible values becoming NaN.

**convert\_timedeltas** : boolean, default True

If True, convert to timedelta where possible. If 'coerce', force conversion, with unconvertible values becoming NaT.

**copy** : boolean, default True

If True, return a copy even if no copy is necessary (e.g. no conversion was done). Note: This is meant for internal use, and should not be confused with inplace.

### Returns

**converted** [same as input object]

**See also:**

[`pandas.to\_datetime`](#) Convert argument to datetime.

[`pandas.to\_timedelta`](#) Convert argument to timedelta.

[`pandas.to\_numeric`](#) Return a fixed frequency timedelta index, with day as the default.

## pandas.Series.copy

`Series.copy (deep=True)`

Make a copy of this object's indices and data.

When `deep=True` (default), a new object will be created with a copy of the calling object's data and indices. Modifications to the data or indices of the copy will not be reflected in the original object (see notes below).

When `deep=False`, a new object will be created without copying the calling object's data or index (only references to the data and index are copied). Any changes to the data of the original will be reflected in the shallow copy (and vice versa).

**Parameters** `deep` : bool, default True

Make a deep copy, including a copy of the data and the indices. With `deep=False` neither the indices nor the data are copied.

**Returns** `copy` : Series, DataFrame or Panel

Object type matches caller.

### Notes

When `deep=True`, data is copied but actual Python objects will not be copied recursively, only the reference to the object. This is in contrast to `copy.deepcopy` in the Standard Library, which recursively copies object data (see examples below).

While Index objects are copied when `deep=True`, the underlying numpy array is not copied for performance reasons. Since Index is immutable, the underlying data can be safely shared and a copy is not needed.

### Examples

```
>>> s = pd.Series([1, 2], index=["a", "b"])
>>> s
a    1
b    2
dtype: int64
```

```
>>> s_copy = s.copy()
>>> s_copy
a    1
b    2
dtype: int64
```

#### Shallow copy versus default (deep) copy:

```
>>> s = pd.Series([1, 2], index=["a", "b"])
>>> deep = s.copy()
>>> shallow = s.copy(deep=False)
```

Shallow copy shares data and index with original.

```
>>> s is shallow
False
>>> s.values is shallow.values and s.index is shallow.index
True
```

Deep copy has own copy of data and index.

```
>>> s is deep
False
>>> s.values is deep.values or s.index is deep.index
False
```

Updates to the data shared by shallow copy and original is reflected in both; deep copy remains unchanged.

```
>>> s[0] = 3
>>> shallow[1] = 4
>>> s
a    3
b    4
dtype: int64
>>> shallow
a    3
b    4
dtype: int64
>>> deep
a    1
b    2
dtype: int64
```

Note that when copying an object containing Python objects, a deep copy will copy the data, but will not do so recursively. Updating a nested data object will be reflected in the deep copy.

```
>>> s = pd.Series([[1, 2], [3, 4]])
>>> deep = s.copy()
>>> s[0][0] = 10
>>> s
0      [10, 2]
1      [3, 4]
dtype: object
>>> deep
0      [10, 2]
1      [3, 4]
dtype: object
```

### **pandas.Series.corr**

`Series.corr` (*other*, *method*='pearson', *min\_periods*=None)  
Compute correlation with *other* Series, excluding missing values

#### **Parameters**

**other** [Series]

**method** : {'pearson', 'kendall', 'spearman'}

- pearson : standard correlation coefficient
- kendall : Kendall Tau correlation coefficient
- spearman : Spearman rank correlation

**min\_periods** : int, optional

Minimum number of observations needed to have a valid result

#### **Returns**

**correlation** [float]

### **pandas.Series.count**

`Series.count` (*level*=None)  
Return number of non-NA/null observations in the Series

**Parameters** **level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a smaller Series

#### **Returns**

**nobs** [int or Series (if level specified)]

### **pandas.Series.cov**

`Series.cov` (*other*, *min\_periods*=None)  
Compute covariance with Series, excluding missing values

**Parameters****other** [Series]**min\_periods** : int, optional

Minimum number of observations needed to have a valid result

**Returns****covariance** [float]**Normalized by N-1 (unbiased estimator).****pandas.Series.cummax**`Series.cummax(axis=None, skipna=True, *args, **kwargs)`

Return cumulative maximum over a DataFrame or Series axis.

Returns a DataFrame or Series of the same size containing the cumulative maximum.

**Parameters axis** : {0 or 'index', 1 or 'columns'}, default 0

The index or the name of the axis. 0 is equivalent to None or 'index'.

**skipna** : boolean, default True

Exclude NA/null values. If an entire row/column is NA, the result will be NA.

**\*args, \*\*kwargs** :

Additional keywords have no effect but might be accepted for compatibility with NumPy.

**Returns****cummax** [scalar or Series]**See also:****`pandas.core.window.Expanding.max`** Similar functionality but ignores NaN values.**`Series.max`** Return the maximum over Series axis.**`Series.cummax`** Return cumulative maximum over Series axis.**`Series.cummin`** Return cumulative minimum over Series axis.**`Series.cumsum`** Return cumulative sum over Series axis.**`Series.cumprod`** Return cumulative product over Series axis.**Examples****Series**

```

>>> s = pd.Series([2, np.nan, 5, -1, 0])
>>> s
0    2.0
1    NaN
2    5.0
3   -1.0

```

(continues on next page)

(continued from previous page)

```
4      0.0
dtype: float64
```

By default, NA values are ignored.

```
>>> s.cummax()
0      2.0
1      NaN
2      5.0
3      5.0
4      5.0
dtype: float64
```

To include NA values in the operation, use `skipna=False`

```
>>> s.cummax(skipna=False)
0      2.0
1      NaN
2      NaN
3      NaN
4      NaN
dtype: float64
```

## DataFrame

```
>>> df = pd.DataFrame([[2.0, 1.0],
...                    [3.0, np.nan],
...                    [1.0, 0.0]],
...                    columns=list('AB'))
>>> df
   A    B
0  2.0  1.0
1  3.0  NaN
2  1.0  0.0
```

By default, iterates over rows and finds the maximum in each column. This is equivalent to `axis=None` or `axis='index'`.

```
>>> df.cummax()
   A    B
0  2.0  1.0
1  3.0  NaN
2  3.0  1.0
```

To iterate over columns and find the maximum in each row, use `axis=1`

```
>>> df.cummax(axis=1)
   A    B
0  2.0  2.0
1  3.0  NaN
2  1.0  1.0
```

**pandas.Series.cummin**

`Series.cummin` (*axis=None*, *skipna=True*, *\*args*, *\*\*kwargs*)

Return cumulative minimum over a DataFrame or Series axis.

Returns a DataFrame or Series of the same size containing the cumulative minimum.

**Parameters** *axis* : {0 or 'index', 1 or 'columns'}, default 0

The index or the name of the axis. 0 is equivalent to None or 'index'.

**skipna** : boolean, default True

Exclude NA/null values. If an entire row/column is NA, the result will be NA.

**\*args, \*\*kwargs** :

Additional keywords have no effect but might be accepted for compatibility with NumPy.

**Returns**

**cummin** [scalar or Series]

**See also:**

[`pandas.core.window.Expanding.min`](#) Similar functionality but ignores NaN values.

[`Series.min`](#) Return the minimum over Series axis.

[`Series.cummax`](#) Return cumulative maximum over Series axis.

[`Series.cummin`](#) Return cumulative minimum over Series axis.

[`Series.cumsum`](#) Return cumulative sum over Series axis.

[`Series.cumprod`](#) Return cumulative product over Series axis.

**Examples****Series**

```
>>> s = pd.Series([2, np.nan, 5, -1, 0])
>>> s
0    2.0
1    NaN
2    5.0
3   -1.0
4    0.0
dtype: float64
```

By default, NA values are ignored.

```
>>> s.cummin()
0    2.0
1    NaN
2    2.0
3   -1.0
4   -1.0
dtype: float64
```

To include NA values in the operation, use `skipna=False`

```
>>> s.cummin(skipna=False)
0      2.0
1      NaN
2      NaN
3      NaN
4      NaN
dtype: float64
```

### DataFrame

```
>>> df = pd.DataFrame([[2.0, 1.0],
...                    [3.0, np.nan],
...                    [1.0, 0.0]],
...                    columns=list('AB'))
>>> df
   A    B
0  2.0  1.0
1  3.0  NaN
2  1.0  0.0
```

By default, iterates over rows and finds the minimum in each column. This is equivalent to `axis=None` or `axis='index'`.

```
>>> df.cummin()
   A    B
0  2.0  1.0
1  2.0  NaN
2  1.0  0.0
```

To iterate over columns and find the minimum in each row, use `axis=1`

```
>>> df.cummin(axis=1)
   A    B
0  2.0  1.0
1  3.0  NaN
2  1.0  0.0
```

## pandas.Series.cumprod

`Series.cumprod(axis=None, skipna=True, *args, **kwargs)`

Return cumulative product over a DataFrame or Series axis.

Returns a DataFrame or Series of the same size containing the cumulative product.

**Parameters** `axis`: {0 or 'index', 1 or 'columns'}, default 0

The index or the name of the axis. 0 is equivalent to None or 'index'.

**skipna**: boolean, default True

Exclude NA/null values. If an entire row/column is NA, the result will be NA.

**\*args, \*\*kwargs**:

Additional keywords have no effect but might be accepted for compatibility with NumPy.

**Returns**

**cumprod** [scalar or Series]

See also:

**pandas.core.window.Expanding.prod** Similar functionality but ignores NaN values.

**Series.prod** Return the product over Series axis.

**Series.cummax** Return cumulative maximum over Series axis.

**Series.cummin** Return cumulative minimum over Series axis.

**Series.cumsum** Return cumulative sum over Series axis.

**Series.cumprod** Return cumulative product over Series axis.

## Examples

### Series

```
>>> s = pd.Series([2, np.nan, 5, -1, 0])
>>> s
0      2.0
1      NaN
2      5.0
3     -1.0
4      0.0
dtype: float64
```

By default, NA values are ignored.

```
>>> s.cumprod()
0      2.0
1      NaN
2     10.0
3    -10.0
4     -0.0
dtype: float64
```

To include NA values in the operation, use `skipna=False`

```
>>> s.cumprod(skipna=False)
0      2.0
1      NaN
2      NaN
3      NaN
4      NaN
dtype: float64
```

### DataFrame

```
>>> df = pd.DataFrame([[2.0, 1.0],
...                    [3.0, np.nan],
...                    [1.0, 0.0]],
...                    columns=list('AB'))
>>> df
   A    B
0  2.0  1.0
```

(continues on next page)

(continued from previous page)

```
1  3.0  NaN
2  1.0   0.0
```

By default, iterates over rows and finds the product in each column. This is equivalent to `axis=None` or `axis='index'`.

```
>>> df.cumprod()
      A      B
0  2.0  1.0
1  6.0  NaN
2  6.0  0.0
```

To iterate over columns and find the product in each row, use `axis=1`

```
>>> df.cumprod(axis=1)
      A      B
0  2.0  2.0
1  3.0  NaN
2  1.0  0.0
```

## pandas.Series.cumsum

`Series.cumsum(axis=None, skipna=True, *args, **kwargs)`

Return cumulative sum over a DataFrame or Series axis.

Returns a DataFrame or Series of the same size containing the cumulative sum.

**Parameters** `axis` : {0 or 'index', 1 or 'columns'}, default 0

The index or the name of the axis. 0 is equivalent to None or 'index'.

**skipna** : boolean, default True

Exclude NA/null values. If an entire row/column is NA, the result will be NA.

**\*args, \*\*kwargs** :

Additional keywords have no effect but might be accepted for compatibility with NumPy.

### Returns

**cumsum** [scalar or Series]

**See also:**

[`pandas.core.window.Expanding.sum`](#) Similar functionality but ignores NaN values.

[`Series.sum`](#) Return the sum over Series axis.

[`Series.cummax`](#) Return cumulative maximum over Series axis.

[`Series.cummin`](#) Return cumulative minimum over Series axis.

[`Series.cumsum`](#) Return cumulative sum over Series axis.

[`Series.cumprod`](#) Return cumulative product over Series axis.

## Examples

### Series

```
>>> s = pd.Series([2, np.nan, 5, -1, 0])
>>> s
0    2.0
1    NaN
2    5.0
3   -1.0
4    0.0
dtype: float64
```

By default, NA values are ignored.

```
>>> s.cumsum()
0    2.0
1    NaN
2    7.0
3    6.0
4    6.0
dtype: float64
```

To include NA values in the operation, use `skipna=False`

```
>>> s.cumsum(skipna=False)
0    2.0
1    NaN
2    NaN
3    NaN
4    NaN
dtype: float64
```

### DataFrame

```
>>> df = pd.DataFrame([[2.0, 1.0],
...                    [3.0, np.nan],
...                    [1.0, 0.0]],
...                    columns=list('AB'))
>>> df
   A    B
0  2.0  1.0
1  3.0  NaN
2  1.0  0.0
```

By default, iterates over rows and finds the sum in each column. This is equivalent to `axis=None` or `axis='index'`.

```
>>> df.cumsum()
   A    B
0  2.0  1.0
1  5.0  NaN
2  6.0  1.0
```

To iterate over columns and find the sum in each row, use `axis=1`

```
>>> df.cumsum(axis=1)
   A    B
0  2.0  3.0
1  3.0 NaN
2  1.0  1.0
```

## pandas.Series.describe

`Series.describe` (*percentiles=None, include=None, exclude=None*)

Generates descriptive statistics that summarize the central tendency, dispersion and shape of a dataset's distribution, excluding NaN values.

Analyzes both numeric and object series, as well as `DataFrame` column sets of mixed data types. The output will vary depending on what is provided. Refer to the notes below for more detail.

**Parameters** `percentiles` : list-like of numbers, optional

The percentiles to include in the output. All should fall between 0 and 1. The default is `[.25, .5, .75]`, which returns the 25th, 50th, and 75th percentiles.

**include** : 'all', list-like of dtypes or None (default), optional

A white list of data types to include in the result. Ignored for `Series`. Here are the options:

- 'all' : All columns of the input will be included in the output.
- A list-like of dtypes : Limits the results to the provided data types. To limit the result to numeric types submit `numpy.number`. To limit it instead to object columns submit the `numpy.object` data type. Strings can also be used in the style of `select_dtypes` (e.g. `df.describe(include=['O'])`). To select pandas categorical columns, use 'category'
- None (default) : The result will include all numeric columns.

**exclude** : list-like of dtypes or None (default), optional,

A black list of data types to omit from the result. Ignored for `Series`. Here are the options:

- A list-like of dtypes : Excludes the provided data types from the result. To exclude numeric types submit `numpy.number`. To exclude object columns submit the data type `numpy.object`. Strings can also be used in the style of `select_dtypes` (e.g. `df.describe(exclude=['O'])`). To exclude pandas categorical columns, use 'category'
- None (default) : The result will exclude nothing.

## Returns

**summary:** Series/DataFrame of summary statistics

## See also:

`DataFrame.count`, `DataFrame.max`, `DataFrame.min`, `DataFrame.mean`, `DataFrame.std`, `DataFrame.select_dtypes`

## Notes

For numeric data, the result's index will include `count`, `mean`, `std`, `min`, `max` as well as `lower`, 50 and upper percentiles. By default the lower percentile is 25 and the upper percentile is 75. The 50 percentile is the same as the median.

For object data (e.g. strings or timestamps), the result's index will include `count`, `unique`, `top`, and `freq`. The `top` is the most common value. The `freq` is the most common value's frequency. Timestamps also include the `first` and `last` items.

If multiple object values have the highest count, then the `count` and `top` results will be arbitrarily chosen from among those with the highest count.

For mixed data types provided via a `DataFrame`, the default is to return only an analysis of numeric columns. If the dataframe consists only of object and categorical data without any numeric columns, the default is to return an analysis of both the object and categorical columns. If `include='all'` is provided as an option, the result will include a union of attributes of each type.

The `include` and `exclude` parameters can be used to limit which columns in a `DataFrame` are analyzed for the output. The parameters are ignored when analyzing a `Series`.

## Examples

Describing a numeric `Series`.

```
>>> s = pd.Series([1, 2, 3])
>>> s.describe()
count      3.0
mean       2.0
std        1.0
min        1.0
25%        1.5
50%        2.0
75%        2.5
max        3.0
```

Describing a categorical `Series`.

```
>>> s = pd.Series(['a', 'a', 'b', 'c'])
>>> s.describe()
count      4
unique     3
top        a
freq       2
dtype: object
```

Describing a timestamp `Series`.

```
>>> s = pd.Series([
...     np.datetime64("2000-01-01"),
...     np.datetime64("2010-01-01"),
...     np.datetime64("2010-01-01")
... ])
>>> s.describe()
count      3
unique     2
top        2010-01-01 00:00:00
```

(continues on next page)

(continued from previous page)

```
freq                2
first      2000-01-01 00:00:00
last       2010-01-01 00:00:00
dtype: object
```

Describing a DataFrame. By default only numeric fields are returned.

```
>>> df = pd.DataFrame({ 'object': ['a', 'b', 'c'],
...                      'numeric': [1, 2, 3],
...                      'categorical': pd.Categorical(['d', 'e', 'f'])
...                      })
>>> df.describe()
      numeric
count      3.0
mean       2.0
std        1.0
min        1.0
25%        1.5
50%        2.0
75%        2.5
max        3.0
```

Describing all columns of a DataFrame regardless of data type.

```
>>> df.describe(include='all')
      categorical  numeric object
count           3      3.0      3
unique          3      NaN      3
top            f      NaN      c
freq           1      NaN      1
mean          NaN      2.0     NaN
std           NaN      1.0     NaN
min           NaN      1.0     NaN
25%           NaN      1.5     NaN
50%           NaN      2.0     NaN
75%           NaN      2.5     NaN
max           NaN      3.0     NaN
```

Describing a column from a DataFrame by accessing it as an attribute.

```
>>> df.numeric.describe()
count      3.0
mean       2.0
std        1.0
min        1.0
25%        1.5
50%        2.0
75%        2.5
max        3.0
Name: numeric, dtype: float64
```

Including only numeric columns in a DataFrame description.

```
>>> df.describe(include=[np.number])
      numeric
count      3.0
```

(continues on next page)

(continued from previous page)

mean	2.0
std	1.0
min	1.0
25%	1.5
50%	2.0
75%	2.5
max	3.0

Including only string columns in a DataFrame description.

```
>>> df.describe(include=[np.object])
      object
count      3
unique      3
top         c
freq        1
```

Including only categorical columns from a DataFrame description.

```
>>> df.describe(include=['category'])
      categorical
count           3
unique           3
top             f
freq            1
```

Excluding numeric columns from a DataFrame description.

```
>>> df.describe(exclude=[np.number])
      categorical  object
count           3      3
unique           3      3
top             f      c
freq            1      1
```

Excluding object columns from a DataFrame description.

```
>>> df.describe(exclude=[np.object])
      categorical  numeric
count           3      3.0
unique           3      NaN
top             f      NaN
freq            1      NaN
mean           NaN      2.0
std            NaN      1.0
min            NaN      1.0
25%            NaN      1.5
50%            NaN      2.0
75%            NaN      2.5
max            NaN      3.0
```

## pandas.Series.diff

Series.**diff** (*periods=1*)

First discrete difference of element.

Calculates the difference of a Series element compared with another element in the Series (default is element in previous row).

**Parameters** `periods` : int, default 1

Periods to shift for calculating difference, accepts negative values.

**Returns**

**diffed** [Series]

**See also:**

***Series.pct\_change*** Percent change over given number of periods.

***Series.shift*** Shift index by desired number of periods with an optional time freq.

***DataFrame.diff*** First discrete difference of object

## Examples

Difference with previous row

```
>>> s = pd.Series([1, 1, 2, 3, 5, 8])
>>> s.diff()
0    NaN
1    0.0
2    1.0
3    1.0
4    2.0
5    3.0
dtype: float64
```

Difference with 3rd previous row

```
>>> s.diff(periods=3)
0    NaN
1    NaN
2    NaN
3    2.0
4    4.0
5    6.0
dtype: float64
```

Difference with following row

```
>>> s.diff(periods=-1)
0    0.0
1   -1.0
2   -1.0
3   -2.0
4   -3.0
5    NaN
dtype: float64
```

### pandas.Series.div

`Series.div` (*other*, *level=None*, *fill\_value=None*, *axis=0*)

Floating division of series and other, element-wise (binary operator *truediv*).

Equivalent to `series / other`, but with support to substitute a `fill_value` for missing data in one of the inputs.

#### Parameters

**other** [Series or scalar value]

**fill\_value** : None or float value, default None (NaN)

Fill existing missing (NaN) values, and any new element needed for successful Series alignment, with this value before computation. If data in both corresponding Series locations is missing the result will be missing

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

#### Returns

**result** [Series]

#### See also:

[`Series.rtruediv`](#)

### Examples

```

>>> a = pd.Series([1, 1, 1, np.nan], index=['a', 'b', 'c', 'd'])
>>> a
a    1.0
b    1.0
c    1.0
d    NaN
dtype: float64
>>> b = pd.Series([1, np.nan, 1, np.nan], index=['a', 'b', 'd', 'e'])
>>> b
a    1.0
b    NaN
d    1.0
e    NaN
dtype: float64
>>> a.add(b, fill_value=0)
a    2.0
b    1.0
c    1.0
d    1.0
e    NaN
dtype: float64

```

### pandas.Series.divide

`Series.divide` (*other*, *level=None*, *fill\_value=None*, *axis=0*)

Floating division of series and other, element-wise (binary operator *truediv*).

Equivalent to `series / other`, but with support to substitute a `fill_value` for missing data in one of the inputs.

#### Parameters

**other** [Series or scalar value]

**fill\_value** : None or float value, default None (NaN)

Fill existing missing (NaN) values, and any new element needed for successful Series alignment, with this value before computation. If data in both corresponding Series locations is missing the result will be missing

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

#### Returns

**result** [Series]

#### See also:

`Series.rtruediv`

#### Examples

```
>>> a = pd.Series([1, 1, 1, np.nan], index=['a', 'b', 'c', 'd'])
>>> a
a    1.0
b    1.0
c    1.0
d    NaN
dtype: float64
>>> b = pd.Series([1, np.nan, 1, np.nan], index=['a', 'b', 'd', 'e'])
>>> b
a    1.0
b    NaN
d    1.0
e    NaN
dtype: float64
>>> a.add(b, fill_value=0)
a    2.0
b    1.0
c    1.0
d    1.0
e    NaN
dtype: float64
```

### pandas.Series.divmod

`Series.divmod(other, level=None, fill_value=None, axis=0)`

Integer division and modulo of series and other, element-wise (binary operator *divmod*).

Equivalent to `series divmod other`, but with support to substitute a `fill_value` for missing data in one of the inputs.

#### Parameters

**other** [Series or scalar value]

**fill\_value** : None or float value, default None (NaN)

Fill existing missing (NaN) values, and any new element needed for successful Series alignment, with this value before computation. If data in both corresponding Series locations is missing the result will be missing

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

### Returns

**result** [Series]

### See also:

Series.None

### Examples

```
>>> a = pd.Series([1, 1, 1, np.nan], index=['a', 'b', 'c', 'd'])
>>> a
a    1.0
b    1.0
c    1.0
d    NaN
dtype: float64
>>> b = pd.Series([1, np.nan, 1, np.nan], index=['a', 'b', 'd', 'e'])
>>> b
a    1.0
b    NaN
d    1.0
e    NaN
dtype: float64
>>> a.add(b, fill_value=0)
a    2.0
b    1.0
c    1.0
d    1.0
e    NaN
dtype: float64
```

## pandas.Series.dot

Series.**dot** (*other*)

Matrix multiplication with DataFrame or inner-product with Series objects. Can also be called using *self* @ *other* in Python >= 3.5.

### Parameters

**other** [Series or DataFrame]

### Returns

**dot\_product** [scalar or Series]

## pandas.Series.drop

`Series.drop` (*labels=None, axis=0, index=None, columns=None, level=None, inplace=False, errors='raise'*)  
Return Series with specified index labels removed.

Remove elements of a Series based on specifying the index labels. When using a multi-index, labels on different levels can be removed by specifying the level.

**Parameters** **labels** : single label or list-like

Index labels to drop.

**axis** : 0, default 0

Redundant for application on Series.

**index, columns** : None

Redundant for application on Series, but index can be used instead of labels.

New in version 0.21.0.

**level** : int or level name, optional

For MultiIndex, level for which the labels will be removed.

**inplace** : bool, default False

If True, do operation inplace and return None.

**errors** : { 'ignore', 'raise' }, default 'raise'

If 'ignore', suppress error and only existing labels are dropped.

### Returns

**dropped** [pandas.Series]

### Raises

**KeyError**

If none of the labels are found in the index.

### See also:

[\*Series.reindex\*](#) Return only specified index labels of Series.

[\*Series.dropna\*](#) Return series without null values.

[\*Series.drop\\_duplicates\*](#) Return Series with duplicate values removed.

[\*DataFrame.drop\*](#) Drop specified labels from rows or columns.

## Examples

```
>>> s = pd.Series(data=np.arange(3), index=['A', 'B', 'C'])
>>> s
A    0
B    1
C    2
dtype: int64
```

Drop labels B en C

```
>>> s.drop(labels=['B', 'C'])
A    0
dtype: int64
```

Drop 2nd level label in MultiIndex Series

```
>>> midx = pd.MultiIndex(levels=[['lama', 'cow', 'falcon'],
...                             ['speed', 'weight', 'length']],
...                       labels=[[0, 0, 0, 1, 1, 1, 2, 2, 2],
...                              [0, 1, 2, 0, 1, 2, 0, 1, 2]])
>>> s = pd.Series([45, 200, 1.2, 30, 250, 1.5, 320, 1, 0.3],
...               index=midx)
>>> s
lama      speed      45.0
          weight     200.0
          length      1.2
cow       speed      30.0
          weight     250.0
          length      1.5
falcon    speed     320.0
          weight      1.0
          length      0.3
dtype: float64
```

```
>>> s.drop(labels='weight', level=1)
lama      speed      45.0
          length      1.2
cow       speed      30.0
          length      1.5
falcon    speed     320.0
          length      0.3
dtype: float64
```

## pandas.Series.drop\_duplicates

**Series.drop\_duplicates** (*keep='first', inplace=False*)

Return Series with duplicate values removed.

**Parameters** **keep** : {'first', 'last', False}, default 'first'

- 'first' : Drop duplicates except for the first occurrence.
- 'last' : Drop duplicates except for the last occurrence.
- False : Drop all duplicates.

**inplace** : boolean, default False

If True, performs operation inplace and returns None.

**Returns**

**deduplicated** [Series]

**See also:**

**Index.drop\_duplicates** equivalent method on Index

**DataFrame.drop\_duplicates** equivalent method on DataFrame

`Series.duplicated` related method on Series, indicating duplicate Series values.

## Examples

Generate an Series with duplicated entries.

```
>>> s = pd.Series(['lama', 'cow', 'lama', 'beetle', 'lama', 'hippo'],
...               name='animal')
>>> s
0      lama
1       cow
2      lama
3    beetle
4      lama
5     hippo
Name: animal, dtype: object
```

With the ‘keep’ parameter, the selection behaviour of duplicated values can be changed. The value ‘first’ keeps the first occurrence for each set of duplicated entries. The default value of keep is ‘first’.

```
>>> s.drop_duplicates()
0      lama
1       cow
3    beetle
5     hippo
Name: animal, dtype: object
```

The value ‘last’ for parameter ‘keep’ keeps the last occurrence for each set of duplicated entries.

```
>>> s.drop_duplicates(keep='last')
1       cow
3    beetle
4      lama
5     hippo
Name: animal, dtype: object
```

The value `False` for parameter ‘keep’ discards all sets of duplicated entries. Setting the value of ‘inplace’ to `True` performs the operation inplace and returns `None`.

```
>>> s.drop_duplicates(keep=False, inplace=True)
>>> s
1       cow
3    beetle
5     hippo
Name: animal, dtype: object
```

## pandas.Series.dropna

`Series.dropna (axis=0, inplace=False, **kwargs)`

Return a new Series with missing values removed.

See the [User Guide](#) for more on which values are considered missing, and how to work with missing data.

**Parameters** `axis`: {0 or ‘index’}, default 0

There is only one axis to drop values from.

**inplace** : bool, default False

If True, do operation inplace and return None.

**\*\*kwargs**

Not in use.

### Returns Series

Series with NA entries dropped from it.

### See also:

**Series.isna** Indicate missing values.

**Series.notna** Indicate existing (non-missing) values.

**Series.fillna** Replace missing values.

**DataFrame.dropna** Drop rows or columns which contain NA values.

**Index.dropna** Drop missing indices.

### Examples

```
>>> ser = pd.Series([1., 2., np.nan])
>>> ser
0    1.0
1    2.0
2     NaN
dtype: float64
```

Drop NA values from a Series.

```
>>> ser.dropna()
0    1.0
1    2.0
dtype: float64
```

Keep the Series with valid entries in the same variable.

```
>>> ser.dropna(inplace=True)
>>> ser
0    1.0
1    2.0
dtype: float64
```

Empty strings are not considered NA values. None is considered an NA value.

```
>>> ser = pd.Series([np.NaN, 2, pd.NaT, '', None, 'I stay'])
>>> ser
0     NaN
1         2
2     NaT
3
4     None
5    I stay
dtype: object
```

(continues on next page)

(continued from previous page)

```
>>> ser.dropna()
1      2
3
5      I stay
dtype: object
```

## pandas.Series.dt

`Series.dt()`

Accessor object for datetimelike properties of the Series values.

### Examples

```
>>> s.dt.hour
>>> s.dt.second
>>> s.dt.quarter
```

Returns a Series indexed like the original Series. Raises `TypeError` if the Series does not contain datetime-like values.

## pandas.Series.duplicated

`Series.duplicated(keep='first')`

Indicate duplicate Series values.

Duplicated values are indicated as `True` values in the resulting Series. Either all duplicates, all except the first or all except the last occurrence of duplicates can be indicated.

**Parameters** `keep` : { 'first', 'last', False }, default 'first'

- 'first' : Mark duplicates as `True` except for the first occurrence.
- 'last' : Mark duplicates as `True` except for the last occurrence.
- False : Mark all duplicates as `True`.

**Returns**

`pandas.core.series.Series`

**See also:**

[`pandas.Index.duplicated`](#) Equivalent method on `pandas.Index`

[`pandas.DataFrame.duplicated`](#) Equivalent method on `pandas.DataFrame`

[`pandas.Series.drop\_duplicates`](#) Remove duplicate values from Series

### Examples

By default, for each set of duplicated values, the first occurrence is set on `False` and all others on `True`:

```
>>> animals = pd.Series(['lama', 'cow', 'lama', 'beetle', 'lama'])
>>> animals.duplicated()
0    False
1    False
2     True
3    False
4     True
dtype: bool
```

which is equivalent to

```
>>> animals.duplicated(keep='first')
0    False
1    False
2     True
3    False
4     True
dtype: bool
```

By using 'last', the last occurrence of each set of duplicated values is set on False and all others on True:

```
>>> animals.duplicated(keep='last')
0     True
1    False
2     True
3    False
4    False
dtype: bool
```

By setting keep on False, all duplicates are True:

```
>>> animals.duplicated(keep=False)
0     True
1    False
2     True
3    False
4     True
dtype: bool
```

## pandas.Series.eq

`Series.eq(other, level=None, fill_value=None, axis=0)`

Equal to of series and other, element-wise (binary operator *eq*).

Equivalent to `series == other`, but with support to substitute a `fill_value` for missing data in one of the inputs.

### Parameters

**other** [Series or scalar value]

**fill\_value** : None or float value, default None (NaN)

Fill existing missing (NaN) values, and any new element needed for successful Series alignment, with this value before computation. If data in both corresponding Series locations is missing the result will be missing

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

### Returns

**result** [Series]

### See also:

`Series.None`

### Examples

```
>>> a = pd.Series([1, 1, 1, np.nan], index=['a', 'b', 'c', 'd'])
>>> a
a    1.0
b    1.0
c    1.0
d    NaN
dtype: float64
>>> b = pd.Series([1, np.nan, 1, np.nan], index=['a', 'b', 'd', 'e'])
>>> b
a    1.0
b    NaN
d    1.0
e    NaN
dtype: float64
>>> a.add(b, fill_value=0)
a    2.0
b    1.0
c    1.0
d    1.0
e    NaN
dtype: float64
```

## pandas.Series.equals

`Series.equals` (*other*)

Determines if two NDFrame objects contain the same elements. NaNs in the same location are considered equal.

## pandas.Series.ewm

`Series.ewm` (*com=None, span=None, halflife=None, alpha=None, min\_periods=0, adjust=True, ignore\_na=False, axis=0*)

Provides exponential weighted functions

New in version 0.18.0.

**Parameters** *com* : float, optional

Specify decay in terms of center of mass,  $\alpha = 1/(1 + com)$ , for  $com \geq 0$

**span** : float, optional

Specify decay in terms of span,  $\alpha = 2/(span + 1)$ , for  $span \geq 1$

**halflife** : float, optional

Specify decay in terms of half-life,  $\alpha = 1 - \exp(\log(0.5)/half\_life)$ , for  $half\_life > 0$

**alpha** : float, optional

Specify smoothing factor  $\alpha$  directly,  $0 < \alpha \leq 1$

New in version 0.18.0.

**min\_periods** : int, default 0

Minimum number of observations in window required to have a value (otherwise result is NA).

**adjust** : boolean, default True

Divide by decaying adjustment factor in beginning periods to account for imbalance in relative weightings (viewing EWMA as a moving average)

**ignore\_na** : boolean, default False

Ignore missing values when calculating weights; specify True to reproduce pre-0.15.0 behavior

### Returns

**a Window sub-classed for the particular operation**

See also:

*rolling* Provides rolling window calculations

*expanding* Provides expanding transformations.

### Notes

Exactly one of center of mass, span, half-life, and alpha must be provided. Allowed values and relationship between the parameters are specified in the parameter descriptions above; see the link at the end of this section for a detailed explanation.

When adjust is True (default), weighted averages are calculated using weights  $(1-\alpha)^{(n-1)}$ ,  $(1-\alpha)^{(n-2)}$ , ...,  $1-\alpha$ , 1.

**When adjust is False, weighted averages are calculated recursively as:**  $weighted\_average[0] = arg[0]$ ;  $weighted\_average[i] = (1-\alpha)*weighted\_average[i-1] + \alpha*arg[i]$ .

When ignore\_na is False (default), weights are based on absolute positions. For example, the weights of x and y used in calculating the final weighted average of [x, None, y] are  $(1-\alpha)^2$  and 1 (if adjust is True), and  $(1-\alpha)^2$  and  $\alpha$  (if adjust is False).

When ignore\_na is True (reproducing pre-0.15.0 behavior), weights are based on relative positions. For example, the weights of x and y used in calculating the final weighted average of [x, None, y] are  $1-\alpha$  and 1 (if adjust is True), and  $1-\alpha$  and  $\alpha$  (if adjust is False).

More details can be found at <http://pandas.pydata.org/pandas-docs/stable/computation.html#exponentially-weighted-windows>

### Examples

```
>>> df = DataFrame({'B': [0, 1, 2, np.nan, 4]})
      B
0    0.0
1    1.0
2    2.0
3   NaN
4    4.0
```

```
>>> df.ewm(com=0.5).mean()
      B
0  0.000000
1  0.750000
2  1.615385
3  1.615385
4  3.670213
```

## pandas.Series.expanding

`Series.expanding` (*min\_periods=1, center=False, axis=0*)

Provides expanding transformations.

New in version 0.18.0.

**Parameters** `min_periods` : int, default 1

Minimum number of observations in window required to have a value (otherwise result is NA).

**center** : boolean, default False

Set the labels at the center of the window.

**axis** [int or string, default 0]

### Returns

a **Window** sub-classed for the particular operation

**See also:**

[\*rolling\*](#) Provides rolling window calculations

[\*ewm\*](#) Provides exponential weighted functions

### Notes

By default, the result is set to the right edge of the window. This can be changed to the center of the window by setting `center=True`.

### Examples

```
>>> df = DataFrame({'B': [0, 1, 2, np.nan, 4]})
      B
0    0.0
1    1.0
2    2.0
3   NaN
4    4.0
```

```
>>> df.expanding(2).sum()
      B
0   NaN
1    1.0
2    3.0
3    3.0
4    7.0
```

## pandas.Series.factorize

`Series.factorize` (*sort=False*, *na\_sentinel=-1*)

Encode the object as an enumerated type or categorical variable.

This method is useful for obtaining a numeric representation of an array when all that matters is identifying distinct values. *factorize* is available as both a top-level function `pandas.factorize()`, and as a method `Series.factorize()` and `Index.factorize()`.

**Parameters** *sort* : boolean, default False

Sort *uniques* and shuffle *labels* to maintain the relationship.

**na\_sentinel** : int, default -1

Value to mark “not found”.

**Returns** *labels* : ndarray

An integer ndarray that’s an indexer into *uniques*. `uniques.take(labels)` will have the same values as *values*.

**uniques** : ndarray, Index, or Categorical

The unique valid values. When *values* is Categorical, *uniques* is a Categorical. When *values* is some other pandas object, an *Index* is returned. Otherwise, a 1-D ndarray is returned.

---

**Note:** Even if there’s a missing value in *values*, *uniques* will *not* contain an entry for it.

---

**See also:**

`pandas.cut` Discretize continuous-valued array.

`pandas.unique` Find the unique valuse in an array.

## Examples

These examples all show *factorize* as a top-level method like `pd.factorize(values)`. The results are identical for methods like `Series.factorize()`.

```
>>> labels, uniques = pd.factorize(['b', 'b', 'a', 'c', 'b'])
>>> labels
array([0, 0, 1, 2, 0])
>>> uniques
array(['b', 'a', 'c'], dtype=object)
```

With `sort=True`, the *uniques* will be sorted, and *labels* will be shuffled so that the relationship is the maintained.

```
>>> labels, uniques = pd.factorize(['b', 'b', 'a', 'c', 'b'], sort=True)
>>> labels
array([1, 1, 0, 2, 1])
>>> uniques
array(['a', 'b', 'c'], dtype=object)
```

Missing values are indicated in *labels* with *na\_sentinel* (-1 by default). Note that missing values are never included in *uniques*.

```
>>> labels, uniques = pd.factorize(['b', None, 'a', 'c', 'b'])
>>> labels
array([ 0, -1,  1,  2,  0])
>>> uniques
array(['b', 'a', 'c'], dtype=object)
```

Thus far, we've only factorized lists (which are internally coerced to NumPy arrays). When factorizing pandas objects, the type of *uniques* will differ. For Categoricals, a *Categorical* is returned.

```
>>> cat = pd.Categorical(['a', 'a', 'c'], categories=['a', 'b', 'c'])
>>> labels, uniques = pd.factorize(cat)
>>> labels
array([0, 0, 1])
>>> uniques
[a, c]
Categories (3, object): [a, b, c]
```

Notice that 'b' is in `uniques.categories`, despite not being present in `cat.values`.

For all other pandas objects, an Index of the appropriate type is returned.

```
>>> cat = pd.Series(['a', 'a', 'c'])
>>> labels, uniques = pd.factorize(cat)
>>> labels
array([0, 0, 1])
>>> uniques
Index(['a', 'c'], dtype='object')
```

## pandas.Series.ffill

`Series.fffll` (*axis=None, inplace=False, limit=None, downcast=None*)  
 Synonym for `DataFrame.fillna(method='ffill')`

**pandas.Series.fillna**

`Series.fillna` (*value=None, method=None, axis=None, inplace=False, limit=None, down-  
cast=None, \*\*kwargs*)

Fill NA/NaN values using the specified method

**Parameters** **value** : scalar, dict, Series, or DataFrame

Value to use to fill holes (e.g. 0), alternately a dict/Series/DataFrame of values specifying which value to use for each index (for a Series) or column (for a DataFrame). (values not in the dict/Series/DataFrame will not be filled). This value cannot be a list.

**method** : {'backfill', 'bfill', 'pad', 'ffill', None}, default None

Method to use for filling holes in reindexed Series pad / ffill: propagate last valid observation forward to next valid backfill / bfill: use NEXT valid observation to fill gap

**axis** [{0 or 'index'}]

**inplace** : boolean, default False

If True, fill in place. Note: this will modify any other views on this object, (e.g. a no-copy slice for a column in a DataFrame).

**limit** : int, default None

If method is specified, this is the maximum number of consecutive NaN values to forward/backward fill. In other words, if there is a gap with more than this number of consecutive NaNs, it will only be partially filled. If method is not specified, this is the maximum number of entries along the entire axis where NaNs will be filled. Must be greater than 0 if not None.

**downcast** : dict, default is None

a dict of item->dtype of what to downcast if possible, or the string 'infer' which will try to downcast to an appropriate equal type (e.g. float64 to int64 if possible)

**Returns**

**filled** [Series]

**See also:**

*interpolate* Fill NaN values using interpolation.

*reindex, asfreq*

**Examples**

```
>>> df = pd.DataFrame([[np.nan, 2, np.nan, 0],
...                    [3, 4, np.nan, 1],
...                    [np.nan, np.nan, np.nan, 5],
...                    [np.nan, 3, np.nan, 4]],
...                    columns=list('ABCD'))
>>> df
   A    B    C    D
0 NaN  2.0 NaN   0
1 3.0  4.0 NaN   1
```

(continues on next page)

(continued from previous page)

2	NaN	NaN	NaN	5
3	NaN	3.0	NaN	4

Replace all NaN elements with 0s.

```
>>> df.fillna(0)
   A    B    C    D
0  0.0  2.0  0.0  0
1  3.0  4.0  0.0  1
2  0.0  0.0  0.0  5
3  0.0  3.0  0.0  4
```

We can also propagate non-null values forward or backward.

```
>>> df.fillna(method='ffill')
   A    B    C    D
0  NaN  2.0  NaN  0
1  3.0  4.0  NaN  1
2  3.0  4.0  NaN  5
3  3.0  3.0  NaN  4
```

Replace all NaN elements in column 'A', 'B', 'C', and 'D', with 0, 1, 2, and 3 respectively.

```
>>> values = {'A': 0, 'B': 1, 'C': 2, 'D': 3}
>>> df.fillna(value=values)
   A    B    C    D
0  0.0  2.0  2.0  0
1  3.0  4.0  2.0  1
2  0.0  1.0  2.0  5
3  0.0  3.0  2.0  4
```

Only replace the first NaN element.

```
>>> df.fillna(value=values, limit=1)
   A    B    C    D
0  0.0  2.0  2.0  0
1  3.0  4.0  NaN  1
2  NaN  1.0  NaN  5
3  NaN  3.0  NaN  4
```

## pandas.Series.filter

**Series.filter** (*items=None, like=None, regex=None, axis=None*)

Subset rows or columns of dataframe according to labels in the specified index.

Note that this routine does not filter a dataframe on its contents. The filter is applied to the labels of the index.

**Parameters** **items** : list-like

List of info axis to restrict to (must not all be present)

**like** : string

Keep info axis where “arg in col == True”

**regex** : string (regular expression)

Keep info axis with `re.search(regex, col) == True`

**axis** : int or string axis name

The axis to filter on. By default this is the info axis, 'index' for Series, 'columns' for DataFrame

### Returns

same type as input object

### See also:

`pandas.DataFrame.loc`

### Notes

The `items`, `like`, and `regex` parameters are enforced to be mutually exclusive.

`axis` defaults to the info axis that is used when indexing with `[]`.

### Examples

```
>>> df
one  two  three
mouse    1    2    3
rabbit   4    5    6
```

```
>>> # select columns by name
>>> df.filter(items=['one', 'three'])
one  three
mouse    1    3
rabbit   4    6
```

```
>>> # select columns by regular expression
>>> df.filter(regex='e$', axis=1)
one  three
mouse    1    3
rabbit   4    6
```

```
>>> # select rows containing 'bbi'
>>> df.filter(like='bbi', axis=0)
one  two  three
rabbit   4    5    6
```

## pandas.Series.first

`Series.first(offset)`

Convenience method for subsetting initial periods of time series data based on a date offset.

### Parameters

**offset** [string, DateOffset, dateutil.relativedelta]

### Returns

**subset** [type of caller]

**Raises** `TypeError`

If the index is not a `DatetimeIndex`

**See also:**

**`last`** Select final periods of time series based on a date offset

**`at_time`** Select values at a particular time of the day

**`between_time`** Select values between particular times of the day

**Examples**

```
>>> i = pd.date_range('2018-04-09', periods=4, freq='2D')
>>> ts = pd.DataFrame({'A': [1,2,3,4]}, index=i)
>>> ts
```

	A
2018-04-09	1
2018-04-11	2
2018-04-13	3
2018-04-15	4

Get the rows for the first 3 days:

```
>>> ts.first('3D')
```

	A
2018-04-09	1
2018-04-11	2

Notice the data for 3 first calendar days were returned, not the first 3 days observed in the dataset, and therefore data for 2018-04-13 was not returned.

**pandas.Series.first\_valid\_index**

`Series.first_valid_index()`  
Return index for first non-NA/null value.

**Returns**

**scalar** [type of index]

**Notes**

If all elements are non-NA/null, returns None. Also returns None for empty NDFrame.

**pandas.Series.floordiv**

`Series.floordiv(other, level=None, fill_value=None, axis=0)`  
Integer division of series and other, element-wise (binary operator *floordiv*).

Equivalent to `series // other`, but with support to substitute a `fill_value` for missing data in one of the inputs.

**Parameters****other** [Series or scalar value]**fill\_value** : None or float value, default None (NaN)

Fill existing missing (NaN) values, and any new element needed for successful Series alignment, with this value before computation. If data in both corresponding Series locations is missing the result will be missing

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

**Returns****result** [Series]**See also:***Series.rfloordiv***Examples**

```
>>> a = pd.Series([1, 1, 1, np.nan], index=['a', 'b', 'c', 'd'])
>>> a
a    1.0
b    1.0
c    1.0
d    NaN
dtype: float64
>>> b = pd.Series([1, np.nan, 1, np.nan], index=['a', 'b', 'd', 'e'])
>>> b
a    1.0
b    NaN
d    1.0
e    NaN
dtype: float64
>>> a.add(b, fill_value=0)
a    2.0
b    1.0
c    1.0
d    1.0
e    NaN
dtype: float64
```

**pandas.Series.from\_array**

**classmethod** `Series.from_array(arr, index=None, name=None, dtype=None, copy=False, fastpath=False)`

Construct Series from array.

Deprecated since version 0.23.0: Use `pd.Series(..)` constructor instead.

## `pandas.Series.from_csv`

**classmethod** `Series.from_csv` (*path*, *sep*=' ', *parse\_dates*=True, *header*=None, *index\_col*=0, *encoding*=None, *infer\_datetime\_format*=False)

Read CSV file.

Deprecated since version 0.21.0: Use `pandas.read_csv()` instead.

It is preferable to use the more powerful `pandas.read_csv()` for most general purposes, but `from_csv` makes for an easy roundtrip to and from a file (the exact counterpart of `to_csv`), especially with a time Series.

This method only differs from `pandas.read_csv()` in some defaults:

- *index\_col* is 0 instead of None (take first column as index by default)
- *header* is None instead of 0 (the first row is not used as the column names)
- *parse\_dates* is True instead of False (try parsing the index as datetime by default)

With `pandas.read_csv()`, the option `squeeze=True` can be used to return a Series like `from_csv`.

### Parameters

**path** [string file path or file handle / StringIO]

**sep** : string, default ' '

Field delimiter

**parse\_dates** : boolean, default True

Parse dates. Different default from `read_table`

**header** : int, default None

Row to use as header (skip prior rows)

**index\_col** : int or sequence, default 0

Column to use for index. If a sequence is given, a MultiIndex is used. Different default from `read_table`

**encoding** : string, optional

a string representing the encoding to use if the contents are non-ascii, for python versions prior to 3

**infer\_datetime\_format**: boolean, default False

If True and *parse\_dates* is True for a column, try to infer the datetime format based on the first datetime string. If the format can be inferred, there often will be a large parsing speed-up.

### Returns

**y** [Series]

**See also:**

`pandas.read_csv`

## pandas.Series.ge

`Series.ge` (*other*, *level=None*, *fill\_value=None*, *axis=0*)

Greater than or equal to of series and other, element-wise (binary operator *ge*).

Equivalent to `series >= other`, but with support to substitute a *fill\_value* for missing data in one of the inputs.

### Parameters

**other** [Series or scalar value]

**fill\_value** : None or float value, default None (NaN)

Fill existing missing (NaN) values, and any new element needed for successful Series alignment, with this value before computation. If data in both corresponding Series locations is missing the result will be missing

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

### Returns

**result** [Series]

### See also:

`Series.None`

## Examples

```

>>> a = pd.Series([1, 1, 1, np.nan], index=['a', 'b', 'c', 'd'])
>>> a
a    1.0
b    1.0
c    1.0
d    NaN
dtype: float64
>>> b = pd.Series([1, np.nan, 1, np.nan], index=['a', 'b', 'd', 'e'])
>>> b
a    1.0
b    NaN
d    1.0
e    NaN
dtype: float64
>>> a.add(b, fill_value=0)
a    2.0
b    1.0
c    1.0
d    1.0
e    NaN
dtype: float64

```

## pandas.Series.get

`Series.get` (*key*, *default=None*)

Get item from object for given key (DataFrame column, Panel slice, etc.). Returns default value if not

found.

**Parameters**

**key** [object]

**Returns**

**value** [type of items contained in object]

**pandas.Series.get\_dtype\_counts**

`Series.get_dtype_counts()`

Return counts of unique dtypes in this object.

**Returns dtype** : Series

Series with the count of columns with each dtype.

**See also:**

**dtypes** Return the dtypes in this object.

**Examples**

```
>>> a = [['a', 1, 1.0], ['b', 2, 2.0], ['c', 3, 3.0]]
>>> df = pd.DataFrame(a, columns=['str', 'int', 'float'])
>>> df
   str  int  float
0   a    1   1.0
1   b    2   2.0
2   c    3   3.0
```

```
>>> df.get_dtype_counts()
float64    1
int64      1
object     1
dtype: int64
```

**pandas.Series.get\_ftype\_counts**

`Series.get_ftype_counts()`

Return counts of unique ftypes in this object.

Deprecated since version 0.23.0.

This is useful for SparseDataFrame or for DataFrames containing sparse arrays.

**Returns dtype** : Series

Series with the count of columns with each type and sparsity (dense/sparse)

**See also:**

**ftypes** Return ftypes (indication of sparse/dense and dtype) in this object.

## Examples

```
>>> a = [['a', 1, 1.0], ['b', 2, 2.0], ['c', 3, 3.0]]
>>> df = pd.DataFrame(a, columns=['str', 'int', 'float'])
>>> df
   str  int  float
0   a    1    1.0
1   b    2    2.0
2   c    3    3.0
```

```
>>> df.get_ftype_counts()
float64:dense    1
int64:dense      1
object:dense     1
dtype: int64
```

## pandas.Series.get\_value

`Series.get_value(label, takeable=False)`

Quickly retrieve single value at passed index label

Deprecated since version 0.21.0: Please use `.at[]` or `.iat[]` accessors.

### Parameters

**label** [object]

**takeable** [interpret the index as indexers, default False]

### Returns

**value** [scalar value]

## pandas.Series.get\_values

`Series.get_values()`

same as `values` (but handles sparseness conversions); is a view

## pandas.Series.groupby

`Series.groupby(by=None, axis=0, level=None, as_index=True, sort=True, group_keys=True, squeeze=False, observed=False, **kwargs)`

Group series using mapper (dict or key function, apply given function to group, return result as series) or by a series of columns.

**Parameters** **by** : mapping, function, label, or list of labels

Used to determine the groups for the `groupby`. If `by` is a function, it's called on each value of the object's index. If a dict or Series is passed, the Series or dict VALUES will be used to determine the groups (the Series' values are first aligned; see `.align()` method). If an ndarray is passed, the values are used as-is determine the groups. A label or list of labels may be passed to group by the columns in `self`. Notice that a tuple is interpreted a (single) key.

**axis** [int, default 0]

**level** : int, level name, or sequence of such, default None

If the axis is a MultiIndex (hierarchical), group by a particular level or levels

**as\_index** : boolean, default True

For aggregated output, return object with group labels as the index. Only relevant for DataFrame input. as\_index=False is effectively “SQL-style” grouped output

**sort** : boolean, default True

Sort group keys. Get better performance by turning this off. Note this does not influence the order of observations within each group. groupby preserves the order of rows within each group.

**group\_keys** : boolean, default True

When calling apply, add group keys to index to identify pieces

**squeeze** : boolean, default False

reduce the dimensionality of the return type if possible, otherwise return a consistent type

**observed** : boolean, default False

This only applies if any of the groupers are Categoricals If True: only show observed values for categorical groupers. If False: show all values for categorical groupers.

New in version 0.23.0.

## Returns

### GroupBy object

See also:

[\*resample\*](#) Convenience method for frequency conversion and resampling of time series.

## Notes

See the [user guide](#) for more.

## Examples

DataFrame results

```
>>> data.groupby(func, axis=0).mean()
>>> data.groupby(['col1', 'col2'])['col3'].mean()
```

DataFrame with hierarchical index

```
>>> data.groupby(['col1', 'col2']).mean()
```

## pandas.Series.gt

`Series.gt` (*other*, *level=None*, *fill\_value=None*, *axis=0*)

Greater than of series and other, element-wise (binary operator *gt*).

Equivalent to `series > other`, but with support to substitute a `fill_value` for missing data in one of the inputs.

#### Parameters

**other** [Series or scalar value]

**fill\_value** : None or float value, default None (NaN)

Fill existing missing (NaN) values, and any new element needed for successful Series alignment, with this value before computation. If data in both corresponding Series locations is missing the result will be missing

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

#### Returns

**result** [Series]

#### See also:

`Series.None`

#### Examples

```
>>> a = pd.Series([1, 1, 1, np.nan], index=['a', 'b', 'c', 'd'])
>>> a
a    1.0
b    1.0
c    1.0
d    NaN
dtype: float64
>>> b = pd.Series([1, np.nan, 1, np.nan], index=['a', 'b', 'd', 'e'])
>>> b
a    1.0
b    NaN
d    1.0
e    NaN
dtype: float64
>>> a.add(b, fill_value=0)
a    2.0
b    1.0
c    1.0
d    1.0
e    NaN
dtype: float64
```

### pandas.Series.head

`Series.head(n=5)`

Return the first *n* rows.

This function returns the first *n* rows for the object based on position. It is useful for quickly testing if your object has the right type of data in it.

**Parameters** *n* : int, default 5

Number of rows to select.

**Returns** `obj_head` : type of caller

The first  $n$  rows of the caller object.

**See also:**

`pandas.DataFrame.tail` Returns the last  $n$  rows.

## Examples

```
>>> df = pd.DataFrame({'animal':['alligator', 'bee', 'falcon', 'lion',
...                               'monkey', 'parrot', 'shark', 'whale', 'zebra']})
>>> df
   animal
0  alligator
1      bee
2   falcon
3     lion
4   monkey
5   parrot
6    shark
7   whale
8   zebra
```

Viewing the first 5 lines

```
>>> df.head()
   animal
0  alligator
1      bee
2   falcon
3     lion
4   monkey
```

Viewing the first  $n$  lines (three in this case)

```
>>> df.head(3)
   animal
0  alligator
1      bee
2   falcon
```

## pandas.Series.hist

`Series.hist` (`by=None`, `ax=None`, `grid=True`, `xlabelsize=None`, `xrot=None`, `ylabelsize=None`, `yrot=None`, `figsize=None`, `bins=10`, `**kwargs`)

Draw histogram of the input series using matplotlib

**Parameters** `by` : object, optional

If passed, then used to form histograms for separate groups

`ax` : matplotlib axis object

If not passed, uses `gca()`

**grid** : boolean, default True

Whether to show axis grid lines

**xlabelsize** : int, default None

If specified changes the x-axis label size

**xrot** : float, default None

rotation of x axis labels

**ylabelsize** : int, default None

If specified changes the y-axis label size

**yrot** : float, default None

rotation of y axis labels

**figsize** : tuple, default None

figure size in inches by default

**bins** : integer or sequence, default 10

Number of histogram bins to be used. If an integer is given, bins + 1 bin edges are calculated and returned. If bins is a sequence, gives bin edges, including left edge of first bin and right edge of last bin. In this case, bins is returned unmodified.

**bins: integer, default 10**

Number of histogram bins to be used

**\*\*kws** : keywords

To be passed to the actual plotting function

**See also:**

`matplotlib.axes.Axes.hist` Plot a histogram using matplotlib.

### pandas.Series.idxmax

`Series.idxmax` (*axis=0, skipna=True, \*args, \*\*kwargs*)

Return the row label of the maximum value.

If multiple values equal the maximum, the first row label with that value is returned.

**Parameters** **skipna** : boolean, default True

Exclude NA/null values. If the entire Series is NA, the result will be NA.

**axis** : int, default 0

For compatibility with DataFrame.idxmax. Redundant for application on Series.

**\*args, \*\*kwargs**

Additional keywords have no effect but might be accepted for compatibility with NumPy.

**Returns**

**idxmax** [Index of maximum of values.]

**Raises** **ValueError**

If the Series is empty.

#### See also:

`numpy.argmax` Return indices of the maximum values along the given axis.

`DataFrame.idxmax` Return index of first occurrence of maximum over requested axis.

`Series.idxmin` Return index *label* of the first occurrence of minimum of values.

#### Notes

This method is the Series version of `ndarray.argmax`. This method returns the label of the maximum, while `ndarray.argmax` returns the position. To get the position, use `series.values.argmax()`.

#### Examples

```
>>> s = pd.Series(data=[1, None, 4, 3, 4],
...                 index=['A', 'B', 'C', 'D', 'E'])
>>> s
A    1.0
B    NaN
C    4.0
D    3.0
E    4.0
dtype: float64
```

```
>>> s.idxmax()
'C'
```

If `skipna` is False and there is an NA value in the data, the function returns `nan`.

```
>>> s.idxmax(skipna=False)
nan
```

### pandas.Series.idxmin

`Series.idxmin` (*axis=None*, *skipna=True*, *\*args*, *\*\*kwargs*)

Return the row label of the minimum value.

If multiple values equal the minimum, the first row label with that value is returned.

**Parameters** `skipna` : boolean, default True

Exclude NA/null values. If the entire Series is NA, the result will be NA.

**axis** : int, default 0

For compatibility with `DataFrame.idxmin`. Redundant for application on Series.

**\*args, \*\*kwargs**

Additional keywords have no effect but might be accepted for compatibility with NumPy.

#### Returns

**idxmin** [Index of minimum of values.]

**Raises ValueError**

If the Series is empty.

**See also:**

`numpy.argmax` Return indices of the minimum values along the given axis.

`DataFrame.idxmin` Return index of first occurrence of minimum over requested axis.

`Series.idxmax` Return index *label* of the first occurrence of maximum of values.

**Notes**

This method is the Series version of `ndarray.argmax`. This method returns the label of the minimum, while `ndarray.argmax` returns the position. To get the position, use `series.values.argmax()`.

**Examples**

```
>>> s = pd.Series(data=[1, None, 4, 1],
...                 index=['A', 'B', 'C', 'D'])
>>> s
A    1.0
B    NaN
C    4.0
D    1.0
dtype: float64
```

```
>>> s.idxmin()
'A'
```

If `skipna` is False and there is an NA value in the data, the function returns nan.

```
>>> s.idxmin(skipna=False)
nan
```

**pandas.Series.infer\_objects**

`Series.infer_objects()`

Attempt to infer better dtypes for object columns.

Attempts soft conversion of object-dtyped columns, leaving non-object and unconvertible columns unchanged. The inference rules are the same as during normal Series/DataFrame construction.

New in version 0.21.0.

**Returns**

**converted** [same type as input object]

**See also:**

`pandas.to_datetime` Convert argument to datetime.

`pandas.to_timedelta` Convert argument to timedelta.

`pandas.to_numeric` Convert argument to numeric typeR

## Examples

```
>>> df = pd.DataFrame({"A": ["a", 1, 2, 3]})
>>> df = df.iloc[1:]
>>> df
   A
1  1
2  2
3  3
```

```
>>> df.dtypes
A    object
dtype: object
```

```
>>> df.infer_objects().dtypes
A    int64
dtype: object
```

## pandas.Series.interpolate

`Series.interpolate` (*method='linear', axis=0, limit=None, inplace=False, limit\_direction='forward', limit\_area=None, downcast=None, \*\*kwargs*)  
Interpolate values according to different methods.

Please note that only `method='linear'` is supported for DataFrames/Series with a MultiIndex.

**Parameters** `method`: {'linear', 'time', 'index', 'values', 'nearest', 'zero', 'slinear', 'quadratic', 'cubic', 'barycentric', 'krogh', 'polynomial', 'spline', 'piecewise\_polynomial', 'from\_derivatives', 'pchip', 'akima'}

- 'linear': ignore the index and treat the values as equally spaced. This is the only method supported on MultiIndexes. default
- 'time': interpolation works on daily and higher resolution data to interpolate given length of interval
- 'index', 'values': use the actual numerical values of the index
- 'nearest', 'zero', 'slinear', 'quadratic', 'cubic', 'barycentric', 'polynomial' is passed to `scipy.interpolate.interpld`. Both 'polynomial' and 'spline' require that you also specify an *order* (int), e.g. `df.interpolate(method='polynomial', order=4)`. These use the actual numerical values of the index.
- 'krogh', 'piecewise\_polynomial', 'spline', 'pchip' and 'akima' are all wrappers around the scipy interpolation methods of similar names. These use the actual numerical values of the index. For more information on their behavior, see the [scipy documentation](#) and [tutorial documentation](#)
- 'from\_derivatives' refers to `BPoly.from_derivatives` which replaces 'piecewise\_polynomial' interpolation method in scipy 0.18

New in version 0.18.1: Added support for the 'akima' method Added interpolate method 'from\_derivatives' which replaces 'piecewise\_polynomial' in scipy 0.18; backwards-compatible with scipy < 0.18

**axis**: {0, 1}, default 0

- 0: fill column-by-column
- 1: fill row-by-row

**limit** : int, default None.

Maximum number of consecutive NaNs to fill. Must be greater than 0.

**limit\_direction** [{ 'forward', 'backward', 'both' }, default 'forward']

**limit\_area** : { 'inside', 'outside' }, default None

- None: (default) no fill restriction
- 'inside' Only fill NaNs surrounded by valid values (interpolate).
- 'outside' Only fill NaNs outside valid values (extrapolate).

If limit is specified, consecutive NaNs will be filled in this direction.

New in version 0.21.0.

**inplace** : bool, default False

Update the NDFrame in place if possible.

**downcast** : optional, 'infer' or None, defaults to None

Downcast dtypes if possible.

**kwargs** [keyword arguments to pass on to the interpolating function.]

### Returns

**Series or DataFrame of same shape interpolated at the NaNs**

**See also:**

[\*reindex\*](#), [\*replace\*](#), [\*fillna\*](#)

### Examples

Filling in NaNs

```
>>> s = pd.Series([0, 1, np.nan, 3])
>>> s.interpolate()
0    0
1    1
2    2
3    3
dtype: float64
```

## pandas.Series.isin

**Series.isin** (*values*)

Check whether *values* are contained in Series.

Return a boolean Series showing whether each element in the Series matches an element in the passed sequence of *values* exactly.

**Parameters** *values* : set or list-like

The sequence of values to test. Passing in a single string will raise a `TypeError`. Instead, turn a single string into a list of one element.

New in version 0.18.1: Support for values as a set.

### Returns

**isin** [Series (bool dtype)]

### Raises `TypeError`

- If *values* is a string

### See also:

`pandas.DataFrame.isin` equivalent method on `DataFrame`

### Examples

```
>>> s = pd.Series(['lama', 'cow', 'lama', 'beetle', 'lama',
...               'hippo'], name='animal')
>>> s.isin(['cow', 'lama'])
0      True
1      True
2      True
3     False
4      True
5     False
Name: animal, dtype: bool
```

Passing a single string as `s.isin('lama')` will raise an error. Use a list of one element instead:

```
>>> s.isin(['lama'])
0      True
1     False
2      True
3     False
4      True
5     False
Name: animal, dtype: bool
```

## `pandas.Series.isna`

`Series.isna()`

Detect missing values.

Return a boolean same-sized object indicating if the values are NA. NA values, such as `None` or `numpy.NaN`, gets mapped to `True` values. Everything else gets mapped to `False` values. Characters such as empty strings `''` or `numpy.inf` are not considered NA values (unless you set `pandas.options.mode.use_inf_as_na = True`).

### Returns `Series`

Mask of bool values for each element in `Series` that indicates whether an element is not an NA value.

### See also:

**Series.isnull** alias of isna

**Series.notna** boolean inverse of isna

**Series.dropna** omit axes labels with missing values

**isna** top-level isna

## Examples

Show which entries in a DataFrame are NA.

```
>>> df = pd.DataFrame({'age': [5, 6, np.NaN],
...                     'born': [pd.NaT, pd.Timestamp('1939-05-27'),
...                               pd.Timestamp('1940-04-25')],
...                     'name': ['Alfred', 'Batman', ''],
...                     'toy': [None, 'Batmobile', 'Joker']})
>>> df
   age      born    name    toy
0  5.0      NaT  Alfred   None
1  6.0 1939-05-27  Batman Batmobile
2  NaN 1940-04-25         Joker
```

```
>>> df.isna()
   age  born  name  toy
0 False  True False  True
1 False False False False
2  True False False False
```

Show which entries in a Series are NA.

```
>>> ser = pd.Series([5, 6, np.NaN])
>>> ser
0    5.0
1    6.0
2    NaN
dtype: float64
```

```
>>> ser.isna()
0    False
1    False
2     True
dtype: bool
```

## pandas.Series.isnull

**Series.isnull()**

Detect missing values.

Return a boolean same-sized object indicating if the values are NA. NA values, such as `None` or `numpy.NaN`, gets mapped to `True` values. Everything else gets mapped to `False` values. Characters such as empty strings `''` or `numpy.inf` are not considered NA values (unless you set `pandas.options.mode.use_inf_as_na = True`).

**Returns Series**

Mask of bool values for each element in Series that indicates whether an element is not an NA value.

See also:

`Series.isnull` alias of `isna`

`Series.notna` boolean inverse of `isna`

`Series.dropna` omit axes labels with missing values

`isna` top-level `isna`

## Examples

Show which entries in a DataFrame are NA.

```
>>> df = pd.DataFrame({'age': [5, 6, np.NaN],
...                     'born': [pd.NaT, pd.Timestamp('1939-05-27'),
...                               pd.Timestamp('1940-04-25')],
...                     'name': ['Alfred', 'Batman', ''],
...                     'toy': [None, 'Batmobile', 'Joker']})
>>> df
   age      born    name    toy
0  5.0      NaT  Alfred   None
1  6.0 1939-05-27  Batman Batmobile
2  NaN 1940-04-25      Joker
```

```
>>> df.isna()
   age  born  name  toy
0 False  True False  True
1 False False False False
2  True False False False
```

Show which entries in a Series are NA.

```
>>> ser = pd.Series([5, 6, np.NaN])
>>> ser
0    5.0
1    6.0
2    NaN
dtype: float64
```

```
>>> ser.isna()
0    False
1    False
2     True
dtype: bool
```

## pandas.Series.item

`Series.item()`

return the first element of the underlying data as a python scalar

**pandas.Series.items**

`Series.items()`  
 Lazily iterate over (index, value) tuples

**pandas.Series.iteritems**

`Series.iteritems()`  
 Lazily iterate over (index, value) tuples

**pandas.Series.keys**

`Series.keys()`  
 Alias for index

**pandas.Series.kurt**

`Series.kurt` (*axis=None, skipna=None, level=None, numeric\_only=None, \*\*kwargs*)  
 Return unbiased kurtosis over requested axis using Fisher's definition of kurtosis (kurtosis of normal == 0.0). Normalized by N-1

**Parameters**

**axis** [{index (0)}]

**skipna** : boolean, default True

Exclude NA/null values when computing the result.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a scalar

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

**Returns**

**kurt** [scalar or Series (if level specified)]

**pandas.Series.kurtosis**

`Series.kurtosis` (*axis=None, skipna=None, level=None, numeric\_only=None, \*\*kwargs*)  
 Return unbiased kurtosis over requested axis using Fisher's definition of kurtosis (kurtosis of normal == 0.0). Normalized by N-1

**Parameters**

**axis** [{index (0)}]

**skipna** : boolean, default True

Exclude NA/null values when computing the result.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a scalar

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

#### Returns

**kurt** [scalar or Series (if level specified)]

### pandas.Series.last

Series.**last** (*offset*)

Convenience method for subsetting final periods of time series data based on a date offset.

#### Parameters

**offset** [string, DateOffset, dateutil.relativedelta]

#### Returns

**subset** [type of caller]

#### Raises

**TypeError**

If the index is not a *DatetimeIndex*

#### See also:

**first** Select initial periods of time series based on a date offset

**at\_time** Select values at a particular time of the day

**between\_time** Select values between particular times of the day

### Examples

```
>>> i = pd.date_range('2018-04-09', periods=4, freq='2D')
>>> ts = pd.DataFrame({'A': [1,2,3,4]}, index=i)
>>> ts
```

	A
2018-04-09	1
2018-04-11	2
2018-04-13	3
2018-04-15	4

Get the rows for the last 3 days:

```
>>> ts.last('3D')
```

	A
2018-04-13	3
2018-04-15	4

Notice the data for 3 last calendar days were returned, not the last 3 observed days in the dataset, and therefore data for 2018-04-11 was not returned.

**pandas.Series.last\_valid\_index****Series.last\_valid\_index()**

Return index for last non-NA/null value.

**Returns****scalar** [type of index]**Notes**

If all elements are non-NA/null, returns None. Also returns None for empty NDFrame.

**pandas.Series.le****Series.le** (*other, level=None, fill\_value=None, axis=0*)Less than or equal to of series and other, element-wise (binary operator *le*).Equivalent to `series <= other`, but with support to substitute a `fill_value` for missing data in one of the inputs.**Parameters****other** [Series or scalar value]**fill\_value** : None or float value, default None (NaN)

Fill existing missing (NaN) values, and any new element needed for successful Series alignment, with this value before computation. If data in both corresponding Series locations is missing the result will be missing

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

**Returns****result** [Series]**See also:**

Series.None

**Examples**

```

>>> a = pd.Series([1, 1, 1, np.nan], index=['a', 'b', 'c', 'd'])
>>> a
a    1.0
b    1.0
c    1.0
d    NaN
dtype: float64
>>> b = pd.Series([1, np.nan, 1, np.nan], index=['a', 'b', 'd', 'e'])
>>> b
a    1.0
b    NaN
d    1.0

```

(continues on next page)

(continued from previous page)

```

e      NaN
dtype: float64
>>> a.add(b, fill_value=0)
a      2.0
b      1.0
c      1.0
d      1.0
e      NaN
dtype: float64

```

## pandas.Series.lt

`Series.lt` (*other*, *level=None*, *fill\_value=None*, *axis=0*)

Less than of series and other, element-wise (binary operator *lt*).

Equivalent to `series < other`, but with support to substitute a `fill_value` for missing data in one of the inputs.

### Parameters

**other** [Series or scalar value]

**fill\_value** : None or float value, default None (NaN)

Fill existing missing (NaN) values, and any new element needed for successful Series alignment, with this value before computation. If data in both corresponding Series locations is missing the result will be missing

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

### Returns

**result** [Series]

### See also:

`Series.None`

## Examples

```

>>> a = pd.Series([1, 1, 1, np.nan], index=['a', 'b', 'c', 'd'])
>>> a
a      1.0
b      1.0
c      1.0
d      NaN
dtype: float64
>>> b = pd.Series([1, np.nan, 1, np.nan], index=['a', 'b', 'd', 'e'])
>>> b
a      1.0
b      NaN
d      1.0
e      NaN
dtype: float64
>>> a.add(b, fill_value=0)

```

(continues on next page)

(continued from previous page)

```

a    2.0
b    1.0
c    1.0
d    1.0
e    NaN
dtype: float64

```

**pandas.Series.mad****Series.mad** (*axis=None, skipna=None, level=None*)

Return the mean absolute deviation of the values for the requested axis

**Parameters****axis** [{index (0)}]**skipna** : boolean, default True

Exclude NA/null values when computing the result.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a scalar

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

**Returns****mad** [scalar or Series (if level specified)]**pandas.Series.map****Series.map** (*arg, na\_action=None*)

Map values of Series using input correspondence (a dict, Series, or function).

**Parameters** **arg** : function, dict, or Series

Mapping correspondence.

**na\_action** : {None, 'ignore'}

If 'ignore', propagate NA values, without passing them to the mapping correspondence.

**Returns** **y** : Series

Same index as caller.

**See also:****Series.apply** For applying more complex functions on a Series.**DataFrame.apply** Apply a function row-/column-wise.**DataFrame.applymap** Apply a function elementwise on a whole DataFrame.

## Notes

When *arg* is a dictionary, values in Series that are not in the dictionary (as keys) are converted to NaN. However, if the dictionary is a dict subclass that defines `__missing__` (i.e. provides a method for default values), then this default is used rather than NaN:

```
>>> from collections import Counter
>>> counter = Counter()
>>> counter['bar'] += 1
>>> y.map(counter)
1    0
2    1
3    0
dtype: int64
```

## Examples

Map inputs to outputs (both of type *Series*):

```
>>> x = pd.Series([1,2,3], index=['one', 'two', 'three'])
>>> x
one      1
two      2
three    3
dtype: int64
```

```
>>> y = pd.Series(['foo', 'bar', 'baz'], index=[1,2,3])
>>> y
1    foo
2    bar
3    baz
```

```
>>> x.map(y)
one    foo
two    bar
three  baz
```

If *arg* is a dictionary, return a new Series with values converted according to the dictionary's mapping:

```
>>> z = {1: 'A', 2: 'B', 3: 'C'}
```

```
>>> x.map(z)
one    A
two    B
three  C
```

Use *na\_action* to control whether NA values are affected by the mapping function.

```
>>> s = pd.Series([1, 2, 3, np.nan])
```

```
>>> s2 = s.map('this is a string {}'.format, na_action=None)
0    this is a string 1.0
1    this is a string 2.0
2    this is a string 3.0
```

(continues on next page)

(continued from previous page)

```
3    this is a string nan
dtype: object
```

```
>>> s3 = s.map('this is a string {}'.format, na_action='ignore')
0    this is a string 1.0
1    this is a string 2.0
2    this is a string 3.0
3                                NaN
dtype: object
```

**pandas.Series.mask**

`Series.mask(cond, other=nan, inplace=False, axis=None, level=None, errors='raise', try_cast=False, raise_on_error=None)`

Return an object of same shape as self and whose corresponding entries are from self where *cond* is False and otherwise are from *other*.

**Parameters** *cond* : boolean NDFrame, array-like, or callable

Where *cond* is False, keep the original value. Where True, replace with corresponding value from *other*. If *cond* is callable, it is computed on the NDFrame and should return boolean NDFrame or array. The callable must not change input NDFrame (though pandas doesn't check it).

New in version 0.18.1: A callable can be used as *cond*.

**other** : scalar, NDFrame, or callable

Entries where *cond* is True are replaced with corresponding value from *other*. If *other* is callable, it is computed on the NDFrame and should return scalar or NDFrame. The callable must not change input NDFrame (though pandas doesn't check it).

New in version 0.18.1: A callable can be used as *other*.

**inplace** : boolean, default False

Whether to perform the operation in place on the data

**axis** [alignment axis if needed, default None]

**level** [alignment level if needed, default None]

**errors** : str, {'raise', 'ignore'}, default 'raise'

- *raise* : allow exceptions to be raised
- *ignore* : suppress exceptions. On error return original object

Note that currently this parameter won't affect the results and will always coerce to a suitable dtype.

**try\_cast** : boolean, default False

try to cast the result back to the input type (if possible),

**raise\_on\_error** : boolean, default True

Whether to raise on invalid data types (e.g. trying to where on strings)

Deprecated since version 0.21.0.

**Returns****wh** [same type as caller]**See also:**`DataFrame.where()`**Notes**

The mask method is an application of the if-then idiom. For each element in the calling DataFrame, if `cond` is `False` the element is used; otherwise the corresponding element from the DataFrame `other` is used.

The signature for `DataFrame.where()` differs from `numpy.where()`. Roughly `df1.where(m, df2)` is equivalent to `np.where(m, df1, df2)`.

For further details and examples see the `mask` documentation in [indexing](#).

**Examples**

```
>>> s = pd.Series(range(5))
>>> s.where(s > 0)
0    NaN
1     1.0
2     2.0
3     3.0
4     4.0
```

```
>>> s.mask(s > 0)
0     0.0
1    NaN
2    NaN
3    NaN
4    NaN
```

```
>>> s.where(s > 1, 10)
0    10.0
1    10.0
2     2.0
3     3.0
4     4.0
```

```
>>> df = pd.DataFrame(np.arange(10).reshape(-1, 2), columns=['A', 'B'])
>>> m = df % 3 == 0
>>> df.where(m, -df)
   A  B
0  0 -1
1 -2  3
2 -4 -5
3  6 -7
4 -8  9
>>> df.where(m, -df) == np.where(m, df, -df)
   A      B
0  True  True
```

(continues on next page)

(continued from previous page)

```

1  True  True
2  True  True
3  True  True
4  True  True
>>> df.where(m, -df) == df.mask(~m, -df)
      A      B
0  True  True
1  True  True
2  True  True
3  True  True
4  True  True

```

### pandas.Series.max

Series.**max** (*axis=None, skipna=None, level=None, numeric\_only=None, \*\*kwargs*)

**This method returns the maximum of the values in the object.** If you want the *index* of the maximum, use `idxmax`. This is the equivalent of the `numpy.ndarray` method `argmax`.

#### Parameters

**axis** [{index (0)}]

**skipna** : boolean, default True

Exclude NA/null values when computing the result.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a scalar

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

#### Returns

**max** [scalar or Series (if level specified)]

### pandas.Series.mean

Series.**mean** (*axis=None, skipna=None, level=None, numeric\_only=None, \*\*kwargs*)

Return the mean of the values for the requested axis

#### Parameters

**axis** [{index (0)}]

**skipna** : boolean, default True

Exclude NA/null values when computing the result.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a scalar

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

**Returns**

**mean** [scalar or Series (if level specified)]

**pandas.Series.median**

`Series.median` (*axis=None, skipna=None, level=None, numeric\_only=None, \*\*kwargs*)

Return the median of the values for the requested axis

**Parameters**

**axis** [{index (0)}]

**skipna** : boolean, default True

Exclude NA/null values when computing the result.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a scalar

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

**Returns**

**median** [scalar or Series (if level specified)]

**pandas.Series.memory\_usage**

`Series.memory_usage` (*index=True, deep=False*)

Return the memory usage of the Series.

The memory usage can optionally include the contribution of the index and of elements of *object* dtype.

**Parameters** **index** : bool, default True

Specifies whether to include the memory usage of the Series index.

**deep** : bool, default False

If True, introspect the data deeply by interrogating *object* dtypes for system-level memory consumption, and include it in the returned value.

**Returns** **int**

Bytes of memory consumed.

**See also:**

`numpy.ndarray.nbytes` Total bytes consumed by the elements of the array.

`DataFrame.memory_usage` Bytes consumed by a DataFrame.

## Examples

```
>>> s = pd.Series(range(3))
>>> s.memory_usage()
104
```

Not including the index gives the size of the rest of the data, which is necessarily smaller:

```
>>> s.memory_usage(index=False)
24
```

The memory footprint of *object* values is ignored by default:

```
>>> s = pd.Series(["a", "b"])
>>> s.values
array(['a', 'b'], dtype=object)
>>> s.memory_usage()
96
>>> s.memory_usage(deep=True)
212
```

## pandas.Series.min

`Series.min(axis=None, skipna=None, level=None, numeric_only=None, **kwargs)`

**This method returns the minimum of the values in the object.** If you want the *index* of the minimum, use `idxmin`. This is the equivalent of the `numpy.ndarray` method `argmin`.

### Parameters

**axis** [{index (0)}]

**skipna** : boolean, default True

Exclude NA/null values when computing the result.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a scalar

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

### Returns

**min** [scalar or Series (if level specified)]

## pandas.Series.mod

`Series.mod(other, level=None, fill_value=None, axis=0)`

Modulo of series and other, element-wise (binary operator `mod`).

Equivalent to `series % other`, but with support to substitute a `fill_value` for missing data in one of the inputs.

**Parameters**

**other** [Series or scalar value]

**fill\_value** : None or float value, default None (NaN)

Fill existing missing (NaN) values, and any new element needed for successful Series alignment, with this value before computation. If data in both corresponding Series locations is missing the result will be missing

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

**Returns**

**result** [Series]

**See also:**

*Series.rmod*

**Examples**

```
>>> a = pd.Series([1, 1, 1, np.nan], index=['a', 'b', 'c', 'd'])
>>> a
a    1.0
b    1.0
c    1.0
d    NaN
dtype: float64
>>> b = pd.Series([1, np.nan, 1, np.nan], index=['a', 'b', 'd', 'e'])
>>> b
a    1.0
b    NaN
d    1.0
e    NaN
dtype: float64
>>> a.add(b, fill_value=0)
a    2.0
b    1.0
c    1.0
d    1.0
e    NaN
dtype: float64
```

**pandas.Series.mode**

`Series.mode()`

Return the mode(s) of the dataset.

Always returns Series even if only one value is returned.

**Returns**

**modes** [Series (sorted)]

**pandas.Series.mul**

`Series.mul` (*other*, *level=None*, *fill\_value=None*, *axis=0*)

Multiplication of series and other, element-wise (binary operator *mul*).

Equivalent to `series * other`, but with support to substitute a *fill\_value* for missing data in one of the inputs.

**Parameters**

**other** [Series or scalar value]

**fill\_value** : None or float value, default None (NaN)

Fill existing missing (NaN) values, and any new element needed for successful Series alignment, with this value before computation. If data in both corresponding Series locations is missing the result will be missing

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

**Returns**

**result** [Series]

**See also:**

[`Series.rmul`](#)

**Examples**

```
>>> a = pd.Series([1, 1, 1, np.nan], index=['a', 'b', 'c', 'd'])
>>> a
a    1.0
b    1.0
c    1.0
d    NaN
dtype: float64
>>> b = pd.Series([1, np.nan, 1, np.nan], index=['a', 'b', 'd', 'e'])
>>> b
a    1.0
b    NaN
d    1.0
e    NaN
dtype: float64
>>> a.add(b, fill_value=0)
a    2.0
b    1.0
c    1.0
d    1.0
e    NaN
dtype: float64
```

**pandas.Series.multiply**

`Series.multiply` (*other*, *level=None*, *fill\_value=None*, *axis=0*)

Multiplication of series and other, element-wise (binary operator *mul*).

Equivalent to `series * other`, but with support to substitute a `fill_value` for missing data in one of the inputs.

#### Parameters

**other** [Series or scalar value]

**fill\_value** : None or float value, default None (NaN)

Fill existing missing (NaN) values, and any new element needed for successful Series alignment, with this value before computation. If data in both corresponding Series locations is missing the result will be missing

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

#### Returns

**result** [Series]

#### See also:

`Series.rmul`

#### Examples

```
>>> a = pd.Series([1, 1, 1, np.nan], index=['a', 'b', 'c', 'd'])
>>> a
a    1.0
b    1.0
c    1.0
d    NaN
dtype: float64
>>> b = pd.Series([1, np.nan, 1, np.nan], index=['a', 'b', 'd', 'e'])
>>> b
a    1.0
b    NaN
d    1.0
e    NaN
dtype: float64
>>> a.add(b, fill_value=0)
a    2.0
b    1.0
c    1.0
d    1.0
e    NaN
dtype: float64
```

### pandas.Series.ne

`Series.ne` (*other, level=None, fill\_value=None, axis=0*)

Not equal to of series and other, element-wise (binary operator *ne*).

Equivalent to `series != other`, but with support to substitute a `fill_value` for missing data in one of the inputs.

#### Parameters

**other** [Series or scalar value]

**fill\_value** : None or float value, default None (NaN)

Fill existing missing (NaN) values, and any new element needed for successful Series alignment, with this value before computation. If data in both corresponding Series locations is missing the result will be missing

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

### Returns

**result** [Series]

### See also:

Series.None

### Examples

```
>>> a = pd.Series([1, 1, 1, np.nan], index=['a', 'b', 'c', 'd'])
>>> a
a    1.0
b    1.0
c    1.0
d    NaN
dtype: float64
>>> b = pd.Series([1, np.nan, 1, np.nan], index=['a', 'b', 'd', 'e'])
>>> b
a    1.0
b    NaN
d    1.0
e    NaN
dtype: float64
>>> a.add(b, fill_value=0)
a    2.0
b    1.0
c    1.0
d    1.0
e    NaN
dtype: float64
```

## pandas.Series.nlargest

Series.**nlargest** (*n=5, keep='first'*)

Return the largest *n* elements.

**Parameters** *n* : int

Return this many descending sorted values

**keep** : {'first', 'last'}, default 'first'

Where there are duplicate values: - *first* : take the first occurrence. - *last* : take the last occurrence.

**Returns** *top\_n* : Series

The  $n$  largest values in the Series, in sorted order

**See also:**

`Series.nsmallest`

## Notes

Faster than `.sort_values(ascending=False).head(n)` for small  $n$  relative to the size of the Series object.

## Examples

```
>>> import pandas as pd
>>> import numpy as np
>>> s = pd.Series(np.random.randn(10**6))
>>> s.nlargest(10)  # only sorts up to the N requested
219921    4.644710
82124     4.608745
421689    4.564644
425277    4.447014
718691    4.414137
43154     4.403520
283187    4.313922
595519    4.273635
503969    4.250236
121637    4.240952
dtype: float64
```

## pandas.Series.nonzero

`Series.nonzero()`

Return the *integer* indices of the elements that are non-zero

This method is equivalent to calling `numpy.nonzero` on the series data. For compatibility with NumPy, the return value is the same (a tuple with an array of indices for each dimension), but it will always be a one-item tuple because series only have one dimension.

**See also:**

`numpy.nonzero`

## Examples

```
>>> s = pd.Series([0, 3, 0, 4])
>>> s.nonzero()
(array([1, 3]),)
>>> s.iloc[s.nonzero()[0]]
1    3
3    4
dtype: int64
```

```
>>> s = pd.Series([0, 3, 0, 4], index=['a', 'b', 'c', 'd'])
# same return although index of s is different
>>> s.nonzero()
(array([1, 3]),)
>>> s.iloc[s.nonzero()[0]]
b      3
d      4
dtype: int64
```

## pandas.Series.notna

`Series.notna()`

Detect existing (non-missing) values.

Return a boolean same-sized object indicating if the values are not NA. Non-missing values get mapped to True. Characters such as empty strings '' or `numpy.inf` are not considered NA values (unless you set `pandas.options.mode.use_inf_as_na = True`). NA values, such as `None` or `numpy.NaN`, get mapped to False values.

### Returns Series

Mask of bool values for each element in Series that indicates whether an element is not an NA value.

### See also:

**`Series.notnull`** alias of `notna`

**`Series.isna`** boolean inverse of `notna`

**`Series.dropna`** omit axes labels with missing values

**`notna`** top-level `notna`

## Examples

Show which entries in a DataFrame are not NA.

```
>>> df = pd.DataFrame({'age': [5, 6, np.NaN],
...                     'born': [pd.NaT, pd.Timestamp('1939-05-27'),
...                               pd.Timestamp('1940-04-25')],
...                     'name': ['Alfred', 'Batman', ''],
...                     'toy': [None, 'Batmobile', 'Joker']})
>>> df
   age      born   name      toy
0  5.0      NaT  Alfred     None
1  6.0 1939-05-27  Batman  Batmobile
2  NaN 1940-04-25      Joker
```

```
>>> df.notna()
   age  born  name  toy
0  True False  True False
1  True  True  True  True
2 False  True  True  True
```

Show which entries in a Series are not NA.

```
>>> ser = pd.Series([5, 6, np.NaN])
>>> ser
0    5.0
1    6.0
2    NaN
dtype: float64
```

```
>>> ser.notna()
0     True
1     True
2    False
dtype: bool
```

## pandas.Series.notnull

`Series.notnull()`

Detect existing (non-missing) values.

Return a boolean same-sized object indicating if the values are not NA. Non-missing values get mapped to True. Characters such as empty strings '' or `numpy.inf` are not considered NA values (unless you set `pandas.options.mode.use_inf_as_na = True`). NA values, such as `None` or `numpy.NaN`, get mapped to False values.

### Returns Series

Mask of bool values for each element in Series that indicates whether an element is not an NA value.

### See also:

[`Series.notnull`](#) alias of `notna`

[`Series.isna`](#) boolean inverse of `notna`

[`Series.dropna`](#) omit axes labels with missing values

[`notna`](#) top-level `notna`

## Examples

Show which entries in a DataFrame are not NA.

```
>>> df = pd.DataFrame({'age': [5, 6, np.NaN],
...                    'born': [pd.NaT, pd.Timestamp('1939-05-27'),
...                             pd.Timestamp('1940-04-25')],
...                    'name': ['Alfred', 'Batman', ''],
...                    'toy': [None, 'Batmobile', 'Joker']})
>>> df
   age      born      name      toy
0  5.0        NaT  Alfred    None
1  6.0  1939-05-27  Batman  Batmobile
2  NaN  1940-04-25      Joker
```

```
>>> df.notna()
   age  born  name  toy
0  True False  True False
1  True  True  True  True
2 False  True  True  True
```

Show which entries in a Series are not NA.

```
>>> ser = pd.Series([5, 6, np.NaN])
>>> ser
0    5.0
1    6.0
2    NaN
dtype: float64
```

```
>>> ser.notna()
0     True
1     True
2    False
dtype: bool
```

## pandas.Series.nsmallest

`Series.nsmallest` ( $n=5$ , *keep*='first')

Return the smallest  $n$  elements.

**Parameters**  $n$  : int

Return this many ascending sorted values

**keep** : {'first', 'last'}, default 'first'

Where there are duplicate values: - *first* : take the first occurrence. - *last* : take the last occurrence.

**Returns** `bottom_n` : Series

The  $n$  smallest values in the Series, in sorted order

**See also:**

[`Series.nlargest`](#)

## Notes

Faster than `.sort_values().head(n)` for small  $n$  relative to the size of the Series object.

## Examples

```
>>> import pandas as pd
>>> import numpy as np
>>> s = pd.Series(np.random.randn(10**6))
>>> s.nsmallest(10) # only sorts up to the N requested
288532    -4.954580
```

(continues on next page)

(continued from previous page)

```
732345    -4.835960
64803     -4.812550
446457    -4.609998
501225    -4.483945
669476    -4.472935
973615    -4.401699
621279    -4.355126
773916    -4.347355
359919    -4.331927
dtype: float64
```

## pandas.Series.nunique

`Series.nunique` (*dropna=True*)

Return number of unique elements in the object.

Excludes NA values by default.

**Parameters** `dropna` : boolean, default True

Don't include NaN in the count.

**Returns**

`nunique` [int]

## pandas.Series.pct\_change

`Series.pct_change` (*periods=1, fill\_method='pad', limit=None, freq=None, \*\*kwargs*)

Percentage change between the current and a prior element.

Computes the percentage change from the immediately previous row by default. This is useful in comparing the percentage of change in a time series of elements.

**Parameters** `periods` : int, default 1

Periods to shift for forming percent change.

**fill\_method** : str, default 'pad'

How to handle NAs before computing percent changes.

**limit** : int, default None

The number of consecutive NAs to fill before stopping.

**freq** : DateOffset, timedelta, or offset alias string, optional

Increment to use from time series API (e.g. 'M' or BDay()).

**\*\*kwargs**

Additional keyword arguments are passed into `DataFrame.shift` or `Series.shift`.

**Returns** `chg` : Series or DataFrame

The same type as the calling object.

**See also:**

[`Series.diff`](#) Compute the difference of two elements in a Series.

**DataFrame.diff** Compute the difference of two elements in a DataFrame.

**Series.shift** Shift the index by some number of periods.

**DataFrame.shift** Shift the index by some number of periods.

## Examples

### Series

```
>>> s = pd.Series([90, 91, 85])
>>> s
0    90
1    91
2    85
dtype: int64
```

```
>>> s.pct_change()
0      NaN
1    0.011111
2   -0.065934
dtype: float64
```

```
>>> s.pct_change(periods=2)
0      NaN
1      NaN
2   -0.055556
dtype: float64
```

See the percentage change in a Series where filling NAs with last valid observation forward to next valid.

```
>>> s = pd.Series([90, 91, None, 85])
>>> s
0    90.0
1    91.0
2     NaN
3    85.0
dtype: float64
```

```
>>> s.pct_change(fill_method='ffill')
0      NaN
1    0.011111
2    0.000000
3   -0.065934
dtype: float64
```

### DataFrame

Percentage change in French franc, Deutsche Mark, and Italian lira from 1980-01-01 to 1980-03-01.

```
>>> df = pd.DataFrame({
...     'FR': [4.0405, 4.0963, 4.3149],
...     'GR': [1.7246, 1.7482, 1.8519],
...     'IT': [804.74, 810.01, 860.13]},
...     index=['1980-01-01', '1980-02-01', '1980-03-01'])
>>> df
```

(continues on next page)

(continued from previous page)

	FR	GR	IT
1980-01-01	4.0405	1.7246	804.74
1980-02-01	4.0963	1.7482	810.01
1980-03-01	4.3149	1.8519	860.13

```
>>> df.pct_change()
              FR          GR          IT
1980-01-01    NaN          NaN          NaN
1980-02-01  0.013810  0.013684  0.006549
1980-03-01  0.053365  0.059318  0.061876
```

Percentage of change in GOOG and APPL stock volume. Shows computing the percentage change between columns.

```
>>> df = pd.DataFrame({
...     '2016': [1769950, 30586265],
...     '2015': [1500923, 40912316],
...     '2014': [1371819, 41403351]},
...     index=['GOOG', 'APPL'])
>>> df
              2016          2015          2014
GOOG  1769950    1500923    1371819
APPL  30586265   40912316   41403351
```

```
>>> df.pct_change(axis='columns')
              2016          2015          2014
GOOG    NaN -0.151997 -0.086016
APPL    NaN  0.337604  0.012002
```

## pandas.Series.pipe

`Series.pipe(func, *args, **kwargs)`  
 Apply func(self, \*args, \*\*kwargs)

**Parameters** `func` : function

function to apply to the NDFrame. `args`, and `kwargs` are passed into `func`. Alternatively a (callable, `data_keyword`) tuple where `data_keyword` is a string indicating the keyword of callable that expects the NDFrame.

**args** : iterable, optional

positional arguments passed into `func`.

**kwargs** : mapping, optional

a dictionary of keyword arguments passed into `func`.

**Returns**

**object** [the return type of `func`.]

**See also:**

`pandas.DataFrame.apply`, `pandas.DataFrame.applymap`, `pandas.Series.map`

## Notes

Use `.pipe` when chaining together functions that expect Series, DataFrames or GroupBy objects. Instead of writing

```
>>> f(g(h(df), arg1=a), arg2=b, arg3=c)
```

You can write

```
>>> (df.pipe(h)
...   .pipe(g, arg1=a)
...   .pipe(f, arg2=b, arg3=c)
...   )
```

If you have a function that takes the data as (say) the second argument, pass a tuple indicating which keyword expects the data. For example, suppose `f` takes its data as `arg2`:

```
>>> (df.pipe(h)
...   .pipe(g, arg1=a)
...   .pipe((f, 'arg2'), arg1=a, arg3=c)
...   )
```

## pandas.Series.plot

`Series.plot` (*kind='line', ax=None, figsize=None, use\_index=True, title=None, grid=None, legend=False, style=None, logx=False, logy=False, loglog=False, xticks=None, yticks=None, xlim=None, ylim=None, rot=None, fontsize=None, colormap=None, table=False, yerr=None, xerr=None, label=None, secondary\_y=False, \*\*kws*)

Make plots of Series using matplotlib / pylab.

*New in version 0.17.0:* Each plot kind has a corresponding method on the `Series.plot` accessor: `s.plot(kind='line')` is equivalent to `s.plot.line()`.

### Parameters

**data** [Series]

**kind** : str

- 'line' : line plot (default)
- 'bar' : vertical bar plot
- 'barh' : horizontal bar plot
- 'hist' : histogram
- 'box' : boxplot
- 'kde' : Kernel Density Estimation plot
- 'density' : same as 'kde'
- 'area' : area plot
- 'pie' : pie plot

**ax** : matplotlib axes object

If not passed, uses `gca()`

**figsize** [a tuple (width, height) in inches]

**use\_index** : boolean, default True

Use index as ticks for x axis

**title** : string or list

Title to use for the plot. If a string is passed, print the string at the top of the figure. If a list is passed and *subplots* is True, print each item in the list above the corresponding subplot.

**grid** : boolean, default None (matlab style default)

Axis grid lines

**legend** : False/True/'reverse'

Place legend on axis subplots

**style** : list or dict

matplotlib line style per column

**logx** : boolean, default False

Use log scaling on x axis

**logy** : boolean, default False

Use log scaling on y axis

**loglog** : boolean, default False

Use log scaling on both x and y axes

**xticks** : sequence

Values to use for the xticks

**yticks** : sequence

Values to use for the yticks

**xlim** [2-tuple/list]

**ylim** [2-tuple/list]

**rot** : int, default None

Rotation for ticks (xticks for vertical, yticks for horizontal plots)

**fontsize** : int, default None

Font size for xticks and yticks

**colormap** : str or matplotlib colormap object, default None

Colormap to select colors from. If string, load colormap with that name from matplotlib.

**colorbar** : boolean, optional

If True, plot colorbar (only relevant for 'scatter' and 'hexbin' plots)

**position** : float

Specify relative alignments for bar plot layout. From 0 (left/bottom-end) to 1 (right/top-end). Default is 0.5 (center)

**table** : boolean, Series or DataFrame, default False

If True, draw a table using the data in the DataFrame and the data will be transposed to meet matplotlib's default layout. If a Series or DataFrame is passed, use passed data to draw a table.

**yerr** : DataFrame, Series, array-like, dict and str

See *Plotting with Error Bars* for detail.

**xerr** [same types as yerr.]

**label** [label argument to provide to plot]

**secondary\_y** : boolean or sequence of ints, default False

If True then y-axis will be on the right

**mark\_right** : boolean, default True

When using a secondary\_y axis, automatically mark the column labels with “(right)” in the legend

**\*\*kws** : keywords

Options to pass to matplotlib plotting method

#### Returns

**axes** [matplotlib.axes.Axes or numpy.ndarray of them]

#### Notes

- See matplotlib documentation online for more on this subject
- If *kind* = 'bar' or 'barh', you can specify relative alignments for bar plot layout by *position* keyword. From 0 (left/bottom-end) to 1 (right/top-end). Default is 0.5 (center)

### pandas.Series.pop

`Series.pop(item)`

Return item and drop from frame. Raise KeyError if not found.

**Parameters** **item** : str

Column label to be popped

#### Returns

**popped** [Series]

#### Examples

```
>>> df = pd.DataFrame([('falcon', 'bird', 389.0),
...                    ('parrot', 'bird', 24.0),
...                    ('lion', 'mammal', 80.5),
...                    ('monkey', 'mammal', np.nan)],
...                   columns=('name', 'class', 'max_speed'))
```

(continues on next page)

(continued from previous page)

```
>>> df
   name  class  max_speed
0  falcon   bird     389.0
1  parrot   bird      24.0
2   lion  mammal      80.5
3  monkey  mammal       NaN
```

```
>>> df.pop('class')
0    bird
1    bird
2  mammal
3  mammal
Name: class, dtype: object
```

```
>>> df
   name  max_speed
0  falcon     389.0
1  parrot     24.0
2   lion     80.5
3  monkey      NaN
```

## pandas.Series.pow

`Series.pow` (*other*, *level=None*, *fill\_value=None*, *axis=0*)

Exponential power of series and other, element-wise (binary operator *pow*).

Equivalent to `series ** other`, but with support to substitute a *fill\_value* for missing data in one of the inputs.

### Parameters

**other** [Series or scalar value]

**fill\_value** : None or float value, default None (NaN)

Fill existing missing (NaN) values, and any new element needed for successful Series alignment, with this value before computation. If data in both corresponding Series locations is missing the result will be missing

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

### Returns

**result** [Series]

### See also:

`Series.rpow`

## Examples

```
>>> a = pd.Series([1, 1, 1, np.nan], index=['a', 'b', 'c', 'd'])
>>> a
a    1.0
```

(continues on next page)

(continued from previous page)

```

b    1.0
c    1.0
d    NaN
dtype: float64
>>> b = pd.Series([1, np.nan, 1, np.nan], index=['a', 'b', 'd', 'e'])
>>> b
a    1.0
b    NaN
d    1.0
e    NaN
dtype: float64
>>> a.add(b, fill_value=0)
a    2.0
b    1.0
c    1.0
d    1.0
e    NaN
dtype: float64

```

### pandas.Series.prod

`Series.prod` (*axis=None, skipna=None, level=None, numeric\_only=None, min\_count=0, \*\*kwargs*)

Return the product of the values for the requested axis

#### Parameters

**axis** [{index (0)}]

**skipna** : boolean, default True

Exclude NA/null values when computing the result.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a scalar

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

**min\_count** : int, default 0

The required number of valid values to perform the operation. If fewer than `min_count` non-NA values are present the result will be NA.

New in version 0.22.0: Added with the default being 0. This means the sum of an all-NA or empty Series is 0, and the product of an all-NA or empty Series is 1.

#### Returns

**prod** [scalar or Series (if level specified)]

### Examples

By default, the product of an empty or all-NA Series is 1

```
>>> pd.Series([]).prod()
1.0
```

This can be controlled with the `min_count` parameter

```
>>> pd.Series([]).prod(min_count=1)
nan
```

Thanks to the `skipna` parameter, `min_count` handles all-NA and empty series identically.

```
>>> pd.Series([np.nan]).prod()
1.0
```

```
>>> pd.Series([np.nan]).prod(min_count=1)
nan
```

## pandas.Series.product

`Series.product` (*axis=None*, *skipna=None*, *level=None*, *numeric\_only=None*, *min\_count=0*, *\*\*kwargs*)

Return the product of the values for the requested axis

### Parameters

**axis** [{index (0)}]

**skipna** : boolean, default True

Exclude NA/null values when computing the result.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a scalar

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

**min\_count** : int, default 0

The required number of valid values to perform the operation. If fewer than `min_count` non-NA values are present the result will be NA.

New in version 0.22.0: Added with the default being 0. This means the sum of an all-NA or empty Series is 0, and the product of an all-NA or empty Series is 1.

### Returns

**prod** [scalar or Series (if level specified)]

## Examples

By default, the product of an empty or all-NA Series is 1

```
>>> pd.Series([]).prod()
1.0
```

This can be controlled with the `min_count` parameter

```
>>> pd.Series([]).prod(min_count=1)
nan
```

Thanks to the `skipna` parameter, `min_count` handles all-NA and empty series identically.

```
>>> pd.Series([np.nan]).prod()
1.0
```

```
>>> pd.Series([np.nan]).prod(min_count=1)
nan
```

## pandas.Series.ptp

`Series.ptp` (*axis=None, skipna=None, level=None, numeric\_only=None, \*\*kwargs*)

**Returns the difference between the maximum value and the** minimum value in the object. This is the equivalent of the `numpy.ndarray` method `ptp`.

### Parameters

**axis** [{index (0)}]

**skipna** : boolean, default True

Exclude NA/null values when computing the result.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a scalar

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

### Returns

**ptp** [scalar or Series (if level specified)]

## pandas.Series.put

`Series.put` (*\*args, \*\*kwargs*)

Applies the `put` method to its `values` attribute if it has one.

**See also:**

`numpy.ndarray.put`

## pandas.Series.quantile

`Series.quantile` (*q=0.5, interpolation='linear'*)

Return value at the given quantile, a la `numpy.percentile`.

**Parameters** **q** : float or array-like, default 0.5 (50% quantile)

$0 \leq q \leq 1$ , the quantile(s) to compute

**interpolation** : { 'linear', 'lower', 'higher', 'midpoint', 'nearest' }

New in version 0.18.0.

This optional parameter specifies the interpolation method to use, when the desired quantile lies between two data points  $i$  and  $j$ :

- linear:  $i + (j - i) * fraction$ , where *fraction* is the fractional part of the index surrounded by  $i$  and  $j$ .
- lower:  $i$ .
- higher:  $j$ .
- nearest:  $i$  or  $j$  whichever is nearest.
- midpoint:  $(i + j) / 2$ .

**Returns** **quantile** : float or Series

if  $q$  is an array, a Series will be returned where the index is  $q$  and the values are the quantiles.

**See also:**

`pandas.core.window.Rolling.quantile`

## Examples

```
>>> s = Series([1, 2, 3, 4])
>>> s.quantile(.5)
2.5
>>> s.quantile([.25, .5, .75])
0.25    1.75
0.50    2.50
0.75    3.25
dtype: float64
```

## pandas.Series.radd

`Series.radd(other, level=None, fill_value=None, axis=0)`

Addition of series and other, element-wise (binary operator *radd*).

Equivalent to `other + series`, but with support to substitute a `fill_value` for missing data in one of the inputs.

### Parameters

**other** [Series or scalar value]

**fill\_value** : None or float value, default None (NaN)

Fill existing missing (NaN) values, and any new element needed for successful Series alignment, with this value before computation. If data in both corresponding Series locations is missing the result will be missing

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

**Returns****result** [Series]**See also:***Series.add***Examples**

```

>>> a = pd.Series([1, 1, 1, np.nan], index=['a', 'b', 'c', 'd'])
>>> a
a    1.0
b    1.0
c    1.0
d    NaN
dtype: float64
>>> b = pd.Series([1, np.nan, 1, np.nan], index=['a', 'b', 'd', 'e'])
>>> b
a    1.0
b    NaN
d    1.0
e    NaN
dtype: float64
>>> a.add(b, fill_value=0)
a    2.0
b    1.0
c    1.0
d    1.0
e    NaN
dtype: float64

```

**pandas.Series.rank**

`Series.rank` (*axis=0, method='average', numeric\_only=None, na\_option='keep', ascending=True, pct=False*)

Compute numerical data ranks (1 through n) along axis. Equal values are assigned a rank that is the average of the ranks of those values

**Parameters** **axis** : {0 or 'index', 1 or 'columns'}, default 0

index to direct ranking

**method** : {'average', 'min', 'max', 'first', 'dense'}

- average: average rank of group
- min: lowest rank in group
- max: highest rank in group
- first: ranks assigned in order they appear in the array
- dense: like 'min', but rank always increases by 1 between groups

**numeric\_only** : boolean, default None

Include only float, int, boolean data. Valid only for DataFrame or Panel objects

**na\_option** : {'keep', 'top', 'bottom'}

- **keep**: leave NA values where they are
- **top**: smallest rank if ascending
- **bottom**: smallest rank if descending

**ascending** : boolean, default True

False for ranks by high (1) to low (N)

**pct** : boolean, default False

Computes percentage rank of data

#### Returns

**ranks** [same type as caller]

### pandas.Series.ravel

`Series.ravel (order='C')`

Return the flattened underlying data as an ndarray

#### See also:

`numpy.ndarray.ravel`

### pandas.Series.rdiv

`Series.rdiv (other, level=None, fill_value=None, axis=0)`

Floating division of series and other, element-wise (binary operator *rtruediv*).

Equivalent to `other / series`, but with support to substitute a `fill_value` for missing data in one of the inputs.

#### Parameters

**other** [Series or scalar value]

**fill\_value** : None or float value, default None (NaN)

Fill existing missing (NaN) values, and any new element needed for successful Series alignment, with this value before computation. If data in both corresponding Series locations is missing the result will be missing

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

#### Returns

**result** [Series]

#### See also:

`Series.truediv`

### Examples

```

>>> a = pd.Series([1, 1, 1, np.nan], index=['a', 'b', 'c', 'd'])
>>> a
a    1.0
b    1.0
c    1.0
d    NaN
dtype: float64
>>> b = pd.Series([1, np.nan, 1, np.nan], index=['a', 'b', 'd', 'e'])
>>> b
a    1.0
b    NaN
d    1.0
e    NaN
dtype: float64
>>> a.add(b, fill_value=0)
a    2.0
b    1.0
c    1.0
d    1.0
e    NaN
dtype: float64

```

### pandas.Series.reindex

**Series.reindex** (*index=None, \*\*kwargs*)

Conform Series to new index with optional filling logic, placing NA/NaN in locations having no value in the previous index. A new object is produced unless the new index is equivalent to the current one and `copy=False`

**Parameters** **index** : array-like, optional (should be specified using keywords)

New labels / index to conform to. Preferably an Index object to avoid duplicating data

**method** : {None, 'backfill'/'bfill', 'pad'/'ffill', 'nearest'}, optional

method to use for filling holes in reindexed DataFrame. Please note: this is only applicable to DataFrames/Series with a monotonically increasing/decreasing index.

- default: don't fill gaps
- pad / ffill: propagate last valid observation forward to next valid
- backfill / bfill: use next valid observation to fill gap
- nearest: use nearest valid observations to fill gap

**copy** : boolean, default True

Return a new object, even if the passed indexes are the same

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

**fill\_value** : scalar, default np.NaN

Value to use for missing values. Defaults to NaN, but can be any "compatible" value

**limit** : int, default None

Maximum number of consecutive elements to forward or backward fill

**tolerance** : optional

Maximum distance between original and new labels for inexact matches. The values of the index at the matching locations must satisfy the equation  $\text{abs}(\text{index}[\text{indexer}] - \text{target}) \leq \text{tolerance}$ .

Tolerance may be a scalar value, which applies the same tolerance to all values, or list-like, which applies variable tolerance per element. List-like includes list, tuple, array, Series, and must be the same size as the index and its dtype must exactly match the index's type.

New in version 0.21.0: (list-like tolerance)

## Returns

**reindexed** [Series]

## Examples

DataFrame.reindex supports two calling conventions

- (index=index\_labels, columns=column\_labels, ...)
- (labels, axis={'index', 'columns'}, ...)

We *highly* recommend using keyword arguments to clarify your intent.

Create a dataframe with some fictional data.

```
>>> index = ['Firefox', 'Chrome', 'Safari', 'IE10', 'Konqueror']
>>> df = pd.DataFrame({
...     'http_status': [200, 200, 404, 404, 301],
...     'response_time': [0.04, 0.02, 0.07, 0.08, 1.0]},
...     index=index)
>>> df
```

	http_status	response_time
Firefox	200	0.04
Chrome	200	0.02
Safari	404	0.07
IE10	404	0.08
Konqueror	301	1.00

Create a new index and reindex the dataframe. By default values in the new index that do not have corresponding records in the dataframe are assigned NaN.

```
>>> new_index= ['Safari', 'Iceweasel', 'Comodo Dragon', 'IE10',
...             'Chrome']
>>> df.reindex(new_index)
```

	http_status	response_time
Safari	404.0	0.07
Iceweasel	NaN	NaN
Comodo Dragon	NaN	NaN
IE10	404.0	0.08
Chrome	200.0	0.02

We can fill in the missing values by passing a value to the keyword `fill_value`. Because the index is not monotonically increasing or decreasing, we cannot use arguments to the keyword `method` to fill the NaN values.

```
>>> df.reindex(new_index, fill_value=0)
           http_status  response_time
Safari              404             0.07
Iceweasel            0             0.00
Comodo Dragon        0             0.00
IE10                 404             0.08
Chrome               200             0.02
```

```
>>> df.reindex(new_index, fill_value='missing')
           http_status  response_time
Safari              404             0.07
Iceweasel          missing          missing
Comodo Dragon      missing          missing
IE10                 404             0.08
Chrome               200             0.02
```

We can also reindex the columns.

```
>>> df.reindex(columns=['http_status', 'user_agent'])
           http_status  user_agent
Firefox              200         NaN
Chrome               200         NaN
Safari              404         NaN
IE10                 404         NaN
Konqueror            301         NaN
```

Or we can use “axis-style” keyword arguments

```
>>> df.reindex(['http_status', 'user_agent'], axis="columns")
           http_status  user_agent
Firefox              200         NaN
Chrome               200         NaN
Safari              404         NaN
IE10                 404         NaN
Konqueror            301         NaN
```

To further illustrate the filling functionality in `reindex`, we will create a dataframe with a monotonically increasing index (for example, a sequence of dates).

```
>>> date_index = pd.date_range('1/1/2010', periods=6, freq='D')
>>> df2 = pd.DataFrame({"prices": [100, 101, np.nan, 100, 89, 88]},
...                    index=date_index)
>>> df2
           prices
2010-01-01    100
2010-01-02    101
2010-01-03     NaN
2010-01-04    100
2010-01-05     89
2010-01-06     88
```

Suppose we decide to expand the dataframe to cover a wider date range.

```
>>> date_index2 = pd.date_range('12/29/2009', periods=10, freq='D')
>>> df2.reindex(date_index2)
           prices
2009-12-29     NaN
```

(continues on next page)

(continued from previous page)

2009-12-30	NaN
2009-12-31	NaN
2010-01-01	100
2010-01-02	101
2010-01-03	NaN
2010-01-04	100
2010-01-05	89
2010-01-06	88
2010-01-07	NaN

The index entries that did not have a value in the original data frame (for example, '2009-12-29') are by default filled with NaN. If desired, we can fill in the missing values using one of several options.

For example, to backpropagate the last valid value to fill the NaN values, pass `bfill` as an argument to the `method` keyword.

```
>>> df2.reindex(date_index2, method='bfill')
prices
2009-12-29    100
2009-12-30    100
2009-12-31    100
2010-01-01    100
2010-01-02    101
2010-01-03    NaN
2010-01-04    100
2010-01-05     89
2010-01-06     88
2010-01-07    NaN
```

Please note that the NaN value present in the original dataframe (at index value 2010-01-03) will not be filled by any of the value propagation schemes. This is because filling while reindexing does not look at dataframe values, but only compares the original and desired indexes. If you do want to fill in the NaN values present in the original dataframe, use the `fillna()` method.

See the [user guide](#) for more.

## pandas.Series.reindex\_axis

`Series.reindex_axis(labels, axis=0, **kwargs)`

Conform Series to new index with optional filling logic.

Deprecated since version 0.21.0: Use `Series.reindex` instead.

## pandas.Series.reindex\_like

`Series.reindex_like(other, method=None, copy=True, limit=None, tolerance=None)`

Return an object with matching indices to myself.

### Parameters

**other** [Object]

**method** [string or None]

**copy** [boolean, default True]

**limit** : int, default None

Maximum number of consecutive labels to fill for inexact matches.

**tolerance** : optional

Maximum distance between labels of the other object and this object for inexact matches. Can be list-like.

New in version 0.21.0: (list-like tolerance)

### Returns

**reindexed** [same as input]

### Notes

Like calling `s.reindex(index=other.index, columns=other.columns, method=...)`

## pandas.Series.rename

`Series.rename(index=None, **kwargs)`

Alter Series index labels or name

Function / dict values must be unique (1-to-1). Labels not contained in a dict / Series will be left as-is. Extra labels listed don't throw an error.

Alternatively, change `Series.name` with a scalar value.

See the [user guide](#) for more.

**Parameters** **index** : scalar, hashable sequence, dict-like or function, optional

dict-like or functions are transformations to apply to the index. Scalar or hashable sequence-like will alter the `Series.name` attribute.

**copy** : boolean, default True

Also copy underlying data

**inplace** : boolean, default False

Whether to return a new Series. If True then value of copy is ignored.

**level** : int or level name, default None

In case of a MultiIndex, only rename labels in the specified level.

### Returns

**renamed** [Series (new object)]

**See also:**

[pandas.Series.rename\\_axis](#)

### Examples

```
>>> s = pd.Series([1, 2, 3])
>>> s
0    1
1    2
```

(continues on next page)

(continued from previous page)

```

2      3
dtype: int64
>>> s.rename("my_name") # scalar, changes Series.name
0      1
1      2
2      3
Name: my_name, dtype: int64
>>> s.rename(lambda x: x ** 2) # function, changes labels
0      1
1      2
4      3
dtype: int64
>>> s.rename({1: 3, 2: 5}) # mapping, changes labels
0      1
3      2
5      3
dtype: int64

```

### pandas.Series.rename\_axis

**Series.rename\_axis** (*mapper*, *axis=0*, *copy=True*, *inplace=False*)  
 Alter the name of the index or columns.

**Parameters** **mapper** : scalar, list-like, optional

Value to set as the axis name attribute.

**axis** : {0 or 'index', 1 or 'columns'}, default 0

The index or the name of the axis.

**copy** : boolean, default True

Also copy underlying data.

**inplace** : boolean, default False

Modifies the object directly, instead of creating a new Series or DataFrame.

**Returns** **renamed** : Series, DataFrame, or None

The same type as the caller or None if *inplace* is True.

**See also:**

[\*pandas.Series.rename\*](#) Alter Series index labels or name

[\*pandas.DataFrame.rename\*](#) Alter DataFrame index labels or name

[\*pandas.Index.rename\*](#) Set new names on index

### Notes

Prior to version 0.21.0, `rename_axis` could also be used to change the axis *labels* by passing a mapping or scalar. This behavior is deprecated and will be removed in a future version. Use `rename` instead.

## Examples

### Series

```
>>> s = pd.Series([1, 2, 3])
>>> s.rename_axis("foo")
foo
0    1
1    2
2    3
dtype: int64
```

### DataFrame

```
>>> df = pd.DataFrame({"A": [1, 2, 3], "B": [4, 5, 6]})
>>> df.rename_axis("foo")
      A  B
foo
0     1  4
1     2  5
2     3  6
```

```
>>> df.rename_axis("bar", axis="columns")
bar  A  B
0     1  4
1     2  5
2     3  6
```

## pandas.Series.reorder\_levels

`Series.reorder_levels` (*order*)

Rearrange index levels using input order. May not drop or duplicate levels

**Parameters** `order` : list of int representing new level order.

(reference level by number or key)

**axis** [where to reorder levels]

**Returns**

type of caller (new object)

## pandas.Series.repeat

`Series.repeat` (*repeats*, *\*args*, *\*\*kwargs*)

Repeat elements of an Series. Refer to *numpy.ndarray.repeat* for more information about the *repeats* argument.

**See also:**

`numpy.ndarray.repeat`

## pandas.Series.replace

`Series.replace(to_replace=None, value=None, inplace=False, limit=None, regex=False, method='pad')`

Replace values given in *to\_replace* with *value*.

Values of the Series are replaced with other values dynamically. This differs from updating with `.loc` or `.iloc`, which require you to specify a location to update with some value.

**Parameters** *to\_replace* : str, regex, list, dict, Series, int, float, or None

How to find the values that will be replaced.

- numeric, str or regex:
  - numeric: numeric values equal to *to\_replace* will be replaced with *value*
  - str: string exactly matching *to\_replace* will be replaced with *value*
  - regex: regexs matching *to\_replace* will be replaced with *value*
- list of str, regex, or numeric:
  - First, if *to\_replace* and *value* are both lists, they **must** be the same length.
  - Second, if *regex=True* then all of the strings in **both** lists will be interpreted as regexs otherwise they will match directly. This doesn't matter much for *value* since there are only a few possible substitution regexes you can use.
  - str, regex and numeric rules apply as above.
- dict:
  - Dicts can be used to specify different replacement values for different existing values. For example, `{ 'a': 'b', 'y': 'z' }` replaces the value 'a' with 'b' and 'y' with 'z'. To use a dict in this way the *value* parameter should be *None*.
  - For a DataFrame a dict can specify that different values should be replaced in different columns. For example, `{ 'a': 1, 'b': 'z' }` looks for the value 1 in column 'a' and the value 'z' in column 'b' and replaces these values with whatever is specified in *value*. The *value* parameter should not be *None* in this case. You can treat this as a special case of passing two lists except that you are specifying the column to search in.
  - For a DataFrame nested dictionaries, e.g., `{ 'a': { 'b': np.nan} }`, are read as follows: look in column 'a' for the value 'b' and replace it with NaN. The *value* parameter should be *None* to use a nested dict in this way. You can nest regular expressions as well. Note that column names (the top-level dictionary keys in a nested dictionary) **cannot** be regular expressions.
- None:
  - This means that the *regex* argument must be a string, compiled regular expression, or list, dict, ndarray or Series of such elements. If *value* is also *None* then this **must** be a nested dictionary or Series.

See the examples section for examples of each of these.

**value** : scalar, dict, list, str, regex, default None

Value to replace any values matching *to\_replace* with. For a DataFrame a dict of values can be used to specify which value to use for each column (columns not in the dict will not be filled). Regular expressions, strings and lists or dicts of such objects are also allowed.

**inplace** : boolean, default False

If True, in place. Note: this will modify any other views on this object (e.g. a column from a DataFrame). Returns the caller if this is True.

**limit** : int, default None

Maximum size gap to forward or backward fill.

**regex** : bool or same types as *to\_replace*, default False

Whether to interpret *to\_replace* and/or *value* as regular expressions. If this is True then *to\_replace* must be a string. Alternatively, this could be a regular expression or a list, dict, or array of regular expressions in which case *to\_replace* must be None.

**method** : { 'pad', 'ffill', 'bfill', None }

The method to use when for replacement, when *to\_replace* is a scalar, list or tuple and *value* is None.

Changed in version 0.23.0: Added to DataFrame.

#### Returns Series

Object after replacement.

#### Raises AssertionError

- If *regex* is not a bool and *to\_replace* is not None.

#### TypeError

- If *to\_replace* is a dict and *value* is not a list, dict, ndarray, or Series
- If *to\_replace* is None and *regex* is not compilable into a regular expression or is a list, dict, ndarray, or Series.
- When replacing multiple bool or datetime64 objects and the arguments to *to\_replace* does not match the type of the value being replaced

#### ValueError

- If a list or an ndarray is passed to *to\_replace* and *value* but they are not the same length.

#### See also:

[\*Series.fillna\*](#) Fill NA values

[\*Series.where\*](#) Replace values based on boolean condition

[\*Series.str.replace\*](#) Simple string replacement.

#### Notes

- Regex substitution is performed under the hood with `re.sub`. The rules for substitution for `re.sub` are the same.
- Regular expressions will only substitute on strings, meaning you cannot provide, for example, a regular expression matching floating point numbers and expect the columns in your frame that have a numeric dtype to be matched. However, if those floating point numbers *are* strings, then you can do this.

- This method has *a lot* of options. You are encouraged to experiment and play with this method to gain intuition about how it works.
- When dict is used as the *to\_replace* value, it is like key(s) in the dict are the *to\_replace* part and value(s) in the dict are the *value* parameter.

## Examples

### Scalar ‘to\_replace’ and ‘value’

```
>>> s = pd.Series([0, 1, 2, 3, 4])
>>> s.replace(0, 5)
0    5
1    1
2    2
3    3
4    4
dtype: int64
```

```
>>> df = pd.DataFrame({'A': [0, 1, 2, 3, 4],
...                    'B': [5, 6, 7, 8, 9],
...                    'C': ['a', 'b', 'c', 'd', 'e']})
>>> df.replace(0, 5)
   A  B  C
0  5  5  a
1  1  6  b
2  2  7  c
3  3  8  d
4  4  9  e
```

### List-like ‘to\_replace’

```
>>> df.replace([0, 1, 2, 3], 4)
   A  B  C
0  4  5  a
1  4  6  b
2  4  7  c
3  4  8  d
4  4  9  e
```

```
>>> df.replace([0, 1, 2, 3], [4, 3, 2, 1])
   A  B  C
0  4  5  a
1  3  6  b
2  2  7  c
3  1  8  d
4  4  9  e
```

```
>>> s.replace([1, 2], method='bfill')
0    0
1    3
2    3
3    3
4    4
dtype: int64
```

**dict-like ‘to\_replace’**

```
>>> df.replace({0: 10, 1: 100})
   A  B  C
0  10  5  a
1 100  6  b
2   2  7  c
3   3  8  d
4   4  9  e
```

```
>>> df.replace({'A': 0, 'B': 5}, 100)
   A   B  C
0 100 100  a
1   1   6  b
2   2   7  c
3   3   8  d
4   4   9  e
```

```
>>> df.replace({'A': {0: 100, 4: 400}})
   A  B  C
0 100  5  a
1   1  6  b
2   2  7  c
3   3  8  d
4 400  9  e
```

**Regular expression ‘to\_replace’**

```
>>> df = pd.DataFrame({'A': ['bat', 'foo', 'bait'],
...                    'B': ['abc', 'bar', 'xyz']})
>>> df.replace(to_replace=r'^ba.$', value='new', regex=True)
   A   B
0  new abc
1  foo new
2 bait xyz
```

```
>>> df.replace({'A': r'^ba.$'}, {'A': 'new'}, regex=True)
   A   B
0  new abc
1  foo bar
2 bait xyz
```

```
>>> df.replace(regex=r'^ba.$', value='new')
   A   B
0  new abc
1  foo new
2 bait xyz
```

```
>>> df.replace(regex={r'^ba.$': 'new', 'foo': 'xyz'})
   A   B
0  new abc
1  xyz new
2 bait xyz
```

```
>>> df.replace(regex=[r'^ba.$', 'foo'], value='new')
   A   B
```

(continues on next page)

(continued from previous page)

```
0   new  abc
1   new  new
2  bait  xyz
```

Note that when replacing multiple `bool` or `datetime64` objects, the data types in the `to_replace` parameter must match the data type of the value being replaced:

```
>>> df = pd.DataFrame({'A': [True, False, True],
...                    'B': [False, True, False]})
>>> df.replace({'a string': 'new value', True: False}) # raises
Traceback (most recent call last):
...
TypeError: Cannot compare types 'ndarray(dtype=bool)' and 'str'
```

This raises a `TypeError` because one of the dict keys is not of the correct type for replacement.

Compare the behavior of `s.replace({'a': None})` and `s.replace('a', None)` to understand the peculiarities of the `to_replace` parameter:

```
>>> s = pd.Series([10, 'a', 'a', 'b', 'a'])
```

When one uses a dict as the `to_replace` value, it is like the value(s) in the dict are equal to the *value* parameter. `s.replace({'a': None})` is equivalent to `s.replace(to_replace={'a': None}, value=None, method=None)`:

```
>>> s.replace({'a': None})
0      10
1     None
2     None
3         b
4     None
dtype: object
```

When `value=None` and `to_replace` is a scalar, list or tuple, `replace` uses the `method` parameter (default 'pad') to do the replacement. So this is why the 'a' values are being replaced by 10 in rows 1 and 2 and 'b' in row 4 in this case. The command `s.replace('a', None)` is actually equivalent to `s.replace(to_replace='a', value=None, method='pad')`:

```
>>> s.replace('a', None)
0      10
1      10
2      10
3         b
4         b
dtype: object
```

## pandas.Series.resample

`Series.resample` (*rule*, *how=None*, *axis=0*, *fill\_method=None*, *closed=None*, *label=None*, *convention='start'*, *kind=None*, *loffset=None*, *limit=None*, *base=0*, *on=None*, *level=None*)

Convenience method for frequency conversion and resampling of time series. Object must have a datetime-like index (`DatetimeIndex`, `PeriodIndex`, or `TimedeltaIndex`), or pass datetime-like values to the `on` or `level` keyword.

**Parameters** **rule** : string

the offset string or object representing target conversion

**axis** [int, optional, default 0]

**closed** : { 'right', 'left' }

Which side of bin interval is closed. The default is 'left' for all frequency offsets except for 'M', 'A', 'Q', 'BM', 'BA', 'BQ', and 'W' which all have a default of 'right'.

**label** : { 'right', 'left' }

Which bin edge label to label bucket with. The default is 'left' for all frequency offsets except for 'M', 'A', 'Q', 'BM', 'BA', 'BQ', and 'W' which all have a default of 'right'.

**convention** : { 'start', 'end', 's', 'e' }

For PeriodIndex only, controls whether to use the start or end of *rule*

**kind**: { 'timestamp', 'period' }, optional

Pass 'timestamp' to convert the resulting index to a `DateTimeIndex` or 'period' to convert it to a `PeriodIndex`. By default the input representation is retained.

**loffset** : timedelta

Adjust the resampled time labels

**base** : int, default 0

For frequencies that evenly subdivide 1 day, the "origin" of the aggregated intervals. For example, for '5min' frequency, base could range from 0 through 4. Defaults to 0

**on** : string, optional

For a `DataFrame`, column to use instead of index for resampling. Column must be datetime-like.

New in version 0.19.0.

**level** : string or int, optional

For a `MultiIndex`, level (name or number) to use for resampling. Level must be datetime-like.

New in version 0.19.0.

**Returns**

**Resampler object**

**See also:**

[\*groupby\*](#) Group by mapping, function, label, or list of labels.

## Notes

See the [user guide](#) for more.

To learn more about the offset strings, please see [this link](#).

## Examples

Start by creating a series with 9 one minute timestamps.

```
>>> index = pd.date_range('1/1/2000', periods=9, freq='T')
>>> series = pd.Series(range(9), index=index)
>>> series
2000-01-01 00:00:00    0
2000-01-01 00:01:00    1
2000-01-01 00:02:00    2
2000-01-01 00:03:00    3
2000-01-01 00:04:00    4
2000-01-01 00:05:00    5
2000-01-01 00:06:00    6
2000-01-01 00:07:00    7
2000-01-01 00:08:00    8
Freq: T, dtype: int64
```

Downsample the series into 3 minute bins and sum the values of the timestamps falling into a bin.

```
>>> series.resample('3T').sum()
2000-01-01 00:00:00    3
2000-01-01 00:03:00   12
2000-01-01 00:06:00   21
Freq: 3T, dtype: int64
```

Downsample the series into 3 minute bins as above, but label each bin using the right edge instead of the left. Please note that the value in the bucket used as the label is not included in the bucket, which it labels. For example, in the original series the bucket 2000-01-01 00:03:00 contains the value 3, but the summed value in the resampled bucket with the label 2000-01-01 00:03:00 does not include 3 (if it did, the summed value would be 6, not 3). To include this value close the right side of the bin interval as illustrated in the example below this one.

```
>>> series.resample('3T', label='right').sum()
2000-01-01 00:03:00    3
2000-01-01 00:06:00   12
2000-01-01 00:09:00   21
Freq: 3T, dtype: int64
```

Downsample the series into 3 minute bins as above, but close the right side of the bin interval.

```
>>> series.resample('3T', label='right', closed='right').sum()
2000-01-01 00:00:00    0
2000-01-01 00:03:00    6
2000-01-01 00:06:00   15
2000-01-01 00:09:00   15
Freq: 3T, dtype: int64
```

Upsample the series into 30 second bins.

```
>>> series.resample('30S').asfreq()[0:5] #select first 5 rows
2000-01-01 00:00:00    0.0
2000-01-01 00:00:30    NaN
2000-01-01 00:01:00    1.0
2000-01-01 00:01:30    NaN
2000-01-01 00:02:00    2.0
Freq: 30S, dtype: float64
```

Upsample the series into 30 second bins and fill the NaN values using the `pad` method.

```
>>> series.resample('30S').pad()[0:5]
2000-01-01 00:00:00     0
2000-01-01 00:00:30     0
2000-01-01 00:01:00     1
2000-01-01 00:01:30     1
2000-01-01 00:02:00     2
Freq: 30S, dtype: int64
```

Upsample the series into 30 second bins and fill the NaN values using the `bfill` method.

```
>>> series.resample('30S').bfill()[0:5]
2000-01-01 00:00:00     0
2000-01-01 00:00:30     1
2000-01-01 00:01:00     1
2000-01-01 00:01:30     2
2000-01-01 00:02:00     2
Freq: 30S, dtype: int64
```

Pass a custom function via `apply`

```
>>> def custom_resampler(array_like):
...     return np.sum(array_like)+5
```

```
>>> series.resample('3T').apply(custom_resampler)
2000-01-01 00:00:00     8
2000-01-01 00:03:00    17
2000-01-01 00:06:00    26
Freq: 3T, dtype: int64
```

For a Series with a PeriodIndex, the keyword *convention* can be used to control whether to use the start or end of *rule*.

```
>>> s = pd.Series([1, 2], index=pd.period_range('2012-01-01',
                                                freq='A',
                                                periods=2))

>>> s
2012    1
2013    2
Freq: A-DEC, dtype: int64
```

Resample by month using 'start' *convention*. Values are assigned to the first month of the period.

```
>>> s.resample('M', convention='start').asfreq().head()
2012-01    1.0
2012-02    NaN
2012-03    NaN
2012-04    NaN
```

(continues on next page)

(continued from previous page)

```
2012-05    NaN
Freq: M, dtype: float64
```

Resample by month using ‘end’ *convention*. Values are assigned to the last month of the period.

```
>>> s.resample('M', convention='end').asfreq()
2012-12    1.0
2013-01    NaN
2013-02    NaN
2013-03    NaN
2013-04    NaN
2013-05    NaN
2013-06    NaN
2013-07    NaN
2013-08    NaN
2013-09    NaN
2013-10    NaN
2013-11    NaN
2013-12    2.0
Freq: M, dtype: float64
```

For DataFrame objects, the keyword `on` can be used to specify the column instead of the index for resampling.

```
>>> df = pd.DataFrame(data=9*[range(4)], columns=['a', 'b', 'c', 'd'])
>>> df['time'] = pd.date_range('1/1/2000', periods=9, freq='T')
>>> df.resample('3T', on='time').sum()
      a  b  c  d
time
2000-01-01 00:00:00  0  3  6  9
2000-01-01 00:03:00  0  3  6  9
2000-01-01 00:06:00  0  3  6  9
```

For a DataFrame with MultiIndex, the keyword `level` can be used to specify on level the resampling needs to take place.

```
>>> time = pd.date_range('1/1/2000', periods=5, freq='T')
>>> df2 = pd.DataFrame(data=10*[range(4)],
                      columns=['a', 'b', 'c', 'd'],
                      index=pd.MultiIndex.from_product([time, [1, 2]]))
>>> df2.resample('3T', level=0).sum()
      a  b  c  d
2000-01-01 00:00:00  0  6 12 18
2000-01-01 00:03:00  0  4  8 12
```

## pandas.Series.reset\_index

`Series.reset_index (level=None, drop=False, name=None, inplace=False)`

Generate a new DataFrame or Series with the index reset.

This is useful when the index needs to be treated as a column, or when the index is meaningless and needs to be reset to the default before another operation.

**Parameters** `level` : int, str, tuple, or list, default optional

For a Series with a MultiIndex, only remove the specified levels from the index.  
Removes all levels by default.

**drop** : bool, default False

Just reset the index, without inserting it as a column in the new DataFrame.

**name** : object, optional

The name to use for the column containing the original Series values. Uses `self.name` by default. This argument is ignored when `drop` is True.

**inplace** : bool, default False

Modify the Series in place (do not create a new object).

### Returns Series or DataFrame

When `drop` is False (the default), a DataFrame is returned. The newly created columns will come first in the DataFrame, followed by the original Series values. When `drop` is True, a *Series* is returned. In either case, if `inplace=True`, no value is returned.

### See also:

[`DataFrame.reset\_index`](#) Analogous function for DataFrame.

### Examples

```
>>> s = pd.Series([1, 2, 3, 4], name='foo',
...               index=pd.Index(['a', 'b', 'c', 'd'], name='idx'))
```

Generate a DataFrame with default index.

```
>>> s.reset_index()
   idx  foo
0    a    1
1    b    2
2    c    3
3    d    4
```

To specify the name of the new column use `name`.

```
>>> s.reset_index(name='values')
   idx  values
0    a        1
1    b        2
2    c        3
3    d        4
```

To generate a new Series with the default set `drop` to True.

```
>>> s.reset_index(drop=True)
0    1
1    2
2    3
3    4
Name: foo, dtype: int64
```

To update the Series in place, without generating a new one set *inplace* to True. Note that it also requires *drop=True*.

```
>>> s.reset_index(inplace=True, drop=True)
>>> s
0    1
1    2
2    3
3    4
Name: foo, dtype: int64
```

The *level* parameter is interesting for Series with a multi-level index.

```
>>> arrays = [np.array(['bar', 'bar', 'baz', 'baz']),
...           np.array(['one', 'two', 'one', 'two'])]
>>> s2 = pd.Series(
...     range(4), name='foo',
...     index=pd.MultiIndex.from_arrays(arrays,
...                                     names=['a', 'b']))
```

To remove a specific level from the Index, use *level*.

```
>>> s2.reset_index(level='a')
      a  foo
b
one bar    0
two bar    1
one baz    2
two baz    3
```

If *level* is not set, all levels are removed from the Index.

```
>>> s2.reset_index()
      a  b  foo
0 bar one    0
1 bar two    1
2 baz one    2
3 baz two    3
```

## pandas.Series.rfloordiv

Series.**rfloordiv** (*other*, *level=None*, *fill\_value=None*, *axis=0*)

Integer division of series and other, element-wise (binary operator *rfloordiv*).

Equivalent to `other // series`, but with support to substitute a *fill\_value* for missing data in one of the inputs.

### Parameters

**other** [Series or scalar value]

**fill\_value** : None or float value, default None (NaN)

Fill existing missing (NaN) values, and any new element needed for successful Series alignment, with this value before computation. If data in both corresponding Series locations is missing the result will be missing

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

### Returns

**result** [Series]

### See also:

`Series.floordiv`

### Examples

```
>>> a = pd.Series([1, 1, 1, np.nan], index=['a', 'b', 'c', 'd'])
>>> a
a    1.0
b    1.0
c    1.0
d     NaN
dtype: float64
>>> b = pd.Series([1, np.nan, 1, np.nan], index=['a', 'b', 'd', 'e'])
>>> b
a    1.0
b     NaN
d    1.0
e     NaN
dtype: float64
>>> a.add(b, fill_value=0)
a    2.0
b    1.0
c    1.0
d    1.0
e     NaN
dtype: float64
```

## pandas.Series.rmod

`Series.rmod(other, level=None, fill_value=None, axis=0)`

Modulo of series and other, element-wise (binary operator *rmod*).

Equivalent to `other % series`, but with support to substitute a `fill_value` for missing data in one of the inputs.

### Parameters

**other** [Series or scalar value]

**fill\_value** : None or float value, default None (NaN)

Fill existing missing (NaN) values, and any new element needed for successful Series alignment, with this value before computation. If data in both corresponding Series locations is missing the result will be missing

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

### Returns

**result** [Series]

See also:

[`Series.mod`](#)

## Examples

```
>>> a = pd.Series([1, 1, 1, np.nan], index=['a', 'b', 'c', 'd'])
>>> a
a    1.0
b    1.0
c    1.0
d    NaN
dtype: float64
>>> b = pd.Series([1, np.nan, 1, np.nan], index=['a', 'b', 'd', 'e'])
>>> b
a    1.0
b    NaN
d    1.0
e    NaN
dtype: float64
>>> a.add(b, fill_value=0)
a    2.0
b    1.0
c    1.0
d    1.0
e    NaN
dtype: float64
```

## pandas.Series.rmul

`Series.rmul` (*other*, *level=None*, *fill\_value=None*, *axis=0*)

Multiplication of series and other, element-wise (binary operator *rmul*).

Equivalent to `other * series`, but with support to substitute a *fill\_value* for missing data in one of the inputs.

### Parameters

**other** [Series or scalar value]

**fill\_value** : None or float value, default None (NaN)

Fill existing missing (NaN) values, and any new element needed for successful Series alignment, with this value before computation. If data in both corresponding Series locations is missing the result will be missing

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

### Returns

**result** [Series]

See also:

[`Series.mul`](#)

## Examples

```
>>> a = pd.Series([1, 1, 1, np.nan], index=['a', 'b', 'c', 'd'])
>>> a
a    1.0
b    1.0
c    1.0
d    NaN
dtype: float64
>>> b = pd.Series([1, np.nan, 1, np.nan], index=['a', 'b', 'd', 'e'])
>>> b
a    1.0
b    NaN
d    1.0
e    NaN
dtype: float64
>>> a.add(b, fill_value=0)
a    2.0
b    1.0
c    1.0
d    1.0
e    NaN
dtype: float64
```

## pandas.Series.rolling

`Series.rolling` (*window*, *min\_periods=None*, *center=False*, *win\_type=None*, *on=None*, *axis=0*, *closed=None*)

Provides rolling window calculations.

New in version 0.18.0.

**Parameters** *window* : int, or offset

Size of the moving window. This is the number of observations used for calculating the statistic. Each window will be a fixed size.

If its an offset then this will be the time period of each window. Each window will be a variable sized based on the observations included in the time-period. This is only valid for datetimelike indexes. This is new in 0.19.0

**min\_periods** : int, default None

Minimum number of observations in window required to have a value (otherwise result is NA). For a window that is specified by an offset, this will default to 1.

**center** : boolean, default False

Set the labels at the center of the window.

**win\_type** : string, default None

Provide a window type. If `None`, all points are evenly weighted. See the notes below for further information.

**on** : string, optional

For a DataFrame, column on which to calculate the rolling window, rather than the index

**closed** : string, default None

Make the interval closed on the 'right', 'left', 'both' or 'neither' endpoints. For offset-based windows, it defaults to 'right'. For fixed windows, defaults to 'both'. Remaining cases not implemented for fixed windows.

New in version 0.20.0.

**axis** [int or string, default 0]

### Returns

**a Window or Rolling sub-classed for the particular operation**

**See also:**

[\*expanding\*](#) Provides expanding transformations.

[\*ewm\*](#) Provides exponential weighted functions

### Notes

By default, the result is set to the right edge of the window. This can be changed to the center of the window by setting `center=True`.

To learn more about the offsets & frequency strings, please see [this link](#).

The recognized win\_types are:

- boxcar
- triang
- blackman
- hamming
- bartlett
- parzen
- bohman
- blackmanharris
- nuttall
- barthann
- kaiser (needs beta)
- gaussian (needs std)
- general\_gaussian (needs power, width)
- slepian (needs width).

If `win_type=None` all points are evenly weighted. To learn more about different window types see [scipy.signal window functions](#).

## Examples

```
>>> df = pd.DataFrame({'B': [0, 1, 2, np.nan, 4]})
>>> df
   B
0  0.0
1  1.0
2  2.0
3  NaN
4  4.0
```

Rolling sum with a window length of 2, using the 'triang' window type.

```
>>> df.rolling(2, win_type='triang').sum()
   B
0  NaN
1  1.0
2  2.5
3  NaN
4  NaN
```

Rolling sum with a window length of 2, min\_periods defaults to the window length.

```
>>> df.rolling(2).sum()
   B
0  NaN
1  1.0
2  3.0
3  NaN
4  NaN
```

Same as above, but explicitly set the min\_periods

```
>>> df.rolling(2, min_periods=1).sum()
   B
0  0.0
1  1.0
2  3.0
3  2.0
4  4.0
```

A ragged (meaning not-a-regular frequency), time-indexed DataFrame

```
>>> df = pd.DataFrame({'B': [0, 1, 2, np.nan, 4]},
...                     index = [pd.Timestamp('20130101 09:00:00'),
...                               pd.Timestamp('20130101 09:00:02'),
...                               pd.Timestamp('20130101 09:00:03'),
...                               pd.Timestamp('20130101 09:00:05'),
...                               pd.Timestamp('20130101 09:00:06')])
```

```
>>> df
                B
2013-01-01 09:00:00  0.0
2013-01-01 09:00:02  1.0
2013-01-01 09:00:03  2.0
2013-01-01 09:00:05  NaN
2013-01-01 09:00:06  4.0
```

Contrasting to an integer rolling window, this will roll a variable length window corresponding to the time period. The default for `min_periods` is 1.

```
>>> df.rolling('2s').sum()
      B
2013-01-01 09:00:00  0.0
2013-01-01 09:00:02  1.0
2013-01-01 09:00:03  3.0
2013-01-01 09:00:05  NaN
2013-01-01 09:00:06  4.0
```

## **pandas.Series.round**

`Series.round(decimals=0, *args, **kwargs)`

Round each value in a Series to the given number of decimals.

**Parameters** `decimals` : int

Number of decimal places to round to (default: 0). If `decimals` is negative, it specifies the number of positions to the left of the decimal point.

**Returns**

**Series object**

**See also:**

`numpy.around`, `DataFrame.round`

## **pandas.Series.rpow**

`Series.rpow(other, level=None, fill_value=None, axis=0)`

Exponential power of series and other, element-wise (binary operator *rpow*).

Equivalent to `other ** series`, but with support to substitute a `fill_value` for missing data in one of the inputs.

**Parameters**

**other** [Series or scalar value]

**fill\_value** : None or float value, default None (NaN)

Fill existing missing (NaN) values, and any new element needed for successful Series alignment, with this value before computation. If data in both corresponding Series locations is missing the result will be missing

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

**Returns**

**result** [Series]

**See also:**

`Series.pow`

## Examples

```
>>> a = pd.Series([1, 1, 1, np.nan], index=['a', 'b', 'c', 'd'])
>>> a
a    1.0
b    1.0
c    1.0
d    NaN
dtype: float64
>>> b = pd.Series([1, np.nan, 1, np.nan], index=['a', 'b', 'd', 'e'])
>>> b
a    1.0
b    NaN
d    1.0
e    NaN
dtype: float64
>>> a.add(b, fill_value=0)
a    2.0
b    1.0
c    1.0
d    1.0
e    NaN
dtype: float64
```

## pandas.Series.rsub

`Series.rsub` (*other*, *level=None*, *fill\_value=None*, *axis=0*)

Subtraction of series and other, element-wise (binary operator *rsub*).

Equivalent to `other - series`, but with support to substitute a `fill_value` for missing data in one of the inputs.

### Parameters

**other** [Series or scalar value]

**fill\_value** : None or float value, default None (NaN)

Fill existing missing (NaN) values, and any new element needed for successful Series alignment, with this value before computation. If data in both corresponding Series locations is missing the result will be missing

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

### Returns

**result** [Series]

**See also:**

[`Series.sub`](#)

## Examples

```

>>> a = pd.Series([1, 1, 1, np.nan], index=['a', 'b', 'c', 'd'])
>>> a
a    1.0
b    1.0
c    1.0
d    NaN
dtype: float64
>>> b = pd.Series([1, np.nan, 1, np.nan], index=['a', 'b', 'd', 'e'])
>>> b
a    1.0
b    NaN
d    1.0
e    NaN
dtype: float64
>>> a.add(b, fill_value=0)
a    2.0
b    1.0
c    1.0
d    1.0
e    NaN
dtype: float64

```

### pandas.Series.rtruediv

`Series.rtruediv` (*other*, *level=None*, *fill\_value=None*, *axis=0*)

Floating division of series and other, element-wise (binary operator *rtruediv*).

Equivalent to `other / series`, but with support to substitute a `fill_value` for missing data in one of the inputs.

#### Parameters

**other** [Series or scalar value]

**fill\_value** : None or float value, default None (NaN)

Fill existing missing (NaN) values, and any new element needed for successful Series alignment, with this value before computation. If data in both corresponding Series locations is missing the result will be missing

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

#### Returns

**result** [Series]

#### See also:

[`Series.truediv`](#)

### Examples

```

>>> a = pd.Series([1, 1, 1, np.nan], index=['a', 'b', 'c', 'd'])
>>> a
a    1.0

```

(continues on next page)

(continued from previous page)

```

b    1.0
c    1.0
d    NaN
dtype: float64
>>> b = pd.Series([1, np.nan, 1, np.nan], index=['a', 'b', 'd', 'e'])
>>> b
a    1.0
b    NaN
d    1.0
e    NaN
dtype: float64
>>> a.add(b, fill_value=0)
a    2.0
b    1.0
c    1.0
d    1.0
e    NaN
dtype: float64

```

### pandas.Series.sample

`Series.sample` (*n=None*, *frac=None*, *replace=False*, *weights=None*, *random\_state=None*, *axis=None*)

Return a random sample of items from an axis of object.

You can use *random\_state* for reproducibility.

**Parameters** *n* : int, optional

Number of items from axis to return. Cannot be used with *frac*. Default = 1 if *frac* = None.

**frac** : float, optional

Fraction of axis items to return. Cannot be used with *n*.

**replace** : boolean, optional

Sample with or without replacement. Default = False.

**weights** : str or ndarray-like, optional

Default 'None' results in equal probability weighting. If passed a Series, will align with target object on index. Index values in weights not found in sampled object will be ignored and index values in sampled object not in weights will be assigned weights of zero. If called on a DataFrame, will accept the name of a column when *axis* = 0. Unless weights are a Series, weights must be same length as axis being sampled. If weights do not sum to 1, they will be normalized to sum to 1. Missing values in the weights column will be treated as zero. inf and -inf values not allowed.

**random\_state** : int or numpy.random.RandomState, optional

Seed for the random number generator (if int), or numpy RandomState object.

**axis** : int or string, optional

Axis to sample. Accepts axis number or name. Default is stat axis for given data type (0 for Series and DataFrames, 1 for Panels).

## Returns

A new object of same type as caller.

## Examples

Generate an example Series and DataFrame:

```
>>> s = pd.Series(np.random.randn(50))
>>> s.head()
0    -0.038497
1     1.820773
2    -0.972766
3    -1.598270
4    -1.095526
dtype: float64
>>> df = pd.DataFrame(np.random.randn(50, 4), columns=list('ABCD'))
>>> df.head()
      A         B         C         D
0  0.016443 -2.318952 -0.566372 -1.028078
1 -1.051921  0.438836  0.658280 -0.175797
2 -1.243569 -0.364626 -0.215065  0.057736
3  1.768216  0.404512 -0.385604 -1.457834
4  1.072446 -1.137172  0.314194 -0.046661
```

Next extract a random sample from both of these objects...

3 random elements from the Series:

```
>>> s.sample(n=3)
27    -0.994689
55    -1.049016
67    -0.224565
dtype: float64
```

And a random 10% of the DataFrame with replacement:

```
>>> df.sample(frac=0.1, replace=True)
      A         B         C         D
35  1.981780  0.142106  1.817165 -0.290805
49 -1.336199 -0.448634 -0.789640  0.217116
40  0.823173 -0.078816  1.009536  1.015108
15  1.421154 -0.055301 -1.922594 -0.019696
6   -0.148339  0.832938  1.787600 -1.383767
```

You can use *random state* for reproducibility:

```
>>> df.sample(random_state=1)
      A         B         C         D
37 -2.027662  0.103611  0.237496 -0.165867
43 -0.259323 -0.583426  1.516140 -0.479118
12 -1.686325 -0.579510  0.985195 -0.460286
8   1.167946  0.429082  1.215742 -1.636041
9   1.197475 -0.864188  1.554031 -1.505264
```

**pandas.Series.searchsorted**`Series.searchsorted` (*value*, *side*='left', *sorter*=None)

Find indices where elements should be inserted to maintain order.

Find the indices into a sorted Series *self* such that, if the corresponding elements in *value* were inserted before the indices, the order of *self* would be preserved.**Parameters** *value* : array\_likeValues to insert into *self*.**side** : {'left', 'right'}, optionalIf 'left', the index of the first suitable location found is given. If 'right', return the last such index. If there is no suitable index, return either 0 or N (where N is the length of *self*).**sorter** : 1-D array\_like, optionalOptional array of integer indices that sort *self* into ascending order. They are typically the result of `np.argsort`.**Returns** *indices* : array of intsArray of insertion points with the same shape as *value*.**See also:**`numpy.searchsorted`**Notes**

Binary search is used to find the required insertion points.

**Examples**

```
>>> x = pd.Series([1, 2, 3])
>>> x
0    1
1    2
2    3
dtype: int64
```

```
>>> x.searchsorted(4)
array([3])
```

```
>>> x.searchsorted([0, 4])
array([0, 3])
```

```
>>> x.searchsorted([1, 3], side='left')
array([0, 2])
```

```
>>> x.searchsorted([1, 3], side='right')
array([1, 3])
```

```
>>> x = pd.Categorical(['apple', 'bread', 'bread',  
                        'cheese', 'milk'], ordered=True)  
[apple, bread, bread, cheese, milk]  
Categories (4, object): [apple < bread < cheese < milk]
```

```
>>> x.searchsorted('bread')  
array([1])      # Note: an array, not a scalar
```

```
>>> x.searchsorted(['bread'], side='right')  
array([3])
```

## pandas.Series.select

`Series.select(crit, axis=0)`

Return data corresponding to axis labels matching criteria

Deprecated since version 0.21.0: Use `df.loc[df.index.map(crit)]` to select via labels

**Parameters** `crit` : function

To be called on each index (label). Should return True or False

**axis** [int]

**Returns**

**selection** [type of caller]

## pandas.Series.sem

`Series.sem(axis=None, skipna=None, level=None, ddof=1, numeric_only=None, **kwargs)`

Return unbiased standard error of the mean over requested axis.

Normalized by N-1 by default. This can be changed using the `ddof` argument

**Parameters**

**axis** [{index (0)}]

**skipna** : boolean, default True

Exclude NA/null values. If an entire row/column is NA, the result will be NA

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a scalar

**ddof** : int, default 1

Delta Degrees of Freedom. The divisor used in calculations is  $N - \text{ddof}$ , where  $N$  represents the number of elements.

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

**Returns**

**sem** [scalar or Series (if level specified)]

## pandas.Series.set\_axis

`Series.set_axis(labels, axis=0, inplace=None)`

Assign desired index to given axis.

Indexes for column or row labels can be changed by assigning a list-like or Index.

Changed in version 0.21.0: The signature is now *labels* and *axis*, consistent with the rest of pandas API. Previously, the *axis* and *labels* arguments were respectively the first and second positional arguments.

**Parameters** **labels** : list-like, Index

The values for the new index.

**axis** : {0 or 'index', 1 or 'columns'}, default 0

The axis to update. The value 0 identifies the rows, and 1 identifies the columns.

**inplace** : boolean, default None

Whether to return a new %(klass)s instance.

**Warning:** `inplace=None` currently falls back to `True`, but in a future version, will default to `False`. Use `inplace=True` explicitly rather than relying on the default.

**Returns** **renamed** : %(klass)s or None

An object of same type as caller if `inplace=False`, None otherwise.

**See also:**

[`pandas.DataFrame.rename\_axis`](#) Alter the name of the index or columns.

## Examples

### Series

```
>>> s = pd.Series([1, 2, 3])
>>> s
0    1
1    2
2    3
dtype: int64
```

```
>>> s.set_axis(['a', 'b', 'c'], axis=0, inplace=False)
a    1
b    2
c    3
dtype: int64
```

The original object is not modified.

```
>>> s
0    1
1    2
2    3
dtype: int64
```

### DataFrame

```
>>> df = pd.DataFrame({"A": [1, 2, 3], "B": [4, 5, 6]})
```

Change the row labels.

```
>>> df.set_axis(['a', 'b', 'c'], axis='index', inplace=False)
   A  B
a  1  4
b  2  5
c  3  6
```

Change the column labels.

```
>>> df.set_axis(['I', 'II'], axis='columns', inplace=False)
   I  II
0  1   4
1  2   5
2  3   6
```

Now, update the labels inplace.

```
>>> df.set_axis(['i', 'ii'], axis='columns', inplace=True)
>>> df
   i  ii
0  1   4
1  2   5
2  3   6
```

## pandas.Series.set\_value

`Series.set_value (label, value, takeable=False)`

Quickly set single value at passed label. If label is not contained, a new object is created with the label placed at the end of the result index.

Deprecated since version 0.21.0: Please use `.at[]` or `.iat[]` accessors.

**Parameters** **label** : object

Partial indexing with MultiIndex not allowed

**value** : object

Scalar value

**takeable** [interpret the index as indexers, default False]

**Returns** **series** : Series

If label is contained, will be reference to calling Series, otherwise a new object

**pandas.Series.shift**`Series.shift` (*periods=1, freq=None, axis=0*)

Shift index by desired number of periods with an optional time freq

**Parameters** `periods` : int

Number of periods to move, can be positive or negative

**freq** : DateOffset, timedelta, or time rule string, optional

Increment to use from the tseries module or time rule (e.g. 'EOM'). See Notes.

**axis** [{0 or 'index'}]**Returns****shifted** [Series]**Notes**

If freq is specified then the index values are shifted but the data is not realigned. That is, use freq if you would like to extend the index when shifting and preserve the original data.

**pandas.Series.skew**`Series.skew` (*axis=None, skipna=None, level=None, numeric\_only=None, \*\*kwargs*)

Return unbiased skew over requested axis Normalized by N-1

**Parameters****axis** [{index (0)}]**skipna** : boolean, default True

Exclude NA/null values when computing the result.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a scalar

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

**Returns****skew** [scalar or Series (if level specified)]**pandas.Series.slice\_shift**`Series.slice_shift` (*periods=1, axis=0*)

Equivalent to *shift* without copying data. The shifted data will not include the dropped periods and the shifted axis will be smaller than the original.

**Parameters** `periods` : int

Number of periods to move, can be positive or negative

#### Returns

**shifted** [same type as caller]

#### Notes

While the *slice\_shift* is faster than *shift*, you may pay for it later during alignment.

### pandas.Series.sort\_index

`Series.sort_index(axis=0, level=None, ascending=True, inplace=False, kind='quicksort', na_position='last', sort_remaining=True)`

Sort Series by index labels.

Returns a new Series sorted by label if *inplace* argument is `False`, otherwise updates the original series and returns `None`.

**Parameters** **axis** : int, default 0

Axis to direct sorting. This can only be 0 for Series.

**level** : int, optional

If not `None`, sort on values in specified index level(s).

**ascending** : bool, default `true`

Sort ascending vs. descending.

**inplace** : bool, default `False`

If `True`, perform operation in-place.

**kind** : { 'quicksort', 'mergesort', 'heapsort' }, default 'quicksort'

Choice of sorting algorithm. See also `numpy.sort()` for more information. 'mergesort' is the only stable algorithm. For DataFrames, this option is only applied when sorting on a single column or label.

**na\_position** : { 'first', 'last' }, default 'last'

If 'first' puts NaNs at the beginning, 'last' puts NaNs at the end. Not implemented for MultiIndex.

**sort\_remaining** : bool, default `True`

If `true` and sorting by level and index is multilevel, sort by other levels too (in order) after sorting by specified level.

**Returns** **pandas.Series**

The original Series sorted by the labels

**See also:**

**DataFrame.sort\_index** Sort DataFrame by the index

**DataFrame.sort\_values** Sort DataFrame by the value

**Series.sort\_values** Sort Series by the value

## Examples

```
>>> s = pd.Series(['a', 'b', 'c', 'd'], index=[3, 2, 1, 4])
>>> s.sort_index()
1      c
2      b
3      a
4      d
dtype: object
```

### Sort Descending

```
>>> s.sort_index(ascending=False)
4      d
3      a
2      b
1      c
dtype: object
```

### Sort Inplace

```
>>> s.sort_index(inplace=True)
>>> s
1      c
2      b
3      a
4      d
dtype: object
```

By default NaNs are put at the end, but use *na\_position* to place them at the beginning

```
>>> s = pd.Series(['a', 'b', 'c', 'd'], index=[3, 2, 1, np.nan])
>>> s.sort_index(na_position='first')
NaN      d
1.0      c
2.0      b
3.0      a
dtype: object
```

### Specify index level to sort

```
>>> arrays = [np.array(['qux', 'qux', 'foo', 'foo',
...                     'baz', 'baz', 'bar', 'bar']),
...           np.array(['two', 'one', 'two', 'one',
...                     'two', 'one', 'two', 'one'])]
>>> s = pd.Series([1, 2, 3, 4, 5, 6, 7, 8], index=arrays)
>>> s.sort_index(level=1)
bar one      8
baz one      6
foo one      4
qux one      2
bar two      7
baz two      5
foo two      3
qux two      1
dtype: int64
```

Does not sort by remaining levels when sorting by levels

```
>>> s.sort_index(level=1, sort_remaining=False)
qux one 2
foo one 4
baz one 6
bar one 8
qux two 1
foo two 3
baz two 5
bar two 7
dtype: int64
```

## pandas.Series.sort\_values

`Series.sort_values` (*axis=0*, *ascending=True*, *inplace=False*, *kind='quicksort'*, *na\_position='last'*)

Sort by the values.

Sort a Series in ascending or descending order by some criterion.

**Parameters** *axis* : {0 or 'index'}, default 0

Axis to direct sorting. The value 'index' is accepted for compatibility with `DataFrame.sort_values`.

**ascending** : bool, default True

If True, sort values in ascending order, otherwise descending.

**inplace** : bool, default False

If True, perform operation in-place.

**kind** : {'quicksort', 'mergesort' or 'heapsort'}, default 'quicksort'

Choice of sorting algorithm. See also `numpy.sort()` for more information. 'mergesort' is the only stable algorithm.

**na\_position** : {'first' or 'last'}, default 'last'

Argument 'first' puts NaNs at the beginning, 'last' puts NaNs at the end.

**Returns** *Series*

Series ordered by values.

**See also:**

**`Series.sort_index`** Sort by the Series indices.

**`DataFrame.sort_values`** Sort DataFrame by the values along either axis.

**`DataFrame.sort_index`** Sort DataFrame by indices.

## Examples

```
>>> s = pd.Series([np.nan, 1, 3, 10, 5])
>>> s
0    NaN
1    1.0
```

(continues on next page)

(continued from previous page)

```
2      3.0
3     10.0
4      5.0
dtype: float64
```

Sort values ascending order (default behaviour)

```
>>> s.sort_values(ascending=True)
1      1.0
2      3.0
4      5.0
3     10.0
0      NaN
dtype: float64
```

Sort values descending order

```
>>> s.sort_values(ascending=False)
3     10.0
4      5.0
2      3.0
1      1.0
0      NaN
dtype: float64
```

Sort values inplace

```
>>> s.sort_values(ascending=False, inplace=True)
>>> s
3     10.0
4      5.0
2      3.0
1      1.0
0      NaN
dtype: float64
```

Sort values putting NAs first

```
>>> s.sort_values(na_position='first')
0      NaN
1      1.0
2      3.0
4      5.0
3     10.0
dtype: float64
```

Sort a series of strings

```
>>> s = pd.Series(['z', 'b', 'd', 'a', 'c'])
>>> s
0      z
1      b
2      d
3      a
4      c
dtype: object
```

```
>>> s.sort_values()
3      a
1      b
4      c
2      d
0      z
dtype: object
```

## pandas.Series.sortlevel

`Series.sortlevel` (*level=0, ascending=True, sort\_remaining=True*)

Sort Series with MultiIndex by chosen level. Data will be lexicographically sorted by the chosen level followed by the other levels (in order),

Deprecated since version 0.20.0: Use `Series.sort_index()`

### Parameters

**level** [int or level name, default None]

**ascending** [bool, default True]

### Returns

**sorted** [Series]

### See also:

`Series.sort_index`

## pandas.Series.squeeze

`Series.squeeze` (*axis=None*)

Squeeze length 1 dimensions.

**Parameters** **axis** : None, integer or string axis name, optional

The axis to squeeze if 1-sized.

New in version 0.20.0.

### Returns

**scalar if 1-sized, else original object**

## pandas.Series.std

`Series.std` (*axis=None, skipna=None, level=None, ddof=1, numeric\_only=None, \*\*kwargs*)

Return sample standard deviation over requested axis.

Normalized by N-1 by default. This can be changed using the ddof argument

### Parameters

**axis** [{index (0)}]

**skipna** : boolean, default True

Exclude NA/null values. If an entire row/column is NA, the result will be NA

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a scalar

**ddof** : int, default 1

Delta Degrees of Freedom. The divisor used in calculations is  $N - \text{ddof}$ , where  $N$  represents the number of elements.

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

#### Returns

**std** [scalar or Series (if level specified)]

### pandas.Series.str

`Series.str()`

Vectorized string functions for Series and Index. NAs stay NA unless handled otherwise by a particular method. Patterned after Python's string methods, with some inspiration from R's stringr package.

#### Examples

```
>>> s.str.split('_')
>>> s.str.replace('_', '')
```

### pandas.Series.sub

`Series.sub(other, level=None, fill_value=None, axis=0)`

Subtraction of series and other, element-wise (binary operator *sub*).

Equivalent to `series - other`, but with support to substitute a `fill_value` for missing data in one of the inputs.

#### Parameters

**other** [Series or scalar value]

**fill\_value** : None or float value, default None (NaN)

Fill existing missing (NaN) values, and any new element needed for successful Series alignment, with this value before computation. If data in both corresponding Series locations is missing the result will be missing

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

#### Returns

**result** [Series]

See also:

[`Series.rsub`](#)

## Examples

```
>>> a = pd.Series([1, 1, 1, np.nan], index=['a', 'b', 'c', 'd'])
>>> a
a    1.0
b    1.0
c    1.0
d    NaN
dtype: float64
>>> b = pd.Series([1, np.nan, 1, np.nan], index=['a', 'b', 'd', 'e'])
>>> b
a    1.0
b    NaN
d    1.0
e    NaN
dtype: float64
>>> a.add(b, fill_value=0)
a    2.0
b    1.0
c    1.0
d    1.0
e    NaN
dtype: float64
```

## pandas.Series.subtract

`Series.subtract` (*other*, *level=None*, *fill\_value=None*, *axis=0*)

Subtraction of series and other, element-wise (binary operator *sub*).

Equivalent to `series - other`, but with support to substitute a `fill_value` for missing data in one of the inputs.

### Parameters

**other** [Series or scalar value]

**fill\_value** : None or float value, default None (NaN)

Fill existing missing (NaN) values, and any new element needed for successful Series alignment, with this value before computation. If data in both corresponding Series locations is missing the result will be missing

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

### Returns

**result** [Series]

### See also:

[`Series.rsub`](#)

## Examples

```

>>> a = pd.Series([1, 1, 1, np.nan], index=['a', 'b', 'c', 'd'])
>>> a
a    1.0
b    1.0
c    1.0
d     NaN
dtype: float64
>>> b = pd.Series([1, np.nan, 1, np.nan], index=['a', 'b', 'd', 'e'])
>>> b
a    1.0
b     NaN
d    1.0
e     NaN
dtype: float64
>>> a.add(b, fill_value=0)
a    2.0
b    1.0
c    1.0
d    1.0
e     NaN
dtype: float64

```

### pandas.Series.sum

`Series.sum(axis=None, skipna=None, level=None, numeric_only=None, min_count=0, **kwargs)`

Return the sum of the values for the requested axis

#### Parameters

**axis** [{index (0)}]

**skipna** : boolean, default True

Exclude NA/null values when computing the result.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a scalar

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

**min\_count** : int, default 0

The required number of valid values to perform the operation. If fewer than `min_count` non-NA values are present the result will be NA.

New in version 0.22.0: Added with the default being 0. This means the sum of an all-NA or empty Series is 0, and the product of an all-NA or empty Series is 1.

#### Returns

**sum** [scalar or Series (if level specified)]

## Examples

By default, the sum of an empty or all-NA Series is 0.

```
>>> pd.Series([]).sum() # min_count=0 is the default
0.0
```

This can be controlled with the `min_count` parameter. For example, if you'd like the sum of an empty series to be NaN, pass `min_count=1`.

```
>>> pd.Series([]).sum(min_count=1)
nan
```

Thanks to the `skipna` parameter, `min_count` handles all-NA and empty series identically.

```
>>> pd.Series([np.nan]).sum()
0.0
```

```
>>> pd.Series([np.nan]).sum(min_count=1)
nan
```

## pandas.Series.swapaxes

`Series.swapaxes` (*axis1*, *axis2*, *copy=True*)  
Interchange axes and swap values axes appropriately

### Returns

**y** [same as input]

## pandas.Series.swaplevel

`Series.swaplevel` (*i=-2*, *j=-1*, *copy=True*)  
Swap levels *i* and *j* in a MultiIndex

**Parameters** *i*, *j*: int, string (can be mixed)

Level of index to be swapped. Can pass level name as string.

### Returns

**swapped** [Series]

**.. versionchanged:: 0.18.1**

The indexes *i* and *j* are now optional, and default to the two innermost levels of the index.

## pandas.Series.tail

`Series.tail` (*n=5*)  
Return the last *n* rows.

This function returns last *n* rows from the object based on position. It is useful for quickly verifying data, for example, after sorting or appending rows.

**Parameters** `n` : int, default 5

Number of rows to select.

**Returns** type of caller

The last  $n$  rows of the caller object.

**See also:**

`pandas.DataFrame.head` The first  $n$  rows of the caller object.

## Examples

```
>>> df = pd.DataFrame({'animal': ['alligator', 'bee', 'falcon', 'lion',
...                               'monkey', 'parrot', 'shark', 'whale', 'zebra']})
>>> df
   animal
0 alligator
1      bee
2   falcon
3     lion
4   monkey
5   parrot
6    shark
7    whale
8    zebra
```

Viewing the last 5 lines

```
>>> df.tail()
   animal
4 monkey
5 parrot
6  shark
7  whale
8  zebra
```

Viewing the last  $n$  lines (three in this case)

```
>>> df.tail(3)
   animal
6  shark
7  whale
8  zebra
```

## pandas.Series.take

`Series.take` (*indices*, *axis=0*, *convert=None*, *is\_copy=True*, *\*\*kwargs*)

Return the elements in the given *positional* indices along an axis.

This means that we are not indexing according to actual values in the index attribute of the object. We are indexing according to the actual position of the element in the object.

**Parameters** *indices* : array-like

An array of ints indicating which positions to take.

**axis** : {0 or 'index', 1 or 'columns', None}, default 0

The axis on which to select elements. 0 means that we are selecting rows, 1 means that we are selecting columns.

**convert** : bool, default True

Whether to convert negative indices into positive ones. For example, -1 would map to the `len(axis) - 1`. The conversions are similar to the behavior of indexing a regular Python list.

Deprecated since version 0.21.0: In the future, negative indices will always be converted.

**is\_copy** : bool, default True

Whether to return a copy of the original object or not.

**\*\*kwargs**

For compatibility with `numpy.take()`. Has no effect on the output.

**Returns taken** : type of caller

An array-like containing the elements taken from the object.

**See also:**

[`DataFrame.loc`](#) Select a subset of a DataFrame by labels.

[`DataFrame.iloc`](#) Select a subset of a DataFrame by positions.

[`numpy.take`](#) Take elements from an array along an axis.

## Examples

```
>>> df = pd.DataFrame([('falcon', 'bird', 389.0),
...                     ('parrot', 'bird', 24.0),
...                     ('lion', 'mammal', 80.5),
...                     ('monkey', 'mammal', np.nan)],
...                    columns=['name', 'class', 'max_speed'],
...                    index=[0, 2, 3, 1])
>>> df
   name  class  max_speed
0  falcon   bird    389.0
2  parrot   bird     24.0
3   lion  mammal     80.5
1  monkey  mammal      NaN
```

Take elements at positions 0 and 3 along the axis 0 (default).

Note how the actual indices selected (0 and 1) do not correspond to our selected indices 0 and 3. That's because we are selecting the 0th and 3rd rows, not rows whose indices equal 0 and 3.

```
>>> df.take([0, 3])
   name  class  max_speed
0  falcon   bird    389.0
1  monkey  mammal      NaN
```

Take elements at indices 1 and 2 along the axis 1 (column selection).

```
>>> df.take([1, 2], axis=1)
      class  max_speed
0    bird      389.0
2    bird       24.0
3  mammal       80.5
1  mammal        NaN
```

We may take elements using negative integers for positive indices, starting from the end of the object, just like with Python lists.

```
>>> df.take([-1, -2])
      name  class  max_speed
1  monkey  mammal        NaN
3    lion  mammal       80.5
```

### pandas.Series.to\_clipboard

`Series.to_clipboard(excel=True, sep=None, **kwargs)`

Copy object to the system clipboard.

Write a text representation of object to the system clipboard. This can be pasted into Excel, for example.

**Parameters** `excel` : bool, default True

- True, use the provided separator, writing in a csv format for allowing easy pasting into excel.
- False, write a string representation of the object to the clipboard.

`sep` : str, default '\t'

Field delimiter.

**\*\*kwargs**

These parameters will be passed to `DataFrame.to_csv`.

**See also:**

[`DataFrame.to\_csv`](#) Write a `DataFrame` to a comma-separated values (csv) file.

[`read\_clipboard`](#) Read text from clipboard and pass to `read_table`.

### Notes

Requirements for your platform.

- Linux : `xclip`, or `xsel` (with `gtk` or `PyQt4` modules)
- Windows : none
- OS X : none

### Examples

Copy the contents of a `DataFrame` to the clipboard.

```
>>> df = pd.DataFrame([[1, 2, 3], [4, 5, 6]], columns=['A', 'B', 'C'])
>>> df.to_clipboard(sep=',')
... # Wrote the following to the system clipboard:
... # ,A,B,C
... # 0,1,2,3
... # 1,4,5,6
```

We can omit the the index by passing the keyword *index* and setting it to false.

```
>>> df.to_clipboard(sep=',', index=False)
... # Wrote the following to the system clipboard:
... # A,B,C
... # 1,2,3
... # 4,5,6
```

### pandas.Series.to\_csv

`Series.to_csv` (*path=None*, *index=True*, *sep=' '*, *na\_rep=""*, *float\_format=None*, *header=False*, *index\_label=None*, *mode='w'*, *encoding=None*, *compression=None*, *date\_format=None*, *decimal='.'*)

Write Series to a comma-separated values (csv) file

**Parameters** *path* : string or file handle, default None

File path or object, if None is provided the result is returned as a string.

**na\_rep** : string, default “

Missing data representation

**float\_format** : string, default None

Format string for floating point numbers

**header** : boolean, default False

Write out series name

**index** : boolean, default True

Write row names (index)

**index\_label** : string or sequence, default None

Column label for index column(s) if desired. If None is given, and *header* and *index* are True, then the index names are used. A sequence should be given if the DataFrame uses MultiIndex.

**mode** [Python write mode, default ‘w’]

**sep** : character, default “,”

Field delimiter for the output file.

**encoding** : string, optional

a string representing the encoding to use if the contents are non-ascii, for python versions prior to 3

**compression** : string, optional

A string representing the compression to use in the output file. Allowed values are 'gzip', 'bz2', 'zip', 'xz'. This input is only used when the first argument is a filename.

**date\_format:** string, default None

Format string for datetime objects.

**decimal:** string, default '.'

Character recognized as decimal separator. E.g. use ',' for European data

### pandas.Series.to\_dense

`Series.to_dense()`

Return dense representation of NDFrame (as opposed to sparse)

### pandas.Series.to\_dict

`Series.to_dict(into=<class 'dict'>)`

Convert Series to {label -> value} dict or dict-like object.

**Parameters** `into` : class, default dict

The collections.Mapping subclass to use as the return object. Can be the actual class or an empty instance of the mapping type you want. If you want a collections.defaultdict, you must pass it initialized.

New in version 0.21.0.

**Returns**

**value\_dict** [collections.Mapping]

### Examples

```
>>> s = pd.Series([1, 2, 3, 4])
>>> s.to_dict()
{0: 1, 1: 2, 2: 3, 3: 4}
>>> from collections import OrderedDict, defaultdict
>>> s.to_dict(OrderedDict)
OrderedDict([(0, 1), (1, 2), (2, 3), (3, 4)])
>>> dd = defaultdict(list)
>>> s.to_dict(dd)
defaultdict(<type 'list'>, {0: 1, 1: 2, 2: 3, 3: 4})
```

### pandas.Series.to\_excel

`Series.to_excel(excel_writer, sheet_name='Sheet1', na_rep="", float_format=None, columns=None, header=True, index=True, index_label=None, startrow=0, startcol=0, engine=None, merge_cells=True, encoding=None, inf_rep='inf', verbose=True)`

Write Series to an excel sheet

New in version 0.20.0.

**Parameters** **excel\_writer** : string or ExcelWriter object

File path or existing ExcelWriter

**sheet\_name** : string, default 'Sheet1'

Name of sheet which will contain DataFrame

**na\_rep** : string, default ''

Missing data representation

**float\_format** : string, default None

Format string for floating point numbers

**columns** : sequence, optional

Columns to write

**header** : boolean or list of string, default True

Write out the column names. If a list of strings is given it is assumed to be aliases for the column names

**index** : boolean, default True

Write row names (index)

**index\_label** : string or sequence, default None

Column label for index column(s) if desired. If None is given, and *header* and *index* are True, then the index names are used. A sequence should be given if the DataFrame uses MultiIndex.

**startrow** :

upper left cell row to dump data frame

**startcol** :

upper left cell column to dump data frame

**engine** : string, default None

write engine to use - you can also set this via the options `io.excel.xlsx.writer`, `io.excel.xls.writer`, and `io.excel.xlsm.writer`.

**merge\_cells** : boolean, default True

Write MultiIndex and Hierarchical Rows as merged cells.

**encoding**: string, default None

encoding of the resulting excel file. Only necessary for xlwt, other writers support unicode natively.

**inf\_rep** : string, default 'inf'

Representation for infinity (there is no native representation for infinity in Excel)

**freeze\_panes** : tuple of integer (length 2), default None

Specifies the one-based bottommost row and rightmost column that is to be frozen

New in version 0.20.0.

## Notes

If passing an existing ExcelWriter object, then the sheet will be added to the existing workbook. This can be used to save different DataFrames to one workbook:

```
>>> writer = pd.ExcelWriter('output.xlsx')
>>> df1.to_excel(writer, 'Sheet1')
>>> df2.to_excel(writer, 'Sheet2')
>>> writer.save()
```

For compatibility with `to_csv`, `to_excel` serializes lists and dicts to strings before writing.

## pandas.Series.to\_frame

`Series.to_frame` (*name=None*)

Convert Series to DataFrame

**Parameters** `name` : object, default None

The passed name should substitute for the series name (if it has one).

**Returns**

`data_frame` [DataFrame]

## pandas.Series.to\_hdf

`Series.to_hdf` (*path\_or\_buf, key, \*\*kwargs*)

Write the contained data to an HDF5 file using HDFStore.

Hierarchical Data Format (HDF) is self-describing, allowing an application to interpret the structure and contents of a file with no outside information. One HDF file can hold a mix of related objects which can be accessed as a group or as individual objects.

In order to add another DataFrame or Series to an existing HDF file please use append mode and a different a key.

For more information see the [user guide](#).

**Parameters** `path_or_buf` : str or pandas.HDFStore

File path or HDFStore object.

**key** : str

Identifier for the group in the store.

**mode** : {'a', 'w', 'r+'}, default 'a'

Mode to open file:

- 'w': write, a new file is created (an existing file with the same name would be deleted).
- 'a': append, an existing file is opened for reading and writing, and if the file does not exist it is created.
- 'r+': similar to 'a', but the file must already exist.

**format** : {'fixed', 'table'}, default 'fixed'

Possible values:

- ‘fixed’: Fixed format. Fast writing/reading. Not-appendable, nor searchable.
- ‘table’: Table format. Write as a PyTables Table structure which may perform worse but allow more flexible operations like searching / selecting subsets of the data.

**append** : bool, default False

For Table formats, append the input data to the existing.

**data\_columns** : list of columns or True, optional

List of columns to create as indexed data columns for on-disk queries, or True to use all columns. By default only the axes of the object are indexed. See [Query via Data Columns](#). Applicable only to format=‘table’.

**complevel** : {0-9}, optional

Specifies a compression level for data. A value of 0 disables compression.

**complib** : {‘zlib’, ‘lzo’, ‘bzip2’, ‘blosc’}, default ‘zlib’

Specifies the compression library to be used. As of v0.20.2 these additional compressors for Blosc are supported (default if no compressor specified: ‘blosc:blosclz’): {‘blosc:blosclz’, ‘blosc:lz4’, ‘blosc:lz4hc’, ‘blosc:snappy’, ‘blosc:zlib’, ‘blosc:zstd’}. Specifying a compression library which is not available issues a ValueError.

**fletcher32** : bool, default False

If applying compression use the fletcher32 checksum.

**dropna** : bool, default False

If true, ALL nan rows will not be written to store.

**errors** : str, default ‘strict’

Specifies how encoding and decoding errors are to be handled. See the errors argument for `open()` for a full list of options.

See also:

**DataFrame.read\_hdf** Read from HDF file.

**DataFrame.to\_parquet** Write a DataFrame to the binary parquet format.

**DataFrame.to\_sql** Write to a sql table.

**DataFrame.to\_feather** Write out feather-format for DataFrames.

**DataFrame.to\_csv** Write out to a csv file.

## Examples

```
>>> df = pd.DataFrame({'A': [1, 2, 3], 'B': [4, 5, 6]},
...                   index=['a', 'b', 'c'])
>>> df.to_hdf('data.h5', key='df', mode='w')
```

We can add another object to the same file:

```
>>> s = pd.Series([1, 2, 3, 4])
>>> s.to_hdf('data.h5', key='s')
```

Reading from HDF file:

```
>>> pd.read_hdf('data.h5', 'df')
A  B
a  1  4
b  2  5
c  3  6
>>> pd.read_hdf('data.h5', 's')
0    1
1    2
2    3
3    4
dtype: int64
```

Deleting file with data:

```
>>> import os
>>> os.remove('data.h5')
```

### pandas.Series.to\_json

`Series.to_json(path_or_buf=None, orient=None, date_format=None, double_precision=10, force_ascii=True, date_unit='ms', default_handler=None, lines=False, compression=None, index=True)`  
Convert the object to a JSON string.

Note NaN's and None will be converted to null and datetime objects will be converted to UNIX timestamps.

**Parameters** `path_or_buf` : string or file handle, optional

File path or object. If not specified, the result is returned as a string.

**orient** : string

Indication of expected JSON string format.

- Series
  - default is 'index'
  - allowed values are: {'split', 'records', 'index'}
- DataFrame
  - default is 'columns'
  - allowed values are: {'split', 'records', 'index', 'columns', 'values'}
- The format of the JSON string
  - 'split' : dict like {'index' -> [index], 'columns' -> [columns], 'data' -> [values]}
  - 'records' : list like [{column -> value}, ... , {column -> value}]
  - 'index' : dict like {index -> {column -> value}}
  - 'columns' : dict like {column -> {index -> value}}

- ‘values’ : just the values array
- ‘table’ : dict like {‘schema’: {schema}, ‘data’: {data}} describing the data, and the data component is like `orient=‘records’`.

Changed in version 0.20.0.

**date\_format** : {None, ‘epoch’, ‘iso’}

Type of date conversion. ‘epoch’ = epoch milliseconds, ‘iso’ = ISO8601. The default depends on the *orient*. For `orient=‘table’`, the default is ‘iso’. For all other orients, the default is ‘epoch’.

**double\_precision** : int, default 10

The number of decimal places to use when encoding floating point values.

**force\_ascii** : boolean, default True

Force encoded string to be ASCII.

**date\_unit** : string, default ‘ms’ (milliseconds)

The time unit to encode to, governs timestamp and ISO8601 precision. One of ‘s’, ‘ms’, ‘us’, ‘ns’ for second, millisecond, microsecond, and nanosecond respectively.

**default\_handler** : callable, default None

Handler to call if object cannot otherwise be converted to a suitable format for JSON. Should receive a single argument which is the object to convert and return a serialisable object.

**lines** : boolean, default False

If ‘orient’ is ‘records’ write out line delimited json format. Will throw ValueError if incorrect ‘orient’ since others are not list like.

New in version 0.19.0.

**compression** : {None, ‘gzip’, ‘bz2’, ‘zip’, ‘xz’}

A string representing the compression to use in the output file, only used when the first argument is a filename.

New in version 0.21.0.

**index** : boolean, default True

Whether to include the index values in the JSON string. Not including the index (`index=False`) is only supported when orient is ‘split’ or ‘table’.

New in version 0.23.0.

#### See also:

[`pandas.read\_json`](#)

#### Examples

```
>>> df = pd.DataFrame([[‘a’, ‘b’], [‘c’, ‘d’]],
...                    index=[‘row 1’, ‘row 2’],
...                    columns=[‘col 1’, ‘col 2’])
>>> df.to_json(orient=‘split’)
```

(continues on next page)

(continued from previous page)

```
'{"columns":["col 1","col 2"],
  "index":["row 1","row 2"],
  "data":[["a","b"],["c","d"]]]'
```

Encoding/decoding a Dataframe using 'records' formatted JSON. Note that index labels are not preserved with this encoding.

```
>>> df.to_json(orient='records')
'[{ "col 1": "a", "col 2": "b"}, { "col 1": "c", "col 2": "d"}]'
```

Encoding/decoding a Dataframe using 'index' formatted JSON:

```
>>> df.to_json(orient='index')
'{"row 1":{"col 1":"a","col 2":"b"},"row 2":{"col 1":"c","col 2":"d"}}'
```

Encoding/decoding a Dataframe using 'columns' formatted JSON:

```
>>> df.to_json(orient='columns')
'{"col 1":{"row 1":"a","row 2":"c"},"col 2":{"row 1":"b","row 2":"d"}}'
```

Encoding/decoding a Dataframe using 'values' formatted JSON:

```
>>> df.to_json(orient='values')
'[[["a","b"],["c","d"]]]'
```

Encoding with Table Schema

```
>>> df.to_json(orient='table')
'{"schema": {"fields": [{"name": "index", "type": "string"},
                        {"name": "col 1", "type": "string"},
                        {"name": "col 2", "type": "string"}],
  "primaryKey": "index",
  "pandas_version": "0.20.0"},
  "data": [{"index": "row 1", "col 1": "a", "col 2": "b"},
            {"index": "row 2", "col 1": "c", "col 2": "d"}]}'
```

## pandas.Series.to\_latex

`Series.to_latex` (*buf=None, columns=None, col\_space=None, header=True, index=True, na\_rep='NaN', formatters=None, float\_format=None, sparsify=None, index\_names=True, bold\_rows=False, column\_format=None, longtable=None, escape=None, encoding=None, decimal='.', multicolumn=None, multirow=None*)

Render an object to a tabular environment table. You can splice this into a LaTeX document. Requires `\usepackage{booktabs}`.

Changed in version 0.20.2: Added to Series

*to\_latex*-specific options:

**bold\_rows** [boolean, default False] Make the row labels bold in the output

**column\_format** [str, default None] The columns format as specified in [LaTeX table format](#) e.g 'rcl' for 3 columns

**longtable** [boolean, default will be read from the pandas config module] Default: False. Use a longtable environment instead of tabular. Requires adding a `\usepackage{longtable}` to your LaTeX preamble.

**escape** [boolean, default will be read from the pandas config module] Default: True. When set to False prevents from escaping latex special characters in column names.

**encoding** [str, default None] A string representing the encoding to use in the output file, defaults to 'ascii' on Python 2 and 'utf-8' on Python 3.

**decimal** [string, default '.'] Character recognized as decimal separator, e.g. ',' in Europe.

New in version 0.18.0.

**multicolumn** [boolean, default True] Use multicolumn to enhance MultiIndex columns. The default will be read from the config module.

New in version 0.20.0.

**multicolumn\_format** [str, default 'l'] The alignment for multicolumns, similar to *column\_format*. The default will be read from the config module.

New in version 0.20.0.

**multirow** [boolean, default False] Use multirow to enhance MultiIndex rows. Requires adding a `\usepackage{multirow}` to your LaTeX preamble. Will print centered labels (instead of top-aligned) across the contained rows, separating groups via clines. The default will be read from the pandas config module.

New in version 0.20.0.

### **pandas.Series.to\_msgpack**

`Series.to_msgpack` (*path\_or\_buf=None, encoding='utf-8', \*\*kwargs*)  
msgpack (serialize) object to input file path

THIS IS AN EXPERIMENTAL LIBRARY and the storage format may not be stable until a future release.

**Parameters** **path** : string File path, buffer-like, or None

if None, return generated string

**append** : boolean whether to append to an existing msgpack

(default is False)

**compress** : type of compressor (zlib or blosc), default to None (no compression)

### **pandas.Series.to\_period**

`Series.to_period` (*freq=None, copy=True*)

Convert Series from DatetimeIndex to PeriodIndex with desired frequency (inferred from index if not passed)

**Parameters**

**freq** [string, default]

**Returns**

**ts** [Series with PeriodIndex]

**pandas.Series.to\_pickle**`Series.to_pickle` (*path*, *compression*='infer', *protocol*=4)

Pickle (serialize) object to file.

**Parameters** *path* : str

File path where the pickled object will be stored.

**compression** : {'infer', 'gzip', 'bz2', 'zip', 'xz', None}, default 'infer'

A string representing the compression to use in the output file. By default, infers from the file extension in specified path.

New in version 0.20.0.

**protocol** : int

Int which indicates which protocol should be used by the pickler, default HIGHEST\_PROTOCOL (see [R27] paragraph 12.1.2). The possible values for this parameter depend on the version of Python. For Python 2.x, possible values are 0, 1, 2. For Python &gt;= 3.0, 3 is a valid value. For Python &gt;= 3.4, 4 is a valid value. A negative value for the protocol parameter is equivalent to setting its value to HIGHEST\_PROTOCOL.

New in version 0.21.0.

**See also:**`read_pickle` Load pickled pandas object (or any object) from file.`DataFrame.to_hdf` Write DataFrame to an HDF5 file.`DataFrame.to_sql` Write DataFrame to a SQL database.`DataFrame.to_parquet` Write a DataFrame to the binary parquet format.**Examples**

```
>>> original_df = pd.DataFrame({"foo": range(5), "bar": range(5, 10)})
>>> original_df
   foo  bar
0    0    5
1    1    6
2    2    7
3    3    8
4    4    9
>>> original_df.to_pickle("./dummy.pkl")
```

```
>>> unpickled_df = pd.read_pickle("./dummy.pkl")
>>> unpickled_df
   foo  bar
0    0    5
1    1    6
2    2    7
3    3    8
4    4    9
```

```
>>> import os
>>> os.remove("./dummy.pkl")
```

## pandas.Series.to\_sparse

`Series.to_sparse` (*kind='block', fill\_value=None*)  
Convert Series to SparseSeries

### Parameters

**kind** [{ 'block', 'integer' }]

**fill\_value** [float, defaults to NaN (missing)]

### Returns

**sp** [SparseSeries]

## pandas.Series.to\_sql

`Series.to_sql` (*name, con, schema=None, if\_exists='fail', index=True, index\_label=None, chunk-size=None, dtype=None*)

Write records stored in a DataFrame to a SQL database.

Databases supported by SQLAlchemy [\[R28\]](#) are supported. Tables can be newly created, appended to, or overwritten.

**Parameters** **name** : string

Name of SQL table.

**con** : sqlalchemy.engine.Engine or sqlite3.Connection

Using SQLAlchemy makes it possible to use any DB supported by that library.  
Legacy support is provided for sqlite3.Connection objects.

**schema** : string, optional

Specify the schema (if database flavor supports this). If None, use default schema.

**if\_exists** : { 'fail', 'replace', 'append' }, default 'fail'

How to behave if the table already exists.

- fail: Raise a ValueError.
- replace: Drop the table before inserting new values.
- append: Insert new values to the existing table.

**index** : boolean, default True

Write DataFrame index as a column. Uses *index\_label* as the column name in the table.

**index\_label** : string or sequence, default None

Column label for index column(s). If None is given (default) and *index* is True, then the index names are used. A sequence should be given if the DataFrame uses MultiIndex.

**chunksize** : int, optional

Rows will be written in batches of this size at a time. By default, all rows will be written at once.

**dtype** : dict, optional

Specifying the datatype for columns. The keys should be the column names and the values should be the SQLAlchemy types or strings for the sqlite3 legacy mode.

#### Raises **ValueError**

When the table already exists and *if\_exists* is 'fail' (the default).

See also:

`pandas.read_sql` read a DataFrame from a table

## References

[R28], [R29]

## Examples

Create an in-memory SQLite database.

```
>>> from sqlalchemy import create_engine
>>> engine = create_engine('sqlite://', echo=False)
```

Create a table from scratch with 3 rows.

```
>>> df = pd.DataFrame({'name' : ['User 1', 'User 2', 'User 3']})
>>> df
   name
0  User 1
1  User 2
2  User 3
```

```
>>> df.to_sql('users', con=engine)
>>> engine.execute("SELECT * FROM users").fetchall()
[(0, 'User 1'), (1, 'User 2'), (2, 'User 3')]
```

```
>>> df1 = pd.DataFrame({'name' : ['User 4', 'User 5']})
>>> df1.to_sql('users', con=engine, if_exists='append')
>>> engine.execute("SELECT * FROM users").fetchall()
[(0, 'User 1'), (1, 'User 2'), (2, 'User 3'),
 (0, 'User 4'), (1, 'User 5')]
```

Overwrite the table with just df1.

```
>>> df1.to_sql('users', con=engine, if_exists='replace',
...           index_label='id')
>>> engine.execute("SELECT * FROM users").fetchall()
[(0, 'User 4'), (1, 'User 5')]
```

Specify the dtype (especially useful for integers with missing values). Notice that while pandas is forced to store the data as floating point, the database supports nullable integers. When fetching the data with Python, we get back integer scalars.

```
>>> df = pd.DataFrame({"A": [1, None, 2]})
>>> df
   A
0  1.0
1  NaN
2  2.0
```

```
>>> from sqlalchemy.types import Integer
>>> df.to_sql('integers', con=engine, index=False,
...          dtype={"A": Integer()})
```

```
>>> engine.execute("SELECT * FROM integers").fetchall()
[(1,), (None,), (2,)]
```

### **pandas.Series.to\_string**

`Series.to_string(buf=None, na_rep='NaN', float_format=None, header=True, index=True, length=False, dtype=False, name=False, max_rows=None)`

Render a string representation of the Series

**Parameters** `buf` : StringIO-like, optional

buffer to write to

**na\_rep** : string, optional

string representation of NaN to use, default 'NaN'

**float\_format** : one-parameter function, optional

formatter function to apply to columns' elements if they are floats default None

**header: boolean, default True**

Add the Series header (index name)

**index** : bool, optional

Add index (row) labels, default True

**length** : boolean, default False

Add the Series length

**dtype** : boolean, default False

Add the Series dtype

**name** : boolean, default False

Add the Series name if not None

**max\_rows** : int, optional

Maximum number of rows to show before truncating. If None, show all.

**Returns**

**formatted** [string (if not buffer passed)]

**pandas.Series.to\_timestamp**`Series.to_timestamp(freq=None, how='start', copy=True)`Cast to DatetimeIndex of timestamps, at *beginning* of period**Parameters** `freq` : string, default frequency of PeriodIndex

Desired frequency

**how** : {'s', 'e', 'start', 'end'}

Convention for converting period to timestamp; start of period vs. end

**Returns**`ts` [Series with DatetimeIndex]**pandas.Series.to\_xarray**`Series.to_xarray()`

Return an xarray object from the pandas object.

**Returns****a DataArray for a Series****a Dataset for a DataFrame****a DataArray for higher dims****Notes**See the [xarray docs](#)**Examples**

```
>>> df = pd.DataFrame({'A' : [1, 1, 2],
                        'B' : ['foo', 'bar', 'foo'],
                        'C' : np.arange(4., 7)})

>>> df
   A  B  C
0  1  foo  4.0
1  1  bar  5.0
2  2  foo  6.0
```

```
>>> df.to_xarray()
<xarray.Dataset>
Dimensions:  (index: 3)
Coordinates:
  * index      (index) int64 0 1 2
Data variables:
  A            (index) int64 1 1 2
  B            (index) object 'foo' 'bar' 'foo'
  C            (index) float64 4.0 5.0 6.0
```

```
>>> df = pd.DataFrame({'A' : [1, 1, 2],
                        'B' : ['foo', 'bar', 'foo'],
                        'C' : np.arange(4.,7)}
                        ).set_index(['B','A'])

>>> df
```

	A	C
foo 1	1	4.0
bar 1	1	5.0
foo 2	2	6.0

```
>>> df.to_xarray()
<xarray.Dataset>
Dimensions:  (A: 2, B: 2)
Coordinates:
  * B        (B) object 'bar' 'foo'
  * A        (A) int64 1 2
Data variables:
  C          (B, A) float64 5.0 nan 4.0 6.0
```

```
>>> p = pd.Panel(np.arange(24).reshape(4,3,2),
                 items=list('ABCD'),
                 major_axis=pd.date_range('20130101', periods=3),
                 minor_axis=['first', 'second'])

>>> p
<class 'pandas.core.panel.Panel'>
Dimensions: 4 (items) x 3 (major_axis) x 2 (minor_axis)
Items axis: A to D
Major_axis axis: 2013-01-01 00:00:00 to 2013-01-03 00:00:00
Minor_axis axis: first to second
```

```
>>> p.to_xarray()
<xarray.DataArray (items: 4, major_axis: 3, minor_axis: 2)>
array([[[ 0,  1],
         [ 2,  3],
         [ 4,  5]],
       [[ 6,  7],
         [ 8,  9],
         [10, 11]],
       [[12, 13],
         [14, 15],
         [16, 17]],
       [[18, 19],
         [20, 21],
         [22, 23]]])
Coordinates:
  * items      (items) object 'A' 'B' 'C' 'D'
  * major_axis (major_axis) datetime64[ns] 2013-01-01 2013-01-02 2013-01-03
  # noqa
  * minor_axis (minor_axis) object 'first' 'second'
```

## pandas.Series.tolist

`Series.tolist()`

Return a list of the values.

These are each a scalar type, which is a Python scalar (for str, int, float) or a pandas scalar (for Timestamp/Timedelta/Interval/Period)

**See also:**

`numpy.ndarray.tolist`

## pandas.Series.transform

`Series.transform(func, *args, **kwargs)`

Call function producing a like-indexed NDFrame and return a NDFrame with the transformed values

New in version 0.20.0.

**Parameters** `func` : callable, string, dictionary, or list of string/callables

To apply to column

Accepted Combinations are:

- string function name
- function
- list of functions
- dict of column names -> functions (or list of functions)

**Returns**

**transformed** [NDFrame]

**See also:**

`pandas.NDFrame.aggregate`, `pandas.NDFrame.apply`

## Examples

```
>>> df = pd.DataFrame(np.random.randn(10, 3), columns=['A', 'B', 'C'],
...                    index=pd.date_range('1/1/2000', periods=10))
df.iloc[3:7] = np.nan
```

```
>>> df.transform(lambda x: (x - x.mean()) / x.std())
```

	A	B	C
2000-01-01	0.579457	1.236184	0.123424

2000-01-09	-0.540524	-1.012676	-0.828968
2000-01-10	-1.366388	-0.614710	0.005378

### pandas.Series.transpose

`Series.transpose(*args, **kwargs)`  
return the transpose, which is by definition self

### pandas.Series.truediv

`Series.truediv(other, level=None, fill_value=None, axis=0)`  
Floating division of series and other, element-wise (binary operator *truediv*).

Equivalent to `series / other`, but with support to substitute a `fill_value` for missing data in one of the inputs.

#### Parameters

**other** [Series or scalar value]

**fill\_value** : None or float value, default None (NaN)

Fill existing missing (NaN) values, and any new element needed for successful Series alignment, with this value before computation. If data in both corresponding Series locations is missing the result will be missing

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

#### Returns

**result** [Series]

#### See also:

[`Series.rtruediv`](#)

### Examples

```
>>> a = pd.Series([1, 1, 1, np.nan], index=['a', 'b', 'c', 'd'])
>>> a
a    1.0
b    1.0
c    1.0
d    NaN
dtype: float64
>>> b = pd.Series([1, np.nan, 1, np.nan], index=['a', 'b', 'd', 'e'])
>>> b
a    1.0
b    NaN
d    1.0
e    NaN
dtype: float64
>>> a.add(b, fill_value=0)
a    2.0
b    1.0
c    1.0
d    1.0
e    NaN
dtype: float64
```

**pandas.Series.truncate**

`Series.truncate` (*before=None, after=None, axis=None, copy=True*)

Truncate a Series or DataFrame before and after some index value.

This is a useful shorthand for boolean indexing based on index values above or below certain thresholds.

**Parameters** **before** : date, string, int

Truncate all rows before this index value.

**after** : date, string, int

Truncate all rows after this index value.

**axis** : {0 or 'index', 1 or 'columns'}, optional

Axis to truncate. Truncates the index (rows) by default.

**copy** : boolean, default is True,

Return a copy of the truncated section.

**Returns** **type of caller**

The truncated Series or DataFrame.

**See also:**

[`DataFrame.loc`](#) Select a subset of a DataFrame by label.

[`DataFrame.iloc`](#) Select a subset of a DataFrame by position.

**Notes**

If the index being truncated contains only datetime values, *before* and *after* may be specified as strings instead of Timestamps.

**Examples**

```
>>> df = pd.DataFrame({'A': ['a', 'b', 'c', 'd', 'e'],
...                    'B': ['f', 'g', 'h', 'i', 'j'],
...                    'C': ['k', 'l', 'm', 'n', 'o']},
...                    index=[1, 2, 3, 4, 5])
>>> df
   A  B  C
1  a  f  k
2  b  g  l
3  c  h  m
4  d  i  n
5  e  j  o
```

```
>>> df.truncate(before=2, after=4)
   A  B  C
2  b  g  l
3  c  h  m
4  d  i  n
```

The columns of a DataFrame can be truncated.

```
>>> df.truncate(before="A", after="B", axis="columns")
   A  B
1  a  f
2  b  g
3  c  h
4  d  i
5  e  j
```

For Series, only rows can be truncated.

```
>>> df['A'].truncate(before=2, after=4)
2    b
3    c
4    d
Name: A, dtype: object
```

The index values in `truncate` can be datetimes or string dates.

```
>>> dates = pd.date_range('2016-01-01', '2016-02-01', freq='s')
>>> df = pd.DataFrame(index=dates, data={'A': 1})
>>> df.tail()
                A
2016-01-31 23:59:56  1
2016-01-31 23:59:57  1
2016-01-31 23:59:58  1
2016-01-31 23:59:59  1
2016-02-01 00:00:00  1
```

```
>>> df.truncate(before=pd.Timestamp('2016-01-05'),
...             after=pd.Timestamp('2016-01-10')).tail()
                A
2016-01-09 23:59:56  1
2016-01-09 23:59:57  1
2016-01-09 23:59:58  1
2016-01-09 23:59:59  1
2016-01-10 00:00:00  1
```

Because the index is a `DatetimeIndex` containing only dates, we can specify *before* and *after* as strings. They will be coerced to `Timestamps` before truncation.

```
>>> df.truncate('2016-01-05', '2016-01-10').tail()
                A
2016-01-09 23:59:56  1
2016-01-09 23:59:57  1
2016-01-09 23:59:58  1
2016-01-09 23:59:59  1
2016-01-10 00:00:00  1
```

Note that `truncate` assumes a 0 value for any unspecified time component (midnight). This differs from partial string slicing, which returns any partially matching dates.

```
>>> df.loc['2016-01-05':'2016-01-10', :].tail()
                A
2016-01-10 23:59:55  1
2016-01-10 23:59:56  1
2016-01-10 23:59:57  1
```

(continues on next page)

(continued from previous page)

```
2016-01-10 23:59:58 1
2016-01-10 23:59:59 1
```

**pandas.Series.tshift****Series.tshift** (*periods=1, freq=None, axis=0*)

Shift the time index, using the index's frequency if available.

**Parameters** **periods** : int

Number of periods to move, can be positive or negative

**freq** : DateOffset, timedelta, or time rule string, default None

Increment to use from the tseries module or time rule (e.g. 'EOM')

**axis** : int or basestring

Corresponds to the axis that contains the Index

**Returns****shifted** [NDFrame]**Notes**

If freq is not specified then tries to use the freq or inferred\_freq attributes of the index. If neither of those attributes exist, a ValueError is thrown

**pandas.Series.tz\_convert****Series.tz\_convert** (*tz, axis=0, level=None, copy=True*)

Convert tz-aware axis to target time zone.

**Parameters****tz** [string or pytz.timezone object]**axis** [the axis to convert]**level** : int, str, default None

If axis is a MultiIndex, convert a specific level. Otherwise must be None

**copy** : boolean, default True

Also make a copy of the underlying data

**Raises** **TypeError**

If the axis is tz-naive.

**pandas.Series.tz\_localize****Series.tz\_localize** (*tz, axis=0, level=None, copy=True, ambiguous='raise'*)

Localize tz-naive TimeSeries to target time zone.

**Parameters**

**tz** [string or pytz.timezone object]

**axis** [the axis to localize]

**level** : int, str, default None

If axis is a MultiIndex, localize a specific level. Otherwise must be None

**copy** : boolean, default True

Also make a copy of the underlying data

**ambiguous** : 'infer', bool-ndarray, 'NaT', default 'raise'

- 'infer' will attempt to infer fall dst-transition hours based on order
- bool-ndarray where True signifies a DST time, False designates a non-DST time (note that this flag is only applicable for ambiguous times)
- 'NaT' will return NaT where there are ambiguous times
- 'raise' will raise an AmbiguousTimeError if there are ambiguous times

**Raises TypeError**

If the TimeSeries is tz-aware and tz is not None.

**pandas.Series.unique**

`Series.unique()`

Return unique values of Series object.

Uniques are returned in order of appearance. Hash table-based unique, therefore does NOT sort.

**Returns ndarray or Categorical**

The unique values returned as a NumPy array. In case of categorical data type, returned as a Categorical.

**See also:**

[`pandas.unique`](#) top-level unique method for any 1-d array-like object.

[`Index.unique`](#) return Index with unique values from an Index object.

**Examples**

```
>>> pd.Series([2, 1, 3, 3], name='A').unique()
array([2, 1, 3])
```

```
>>> pd.Series([pd.Timestamp('2016-01-01') for _ in range(3)]).unique()
array(['2016-01-01T00:00:00.000000000'], dtype='datetime64[ns]')
```

```
>>> pd.Series([pd.Timestamp('2016-01-01', tz='US/Eastern')
...           for _ in range(3)]).unique()
array([Timestamp('2016-01-01 00:00:00-0500', tz='US/Eastern')],
      dtype=object)
```

An unordered Categorical will return categories in the order of appearance.

```
>>> pd.Series(pd.Categorical(list('baabc'))).unique()
[b, a, c]
Categories (3, object): [b, a, c]
```

An ordered Categorical preserves the category ordering.

```
>>> pd.Series(pd.Categorical(list('baabc'), categories=list('abc'),
...                           ordered=True)).unique()
[b, a, c]
Categories (3, object): [a < b < c]
```

## pandas.Series.unstack

`Series.unstack (level=-1, fill_value=None)`

Unstack, a.k.a. pivot, Series with MultiIndex to produce DataFrame. The level involved will automatically get sorted.

**Parameters** `level` : int, string, or list of these, default last level

Level(s) to unstack, can pass level name

`fill_value` : replace NaN with this value if the unstack produces missing values

New in version 0.18.0.

**Returns**

`unstacked` [DataFrame]

## Examples

```
>>> s = pd.Series([1, 2, 3, 4],
...               index=pd.MultiIndex.from_product([['one', 'two'], ['a', 'b']]))
>>> s
one  a    1
     b    2
two  a    3
     b    4
dtype: int64
```

```
>>> s.unstack(level=-1)
     a  b
one  1  2
two  3  4
```

```
>>> s.unstack(level=0)
     one  two
a      1    3
b      2    4
```

## pandas.Series.update

`Series.update(other)`

Modify Series in place using non-NA values from passed Series. Aligns on index

### Parameters

**other** [Series]

### Examples

```
>>> s = pd.Series([1, 2, 3])
>>> s.update(pd.Series([4, 5, 6]))
>>> s
0    4
1    5
2    6
dtype: int64
```

```
>>> s = pd.Series(['a', 'b', 'c'])
>>> s.update(pd.Series(['d', 'e'], index=[0, 2]))
>>> s
0    d
1    b
2    e
dtype: object
```

```
>>> s = pd.Series([1, 2, 3])
>>> s.update(pd.Series([4, 5, 6, 7, 8]))
>>> s
0    4
1    5
2    6
dtype: int64
```

If other contains NaNs the corresponding values are not updated in the original Series.

```
>>> s = pd.Series([1, 2, 3])
>>> s.update(pd.Series([4, np.nan, 6]))
>>> s
0    4
1    2
2    6
dtype: int64
```

## pandas.Series.valid

`Series.valid(inplace=False, **kwargs)`

Return Series without null values.

Deprecated since version 0.23.0: Use `Series.dropna()` instead.

**pandas.Series.value\_counts**

`Series.value_counts` (*normalize=False, sort=True, ascending=False, bins=None, dropna=True*)

Returns object containing counts of unique values.

The resulting object will be in descending order so that the first element is the most frequently-occurring element. Excludes NA values by default.

**Parameters** **normalize** : boolean, default False

If True then the object returned will contain the relative frequencies of the unique values.

**sort** : boolean, default True

Sort by values

**ascending** : boolean, default False

Sort in ascending order

**bins** : integer, optional

Rather than count values, group them into half-open bins, a convenience for `pd.cut`, only works with numeric data

**dropna** : boolean, default True

Don't include counts of NaN.

**Returns**

**counts** [Series]

**pandas.Series.var**

`Series.var` (*axis=None, skipna=None, level=None, ddof=1, numeric\_only=None, \*\*kwargs*)

Return unbiased variance over requested axis.

Normalized by N-1 by default. This can be changed using the `ddof` argument

**Parameters**

**axis** [{index (0)}]

**skipna** : boolean, default True

Exclude NA/null values. If an entire row/column is NA, the result will be NA

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a scalar

**ddof** : int, default 1

Delta Degrees of Freedom. The divisor used in calculations is  $N - \text{ddof}$ , where  $N$  represents the number of elements.

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

**Returns**

**var** [scalar or Series (if level specified)]

**pandas.Series.view**

`Series.view` (*dtype=None*)

Create a new view of the Series.

This function will return a new Series with a view of the same underlying values in memory, optionally reinterpreted with a new data type. The new data type must preserve the same size in bytes as to not cause index misalignment.

**Parameters** **dtype** : data type

Data type object or one of their string representations.

**Returns** **Series**

A new Series object as a view of the same data in memory.

**See also:**

**numpy.ndarray.view** Equivalent numpy function to create a new view of the same data in memory.

**Notes**

Series are instantiated with `dtype=float64` by default. While `numpy.ndarray.view()` will return a view with the same data type as the original array, `Series.view()` (without specified `dtype`) will try using `float64` and may fail if the original data type size in bytes is not the same.

**Examples**

```
>>> s = pd.Series([-2, -1, 0, 1, 2], dtype='int8')
>>> s
0    -2
1    -1
2     0
3     1
4     2
dtype: int8
```

The 8 bit signed integer representation of `-1` is `0b11111111`, but the same bytes represent 255 if read as an 8 bit unsigned integer:

```
>>> us = s.view('uint8')
>>> us
0    254
1    255
2     0
3     1
4     2
dtype: uint8
```

The views share the same underlying values:

```

>>> us[0] = 128
>>> s
0    -128
1      -1
2       0
3       1
4       2
dtype: int8

```

### pandas.Series.where

`Series.where(cond, other=nan, inplace=False, axis=None, level=None, errors='raise', try_cast=False, raise_on_error=None)`

Return an object of same shape as self and whose corresponding entries are from self where *cond* is True and otherwise are from *other*.

**Parameters** *cond* : boolean NDFrame, array-like, or callable

Where *cond* is True, keep the original value. Where False, replace with corresponding value from *other*. If *cond* is callable, it is computed on the NDFrame and should return boolean NDFrame or array. The callable must not change input NDFrame (though pandas doesn't check it).

New in version 0.18.1: A callable can be used as *cond*.

**other** : scalar, NDFrame, or callable

Entries where *cond* is False are replaced with corresponding value from *other*. If *other* is callable, it is computed on the NDFrame and should return scalar or NDFrame. The callable must not change input NDFrame (though pandas doesn't check it).

New in version 0.18.1: A callable can be used as *other*.

**inplace** : boolean, default False

Whether to perform the operation in place on the data

**axis** [alignment axis if needed, default None]

**level** [alignment level if needed, default None]

**errors** : str, {'raise', 'ignore'}, default 'raise'

- *raise* : allow exceptions to be raised
- *ignore* : suppress exceptions. On error return original object

Note that currently this parameter won't affect the results and will always coerce to a suitable dtype.

**try\_cast** : boolean, default False

try to cast the result back to the input type (if possible),

**raise\_on\_error** : boolean, default True

Whether to raise on invalid data types (e.g. trying to where on strings)

Deprecated since version 0.21.0.

### Returns

**wh** [same type as caller]

**See also:**

`DataFrame.mask()`

## Notes

The `where` method is an application of the if-then idiom. For each element in the calling `DataFrame`, if `cond` is `True` the element is used; otherwise the corresponding element from the `DataFrame` `other` is used.

The signature for `DataFrame.where()` differs from `numpy.where()`. Roughly `df1.where(m, df2)` is equivalent to `np.where(m, df1, df2)`.

For further details and examples see the `where` documentation in [indexing](#).

## Examples

```
>>> s = pd.Series(range(5))
>>> s.where(s > 0)
0    NaN
1     1.0
2     2.0
3     3.0
4     4.0
```

```
>>> s.mask(s > 0)
0     0.0
1     NaN
2     NaN
3     NaN
4     NaN
```

```
>>> s.where(s > 1, 10)
0    10.0
1    10.0
2     2.0
3     3.0
4     4.0
```

```
>>> df = pd.DataFrame(np.arange(10).reshape(-1, 2), columns=['A', 'B'])
>>> m = df % 3 == 0
>>> df.where(m, -df)
   A  B
0  0 -1
1 -2  3
2 -4 -5
3  6 -7
4 -8  9
>>> df.where(m, -df) == np.where(m, df, -df)
   A      B
0  True  True
1  True  True
2  True  True
```

(continues on next page)

(continued from previous page)

```

3  True  True
4  True  True
>>> df.where(m, -df) == df.mask(~m, -df)
      A      B
0  True  True
1  True  True
2  True  True
3  True  True
4  True  True

```

**pandas.Series.xs****Series.xs** (*key*, *axis=0*, *level=None*, *drop\_level=True*)

Returns a cross-section (row(s) or column(s)) from the Series/DataFrame. Defaults to cross-section on the rows (*axis=0*).

**Parameters** **key** : object

Some label contained in the index, or partially in a MultiIndex

**axis** : int, default 0

Axis to retrieve cross-section on

**level** : object, defaults to first *n* levels (*n=1* or *len(key)*)

In case of a key partially contained in a MultiIndex, indicate which levels are used. Levels can be referred by label or position.

**drop\_level** : boolean, default True

If False, returns object with same levels as self.

**Returns****xs** [Series or DataFrame]**Notes**

*xs* is only for getting, not setting values.

MultiIndex Slicers is a generic way to get/set values on any level or levels. It is a superset of *xs* functionality, see [MultiIndex Slicers](#)

**Examples**

```

>>> df
      A  B  C
a  4  5  2
b  4  0  9
c  9  7  3
>>> df.xs('a')
A    4
B    5
C    2

```

(continues on next page)

(continued from previous page)

```
Name: a
>>> df.xs('C', axis=1)
a      2
b      9
c      3
Name: C
```

```
>>> df
      first second third      A  B  C  D
bar    one     1      4  1  8  9
      two     1      7  5  5  0
baz    one     1      6  6  8  0
      three    2      5  3  5  3
>>> df.xs(('baz', 'three'))
      A  B  C  D
third
2      5  3  5  3
>>> df.xs('one', level=1)
      A  B  C  D
first third
bar    1      4  1  8  9
baz    1      6  6  8  0
>>> df.xs(('baz', 2), level=[0, 'third'])
      A  B  C  D
second
three    5  3  5  3
```

### 34.3.2 Attributes

#### Axes

<code>Series.index</code>	The index (axis labels) of the Series.
<code>Series.values</code>	Return Series as ndarray or ndarray-like depending on the dtype
<code>Series.dtype</code>	return the dtype object of the underlying data
<code>Series.ftype</code>	return if the data is sparsedense
<code>Series.shape</code>	return a tuple of the shape of the underlying data
<code>Series.nbytes</code>	return the number of bytes in the underlying data
<code>Series.ndim</code>	return the number of dimensions of the underlying data, by definition 1
<code>Series.size</code>	return the number of elements in the underlying data
<code>Series.strides</code>	return the strides of the underlying data
<code>Series.itemsize</code>	return the size of the dtype of the item of the underlying data
<code>Series.base</code>	return the base object if the memory of the underlying data is shared
<code>Series.T</code>	return the transpose, which is by definition self
<code>Series.memory_usage([index, deep])</code>	Return the memory usage of the Series.
<code>Series.hasnans</code>	return if I have any nans; enables various perf speedups

Continued on next page

Table 27 – continued from previous page

<code>Series.flags</code>	
<code>Series.empty</code>	
<code>Series.dtypes</code>	return the dtype object of the underlying data
<code>Series.ftypes</code>	return if the data is sparsedense
<code>Series.data</code>	return the data pointer of the underlying data
<code>Series.is_copy</code>	
<code>Series.name</code>	
<code>Series.put(*args, **kwargs)</code>	Applies the <i>put</i> method to its <i>values</i> attribute if it has one.

### 34.3.2.1 pandas.Series.empty

`Series.empty`

### 34.3.2.2 pandas.Series.is\_copy

`Series.is_copy`

### 34.3.2.3 pandas.Series.name

`Series.name`

## 34.3.3 Conversion

<code>Series.astype(dtype[, copy, errors])</code>	Cast a pandas object to a specified dtype <i>dtype</i> .
<code>Series.infer_objects()</code>	Attempt to infer better dtypes for object columns.
<code>Series.convert_objects([convert_dates, ...])</code>	(DEPRECATED) Attempt to infer better dtype for object columns.
<code>Series.copy([deep])</code>	Make a copy of this object's indices and data.
<code>Series.bool()</code>	Return the bool of a single element PandasObject.
<code>Series.to_period([freq, copy])</code>	Convert Series from DatetimeIndex to PeriodIndex with desired frequency (inferred from index if not passed)
<code>Series.to_timestamp([freq, how, copy])</code>	Cast to datetimelindex of timestamps, at <i>beginning</i> of period
<code>Series.tolist()</code>	Return a list of the values.
<code>Series.get_values()</code>	same as values (but handles sparseness conversions); is a view

## 34.3.4 Indexing, iteration

<code>Series.get(key[, default])</code>	Get item from object for given key (DataFrame column, Panel slice, etc.).
<code>Series.at</code>	Access a single value for a row/column label pair.
<code>Series.iat</code>	Access a single value for a row/column pair by integer position.

Continued on next page

Table 29 – continued from previous page

<code>Series.loc</code>	Access a group of rows and columns by label(s) or a boolean array.
<code>Series.iloc</code>	Purely integer-location based indexing for selection by position.
<code>Series.__iter__()</code>	Return an iterator of the values.
<code>Series.iteritems()</code>	Lazily iterate over (index, value) tuples
<code>Series.items()</code>	Lazily iterate over (index, value) tuples
<code>Series.keys()</code>	Alias for index
<code>Series.pop(item)</code>	Return item and drop from frame.
<code>Series.item()</code>	return the first element of the underlying data as a python scalar
<code>Series.xs(key[, axis, level, drop_level])</code>	Returns a cross-section (row(s) or column(s)) from the Series/DataFrame.

#### 34.3.4.1 pandas.Series.\_\_iter\_\_

`Series.__iter__()`

Return an iterator of the values.

These are each a scalar type, which is a Python scalar (for str, int, float) or a pandas scalar (for Timestamp/Timedelta/Interval/Period)

For more information on `.at`, `.iat`, `.loc`, and `.iloc`, see the [indexing documentation](#).

### 34.3.5 Binary operator functions

<code>Series.add(other[, level, fill_value, axis])</code>	Addition of series and other, element-wise (binary operator <i>add</i> ).
<code>Series.sub(other[, level, fill_value, axis])</code>	Subtraction of series and other, element-wise (binary operator <i>sub</i> ).
<code>Series.mul(other[, level, fill_value, axis])</code>	Multiplication of series and other, element-wise (binary operator <i>mul</i> ).
<code>Series.div(other[, level, fill_value, axis])</code>	Floating division of series and other, element-wise (binary operator <i>truediv</i> ).
<code>Series.truediv(other[, level, fill_value, axis])</code>	Floating division of series and other, element-wise (binary operator <i>truediv</i> ).
<code>Series.floordiv(other[, level, fill_value, axis])</code>	Integer division of series and other, element-wise (binary operator <i>floordiv</i> ).
<code>Series.mod(other[, level, fill_value, axis])</code>	Modulo of series and other, element-wise (binary operator <i>mod</i> ).
<code>Series.pow(other[, level, fill_value, axis])</code>	Exponential power of series and other, element-wise (binary operator <i>pow</i> ).
<code>Series.radd(other[, level, fill_value, axis])</code>	Addition of series and other, element-wise (binary operator <i>radd</i> ).
<code>Series.rsub(other[, level, fill_value, axis])</code>	Subtraction of series and other, element-wise (binary operator <i>rsub</i> ).
<code>Series.rmul(other[, level, fill_value, axis])</code>	Multiplication of series and other, element-wise (binary operator <i>rmul</i> ).
<code>Series.rdiv(other[, level, fill_value, axis])</code>	Floating division of series and other, element-wise (binary operator <i>rtruediv</i> ).

Continued on next page

Table 30 – continued from previous page

<code>Series.rtruediv</code> (other[, level, fill_value, axis])	Floating division of series and other, element-wise (binary operator <i>rtruediv</i> ).
<code>Series.rfloordiv</code> (other[, level, fill_value, ...])	Integer division of series and other, element-wise (binary operator <i>rfloordiv</i> ).
<code>Series.rmod</code> (other[, level, fill_value, axis])	Modulo of series and other, element-wise (binary operator <i>rmod</i> ).
<code>Series.rpow</code> (other[, level, fill_value, axis])	Exponential power of series and other, element-wise (binary operator <i>rpow</i> ).
<code>Series.combine</code> (other, func[, fill_value])	Perform elementwise binary operation on two Series using given function with optional fill value when an index is missing from one Series or the other
<code>Series.combine_first</code> (other)	Combine Series values, choosing the calling Series's values first.
<code>Series.round</code> ([decimals])	Round each value in a Series to the given number of decimals.
<code>Series.lt</code> (other[, level, fill_value, axis])	Less than of series and other, element-wise (binary operator <i>lt</i> ).
<code>Series.gt</code> (other[, level, fill_value, axis])	Greater than of series and other, element-wise (binary operator <i>gt</i> ).
<code>Series.le</code> (other[, level, fill_value, axis])	Less than or equal to of series and other, element-wise (binary operator <i>le</i> ).
<code>Series.ge</code> (other[, level, fill_value, axis])	Greater than or equal to of series and other, element-wise (binary operator <i>ge</i> ).
<code>Series.ne</code> (other[, level, fill_value, axis])	Not equal to of series and other, element-wise (binary operator <i>ne</i> ).
<code>Series.eq</code> (other[, level, fill_value, axis])	Equal to of series and other, element-wise (binary operator <i>eq</i> ).
<code>Series.product</code> ([axis, skipna, level, ...])	Return the product of the values for the requested axis
<code>Series.dot</code> (other)	Matrix multiplication with DataFrame or inner-product with Series objects.

### 34.3.6 Function application, GroupBy & Window

<code>Series.apply</code> (func[, convert_dtype, args])	Invoke function on values of Series.
<code>Series.agg</code> (func[, axis])	Aggregate using one or more operations over the specified axis.
<code>Series.aggregate</code> (func[, axis])	Aggregate using one or more operations over the specified axis.
<code>Series.transform</code> (func, *args, **kwargs)	Call function producing a like-indexed NDFrame and return a NDFrame with the transformed values
<code>Series.map</code> (arg[, na_action])	Map values of Series using input correspondence (a dict, Series, or function).
<code>Series.groupby</code> ([by, axis, level, as_index, ...])	Group series using mapper (dict or key function, apply given function to group, return result as series) or by a series of columns.
<code>Series.rolling</code> (window[, min_periods, ...])	Provides rolling window calculations.
<code>Series.expanding</code> ([min_periods, center, axis])	Provides expanding transformations.
<code>Series.ewm</code> ([com, span, halflife, alpha, ...])	Provides exponential weighted functions
<code>Series.pipe</code> (func, *args, **kwargs)	Apply func(self, *args, **kwargs)

### 34.3.7 Computations / Descriptive Stats

<code>Series.abs()</code>	Return a Series/DataFrame with absolute numeric value of each element.
<code>Series.all([axis, bool_only, skipna, level])</code>	Return whether all elements are True, potentially over an axis.
<code>Series.any([axis, bool_only, skipna, level])</code>	Return whether any element is True over requested axis.
<code>Series.autocorr([lag])</code>	Lag-N autocorrelation
<code>Series.between(left, right[, inclusive])</code>	Return boolean Series equivalent to <code>left &lt;= series &lt;= right</code> .
<code>Series.clip([lower, upper, axis, inplace])</code>	Trim values at input threshold(s).
<code>Series.clip_lower(threshold[, axis, inplace])</code>	Return copy of the input with values below a threshold truncated.
<code>Series.clip_upper(threshold[, axis, inplace])</code>	Return copy of input with values above given value(s) truncated.
<code>Series.corr(other[, method, min_periods])</code>	Compute correlation with <i>other</i> Series, excluding missing values
<code>Series.count([level])</code>	Return number of non-NA/null observations in the Series
<code>Series.cov(other[, min_periods])</code>	Compute covariance with Series, excluding missing values
<code>Series.cummax([axis, skipna])</code>	Return cumulative maximum over a DataFrame or Series axis.
<code>Series.cummin([axis, skipna])</code>	Return cumulative minimum over a DataFrame or Series axis.
<code>Series.cumprod([axis, skipna])</code>	Return cumulative product over a DataFrame or Series axis.
<code>Series.cumsum([axis, skipna])</code>	Return cumulative sum over a DataFrame or Series axis.
<code>Series.describe([percentiles, include, exclude])</code>	Generates descriptive statistics that summarize the central tendency, dispersion and shape of a dataset's distribution, excluding NaN values.
<code>Series.diff([periods])</code>	First discrete difference of element.
<code>Series.factorize([sort, na_sentinel])</code>	Encode the object as an enumerated type or categorical variable.
<code>Series.kurt([axis, skipna, level, numeric_only])</code>	Return unbiased kurtosis over requested axis using Fisher's definition of kurtosis (kurtosis of normal == 0.0).
<code>Series.mad([axis, skipna, level])</code>	Return the mean absolute deviation of the values for the requested axis
<code>Series.max([axis, skipna, level, numeric_only])</code>	This method returns the maximum of the values in the object.
<code>Series.mean([axis, skipna, level, numeric_only])</code>	Return the mean of the values for the requested axis
<code>Series.median([axis, skipna, level, ...])</code>	Return the median of the values for the requested axis
<code>Series.min([axis, skipna, level, numeric_only])</code>	This method returns the minimum of the values in the object.
<code>Series.mode()</code>	Return the mode(s) of the dataset.
<code>Series.nlargest([n, keep])</code>	Return the largest <i>n</i> elements.
<code>Series.nsmallest([n, keep])</code>	Return the smallest <i>n</i> elements.
<code>Series.pct_change([periods, fill_method, ...])</code>	Percentage change between the current and a prior element.
<code>Series.prod([axis, skipna, level, ...])</code>	Return the product of the values for the requested axis

Continued on next page

Table 32 – continued from previous page

<code>Series.quantile([q, interpolation])</code>	Return value at the given quantile, a la <code>numpy.percentile</code> .
<code>Series.rank([axis, method, numeric_only, ...])</code>	Compute numerical data ranks (1 through n) along axis.
<code>Series.sem([axis, skipna, level, ddof, ...])</code>	Return unbiased standard error of the mean over requested axis.
<code>Series.skew([axis, skipna, level, numeric_only])</code>	Return unbiased skew over requested axis Normalized by N-1
<code>Series.std([axis, skipna, level, ddof, ...])</code>	Return sample standard deviation over requested axis.
<code>Series.sum([axis, skipna, level, ...])</code>	Return the sum of the values for the requested axis
<code>Series.var([axis, skipna, level, ddof, ...])</code>	Return unbiased variance over requested axis.
<code>Series.kurtosis([axis, skipna, level, ...])</code>	Return unbiased kurtosis over requested axis using Fisher's definition of kurtosis (kurtosis of normal == 0.0).
<code>Series.unique()</code>	Return unique values of Series object.
<code>Series.nunique([dropna])</code>	Return number of unique elements in the object.
<code>Series.is_unique</code>	Return boolean if values in the object are unique
<code>Series.is_monotonic</code>	Return boolean if values in the object are monotonic_increasing
<code>Series.is_monotonic_increasing</code>	Return boolean if values in the object are monotonic_increasing
<code>Series.is_monotonic_decreasing</code>	Return boolean if values in the object are monotonic_decreasing
<code>Series.value_counts([normalize, sort, ...])</code>	Returns object containing counts of unique values.
<code>Series.compound([axis, skipna, level])</code>	Return the compound percentage of the values for the requested axis
<code>Series.nonzero()</code>	Return the <i>integer</i> indices of the elements that are non-zero
<code>Series.ptp([axis, skipna, level, numeric_only])</code>	Returns the difference between the maximum value and the minimum value in the object.

### 34.3.8 Reindexing / Selection / Label manipulation

<code>Series.align(other[, join, axis, level, ...])</code>	Align two objects on their axes with the specified join method for each axis Index
<code>Series.drop([labels, axis, index, columns, ...])</code>	Return Series with specified index labels removed.
<code>Series.drop_duplicates([keep, inplace])</code>	Return Series with duplicate values removed.
<code>Series.duplicated([keep])</code>	Indicate duplicate Series values.
<code>Series.equals(other)</code>	Determines if two NDFrame objects contain the same elements.
<code>Series.first(offset)</code>	Convenience method for subsetting initial periods of time series data based on a date offset.
<code>Series.head([n])</code>	Return the first <i>n</i> rows.
<code>Series.idxmax([axis, skipna])</code>	Return the row label of the maximum value.
<code>Series.idxmin([axis, skipna])</code>	Return the row label of the minimum value.
<code>Series.isin(values)</code>	Check whether <i>values</i> are contained in Series.
<code>Series.last(offset)</code>	Convenience method for subsetting final periods of time series data based on a date offset.
<code>Series.reindex([index])</code>	Conform Series to new index with optional filling logic, placing NA/NaN in locations having no value in the previous index.

Continued on next page

Table 33 – continued from previous page

<code>Series.reindex_like(other[, method, copy, ...])</code>	Return an object with matching indices to myself.
<code>Series.rename([index])</code>	Alter Series index labels or name
<code>Series.rename_axis(mapper[, axis, copy, inplace])</code>	Alter the name of the index or columns.
<code>Series.reset_index([level, drop, name, inplace])</code>	Generate a new DataFrame or Series with the index reset.
<code>Series.sample([n, frac, replace, weights, ...])</code>	Return a random sample of items from an axis of object.
<code>Series.select(crit[, axis])</code>	(DEPRECATED) Return data corresponding to axis labels matching criteria
<code>Series.set_axis(labels[, axis, inplace])</code>	Assign desired index to given axis.
<code>Series.take(indices[, axis, convert, is_copy])</code>	Return the elements in the given <i>positional</i> indices along an axis.
<code>Series.tail([n])</code>	Return the last <i>n</i> rows.
<code>Series.truncate([before, after, axis, copy])</code>	Truncate a Series or DataFrame before and after some index value.
<code>Series.where(cond[, other, inplace, axis, ...])</code>	Return an object of same shape as self and whose corresponding entries are from self where <i>cond</i> is True and otherwise are from <i>other</i> .
<code>Series.mask(cond[, other, inplace, axis, ...])</code>	Return an object of same shape as self and whose corresponding entries are from self where <i>cond</i> is False and otherwise are from <i>other</i> .
<code>Series.add_prefix(prefix)</code>	Prefix labels with string <i>prefix</i> .
<code>Series.add_suffix(suffix)</code>	Suffix labels with string <i>suffix</i> .
<code>Series.filter([items, like, regex, axis])</code>	Subset rows or columns of dataframe according to labels in the specified index.

### 34.3.9 Missing data handling

<code>Series.isna()</code>	Detect missing values.
<code>Series.notna()</code>	Detect existing (non-missing) values.
<code>Series.dropna([axis, inplace])</code>	Return a new Series with missing values removed.
<code>Series.fillna([value, method, axis, ...])</code>	Fill NA/NaN values using the specified method
<code>Series.interpolate([method, axis, limit, ...])</code>	Interpolate values according to different methods.

### 34.3.10 Reshaping, sorting

<code>Series.argsort([axis, kind, order])</code>	Overrides ndarray.argsort.
<code>Series.argmin([axis, skipna])</code>	(DEPRECATED) ..
<code>Series.argmax([axis, skipna])</code>	(DEPRECATED) ..
<code>Series.reorder_levels(order)</code>	Rearrange index levels using input order.
<code>Series.sort_values([axis, ascending, ...])</code>	Sort by the values.
<code>Series.sort_index([axis, level, ascending, ...])</code>	Sort Series by index labels.
<code>Series.swaplevel([i, j, copy])</code>	Swap levels <i>i</i> and <i>j</i> in a MultiIndex
<code>Series.unstack([level, fill_value])</code>	Unstack, a.k.a.
<code>Series.searchsorted(value[, side, sorter])</code>	Find indices where elements should be inserted to maintain order.
<code>Series.ravel([order])</code>	Return the flattened underlying data as an ndarray
<code>Series.repeat(repeats, *args, **kwargs)</code>	Repeat elements of an Series.
<code>Series.squeeze([axis])</code>	Squeeze length 1 dimensions.

Continued on next page

Table 35 – continued from previous page

<code>Series.view([dtype])</code>	Create a new view of the Series.
<code>Series.sortlevel([level, ascending, ...])</code>	(DEPRECATED) Sort Series with MultiIndex by chosen level.

### 34.3.11 Combining / joining / merging

<code>Series.append(to_append[, ignore_index, ...])</code>	Concatenate two or more Series.
<code>Series.replace([to_replace, value, inplace, ...])</code>	Replace values given in <i>to_replace</i> with <i>value</i> .
<code>Series.update(other)</code>	Modify Series in place using non-NA values from passed Series.

### 34.3.12 Time series-related

<code>Series.asfreq(freq[, method, how, ...])</code>	Convert TimeSeries to specified frequency.
<code>Series.asof(where[, subset])</code>	The last row without any NaN is taken (or the last row without NaN considering only the subset of columns in the case of a DataFrame)
<code>Series.shift([periods, freq, axis])</code>	Shift index by desired number of periods with an optional time freq
<code>Series.first_valid_index()</code>	Return index for first non-NA/null value.
<code>Series.last_valid_index()</code>	Return index for last non-NA/null value.
<code>Series.resample(rule[, how, axis, ...])</code>	Convenience method for frequency conversion and re-sampling of time series.
<code>Series.tz_convert(tz[, axis, level, copy])</code>	Convert tz-aware axis to target time zone.
<code>Series.tz_localize(tz[, axis, level, copy, ...])</code>	Localize tz-naive TimeSeries to target time zone.
<code>Series.at_time(time[, asof])</code>	Select values at particular time of day (e.g.
<code>Series.between_time(start_time, end_time[, ...])</code>	Select values between particular times of the day (e.g., 9:00-9:30 AM).
<code>Series.tshift([periods, freq, axis])</code>	Shift the time index, using the index's frequency if available.
<code>Series.slice_shift([periods, axis])</code>	Equivalent to <i>shift</i> without copying data.

### 34.3.13 Datetimelike Properties

`Series.dt` can be used to access the values of the series as datetimelike and return several properties. These can be accessed like `Series.dt.<property>`.

#### Datetime Properties

<code>Series.dt.date</code>	Returns numpy array of python datetime.date objects (namely, the date part of Timestamps without timezone information).
<code>Series.dt.time</code>	Returns numpy array of datetime.time.
<code>Series.dt.year</code>	The year of the datetime
<code>Series.dt.month</code>	The month as January=1, December=12
<code>Series.dt.day</code>	The days of the datetime
<code>Series.dt.hour</code>	The hours of the datetime
<code>Series.dt.minute</code>	The minutes of the datetime
<code>Series.dt.second</code>	The seconds of the datetime

Continued on next page

Table 38 – continued from previous page

<code>Series.dt.microsecond</code>	The microseconds of the datetime
<code>Series.dt.nanosecond</code>	The nanoseconds of the datetime
<code>Series.dt.week</code>	The week ordinal of the year
<code>Series.dt.weekofyear</code>	The week ordinal of the year
<code>Series.dt.dayofweek</code>	The day of the week with Monday=0, Sunday=6
<code>Series.dt.weekday</code>	The day of the week with Monday=0, Sunday=6
<code>Series.dt.dayofyear</code>	The ordinal day of the year
<code>Series.dt.quarter</code>	The quarter of the date
<code>Series.dt.is_month_start</code>	Logical indicating if first day of month (defined by frequency)
<code>Series.dt.is_month_end</code>	Indicator for whether the date is the last day of the month.
<code>Series.dt.is_quarter_start</code>	Indicator for whether the date is the first day of a quarter.
<code>Series.dt.is_quarter_end</code>	Indicator for whether the date is the last day of a quarter.
<code>Series.dt.is_year_start</code>	Indicate whether the date is the first day of a year.
<code>Series.dt.is_year_end</code>	Indicate whether the date is the last day of the year.
<code>Series.dt.is_leap_year</code>	Boolean indicator if the date belongs to a leap year.
<code>Series.dt.daysinmonth</code>	The number of days in the month
<code>Series.dt.days_in_month</code>	The number of days in the month
<code>Series.dt.tz</code>	
<code>Series.dt.freq</code>	

### 34.3.13.1 pandas.Series.dt.date

`Series.dt.date`

Returns numpy array of python datetime.date objects (namely, the date part of Timestamps without timezone information).

### 34.3.13.2 pandas.Series.dt.time

`Series.dt.time`

Returns numpy array of datetime.time. The time part of the Timestamps.

### 34.3.13.3 pandas.Series.dt.year

`Series.dt.year`

The year of the datetime

### 34.3.13.4 pandas.Series.dt.month

`Series.dt.month`

The month as January=1, December=12

### 34.3.13.5 pandas.Series.dt.day

`Series.dt.day`

The days of the datetime

#### 34.3.13.6 pandas.Series.dt.hour

`Series.dt.hour`

The hours of the datetime

#### 34.3.13.7 pandas.Series.dt.minute

`Series.dt.minute`

The minutes of the datetime

#### 34.3.13.8 pandas.Series.dt.second

`Series.dt.second`

The seconds of the datetime

#### 34.3.13.9 pandas.Series.dt.microsecond

`Series.dt.microsecond`

The microseconds of the datetime

#### 34.3.13.10 pandas.Series.dt.nanosecond

`Series.dt.nanosecond`

The nanoseconds of the datetime

#### 34.3.13.11 pandas.Series.dt.week

`Series.dt.week`

The week ordinal of the year

#### 34.3.13.12 pandas.Series.dt.weekofyear

`Series.dt.weekofyear`

The week ordinal of the year

#### 34.3.13.13 pandas.Series.dt.dayofweek

`Series.dt.dayofweek`

The day of the week with Monday=0, Sunday=6

#### 34.3.13.14 pandas.Series.dt.weekday

`Series.dt.weekday`

The day of the week with Monday=0, Sunday=6

#### 34.3.13.15 pandas.Series.dt.dayofyear

`Series.dt.dayofyear`

The ordinal day of the year

#### 34.3.13.16 pandas.Series.dt.quarter

`Series.dt.quarter`

The quarter of the date

#### 34.3.13.17 pandas.Series.dt.is\_month\_start

`Series.dt.is_month_start`

Logical indicating if first day of month (defined by frequency)

#### 34.3.13.18 pandas.Series.dt.is\_month\_end

`Series.dt.is_month_end`

Indicator for whether the date is the last day of the month.

**Returns** Series or array

For Series, returns a Series with boolean values. For DatetimeIndex, returns a boolean array.

**See also:**

[`is\_month\_start`](#) Indicator for whether the date is the first day of the month.

### Examples

This method is available on Series with datetime values under the `.dt` accessor, and directly on DatetimeIndex.

```
>>> dates = pd.Series(pd.date_range("2018-02-27", periods=3))
>>> dates
0    2018-02-27
1    2018-02-28
2    2018-03-01
dtype: datetime64[ns]
>>> dates.dt.is_month_end
0    False
1     True
2    False
dtype: bool
```

```
>>> idx = pd.date_range("2018-02-27", periods=3)
>>> idx.is_month_end
array([False,  True, False], dtype=bool)
```

### 34.3.13.19 pandas.Series.dt.is\_quarter\_start

#### Series.dt.is\_quarter\_start

Indicator for whether the date is the first day of a quarter.

**Returns** `is_quarter_start` : Series or DatetimeIndex

The same type as the original data with boolean values. Series will have the same name and index. DatetimeIndex will have the same name.

**See also:**

`quarter` Return the quarter of the date.

`is_quarter_end` Similar property for indicating the quarter start.

#### Examples

This method is available on Series with datetime values under the `.dt` accessor, and directly on DatetimeIndex.

```
>>> df = pd.DataFrame({'dates': pd.date_range("2017-03-30",
...                                           periods=4)})
>>> df.assign(quarter=df.dates.dt.quarter,
...           is_quarter_start=df.dates.dt.is_quarter_start)
   dates      quarter  is_quarter_start
0 2017-03-30         1                False
1 2017-03-31         1                False
2 2017-04-01         2                 True
3 2017-04-02         2                False
```

```
>>> idx = pd.date_range('2017-03-30', periods=4)
>>> idx
DatetimeIndex(['2017-03-30', '2017-03-31', '2017-04-01', '2017-04-02'],
              dtype='datetime64[ns]', freq='D')
```

```
>>> idx.is_quarter_start
array([False, False,  True, False])
```

### 34.3.13.20 pandas.Series.dt.is\_quarter\_end

#### Series.dt.is\_quarter\_end

Indicator for whether the date is the last day of a quarter.

**Returns** `is_quarter_end` : Series or DatetimeIndex

The same type as the original data with boolean values. Series will have the same name and index. DatetimeIndex will have the same name.

**See also:**

`quarter` Return the quarter of the date.

`is_quarter_start` Similar property indicating the quarter start.

## Examples

This method is available on Series with datetime values under the `.dt` accessor, and directly on `DatetimeIndex`.

```
>>> df = pd.DataFrame({'dates': pd.date_range("2017-03-30",
...                                           periods=4)})
>>> df.assign(quarter=df.dates.dt.quarter,
...           is_quarter_end=df.dates.dt.is_quarter_end)
   dates      quarter  is_quarter_end
0 2017-03-30         1             False
1 2017-03-31         1              True
2 2017-04-01         2             False
3 2017-04-02         2             False
```

```
>>> idx = pd.date_range('2017-03-30', periods=4)
>>> idx
DatetimeIndex(['2017-03-30', '2017-03-31', '2017-04-01', '2017-04-02'],
              dtype='datetime64[ns]', freq='D')
```

```
>>> idx.is_quarter_end
array([False,  True, False, False])
```

### 34.3.13.21 pandas.Series.dt.is\_year\_start

`Series.dt.is_year_start`

Indicate whether the date is the first day of a year.

**Returns** Series or DatetimeIndex

The same type as the original data with boolean values. Series will have the same name and index. `DatetimeIndex` will have the same name.

**See also:**

[`is\_year\_end`](#) Similar property indicating the last day of the year.

## Examples

This method is available on Series with datetime values under the `.dt` accessor, and directly on `DatetimeIndex`.

```
>>> dates = pd.Series(pd.date_range("2017-12-30", periods=3))
>>> dates
0    2017-12-30
1    2017-12-31
2    2018-01-01
dtype: datetime64[ns]
```

```
>>> dates.dt.is_year_start
0    False
1    False
2     True
dtype: bool
```

```
>>> idx = pd.date_range("2017-12-30", periods=3)
>>> idx
DatetimeIndex(['2017-12-30', '2017-12-31', '2018-01-01'],
              dtype='datetime64[ns]', freq='D')
```

```
>>> idx.is_year_start
array([False, False,  True])
```

### 34.3.13.22 pandas.Series.dt.is\_year\_end

**Series.dt.is\_year\_end**

Indicate whether the date is the last day of the year.

**Returns Series or DatetimeIndex**

The same type as the original data with boolean values. Series will have the same name and index. DatetimeIndex will have the same name.

**See also:**

[\*is\\_year\\_start\*](#) Similar property indicating the start of the year.

#### Examples

This method is available on Series with datetime values under the `.dt` accessor, and directly on DatetimeIndex.

```
>>> dates = pd.Series(pd.date_range("2017-12-30", periods=3))
>>> dates
0    2017-12-30
1    2017-12-31
2    2018-01-01
dtype: datetime64[ns]
```

```
>>> dates.dt.is_year_end
0    False
1     True
2    False
dtype: bool
```

```
>>> idx = pd.date_range("2017-12-30", periods=3)
>>> idx
DatetimeIndex(['2017-12-30', '2017-12-31', '2018-01-01'],
              dtype='datetime64[ns]', freq='D')
```

```
>>> idx.is_year_end
array([False,  True, False])
```

### 34.3.13.23 pandas.Series.dt.is\_leap\_year

**Series.dt.is\_leap\_year**

Boolean indicator if the date belongs to a leap year.

A leap year is a year, which has 366 days (instead of 365) including 29th of February as an intercalary day. Leap years are years which are multiples of four with the exception of years divisible by 100 but not by 400.

**Returns Series or ndarray**

Booleans indicating if dates belong to a leap year.

**Examples**

This method is available on Series with datetime values under the `.dt` accessor, and directly on `DatetimeIndex`.

```
>>> idx = pd.date_range("2012-01-01", "2015-01-01", freq="Y")
>>> idx
DatetimeIndex(['2012-12-31', '2013-12-31', '2014-12-31'],
              dtype='datetime64[ns]', freq='A-DEC')
>>> idx.is_leap_year
array([ True, False, False], dtype=bool)
```

```
>>> dates = pd.Series(idx)
>>> dates_series
0    2012-12-31
1    2013-12-31
2    2014-12-31
dtype: datetime64[ns]
>>> dates_series.dt.is_leap_year
0      True
1     False
2     False
dtype: bool
```

**34.3.13.24 pandas.Series.dt.daysinmonth**

`Series.dt.daysinmonth`

The number of days in the month

**34.3.13.25 pandas.Series.dt.days\_in\_month**

`Series.dt.days_in_month`

The number of days in the month

**34.3.13.26 pandas.Series.dt.tz**

`Series.dt.tz`

**34.3.13.27 pandas.Series.dt.freq**

`Series.dt.freq`

**Datetime Methods**

---

*Series.dt.to\_period(\*args, \*\*kwargs)*

Cast to `PeriodIndex` at a particular frequency.

Continued on next page

Table 39 – continued from previous page

<code>Series.dt.to_pydatetime()</code>	Return the data as an array of native Python datetime objects
<code>Series.dt.tz_localize(*args, **kwargs)</code>	Localize tz-naive DatetimeIndex to tz-aware DateTimeIndex.
<code>Series.dt.tz_convert(*args, **kwargs)</code>	Convert tz-aware DatetimeIndex from one time zone to another.
<code>Series.dt.normalize(*args, **kwargs)</code>	Convert times to midnight.
<code>Series.dt.strftime(*args, **kwargs)</code>	Convert to Index using specified date_format.
<code>Series.dt.round(*args, **kwargs)</code>	round the data to the specified <i>freq</i> .
<code>Series.dt.floor(*args, **kwargs)</code>	floor the data to the specified <i>freq</i> .
<code>Series.dt.ceil(*args, **kwargs)</code>	ceil the data to the specified <i>freq</i> .
<code>Series.dt.month_name(*args, **kwargs)</code>	Return the month names of the DateTimeIndex with specified locale.
<code>Series.dt.day_name(*args, **kwargs)</code>	Return the day names of the DateTimeIndex with specified locale.

### 34.3.13.28 pandas.Series.dt.to\_period

`Series.dt.to_period(*args, **kwargs)`

Cast to PeriodIndex at a particular frequency.

Converts DatetimeIndex to PeriodIndex.

**Parameters** *freq* : string or Offset, optional

One of pandas' *offset strings* or an Offset object. Will be inferred by default.

**Returns**

**PeriodIndex**

**Raises** **ValueError**

When converting a DatetimeIndex with non-regular values, so that a frequency cannot be inferred.

**See also:**

`pandas.PeriodIndex` Immutable ndarray holding ordinal values

`pandas.DatetimeIndex.to_pydatetime` Return DatetimeIndex as object

### Examples

```
>>> df = pd.DataFrame({"y": [1,2,3]},
...                     index=pd.to_datetime(["2000-03-31 00:00:00",
...                                             "2000-05-31 00:00:00",
...                                             "2000-08-31 00:00:00"]))
>>> df.index.to_period("M")
PeriodIndex(['2000-03', '2000-05', '2000-08'],
            dtype='period[M]', freq='M')
```

Infer the daily frequency

```
>>> idx = pd.date_range("2017-01-01", periods=2)
>>> idx.to_period()
PeriodIndex(['2017-01-01', '2017-01-02'],
            dtype='period[D]', freq='D')
```

### 34.3.13.29 pandas.Series.dt.to\_pydatetime

`Series.dt.to_pydatetime()`

Return the data as an array of native Python datetime objects

Timezone information is retained if present.

**Warning:** Python's datetime uses microsecond resolution, which is lower than pandas (nanosecond). The values are truncated.

**Returns** `numpy.ndarray`

object dtype array containing native Python datetime objects.

**See also:**

`datetime.datetime` Standard library value for a datetime.

#### Examples

```
>>> s = pd.Series(pd.date_range('20180310', periods=2))
>>> s
0    2018-03-10
1    2018-03-11
dtype: datetime64[ns]
```

```
>>> s.dt.to_pydatetime()
array([datetime.datetime(2018, 3, 10, 0, 0),
       datetime.datetime(2018, 3, 11, 0, 0)], dtype=object)
```

pandas' nanosecond precision is truncated to microseconds.

```
>>> s = pd.Series(pd.date_range('20180310', periods=2, freq='ns'))
>>> s
0    2018-03-10 00:00:00.000000000
1    2018-03-10 00:00:00.000000001
dtype: datetime64[ns]
```

```
>>> s.dt.to_pydatetime()
array([datetime.datetime(2018, 3, 10, 0, 0),
       datetime.datetime(2018, 3, 10, 0, 0)], dtype=object)
```

### 34.3.13.30 pandas.Series.dt.tz\_localize

`Series.dt.tz_localize(*args, **kwargs)`

Localize tz-naive DatetimeIndex to tz-aware DatetimeIndex.

This method takes a time zone (tz) naive DatetimeIndex object and makes this time zone aware. It does not move the time to another time zone. Time zone localization helps to switch from time zone aware to time zone unaware objects.

**Parameters** `tz` : string, pytz.timezone, dateutil.tz.tzfile or None

Time zone to convert timestamps to. Passing None will remove the time zone information preserving local time.

**ambiguous** : str { 'infer', 'NaT', 'raise' } or bool array, default 'raise'

- 'infer' will attempt to infer fall dst-transition hours based on order
- bool-ndarray where True signifies a DST time, False signifies a non-DST time (note that this flag is only applicable for ambiguous times)
- 'NaT' will return NaT where there are ambiguous times
- 'raise' will raise an AmbiguousTimeError if there are ambiguous times

**errors** : { 'raise', 'coerce' }, default 'raise'

- 'raise' will raise a **NonExistentTimeError** if a timestamp is not valid in the specified time zone (e.g. due to a transition from or to DST time)
- 'coerce' will return NaT if the timestamp can not be converted to the specified time zone

New in version 0.19.0.

**Returns** DatetimeIndex

Index converted to the specified time zone.

**Raises** TypeError

If the DatetimeIndex is tz-aware and tz is not None.

**See also:**

**`DatetimeIndex.tz_convert`** Convert tz-aware DatetimeIndex from one time zone to another.

## Examples

```
>>> tz_naive = pd.date_range('2018-03-01 09:00', periods=3)
>>> tz_naive
DatetimeIndex(['2018-03-01 09:00:00', '2018-03-02 09:00:00',
              '2018-03-03 09:00:00'],
              dtype='datetime64[ns]', freq='D')
```

Localize DatetimeIndex in US/Eastern time zone:

```
>>> tz_aware = tz_naive.tz_localize(tz='US/Eastern')
>>> tz_aware
DatetimeIndex(['2018-03-01 09:00:00-05:00',
              '2018-03-02 09:00:00-05:00',
              '2018-03-03 09:00:00-05:00'],
              dtype='datetime64[ns, US/Eastern]', freq='D')
```

With the `tz=None`, we can remove the time zone information while keeping the local time (not converted to UTC):

```
>>> tz_aware.tz_localize(None)
DatetimeIndex(['2018-03-01 09:00:00', '2018-03-02 09:00:00',
              '2018-03-03 09:00:00'],
              dtype='datetime64[ns]', freq='D')
```

### 34.3.13.31 pandas.Series.dt.tz\_convert

`Series.dt.tz_convert(*args, **kwargs)`

Convert tz-aware DatetimeIndex from one time zone to another.

**Parameters** `tz`: string, pytz.timezone, dateutil.tz.tzfile or None

Time zone for time. Corresponding timestamps would be converted to this time zone of the DatetimeIndex. A `tz` of None will convert to UTC and remove the timezone information.

**Returns**

**normalized** [DatetimeIndex]

**Raises** `TypeError`

If DatetimeIndex is tz-naive.

**See also:**

[`DatetimeIndex.tz`](#) A timezone that has a variable offset from UTC

[`DatetimeIndex.tz\_localize`](#) Localize tz-naive DatetimeIndex to a given time zone, or remove time-zone from a tz-aware DatetimeIndex.

### Examples

With the `tz` parameter, we can change the DatetimeIndex to other time zones:

```
>>> dti = pd.DatetimeIndex(start='2014-08-01 09:00',
...                          freq='H', periods=3, tz='Europe/Berlin')
```

```
>>> dti
DatetimeIndex(['2014-08-01 09:00:00+02:00',
              '2014-08-01 10:00:00+02:00',
              '2014-08-01 11:00:00+02:00'],
              dtype='datetime64[ns, Europe/Berlin]', freq='H')
```

```
>>> dti.tz_convert('US/Central')
DatetimeIndex(['2014-08-01 02:00:00-05:00',
              '2014-08-01 03:00:00-05:00',
              '2014-08-01 04:00:00-05:00'],
              dtype='datetime64[ns, US/Central]', freq='H')
```

With the `tz=None`, we can remove the timezone (after converting to UTC if necessary):

```
>>> dti = pd.DatetimeIndex(start='2014-08-01 09:00', freq='H',
...                          periods=3, tz='Europe/Berlin')
```

```
>>> dti
DatetimeIndex(['2014-08-01 09:00:00+02:00',
               '2014-08-01 10:00:00+02:00',
               '2014-08-01 11:00:00+02:00'],
              dtype='datetime64[ns, Europe/Berlin]', freq='H')
```

```
>>> dti.tz_convert(None)
DatetimeIndex(['2014-08-01 07:00:00',
               '2014-08-01 08:00:00',
               '2014-08-01 09:00:00'],
              dtype='datetime64[ns]', freq='H')
```

### 34.3.13.32 pandas.Series.dt.normalize

`Series.dt.normalize(*args, **kwargs)`

Convert times to midnight.

The time component of the date-time is converted to midnight i.e. 00:00:00. This is useful in cases, when the time does not matter. Length is unaltered. The timezones are unaffected.

This method is available on Series with datetime values under the `.dt` accessor, and directly on `DatetimeIndex`.

#### Returns DatetimeIndex or Series

The same type as the original data. Series will have the same name and index. `DatetimeIndex` will have the same name.

See also:

**floor** Floor the datetimes to the specified freq.

**ceil** Ceil the datetimes to the specified freq.

**round** Round the datetimes to the specified freq.

### Examples

```
>>> idx = pd.DatetimeIndex(start='2014-08-01 10:00', freq='H',
...                        periods=3, tz='Asia/Calcutta')
>>> idx
DatetimeIndex(['2014-08-01 10:00:00+05:30',
               '2014-08-01 11:00:00+05:30',
               '2014-08-01 12:00:00+05:30'],
              dtype='datetime64[ns, Asia/Calcutta]', freq='H')
>>> idx.normalize()
DatetimeIndex(['2014-08-01 00:00:00+05:30',
               '2014-08-01 00:00:00+05:30',
               '2014-08-01 00:00:00+05:30'],
              dtype='datetime64[ns, Asia/Calcutta]', freq=None)
```

### 34.3.13.33 pandas.Series.dt.strftime

`Series.dt.strftime(*args, **kwargs)`

Convert to Index using specified `date_format`.

Return an Index of formatted strings specified by `date_format`, which supports the same string format as the python standard library. Details of the string format can be found in [python string format doc](#)

**Parameters** `date_format` : str

Date format string (e.g. “%Y-%m-%d”).

**Returns** Index

Index of formatted strings

**See also:**

[`pandas.to\_datetime`](#) Convert the given argument to datetime

[`DatetimeIndex.normalize`](#) Return DatetimeIndex with times to midnight.

[`DatetimeIndex.round`](#) Round the DatetimeIndex to the specified freq.

[`DatetimeIndex.floor`](#) Floor the DatetimeIndex to the specified freq.

## Examples

```
>>> rng = pd.date_range(pd.Timestamp("2018-03-10 09:00"),
...                      periods=3, freq='s')
>>> rng.strftime('%B %d, %Y, %r')
Index(['March 10, 2018, 09:00:00 AM', 'March 10, 2018, 09:00:01 AM',
       'March 10, 2018, 09:00:02 AM'],
      dtype='object')
```

### 34.3.13.34 pandas.Series.dt.round

`Series.dt.round(*args, **kwargs)`  
round the data to the specified *freq*.

**Parameters** `freq` : str or Offset

The frequency level to round the index to. Must be a fixed frequency like ‘S’ (second) not ‘ME’ (month end). See [frequency aliases](#) for a list of possible *freq* values.

**Returns** DatetimeIndex, TimedeltaIndex, or Series

Index of the same type for a DatetimeIndex or TimedeltaIndex, or a Series with the same index for a Series.

**Raises**

**ValueError** if the ‘freq’ cannot be converted.

## Examples

### DatetimeIndex

```
>>> rng = pd.date_range('1/1/2018 11:59:00', periods=3, freq='min')
>>> rng
DatetimeIndex(['2018-01-01 11:59:00', '2018-01-01 12:00:00',
              '2018-01-01 12:01:00'],
             dtype='datetime64[ns]', freq='T')
```

(continues on next page)

(continued from previous page)

```
>>> rng.round('H')
DatetimeIndex(['2018-01-01 12:00:00', '2018-01-01 12:00:00',
              '2018-01-01 12:00:00'],
              dtype='datetime64[ns]', freq=None)
```

**Series**

```
>>> pd.Series(rng).dt.round("H")
0    2018-01-01 12:00:00
1    2018-01-01 12:00:00
2    2018-01-01 12:00:00
dtype: datetime64[ns]
```

**34.3.13.35 pandas.Series.dt.floor**

`Series.dt.floor(*args, **kwargs)`  
 floor the data to the specified *freq*.

**Parameters** *freq* : str or Offset

The frequency level to floor the index to. Must be a fixed frequency like ‘S’ (second) not ‘ME’ (month end). See [frequency aliases](#) for a list of possible *freq* values.

**Returns** `DatetimeIndex`, `TimedeltaIndex`, or `Series`

Index of the same type for a `DatetimeIndex` or `TimedeltaIndex`, or a `Series` with the same index for a `Series`.

**Raises**

**ValueError** if the ‘freq’ cannot be converted.

**Examples****DatetimeIndex**

```
>>> rng = pd.date_range('1/1/2018 11:59:00', periods=3, freq='min')
>>> rng
DatetimeIndex(['2018-01-01 11:59:00', '2018-01-01 12:00:00',
              '2018-01-01 12:01:00'],
              dtype='datetime64[ns]', freq='T')
>>> rng.floor('H')
DatetimeIndex(['2018-01-01 11:00:00', '2018-01-01 12:00:00',
              '2018-01-01 12:00:00'],
              dtype='datetime64[ns]', freq=None)
```

**Series**

```
>>> pd.Series(rng).dt.floor("H")
0    2018-01-01 11:00:00
1    2018-01-01 12:00:00
2    2018-01-01 12:00:00
dtype: datetime64[ns]
```

### 34.3.13.36 pandas.Series.dt.ceil

`Series.dt.ceil(*args, **kwargs)`  
ceil the data to the specified *freq*.

**Parameters** `freq` : str or Offset

The frequency level to ceil the index to. Must be a fixed frequency like ‘S’ (second) not ‘ME’ (month end). See *frequency aliases* for a list of possible *freq* values.

**Returns** `DatetimeIndex, TimedeltaIndex, or Series`

Index of the same type for a `DatetimeIndex` or `TimedeltaIndex`, or a `Series` with the same index for a `Series`.

**Raises**

**ValueError** if the ‘freq’ cannot be converted.

#### Examples

##### DatetimeIndex

```
>>> rng = pd.date_range('1/1/2018 11:59:00', periods=3, freq='min')
>>> rng
DatetimeIndex(['2018-01-01 11:59:00', '2018-01-01 12:00:00',
              '2018-01-01 12:01:00'],
              dtype='datetime64[ns]', freq='T')
>>> rng.ceil('H')
DatetimeIndex(['2018-01-01 12:00:00', '2018-01-01 12:00:00',
              '2018-01-01 13:00:00'],
              dtype='datetime64[ns]', freq=None)
```

##### Series

```
>>> pd.Series(rng).dt.ceil("H")
0    2018-01-01 12:00:00
1    2018-01-01 12:00:00
2    2018-01-01 13:00:00
dtype: datetime64[ns]
```

### 34.3.13.37 pandas.Series.dt.month\_name

`Series.dt.month_name(*args, **kwargs)`

Return the month names of the `DateTimeIndex` with specified locale.

**Parameters** `locale` : string, default None (English locale)

locale determining the language in which to return the month name

**Returns** `month_names` : Index

Index of month names

.. versionadded:: 0.23.0

**34.3.13.38 pandas.Series.dt.day\_name**`Series.dt.day_name(*args, **kwargs)`

Return the day names of the DateTimeIndex with specified locale.

**Parameters** `locale` : string, default None (English locale)

locale determining the language in which to return the day name

**Returns** `month_names` : Index

Index of day names

**.. versionadded:: 0.23.0****Timedelta Properties**

<code>Series.dt.days</code>	Number of days for each element.
<code>Series.dt.seconds</code>	Number of seconds ( $\geq 0$ and less than 1 day) for each element.
<code>Series.dt.microseconds</code>	Number of microseconds ( $\geq 0$ and less than 1 second) for each element.
<code>Series.dt.nanoseconds</code>	Number of nanoseconds ( $\geq 0$ and less than 1 microsecond) for each element.
<code>Series.dt.components</code>	Return a dataframe of the components (days, hours, minutes, seconds, milliseconds, microseconds, nanoseconds) of the Timedeltas.

**34.3.13.39 pandas.Series.dt.days**`Series.dt.days`

Number of days for each element.

**34.3.13.40 pandas.Series.dt.seconds**`Series.dt.seconds`Number of seconds ( $\geq 0$  and less than 1 day) for each element.**34.3.13.41 pandas.Series.dt.microseconds**`Series.dt.microseconds`Number of microseconds ( $\geq 0$  and less than 1 second) for each element.**34.3.13.42 pandas.Series.dt.nanoseconds**`Series.dt.nanoseconds`Number of nanoseconds ( $\geq 0$  and less than 1 microsecond) for each element.**34.3.13.43 pandas.Series.dt.components**`Series.dt.components`

Return a dataframe of the components (days, hours, minutes, seconds, milliseconds, microseconds, nanosec-

onds) of the Timedeltas.

**Returns**

**a DataFrame**

### Timedelta Methods

<code>Series.dt.to_pytimedelta()</code>	Return an array of native <i>datetime.timedelta</i> objects.
<code>Series.dt.total_seconds(*args, **kwargs)</code>	Return total duration of each element expressed in seconds.

#### 34.3.13.44 pandas.Series.dt.to\_pytimedelta

`Series.dt.to_pytimedelta()`

Return an array of native *datetime.timedelta* objects.

Python's standard *datetime* library uses a different representation *timedelta*'s. This method converts a Series of pandas Timedeltas to *datetime.timedelta* format with the same length as the original Series.

**Returns** **a** : `numpy.ndarray`

1D array containing data with *datetime.timedelta* type.

**See also:**

`datetime.timedelta`

### Examples

```
>>> s = pd.Series(pd.to_timedelta(np.arange(5), unit='d'))
>>> s
0    0 days
1    1 days
2    2 days
3    3 days
4    4 days
dtype: timedelta64[ns]
```

```
>>> s.dt.to_pytimedelta()
array([datetime.timedelta(0), datetime.timedelta(1),
       datetime.timedelta(2), datetime.timedelta(3),
       datetime.timedelta(4)], dtype=object)
```

#### 34.3.13.45 pandas.Series.dt.total\_seconds

`Series.dt.total_seconds(*args, **kwargs)`

Return total duration of each element expressed in seconds.

This method is available directly on *TimedeltaIndex* and on Series containing *timedelta* values under the `.dt` namespace.

**Returns** **seconds** : `Float64Index` or `Series`

When the calling object is a `TimedeltaIndex`, the return type is a `Float64Index`. When the calling object is a `Series`, the return type is `Series` of type `float64` whose index is the same as the original.

See also:

`datetime.timedelta.total_seconds` Standard library version of this method.

`TimedeltaIndex.components` Return a `DataFrame` with components of each `Timedelta`.

## Examples

### Series

```
>>> s = pd.Series(pd.to_timedelta(np.arange(5), unit='d'))
>>> s
0    0 days
1    1 days
2    2 days
3    3 days
4    4 days
dtype: timedelta64[ns]
```

```
>>> s.dt.total_seconds()
0         0.0
1    86400.0
2   172800.0
3   259200.0
4   345600.0
dtype: float64
```

### TimedeltaIndex

```
>>> idx = pd.to_timedelta(np.arange(5), unit='d')
>>> idx
TimedeltaIndex(['0 days', '1 days', '2 days', '3 days', '4 days'],
               dtype='timedelta64[ns]', freq=None)
```

```
>>> idx.total_seconds()
Float64Index([0.0, 86400.0, 172800.0, 259200.000000000003, 345600.0],
             dtype='float64')
```

## 34.3.14 String handling

`Series.str` can be used to access the values of the series as strings and apply several methods to it. These can be accessed like `Series.str.<function/property>`.

<code>Series.str.capitalize()</code>	Convert strings in the <code>Series/Index</code> to be capitalized.
<code>Series.str.cat([others, sep, na_rep, join])</code>	Concatenate strings in the <code>Series/Index</code> with given separator.
<code>Series.str.center(width[, fillchar])</code>	Filling left and right side of strings in the <code>Series/Index</code> with an additional character.

Continued on next page

Table 42 – continued from previous page

<code>Series.str.contains(pat[, case, flags, na, ...])</code>	Test if pattern or regex is contained within a string of a Series or Index.
<code>Series.str.count(pat[, flags])</code>	Count occurrences of pattern in each string of the Series/Index.
<code>Series.str.decode(encoding[, errors])</code>	Decode character string in the Series/Index using indicated encoding.
<code>Series.str.encode(encoding[, errors])</code>	Encode character string in the Series/Index using indicated encoding.
<code>Series.str.endswith(pat[, na])</code>	Test if the end of each string element matches a pattern.
<code>Series.str.extract(pat[, flags, expand])</code>	For each subject string in the Series, extract groups from the first match of regular expression pat.
<code>Series.str.extractall(pat[, flags])</code>	For each subject string in the Series, extract groups from all matches of regular expression pat.
<code>Series.str.find(sub[, start, end])</code>	Return lowest indexes in each strings in the Series/Index where the substring is fully contained between [start:end].
<code>Series.str.findall(pat[, flags])</code>	Find all occurrences of pattern or regular expression in the Series/Index.
<code>Series.str.get(i)</code>	Extract element from each component at specified position.
<code>Series.str.index(sub[, start, end])</code>	Return lowest indexes in each strings where the substring is fully contained between [start:end].
<code>Series.str.join(sep)</code>	Join lists contained as elements in the Series/Index with passed delimiter.
<code>Series.str.len()</code>	Compute length of each string in the Series/Index.
<code>Series.str.ljust(width[, fillchar])</code>	Filling right side of strings in the Series/Index with an additional character.
<code>Series.str.lower()</code>	Convert strings in the Series/Index to lowercase.
<code>Series.str.lstrip([to_strip])</code>	Strip whitespace (including newlines) from each string in the Series/Index from left side.
<code>Series.str.match(pat[, case, flags, na, ...])</code>	Determine if each string matches a regular expression.
<code>Series.str.normalize(form)</code>	Return the Unicode normal form for the strings in the Series/Index.
<code>Series.str.pad(width[, side, fillchar])</code>	Pad strings in the Series/Index with an additional character to specified side.
<code>Series.str.partition([pat, expand])</code>	Split the string at the first occurrence of <i>sep</i> , and return 3 elements containing the part before the separator, the separator itself, and the part after the separator.
<code>Series.str.repeat(repeats)</code>	Duplicate each string in the Series/Index by indicated number of times.
<code>Series.str.replace(pat, repl[, n, case, ...])</code>	Replace occurrences of pattern/regex in the Series/Index with some other string.
<code>Series.str.rfind(sub[, start, end])</code>	Return highest indexes in each strings in the Series/Index where the substring is fully contained between [start:end].
<code>Series.str.rindex(sub[, start, end])</code>	Return highest indexes in each strings where the substring is fully contained between [start:end].
<code>Series.str.rjust(width[, fillchar])</code>	Filling left side of strings in the Series/Index with an additional character.

Continued on next page

Table 42 – continued from previous page

<code>Series.str.rpartition([pat, expand])</code>	Split the string at the last occurrence of <i>sep</i> , and return 3 elements containing the part before the separator, the separator itself, and the part after the separator.
<code>Series.str.rstrip([to_strip])</code>	Strip whitespace (including newlines) from each string in the Series/Index from right side.
<code>Series.str.slice([start, stop, step])</code>	Slice substrings from each element in the Series/Index
<code>Series.str.slice_replace([start, stop, repl])</code>	Replace a positional slice of a string with another value.
<code>Series.str.split([pat, n, expand])</code>	Split strings around given separator/delimiter.
<code>Series.str.rsplit([pat, n, expand])</code>	Split each string in the Series/Index by the given delimiter string, starting at the end of the string and working to the front.
<code>Series.str.startswith(pat[, na])</code>	Test if the start of each string element matches a pattern.
<code>Series.str.strip([to_strip])</code>	Strip whitespace (including newlines) from each string in the Series/Index from left and right sides.
<code>Series.str.swapcase()</code>	Convert strings in the Series/Index to be swapcased.
<code>Series.str.title()</code>	Convert strings in the Series/Index to titlecase.
<code>Series.str.translate(table[, deletechars])</code>	Map all characters in the string through the given mapping table.
<code>Series.str.upper()</code>	Convert strings in the Series/Index to uppercase.
<code>Series.str.wrap(width, **kwargs)</code>	Wrap long strings in the Series/Index to be formatted in paragraphs with length less than a given width.
<code>Series.str.zfill(width)</code>	Filling left side of strings in the Series/Index with 0.
<code>Series.str.isalnum()</code>	Check whether all characters in each string in the Series/Index are alphanumeric.
<code>Series.str.isalpha()</code>	Check whether all characters in each string in the Series/Index are alphabetic.
<code>Series.str.isdigit()</code>	Check whether all characters in each string in the Series/Index are digits.
<code>Series.str.isspace()</code>	Check whether all characters in each string in the Series/Index are whitespace.
<code>Series.str.islower()</code>	Check whether all characters in each string in the Series/Index are lowercase.
<code>Series.str.isupper()</code>	Check whether all characters in each string in the Series/Index are uppercase.
<code>Series.str.istitle()</code>	Check whether all characters in each string in the Series/Index are titlecase.
<code>Series.str.isnumeric()</code>	Check whether all characters in each string in the Series/Index are numeric.
<code>Series.str.isdecimal()</code>	Check whether all characters in each string in the Series/Index are decimal.
<code>Series.str.get_dummies([sep])</code>	Split each string in the Series by sep and return a frame of dummy/indicator variables.

### 34.3.14.1 pandas.Series.str.capitalize

`Series.str.capitalize()`

Convert strings in the Series/Index to be capitalized.

Equivalent to `str.capitalize()`.

**Returns**

**Series/Index of objects**

**See also:**

***Series.str.lower*** Converts all characters to lowercase.

***Series.str.upper*** Converts all characters to uppercase.

***Series.str.title*** Converts first character of each word to uppercase and remaining to lowercase.

***Series.str.capitalize*** Converts first character to uppercase and remaining to lowercase.

***Series.str.swapcase*** Converts uppercase to lowercase and lowercase to uppercase.

**Examples**

```
>>> s = pd.Series(['lower', 'CAPITALS', 'this is a sentence', 'SwApCaSe'])
>>> s
0          lower
1        CAPITALS
2    this is a sentence
3          SwApCaSe
dtype: object
```

```
>>> s.str.lower()
0          lower
1        capitals
2    this is a sentence
3          swapcase
dtype: object
```

```
>>> s.str.upper()
0          LOWER
1        CAPITALS
2    THIS IS A SENTENCE
3          SWAPCASE
dtype: object
```

```
>>> s.str.title()
0          Lower
1        Capitals
2    This Is A Sentence
3          Swapcase
dtype: object
```

```
>>> s.str.capitalize()
0          Lower
1        Capitals
2    This is a sentence
3          Swapcase
dtype: object
```

```
>>> s.str.swapcase()
0          LOWER
1        capitals
2    THIS IS A SENTENCE
3          sWaPcAsE
dtype: object
```

### 34.3.14.2 pandas.Series.str.cat

`Series.str.cat` (*others=None, sep=None, na\_rep=None, join=None*)

Concatenate strings in the Series/Index with given separator.

If *others* is specified, this function concatenates the Series/Index and elements of *others* element-wise. If *others* is not passed, then all values in the Series/Index are concatenated into a single string with a given *sep*.

**Parameters** *others* : Series, Index, DataFrame, np.ndarray or list-like

Series, Index, DataFrame, np.ndarray (one- or two-dimensional) and other list-likes of strings must have the same length as the calling Series/Index, with the exception of indexed objects (i.e. Series/Index/DataFrame) if *join* is not None.

If *others* is a list-like that contains a combination of Series, np.ndarray (1-dim) or list-like, then all elements will be unpacked and must satisfy the above criteria individually.

If *others* is None, the method returns the concatenation of all strings in the calling Series/Index.

**sep** : string or None, default None

If None, concatenates without any separator.

**na\_rep** : string or None, default None

Representation that is inserted for all missing values:

- If *na\_rep* is None, and *others* is None, missing values in the Series/Index are omitted from the result.
- If *na\_rep* is None, and *others* is not None, a row containing a missing value in any of the columns (before concatenation) will have a missing value in the result.

**join** : { 'left', 'right', 'outer', 'inner' }, default None

Determines the join-style between the calling Series/Index and any Series/Index/DataFrame in *others* (objects without an index need to match the length of the calling Series/Index). If None, alignment is disabled, but this option will be removed in a future version of pandas and replaced with a default of 'left'. To disable alignment, use *.values* on any Series/Index/DataFrame in *others*.

New in version 0.23.0.

**Returns** *concat* : str or Series/Index of objects

If *others* is None, *str* is returned, otherwise a *Series/Index* (same type as caller) of objects is returned.

See also:

[\*split\*](#) Split each string in the Series/Index

### Examples

When not passing *others*, all values are concatenated into a single string:

```
>>> s = pd.Series(['a', 'b', np.nan, 'd'])
>>> s.str.cat(sep=' ')
'a b d'
```

By default, NA values in the Series are ignored. Using *na\_rep*, they can be given a representation:

```
>>> s.str.cat(sep=' ', na_rep='?')
'a b ? d'
```

If *others* is specified, corresponding values are concatenated with the separator. Result will be a Series of strings.

```
>>> s.str.cat(['A', 'B', 'C', 'D'], sep=',')
0    a,A
1    b,B
2    NaN
3    d,D
dtype: object
```

Missing values will remain missing in the result, but can again be represented using *na\_rep*

```
>>> s.str.cat(['A', 'B', 'C', 'D'], sep=',', na_rep='-')
0    a,A
1    b,B
2    -,C
3    d,D
dtype: object
```

If *sep* is not specified, the values are concatenated without separation.

```
>>> s.str.cat(['A', 'B', 'C', 'D'], na_rep='-')
0    aA
1    bB
2    -C
3    dD
dtype: object
```

Series with different indexes can be aligned before concatenation. The *join*-keyword works as in other methods.

```
>>> t = pd.Series(['d', 'a', 'e', 'c'], index=[3, 0, 4, 2])
>>> s.str.cat(t, join=None, na_rep='-')
0    ad
1    ba
2    -e
3    dc
dtype: object
>>>
>>> s.str.cat(t, join='left', na_rep='-')
0    aa
1    b-
2    -c
3    dd
dtype: object
>>>
>>> s.str.cat(t, join='outer', na_rep='-')
0    aa
1    b-
2    -c
```

(continues on next page)

(continued from previous page)

```

3    dd
4    -e
dtype: object
>>>
>>> s.str.cat(t, join='inner', na_rep='-')
0    aa
2    -c
3    dd
dtype: object
>>>
>>> s.str.cat(t, join='right', na_rep='-')
3    dd
0    aa
4    -e
2    -c
dtype: object

```

For more examples, see [here](#).

#### 34.3.14.3 pandas.Series.str.center

`Series.str.center` (*width*, *fillchar*=`' '`)

Filling left and right side of strings in the Series/Index with an additional character. Equivalent to `str.center()`.

**Parameters** *width* : int

Minimum width of resulting string; additional characters will be filled with *fillchar*

**fillchar** : str

Additional character for filling, default is whitespace

**Returns**

**filled** [Series/Index of objects]

#### 34.3.14.4 pandas.Series.str.contains

`Series.str.contains` (*pat*, *case*=`True`, *flags*=0, *na*=`nan`, *regex*=`True`)

Test if pattern or regex is contained within a string of a Series or Index.

Return boolean Series or Index based on whether a given pattern or regex is contained within a string of a Series or Index.

**Parameters** *pat* : str

Character sequence or regular expression.

**case** : bool, default True

If True, case sensitive.

**flags** : int, default 0 (no flags)

Flags to pass through to the re module, e.g. `re.IGNORECASE`.

**na** : default NaN

Fill value for missing values.

**regex** : bool, default True

If True, assumes the pat is a regular expression.

If False, treats the pat as a literal string.

**Returns Series or Index of boolean values**

A Series or Index of boolean values indicating whether the given pattern is contained within the string of each element of the Series or Index.

**See also:**

*match* analogous, but stricter, relying on re.match instead of re.search

## Examples

Returning a Series of booleans using only a literal pattern.

```
>>> s1 = pd.Series(['Mouse', 'dog', 'house and parrot', '23', np.NaN])
>>> s1.str.contains('og', regex=False)
0    False
1     True
2    False
3    False
4      NaN
dtype: object
```

Returning an Index of booleans using only a literal pattern.

```
>>> ind = pd.Index(['Mouse', 'dog', 'house and parrot', '23.0', np.NaN])
>>> ind.str.contains('23', regex=False)
Index([False, False, False, True, nan], dtype='object')
```

Specifying case sensitivity using *case*.

```
>>> s1.str.contains('oG', case=True, regex=True)
0    False
1    False
2    False
3    False
4      NaN
dtype: object
```

Specifying *na* to be *False* instead of *NaN* replaces NaN values with *False*. If Series or Index does not contain NaN values the resultant dtype will be *bool*, otherwise, an *object* dtype.

```
>>> s1.str.contains('og', na=False, regex=True)
0    False
1     True
2    False
3    False
4    False
dtype: bool
```

Returning 'house' and 'parrot' within same string.

```
>>> s1.str.contains('house|parrot', regex=True)
0    False
1    False
2     True
3    False
4      NaN
dtype: object
```

Ignoring case sensitivity using *flags* with regex.

```
>>> import re
>>> s1.str.contains('PARROT', flags=re.IGNORECASE, regex=True)
0    False
1    False
2     True
3    False
4      NaN
dtype: object
```

Returning any digit using regular expression.

```
>>> s1.str.contains('\d', regex=True)
0    False
1    False
2    False
3     True
4      NaN
dtype: object
```

Ensure *pat* is not a literal pattern when *regex* is set to *True*. Note in the following example one might expect only *s2[1]* and *s2[3]* to return *True*. However, *'0'* as a regex matches any character followed by a 0.

```
>>> s2 = pd.Series(['40', '40.0', '41', '41.0', '35'])
>>> s2.str.contains('.0', regex=True)
0     True
1     True
2    False
3     True
4    False
dtype: bool
```

#### 34.3.14.5 pandas.Series.str.count

`Series.str.count` (*pat*, *flags=0*, *\*\*kwargs*)

Count occurrences of pattern in each string of the Series/Index.

This function is used to count the number of times a particular regex pattern is repeated in each of the string elements of the *Series*.

**Parameters** *pat* : str

Valid regular expression.

**flags** : int, default 0, meaning no flags

Flags for the *re* module. For a complete list, [see here](#).

**\*\*kwargs**

For compatability with other string methods. Not used.

**Returns** **counts** : Series or Index

Same type as the calling object containing the integer counts.

**See also:**

**re** Standard library module for regular expressions.

**str.count** Standard library version, without regular expression support.

## Notes

Some characters need to be escaped when passing in *pat*. eg. '\$' has a special meaning in regex and must be escaped when finding this literal character.

## Examples

```
>>> s = pd.Series(['A', 'B', 'Aaba', 'Baca', np.nan, 'CABA', 'cat'])
>>> s.str.count('a')
0      0.0
1      0.0
2      2.0
3      2.0
4      NaN
5      0.0
6      1.0
dtype: float64
```

Escape '\$' to find the literal dollar sign.

```
>>> s = pd.Series(['$', 'B', 'Aab$', '$$ca', 'C$B$', 'cat'])
>>> s.str.count('\$')
0      1
1      0
2      1
3      2
4      2
5      0
dtype: int64
```

This is also available on Index

```
>>> pd.Index(['A', 'A', 'Aaba', 'cat']).str.count('a')
Int64Index([0, 0, 2, 1], dtype='int64')
```

### 34.3.14.6 pandas.Series.str.decode

**Series.str.decode** (*encoding*, *errors*='strict')

Decode character string in the Series/Index using indicated encoding. Equivalent to `str.decode()` in python2 and `bytes.decode()` in python3.

**Parameters**

**encoding** [str]

**errors** [str, optional]

**Returns**

**decoded** [Series/Index of objects]

### 34.3.14.7 pandas.Series.str.encode

`Series.str.encode(encoding, errors='strict')`

Encode character string in the Series/Index using indicated encoding. Equivalent to `str.encode()`.

**Parameters**

**encoding** [str]

**errors** [str, optional]

**Returns**

**encoded** [Series/Index of objects]

### 34.3.14.8 pandas.Series.str.endswith

`Series.str.endswith(pat, na=nan)`

Test if the end of each string element matches a pattern.

Equivalent to `str.endswith()`.

**Parameters** **pat** : str

Character sequence. Regular expressions are not accepted.

**na** : object, default NaN

Object shown if element tested is not a string.

**Returns** **Series or Index of bool**

A Series of booleans indicating whether the given pattern matches the end of each string element.

**See also:**

**str.endswith** Python standard library string method.

**Series.str.startswith** Same as `endswith`, but tests the start of string.

**Series.str.contains** Tests if string element contains a pattern.

### Examples

```
>>> s = pd.Series(['bat', 'bear', 'caT', np.nan])
>>> s
0    bat
1   bear
2   caT
3   NaN
dtype: object
```

```
>>> s.str.endswith('t')
0      True
1     False
2     False
3       NaN
dtype: object
```

Specifying *na* to be *False* instead of *NaN*.

```
>>> s.str.endswith('t', na=False)
0      True
1     False
2     False
3     False
dtype: bool
```

### 34.3.14.9 pandas.Series.str.extract

`Series.str.extract` (*pat, flags=0, expand=True*)

For each subject string in the Series, extract groups from the first match of regular expression *pat*.

**Parameters** *pat* : string

Regular expression pattern with capturing groups

**flags** : int, default 0 (no flags)

re module flags, e.g. `re.IGNORECASE`

**expand** : bool, default True

- If True, return DataFrame.
- If False, return Series/Index/DataFrame.

New in version 0.18.0.

**Returns**

**DataFrame with one row for each subject string, and one column for each group. Any capture group names in regular expression *pat* will be used for column names; otherwise capture group numbers will be used. The dtype of each result column is always object, even when no match is found. If *expand=False* and *pat* has only one capture group, then return a Series (if subject is a Series) or Index (if subject is an Index).**

See also:

[`extractall`](#) returns all matches (not just the first match)

### Examples

A pattern with two groups will return a DataFrame with two columns. Non-matches will be NaN.

```
>>> s = Series(['a1', 'b2', 'c3'])
>>> s.str.extract(r'([ab])(\d)')
   0  1
0   a  1
1   b  2
2  NaN NaN
```

A pattern may contain optional groups.

```
>>> s.str.extract(r'([ab])?(\d)')
   0  1
0   a  1
1   b  2
2  NaN 3
```

Named groups will become column names in the result.

```
>>> s.str.extract(r'(?P<letter>[ab])(?P<digit>\d)')
   letter digit
0      a      1
1      b      2
2    NaN    NaN
```

A pattern with one group will return a DataFrame with one column if `expand=True`.

```
>>> s.str.extract(r'[ab](\d)', expand=True)
   0
0   1
1   2
2  NaN
```

A pattern with one group will return a Series if `expand=False`.

```
>>> s.str.extract(r'[ab](\d)', expand=False)
0      1
1      2
2    NaN
dtype: object
```

#### 34.3.14.10 pandas.Series.str.extractall

`Series.str.extractall(pat, flags=0)`

For each subject string in the Series, extract groups from all matches of regular expression `pat`. When each subject string in the Series has exactly one match, `extractall(pat).xs(0, level='match')` is the same as `extract(pat)`.

New in version 0.18.0.

**Parameters** `pat` : string

Regular expression pattern with capturing groups

`flags` : int, default 0 (no flags)

re module flags, e.g. `re.IGNORECASE`

**Returns**

A DataFrame with one row for each match, and one column for each

group. Its rows have a `MultiIndex` with first levels that come from the subject Series. The last level is named `'match'` and indicates the order in the subject. Any capture group names in regular expression `pat` will be used for column names; otherwise capture group numbers will be used.

See also:

`extract` returns first match only (not all matches)

## Examples

A pattern with one group will return a DataFrame with one column. Indices with no matches will not appear in the result.

```
>>> s = Series(["a1a2", "b1", "c1"], index=["A", "B", "C"])
>>> s.str.extractall(r"[ab](\d)")
      match
A 0      1
  1      2
B 0      1
```

Capture group names are used for column names of the result.

```
>>> s.str.extractall(r"[ab](?P<digit>\d)")
      digit
      match
A 0      1
  1      2
B 0      1
```

A pattern with two groups will return a DataFrame with two columns.

```
>>> s.str.extractall(r"(?P<letter>[ab])(?P<digit>\d)")
      letter digit
      match
A 0      a      1
  1      a      2
B 0      b      1
```

Optional groups that do not match are NaN in the result.

```
>>> s.str.extractall(r"(?P<letter>[ab])?(?P<digit>\d)")
      letter digit
      match
A 0      a      1
  1      a      2
B 0      b      1
C 0     NaN      1
```

### 34.3.14.11 pandas.Series.str.find

`Series.str.find(sub, start=0, end=None)`

Return lowest indexes in each strings in the Series/Index where the substring is fully contained between [start:end]. Return -1 on failure. Equivalent to standard `str.find()`.

**Parameters** `sub` : str

Substring being searched

`start` : int

Left edge index

`end` : int

Right edge index

**Returns**

**found** [Series/Index of integer values]

**See also:**

[`rfind`](#) Return highest indexes in each strings

### 34.3.14.12 pandas.Series.str.findall

`Series.str.findall(pat, flags=0, **kwargs)`

Find all occurrences of pattern or regular expression in the Series/Index.

Equivalent to applying `re.findall()` to all the elements in the Series/Index.

**Parameters** `pat` : string

Pattern or regular expression.

`flags` : int, default 0

re module flags, e.g. `re.IGNORECASE` (default is 0, which means no flags).

**Returns** Series/Index of lists of strings

All non-overlapping matches of pattern or regular expression in each string of this Series/Index.

**See also:**

[`count`](#) Count occurrences of pattern or regular expression in each string of the Series/Index.

[`extractall`](#) For each string in the Series, extract groups from all matches of regular expression and return a DataFrame with one row for each match and one column for each group.

[`re.findall`](#) The equivalent re function to all non-overlapping matches of pattern or regular expression in string, as a list of strings.

### Examples

```
>>> s = pd.Series(['Lion', 'Monkey', 'Rabbit'])
```

The search for the pattern 'Monkey' returns one match:

```
>>> s.str.findall('Monkey')
0      []
1    [Monkey]
2      []
dtype: object
```

On the other hand, the search for the pattern 'MONKEY' doesn't return any match:

```
>>> s.str.findall('MONKEY')
0      []
1      []
2      []
dtype: object
```

Flags can be added to the pattern or regular expression. For instance, to find the pattern 'MONKEY' ignoring the case:

```
>>> import re
>>> s.str.findall('MONKEY', flags=re.IGNORECASE)
0      []
1    [Monkey]
2      []
dtype: object
```

When the pattern matches more than one string in the Series, all matches are returned:

```
>>> s.str.findall('on')
0    [on]
1    [on]
2      []
dtype: object
```

Regular expressions are supported too. For instance, the search for all the strings ending with the word 'on' is shown next:

```
>>> s.str.findall('on$')
0    [on]
1      []
2      []
dtype: object
```

If the pattern is found more than once in the same string, then a list of multiple strings is returned:

```
>>> s.str.findall('b')
0      []
1      []
2    [b, b]
dtype: object
```

#### 34.3.14.13 pandas.Series.str.get

`Series.str.get(i)`

Extract element from each component at specified position.

Extract element from lists, tuples, or strings in each element in the Series/Index.

**Parameters** `i`: int

Position of element to extract.

### Returns

**items** [Series/Index of objects]

### Examples

```
>>> s = pd.Series(["String",
                  (1, 2, 3),
                  ["a", "b", "c"],
                  123, -456,
                  {1:"Hello", "2":"World"}])
>>> s
0          String
1          (1, 2, 3)
2          [a, b, c]
3           123
4          -456
5    {1: 'Hello', '2': 'World'}
dtype: object
```

```
>>> s.str.get(1)
0          t
1          2
2          b
3         NaN
4         NaN
5       Hello
dtype: object
```

```
>>> s.str.get(-1)
0          g
1          3
2          c
3         NaN
4         NaN
5         NaN
dtype: object
```

#### 34.3.14.14 pandas.Series.str.index

`Series.str.index` (*sub*, *start=0*, *end=None*)

Return lowest indexes in each strings where the substring is fully contained between [start:end]. This is the same as `str.find` except instead of returning -1, it raises a `ValueError` when the substring is not found. Equivalent to standard `str.index`.

**Parameters** *sub* : str

Substring being searched

**start** : int

Left edge index

**end** : int

Right edge index

#### Returns

**found** [Series/Index of objects]

**See also:**

[\*rinter\*](#) Return highest indexes in each strings

### 34.3.14.15 pandas.Series.str.join

`Series.str.join(sep)`

Join lists contained as elements in the Series/Index with passed delimiter.

If the elements of a Series are lists themselves, join the content of these lists using the delimiter passed to the function. This function is an equivalent to `str.join()`.

**Parameters** `sep` : str

Delimiter to use between list entries.

#### Returns

**Series/Index:** object

**See also:**

[\*str.join\*](#) Standard library version of this method.

[\*Series.str.split\*](#) Split strings around given separator/delimiter.

#### Notes

If any of the lists does not contain string objects the result of the join will be *NaN*.

#### Examples

Example with a list that contains non-string elements.

```
>>> s = pd.Series(['lion', 'elephant', 'zebra'],
...               [1.1, 2.2, 3.3],
...               ['cat', np.nan, 'dog'],
...               ['cow', 4.5, 'goat'],
...               ['duck', ['swan', 'fish'], 'guppy'])
>>> s
0      [lion, elephant, zebra]
1      [1.1, 2.2, 3.3]
2      [cat, nan, dog]
3      [cow, 4.5, goat]
4      [duck, [swan, fish], guppy]
dtype: object
```

Join all lists using an '-', the lists containing object(s) of types other than str will become a NaN.

```
>>> s.str.join('-')
0    lion-elephant-zebra
1                      NaN
2                      NaN
3                      NaN
4                      NaN
dtype: object
```

#### 34.3.14.16 pandas.Series.str.len

`Series.str.len()`

Compute length of each string in the Series/Index.

##### Returns

**lengths** [Series/Index of integer values]

#### 34.3.14.17 pandas.Series.str.ljust

`Series.str.ljust(width, fillchar=' ')`

Filling right side of strings in the Series/Index with an additional character. Equivalent to `str.ljust()`.

##### Parameters

**width** : int

Minimum width of resulting string; additional characters will be filled with `fillchar`

##### **fillchar** : str

Additional character for filling, default is whitespace

##### Returns

**filled** [Series/Index of objects]

#### 34.3.14.18 pandas.Series.str.lower

`Series.str.lower()`

Convert strings in the Series/Index to lowercase.

Equivalent to `str.lower()`.

##### Returns

**Series/Index of objects**

See also:

**`Series.str.lower`** Converts all characters to lowercase.

**`Series.str.upper`** Converts all characters to uppercase.

**`Series.str.title`** Converts first character of each word to uppercase and remaining to lowercase.

**`Series.str.capitalize`** Converts first character to uppercase and remaining to lowercase.

**`Series.str.swapcase`** Converts uppercase to lowercase and lowercase to uppercase.

## Examples

```
>>> s = pd.Series(['lower', 'CAPITALS', 'this is a sentence', 'SwApCaSe'])
>>> s
0          lower
1        CAPITALS
2  this is a sentence
3        SwApCaSe
dtype: object
```

```
>>> s.str.lower()
0          lower
1        capitals
2  this is a sentence
3        swapcase
dtype: object
```

```
>>> s.str.upper()
0          LOWER
1        CAPITALS
2  THIS IS A SENTENCE
3        SWAPCASE
dtype: object
```

```
>>> s.str.title()
0          Lower
1        Capitals
2  This Is A Sentence
3        Swapcase
dtype: object
```

```
>>> s.str.capitalize()
0          Lower
1        Capitals
2  This is a sentence
3        Swapcase
dtype: object
```

```
>>> s.str.swapcase()
0          LOWER
1        capitals
2  THIS IS A SENTENCE
3        sWaPcAsE
dtype: object
```

### 34.3.14.19 pandas.Series.str.lstrip

`Series.str.lstrip` (*to\_strip=None*)

Strip whitespace (including newlines) from each string in the Series/Index from left side. Equivalent to `str.lstrip()`.

#### Returns

**stripped** [Series/Index of objects]

#### 34.3.14.20 pandas.Series.str.match

`Series.str.match(pat, case=True, flags=0, na=nan, as_indexer=None)`

Determine if each string matches a regular expression.

**Parameters** `pat` : string

Character sequence or regular expression

**case** : boolean, default True

If True, case sensitive

**flags** : int, default 0 (no flags)

re module flags, e.g. re.IGNORECASE

**na** [default NaN, fill value for missing values.]

**as\_indexer**

Deprecated since version 0.21.0.

**Returns**

Series/array of boolean values

**See also:**

[`contains`](#) analogous, but less strict, relying on re.search instead of re.match

[`extract`](#) extract matched groups

#### 34.3.14.21 pandas.Series.str.normalize

`Series.str.normalize(form)`

Return the Unicode normal form for the strings in the Series/Index. For more information on the forms, see the `unicodedata.normalize()`.

**Parameters** `form` : {'NFC', 'NFKC', 'NFD', 'NFKD'}

Unicode form

**Returns**

**normalized** [Series/Index of objects]

#### 34.3.14.22 pandas.Series.str.pad

`Series.str.pad(width, side='left', fillchar=' ')`

Pad strings in the Series/Index with an additional character to specified side.

**Parameters** `width` : int

Minimum width of resulting string; additional characters will be filled with spaces

**side** [{'left', 'right', 'both'}, default 'left']

**fillchar** : str

Additional character for filling, default is whitespace

**Returns****padded** [Series/Index of objects]**34.3.14.23 pandas.Series.str.partition**`Series.str.partition` (*pat*=' ', *expand*=True)

Split the string at the first occurrence of *sep*, and return 3 elements containing the part before the separator, the separator itself, and the part after the separator. If the separator is not found, return 3 elements containing the string itself, followed by two empty strings.

**Parameters** *pat* : string, default whitespace

String to split on.

**expand** : bool, default True

- If True, return DataFrame/MultiIndex expanding dimensionality.
- If False, return Series/Index.

**Returns****split** [DataFrame/MultiIndex or Series/Index of objects]**See also:**[`rpartition`](#) Split the string at the last occurrence of *sep***Examples**

```
>>> s = Series(['A_B_C', 'D_E_F', 'X'])
0    A_B_C
1    D_E_F
2         X
dtype: object
```

```
>>> s.str.partition('_')
   0  1  2
0  A  _  B_C
1  D  _  E_F
2  X
```

```
>>> s.str.rpartition('_')
   0  1  2
0  A_B  _  C
1  D_E  _  F
2         X
```

**34.3.14.24 pandas.Series.str.repeat**`Series.str.repeat` (*repeats*)

Duplicate each string in the Series/Index by indicated number of times.

**Parameters** *repeats* : int or array

Same value for all (int) or different value per (array)

**Returns****repeated** [Series/Index of objects]**34.3.14.25 pandas.Series.str.replace**`Series.str.replace(pat, repl, n=-1, case=None, flags=0, regex=True)`

Replace occurrences of pattern/regex in the Series/Index with some other string. Equivalent to `str.replace()` or `re.sub()`.

**Parameters** `pat` : string or compiled regex

String can be a character sequence or regular expression.

New in version 0.20.0: `pat` also accepts a compiled regex.**repl** : string or callable

Replacement string or a callable. The callable is passed the regex match object and must return a replacement string to be used. See `re.sub()`.

New in version 0.20.0: `repl` also accepts a callable.**n** : int, default -1 (all)

Number of replacements to make from start

**case** : boolean, default None

- If True, case sensitive (the default if `pat` is a string)
- Set to False for case insensitive
- Cannot be set if `pat` is a compiled regex

**flags** : int, default 0 (no flags)

- re module flags, e.g. `re.IGNORECASE`
- Cannot be set if `pat` is a compiled regex

**regex** : boolean, default True

- If True, assumes the passed-in pattern is a regular expression.
- If False, treats the pattern as a literal string
- Cannot be set to False if `pat` is a compiled regex or `repl` is a callable.

New in version 0.23.0.

**Returns****replaced** [Series/Index of objects]**Raises** `ValueError`

- if `regex` is False and `repl` is a callable or `pat` is a compiled regex
- if `pat` is a compiled regex and `case` or `flags` is set

**Notes**

When `pat` is a compiled regex, all flags should be included in the compiled regex. Use of `case`, `flags`, or `regex=False` with a compiled regex will raise an error.

## Examples

When *pat* is a string and *regex* is True (the default), the given *pat* is compiled as a regex. When *repl* is a string, it replaces matching regex patterns as with `re.sub()`. NaN value(s) in the Series are left as is:

```
>>> pd.Series(['foo', 'fuz', np.nan]).str.replace('f.', 'ba', regex=True)
0    bao
1    baz
2    NaN
dtype: object
```

When *pat* is a string and *regex* is False, every *pat* is replaced with *repl* as with `str.replace()`:

```
>>> pd.Series(['f.o', 'fuz', np.nan]).str.replace('f.', 'ba', regex=False)
0    bao
1    fuz
2    NaN
dtype: object
```

When *repl* is a callable, it is called on every *pat* using `re.sub()`. The callable should expect one positional argument (a regex object) and return a string.

To get the idea:

```
>>> pd.Series(['foo', 'fuz', np.nan]).str.replace('f', repr)
0    <_sre.SRE_Match object; span=(0, 1), match='f'>oo
1    <_sre.SRE_Match object; span=(0, 1), match='f'>uz
2    NaN
dtype: object
```

Reverse every lowercase alphabetic word:

```
>>> repl = lambda m: m.group(0)[::-1]
>>> pd.Series(['foo 123', 'bar baz', np.nan]).str.replace(r'[a-z]+', repl)
0    oof 123
1    rab zab
2    NaN
dtype: object
```

Using regex groups (extract second group and swap case):

```
>>> pat = r"(?P<one>\w+) (?P<two>\w+) (?P<three>\w+)"
>>> repl = lambda m: m.group('two').swapcase()
>>> pd.Series(['One Two Three', 'Foo Bar Baz']).str.replace(pat, repl)
0    tWO
1    bAR
dtype: object
```

Using a compiled regex with flags

```
>>> regex_pat = re.compile(r'FUZ', flags=re.IGNORECASE)
>>> pd.Series(['foo', 'fuz', np.nan]).str.replace(regex_pat, 'bar')
0    foo
1    bar
2    NaN
dtype: object
```

#### 34.3.14.26 pandas.Series.str.rfind

`Series.str.rfind(sub, start=0, end=None)`

Return highest indexes in each strings in the Series/Index where the substring is fully contained between [start:end]. Return -1 on failure. Equivalent to standard `str.rfind()`.

**Parameters** `sub` : str

Substring being searched

`start` : int

Left edge index

`end` : int

Right edge index

**Returns**

**found** [Series/Index of integer values]

**See also:**

[`find`](#) Return lowest indexes in each strings

#### 34.3.14.27 pandas.Series.str.rindex

`Series.str.rindex(sub, start=0, end=None)`

Return highest indexes in each strings where the substring is fully contained between [start:end]. This is the same as `str.rfind` except instead of returning -1, it raises a `ValueError` when the substring is not found. Equivalent to standard `str.rindex`.

**Parameters** `sub` : str

Substring being searched

`start` : int

Left edge index

`end` : int

Right edge index

**Returns**

**found** [Series/Index of objects]

**See also:**

[`index`](#) Return lowest indexes in each strings

#### 34.3.14.28 pandas.Series.str.rjust

`Series.str.rjust(width, fillchar='')`

Filling left side of strings in the Series/Index with an additional character. Equivalent to `str.rjust()`.

**Parameters** `width` : int

Minimum width of resulting string; additional characters will be filled with `fillchar`

**fillchar** : str

Additional character for filling, default is whitespace

**Returns**

**filled** [Series/Index of objects]

### 34.3.14.29 pandas.Series.str.rpartition

`Series.str.rpartition(pat=' ', expand=True)`

Split the string at the last occurrence of *sep*, and return 3 elements containing the part before the separator, the separator itself, and the part after the separator. If the separator is not found, return 3 elements containing two empty strings, followed by the string itself.

**Parameters** **pat** : string, default whitespace

String to split on.

**expand** : bool, default True

- If True, return DataFrame/MultiIndex expanding dimensionality.
- If False, return Series/Index.

**Returns**

**split** [DataFrame/MultiIndex or Series/Index of objects]

**See also:**

[\*partition\*](#) Split the string at the first occurrence of *sep*

### Examples

```
>>> s = Series(['A_B_C', 'D_E_F', 'X'])
0    A_B_C
1    D_E_F
2         X
dtype: object
```

```
>>> s.str.partition('_')
   0  1  2
0  A  _  B_C
1  D  _  E_F
2  X
```

```
>>> s.str.rpartition('_')
   0  1  2
0  A_B  _  C
1  D_E  _  F
2         X
```

#### 34.3.14.30 pandas.Series.str.rstrip

`Series.str.rstrip` (*to\_strip=None*)

Strip whitespace (including newlines) from each string in the Series/Index from right side. Equivalent to `str.rstrip()`.

**Returns**

**stripped** [Series/Index of objects]

#### 34.3.14.31 pandas.Series.str.slice

`Series.str.slice` (*start=None, stop=None, step=None*)

Slice substrings from each element in the Series/Index

**Parameters**

**start** [int or None]

**stop** [int or None]

**step** [int or None]

**Returns**

**sliced** [Series/Index of objects]

#### 34.3.14.32 pandas.Series.str.slice\_replace

`Series.str.slice_replace` (*start=None, stop=None, repl=None*)

Replace a positional slice of a string with another value.

**Parameters** **start** : int, optional

Left index position to use for the slice. If not specified (None), the slice is unbounded on the left, i.e. slice from the start of the string.

**stop** : int, optional

Right index position to use for the slice. If not specified (None), the slice is unbounded on the right, i.e. slice until the end of the string.

**repl** : str, optional

String for replacement. If not specified (None), the sliced region is replaced with an empty string.

**Returns** **replaced** : Series or Index

Same type as the original object.

**See also:**

[`Series.str.slice`](#) Just slicing without replacement.

#### Examples

```
>>> s = pd.Series(['a', 'ab', 'abc', 'abdc', 'abcde'])
>>> s
0      a
1     ab
2    abc
3   abdc
4  abcde
dtype: object
```

Specify just *start*, meaning replace *start* until the end of the string with *repl*.

```
>>> s.str.slice_replace(1, repl='X')
0    aX
1    aX
2    aX
3    aX
4    aX
dtype: object
```

Specify just *stop*, meaning the start of the string to *stop* is replaced with *repl*, and the rest of the string is included.

```
>>> s.str.slice_replace(stop=2, repl='X')
0      X
1      X
2     Xc
3    Xdc
4   Xcde
dtype: object
```

Specify *start* and *stop*, meaning the slice from *start* to *stop* is replaced with *repl*. Everything before or after *start* and *stop* is included as is.

```
>>> s.str.slice_replace(start=1, stop=3, repl='X')
0      aX
1      aX
2      aX
3     aXc
4    aXde
dtype: object
```

### 34.3.14.33 pandas.Series.str.split

`Series.str.split` (*pat=None, n=-1, expand=False*)

Split strings around given separator/delimiter.

Split each string in the caller's values by given pattern, propagating NaN values. Equivalent to `str.split()`.

**Parameters** *pat* : str, optional

String or regular expression to split on. If not specified, split on whitespace.

**n** : int, default -1 (all)

Limit number of splits in output. None, 0 and -1 will be interpreted as return all splits.

**expand** : bool, default False

Expand the splitted strings into separate columns.

- If `True`, return `DataFrame`/`MultiIndex` expanding dimensionality.
- If `False`, return `Series`/`Index`, containing lists of strings.

**Returns Series, Index, DataFrame or MultiIndex**

Type matches caller unless `expand=True` (see Notes).

**See also:**

`str.split` Standard library version of this method.

`Series.str.get_dummies` Split each string into dummy variables.

`Series.str.partition` Split string on a separator, returning the before, separator, and after components.

**Notes**

The handling of the `n` keyword depends on the number of found splits:

- If found splits  $> n$ , make first  $n$  splits only
- If found splits  $\leq n$ , make all splits
- If for a certain row the number of found splits  $< n$ , append `None` for padding up to  $n$  if `expand=True`

If using `expand=True`, `Series` and `Index` callers return `DataFrame` and `MultiIndex` objects, respectively.

**Examples**

```
>>> s = pd.Series(["this is good text", "but this is even better"])
```

By default, `split` will return an object of the same size having lists containing the split elements

```
>>> s.str.split()
0      [this, is, good, text]
1      [but, this, is, even, better]
dtype: object
>>> s.str.split("random")
0      [this is good text]
1      [but this is even better]
dtype: object
```

When using `expand=True`, the split elements will expand out into separate columns.

For `Series` object, output return type is `DataFrame`.

```
>>> s.str.split(expand=True)
   0      1      2      3      4
0  this   is  good  text  None
1  but   this   is  even  better
>>> s.str.split(" is ", expand=True)
   0      1
0   this   good text
1  but this   even better
```

For `Index` object, output return type is `MultiIndex`.

```
>>> i = pd.Index(["ba 100 001", "ba 101 002", "ba 102 003"])
>>> i.str.split(expand=True)
MultiIndex(levels=[['ba'], ['100', '101', '102'], ['001', '002', '003']],
            labels=[[0, 0, 0], [0, 1, 2], [0, 1, 2]])
```

Parameter *n* can be used to limit the number of splits in the output.

```
>>> s.str.split("is", n=1)
0      [th,  is good text]
1    [but th,  is even better]
dtype: object
>>> s.str.split("is", n=1, expand=True)
      0      1
0    th    is good text
1  but th  is even better
```

If NaN is present, it is propagated throughout the columns during the split.

```
>>> s = pd.Series(["this is good text", "but this is even better", np.nan])
>>> s.str.split(n=3, expand=True)
      0      1      2      3
0  this    is  good    text
1  but   this    is  even better
2   NaN   NaN   NaN    NaN
```

#### 34.3.14.34 pandas.Series.str.rsplit

`Series.str.rsplit` (*pat=None, n=-1, expand=False*)

Split each string in the Series/Index by the given delimiter string, starting at the end of the string and working to the front. Equivalent to `str.rsplit()`.

**Parameters** *pat* : string, default None

Separator to split on. If None, splits on whitespace

*n* : int, default -1 (all)

None, 0 and -1 will be interpreted as return all splits

**expand** : bool, default False

- If True, return DataFrame/MultiIndex expanding dimensionality.
- If False, return Series/Index.

**Returns**

`split` [Series/Index or DataFrame/MultiIndex of objects]

#### 34.3.14.35 pandas.Series.str.startswith

`Series.str.startswith` (*pat, na=nan*)

Test if the start of each string element matches a pattern.

Equivalent to `str.startswith()`.

**Parameters** *pat* : str

Character sequence. Regular expressions are not accepted.

**na** : object, default NaN

Object shown if element tested is not a string.

#### Returns Series or Index of bool

A Series of booleans indicating whether the given pattern matches the start of each string element.

#### See also:

**str.startswith** Python standard library string method.

**Series.str.endswith** Same as startswith, but tests the end of string.

**Series.str.contains** Tests if string element contains a pattern.

#### Examples

```
>>> s = pd.Series(['bat', 'Bear', 'cat', np.nan])
>>> s
0    bat
1   Bear
2    cat
3   NaN
dtype: object
```

```
>>> s.str.startswith('b')
0    True
1   False
2   False
3   NaN
dtype: object
```

Specifying *na* to be *False* instead of *NaN*.

```
>>> s.str.startswith('b', na=False)
0    True
1   False
2   False
3   False
dtype: bool
```

#### 34.3.14.36 pandas.Series.str.strip

**Series.str.strip** (*to\_strip=None*)

Strip whitespace (including newlines) from each string in the Series/Index from left and right sides. Equivalent to `str.strip()`.

#### Returns

**stripped** [Series/Index of objects]

### 34.3.14.37 pandas.Series.str.swapcase

`Series.str.swapcase()`

Convert strings in the Series/Index to be swapcased.

Equivalent to `str.swapcase()`.

#### Returns

Series/Index of objects

See also:

**`Series.str.lower`** Converts all characters to lowercase.

**`Series.str.upper`** Converts all characters to uppercase.

**`Series.str.title`** Converts first character of each word to uppercase and remaining to lowercase.

**`Series.str.capitalize`** Converts first character to uppercase and remaining to lowercase.

**`Series.str.swapcase`** Converts uppercase to lowercase and lowercase to uppercase.

#### Examples

```
>>> s = pd.Series(['lower', 'CAPITALS', 'this is a sentence', 'SwApCaSe'])
>>> s
0          lower
1        CAPITALS
2  this is a sentence
3        SwApCaSe
dtype: object
```

```
>>> s.str.lower()
0          lower
1        capitals
2  this is a sentence
3        swapcase
dtype: object
```

```
>>> s.str.upper()
0          LOWER
1        CAPITALS
2  THIS IS A SENTENCE
3        SWAPCASE
dtype: object
```

```
>>> s.str.title()
0          Lower
1        Capitals
2  This Is A Sentence
3        Swapcase
dtype: object
```

```
>>> s.str.capitalize()
0          Lower
1        Capitals
```

(continues on next page)

(continued from previous page)

```

2    This is a sentence
3                Swapcase
dtype: object

```

```

>>> s.str.swapcase()
0                LOWER
1            capitals
2    THIS IS A SENTENCE
3            sWaPcAsE
dtype: object

```

#### 34.3.14.38 pandas.Series.str.title

`Series.str.title()`

Convert strings in the Series/Index to titlecase.

Equivalent to `str.title()`.

##### Returns

**Series/Index of objects**

**See also:**

**`Series.str.lower`** Converts all characters to lowercase.

**`Series.str.upper`** Converts all characters to uppercase.

**`Series.str.title`** Converts first character of each word to uppercase and remaining to lowercase.

**`Series.str.capitalize`** Converts first character to uppercase and remaining to lowercase.

**`Series.str.swapcase`** Converts uppercase to lowercase and lowercase to uppercase.

##### Examples

```

>>> s = pd.Series(['lower', 'CAPITALS', 'this is a sentence', 'SwApCaSe'])
>>> s
0                lower
1            CAPITALS
2    this is a sentence
3            SwApCaSe
dtype: object

```

```

>>> s.str.lower()
0                lower
1            capitals
2    this is a sentence
3            swapcase
dtype: object

```

```

>>> s.str.upper()
0                LOWER
1            CAPITALS
2    THIS IS A SENTENCE

```

(continues on next page)

(continued from previous page)

```
3          SWAPCASE
dtype: object
```

```
>>> s.str.title()
0          Lower
1        Capitals
2  This Is A Sentence
3        Swapcase
dtype: object
```

```
>>> s.str.capitalize()
0          Lower
1        Capitals
2  This is a sentence
3        Swapcase
dtype: object
```

```
>>> s.str.swapcase()
0          LOWER
1        capitals
2  THIS IS A SENTENCE
3        sWaPcAsE
dtype: object
```

### 34.3.14.39 pandas.Series.str.translate

`Series.str.translate(table, deletechars=None)`

Map all characters in the string through the given mapping table. Equivalent to standard `str.translate()`. Note that the optional argument `deletechars` is only valid if you are using python 2. For python 3, character deletion should be specified via the `table` argument.

**Parameters** `table` : dict (python 3), str or None (python 2)

In python 3, `table` is a mapping of Unicode ordinals to Unicode ordinals, strings, or None. Unmapped characters are left untouched. Characters mapped to None are deleted. `str.maketrans()` is a helper function for making translation tables. In python 2, `table` is either a string of length 256 or None. If the `table` argument is None, no translation is applied and the operation simply removes the characters in `deletechars`. `string.maketrans()` is a helper function for making translation tables.

**deletechars** : str, optional (python 2)

A string of characters to delete. This argument is only valid in python 2.

**Returns**

**translated** [Series/Index of objects]

### 34.3.14.40 pandas.Series.str.upper

`Series.str.upper()`

Convert strings in the Series/Index to uppercase.

Equivalent to `str.upper()`.

**Returns****Series/Index of objects****See also:***Series.str.lower* Converts all characters to lowercase.*Series.str.upper* Converts all characters to uppercase.*Series.str.title* Converts first character of each word to uppercase and remaining to lowercase.*Series.str.capitalize* Converts first character to uppercase and remaining to lowercase.*Series.str.swapcase* Converts uppercase to lowercase and lowercase to uppercase.**Examples**

```
>>> s = pd.Series(['lower', 'CAPITALS', 'this is a sentence', 'SwApCaSe'])
>>> s
0          lower
1        CAPITALS
2    this is a sentence
3          SwApCaSe
dtype: object
```

```
>>> s.str.lower()
0          lower
1        capitals
2    this is a sentence
3          swapcase
dtype: object
```

```
>>> s.str.upper()
0          LOWER
1        CAPITALS
2    THIS IS A SENTENCE
3          SWAPCASE
dtype: object
```

```
>>> s.str.title()
0          Lower
1        Capitals
2    This Is A Sentence
3          Swapcase
dtype: object
```

```
>>> s.str.capitalize()
0          Lower
1        Capitals
2    This is a sentence
3          Swapcase
dtype: object
```

```
>>> s.str.swapcase()
0          LOWER
```

(continues on next page)

(continued from previous page)

```
1          capitals
2  THIS IS A SENTENCE
3          sWaPcAsE
dtype: object
```

#### 34.3.14.41 pandas.Series.str.wrap

`Series.str.wrap` (*width*, *\*\*kwargs*)

Wrap long strings in the Series/Index to be formatted in paragraphs with length less than a given width.

This method has the same keyword parameters and defaults as `textwrap.TextWrapper`.

**Parameters** `width` : int

Maximum line-width

**expand\_tabs** : bool, optional

If true, tab characters will be expanded to spaces (default: True)

**replace\_whitespace** : bool, optional

If true, each whitespace character (as defined by `string.whitespace`) remaining after tab expansion will be replaced by a single space (default: True)

**drop\_whitespace** : bool, optional

If true, whitespace that, after wrapping, happens to end up at the beginning or end of a line is dropped (default: True)

**break\_long\_words** : bool, optional

If true, then words longer than width will be broken in order to ensure that no lines are longer than width. If it is false, long words will not be broken, and some lines may be longer than width. (default: True)

**break\_on\_hyphens** : bool, optional

If true, wrapping will occur preferably on whitespace and right after hyphens in compound words, as it is customary in English. If false, only whitespaces will be considered as potentially good places for line breaks, but you need to set `break_long_words` to false if you want truly insecable words. (default: True)

**Returns**

**wrapped** [Series/Index of objects]

#### Notes

Internally, this method uses a `textwrap.TextWrapper` instance with default settings. To achieve behavior matching R's `stringr` library `str_wrap` function, use the arguments:

- `expand_tabs = False`
- `replace_whitespace = True`
- `drop_whitespace = True`
- `break_long_words = False`
- `break_on_hyphens = False`

## Examples

```
>>> s = pd.Series(['line to be wrapped', 'another line to be wrapped'])
>>> s.str.wrap(12)
0          line to be\nwrapped
1  another line\nto be\nwrapped
```

### 34.3.14.42 pandas.Series.str.zfill

`Series.str.zfill(width)`

Filling left side of strings in the Series/Index with 0. Equivalent to `str.zfill()`.

**Parameters** `width`: int

Minimum width of resulting string; additional characters will be filled with 0

**Returns**

**filled** [Series/Index of objects]

### 34.3.14.43 pandas.Series.str.isalnum

`Series.str.isalnum()`

Check whether all characters in each string in the Series/Index are alphanumeric. Equivalent to `str.isalnum()`.

**Returns**

**is** [Series/array of boolean values]

### 34.3.14.44 pandas.Series.str.isalpha

`Series.str.isalpha()`

Check whether all characters in each string in the Series/Index are alphabetic. Equivalent to `str.isalpha()`.

**Returns**

**is** [Series/array of boolean values]

### 34.3.14.45 pandas.Series.str.isdigit

`Series.str.isdigit()`

Check whether all characters in each string in the Series/Index are digits. Equivalent to `str.isdigit()`.

**Returns**

**is** [Series/array of boolean values]

### 34.3.14.46 pandas.Series.str.isspace

`Series.str.isspace()`

Check whether all characters in each string in the Series/Index are whitespace. Equivalent to `str.isspace()`.

**Returns**

**is** [Series/array of boolean values]

#### **34.3.14.47 pandas.Series.str.islower**

`Series.str.islower()`

Check whether all characters in each string in the Series/Index are lowercase. Equivalent to `str.islower()`.

##### **Returns**

**is** [Series/array of boolean values]

#### **34.3.14.48 pandas.Series.str.isupper**

`Series.str.isupper()`

Check whether all characters in each string in the Series/Index are uppercase. Equivalent to `str.isupper()`.

##### **Returns**

**is** [Series/array of boolean values]

#### **34.3.14.49 pandas.Series.str.istitle**

`Series.str.istitle()`

Check whether all characters in each string in the Series/Index are titlecase. Equivalent to `str.istitle()`.

##### **Returns**

**is** [Series/array of boolean values]

#### **34.3.14.50 pandas.Series.str.isnumeric**

`Series.str.isnumeric()`

Check whether all characters in each string in the Series/Index are numeric. Equivalent to `str.isnumeric()`.

##### **Returns**

**is** [Series/array of boolean values]

#### **34.3.14.51 pandas.Series.str.isdecimal**

`Series.str.isdecimal()`

Check whether all characters in each string in the Series/Index are decimal. Equivalent to `str.isdecimal()`.

##### **Returns**

**is** [Series/array of boolean values]

#### **34.3.14.52 pandas.Series.str.get\_dummies**

`Series.str.get_dummies(sep='|')`

Split each string in the Series by sep and return a frame of dummy/indicator variables.

**Parameters** `sep`: string, default “|”

String to split on.

**Returns****dummies** [DataFrame]**See also:**`pandas.get_dummies`**Examples**

```
>>> Series(['a|b', 'a', 'a|c']).str.get_dummies()
   a  b  c
0  1  1  0
1  1  0  0
2  1  0  1
```

```
>>> Series(['a|b', np.nan, 'a|c']).str.get_dummies()
   a  b  c
0  1  1  0
1  0  0  0
2  1  0  1
```

### 34.3.15 Categorical

Pandas defines a custom data type for representing data that can take only a limited, fixed set of values. The dtype of a `Categorical` can be described by a `pandas.api.types.CategoricalDtype`.

---

<code>api.types.CategoricalDtype([categories, ordered])</code>	Type for categorical data with the categories and orderedness
--	---

---

#### 34.3.15.1 pandas.api.types.CategoricalDtype

**class** `pandas.api.types.CategoricalDtype` (*categories=None, ordered=None*)

Type for categorical data with the categories and orderedness

Changed in version 0.21.0.

**Parameters** **categories** : sequence, optional

Must be unique, and must not contain any nulls.

**ordered** [bool, default False]

**See also:**`pandas.Categorical`**Notes**

This class is useful for specifying the type of a `Categorical` independent of the values. See `CategoricalDtype` for more.

## Examples

```
>>> t = CategoricalDtype(categories=['b', 'a'], ordered=True)
>>> pd.Series(['a', 'b', 'a', 'c'], dtype=t)
0      a
1      b
2      a
3     NaN
dtype: category
Categories (2, object): [b < a]
```

## Attributes

<i>categories</i>	An Index containing the unique categories allowed.
<i>ordered</i>	Whether the categories have an ordered relationship

### pandas.api.types.CategoricalDtype.categories

`CategoricalDtype.categories`  
An Index containing the unique categories allowed.

### pandas.api.types.CategoricalDtype.ordered

`CategoricalDtype.ordered`  
Whether the categories have an ordered relationship

## Methods

None	
------	--

<i>api.types.CategoricalDtype.categories</i>	An Index containing the unique categories allowed.
<i>api.types.CategoricalDtype.ordered</i>	Whether the categories have an ordered relationship

Categorical data can be stored in a *pandas.Categorical*

<i>Categorical</i> (values[, categories, ordered, ...])	Represents a categorical variable in classic R / S-plus fashion
---	---

### 34.3.15.2 pandas.Categorical

**class** `pandas.Categorical` (*values, categories=None, ordered=None, dtype=None, fastpath=False*)  
Represents a categorical variable in classic R / S-plus fashion

*Categoricals* can only take on only a limited, and usually fixed, number of possible values (*categories*). In contrast to statistical categorical variables, a *Categorical* might have an order, but numerical operations (additions, divisions, ...) are not possible.

All values of the *Categorical* are either in *categories* or *np.nan*. Assigning values outside of *categories* will raise a *ValueError*. Order is defined by the order of the *categories*, not lexical order of the values.

**Parameters** **values** : list-like

The values of the categorical. If categories are given, values not in categories will be replaced with NaN.

**categories** : Index-like (unique), optional

The unique categories for this categorical. If not given, the categories are assumed to be the unique values of values.

**ordered** : boolean, (default False)

Whether or not this categorical is treated as a ordered categorical. If not given, the resulting categorical will not be ordered.

**dtype** : CategoricalDtype

An instance of *CategoricalDtype* to use for this categorical

New in version 0.21.0.

**Raises** **ValueError**

If the categories do not validate.

**TypeError**

If an explicit `ordered=True` is given but no *categories* and the *values* are not sortable.

**See also:**

*pandas.api.types.CategoricalDtype* Type for categorical data

*CategoricalIndex* An Index with an underlying *Categorical*

## Notes

See the [user guide](#) for more.

## Examples

```
>>> pd.Categorical([1, 2, 3, 1, 2, 3])
[1, 2, 3, 1, 2, 3]
Categories (3, int64): [1, 2, 3]
```

```
>>> pd.Categorical(['a', 'b', 'c', 'a', 'b', 'c'])
[a, b, c, a, b, c]
Categories (3, object): [a, b, c]
```

Ordered *Categoricals* can be sorted according to the custom order of the categories and can have a min and max value.

```

>>> c = pd.Categorical(['a', 'b', 'c', 'a', 'b', 'c'], ordered=True,
...                     categories=['c', 'b', 'a'])
>>> c
[a, b, c, a, b, c]
Categories (3, object): [c < b < a]
>>> c.min()
'c'

```

## Attributes

<code>categories</code>	The categories of this categorical.
<code>codes</code>	The category codes of this categorical.
<code>ordered</code>	Whether the categories have an ordered relationship
<code>dtype</code>	The <code>CategoricalDtype</code> for this instance

## pandas.Categorical.categories

### `Categorical.categories`

The categories of this categorical.

Setting assigns new values to each category (effectively a rename of each individual category).

The assigned value has to be a list-like object. All items must be unique and the number of items in the new categories must be the same as the number of items in the old categories.

Assigning to `categories` is an inplace operation!

#### **Raises** `ValueError`

If the new categories do not validate as categories or if the number of new categories is unequal the number of old categories

#### **See also:**

`rename_categories`, `reorder_categories`, `add_categories`, `remove_categories`, `remove_unused_categories`, `set_categories`

## pandas.Categorical.codes

### `Categorical.codes`

The category codes of this categorical.

Level codes are an array of integer which are the positions of the real values in the categories array.

There is no setter, use the other categorical methods and the normal item setter to change values in the categorical.

## pandas.Categorical.ordered

### `Categorical.ordered`

Whether the categories have an ordered relationship

## pandas.Categorical.dtype

`Categorical.dtype`

The *CategoricalDtype* for this instance

## Methods

<code>from_codes(codes, categories[, ordered])</code>	Make a Categorical type from codes and categories arrays.
<code>__array__([dtype])</code>	The numpy array interface.

## pandas.Categorical.from\_codes

**classmethod** `Categorical.from_codes(codes, categories, ordered=False)`

Make a Categorical type from codes and categories arrays.

This constructor is useful if you already have codes and categories and so do not need the (computation intensive) factorization step, which is usually done on the constructor.

If your data does not follow this convention, please use the normal constructor.

**Parameters** `codes` : array-like, integers

An integer array, where each integer points to a category in categories or -1 for NaN

**categories** : index-like

The categories for the categorical. Items need to be unique.

**ordered** : boolean, (default False)

Whether or not this categorical is treated as a ordered categorical. If not given, the resulting categorical will be unordered.

## pandas.Categorical.\_\_array\_\_

`Categorical.__array__(dtype=None)`

The numpy array interface.

**Returns** `values` : numpy array

A numpy array of either the specified dtype or, if dtype==None (default), the same dtype as `categorical.categories.dtype`

The alternative `Categorical.from_codes()` constructor can be used when you have the categories and integer codes already:

<code>Categorical.from_codes(codes, categories[, ...])</code>	Make a Categorical type from codes and categories arrays.
---	---

The dtype information is available on the `Categorical`

<code>Categorical.dtype</code>	The <code>CategoricalDtype</code> for this instance
<code>Categorical.categories</code>	The categories of this categorical.
<code>Categorical.ordered</code>	Whether the categories have an ordered relationship
<code>Categorical.codes</code>	The category codes of this categorical.

`np.asarray(categorical)` works by implementing the array interface. Be aware, that this converts the Categorical back to a NumPy array, so categories and order information is not preserved!

<code>Categorical.__array__([dtype])</code>	The numpy array interface.
---	----------------------------

A Categorical can be stored in a Series or DataFrame. To create a Series of dtype category, use `cat = s.astype(dtype)` or `Series(..., dtype=dtype)` where dtype is either

- the string 'category'
- an instance of `CategoricalDtype`.

If the Series is of dtype CategoricalDtype, `Series.cat` can be used to change the categorical data. This accessor is similar to the `Series.dt` or `Series.str` and has the following usable methods and properties:

<code>Series.cat.categories</code>	The categories of this categorical.
<code>Series.cat.ordered</code>	Whether the categories have an ordered relationship
<code>Series.cat.codes</code>	

### 34.3.15.3 pandas.Series.cat.categories

`Series.cat.categories`

The categories of this categorical.

Setting assigns new values to each category (effectively a rename of each individual category).

The assigned value has to be a list-like object. All items must be unique and the number of items in the new categories must be the same as the number of items in the old categories.

Assigning to `categories` is a inplace operation!

#### Raises ValueError

If the new categories do not validate as categories or if the number of new categories is unequal the number of old categories

See also:

`rename_categories`, `reorder_categories`, `add_categories`, `remove_categories`, `remove_unused_categories`, `set_categories`

### 34.3.15.4 pandas.Series.cat.ordered

`Series.cat.ordered`

Whether the categories have an ordered relationship

### 34.3.15.5 pandas.Series.cat.codes

`Series.cat.codes`

<code>Series.cat.rename_categories(*args, **kwargs)</code>	Renames categories.
<code>Series.cat.reorder_categories(*args, **kwargs)</code>	Reorders categories as specified in new_categories.
<code>Series.cat.add_categories(*args, **kwargs)</code>	Add new categories.
<code>Series.cat.remove_categories(*args, **kwargs)</code>	Removes the specified categories.
<code>Series.cat.remove_unused_categories(*args, ...)</code>	Removes categories which are not used.
<code>Series.cat.set_categories(*args, **kwargs)</code>	Sets the categories to the specified new_categories.
<code>Series.cat.as_ordered(*args, **kwargs)</code>	Sets the Categorical to be ordered
<code>Series.cat.as_unordered(*args, **kwargs)</code>	Sets the Categorical to be unordered

### 34.3.15.6 pandas.Series.cat.rename\_categories

`Series.cat.rename_categories(*args, **kwargs)`

Renames categories.

**Parameters** `new_categories` : list-like, dict-like or callable

- list-like: all items must be unique and the number of items in the new categories must match the existing number of categories.
- dict-like: specifies a mapping from old categories to new. Categories not contained in the mapping are passed through and extra categories in the mapping are ignored.
- callable : a callable that is called on all items in the old categories and whose return values comprise the new categories.

New in version 0.21.0.

New in version 0.23.0.

**Warning:** Currently, Series are considered list like. In a future version of pandas they'll be considered dict-like.

**inplace** : boolean (default: False)

Whether or not to rename the categories inplace or return a copy of this categorical with renamed categories.

**Returns** `cat` : Categorical or None

With `inplace=False`, the new categorical is returned. With `inplace=True`, there is no return value.

**Raises** `ValueError`

If new categories are list-like and do not have the same number of items than the current categories or do not validate as categories

**See also:**

`reorder_categories`, `add_categories`, `remove_categories`,  
`remove_unused_categories`, `set_categories`

## Examples

```
>>> c = Categorical(['a', 'a', 'b'])
>>> c.rename_categories([0, 1])
[0, 0, 1]
Categories (2, int64): [0, 1]
```

For dict-like `new_categories`, extra keys are ignored and categories not in the dictionary are passed through

```
>>> c.rename_categories({'a': 'A', 'c': 'C'})
[A, A, b]
Categories (2, object): [A, b]
```

You may also provide a callable to create the new categories

```
>>> c.rename_categories(lambda x: x.upper())
[A, A, B]
Categories (2, object): [A, B]
```

### 34.3.15.7 pandas.Series.cat.reorder\_categories

`Series.cat.reorder_categories(*args, **kwargs)`

Reorders categories as specified in `new_categories`.

`new_categories` need to include all old categories and no new category items.

**Parameters** `new_categories` : Index-like

The categories in new order.

**ordered** : boolean, optional

Whether or not the categorical is treated as a ordered categorical. If not given, do not change the ordered information.

**inplace** : boolean (default: False)

Whether or not to reorder the categories inplace or return a copy of this categorical with reordered categories.

**Returns**

**cat** [Categorical with reordered categories or None if inplace.]

**Raises** `ValueError`

If the new categories do not contain all old category items or any new ones

**See also:**

`rename_categories`, `add_categories`, `remove_categories`,  
`remove_unused_categories`, `set_categories`

### 34.3.15.8 pandas.Series.cat.add\_categories

`Series.cat.add_categories(*args, **kwargs)`

Add new categories.

`new_categories` will be included at the last/highest place in the categories and will be unused directly after this call.

**Parameters** `new_categories` : category or list-like of category

The new categories to be included.

**inplace** : boolean (default: False)

Whether or not to add the categories inplace or return a copy of this categorical with added categories.

**Returns**

**cat** [Categorical with new categories added or None if inplace.]

**Raises** `ValueError`

If the new categories include old categories or do not validate as categories

**See also:**

`rename_categories`, `reorder_categories`, `remove_categories`,  
`remove_unused_categories`, `set_categories`

#### 34.3.15.9 `pandas.Series.cat.remove_categories`

`Series.cat.remove_categories(*args, **kwargs)`

Removes the specified categories.

*removals* must be included in the old categories. Values which were in the removed categories will be set to NaN

**Parameters** `removals` : category or list of categories

The categories which should be removed.

**inplace** : boolean (default: False)

Whether or not to remove the categories inplace or return a copy of this categorical with removed categories.

**Returns**

**cat** [Categorical with removed categories or None if inplace.]

**Raises** `ValueError`

If the removals are not contained in the categories

**See also:**

`rename_categories`, `reorder_categories`, `add_categories`,  
`remove_unused_categories`, `set_categories`

#### 34.3.15.10 `pandas.Series.cat.remove_unused_categories`

`Series.cat.remove_unused_categories(*args, **kwargs)`

Removes categories which are not used.

**Parameters** `inplace` : boolean (default: False)

Whether or not to drop unused categories inplace or return a copy of this categorical with unused categories dropped.

**Returns**

**cat** [Categorical with unused categories dropped or None if inplace.]

See also:

`rename_categories`, `reorder_categories`, `add_categories`, `remove_categories`,  
`set_categories`

### 34.3.15.11 pandas.Series.cat.set\_categories

`Series.cat.set_categories(*args, **kwargs)`

Sets the categories to the specified new\_categories.

*new\_categories* can include new categories (which will result in unused categories) or remove old categories (which results in values set to NaN). If *rename==True*, the categories will simply be renamed (less or more items than in old categories will result in values set to NaN or in unused categories respectively).

This method can be used to perform more than one action of adding, removing, and reordering simultaneously and is therefore faster than performing the individual steps via the more specialised methods.

On the other hand this method does not do checks (e.g., whether the old categories are included in the new categories on a reorder), which can result in surprising changes, for example when using special string dtypes on python3, which does not consider a S1 string equal to a single char python string.

**Parameters** *new\_categories* : Index-like

The categories in new order.

**ordered** : boolean, (default: False)

Whether or not the categorical is treated as an ordered categorical. If not given, do not change the ordered information.

**rename** : boolean (default: False)

Whether or not the new\_categories should be considered as a rename of the old categories or as reordered categories.

**inplace** : boolean (default: False)

Whether or not to reorder the categories inplace or return a copy of this categorical with reordered categories.

**Returns**

**cat** [Categorical with reordered categories or None if inplace.]

**Raises** `ValueError`

If *new\_categories* does not validate as categories

See also:

`rename_categories`, `reorder_categories`, `add_categories`, `remove_categories`,  
`remove_unused_categories`

### 34.3.15.12 pandas.Series.cat.as\_ordered

`Series.cat.as_ordered(*args, **kwargs)`

Sets the Categorical to be ordered

**Parameters** *inplace* : boolean (default: False)

Whether or not to set the ordered attribute inplace or return a copy of this categorical with ordered set to True

### 34.3.15.13 pandas.Series.cat.as\_unordered

`Series.cat.as_unordered(*args, **kwargs)`

Sets the Categorical to be unordered

**Parameters** `inplace` : boolean (default: False)

Whether or not to set the ordered attribute inplace or return a copy of this categorical with ordered set to False

### 34.3.16 Plotting

`Series.plot` is both a callable method and a namespace attribute for specific plotting methods of the form `Series.plot.<kind>`.

<code>Series.plot([kind, ax, figsize, ...])</code>	Series plotting accessor and method
<code>Series.plot.area(**kwargs)</code>	Area plot
<code>Series.plot.bar(**kwargs)</code>	Vertical bar plot
<code>Series.plot.barh(**kwargs)</code>	Horizontal bar plot
<code>Series.plot.box(**kwargs)</code>	Boxplot
<code>Series.plot.density([bw_method, ind])</code>	Generate Kernel Density Estimate plot using Gaussian kernels.
<code>Series.plot.hist([bins])</code>	Histogram
<code>Series.plot.kde([bw_method, ind])</code>	Generate Kernel Density Estimate plot using Gaussian kernels.
<code>Series.plot.line(**kwargs)</code>	Line plot
<code>Series.plot.pie(**kwargs)</code>	Pie chart

#### 34.3.16.1 pandas.Series.plot.area

`Series.plot.area(**kwargs)`

Area plot

**Parameters** `**kwargs` : optional

Additional keyword arguments are documented in `pandas.Series.plot()`.

**Returns**

`axes` [`matplotlib.axes.Axes` or `numpy.ndarray` of them]

#### 34.3.16.2 pandas.Series.plot.bar

`Series.plot.bar(**kwargs)`

Vertical bar plot

**Parameters** `**kwargs` : optional

Additional keyword arguments are documented in `pandas.Series.plot()`.

**Returns**

`axes` [`matplotlib.axes.Axes` or `numpy.ndarray` of them]

### 34.3.16.3 pandas.Series.plot.barh

`Series.plot.barh(**kws)`

Horizontal bar plot

**Parameters** `**kws` : optional

Additional keyword arguments are documented in `pandas.Series.plot()`.

**Returns**

`axes` [`matplotlib.axes.Axes` or `numpy.ndarray` of them]

### 34.3.16.4 pandas.Series.plot.box

`Series.plot.box(**kws)`

Boxplot

**Parameters** `**kws` : optional

Additional keyword arguments are documented in `pandas.Series.plot()`.

**Returns**

`axes` [`matplotlib.axes.Axes` or `numpy.ndarray` of them]

### 34.3.16.5 pandas.Series.plot.density

`Series.plot.density(bw_method=None, ind=None, **kws)`

Generate Kernel Density Estimate plot using Gaussian kernels.

In statistics, [kernel density estimation](#) (KDE) is a non-parametric way to estimate the probability density function (PDF) of a random variable. This function uses Gaussian kernels and includes automatic bandwidth determination.

**Parameters** `bw_method` : str, scalar or callable, optional

The method used to calculate the estimator bandwidth. This can be 'scott', 'silverman', a scalar constant or a callable. If None (default), 'scott' is used. See `scipy.stats.gaussian_kde` for more information.

`ind` : NumPy array or integer, optional

Evaluation points for the estimated PDF. If None (default), 1000 equally spaced points are used. If `ind` is a NumPy array, the KDE is evaluated at the points passed. If `ind` is an integer, `ind` number of equally spaced points are used.

`**kws` : optional

Additional keyword arguments are documented in `pandas.Series.plot()`.

**Returns**

`axes` [`matplotlib.axes.Axes` or `numpy.ndarray` of them]

**See also:**

`scipy.stats.gaussian_kde` Representation of a kernel-density estimate using Gaussian kernels. This is the function used internally to estimate the PDF.

`DataFrame.plot.kde` Generate a KDE plot for a DataFrame.

## Examples

Given a Series of points randomly sampled from an unknown distribution, estimate its PDF using KDE with automatic bandwidth determination and plot the results, evaluating them at 1000 equally spaced points (default):

```
>>> s = pd.Series([1, 2, 2.5, 3, 3.5, 4, 5])
>>> ax = s.plot.kde()
```

A scalar bandwidth can be specified. Using a small bandwidth value can lead to overfitting, while using a large bandwidth value may result in underfitting:

```
>>> ax = s.plot.kde(bw_method=0.3)
```

```
>>> ax = s.plot.kde(bw_method=3)
```

Finally, the *ind* parameter determines the evaluation points for the plot of the estimated PDF:

```
>>> ax = s.plot.kde(ind=[1, 2, 3, 4, 5])
```

### 34.3.16.6 pandas.Series.plot.hist

`Series.plot.hist` (*bins=10, \*\*kws*)

Histogram

**Parameters** **bins**: integer, default 10

Number of histogram bins to be used

**\*\*kws**: optional

Additional keyword arguments are documented in `pandas.Series.plot()`.

**Returns**

**axes** [`matplotlib.axes.Axes` or `numpy.ndarray` of them]

### 34.3.16.7 pandas.Series.plot.kde

`Series.plot.kde` (*bw\_method=None, ind=None, \*\*kws*)

Generate Kernel Density Estimate plot using Gaussian kernels.

In statistics, [kernel density estimation](#) (KDE) is a non-parametric way to estimate the probability density function (PDF) of a random variable. This function uses Gaussian kernels and includes automatic bandwidth determination.

**Parameters** **bw\_method**: str, scalar or callable, optional

The method used to calculate the estimator bandwidth. This can be 'scott', 'silverman', a scalar constant or a callable. If None (default), 'scott' is used. See `scipy.stats.gaussian_kde` for more information.

**ind**: NumPy array or integer, optional

Evaluation points for the estimated PDF. If None (default), 1000 equally spaced points are used. If *ind* is a NumPy array, the KDE is evaluated at the points passed. If *ind* is an integer, *ind* number of equally spaced points are used.

**\*\*kws**: optional

Additional keyword arguments are documented in `pandas.Series.plot()`.

#### Returns

**axes** [matplotlib.axes.Axes or numpy.ndarray of them]

#### See also:

**scipy.stats.gaussian\_kde** Representation of a kernel-density estimate using Gaussian kernels. This is the function used internally to estimate the PDF.

**DataFrame.plot.kde** Generate a KDE plot for a DataFrame.

#### Examples

Given a Series of points randomly sampled from an unknown distribution, estimate its PDF using KDE with automatic bandwidth determination and plot the results, evaluating them at 1000 equally spaced points (default):

```
>>> s = pd.Series([1, 2, 2.5, 3, 3.5, 4, 5])
>>> ax = s.plot.kde()
```

A scalar bandwidth can be specified. Using a small bandwidth value can lead to overfitting, while using a large bandwidth value may result in underfitting:

```
>>> ax = s.plot.kde(bw_method=0.3)
```

```
>>> ax = s.plot.kde(bw_method=3)
```

Finally, the *ind* parameter determines the evaluation points for the plot of the estimated PDF:

```
>>> ax = s.plot.kde(ind=[1, 2, 3, 4, 5])
```

### 34.3.16.8 pandas.Series.plot.line

`Series.plot.line(**kws)`

Line plot

**Parameters** ‘\*\*kws’: optional

Additional keyword arguments are documented in `pandas.Series.plot()`.

#### Returns

**axes** [matplotlib.axes.Axes or numpy.ndarray of them]

#### Examples

```
>>> s = pd.Series([1, 3, 2])
>>> s.plot.line()
```

### 34.3.16.9 pandas.Series.plot.pie

`Series.plot.pie(**kws)`

Pie chart

**Parameters** `**kwargs` : optional

Additional keyword arguments are documented in `pandas.Series.plot()`.

**Returns**

**axes** [matplotlib.axes.Axes or numpy.ndarray of them]

<code>Series.hist([by, ax, grid, xlabelsize, ...])</code>	Draw histogram of the input series using matplotlib
---	---

### 34.3.17 Serialization / IO / Conversion

<code>Series.to_pickle(path[, compression, protocol])</code>	Pickle (serialize) object to file.
<code>Series.to_csv([path, index, sep, na_rep, ...])</code>	Write Series to a comma-separated values (csv) file
<code>Series.to_dict([into])</code>	Convert Series to {label -> value} dict or dict-like object.
<code>Series.to_excel(excel_writer[, sheet_name, ...])</code>	Write Series to an excel sheet
<code>Series.to_frame([name])</code>	Convert Series to DataFrame
<code>Series.to_xarray()</code>	Return an xarray object from the pandas object.
<code>Series.to_hdf(path_or_buf, key, **kwargs)</code>	Write the contained data to an HDF5 file using HDFStore.
<code>Series.to_sql(name, con[, schema, ...])</code>	Write records stored in a DataFrame to a SQL database.
<code>Series.to_msgpack([path_or_buf, encoding])</code>	msgpack (serialize) object to input file path
<code>Series.to_json([path_or_buf, orient, ...])</code>	Convert the object to a JSON string.
<code>Series.to_sparse([kind, fill_value])</code>	Convert Series to SparseSeries
<code>Series.to_dense()</code>	Return dense representation of NDFrame (as opposed to sparse)
<code>Series.to_string([buf, na_rep, ...])</code>	Render a string representation of the Series
<code>Series.to_clipboard([excel, sep])</code>	Copy object to the system clipboard.
<code>Series.to_latex([buf, columns, col_space, ...])</code>	Render an object to a tabular environment table.

### 34.3.18 Sparse

<code>SparseSeries.to_coo([row_levels, ...])</code>	Create a <code>scipy.sparse.coo_matrix</code> from a <code>SparseSeries</code> with <code>MultiIndex</code> .
<code>SparseSeries.from_coo(A[, dense_index])</code>	Create a <code>SparseSeries</code> from a <code>scipy.sparse.coo_matrix</code> .

#### 34.3.18.1 pandas.SparseSeries.to\_coo

`SparseSeries.to_coo(row_levels=(0, ), column_levels=(1, ), sort_labels=False)`

Create a `scipy.sparse.coo_matrix` from a `SparseSeries` with `MultiIndex`.

Use `row_levels` and `column_levels` to determine the row and column coordinates respectively. `row_levels` and `column_levels` are the names (labels) or numbers of the levels. {`row_levels`, `column_levels`} must be a partition of the `MultiIndex` level names (or numbers).

**Parameters**

**row\_levels** [tuple/list]

**column\_levels** [tuple/list]

**sort\_labels** : bool, default False

Sort the row and column labels before forming the sparse matrix.

**Returns**

**y** [scipy.sparse.coo\_matrix]  
**rows** [list (row labels)]  
**columns** [list (column labels)]

**Examples**

```
>>> from numpy import nan
>>> s = Series([3.0, nan, 1.0, 3.0, nan, nan])
>>> s.index = MultiIndex.from_tuples([(1, 2, 'a', 0),
                                     (1, 2, 'a', 1),
                                     (1, 1, 'b', 0),
                                     (1, 1, 'b', 1),
                                     (2, 1, 'b', 0),
                                     (2, 1, 'b', 1)],
                                     names=['A', 'B', 'C', 'D'])

>>> ss = s.to_sparse()
>>> A, rows, columns = ss.to_coo(row_levels=['A', 'B'],
                                column_levels=['C', 'D'],
                                sort_labels=True)

>>> A
<3x4 sparse matrix of type '<class 'numpy.float64'>'
  with 3 stored elements in COOrdinate format>
>>> A.todense()
matrix([[ 0.,  0.,  1.,  3.],
        [ 3.,  0.,  0.,  0.],
        [ 0.,  0.,  0.,  0.]])
>>> rows
[(1, 1), (1, 2), (2, 1)]
>>> columns
[('a', 0), ('a', 1), ('b', 0), ('b', 1)]
```

### 34.3.18.2 pandas.SparseSeries.from\_coo

**classmethod** `SparseSeries.from_coo(A, dense_index=False)`

Create a SparseSeries from a scipy.sparse.coo\_matrix.

**Parameters**

**A** [scipy.sparse.coo\_matrix]  
**dense\_index** : bool, default False

If False (default), the SparseSeries index consists of only the coords of the non-null entries of the original coo\_matrix. If True, the SparseSeries index consists of the full sorted (row, col) coordinates of the coo\_matrix.

**Returns**

**s** [SparseSeries]

## Examples

```
>>> from scipy import sparse
>>> A = sparse.coo_matrix(([3.0, 1.0, 2.0], ([1, 0, 0], [0, 2, 3])),
                          shape=(3, 4))
>>> A
<3x4 sparse matrix of type '<class 'numpy.float64''>'
  with 3 stored elements in COOrdinate format>
>>> A.todense()
matrix([[ 0.,  0.,  1.,  2.],
        [ 3.,  0.,  0.,  0.],
        [ 0.,  0.,  0.,  0.]])
>>> ss = SparseSeries.from_coo(A)
>>> ss
0 2 1
3 2
1 0 3
dtype: float64
BlockIndex
Block locations: array([0], dtype=int32)
Block lengths: array([3], dtype=int32)
```

## 34.4 DataFrame

### 34.4.1 Constructor

<code>DataFrame([data, index, columns, dtype, copy])</code>	Two-dimensional size-mutable, potentially heterogeneous tabular data structure with labeled axes (rows and columns).
---	--

#### 34.4.1.1 pandas.DataFrame

**class** pandas.DataFrame (*data=None, index=None, columns=None, dtype=None, copy=False*)

Two-dimensional size-mutable, potentially heterogeneous tabular data structure with labeled axes (rows and columns). Arithmetic operations align on both row and column labels. Can be thought of as a dict-like container for Series objects. The primary pandas data structure.

**Parameters** **data** : numpy ndarray (structured or homogeneous), dict, or DataFrame

Dict can contain Series, arrays, constants, or list-like objects

Changed in version 0.23.0: If data is a dict, argument order is maintained for Python 3.6 and later.

**index** : Index or array-like

Index to use for resulting frame. Will default to RangeIndex if no indexing information part of input data and no index provided

**columns** : Index or array-like

Column labels to use for resulting frame. Will default to RangeIndex (0, 1, 2, ..., n) if no column labels are provided

**dtype** : dtype, default None

Data type to force. Only a single dtype is allowed. If None, infer

**copy** : boolean, default False

Copy data from inputs. Only affects DataFrame / 2d ndarray input

**See also:**

*DataFrame.from\_records* constructor from tuples, also record arrays

*DataFrame.from\_dict* from dicts of Series, arrays, or dicts

*DataFrame.from\_items* from sequence of (key, value) pairs

*pandas.read\_csv*, *pandas.read\_table*, *pandas.read\_clipboard*

## Examples

Constructing DataFrame from a dictionary.

```
>>> d = {'col1': [1, 2], 'col2': [3, 4]}
>>> df = pd.DataFrame(data=d)
>>> df
   col1  col2
0     1     3
1     2     4
```

Notice that the inferred dtype is int64.

```
>>> df.dtypes
col1    int64
col2    int64
dtype: object
```

To enforce a single dtype:

```
>>> df = pd.DataFrame(data=d, dtype=np.int8)
>>> df.dtypes
col1    int8
col2    int8
dtype: object
```

Constructing DataFrame from numpy ndarray:

```
>>> df2 = pd.DataFrame(np.random.randint(low=0, high=10, size=(5, 5)),
...                     columns=['a', 'b', 'c', 'd', 'e'])
>>> df2
   a  b  c  d  e
0  2  8  8  3  4
1  4  2  9  0  9
2  1  0  7  8  0
3  5  1  7  1  3
4  6  0  2  4  2
```

## Attributes

<i>T</i>	Transpose index and columns.
<i>at</i>	Access a single value for a row/column label pair.
<i>axes</i>	Return a list representing the axes of the DataFrame.
<i>blocks</i>	(DEPRECATED) Internal property, property synonym for <i>as_blocks()</i>
<i>columns</i>	The column labels of the DataFrame.
<i>dtypes</i>	Return the dtypes in the DataFrame.
<i>empty</i>	Indicator whether DataFrame is empty.
<i>ftypes</i>	Return the ftypes (indication of sparse/dense and dtype) in DataFrame.
<i>iat</i>	Access a single value for a row/column pair by integer position.
<i>iloc</i>	Purely integer-location based indexing for selection by position.
<i>index</i>	The index (row labels) of the DataFrame.
<i>ix</i>	A primarily label-location based indexer, with integer position fallback.
<i>loc</i>	Access a group of rows and columns by label(s) or a boolean array.
<i>ndim</i>	Return an int representing the number of axes / array dimensions.
<i>shape</i>	Return a tuple representing the dimensionality of the DataFrame.
<i>size</i>	Return an int representing the number of elements in this object.
<i>style</i>	Property returning a Styler object containing methods for building a styled HTML representation fo the DataFrame.
<i>values</i>	Return a Numpy representation of the DataFrame.

## pandas.DataFrame.T

`DataFrame.T`

Transpose index and columns.

Reflect the DataFrame over its main diagonal by writing rows as columns and vice-versa. The property *T* is an accessor to the method *transpose()*.

**Parameters** *copy* : bool, default False

If True, the underlying data is copied. Otherwise (default), no copy is made if possible.

**\*args, \*\*kwargs**

Additional keywords have no effect but might be accepted for compatibility with numpy.

**Returns** **DataFrame**

The transposed DataFrame.

**See also:**

`numpy.transpose` Permute the dimensions of a given array.

## Notes

Transposing a DataFrame with mixed dtypes will result in a homogeneous DataFrame with the *object* dtype. In such a case, a copy of the data is always made.

## Examples

### Square DataFrame with homogeneous dtype

```
>>> d1 = {'col1': [1, 2], 'col2': [3, 4]}
>>> df1 = pd.DataFrame(data=d1)
>>> df1
   col1  col2
0     1     3
1     2     4
```

```
>>> df1_transposed = df1.T # or df1.transpose()
>>> df1_transposed
   0  1
col1 1  2
col2 3  4
```

When the dtype is homogeneous in the original DataFrame, we get a transposed DataFrame with the same dtype:

```
>>> df1.dtypes
col1    int64
col2    int64
dtype: object
>>> df1_transposed.dtypes
0    int64
1    int64
dtype: object
```

### Non-square DataFrame with mixed dtypes

```
>>> d2 = {'name': ['Alice', 'Bob'],
...       'score': [9.5, 8],
...       'employed': [False, True],
...       'kids': [0, 0]}
>>> df2 = pd.DataFrame(data=d2)
>>> df2
   name  score  employed  kids
0  Alice   9.5     False    0
1   Bob   8.0      True    0
```

```
>>> df2_transposed = df2.T # or df2.transpose()
>>> df2_transposed
   0  1
name  Alice  Bob
score   9.5    8
employed False  True
kids      0    0
```

When the DataFrame has mixed dtypes, we get a transposed DataFrame with the *object* dtype:

```
>>> df2.dtypes
name          object
score        float64
employed      bool
kids          int64
dtype: object
>>> df2_transposed.dtypes
0    object
1    object
dtype: object
```

## pandas.DataFrame.at

### DataFrame.at

Access a single value for a row/column label pair.

Similar to `loc`, in that both provide label-based lookups. Use `at` if you only need to get or set a single value in a DataFrame or Series.

#### Raises **KeyError**

When label does not exist in DataFrame

#### See also:

**DataFrame.iat** Access a single value for a row/column pair by integer position

**DataFrame.loc** Access a group of rows and columns by label(s)

**Series.at** Access a single value using a label

## Examples

```
>>> df = pd.DataFrame([[0, 2, 3], [0, 4, 1], [10, 20, 30]],
...                    index=[4, 5, 6], columns=['A', 'B', 'C'])
>>> df
   A  B  C
4  0  2  3
5  0  4  1
6 10 20 30
```

Get value at specified row/column pair

```
>>> df.at[4, 'B']
2
```

Set value at specified row/column pair

```
>>> df.at[4, 'B'] = 10
>>> df.at[4, 'B']
10
```

Get value within a Series

```
>>> df.loc[5].at['B']
4
```

## pandas.DataFrame.axes

### DataFrame.axes

Return a list representing the axes of the DataFrame.

It has the row axis labels and column axis labels as the only members. They are returned in that order.

### Examples

```
>>> df = pd.DataFrame({'col1': [1, 2], 'col2': [3, 4]})
>>> df.axes
[RangeIndex(start=0, stop=2, step=1), Index(['col1', 'col2'],
dtype='object')]
```

## pandas.DataFrame.blocks

### DataFrame.blocks

Internal property, property synonym for `as_blocks()`

Deprecated since version 0.21.0.

## pandas.DataFrame.columns

### DataFrame.columns

The column labels of the DataFrame.

## pandas.DataFrame.dtypes

### DataFrame.dtypes

Return the dtypes in the DataFrame.

This returns a Series with the data type of each column. The result's index is the original DataFrame's columns. Columns with mixed types are stored with the `object` dtype. See [the User Guide](#) for more.

#### Returns pandas.Series

The data type of each column.

See also:

[`pandas.DataFrame.ftypes`](#) dtype and sparsity information.

### Examples

```
>>> df = pd.DataFrame({'float': [1.0],
...                    'int': [1],
...                    'datetime': [pd.Timestamp('20180310')],
...                    'string': ['foo']})
>>> df.dtypes
float          float64
int            int64
```

(continues on next page)

(continued from previous page)

```

datetime    datetime64[ns]
string      object
dtype: object

```

**pandas.DataFrame.empty****DataFrame.empty**

Indicator whether DataFrame is empty.

True if DataFrame is entirely empty (no items), meaning any of the axes are of length 0.

**Returns bool**

If DataFrame is empty, return True, if not return False.

**See also:***pandas.Series.dropna, pandas.DataFrame.dropna***Notes**

If DataFrame contains only NaNs, it is still not considered empty. See the example below.

**Examples**

An example of an actual empty DataFrame. Notice the index is empty:

```

>>> df_empty = pd.DataFrame({'A' : []})
>>> df_empty
Empty DataFrame
Columns: [A]
Index: []
>>> df_empty.empty
True

```

If we only have NaNs in our DataFrame, it is not considered empty! We will need to drop the NaNs to make the DataFrame empty:

```

>>> df = pd.DataFrame({'A' : [np.nan]})
>>> df
   A
0 NaN
>>> df.empty
False
>>> df.dropna().empty
True

```

**pandas.DataFrame.ftypes****DataFrame.ftypes**

Return the ftypes (indication of sparse/dense and dtype) in DataFrame.

This returns a Series with the data type of each column. The result's index is the original DataFrame's columns. Columns with mixed types are stored with the `object` dtype. See *the User Guide* for more.

**Returns** `pandas.Series`

The data type and indication of sparse/dense of each column.

**See also:**

`pandas.DataFrame.dtypes` Series with just dtype information.

`pandas.SparseDataFrame` Container for sparse tabular data.

**Notes**

Sparse data should have the same dtypes as its dense representation.

**Examples**

```
>>> import numpy as np
>>> arr = np.random.RandomState(0).randn(100, 4)
>>> arr[arr < .8] = np.nan
>>> pd.DataFrame(arr).dtypes
0    float64:dense
1    float64:dense
2    float64:dense
3    float64:dense
dtype: object
```

```
>>> pd.SparseDataFrame(arr).dtypes
0    float64:sparse
1    float64:sparse
2    float64:sparse
3    float64:sparse
dtype: object
```

## **pandas.DataFrame.iat**

### **DataFrame.iat**

Access a single value for a row/column pair by integer position.

Similar to `iloc`, in that both provide integer-based lookups. Use `iat` if you only need to get or set a single value in a DataFrame or Series.

**Raises** `IndexError`

When integer position is out of bounds

**See also:**

`DataFrame.at` Access a single value for a row/column label pair

`DataFrame.loc` Access a group of rows and columns by label(s)

`DataFrame.iloc` Access a group of rows and columns by integer position(s)

## Examples

```
>>> df = pd.DataFrame([[0, 2, 3], [0, 4, 1], [10, 20, 30]],
...                     columns=['A', 'B', 'C'])
>>> df
   A  B  C
0  0  2  3
1  0  4  1
2 10 20 30
```

Get value at specified row/column pair

```
>>> df.iat[1, 2]
1
```

Set value at specified row/column pair

```
>>> df.iat[1, 2] = 10
>>> df.iat[1, 2]
10
```

Get value within a series

```
>>> df.loc[0].iat[1]
2
```

## pandas.DataFrame.iloc

### DataFrame.iloc

Purely integer-location based indexing for selection by position.

`.iloc[]` is primarily integer position based (from 0 to `length-1` of the axis), but may also be used with a boolean array.

Allowed inputs are:

- An integer, e.g. 5.
- A list or array of integers, e.g. `[4, 3, 0]`.
- A slice object with ints, e.g. `1:7`.
- A boolean array.
- A callable function with one argument (the calling Series, DataFrame or Panel) and that returns valid output for indexing (one of the above)

`.iloc` will raise `IndexError` if a requested indexer is out-of-bounds, except *slice* indexers which allow out-of-bounds indexing (this conforms with python/numpy *slice* semantics).

See more at [Selection by Position](#)

## pandas.DataFrame.index

### DataFrame.index

The index (row labels) of the DataFrame.

## pandas.DataFrame.ix

### DataFrame.ix

A primarily label-location based indexer, with integer position fallback.

Warning: Starting in 0.20.0, the .ix indexer is deprecated, in favor of the more strict .iloc and .loc indexers.

.ix[] supports mixed integer and label based access. It is primarily label based, but will fall back to integer positional access unless the corresponding axis is of integer type.

.ix is the most general indexer and will support any of the inputs in .loc and .iloc. .ix also supports floating point label schemes. .ix is exceptionally useful when dealing with mixed positional and label based hierarchical indexes.

However, when an axis is integer based, ONLY label based access and not positional access is supported. Thus, in such cases, it's usually better to be explicit and use .iloc or .loc.

See more at [Advanced Indexing](#).

## pandas.DataFrame.loc

### DataFrame.loc

Access a group of rows and columns by label(s) or a boolean array.

.loc[] is primarily label based, but may also be used with a boolean array.

Allowed inputs are:

- A single label, e.g. 5 or 'a', (note that 5 is interpreted as a *label* of the index, and **never** as an integer position along the index).
- A list or array of labels, e.g. ['a', 'b', 'c'].
- A slice object with labels, e.g. 'a':'f'.

**Warning:** Note that contrary to usual python slices, **both** the start and the stop are included

- A boolean array of the same length as the axis being sliced, e.g. [True, False, True].
- A callable function with one argument (the calling Series, DataFrame or Panel) and that returns valid output for indexing (one of the above)

See more at [Selection by Label](#)

#### Raises KeyError:

when any items are not found

See also:

**DataFrame.at** Access a single value for a row/column label pair

**DataFrame.iloc** Access group of rows and columns by integer position(s)

**DataFrame.xs** Returns a cross-section (row(s) or column(s)) from the Series/DataFrame.

**Series.loc** Access group of values using labels

## Examples

### Getting values

```
>>> df = pd.DataFrame([[1, 2], [4, 5], [7, 8]],
...                     index=['cobra', 'viper', 'sidewinder'],
...                     columns=['max_speed', 'shield'])
>>> df
```

	max_speed	shield
cobra	1	2
viper	4	5
sidewinder	7	8

Single label. Note this returns the row as a Series.

```
>>> df.loc['viper']
max_speed    4
shield       5
Name: viper, dtype: int64
```

List of labels. Note using [ ] returns a DataFrame.

```
>>> df.loc[['viper', 'sidewinder']]
```

	max_speed	shield
viper	4	5
sidewinder	7	8

Single label for row and column

```
>>> df.loc['cobra', 'shield']
2
```

Slice with labels for row and single label for column. As mentioned above, note that both the start and stop of the slice are included.

```
>>> df.loc['cobra':'viper', 'max_speed']
cobra    1
viper    4
Name: max_speed, dtype: int64
```

Boolean list with the same length as the row axis

```
>>> df.loc[[False, False, True]]
```

	max_speed	shield
sidewinder	7	8

Conditional that returns a boolean Series

```
>>> df.loc[df['shield'] > 6]
```

	max_speed	shield
sidewinder	7	8

Conditional that returns a boolean Series with column labels specified

```
>>> df.loc[df['shield'] > 6, ['max_speed']]
```

	max_speed
sidewinder	7

Callable that returns a boolean Series

```
>>> df.loc[lambda df: df['shield'] == 8]
      max_speed  shield
sidewinder      7      8
```

### Setting values

Set value for all items matching the list of labels

```
>>> df.loc[['viper', 'sidewinder'], ['shield']] = 50
>>> df
      max_speed  shield
cobra           1      2
viper           4     50
sidewinder      7     50
```

Set value for an entire row

```
>>> df.loc['cobra'] = 10
>>> df
      max_speed  shield
cobra         10     10
viper          4     50
sidewinder     7     50
```

Set value for an entire column

```
>>> df.loc[:, 'max_speed'] = 30
>>> df
      max_speed  shield
cobra         30     10
viper         30     50
sidewinder    30     50
```

Set value for rows matching callable condition

```
>>> df.loc[df['shield'] > 35] = 0
>>> df
      max_speed  shield
cobra         30     10
viper          0      0
sidewinder     0      0
```

### Getting values on a DataFrame with an index that has integer labels

Another example using integers for the index

```
>>> df = pd.DataFrame([[1, 2], [4, 5], [7, 8]],
...                    index=[7, 8, 9], columns=['max_speed', 'shield'])
>>> df
      max_speed  shield
7           1      2
8           4      5
9           7      8
```

Slice with integer labels for rows. As mentioned above, note that both the start and stop of the slice are included.

```
>>> df.loc[7:9]
      max_speed  shield
7             1       2
8             4       5
9             7       8
```

### Getting values with a MultiIndex

A number of examples using a DataFrame with a MultiIndex

```
>>> tuples = [
...     ('cobra', 'mark i'), ('cobra', 'mark ii'),
...     ('sidewinder', 'mark i'), ('sidewinder', 'mark ii'),
...     ('viper', 'mark ii'), ('viper', 'mark iii')
... ]
>>> index = pd.MultiIndex.from_tuples(tuples)
>>> values = [[12, 2], [0, 4], [10, 20],
...           [1, 4], [7, 1], [16, 36]]
>>> df = pd.DataFrame(values, columns=['max_speed', 'shield'], index=index)
>>> df
```

		max_speed	shield
cobra	mark i	12	2
	mark ii	0	4
sidewinder	mark i	10	20
	mark ii	1	4
viper	mark ii	7	1
	mark iii	16	36

Single label. Note this returns a DataFrame with a single index.

```
>>> df.loc['cobra']
      max_speed  shield
mark i         12       2
mark ii         0       4
```

Single index tuple. Note this returns a Series.

```
>>> df.loc[('cobra', 'mark ii')]
max_speed    0
shield        4
Name: (cobra, mark ii), dtype: int64
```

Single label for row and column. Similar to passing in a tuple, this returns a Series.

```
>>> df.loc['cobra', 'mark i']
max_speed    12
shield        2
Name: (cobra, mark i), dtype: int64
```

Single tuple. Note using [ [] ] returns a DataFrame.

```
>>> df.loc[['cobra', 'mark ii']]
      max_speed  shield
cobra mark ii         0       4
```

Single tuple for the index with a single label for the column

```
>>> df.loc[('cobra', 'mark i'), 'shield']
2
```

Slice from index tuple to single label

```
>>> df.loc[('cobra', 'mark i'):'viper']
      max_speed  shield
cobra      mark i      12      2
           mark ii       0      4
sidewinder mark i      10     20
           mark ii       1      4
viper      mark ii       7      1
           mark iii      16     36
```

Slice from index tuple to index tuple

```
>>> df.loc[('cobra', 'mark i'):(viper', 'mark ii')]
      max_speed  shield
cobra      mark i      12      2
           mark ii       0      4
sidewinder mark i      10     20
           mark ii       1      4
viper      mark ii       7      1
```

## pandas.DataFrame.ndim

`DataFrame.ndim`

Return an int representing the number of axes / array dimensions.

Return 1 if Series. Otherwise return 2 if DataFrame.

**See also:**

`ndarray.ndim`

## Examples

```
>>> s = pd.Series({'a': 1, 'b': 2, 'c': 3})
>>> s.ndim
1
```

```
>>> df = pd.DataFrame({'col1': [1, 2], 'col2': [3, 4]})
>>> df.ndim
2
```

## pandas.DataFrame.shape

`DataFrame.shape`

Return a tuple representing the dimensionality of the DataFrame.

**See also:**

`ndarray.shape`

## Examples

```
>>> df = pd.DataFrame({'col1': [1, 2], 'col2': [3, 4]})
>>> df.shape
(2, 2)
```

```
>>> df = pd.DataFrame({'col1': [1, 2], 'col2': [3, 4],
...                    'col3': [5, 6]})
>>> df.shape
(2, 3)
```

## pandas.DataFrame.size

### DataFrame.size

Return an int representing the number of elements in this object.

Return the number of rows if Series. Otherwise return the number of rows times number of columns if DataFrame.

#### See also:

`ndarray.size`

## Examples

```
>>> s = pd.Series({'a': 1, 'b': 2, 'c': 3})
>>> s.size
3
```

```
>>> df = pd.DataFrame({'col1': [1, 2], 'col2': [3, 4]})
>>> df.size
4
```

## pandas.DataFrame.style

### DataFrame.style

Property returning a Styler object containing methods for building a styled HTML representation for the DataFrame.

#### See also:

`pandas.io.formats.style.Styler`

## pandas.DataFrame.values

### DataFrame.values

Return a Numpy representation of the DataFrame.

Only the values in the DataFrame will be returned, the axes labels will be removed.

#### Returns `numpy.ndarray`

The values of the DataFrame.

See also:

`pandas.DataFrame.index` Retrieve the index labels

`pandas.DataFrame.columns` Retrieving the column names

## Notes

The dtype will be a lower-common-denominator dtype (implicit upcasting); that is to say if the dtypes (even of numeric types) are mixed, the one that accommodates all will be chosen. Use this with care if you are not dealing with the blocks.

e.g. If the dtypes are float16 and float32, dtype will be upcast to float32. If dtypes are int32 and uint8, dtype will be upcast to int32. By `numpy.find_common_type()` convention, mixing int64 and uint64 will result in a float64 dtype.

## Examples

A DataFrame where all columns are the same type (e.g., int64) results in an array of the same type.

```
>>> df = pd.DataFrame({'age': [ 3, 29],
...                     'height': [94, 170],
...                     'weight': [31, 115]})
>>> df
   age  height  weight
0    3     94     31
1   29    170    115
>>> df.dtypes
age      int64
height   int64
weight   int64
dtype: object
>>> df.values
array([[ 3, 94, 31],
       [29, 170, 115]], dtype=int64)
```

A DataFrame with mixed type columns(e.g., str/object, int64, float32) results in an ndarray of the broadest type that accommodates these mixed types (e.g., object).

```
>>> df2 = pd.DataFrame([('parrot', 24.0, 'second'),
...                     ('lion', 80.5, 1),
...                     ('monkey', np.nan, None)],
...                     columns=('name', 'max_speed', 'rank'))
>>> df2.dtypes
name      object
max_speed  float64
rank      object
dtype: object
>>> df2.values
array([('parrot', 24.0, 'second'],
      ['lion', 80.5, 1],
      ['monkey', nan, None]], dtype=object)
```

is_copy	
---------	--

## Methods

<code>abs()</code>	Return a Series/DataFrame with absolute numeric value of each element.
<code>add(other[, axis, level, fill_value])</code>	Addition of dataframe and other, element-wise (binary operator <i>add</i> ).
<code>add_prefix(prefix)</code>	Prefix labels with string <i>prefix</i> .
<code>add_suffix(suffix)</code>	Suffix labels with string <i>suffix</i> .
<code>agg(func[, axis])</code>	Aggregate using one or more operations over the specified axis.
<code>aggregate(func[, axis])</code>	Aggregate using one or more operations over the specified axis.
<code>align(other[, join, axis, level, copy, ...])</code>	Align two objects on their axes with the specified join method for each axis Index
<code>all([axis, bool_only, skipna, level])</code>	Return whether all elements are True, potentially over an axis.
<code>any([axis, bool_only, skipna, level])</code>	Return whether any element is True over requested axis.
<code>append(other[, ignore_index, ...])</code>	Append rows of <i>other</i> to the end of this frame, returning a new object.
<code>apply(func[, axis, broadcast, raw, reduce, ...])</code>	Apply a function along an axis of the DataFrame.
<code>applymap(func)</code>	Apply a function to a Dataframe elementwise.
<code>as_blocks([copy])</code>	(DEPRECATED) Convert the frame to a dict of dtype -> Constructor Types that each has a homogeneous dtype.
<code>as_matrix([columns])</code>	(DEPRECATED) Convert the frame to its Numpy-array representation.
<code>asfreq(freq[, method, how, normalize, ...])</code>	Convert TimeSeries to specified frequency.
<code>asof(where[, subset])</code>	The last row without any NaN is taken (or the last row without NaN considering only the subset of columns in the case of a DataFrame)
<code>assign(**kwargs)</code>	Assign new columns to a DataFrame, returning a new object (a copy) with the new columns added to the original ones.
<code>astype(dtype[, copy, errors])</code>	Cast a pandas object to a specified dtype <i>dtype</i> .
<code>at_time(time[, asof])</code>	Select values at particular time of day (e.g.
<code>between_time(start_time, end_time[, ...])</code>	Select values between particular times of the day (e.g., 9:00-9:30 AM).
<code>bfill([axis, inplace, limit, downcast])</code>	Synonym for <code>DataFrame.fillna(method='bfill')</code>
<code>bool()</code>	Return the bool of a single element PandasObject.
<code>boxplot([column, by, ax, fontsize, rot, ...])</code>	Make a box plot from DataFrame columns.
<code>clip([lower, upper, axis, inplace])</code>	Trim values at input threshold(s).
<code>clip_lower(threshold[, axis, inplace])</code>	Return copy of the input with values below a threshold truncated.
<code>clip_upper(threshold[, axis, inplace])</code>	Return copy of input with values above given value(s) truncated.
<code>combine(other, func[, fill_value, overwrite])</code>	Add two DataFrame objects and do not propagate NaN values, so if for a (column, time) one frame is missing a value, it will default to the other frame's value (which might be NaN as well)

Continued on next page

Table 61 – continued from previous page

<code>combine_first(other)</code>	Combine two DataFrame objects and default to non-null values in frame calling the method.
<code>compound([axis, skipna, level])</code>	Return the compound percentage of the values for the requested axis
<code>consolidate([inplace])</code>	(DEPRECATED) Compute NDFrame with “consolidated” internals (data of each dtype grouped together in a single ndarray).
<code>convert_objects([convert_dates, ...])</code>	(DEPRECATED) Attempt to infer better dtype for object columns.
<code>copy([deep])</code>	Make a copy of this object’s indices and data.
<code>corr([method, min_periods])</code>	Compute pairwise correlation of columns, excluding NA/null values
<code>corrwith(other[, axis, drop])</code>	Compute pairwise correlation between rows or columns of two DataFrame objects.
<code>count([axis, level, numeric_only])</code>	Count non-NA cells for each column or row.
<code>cov([min_periods])</code>	Compute pairwise covariance of columns, excluding NA/null values.
<code>cummax([axis, skipna])</code>	Return cumulative maximum over a DataFrame or Series axis.
<code>cummin([axis, skipna])</code>	Return cumulative minimum over a DataFrame or Series axis.
<code>cumprod([axis, skipna])</code>	Return cumulative product over a DataFrame or Series axis.
<code>cumsum([axis, skipna])</code>	Return cumulative sum over a DataFrame or Series axis.
<code>describe([percentiles, include, exclude])</code>	Generates descriptive statistics that summarize the central tendency, dispersion and shape of a dataset’s distribution, excluding NaN values.
<code>diff([periods, axis])</code>	First discrete difference of element.
<code>div(other[, axis, level, fill_value])</code>	Floating division of dataframe and other, element-wise (binary operator <i>truediv</i> ).
<code>divide(other[, axis, level, fill_value])</code>	Floating division of dataframe and other, element-wise (binary operator <i>truediv</i> ).
<code>dot(other)</code>	Matrix multiplication with DataFrame or Series objects.
<code>drop([labels, axis, index, columns, level, ...])</code>	Drop specified labels from rows or columns.
<code>drop_duplicates([subset, keep, inplace])</code>	Return DataFrame with duplicate rows removed, optionally only considering certain columns
<code>dropna([axis, how, thresh, subset, inplace])</code>	Remove missing values.
<code>duplicated([subset, keep])</code>	Return boolean Series denoting duplicate rows, optionally only considering certain columns
<code>eq(other[, axis, level])</code>	Wrapper for flexible comparison methods <i>eq</i>
<code>equals(other)</code>	Determines if two NDFrame objects contain the same elements.
<code>eval(expr[, inplace])</code>	Evaluate a string describing operations on DataFrame columns.
<code>ewm([com, span, halflife, alpha, ...])</code>	Provides exponential weighted functions
<code>expanding([min_periods, center, axis])</code>	Provides expanding transformations.
<code>ffill([axis, inplace, limit, downcast])</code>	Synonym for <code>DataFrame.fillna(method='ffill')</code>
<code>fillna([value, method, axis, inplace, ...])</code>	Fill NA/NaN values using the specified method

Continued on next page

Table 61 – continued from previous page

<code>filter([items, like, regex, axis])</code>	Subset rows or columns of dataframe according to labels in the specified index.
<code>first(offset)</code>	Convenience method for subsetting initial periods of time series data based on a date offset.
<code>first_valid_index()</code>	Return index for first non-NA/null value.
<code>floordiv(other[, axis, level, fill_value])</code>	Integer division of dataframe and other, element-wise (binary operator <i>floordiv</i> ).
<code>from_csv(path[, header, sep, index_col, ...])</code>	(DEPRECATED) Read CSV file.
<code>from_dict(data[, orient, dtype, columns])</code>	Construct DataFrame from dict of array-like or dicts.
<code>from_items(items[, columns, orient])</code>	(DEPRECATED) Construct a dataframe from a list of tuples
<code>from_records(data[, index, exclude, ...])</code>	Convert structured or record ndarray to DataFrame
<code>ge(other[, axis, level])</code>	Wrapper for flexible comparison methods <i>ge</i>
<code>get(key[, default])</code>	Get item from object for given key (DataFrame column, Panel slice, etc.).
<code>get_dtype_counts()</code>	Return counts of unique dtypes in this object.
<code>get_ftype_counts()</code>	(DEPRECATED) Return counts of unique ftypes in this object.
<code>get_value(index, col[, takeable])</code>	(DEPRECATED) Quickly retrieve single value at passed column and index
<code>get_values()</code>	Return an ndarray after converting sparse values to dense.
<code>groupby([by, axis, level, as_index, sort, ...])</code>	Group series using mapper (dict or key function, apply given function to group, return result as series) or by a series of columns.
<code>gt(other[, axis, level])</code>	Wrapper for flexible comparison methods <i>gt</i>
<code>head([n])</code>	Return the first <i>n</i> rows.
<code>hist([column, by, grid, xlabelsize, xrot, ...])</code>	Make a histogram of the DataFrame's.
<code>idxmax([axis, skipna])</code>	Return index of first occurrence of maximum over requested axis.
<code>idxmin([axis, skipna])</code>	Return index of first occurrence of minimum over requested axis.
<code>infer_objects()</code>	Attempt to infer better dtypes for object columns.
<code>info([verbose, buf, max_cols, memory_usage, ...])</code>	Print a concise summary of a DataFrame.
<code>insert(loc, column, value[, allow_duplicates])</code>	Insert column into DataFrame at specified location.
<code>interpolate([method, axis, limit, inplace, ...])</code>	Interpolate values according to different methods.
<code>isin(values)</code>	Return boolean DataFrame showing whether each element in the DataFrame is contained in values.
<code>isna()</code>	Detect missing values.
<code>isnull()</code>	Detect missing values.
<code>items()</code>	Iterator over (column name, Series) pairs.
<code>iteritems()</code>	Iterator over (column name, Series) pairs.
<code>iterrows()</code>	Iterate over DataFrame rows as (index, Series) pairs.
<code>itertuples([index, name])</code>	Iterate over DataFrame rows as namedtuples, with index value as first element of the tuple.
<code>join(other[, on, how, lsuffix, rsuffix, sort])</code>	Join columns with other DataFrame either on index or on a key column.
<code>keys()</code>	Get the 'info axis' (see Indexing for more)

Continued on next page

Table 61 – continued from previous page

<code>kurt([axis, skipna, level, numeric_only])</code>	Return unbiased kurtosis over requested axis using Fisher’s definition of kurtosis (kurtosis of normal == 0.0).
<code>kurtosis([axis, skipna, level, numeric_only])</code>	Return unbiased kurtosis over requested axis using Fisher’s definition of kurtosis (kurtosis of normal == 0.0).
<code>last(offset)</code>	Convenience method for subsetting final periods of time series data based on a date offset.
<code>last_valid_index()</code>	Return index for last non-NA/null value.
<code>le(other[, axis, level])</code>	Wrapper for flexible comparison methods <code>le</code>
<code>lookup(row_labels, col_labels)</code>	Label-based “fancy indexing” function for DataFrame.
<code>lt(other[, axis, level])</code>	Wrapper for flexible comparison methods <code>lt</code>
<code>mad([axis, skipna, level])</code>	Return the mean absolute deviation of the values for the requested axis
<code>mask(cond[, other, inplace, axis, level, ...])</code>	Return an object of same shape as self and whose corresponding entries are from self where <i>cond</i> is False and otherwise are from <i>other</i> .
<code>max([axis, skipna, level, numeric_only])</code>	This method returns the maximum of the values in the object.
<code>mean([axis, skipna, level, numeric_only])</code>	Return the mean of the values for the requested axis
<code>median([axis, skipna, level, numeric_only])</code>	Return the median of the values for the requested axis
<code>melt([id_vars, value_vars, var_name, ...])</code>	“Unpivots” a DataFrame from wide format to long format, optionally leaving identifier variables set.
<code>memory_usage([index, deep])</code>	Return the memory usage of each column in bytes.
<code>merge(right[, how, on, left_on, right_on, ...])</code>	Merge DataFrame objects by performing a database-style join operation by columns or indexes.
<code>min([axis, skipna, level, numeric_only])</code>	This method returns the minimum of the values in the object.
<code>mod(other[, axis, level, fill_value])</code>	Modulo of dataframe and other, element-wise (binary operator <i>mod</i> ).
<code>mode([axis, numeric_only])</code>	Gets the mode(s) of each element along the axis selected.
<code>mul(other[, axis, level, fill_value])</code>	Multiplication of dataframe and other, element-wise (binary operator <i>mul</i> ).
<code>multiply(other[, axis, level, fill_value])</code>	Multiplication of dataframe and other, element-wise (binary operator <i>mul</i> ).
<code>ne(other[, axis, level])</code>	Wrapper for flexible comparison methods <i>ne</i>
<code>nlargest(n, columns[, keep])</code>	Return the first <i>n</i> rows ordered by <i>columns</i> in descending order.
<code>notna()</code>	Detect existing (non-missing) values.
<code>notnull()</code>	Detect existing (non-missing) values.
<code>nsmallest(n, columns[, keep])</code>	Get the rows of a DataFrame sorted by the <i>n</i> smallest values of <i>columns</i> .
<code>nunique([axis, dropna])</code>	Return Series with number of distinct observations over requested axis.
<code>pct_change([periods, fill_method, limit, freq])</code>	Percentage change between the current and a prior element.
<code>pipe(func, *args, **kwargs)</code>	Apply <code>func(self, *args, **kwargs)</code>

Continued on next page

Table 61 – continued from previous page

<code>pivot([index, columns, values])</code>	Return reshaped DataFrame organized by given index / column values.
<code>pivot_table([values, index, columns, ...])</code>	Create a spreadsheet-style pivot table as a DataFrame.
<code>plot</code>	alias of <code>pandas.plotting._core.FramePlotMethods</code>
<code>pop(item)</code>	Return item and drop from frame.
<code>pow(other[, axis, level, fill_value])</code>	Exponential power of dataframe and other, element-wise (binary operator <code>pow</code> ).
<code>prod([axis, skipna, level, numeric_only, ...])</code>	Return the product of the values for the requested axis
<code>product([axis, skipna, level, numeric_only, ...])</code>	Return the product of the values for the requested axis
<code>quantile([q, axis, numeric_only, interpolation])</code>	Return values at the given quantile over requested axis, a la <code>numpy.percentile</code> .
<code>query(expr[, inplace])</code>	Query the columns of a frame with a boolean expression.
<code>radd(other[, axis, level, fill_value])</code>	Addition of dataframe and other, element-wise (binary operator <code>radd</code> ).
<code>rank([axis, method, numeric_only, ...])</code>	Compute numerical data ranks (1 through n) along axis.
<code>rdiv(other[, axis, level, fill_value])</code>	Floating division of dataframe and other, element-wise (binary operator <code>rtruediv</code> ).
<code>reindex([labels, index, columns, axis, ...])</code>	Conform DataFrame to new index with optional filling logic, placing NA/NaN in locations having no value in the previous index.
<code>reindex_axis(labels[, axis, method, level, ...])</code>	Conform input object to new index with optional filling logic, placing NA/NaN in locations having no value in the previous index.
<code>reindex_like(other[, method, copy, limit, ...])</code>	Return an object with matching indices to myself.
<code>rename([mapper, index, columns, axis, copy, ...])</code>	Alter axes labels.
<code>rename_axis(mapper[, axis, copy, inplace])</code>	Alter the name of the index or columns.
<code>reorder_levels(order[, axis])</code>	Rearrange index levels using input order.
<code>replace([to_replace, value, inplace, limit, ...])</code>	Replace values given in <code>to_replace</code> with <code>value</code> .
<code>resample(rule[, how, axis, fill_method, ...])</code>	Convenience method for frequency conversion and resampling of time series.
<code>reset_index([level, drop, inplace, ...])</code>	For DataFrame with multi-level index, return new DataFrame with labeling information in the columns under the index names, defaulting to 'level_0', 'level_1', etc.
<code>rfloordiv(other[, axis, level, fill_value])</code>	Integer division of dataframe and other, element-wise (binary operator <code>rfloordiv</code> ).
<code>rmod(other[, axis, level, fill_value])</code>	Modulo of dataframe and other, element-wise (binary operator <code>rmod</code> ).
<code>rmul(other[, axis, level, fill_value])</code>	Multiplication of dataframe and other, element-wise (binary operator <code>rmul</code> ).
<code>rolling(window[, min_periods, center, ...])</code>	Provides rolling window calculations.
<code>round([decimals])</code>	Round a DataFrame to a variable number of decimal places.
<code>rpow(other[, axis, level, fill_value])</code>	Exponential power of dataframe and other, element-wise (binary operator <code>rpow</code> ).

Continued on next page

Table 61 – continued from previous page

<code>rsub</code> (other[, axis, level, fill_value])	Subtraction of dataframe and other, element-wise (binary operator <i>rsub</i> ).
<code>rtruediv</code> (other[, axis, level, fill_value])	Floating division of dataframe and other, element-wise (binary operator <i>rtruediv</i> ).
<code>sample</code> ([n, frac, replace, weights, ...])	Return a random sample of items from an axis of object.
<code>select</code> (crit[, axis])	(DEPRECATED) Return data corresponding to axis labels matching criteria
<code>select_dtypes</code> ([include, exclude])	Return a subset of the DataFrame's columns based on the column dtypes.
<code>sem</code> ([axis, skipna, level, ddof, numeric_only])	Return unbiased standard error of the mean over requested axis.
<code>set_axis</code> (labels[, axis, inplace])	Assign desired index to given axis.
<code>set_index</code> (keys[, drop, append, inplace, ...])	Set the DataFrame index (row labels) using one or more existing columns.
<code>set_value</code> (index, col, value[, takeable])	(DEPRECATED) Put single value at passed column and index
<code>shift</code> ([periods, freq, axis])	Shift index by desired number of periods with an optional time freq
<code>skew</code> ([axis, skipna, level, numeric_only])	Return unbiased skew over requested axis Normalized by N-1
<code>slice_shift</code> ([periods, axis])	Equivalent to <i>shift</i> without copying data.
<code>sort_index</code> ([axis, level, ascending, ...])	Sort object by labels (along an axis)
<code>sort_values</code> (by[, axis, ascending, inplace, ...])	Sort by the values along either axis
<code>sortlevel</code> ([level, axis, ascending, inplace, ...])	(DEPRECATED) Sort multilevel index by chosen axis and primary level.
<code>squeeze</code> ([axis])	Squeeze length 1 dimensions.
<code>stack</code> ([level, dropna])	Stack the prescribed level(s) from columns to index.
<code>std</code> ([axis, skipna, level, ddof, numeric_only])	Return sample standard deviation over requested axis.
<code>sub</code> (other[, axis, level, fill_value])	Subtraction of dataframe and other, element-wise (binary operator <i>sub</i> ).
<code>subtract</code> (other[, axis, level, fill_value])	Subtraction of dataframe and other, element-wise (binary operator <i>sub</i> ).
<code>sum</code> ([axis, skipna, level, numeric_only, ...])	Return the sum of the values for the requested axis
<code>swapaxes</code> (axis1, axis2[, copy])	Interchange axes and swap values axes appropriately
<code>swaplevel</code> ([i, j, axis])	Swap levels i and j in a MultiIndex on a particular axis
<code>tail</code> ([n])	Return the last <i>n</i> rows.
<code>take</code> (indices[, axis, convert, is_copy])	Return the elements in the given <i>positional</i> indices along an axis.
<code>to_clipboard</code> ([excel, sep])	Copy object to the system clipboard.
<code>to_csv</code> ([path_or_buf, sep, na_rep, ...])	Write DataFrame to a comma-separated values (csv) file
<code>to_dense</code> ()	Return dense representation of NDFrame (as opposed to sparse)
<code>to_dict</code> ([orient, into])	Convert the DataFrame to a dictionary.
<code>to_excel</code> (excel_writer[, sheet_name, na_rep, ...])	Write DataFrame to an excel sheet
<code>to_feather</code> (fname)	write out the binary feather-format for DataFrames
<code>to_gbq</code> (destination_table, project_id[, ...])	Write a DataFrame to a Google BigQuery table.

Continued on next page

Table 61 – continued from previous page

<code>to_hdf(path_or_buf, key, **kwargs)</code>	Write the contained data to an HDF5 file using HDF-Store.
<code>to_html([buf, columns, col_space, header, ...])</code>	Render a DataFrame as an HTML table.
<code>to_json([path_or_buf, orient, date_format, ...])</code>	Convert the object to a JSON string.
<code>to_latex([buf, columns, col_space, header, ...])</code>	Render an object to a tabular environment table.
<code>to_msgpack([path_or_buf, encoding])</code>	msgpack (serialize) object to input file path
<code>to_panel()</code>	(DEPRECATED) Transform long (stacked) format (DataFrame) into wide (3D, Panel) format.
<code>to_parquet(fname[, engine, compression])</code>	Write a DataFrame to the binary parquet format.
<code>to_period([freq, axis, copy])</code>	Convert DataFrame from DatetimeIndex to PeriodIndex with desired frequency (inferred from index if not passed)
<code>to_pickle(path[, compression, protocol])</code>	Pickle (serialize) object to file.
<code>to_records([index, convert_datetime64])</code>	Convert DataFrame to a NumPy record array.
<code>to_sparse([fill_value, kind])</code>	Convert to SparseDataFrame
<code>to_sql(name, con[, schema, if_exists, ...])</code>	Write records stored in a DataFrame to a SQL database.
<code>to_stata(fname[, convert_dates, ...])</code>	Export Stata binary dta files.
<code>to_string([buf, columns, col_space, header, ...])</code>	Render a DataFrame to a console-friendly tabular output.
<code>to_timestamp([freq, how, axis, copy])</code>	Cast to DatetimeIndex of timestamps, at <i>beginning</i> of period
<code>to_xarray()</code>	Return an xarray object from the pandas object.
<code>transform(func, *args, **kwargs)</code>	Call function producing a like-indexed NDFrame and return a NDFrame with the transformed values
<code>transpose(*args, **kwargs)</code>	Transpose index and columns.
<code>truediv(other[, axis, level, fill_value])</code>	Floating division of dataframe and other, element-wise (binary operator <i>truediv</i> ).
<code>truncate([before, after, axis, copy])</code>	Truncate a Series or DataFrame before and after some index value.
<code>tshift([periods, freq, axis])</code>	Shift the time index, using the index's frequency if available.
<code>tz_convert(tz[, axis, level, copy])</code>	Convert tz-aware axis to target time zone.
<code>tz_localize(tz[, axis, level, copy, ambiguous])</code>	Localize tz-naive TimeSeries to target time zone.
<code>unstack([level, fill_value])</code>	Pivot a level of the (necessarily hierarchical) index labels, returning a DataFrame having a new level of column labels whose inner-most level consists of the pivoted index labels.
<code>update(other[, join, overwrite, ...])</code>	Modify in place using non-NA values from another DataFrame.
<code>var([axis, skipna, level, ddof, numeric_only])</code>	Return unbiased variance over requested axis.
<code>where(cond[, other, inplace, axis, level, ...])</code>	Return an object of same shape as self and whose corresponding entries are from self where <i>cond</i> is True and otherwise are from <i>other</i> .
<code>xs(key[, axis, level, drop_level])</code>	Returns a cross-section (row(s) or column(s)) from the Series/DataFrame.

**pandas.DataFrame.abs**DataFrame.**abs** ()

Return a Series/DataFrame with absolute numeric value of each element.

This function only applies to elements that are all numeric.

**Returns** `abs`

Series/DataFrame containing the absolute value of each element.

**See also:**

`numpy.absolute` calculate the absolute value element-wise.

**Notes**

For complex inputs,  $1.2 + 1j$ , the absolute value is  $\sqrt{a^2 + b^2}$ .

**Examples**

Absolute numeric values in a Series.

```
>>> s = pd.Series([-1.10, 2, -3.33, 4])
>>> s.abs()
0    1.10
1    2.00
2    3.33
3    4.00
dtype: float64
```

Absolute numeric values in a Series with complex numbers.

```
>>> s = pd.Series([1.2 + 1j])
>>> s.abs()
0    1.56205
dtype: float64
```

Absolute numeric values in a Series with a Timedelta element.

```
>>> s = pd.Series([pd.Timedelta('1 days')])
>>> s.abs()
0    1 days
dtype: timedelta64[ns]
```

Select rows with data closest to certain value using `argsort` (from [StackOverflow](#)).

```
>>> df = pd.DataFrame({
...     'a': [4, 5, 6, 7],
...     'b': [10, 20, 30, 40],
...     'c': [100, 50, -30, -50]
... })
>>> df
   a  b  c
0  4 10 100
1  5 20  50
2  6 30 -30
3  7 40 -50
>>> df.loc[(df.c - 43).abs().argsort()]
   a  b  c
1  5 20  50
```

3	7	40	-50

**pandas.DataFrame.add**`DataFrame.add(other, axis='columns', level=None, fill_value=None)`Addition of dataframe and other, element-wise (binary operator *add*).Equivalent to `dataframe + other`, but with support to substitute a `fill_value` for missing data in one of the inputs.**Parameters****other** [Series, DataFrame, or constant]**axis** : {0, 1, 'index', 'columns'}

For Series input, axis to match Series index on

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

**fill\_value** : None or float value, default None

Fill existing missing (NaN) values, and any new element needed for successful DataFrame alignment, with this value before computation. If data in both corresponding DataFrame locations is missing the result will be missing

**Returns****result** [DataFrame]**See also:**`DataFrame.radd`**Notes**

Mismatched indices will be unioned together

**Examples**

```

>>> a = pd.DataFrame([1, 1, 1, np.nan], index=['a', 'b', 'c', 'd'],
...                   columns=['one'])
>>> a
   one
a  1.0
b  1.0
c  1.0
d  NaN
>>> b = pd.DataFrame(dict(one=[1, np.nan, 1, np.nan],
...                       two=[np.nan, 2, np.nan, 2]),
...                   index=['a', 'b', 'd', 'e'])
>>> b

```

(continues on next page)

(continued from previous page)

```

      one  two
a  1.0  NaN
b  NaN  2.0
d  1.0  NaN
e  NaN  2.0
>>> a.add(b, fill_value=0)
      one  two
a  2.0  NaN
b  1.0  2.0
c  1.0  NaN
d  1.0  NaN
e  NaN  2.0

```

**pandas.DataFrame.add\_prefix****DataFrame.add\_prefix** (*prefix*)Prefix labels with string *prefix*.

For Series, the row labels are prefixed. For DataFrame, the column labels are prefixed.

**Parameters** *prefix* : str

The string to add before each label.

**Returns** **Series or DataFrame**

New Series or DataFrame with updated labels.

**See also:****Series.add\_suffix** Suffix row labels with string *suffix*.**DataFrame.add\_suffix** Suffix column labels with string *suffix*.**Examples**

```

>>> s = pd.Series([1, 2, 3, 4])
>>> s
0    1
1    2
2    3
3    4
dtype: int64

```

```

>>> s.add_prefix('item_')
item_0    1
item_1    2
item_2    3
item_3    4
dtype: int64

```

```

>>> df = pd.DataFrame({'A': [1, 2, 3, 4], 'B': [3, 4, 5, 6]})
>>> df
   A  B

```

(continues on next page)

(continued from previous page)

```
0  1  3
1  2  4
2  3  5
3  4  6
```

```
>>> df.add_prefix('col_')
      col_A  col_B
0         1     3
1         2     4
2         3     5
3         4     6
```

**pandas.DataFrame.add\_suffix****DataFrame.add\_suffix** (*suffix*)Suffix labels with string *suffix*.

For Series, the row labels are suffixed. For DataFrame, the column labels are suffixed.

**Parameters** *suffix* : str

The string to add after each label.

**Returns** Series or DataFrame

New Series or DataFrame with updated labels.

**See also:****Series.add\_prefix** Prefix row labels with string *prefix*.**DataFrame.add\_prefix** Prefix column labels with string *prefix*.**Examples**

```
>>> s = pd.Series([1, 2, 3, 4])
>>> s
0    1
1    2
2    3
3    4
dtype: int64
```

```
>>> s.add_suffix('_item')
0_item    1
1_item    2
2_item    3
3_item    4
dtype: int64
```

```
>>> df = pd.DataFrame({'A': [1, 2, 3, 4], 'B': [3, 4, 5, 6]})
>>> df
   A  B
0  1  3
```

(continues on next page)

(continued from previous page)

```
1  2  4
2  3  5
3  4  6
```

```
>>> df.add_suffix('_col')
      A_col  B_col
0         1     3
1         2     4
2         3     5
3         4     6
```

## pandas.DataFrame.agg

`DataFrame.agg(func, axis=0, *args, **kwargs)`

Aggregate using one or more operations over the specified axis.

New in version 0.20.0.

**Parameters** **func** : function, string, dictionary, or list of string/functions

Function to use for aggregating the data. If a function, must either work when passed a DataFrame or when passed to DataFrame.apply. For a DataFrame, can pass a dict, if the keys are DataFrame column names.

Accepted combinations are:

- string function name.
- function.
- list of functions.
- dict of column names -> functions (or list of functions).

**axis** : {0 or 'index', 1 or 'columns'}, default 0

- 0 or 'index': apply function to each column.
- 1 or 'columns': apply function to each row.

**\*args**

Positional arguments to pass to *func*.

**\*\*kwargs**

Keyword arguments to pass to *func*.

**Returns**

**aggregated** [DataFrame]

**See also:**

**DataFrame.apply** Perform any type of operations.

**DataFrame.transform** Perform transformation type operations.

**pandas.core.groupby.GroupBy** Perform operations over groups.

**pandas.core.resample.Resampler** Perform operations over resampled bins.

**pandas.core.window.Rolling** Perform operations over rolling window.

**pandas.core.window.Expanding** Perform operations over expanding window.

**pandas.core.window.EWM** Perform operation over exponential weighted window.

## Notes

*agg* is an alias for *aggregate*. Use the alias.

A passed user-defined-function will be passed a Series for evaluation.

The aggregation operations are always performed over an axis, either the index (default) or the column axis. This behavior is different from *numpy* aggregation functions (*mean*, *median*, *prod*, *sum*, *std*, *var*), where the default is to compute the aggregation of the flattened array, e.g., `numpy.mean(arr_2d)` as opposed to `numpy.mean(arr_2d, axis=0)`.

*agg* is an alias for *aggregate*. Use the alias.

## Examples

```
>>> df = pd.DataFrame([[1, 2, 3],
...                    [4, 5, 6],
...                    [7, 8, 9],
...                    [np.nan, np.nan, np.nan]],
...                   columns=['A', 'B', 'C'])
```

Aggregate these functions over the rows.

```
>>> df.agg(['sum', 'min'])
      A      B      C
sum  12.0  15.0  18.0
min   1.0   2.0   3.0
```

Different aggregations per column.

```
>>> df.agg({'A' : ['sum', 'min'], 'B' : ['min', 'max']})
      A      B
max  NaN  8.0
min   1.0  2.0
sum  12.0 NaN
```

Aggregate over the columns.

```
>>> df.agg("mean", axis="columns")
0      2.0
1      5.0
2      8.0
3      NaN
dtype: float64
```

## pandas.DataFrame.aggregate

`DataFrame.aggregate(func, axis=0, *args, **kwargs)`

Aggregate using one or more operations over the specified axis.

New in version 0.20.0.

**Parameters** **func** : function, string, dictionary, or list of string/functions

Function to use for aggregating the data. If a function, must either work when passed a DataFrame or when passed to DataFrame.apply. For a DataFrame, can pass a dict, if the keys are DataFrame column names.

Accepted combinations are:

- string function name.
- function.
- list of functions.
- dict of column names -> functions (or list of functions).

**axis** : {0 or 'index', 1 or 'columns'}, default 0

- 0 or 'index': apply function to each column.
- 1 or 'columns': apply function to each row.

**\*args**

Positional arguments to pass to *func*.

**\*\*kwargs**

Keyword arguments to pass to *func*.

**Returns**

**aggregated** [DataFrame]

**See also:**

**DataFrame.apply** Perform any type of operations.

**DataFrame.transform** Perform transformation type operations.

**pandas.core.groupby.GroupBy** Perform operations over groups.

**pandas.core.resample.Resampler** Perform operations over resampled bins.

**pandas.core.window.Rolling** Perform operations over rolling window.

**pandas.core.window.Expanding** Perform operations over expanding window.

**pandas.core.window.EWM** Perform operation over exponential weighted window.

## Notes

*agg* is an alias for *aggregate*. Use the alias.

A passed user-defined-function will be passed a Series for evaluation.

The aggregation operations are always performed over an axis, either the index (default) or the column axis. This behavior is different from *numpy* aggregation functions (*mean*, *median*, *prod*, *sum*, *std*, *var*), where the default is to compute the aggregation of the flattened array, e.g., `numpy.mean(arr_2d)` as opposed to `numpy.mean(arr_2d, axis=0)`.

*agg* is an alias for *aggregate*. Use the alias.

## Examples

```
>>> df = pd.DataFrame([[1, 2, 3],
...                     [4, 5, 6],
...                     [7, 8, 9],
...                     [np.nan, np.nan, np.nan]],
...                    columns=['A', 'B', 'C'])
```

Aggregate these functions over the rows.

```
>>> df.agg(['sum', 'min'])
      A      B      C
sum  12.0  15.0  18.0
min   1.0   2.0   3.0
```

Different aggregations per column.

```
>>> df.agg({'A' : ['sum', 'min'], 'B' : ['min', 'max']})
      A      B
max  NaN   8.0
min   1.0   2.0
sum  12.0  NaN
```

Aggregate over the columns.

```
>>> df.agg("mean", axis="columns")
0      2.0
1      5.0
2      8.0
3      NaN
dtype: float64
```

## pandas.DataFrame.align

`DataFrame.align(other, join='outer', axis=None, level=None, copy=True, fill_value=None, method=None, limit=None, fill_axis=0, broadcast_axis=None)`

Align two objects on their axes with the specified join method for each axis Index

### Parameters

**other** [DataFrame or Series]

**join** [{‘outer’, ‘inner’, ‘left’, ‘right’}, default ‘outer’]

**axis** : allowed axis of the other object, default None

Align on index (0), columns (1), or both (None)

**level** : int or level name, default None

Broadcast across a level, matching Index values on the passed MultiIndex level

**copy** : boolean, default True

Always returns new objects. If copy=False and no reindexing is required then original objects are returned.

**fill\_value** : scalar, default np.NaN

Value to use for missing values. Defaults to NaN, but can be any “compatible” value

**method** [str, default None]

**limit** [int, default None]

**fill\_axis** : {0 or ‘index’, 1 or ‘columns’}, default 0

Filling axis, method and limit

**broadcast\_axis** : {0 or ‘index’, 1 or ‘columns’}, default None

Broadcast values along this axis, if aligning two objects of different dimensions

**Returns** (**left**, **right**) : (DataFrame, type of other)

Aligned objects

## **pandas.DataFrame.all**

`DataFrame.all` (*axis=0*, *bool\_only=None*, *skipna=True*, *level=None*, *\*\*kwargs*)

Return whether all elements are True, potentially over an axis.

Returns True if all elements within a series or along a Dataframe axis are non-zero, not-empty or not-False.

**Parameters** **axis** : {0 or ‘index’, 1 or ‘columns’, None}, default 0

Indicate which axis or axes should be reduced.

- 0 / ‘index’ : reduce the index, return a Series whose index is the original column labels.
- 1 / ‘columns’ : reduce the columns, return a Series whose index is the original index.
- None : reduce all axes, return a scalar.

**skipna** : boolean, default True

Exclude NA/null values. If an entire row/column is NA, the result will be NA.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a Series.

**bool\_only** : boolean, default None

Include only boolean columns. If None, will attempt to use everything, then use only boolean data. Not implemented for Series.

**\*\*kwargs** : any, default None

Additional keywords have no effect but might be accepted for compatibility with NumPy.

### **Returns**

**all** [Series or DataFrame (if level specified)]

**See also:**

[`pandas.Series.all`](#) Return True if all elements are True

**pandas.DataFrame.any** Return True if one (or more) elements are True

## Examples

### Series

```
>>> pd.Series([True, True]).all()
True
>>> pd.Series([True, False]).all()
False
```

### DataFrames

Create a dataframe from a dictionary.

```
>>> df = pd.DataFrame({'col1': [True, True], 'col2': [True, False]})
>>> df
   col1  col2
0  True  True
1  True False
```

Default behaviour checks if column-wise values all return True.

```
>>> df.all()
col1    True
col2   False
dtype: bool
```

Specify `axis='columns'` to check if row-wise values all return True.

```
>>> df.all(axis='columns')
0    True
1   False
dtype: bool
```

Or `axis=None` for whether every value is True.

```
>>> df.all(axis=None)
False
```

## pandas.DataFrame.any

`DataFrame.any` (*axis=0*, *bool\_only=None*, *skipna=True*, *level=None*, *\*\*kwargs*)

Return whether any element is True over requested axis.

Unlike `DataFrame.all()`, this performs an *or* operation. If any of the values along the specified axis is True, this will return True.

**Parameters** `axis`: {0 or 'index', 1 or 'columns', None}, default 0

Indicate which axis or axes should be reduced.

- 0 / 'index' : reduce the index, return a Series whose index is the original column labels.
- 1 / 'columns' : reduce the columns, return a Series whose index is the original index.

- None : reduce all axes, return a scalar.

**skipna** : boolean, default True

Exclude NA/null values. If an entire row/column is NA, the result will be NA.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a Series.

**bool\_only** : boolean, default None

Include only boolean columns. If None, will attempt to use everything, then use only boolean data. Not implemented for Series.

**\*\*kwargs** : any, default None

Additional keywords have no effect but might be accepted for compatibility with NumPy.

### Returns

**any** [Series or DataFrame (if level specified)]

**See also:**

[`pandas.DataFrame.all`](#) Return whether all elements are True.

## Examples

### Series

For Series input, the output is a scalar indicating whether any element is True.

```
>>> pd.Series([True, False]).any()
True
```

### DataFrame

Whether each column contains at least one True element (the default).

```
>>> df = pd.DataFrame({"A": [1, 2], "B": [0, 2], "C": [0, 0]})
>>> df
   A  B  C
0  1  0  0
1  2  2  0
```

```
>>> df.any()
A      True
B      True
C     False
dtype: bool
```

Aggregating over the columns.

```
>>> df = pd.DataFrame({"A": [True, False], "B": [1, 2]})
>>> df
   A  B
0  True  1
1 False  2
```

```
>>> df.any(axis='columns')
0      True
1      True
dtype: bool
```

```
>>> df = pd.DataFrame({"A": [True, False], "B": [1, 0]})
>>> df
   A  B
0  True  1
1 False  0
```

```
>>> df.any(axis='columns')
0      True
1     False
dtype: bool
```

Aggregating over the entire DataFrame with `axis=None`.

```
>>> df.any(axis=None)
True
```

`any` for an empty DataFrame is an empty Series.

```
>>> pd.DataFrame([]).any()
Series([], dtype: bool)
```

## pandas.DataFrame.append

`DataFrame.append(other, ignore_index=False, verify_integrity=False, sort=None)`

Append rows of *other* to the end of this frame, returning a new object. Columns not in this frame are added as new columns.

**Parameters** **other** : DataFrame or Series/dict-like object, or list of these

The data to append.

**ignore\_index** : boolean, default False

If True, do not use the index labels.

**verify\_integrity** : boolean, default False

If True, raise `ValueError` on creating index with duplicates.

**sort** : boolean, default None

Sort columns if the columns of *self* and *other* are not aligned. The default sorting is deprecated and will change to not-sorting in a future version of pandas. Explicitly pass `sort=True` to silence the warning and sort. Explicitly pass `sort=False` to silence the warning and not sort.

New in version 0.23.0.

**Returns**

**appended** [DataFrame]

See also:

**pandas.concat** General function to concatenate DataFrame, Series or Panel objects

## Notes

If a list of dict/series is passed and the keys are all contained in the DataFrame's index, the order of the columns in the resulting DataFrame will be unchanged.

Iteratively appending rows to a DataFrame can be more computationally intensive than a single concatenate. A better solution is to append those rows to a list and then concatenate the list with the original DataFrame all at once.

## Examples

```
>>> df = pd.DataFrame([[1, 2], [3, 4]], columns=list('AB'))
>>> df
   A  B
0  1  2
1  3  4
>>> df2 = pd.DataFrame([[5, 6], [7, 8]], columns=list('AB'))
>>> df.append(df2)
   A  B
0  1  2
1  3  4
0  5  6
1  7  8
```

With `ignore_index` set to `True`:

```
>>> df.append(df2, ignore_index=True)
   A  B
0  1  2
1  3  4
2  5  6
3  7  8
```

The following, while not recommended methods for generating DataFrames, show two ways to generate a DataFrame from multiple data sources.

Less efficient:

```
>>> df = pd.DataFrame(columns=['A'])
>>> for i in range(5):
...     df = df.append({'A': i}, ignore_index=True)
>>> df
   A
0  0
1  1
2  2
3  3
4  4
```

More efficient:

```
>>> pd.concat([pd.DataFrame([i], columns=['A']) for i in range(5)],
...           ignore_index=True)
```

(continues on next page)

(continued from previous page)

	A
0	0
1	1
2	2
3	3
4	4

**pandas.DataFrame.apply**

`DataFrame.apply(func, axis=0, broadcast=None, raw=False, reduce=None, result_type=None, args=(), **kwargs)`

Apply a function along an axis of the DataFrame.

Objects passed to the function are Series objects whose index is either the DataFrame's index (`axis=0`) or the DataFrame's columns (`axis=1`). By default (`result_type=None`), the final return type is inferred from the return type of the applied function. Otherwise, it depends on the `result_type` argument.

**Parameters** `func` : function

Function to apply to each column or row.

**axis** : {0 or 'index', 1 or 'columns'}, default 0

Axis along which the function is applied:

- 0 or 'index': apply function to each column.
- 1 or 'columns': apply function to each row.

**broadcast** : bool, optional

Only relevant for aggregation functions:

- `False` or `None` : returns a Series whose length is the length of the index or the number of columns (based on the `axis` parameter)
- `True` : results will be broadcast to the original shape of the frame, the original index and columns will be retained.

Deprecated since version 0.23.0: This argument will be removed in a future version, replaced by `result_type='broadcast'`.

**raw** : bool, default False

- `False` : passes each row or column as a Series to the function.
- `True` : the passed function will receive ndarray objects instead. If you are just applying a NumPy reduction function this will achieve much better performance.

**reduce** : bool or None, default None

Try to apply reduction procedures. If the DataFrame is empty, `apply` will use `reduce` to determine whether the result should be a Series or a DataFrame. If `reduce=None` (the default), `apply`'s return value will be guessed by calling `func` on an empty Series (note: while guessing, exceptions raised by `func` will be ignored). If `reduce=True` a Series will always be returned, and if `reduce=False` a DataFrame will always be returned.

Deprecated since version 0.23.0: This argument will be removed in a future version, replaced by `result_type='reduce'`.

**result\_type** : {'expand', 'reduce', 'broadcast', None}, default None

These only act when `axis=1` (columns):

- 'expand' : list-like results will be turned into columns.
- 'reduce' : returns a Series if possible rather than expanding list-like results. This is the opposite of 'expand'.
- 'broadcast' : results will be broadcast to the original shape of the DataFrame, the original index and columns will be retained.

The default behaviour (None) depends on the return value of the applied function: list-like results will be returned as a Series of those. However if the apply function returns a Series these are expanded to columns.

New in version 0.23.0.

**args** : tuple

Positional arguments to pass to *func* in addition to the array/series.

**\*\*kwds**

Additional keyword arguments to pass as keywords arguments to *func*.

### Returns

**applied** [Series or DataFrame]

**See also:**

[\*DataFrame.applymap\*](#) For elementwise operations

[\*DataFrame.agg\*](#) only perform aggregating type operations

[\*DataFrame.transform\*](#) only perform transforming type operations

### Notes

In the current implementation `apply` calls *func* twice on the first column/row to decide whether it can take a fast or slow code path. This can lead to unexpected behavior if *func* has side-effects, as they will take effect twice for the first column/row.

### Examples

```
>>> df = pd.DataFrame([[4, 9],] * 3, columns=['A', 'B'])
>>> df
   A  B
0  4  9
1  4  9
2  4  9
```

Using a numpy universal function (in this case the same as `np.sqrt(df)`):

```
>>> df.apply(np.sqrt)
   A    B
0  2.0  3.0
1  2.0  3.0
2  2.0  3.0
```

Using a reducing function on either axis

```
>>> df.apply(np.sum, axis=0)
A    12
B    27
dtype: int64
```

```
>>> df.apply(np.sum, axis=1)
0    13
1    13
2    13
dtype: int64
```

Returning a list-like will result in a Series

```
>>> df.apply(lambda x: [1, 2], axis=1)
0    [1, 2]
1    [1, 2]
2    [1, 2]
dtype: object
```

Passing `result_type='expand'` will expand list-like results to columns of a DataFrame

```
>>> df.apply(lambda x: [1, 2], axis=1, result_type='expand')
0  1
0  1  2
1  1  2
2  1  2
```

Returning a Series inside the function is similar to passing `result_type='expand'`. The resulting column names will be the Series index.

```
>>> df.apply(lambda x: pd.Series([1, 2], index=['foo', 'bar']), axis=1)
   foo  bar
0     1    2
1     1    2
2     1    2
```

Passing `result_type='broadcast'` will ensure the same shape result, whether list-like or scalar is returned by the function, and broadcast it along the axis. The resulting column names will be the originals.

```
>>> df.apply(lambda x: [1, 2], axis=1, result_type='broadcast')
   A  B
0  1  2
1  1  2
2  1  2
```

## pandas.DataFrame.applymap

`DataFrame.applymap(func)`

Apply a function to a DataFrame elementwise.

This method applies a function that accepts and returns a scalar to every element of a DataFrame.

**Parameters** `func` : callable

Python function, returns a single value from a single value.

**Returns DataFrame**

Transformed DataFrame.

**See also:**

**`DataFrame.apply`** Apply a function along input axis of DataFrame

**Examples**

```
>>> df = pd.DataFrame([[1, 2.12], [3.356, 4.567]])
>>> df
   0      1
0  1.000  2.120
1  3.356  4.567
```

```
>>> df.applymap(lambda x: len(str(x)))
   0  1
0  3  4
1  5  5
```

Note that a vectorized version of *func* often exists, which will be much faster. You could square each number elementwise.

```
>>> df.applymap(lambda x: x**2)
   0      1
0  1.000000  4.494400
1 11.262736 20.857489
```

But it's better to avoid `applymap` in that case.

```
>>> df ** 2
   0      1
0  1.000000  4.494400
1 11.262736 20.857489
```

**pandas.DataFrame.as\_blocks**

`DataFrame.as_blocks` (*copy=True*)

Convert the frame to a dict of dtype -> Constructor Types that each has a homogeneous dtype.

Deprecated since version 0.21.0.

**NOTE: the dtypes of the blocks WILL BE PRESERVED HERE (unlike in `as_matrix`)**

**Parameters**

**copy** [boolean, default True]

**Returns**

**values** [a dict of dtype -> Constructor Types]

**pandas.DataFrame.as\_matrix**`DataFrame.as_matrix (columns=None)`

Convert the frame to its Numpy-array representation.

Deprecated since version 0.23.0: Use `DataFrame.values()` instead.**Parameters** `columns`: list, optional, default:None

If None, return all columns, otherwise, returns specified columns.

**Returns** `values` : ndarray

If the caller is heterogeneous and contains booleans or objects, the result will be of dtype=object. See Notes.

**See also:**`pandas.DataFrame.values`**Notes**

Return is NOT a Numpy-matrix, rather, a Numpy-array.

The dtype will be a lower-common-denominator dtype (implicit upcasting); that is to say if the dtypes (even of numeric types) are mixed, the one that accommodates all will be chosen. Use this with care if you are not dealing with the blocks.

e.g. If the dtypes are float16 and float32, dtype will be upcast to float32. If dtypes are int32 and uint8, dtype will be upcase to int32. By `numpy.find_common_type` convention, mixing int64 and uint64 will result in a float64 dtype.This method is provided for backwards compatibility. Generally, it is recommended to use `‘.values’`.**pandas.DataFrame.asfreq**`DataFrame.asfreq (freq, method=None, how=None, normalize=False, fill_value=None)`

Convert TimeSeries to specified frequency.

Optionally provide filling method to pad/backfill missing values.

Returns the original data conformed to a new index with the specified frequency. `resample` is more appropriate if an operation, such as summarization, is necessary to represent the data at the new frequency.**Parameters****freq** [DateOffset object, or string]**method** : {‘backfill’/‘bfill’, ‘pad’/‘ffill’}, default None

Method to use for filling holes in reindexed Series (note this does not fill NaNs that already were present):

- ‘pad’ / ‘ffill’: propagate last valid observation forward to next valid
- ‘backfill’ / ‘bfill’: use NEXT valid observation to fill

**how** : {‘start’, ‘end’}, default end

For PeriodIndex only, see PeriodIndex.asfreq

**normalize** : bool, default False

Whether to reset output index to midnight

**fill\_value:** scalar, optional

Value to use for missing values, applied during upsampling (note this does not fill NaNs that already were present).

New in version 0.20.0.

### Returns

**converted** [type of caller]

**See also:**

[\*reindex\*](#)

### Notes

To learn more about the frequency strings, please see [this link](#).

### Examples

Start by creating a series with 4 one minute timestamps.

```
>>> index = pd.date_range('1/1/2000', periods=4, freq='T')
>>> series = pd.Series([0.0, None, 2.0, 3.0], index=index)
>>> df = pd.DataFrame({'s':series})
>>> df
```

	s
2000-01-01 00:00:00	0.0
2000-01-01 00:01:00	NaN
2000-01-01 00:02:00	2.0
2000-01-01 00:03:00	3.0

Upsample the series into 30 second bins.

```
>>> df.asfreq(freq='30S')
s
2000-01-01 00:00:00    0.0
2000-01-01 00:00:30    NaN
2000-01-01 00:01:00    NaN
2000-01-01 00:01:30    NaN
2000-01-01 00:02:00    2.0
2000-01-01 00:02:30    NaN
2000-01-01 00:03:00    3.0
```

Upsample again, providing a fill value.

```
>>> df.asfreq(freq='30S', fill_value=9.0)
s
2000-01-01 00:00:00    0.0
2000-01-01 00:00:30    9.0
2000-01-01 00:01:00    NaN
2000-01-01 00:01:30    9.0
2000-01-01 00:02:00    2.0
2000-01-01 00:02:30    9.0
2000-01-01 00:03:00    3.0
```

Upsample again, providing a method.

```
>>> df.asfreq(freq='30S', method='bfill')
s
2000-01-01 00:00:00    0.0
2000-01-01 00:00:30   NaN
2000-01-01 00:01:00   NaN
2000-01-01 00:01:30    2.0
2000-01-01 00:02:00    2.0
2000-01-01 00:02:30    3.0
2000-01-01 00:03:00    3.0
```

## pandas.DataFrame.asof

`DataFrame.asof` (*where*, *subset=None*)

The last row without any NaN is taken (or the last row without NaN considering only the subset of columns in the case of a DataFrame)

New in version 0.19.0: For DataFrame

If there is no good value, NaN is returned for a Series a Series of NaN values for a DataFrame

### Parameters

**where** [date or array of dates]

**subset** : string or list of strings, default None

if not None use these columns for NaN propagation

### Returns where is scalar

- value or NaN if input is Series
- Series if input is DataFrame

**where is Index: same shape object as input**

**See also:**

[`merge\_asof`](#)

### Notes

Dates are assumed to be sorted Raises if this is not the case

## pandas.DataFrame.assign

`DataFrame.assign` (*\*\*kwargs*)

Assign new columns to a DataFrame, returning a new object (a copy) with the new columns added to the original ones. Existing columns that are re-assigned will be overwritten.

**Parameters** *kwargs* : keyword, value pairs

keywords are the column names. If the values are callable, they are computed on the DataFrame and assigned to the new columns. The callable must not change input DataFrame (though pandas doesn't check it). If the values are not callable, (e.g. a Series, scalar, or array), they are simply assigned.

**Returns** `df` : DataFrame

A new DataFrame with the new columns in addition to all the existing columns.

**Notes**

Assigning multiple columns within the same `assign` is possible. For Python 3.6 and above, later items in `**kwargs` may refer to newly created or modified columns in `df`; items are computed and assigned into `df` in order. For Python 3.5 and below, the order of keyword arguments is not specified, you cannot refer to newly created or modified columns. All items are computed first, and then assigned in alphabetical order.

Changed in version 0.23.0: Keyword argument order is maintained for Python 3.6 and later.

**Examples**

```
>>> df = pd.DataFrame({'A': range(1, 11), 'B': np.random.randn(10)})
```

Where the value is a callable, evaluated on `df`:

```
>>> df.assign(ln_A = lambda x: np.log(x.A))
   A         B      ln_A
0  1  0.426905  0.000000
1  2 -0.780949  0.693147
2  3 -0.418711  1.098612
3  4 -0.269708  1.386294
4  5 -0.274002  1.609438
5  6 -0.500792  1.791759
6  7  1.649697  1.945910
7  8 -1.495604  2.079442
8  9  0.549296  2.197225
9 10 -0.758542  2.302585
```

Where the value already exists and is inserted:

```
>>> newcol = np.log(df['A'])
>>> df.assign(ln_A=newcol)
   A         B      ln_A
0  1  0.426905  0.000000
1  2 -0.780949  0.693147
2  3 -0.418711  1.098612
3  4 -0.269708  1.386294
4  5 -0.274002  1.609438
5  6 -0.500792  1.791759
6  7  1.649697  1.945910
7  8 -1.495604  2.079442
8  9  0.549296  2.197225
9 10 -0.758542  2.302585
```

Where the keyword arguments depend on each other

```
>>> df = pd.DataFrame({'A': [1, 2, 3]})
```

```
>>> df.assign(B=df.A, C=lambda x:x['A']+ x['B'])
   A  B  C
0  1  1  2
1  2  2  4
2  3  3  6
```

## pandas.DataFrame.astype

`DataFrame.astype(dtype, copy=True, errors='raise', **kwargs)`

Cast a pandas object to a specified dtype dtype.

**Parameters** **dtype** : data type, or dict of column name -> data type

Use a `numpy.dtype` or Python type to cast entire pandas object to the same type. Alternatively, use `{col: dtype, ...}`, where `col` is a column label and `dtype` is a `numpy.dtype` or Python type to cast one or more of the DataFrame's columns to column-specific types.

**copy** : bool, default True.

Return a copy when `copy=True` (be very careful setting `copy=False` as changes to values then may propagate to other pandas objects).

**errors** : {'raise', 'ignore'}, default 'raise'.

Control raising of exceptions on invalid data for provided dtype.

- `raise` : allow exceptions to be raised
- `ignore` : suppress exceptions. On error return original object

New in version 0.20.0.

**raise\_on\_error** : raise on invalid input

Deprecated since version 0.20.0: Use `errors` instead

**kwargs** [keyword arguments to pass on to the constructor]

### Returns

**casted** [type of caller]

See also:

[`pandas.to\_datetime`](#) Convert argument to datetime.

[`pandas.to\_timedelta`](#) Convert argument to timedelta.

[`pandas.to\_numeric`](#) Convert argument to a numeric type.

[`numpy.ndarray.astype`](#) Cast a numpy array to a specified type.

### Examples

```
>>> ser = pd.Series([1, 2], dtype='int32')
>>> ser
0    1
1    2
dtype: int32
>>> ser.astype('int64')
0    1
1    2
dtype: int64
```

Convert to categorical type:

```
>>> ser.astype('category')
0    1
1    2
dtype: category
Categories (2, int64): [1, 2]
```

Convert to ordered categorical type with custom ordering:

```
>>> ser.astype('category', ordered=True, categories=[2, 1])
0    1
1    2
dtype: category
Categories (2, int64): [2 < 1]
```

Note that using `copy=False` and changing data on a new pandas object may propagate changes:

```
>>> s1 = pd.Series([1,2])
>>> s2 = s1.astype('int64', copy=False)
>>> s2[0] = 10
>>> s1 # note that s1[0] has changed too
0    10
1     2
dtype: int64
```

## pandas.DataFrame.at\_time

`DataFrame.at_time` (*time*, *asof=False*)

Select values at particular time of day (e.g. 9:30AM).

### Parameters

**time** [datetime.time or string]

### Returns

**values\_at\_time** [type of caller]

### Raises `TypeError`

If the index is not a *DatetimeIndex*

See also:

***between\_time*** Select values between particular times of the day

***first*** Select initial periods of time series based on a date offset

**last** Select final periods of time series based on a date offset

**DatetimeIndex.indexer\_at\_time** Get just the index locations for values at particular time of the day

## Examples

```
>>> i = pd.date_range('2018-04-09', periods=4, freq='12H')
>>> ts = pd.DataFrame({'A': [1,2,3,4]}, index=i)
>>> ts
```

	A
2018-04-09 00:00:00	1
2018-04-09 12:00:00	2
2018-04-10 00:00:00	3
2018-04-10 12:00:00	4

```
>>> ts.at_time('12:00')
```

	A
2018-04-09 12:00:00	2
2018-04-10 12:00:00	4

## pandas.DataFrame.between\_time

**DataFrame.between\_time** (*start\_time*, *end\_time*, *include\_start=True*, *include\_end=True*)

Select values between particular times of the day (e.g., 9:00-9:30 AM).

By setting *start\_time* to be later than *end\_time*, you can get the times that are *not* between the two times.

### Parameters

**start\_time** [datetime.time or string]

**end\_time** [datetime.time or string]

**include\_start** [boolean, default True]

**include\_end** [boolean, default True]

### Returns

**values\_between\_time** [type of caller]

### Raises TypeError

If the index is not a *DatetimeIndex*

### See also:

**at\_time** Select values at a particular time of the day

**first** Select initial periods of time series based on a date offset

**last** Select final periods of time series based on a date offset

**DatetimeIndex.indexer\_between\_time** Get just the index locations for values between particular times of the day

## Examples

```
>>> i = pd.date_range('2018-04-09', periods=4, freq='1D20min')
>>> ts = pd.DataFrame({'A': [1,2,3,4]}, index=i)
>>> ts
```

	A
2018-04-09 00:00:00	1
2018-04-10 00:20:00	2
2018-04-11 00:40:00	3
2018-04-12 01:00:00	4

```
>>> ts.between_time('0:15', '0:45')
A
2018-04-10 00:20:00  2
2018-04-11 00:40:00  3
```

You get the times that are *not* between two times by setting `start_time` later than `end_time`:

```
>>> ts.between_time('0:45', '0:15')
A
2018-04-09 00:00:00  1
2018-04-12 01:00:00  4
```

## pandas.DataFrame.bfill

`DataFrame.bfill` (*axis=None, inplace=False, limit=None, downcast=None*)  
 Synonym for `DataFrame.fillna(method='bfill')`

## pandas.DataFrame.bool

`DataFrame.bool()`  
 Return the bool of a single element PandasObject.

This must be a boolean scalar value, either True or False. Raise a `ValueError` if the PandasObject does not have exactly 1 element, or that element is not boolean

## pandas.DataFrame.boxplot

`DataFrame.boxplot` (*column=None, by=None, ax=None, fontsize=None, rot=0, grid=True, figsize=None, layout=None, return\_type=None, \*\*kwargs*)  
 Make a box plot from DataFrame columns.

Make a box-and-whisker plot from DataFrame columns, optionally grouped by some other columns. A box plot is a method for graphically depicting groups of numerical data through their quartiles. The box extends from the Q1 to Q3 quartile values of the data, with a line at the median (Q2). The whiskers extend from the edges of box to show the range of the data. The position of the whiskers is set by default to  $1.5 * IQR$  ( $IQR = Q3 - Q1$ ) from the edges of the box. Outlier points are those past the end of the whiskers.

For further details see Wikipedia's entry for `boxplot`.

**Parameters** `column` : str or list of str, optional

Column name or list of names, or vector. Can be any valid input to `pandas.DataFrame.groupby()`.

**by** : str or array-like, optional

Column in the DataFrame to `pandas.DataFrame.groupby()`. One box-plot will be done per value of columns in *by*.

**ax** : object of class `matplotlib.axes.Axes`, optional

The matplotlib axes to be used by boxplot.

**fontsize** : float or str

Tick label font size in points or as a string (e.g., *large*).

**rot** : int or float, default 0

The rotation angle of labels (in degrees) with respect to the screen coordinate system.

**grid** : boolean, default True

Setting this to True will show the grid.

**figsize** : A tuple (width, height) in inches

The size of the figure to create in matplotlib.

**layout** : tuple (rows, columns), optional

For example, (3, 5) will display the subplots using 3 columns and 5 rows, starting from the top-left.

**return\_type** : { 'axes', 'dict', 'both' } or None, default 'axes'

The kind of object to return. The default is `axes`.

- 'axes' returns the matplotlib axes the boxplot is drawn on.
- 'dict' returns a dictionary whose values are the matplotlib Lines of the boxplot.
- 'both' returns a namedtuple with the axes and dict.
- when grouping with *by*, a Series mapping columns to *return\_type* is returned.

If *return\_type* is *None*, a NumPy array of axes with the same shape as *layout* is returned.

**\*\*kwds**

All other plotting keyword arguments to be passed to `matplotlib.pyplot.boxplot()`.

#### Returns result :

The return type depends on the *return\_type* parameter:

- 'axes' : object of class `matplotlib.axes.Axes`
- 'dict' : dict of `matplotlib.lines.Line2D` objects
- 'both' : a namedtuple with structure (ax, lines)

For data grouped with *by*:

- *Series*
- array (for *return\_type* = None)

See also:

`Series.plot.hist` Make a histogram.

`matplotlib.pyplot.boxplot` Matplotlib equivalent plot.

## Notes

Use `return_type='dict'` when you want to tweak the appearance of the lines after plotting. In this case a dict containing the Lines making up the boxes, caps, fliers, medians, and whiskers is returned.

## Examples

Boxplots can be created for every column in the dataframe by `df.boxplot()` or indicating the columns to be used:

```
>>> np.random.seed(1234)
>>> df = pd.DataFrame(np.random.randn(10,4),
...                    columns=['Col1', 'Col2', 'Col3', 'Col4'])
>>> boxplot = df.boxplot(column=['Col1', 'Col2', 'Col3'])
```

Boxplots of variables distributions grouped by the values of a third variable can be created using the option `by`. For instance:

```
>>> df = pd.DataFrame(np.random.randn(10, 2),
...                    columns=['Col1', 'Col2'])
>>> df['X'] = pd.Series(['A', 'A', 'A', 'A', 'A',
...                     'B', 'B', 'B', 'B', 'B'])
>>> boxplot = df.boxplot(by='X')
```

A list of strings (i.e. `['X', 'Y']`) can be passed to `boxplot` in order to group the data by combination of the variables in the x-axis:

```
>>> df = pd.DataFrame(np.random.randn(10,3),
...                    columns=['Col1', 'Col2', 'Col3'])
>>> df['X'] = pd.Series(['A', 'A', 'A', 'A', 'A',
...                     'B', 'B', 'B', 'B', 'B'])
>>> df['Y'] = pd.Series(['A', 'B', 'A', 'B', 'A',
...                     'B', 'A', 'B', 'A', 'B'])
>>> boxplot = df.boxplot(column=['Col1', 'Col2'], by=['X', 'Y'])
```

The layout of boxplot can be adjusted giving a tuple to `layout`:

```
>>> boxplot = df.boxplot(column=['Col1', 'Col2'], by='X',
...                       layout=(2, 1))
```

Additional formatting can be done to the boxplot, like suppressing the grid (`grid=False`), rotating the labels in the x-axis (i.e. `rot=45`) or changing the fontsize (i.e. `fontsize=15`):

```
>>> boxplot = df.boxplot(grid=False, rot=45, fontsize=15)
```

The parameter `return_type` can be used to select the type of element returned by `boxplot`. When `return_type='axes'` is selected, the matplotlib axes on which the boxplot is drawn are returned:

```
>>> boxplot = df.boxplot(column=['Col1', 'Col2'], return_type='axes')
>>> type(boxplot)
<class 'matplotlib.axes._subplots.AxesSubplot'>
```

When grouping with `by`, a Series mapping columns to `return_type` is returned:

```
>>> boxplot = df.boxplot(column=['Col1', 'Col2'], by='X',
...                        return_type='axes')
>>> type(boxplot)
<class 'pandas.core.series.Series'>
```

If `return_type` is `None`, a NumPy array of axes with the same shape as `layout` is returned:

```
>>> boxplot = df.boxplot(column=['Col1', 'Col2'], by='X',
...                        return_type=None)
>>> type(boxplot)
<class 'numpy.ndarray'>
```

## pandas.DataFrame.clip

`DataFrame.clip` (*lower=None, upper=None, axis=None, inplace=False, \*args, \*\*kwargs*)

Trim values at input threshold(s).

Assigns values outside boundary to boundary values. Thresholds can be singular values or array like, and in the latter case the clipping is performed element-wise in the specified axis.

**Parameters** **lower** : float or array\_like, default None

Minimum threshold value. All values below this threshold will be set to it.

**upper** : float or array\_like, default None

Maximum threshold value. All values above this threshold will be set to it.

**axis** : int or string axis name, optional

Align object with lower and upper along the given axis.

**inplace** : boolean, default False

Whether to perform the operation in place on the data.

New in version 0.21.0.

**\*args, \*\*kwargs**

Additional keywords have no effect but might be accepted for compatibility with numpy.

**Returns** **Series or DataFrame**

Same type as calling object with the values outside the clip boundaries replaced

**See also:**

**`clip_lower`** Clip values below specified threshold(s).

**`clip_upper`** Clip values above specified threshold(s).

## Examples

```
>>> data = {'col_0': [9, -3, 0, -1, 5], 'col_1': [-2, -7, 6, 8, -5]}
>>> df = pd.DataFrame(data)
>>> df
   col_0  col_1
0      9    -2
1     -3    -7
2      0     6
3     -1     8
4      5    -5
```

Clips per column using lower and upper thresholds:

```
>>> df.clip(-4, 6)
   col_0  col_1
0      6    -2
1     -3    -4
2      0     6
3     -1     6
4      5    -4
```

Clips using specific lower and upper thresholds per column element:

```
>>> t = pd.Series([2, -4, -1, 6, 3])
>>> t
0      2
1     -4
2     -1
3      6
4      3
dtype: int64
```

```
>>> df.clip(t, t + 4, axis=0)
   col_0  col_1
0      6      2
1     -3     -4
2      0      3
3      6      8
4      5      3
```

## pandas.DataFrame.clip\_lower

`DataFrame.clip_lower(threshold, axis=None, inplace=False)`

Return copy of the input with values below a threshold truncated.

**Parameters** `threshold` : numeric or array-like

Minimum value allowed. All values below threshold will be set to this value.

- float : every value is compared to *threshold*.
- array-like : The shape of *threshold* should match the object it's compared to. When *self* is a Series, *threshold* should be the length. When *self* is a DataFrame, *threshold* should 2-D and the same shape as *self* for *axis=None*, or 1-D and the same length as the axis being compared.

**axis** : {0 or 'index', 1 or 'columns'}, default 0

Align *self* with *threshold* along the given axis.

**inplace** : boolean, default False

Whether to perform the operation in place on the data.

New in version 0.21.0.

### Returns

**clipped** [same type as input]

### See also:

[`Series.clip`](#) Return copy of input with values below and above thresholds truncated.

[`Series.clip\_upper`](#) Return copy of input with values above threshold truncated.

### Examples

Series single threshold clipping:

```
>>> s = pd.Series([5, 6, 7, 8, 9])
>>> s.clip_lower(8)
0      8
1      8
2      8
3      8
4      9
dtype: int64
```

Series clipping element-wise using an array of thresholds. *threshold* should be the same length as the Series.

```
>>> elemwise_thresholds = [4, 8, 7, 2, 5]
>>> s.clip_lower(elemwise_thresholds)
0      5
1      8
2      7
3      8
4      9
dtype: int64
```

DataFrames can be compared to a scalar.

```
>>> df = pd.DataFrame({"A": [1, 3, 5], "B": [2, 4, 6]})
>>> df
   A  B
0  1  2
1  3  4
2  5  6
```

```
>>> df.clip_lower(3)
   A  B
0  3  3
1  3  4
2  5  6
```

Or to an array of values. By default, *threshold* should be the same shape as the DataFrame.

```
>>> df.clip_lower(np.array([[3, 4], [2, 2], [6, 2]]))
   A  B
0  3  4
1  3  4
2  6  6
```

Control how *threshold* is broadcast with *axis*. In this case *threshold* should be the same length as the axis specified by *axis*.

```
>>> df.clip_lower(np.array([3, 3, 5]), axis='index')
   A  B
0  3  3
1  3  4
2  5  6
```

```
>>> df.clip_lower(np.array([4, 5]), axis='columns')
   A  B
0  4  5
1  4  5
2  5  6
```

## pandas.DataFrame.clip\_upper

`DataFrame.clip_upper` (*threshold*, *axis=None*, *inplace=False*)

Return copy of input with values above given value(s) truncated.

### Parameters

**threshold** [float or array\_like]

**axis** : int or string axis name, optional

Align object with threshold along the given axis.

**inplace** : boolean, default False

Whether to perform the operation in place on the data

New in version 0.21.0.

### Returns

**clipped** [same type as input]

**See also:**

[\*clip\*](#)

## pandas.DataFrame.combine

`DataFrame.combine` (*other*, *func*, *fill\_value=None*, *overwrite=True*)

Add two DataFrame objects and do not propagate NaN values, so if for a (column, time) one frame is missing a value, it will default to the other frame's value (which might be NaN as well)

### Parameters

**other** [DataFrame]

**func** : function

Function that takes two series as inputs and return a Series or a scalar

**fill\_value** [scalar value]

**overwrite** : boolean, default True

If True then overwrite values for common keys in the calling frame

### Returns

**result** [DataFrame]

### See also:

**DataFrame.combine\_first** Combine two DataFrame objects and default to non-null values in frame calling the method

### Examples

```
>>> df1 = DataFrame({'A': [0, 0], 'B': [4, 4]})
>>> df2 = DataFrame({'A': [1, 1], 'B': [3, 3]})
>>> df1.combine(df2, lambda s1, s2: s1 if s1.sum() < s2.sum() else s2)
   A  B
0  0  3
1  0  3
```

## pandas.DataFrame.combine\_first

**DataFrame.combine\_first** (*other*)

Combine two DataFrame objects and default to non-null values in frame calling the method. Result index columns will be the union of the respective indexes and columns

### Parameters

**other** [DataFrame]

### Returns

**combined** [DataFrame]

### See also:

**DataFrame.combine** Perform series-wise operation on two DataFrames using a given function

### Examples

df1's values prioritized, use values from df2 to fill holes:

```
>>> df1 = pd.DataFrame([[1, np.nan]])
>>> df2 = pd.DataFrame([[3, 4]])
>>> df1.combine_first(df2)
   0  1
0  1  4.0
```

### pandas.DataFrame.compound

`DataFrame.compound` (*axis=None, skipna=None, level=None*)

Return the compound percentage of the values for the requested axis

#### Parameters

**axis** [{index (0), columns (1)}]

**skipna** : boolean, default True

Exclude NA/null values when computing the result.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a Series

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

#### Returns

**compounded** [Series or DataFrame (if level specified)]

### pandas.DataFrame.consolidate

`DataFrame.consolidate` (*inplace=False*)

Compute NDFrame with “consolidated” internals (data of each dtype grouped together in a single ndarray).

Deprecated since version 0.20.0: Consolidate will be an internal implementation only.

### pandas.DataFrame.convert\_objects

`DataFrame.convert_objects` (*convert\_dates=True, convert\_numeric=False, convert\_timedeltas=True, copy=True*)

Attempt to infer better dtype for object columns.

Deprecated since version 0.21.0.

**Parameters** **convert\_dates** : boolean, default True

If True, convert to date where possible. If ‘coerce’, force conversion, with unconvertible values becoming NaT.

**convert\_numeric** : boolean, default False

If True, attempt to coerce to numbers (including strings), with unconvertible values becoming NaN.

**convert\_timedeltas** : boolean, default True

If True, convert to timedelta where possible. If ‘coerce’, force conversion, with unconvertible values becoming NaT.

**copy** : boolean, default True

If True, return a copy even if no copy is necessary (e.g. no conversion was done).  
Note: This is meant for internal use, and should not be confused with inplace.

**Returns****converted** [same as input object]**See also:***pandas.to\_datetime* Convert argument to datetime.*pandas.to\_timedelta* Convert argument to timedelta.*pandas.to\_numeric* Return a fixed frequency timedelta index, with day as the default.**pandas.DataFrame.copy**`DataFrame.copy (deep=True)`

Make a copy of this object's indices and data.

When `deep=True` (default), a new object will be created with a copy of the calling object's data and indices. Modifications to the data or indices of the copy will not be reflected in the original object (see notes below).

When `deep=False`, a new object will be created without copying the calling object's data or index (only references to the data and index are copied). Any changes to the data of the original will be reflected in the shallow copy (and vice versa).

**Parameters** `deep` : bool, default True

Make a deep copy, including a copy of the data and the indices. With `deep=False` neither the indices nor the data are copied.

**Returns** `copy` : Series, DataFrame or Panel

Object type matches caller.

**Notes**

When `deep=True`, data is copied but actual Python objects will not be copied recursively, only the reference to the object. This is in contrast to `copy.deepcopy` in the Standard Library, which recursively copies object data (see examples below).

While `Index` objects are copied when `deep=True`, the underlying numpy array is not copied for performance reasons. Since `Index` is immutable, the underlying data can be safely shared and a copy is not needed.

**Examples**

```
>>> s = pd.Series([1, 2], index=["a", "b"])
>>> s
a    1
b    2
dtype: int64
```

```
>>> s_copy = s.copy()
>>> s_copy
a    1
```

(continues on next page)

(continued from previous page)

```
b      2
dtype: int64
```

**Shallow copy versus default (deep) copy:**

```
>>> s = pd.Series([1, 2], index=["a", "b"])
>>> deep = s.copy()
>>> shallow = s.copy(deep=False)
```

Shallow copy shares data and index with original.

```
>>> s is shallow
False
>>> s.values is shallow.values and s.index is shallow.index
True
```

Deep copy has own copy of data and index.

```
>>> s is deep
False
>>> s.values is deep.values or s.index is deep.index
False
```

Updates to the data shared by shallow copy and original is reflected in both; deep copy remains unchanged.

```
>>> s[0] = 3
>>> shallow[1] = 4
>>> s
a      3
b      4
dtype: int64
>>> shallow
a      3
b      4
dtype: int64
>>> deep
a      1
b      2
dtype: int64
```

Note that when copying an object containing Python objects, a deep copy will copy the data, but will not do so recursively. Updating a nested data object will be reflected in the deep copy.

```
>>> s = pd.Series([[1, 2], [3, 4]])
>>> deep = s.copy()
>>> s[0][0] = 10
>>> s
0      [10, 2]
1      [3, 4]
dtype: object
>>> deep
0      [10, 2]
1      [3, 4]
dtype: object
```

**pandas.DataFrame.corr**

`DataFrame.corr` (*method='pearson', min\_periods=1*)

Compute pairwise correlation of columns, excluding NA/null values

**Parameters** **method** : {'pearson', 'kendall', 'spearman'}

- **pearson** : standard correlation coefficient
- **kendall** : Kendall Tau correlation coefficient
- **spearman** : Spearman rank correlation

**min\_periods** : int, optional

Minimum number of observations required per pair of columns to have a valid result. Currently only available for pearson and spearman correlation

**Returns**

**y** [DataFrame]

**pandas.DataFrame.corrwith**

`DataFrame.corrwith` (*other, axis=0, drop=False*)

Compute pairwise correlation between rows or columns of two DataFrame objects.

**Parameters**

**other** [DataFrame, Series]

**axis** : {0 or 'index', 1 or 'columns'}, default 0

0 or 'index' to compute column-wise, 1 or 'columns' for row-wise

**drop** : boolean, default False

Drop missing indices from result, default returns union of all

**Returns**

**correls** [Series]

**pandas.DataFrame.count**

`DataFrame.count` (*axis=0, level=None, numeric\_only=False*)

Count non-NA cells for each column or row.

The values *None*, *NaN*, *NaT*, and optionally *numpy.inf* (depending on *pandas.options.mode.use\_inf\_as\_na*) are considered NA.

**Parameters** **axis** : {0 or 'index', 1 or 'columns'}, default 0

If 0 or 'index' counts are generated for each column. If 1 or 'columns' counts are generated for each **row**.

**level** : int or str, optional

If the axis is a *MultiIndex* (hierarchical), count along a particular *level*, collapsing into a *DataFrame*. A *str* specifies the level name.

**numeric\_only** : boolean, default False

Include only *float*, *int* or *boolean* data.

### Returns Series or DataFrame

For each column/row the number of non-NA/null entries. If *level* is specified returns a *DataFrame*.

### See also:

[\*Series.count\*](#) number of non-NA elements in a Series

[\*DataFrame.shape\*](#) number of DataFrame rows and columns (including NA elements)

[\*DataFrame.isna\*](#) boolean same-sized DataFrame showing places of NA elements

### Examples

Constructing DataFrame from a dictionary:

```
>>> df = pd.DataFrame({"Person":
...                     ["John", "Myla", None, "John", "Myla"],
...                     "Age": [24., np.nan, 21., 33, 26],
...                     "Single": [False, True, True, True, False]})
>>> df
   Person  Age  Single
0   John  24.0   False
1   Myla   NaN    True
2   None  21.0    True
3   John  33.0    True
4   Myla  26.0   False
```

Notice the uncounted NA values:

```
>>> df.count()
Person      4
Age         4
Single      5
dtype: int64
```

Counts for each row:

```
>>> df.count(axis='columns')
0      3
1      2
2      2
3      3
4      3
dtype: int64
```

Counts for one level of a *MultiIndex*:

```
>>> df.set_index(["Person", "Single"]).count(level="Person")
Age
Person
John      2
Myla      1
```

**pandas.DataFrame.cov**

`DataFrame.cov` (*min\_periods=None*)

Compute pairwise covariance of columns, excluding NA/null values.

Compute the pairwise covariance among the series of a DataFrame. The returned data frame is the [covariance matrix](#) of the columns of the DataFrame.

Both NA and null values are automatically excluded from the calculation. (See the note below about bias from missing values.) A threshold can be set for the minimum number of observations for each value created. Comparisons with observations below this threshold will be returned as NaN.

This method is generally used for the analysis of time series data to understand the relationship between different measures across time.

**Parameters** `min_periods` : int, optional

Minimum number of observations required per pair of columns to have a valid result.

**Returns** `DataFrame`

The covariance matrix of the series of the DataFrame.

**See also:**

[pandas.Series.cov](#) compute covariance with another Series

[pandas.core.window.EWM.cov](#) exponential weighted sample covariance

[pandas.core.window.Expanding.cov](#) expanding sample covariance

[pandas.core.window.Rolling.cov](#) rolling sample covariance

**Notes**

Returns the covariance matrix of the DataFrame's time series. The covariance is normalized by N-1.

For DataFrames that have Series that are missing data (assuming that data is [missing at random](#)) the returned covariance matrix will be an unbiased estimate of the variance and covariance between the member Series.

However, for many applications this estimate may not be acceptable because the estimate covariance matrix is not guaranteed to be positive semi-definite. This could lead to estimate correlations having absolute values which are greater than one, and/or a non-invertible covariance matrix. See [Estimation of covariance matrices](#) for more details.

**Examples**

```
>>> df = pd.DataFrame([(1, 2), (0, 3), (2, 0), (1, 1)],
...                    columns=['dogs', 'cats'])
>>> df.cov()
           dogs      cats
dogs  0.666667 -1.000000
cats -1.000000  1.666667
```

```

>>> np.random.seed(42)
>>> df = pd.DataFrame(np.random.randn(1000, 5),
...                    columns=['a', 'b', 'c', 'd', 'e'])
>>> df.cov()

```

	a	b	c	d	e
a	0.998438	-0.020161	0.059277	-0.008943	0.014144
b	-0.020161	1.059352	-0.008543	-0.024738	0.009826
c	0.059277	-0.008543	1.010670	-0.001486	-0.000271
d	-0.008943	-0.024738	-0.001486	0.921297	-0.013692
e	0.014144	0.009826	-0.000271	-0.013692	0.977795

### Minimum number of periods

This method also supports an optional `min_periods` keyword that specifies the required minimum number of non-NA observations for each column pair in order to have a valid result:

```

>>> np.random.seed(42)
>>> df = pd.DataFrame(np.random.randn(20, 3),
...                    columns=['a', 'b', 'c'])
>>> df.loc[df.index[:5], 'a'] = np.nan
>>> df.loc[df.index[5:10], 'b'] = np.nan
>>> df.cov(min_periods=12)

```

	a	b	c
a	0.316741	NaN	-0.150812
b	NaN	1.248003	0.191417
c	-0.150812	0.191417	0.895202

## pandas.DataFrame.cummax

`DataFrame.cummax` (*axis=None, skipna=True, \*args, \*\*kwargs*)

Return cumulative maximum over a DataFrame or Series axis.

Returns a DataFrame or Series of the same size containing the cumulative maximum.

**Parameters** `axis` : {0 or 'index', 1 or 'columns'}, default 0

The index or the name of the axis. 0 is equivalent to None or 'index'.

`skipna` : boolean, default True

Exclude NA/null values. If an entire row/column is NA, the result will be NA.

`*args, **kwargs` :

Additional keywords have no effect but might be accepted for compatibility with NumPy.

### Returns

`cummax` [Series or DataFrame]

See also:

[`pandas.core.window.Expanding.max`](#) Similar functionality but ignores NaN values.

[`DataFrame.max`](#) Return the maximum over DataFrame axis.

[`DataFrame.cummax`](#) Return cumulative maximum over DataFrame axis.

[`DataFrame.cummin`](#) Return cumulative minimum over DataFrame axis.

**DataFrame.cumsum** Return cumulative sum over DataFrame axis.

**DataFrame.cumprod** Return cumulative product over DataFrame axis.

## Examples

### Series

```
>>> s = pd.Series([2, np.nan, 5, -1, 0])
>>> s
0    2.0
1    NaN
2    5.0
3   -1.0
4    0.0
dtype: float64
```

By default, NA values are ignored.

```
>>> s.cummax()
0    2.0
1    NaN
2    5.0
3    5.0
4    5.0
dtype: float64
```

To include NA values in the operation, use `skipna=False`

```
>>> s.cummax(skipna=False)
0    2.0
1    NaN
2    NaN
3    NaN
4    NaN
dtype: float64
```

### DataFrame

```
>>> df = pd.DataFrame([[2.0, 1.0],
...                    [3.0, np.nan],
...                    [1.0, 0.0]],
...                    columns=list('AB'))
>>> df
   A    B
0  2.0  1.0
1  3.0  NaN
2  1.0  0.0
```

By default, iterates over rows and finds the maximum in each column. This is equivalent to `axis=None` or `axis='index'`.

```
>>> df.cummax()
   A    B
0  2.0  1.0
1  3.0  NaN
2  3.0  1.0
```

To iterate over columns and find the maximum in each row, use `axis=1`

```
>>> df.cummax(axis=1)
   A    B
0  2.0  2.0
1  3.0  NaN
2  1.0  1.0
```

## pandas.DataFrame.cummin

`DataFrame.cummin` (*axis=None, skipna=True, \*args, \*\*kwargs*)

Return cumulative minimum over a DataFrame or Series axis.

Returns a DataFrame or Series of the same size containing the cumulative minimum.

**Parameters** **axis** : {0 or 'index', 1 or 'columns'}, default 0

The index or the name of the axis. 0 is equivalent to None or 'index'.

**skipna** : boolean, default True

Exclude NA/null values. If an entire row/column is NA, the result will be NA.

**\*args, \*\*kwargs** :

Additional keywords have no effect but might be accepted for compatibility with NumPy.

### Returns

**cummin** [Series or DataFrame]

See also:

[`pandas.core.window.Expanding.min`](#) Similar functionality but ignores NaN values.

[`DataFrame.min`](#) Return the minimum over DataFrame axis.

[`DataFrame.cummax`](#) Return cumulative maximum over DataFrame axis.

[`DataFrame.cummin`](#) Return cumulative minimum over DataFrame axis.

[`DataFrame.cumsum`](#) Return cumulative sum over DataFrame axis.

[`DataFrame.cumprod`](#) Return cumulative product over DataFrame axis.

## Examples

### Series

```
>>> s = pd.Series([2, np.nan, 5, -1, 0])
>>> s
0    2.0
1    NaN
2    5.0
3   -1.0
4    0.0
dtype: float64
```

By default, NA values are ignored.

```
>>> s.cummin()
0    2.0
1    NaN
2    2.0
3   -1.0
4   -1.0
dtype: float64
```

To include NA values in the operation, use `skipna=False`

```
>>> s.cummin(skipna=False)
0    2.0
1    NaN
2    NaN
3    NaN
4    NaN
dtype: float64
```

### DataFrame

```
>>> df = pd.DataFrame([[2.0, 1.0],
...                    [3.0, np.nan],
...                    [1.0, 0.0]],
...                    columns=list('AB'))
>>> df
   A  B
0  2.0 1.0
1  3.0 NaN
2  1.0 0.0
```

By default, iterates over rows and finds the minimum in each column. This is equivalent to `axis=None` or `axis='index'`.

```
>>> df.cummin()
   A  B
0  2.0 1.0
1  2.0 NaN
2  1.0 0.0
```

To iterate over columns and find the minimum in each row, use `axis=1`

```
>>> df.cummin(axis=1)
   A  B
0  2.0 1.0
1  3.0 NaN
2  1.0 0.0
```

### pandas.DataFrame.cumprod

`DataFrame.cumprod(axis=None, skipna=True, *args, **kwargs)`

Return cumulative product over a DataFrame or Series axis.

Returns a DataFrame or Series of the same size containing the cumulative product.

**Parameters** `axis`: {0 or 'index', 1 or 'columns'}, default 0

The index or the name of the axis. 0 is equivalent to None or 'index'.

**skipna** : boolean, default True

Exclude NA/null values. If an entire row/column is NA, the result will be NA.

**\*args, \*\*kwargs** :

Additional keywords have no effect but might be accepted for compatibility with NumPy.

### Returns

**cumprod** [Series or DataFrame]

See also:

**pandas.core.window.Expanding.prod** Similar functionality but ignores NaN values.

**DataFrame.prod** Return the product over DataFrame axis.

**DataFrame.cummax** Return cumulative maximum over DataFrame axis.

**DataFrame.cummin** Return cumulative minimum over DataFrame axis.

**DataFrame.cumsum** Return cumulative sum over DataFrame axis.

**DataFrame.cumprod** Return cumulative product over DataFrame axis.

## Examples

### Series

```
>>> s = pd.Series([2, np.nan, 5, -1, 0])
>>> s
0    2.0
1    NaN
2    5.0
3   -1.0
4    0.0
dtype: float64
```

By default, NA values are ignored.

```
>>> s.cumprod()
0    2.0
1    NaN
2   10.0
3  -10.0
4   -0.0
dtype: float64
```

To include NA values in the operation, use `skipna=False`

```
>>> s.cumprod(skipna=False)
0    2.0
1    NaN
2    NaN
3    NaN
4    NaN
dtype: float64
```

### DataFrame

```
>>> df = pd.DataFrame([[2.0, 1.0],
...                    [3.0, np.nan],
...                    [1.0, 0.0]],
...                    columns=list('AB'))
>>> df
   A    B
0  2.0  1.0
1  3.0  NaN
2  1.0  0.0
```

By default, iterates over rows and finds the product in each column. This is equivalent to `axis=None` or `axis='index'`.

```
>>> df.cumprod()
   A    B
0  2.0  1.0
1  6.0  NaN
2  6.0  0.0
```

To iterate over columns and find the product in each row, use `axis=1`

```
>>> df.cumprod(axis=1)
   A    B
0  2.0  2.0
1  3.0  NaN
2  1.0  0.0
```

## pandas.DataFrame.cumsum

`DataFrame.cumsum(axis=None, skipna=True, *args, **kwargs)`

Return cumulative sum over a DataFrame or Series axis.

Returns a DataFrame or Series of the same size containing the cumulative sum.

**Parameters** `axis`: {0 or 'index', 1 or 'columns'}, default 0

The index or the name of the axis. 0 is equivalent to None or 'index'.

**skipna**: boolean, default True

Exclude NA/null values. If an entire row/column is NA, the result will be NA.

**\*args, \*\*kwargs**:

Additional keywords have no effect but might be accepted for compatibility with NumPy.

### Returns

**cumsum** [Series or DataFrame]

See also:

[`pandas.core.window.Expanding.sum`](#) Similar functionality but ignores NaN values.

[`DataFrame.sum`](#) Return the sum over DataFrame axis.

[`DataFrame.cummax`](#) Return cumulative maximum over DataFrame axis.

[`DataFrame.cummin`](#) Return cumulative minimum over DataFrame axis.

**DataFrame.cumsum** Return cumulative sum over DataFrame axis.

**DataFrame.cumprod** Return cumulative product over DataFrame axis.

## Examples

### Series

```
>>> s = pd.Series([2, np.nan, 5, -1, 0])
>>> s
0    2.0
1    NaN
2    5.0
3   -1.0
4    0.0
dtype: float64
```

By default, NA values are ignored.

```
>>> s.cumsum()
0    2.0
1    NaN
2    7.0
3    6.0
4    6.0
dtype: float64
```

To include NA values in the operation, use `skipna=False`

```
>>> s.cumsum(skipna=False)
0    2.0
1    NaN
2    NaN
3    NaN
4    NaN
dtype: float64
```

### DataFrame

```
>>> df = pd.DataFrame([[2.0, 1.0],
...                    [3.0, np.nan],
...                    [1.0, 0.0]],
...                    columns=list('AB'))
>>> df
   A    B
0  2.0  1.0
1  3.0  NaN
2  1.0  0.0
```

By default, iterates over rows and finds the sum in each column. This is equivalent to `axis=None` or `axis='index'`.

```
>>> df.cumsum()
   A    B
0  2.0  1.0
1  5.0  NaN
2  6.0  1.0
```

To iterate over columns and find the sum in each row, use `axis=1`

```
>>> df.cumsum(axis=1)
      A      B
0  2.0  3.0
1  3.0  NaN
2  1.0  1.0
```

## pandas.DataFrame.describe

`DataFrame.describe` (*percentiles=None, include=None, exclude=None*)

Generates descriptive statistics that summarize the central tendency, dispersion and shape of a dataset's distribution, excluding NaN values.

Analyzes both numeric and object series, as well as `DataFrame` column sets of mixed data types. The output will vary depending on what is provided. Refer to the notes below for more detail.

**Parameters** `percentiles` : list-like of numbers, optional

The percentiles to include in the output. All should fall between 0 and 1. The default is `[.25, .5, .75]`, which returns the 25th, 50th, and 75th percentiles.

**include** : 'all', list-like of dtypes or None (default), optional

A white list of data types to include in the result. Ignored for `Series`. Here are the options:

- 'all' : All columns of the input will be included in the output.
- A list-like of dtypes : Limits the results to the provided data types. To limit the result to numeric types submit `numpy.number`. To limit it instead to object columns submit the `numpy.object` data type. Strings can also be used in the style of `select_dtypes` (e.g. `df.describe(include=['O'])`). To select pandas categorical columns, use 'category'
- None (default) : The result will include all numeric columns.

**exclude** : list-like of dtypes or None (default), optional,

A black list of data types to omit from the result. Ignored for `Series`. Here are the options:

- A list-like of dtypes : Excludes the provided data types from the result. To exclude numeric types submit `numpy.number`. To exclude object columns submit the data type `numpy.object`. Strings can also be used in the style of `select_dtypes` (e.g. `df.describe(include=['O'])`). To exclude pandas categorical columns, use 'category'
- None (default) : The result will exclude nothing.

## Returns

**summary:** `Series/DataFrame` of summary statistics

See also:

`DataFrame.count`, `DataFrame.max`, `DataFrame.min`, `DataFrame.mean`, `DataFrame.std`, `DataFrame.select_dtypes`

## Notes

For numeric data, the result's index will include `count`, `mean`, `std`, `min`, `max` as well as `lower`, 50 and upper percentiles. By default the lower percentile is 25 and the upper percentile is 75. The 50 percentile is the same as the median.

For object data (e.g. strings or timestamps), the result's index will include `count`, `unique`, `top`, and `freq`. The `top` is the most common value. The `freq` is the most common value's frequency. Timestamps also include the `first` and `last` items.

If multiple object values have the highest count, then the `count` and `top` results will be arbitrarily chosen from among those with the highest count.

For mixed data types provided via a `DataFrame`, the default is to return only an analysis of numeric columns. If the dataframe consists only of object and categorical data without any numeric columns, the default is to return an analysis of both the object and categorical columns. If `include='all'` is provided as an option, the result will include a union of attributes of each type.

The `include` and `exclude` parameters can be used to limit which columns in a `DataFrame` are analyzed for the output. The parameters are ignored when analyzing a `Series`.

## Examples

Describing a numeric Series.

```
>>> s = pd.Series([1, 2, 3])
>>> s.describe()
count      3.0
mean       2.0
std        1.0
min        1.0
25%        1.5
50%        2.0
75%        2.5
max        3.0
```

Describing a categorical Series.

```
>>> s = pd.Series(['a', 'a', 'b', 'c'])
>>> s.describe()
count      4
unique     3
top        a
freq       2
dtype: object
```

Describing a timestamp Series.

```
>>> s = pd.Series([
...     np.datetime64("2000-01-01"),
...     np.datetime64("2010-01-01"),
...     np.datetime64("2010-01-01")
... ])
>>> s.describe()
count      3
unique     2
top        2010-01-01 00:00:00
```

(continues on next page)

(continued from previous page)

```

freq                2
first      2000-01-01 00:00:00
last       2010-01-01 00:00:00
dtype: object

```

Describing a DataFrame. By default only numeric fields are returned.

```

>>> df = pd.DataFrame({ 'object': ['a', 'b', 'c'],
...                      'numeric': [1, 2, 3],
...                      'categorical': pd.Categorical(['d', 'e', 'f'])
...                      })
>>> df.describe()

```

	numeric
count	3.0
mean	2.0
std	1.0
min	1.0
25%	1.5
50%	2.0
75%	2.5
max	3.0

Describing all columns of a DataFrame regardless of data type.

```

>>> df.describe(include='all')

```

	categorical	numeric	object
count	3	3.0	3
unique	3	NaN	3
top	f	NaN	c
freq	1	NaN	1
mean	NaN	2.0	NaN
std	NaN	1.0	NaN
min	NaN	1.0	NaN
25%	NaN	1.5	NaN
50%	NaN	2.0	NaN
75%	NaN	2.5	NaN
max	NaN	3.0	NaN

Describing a column from a DataFrame by accessing it as an attribute.

```

>>> df.numeric.describe()
count      3.0
mean       2.0
std        1.0
min        1.0
25%        1.5
50%        2.0
75%        2.5
max         3.0
Name: numeric, dtype: float64

```

Including only numeric columns in a DataFrame description.

```

>>> df.describe(include=[np.number])

```

	numeric
count	3.0

(continues on next page)

(continued from previous page)

mean	2.0
std	1.0
min	1.0
25%	1.5
50%	2.0
75%	2.5
max	3.0

Including only string columns in a DataFrame description.

```
>>> df.describe(include=[np.object])
      object
count      3
unique      3
top         c
freq        1
```

Including only categorical columns from a DataFrame description.

```
>>> df.describe(include=['category'])
      categorical
count           3
unique          3
top             f
freq            1
```

Excluding numeric columns from a DataFrame description.

```
>>> df.describe(exclude=[np.number])
      categorical  object
count           3      3
unique          3      3
top             f      c
freq            1      1
```

Excluding object columns from a DataFrame description.

```
>>> df.describe(exclude=[np.object])
      categorical  numeric
count           3      3.0
unique          3      NaN
top             f      NaN
freq            1      NaN
mean           NaN      2.0
std            NaN      1.0
min            NaN      1.0
25%            NaN      1.5
50%            NaN      2.0
75%            NaN      2.5
max            NaN      3.0
```

## **pandas.DataFrame.diff**

DataFrame.**diff** (*periods=1, axis=0*)

First discrete difference of element.

Calculates the difference of a DataFrame element compared with another element in the DataFrame (default is the element in the same column of the previous row).

**Parameters** `periods` : int, default 1

Periods to shift for calculating difference, accepts negative values.

**axis** : {0 or 'index', 1 or 'columns'}, default 0

Take difference over rows (0) or columns (1).

New in version 0.16.1..

**Returns**

**diffed** [DataFrame]

**See also:**

*[Series.diff](#)* First discrete difference for a Series.

*[DataFrame.pct\\_change](#)* Percent change over given number of periods.

*[DataFrame.shift](#)* Shift index by desired number of periods with an optional time freq.

## Examples

Difference with previous row

```
>>> df = pd.DataFrame({'a': [1, 2, 3, 4, 5, 6],
...                    'b': [1, 1, 2, 3, 5, 8],
...                    'c': [1, 4, 9, 16, 25, 36]})
>>> df
   a  b  c
0  1  1  1
1  2  1  4
2  3  2  9
3  4  3 16
4  5  5 25
5  6  8 36
```

```
>>> df.diff()
   a    b    c
0 NaN NaN NaN
1 1.0 0.0 3.0
2 1.0 1.0 5.0
3 1.0 1.0 7.0
4 1.0 2.0 9.0
5 1.0 3.0 11.0
```

Difference with previous column

```
>>> df.diff(axis=1)
   a    b    c
0 NaN 0.0 0.0
1 NaN -1.0 3.0
2 NaN -1.0 7.0
3 NaN -1.0 13.0
4 NaN 0.0 20.0
5 NaN 2.0 28.0
```

Difference with 3rd previous row

```
>>> df.diff(periods=3)
   a    b    c
0 NaN NaN NaN
1 NaN NaN NaN
2 NaN NaN NaN
3 3.0 2.0 15.0
4 3.0 4.0 21.0
5 3.0 6.0 27.0
```

Difference with following row

```
>>> df.diff(periods=-1)
   a    b    c
0 -1.0 0.0 -3.0
1 -1.0 -1.0 -5.0
2 -1.0 -1.0 -7.0
3 -1.0 -2.0 -9.0
4 -1.0 -3.0 -11.0
5 NaN NaN NaN
```

## pandas.DataFrame.div

`DataFrame.div` (*other*, *axis*='columns', *level*=None, *fill\_value*=None)

Floating division of dataframe and other, element-wise (binary operator *truediv*).

Equivalent to `dataframe / other`, but with support to substitute a `fill_value` for missing data in one of the inputs.

### Parameters

**other** [Series, DataFrame, or constant]

**axis** : {0, 1, 'index', 'columns'}

For Series input, axis to match Series index on

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

**fill\_value** : None or float value, default None

Fill existing missing (NaN) values, and any new element needed for successful DataFrame alignment, with this value before computation. If data in both corresponding DataFrame locations is missing the result will be missing

### Returns

**result** [DataFrame]

### See also:

`DataFrame.rtruediv`

### Notes

Mismatched indices will be unioned together

## Examples

None

### pandas.DataFrame.divide

`DataFrame.divide` (*other*, *axis*='columns', *level*=None, *fill\_value*=None)

Floating division of dataframe and other, element-wise (binary operator *truediv*).

Equivalent to `dataframe / other`, but with support to substitute a *fill\_value* for missing data in one of the inputs.

#### Parameters

**other** [Series, DataFrame, or constant]

**axis** : {0, 1, 'index', 'columns'}

For Series input, axis to match Series index on

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

**fill\_value** : None or float value, default None

Fill existing missing (NaN) values, and any new element needed for successful DataFrame alignment, with this value before computation. If data in both corresponding DataFrame locations is missing the result will be missing

#### Returns

**result** [DataFrame]

**See also:**

`DataFrame.rtruediv`

## Notes

Mismatched indices will be unioned together

## Examples

None

### pandas.DataFrame.dot

`DataFrame.dot` (*other*)

Matrix multiplication with DataFrame or Series objects. Can also be called using *self @ other* in Python >= 3.5.

#### Parameters

**other** [DataFrame or Series]

#### Returns

**dot\_product** [DataFrame or Series]

## **pandas.DataFrame.drop**

`DataFrame.drop` (*labels=None, axis=0, index=None, columns=None, level=None, inplace=False, errors='raise'*)

Drop specified labels from rows or columns.

Remove rows or columns by specifying label names and corresponding axis, or by specifying directly index or column names. When using a multi-index, labels on different levels can be removed by specifying the level.

**Parameters** **labels** : single label or list-like

Index or column labels to drop.

**axis** : {0 or 'index', 1 or 'columns'}, default 0

Whether to drop labels from the index (0 or 'index') or columns (1 or 'columns').

**index, columns** : single label or list-like

Alternative to specifying axis (*labels, axis=1* is equivalent to *columns=labels*).

New in version 0.21.0.

**level** : int or level name, optional

For MultiIndex, level from which the labels will be removed.

**inplace** : bool, default False

If True, do operation inplace and return None.

**errors** : {'ignore', 'raise'}, default 'raise'

If 'ignore', suppress error and only existing labels are dropped.

**Returns**

**dropped** [pandas.DataFrame]

**Raises** **KeyError**

If none of the labels are found in the selected axis

**See also:**

[\*DataFrame.loc\*](#) Label-location based indexer for selection by label.

[\*DataFrame.dropna\*](#) Return DataFrame with labels on given axis omitted where (all or any) data are missing

[\*DataFrame.drop\\_duplicates\*](#) Return DataFrame with duplicate rows removed, optionally only considering certain columns

[\*Series.drop\*](#) Return Series with specified index labels removed.

## **Examples**

```
>>> df = pd.DataFrame(np.arange(12).reshape(3,4),
...                    columns=['A', 'B', 'C', 'D'])
>>> df
   A  B  C  D
0  0  1  2  3
1  4  5  6  7
2  8  9 10 11
```

### Drop columns

```
>>> df.drop(['B', 'C'], axis=1)
   A  D
0  0  3
1  4  7
2  8 11
```

```
>>> df.drop(columns=['B', 'C'])
   A  D
0  0  3
1  4  7
2  8 11
```

### Drop a row by index

```
>>> df.drop([0, 1])
   A  B  C  D
2  8  9 10 11
```

### Drop columns and/or rows of MultiIndex DataFrame

```
>>> midx = pd.MultiIndex(levels=[['lama', 'cow', 'falcon'],
...                               ['speed', 'weight', 'length']],
...                       labels=[[0, 0, 0, 1, 1, 1, 2, 2, 2],
...                               [0, 1, 2, 0, 1, 2, 0, 1, 2]])
>>> df = pd.DataFrame(index=midx, columns=['big', 'small'],
...                    data=[[45, 30], [200, 100], [1.5, 1], [30, 20],
...                          [250, 150], [1.5, 0.8], [320, 250],
...                          [1, 0.8], [0.3, 0.2]])
>>> df
```

		big	small
lama	speed	45.0	30.0
	weight	200.0	100.0
	length	1.5	1.0
cow	speed	30.0	20.0
	weight	250.0	150.0
	length	1.5	0.8
falcon	speed	320.0	250.0
	weight	1.0	0.8
	length	0.3	0.2

```
>>> df.drop(index='cow', columns='small')
           big
lama  speed  45.0
      weight 200.0
      length  1.5
falcon speed 320.0
```

(continues on next page)

(continued from previous page)

weight	1.0
length	0.3

```
>>> df.drop(index='length', level=1)
```

		big	small
lama	speed	45.0	30.0
	weight	200.0	100.0
cow	speed	30.0	20.0
	weight	250.0	150.0
falcon	speed	320.0	250.0
	weight	1.0	0.8

## pandas.DataFrame.drop\_duplicates

`DataFrame.drop_duplicates` (*subset=None, keep='first', inplace=False*)

Return DataFrame with duplicate rows removed, optionally only considering certain columns

**Parameters** **subset** : column label or sequence of labels, optional

Only consider certain columns for identifying duplicates, by default use all of the columns

**keep** : {'first', 'last', False}, default 'first'

- **first** : Drop duplicates except for the first occurrence.
- **last** : Drop duplicates except for the last occurrence.
- **False** : Drop all duplicates.

**inplace** : boolean, default False

Whether to drop duplicates in place or to return a copy

**Returns**

**deduplicated** [DataFrame]

## pandas.DataFrame.dropna

`DataFrame.dropna` (*axis=0, how='any', thresh=None, subset=None, inplace=False*)

Remove missing values.

See the [User Guide](#) for more on which values are considered missing, and how to work with missing data.

**Parameters** **axis** : {0 or 'index', 1 or 'columns'}, default 0

Determine if rows or columns which contain missing values are removed.

- 0, or 'index' : Drop rows which contain missing values.
- 1, or 'columns' : Drop columns which contain missing value.

Deprecated since version 0.23.0:: Pass tuple or list to drop on multiple axes.

**how** : {'any', 'all'}, default 'any'

Determine if row or column is removed from DataFrame, when we have at least one NA or all NA.

- ‘any’ : If any NA values are present, drop that row or column.
- ‘all’ : If all values are NA, drop that row or column.

**thresh** : int, optional

Require that many non-NA values.

**subset** : array-like, optional

Labels along other axis to consider, e.g. if you are dropping rows these would be a list of columns to include.

**inplace** : bool, default False

If True, do operation inplace and return None.

### Returns DataFrame

DataFrame with NA entries dropped from it.

See also:

[`DataFrame.isna`](#) Indicate missing values.

[`DataFrame.notna`](#) Indicate existing (non-missing) values.

[`DataFrame.fillna`](#) Replace missing values.

[`Series.dropna`](#) Drop missing values.

[`Index.dropna`](#) Drop missing indices.

### Examples

```
>>> df = pd.DataFrame({"name": ['Alfred', 'Batman', 'Catwoman'],
...                     "toy": [np.nan, 'Batmobile', 'Bullwhip'],
...                     "born": [pd.NaT, pd.Timestamp("1940-04-25"),
...                               pd.NaT]})
>>> df
```

	name	toy	born
0	Alfred	NaN	NaT
1	Batman	Batmobile	1940-04-25
2	Catwoman	Bullwhip	NaT

Drop the rows where at least one element is missing.

```
>>> df.dropna()
```

	name	toy	born
1	Batman	Batmobile	1940-04-25

Drop the columns where at least one element is missing.

```
>>> df.dropna(axis='columns')
```

	name
0	Alfred
1	Batman
2	Catwoman

Drop the rows where all elements are missing.

```
>>> df.dropna(how='all')
   name      toy      born
0  Alfred    NaN     NaT
1  Batman  Batmobile 1940-04-25
2 Catwoman  Bullwhip     NaT
```

Keep only the rows with at least 2 non-NA values.

```
>>> df.dropna(thresh=2)
   name      toy      born
1  Batman  Batmobile 1940-04-25
2 Catwoman  Bullwhip     NaT
```

Define in which columns to look for missing values.

```
>>> df.dropna(subset=['name', 'born'])
   name      toy      born
1  Batman  Batmobile 1940-04-25
```

Keep the DataFrame with valid entries in the same variable.

```
>>> df.dropna(inplace=True)
>>> df
   name      toy      born
1  Batman  Batmobile 1940-04-25
```

## pandas.DataFrame.duplicated

`DataFrame.duplicated` (*subset=None, keep='first'*)

Return boolean Series denoting duplicate rows, optionally only considering certain columns

**Parameters** **subset** : column label or sequence of labels, optional

Only consider certain columns for identifying duplicates, by default use all of the columns

**keep** : {'first', 'last', False}, default 'first'

- **first** : Mark duplicates as True except for the first occurrence.
- **last** : Mark duplicates as True except for the last occurrence.
- **False** : Mark all duplicates as True.

**Returns**

**duplicated** [Series]

## pandas.DataFrame.eq

`DataFrame.eq` (*other, axis='columns', level=None*)

Wrapper for flexible comparison methods eq

**pandas.DataFrame.equals**`DataFrame.equals` (*other*)

Determines if two NDFrame objects contain the same elements. NaNs in the same location are considered equal.

**pandas.DataFrame.eval**`DataFrame.eval` (*expr*, *inplace=False*, *\*\*kwargs*)

Evaluate a string describing operations on DataFrame columns.

Operates on columns only, not specific rows or elements. This allows *eval* to run arbitrary code, which can make you vulnerable to code injection if you pass user input to this function.

**Parameters** *expr* : str

The expression string to evaluate.

**inplace** : bool, default False

If the expression contains an assignment, whether to perform the operation in-place and mutate the existing DataFrame. Otherwise, a new DataFrame is returned.

New in version 0.18.0..

**kwargs** : dict

See the documentation for `eval()` for complete details on the keyword arguments accepted by `query()`.

**Returns** ndarray, scalar, or pandas object

The result of the evaluation.

**See also:**

**`DataFrame.query`** Evaluates a boolean expression to query the columns of a frame.

**`DataFrame.assign`** Can evaluate an expression or function to create new values for a column.

**`pandas.eval`** Evaluate a Python expression as a string using various backends.

**Notes**

For more details see the API documentation for `eval()`. For detailed examples see *enhancing performance with eval*.

**Examples**

```
>>> df = pd.DataFrame({'A': range(1, 6), 'B': range(10, 0, -2)})
>>> df
   A  B
0  1 10
1  2  8
2  3  6
3  4  4
```

(continues on next page)

(continued from previous page)

```

4  5    2
>>> df.eval('A + B')
0     11
1     10
2      9
3      8
4      7
dtype: int64

```

Assignment is allowed though by default the original DataFrame is not modified.

```

>>> df.eval('C = A + B')
   A  B  C
0  1 10 11
1  2  8 10
2  3  6  9
3  4  4  8
4  5  2  7
>>> df
   A  B
0  1 10
1  2  8
2  3  6
3  4  4
4  5  2

```

Use `inplace=True` to modify the original DataFrame.

```

>>> df.eval('C = A + B', inplace=True)
>>> df
   A  B  C
0  1 10 11
1  2  8 10
2  3  6  9
3  4  4  8
4  5  2  7

```

## pandas.DataFrame.ewm

`DataFrame.ewm(com=None, span=None, halflife=None, alpha=None, min_periods=0, adjust=True, ignore_na=False, axis=0)`

Provides exponential weighted functions

New in version 0.18.0.

**Parameters** `com` : float, optional

Specify decay in terms of center of mass,  $\alpha = 1/(1 + com)$ , for  $com \geq 0$

`span` : float, optional

Specify decay in terms of span,  $\alpha = 2/(span + 1)$ , for  $span \geq 1$

`halflife` : float, optional

Specify decay in terms of half-life,  $\alpha = 1 - \exp(\log(0.5)/halflife)$ , for  $halflife > 0$

**alpha** : float, optional

Specify smoothing factor  $\alpha$  directly,  $0 < \alpha \leq 1$

New in version 0.18.0.

**min\_periods** : int, default 0

Minimum number of observations in window required to have a value (otherwise result is NA).

**adjust** : boolean, default True

Divide by decaying adjustment factor in beginning periods to account for imbalance in relative weightings (viewing EWMA as a moving average)

**ignore\_na** : boolean, default False

Ignore missing values when calculating weights; specify True to reproduce pre-0.15.0 behavior

### Returns

**a Window sub-classed for the particular operation**

See also:

*rolling* Provides rolling window calculations

*expanding* Provides expanding transformations.

### Notes

Exactly one of center of mass, span, half-life, and alpha must be provided. Allowed values and relationship between the parameters are specified in the parameter descriptions above; see the link at the end of this section for a detailed explanation.

When adjust is True (default), weighted averages are calculated using weights  $(1-\alpha)^{(n-1)}$ ,  $(1-\alpha)^{(n-2)}$ , ...,  $1-\alpha$ , 1.

**When adjust is False, weighted averages are calculated recursively as:**  $\text{weighted\_average}[0] = \text{arg}[0]$ ;  $\text{weighted\_average}[i] = (1-\alpha) * \text{weighted\_average}[i-1] + \alpha * \text{arg}[i]$ .

When ignore\_na is False (default), weights are based on absolute positions. For example, the weights of x and y used in calculating the final weighted average of [x, None, y] are  $(1-\alpha)^2$  and 1 (if adjust is True), and  $(1-\alpha)^2$  and alpha (if adjust is False).

When ignore\_na is True (reproducing pre-0.15.0 behavior), weights are based on relative positions. For example, the weights of x and y used in calculating the final weighted average of [x, None, y] are  $1-\alpha$  and 1 (if adjust is True), and  $1-\alpha$  and alpha (if adjust is False).

More details can be found at <http://pandas.pydata.org/pandas-docs/stable/computation.html#exponentially-weighted-windows>

### Examples

```
>>> df = DataFrame({'B': [0, 1, 2, np.nan, 4]})
      B
0  0.0
1  1.0
```

(continues on next page)

(continued from previous page)

```
2  2.0
3  NaN
4  4.0
```

```
>>> df.ewm(com=0.5).mean()
      B
0  0.000000
1  0.750000
2  1.615385
3  1.615385
4  3.670213
```

## pandas.DataFrame.expanding

`DataFrame.expanding` (*min\_periods=1, center=False, axis=0*)

Provides expanding transformations.

New in version 0.18.0.

**Parameters** `min_periods` : int, default 1

Minimum number of observations in window required to have a value (otherwise result is NA).

**center** : boolean, default False

Set the labels at the center of the window.

**axis** [int or string, default 0]

### Returns

a Window sub-classed for the particular operation

See also:

[\*rolling\*](#) Provides rolling window calculations

[\*ewm\*](#) Provides exponential weighted functions

### Notes

By default, the result is set to the right edge of the window. This can be changed to the center of the window by setting `center=True`.

### Examples

```
>>> df = DataFrame({'B': [0, 1, 2, np.nan, 4]})
      B
0  0.0
1  1.0
2  2.0
3  NaN
4  4.0
```

```
>>> df.expanding(2).sum()
      B
0  NaN
1  1.0
2  3.0
3  3.0
4  7.0
```

### pandas.DataFrame.fffll

DataFrame.fffll (*axis=None, inplace=False, limit=None, downcast=None*)

Synonym for `DataFrame.fillna(method='fffll')`

### pandas.DataFrame.fillna

DataFrame.fillna (*value=None, method=None, axis=None, inplace=False, limit=None, downcast=None, \*\*kwargs*)

Fill NA/NaN values using the specified method

**Parameters** **value** : scalar, dict, Series, or DataFrame

Value to use to fill holes (e.g. 0), alternately a dict/Series/DataFrame of values specifying which value to use for each index (for a Series) or column (for a DataFrame). (values not in the dict/Series/DataFrame will not be filled). This value cannot be a list.

**method** : {'backfill', 'bfill', 'pad', 'fffll', None}, default None

Method to use for filling holes in reindexed Series pad / ffffll: propagate last valid observation forward to next valid backfill / bfffll: use NEXT valid observation to fill gap

**axis** [{0 or 'index', 1 or 'columns'}]

**inplace** : boolean, default False

If True, fill in place. Note: this will modify any other views on this object, (e.g. a no-copy slice for a column in a DataFrame).

**limit** : int, default None

If method is specified, this is the maximum number of consecutive NaN values to forward/backward fill. In other words, if there is a gap with more than this number of consecutive NaNs, it will only be partially filled. If method is not specified, this is the maximum number of entries along the entire axis where NaNs will be filled. Must be greater than 0 if not None.

**downcast** : dict, default is None

a dict of item->dtype of what to downcast if possible, or the string 'infer' which will try to downcast to an appropriate equal type (e.g. float64 to int64 if possible)

#### Returns

**filled** [DataFrame]

See also:

*interpolate* Fill NaN values using interpolation.

*reindex, asfreq*

## Examples

```
>>> df = pd.DataFrame([[np.nan, 2, np.nan, 0],
...                     [3, 4, np.nan, 1],
...                     [np.nan, np.nan, np.nan, 5],
...                     [np.nan, 3, np.nan, 4]],
...                     columns=list('ABCD'))
>>> df
```

	A	B	C	D
0	NaN	2.0	NaN	0
1	3.0	4.0	NaN	1
2	NaN	NaN	NaN	5
3	NaN	3.0	NaN	4

Replace all NaN elements with 0s.

```
>>> df.fillna(0)
```

	A	B	C	D
0	0.0	2.0	0.0	0
1	3.0	4.0	0.0	1
2	0.0	0.0	0.0	5
3	0.0	3.0	0.0	4

We can also propagate non-null values forward or backward.

```
>>> df.fillna(method='ffill')
```

	A	B	C	D
0	NaN	2.0	NaN	0
1	3.0	4.0	NaN	1
2	3.0	4.0	NaN	5
3	3.0	3.0	NaN	4

Replace all NaN elements in column 'A', 'B', 'C', and 'D', with 0, 1, 2, and 3 respectively.

```
>>> values = {'A': 0, 'B': 1, 'C': 2, 'D': 3}
>>> df.fillna(value=values)
```

	A	B	C	D
0	0.0	2.0	2.0	0
1	3.0	4.0	2.0	1
2	0.0	1.0	2.0	5
3	0.0	3.0	2.0	4

Only replace the first NaN element.

```
>>> df.fillna(value=values, limit=1)
```

	A	B	C	D
0	0.0	2.0	2.0	0
1	3.0	4.0	NaN	1
2	NaN	1.0	NaN	5
3	NaN	3.0	NaN	4

**pandas.DataFrame.filter**

`DataFrame.filter` (*items=None, like=None, regex=None, axis=None*)

Subset rows or columns of dataframe according to labels in the specified index.

Note that this routine does not filter a dataframe on its contents. The filter is applied to the labels of the index.

**Parameters** *items* : list-like

List of info axis to restrict to (must not all be present)

**like** : string

Keep info axis where “arg in col == True”

**regex** : string (regular expression)

Keep info axis with `re.search(regex, col) == True`

**axis** : int or string axis name

The axis to filter on. By default this is the info axis, ‘index’ for Series, ‘columns’ for DataFrame

**Returns**

same type as input object

**See also:**

`pandas.DataFrame.loc`

**Notes**

The *items*, *like*, and *regex* parameters are enforced to be mutually exclusive.

*axis* defaults to the info axis that is used when indexing with `[]`.

**Examples**

```
>>> df
one two three
mouse 1 2 3
rabbit 4 5 6
```

```
>>> # select columns by name
>>> df.filter(items=['one', 'three'])
one three
mouse 1 3
rabbit 4 6
```

```
>>> # select columns by regular expression
>>> df.filter(regex='e$', axis=1)
one three
mouse 1 3
rabbit 4 6
```

```
>>> # select rows containing 'bbi'
>>> df.filter(like='bbi', axis=0)
one two three
rabbit 4 5 6
```

## pandas.DataFrame.first

`DataFrame.first(offset)`

Convenience method for subsetting initial periods of time series data based on a date offset.

### Parameters

**offset** [string, DateOffset, dateutil.relativedelta]

### Returns

**subset** [type of caller]

### Raises `TypeError`

If the index is not a *DatetimeIndex*

### See also:

**last** Select final periods of time series based on a date offset

**at\_time** Select values at a particular time of the day

**between\_time** Select values between particular times of the day

## Examples

```
>>> i = pd.date_range('2018-04-09', periods=4, freq='2D')
>>> ts = pd.DataFrame({'A': [1,2,3,4]}, index=i)
>>> ts
           A
2018-04-09  1
2018-04-11  2
2018-04-13  3
2018-04-15  4
```

Get the rows for the first 3 days:

```
>>> ts.first('3D')
           A
2018-04-09  1
2018-04-11  2
```

Notice the data for 3 first calendar days were returned, not the first 3 days observed in the dataset, and therefore data for 2018-04-13 was not returned.

## pandas.DataFrame.first\_valid\_index

`DataFrame.first_valid_index()`

Return index for first non-NA/null value.

**Returns****scalar** [type of index]**Notes**

If all elements are non-NA/null, returns None. Also returns None for empty NDFrame.

**pandas.DataFrame.floordiv**

`DataFrame.floordiv` (*other*, *axis*='columns', *level*=None, *fill\_value*=None)

Integer division of dataframe and other, element-wise (binary operator *floordiv*).

Equivalent to `dataframe // other`, but with support to substitute a *fill\_value* for missing data in one of the inputs.

**Parameters**

**other** [Series, DataFrame, or constant]

**axis** : {0, 1, 'index', 'columns'}

For Series input, axis to match Series index on

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

**fill\_value** : None or float value, default None

Fill existing missing (NaN) values, and any new element needed for successful DataFrame alignment, with this value before computation. If data in both corresponding DataFrame locations is missing the result will be missing

**Returns****result** [DataFrame]**See also:**

`DataFrame.rfloordiv`

**Notes**

Mismatched indices will be unioned together

**Examples**

None

**pandas.DataFrame.from\_csv**

**classmethod** `DataFrame.from_csv` (*path*, *header*=0, *sep*=' ', *index\_col*=0, *parse\_dates*=True, *encoding*=None, *tupleize\_cols*=None, *infer\_datetime\_format*=False)

Read CSV file.

Deprecated since version 0.21.0: Use `pandas.read_csv()` instead.

It is preferable to use the more powerful `pandas.read_csv()` for most general purposes, but `from_csv` makes for an easy roundtrip to and from a file (the exact counterpart of `to_csv`), especially with a DataFrame of time series data.

This method only differs from the preferred `pandas.read_csv()` in some defaults:

- `index_col` is 0 instead of `None` (take first column as index by default)
- `parse_dates` is `True` instead of `False` (try parsing the index as datetime by default)

So a `pd.DataFrame.from_csv(path)` can be replaced by `pd.read_csv(path, index_col=0, parse_dates=True)`.

#### Parameters

**path** [string file path or file handle / StringIO]

**header** : int, default 0

Row to use as header (skip prior rows)

**sep** : string, default ','

Field delimiter

**index\_col** : int or sequence, default 0

Column to use for index. If a sequence is given, a MultiIndex is used. Different default from `read_table`

**parse\_dates** : boolean, default True

Parse dates. Different default from `read_table`

**tupleize\_cols** : boolean, default False

write multi\_index columns as a list of tuples (if True) or new (expanded format) if False)

**infer\_datetime\_format**: boolean, default False

If True and `parse_dates` is True for a column, try to infer the datetime format based on the first datetime string. If the format can be inferred, there often will be a large parsing speed-up.

#### Returns

**y** [DataFrame]

See also:

`pandas.read_csv`

### **pandas.DataFrame.from\_dict**

**classmethod** `DataFrame.from_dict` (*data*, *orient*='columns', *dtype*=None, *columns*=None)  
Construct DataFrame from dict of array-like or dicts.

Creates DataFrame object from dictionary by columns or by index allowing dtype specification.

**Parameters** **data** : dict

Of the form {field : array-like} or {field : dict}.

**orient** : {'columns', 'index'}, default 'columns'

The “orientation” of the data. If the keys of the passed dict should be the columns of the resulting DataFrame, pass 'columns' (default). Otherwise if the keys should be rows, pass 'index'.

**dtype** : dtype, default None

Data type to force, otherwise infer.

**columns** : list, default None

Column labels to use when orient='index'. Raises a ValueError if used with orient='columns'.

New in version 0.23.0.

### Returns

**pandas.DataFrame**

See also:

**DataFrame.from\_records** DataFrame from ndarray (structured dtype), list of tuples, dict, or DataFrame

**DataFrame** DataFrame object creation using constructor

### Examples

By default the keys of the dict become the DataFrame columns:

```
>>> data = {'col_1': [3, 2, 1, 0], 'col_2': ['a', 'b', 'c', 'd']}
>>> pd.DataFrame.from_dict(data)
   col_1 col_2
0      3    a
1      2    b
2      1    c
3      0    d
```

Specify orient='index' to create the DataFrame using dictionary keys as rows:

```
>>> data = {'row_1': [3, 2, 1, 0], 'row_2': ['a', 'b', 'c', 'd']}
>>> pd.DataFrame.from_dict(data, orient='index')
      0  1  2  3
row_1  3  2  1  0
row_2  a  b  c  d
```

When using the 'index' orientation, the column names can be specified manually:

```
>>> pd.DataFrame.from_dict(data, orient='index',
...                          columns=['A', 'B', 'C', 'D'])
      A  B  C  D
row_1  3  2  1  0
row_2  a  b  c  d
```

### pandas.DataFrame.from\_items

**classmethod** `DataFrame.from_items` (*items*, *columns=None*, *orient='columns'*)

Construct a dataframe from a list of tuples

Deprecated since version 0.23.0: `from_items` is deprecated and will be removed in a future version. Use `DataFrame.from_dict(dict(items))` instead. `DataFrame.from_dict(OrderedDict(items))` may be used to preserve the key order.

Convert (key, value) pairs to DataFrame. The keys will be the axis index (usually the columns, but depends on the specified orientation). The values should be arrays or Series.

**Parameters** *items* : sequence of (key, value) pairs

Values should be arrays or Series.

**columns** : sequence of column labels, optional

Must be passed if *orient*='index'.

**orient** : {'columns', 'index'}, default 'columns'

The “orientation” of the data. If the keys of the input correspond to column labels, pass 'columns' (default). Otherwise if the keys correspond to the index, pass 'index'.

**Returns**

**frame** [DataFrame]

### pandas.DataFrame.from\_records

**classmethod** `DataFrame.from_records` (*data*, *index=None*, *exclude=None*, *columns=None*, *coerce\_float=False*, *nrows=None*)

Convert structured or record ndarray to DataFrame

**Parameters**

**data** [ndarray (structured dtype), list of tuples, dict, or DataFrame]

**index** : string, list of fields, array-like

Field of array to use as the index, alternately a specific set of input labels to use

**exclude** : sequence, default None

Columns or fields to exclude

**columns** : sequence, default None

Column names to use. If the passed data do not have names associated with them, this argument provides names for the columns. Otherwise this argument indicates the order of the columns in the result (any names not found in the data will become all-NA columns)

**coerce\_float** : boolean, default False

Attempt to convert values of non-string, non-numeric objects (like decimal.Decimal) to floating point, useful for SQL result sets

**Returns**

**df** [DataFrame]

**pandas.DataFrame.ge**`DataFrame.ge` (*other*, *axis*='columns', *level*=None)Wrapper for flexible comparison methods `ge`**pandas.DataFrame.get**`DataFrame.get` (*key*, *default*=None)

Get item from object for given key (DataFrame column, Panel slice, etc.). Returns default value if not found.

**Parameters****key** [object]**Returns****value** [type of items contained in object]**pandas.DataFrame.get\_dtype\_counts**`DataFrame.get_dtype_counts` ()

Return counts of unique dtypes in this object.

**Returns dtype** : Series

Series with the count of columns with each dtype.

**See also:**[`dtypes`](#) Return the dtypes in this object.**Examples**

```
>>> a = [['a', 1, 1.0], ['b', 2, 2.0], ['c', 3, 3.0]]
>>> df = pd.DataFrame(a, columns=['str', 'int', 'float'])
>>> df
   str  int  float
0   a    1    1.0
1   b    2    2.0
2   c    3    3.0
```

```
>>> df.get_dtype_counts()
float64    1
int64      1
object     1
dtype: int64
```

**pandas.DataFrame.get\_ftype\_counts**`DataFrame.get_ftype_counts` ()

Return counts of unique ftypes in this object.

Deprecated since version 0.23.0.

This is useful for `SparseDataFrame` or for `DataFrames` containing sparse arrays.

**Returns** `dtype` : Series

Series with the count of columns with each type and sparsity (dense/sparse)

**See also:**

*ftypes* Return ftypes (indication of sparse/dense and dtype) in this object.

### Examples

```
>>> a = [['a', 1, 1.0], ['b', 2, 2.0], ['c', 3, 3.0]]
>>> df = pd.DataFrame(a, columns=['str', 'int', 'float'])
>>> df
   str  int  float
0   a    1   1.0
1   b    2   2.0
2   c    3   3.0
```

```
>>> df.get_ftype_counts()
float64:dense    1
int64:dense      1
object:dense     1
dtype: int64
```

### `pandas.DataFrame.get_value`

`DataFrame.get_value(index, col, takeable=False)`

Quickly retrieve single value at passed column and index

Deprecated since version 0.21.0: Use `.at[]` or `.iat[]` accessors instead.

#### Parameters

**index** [row label]

**col** [column label]

**takeable** [interpret the index/col as indexers, default False]

#### Returns

**value** [scalar value]

### `pandas.DataFrame.get_values`

`DataFrame.get_values()`

Return an ndarray after converting sparse values to dense.

This is the same as `.values` for non-sparse data. For sparse data contained in a `pandas.SparseArray`, the data are first converted to a dense representation.

**Returns** `numpy.ndarray`

Numpy representation of `DataFrame`

**See also:**

**values** Numpy representation of DataFrame.

**pandas.SparseArray** Container for sparse data.

## Examples

```
>>> df = pd.DataFrame({'a': [1, 2], 'b': [True, False],
...                    'c': [1.0, 2.0]})
>>> df
   a     b     c
0  1   True  1.0
1  2  False  2.0
```

```
>>> df.get_values()
array([[1, True, 1.0], [2, False, 2.0]], dtype=object)
```

```
>>> df = pd.DataFrame({"a": pd.SparseArray([1, None, None]),
...                    "c": [1.0, 2.0, 3.0]})
>>> df
   a     c
0  1.0  1.0
1  NaN  2.0
2  NaN  3.0
```

```
>>> df.get_values()
array([[ 1.,  1.],
       [nan,  2.],
       [nan,  3.]])
```

## pandas.DataFrame.groupby

**DataFrame.groupby** (*by=None, axis=0, level=None, as\_index=True, sort=True, group\_keys=True, squeeze=False, observed=False, \*\*kwargs*)

Group series using mapper (dict or key function, apply given function to group, return result as series) or by a series of columns.

**Parameters** **by** : mapping, function, label, or list of labels

Used to determine the groups for the groupby. If *by* is a function, it's called on each value of the object's index. If a dict or Series is passed, the Series or dict VALUES will be used to determine the groups (the Series' values are first aligned; see `.align()` method). If an ndarray is passed, the values are used as-is determine the groups. A label or list of labels may be passed to group by the columns in *self*. Notice that a tuple is interpreted a (single) key.

**axis** [int, default 0]

**level** : int, level name, or sequence of such, default None

If the axis is a MultiIndex (hierarchical), group by a particular level or levels

**as\_index** : boolean, default True

For aggregated output, return object with group labels as the index. Only relevant for DataFrame input. *as\_index=False* is effectively "SQL-style" grouped output

**sort** : boolean, default True

Sort group keys. Get better performance by turning this off. Note this does not influence the order of observations within each group. `groupby` preserves the order of rows within each group.

**group\_keys** : boolean, default True

When calling `apply`, add group keys to index to identify pieces

**squeeze** : boolean, default False

reduce the dimensionality of the return type if possible, otherwise return a consistent type

**observed** : boolean, default False

This only applies if any of the groupers are Categoricals. If True: only show observed values for categorical groupers. If False: show all values for categorical groupers.

New in version 0.23.0.

## Returns

### GroupBy object

See also:

[\*resample\*](#) Convenience method for frequency conversion and resampling of time series.

## Notes

See the [user guide](#) for more.

## Examples

DataFrame results

```
>>> data.groupby(func, axis=0).mean()
>>> data.groupby(['col1', 'col2'])['col3'].mean()
```

DataFrame with hierarchical index

```
>>> data.groupby(['col1', 'col2']).mean()
```

## pandas.DataFrame.gt

`DataFrame.gt` (*other*, *axis*='columns', *level*=None)  
Wrapper for flexible comparison methods `gt`

## pandas.DataFrame.head

`DataFrame.head` (*n*=5)  
Return the first *n* rows.

This function returns the first  $n$  rows for the object based on position. It is useful for quickly testing if your object has the right type of data in it.

**Parameters** **n** : int, default 5

Number of rows to select.

**Returns** **obj\_head** : type of caller

The first  $n$  rows of the caller object.

**See also:**

[`pandas.DataFrame.tail`](#) Returns the last  $n$  rows.

## Examples

```
>>> df = pd.DataFrame({'animal': ['alligator', 'bee', 'falcon', 'lion',
...                               'monkey', 'parrot', 'shark', 'whale', 'zebra']})
>>> df
   animal
0 alligator
1      bee
2   falcon
3     lion
4   monkey
5   parrot
6    shark
7    whale
8    zebra
```

Viewing the first 5 lines

```
>>> df.head()
   animal
0 alligator
1      bee
2   falcon
3     lion
4   monkey
```

Viewing the first  $n$  lines (three in this case)

```
>>> df.head(3)
   animal
0 alligator
1      bee
2   falcon
```

## pandas.DataFrame.hist

`DataFrame.hist` (*column=None, by=None, grid=True, xlabelsize=None, xrot=None, ylabelsize=None, yrot=None, ax=None, sharex=False, sharey=False, figsize=None, layout=None, bins=10, \*\*kws*)

Make a histogram of the DataFrame's.

A **histogram** is a representation of the distribution of data. This function calls `matplotlib.pyplot.hist()`, on each series in the DataFrame, resulting in one histogram per column.

**Parameters** **data** : DataFrame

The pandas object holding the data.

**column** : string or sequence

If passed, will be used to limit data to a subset of columns.

**by** : object, optional

If passed, then used to form histograms for separate groups.

**grid** : boolean, default True

Whether to show axis grid lines.

**xlabelsize** : int, default None

If specified changes the x-axis label size.

**xrot** : float, default None

Rotation of x axis labels. For example, a value of 90 displays the x labels rotated 90 degrees clockwise.

**ylabelsize** : int, default None

If specified changes the y-axis label size.

**yrot** : float, default None

Rotation of y axis labels. For example, a value of 90 displays the y labels rotated 90 degrees clockwise.

**ax** : Matplotlib axes object, default None

The axes to plot the histogram on.

**sharex** : boolean, default True if ax is None else False

In case subplots=True, share x axis and set some x axis labels to invisible; defaults to True if ax is None otherwise False if an ax is passed in. Note that passing in both an ax and sharex=True will alter all x axis labels for all subplots in a figure.

**sharey** : boolean, default False

In case subplots=True, share y axis and set some y axis labels to invisible.

**figsize** : tuple

The size in inches of the figure to create. Uses the value in *matplotlib.rcParams* by default.

**layout** : tuple, optional

Tuple of (rows, columns) for the layout of the histograms.

**bins** : integer or sequence, default 10

Number of histogram bins to be used. If an integer is given, bins + 1 bin edges are calculated and returned. If bins is a sequence, gives bin edges, including left edge of first bin and right edge of last bin. In this case, bins is returned unmodified.

**\*\*kwds**

All other plotting keyword arguments to be passed to `matplotlib.pyplot.hist()`.

### Returns

**axes** [matplotlib.AxesSubplot or numpy.ndarray of them]

### See also:

**matplotlib.pyplot.hist** Plot a histogram using matplotlib.

### Examples

This example draws a histogram based on the length and width of some animals, displayed in three bins

```
>>> df = pd.DataFrame({
...     'length': [1.5, 0.5, 1.2, 0.9, 3],
...     'width': [0.7, 0.2, 0.15, 0.2, 1.1]
...     }, index= ['pig', 'rabbit', 'duck', 'chicken', 'horse'])
>>> hist = df.hist(bins=3)
```

## pandas.DataFrame.idxmax

`DataFrame.idxmax` (*axis=0, skipna=True*)

Return index of first occurrence of maximum over requested axis. NA/null values are excluded.

**Parameters** **axis** : {0 or 'index', 1 or 'columns'}, default 0

0 or 'index' for row-wise, 1 or 'columns' for column-wise

**skipna** : boolean, default True

Exclude NA/null values. If an entire row/column is NA, the result will be NA.

### Returns

**idxmax** [Series]

### Raises ValueError

- If the row/column is empty

### See also:

`Series.idxmax`

### Notes

This method is the DataFrame version of `ndarray.argmax`.

## pandas.DataFrame.idxmin

`DataFrame.idxmin` (*axis=0, skipna=True*)

Return index of first occurrence of minimum over requested axis. NA/null values are excluded.

**Parameters** **axis** : {0 or 'index', 1 or 'columns'}, default 0

0 or 'index' for row-wise, 1 or 'columns' for column-wise

**skipna** : boolean, default True

Exclude NA/null values. If an entire row/column is NA, the result will be NA.

### Returns

**idxmin** [Series]

### Raises ValueError

- If the row/column is empty

### See also:

*Series.idxmin*

### Notes

This method is the DataFrame version of `ndarray.argmax`.

## pandas.DataFrame.infer\_objects

`DataFrame.infer_objects()`

Attempt to infer better dtypes for object columns.

Attempts soft conversion of object-dtyped columns, leaving non-object and unconvertible columns unchanged. The inference rules are the same as during normal Series/DataFrame construction.

New in version 0.21.0.

### Returns

**converted** [same type as input object]

### See also:

*pandas.to\_datetime* Convert argument to datetime.

*pandas.to\_timedelta* Convert argument to timedelta.

*pandas.to\_numeric* Convert argument to numeric typeR

### Examples

```
>>> df = pd.DataFrame({"A": ["a", 1, 2, 3]})
>>> df = df.iloc[1:]
>>> df
   A
1  1
2  2
3  3
```

```
>>> df.dtypes
A    object
dtype: object
```

```
>>> df.infer_objects().dtypes
A      int64
dtype: object
```

## pandas.DataFrame.info

`DataFrame.info(verbose=None, buf=None, max_cols=None, memory_usage=None, null_counts=None)`

Print a concise summary of a DataFrame.

This method prints information about a DataFrame including the index dtype and column dtypes, non-null values and memory usage.

**Parameters** `verbose` : bool, optional

Whether to print the full summary. By default, the setting in `pandas.options.display.max_info_columns` is followed.

**buf** : writable buffer, defaults to `sys.stdout`

Where to send the output. By default, the output is printed to `sys.stdout`. Pass a writable buffer if you need to further process the output.

**max\_cols** : int, optional

When to switch from the verbose to the truncated output. If the DataFrame has more than `max_cols` columns, the truncated output is used. By default, the setting in `pandas.options.display.max_info_columns` is used.

**memory\_usage** : bool, str, optional

Specifies whether total memory usage of the DataFrame elements (including the index) should be displayed. By default, this follows the `pandas.options.display.memory_usage` setting.

True always show memory usage. False never shows memory usage. A value of 'deep' is equivalent to "True with deep introspection". Memory usage is shown in human-readable units (base-2 representation). Without deep introspection a memory estimation is made based in column dtype and number of rows assuming values consume the same memory amount for corresponding dtypes. With deep memory introspection, a real memory usage calculation is performed at the cost of computational resources.

**null\_counts** : bool, optional

Whether to show the non-null counts. By default, this is shown only if the frame is smaller than `pandas.options.display.max_info_rows` and `pandas.options.display.max_info_columns`. A value of True always shows the counts, and False never shows the counts.

**Returns** None

This method prints a summary of a DataFrame and returns None.

See also:

[`DataFrame.describe`](#) Generate descriptive statistics of DataFrame columns.

[`DataFrame.memory\_usage`](#) Memory usage of DataFrame columns.

## Examples

```
>>> int_values = [1, 2, 3, 4, 5]
>>> text_values = ['alpha', 'beta', 'gamma', 'delta', 'epsilon']
>>> float_values = [0.0, 0.25, 0.5, 0.75, 1.0]
>>> df = pd.DataFrame({"int_col": int_values, "text_col": text_values,
...                     "float_col": float_values})
>>> df
   int_col text_col  float_col
0         1   alpha         0.00
1         2   beta         0.25
2         3  gamma         0.50
3         4  delta         0.75
4         5 epsilon         1.00
```

Prints information of all columns:

```
>>> df.info(verbose=True)
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 5 entries, 0 to 4
Data columns (total 3 columns):
int_col      5 non-null int64
text_col     5 non-null object
float_col    5 non-null float64
dtypes: float64(1), int64(1), object(1)
memory usage: 200.0+ bytes
```

Prints a summary of columns count and its dtypes but not per column information:

```
>>> df.info(verbose=False)
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 5 entries, 0 to 4
Columns: 3 entries, int_col to float_col
dtypes: float64(1), int64(1), object(1)
memory usage: 200.0+ bytes
```

Pipe output of DataFrame.info to buffer instead of sys.stdout, get buffer content and writes to a text file:

```
>>> import io
>>> buffer = io.StringIO()
>>> df.info(buf=buffer)
>>> s = buffer.getvalue()
>>> with open("df_info.txt", "w", encoding="utf-8") as f:
...     f.write(s)
260
```

The *memory\_usage* parameter allows deep introspection mode, specially useful for big DataFrames and fine-tune memory optimization:

```
>>> random_strings_array = np.random.choice(['a', 'b', 'c'], 10 ** 6)
>>> df = pd.DataFrame({
...     'column_1': np.random.choice(['a', 'b', 'c'], 10 ** 6),
...     'column_2': np.random.choice(['a', 'b', 'c'], 10 ** 6),
...     'column_3': np.random.choice(['a', 'b', 'c'], 10 ** 6)
... })
>>> df.info()
<class 'pandas.core.frame.DataFrame'>
```

(continues on next page)

(continued from previous page)

```

RangeIndex: 1000000 entries, 0 to 999999
Data columns (total 3 columns):
column_1    1000000 non-null object
column_2    1000000 non-null object
column_3    1000000 non-null object
dtypes: object(3)
memory usage: 22.9+ MB

```

```

>>> df.info(memory_usage='deep')
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 1000000 entries, 0 to 999999
Data columns (total 3 columns):
column_1    1000000 non-null object
column_2    1000000 non-null object
column_3    1000000 non-null object
dtypes: object(3)
memory usage: 188.8 MB

```

### pandas.DataFrame.insert

`DataFrame.insert` (*loc*, *column*, *value*, *allow\_duplicates=False*)

Insert column into DataFrame at specified location.

Raises a `ValueError` if *column* is already contained in the DataFrame, unless *allow\_duplicates* is set to `True`.

**Parameters** *loc* : int

Insertion index. Must verify  $0 \leq \text{loc} \leq \text{len}(\text{columns})$

**column** : string, number, or hashable object

label of the inserted column

**value** [int, Series, or array-like]

**allow\_duplicates** [bool, optional]

### pandas.DataFrame.interpolate

`DataFrame.interpolate` (*method='linear'*, *axis=0*, *limit=None*, *inplace=False*,  
*limit\_direction='forward'*, *limit\_area=None*, *downcast=None*,  
*\*\*kwargs*)

Interpolate values according to different methods.

Please note that only `method='linear'` is supported for DataFrames/Series with a MultiIndex.

**Parameters** *method* : {'linear', 'time', 'index', 'values', 'nearest', 'zero',

'slinear', 'quadratic', 'cubic', 'barycentric', 'krogh', 'polynomial', 'spline',  
'piecewise\_polynomial', 'from\_derivatives', 'pchip', 'akima' }

- 'linear': ignore the index and treat the values as equally spaced. This is the only method supported on MultiIndexes. default

- ‘time’: interpolation works on daily and higher resolution data to interpolate given length of interval
- ‘index’, ‘values’: use the actual numerical values of the index
- ‘nearest’, ‘zero’, ‘slinear’, ‘quadratic’, ‘cubic’, ‘barycentric’, ‘polynomial’ is passed to `scipy.interpolate.interpld`. Both ‘polynomial’ and ‘spline’ require that you also specify an *order* (int), e.g. `df.interpolate(method='polynomial', order=4)`. These use the actual numerical values of the index.
- ‘krogh’, ‘piecewise\_polynomial’, ‘spline’, ‘pchip’ and ‘akima’ are all wrappers around the scipy interpolation methods of similar names. These use the actual numerical values of the index. For more information on their behavior, see the [scipy documentation](#) and [tutorial documentation](#)
- ‘from\_derivatives’ refers to `BPoly.from_derivatives` which replaces ‘piecewise\_polynomial’ interpolation method in scipy 0.18

New in version 0.18.1: Added support for the ‘akima’ method Added interpolate method ‘from\_derivatives’ which replaces ‘piecewise\_polynomial’ in scipy 0.18; backwards-compatible with scipy < 0.18

**axis** : {0, 1}, default 0

- 0: fill column-by-column
- 1: fill row-by-row

**limit** : int, default None.

Maximum number of consecutive NaNs to fill. Must be greater than 0.

**limit\_direction** [{‘forward’, ‘backward’, ‘both’}, default ‘forward’]

**limit\_area** : {‘inside’, ‘outside’}, default None

- None: (default) no fill restriction
- ‘inside’ Only fill NaNs surrounded by valid values (interpolate).
- ‘outside’ Only fill NaNs outside valid values (extrapolate).

If limit is specified, consecutive NaNs will be filled in this direction.

New in version 0.21.0.

**inplace** : bool, default False

Update the NDFrame in place if possible.

**downcast** : optional, ‘infer’ or None, defaults to None

Downcast dtypes if possible.

**kwargs** [keyword arguments to pass on to the interpolating function.]

## Returns

Series or DataFrame of same shape interpolated at the NaNs

See also:

[reindex](#), [replace](#), [fillna](#)

## Examples

### Filling in NaNs

```
>>> s = pd.Series([0, 1, np.nan, 3])
>>> s.interpolate()
0    0
1    1
2    2
3    3
dtype: float64
```

## pandas.DataFrame.isin

`DataFrame.isin(values)`

Return boolean DataFrame showing whether each element in the DataFrame is contained in values.

**Parameters** `values` : iterable, Series, DataFrame or dictionary

The result will only be true at a location if all the labels match. If *values* is a Series, that's the index. If *values* is a dictionary, the keys must be the column names, which must match. If *values* is a DataFrame, then both the index and column labels must match.

**Returns**

**DataFrame of booleans**

## Examples

When values is a list:

```
>>> df = pd.DataFrame({'A': [1, 2, 3], 'B': ['a', 'b', 'f']})
>>> df.isin([1, 3, 12, 'a'])
   A    B
0  True  True
1 False False
2  True False
```

When values is a dict:

```
>>> df = pd.DataFrame({'A': [1, 2, 3], 'B': [1, 4, 7]})
>>> df.isin({'A': [1, 3], 'B': [4, 7, 12]})
   A    B
0  True False # Note that B didn't match the 1 here.
1 False  True
2  True  True
```

When values is a Series or DataFrame:

```
>>> df = pd.DataFrame({'A': [1, 2, 3], 'B': ['a', 'b', 'f']})
>>> other = DataFrame({'A': [1, 3, 3, 2], 'B': ['e', 'f', 'f', 'e']})
>>> df.isin(other)
   A    B
0  True False
```

(continues on next page)

(continued from previous page)

```

1 False False # Column A in `other` has a 3, but not at index 1.
2  True  True

```

**pandas.DataFrame.isna**`DataFrame.isna()`

Detect missing values.

Return a boolean same-sized object indicating if the values are NA. NA values, such as `None` or `numpy.NaN`, gets mapped to `True` values. Everything else gets mapped to `False` values. Characters such as empty strings `' '` or `numpy.inf` are not considered NA values (unless you set `pandas.options.mode.use_inf_as_na = True`).

**Returns DataFrame**

Mask of bool values for each element in `DataFrame` that indicates whether an element is not an NA value.

**See also:**`DataFrame.isnull` alias of `isna``DataFrame.notna` boolean inverse of `isna``DataFrame.dropna` omit axes labels with missing values`isna` top-level `isna`**Examples**Show which entries in a `DataFrame` are NA.

```

>>> df = pd.DataFrame({'age': [5, 6, np.NaN],
...                     'born': [pd.NaT, pd.Timestamp('1939-05-27'),
...                               pd.Timestamp('1940-04-25')],
...                     'name': ['Alfred', 'Batman', ''],
...                     'toy': [None, 'Batmobile', 'Joker']})
>>> df
   age      born   name      toy
0  5.0      NaT  Alfred     None
1  6.0 1939-05-27  Batman  Batmobile
2  NaN 1940-04-25      Joker

```

```

>>> df.isna()
   age  born  name  toy
0 False  True False  True
1 False False False False
2  True False False False

```

Show which entries in a `Series` are NA.

```

>>> ser = pd.Series([5, 6, np.NaN])
>>> ser
0    5.0
1    6.0

```

(continues on next page)

(continued from previous page)

```
2    NaN
dtype: float64
```

```
>>> ser.isna()
0    False
1    False
2     True
dtype: bool
```

**pandas.DataFrame.isnull**`DataFrame.isnull()`

Detect missing values.

Return a boolean same-sized object indicating if the values are NA. NA values, such as `None` or `numpy.NaN`, gets mapped to `True` values. Everything else gets mapped to `False` values. Characters such as empty strings `' '` or `numpy.inf` are not considered NA values (unless you set `pandas.options.mode.use_inf_as_na = True`).

**Returns DataFrame**

Mask of bool values for each element in `DataFrame` that indicates whether an element is not an NA value.

**See also:**`DataFrame.isnull` alias of `isna``DataFrame.notna` boolean inverse of `isna``DataFrame.dropna` omit axes labels with missing values`isna` top-level `isna`**Examples**Show which entries in a `DataFrame` are NA.

```
>>> df = pd.DataFrame({'age': [5, 6, np.NaN],
...                     'born': [pd.NaT, pd.Timestamp('1939-05-27'),
...                               pd.Timestamp('1940-04-25')],
...                     'name': ['Alfred', 'Batman', ''],
...                     'toy': [None, 'Batmobile', 'Joker']})
>>> df
   age      born   name      toy
0  5.0      NaT  Alfred     None
1  6.0 1939-05-27  Batman  Batmobile
2  NaN 1940-04-25     Joker     Joker
```

```
>>> df.isna()
   age  born  name  toy
0  False  True  False  True
1  False  False  False  False
2   True  False  False  False
```

Show which entries in a Series are NA.

```
>>> ser = pd.Series([5, 6, np.NaN])
>>> ser
0    5.0
1    6.0
2     NaN
dtype: float64
```

```
>>> ser.isna()
0    False
1    False
2     True
dtype: bool
```

### **pandas.DataFrame.items**

`DataFrame.items()`

Iterator over (column name, Series) pairs.

**See also:**

*[iterrows](#)* Iterate over DataFrame rows as (index, Series) pairs.

*[itertuples](#)* Iterate over DataFrame rows as namedtuples of the values.

### **pandas.DataFrame.iteritems**

`DataFrame.iteritems()`

Iterator over (column name, Series) pairs.

**See also:**

*[iterrows](#)* Iterate over DataFrame rows as (index, Series) pairs.

*[itertuples](#)* Iterate over DataFrame rows as namedtuples of the values.

### **pandas.DataFrame.iterrows**

`DataFrame.iterrows()`

Iterate over DataFrame rows as (index, Series) pairs.

**Returns it :** generator

A generator that iterates over the rows of the frame.

**See also:**

*[itertuples](#)* Iterate over DataFrame rows as namedtuples of the values.

*[iteritems](#)* Iterate over (column name, Series) pairs.

## Notes

1. Because `iterrows` returns a Series for each row, it does **not** preserve dtypes across the rows (dtypes are preserved across columns for DataFrames). For example,

```
>>> df = pd.DataFrame([[1, 1.5]], columns=['int', 'float'])
>>> row = next(df.iterrows())[1]
>>> row
int      1.0
float    1.5
Name: 0, dtype: float64
>>> print(row['int'].dtype)
float64
>>> print(df['int'].dtype)
int64
```

To preserve dtypes while iterating over the rows, it is better to use `itertuples()` which returns namedtuples of the values and which is generally faster than `iterrows`.

2. You should **never modify** something you are iterating over. This is not guaranteed to work in all cases. Depending on the data types, the iterator returns a copy and not a view, and writing to it will have no effect.

## pandas.DataFrame.itertuples

`DataFrame.itertuples` (*index=True, name='Pandas'*)

Iterate over DataFrame rows as namedtuples, with index value as first element of the tuple.

**Parameters** `index` : boolean, default True

If True, return the index as the first element of the tuple.

`name` : string, default "Pandas"

The name of the returned namedtuples or None to return regular tuples.

**See also:**

`iterrows` Iterate over DataFrame rows as (index, Series) pairs.

`iteritems` Iterate over (column name, Series) pairs.

## Notes

The column names will be renamed to positional names if they are invalid Python identifiers, repeated, or start with an underscore. With a large number of columns (>255), regular tuples are returned.

## Examples

```
>>> df = pd.DataFrame({'col1': [1, 2], 'col2': [0.1, 0.2]},
                      index=['a', 'b'])
>>> df
   col1  col2
a      1   0.1
```

(continues on next page)

(continued from previous page)

```

b      2      0.2
>>> for row in df.itertuples():
...     print(row)
...
Pandas(Index='a', col1=1, col2=0.10000000000000001)
Pandas(Index='b', col1=2, col2=0.20000000000000001)

```

## pandas.DataFrame.join

`DataFrame.join(other, on=None, how='left', lsuffix="", rsuffix="", sort=False)`

Join columns with other DataFrame either on index or on a key column. Efficiently Join multiple DataFrame objects by index at once by passing a list.

**Parameters** **other** : DataFrame, Series with name field set, or list of DataFrame

Index should be similar to one of the columns in this one. If a Series is passed, its name attribute must be set, and that will be used as the column name in the resulting joined DataFrame

**on** : name, tuple/list of names, or array-like

Column or index level name(s) in the caller to join on the index in *other*, otherwise joins index-on-index. If multiple values given, the *other* DataFrame must have a MultiIndex. Can pass an array as the join key if it is not already contained in the calling DataFrame. Like an Excel VLOOKUP operation

**how** : { 'left', 'right', 'outer', 'inner' }, default: 'left'

How to handle the operation of the two objects.

- left: use calling frame's index (or column if on is specified)
- right: use other frame's index
- outer: form union of calling frame's index (or column if on is specified) with other frame's index, and sort it lexicographically
- inner: form intersection of calling frame's index (or column if on is specified) with other frame's index, preserving the order of the calling's one

**lsuffix** : string

Suffix to use from left frame's overlapping columns

**rsuffix** : string

Suffix to use from right frame's overlapping columns

**sort** : boolean, default False

Order result DataFrame lexicographically by the join key. If False, the order of the join key depends on the join type (how keyword)

### Returns

**joined** [DataFrame]

See also:

[`DataFrame.merge`](#) For column(s)-on-columns(s) operations

## Notes

on, lsuffix, and rsuffix options are not supported when passing a list of DataFrame objects

Support for specifying index levels as the *on* parameter was added in version 0.23.0

## Examples

```
>>> caller = pd.DataFrame({'key': ['K0', 'K1', 'K2', 'K3', 'K4', 'K5'],
...                        'A': ['A0', 'A1', 'A2', 'A3', 'A4', 'A5']})
```

```
>>> caller
   A key
0  A0  K0
1  A1  K1
2  A2  K2
3  A3  K3
4  A4  K4
5  A5  K5
```

```
>>> other = pd.DataFrame({'key': ['K0', 'K1', 'K2'],
...                       'B': ['B0', 'B1', 'B2']})
```

```
>>> other
   B key
0  B0  K0
1  B1  K1
2  B2  K2
```

Join DataFrames using their indexes.

```
>>> caller.join(other, lsuffix='_caller', rsuffix='_other')
```

```
>>>
   A key_caller  B key_other
0  A0          K0  B0          K0
1  A1          K1  B1          K1
2  A2          K2  B2          K2
3  A3          K3  NaN         NaN
4  A4          K4  NaN         NaN
5  A5          K5  NaN         NaN
```

If we want to join using the key columns, we need to set key to be the index in both caller and other. The joined DataFrame will have key as its index.

```
>>> caller.set_index('key').join(other.set_index('key'))
```

```
>>>
   A    B
key
K0  A0  B0
K1  A1  B1
K2  A2  B2
K3  A3  NaN
K4  A4  NaN
K5  A5  NaN
```

Another option to join using the key columns is to use the `on` parameter. `DataFrame.join` always uses other's index but we can use any column in the caller. This method preserves the original caller's index in the result.

```
>>> caller.join(other.set_index('key'), on='key')
```

```
>>>
   A key  B
0  A0  K0  B0
1  A1  K1  B1
2  A2  K2  B2
3  A3  K3  NaN
4  A4  K4  NaN
5  A5  K5  NaN
```

### **pandas.DataFrame.keys**

`DataFrame.keys()`

Get the 'info axis' (see Indexing for more)

This is index for Series, columns for DataFrame and `major_axis` for Panel.

### **pandas.DataFrame.kurt**

`DataFrame.kurt` (*axis=None, skipna=None, level=None, numeric\_only=None, \*\*kwargs*)

Return unbiased kurtosis over requested axis using Fisher's definition of kurtosis (kurtosis of normal == 0.0). Normalized by N-1

#### **Parameters**

**axis** [{index (0), columns (1)}]

**skipna** : boolean, default True

Exclude NA/null values when computing the result.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a Series

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

#### **Returns**

**kurt** [Series or DataFrame (if level specified)]

### **pandas.DataFrame.kurtosis**

`DataFrame.kurtosis` (*axis=None, skipna=None, level=None, numeric\_only=None, \*\*kwargs*)

Return unbiased kurtosis over requested axis using Fisher's definition of kurtosis (kurtosis of normal == 0.0). Normalized by N-1

#### **Parameters**

**axis** [{index (0), columns (1)}]

**skipna** : boolean, default True

Exclude NA/null values when computing the result.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a Series

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

### Returns

**kurt** [Series or DataFrame (if level specified)]

## pandas.DataFrame.last

`DataFrame.last` (*offset*)

Convenience method for subsetting final periods of time series data based on a date offset.

### Parameters

**offset** [string, DateOffset, dateutil.relativedelta]

### Returns

**subset** [type of caller]

### Raises TypeError

If the index is not a *DatetimeIndex*

### See also:

**first** Select initial periods of time series based on a date offset

**at\_time** Select values at a particular time of the day

**between\_time** Select values between particular times of the day

## Examples

```
>>> i = pd.date_range('2018-04-09', periods=4, freq='2D')
>>> ts = pd.DataFrame({'A': [1,2,3,4]}, index=i)
>>> ts
```

	A
2018-04-09	1
2018-04-11	2
2018-04-13	3
2018-04-15	4

Get the rows for the last 3 days:

```
>>> ts.last('3D')
```

	A
2018-04-13	3
2018-04-15	4

Notice the data for 3 last calendar days were returned, not the last 3 observed days in the dataset, and therefore data for 2018-04-11 was not returned.

### **pandas.DataFrame.last\_valid\_index**

`DataFrame.last_valid_index()`  
Return index for last non-NA/null value.

#### **Returns**

**scalar** [type of index]

#### **Notes**

If all elements are non-NA/null, returns None. Also returns None for empty NDFrame.

### **pandas.DataFrame.le**

`DataFrame.le(other, axis='columns', level=None)`  
Wrapper for flexible comparison methods `le`

### **pandas.DataFrame.lookup**

`DataFrame.lookup(row_labels, col_labels)`  
Label-based “fancy indexing” function for DataFrame. Given equal-length arrays of row and column labels, return an array of the values corresponding to each (row, col) pair.

**Parameters** `row_labels` : sequence

The row labels to use for lookup

`col_labels` : sequence

The column labels to use for lookup

#### **Notes**

Akin to:

```
result = []
for row, col in zip(row_labels, col_labels):
    result.append(df.get_value(row, col))
```

#### **Examples**

**values** [ndarray] The found values

**pandas.DataFrame.lt**`DataFrame.lt` (*other*, *axis*='columns', *level*=None)Wrapper for flexible comparison methods `lt`**pandas.DataFrame.mad**`DataFrame.mad` (*axis*=None, *skipna*=None, *level*=None)

Return the mean absolute deviation of the values for the requested axis

**Parameters****axis** [{index (0), columns (1)}]**skipna** : boolean, default True

Exclude NA/null values when computing the result.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a Series

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

**Returns****mad** [Series or DataFrame (if level specified)]**pandas.DataFrame.mask**`DataFrame.mask` (*cond*, *other*=nan, *inplace*=False, *axis*=None, *level*=None, *errors*='raise',  
*try\_cast*=False, *raise\_on\_error*=None)Return an object of same shape as self and whose corresponding entries are from self where *cond* is False and otherwise are from *other*.**Parameters** **cond** : boolean NDFrame, array-like, or callableWhere *cond* is False, keep the original value. Where True, replace with corresponding value from *other*. If *cond* is callable, it is computed on the NDFrame and should return boolean NDFrame or array. The callable must not change input NDFrame (though pandas doesn't check it).New in version 0.18.1: A callable can be used as *cond*.**other** : scalar, NDFrame, or callableEntries where *cond* is True are replaced with corresponding value from *other*. If *other* is callable, it is computed on the NDFrame and should return scalar or NDFrame. The callable must not change input NDFrame (though pandas doesn't check it).New in version 0.18.1: A callable can be used as *other*.**inplace** : boolean, default False

Whether to perform the operation in place on the data

**axis** [alignment axis if needed, default None]

**level** [alignment level if needed, default None]

**errors** : str, {'raise', 'ignore'}, default 'raise'

- **raise** : allow exceptions to be raised
- **ignore** : suppress exceptions. On error return original object

Note that currently this parameter won't affect the results and will always coerce to a suitable dtype.

**try\_cast** : boolean, default False

try to cast the result back to the input type (if possible),

**raise\_on\_error** : boolean, default True

Whether to raise on invalid data types (e.g. trying to where on strings)

Deprecated since version 0.21.0.

### Returns

**wh** [same type as caller]

### See also:

[`DataFrame.where\(\)`](#)

### Notes

The mask method is an application of the if-then idiom. For each element in the calling DataFrame, if `cond` is `False` the element is used; otherwise the corresponding element from the DataFrame `other` is used.

The signature for [`DataFrame.where\(\)`](#) differs from [`numpy.where\(\)`](#). Roughly `df1.where(m, df2)` is equivalent to `np.where(m, df1, df2)`.

For further details and examples see the `mask` documentation in [indexing](#).

### Examples

```
>>> s = pd.Series(range(5))
>>> s.where(s > 0)
0    NaN
1     1.0
2     2.0
3     3.0
4     4.0
```

```
>>> s.mask(s > 0)
0     0.0
1     NaN
2     NaN
3     NaN
4     NaN
```

```

>>> s.where(s > 1, 10)
0    10.0
1    10.0
2     2.0
3     3.0
4     4.0

>>> df = pd.DataFrame(np.arange(10).reshape(-1, 2), columns=['A', 'B'])
>>> m = df % 3 == 0
>>> df.where(m, -df)
   A  B
0  0 -1
1 -2  3
2 -4 -5
3  6 -7
4 -8  9
>>> df.where(m, -df) == np.where(m, df, -df)
   A      B
0  True  True
1  True  True
2  True  True
3  True  True
4  True  True
>>> df.where(m, -df) == df.mask(~m, -df)
   A      B
0  True  True
1  True  True
2  True  True
3  True  True
4  True  True

```

### pandas.DataFrame.max

DataFrame.**max** (*axis=None, skipna=None, level=None, numeric\_only=None, \*\*kwargs*)

**This method returns the maximum of the values in the object.** If you want the *index* of the maximum, use `idxmax`. This is the equivalent of the `numpy.ndarray` method `argmax`.

#### Parameters

**axis** [{index (0), columns (1)}]

**skipna** : boolean, default True

Exclude NA/null values when computing the result.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a Series

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

#### Returns

**max** [Series or DataFrame (if level specified)]

## pandas.DataFrame.mean

DataFrame.**mean** (*axis=None, skipna=None, level=None, numeric\_only=None, \*\*kwargs*)

Return the mean of the values for the requested axis

### Parameters

**axis** [{index (0), columns (1)}]

**skipna** : boolean, default True

Exclude NA/null values when computing the result.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a Series

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

### Returns

**mean** [Series or DataFrame (if level specified)]

## pandas.DataFrame.median

DataFrame.**median** (*axis=None, skipna=None, level=None, numeric\_only=None, \*\*kwargs*)

Return the median of the values for the requested axis

### Parameters

**axis** [{index (0), columns (1)}]

**skipna** : boolean, default True

Exclude NA/null values when computing the result.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a Series

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

### Returns

**median** [Series or DataFrame (if level specified)]

## pandas.DataFrame.melt

DataFrame.**melt** (*id\_vars=None, value\_vars=None, var\_name=None, value\_name='value', col\_level=None*)

“Unpivots” a DataFrame from wide format to long format, optionally leaving identifier variables set.

This function is useful to massage a DataFrame into a format where one or more columns are identifier variables (*id\_vars*), while all other columns, considered measured variables (*value\_vars*), are “unpivoted” to the row axis, leaving just two non-identifier columns, ‘variable’ and ‘value’.

New in version 0.20.0.

### Parameters

- frame** [DataFrame]  
**id\_vars** : tuple, list, or ndarray, optional  
 Column(s) to use as identifier variables.
- value\_vars** : tuple, list, or ndarray, optional  
 Column(s) to unpivot. If not specified, uses all columns that are not set as *id\_vars*.
- var\_name** : scalar  
 Name to use for the ‘variable’ column. If None it uses `frame.columns.name` or ‘variable’.
- value\_name** : scalar, default ‘value’  
 Name to use for the ‘value’ column.
- col\_level** : int or string, optional  
 If columns are a MultiIndex then use this level to melt.

### See also:

[`melt`](#), [`pivot\_table`](#), [`DataFrame.pivot`](#)

### Examples

```
>>> import pandas as pd
>>> df = pd.DataFrame({'A': {0: 'a', 1: 'b', 2: 'c'},
...                   'B': {0: 1, 1: 3, 2: 5},
...                   'C': {0: 2, 1: 4, 2: 6}})
>>> df
   A  B  C
0  a  1  2
1  b  3  4
2  c  5  6
```

```
>>> df.melt(id_vars=['A'], value_vars=['B'])
   A variable  value
0  a         B      1
1  b         B      3
2  c         B      5
```

```
>>> df.melt(id_vars=['A'], value_vars=['B', 'C'])
   A variable  value
0  a         B      1
1  b         B      3
2  c         B      5
3  a         C      2
4  b         C      4
5  c         C      6
```

The names of ‘variable’ and ‘value’ columns can be customized:

```
>>> df.melt(id_vars=['A'], value_vars=['B'],
...         var_name='myVarname', value_name='myValname')
   A myVarname myValname
0  a         B         1
1  b         B         3
2  c         B         5
```

If you have multi-index columns:

```
>>> df.columns = [list('ABC'), list('DEF')]
>>> df
   A B C
   D E F
0  a 1 2
1  b 3 4
2  c 5 6
```

```
>>> df.melt(col_level=0, id_vars=['A'], value_vars=['B'])
   A variable  value
0  a         B      1
1  b         B      3
2  c         B      5
```

```
>>> df.melt(id_vars=[('A', 'D')], value_vars=[('B', 'E')])
   (A, D) variable_0 variable_1  value
0      a           B           E      1
1      b           B           E      3
2      c           B           E      5
```

## pandas.DataFrame.memory\_usage

`DataFrame.memory_usage(index=True, deep=False)`

Return the memory usage of each column in bytes.

The memory usage can optionally include the contribution of the index and elements of *object* dtype.

This value is displayed in *DataFrame.info* by default. This can be suppressed by setting `pandas.options.display.memory_usage` to False.

**Parameters** `index` : bool, default True

Specifies whether to include the memory usage of the DataFrame’s index in returned Series. If `index=True` the memory usage of the index the first item in the output.

**deep** : bool, default False

If True, introspect the data deeply by interrogating *object* dtypes for system-level memory consumption, and include it in the returned values.

**Returns** `sizes` : Series

A Series whose index is the original column names and whose values is the memory usage of each column in bytes.

**See also:**

**`numpy.ndarray.nbytes`** Total bytes consumed by the elements of an ndarray.

**`Series.memory_usage`** Bytes consumed by a Series.

**`pandas.Categorical`** Memory-efficient array for string values with many repeated values.

**`DataFrame.info`** Concise summary of a DataFrame.

## Examples

```
>>> dtypes = ['int64', 'float64', 'complex128', 'object', 'bool']
>>> data = dict([(t, np.ones(shape=5000).astype(t))
...              for t in dtypes])
>>> df = pd.DataFrame(data)
>>> df.head()
   int64  float64  complex128  object  bool
0      1      1.0      (1+0j)      1  True
1      1      1.0      (1+0j)      1  True
2      1      1.0      (1+0j)      1  True
3      1      1.0      (1+0j)      1  True
4      1      1.0      (1+0j)      1  True
```

```
>>> df.memory_usage()
Index          80
int64         40000
float64        40000
complex128     80000
object         40000
bool           5000
dtype: int64
```

```
>>> df.memory_usage(index=False)
int64         40000
float64        40000
complex128     80000
object         40000
bool           5000
dtype: int64
```

The memory footprint of *object* dtype columns is ignored by default:

```
>>> df.memory_usage(deep=True)
Index          80
int64         40000
float64        40000
complex128     80000
object        160000
bool           5000
dtype: int64
```

Use a Categorical for efficient storage of an object-dtype column with many repeated values.

```
>>> df['object'].astype('category').memory_usage(deep=True)
5168
```

## pandas.DataFrame.merge

```
DataFrame.merge(right, how='inner', on=None, left_on=None, right_on=None, left_index=False,
                 right_index=False, sort=False, suffixes=('_x', '_y'), copy=True, indica-
                 tor=False, validate=None)
```

Merge DataFrame objects by performing a database-style join operation by columns or indexes.

If joining columns on columns, the DataFrame indexes *will be ignored*. Otherwise if joining indexes on indexes or indexes on a column or columns, the index will be passed on.

### Parameters

**right** [DataFrame]

**how** : { 'left', 'right', 'outer', 'inner' }, default 'inner'

- left: use only keys from left frame, similar to a SQL left outer join; preserve key order
- right: use only keys from right frame, similar to a SQL right outer join; preserve key order
- outer: use union of keys from both frames, similar to a SQL full outer join; sort keys lexicographically
- inner: use intersection of keys from both frames, similar to a SQL inner join; preserve the order of the left keys

**on** : label or list

Column or index level names to join on. These must be found in both DataFrames. If *on* is None and not merging on indexes then this defaults to the intersection of the columns in both DataFrames.

**left\_on** : label or list, or array-like

Column or index level names to join on in the left DataFrame. Can also be an array or list of arrays of the length of the left DataFrame. These arrays are treated as if they are columns.

**right\_on** : label or list, or array-like

Column or index level names to join on in the right DataFrame. Can also be an array or list of arrays of the length of the right DataFrame. These arrays are treated as if they are columns.

**left\_index** : boolean, default False

Use the index from the left DataFrame as the join key(s). If it is a MultiIndex, the number of keys in the other DataFrame (either the index or a number of columns) must match the number of levels

**right\_index** : boolean, default False

Use the index from the right DataFrame as the join key. Same caveats as left\_index

**sort** : boolean, default False

Sort the join keys lexicographically in the result DataFrame. If False, the order of the join keys depends on the join type (how keyword)

**suffixes** : 2-length sequence (tuple, list, ...)

Suffix to apply to overlapping column names in the left and right side, respectively

**copy** : boolean, default True

If False, do not copy data unnecessarily

**indicator** : boolean or string, default False

If True, adds a column to output DataFrame called “\_merge” with information on the source of each row. If string, column with information on source of each row will be added to output DataFrame, and column will be named value of string. Information column is Categorical-type and takes on a value of “left\_only” for observations whose merge key only appears in ‘left’ DataFrame, “right\_only” for observations whose merge key only appears in ‘right’ DataFrame, and “both” if the observation’s merge key is found in both.

**validate** : string, default None

If specified, checks if merge is of specified type.

- “one\_to\_one” or “1:1”: check if merge keys are unique in both left and right datasets.
- “one\_to\_many” or “1:m”: check if merge keys are unique in left dataset.
- “many\_to\_one” or “m:1”: check if merge keys are unique in right dataset.
- “many\_to\_many” or “m:m”: allowed, but does not result in checks.

New in version 0.21.0.

**Returns** **merged** : DataFrame

The output type will be the same as ‘left’, if it is a subclass of DataFrame.

**See also:**

[\*merge\\_ordered\*](#), [\*merge\\_asof\*](#), [\*DataFrame.join\*](#)

## Notes

Support for specifying index levels as the *on*, *left\_on*, and *right\_on* parameters was added in version 0.23.0

## Examples

```
>>> A          >>> B
   lkey value   rkey value
0   foo    1    0   foo    5
1   bar    2    1   bar    6
2   baz    3    2   qux    7
3   foo    4    3   bar    8
```

```
>>> A.merge(B, left_on='lkey', right_on='rkey', how='outer')
   lkey  value_x  rkey  value_y
0   foo      1    foo      5
1   foo      4    foo      5
2   bar      2    bar      6
3   bar      2    bar      8
4   baz      3   NaN     NaN
5   NaN     NaN   qux      7
```

### pandas.DataFrame.min

`DataFrame.min` (*axis=None, skipna=None, level=None, numeric\_only=None, \*\*kwargs*)

**This method returns the minimum of the values in the object.** If you want the *index* of the minimum, use `idxmin`. This is the equivalent of the `numpy.ndarray` method `argmin`.

#### Parameters

**axis** [{index (0), columns (1)}]

**skipna** : boolean, default True

Exclude NA/null values when computing the result.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a Series

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

#### Returns

**min** [Series or DataFrame (if level specified)]

### pandas.DataFrame.mod

`DataFrame.mod` (*other, axis='columns', level=None, fill\_value=None*)

Modulo of dataframe and other, element-wise (binary operator *mod*).

Equivalent to `dataframe % other`, but with support to substitute a `fill_value` for missing data in one of the inputs.

#### Parameters

**other** [Series, DataFrame, or constant]

**axis** : {0, 1, 'index', 'columns'}

For Series input, axis to match Series index on

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

**fill\_value** : None or float value, default None

Fill existing missing (NaN) values, and any new element needed for successful DataFrame alignment, with this value before computation. If data in both corresponding DataFrame locations is missing the result will be missing

#### Returns

**result** [DataFrame]

**See also:**

`DataFrame.rmod`

## Notes

Mismatched indices will be unioned together

## Examples

None

### pandas.DataFrame.mode

`DataFrame.mode(axis=0, numeric_only=False)`

Gets the mode(s) of each element along the axis selected. Adds a row for each mode per label, fills in gaps with nan.

Note that there could be multiple values returned for the selected axis (when more than one item share the maximum frequency), which is the reason why a dataframe is returned. If you want to impute missing values with the mode in a dataframe `df`, you can just do this: `df.fillna(df.mode().iloc[0])`

**Parameters** `axis`: {0 or 'index', 1 or 'columns'}, default 0

- 0 or 'index': get mode of each column
- 1 or 'columns': get mode of each row

**numeric\_only**: boolean, default False

if True, only apply to numeric columns

#### Returns

**modes** [DataFrame (sorted)]

## Examples

```
>>> df = pd.DataFrame({'A': [1, 2, 1, 2, 1, 2, 3]})
>>> df.mode()
   A
0  1
1  2
```

### pandas.DataFrame.mul

`DataFrame.mul(other, axis='columns', level=None, fill_value=None)`

Multiplication of dataframe and other, element-wise (binary operator *mul*).

Equivalent to `dataframe * other`, but with support to substitute a `fill_value` for missing data in one of the inputs.

#### Parameters

**other** [Series, DataFrame, or constant]

**axis**: {0, 1, 'index', 'columns'}

For Series input, axis to match Series index on

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

**fill\_value** : None or float value, default None

Fill existing missing (NaN) values, and any new element needed for successful DataFrame alignment, with this value before computation. If data in both corresponding DataFrame locations is missing the result will be missing

#### Returns

**result** [DataFrame]

#### See also:

[`DataFrame.rmul`](#)

#### Notes

Mismatched indices will be unioned together

#### Examples

None

### **pandas.DataFrame.multiply**

`DataFrame.multiply` (*other*, *axis*='columns', *level*=None, *fill\_value*=None)

Multiplication of dataframe and other, element-wise (binary operator *mul*).

Equivalent to `dataframe * other`, but with support to substitute a *fill\_value* for missing data in one of the inputs.

#### Parameters

**other** [Series, DataFrame, or constant]

**axis** : {0, 1, 'index', 'columns'}

For Series input, axis to match Series index on

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

**fill\_value** : None or float value, default None

Fill existing missing (NaN) values, and any new element needed for successful DataFrame alignment, with this value before computation. If data in both corresponding DataFrame locations is missing the result will be missing

#### Returns

**result** [DataFrame]

#### See also:

[`DataFrame.rmul`](#)

## Notes

Mismatched indices will be unioned together

## Examples

None

### pandas.DataFrame.ne

`DataFrame.ne` (*other*, *axis*='columns', *level*=None)  
Wrapper for flexible comparison methods `ne`

### pandas.DataFrame.nlargest

`DataFrame.nlargest` (*n*, *columns*, *keep*='first')

Return the first *n* rows ordered by *columns* in descending order.

Return the first *n* rows with the largest values in *columns*, in descending order. The columns that are not specified are returned as well, but not used for ordering.

This method is equivalent to `df.sort_values(columns, ascending=False).head(n)`, but more performant.

**Parameters** *n* : int

Number of rows to return.

**columns** : label or list of labels

Column label(s) to order by.

**keep** : {'first', 'last'}, default 'first'

Where there are duplicate values:

- *first* : prioritize the first occurrence(s)
- *last* : prioritize the last occurrence(s)

**Returns** `DataFrame`

The first *n* rows ordered by the given columns in descending order.

**See also:**

`DataFrame.nsmallest` Return the first *n* rows ordered by *columns* in ascending order.

`DataFrame.sort_values` Sort `DataFrame` by the values

`DataFrame.head` Return the first *n* rows without re-ordering.

## Notes

This function cannot be used with all column types. For example, when specifying columns with *object* or *category* dtypes, `TypeError` is raised.

## Examples

```
>>> df = pd.DataFrame({'a': [1, 10, 8, 10, -1],
...                     'b': list('abdce'),
...                     'c': [1.0, 2.0, np.nan, 3.0, 4.0]})
>>> df
```

	a	b	c
0	1	a	1.0
1	10	b	2.0
2	8	d	NaN
3	10	c	3.0
4	-1	e	4.0

In the following example, we will use `nlargest` to select the three rows having the largest values in column “a”.

```
>>> df.nlargest(3, 'a')
```

	a	b	c
1	10	b	2.0
3	10	c	3.0
2	8	d	NaN

When using `keep='last'`, ties are resolved in reverse order:

```
>>> df.nlargest(3, 'a', keep='last')
```

	a	b	c
3	10	c	3.0
1	10	b	2.0
2	8	d	NaN

To order by the largest values in column “a” and then “c”, we can specify multiple columns like in the next example.

```
>>> df.nlargest(3, ['a', 'c'])
```

	a	b	c
3	10	c	3.0
1	10	b	2.0
2	8	d	NaN

Attempting to use `nlargest` on non-numeric dtypes will raise a `TypeError`:

```
>>> df.nlargest(3, 'b')
Traceback (most recent call last):
TypeError: Column 'b' has dtype object, cannot use method 'nlargest'
```

## pandas.DataFrame.notna

`DataFrame.notna()`

Detect existing (non-missing) values.

Return a boolean same-sized object indicating if the values are not NA. Non-missing values get mapped to `True`. Characters such as empty strings `' '` or `numpy.inf` are not considered NA values (unless you set `pandas.options.mode.use_inf_as_na = True`). NA values, such as `None` or `numpy.NaN`, get mapped to `False` values.

**Returns DataFrame**

Mask of bool values for each element in DataFrame that indicates whether an element is not an NA value.

See also:

`DataFrame.notnull` alias of `notna`

`DataFrame.isna` boolean inverse of `notna`

`DataFrame.dropna` omit axes labels with missing values

`notna` top-level `notna`

## Examples

Show which entries in a DataFrame are not NA.

```
>>> df = pd.DataFrame({'age': [5, 6, np.NaN],
...                     'born': [pd.NaT, pd.Timestamp('1939-05-27'),
...                               pd.Timestamp('1940-04-25')],
...                     'name': ['Alfred', 'Batman', ''],
...                     'toy': [None, 'Batmobile', 'Joker']})
>>> df
   age      born   name    toy
0  5.0      NaT  Alfred   None
1  6.0 1939-05-27  Batman Batmobile
2  NaN 1940-04-25      Joker
```

```
>>> df.notna()
   age  born  name  toy
0  True False  True False
1  True  True  True  True
2 False  True  True  True
```

Show which entries in a Series are not NA.

```
>>> ser = pd.Series([5, 6, np.NaN])
>>> ser
0    5.0
1    6.0
2    NaN
dtype: float64
```

```
>>> ser.notna()
0    True
1    True
2   False
dtype: bool
```

## pandas.DataFrame.notnull

`DataFrame.notnull()`

Detect existing (non-missing) values.

Return a boolean same-sized object indicating if the values are not NA. Non-missing values get mapped to True. Characters such as empty strings `' '` or `numpy.inf` are not considered NA values (unless you set

`pandas.options.mode.use_inf_as_na = True`). NA values, such as `None` or `numpy.NaN`, get mapped to `False` values.

### Returns DataFrame

Mask of bool values for each element in `DataFrame` that indicates whether an element is not an NA value.

### See also:

`DataFrame.notnull` alias of `notna`

`DataFrame.isna` boolean inverse of `notna`

`DataFrame.dropna` omit axes labels with missing values

`notna` top-level `notna`

### Examples

Show which entries in a `DataFrame` are not NA.

```
>>> df = pd.DataFrame({'age': [5, 6, np.NaN],
...                     'born': [pd.NaT, pd.Timestamp('1939-05-27'),
...                               pd.Timestamp('1940-04-25')],
...                     'name': ['Alfred', 'Batman', ''],
...                     'toy': [None, 'Batmobile', 'Joker']})
>>> df
   age      born   name    toy
0  5.0      NaT  Alfred   None
1  6.0 1939-05-27  Batman Batmobile
2  NaN 1940-04-25      Joker
```

```
>>> df.notna()
   age  born  name  toy
0  True False  True False
1  True  True  True  True
2 False  True  True  True
```

Show which entries in a `Series` are not NA.

```
>>> ser = pd.Series([5, 6, np.NaN])
>>> ser
0    5.0
1    6.0
2    NaN
dtype: float64
```

```
>>> ser.notna()
0    True
1    True
2   False
dtype: bool
```

**pandas.DataFrame.nsmallest**

`DataFrame.nsmallest` (*n*, *columns*, *keep*='first')

Get the rows of a DataFrame sorted by the *n* smallest values of *columns*.

**Parameters** *n* : int

Number of items to retrieve

**columns** : list or str

Column name or names to order by

**keep** : {'first', 'last'}, default 'first'

Where there are duplicate values: - *first* : take the first occurrence. - *last* : take the last occurrence.

**Returns**

**DataFrame**

**Examples**

```
>>> df = pd.DataFrame({'a': [1, 10, 8, 11, -1],
...                     'b': list('abdce'),
...                     'c': [1.0, 2.0, np.nan, 3.0, 4.0]})
>>> df.nsmallest(3, 'a')
   a  b  c
4 -1  e  4
0  1  a  1
2  8  d NaN
```

**pandas.DataFrame.nunique**

`DataFrame.nunique` (*axis*=0, *dropna*=True)

Return Series with number of distinct observations over requested axis.

New in version 0.20.0.

**Parameters**

**axis** [{0 or 'index', 1 or 'columns'}, default 0]

**dropna** : boolean, default True

Don't include NaN in the counts.

**Returns**

**nunique** [Series]

**Examples**

```
>>> df = pd.DataFrame({'A': [1, 2, 3], 'B': [1, 1, 1]})
>>> df.nunique()
A    3
B    1
```

```
>>> df.nunique(axis=1)
0    1
1    2
2    2
```

## pandas.DataFrame.pct\_change

`DataFrame.pct_change` (*periods=1, fill\_method='pad', limit=None, freq=None, \*\*kwargs*)

Percentage change between the current and a prior element.

Computes the percentage change from the immediately previous row by default. This is useful in comparing the percentage of change in a time series of elements.

**Parameters** *periods* : int, default 1

Periods to shift for forming percent change.

*fill\_method* : str, default 'pad'

How to handle NAs before computing percent changes.

*limit* : int, default None

The number of consecutive NAs to fill before stopping.

*freq* : DateOffset, timedelta, or offset alias string, optional

Increment to use from time series API (e.g. 'M' or BDay()).

**\*\*kwargs**

Additional keyword arguments are passed into *DataFrame.shift* or *Series.shift*.

**Returns** *chg* : Series or DataFrame

The same type as the calling object.

**See also:**

[\*Series.diff\*](#) Compute the difference of two elements in a Series.

[\*DataFrame.diff\*](#) Compute the difference of two elements in a DataFrame.

[\*Series.shift\*](#) Shift the index by some number of periods.

[\*DataFrame.shift\*](#) Shift the index by some number of periods.

## Examples

### Series

```
>>> s = pd.Series([90, 91, 85])
>>> s
0    90
1    91
2    85
dtype: int64
```

```
>>> s.pct_change()
0      NaN
1    0.011111
2   -0.065934
dtype: float64
```

```
>>> s.pct_change(periods=2)
0      NaN
1      NaN
2   -0.055556
dtype: float64
```

See the percentage change in a Series where filling NAs with last valid observation forward to next valid.

```
>>> s = pd.Series([90, 91, None, 85])
>>> s
0    90.0
1    91.0
2      NaN
3    85.0
dtype: float64
```

```
>>> s.pct_change(fill_method='ffill')
0      NaN
1    0.011111
2    0.000000
3   -0.065934
dtype: float64
```

## DataFrame

Percentage change in French franc, Deutsche Mark, and Italian lira from 1980-01-01 to 1980-03-01.

```
>>> df = pd.DataFrame({
...     'FR': [4.0405, 4.0963, 4.3149],
...     'GR': [1.7246, 1.7482, 1.8519],
...     'IT': [804.74, 810.01, 860.13]},
...     index=['1980-01-01', '1980-02-01', '1980-03-01'])
>>> df
```

	FR	GR	IT
1980-01-01	4.0405	1.7246	804.74
1980-02-01	4.0963	1.7482	810.01
1980-03-01	4.3149	1.8519	860.13

```
>>> df.pct_change()
           FR          GR          IT
1980-01-01   NaN        NaN        NaN
1980-02-01  0.013810  0.013684  0.006549
1980-03-01  0.053365  0.059318  0.061876
```

Percentage of change in GOOG and APPL stock volume. Shows computing the percentage change between columns.

```
>>> df = pd.DataFrame({
...     '2016': [1769950, 30586265],
...     '2015': [1500923, 40912316],
```

(continues on next page)

(continued from previous page)

```
...     '2014': [1371819, 41403351]},
...     index=['GOOG', 'APPL'])
>>> df
      2016      2015      2014
GOOG  1769950  1500923  1371819
APPL  30586265  40912316  41403351
```

```
>>> df.pct_change(axis='columns')
      2016      2015      2014
GOOG   NaN -0.151997 -0.086016
APPL   NaN  0.337604  0.012002
```

## pandas.DataFrame.pipe

`DataFrame.pipe(func, *args, **kwargs)`

Apply func(self, \*args, \*\*kwargs)

**Parameters** `func` : function

function to apply to the NDFrame. `args`, and `kwargs` are passed into `func`. Alternatively a (callable, `data_keyword`) tuple where `data_keyword` is a string indicating the keyword of callable that expects the NDFrame.

`args` : iterable, optional

positional arguments passed into `func`.

`kwargs` : mapping, optional

a dictionary of keyword arguments passed into `func`.

**Returns**

**object** [the return type of `func`.]

**See also:**

`pandas.DataFrame.apply`, `pandas.DataFrame.applymap`, `pandas.Series.map`

## Notes

Use `.pipe` when chaining together functions that expect Series, DataFrames or GroupBy objects. Instead of writing

```
>>> f(g(h(df), arg1=a), arg2=b, arg3=c)
```

You can write

```
>>> (df.pipe(h)
...   .pipe(g, arg1=a)
...   .pipe(f, arg2=b, arg3=c)
... )
```

If you have a function that takes the data as (say) the second argument, pass a tuple indicating which keyword expects the data. For example, suppose `f` takes its data as `arg2`:

```
>>> (df.pipe(h)
...   .pipe(g, arg1=a)
...   .pipe((f, 'arg2'), arg1=a, arg3=c)
...   )
```

## pandas.DataFrame.pivot

`DataFrame.pivot` (*index=None, columns=None, values=None*)

Return reshaped DataFrame organized by given index / column values.

Reshape data (produce a “pivot” table) based on column values. Uses unique values from specified *index* / *columns* to form axes of the resulting DataFrame. This function does not support data aggregation, multiple values will result in a MultiIndex in the columns. See the [User Guide](#) for more on reshaping.

**Parameters** *index* : string or object, optional

Column to use to make new frame’s index. If None, uses existing index.

**columns** : string or object

Column to use to make new frame’s columns.

**values** : string, object or a list of the previous, optional

Column(s) to use for populating new frame’s values. If not specified, all remaining columns will be used and the result will have hierarchically indexed columns.

Changed in version 0.23.0: Also accept list of column names.

**Returns** `DataFrame`

Returns reshaped DataFrame.

**Raises** `ValueError`:

When there are any *index*, *columns* combinations with multiple values.  
*DataFrame.pivot\_table* when you need to aggregate.

**See also:**

[`DataFrame.pivot\_table`](#) generalization of pivot that can handle duplicate values for one index/column pair.

[`DataFrame.unstack`](#) pivot based on the index values instead of a column.

## Notes

For finer-tuned control, see hierarchical indexing documentation along with the related stack/unstack methods.

## Examples

```
>>> df = pd.DataFrame({'foo': ['one', 'one', 'one', 'two', 'two',
...                             'two'],
...                    'bar': ['A', 'B', 'C', 'A', 'B', 'C'],
...                    'baz': [1, 2, 3, 4, 5, 6],
```

(continues on next page)

(continued from previous page)

```
...             'zoo': ['x', 'y', 'z', 'q', 'w', 't'])
>>> df
   foo bar baz zoo
0  one  A   1   x
1  one  B   2   y
2  one  C   3   z
3  two  A   4   q
4  two  B   5   w
5  two  C   6   t
```

```
>>> df.pivot(index='foo', columns='bar', values='baz')
bar A    B    C
foo
one 1    2    3
two 4    5    6
```

```
>>> df.pivot(index='foo', columns='bar')['baz']
bar A    B    C
foo
one 1    2    3
two 4    5    6
```

```
>>> df.pivot(index='foo', columns='bar', values=['baz', 'zoo'])
      baz      zoo
bar  A  B  C  A  B  C
foo
one   1  2  3   x  y  z
two   4  5  6   q  w  t
```

A `ValueError` is raised if there are any duplicates.

```
>>> df = pd.DataFrame({"foo": ['one', 'one', 'two', 'two'],
...                     "bar": ['A', 'A', 'B', 'C'],
...                     "baz": [1, 2, 3, 4]})
>>> df
   foo bar baz
0  one  A   1
1  one  A   2
2  two  B   3
3  two  C   4
```

Notice that the first two rows are the same for our *index* and *columns* arguments.

```
>>> df.pivot(index='foo', columns='bar', values='baz')
Traceback (most recent call last):
...
ValueError: Index contains duplicate entries, cannot reshape
```

## pandas.DataFrame.pivot\_table

`DataFrame.pivot_table(values=None, index=None, columns=None, aggfunc='mean', fill_value=None, margins=False, dropna=True, margins_name='All')`

Create a spreadsheet-style pivot table as a `DataFrame`. The levels in the pivot table will be stored in `MultiIndex` objects (hierarchical indexes) on the index and columns of the result `DataFrame`

**Parameters****values** [column to aggregate, optional]**index** : column, Grouper, array, or list of the previous

If an array is passed, it must be the same length as the data. The list can contain any of the other types (except list). Keys to group by on the pivot table index. If an array is passed, it is being used as the same manner as column values.

**columns** : column, Grouper, array, or list of the previous

If an array is passed, it must be the same length as the data. The list can contain any of the other types (except list). Keys to group by on the pivot table column. If an array is passed, it is being used as the same manner as column values.

**aggfunc** : function, list of functions, dict, default numpy.mean

If list of functions passed, the resulting pivot table will have hierarchical columns whose top level are the function names (inferred from the function objects themselves) If dict is passed, the key is column to aggregate and value is function or list of functions

**fill\_value** : scalar, default None

Value to replace missing values with

**margins** : boolean, default False

Add all row / columns (e.g. for subtotal / grand totals)

**dropna** : boolean, default True

Do not include columns whose entries are all NaN

**margins\_name** : string, default 'All'

Name of the row / column that will contain the totals when margins is True.

**Returns****table** [DataFrame]**See also:***DataFrame.pivot* pivot without aggregation that can handle non-numeric data**Examples**

```
>>> df = pd.DataFrame({"A": ["foo", "foo", "foo", "foo", "foo",
...                           "bar", "bar", "bar", "bar"],
...                    "B": ["one", "one", "one", "two", "two",
...                           "one", "one", "two", "two"],
...                    "C": ["small", "large", "large", "small",
...                           "small", "large", "small", "small",
...                           "large"],
...                    "D": [1, 2, 2, 3, 3, 4, 5, 6, 7]})
>>> df
   A  B  C  D
0  foo one small 1
1  foo one large 2
2  foo one large 2
```

(continues on next page)

(continued from previous page)

```

3  foo  two  small  3
4  foo  two  small  3
5  bar  one  large  4
6  bar  one  small  5
7  bar  two  small  6
8  bar  two  large  7

```

```

>>> table = pivot_table(df, values='D', index=['A', 'B'],
...                      columns=['C'], aggfunc=np.sum)
>>> table
C      large  small
A  B
bar one    4.0    5.0
   two    7.0    6.0
foo one    4.0    1.0
   two    NaN    6.0

```

```

>>> table = pivot_table(df, values='D', index=['A', 'B'],
...                      columns=['C'], aggfunc=np.sum)
>>> table
C      large  small
A  B
bar one    4.0    5.0
   two    7.0    6.0
foo one    4.0    1.0
   two    NaN    6.0

```

```

>>> table = pivot_table(df, values=['D', 'E'], index=['A', 'C'],
...                      aggfunc={'D': np.mean,
...                                'E': [min, max, np.mean]})
>>> table
      D      E
      mean max median min
A  C
bar large  5.500000  16   14.5  13
   small  5.500000  15   14.5  14
foo large  2.000000  10    9.5   9
   small  2.333333  12   11.0   8

```

## pandas.DataFrame.plot

`DataFrame.plot` (*x=None*, *y=None*, *kind='line'*, *ax=None*, *subplots=False*, *sharex=None*, *sharey=False*, *layout=None*, *figsize=None*, *use\_index=True*, *title=None*, *grid=None*, *legend=True*, *style=None*, *logx=False*, *logy=False*, *loglog=False*, *xticks=None*, *yticks=None*, *xlim=None*, *ylim=None*, *rot=None*, *fontsize=None*, *colormap=None*, *table=False*, *yerr=None*, *xerr=None*, *secondary\_y=False*, *sort\_columns=False*, *\*\*kwds*)

Make plots of DataFrame using matplotlib / pylab.

*New in version 0.17.0:* Each plot kind has a corresponding method on the `DataFrame.plot` accessor: `df.plot(kind='line')` is equivalent to `df.plot.line()`.

### Parameters

**data** [DataFrame]

**x** [label or position, default None]

**y** : label, position or list of label, positions, default None

Allows plotting of one column versus another

**kind** : str

- 'line' : line plot (default)
- 'bar' : vertical bar plot
- 'barh' : horizontal bar plot
- 'hist' : histogram
- 'box' : boxplot
- 'kde' : Kernel Density Estimation plot
- 'density' : same as 'kde'
- 'area' : area plot
- 'pie' : pie plot
- 'scatter' : scatter plot
- 'hexbin' : hexbin plot

**ax** [matplotlib axes object, default None]

**subplots** : boolean, default False

Make separate subplots for each column

**sharex** : boolean, default True if ax is None else False

In case subplots=True, share x axis and set some x axis labels to invisible; defaults to True if ax is None otherwise False if an ax is passed in; Be aware, that passing in both an ax and sharex=True will alter all x axis labels for all axis in a figure!

**sharey** : boolean, default False

In case subplots=True, share y axis and set some y axis labels to invisible

**layout** : tuple (optional)

(rows, columns) for the layout of subplots

**figsize** [a tuple (width, height) in inches]

**use\_index** : boolean, default True

Use index as ticks for x axis

**title** : string or list

Title to use for the plot. If a string is passed, print the string at the top of the figure. If a list is passed and *subplots* is True, print each item in the list above the corresponding subplot.

**grid** : boolean, default None (matlab style default)

Axis grid lines

**legend** : False/True/'reverse'

Place legend on axis subplots

**style** : list or dict

matplotlib line style per column

**logx** : boolean, default False

Use log scaling on x axis

**logy** : boolean, default False

Use log scaling on y axis

**loglog** : boolean, default False

Use log scaling on both x and y axes

**xticks** : sequence

Values to use for the xticks

**yticks** : sequence

Values to use for the yticks

**xlim** [2-tuple/list]

**ylim** [2-tuple/list]

**rot** : int, default None

Rotation for ticks (xticks for vertical, yticks for horizontal plots)

**fontsize** : int, default None

Font size for xticks and yticks

**colormap** : str or matplotlib colormap object, default None

Colormap to select colors from. If string, load colormap with that name from matplotlib.

**colorbar** : boolean, optional

If True, plot colorbar (only relevant for ‘scatter’ and ‘hexbin’ plots)

**position** : float

Specify relative alignments for bar plot layout. From 0 (left/bottom-end) to 1 (right/top-end). Default is 0.5 (center)

**table** : boolean, Series or DataFrame, default False

If True, draw a table using the data in the DataFrame and the data will be transposed to meet matplotlib’s default layout. If a Series or DataFrame is passed, use passed data to draw a table.

**yerr** : DataFrame, Series, array-like, dict and str

See [Plotting with Error Bars](#) for detail.

**xerr** [same types as yerr.]

**stacked** : boolean, default False in line and

bar plots, and True in area plot. If True, create stacked plot.

**sort\_columns** : boolean, default False

Sort column names to determine plot ordering

**secondary\_y** : boolean or sequence, default False

Whether to plot on the secondary y-axis If a list/tuple, which columns to plot on secondary y-axis

**mark\_right** : boolean, default True

When using a secondary\_y axis, automatically mark the column labels with “(right)” in the legend

**\*\*kwargs** : keywords

Options to pass to matplotlib plotting method

### Returns

**axes** [matplotlib.axes.Axes or numpy.ndarray of them]

### Notes

- See matplotlib documentation online for more on this subject
- If *kind* = ‘bar’ or ‘barh’, you can specify relative alignments for bar plot layout by *position* keyword. From 0 (left/bottom-end) to 1 (right/top-end). Default is 0.5 (center)
- If *kind* = ‘scatter’ and the argument *c* is the name of a dataframe column, the values of that column are used to color each point.
- If *kind* = ‘hexbin’, you can control the size of the bins with the *gridsize* argument. By default, a histogram of the counts around each (*x*, *y*) point is computed. You can specify alternative aggregations by passing values to the *C* and *reduce\_C\_function* arguments. *C* specifies the value at each (*x*, *y*) point and *reduce\_C\_function* is a function of one argument that reduces all the values in a bin to a single number (e.g. *mean*, *max*, *sum*, *std*).

## pandas.DataFrame.pop

DataFrame.**pop** (*item*)

Return item and drop from frame. Raise KeyError if not found.

**Parameters** *item* : str

Column label to be popped

### Returns

**popped** [Series]

### Examples

```
>>> df = pd.DataFrame([('falcon', 'bird', 389.0),
...                    ('parrot', 'bird', 24.0),
...                    ('lion', 'mammal', 80.5),
...                    ('monkey', 'mammal', np.nan)],
...                    columns=('name', 'class', 'max_speed'))
```

(continues on next page)

(continued from previous page)

```
>>> df
   name  class  max_speed
0  falcon   bird    389.0
1  parrot   bird     24.0
2   lion  mammal     80.5
3  monkey  mammal      NaN
```

```
>>> df.pop('class')
0    bird
1    bird
2  mammal
3  mammal
Name: class, dtype: object
```

```
>>> df
   name  max_speed
0  falcon    389.0
1  parrot    24.0
2   lion    80.5
3  monkey     NaN
```

**pandas.DataFrame.pow**

`DataFrame.pow` (*other*, *axis*='columns', *level*=None, *fill\_value*=None)

Exponential power of dataframe and other, element-wise (binary operator *pow*).

Equivalent to `dataframe ** other`, but with support to substitute a *fill\_value* for missing data in one of the inputs.

**Parameters**

**other** [Series, DataFrame, or constant]

**axis** : {0, 1, 'index', 'columns'}

For Series input, axis to match Series index on

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

**fill\_value** : None or float value, default None

Fill existing missing (NaN) values, and any new element needed for successful DataFrame alignment, with this value before computation. If data in both corresponding DataFrame locations is missing the result will be missing

**Returns**

**result** [DataFrame]

**See also:**

[`DataFrame.rpow`](#)

**Notes**

Mismatched indices will be unioned together

## Examples

None

### pandas.DataFrame.prod

`DataFrame.prod(axis=None, skipna=None, level=None, numeric_only=None, min_count=0, **kwargs)`

Return the product of the values for the requested axis

#### Parameters

**axis** [{index (0), columns (1)}]

**skipna** : boolean, default True

Exclude NA/null values when computing the result.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a Series

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

**min\_count** : int, default 0

The required number of valid values to perform the operation. If fewer than `min_count` non-NA values are present the result will be NA.

New in version 0.22.0: Added with the default being 0. This means the sum of an all-NA or empty Series is 0, and the product of an all-NA or empty Series is 1.

#### Returns

**prod** [Series or DataFrame (if level specified)]

## Examples

By default, the product of an empty or all-NA Series is 1

```
>>> pd.Series([]).prod()
1.0
```

This can be controlled with the `min_count` parameter

```
>>> pd.Series([]).prod(min_count=1)
nan
```

Thanks to the `skipna` parameter, `min_count` handles all-NA and empty series identically.

```
>>> pd.Series([np.nan]).prod()
1.0
```

```
>>> pd.Series([np.nan]).prod(min_count=1)
nan
```

## pandas.DataFrame.product

`DataFrame.product` (*axis=None, skipna=None, level=None, numeric\_only=None, min\_count=0, \*\*kwargs*)

Return the product of the values for the requested axis

### Parameters

**axis** [{index (0), columns (1)}]

**skipna** : boolean, default True

Exclude NA/null values when computing the result.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a Series

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

**min\_count** : int, default 0

The required number of valid values to perform the operation. If fewer than `min_count` non-NA values are present the result will be NA.

New in version 0.22.0: Added with the default being 0. This means the sum of an all-NA or empty Series is 0, and the product of an all-NA or empty Series is 1.

### Returns

**prod** [Series or DataFrame (if level specified)]

## Examples

By default, the product of an empty or all-NA Series is 1

```
>>> pd.Series([]).prod()
1.0
```

This can be controlled with the `min_count` parameter

```
>>> pd.Series([]).prod(min_count=1)
nan
```

Thanks to the `skipna` parameter, `min_count` handles all-NA and empty series identically.

```
>>> pd.Series([np.nan]).prod()
1.0
```

```
>>> pd.Series([np.nan]).prod(min_count=1)
nan
```

**pandas.DataFrame.quantile**

`DataFrame.quantile` (*q=0.5, axis=0, numeric\_only=True, interpolation='linear'*)

Return values at the given quantile over requested axis, a la `numpy.percentile`.

**Parameters** *q* : float or array-like, default 0.5 (50% quantile)

0 <= *q* <= 1, the quantile(s) to compute

**axis** : {0, 1, 'index', 'columns'} (default 0)

0 or 'index' for row-wise, 1 or 'columns' for column-wise

**numeric\_only** : boolean, default True

If False, the quantile of datetime and timedelta data will be computed as well

**interpolation** : {'linear', 'lower', 'higher', 'midpoint', 'nearest'}

New in version 0.18.0.

This optional parameter specifies the interpolation method to use, when the desired quantile lies between two data points *i* and *j*:

- linear:  $i + (j - i) * \text{fraction}$ , where *fraction* is the fractional part of the index surrounded by *i* and *j*.
- lower: *i*.
- higher: *j*.
- nearest: *i* or *j* whichever is nearest.
- midpoint:  $(i + j) / 2$ .

**Returns** **quantiles** : Series or DataFrame

- If *q* is an array, a DataFrame will be returned where the index is *q*, the columns are the columns of self, and the values are the quantiles.
- If *q* is a float, a Series will be returned where the index is the columns of self and the values are the quantiles.

**See also:**

`pandas.core.window.Rolling.quantile`

**Examples**

```
>>> df = pd.DataFrame(np.array([[1, 1], [2, 10], [3, 100], [4, 100]]),
                        columns=['a', 'b'])
>>> df.quantile(.1)
a    1.3
b    3.7
dtype: float64
>>> df.quantile([.1, .5])
      a    b
0.1  1.3  3.7
0.5  2.5 55.0
```

Specifying *numeric\_only=False* will also compute the quantile of datetime and timedelta data.

```
>>> df = pd.DataFrame({'A': [1, 2],
                        'B': [pd.Timestamp('2010'),
                              pd.Timestamp('2011')],
                        'C': [pd.Timedelta('1 days'),
                              pd.Timedelta('2 days')]])
>>> df.quantile(0.5, numeric_only=False)
A          1.5
B    2010-07-02 12:00:00
C          1 days 12:00:00
Name: 0.5, dtype: object
```

## pandas.DataFrame.query

`DataFrame.query` (*expr*, *inplace=False*, *\*\*kwargs*)

Query the columns of a frame with a boolean expression.

**Parameters** *expr* : string

The query string to evaluate. You can refer to variables in the environment by prefixing them with an '@' character like @a + b.

**inplace** : bool

Whether the query should modify the data in place or return a modified copy

New in version 0.18.0.

**kwargs** : dict

See the documentation for `pandas.eval()` for complete details on the keyword arguments accepted by `DataFrame.query()`.

**Returns**

**q** [DataFrame]

**See also:**

`pandas.eval`, `DataFrame.eval`

## Notes

The result of the evaluation of this expression is first passed to `DataFrame.loc` and if that fails because of a multidimensional key (e.g., a DataFrame) then the result will be passed to `DataFrame.__getitem__()`.

This method uses the top-level `pandas.eval()` function to evaluate the passed query.

The `query()` method uses a slightly modified Python syntax by default. For example, the & and | (bitwise) operators have the precedence of their boolean cousins, `and` and `or`. This *is* syntactically valid Python, however the semantics are different.

You can change the semantics of the expression by passing the keyword argument `parser='python'`. This enforces the same semantics as evaluation in Python space. Likewise, you can pass `engine='python'` to evaluate an expression using Python itself as a backend. This is not recommended as it is inefficient compared to using `numexpr` as the engine.

The `DataFrame.index` and `DataFrame.columns` attributes of the `DataFrame` instance are placed in the query namespace by default, which allows you to treat both the index and columns of

the frame as a column in the frame. The identifier `index` is used for the frame index; you can also use the name of the index to identify it in a query. Please note that Python keywords may not be used as identifiers.

For further details and examples see the [query](#) documentation in *indexing*.

## Examples

```
>>> from numpy.random import randn
>>> from pandas import DataFrame
>>> df = pd.DataFrame(randn(10, 2), columns=list('ab'))
>>> df.query('a > b')
>>> df[df.a > df.b]  # same result as the previous expression
```

## pandas.DataFrame.radd

`DataFrame.radd(other, axis='columns', level=None, fill_value=None)`

Addition of dataframe and other, element-wise (binary operator *radd*).

Equivalent to `other + dataframe`, but with support to substitute a `fill_value` for missing data in one of the inputs.

### Parameters

**other** [Series, DataFrame, or constant]

**axis** : {0, 1, 'index', 'columns'}

For Series input, axis to match Series index on

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

**fill\_value** : None or float value, default None

Fill existing missing (NaN) values, and any new element needed for successful DataFrame alignment, with this value before computation. If data in both corresponding DataFrame locations is missing the result will be missing

### Returns

**result** [DataFrame]

**See also:**

[\*DataFrame.add\*](#)

## Notes

Mismatched indices will be unioned together

## Examples

```

>>> a = pd.DataFrame([1, 1, 1, np.nan], index=['a', 'b', 'c', 'd'],
...                   columns=['one'])
>>> a
   one
a  1.0
b  1.0
c  1.0
d  NaN
>>> b = pd.DataFrame(dict(one=[1, np.nan, 1, np.nan],
...                       two=[np.nan, 2, np.nan, 2]),
...                   index=['a', 'b', 'd', 'e'])
>>> b
   one  two
a  1.0  NaN
b  NaN  2.0
d  1.0  NaN
e  NaN  2.0
>>> a.add(b, fill_value=0)
   one  two
a  2.0  NaN
b  1.0  2.0
c  1.0  NaN
d  1.0  NaN
e  NaN  2.0

```

## pandas.DataFrame.rank

`DataFrame.rank` (*axis=0*, *method='average'*, *numeric\_only=None*, *na\_option='keep'*, *ascending=True*, *pct=False*)

Compute numerical data ranks (1 through n) along axis. Equal values are assigned a rank that is the average of the ranks of those values

**Parameters** *axis*: {0 or 'index', 1 or 'columns'}, default 0

index to direct ranking

**method**: {'average', 'min', 'max', 'first', 'dense'}

- average: average rank of group
- min: lowest rank in group
- max: highest rank in group
- first: ranks assigned in order they appear in the array
- dense: like 'min', but rank always increases by 1 between groups

**numeric\_only**: boolean, default None

Include only float, int, boolean data. Valid only for DataFrame or Panel objects

**na\_option**: {'keep', 'top', 'bottom'}

- keep: leave NA values where they are
- top: smallest rank if ascending
- bottom: smallest rank if descending

**ascending**: boolean, default True

False for ranks by high (1) to low (N)

**pct** : boolean, default False

Computes percentage rank of data

### Returns

**ranks** [same type as caller]

## pandas.DataFrame.rdiv

`DataFrame.rdiv(other, axis='columns', level=None, fill_value=None)`

Floating division of dataframe and other, element-wise (binary operator *rtruediv*).

Equivalent to `other / dataframe`, but with support to substitute a `fill_value` for missing data in one of the inputs.

### Parameters

**other** [Series, DataFrame, or constant]

**axis** : {0, 1, 'index', 'columns'}

For Series input, axis to match Series index on

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

**fill\_value** : None or float value, default None

Fill existing missing (NaN) values, and any new element needed for successful DataFrame alignment, with this value before computation. If data in both corresponding DataFrame locations is missing the result will be missing

### Returns

**result** [DataFrame]

### See also:

`DataFrame.truediv`

### Notes

Mismatched indices will be unioned together

### Examples

None

## pandas.DataFrame.reindex

`DataFrame.reindex(labels=None, index=None, columns=None, axis=None, method=None, copy=True, level=None, fill_value=nan, limit=None, tolerance=None)`

Conform DataFrame to new index with optional filling logic, placing NA/NaN in locations having no value in the previous index. A new object is produced unless the new index is equivalent to the current one and `copy=False`

**Parameters** **labels** : array-like, optional

New labels / index to conform the axis specified by 'axis' to.

**index, columns** : array-like, optional (should be specified using keywords)

New labels / index to conform to. Preferably an Index object to avoid duplicating data

**axis** : int or str, optional

Axis to target. Can be either the axis name ('index', 'columns') or number (0, 1).

**method** : {None, 'backfill'/'bfill', 'pad'/'ffill', 'nearest'}, optional

method to use for filling holes in reindexed DataFrame. Please note: this is only applicable to DataFrames/Series with a monotonically increasing/decreasing index.

- default: don't fill gaps
- pad / ffill: propagate last valid observation forward to next valid
- backfill / bfill: use next valid observation to fill gap
- nearest: use nearest valid observations to fill gap

**copy** : boolean, default True

Return a new object, even if the passed indexes are the same

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

**fill\_value** : scalar, default np.NaN

Value to use for missing values. Defaults to NaN, but can be any "compatible" value

**limit** : int, default None

Maximum number of consecutive elements to forward or backward fill

**tolerance** : optional

Maximum distance between original and new labels for inexact matches. The values of the index at the matching locations must satisfy the equation  $\text{abs}(\text{index}[\text{indexer}] - \text{target}) \leq \text{tolerance}$ .

Tolerance may be a scalar value, which applies the same tolerance to all values, or list-like, which applies variable tolerance per element. List-like includes list, tuple, array, Series, and must be the same size as the index and its dtype must exactly match the index's type.

New in version 0.21.0: (list-like tolerance)

**Returns**

**reindexed** [DataFrame]

## Examples

DataFrame.reindex supports two calling conventions

- (index=index\_labels, columns=column\_labels, ...)

- (labels, axis={'index', 'columns'}, ...)

We *highly* recommend using keyword arguments to clarify your intent.

Create a dataframe with some fictional data.

```
>>> index = ['Firefox', 'Chrome', 'Safari', 'IE10', 'Konqueror']
>>> df = pd.DataFrame({
...     'http_status': [200, 200, 404, 404, 301],
...     'response_time': [0.04, 0.02, 0.07, 0.08, 1.0]},
...     index=index)
>>> df
```

	http_status	response_time
Firefox	200	0.04
Chrome	200	0.02
Safari	404	0.07
IE10	404	0.08
Konqueror	301	1.00

Create a new index and reindex the dataframe. By default values in the new index that do not have corresponding records in the dataframe are assigned NaN.

```
>>> new_index= ['Safari', 'Iceweasel', 'Comodo Dragon', 'IE10',
...             'Chrome']
>>> df.reindex(new_index)
```

	http_status	response_time
Safari	404.0	0.07
Iceweasel	NaN	NaN
Comodo Dragon	NaN	NaN
IE10	404.0	0.08
Chrome	200.0	0.02

We can fill in the missing values by passing a value to the keyword `fill_value`. Because the index is not monotonically increasing or decreasing, we cannot use arguments to the keyword method to fill the NaN values.

```
>>> df.reindex(new_index, fill_value=0)
```

	http_status	response_time
Safari	404	0.07
Iceweasel	0	0.00
Comodo Dragon	0	0.00
IE10	404	0.08
Chrome	200	0.02

```
>>> df.reindex(new_index, fill_value='missing')
```

	http_status	response_time
Safari	404	0.07
Iceweasel	missing	missing
Comodo Dragon	missing	missing
IE10	404	0.08
Chrome	200	0.02

We can also reindex the columns.

```
>>> df.reindex(columns=['http_status', 'user_agent'])
```

	http_status	user_agent
Firefox	200	NaN
Chrome	200	NaN

(continues on next page)

(continued from previous page)

Safari	404	NaN
IE10	404	NaN
Konqueror	301	NaN

Or we can use “axis-style” keyword arguments

```
>>> df.reindex(['http_status', 'user_agent'], axis="columns")
      http_status  user_agent
Firefox         200        NaN
Chrome          200        NaN
Safari          404        NaN
IE10            404        NaN
Konqueror       301        NaN
```

To further illustrate the filling functionality in `reindex`, we will create a dataframe with a monotonically increasing index (for example, a sequence of dates).

```
>>> date_index = pd.date_range('1/1/2010', periods=6, freq='D')
>>> df2 = pd.DataFrame({"prices": [100, 101, np.nan, 100, 89, 88]},
...                     index=date_index)
>>> df2
      prices
2010-01-01    100
2010-01-02    101
2010-01-03     NaN
2010-01-04    100
2010-01-05     89
2010-01-06     88
```

Suppose we decide to expand the dataframe to cover a wider date range.

```
>>> date_index2 = pd.date_range('12/29/2009', periods=10, freq='D')
>>> df2.reindex(date_index2)
      prices
2009-12-29     NaN
2009-12-30     NaN
2009-12-31     NaN
2010-01-01    100
2010-01-02    101
2010-01-03     NaN
2010-01-04    100
2010-01-05     89
2010-01-06     88
2010-01-07     NaN
```

The index entries that did not have a value in the original data frame (for example, ‘2009-12-29’) are by default filled with `NaN`. If desired, we can fill in the missing values using one of several options.

For example, to backpropagate the last valid value to fill the `NaN` values, pass `bfill` as an argument to the method keyword.

```
>>> df2.reindex(date_index2, method='bfill')
      prices
2009-12-29    100
2009-12-30    100
2009-12-31    100
2010-01-01    100
```

(continues on next page)

(continued from previous page)

2010-01-02	101
2010-01-03	NaN
2010-01-04	100
2010-01-05	89
2010-01-06	88
2010-01-07	NaN

Please note that the NaN value present in the original dataframe (at index value 2010-01-03) will not be filled by any of the value propagation schemes. This is because filling while reindexing does not look at dataframe values, but only compares the original and desired indexes. If you do want to fill in the NaN values present in the original dataframe, use the `fillna()` method.

See the [user guide](#) for more.

### pandas.DataFrame.reindex\_axis

`DataFrame.reindex_axis(labels, axis=0, method=None, level=None, copy=True, limit=None, fill_value=nan)`

Conform input object to new index with optional filling logic, placing NA/NaN in locations having no value in the previous index. A new object is produced unless the new index is equivalent to the current one and `copy=False`

**Parameters** `labels` : array-like

New labels / index to conform to. Preferably an Index object to avoid duplicating data

**axis** : [{0 or 'index', 1 or 'columns'}]

**method** : {None, 'backfill'/'bfill', 'pad'/'ffill', 'nearest'}, optional

Method to use for filling holes in reindexed DataFrame:

- default: don't fill gaps
- pad / ffill: propagate last valid observation forward to next valid
- backfill / bfill: use next valid observation to fill gap
- nearest: use nearest valid observations to fill gap

**copy** : boolean, default True

Return a new object, even if the passed indexes are the same

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

**limit** : int, default None

Maximum number of consecutive elements to forward or backward fill

**tolerance** : optional

Maximum distance between original and new labels for inexact matches. The values of the index at the matching locations must satisfy the equation `abs(index[indexer] - target) <= tolerance`.

Tolerance may be a scalar value, which applies the same tolerance to all values, or list-like, which applies variable tolerance per element. List-like includes list,

tuple, array, Series, and must be the same size as the index and its dtype must exactly match the index's type.

New in version 0.21.0: (list-like tolerance)

#### Returns

**reindexed** [DataFrame]

#### See also:

[\*reindex\*](#), [\*reindex\\_like\*](#)

#### Examples

```
>>> df.reindex_axis(['A', 'B', 'C'], axis=1)
```

### pandas.DataFrame.reindex\_like

DataFrame.**reindex\_like** (*other*, *method=None*, *copy=True*, *limit=None*, *tolerance=None*)

Return an object with matching indices to myself.

#### Parameters

**other** [Object]

**method** [string or None]

**copy** [boolean, default True]

**limit** : int, default None

Maximum number of consecutive labels to fill for inexact matches.

**tolerance** : optional

Maximum distance between labels of the other object and this object for inexact matches. Can be list-like.

New in version 0.21.0: (list-like tolerance)

#### Returns

**reindexed** [same as input]

#### Notes

Like calling `s.reindex(index=other.index, columns=other.columns, method=...)`

### pandas.DataFrame.rename

DataFrame.**rename** (*mapper=None*, *index=None*, *columns=None*, *axis=None*, *copy=True*, *inplace=False*, *level=None*)

Alter axes labels.

Function / dict values must be unique (1-to-1). Labels not contained in a dict / Series will be left as-is. Extra labels listed don't throw an error.

See the [\*user guide\*](#) for more.

**Parameters** `mapper`, `index`, `columns` : dict-like or function, optional

dict-like or functions transformations to apply to that axis' values. Use either `mapper` and `axis` to specify the axis to target with `mapper`, or `index` and `columns`.

**axis** : int or str, optional

Axis to target with `mapper`. Can be either the axis name ('index', 'columns') or number (0, 1). The default is 'index'.

**copy** : boolean, default True

Also copy underlying data

**inplace** : boolean, default False

Whether to return a new DataFrame. If True then value of `copy` is ignored.

**level** : int or level name, default None

In case of a MultiIndex, only rename labels in the specified level.

**Returns**

**renamed** [DataFrame]

**See also:**

`pandas.DataFrame.rename_axis`

## Examples

`DataFrame.rename` supports two calling conventions

- `(index=index_mapper, columns=columns_mapper, ...)`
- `(mapper, axis={'index', 'columns'}, ...)`

We *highly* recommend using keyword arguments to clarify your intent.

```
>>> df = pd.DataFrame({"A": [1, 2, 3], "B": [4, 5, 6]})
>>> df.rename(index=str, columns={"A": "a", "B": "c"})
   a  c
0  1  4
1  2  5
2  3  6
```

```
>>> df.rename(index=str, columns={"A": "a", "C": "c"})
   a  B
0  1  4
1  2  5
2  3  6
```

Using axis-style parameters

```
>>> df.rename(str.lower, axis='columns')
   a  b
0  1  4
1  2  5
2  3  6
```

```
>>> df.rename({1: 2, 2: 4}, axis='index')
   A  B
0  1  4
2  2  5
4  3  6
```

## **pandas.DataFrame.rename\_axis**

`DataFrame.rename_axis` (*mapper*, *axis=0*, *copy=True*, *inplace=False*)

Alter the name of the index or columns.

**Parameters** **mapper** : scalar, list-like, optional

Value to set as the axis name attribute.

**axis** : {0 or 'index', 1 or 'columns'}, default 0

The index or the name of the axis.

**copy** : boolean, default True

Also copy underlying data.

**inplace** : boolean, default False

Modifies the object directly, instead of creating a new Series or DataFrame.

**Returns** **renamed** : Series, DataFrame, or None

The same type as the caller or None if *inplace* is True.

**See also:**

[`pandas.Series.rename`](#) Alter Series index labels or name

[`pandas.DataFrame.rename`](#) Alter DataFrame index labels or name

[`pandas.Index.rename`](#) Set new names on index

## **Notes**

Prior to version 0.21.0, `rename_axis` could also be used to change the axis *labels* by passing a mapping or scalar. This behavior is deprecated and will be removed in a future version. Use `rename` instead.

## **Examples**

### **Series**

```
>>> s = pd.Series([1, 2, 3])
>>> s.rename_axis("foo")
foo
0    1
1    2
2    3
dtype: int64
```

### **DataFrame**

```
>>> df = pd.DataFrame({"A": [1, 2, 3], "B": [4, 5, 6]})
>>> df.rename_axis("foo")
```

	A	B
foo		
0	1	4
1	2	5
2	3	6

```
>>> df.rename_axis("bar", axis="columns")
```

	A	B
bar		
0	1	4
1	2	5
2	3	6

### pandas.DataFrame.reorder\_levels

`DataFrame.reorder_levels` (*order*, *axis=0*)

Rearrange index levels using input order. May not drop or duplicate levels

**Parameters** *order* : list of int or list of str

List representing new level order. Reference level by number (position) or by key (label).

**axis** : int

Where to reorder levels.

**Returns**

type of caller (new object)

### pandas.DataFrame.replace

`DataFrame.replace` (*to\_replace=None*, *value=None*, *inplace=False*, *limit=None*, *regex=False*, *method='pad'*)

Replace values given in *to\_replace* with *value*.

Values of the DataFrame are replaced with other values dynamically. This differs from updating with `.loc` or `.iloc`, which require you to specify a location to update with some value.

**Parameters** *to\_replace* : str, regex, list, dict, Series, int, float, or None

How to find the values that will be replaced.

- numeric, str or regex:
  - numeric: numeric values equal to *to\_replace* will be replaced with *value*
  - str: string exactly matching *to\_replace* will be replaced with *value*
  - regex: regexs matching *to\_replace* will be replaced with *value*
- list of str, regex, or numeric:
  - First, if *to\_replace* and *value* are both lists, they **must** be the same length.
  - Second, if *regex=True* then all of the strings in **both** lists will be interpreted as regexs otherwise they will match directly. This doesn't matter

much for *value* since there are only a few possible substitution regexes you can use.

- str, regex and numeric rules apply as above.
- dict:
  - Dicts can be used to specify different replacement values for different existing values. For example, `{ 'a': 'b', 'y': 'z' }` replaces the value 'a' with 'b' and 'y' with 'z'. To use a dict in this way the *value* parameter should be *None*.
  - For a DataFrame a dict can specify that different values should be replaced in different columns. For example, `{ 'a': 1, 'b': 'z' }` looks for the value 1 in column 'a' and the value 'z' in column 'b' and replaces these values with whatever is specified in *value*. The *value* parameter should not be *None* in this case. You can treat this as a special case of passing two lists except that you are specifying the column to search in.
  - For a DataFrame nested dictionaries, e.g., `{ 'a': { 'b': np.nan} }`, are read as follows: look in column 'a' for the value 'b' and replace it with NaN. The *value* parameter should be *None* to use a nested dict in this way. You can nest regular expressions as well. Note that column names (the top-level dictionary keys in a nested dictionary) **cannot** be regular expressions.
- None:
  - This means that the *regex* argument must be a string, compiled regular expression, or list, dict, ndarray or Series of such elements. If *value* is also *None* then this **must** be a nested dictionary or Series.

See the examples section for examples of each of these.

**value** : scalar, dict, list, str, regex, default None

Value to replace any values matching *to\_replace* with. For a DataFrame a dict of values can be used to specify which value to use for each column (columns not in the dict will not be filled). Regular expressions, strings and lists or dicts of such objects are also allowed.

**inplace** : boolean, default False

If True, in place. Note: this will modify any other views on this object (e.g. a column from a DataFrame). Returns the caller if this is True.

**limit** : int, default None

Maximum size gap to forward or backward fill.

**regex** : bool or same types as *to\_replace*, default False

Whether to interpret *to\_replace* and/or *value* as regular expressions. If this is True then *to\_replace* must be a string. Alternatively, this could be a regular expression or a list, dict, or array of regular expressions in which case *to\_replace* must be *None*.

**method** : { 'pad', 'ffill', 'bfill', *None* }

The method to use when for replacement, when *to\_replace* is a scalar, list or tuple and *value* is *None*.

Changed in version 0.23.0: Added to DataFrame.

**Returns DataFrame**

Object after replacement.

#### Raises `AssertionError`

- If *regex* is not a `bool` and *to\_replace* is not `None`.

#### `TypeError`

- If *to\_replace* is a `dict` and *value* is not a `list`, `dict`, `ndarray`, or `Series`
- If *to\_replace* is `None` and *regex* is not compilable into a regular expression or is a `list`, `dict`, `ndarray`, or `Series`.
- When replacing multiple `bool` or `datetime64` objects and the arguments to *to\_replace* does not match the type of the value being replaced

#### `ValueError`

- If a `list` or an `ndarray` is passed to *to\_replace* and *value* but they are not the same length.

#### See also:

[`DataFrame.fillna`](#) Fill NA values

[`DataFrame.where`](#) Replace values based on boolean condition

[`Series.str.replace`](#) Simple string replacement.

#### Notes

- Regex substitution is performed under the hood with `re.sub`. The rules for substitution for `re.sub` are the same.
- Regular expressions will only substitute on strings, meaning you cannot provide, for example, a regular expression matching floating point numbers and expect the columns in your frame that have a numeric dtype to be matched. However, if those floating point numbers *are* strings, then you can do this.
- This method has *a lot* of options. You are encouraged to experiment and play with this method to gain intuition about how it works.
- When `dict` is used as the *to\_replace* value, it is like `key(s)` in the `dict` are the *to\_replace* part and `value(s)` in the `dict` are the *value* parameter.

#### Examples

##### Scalar ‘to\_replace’ and ‘value’

```
>>> s = pd.Series([0, 1, 2, 3, 4])
>>> s.replace(0, 5)
0    5
1    1
2    2
3    3
4    4
dtype: int64
```

```
>>> df = pd.DataFrame({'A': [0, 1, 2, 3, 4],
...                     'B': [5, 6, 7, 8, 9],
...                     'C': ['a', 'b', 'c', 'd', 'e']})
>>> df.replace(0, 5)
```

	A	B	C
0	5	5	a
1	1	6	b
2	2	7	c
3	3	8	d
4	4	9	e

**List-like ‘to\_replace’**

```
>>> df.replace([0, 1, 2, 3], 4)
```

	A	B	C
0	4	5	a
1	4	6	b
2	4	7	c
3	4	8	d
4	4	9	e

```
>>> df.replace([0, 1, 2, 3], [4, 3, 2, 1])
```

	A	B	C
0	4	5	a
1	3	6	b
2	2	7	c
3	1	8	d
4	4	9	e

```
>>> s.replace([1, 2], method='bfill')
```

0	0
1	3
2	3
3	3
4	4

dtype: int64

**dict-like ‘to\_replace’**

```
>>> df.replace({0: 10, 1: 100})
```

	A	B	C
0	10	5	a
1	100	6	b
2	2	7	c
3	3	8	d
4	4	9	e

```
>>> df.replace({'A': 0, 'B': 5}, 100)
```

	A	B	C
0	100	100	a
1	1	6	b
2	2	7	c
3	3	8	d
4	4	9	e

```
>>> df.replace({'A': {0: 100, 4: 400}})
   A  B  C
0 100  5  a
1   1  6  b
2   2  7  c
3   3  8  d
4 400  9  e
```

**Regular expression ‘to\_replace’**

```
>>> df = pd.DataFrame({'A': ['bat', 'foo', 'bait'],
...                     'B': ['abc', 'bar', 'xyz']})
>>> df.replace(to_replace=r'^ba.$', value='new', regex=True)
   A  B
0  new abc
1  foo new
2  bait xyz
```

```
>>> df.replace({'A': r'^ba.$'}, {'A': 'new'}, regex=True)
   A  B
0  new abc
1  foo bar
2  bait xyz
```

```
>>> df.replace(regex=r'^ba.$', value='new')
   A  B
0  new abc
1  foo new
2  bait xyz
```

```
>>> df.replace(regex={'r'^ba.$': 'new', 'foo': 'xyz'})
   A  B
0  new abc
1  xyz new
2  bait xyz
```

```
>>> df.replace(regex=[r'^ba.$', 'foo'], value='new')
   A  B
0  new abc
1  new new
2  bait xyz
```

Note that when replacing multiple bool or datetime64 objects, the data types in the *to\_replace* parameter must match the data type of the value being replaced:

```
>>> df = pd.DataFrame({'A': [True, False, True],
...                     'B': [False, True, False]})
>>> df.replace({'a string': 'new value', True: False}) # raises
Traceback (most recent call last):
...
TypeError: Cannot compare types 'ndarray(dtype=bool)' and 'str'
```

This raises a `TypeError` because one of the dict keys is not of the correct type for replacement.

Compare the behavior of `s.replace({'a': None})` and `s.replace('a', None)` to understand the peculiarities of the *to\_replace* parameter:

```
>>> s = pd.Series([10, 'a', 'a', 'b', 'a'])
```

When one uses a dict as the *to\_replace* value, it is like the value(s) in the dict are equal to the *value* parameter. `s.replace({'a': None})` is equivalent to `s.replace(to_replace={'a': None}, value=None, method=None)`:

```
>>> s.replace({'a': None})
0      10
1     None
2     None
3        b
4     None
dtype: object
```

When *value=None* and *to\_replace* is a scalar, list or tuple, *replace* uses the *method* parameter (default 'pad') to do the replacement. So this is why the 'a' values are being replaced by 10 in rows 1 and 2 and 'b' in row 4 in this case. The command `s.replace('a', None)` is actually equivalent to `s.replace(to_replace='a', value=None, method='pad')`:

```
>>> s.replace('a', None)
0      10
1      10
2      10
3        b
4        b
dtype: object
```

## pandas.DataFrame.resample

`DataFrame.resample` (*rule*, *how=None*, *axis=0*, *fill\_method=None*, *closed=None*, *label=None*, *convention='start'*, *kind=None*, *loffset=None*, *limit=None*, *base=0*, *on=None*, *level=None*)

Convenience method for frequency conversion and resampling of time series. Object must have a datetime-like index (DatetimeIndex, PeriodIndex, or TimedeltaIndex), or pass datetime-like values to the *on* or *level* keyword.

**Parameters** *rule* : string

the offset string or object representing target conversion

**axis** [int, optional, default 0]

**closed** : {'right', 'left'}

Which side of bin interval is closed. The default is 'left' for all frequency offsets except for 'M', 'A', 'Q', 'BM', 'BA', 'BQ', and 'W' which all have a default of 'right'.

**label** : {'right', 'left'}

Which bin edge label to label bucket with. The default is 'left' for all frequency offsets except for 'M', 'A', 'Q', 'BM', 'BA', 'BQ', and 'W' which all have a default of 'right'.

**convention** : {'start', 'end', 's', 'e'}

For PeriodIndex only, controls whether to use the start or end of *rule*

**kind: {'timestamp', 'period'}, optional**

Pass 'timestamp' to convert the resulting index to a `DateTimeIndex` or 'period' to convert it to a `PeriodIndex`. By default the input representation is retained.

**loffset : timedelta**

Adjust the resampled time labels

**base : int, default 0**

For frequencies that evenly subdivide 1 day, the “origin” of the aggregated intervals. For example, for '5min' frequency, base could range from 0 through 4. Defaults to 0

**on : string, optional**

For a `DataFrame`, column to use instead of index for resampling. Column must be datetime-like.

New in version 0.19.0.

**level : string or int, optional**

For a `MultiIndex`, level (name or number) to use for resampling. Level must be datetime-like.

New in version 0.19.0.

**Returns****Resampler object****See also:**

[`groupby`](#) Group by mapping, function, label, or list of labels.

**Notes**

See the [user guide](#) for more.

To learn more about the offset strings, please see [this link](#).

**Examples**

Start by creating a series with 9 one minute timestamps.

```
>>> index = pd.date_range('1/1/2000', periods=9, freq='T')
>>> series = pd.Series(range(9), index=index)
>>> series
2000-01-01 00:00:00    0
2000-01-01 00:01:00    1
2000-01-01 00:02:00    2
2000-01-01 00:03:00    3
2000-01-01 00:04:00    4
2000-01-01 00:05:00    5
2000-01-01 00:06:00    6
2000-01-01 00:07:00    7
```

(continues on next page)

(continued from previous page)

```
2000-01-01 00:08:00    8
Freq: T, dtype: int64
```

Downsample the series into 3 minute bins and sum the values of the timestamps falling into a bin.

```
>>> series.resample('3T').sum()
2000-01-01 00:00:00    3
2000-01-01 00:03:00   12
2000-01-01 00:06:00   21
Freq: 3T, dtype: int64
```

Downsample the series into 3 minute bins as above, but label each bin using the right edge instead of the left. Please note that the value in the bucket used as the label is not included in the bucket, which it labels. For example, in the original series the bucket 2000-01-01 00:03:00 contains the value 3, but the summed value in the resampled bucket with the label 2000-01-01 00:03:00 does not include 3 (if it did, the summed value would be 6, not 3). To include this value close the right side of the bin interval as illustrated in the example below this one.

```
>>> series.resample('3T', label='right').sum()
2000-01-01 00:03:00    3
2000-01-01 00:06:00   12
2000-01-01 00:09:00   21
Freq: 3T, dtype: int64
```

Downsample the series into 3 minute bins as above, but close the right side of the bin interval.

```
>>> series.resample('3T', label='right', closed='right').sum()
2000-01-01 00:00:00    0
2000-01-01 00:03:00    6
2000-01-01 00:06:00   15
2000-01-01 00:09:00   15
Freq: 3T, dtype: int64
```

Upsample the series into 30 second bins.

```
>>> series.resample('30S').asfreq()[0:5] #select first 5 rows
2000-01-01 00:00:00    0.0
2000-01-01 00:00:30   NaN
2000-01-01 00:01:00    1.0
2000-01-01 00:01:30   NaN
2000-01-01 00:02:00    2.0
Freq: 30S, dtype: float64
```

Upsample the series into 30 second bins and fill the NaN values using the pad method.

```
>>> series.resample('30S').pad()[0:5]
2000-01-01 00:00:00    0
2000-01-01 00:00:30    0
2000-01-01 00:01:00    1
2000-01-01 00:01:30    1
2000-01-01 00:02:00    2
Freq: 30S, dtype: int64
```

Upsample the series into 30 second bins and fill the NaN values using the bfill method.

```
>>> series.resample('30S').bfill()[0:5]
2000-01-01 00:00:00    0
2000-01-01 00:00:30    1
2000-01-01 00:01:00    1
2000-01-01 00:01:30    2
2000-01-01 00:02:00    2
Freq: 30S, dtype: int64
```

Pass a custom function via `apply`

```
>>> def custom_resampler(array_like):
...     return np.sum(array_like)+5
```

```
>>> series.resample('3T').apply(custom_resampler)
2000-01-01 00:00:00     8
2000-01-01 00:03:00    17
2000-01-01 00:06:00    26
Freq: 3T, dtype: int64
```

For a Series with a PeriodIndex, the keyword *convention* can be used to control whether to use the start or end of *rule*.

```
>>> s = pd.Series([1, 2], index=pd.period_range('2012-01-01',
                                                freq='A',
                                                periods=2))

>>> s
2012    1
2013    2
Freq: A-DEC, dtype: int64
```

Resample by month using ‘start’ *convention*. Values are assigned to the first month of the period.

```
>>> s.resample('M', convention='start').asfreq().head()
2012-01    1.0
2012-02    NaN
2012-03    NaN
2012-04    NaN
2012-05    NaN
Freq: M, dtype: float64
```

Resample by month using ‘end’ *convention*. Values are assigned to the last month of the period.

```
>>> s.resample('M', convention='end').asfreq()
2012-12    1.0
2013-01    NaN
2013-02    NaN
2013-03    NaN
2013-04    NaN
2013-05    NaN
2013-06    NaN
2013-07    NaN
2013-08    NaN
2013-09    NaN
2013-10    NaN
2013-11    NaN
2013-12    2.0
Freq: M, dtype: float64
```

For DataFrame objects, the keyword `on` can be used to specify the column instead of the index for resampling.

```
>>> df = pd.DataFrame(data=9*[range(4)], columns=['a', 'b', 'c', 'd'])
>>> df['time'] = pd.date_range('1/1/2000', periods=9, freq='T')
>>> df.resample('3T', on='time').sum()
      a  b  c  d
time
2000-01-01 00:00:00  0  3  6  9
2000-01-01 00:03:00  0  3  6  9
2000-01-01 00:06:00  0  3  6  9
```

For a DataFrame with MultiIndex, the keyword `level` can be used to specify on level the resampling needs to take place.

```
>>> time = pd.date_range('1/1/2000', periods=5, freq='T')
>>> df2 = pd.DataFrame(data=10*[range(4)],
                      columns=['a', 'b', 'c', 'd'],
                      index=pd.MultiIndex.from_product([time, [1, 2]]))
>>> df2.resample('3T', level=0).sum()
      a  b  c  d
time
2000-01-01 00:00:00  0  6 12 18
2000-01-01 00:03:00  0  4  8 12
```

## pandas.DataFrame.reset\_index

`DataFrame.reset_index(level=None, drop=False, inplace=False, col_level=0, col_fill="")`

For DataFrame with multi-level index, return new DataFrame with labeling information in the columns under the index names, defaulting to 'level\_0', 'level\_1', etc. if any are None. For a standard index, the index name will be used (if set), otherwise a default 'index' or 'level\_0' (if 'index' is already taken) will be used.

**Parameters** `level` : int, str, tuple, or list, default None

Only remove the given levels from the index. Removes all levels by default

**drop** : boolean, default False

Do not try to insert index into dataframe columns. This resets the index to the default integer index.

**inplace** : boolean, default False

Modify the DataFrame in place (do not create a new object)

**col\_level** : int or str, default 0

If the columns have multiple levels, determines which level the labels are inserted into. By default it is inserted into the first level.

**col\_fill** : object, default ''

If the columns have multiple levels, determines how the other levels are named. If None then the index name is repeated.

**Returns**

**resetted** [DataFrame]

## Examples

```
>>> df = pd.DataFrame([('bird', 389.0),
...                     ('bird', 24.0),
...                     ('mammal', 80.5),
...                     ('mammal', np.nan)],
...                     index=['falcon', 'parrot', 'lion', 'monkey'],
...                     columns=('class', 'max_speed'))
>>> df
```

	class	max_speed
falcon	bird	389.0
parrot	bird	24.0
lion	mammal	80.5
monkey	mammal	NaN

When we reset the index, the old index is added as a column, and a new sequential index is used:

```
>>> df.reset_index()
   index  class  max_speed
0  falcon   bird    389.0
1  parrot   bird     24.0
2    lion  mammal     80.5
3  monkey  mammal     NaN
```

We can use the `drop` parameter to avoid the old index being added as a column:

```
>>> df.reset_index(drop=True)
   class  max_speed
0   bird    389.0
1   bird     24.0
2  mammal     80.5
3  mammal     NaN
```

You can also use `reset_index` with *MultiIndex*.

```
>>> index = pd.MultiIndex.from_tuples([('bird', 'falcon'),
...                                   ('bird', 'parrot'),
...                                   ('mammal', 'lion'),
...                                   ('mammal', 'monkey')],
...                                   names=['class', 'name'])
>>> columns = pd.MultiIndex.from_tuples([('speed', 'max'),
...                                      ('species', 'type')])
>>> df = pd.DataFrame([(389.0, 'fly'),
...                    (24.0, 'fly'),
...                    (80.5, 'run'),
...                    (np.nan, 'jump')],
...                    index=index,
...                    columns=columns)
>>> df
```

		speed	species
		max	type
class	name		
bird	falcon	389.0	fly
	parrot	24.0	fly
mammal	lion	80.5	run
	monkey	NaN	jump

If the index has multiple levels, we can reset a subset of them:

```
>>> df.reset_index(level='class')
      class  speed species
      max    type
name
falcon   bird  389.0    fly
parrot   bird   24.0    fly
lion     mammal  80.5    run
monkey   mammal   NaN    jump
```

If we are not dropping the index, by default, it is placed in the top level. We can place it in another level:

```
>>> df.reset_index(level='class', col_level=1)
      class  speed species
      max    type
name
falcon   bird  389.0    fly
parrot   bird   24.0    fly
lion     mammal  80.5    run
monkey   mammal   NaN    jump
```

When the index is inserted under another level, we can specify under which one with the parameter *col\_fill*:

```
>>> df.reset_index(level='class', col_level=1, col_fill='species')
      species  speed species
      class    max    type
name
falcon      bird  389.0    fly
parrot      bird   24.0    fly
lion        mammal  80.5    run
monkey      mammal   NaN    jump
```

If we specify a nonexistent level for *col\_fill*, it is created:

```
>>> df.reset_index(level='class', col_level=1, col_fill='genus')
      genus  speed species
      class    max    type
name
falcon      bird  389.0    fly
parrot      bird   24.0    fly
lion        mammal  80.5    run
monkey      mammal   NaN    jump
```

## pandas.DataFrame.rfloordiv

`DataFrame.rfloordiv(other, axis='columns', level=None, fill_value=None)`

Integer division of dataframe and other, element-wise (binary operator *rfloordiv*).

Equivalent to `other // dataframe`, but with support to substitute a *fill\_value* for missing data in one of the inputs.

### Parameters

**other** [Series, DataFrame, or constant]

**axis** : {0, 1, 'index', 'columns'}

For Series input, axis to match Series index on

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

**fill\_value** : None or float value, default None

Fill existing missing (NaN) values, and any new element needed for successful DataFrame alignment, with this value before computation. If data in both corresponding DataFrame locations is missing the result will be missing

#### Returns

**result** [DataFrame]

#### See also:

[`DataFrame.floordiv`](#)

#### Notes

Mismatched indices will be unioned together

#### Examples

None

### **pandas.DataFrame.rmod**

`DataFrame.rmod(other, axis='columns', level=None, fill_value=None)`

Modulo of dataframe and other, element-wise (binary operator *rmod*).

Equivalent to `other % dataframe`, but with support to substitute a `fill_value` for missing data in one of the inputs.

#### Parameters

**other** [Series, DataFrame, or constant]

**axis** : {0, 1, 'index', 'columns'}

For Series input, axis to match Series index on

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

**fill\_value** : None or float value, default None

Fill existing missing (NaN) values, and any new element needed for successful DataFrame alignment, with this value before computation. If data in both corresponding DataFrame locations is missing the result will be missing

#### Returns

**result** [DataFrame]

#### See also:

[`DataFrame.mod`](#)

## Notes

Mismatched indices will be unioned together

## Examples

None

### pandas.DataFrame.rmul

`DataFrame.rmul` (*other*, *axis*='columns', *level*=None, *fill\_value*=None)

Multiplication of dataframe and other, element-wise (binary operator *rmul*).

Equivalent to `other * dataframe`, but with support to substitute a *fill\_value* for missing data in one of the inputs.

#### Parameters

**other** [Series, DataFrame, or constant]

**axis** : {0, 1, 'index', 'columns'}

For Series input, axis to match Series index on

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

**fill\_value** : None or float value, default None

Fill existing missing (NaN) values, and any new element needed for successful DataFrame alignment, with this value before computation. If data in both corresponding DataFrame locations is missing the result will be missing

#### Returns

**result** [DataFrame]

**See also:**

[`DataFrame.mul`](#)

## Notes

Mismatched indices will be unioned together

## Examples

None

### pandas.DataFrame.rolling

`DataFrame.rolling` (*window*, *min\_periods*=None, *center*=False, *win\_type*=None, *on*=None, *axis*=0, *closed*=None)

Provides rolling window calculations.

New in version 0.18.0.

**Parameters** **window** : int, or offset

Size of the moving window. This is the number of observations used for calculating the statistic. Each window will be a fixed size.

If its an offset then this will be the time period of each window. Each window will be a variable sized based on the observations included in the time-period. This is only valid for datetimelike indexes. This is new in 0.19.0

**min\_periods** : int, default None

Minimum number of observations in window required to have a value (otherwise result is NA). For a window that is specified by an offset, this will default to 1.

**center** : boolean, default False

Set the labels at the center of the window.

**win\_type** : string, default None

Provide a window type. If None, all points are evenly weighted. See the notes below for further information.

**on** : string, optional

For a DataFrame, column on which to calculate the rolling window, rather than the index

**closed** : string, default None

Make the interval closed on the 'right', 'left', 'both' or 'neither' endpoints. For offset-based windows, it defaults to 'right'. For fixed windows, defaults to 'both'. Remaining cases not implemented for fixed windows.

New in version 0.20.0.

**axis** [int or string, default 0]

## Returns

**a Window or Rolling sub-classed for the particular operation**

See also:

***expanding*** Provides expanding transformations.

***ewm*** Provides exponential weighted functions

## Notes

By default, the result is set to the right edge of the window. This can be changed to the center of the window by setting `center=True`.

To learn more about the offsets & frequency strings, please see [this link](#).

The recognized win\_types are:

- boxcar
- triang
- blackman

- hamming
- bartlett
- parzen
- bohman
- blackmanharris
- nuttall
- barthann
- kaiser (needs beta)
- gaussian (needs std)
- general\_gaussian (needs power, width)
- slepian (needs width).

If `win_type=None` all points are evenly weighted. To learn more about different window types see [scipy.signal window functions](#).

## Examples

```
>>> df = pd.DataFrame({'B': [0, 1, 2, np.nan, 4]})
>>> df
   B
0  0.0
1  1.0
2  2.0
3  NaN
4  4.0
```

Rolling sum with a window length of 2, using the 'triang' window type.

```
>>> df.rolling(2, win_type='triang').sum()
   B
0  NaN
1  1.0
2  2.5
3  NaN
4  NaN
```

Rolling sum with a window length of 2, `min_periods` defaults to the window length.

```
>>> df.rolling(2).sum()
   B
0  NaN
1  1.0
2  3.0
3  NaN
4  NaN
```

Same as above, but explicitly set the `min_periods`

```
>>> df.rolling(2, min_periods=1).sum()
      B
0  0.0
1  1.0
2  3.0
3  2.0
4  4.0
```

A ragged (meaning not-a-regular frequency), time-indexed DataFrame

```
>>> df = pd.DataFrame({'B': [0, 1, 2, np.nan, 4]},
...                    index = [pd.Timestamp('20130101 09:00:00'),
...                              pd.Timestamp('20130101 09:00:02'),
...                              pd.Timestamp('20130101 09:00:03'),
...                              pd.Timestamp('20130101 09:00:05'),
...                              pd.Timestamp('20130101 09:00:06')])
```

```
>>> df
                B
2013-01-01 09:00:00  0.0
2013-01-01 09:00:02  1.0
2013-01-01 09:00:03  2.0
2013-01-01 09:00:05  NaN
2013-01-01 09:00:06  4.0
```

Contrasting to an integer rolling window, this will roll a variable length window corresponding to the time period. The default for `min_periods` is 1.

```
>>> df.rolling('2s').sum()
                B
2013-01-01 09:00:00  0.0
2013-01-01 09:00:02  1.0
2013-01-01 09:00:03  3.0
2013-01-01 09:00:05  NaN
2013-01-01 09:00:06  4.0
```

## pandas.DataFrame.round

`DataFrame.round(decimals=0, *args, **kwargs)`

Round a DataFrame to a variable number of decimal places.

**Parameters** `decimals` : int, dict, Series

Number of decimal places to round each column to. If an int is given, round each column to the same number of places. Otherwise dict and Series round to variable numbers of places. Column names should be in the keys if `decimals` is a dict-like, or in the index if `decimals` is a Series. Any columns not included in `decimals` will be left as is. Elements of `decimals` which are not columns of the input will be ignored.

**Returns**

**DataFrame object**

See also:

`numpy.around`, `Series.round`

## Examples

```
>>> df = pd.DataFrame(np.random.random([3, 3]),
...                    columns=['A', 'B', 'C'], index=['first', 'second', 'third'])
>>> df
           A          B          C
first  0.028208  0.992815  0.173891
second 0.038683  0.645646  0.577595
third   0.877076  0.149370  0.491027
>>> df.round(2)
           A          B          C
first   0.03   0.99   0.17
second  0.04   0.65   0.58
third   0.88   0.15   0.49
>>> df.round({'A': 1, 'C': 2})
           A          B          C
first   0.0  0.992815   0.17
second  0.0  0.645646   0.58
third   0.9  0.149370   0.49
>>> decimals = pd.Series([1, 0, 2], index=['A', 'B', 'C'])
>>> df.round(decimals)
           A  B          C
first   0.0  1   0.17
second  0.0  1   0.58
third   0.9  0   0.49
```

## pandas.DataFrame.rpow

`DataFrame.rpow` (*other*, *axis*='columns', *level*=None, *fill\_value*=None)

Exponential power of dataframe and other, element-wise (binary operator *rpow*).

Equivalent to `other ** dataframe`, but with support to substitute a *fill\_value* for missing data in one of the inputs.

### Parameters

**other** [Series, DataFrame, or constant]

**axis** : {0, 1, 'index', 'columns'}

For Series input, axis to match Series index on

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

**fill\_value** : None or float value, default None

Fill existing missing (NaN) values, and any new element needed for successful DataFrame alignment, with this value before computation. If data in both corresponding DataFrame locations is missing the result will be missing

### Returns

**result** [DataFrame]

See also:

[\*DataFrame.pow\*](#)

## Notes

Mismatched indices will be unioned together

## Examples

None

### pandas.DataFrame.rsub

`DataFrame.rsub` (*other*, *axis*='columns', *level*=None, *fill\_value*=None)

Subtraction of dataframe and other, element-wise (binary operator *rsub*).

Equivalent to `other - dataframe`, but with support to substitute a *fill\_value* for missing data in one of the inputs.

#### Parameters

**other** [Series, DataFrame, or constant]

**axis** : {0, 1, 'index', 'columns'}

For Series input, axis to match Series index on

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

**fill\_value** : None or float value, default None

Fill existing missing (NaN) values, and any new element needed for successful DataFrame alignment, with this value before computation. If data in both corresponding DataFrame locations is missing the result will be missing

#### Returns

**result** [DataFrame]

**See also:**

[`DataFrame.sub`](#)

## Notes

Mismatched indices will be unioned together

## Examples

```

>>> a = pd.DataFrame([2, 1, 1, np.nan], index=['a', 'b', 'c', 'd'],
...                   columns=['one'])
>>> a
   one
a  2.0
b  1.0
c  1.0
d  NaN

```

(continues on next page)

(continued from previous page)

```

>>> b = pd.DataFrame(dict(one=[1, np.nan, 1, np.nan],
...                         two=[3, 2, np.nan, 2]),
...                   index=['a', 'b', 'd', 'e'])
>>> b
   one  two
a  1.0  3.0
b  NaN  2.0
d  1.0  NaN
e  NaN  2.0
>>> a.sub(b, fill_value=0)
   one  two
a  1.0 -3.0
b  1.0 -2.0
c  1.0  NaN
d -1.0  NaN
e  NaN -2.0

```

**pandas.DataFrame.rtruediv**`DataFrame.rtruediv` (*other*, *axis*='columns', *level*=None, *fill\_value*=None)Floating division of dataframe and other, element-wise (binary operator *rtruediv*).Equivalent to `other / dataframe`, but with support to substitute a *fill\_value* for missing data in one of the inputs.**Parameters****other** [Series, DataFrame, or constant]**axis** : {0, 1, 'index', 'columns'}

For Series input, axis to match Series index on

## Examples

None

### pandas.DataFrame.sample

`DataFrame.sample` (*n=None*, *frac=None*, *replace=False*, *weights=None*, *random\_state=None*, *axis=None*)

Return a random sample of items from an axis of object.

You can use *random\_state* for reproducibility.

**Parameters** *n* : int, optional

Number of items from axis to return. Cannot be used with *frac*. Default = 1 if *frac* = None.

**frac** : float, optional

Fraction of axis items to return. Cannot be used with *n*.

**replace** : boolean, optional

Sample with or without replacement. Default = False.

**weights** : str or ndarray-like, optional

Default 'None' results in equal probability weighting. If passed a Series, will align with target object on index. Index values in weights not found in sampled object will be ignored and index values in sampled object not in weights will be assigned weights of zero. If called on a DataFrame, will accept the name of a column when *axis* = 0. Unless weights are a Series, weights must be same length as axis being sampled. If weights do not sum to 1, they will be normalized to sum to 1. Missing values in the weights column will be treated as zero. inf and -inf values not allowed.

**random\_state** : int or numpy.random.RandomState, optional

Seed for the random number generator (if int), or numpy RandomState object.

**axis** : int or string, optional

Axis to sample. Accepts axis number or name. Default is stat axis for given data type (0 for Series and DataFrames, 1 for Panels).

### Returns

**A new object of same type as caller.**

## Examples

Generate an example Series and DataFrame:

```

>>> s = pd.Series(np.random.randn(50))
>>> s.head()
0    -0.038497
1     1.820773
2    -0.972766
3    -1.598270

```

(continues on next page)

(continued from previous page)

```

4    -1.095526
dtype: float64
>>> df = pd.DataFrame(np.random.randn(50, 4), columns=list('ABCD'))
>>> df.head()

```

	A	B	C	D
0	0.016443	-2.318952	-0.566372	-1.028078
1	-1.051921	0.438836	0.658280	-0.175797
2	-1.243569	-0.364626	-0.215065	0.057736
3	1.768216	0.404512	-0.385604	-1.457834
4	1.072446	-1.137172	0.314194	-0.046661

Next extract a random sample from both of these objects...

3 random elements from the Series:

```

>>> s.sample(n=3)
27    -0.994689
55    -1.049016
67    -0.224565
dtype: float64

```

And a random 10% of the DataFrame with replacement:

```

>>> df.sample(frac=0.1, replace=True)

```

	A	B	C	D
35	1.981780	0.142106	1.817165	-0.290805
49	-1.336199	-0.448634	-0.789640	0.217116
40	0.823173	-0.078816	1.009536	1.015108
15	1.421154	-0.055301	-1.922594	-0.019696
6	-0.148339	0.832938	1.787600	-1.383767

You can use *random state* for reproducibility:

```

>>> df.sample(random_state=1)

```

	A	B	C	D
37	-2.027662	0.103611	0.237496	-0.165867
43	-0.259323	-0.583426	1.516140	-0.479118
12	-1.686325	-0.579510	0.985195	-0.460286
8	1.167946	0.429082	1.215742	-1.636041
9	1.197475	-0.864188	1.554031	-1.505264

## pandas.DataFrame.select

`DataFrame.select (crit, axis=0)`

Return data corresponding to axis labels matching criteria

Deprecated since version 0.21.0: Use `df.loc[df.index.map(crit)]` to select via labels

**Parameters** `crit`: function

To be called on each index (label). Should return True or False

**axis** [int]

**Returns**

**selection** [type of caller]

**pandas.DataFrame.select\_dtypes**`DataFrame.select_dtypes` (*include=None, exclude=None*)

Return a subset of the DataFrame's columns based on the column dtypes.

**Parameters** `include, exclude` : scalar or list-like

A selection of dtypes or strings to be included/excluded. At least one of these parameters must be supplied.

**Returns** `subset` : DataFrameThe subset of the frame including the dtypes in `include` and excluding the dtypes in `exclude`.**Raises** `ValueError`

- If both of `include` and `exclude` are empty
- If `include` and `exclude` have overlapping elements
- If any kind of string dtype is passed in.

**Notes**

- To select all *numeric* types, use `np.number` or `'number'`
- To select strings you must use the `object` dtype, but note that this will return *all* object dtype columns
- See the [numpy dtype hierarchy](#)
- To select datetimes, use `np.datetime64`, `'datetime'` or `'datetime64'`
- To select timedeltas, use `np.timedelta64`, `'timedelta'` or `'timedelta64'`
- To select Pandas categorical dtypes, use `'category'`
- To select Pandas datetimetz dtypes, use `'datetimez'` (new in 0.20.0) or `'datetime64[ns, tz]'`

**Examples**

```
>>> df = pd.DataFrame({'a': [1, 2] * 3,
...                     'b': [True, False] * 3,
...                     'c': [1.0, 2.0] * 3})
>>> df
```

	a	b	c
0	1	True	1.0
1	2	False	2.0
2	1	True	1.0
3	2	False	2.0
4	1	True	1.0
5	2	False	2.0

```
>>> df.select_dtypes(include='bool')
b
0  True
```

(continues on next page)

(continued from previous page)

```
1 False
2 True
3 False
4 True
5 False
```

```
>>> df.select_dtypes(include=['float64'])
   c
0  1.0
1  2.0
2  1.0
3  2.0
4  1.0
5  2.0
```

```
>>> df.select_dtypes(exclude=['int'])
   b    c
0  True  1.0
1 False  2.0
2  True  1.0
3 False  2.0
4  True  1.0
5 False  2.0
```

## pandas.DataFrame.sem

DataFrame.**sem**(axis=None, skipna=None, level=None, ddof=1, numeric\_only=None, \*\*kwargs)

Return unbiased standard error of the mean over requested axis.

Normalized by N-1 by default. This can be changed using the ddof argument

### Parameters

**axis** [{index (0), columns (1)}]

**skipna** : boolean, default True

Exclude NA/null values. If an entire row/column is NA, the result will be NA

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a Series

**ddof** : int, default 1

Delta Degrees of Freedom. The divisor used in calculations is N - ddof, where N represents the number of elements.

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

### Returns

**sem** [Series or DataFrame (if level specified)]

**pandas.DataFrame.set\_axis**

`DataFrame.set_axis` (*labels*, *axis*=0, *inplace*=None)

Assign desired index to given axis.

Indexes for column or row labels can be changed by assigning a list-like or Index.

Changed in version 0.21.0: The signature is now *labels* and *axis*, consistent with the rest of pandas API. Previously, the *axis* and *labels* arguments were respectively the first and second positional arguments.

**Parameters** *labels* : list-like, Index

The values for the new index.

**axis** : {0 or 'index', 1 or 'columns'}, default 0

The axis to update. The value 0 identifies the rows, and 1 identifies the columns.

**inplace** : boolean, default None

Whether to return a new %(klass)s instance.

**Warning:** `inplace=None` currently falls back to `True`, but in a future version, will default to `False`. Use `inplace=True` explicitly rather than relying on the default.

**Returns** *renamed* : %(klass)s or None

An object of same type as caller if `inplace=False`, None otherwise.

**See also:**

[`pandas.DataFrame.rename\_axis`](#) Alter the name of the index or columns.

**Examples****Series**

```
>>> s = pd.Series([1, 2, 3])
>>> s
0    1
1    2
2    3
dtype: int64
```

```
>>> s.set_axis(['a', 'b', 'c'], axis=0, inplace=False)
a    1
b    2
c    3
dtype: int64
```

The original object is not modified.

```
>>> s
0    1
1    2
```

(continues on next page)

(continued from previous page)

```
2      3
dtype: int64
```

**DataFrame**

```
>>> df = pd.DataFrame({"A": [1, 2, 3], "B": [4, 5, 6]})
```

Change the row labels.

```
>>> df.set_axis(['a', 'b', 'c'], axis='index', inplace=False)
   A  B
a  1  4
b  2  5
c  3  6
```

Change the column labels.

```
>>> df.set_axis(['I', 'II'], axis='columns', inplace=False)
   I  II
0  1   4
1  2   5
2  3   6
```

Now, update the labels inplace.

```
>>> df.set_axis(['i', 'ii'], axis='columns', inplace=True)
>>> df
   i  ii
0  1   4
1  2   5
2  3   6
```

**pandas.DataFrame.set\_index**

`DataFrame.set_index(keys, drop=True, append=False, inplace=False, verify_integrity=False)`

Set the DataFrame index (row labels) using one or more existing columns. By default yields a new object.

**Parameters**

**keys** [column label or list of column labels / arrays]

**drop** : boolean, default True

Delete columns to be used as the new index

**append** : boolean, default False

Whether to append columns to existing index

**inplace** : boolean, default False

Modify the DataFrame in place (do not create a new object)

**verify\_integrity** : boolean, default False

Check the new index for duplicates. Otherwise defer the check until necessary.

Setting to False will improve the performance of this method

**Returns**

**dataframe** [DataFrame]

## Examples

```
>>> df = pd.DataFrame({'month': [1, 4, 7, 10],
...                     'year': [2012, 2014, 2013, 2014],
...                     'sale': [55, 40, 84, 31]})
```

	month	sale	year
0	1	55	2012
1	4	40	2014
2	7	84	2013
3	10	31	2014

Set the index to become the ‘month’ column:

```
>>> df.set_index('month')
      sale  year
month
1      55  2012
4      40  2014
7      84  2013
10     31  2014
```

Create a multi-index using columns ‘year’ and ‘month’:

```
>>> df.set_index(['year', 'month'])
      sale
year month
2012  1    55
2014  4    40
2013  7    84
2014  10   31
```

Create a multi-index using a set of values and a column:

```
>>> df.set_index([1, 2, 3, 4], 'year')
      month  sale
year
1  2012    1    55
2  2014    4    40
3  2013    7    84
4  2014   10    31
```

## pandas.DataFrame.set\_value

`DataFrame.set_value(index, col, value, takeable=False)`

Put single value at passed column and index

Deprecated since version 0.21.0: Use `.at[]` or `.iat[]` accessors instead.

### Parameters

**index** [row label]**col** [column label]**value** [scalar value]

**takeable** [interpret the index/col as indexers, default False]

**Returns frame** : DataFrame

If label pair is contained, will be reference to calling DataFrame, otherwise a new object

## **pandas.DataFrame.shift**

DataFrame.**shift** (*periods=1, freq=None, axis=0*)

Shift index by desired number of periods with an optional time freq

**Parameters periods** : int

Number of periods to move, can be positive or negative

**freq** : DateOffset, timedelta, or time rule string, optional

Increment to use from the tseries module or time rule (e.g. 'EOM'). See Notes.

**axis** [{0 or 'index', 1 or 'columns'}]

**Returns**

**shifted** [DataFrame]

## **Notes**

If freq is specified then the index values are shifted but the data is not realigned. That is, use freq if you would like to extend the index when shifting and preserve the original data.

## **pandas.DataFrame.skew**

DataFrame.**skew** (*axis=None, skipna=None, level=None, numeric\_only=None, \*\*kwargs*)

Return unbiased skew over requested axis Normalized by N-1

**Parameters**

**axis** [{index (0), columns (1)}]

**skipna** : boolean, default True

Exclude NA/null values when computing the result.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a Series

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

**Returns**

**skew** [Series or DataFrame (if level specified)]

**pandas.DataFrame.slice\_shift**`DataFrame.slice_shift` (*periods=1, axis=0*)

Equivalent to *shift* without copying data. The shifted data will not include the dropped periods and the shifted axis will be smaller than the original.

**Parameters** *periods* : int

Number of periods to move, can be positive or negative

**Returns**

**shifted** [same type as caller]

**Notes**

While the *slice\_shift* is faster than *shift*, you may pay for it later during alignment.

**pandas.DataFrame.sort\_index**

`DataFrame.sort_index` (*axis=0, level=None, ascending=True, inplace=False, kind='quicksort', na\_position='last', sort\_remaining=True, by=None*)

Sort object by labels (along an axis)

**Parameters**

**axis** [index, columns to direct sorting]

**level** : int or level name or list of ints or list of level names

if not None, sort on values in specified index level(s)

**ascending** : boolean, default True

Sort ascending vs. descending

**inplace** : bool, default False

if True, perform operation in-place

**kind** : { 'quicksort', 'mergesort', 'heapsort' }, default 'quicksort'

Choice of sorting algorithm. See also `ndarray.sort` for more information. *mergesort* is the only stable algorithm. For DataFrames, this option is only applied when sorting on a single column or label.

**na\_position** : { 'first', 'last' }, default 'last'

*first* puts NaNs at the beginning, *last* puts NaNs at the end. Not implemented for MultiIndex.

**sort\_remaining** : bool, default True

if true and sorting by level and index is multilevel, sort by other levels too (in order) after sorting by specified level

**Returns**

**sorted\_obj** [DataFrame]

## pandas.DataFrame.sort\_values

`DataFrame.sort_values` (*by*, *axis=0*, *ascending=True*, *inplace=False*, *kind='quicksort'*,  
*na\_position='last'*)

Sort by the values along either axis

**Parameters** *by* : str or list of str

Name or list of names to sort by.

- if *axis* is 0 or *'index'* then *by* may contain index levels and/or column labels
- if *axis* is 1 or *'columns'* then *by* may contain column levels and/or index labels

Changed in version 0.23.0: Allow specifying index or column level names.

**axis** : {0 or *'index'*, 1 or *'columns'*}, default 0

Axis to be sorted

**ascending** : bool or list of bool, default True

Sort ascending vs. descending. Specify list for multiple sort orders. If this is a list of bools, must match the length of the *by*.

**inplace** : bool, default False

if True, perform operation in-place

**kind** : {*'quicksort'*, *'mergesort'*, *'heapsort'*}, default *'quicksort'*

Choice of sorting algorithm. See also `ndarray.sort` for more information. *mergesort* is the only stable algorithm. For DataFrames, this option is only applied when sorting on a single column or label.

**na\_position** : {*'first'*, *'last'*}, default *'last'*

*first* puts NaNs at the beginning, *last* puts NaNs at the end

### Returns

**sorted\_obj** [DataFrame]

## Examples

```
>>> df = pd.DataFrame({
...     'col1' : ['A', 'A', 'B', np.nan, 'D', 'C'],
...     'col2' : [2, 1, 9, 8, 7, 4],
...     'col3' : [0, 1, 9, 4, 2, 3],
... })
>>> df
   col1  col2  col3
0    A     2     0
1    A     1     1
2    B     9     9
3  NaN     8     4
4    D     7     2
5    C     4     3
```

Sort by col1

```
>>> df.sort_values(by=['col1'])
   col1 col2 col3
0    A     2     0
1    A     1     1
2    B     9     9
5    C     4     3
4    D     7     2
3   NaN     8     4
```

Sort by multiple columns

```
>>> df.sort_values(by=['col1', 'col2'])
   col1 col2 col3
1    A     1     1
0    A     2     0
2    B     9     9
5    C     4     3
4    D     7     2
3   NaN     8     4
```

Sort Descending

```
>>> df.sort_values(by='col1', ascending=False)
   col1 col2 col3
4    D     7     2
5    C     4     3
2    B     9     9
0    A     2     0
1    A     1     1
3   NaN     8     4
```

Putting NAs first

```
>>> df.sort_values(by='col1', ascending=False, na_position='first')
   col1 col2 col3
3   NaN     8     4
4    D     7     2
5    C     4     3
2    B     9     9
0    A     2     0
1    A     1     1
```

## pandas.DataFrame.sortlevel

`DataFrame.sortlevel` (*level=0, axis=0, ascending=True, inplace=False, sort\_remaining=True*)

Sort multilevel index by chosen axis and primary level. Data will be lexicographically sorted by the chosen level followed by the other levels (in order).

Deprecated since version 0.20.0: Use `DataFrame.sort_index()`

### Parameters

**level** [int]

**axis** [{0 or 'index', 1 or 'columns'}, default 0]

**ascending** [boolean, default True]

**inplace** : boolean, default False

Sort the DataFrame without creating a new instance

**sort\_remaining** : boolean, default True

Sort by the other levels too.

#### Returns

**sorted** [DataFrame]

**See also:**

`DataFrame.sort_index`

### **pandas.DataFrame.squeeze**

`DataFrame.squeeze` (*axis=None*)

Squeeze length 1 dimensions.

**Parameters** **axis** : None, integer or string axis name, optional

The axis to squeeze if 1-sized.

New in version 0.20.0.

#### Returns

**scalar if 1-sized, else original object**

### **pandas.DataFrame.stack**

`DataFrame.stack` (*level=-1, dropna=True*)

Stack the prescribed level(s) from columns to index.

Return a reshaped DataFrame or Series having a multi-level index with one or more new inner-most levels compared to the current DataFrame. The new inner-most levels are created by pivoting the columns of the current dataframe:

- if the columns have a single level, the output is a Series;
- if the columns have multiple levels, the new index level(s) is (are) taken from the prescribed level(s) and the output is a DataFrame.

The new index levels are sorted.

**Parameters** **level** : int, str, list, default -1

Level(s) to stack from the column axis onto the index axis, defined as one index or label, or a list of indices or labels.

**dropna** : bool, default True

Whether to drop rows in the resulting Frame/Series with missing values. Stacking a column level onto the index axis can create combinations of index and column values that are missing from the original dataframe. See Examples section.

**Returns** **DataFrame or Series**

Stacked dataframe or series.

**See also:**

**DataFrame.unstack** Unstack prescribed level(s) from index axis onto column axis.

**DataFrame.pivot** Reshape dataframe from long format to wide format.

**DataFrame.pivot\_table** Create a spreadsheet-style pivot table as a DataFrame.

## Notes

The function is named by analogy with a collection of books being re-organised from being side by side on a horizontal position (the columns of the dataframe) to being stacked vertically on top of each other (in the index of the dataframe).

## Examples

### Single level columns

```
>>> df_single_level_cols = pd.DataFrame([[0, 1], [2, 3]],
...                                     index=['cat', 'dog'],
...                                     columns=['weight', 'height'])
```

Stacking a dataframe with a single level column axis returns a Series:

```
>>> df_single_level_cols
   weight height
cat      0      1
dog      2      3
>>> df_single_level_cols.stack()
cat weight      0
   height      1
dog weight      2
   height      3
dtype: int64
```

### Multi level columns: simple case

```
>>> multicoll = pd.MultiIndex.from_tuples([('weight', 'kg'),
...                                       ('weight', 'pounds')])
>>> df_multi_level_cols1 = pd.DataFrame([[1, 2], [2, 4]],
...                                     index=['cat', 'dog'],
...                                     columns=multicoll)
```

Stacking a dataframe with a multi-level column axis:

```
>>> df_multi_level_cols1
   weight
   kg    pounds
cat   1         2
dog   2         4
>>> df_multi_level_cols1.stack()
   weight
cat kg      1
   pounds   2
dog kg      2
   pounds   4
```

### Missing values

```
>>> multicol2 = pd.MultiIndex.from_tuples([('weight', 'kg'),
...                                     ('height', 'm')])
>>> df_multi_level_cols2 = pd.DataFrame([[1.0, 2.0], [3.0, 4.0]],
...                                     index=['cat', 'dog'],
...                                     columns=multicol2)
```

It is common to have missing values when stacking a dataframe with multi-level columns, as the stacked dataframe typically has more values than the original dataframe. Missing values are filled with NaNs:

```
>>> df_multi_level_cols2
      weight height
      kg      m
cat    1.0    2.0
dog    3.0    4.0
>>> df_multi_level_cols2.stack()
      height weight
cat kg      NaN   1.0
   m      2.0   NaN
dog kg      NaN   3.0
   m      4.0   NaN
```

### Prescribing the level(s) to be stacked

The first parameter controls which level or levels are stacked:

```
>>> df_multi_level_cols2.stack(0)
      kg      m
cat height NaN  2.0
   weight 1.0 NaN
dog height NaN  4.0
   weight 3.0 NaN
>>> df_multi_level_cols2.stack([0, 1])
cat  height m      2.0
   weight kg      1.0
dog  height m      4.0
   weight kg      3.0
dtype: float64
```

### Dropping missing values

```
>>> df_multi_level_cols3 = pd.DataFrame([[None, 1.0], [2.0, 3.0]],
...                                     index=['cat', 'dog'],
...                                     columns=multicol2)
```

Note that rows where all values are missing are dropped by default but this behaviour can be controlled via the `dropna` keyword parameter:

```
>>> df_multi_level_cols3
      weight height
      kg      m
cat    NaN    1.0
dog    2.0    3.0
>>> df_multi_level_cols3.stack(dropna=False)
      height weight
cat kg      NaN   NaN
   m      1.0   NaN
dog kg      NaN   2.0
```

(continues on next page)

(continued from previous page)

```

      m      3.0      NaN
>>> df_multi_level_cols3.stack(dropna=True)
      height  weight
cat m      1.0      NaN
dog kg      NaN      2.0
      m      3.0      NaN

```

**pandas.DataFrame.std**

`DataFrame.std` (*axis=None, skipna=None, level=None, ddof=1, numeric\_only=None, \*\*kwargs*)

Return sample standard deviation over requested axis.

Normalized by N-1 by default. This can be changed using the `ddof` argument

**Parameters**

**axis** [{index (0), columns (1)}]

**skipna** : boolean, default True

Exclude NA/null values. If an entire row/column is NA, the result will be NA

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a Series

**ddof** : int, default 1

Delta Degrees of Freedom. The divisor used in calculations is  $N - \text{ddof}$ , where  $N$  represents the number of elements.

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

**Returns**

**std** [Series or DataFrame (if level specified)]

**pandas.DataFrame.sub**

`DataFrame.sub` (*other, axis='columns', level=None, fill\_value=None*)

Subtraction of dataframe and other, element-wise (binary operator *sub*).

Equivalent to `dataframe - other`, but with support to substitute a `fill_value` for missing data in one of the inputs.

**Parameters**

**other** [Series, DataFrame, or constant]

**axis** : {0, 1, 'index', 'columns'}

For Series input, axis to match Series index on

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

**fill\_value** : None or float value, default None

Fill existing missing (NaN) values, and any new element needed for successful DataFrame alignment, with this value before computation. If data in both corresponding DataFrame locations is missing the result will be missing

### Returns

**result** [DataFrame]

### See also:

[`DataFrame.rsub`](#)

### Notes

Mismatched indices will be unioned together

### Examples

```
>>> a = pd.DataFrame([2, 1, 1, np.nan], index=['a', 'b', 'c', 'd'],
...                   columns=['one'])
>>> a
   one
a  2.0
b  1.0
c  1.0
d  NaN
>>> b = pd.DataFrame(dict(one=[1, np.nan, 1, np.nan],
...                       two=[3, 2, np.nan, 2]),
...                   index=['a', 'b', 'd', 'e'])
>>> b
   one  two
a  1.0  3.0
b  NaN  2.0
d  1.0  NaN
e  NaN  2.0
>>> a.sub(b, fill_value=0)
   one  two
a  1.0 -3.0
b  1.0 -2.0
c  1.0  NaN
d -1.0  NaN
e  NaN -2.0
```

## pandas.DataFrame.subtract

`DataFrame.subtract` (*other*, *axis*='columns', *level*=None, *fill\_value*=None)

Subtraction of dataframe and other, element-wise (binary operator *sub*).

Equivalent to `dataframe - other`, but with support to substitute a *fill\_value* for missing data in one of the inputs.

### Parameters

**other** [Series, DataFrame, or constant]

**axis** : {0, 1, 'index', 'columns'}

For Series input, axis to match Series index on

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

**fill\_value** : None or float value, default None

Fill existing missing (NaN) values, and any new element needed for successful DataFrame alignment, with this value before computation. If data in both corresponding DataFrame locations is missing the result will be missing

### Returns

**result** [DataFrame]

### See also:

[`DataFrame.rsub`](#)

### Notes

Mismatched indices will be unioned together

### Examples

```
>>> a = pd.DataFrame([2, 1, 1, np.nan], index=['a', 'b', 'c', 'd'],
...                   columns=['one'])
>>> a
   one
a  2.0
b  1.0
c  1.0
d  NaN
>>> b = pd.DataFrame(dict(one=[1, np.nan, 1, np.nan],
...                       two=[3, 2, np.nan, 2]),
...                   index=['a', 'b', 'd', 'e'])
>>> b
   one  two
a  1.0  3.0
b  NaN  2.0
d  1.0  NaN
e  NaN  2.0
>>> a.sub(b, fill_value=0)
   one  two
a  1.0 -3.0
b  1.0 -2.0
c  1.0  NaN
d -1.0  NaN
e  NaN -2.0
```

## pandas.DataFrame.sum

`DataFrame.sum(axis=None, skipna=None, level=None, numeric_only=None, min_count=0, **kwargs)`

Return the sum of the values for the requested axis

### Parameters

**axis** [{index (0), columns (1)}]

**skipna** : boolean, default True

Exclude NA/null values when computing the result.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a Series

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

**min\_count** : int, default 0

The required number of valid values to perform the operation. If fewer than `min_count` non-NA values are present the result will be NA.

New in version 0.22.0: Added with the default being 0. This means the sum of an all-NA or empty Series is 0, and the product of an all-NA or empty Series is 1.

### Returns

**sum** [Series or DataFrame (if level specified)]

## Examples

By default, the sum of an empty or all-NA Series is 0.

```
>>> pd.Series([]).sum() # min_count=0 is the default
0.0
```

This can be controlled with the `min_count` parameter. For example, if you'd like the sum of an empty series to be NaN, pass `min_count=1`.

```
>>> pd.Series([]).sum(min_count=1)
nan
```

Thanks to the `skipna` parameter, `min_count` handles all-NA and empty series identically.

```
>>> pd.Series([np.nan]).sum()
0.0
```

```
>>> pd.Series([np.nan]).sum(min_count=1)
nan
```

**pandas.DataFrame.swapaxes**

`DataFrame.swapaxes` (*axis1*, *axis2*, *copy=True*)  
Interchange axes and swap values axes appropriately

**Returns**

**y** [same as input]

**pandas.DataFrame.swaplevel**

`DataFrame.swaplevel` (*i=-2*, *j=-1*, *axis=0*)  
Swap levels *i* and *j* in a MultiIndex on a particular axis

**Parameters** *i*, *j* : int, string (can be mixed)

Level of index to be swapped. Can pass level name as string.

**Returns**

**swapped** [type of caller (new object)]

**.. versionchanged:: 0.18.1**

The indexes *i* and *j* are now optional, and default to the two innermost levels of the index.

**pandas.DataFrame.tail**

`DataFrame.tail` (*n=5*)  
Return the last *n* rows.

This function returns last *n* rows from the object based on position. It is useful for quickly verifying data, for example, after sorting or appending rows.

**Parameters** *n* : int, default 5

Number of rows to select.

**Returns** type of caller

The last *n* rows of the caller object.

**See also:**

[`pandas.DataFrame.head`](#) The first *n* rows of the caller object.

**Examples**

```
>>> df = pd.DataFrame({'animal': ['alligator', 'bee', 'falcon', 'lion',
...                               'monkey', 'parrot', 'shark', 'whale', 'zebra']})
>>> df
   animal
0 alligator
1      bee
2    falcon
3      lion
```

(continues on next page)

(continued from previous page)

```
4    monkey
5    parrot
6     shark
7     whale
8     zebra
```

Viewing the last 5 lines

```
>>> df.tail()
      animal
4    monkey
5    parrot
6     shark
7     whale
8     zebra
```

Viewing the last  $n$  lines (three in this case)

```
>>> df.tail(3)
      animal
6     shark
7     whale
8     zebra
```

## pandas.DataFrame.take

`DataFrame.take` (*indices*, *axis=0*, *convert=None*, *is\_copy=True*, *\*\*kwargs*)

Return the elements in the given *positional* indices along an axis.

This means that we are not indexing according to actual values in the index attribute of the object. We are indexing according to the actual position of the element in the object.

**Parameters** **indices** : array-like

An array of ints indicating which positions to take.

**axis** : {0 or 'index', 1 or 'columns', None}, default 0

The axis on which to select elements. 0 means that we are selecting rows, 1 means that we are selecting columns.

**convert** : bool, default True

Whether to convert negative indices into positive ones. For example, -1 would map to the `len(axis) - 1`. The conversions are similar to the behavior of indexing a regular Python list.

Deprecated since version 0.21.0: In the future, negative indices will always be converted.

**is\_copy** : bool, default True

Whether to return a copy of the original object or not.

**\*\*kwargs**

For compatibility with `numpy.take()`. Has no effect on the output.

**Returns** **taken** : type of caller

An array-like containing the elements taken from the object.

**See also:**

**DataFrame.loc** Select a subset of a DataFrame by labels.

**DataFrame.iloc** Select a subset of a DataFrame by positions.

**numpy.take** Take elements from an array along an axis.

## Examples

```
>>> df = pd.DataFrame([('falcon', 'bird', 389.0),
...                     ('parrot', 'bird', 24.0),
...                     ('lion', 'mammal', 80.5),
...                     ('monkey', 'mammal', np.nan)],
...                    columns=['name', 'class', 'max_speed'],
...                    index=[0, 2, 3, 1])
>>> df
```

	name	class	max_speed
0	falcon	bird	389.0
2	parrot	bird	24.0
3	lion	mammal	80.5
1	monkey	mammal	NaN

Take elements at positions 0 and 3 along the axis 0 (default).

Note how the actual indices selected (0 and 1) do not correspond to our selected indices 0 and 3. That's because we are selecting the 0th and 3rd rows, not rows whose indices equal 0 and 3.

```
>>> df.take([0, 3])
```

	name	class	max_speed
0	falcon	bird	389.0
1	monkey	mammal	NaN

Take elements at indices 1 and 2 along the axis 1 (column selection).

```
>>> df.take([1, 2], axis=1)
```

	class	max_speed
0	bird	389.0
2	bird	24.0
3	mammal	80.5
1	mammal	NaN

We may take elements using negative integers for positive indices, starting from the end of the object, just like with Python lists.

```
>>> df.take([-1, -2])
```

	name	class	max_speed
1	monkey	mammal	NaN
3	lion	mammal	80.5

## pandas.DataFrame.to\_clipboard

**DataFrame.to\_clipboard** (*excel=True, sep=None, \*\*kwargs*)

Copy object to the system clipboard.

Write a text representation of object to the system clipboard. This can be pasted into Excel, for example.

**Parameters** `excel` : bool, default True

- True, use the provided separator, writing in a csv format for allowing easy pasting into excel.
- False, write a string representation of the object to the clipboard.

**sep** : str, default ' \t '

Field delimiter.

**\*\*kwargs**

These parameters will be passed to `DataFrame.to_csv`.

**See also:**

[`DataFrame.to\_csv`](#) Write a `DataFrame` to a comma-separated values (csv) file.

[`read\_clipboard`](#) Read text from clipboard and pass to `read_table`.

## Notes

Requirements for your platform.

- Linux : `xclip`, or `xsel` (with `gtk` or `PyQt4` modules)
- Windows : none
- OS X : none

## Examples

Copy the contents of a `DataFrame` to the clipboard.

```
>>> df = pd.DataFrame([[1, 2, 3], [4, 5, 6]], columns=['A', 'B', 'C'])
>>> df.to_clipboard(sep=',')
... # Wrote the following to the system clipboard:
... # ,A,B,C
... # 0,1,2,3
... # 1,4,5,6
```

We can omit the the index by passing the keyword `index` and setting it to false.

```
>>> df.to_clipboard(sep=',', index=False)
... # Wrote the following to the system clipboard:
... # A,B,C
... # 1,2,3
... # 4,5,6
```

**pandas.DataFrame.to\_csv**

```
DataFrame.to_csv(path_or_buf=None, sep=', ', na_rep="", float_format=None, columns=None,
                  header=True, index=True, index_label=None, mode='w', encoding=None,
                  compression=None, quoting=None, quotechar='"', line_terminator='\n',
                  chunksize=None, tupleize_cols=None, date_format=None, doublequote=True,
                  escapechar=None, decimal='.')
```

Write DataFrame to a comma-separated values (csv) file

**Parameters** **path\_or\_buf** : string or file handle, default None

File path or object, if None is provided the result is returned as a string.

**sep** : character, default ','

Field delimiter for the output file.

**na\_rep** : string, default ''

Missing data representation

**float\_format** : string, default None

Format string for floating point numbers

**columns** : sequence, optional

Columns to write

**header** : boolean or list of string, default True

Write out the column names. If a list of strings is given it is assumed to be aliases for the column names

**index** : boolean, default True

Write row names (index)

**index\_label** : string or sequence, or False, default None

Column label for index column(s) if desired. If None is given, and *header* and *index* are True, then the index names are used. A sequence should be given if the DataFrame uses MultiIndex. If False do not print fields for index names. Use *index\_label=False* for easier importing in R

**mode** : str

Python write mode, default 'w'

**encoding** : string, optional

A string representing the encoding to use in the output file, defaults to 'ascii' on Python 2 and 'utf-8' on Python 3.

**compression** : string, optional

A string representing the compression to use in the output file. Allowed values are 'gzip', 'bz2', 'zip', 'xz'. This input is only used when the first argument is a filename.

**line\_terminator** : string, default '\n'

The newline character or character sequence to use in the output file

**quoting** : optional constant from csv module

defaults to `csv.QUOTE_MINIMAL`. If you have set a *float\_format* then floats are converted to strings and thus `csv.QUOTE_NONNUMERIC` will treat them as non-numeric

**quotechar** : string (length 1), default `“”`

character used to quote fields

**doublequote** : boolean, default `True`

Control quoting of *quotechar* inside a field

**escapechar** : string (length 1), default `None`

character used to escape *sep* and *quotechar* when appropriate

**chunksize** : int or `None`

rows to write at a time

**tupleize\_cols** : boolean, default `False`

Deprecated since version 0.21.0: This argument will be removed and will always write each row of the multi-index as a separate row in the CSV file.

Write MultiIndex columns as a list of tuples (if `True`) or in the new, expanded format, where each MultiIndex column is a row in the CSV (if `False`).

**date\_format** : string, default `None`

Format string for datetime objects

**decimal**: string, default `‘.`

Character recognized as decimal separator. E.g. use `‘,’` for European data

## **pandas.DataFrame.to\_dense**

`DataFrame.to_dense()`

Return dense representation of NDFrame (as opposed to sparse)

## **pandas.DataFrame.to\_dict**

`DataFrame.to_dict(orient='dict', into=<class 'dict'>)`

Convert the DataFrame to a dictionary.

The type of the key-value pairs can be customized with the parameters (see below).

**Parameters** **orient** : str {`‘dict’`, `‘list’`, `‘series’`, `‘split’`, `‘records’`, `‘index’`}

Determines the type of the values of the dictionary.

- `‘dict’` (default) : dict like {column -> {index -> value}}
- `‘list’` : dict like {column -> [values]}
- `‘series’` : dict like {column -> Series(values)}
- `‘split’` : dict like {`‘index’` -> [index], `‘columns’` -> [columns], `‘data’` -> [values]}
- `‘records’` : list like [{column -> value}, ... , {column -> value}]
- `‘index’` : dict like {index -> {column -> value}}

Abbreviations are allowed. *s* indicates *series* and *sp* indicates *split*.

**into** : class, default dict

The collections.Mapping subclass used for all Mappings in the return value. Can be the actual class or an empty instance of the mapping type you want. If you want a collections.defaultdict, you must pass it initialized.

New in version 0.21.0.

### Returns

**result** [collections.Mapping like {column -> {index -> value}}]

See also:

[`DataFrame.from\_dict`](#) create a DataFrame from a dictionary

[`DataFrame.to\_json`](#) convert a DataFrame to JSON format

### Examples

```
>>> df = pd.DataFrame({'col1': [1, 2],
...                     'col2': [0.5, 0.75]},
...                     index=['a', 'b'])
>>> df
   col1  col2
a      1   0.50
b      2   0.75
>>> df.to_dict()
{'col1': {'a': 1, 'b': 2}, 'col2': {'a': 0.5, 'b': 0.75}}
```

You can specify the return orientation.

```
>>> df.to_dict('series')
{'col1': a      1
         b      2
         Name: col1, dtype: int64,
 'col2': a      0.50
         b      0.75
         Name: col2, dtype: float64}
```

```
>>> df.to_dict('split')
{'index': ['a', 'b'], 'columns': ['col1', 'col2'],
 'data': [[1.0, 0.5], [2.0, 0.75]]}
```

```
>>> df.to_dict('records')
[{'col1': 1.0, 'col2': 0.5}, {'col1': 2.0, 'col2': 0.75}]
```

```
>>> df.to_dict('index')
{'a': {'col1': 1.0, 'col2': 0.5}, 'b': {'col1': 2.0, 'col2': 0.75}}
```

You can also specify the mapping type.

```
>>> from collections import OrderedDict, defaultdict
>>> df.to_dict(into=OrderedDict)
OrderedDict([('col1', OrderedDict([('a', 1), ('b', 2)])),
            ('col2', OrderedDict([('a', 0.5), ('b', 0.75)]))])
```

If you want a *defaultdict*, you need to initialize it:

```
>>> dd = defaultdict(list)
>>> df.to_dict('records', into=dd)
[defaultdict(<class 'list'>, {'col1': 1.0, 'col2': 0.5}),
 defaultdict(<class 'list'>, {'col1': 2.0, 'col2': 0.75})]
```

## pandas.DataFrame.to\_excel

`DataFrame.to_excel(excel_writer, sheet_name='Sheet1', na_rep="", float_format=None, columns=None, header=True, index=True, index_label=None, startrow=0, startcol=0, engine=None, merge_cells=True, encoding=None, inf_rep='inf', verbose=True, freeze_panes=None)`

Write DataFrame to an excel sheet

**Parameters excel\_writer** : string or ExcelWriter object

File path or existing ExcelWriter

**sheet\_name** : string, default 'Sheet1'

Name of sheet which will contain DataFrame

**na\_rep** : string, default ''

Missing data representation

**float\_format** : string, default None

Format string for floating point numbers

**columns** : sequence, optional

Columns to write

**header** : boolean or list of string, default True

Write out the column names. If a list of strings is given it is assumed to be aliases for the column names

**index** : boolean, default True

Write row names (index)

**index\_label** : string or sequence, default None

Column label for index column(s) if desired. If None is given, and *header* and *index* are True, then the index names are used. A sequence should be given if the DataFrame uses MultiIndex.

**startrow** :

upper left cell row to dump data frame

**startcol** :

upper left cell column to dump data frame

**engine** : string, default None

write engine to use - you can also set this via the options `io.excel.xlsx.writer`, `io.excel.xls.writer`, and `io.excel.xlsm.writer`.

**merge\_cells** : boolean, default True

Write MultiIndex and Hierarchical Rows as merged cells.

**encoding: string, default None**

encoding of the resulting excel file. Only necessary for xlwt, other writers support unicode natively.

**inf\_rep : string, default 'inf'**

Representation for infinity (there is no native representation for infinity in Excel)

**freeze\_panes : tuple of integer (length 2), default None**

Specifies the one-based bottommost row and rightmost column that is to be frozen

New in version 0.20.0.

## Notes

If passing an existing ExcelWriter object, then the sheet will be added to the existing workbook. This can be used to save different DataFrames to one workbook:

```
>>> writer = pd.ExcelWriter('output.xlsx')
>>> df1.to_excel(writer, 'Sheet1')
>>> df2.to_excel(writer, 'Sheet2')
>>> writer.save()
```

For compatibility with to\_csv, to\_excel serializes lists and dicts to strings before writing.

## pandas.DataFrame.to\_feather

`DataFrame.to_feather(fname)`

write out the binary feather-format for DataFrames

New in version 0.20.0.

**Parameters fname : str**

string file path

## pandas.DataFrame.to\_gbq

`DataFrame.to_gbq(destination_table, project_id, chunksize=None, verbose=None, reauth=False, if_exists='fail', private_key=None, auth_local_webserver=False, table_schema=None)`

Write a DataFrame to a Google BigQuery table.

This function requires the `pandas-gbq` package.

Authentication to the Google BigQuery service is via OAuth 2.0.

- If `private_key` is provided, the library loads the JSON service account credentials and uses those to authenticate.
- If no `private_key` is provided, the library tries `application default credentials`.
- If application default credentials are not found or cannot be used with BigQuery, the library authenticates with user account credentials. In this case, you will be asked to grant permissions for product name 'pandas GBQ'.

**Parameters** `destination_table` : str

Name of table to be written, in the form 'dataset.tablename'.

**project\_id** : str

Google BigQuery Account project ID.

**chunksize** : int, optional

Number of rows to be inserted in each chunk from the dataframe. Set to `None` to load the whole dataframe at once.

**reauth** : bool, default False

Force Google BigQuery to reauthenticate the user. This is useful if multiple accounts are used.

**if\_exists** : str, default 'fail'

Behavior when the destination table exists. Value can be one of:

'fail' If table exists, do nothing.

'replace' If table exists, drop it, recreate it, and insert data.

'append' If table exists, insert data. Create if does not exist.

**private\_key** : str, optional

Service account private key in JSON format. Can be file path or string contents. This is useful for remote server authentication (eg. Jupyter/IPython notebook on remote host).

**auth\_local\_webserver** : bool, default False

Use the [local webserver flow](#) instead of the [console flow](#) when getting user credentials.

*New in version 0.2.0 of pandas-gbq.*

**table\_schema** : list of dicts, optional

List of BigQuery table fields to which according DataFrame columns conform to, e.g. `[{'name': 'col1', 'type': 'STRING'}, ...]`. If schema is not provided, it will be generated according to dtypes of DataFrame columns. See BigQuery API documentation on available names of a field.

*New in version 0.3.1 of pandas-gbq.*

**verbose** : boolean, deprecated

*Deprecated in Pandas-GBQ 0.4.0.* Use the [logging module](#) to adjust verbosity instead.

**See also:**

[pandas\\_gbq.to\\_gbq](#) This function in the pandas-gbq library.

[pandas.read\\_gbq](#) Read a DataFrame from Google BigQuery.

**pandas.DataFrame.to\_hdf**

`DataFrame.to_hdf` (*path\_or\_buf*, *key*, *\*\*kwargs*)

Write the contained data to an HDF5 file using HDFStore.

Hierarchical Data Format (HDF) is self-describing, allowing an application to interpret the structure and contents of a file with no outside information. One HDF file can hold a mix of related objects which can be accessed as a group or as individual objects.

In order to add another DataFrame or Series to an existing HDF file please use append mode and a different a key.

For more information see the [user guide](#).

**Parameters** `path_or_buf` : str or pandas.HDFStore

File path or HDFStore object.

**key** : str

Identifier for the group in the store.

**mode** : {'a', 'w', 'r+'}, default 'a'

Mode to open file:

- 'w': write, a new file is created (an existing file with the same name would be deleted).
- 'a': append, an existing file is opened for reading and writing, and if the file does not exist it is created.
- 'r+': similar to 'a', but the file must already exist.

**format** : {'fixed', 'table'}, default 'fixed'

Possible values:

- 'fixed': Fixed format. Fast writing/reading. Not-appendable, nor searchable.
- 'table': Table format. Write as a PyTables Table structure which may perform worse but allow more flexible operations like searching / selecting subsets of the data.

**append** : bool, default False

For Table formats, append the input data to the existing.

**data\_columns** : list of columns or True, optional

List of columns to create as indexed data columns for on-disk queries, or True to use all columns. By default only the axes of the object are indexed. See [Query via Data Columns](#). Applicable only to format='table'.

**complevel** : {0-9}, optional

Specifies a compression level for data. A value of 0 disables compression.

**complib** : {'zlib', 'lzo', 'bzip2', 'blosc'}, default 'zlib'

Specifies the compression library to be used. As of v0.20.2 these additional compressors for Blosc are supported (default if no compressor specified: 'blosc:blosclz'): {'blosc:blosclz', 'blosc:lz4', 'blosc:lz4hc', 'blosc:snappy', 'blosc:zlib', 'blosc:zstd'}. Specifying a compression library which is not available issues a ValueError.

**fletcher32** : bool, default False

If applying compression use the fletcher32 checksum.

**dropna** : bool, default False

If true, ALL nan rows will not be written to store.

**errors** : str, default 'strict'

Specifies how encoding and decoding errors are to be handled. See the errors argument for `open()` for a full list of options.

See also:

**DataFrame.read\_hdf** Read from HDF file.

**DataFrame.to\_parquet** Write a DataFrame to the binary parquet format.

**DataFrame.to\_sql** Write to a sql table.

**DataFrame.to\_feather** Write out feather-format for DataFrames.

**DataFrame.to\_csv** Write out to a csv file.

## Examples

```
>>> df = pd.DataFrame({'A': [1, 2, 3], 'B': [4, 5, 6]},
...                    index=['a', 'b', 'c'])
>>> df.to_hdf('data.h5', key='df', mode='w')
```

We can add another object to the same file:

```
>>> s = pd.Series([1, 2, 3, 4])
>>> s.to_hdf('data.h5', key='s')
```

Reading from HDF file:

```
>>> pd.read_hdf('data.h5', 'df')
A  B
a  1  4
b  2  5
c  3  6
>>> pd.read_hdf('data.h5', 's')
0    1
1    2
2    3
3    4
dtype: int64
```

Deleting file with data:

```
>>> import os
>>> os.remove('data.h5')
```

**pandas.DataFrame.to\_html**

`DataFrame.to_html` (*buf=None, columns=None, col\_space=None, header=True, index=True, na\_rep='NaN', formatters=None, float\_format=None, sparsify=None, index\_names=True, justify=None, bold\_rows=True, classes=None, escape=True, max\_rows=None, max\_cols=None, show\_dimensions=False, notebook=False, decimal='.', border=None, table\_id=None*)

Render a DataFrame as an HTML table.

*to\_html*-specific options:

**bold\_rows** [boolean, default True] Make the row labels bold in the output

**classes** [str or list or tuple, default None] CSS class(es) to apply to the resulting html table

**escape** [boolean, default True] Convert the characters <, >, and & to HTML-safe sequences.

**max\_rows** [int, optional] Maximum number of rows to show before truncating. If None, show all.

**max\_cols** [int, optional] Maximum number of columns to show before truncating. If None, show all.

**decimal** [string, default '.'] Character recognized as decimal separator, e.g. ',' in Europe

New in version 0.18.0.

**border** [int] A `border=border` attribute is included in the opening `<table>` tag. Default `pd.options.html.border`.

New in version 0.19.0.

**table\_id** [str, optional] A css id is included in the opening `<table>` tag if specified.

New in version 0.23.0.

**Parameters** **buf**: StringIO-like, optional

buffer to write to

**columns**: sequence, optional

the subset of columns to write; default None writes all columns

**col\_space**: int, optional

the minimum width of each column

**header**: bool, optional

whether to print column labels, default True

**index**: bool, optional

whether to print index (row) labels, default True

**na\_rep**: string, optional

string representation of NAN to use, default 'NaN'

**formatters**: list or dict of one-parameter functions, optional

formatter functions to apply to columns' elements by position or name, default None. The result of each function must be a unicode string. List must be of length equal to the number of columns.

**float\_format**: one-parameter function, optional

formatter function to apply to columns' elements if they are floats, default None.  
The result of this function must be a unicode string.

**sparsify** : bool, optional

Set to False for a DataFrame with a hierarchical index to print every multiindex key at each row, default True

**index\_names** : bool, optional

Prints the names of the indexes, default True

**line\_width** : int, optional

Width to wrap a line in characters, default no wrap

**table\_id** : str, optional

id for the <table> element create by to\_html

New in version 0.23.0.

**justify** : str, default None

How to justify the column labels. If None uses the option from the print configuration (controlled by set\_option), 'right' out of the box. Valid values are

- left
- right
- center
- justify
- justify-all
- start
- end
- inherit
- match-parent
- initial
- unset

#### Returns

**formatted** [string (or unicode, depending on data and options)]

### pandas.DataFrame.to\_json

`DataFrame.to_json` (*path\_or\_buf=None, orient=None, date\_format=None, double\_precision=10, force\_ascii=True, date\_unit='ms', default\_handler=None, lines=False, compression=None, index=True*)

Convert the object to a JSON string.

Note NaN's and None will be converted to null and datetime objects will be converted to UNIX timestamps.

**Parameters** **path\_or\_buf** : string or file handle, optional

File path or object. If not specified, the result is returned as a string.

**orient** : string

Indication of expected JSON string format.

- Series
  - default is 'index'
  - allowed values are: {'split','records','index'}
- DataFrame
  - default is 'columns'
  - allowed values are: {'split','records','index','columns','values'}
- The format of the JSON string
  - 'split' : dict like {'index' -> [index], 'columns' -> [columns], 'data' -> [values]}
  - 'records' : list like [{column -> value}, ... , {column -> value}]
  - 'index' : dict like {index -> {column -> value}}
  - 'columns' : dict like {column -> {index -> value}}
  - 'values' : just the values array
  - 'table' : dict like {'schema': {schema}, 'data': {data}} describing the data, and the data component is like `orient='records'`.

Changed in version 0.20.0.

**date\_format** : {None, 'epoch', 'iso'}

Type of date conversion. 'epoch' = epoch milliseconds, 'iso' = ISO8601. The default depends on the *orient*. For `orient='table'`, the default is 'iso'. For all other orients, the default is 'epoch'.

**double\_precision** : int, default 10

The number of decimal places to use when encoding floating point values.

**force\_ascii** : boolean, default True

Force encoded string to be ASCII.

**date\_unit** : string, default 'ms' (milliseconds)

The time unit to encode to, governs timestamp and ISO8601 precision. One of 's', 'ms', 'us', 'ns' for second, millisecond, microsecond, and nanosecond respectively.

**default\_handler** : callable, default None

Handler to call if object cannot otherwise be converted to a suitable format for JSON. Should receive a single argument which is the object to convert and return a serialisable object.

**lines** : boolean, default False

If 'orient' is 'records' write out line delimited json format. Will throw ValueError if incorrect 'orient' since others are not list like.

New in version 0.19.0.

**compression** : {None, 'gzip', 'bz2', 'zip', 'xz'}

A string representing the compression to use in the output file, only used when the first argument is a filename.

New in version 0.21.0.

**index** : boolean, default True

Whether to include the index values in the JSON string. Not including the index (index=False) is only supported when orient is 'split' or 'table'.

New in version 0.23.0.

**See also:**

[`pandas.read\_json`](#)

## Examples

```
>>> df = pd.DataFrame([[ 'a', 'b'], [ 'c', 'd']],
...                    index=[ 'row 1', 'row 2'],
...                    columns=[ 'col 1', 'col 2'])
>>> df.to_json(orient='split')
'{"columns":["col 1","col 2"],
  "index":["row 1","row 2"],
  "data":[["a","b"],["c","d"]]]'
```

Encoding/decoding a Dataframe using 'records' formatted JSON. Note that index labels are not preserved with this encoding.

```
>>> df.to_json(orient='records')
'[{"col 1":"a","col 2":"b"}, {"col 1":"c","col 2":"d"}]'
```

Encoding/decoding a Dataframe using 'index' formatted JSON:

```
>>> df.to_json(orient='index')
'{"row 1":{"col 1":"a","col 2":"b"},"row 2":{"col 1":"c","col 2":"d"}}'
```

Encoding/decoding a Dataframe using 'columns' formatted JSON:

```
>>> df.to_json(orient='columns')
'{"col 1":{"row 1":"a","row 2":"c"},"col 2":{"row 1":"b","row 2":"d"}}'
```

Encoding/decoding a Dataframe using 'values' formatted JSON:

```
>>> df.to_json(orient='values')
'[["a","b"],["c","d"]]'
```

Encoding with Table Schema

```
>>> df.to_json(orient='table')
'{"schema": {"fields": [{"name": "index", "type": "string"},
                        {"name": "col 1", "type": "string"},
                        {"name": "col 2", "type": "string"}],
  "primaryKey": "index",
  "pandas_version": "0.20.0"},
  "data": [{"index": "row 1", "col 1": "a", "col 2": "b"},
            {"index": "row 2", "col 1": "c", "col 2": "d"}]}'
```

**pandas.DataFrame.to\_latex**

`DataFrame.to_latex` (*buf=None, columns=None, col\_space=None, header=True, index=True, na\_rep='NaN', formatters=None, float\_format=None, sparsify=None, index\_names=True, bold\_rows=False, column\_format=None, longtable=None, escape=None, encoding=None, decimal='.', multicolumn=None, multicolumn\_format=None, multirow=None*)

Render an object to a tabular environment table. You can splice this into a LaTeX document. Requires `\usepackage{booktabs}`.

Changed in version 0.20.2: Added to Series

*to\_latex*-specific options:

**bold\_rows** [boolean, default False] Make the row labels bold in the output

**column\_format** [str, default None] The columns format as specified in [LaTeX table format](#) e.g 'rcl' for 3 columns

**longtable** [boolean, default will be read from the pandas config module] Default: False. Use a longtable environment instead of tabular. Requires adding a `\usepackage{longtable}` to your LaTeX preamble.

**escape** [boolean, default will be read from the pandas config module] Default: True. When set to False prevents from escaping latex special characters in column names.

**encoding** [str, default None] A string representing the encoding to use in the output file, defaults to 'ascii' on Python 2 and 'utf-8' on Python 3.

**decimal** [string, default '.'] Character recognized as decimal separator, e.g. ',' in Europe.

New in version 0.18.0.

**multicolumn** [boolean, default True] Use multicolumn to enhance MultiIndex columns. The default will be read from the config module.

New in version 0.20.0.

**multicolumn\_format** [str, default 'l'] The alignment for multicolumns, similar to *column\_format* The default will be read from the config module.

New in version 0.20.0.

**multirow** [boolean, default False] Use multirow to enhance MultiIndex rows. Requires adding a `\usepackage{multirow}` to your LaTeX preamble. Will print centered labels (instead of top-aligned) across the contained rows, separating groups via clines. The default will be read from the pandas config module.

New in version 0.20.0.

**pandas.DataFrame.to\_msgpack**

`DataFrame.to_msgpack` (*path\_or\_buf=None, encoding='utf-8', \*\*kwargs*)  
msgpack (serialize) object to input file path

THIS IS AN EXPERIMENTAL LIBRARY and the storage format may not be stable until a future release.

**Parameters** **path** : string File path, buffer-like, or None

if None, return generated string

**append** : boolean whether to append to an existing msgpack

(default is False)

**compress** : type of compressor (zlib or blosc), default to None (no compression)

### **pandas.DataFrame.to\_panel**

`DataFrame.to_panel()`

Transform long (stacked) format (DataFrame) into wide (3D, Panel) format.

Deprecated since version 0.20.0.

Currently the index of the DataFrame must be a 2-level MultiIndex. This may be generalized later

#### **Returns**

**panel** [Panel]

### **pandas.DataFrame.to\_parquet**

`DataFrame.to_parquet(fname, engine='auto', compression='snappy', **kwargs)`

Write a DataFrame to the binary parquet format.

New in version 0.21.0.

This function writes the dataframe as a [parquet file](#). You can choose different parquet backends, and have the option of compression. See [the user guide](#) for more details.

#### **Parameters fname** : str

String file path.

**engine** : {'auto', 'pyarrow', 'fastparquet'}, default 'auto'

Parquet library to use. If 'auto', then the option `io.parquet.engine` is used. The default `io.parquet.engine` behavior is to try 'pyarrow', falling back to 'fastparquet' if 'pyarrow' is unavailable.

**compression** : {'snappy', 'gzip', 'brotli', None}, default 'snappy'

Name of the compression to use. Use `None` for no compression.

#### **\*\*kwargs**

Additional arguments passed to the parquet library. See [pandas io](#) for more details.

#### **See also:**

[read\\_parquet](#) Read a parquet file.

[DataFrame.to\\_csv](#) Write a csv file.

[DataFrame.to\\_sql](#) Write to a sql table.

[DataFrame.to\\_hdf](#) Write to hdf.

#### **Notes**

This function requires either the [fastparquet](#) or [pyarrow](#) library.

## Examples

```
>>> df = pd.DataFrame(data={'col1': [1, 2], 'col2': [3, 4]})
>>> df.to_parquet('df.parquet.gz', compression='gzip')
>>> pd.read_parquet('df.parquet.gz')
   col1  col2
0     1     3
1     2     4
```

## pandas.DataFrame.to\_period

`DataFrame.to_period` (*freq=None, axis=0, copy=True*)

Convert DataFrame from DatetimeIndex to PeriodIndex with desired frequency (inferred from index if not passed)

### Parameters

**freq** [string, default]

**axis** : {0 or 'index', 1 or 'columns'}, default 0

The axis to convert (the index by default)

**copy** : boolean, default True

If False then underlying input data is not copied

### Returns

**ts** [TimeSeries with PeriodIndex]

## pandas.DataFrame.to\_pickle

`DataFrame.to_pickle` (*path, compression='infer', protocol=4*)

Pickle (serialize) object to file.

### Parameters

**path** : str

File path where the pickled object will be stored.

**compression** : {'infer', 'gzip', 'bz2', 'zip', 'xz', None}, default 'infer'

A string representing the compression to use in the output file. By default, infers from the file extension in specified path.

New in version 0.20.0.

**protocol** : int

Int which indicates which protocol should be used by the pickler, default HIGHEST\_PROTOCOL (see [R15] paragraph 12.1.2). The possible values for this parameter depend on the version of Python. For Python 2.x, possible values are 0, 1, 2. For Python >= 3.0, 3 is a valid value. For Python >= 3.4, 4 is a valid value. A negative value for the protocol parameter is equivalent to setting its value to HIGHEST\_PROTOCOL.

New in version 0.21.0.

See also:

`read_pickle` Load pickled pandas object (or any object) from file.

`DataFrame.to_hdf` Write DataFrame to an HDF5 file.

`DataFrame.to_sql` Write DataFrame to a SQL database.

`DataFrame.to_parquet` Write a DataFrame to the binary parquet format.

## Examples

```
>>> original_df = pd.DataFrame({"foo": range(5), "bar": range(5, 10)})
>>> original_df
   foo  bar
0    0    5
1    1    6
2    2    7
3    3    8
4    4    9
>>> original_df.to_pickle("./dummy.pkl")
```

```
>>> unpickled_df = pd.read_pickle("./dummy.pkl")
>>> unpickled_df
   foo  bar
0    0    5
1    1    6
2    2    7
3    3    8
4    4    9
```

```
>>> import os
>>> os.remove("./dummy.pkl")
```

## pandas.DataFrame.to\_records

`DataFrame.to_records` (*index=True, convert\_datetime64=None*)

Convert DataFrame to a NumPy record array.

Index will be put in the ‘index’ field of the record array if requested.

**Parameters** `index` : boolean, default True

Include index in resulting record array, stored in ‘index’ field.

**convert\_datetime64** : boolean, default None

Deprecated since version 0.23.0.

Whether to convert the index to `datetime.datetime` if it is a `DatetimeIndex`.

**Returns**

`y` [numpy.recarray]

**See also:**

`DataFrame.from_records` convert structured or record ndarray to DataFrame.

`numpy.recarray` ndarray that allows field access using attributes, analogous to typed columns in a spreadsheet.

## Examples

```
>>> df = pd.DataFrame({'A': [1, 2], 'B': [0.5, 0.75]},
...                    index=['a', 'b'])
>>> df
   A    B
a  1  0.5
b  2  0.75
>>> df.to_records()
rec.array([( 'a', 1, 0.5 ), ( 'b', 2, 0.75)],
          dtype=[('index', 'O'), ('A', '<i8'), ('B', '<f8')])
```

The index can be excluded from the record array:

```
>>> df.to_records(index=False)
rec.array([(1, 0.5 ), (2, 0.75)],
          dtype=[('A', '<i8'), ('B', '<f8')])
```

By default, timestamps are converted to *datetime.datetime*:

```
>>> df.index = pd.date_range('2018-01-01 09:00', periods=2, freq='min')
>>> df
              A    B
2018-01-01 09:00:00  1  0.50
2018-01-01 09:01:00  2  0.75
>>> df.to_records()
rec.array([(datetime.datetime(2018, 1, 1, 9, 0), 1, 0.5 ),
          (datetime.datetime(2018, 1, 1, 9, 1), 2, 0.75)],
          dtype=[('index', 'O'), ('A', '<i8'), ('B', '<f8')])
```

The timestamp conversion can be disabled so NumPy's *datetime64* data type is used instead:

```
>>> df.to_records(convert_datetime64=False)
rec.array([( '2018-01-01T09:00:00.000000000', 1, 0.5 ),
          ( '2018-01-01T09:01:00.000000000', 2, 0.75)],
          dtype=[('index', '<M8[ns]'), ('A', '<i8'), ('B', '<f8')])
```

## pandas.DataFrame.to\_sparse

`DataFrame.to_sparse` (*fill\_value=None, kind='block'*)

Convert to SparseDataFrame

### Parameters

**fill\_value** [float, default NaN]

**kind** [{ 'block', 'integer' }]

### Returns

**y** [SparseDataFrame]

**pandas.DataFrame.to\_stata**

`DataFrame.to_stata` (*fname*, *convert\_dates=None*, *write\_index=True*, *encoding='latin-1'*, *byteorder=None*, *time\_stamp=None*, *data\_label=None*, *variable\_labels=None*, *version=114*, *convert\_strl=None*)

Export Stata binary dta files.

**Parameters** **fname** : path (string), buffer or path object

string, path object (`pathlib.Path` or `py._path.local.LocalPath`) or object implementing a binary `write()` functions. If using a buffer then the buffer will not be automatically closed after the file data has been written.

**convert\_dates** : dict

Dictionary mapping columns containing datetime types to stata internal format to use when writing the dates. Options are 'tc', 'td', 'tm', 'tw', 'th', 'tq', 'ty'. Column can be either an integer or a name. Datetime columns that do not have a conversion type specified will be converted to 'tc'. Raises `NotImplementedError` if a datetime column has timezone information.

**write\_index** : bool

Write the index to Stata dataset.

**encoding** : str

Default is latin-1. Unicode is not supported.

**byteorder** : str

Can be ">", "<", "little", or "big". default is `sys.byteorder`.

**time\_stamp** : datetime

A datetime to use as file creation date. Default is the current time.

**data\_label** : str

A label for the data set. Must be 80 characters or smaller.

**variable\_labels** : dict

Dictionary containing columns as keys and variable labels as values. Each label must be 80 characters or smaller.

New in version 0.19.0.

**version** : {114, 117}

Version to use in the output dta file. Version 114 can be used read by Stata 10 and later. Version 117 can be read by Stata 13 or later. Version 114 limits string variables to 244 characters or fewer while 117 allows strings with lengths up to 2,000,000 characters.

New in version 0.23.0.

**convert\_strl** : list, optional

List of column names to convert to string columns to Stata StrL format. Only available if version is 117. Storing strings in the StrL format can produce smaller dta files if strings have more than 8 characters and values are repeated.

New in version 0.23.0.

**Raises** `NotImplementedError`

- If datetimes contain timezone information
- Column dtype is not representable in Stata

**ValueError**

- Columns listed in `convert_dates` are neither `datetime64[ns]` or `datetime.datetime`
- Column listed in `convert_dates` is not in `DataFrame`
- Categorical label contains more than 32,000 characters

New in version 0.19.0.

**See also:**

`pandas.read_stata` Import Stata data files

`pandas.io.stata.StataWriter` low-level writer for Stata data files

`pandas.io.stata.StataWriter117` low-level writer for version 117 files

**Examples**

```
>>> data.to_stata('./data_file.dta')
```

Or with dates

```
>>> data.to_stata('./date_data_file.dta', {2 : 'tw'})
```

Alternatively you can create an instance of the `StataWriter` class

```
>>> writer = StataWriter('./data_file.dta', data)
>>> writer.write_file()
```

With dates:

```
>>> writer = StataWriter('./date_data_file.dta', data, {2 : 'tw'})
>>> writer.write_file()
```

**pandas.DataFrame.to\_string**

`DataFrame.to_string`(*buf=None, columns=None, col\_space=None, header=True, index=True, na\_rep='NaN', formatters=None, float\_format=None, sparsify=None, index\_names=True, justify=None, line\_width=None, max\_rows=None, max\_cols=None, show\_dimensions=False*)

Render a `DataFrame` to a console-friendly tabular output.

**Parameters** `buf` : StringIO-like, optional

buffer to write to

**columns** : sequence, optional

the subset of columns to write; default `None` writes all columns

**col\_space** : int, optional

the minimum width of each column

**header** : bool, optional

Write out the column names. If a list of strings is given, it is assumed to be aliases for the column names

**index** : bool, optional

whether to print index (row) labels, default True

**na\_rep** : string, optional

string representation of NAN to use, default 'NaN'

**formatters** : list or dict of one-parameter functions, optional

formatter functions to apply to columns' elements by position or name, default None. The result of each function must be a unicode string. List must be of length equal to the number of columns.

**float\_format** : one-parameter function, optional

formatter function to apply to columns' elements if they are floats, default None. The result of this function must be a unicode string.

**sparsify** : bool, optional

Set to False for a DataFrame with a hierarchical index to print every multiindex key at each row, default True

**index\_names** : bool, optional

Prints the names of the indexes, default True

**line\_width** : int, optional

Width to wrap a line in characters, default no wrap

**table\_id** : str, optional

id for the <table> element create by to\_html

New in version 0.23.0.

**justify** : str, default None

How to justify the column labels. If None uses the option from the print configuration (controlled by set\_option), 'right' out of the box. Valid values are

- left
- right
- center
- justify
- justify-all
- start
- end
- inherit
- match-parent
- initial
- unset

**Returns****formatted** [string (or unicode, depending on data and options)]**pandas.DataFrame.to\_timestamp**`DataFrame.to_timestamp` (*freq=None, how='start', axis=0, copy=True*)Cast to DatetimeIndex of timestamps, at *beginning* of period**Parameters** **freq** : string, default frequency of PeriodIndex

Desired frequency

**how** : {'s', 'e', 'start', 'end'}

Convention for converting period to timestamp; start of period vs. end

**axis** : {0 or 'index', 1 or 'columns'}, default 0

The axis to convert (the index by default)

**copy** : boolean, default True

If false then underlying input data is not copied

**Returns****df** [DataFrame with DatetimeIndex]**pandas.DataFrame.to\_xarray**`DataFrame.to_xarray()`

Return an xarray object from the pandas object.

**Returns****a DataArray for a Series****a Dataset for a DataFrame****a DataArray for higher dims****Notes**See the [xarray docs](#)**Examples**

```
>>> df = pd.DataFrame({'A' : [1, 1, 2],
                        'B' : ['foo', 'bar', 'foo'],
                        'C' : np.arange(4.,7)})
>>> df
   A  B    C
0  1  foo  4.0
1  1  bar  5.0
2  2  foo  6.0
```

```

→ # noqa
* minor_axis (minor_axis) object 'first' 'second'

```

**pandas.DataFrame.transform**

`DataFrame.transform(func, *args, **kwargs)`

Call function producing a like-indexed NDFrame and return a NDFrame with the transformed values

New in version 0.20.0.

**Parameters** `func` : callable, string, dictionary, or list of string/callables

To apply to column

Accepted Combinations are:

- string function name
- function
- list of functions
- dict of column names -> functions (or list of functions)

**Returns**

**transformed** [NDFrame]

**See also:**

`pandas.NDFrame.aggregate`, `pandas.NDFrame.apply`

**Examples**

```

>>> df = pd.DataFrame(np.random.randn(10, 3), columns=['A', 'B', 'C'],
...                    index=pd.date_range('1/1/2000', periods=10))
df.iloc[3:7] = np.nan

```

```

>>> df.transform(lambda x: (x - x.mean()) / x.std())

```

## pandas.DataFrame.transpose

`DataFrame.transpose(*args, **kwargs)`

Transpose index and columns.

Reflect the DataFrame over its main diagonal by writing rows as columns and vice-versa. The property *T* is an accessor to the method `transpose()`.

**Parameters** `copy` : bool, default False

If True, the underlying data is copied. Otherwise (default), no copy is made if possible.

**\*args, \*\*kwargs**

Additional keywords have no effect but might be accepted for compatibility with numpy.

**Returns** `DataFrame`

The transposed DataFrame.

**See also:**

`numpy.transpose` Permute the dimensions of a given array.

## Notes

Transposing a DataFrame with mixed dtypes will result in a homogeneous DataFrame with the *object* dtype. In such a case, a copy of the data is always made.

## Examples

### Square DataFrame with homogeneous dtype

```
>>> d1 = {'col1': [1, 2], 'col2': [3, 4]}
>>> df1 = pd.DataFrame(data=d1)
>>> df1
   col1  col2
0     1     3
1     2     4
```

```
>>> df1_transposed = df1.T # or df1.transpose()
>>> df1_transposed
   0  1
col1 1  2
col2 3  4
```

When the dtype is homogeneous in the original DataFrame, we get a transposed DataFrame with the same dtype:

```
>>> df1.dtypes
col1    int64
col2    int64
dtype: object
>>> df1_transposed.dtypes
```

(continues on next page)

(continued from previous page)

```
0    int64
1    int64
dtype: object
```

**Non-square DataFrame with mixed dtypes**

```
>>> d2 = {'name': ['Alice', 'Bob'],
...       'score': [9.5, 8],
...       'employed': [False, True],
...       'kids': [0, 0]}
>>> df2 = pd.DataFrame(data=d2)
>>> df2
   name  score  employed  kids
0  Alice   9.5     False    0
1   Bob    8.0      True    0
```

```
>>> df2_transposed = df2.T # or df2.transpose()
>>> df2_transposed
      0    1
name   Alice  Bob
score    9.5    8
employed False  True
kids       0    0
```

When the DataFrame has mixed dtypes, we get a transposed DataFrame with the *object* dtype:

```
>>> df2.dtypes
name      object
score    float64
employed    bool
kids      int64
dtype: object
>>> df2_transposed.dtypes
0    object
1    object
dtype: object
```

**pandas.DataFrame.truediv**

`DataFrame.truediv` (*other*, *axis*='columns', *level*=None, *fill\_value*=None)

Floating division of dataframe and other, element-wise (binary operator *truediv*).

Equivalent to `dataframe / other`, but with support to substitute a *fill\_value* for missing data in one of the inputs.

**Parameters**

**other** [Series, DataFrame, or constant]

**axis** : {0, 1, 'index', 'columns'}

For Series input, axis to match Series index on

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

**fill\_value** : None or float value, default None

Fill existing missing (NaN) values, and any new element needed for successful DataFrame alignment, with this value before computation. If data in both corresponding DataFrame locations is missing the result will be missing

#### Returns

**result** [DataFrame]

#### See also:

`DataFrame.rtruediv`

#### Notes

Mismatched indices will be unioned together

#### Examples

None

### **pandas.DataFrame.truncate**

`DataFrame.truncate` (*before=None, after=None, axis=None, copy=True*)

Truncate a Series or DataFrame before and after some index value.

This is a useful shorthand for boolean indexing based on index values above or below certain thresholds.

**Parameters** **before** : date, string, int

Truncate all rows before this index value.

**after** : date, string, int

Truncate all rows after this index value.

**axis** : {0 or 'index', 1 or 'columns'}, optional

Axis to truncate. Truncates the index (rows) by default.

**copy** : boolean, default is True,

Return a copy of the truncated section.

**Returns** **type of caller**

The truncated Series or DataFrame.

#### See also:

`DataFrame.loc` Select a subset of a DataFrame by label.

`DataFrame.iloc` Select a subset of a DataFrame by position.

#### Notes

If the index being truncated contains only datetime values, *before* and *after* may be specified as strings instead of Timestamps.

## Examples

```
>>> df = pd.DataFrame({'A': ['a', 'b', 'c', 'd', 'e'],
...                     'B': ['f', 'g', 'h', 'i', 'j'],
...                     'C': ['k', 'l', 'm', 'n', 'o']},
...                     index=[1, 2, 3, 4, 5])
>>> df
   A  B  C
1  a  f  k
2  b  g  l
3  c  h  m
4  d  i  n
5  e  j  o
```

```
>>> df.truncate(before=2, after=4)
   A  B  C
2  b  g  l
3  c  h  m
4  d  i  n
```

The columns of a DataFrame can be truncated.

```
>>> df.truncate(before="A", after="B", axis="columns")
   A  B
1  a  f
2  b  g
3  c  h
4  d  i
5  e  j
```

For Series, only rows can be truncated.

```
>>> df['A'].truncate(before=2, after=4)
2    b
3    c
4    d
Name: A, dtype: object
```

The index values in `truncate` can be datetimes or string dates.

```
>>> dates = pd.date_range('2016-01-01', '2016-02-01', freq='s')
>>> df = pd.DataFrame(index=dates, data={'A': 1})
>>> df.tail()
                A
2016-01-31 23:59:56  1
2016-01-31 23:59:57  1
2016-01-31 23:59:58  1
2016-01-31 23:59:59  1
2016-02-01 00:00:00  1
```

```
>>> df.truncate(before=pd.Timestamp('2016-01-05'),
...             after=pd.Timestamp('2016-01-10')).tail()
                A
2016-01-09 23:59:56  1
2016-01-09 23:59:57  1
2016-01-09 23:59:58  1
```

(continues on next page)

(continued from previous page)

```
2016-01-09 23:59:59    1
2016-01-10 00:00:00    1
```

Because the index is a `DatetimeIndex` containing only dates, we can specify *before* and *after* as strings. They will be coerced to Timestamps before truncation.

```
>>> df.truncate('2016-01-05', '2016-01-10').tail()
      A
2016-01-09 23:59:56    1
2016-01-09 23:59:57    1
2016-01-09 23:59:58    1
2016-01-09 23:59:59    1
2016-01-10 00:00:00    1
```

Note that `truncate` assumes a 0 value for any unspecified time component (midnight). This differs from partial string slicing, which returns any partially matching dates.

```
>>> df.loc['2016-01-05':'2016-01-10', :].tail()
      A
2016-01-10 23:59:55    1
2016-01-10 23:59:56    1
2016-01-10 23:59:57    1
2016-01-10 23:59:58    1
2016-01-10 23:59:59    1
```

## pandas.DataFrame.tshift

`DataFrame.tshift` (*periods=1, freq=None, axis=0*)

Shift the time index, using the index's frequency if available.

**Parameters** `periods` : int

Number of periods to move, can be positive or negative

**freq** : `DateOffset`, `timedelta`, or time rule string, default `None`

Increment to use from the `tseries` module or time rule (e.g. 'EOM')

**axis** : int or basestring

Corresponds to the axis that contains the Index

**Returns**

**shifted** [NDFrame]

## Notes

If `freq` is not specified then tries to use the `freq` or `inferred_freq` attributes of the index. If neither of those attributes exist, a `ValueError` is thrown

## pandas.DataFrame.tz\_convert

`DataFrame.tz_convert` (*tz, axis=0, level=None, copy=True*)

Convert tz-aware axis to target time zone.

**Parameters****tz** [string or pytz.timezone object]**axis** [the axis to convert]**level** : int, str, default None

If axis is a MultiIndex, convert a specific level. Otherwise must be None

**copy** : boolean, default True

Also make a copy of the underlying data

**Raises** **TypeError**

If the axis is tz-naive.

**pandas.DataFrame.tz\_localize**`DataFrame.tz_localize(tz, axis=0, level=None, copy=True, ambiguous='raise')`

Localize tz-naive TimeSeries to target time zone.

**Parameters****tz** [string or pytz.timezone object]**axis** [the axis to localize]**level** : int, str, default None

If axis is a MultiIndex, localize a specific level. Otherwise must be None

**copy** : boolean, default True

Also make a copy of the underlying data

**ambiguous** : 'infer', bool-ndarray, 'NaT', default 'raise'

- 'infer' will attempt to infer fall dst-transition hours based on order
- bool-ndarray where True signifies a DST time, False designates a non-DST time (note that this flag is only applicable for ambiguous times)
- 'NaT' will return NaT where there are ambiguous times
- 'raise' will raise an AmbiguousTimeError if there are ambiguous times

**Raises** **TypeError**

If the TimeSeries is tz-aware and tz is not None.

**pandas.DataFrame.unstack**`DataFrame.unstack(level=-1, fill_value=None)`

Pivot a level of the (necessarily hierarchical) index labels, returning a DataFrame having a new level of column labels whose inner-most level consists of the pivoted index labels. If the index is not a MultiIndex, the output will be a Series (the analogue of stack when the columns are not a MultiIndex). The level involved will automatically get sorted.

**Parameters** **level** : int, string, or list of these, default -1 (last level)

Level(s) of index to unstack, can pass level name

**fill\_value** : replace NaN with this value if the unstack produces missing values  
New in version 0.18.0.

### Returns

**unstacked** [DataFrame or Series]

See also:

**DataFrame.pivot** Pivot a table based on column values.

**DataFrame.stack** Pivot a level of the column labels (inverse operation from *unstack*).

### Examples

```
>>> index = pd.MultiIndex.from_tuples([('one', 'a'), ('one', 'b'),
...                                   ('two', 'a'), ('two', 'b')])
>>> s = pd.Series(np.arange(1.0, 5.0), index=index)
>>> s
one  a    1.0
     b    2.0
two  a    3.0
     b    4.0
dtype: float64
```

```
>>> s.unstack(level=-1)
     a    b
one  1.0  2.0
two  3.0  4.0
```

```
>>> s.unstack(level=0)
     one  two
a    1.0   3.0
b    2.0   4.0
```

```
>>> df = s.unstack(level=0)
>>> df.unstack()
one  a    1.0
     b    2.0
two  a    3.0
     b    4.0
dtype: float64
```

### pandas.DataFrame.update

**DataFrame.update** (*other*, *join*='left', *overwrite*=True, *filter\_func*=None, *raise\_conflict*=False)

Modify in place using non-NA values from another DataFrame.

Aligns on indices. There is no return value.

**Parameters** **other** : DataFrame, or object coercible into a DataFrame

Should have at least one matching index/column label with the original DataFrame. If a Series is passed, its name attribute must be set, and that will be used as the column name to align with the original DataFrame.

**join** : {'left'}, default 'left'

Only left join is implemented, keeping the index and columns of the original object.

**overwrite** : bool, default True

How to handle non-NA values for overlapping keys:

- True: overwrite original DataFrame's values with values from *other*.
- False: only update values that are NA in the original DataFrame.

**filter\_func** : callable(1d-array) -> boolean 1d-array, optional

Can choose to replace values other than NA. Return True for values that should be updated.

**raise\_conflict** : bool, default False

If True, will raise a ValueError if the DataFrame and *other* both contain non-NA data in the same place.

#### Raises ValueError

When *raise\_conflict* is True and there's overlapping non-NA data.

**See also:**

`dict.update` Similar method for dictionaries.

`DataFrame.merge` For column(s)-on-columns(s) operations.

#### Examples

```
>>> df = pd.DataFrame({'A': [1, 2, 3],
...                    'B': [400, 500, 600]})
>>> new_df = pd.DataFrame({'B': [4, 5, 6],
...                        'C': [7, 8, 9]})
>>> df.update(new_df)
>>> df
   A  B
0  1  4
1  2  5
2  3  6
```

The DataFrame's length does not increase as a result of the update, only values at matching index/column labels are updated.

```
>>> df = pd.DataFrame({'A': ['a', 'b', 'c'],
...                    'B': ['x', 'y', 'z']})
>>> new_df = pd.DataFrame({'B': ['d', 'e', 'f', 'g', 'h', 'i']})
>>> df.update(new_df)
>>> df
   A  B
0  a  d
```

(continues on next page)

(continued from previous page)

```
1  b  e
2  c  f
```

For Series, it's name attribute must be set.

```
>>> df = pd.DataFrame({'A': ['a', 'b', 'c'],
...                     'B': ['x', 'y', 'z']})
>>> new_column = pd.Series(['d', 'e'], name='B', index=[0, 2])
>>> df.update(new_column)
>>> df
   A  B
0  a  d
1  b  y
2  c  e
>>> df = pd.DataFrame({'A': ['a', 'b', 'c'],
...                     'B': ['x', 'y', 'z']})
>>> new_df = pd.DataFrame({'B': ['d', 'e']}, index=[1, 2])
>>> df.update(new_df)
>>> df
   A  B
0  a  x
1  b  d
2  c  e
```

If *other* contains NaNs the corresponding values are not updated in the original dataframe.

```
>>> df = pd.DataFrame({'A': [1, 2, 3],
...                     'B': [400, 500, 600]})
>>> new_df = pd.DataFrame({'B': [4, np.nan, 6]})
>>> df.update(new_df)
>>> df
   A    B
0  1  4.0
1  2 500.0
2  3  6.0
```

## pandas.DataFrame.var

`DataFrame.var` (*axis=None, skipna=None, level=None, ddof=1, numeric\_only=None, \*\*kwargs*)

Return unbiased variance over requested axis.

Normalized by N-1 by default. This can be changed using the `ddof` argument

### Parameters

**axis** [{index (0), columns (1)}]

**skipna** : boolean, default True

Exclude NA/null values. If an entire row/column is NA, the result will be NA

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a Series

**ddof** : int, default 1

Delta Degrees of Freedom. The divisor used in calculations is  $N - \text{ddof}$ , where  $N$  represents the number of elements.

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

#### Returns

**var** [Series or DataFrame (if level specified)]

### pandas.DataFrame.where

`DataFrame.where(cond, other=nan, inplace=False, axis=None, level=None, errors='raise', try_cast=False, raise_on_error=None)`

Return an object of same shape as self and whose corresponding entries are from self where *cond* is True and otherwise are from *other*.

**Parameters** **cond** : boolean NDFrame, array-like, or callable

Where *cond* is True, keep the original value. Where False, replace with corresponding value from *other*. If *cond* is callable, it is computed on the NDFrame and should return boolean NDFrame or array. The callable must not change input NDFrame (though pandas doesn't check it).

New in version 0.18.1: A callable can be used as cond.

**other** : scalar, NDFrame, or callable

Entries where *cond* is False are replaced with corresponding value from *other*. If *other* is callable, it is computed on the NDFrame and should return scalar or NDFrame. The callable must not change input NDFrame (though pandas doesn't check it).

New in version 0.18.1: A callable can be used as other.

**inplace** : boolean, default False

Whether to perform the operation in place on the data

**axis** [alignment axis if needed, default None]

**level** [alignment level if needed, default None]

**errors** : str, {'raise', 'ignore'}, default 'raise'

- **raise** : allow exceptions to be raised
- **ignore** : suppress exceptions. On error return original object

Note that currently this parameter won't affect the results and will always coerce to a suitable dtype.

**try\_cast** : boolean, default False

try to cast the result back to the input type (if possible),

**raise\_on\_error** : boolean, default True

Whether to raise on invalid data types (e.g. trying to where on strings)

Deprecated since version 0.21.0.

### Returns

**wh** [same type as caller]

### See also:

`DataFrame.mask()`

### Notes

The `where` method is an application of the if-then idiom. For each element in the calling `DataFrame`, if `cond` is `True` the element is used; otherwise the corresponding element from the `DataFrame` `other` is used.

The signature for `DataFrame.where()` differs from `numpy.where()`. Roughly `df1.where(m, df2)` is equivalent to `np.where(m, df1, df2)`.

For further details and examples see the `where` documentation in [indexing](#).

### Examples

```
>>> s = pd.Series(range(5))
>>> s.where(s > 0)
0    NaN
1     1.0
2     2.0
3     3.0
4     4.0
```

```
>>> s.mask(s > 0)
0     0.0
1    NaN
2    NaN
3    NaN
4    NaN
```

```
>>> s.where(s > 1, 10)
0    10.0
1    10.0
2     2.0
3     3.0
4     4.0
```

```
>>> df = pd.DataFrame(np.arange(10).reshape(-1, 2), columns=['A', 'B'])
>>> m = df % 3 == 0
>>> df.where(m, -df)
   A  B
0  0 -1
1 -2  3
2 -4 -5
3  6 -7
4 -8  9
>>> df.where(m, -df) == np.where(m, df, -df)
   A  B
0  True True
```

(continues on next page)

(continued from previous page)

```

1  True  True
2  True  True
3  True  True
4  True  True
>>> df.where(m, -df) == df.mask(~m, -df)
      A      B
0  True  True
1  True  True
2  True  True
3  True  True
4  True  True

```

**pandas.DataFrame.xs****DataFrame.xs** (*key*, *axis=0*, *level=None*, *drop\_level=True*)

Returns a cross-section (row(s) or column(s)) from the Series/DataFrame. Defaults to cross-section on the rows (*axis=0*).

**Parameters** **key** : object

Some label contained in the index, or partially in a MultiIndex

**axis** : int, default 0

Axis to retrieve cross-section on

**level** : object, defaults to first n levels (*n=1* or *len(key)*)

In case of a key partially contained in a MultiIndex, indicate which levels are used. Levels can be referred by label or position.

**drop\_level** : boolean, default True

If False, returns object with same levels as self.

**Returns****xs** [Series or DataFrame]**Notes**

*xs* is only for getting, not setting values.

MultiIndex Slicers is a generic way to get/set values on any level or levels. It is a superset of *xs* functionality, see [MultiIndex Slicers](#)

**Examples**

```

>>> df
      A  B  C
a    4  5  2
b    4  0  9
c    9  7  3
>>> df.xs('a')
      A
a    4

```

(continues on next page)

(continued from previous page)

```

B      5
C      2
Name: a
>>> df.xs('C', axis=1)
a      2
b      9
c      3
Name: C

```

```

>>> df
      first second third   A  B  C  D
bar    one     1     4  1  8  9
      two     1     7  5  5  0
baz    one     1     6  6  8  0
      three    2     5  3  5  3
>>> df.xs(('baz', 'three'))
      A  B  C  D
third
2      5  3  5  3
>>> df.xs('one', level=1)
      A  B  C  D
first third
bar    1     4  1  8  9
baz    1     6  6  8  0
>>> df.xs(('baz', 2), level=[0, 'third'])
      A  B  C  D
second
three  5  3  5  3

```

### 34.4.2 Attributes and underlying data

#### Axes

<code>DataFrame.index</code>	The index (row labels) of the DataFrame.
<code>DataFrame.columns</code>	The column labels of the DataFrame.
<code>DataFrame.dtypes</code>	Return the dtypes in the DataFrame.
<code>DataFrame.ftypes</code>	Return the ftypes (indication of sparse/dense and dtype) in DataFrame.
<code>DataFrame.get_dtype_counts()</code>	Return counts of unique dtypes in this object.
<code>DataFrame.get_ftype_counts()</code>	(DEPRECATED) Return counts of unique ftypes in this object.
<code>DataFrame.select_dtypes([include, exclude])</code>	Return a subset of the DataFrame's columns based on the column dtypes.
<code>DataFrame.values</code>	Return a Numpy representation of the DataFrame.
<code>DataFrame.get_values()</code>	Return an ndarray after converting sparse values to dense.
<code>DataFrame.axes</code>	Return a list representing the axes of the DataFrame.
<code>DataFrame.ndim</code>	Return an int representing the number of axes / array dimensions.

Continued on next page

Table 63 – continued from previous page

<code>DataFrame.size</code>	Return an int representing the number of elements in this object.
<code>DataFrame.shape</code>	Return a tuple representing the dimensionality of the DataFrame.
<code>DataFrame.memory_usage([index, deep])</code>	Return the memory usage of each column in bytes.
<code>DataFrame.empty</code>	Indicator whether DataFrame is empty.
<code>DataFrame.is_copy</code>	

#### 34.4.2.1 pandas.DataFrame.is\_copy

`DataFrame.is_copy`

### 34.4.3 Conversion

<code>DataFrame.astype(dtype[, copy, errors])</code>	Cast a pandas object to a specified dtype <code>dtype</code> .
<code>DataFrame.convert_objects([convert_dates, ...])</code>	(DEPRECATED) Attempt to infer better dtype for object columns.
<code>DataFrame.infer_objects()</code>	Attempt to infer better dtypes for object columns.
<code>DataFrame.copy([deep])</code>	Make a copy of this object's indices and data.
<code>DataFrame.isna()</code>	Detect missing values.
<code>DataFrame.notna()</code>	Detect existing (non-missing) values.
<code>DataFrame.bool()</code>	Return the bool of a single element PandasObject.

### 34.4.4 Indexing, iteration

<code>DataFrame.head([n])</code>	Return the first <i>n</i> rows.
<code>DataFrame.at</code>	Access a single value for a row/column label pair.
<code>DataFrame.iat</code>	Access a single value for a row/column pair by integer position.
<code>DataFrame.loc</code>	Access a group of rows and columns by label(s) or a boolean array.
<code>DataFrame.iloc</code>	Purely integer-location based indexing for selection by position.
<code>DataFrame.insert(loc, column, value[, ...])</code>	Insert column into DataFrame at specified location.
<code>DataFrame.insert(loc, column, value[, ...])</code>	Insert column into DataFrame at specified location.
<code>DataFrame.__iter__()</code>	Iterate over infor axis
<code>DataFrame.items()</code>	Iterator over (column name, Series) pairs.
<code>DataFrame.keys()</code>	Get the 'info axis' (see Indexing for more)
<code>DataFrame.iteritems()</code>	Iterator over (column name, Series) pairs.
<code>DataFrame.iterrows()</code>	Iterate over DataFrame rows as (index, Series) pairs.
<code>DataFrame.itertuples([index, name])</code>	Iterate over DataFrame rows as namedtuples, with index value as first element of the tuple.
<code>DataFrame.lookup(row_labels, col_labels)</code>	Label-based "fancy indexing" function for DataFrame.
<code>DataFrame.pop(item)</code>	Return item and drop from frame.
<code>DataFrame.tail([n])</code>	Return the last <i>n</i> rows.
<code>DataFrame.xs(key[, axis, level, drop_level])</code>	Returns a cross-section (row(s) or column(s)) from the Series/DataFrame.

Continued on next page

Table 65 – continued from previous page

<code>DataFrame.get(key[, default])</code>	Get item from object for given key (DataFrame column, Panel slice, etc.).
<code>DataFrame.isin(values)</code>	Return boolean DataFrame showing whether each element in the DataFrame is contained in values.
<code>DataFrame.where(cond[, other, inplace, ...])</code>	Return an object of same shape as self and whose corresponding entries are from self where <i>cond</i> is True and otherwise are from <i>other</i> .
<code>DataFrame.mask(cond[, other, inplace, axis, ...])</code>	Return an object of same shape as self and whose corresponding entries are from self where <i>cond</i> is False and otherwise are from <i>other</i> .
<code>DataFrame.query(expr[, inplace])</code>	Query the columns of a frame with a boolean expression.

#### 34.4.4.1 pandas.DataFrame.\_\_iter\_\_

`DataFrame.__iter__()`  
Iterate over infor axis

For more information on `.at`, `.iat`, `.loc`, and `.iloc`, see the [indexing documentation](#).

#### 34.4.5 Binary operator functions

<code>DataFrame.add(other[, axis, level, fill_value])</code>	Addition of dataframe and other, element-wise (binary operator <i>add</i> ).
<code>DataFrame.sub(other[, axis, level, fill_value])</code>	Subtraction of dataframe and other, element-wise (binary operator <i>sub</i> ).
<code>DataFrame.mul(other[, axis, level, fill_value])</code>	Multiplication of dataframe and other, element-wise (binary operator <i>mul</i> ).
<code>DataFrame.div(other[, axis, level, fill_value])</code>	Floating division of dataframe and other, element-wise (binary operator <i>truediv</i> ).
<code>DataFrame.truediv(other[, axis, level, ...])</code>	Floating division of dataframe and other, element-wise (binary operator <i>truediv</i> ).
<code>DataFrame.floordiv(other[, axis, level, ...])</code>	Integer division of dataframe and other, element-wise (binary operator <i>floordiv</i> ).
<code>DataFrame.mod(other[, axis, level, fill_value])</code>	Modulo of dataframe and other, element-wise (binary operator <i>mod</i> ).
<code>DataFrame.pow(other[, axis, level, fill_value])</code>	Exponential power of dataframe and other, element-wise (binary operator <i>pow</i> ).
<code>DataFrame.dot(other)</code>	Matrix multiplication with DataFrame or Series objects.
<code>DataFrame.radd(other[, axis, level, fill_value])</code>	Addition of dataframe and other, element-wise (binary operator <i>radd</i> ).
<code>DataFrame.rsub(other[, axis, level, fill_value])</code>	Subtraction of dataframe and other, element-wise (binary operator <i>rsub</i> ).
<code>DataFrame.rmul(other[, axis, level, fill_value])</code>	Multiplication of dataframe and other, element-wise (binary operator <i>rmul</i> ).
<code>DataFrame.rdiv(other[, axis, level, fill_value])</code>	Floating division of dataframe and other, element-wise (binary operator <i>rtruediv</i> ).
<code>DataFrame.rtruediv(other[, axis, level, ...])</code>	Floating division of dataframe and other, element-wise (binary operator <i>rtruediv</i> ).

Continued on next page

Table 66 – continued from previous page

<code>DataFrame.rfloordiv(other[, axis, level, ...])</code>	Integer division of dataframe and other, element-wise (binary operator <i>rfloordiv</i> ).
<code>DataFrame.rmod(other[, axis, level, fill_value])</code>	Modulo of dataframe and other, element-wise (binary operator <i>rmod</i> ).
<code>DataFrame.rpow(other[, axis, level, fill_value])</code>	Exponential power of dataframe and other, element-wise (binary operator <i>rpow</i> ).
<code>DataFrame.lt(other[, axis, level])</code>	Wrapper for flexible comparison methods <i>lt</i>
<code>DataFrame.gt(other[, axis, level])</code>	Wrapper for flexible comparison methods <i>gt</i>
<code>DataFrame.le(other[, axis, level])</code>	Wrapper for flexible comparison methods <i>le</i>
<code>DataFrame.ge(other[, axis, level])</code>	Wrapper for flexible comparison methods <i>ge</i>
<code>DataFrame.ne(other[, axis, level])</code>	Wrapper for flexible comparison methods <i>ne</i>
<code>DataFrame.eq(other[, axis, level])</code>	Wrapper for flexible comparison methods <i>eq</i>
<code>DataFrame.combine(other, func[, fill_value, ...])</code>	Add two DataFrame objects and do not propagate NaN values, so if for a (column, time) one frame is missing a value, it will default to the other frame's value (which might be NaN as well)
<code>DataFrame.combine_first(other)</code>	Combine two DataFrame objects and default to non-null values in frame calling the method.

### 34.4.6 Function application, GroupBy & Window

<code>DataFrame.apply(func[, axis, broadcast, ...])</code>	Apply a function along an axis of the DataFrame.
<code>DataFrame.applymap(func)</code>	Apply a function to a Dataframe elementwise.
<code>DataFrame.pipe(func, *args, **kwargs)</code>	Apply <code>func(self, *args, **kwargs)</code>
<code>DataFrame.agg(func[, axis])</code>	Aggregate using one or more operations over the specified axis.
<code>DataFrame.aggregate(func[, axis])</code>	Aggregate using one or more operations over the specified axis.
<code>DataFrame.transform(func, *args, **kwargs)</code>	Call function producing a like-indexed NDFrame and return a NDFrame with the transformed values
<code>DataFrame.groupby([by, axis, level, ...])</code>	Group series using mapper (dict or key function, apply given function to group, return result as series) or by a series of columns.
<code>DataFrame.rolling(window[, min_periods, ...])</code>	Provides rolling window calculations.
<code>DataFrame.expanding([min_periods, center, axis])</code>	Provides expanding transformations.
<code>DataFrame.ewm([com, span, halflife, alpha, ...])</code>	Provides exponential weighted functions

### 34.4.7 Computations / Descriptive Stats

<code>DataFrame.abs()</code>	Return a Series/DataFrame with absolute numeric value of each element.
<code>DataFrame.all([axis, bool_only, skipna, level])</code>	Return whether all elements are True, potentially over an axis.
<code>DataFrame.any([axis, bool_only, skipna, level])</code>	Return whether any element is True over requested axis.
<code>DataFrame.clip([lower, upper, axis, inplace])</code>	Trim values at input threshold(s).
<code>DataFrame.clip_lower(threshold[, axis, inplace])</code>	Return copy of the input with values below a threshold truncated.

Continued on next page

Table 68 – continued from previous page

<code>DataFrame.clip_upper(threshold[, axis, inplace])</code>	Return copy of input with values above given value(s) truncated.
<code>DataFrame.compound([axis, skipna, level])</code>	Return the compound percentage of the values for the requested axis
<code>DataFrame.corr([method, min_periods])</code>	Compute pairwise correlation of columns, excluding NA/null values
<code>DataFrame.corrwith(other[, axis, drop])</code>	Compute pairwise correlation between rows or columns of two DataFrame objects.
<code>DataFrame.count([axis, level, numeric_only])</code>	Count non-NA cells for each column or row.
<code>DataFrame.cov([min_periods])</code>	Compute pairwise covariance of columns, excluding NA/null values.
<code>DataFrame.cummax([axis, skipna])</code>	Return cumulative maximum over a DataFrame or Series axis.
<code>DataFrame.cummin([axis, skipna])</code>	Return cumulative minimum over a DataFrame or Series axis.
<code>DataFrame.cumprod([axis, skipna])</code>	Return cumulative product over a DataFrame or Series axis.
<code>DataFrame.cumsum([axis, skipna])</code>	Return cumulative sum over a DataFrame or Series axis.
<code>DataFrame.describe([percentiles, include, ...])</code>	Generates descriptive statistics that summarize the central tendency, dispersion and shape of a dataset's distribution, excluding NaN values.
<code>DataFrame.diff([periods, axis])</code>	First discrete difference of element.
<code>DataFrame.eval(expr[, inplace])</code>	Evaluate a string describing operations on DataFrame columns.
<code>DataFrame.kurt([axis, skipna, level, ...])</code>	Return unbiased kurtosis over requested axis using Fisher's definition of kurtosis (kurtosis of normal == 0.0).
<code>DataFrame.kurtosis([axis, skipna, level, ...])</code>	Return unbiased kurtosis over requested axis using Fisher's definition of kurtosis (kurtosis of normal == 0.0).
<code>DataFrame.mad([axis, skipna, level])</code>	Return the mean absolute deviation of the values for the requested axis
<code>DataFrame.max([axis, skipna, level, ...])</code>	This method returns the maximum of the values in the object.
<code>DataFrame.mean([axis, skipna, level, ...])</code>	Return the mean of the values for the requested axis
<code>DataFrame.median([axis, skipna, level, ...])</code>	Return the median of the values for the requested axis
<code>DataFrame.min([axis, skipna, level, ...])</code>	This method returns the minimum of the values in the object.
<code>DataFrame.mode([axis, numeric_only])</code>	Gets the mode(s) of each element along the axis selected.
<code>DataFrame.pct_change([periods, fill_method, ...])</code>	Percentage change between the current and a prior element.
<code>DataFrame.prod([axis, skipna, level, ...])</code>	Return the product of the values for the requested axis
<code>DataFrame.product([axis, skipna, level, ...])</code>	Return the product of the values for the requested axis
<code>DataFrame.quantile([q, axis, numeric_only, ...])</code>	Return values at the given quantile over requested axis, a la numpy.percentile.
<code>DataFrame.rank([axis, method, numeric_only, ...])</code>	Compute numerical data ranks (1 through n) along axis.
<code>DataFrame.round([decimals])</code>	Round a DataFrame to a variable number of decimal places.

Continued on next page

Table 68 – continued from previous page

<code>DataFrame.sem([axis, skipna, level, ddof, ...])</code>	Return unbiased standard error of the mean over requested axis.
<code>DataFrame.skew([axis, skipna, level, ...])</code>	Return unbiased skew over requested axis Normalized by N-1
<code>DataFrame.sum([axis, skipna, level, ...])</code>	Return the sum of the values for the requested axis
<code>DataFrame.std([axis, skipna, level, ddof, ...])</code>	Return sample standard deviation over requested axis.
<code>DataFrame.var([axis, skipna, level, ddof, ...])</code>	Return unbiased variance over requested axis.
<code>DataFrame.nunique([axis, dropna])</code>	Return Series with number of distinct observations over requested axis.

### 34.4.8 Reindexing / Selection / Label manipulation

<code>DataFrame.add_prefix(prefix)</code>	Prefix labels with string <i>prefix</i> .
<code>DataFrame.add_suffix(suffix)</code>	Suffix labels with string <i>suffix</i> .
<code>DataFrame.align(other[, join, axis, level, ...])</code>	Align two objects on their axes with the specified join method for each axis Index
<code>DataFrame.at_time(time[, asof])</code>	Select values at particular time of day (e.g.
<code>DataFrame.between_time(start_time, end_time)</code>	Select values between particular times of the day (e.g., 9:00-9:30 AM).
<code>DataFrame.drop([labels, axis, index, ...])</code>	Drop specified labels from rows or columns.
<code>DataFrame.drop_duplicates([subset, keep, ...])</code>	Return DataFrame with duplicate rows removed, optionally only considering certain columns
<code>DataFrame.duplicated([subset, keep])</code>	Return boolean Series denoting duplicate rows, optionally only considering certain columns
<code>DataFrame.equals(other)</code>	Determines if two NDFrame objects contain the same elements.
<code>DataFrame.filter([items, like, regex, axis])</code>	Subset rows or columns of dataframe according to labels in the specified index.
<code>DataFrame.first(offset)</code>	Convenience method for subsetting initial periods of time series data based on a date offset.
<code>DataFrame.head([n])</code>	Return the first <i>n</i> rows.
<code>DataFrame.idxmax([axis, skipna])</code>	Return index of first occurrence of maximum over requested axis.
<code>DataFrame.idxmin([axis, skipna])</code>	Return index of first occurrence of minimum over requested axis.
<code>DataFrame.last(offset)</code>	Convenience method for subsetting final periods of time series data based on a date offset.
<code>DataFrame.reindex([labels, index, columns, ...])</code>	Conform DataFrame to new index with optional filling logic, placing NA/NaN in locations having no value in the previous index.
<code>DataFrame.reindex_axis(labels[, axis, ...])</code>	Conform input object to new index with optional filling logic, placing NA/NaN in locations having no value in the previous index.
<code>DataFrame.reindex_like(other[, method, ...])</code>	Return an object with matching indices to myself.
<code>DataFrame.rename([mapper, index, columns, ...])</code>	Alter axes labels.
<code>DataFrame.rename_axis(mapper[, axis, copy, ...])</code>	Alter the name of the index or columns.

Continued on next page

Table 69 – continued from previous page

<code>DataFrame.reset_index([level, drop, ...])</code>	For DataFrame with multi-level index, return new DataFrame with labeling information in the columns under the index names, defaulting to 'level_0', 'level_1', etc.
<code>DataFrame.sample([n, frac, replace, ...])</code>	Return a random sample of items from an axis of object.
<code>DataFrame.select(crit[, axis])</code>	(DEPRECATED) Return data corresponding to axis labels matching criteria
<code>DataFrame.set_axis(labels[, axis, inplace])</code>	Assign desired index to given axis.
<code>DataFrame.set_index(keys[, drop, append, ...])</code>	Set the DataFrame index (row labels) using one or more existing columns.
<code>DataFrame.tail([n])</code>	Return the last <i>n</i> rows.
<code>DataFrame.take(indices[, axis, convert, is_copy])</code>	Return the elements in the given <i>positional</i> indices along an axis.
<code>DataFrame.truncate([before, after, axis, copy])</code>	Truncate a Series or DataFrame before and after some index value.

### 34.4.9 Missing data handling

<code>DataFrame.dropna([axis, how, thresh, ...])</code>	Remove missing values.
<code>DataFrame.fillna([value, method, axis, ...])</code>	Fill NA/NaN values using the specified method
<code>DataFrame.replace([to_replace, value, ...])</code>	Replace values given in <i>to_replace</i> with <i>value</i> .
<code>DataFrame.interpolate([method, axis, limit, ...])</code>	Interpolate values according to different methods.

### 34.4.10 Reshaping, sorting, transposing

<code>DataFrame.pivot([index, columns, values])</code>	Return reshaped DataFrame organized by given index / column values.
<code>DataFrame.pivot_table([values, index, ...])</code>	Create a spreadsheet-style pivot table as a DataFrame.
<code>DataFrame.reorder_levels(order[, axis])</code>	Rearrange index levels using input order.
<code>DataFrame.sort_values(by[, axis, ascending, ...])</code>	Sort by the values along either axis
<code>DataFrame.sort_index([axis, level, ...])</code>	Sort object by labels (along an axis)
<code>DataFrame.nlargest(n, columns[, keep])</code>	Return the first <i>n</i> rows ordered by <i>columns</i> in descending order.
<code>DataFrame.nsmallest(n, columns[, keep])</code>	Get the rows of a DataFrame sorted by the <i>n</i> smallest values of <i>columns</i> .
<code>DataFrame.swaplevel([i, j, axis])</code>	Swap levels <i>i</i> and <i>j</i> in a MultiIndex on a particular axis
<code>DataFrame.stack([level, dropna])</code>	Stack the prescribed level(s) from columns to index.
<code>DataFrame.unstack([level, fill_value])</code>	Pivot a level of the (necessarily hierarchical) index labels, returning a DataFrame having a new level of column labels whose inner-most level consists of the pivoted index labels.
<code>DataFrame.swapaxes(axis1, axis2[, copy])</code>	Interchange axes and swap values axes appropriately
<code>DataFrame.melt([id_vars, value_vars, ...])</code>	“Unpivots” a DataFrame from wide format to long format, optionally leaving identifier variables set.
<code>DataFrame.squeeze([axis])</code>	Squeeze length 1 dimensions.
<code>DataFrame.to_panel()</code>	(DEPRECATED) Transform long (stacked) format (DataFrame) into wide (3D, Panel) format.

Continued on next page

Table 71 – continued from previous page

<code>DataFrame.to_xarray()</code>	Return an xarray object from the pandas object.
<code>DataFrame.T</code>	Transpose index and columns.
<code>DataFrame.transpose(*args, **kwargs)</code>	Transpose index and columns.

### 34.4.11 Combining / joining / merging

<code>DataFrame.append(other[, ignore_index, ...])</code>	Append rows of <i>other</i> to the end of this frame, returning a new object.
<code>DataFrame.assign(**kwargs)</code>	Assign new columns to a DataFrame, returning a new object (a copy) with the new columns added to the original ones.
<code>DataFrame.join(other[, on, how, lsuffix, ...])</code>	Join columns with other DataFrame either on index or on a key column.
<code>DataFrame.merge(right[, how, on, left_on, ...])</code>	Merge DataFrame objects by performing a database-style join operation by columns or indexes.
<code>DataFrame.update(other[, join, overwrite, ...])</code>	Modify in place using non-NA values from another DataFrame.

### 34.4.12 Time series-related

<code>DataFrame.asfreq(freq[, method, how, ...])</code>	Convert TimeSeries to specified frequency.
<code>DataFrame.asof(where[, subset])</code>	The last row without any NaN is taken (or the last row without NaN considering only the subset of columns in the case of a DataFrame)
<code>DataFrame.shift([periods, freq, axis])</code>	Shift index by desired number of periods with an optional time freq
<code>DataFrame.slice_shift([periods, axis])</code>	Equivalent to <i>shift</i> without copying data.
<code>DataFrame.tshift([periods, freq, axis])</code>	Shift the time index, using the index's frequency if available.
<code>DataFrame.first_valid_index()</code>	Return index for first non-NA/null value.
<code>DataFrame.last_valid_index()</code>	Return index for last non-NA/null value.
<code>DataFrame.resample(rule[, how, axis, ...])</code>	Convenience method for frequency conversion and resampling of time series.
<code>DataFrame.to_period([freq, axis, copy])</code>	Convert DataFrame from DatetimeIndex to PeriodIndex with desired frequency (inferred from index if not passed)
<code>DataFrame.to_timestamp([freq, how, axis, copy])</code>	Cast to DatetimeIndex of timestamps, at <i>beginning</i> of period
<code>DataFrame.tz_convert(tz[, axis, level, copy])</code>	Convert tz-aware axis to target time zone.
<code>DataFrame.tz_localize(tz[, axis, level, ...])</code>	Localize tz-naive TimeSeries to target time zone.

### 34.4.13 Plotting

`DataFrame.plot` is both a callable method and a namespace attribute for specific plotting methods of the form `DataFrame.plot.<kind>`.

<code>DataFrame.plot([x, y, kind, ax, ...])</code>	DataFrame plotting accessor and method
--	--

<code>DataFrame.plot.area(x, y)</code>	Area plot
<code>DataFrame.plot.bar(x, y)</code>	Vertical bar plot.
<code>DataFrame.plot.barh(x, y)</code>	Make a horizontal bar plot.
<code>DataFrame.plot.box([by])</code>	Make a box plot of the DataFrame columns.
<code>DataFrame.plot.density([bw_method, ind])</code>	Generate Kernel Density Estimate plot using Gaussian kernels.
<code>DataFrame.plot.hexbin(x, y[, C, ...])</code>	Generate a hexagonal binning plot.
<code>DataFrame.plot.hist([by, bins])</code>	Draw one histogram of the DataFrame's columns.
<code>DataFrame.plot.kde([bw_method, ind])</code>	Generate Kernel Density Estimate plot using Gaussian kernels.
<code>DataFrame.plot.line(x, y)</code>	Plot DataFrame columns as lines.
<code>DataFrame.plot.pie([y])</code>	Generate a pie plot.
<code>DataFrame.plot.scatter(x, y[, s, c])</code>	Create a scatter plot with varying marker point size and color.

#### 34.4.13.1 pandas.DataFrame.plot.area

`DataFrame.plot.area` (*x=None, y=None, \*\*kws*)

Area plot

**Parameters** *x, y* : label or position, optional

Coordinates for each point.

**\*\*kws** : optional

Additional keyword arguments are documented in `pandas.DataFrame.plot()`.

**Returns**

**axes** [`matplotlib.axes.Axes` or `numpy.ndarray` of them]

#### 34.4.13.2 pandas.DataFrame.plot.bar

`DataFrame.plot.bar` (*x=None, y=None, \*\*kws*)

Vertical bar plot.

A bar plot is a plot that presents categorical data with rectangular bars with lengths proportional to the values that they represent. A bar plot shows comparisons among discrete categories. One axis of the plot shows the specific categories being compared, and the other axis represents a measured value.

**Parameters** *x* : label or position, optional

Allows plotting of one column versus another. If not specified, the index of the DataFrame is used.

*y* : label or position, optional

Allows plotting of one column versus another. If not specified, all numerical columns are used.

**\*\*kws**

Additional keyword arguments are documented in `pandas.DataFrame.plot()`.

**Returns** **axes** : `matplotlib.axes.Axes` or `np.ndarray` of them

An ndarray is returned with one `matplotlib.axes.Axes` per column when `subplots=True`.

See also:

`pandas.DataFrame.plot.barh` Horizontal bar plot.

`pandas.DataFrame.plot` Make plots of a DataFrame.

`matplotlib.pyplot.bar` Make a bar plot with matplotlib.

## Examples

Basic plot.

```
>>> df = pd.DataFrame({'lab':['A', 'B', 'C'], 'val':[10, 30, 20]})
>>> ax = df.plot.bar(x='lab', y='val', rot=0)
```

Plot a whole dataframe to a bar plot. Each column is assigned a distinct color, and each row is nested in a group along the horizontal axis.

```
>>> speed = [0.1, 17.5, 40, 48, 52, 69, 88]
>>> lifespan = [2, 8, 70, 1.5, 25, 12, 28]
>>> index = ['snail', 'pig', 'elephant',
...         'rabbit', 'giraffe', 'coyote', 'horse']
>>> df = pd.DataFrame({'speed': speed,
...                   'lifespan': lifespan}, index=index)
>>> ax = df.plot.bar(rot=0)
```

Instead of nesting, the figure can be split by column with `subplots=True`. In this case, a `numpy.ndarray` of `matplotlib.axes.Axes` are returned.

```
>>> axes = df.plot.bar(rot=0, subplots=True)
>>> axes[1].legend(loc=2)
```

Plot a single column.

```
>>> ax = df.plot.bar(y='speed', rot=0)
```

Plot only selected categories for the DataFrame.

```
>>> ax = df.plot.bar(x='lifespan', rot=0)
```

### 34.4.13.3 pandas.DataFrame.plot.barh

`DataFrame.plot.barh` (`x=None`, `y=None`, `**kws`)

Make a horizontal bar plot.

A horizontal bar plot is a plot that presents quantitative data with rectangular bars with lengths proportional to the values that they represent. A bar plot shows comparisons among discrete categories. One axis of the plot shows the specific categories being compared, and the other axis represents a measured value.

**Parameters** `x` : label or position, default `DataFrame.index`

Column to be used for categories.

`y` : label or position, default All numeric columns in dataframe

Columns to be plotted from the DataFrame.

**\*\*kwds**

Keyword arguments to pass on to `pandas.DataFrame.plot()`.

### Returns

**axes** [`matplotlib.axes.Axes` or `numpy.ndarray` of them.]

See also:

**`pandas.DataFrame.plot.bar`** Vertical bar plot.

**`pandas.DataFrame.plot`** Make plots of DataFrame using matplotlib.

**`matplotlib.axes.Axes.bar`** Plot a vertical bar plot using matplotlib.

## Examples

Basic example

```
>>> df = pd.DataFrame({'lab': ['A', 'B', 'C'], 'val': [10, 30, 20]})
>>> ax = df.plot.barh(x='lab', y='val')
```

Plot a whole DataFrame to a horizontal bar plot

```
>>> speed = [0.1, 17.5, 40, 48, 52, 69, 88]
>>> lifespan = [2, 8, 70, 1.5, 25, 12, 28]
>>> index = ['snail', 'pig', 'elephant',
...         'rabbit', 'giraffe', 'coyote', 'horse']
>>> df = pd.DataFrame({'speed': speed,
...                   'lifespan': lifespan}, index=index)
>>> ax = df.plot.barh()
```

Plot a column of the DataFrame to a horizontal bar plot

```
>>> speed = [0.1, 17.5, 40, 48, 52, 69, 88]
>>> lifespan = [2, 8, 70, 1.5, 25, 12, 28]
>>> index = ['snail', 'pig', 'elephant',
...         'rabbit', 'giraffe', 'coyote', 'horse']
>>> df = pd.DataFrame({'speed': speed,
...                   'lifespan': lifespan}, index=index)
>>> ax = df.plot.barh(y='speed')
```

Plot DataFrame versus the desired column

```
>>> speed = [0.1, 17.5, 40, 48, 52, 69, 88]
>>> lifespan = [2, 8, 70, 1.5, 25, 12, 28]
>>> index = ['snail', 'pig', 'elephant',
...         'rabbit', 'giraffe', 'coyote', 'horse']
>>> df = pd.DataFrame({'speed': speed,
...                   'lifespan': lifespan}, index=index)
>>> ax = df.plot.barh(x='lifespan')
```

### 34.4.13.4 pandas.DataFrame.plot.box

`DataFrame.plot.box` (*by=None, \*\*kws*)

Make a box plot of the DataFrame columns.

A box plot is a method for graphically depicting groups of numerical data through their quartiles. The box extends from the Q1 to Q3 quartile values of the data, with a line at the median (Q2). The whiskers extend from the edges of box to show the range of the data. The position of the whiskers is set by default to  $1.5 \times \text{IQR}$  ( $\text{IQR} = Q3 - Q1$ ) from the edges of the box. Outlier points are those past the end of the whiskers.

For further details see Wikipedia's entry for [boxplot](#).

A consideration when using this chart is that the box and the whiskers can overlap, which is very common when plotting small sets of data.

**Parameters** *by* : string or sequence

Column in the DataFrame to group by.

**\*\*kws** : optional

Additional keywords are documented in `pandas.DataFrame.plot()`.

**Returns**

**axes** [`matplotlib.axes.Axes` or `numpy.ndarray` of them]

See also:

`pandas.DataFrame.boxplot` Another method to draw a box plot.

`pandas.Series.plot.box` Draw a box plot from a Series object.

`matplotlib.pyplot.boxplot` Draw a box plot in matplotlib.

### Examples

Draw a box plot from a DataFrame with four columns of randomly generated data.

```
>>> data = np.random.randn(25, 4)
>>> df = pd.DataFrame(data, columns=list('ABCD'))
>>> ax = df.plot.box()
```

### 34.4.13.5 pandas.DataFrame.plot.density

`DataFrame.plot.density` (*bw\_method=None, ind=None, \*\*kws*)

Generate Kernel Density Estimate plot using Gaussian kernels.

In statistics, [kernel density estimation](#) (KDE) is a non-parametric way to estimate the probability density function (PDF) of a random variable. This function uses Gaussian kernels and includes automatic bandwidth determination.

**Parameters** *bw\_method* : str, scalar or callable, optional

The method used to calculate the estimator bandwidth. This can be 'scott', 'silverman', a scalar constant or a callable. If None (default), 'scott' is used. See `scipy.stats.gaussian_kde` for more information.

**ind** : NumPy array or integer, optional

Evaluation points for the estimated PDF. If `None` (default), 1000 equally spaced points are used. If `ind` is a NumPy array, the KDE is evaluated at the points passed. If `ind` is an integer, `ind` number of equally spaced points are used.

**\*\*kwds** : optional

Additional keyword arguments are documented in `pandas.DataFrame.plot()`.

### Returns

**axes** [matplotlib.axes.Axes or numpy.ndarray of them]

**See also:**

**scipy.stats.gaussian\_kde** Representation of a kernel-density estimate using Gaussian kernels. This is the function used internally to estimate the PDF.

**Series.plot.kde** Generate a KDE plot for a Series.

### Examples

Given several Series of points randomly sampled from unknown distributions, estimate their PDFs using KDE with automatic bandwidth determination and plot the results, evaluating them at 1000 equally spaced points (default):

```
>>> df = pd.DataFrame({
...     'x': [1, 2, 2.5, 3, 3.5, 4, 5],
...     'y': [4, 4, 4.5, 5, 5.5, 6, 6],
... })
>>> ax = df.plot.kde()
```

A scalar bandwidth can be specified. Using a small bandwidth value can lead to overfitting, while using a large bandwidth value may result in underfitting:

```
>>> ax = df.plot.kde(bw_method=0.3)
```

```
>>> ax = df.plot.kde(bw_method=3)
```

Finally, the `ind` parameter determines the evaluation points for the plot of the estimated PDF:

```
>>> ax = df.plot.kde(ind=[1, 2, 3, 4, 5, 6])
```

#### 34.4.13.6 pandas.DataFrame.plot.hexbin

`DataFrame.plot.hexbin(x, y, C=None, reduce_C_function=None, gridsize=None, **kwds)`

Generate a hexagonal binning plot.

Generate a hexagonal binning plot of `x` versus `y`. If `C` is `None` (the default), this is a histogram of the number of occurrences of the observations at `(x[i], y[i])`.

If `C` is specified, specifies values at given coordinates `(x[i], y[i])`. These values are accumulated for each hexagonal bin and then reduced according to `reduce_C_function`, having as default the NumPy's mean function (`numpy.mean()`). (If `C` is specified, it must also be a 1-D sequence of the same length as `x` and `y`, or a column label.)

**Parameters** `x` : int or str

The column label or position for x points.

**y** : int or str

The column label or position for y points.

**C** : int or str, optional

The column label or position for the value of (x, y) point.

**reduce\_C\_function** : callable, default *np.mean*

Function of one argument that reduces all the values in a bin to a single number (e.g. *np.mean*, *np.max*, *np.sum*, *np.std*).

**gridsize** : int or tuple of (int, int), default 100

The number of hexagons in the x-direction. The corresponding number of hexagons in the y-direction is chosen in a way that the hexagons are approximately regular. Alternatively, gridsize can be a tuple with two elements specifying the number of hexagons in the x-direction and the y-direction.

**\*\*kwds**

Additional keyword arguments are documented in *pandas.DataFrame.plot()*.

**Returns** *matplotlib.AxesSubplot*

The matplotlib *Axes* on which the hexbin is plotted.

**See also:**

*DataFrame.plot* Make plots of a DataFrame.

*matplotlib.pyplot.hexbin* hexagonal binning plot using matplotlib, the matplotlib function that is used under the hood.

## Examples

The following examples are generated with random data from a normal distribution.

```
>>> n = 10000
>>> df = pd.DataFrame({'x': np.random.randn(n),
...                    'y': np.random.randn(n)})
>>> ax = df.plot.hexbin(x='x', y='y', gridsize=20)
```

The next example uses *C* and *np.sum* as *reduce\_C\_function*. Note that 'observations' values ranges from 1 to 5 but the result plot shows values up to more than 25. This is because of the *reduce\_C\_function*.

```
>>> n = 500
>>> df = pd.DataFrame({
...     'coord_x': np.random.uniform(-3, 3, size=n),
...     'coord_y': np.random.uniform(30, 50, size=n),
...     'observations': np.random.randint(1, 5, size=n)
... })
>>> ax = df.plot.hexbin(x='coord_x',
...                     y='coord_y',
...                     C='observations',
...                     reduce_C_function=np.sum,
```

(continues on next page)

(continued from previous page)

```
...         gridsize=10,
...         cmap="viridis")
```

### 34.4.13.7 pandas.DataFrame.plot.hist

`DataFrame.plot.hist` (*by=None, bins=10, \*\*kws*)

Draw one histogram of the DataFrame's columns.

A histogram is a representation of the distribution of data. This function groups the values of all given Series in the DataFrame into bins and draws all bins in one `matplotlib.axes.Axes`. This is useful when the DataFrame's Series are in a similar scale.

**Parameters** *by* : str or sequence, optional

Column in the DataFrame to group by.

*bins* : int, default 10

Number of histogram bins to be used.

**\*\*kws**

Additional keyword arguments are documented in `pandas.DataFrame.plot()`.

**Returns**

*axes* [matplotlib.AxesSubplot histogram.]

See also:

`DataFrame.hist` Draw histograms per DataFrame's Series.

`Series.hist` Draw a histogram with Series' data.

### Examples

When we draw a dice 6000 times, we expect to get each value around 1000 times. But when we draw two dices and sum the result, the distribution is going to be quite different. A histogram illustrates those distributions.

```
>>> df = pd.DataFrame(
...     np.random.randint(1, 7, 6000),
...     columns = ['one'])
>>> df['two'] = df['one'] + np.random.randint(1, 7, 6000)
>>> ax = df.plot.hist(bins=12, alpha=0.5)
```

### 34.4.13.8 pandas.DataFrame.plot.kde

`DataFrame.plot.kde` (*bw\_method=None, ind=None, \*\*kws*)

Generate Kernel Density Estimate plot using Gaussian kernels.

In statistics, [kernel density estimation](#) (KDE) is a non-parametric way to estimate the probability density function (PDF) of a random variable. This function uses Gaussian kernels and includes automatic bandwidth determination.

**Parameters** *bw\_method* : str, scalar or callable, optional

The method used to calculate the estimator bandwidth. This can be 'scott', 'silverman', a scalar constant or a callable. If None (default), 'scott' is used. See `scipy.stats.gaussian_kde` for more information.

**ind** : NumPy array or integer, optional

Evaluation points for the estimated PDF. If None (default), 1000 equally spaced points are used. If *ind* is a NumPy array, the KDE is evaluated at the points passed. If *ind* is an integer, *ind* number of equally spaced points are used.

**\*\*kwargs** : optional

Additional keyword arguments are documented in `pandas.DataFrame.plot()`.

### Returns

**axes** [matplotlib.axes.Axes or numpy.ndarray of them]

See also:

`scipy.stats.gaussian_kde` Representation of a kernel-density estimate using Gaussian kernels. This is the function used internally to estimate the PDF.

`Series.plot.kde` Generate a KDE plot for a Series.

### Examples

Given several Series of points randomly sampled from unknown distributions, estimate their PDFs using KDE with automatic bandwidth determination and plot the results, evaluating them at 1000 equally spaced points (default):

```
>>> df = pd.DataFrame({
...     'x': [1, 2, 2.5, 3, 3.5, 4, 5],
...     'y': [4, 4, 4.5, 5, 5.5, 6, 6],
... })
>>> ax = df.plot.kde()
```

A scalar bandwidth can be specified. Using a small bandwidth value can lead to overfitting, while using a large bandwidth value may result in underfitting:

```
>>> ax = df.plot.kde(bw_method=0.3)
```

```
>>> ax = df.plot.kde(bw_method=3)
```

Finally, the *ind* parameter determines the evaluation points for the plot of the estimated PDF:

```
>>> ax = df.plot.kde(ind=[1, 2, 3, 4, 5, 6])
```

#### 34.4.13.9 pandas.DataFrame.plot.line

`DataFrame.plot.line` (*x=None, y=None, \*\*kwargs*)

Plot DataFrame columns as lines.

This function is useful to plot lines using DataFrame's values as coordinates.

**Parameters** *x* : int or str, optional

Columns to use for the horizontal axis. Either the location or the label of the columns to be used. By default, it will use the DataFrame indices.

**y** : int, str, or list of them, optional

The values to be plotted. Either the location or the label of the columns to be used. By default, it will use the remaining DataFrame numeric columns.

**\*\*kwds**

Keyword arguments to pass on to `pandas.DataFrame.plot()`.

**Returns** `axes` : `matplotlib.axes.Axes` or `numpy.ndarray`

Returns an ndarray when `subplots=True`.

**See also:**

`matplotlib.pyplot.plot` Plot y versus x as lines and/or markers.

## Examples

The following example shows the populations for some animals over the years.

```
>>> df = pd.DataFrame({
...     'pig': [20, 18, 489, 675, 1776],
...     'horse': [4, 25, 281, 600, 1900]
...     }, index=[1990, 1997, 2003, 2009, 2014])
>>> lines = df.plot.line()
```

An example with subplots, so an array of axes is returned.

```
>>> axes = df.plot.line(subplots=True)
>>> type(axes)
<class 'numpy.ndarray'>
```

The following example shows the relationship between both populations.

```
>>> lines = df.plot.line(x='pig', y='horse')
```

### 34.4.13.10 pandas.DataFrame.plot.pie

`DataFrame.plot.pie` (`y=None`, `**kwds`)

Generate a pie plot.

A pie plot is a proportional representation of the numerical data in a column. This function wraps `matplotlib.pyplot.pie()` for the specified column. If no column reference is passed and `subplots=True` a pie plot is drawn for each numerical column independently.

**Parameters** **y** : int or label, optional

Label or position of the column to plot. If not provided, `subplots=True` argument must be passed.

**\*\*kwds**

Keyword arguments to pass on to `pandas.DataFrame.plot()`.

**Returns** `axes` : `matplotlib.axes.Axes` or `np.ndarray` of them.

A NumPy array is returned when *subplots* is True.

See also:

**`Series.plot.pie`** Generate a pie plot for a Series.

**`DataFrame.plot`** Make plots of a DataFrame.

## Examples

In the example below we have a DataFrame with the information about planet's mass and radius. We pass the 'mass' column to the pie function to get a pie plot.

```
>>> df = pd.DataFrame({'mass': [0.330, 4.87, 5.97],
...                     'radius': [2439.7, 6051.8, 6378.1]},
...                     index=['Mercury', 'Venus', 'Earth'])
>>> plot = df.plot.pie(y='mass', figsize=(5, 5))
```

```
>>> plot = df.plot.pie(subplots=True, figsize=(6, 3))
```

### 34.4.13.11 pandas.DataFrame.plot.scatter

**DataFrame.plot.scatter** (*x*, *y*, *s=None*, *c=None*, *\*\*kws*)

Create a scatter plot with varying marker point size and color.

The coordinates of each point are defined by two dataframe columns and filled circles are used to represent each point. This kind of plot is useful to see complex correlations between two variables. Points could be for instance natural 2D coordinates like longitude and latitude in a map or, in general, any pair of metrics that can be plotted against each other.

**Parameters** **x** : int or str

The column name or column position to be used as horizontal coordinates for each point.

**y** : int or str

The column name or column position to be used as vertical coordinates for each point.

**s** : scalar or array\_like, optional

The size of each point. Possible values are:

- A single scalar so all points have the same size.
- A sequence of scalars, which will be used for each point's size recursively. For instance, when passing [2,14] all points size will be either 2 or 14, alternatively.

**c** : str, int or array\_like, optional

The color of each point. Possible values are:

- A single color string referred to by name, RGB or RGBA code, for instance 'red' or '#a98d19'.
- A sequence of color strings referred to by name, RGB or RGBA code, which will be used for each point's color recursively. For instance ['green', 'yellow'] all points will be filled in green or yellow, alternatively.

- A column name or position whose values will be used to color the marker points according to a colormap.

**\*\*kwargs**

Keyword arguments to pass on to `pandas.DataFrame.plot()`.

**Returns**

**axes** [`matplotlib.axes.Axes` or `numpy.ndarray` of them]

**See also:**

**matplotlib.pyplot.scatter** scatter plot using multiple input data formats.

## Examples

Let's see how to draw a scatter plot using coordinates from the values in a DataFrame's columns.

```
>>> df = pd.DataFrame([[5.1, 3.5, 0], [4.9, 3.0, 0], [7.0, 3.2, 1],
...                    [6.4, 3.2, 1], [5.9, 3.0, 2]],
...                    columns=['length', 'width', 'species'])
>>> ax1 = df.plot.scatter(x='length',
...                        y='width',
...                        c='DarkBlue')
```

And now with the color determined by a column as well.

```
>>> ax2 = df.plot.scatter(x='length',
...                        y='width',
...                        c='species',
...                        colormap='viridis')
```

<code>DataFrame.boxplot([column, by, ax, ...])</code>	Make a box plot from DataFrame columns.
<code>DataFrame.hist([column, by, grid, ...])</code>	Make a histogram of the DataFrame's.

## 34.4.14 Serialization / IO / Conversion

<code>DataFrame.from_csv(path[, header, sep, ...])</code>	(DEPRECATED) Read CSV file.
<code>DataFrame.from_dict(data[, orient, dtype, ...])</code>	Construct DataFrame from dict of array-like or dicts.
<code>DataFrame.from_items(items[, columns, orient])</code>	(DEPRECATED) Construct a dataframe from a list of tuples
<code>DataFrame.from_records(data[, index, ...])</code>	Convert structured or record ndarray to DataFrame
<code>DataFrame.info([verbose, buf, max_cols, ...])</code>	Print a concise summary of a DataFrame.
<code>DataFrame.to_parquet(fname[, engine, ...])</code>	Write a DataFrame to the binary parquet format.
<code>DataFrame.to_pickle(path[, compression, ...])</code>	Pickle (serialize) object to file.
<code>DataFrame.to_csv([path_or_buf, sep, na_rep, ...])</code>	Write DataFrame to a comma-separated values (csv) file
<code>DataFrame.to_hdf(path_or_buf, key, **kwargs)</code>	Write the contained data to an HDF5 file using HDFStore.
<code>DataFrame.to_sql(name, con[, schema, ...])</code>	Write records stored in a DataFrame to a SQL database.
<code>DataFrame.to_dict([orient, into])</code>	Convert the DataFrame to a dictionary.
<code>DataFrame.to_excel(excel_writer[, ...])</code>	Write DataFrame to an excel sheet

Continued on next page

Table 77 – continued from previous page

<code>DataFrame.to_json([path_or_buf, orient, ...])</code>	Convert the object to a JSON string.
<code>DataFrame.to_html([buf, columns, col_space, ...])</code>	Render a DataFrame as an HTML table.
<code>DataFrame.to_feather(fname)</code>	write out the binary feather-format for DataFrames
<code>DataFrame.to_latex([buf, columns, ...])</code>	Render an object to a tabular environment table.
<code>DataFrame.to_stata(fname[, convert_dates, ...])</code>	Export Stata binary dta files.
<code>DataFrame.to_msgpack([path_or_buf, encoding])</code>	msgpack (serialize) object to input file path
<code>DataFrame.to_gbq(destination_table, project_id)</code>	Write a DataFrame to a Google BigQuery table.
<code>DataFrame.to_records([index, convert_datetime64])</code>	Convert DataFrame to a NumPy record array.
<code>DataFrame.to_sparse([fill_value, kind])</code>	Convert to SparseDataFrame
<code>DataFrame.to_dense()</code>	Return dense representation of NDFrame (as opposed to sparse)
<code>DataFrame.to_string([buf, columns, ...])</code>	Render a DataFrame to a console-friendly tabular output.
<code>DataFrame.to_clipboard([excel, sep])</code>	Copy object to the system clipboard.
<code>DataFrame.style</code>	Property returning a Styler object containing methods for building a styled HTML representation fo the DataFrame.

### 34.4.15 Sparse

<code>SparseDataFrame.to_coo()</code>	Return the contents of the frame as a sparse SciPy COO matrix.
---------------------------------------	--

#### 34.4.15.1 pandas.SparseDataFrame.to\_coo

`SparseDataFrame.to_coo()`

Return the contents of the frame as a sparse SciPy COO matrix.

New in version 0.20.0.

**Returns** `coo_matrix` : `scipy.sparse.spmatrix`

If the caller is heterogeneous and contains booleans or objects, the result will be of `dtype=object`. See Notes.

#### Notes

The dtype will be the lowest-common-denominator type (implicit upcasting); that is to say if the dtypes (even of numeric types) are mixed, the one that accommodates all will be chosen.

e.g. If the dtypes are `float16` and `float32`, dtype will be upcast to `float32`. By `numpy.find_common_type` convention, mixing `int64` and `uint64` will result in a `float64` dtype.

## 34.5 Panel

### 34.5.1 Constructor

---

<code>Panel([data, items, major_axis, minor_axis, ...])</code>	(DEPRECATED) Represents wide format panel data, stored as 3-dimensional array
--	---

---

#### 34.5.1.1 pandas.Panel

**class** `pandas.Panel` (*data=None, items=None, major\_axis=None, minor\_axis=None, copy=False, dtype=None*)

Represents wide format panel data, stored as 3-dimensional array

Deprecated since version 0.20.0: The recommended way to represent 3-D data are with a MultiIndex on a DataFrame via the `to_frame()` method or with the `xarray` package. Pandas provides a `to_xarray()` method to automate this conversion.

**Parameters** **data** : ndarray (items x major x minor), or dict of DataFrames

**items** [Index or array-like] axis=0

**major\_axis** [Index or array-like] axis=1

**minor\_axis** [Index or array-like] axis=2

**dtype** [dtype, default None] Data type to force, otherwise infer

**copy** [boolean, default False] Copy data from inputs. Only affects DataFrame / 2d ndarray input

#### Attributes

<code>at</code>	Access a single value for a row/column label pair.
<code>axes</code>	Return index label(s) of the internal NDFrame
<code>blocks</code>	(DEPRECATED) Internal property, property synonym for <code>as_blocks()</code>
<code>dtypes</code>	Return the dtypes in the DataFrame.
<code>empty</code>	Indicator whether DataFrame is empty.
<code>ftypes</code>	Return the ftypes (indication of sparse/dense and dtype) in DataFrame.
<code>iat</code>	Access a single value for a row/column pair by integer position.
<code>iloc</code>	Purely integer-location based indexing for selection by position.
<code>items</code>	
<code>ix</code>	A primarily label-location based indexer, with integer position fallback.
<code>loc</code>	Access a group of rows and columns by label(s) or a boolean array.
<code>major_axis</code>	
<code>minor_axis</code>	

Continued on next page

Table 80 – continued from previous page

<i>ndim</i>	Return an int representing the number of axes / array dimensions.
<i>shape</i>	Return a tuple of axis dimensions
<i>size</i>	Return an int representing the number of elements in this object.
<i>values</i>	Return a Numpy representation of the DataFrame.

**pandas.Panel.at****Panel.at**

Access a single value for a row/column label pair.

Similar to `loc`, in that both provide label-based lookups. Use `at` if you only need to get or set a single value in a DataFrame or Series.

**Raises KeyError**

When label does not exist in DataFrame

**See also:**

**DataFrame.iat** Access a single value for a row/column pair by integer position

**DataFrame.loc** Access a group of rows and columns by label(s)

**Series.at** Access a single value using a label

**Examples**

```
>>> df = pd.DataFrame([[0, 2, 3], [0, 4, 1], [10, 20, 30]],
...                    index=[4, 5, 6], columns=['A', 'B', 'C'])
>>> df
   A  B  C
4  0  2  3
5  0  4  1
6 10 20 30
```

Get value at specified row/column pair

```
>>> df.at[4, 'B']
2
```

Set value at specified row/column pair

```
>>> df.at[4, 'B'] = 10
>>> df.at[4, 'B']
10
```

Get value within a Series

```
>>> df.loc[5].at['B']
4
```

## pandas.Panel.axes

### Panel.axes

Return index label(s) of the internal NDFrame

## pandas.Panel.blocks

### Panel.blocks

Internal property, property synonym for `as_blocks()`

Deprecated since version 0.21.0.

## pandas.Panel.dtypes

### Panel.dtypes

Return the dtypes in the DataFrame.

This returns a Series with the data type of each column. The result's index is the original DataFrame's columns. Columns with mixed types are stored with the `object` dtype. See [the User Guide](#) for more.

#### Returns pandas.Series

The data type of each column.

See also:

[`pandas.DataFrame.ftypes`](#) dtype and sparsity information.

## Examples

```
>>> df = pd.DataFrame({'float': [1.0],
...                    'int': [1],
...                    'datetime': [pd.Timestamp('20180310')],
...                    'string': ['foo']})
>>> df.dtypes
float          float64
int            int64
datetime      datetime64[ns]
string         object
dtype: object
```

## pandas.Panel.empty

### Panel.empty

Indicator whether DataFrame is empty.

True if DataFrame is entirely empty (no items), meaning any of the axes are of length 0.

#### Returns bool

If DataFrame is empty, return True, if not return False.

See also:

[`pandas.Series.dropna`](#), [`pandas.DataFrame.dropna`](#)

## Notes

If DataFrame contains only NaNs, it is still not considered empty. See the example below.

## Examples

An example of an actual empty DataFrame. Notice the index is empty:

```

>>> df_empty = pd.DataFrame({'A' : []})
>>> df_empty
Empty DataFrame
Columns: [A]
Index: []
>>> df_empty.empty
True

```

If we only have NaNs in our DataFrame, it is not considered empty! We will need to drop the NaNs to make the DataFrame empty:

```

>>> df = pd.DataFrame({'A' : [np.nan]})
>>> df
   A
0 NaN
>>> df.empty
False
>>> df.dropna().empty
True

```

## pandas.Panel.ftypes

### Panel.ftypes

Return the ftypes (indication of sparse/dense and dtype) in DataFrame.

This returns a Series with the data type of each column. The result's index is the original DataFrame's columns. Columns with mixed types are stored with the `object` dtype. See [the User Guide](#) for more.

#### Returns pandas.Series

The data type and indication of sparse/dense of each column.

#### See also:

**`pandas.DataFrame.dtypes`** Series with just dtype information.

**`pandas.SparseDataFrame`** Container for sparse tabular data.

## Notes

Sparse data should have the same dtypes as its dense representation.

## Examples

```
>>> import numpy as np
>>> arr = np.random.RandomState(0).randn(100, 4)
>>> arr[arr < .8] = np.nan
>>> pd.DataFrame(arr).ftypes
0    float64:dense
1    float64:dense
2    float64:dense
3    float64:dense
dtype: object
```

```
>>> pd.SparseDataFrame(arr).ftypes
0    float64:sparse
1    float64:sparse
2    float64:sparse
3    float64:sparse
dtype: object
```

## pandas.Panel.iat

### Panel.iat

Access a single value for a row/column pair by integer position.

Similar to `iloc`, in that both provide integer-based lookups. Use `iat` if you only need to get or set a single value in a DataFrame or Series.

#### Raises `IndexError`

When integer position is out of bounds

#### See also:

**`DataFrame.at`** Access a single value for a row/column label pair

**`DataFrame.loc`** Access a group of rows and columns by label(s)

**`DataFrame.iloc`** Access a group of rows and columns by integer position(s)

## Examples

```
>>> df = pd.DataFrame([[0, 2, 3], [0, 4, 1], [10, 20, 30]],
...                    columns=['A', 'B', 'C'])
>>> df
   A  B  C
0  0  2  3
1  0  4  1
2 10 20 30
```

Get value at specified row/column pair

```
>>> df.iat[1, 2]
1
```

Set value at specified row/column pair

```
>>> df.iat[1, 2] = 10
>>> df.iat[1, 2]
10
```

Get value within a series

```
>>> df.loc[0].iat[1]
2
```

## pandas.Panel.iloc

### Panel.iloc

Purely integer-location based indexing for selection by position.

`.iloc[]` is primarily integer position based (from 0 to `length-1` of the axis), but may also be used with a boolean array.

Allowed inputs are:

- An integer, e.g. 5.
- A list or array of integers, e.g. `[4, 3, 0]`.
- A slice object with ints, e.g. `1:7`.
- A boolean array.
- A callable function with one argument (the calling Series, DataFrame or Panel) and that returns valid output for indexing (one of the above)

`.iloc` will raise `IndexError` if a requested indexer is out-of-bounds, except *slice* indexers which allow out-of-bounds indexing (this conforms with python/numpy *slice* semantics).

See more at [Selection by Position](#)

## pandas.Panel.items

### Panel.items

## pandas.Panel.ix

### Panel.ix

A primarily label-location based indexer, with integer position fallback.

Warning: Starting in 0.20.0, the `.ix` indexer is deprecated, in favor of the more strict `.iloc` and `.loc` indexers.

`.ix[]` supports mixed integer and label based access. It is primarily label based, but will fall back to integer positional access unless the corresponding axis is of integer type.

`.ix` is the most general indexer and will support any of the inputs in `.loc` and `.iloc`. `.ix` also supports floating point label schemes. `.ix` is exceptionally useful when dealing with mixed positional and label based hierarchical indexes.

However, when an axis is integer based, ONLY label based access and not positional access is supported. Thus, in such cases, it's usually better to be explicit and use `.iloc` or `.loc`.

See more at [Advanced Indexing](#).

## pandas.Panel.loc

### Panel.loc

Access a group of rows and columns by label(s) or a boolean array.

.loc[] is primarily label based, but may also be used with a boolean array.

Allowed inputs are:

- A single label, e.g. 5 or 'a', (note that 5 is interpreted as a *label* of the index, and **never** as an integer position along the index).
- A list or array of labels, e.g. ['a', 'b', 'c'].
- A slice object with labels, e.g. 'a':'f'.

**Warning:** Note that contrary to usual python slices, **both** the start and the stop are included

- A boolean array of the same length as the axis being sliced, e.g. [True, False, True].
- A callable function with one argument (the calling Series, DataFrame or Panel) and that returns valid output for indexing (one of the above)

See more at [Selection by Label](#)

#### Raises KeyError:

when any items are not found

See also:

**DataFrame.at** Access a single value for a row/column label pair

**DataFrame.iloc** Access group of rows and columns by integer position(s)

**DataFrame.xs** Returns a cross-section (row(s) or column(s)) from the Series/DataFrame.

**Series.loc** Access group of values using labels

## Examples

### Getting values

```
>>> df = pd.DataFrame([[1, 2], [4, 5], [7, 8]],
...                    index=['cobra', 'viper', 'sidewinder'],
...                    columns=['max_speed', 'shield'])
>>> df
```

	max_speed	shield
cobra	1	2
viper	4	5
sidewinder	7	8

Single label. Note this returns the row as a Series.

```
>>> df.loc['viper']
max_speed    4
shield       5
Name: viper, dtype: int64
```

List of labels. Note using `[[]]` returns a DataFrame.

```
>>> df.loc[['viper', 'sidewinder']]
          max_speed  shield
viper              4      5
sidewinder         7      8
```

Single label for row and column

```
>>> df.loc['cobra', 'shield']
2
```

Slice with labels for row and single label for column. As mentioned above, note that both the start and stop of the slice are included.

```
>>> df.loc['cobra':'viper', 'max_speed']
cobra      1
viper      4
Name: max_speed, dtype: int64
```

Boolean list with the same length as the row axis

```
>>> df.loc[[False, False, True]]
          max_speed  shield
sidewinder         7      8
```

Conditional that returns a boolean Series

```
>>> df.loc[df['shield'] > 6]
          max_speed  shield
sidewinder         7      8
```

Conditional that returns a boolean Series with column labels specified

```
>>> df.loc[df['shield'] > 6, ['max_speed']]
          max_speed
sidewinder         7
```

Callable that returns a boolean Series

```
>>> df.loc[lambda df: df['shield'] == 8]
          max_speed  shield
sidewinder         7      8
```

## Setting values

Set value for all items matching the list of labels

```
>>> df.loc[['viper', 'sidewinder'], ['shield']] = 50
>>> df
          max_speed  shield
cobra              1      2
viper              4     50
sidewinder         7     50
```

Set value for an entire row

```
>>> df.loc['cobra'] = 10
>>> df
```

	max_speed	shield
cobra	10	10
viper	4	50
sidewinder	7	50

Set value for an entire column

```
>>> df.loc[:, 'max_speed'] = 30
>>> df
```

	max_speed	shield
cobra	30	10
viper	30	50
sidewinder	30	50

Set value for rows matching callable condition

```
>>> df.loc[df['shield'] > 35] = 0
>>> df
```

	max_speed	shield
cobra	30	10
viper	0	0
sidewinder	0	0

### Getting values on a DataFrame with an index that has integer labels

Another example using integers for the index

```
>>> df = pd.DataFrame([[1, 2], [4, 5], [7, 8]],
...                    index=[7, 8, 9], columns=['max_speed', 'shield'])
>>> df
```

	max_speed	shield
7	1	2
8	4	5
9	7	8

Slice with integer labels for rows. As mentioned above, note that both the start and stop of the slice are included.

```
>>> df.loc[7:9]
```

	max_speed	shield
7	1	2
8	4	5
9	7	8

### Getting values with a MultiIndex

A number of examples using a DataFrame with a MultiIndex

```
>>> tuples = [
...     ('cobra', 'mark i'), ('cobra', 'mark ii'),
...     ('sidewinder', 'mark i'), ('sidewinder', 'mark ii'),
...     ('viper', 'mark ii'), ('viper', 'mark iii')
... ]
>>> index = pd.MultiIndex.from_tuples(tuples)
>>> values = [[12, 2], [0, 4], [10, 20],
...           [1, 4], [7, 1], [16, 36]]
```

(continues on next page)

(continued from previous page)

```
>>> df = pd.DataFrame(values, columns=['max_speed', 'shield'], index=index)
>>> df
```

		max_speed	shield
cobra	mark i	12	2
	mark ii	0	4
sidewinder	mark i	10	20
	mark ii	1	4
viper	mark ii	7	1
	mark iii	16	36

Single label. Note this returns a DataFrame with a single index.

```
>>> df.loc['cobra']
```

	max_speed	shield
mark i	12	2
mark ii	0	4

Single index tuple. Note this returns a Series.

```
>>> df.loc[('cobra', 'mark ii')]
max_speed    0
shield       4
Name: (cobra, mark ii), dtype: int64
```

Single label for row and column. Similar to passing in a tuple, this returns a Series.

```
>>> df.loc['cobra', 'mark i']
max_speed    12
shield       2
Name: (cobra, mark i), dtype: int64
```

Single tuple. Note using [ [] ] returns a DataFrame.

```
>>> df.loc[['cobra', 'mark ii']]
```

		max_speed	shield
cobra	mark ii	0	4

Single tuple for the index with a single label for the column

```
>>> df.loc[('cobra', 'mark i'), 'shield']
2
```

Slice from index tuple to single label

```
>>> df.loc[('cobra', 'mark i'):'viper']
```

		max_speed	shield
cobra	mark i	12	2
	mark ii	0	4
sidewinder	mark i	10	20
	mark ii	1	4
viper	mark ii	7	1
	mark iii	16	36

Slice from index tuple to index tuple

```
>>> df.loc[('cobra', 'mark i'):('viper', 'mark ii')]
      max_speed  shield
cobra      mark i      12      2
           mark ii      0      4
sidewinder mark i      10     20
           mark ii      1      4
viper      mark ii      7      1
```

### pandas.Panel.major\_axis

Panel.**major\_axis**

### pandas.Panel.minor\_axis

Panel.**minor\_axis**

### pandas.Panel.ndim

Panel.**ndim**

Return an int representing the number of axes / array dimensions.

Return 1 if Series. Otherwise return 2 if DataFrame.

**See also:**

ndarray.ndim

### Examples

```
>>> s = pd.Series({'a': 1, 'b': 2, 'c': 3})
>>> s.ndim
1
```

```
>>> df = pd.DataFrame({'col1': [1, 2], 'col2': [3, 4]})
>>> df.ndim
2
```

### pandas.Panel.shape

Panel.**shape**

Return a tuple of axis dimensions

### pandas.Panel.size

Panel.**size**

Return an int representing the number of elements in this object.

Return the number of rows if Series. Otherwise return the number of rows times number of columns if DataFrame.

**See also:**`ndarray.size`**Examples**

```
>>> s = pd.Series({'a': 1, 'b': 2, 'c': 3})
>>> s.size
3
```

```
>>> df = pd.DataFrame({'col1': [1, 2], 'col2': [3, 4]})
>>> df.size
4
```

**pandas.Panel.values****Panel.values**

Return a Numpy representation of the DataFrame.

Only the values in the DataFrame will be returned, the axes labels will be removed.

**Returns** `numpy.ndarray`

The values of the DataFrame.

**See also:**

[`pandas.DataFrame.index`](#) Retrieve the index labels

[`pandas.DataFrame.columns`](#) Retrieving the column names

**Notes**

The dtype will be a lower-common-denominator dtype (implicit upcasting); that is to say if the dtypes (even of numeric types) are mixed, the one that accommodates all will be chosen. Use this with care if you are not dealing with the blocks.

e.g. If the dtypes are float16 and float32, dtype will be upcast to float32. If dtypes are int32 and uint8, dtype will be upcast to int32. By `numpy.find_common_type()` convention, mixing int64 and uint64 will result in a float64 dtype.

**Examples**

A DataFrame where all columns are the same type (e.g., int64) results in an array of the same type.

```
>>> df = pd.DataFrame({'age': [ 3, 29],
...                     'height': [94, 170],
...                     'weight': [31, 115]})
>>> df
   age  height  weight
0    3     94     31
1   29    170    115
>>> df.dtypes
```

(continues on next page)

(continued from previous page)

```

age      int64
height   int64
weight   int64
dtype: object
>>> df.values
array([[ 3,  94,  31],
       [29, 170, 115]], dtype=int64)

```

A DataFrame with mixed type columns(e.g., str/object, int64, float32) results in an ndarray of the broadest type that accommodates these mixed types (e.g., object).

```

>>> df2 = pd.DataFrame([('parrot', 24.0, 'second'),
...                      ('lion', 80.5, 1),
...                      ('monkey', np.nan, None)],
...                     columns=('name', 'max_speed', 'rank'))
>>> df2.dtypes
name      object
max_speed float64
rank      object
dtype: object
>>> df2.values
array([['parrot', 24.0, 'second'],
       ['lion', 80.5, 1],
       ['monkey', nan, None]], dtype=object)

```

is_copy	
---------	--

## Methods

<code>abs()</code>	Return a Series/DataFrame with absolute numeric value of each element.
<code>add(other[, axis])</code>	Addition of series and other, element-wise (binary operator <i>add</i> ).
<code>add_prefix(prefix)</code>	Prefix labels with string <i>prefix</i> .
<code>add_suffix(suffix)</code>	Suffix labels with string <i>suffix</i> .
<code>align(other, **kwargs)</code>	Align two objects on their axes with the specified join method for each axis Index
<code>all([axis, bool_only, skipna, level])</code>	Return whether all elements are True, potentially over an axis.
<code>any([axis, bool_only, skipna, level])</code>	Return whether any element is True over requested axis.
<code>apply(func[, axis])</code>	Applies function along axis (or axes) of the Panel
<code>as_blocks([copy])</code>	(DEPRECATED) Convert the frame to a dict of dtype -> Constructor Types that each has a homogeneous dtype.
<code>as_matrix()</code>	Convert the frame to its Numpy-array representation.
<code>asfreq(freq[, method, how, normalize, ...])</code>	Convert TimeSeries to specified frequency.
<code>asof(where[, subset])</code>	The last row without any NaN is taken (or the last row without NaN considering only the subset of columns in the case of a DataFrame)

Continued on next page

Table 81 – continued from previous page

<code>astype(dtype[, copy, errors])</code>	Cast a pandas object to a specified dtype <code>dtype</code> .
<code>at_time(time[, asof])</code>	Select values at particular time of day (e.g.
<code>between_time(start_time, end_time[, ...])</code>	Select values between particular times of the day (e.g., 9:00-9:30 AM).
<code>bfill([axis, inplace, limit, downcast])</code>	Synonym for <code>DataFrame.fillna(method='bfill')</code>
<code>bool()</code>	Return the bool of a single element PandasObject.
<code>clip([lower, upper, axis, inplace])</code>	Trim values at input threshold(s).
<code>clip_lower(threshold[, axis, inplace])</code>	Return copy of the input with values below a threshold truncated.
<code>clip_upper(threshold[, axis, inplace])</code>	Return copy of input with values above given value(s) truncated.
<code>compound([axis, skipna, level])</code>	Return the compound percentage of the values for the requested axis
<code>conform(frame[, axis])</code>	Conform input DataFrame to align with chosen axis pair.
<code>consolidate([inplace])</code>	(DEPRECATED) Compute NDFrame with “consolidated” internals (data of each dtype grouped together in a single ndarray).
<code>convert_objects([convert_dates, ...])</code>	(DEPRECATED) Attempt to infer better dtype for object columns.
<code>copy([deep])</code>	Make a copy of this object’s indices and data.
<code>count([axis])</code>	Return number of observations over requested axis.
<code>cummax([axis, skipna])</code>	Return cumulative maximum over a DataFrame or Series axis.
<code>cummin([axis, skipna])</code>	Return cumulative minimum over a DataFrame or Series axis.
<code>cumprod([axis, skipna])</code>	Return cumulative product over a DataFrame or Series axis.
<code>cumsum([axis, skipna])</code>	Return cumulative sum over a DataFrame or Series axis.
<code>describe([percentiles, include, exclude])</code>	Generates descriptive statistics that summarize the central tendency, dispersion and shape of a dataset’s distribution, excluding NaN values.
<code>div(other[, axis])</code>	Floating division of series and other, element-wise (binary operator <code>truediv</code> ).
<code>divide(other[, axis])</code>	Floating division of series and other, element-wise (binary operator <code>truediv</code> ).
<code>dropna([axis, how, inplace])</code>	Drop 2D from panel, holding passed axis constant
<code>eq(other[, axis])</code>	Wrapper for comparison method <code>eq</code>
<code>equals(other)</code>	Determines if two NDFrame objects contain the same elements.
<code>ffill([axis, inplace, limit, downcast])</code>	Synonym for <code>DataFrame.fillna(method='ffill')</code>
<code>fillna([value, method, axis, inplace, ...])</code>	Fill NA/NaN values using the specified method
<code>filter([items, like, regex, axis])</code>	Subset rows or columns of dataframe according to labels in the specified index.
<code>first(offset)</code>	Convenience method for subsetting initial periods of time series data based on a date offset.
<code>first_valid_index()</code>	Return index for first non-NA/null value.

Continued on next page

Table 81 – continued from previous page

<code>floordiv</code> ( <i>other</i> [, <i>axis</i> ])	Integer division of series and other, element-wise (binary operator <i>floordiv</i> ).
<code>fromDict</code> ( <i>data</i> [, <i>intersect</i> , <i>orient</i> , <i>dtype</i> ])	Construct Panel from dict of DataFrame objects
<code>from_dict</code> ( <i>data</i> [, <i>intersect</i> , <i>orient</i> , <i>dtype</i> ])	Construct Panel from dict of DataFrame objects
<code>ge</code> ( <i>other</i> [, <i>axis</i> ])	Wrapper for comparison method <i>ge</i>
<code>get</code> ( <i>key</i> [, <i>default</i> ])	Get item from object for given key (DataFrame column, Panel slice, etc.).
<code>get_dtype_counts</code> ()	Return counts of unique dtypes in this object.
<code>get_ftype_counts</code> ()	(DEPRECATED) Return counts of unique ftypes in this object.
<code>get_value</code> (*args, **kwargs)	(DEPRECATED) Quickly retrieve single value at (item, major, minor) location
<code>get_values</code> ()	Return an ndarray after converting sparse values to dense.
<code>groupby</code> ( <i>function</i> [, <i>axis</i> ])	Group data on given axis, returning GroupBy object
<code>gt</code> ( <i>other</i> [, <i>axis</i> ])	Wrapper for comparison method <i>gt</i>
<code>head</code> ([ <i>n</i> ])	Return the first <i>n</i> rows.
<code>infer_objects</code> ()	Attempt to infer better dtypes for object columns.
<code>interpolate</code> ([ <i>method</i> , <i>axis</i> , <i>limit</i> , <i>inplace</i> , ...])	Interpolate values according to different methods.
<code>isna</code> ()	Detect missing values.
<code>isnull</code> ()	Detect missing values.
<code>iteritems</code> ()	Iterate over (label, values) on info axis
<code>join</code> ( <i>other</i> [, <i>how</i> , <i>lsuffix</i> , <i>rsuffix</i> ])	Join items with other Panel either on major and minor axes column
<code>keys</code> ()	Get the ‘info axis’ (see Indexing for more)
<code>kurt</code> ([ <i>axis</i> , <i>skipna</i> , <i>level</i> , <i>numeric_only</i> ])	Return unbiased kurtosis over requested axis using Fisher’s definition of kurtosis (kurtosis of normal == 0.0).
<code>kurtosis</code> ([ <i>axis</i> , <i>skipna</i> , <i>level</i> , <i>numeric_only</i> ])	Return unbiased kurtosis over requested axis using Fisher’s definition of kurtosis (kurtosis of normal == 0.0).
<code>last</code> ( <i>offset</i> )	Convenience method for subsetting final periods of time series data based on a date offset.
<code>last_valid_index</code> ()	Return index for last non-NA/null value.
<code>le</code> ( <i>other</i> [, <i>axis</i> ])	Wrapper for comparison method <i>le</i>
<code>lt</code> ( <i>other</i> [, <i>axis</i> ])	Wrapper for comparison method <i>lt</i>
<code>mad</code> ([ <i>axis</i> , <i>skipna</i> , <i>level</i> ])	Return the mean absolute deviation of the values for the requested axis
<code>major_xs</code> ( <i>key</i> )	Return slice of panel along major axis
<code>mask</code> ( <i>cond</i> [, <i>other</i> , <i>inplace</i> , <i>axis</i> , <i>level</i> , ...])	Return an object of same shape as self and whose corresponding entries are from self where <i>cond</i> is False and otherwise are from <i>other</i> .
<code>max</code> ([ <i>axis</i> , <i>skipna</i> , <i>level</i> , <i>numeric_only</i> ])	This method returns the maximum of the values in the object.
<code>mean</code> ([ <i>axis</i> , <i>skipna</i> , <i>level</i> , <i>numeric_only</i> ])	Return the mean of the values for the requested axis
<code>median</code> ([ <i>axis</i> , <i>skipna</i> , <i>level</i> , <i>numeric_only</i> ])	Return the median of the values for the requested axis
<code>min</code> ([ <i>axis</i> , <i>skipna</i> , <i>level</i> , <i>numeric_only</i> ])	This method returns the minimum of the values in the object.
<code>minor_xs</code> ( <i>key</i> )	Return slice of panel along minor axis

Continued on next page

Table 81 – continued from previous page

<code>mod(other[, axis])</code>	Modulo of series and other, element-wise (binary operator <i>mod</i> ).
<code>mul(other[, axis])</code>	Multiplication of series and other, element-wise (binary operator <i>mul</i> ).
<code>multiply(other[, axis])</code>	Multiplication of series and other, element-wise (binary operator <i>mul</i> ).
<code>ne(other[, axis])</code>	Wrapper for comparison method <i>ne</i>
<code>notna()</code>	Detect existing (non-missing) values.
<code>notnull()</code>	Detect existing (non-missing) values.
<code>pct_change([periods, fill_method, limit, freq])</code>	Percentage change between the current and a prior element.
<code>pipe(func, *args, **kwargs)</code>	Apply <i>func</i> (self, *args, **kwargs)
<code>pop(item)</code>	Return item and drop from frame.
<code>pow(other[, axis])</code>	Exponential power of series and other, element-wise (binary operator <i>pow</i> ).
<code>prod([axis, skipna, level, numeric_only, ...])</code>	Return the product of the values for the requested axis
<code>product([axis, skipna, level, numeric_only, ...])</code>	Return the product of the values for the requested axis
<code>radd(other[, axis])</code>	Addition of series and other, element-wise (binary operator <i>radd</i> ).
<code>rank([axis, method, numeric_only, ...])</code>	Compute numerical data ranks (1 through n) along axis.
<code>rdiv(other[, axis])</code>	Floating division of series and other, element-wise (binary operator <i>rtruediv</i> ).
<code>reindex(*args, **kwargs)</code>	Conform Panel to new index with optional filling logic, placing NA/NaN in locations having no value in the previous index.
<code>reindex_axis(labels[, axis, method, level, ...])</code>	Conform input object to new index with optional filling logic, placing NA/NaN in locations having no value in the previous index.
<code>reindex_like(other[, method, copy, limit, ...])</code>	Return an object with matching indices to myself.
<code>rename([items, major_axis, minor_axis])</code>	Alter axes input function or functions.
<code>rename_axis(mapper[, axis, copy, inplace])</code>	Alter the name of the index or columns.
<code>replace([to_replace, value, inplace, limit, ...])</code>	Replace values given in <i>to_replace</i> with <i>value</i> .
<code>resample(rule[, how, axis, fill_method, ...])</code>	Convenience method for frequency conversion and resampling of time series.
<code>rfloordiv(other[, axis])</code>	Integer division of series and other, element-wise (binary operator <i>rfloordiv</i> ).
<code>rmod(other[, axis])</code>	Modulo of series and other, element-wise (binary operator <i>rmod</i> ).
<code>rmul(other[, axis])</code>	Multiplication of series and other, element-wise (binary operator <i>rmul</i> ).
<code>round([decimals])</code>	Round each value in Panel to a specified number of decimal places.
<code>rpow(other[, axis])</code>	Exponential power of series and other, element-wise (binary operator <i>rpow</i> ).
<code>rsub(other[, axis])</code>	Subtraction of series and other, element-wise (binary operator <i>rsub</i> ).
<code>rtruediv(other[, axis])</code>	Floating division of series and other, element-wise (binary operator <i>rtruediv</i> ).

Continued on next page

Table 81 – continued from previous page

<code>sample([n, frac, replace, weights, ...])</code>	Return a random sample of items from an axis of object.
<code>select(crit[, axis])</code>	(DEPRECATED) Return data corresponding to axis labels matching criteria
<code>sem([axis, skipna, level, ddof, numeric_only])</code>	Return unbiased standard error of the mean over requested axis.
<code>set_axis(labels[, axis, inplace])</code>	Assign desired index to given axis.
<code>set_value(*args, **kwargs)</code>	(DEPRECATED) Quickly set single value at (item, major, minor) location
<code>shift([periods, freq, axis])</code>	Shift index by desired number of periods with an optional time freq.
<code>skew([axis, skipna, level, numeric_only])</code>	Return unbiased skew over requested axis Normalized by N-1
<code>slice_shift([periods, axis])</code>	Equivalent to <i>shift</i> without copying data.
<code>sort_index([axis, level, ascending, ...])</code>	Sort object by labels (along an axis)
<code>sort_values([by, axis, ascending, inplace, ...])</code>	NOT IMPLEMENTED: do not call this method, as sorting values is not supported for Panel objects and will raise an error.
<code>squeeze([axis])</code>	Squeeze length 1 dimensions.
<code>std([axis, skipna, level, ddof, numeric_only])</code>	Return sample standard deviation over requested axis.
<code>sub(other[, axis])</code>	Subtraction of series and other, element-wise (binary operator <i>sub</i> ).
<code>subtract(other[, axis])</code>	Subtraction of series and other, element-wise (binary operator <i>sub</i> ).
<code>sum([axis, skipna, level, numeric_only, ...])</code>	Return the sum of the values for the requested axis
<code>swapaxes(axis1, axis2[, copy])</code>	Interchange axes and swap values axes appropriately
<code>swaplevel([i, j, axis])</code>	Swap levels i and j in a MultiIndex on a particular axis
<code>tail([n])</code>	Return the last <i>n</i> rows.
<code>take(indices[, axis, convert, is_copy])</code>	Return the elements in the given <i>positional</i> indices along an axis.
<code>to_clipboard([excel, sep])</code>	Copy object to the system clipboard.
<code>to_dense()</code>	Return dense representation of NDFrame (as opposed to sparse)
<code>to_excel(path[, na_rep, engine])</code>	Write each DataFrame in Panel to a separate excel sheet
<code>to_frame([filter_observations])</code>	Transform wide format into long (stacked) format as DataFrame whose columns are the Panel's items and whose index is a MultiIndex formed of the Panel's major and minor axes.
<code>to_hdf(path_or_buf, key, **kwargs)</code>	Write the contained data to an HDF5 file using HDF-Store.
<code>to_json([path_or_buf, orient, date_format, ...])</code>	Convert the object to a JSON string.
<code>to_latex([buf, columns, col_space, header, ...])</code>	Render an object to a tabular environment table.
<code>to_msgpack([path_or_buf, encoding])</code>	msgpack (serialize) object to input file path
<code>to_pickle(path[, compression, protocol])</code>	Pickle (serialize) object to file.
<code>to_sparse(*args, **kwargs)</code>	NOT IMPLEMENTED: do not call this method, as sparsifying is not supported for Panel objects and will raise an error.

Continued on next page

Table 81 – continued from previous page

<code>to_sql(name, con[, schema, if_exists, ...])</code>	Write records stored in a DataFrame to a SQL database.
<code>to_xarray()</code>	Return an xarray object from the pandas object.
<code>transpose(*args, **kwargs)</code>	Permute the dimensions of the Panel
<code>truediv(other[, axis])</code>	Floating division of series and other, element-wise (binary operator <i>truediv</i> ).
<code>truncate([before, after, axis, copy])</code>	Truncate a Series or DataFrame before and after some index value.
<code>tshift([periods, freq, axis])</code>	Shift the time index, using the index's frequency if available.
<code>tz_convert(tz[, axis, level, copy])</code>	Convert tz-aware axis to target time zone.
<code>tz_localize(tz[, axis, level, copy, ambiguous])</code>	Localize tz-naive TimeSeries to target time zone.
<code>update(other[, join, overwrite, ...])</code>	Modify Panel in place using non-NA values from passed Panel, or object coercible to Panel.
<code>var([axis, skipna, level, ddof, numeric_only])</code>	Return unbiased variance over requested axis.
<code>where(cond[, other, inplace, axis, level, ...])</code>	Return an object of same shape as self and whose corresponding entries are from self where <i>cond</i> is True and otherwise are from <i>other</i> .
<code>xs(key[, axis])</code>	Return slice of panel along selected axis

**pandas.Panel.abs**`Panel.abs()`

Return a Series/DataFrame with absolute numeric value of each element.

This function only applies to elements that are all numeric.

**Returns abs**

Series/DataFrame containing the absolute value of each element.

**See also:**`numpy.absolute` calculate the absolute value element-wise.**Notes**For complex inputs,  $1.2 + 1j$ , the absolute value is  $\sqrt{a^2 + b^2}$ .**Examples**

Absolute numeric values in a Series.

```
>>> s = pd.Series([-1.10, 2, -3.33, 4])
>>> s.abs()
0    1.10
1    2.00
2    3.33
3    4.00
dtype: float64
```

Absolute numeric values in a Series with complex numbers.

```
>>> s = pd.Series([1.2 + 1j])
>>> s.abs()
0    1.56205
dtype: float64
```

Absolute numeric values in a Series with a Timedelta element.

```
>>> s = pd.Series([pd.Timedelta('1 days')])
>>> s.abs()
0    1 days
dtype: timedelta64[ns]
```

Select rows with data closest to certain value using `argsort` (from [StackOverflow](#)).

```
>>> df = pd.DataFrame({
...     'a': [4, 5, 6, 7],
...     'b': [10, 20, 30, 40],
...     'c': [100, 50, -30, -50]
... })
>>> df
   a  b  c
0  4 10 100
1  5 20  50
2  6 30 -30
3  7 40 -50
>>> df.loc[(df.c - 43).abs().argsort()]
   a  b  c
1  5 20  50
0  4 10 100
2  6 30 -30
3  7 40 -50
```

## **pandas.Panel.add**

`Panel.add(other, axis=0)`

Addition of series and other, element-wise (binary operator *add*). Equivalent to `panel + other`.

### **Parameters**

**other** [DataFrame or Panel]

**axis** : {items, major\_axis, minor\_axis}

Axis to broadcast over

### **Returns**

**Panel**

**See also:**

[\*Panel.radd\*](#)

## **pandas.Panel.add\_prefix**

`Panel.add_prefix(prefix)`

Prefix labels with string *prefix*.

For Series, the row labels are prefixed. For DataFrame, the column labels are prefixed.

**Parameters** `prefix` : str

The string to add before each label.

**Returns** Series or DataFrame

New Series or DataFrame with updated labels.

**See also:**

[`Series.add\_suffix`](#) Suffix row labels with string *suffix*.

[`DataFrame.add\_suffix`](#) Suffix column labels with string *suffix*.

## Examples

```
>>> s = pd.Series([1, 2, 3, 4])
>>> s
0    1
1    2
2    3
3    4
dtype: int64
```

```
>>> s.add_prefix('item_')
item_0    1
item_1    2
item_2    3
item_3    4
dtype: int64
```

```
>>> df = pd.DataFrame({'A': [1, 2, 3, 4], 'B': [3, 4, 5, 6]})
>>> df
   A  B
0  1  3
1  2  4
2  3  5
3  4  6
```

```
>>> df.add_prefix('col_')
   col_A  col_B
0      1      3
1      2      4
2      3      5
3      4      6
```

## pandas.Panel.add\_suffix

`Panel.add_suffix` (*suffix*)

Suffix labels with string *suffix*.

For Series, the row labels are suffixed. For DataFrame, the column labels are suffixed.

**Parameters** `suffix` : str

The string to add after each label.

### Returns Series or DataFrame

New Series or DataFrame with updated labels.

### See also:

[`Series.add\_prefix`](#) Prefix row labels with string *prefix*.

[`DataFrame.add\_prefix`](#) Prefix column labels with string *prefix*.

### Examples

```
>>> s = pd.Series([1, 2, 3, 4])
>>> s
0    1
1    2
2    3
3    4
dtype: int64
```

```
>>> s.add_suffix('_item')
0_item    1
1_item    2
2_item    3
3_item    4
dtype: int64
```

```
>>> df = pd.DataFrame({'A': [1, 2, 3, 4], 'B': [3, 4, 5, 6]})
>>> df
   A  B
0  1  3
1  2  4
2  3  5
3  4  6
```

```
>>> df.add_suffix('_col')
   A_col  B_col
0      1     3
1      2     4
2      3     5
3      4     6
```

## pandas.Panel.align

`Panel.align` (*other*, *\*\*kwargs*)

Align two objects on their axes with the specified join method for each axis Index

### Parameters

**other** [DataFrame or Series]

**join** [{‘outer’, ‘inner’, ‘left’, ‘right’}, default ‘outer’]

**axis** : allowed axis of the other object, default None

Align on index (0), columns (1), or both (None)

**level** : int or level name, default None

Broadcast across a level, matching Index values on the passed MultiIndex level

**copy** : boolean, default True

Always returns new objects. If copy=False and no reindexing is required then original objects are returned.

**fill\_value** : scalar, default np.NaN

Value to use for missing values. Defaults to NaN, but can be any “compatible” value

**method** [str, default None]

**limit** [int, default None]

**fill\_axis** : int or labels for object, default 0

Filling axis, method and limit

**broadcast\_axis** : int or labels for object, default None

Broadcast values along this axis, if aligning two objects of different dimensions

**Returns** (**left**, **right**) : (NDFrame, type of other)

Aligned objects

## pandas.Panel.all

`Panel.all` (*axis=0*, *bool\_only=None*, *skipna=True*, *level=None*, *\*\*kwargs*)

Return whether all elements are True, potentially over an axis.

Returns True if all elements within a series or along a Dataframe axis are non-zero, not-empty or not-False.

**Parameters** **axis** : {0 or ‘index’, 1 or ‘columns’, None}, default 0

Indicate which axis or axes should be reduced.

- 0 / ‘index’ : reduce the index, return a Series whose index is the original column labels.
- 1 / ‘columns’ : reduce the columns, return a Series whose index is the original index.
- None : reduce all axes, return a scalar.

**skipna** : boolean, default True

Exclude NA/null values. If an entire row/column is NA, the result will be NA.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a DataFrame.

**bool\_only** : boolean, default None

Include only boolean columns. If None, will attempt to use everything, then use only boolean data. Not implemented for Series.

**\*\*kwargs** : any, default None

Additional keywords have no effect but might be accepted for compatibility with NumPy.

### Returns

**all** [DataFrame or Panel (if level specified)]

See also:

[`pandas.Series.all`](#) Return True if all elements are True

[`pandas.DataFrame.any`](#) Return True if one (or more) elements are True

## Examples

### Series

```
>>> pd.Series([True, True]).all()
True
>>> pd.Series([True, False]).all()
False
```

### DataFrames

Create a dataframe from a dictionary.

```
>>> df = pd.DataFrame({'col1': [True, True], 'col2': [True, False]})
>>> df
   col1  col2
0  True   True
1  True  False
```

Default behaviour checks if column-wise values all return True.

```
>>> df.all()
col1    True
col2   False
dtype: bool
```

Specify `axis='columns'` to check if row-wise values all return True.

```
>>> df.all(axis='columns')
0     True
1    False
dtype: bool
```

Or `axis=None` for whether every value is True.

```
>>> df.all(axis=None)
False
```

### `pandas.Panel.any`

`Panel.any` (*axis=0*, *bool\_only=None*, *skipna=True*, *level=None*, *\*\*kwargs*)

Return whether any element is True over requested axis.

Unlike `DataFrame.all()`, this performs an *or* operation. If any of the values along the specified axis is True, this will return True.

**Parameters** `axis` : {0 or 'index', 1 or 'columns', None}, default 0

Indicate which axis or axes should be reduced.

- 0 / 'index' : reduce the index, return a Series whose index is the original column labels.
- 1 / 'columns' : reduce the columns, return a Series whose index is the original index.
- None : reduce all axes, return a scalar.

**skipna** : boolean, default True

Exclude NA/null values. If an entire row/column is NA, the result will be NA.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a DataFrame.

**bool\_only** : boolean, default None

Include only boolean columns. If None, will attempt to use everything, then use only boolean data. Not implemented for Series.

**\*\*kwargs** : any, default None

Additional keywords have no effect but might be accepted for compatibility with NumPy.

### Returns

**any** [DataFrame or Panel (if level specified)]

**See also:**

`pandas.DataFrame.all` Return whether all elements are True.

## Examples

### Series

For Series input, the output is a scalar indicating whether any element is True.

```
>>> pd.Series([True, False]).any()
True
```

### DataFrame

Whether each column contains at least one True element (the default).

```
>>> df = pd.DataFrame({"A": [1, 2], "B": [0, 2], "C": [0, 0]})
>>> df
   A  B  C
0  1  0  0
1  2  2  0
```

```
>>> df.any()
A      True
B      True
C     False
dtype: bool
```

Aggregating over the columns.

```
>>> df = pd.DataFrame({"A": [True, False], "B": [1, 2]})
>>> df
   A  B
0  True  1
1 False  2
```

```
>>> df.any(axis='columns')
0      True
1      True
dtype: bool
```

```
>>> df = pd.DataFrame({"A": [True, False], "B": [1, 0]})
>>> df
   A  B
0  True  1
1 False  0
```

```
>>> df.any(axis='columns')
0      True
1     False
dtype: bool
```

Aggregating over the entire DataFrame with `axis=None`.

```
>>> df.any(axis=None)
True
```

`any` for an empty DataFrame is an empty Series.

```
>>> pd.DataFrame([]).any()
Series([], dtype: bool)
```

## pandas.Panel.apply

`Panel.apply(func, axis='major', **kwargs)`

Applies function along axis (or axes) of the Panel

**Parameters** `func` : function

Function to apply to each combination of ‘other’ axes e.g. if `axis = ‘items’`, the combination of `major_axis/minor_axis` will each be passed as a Series; if `axis = (‘items’, ‘major’)`, DataFrames of items & major axis will be passed

**axis** : {‘items’, ‘minor’, ‘major’}, or {0, 1, 2}, or a tuple with two axes

**Additional keyword arguments will be passed as keywords to the function**

**Returns****result** [Panel, DataFrame, or Series]**Examples**

Returns a Panel with the square root of each element

```
>>> p = pd.Panel(np.random.rand(4, 3, 2))
>>> p.apply(np.sqrt)
```

Equivalent to `p.sum(1)`, returning a DataFrame

```
>>> p.apply(lambda x: x.sum(), axis=1)
```

Equivalent to previous:

```
>>> p.apply(lambda x: x.sum(), axis='major')
```

Return the shapes of each DataFrame over axis 2 (i.e the shapes of items x major), as a Series

```
>>> p.apply(lambda x: x.shape, axis=(0, 1))
```

**pandas.Panel.as\_blocks**`Panel.as_blocks` (*copy=True*)

Convert the frame to a dict of dtype -&gt; Constructor Types that each has a homogeneous dtype.

Deprecated since version 0.21.0.

**NOTE: the dtypes of the blocks WILL BE PRESERVED HERE (unlike in `as_matrix`)****Parameters****copy** [boolean, default True]**Returns****values** [a dict of dtype -> Constructor Types]**pandas.Panel.as\_matrix**`Panel.as_matrix()`

Convert the frame to its Numpy-array representation.

Deprecated since version 0.23.0: Use `DataFrame.values()` instead.**Parameters columns: list, optional, default:None**

If None, return all columns, otherwise, returns specified columns.

**Returns values : ndarray**

If the caller is heterogeneous and contains booleans or objects, the result will be of dtype=object. See Notes.

**See also:**`pandas.DataFrame.values`

## Notes

Return is NOT a Numpy-matrix, rather, a Numpy-array.

The dtype will be a lower-common-denominator dtype (implicit upcasting); that is to say if the dtypes (even of numeric types) are mixed, the one that accommodates all will be chosen. Use this with care if you are not dealing with the blocks.

e.g. If the dtypes are float16 and float32, dtype will be upcast to float32. If dtypes are int32 and uint8, dtype will be upcase to int32. By `numpy.find_common_type` convention, mixing int64 and uint64 will result in a float64 dtype.

This method is provided for backwards compatibility. Generally, it is recommended to use `‘.values’`.

## pandas.Panel.asfreq

`Panel.asfreq(freq, method=None, how=None, normalize=False, fill_value=None)`

Convert TimeSeries to specified frequency.

Optionally provide filling method to pad/backfill missing values.

Returns the original data conformed to a new index with the specified frequency. `resample` is more appropriate if an operation, such as summarization, is necessary to represent the data at the new frequency.

### Parameters

**freq** [DateOffset object, or string]

**method** : {‘backfill’/‘bfill’, ‘pad’/‘ffill’}, default None

Method to use for filling holes in reindexed Series (note this does not fill NaNs that already were present):

- ‘pad’ / ‘ffill’: propagate last valid observation forward to next valid
- ‘backfill’ / ‘bfill’: use NEXT valid observation to fill

**how** : {‘start’, ‘end’}, default end

For PeriodIndex only, see PeriodIndex.asfreq

**normalize** : bool, default False

Whether to reset output index to midnight

**fill\_value**: scalar, optional

Value to use for missing values, applied during upsampling (note this does not fill NaNs that already were present).

New in version 0.20.0.

### Returns

**converted** [type of caller]

**See also:**

[`reindex`](#)

## Notes

To learn more about the frequency strings, please see [this link](#).

## Examples

Start by creating a series with 4 one minute timestamps.

```
>>> index = pd.date_range('1/1/2000', periods=4, freq='T')
>>> series = pd.Series([0.0, None, 2.0, 3.0], index=index)
>>> df = pd.DataFrame({'s':series})
>>> df
```

	s
2000-01-01 00:00:00	0.0
2000-01-01 00:01:00	NaN
2000-01-01 00:02:00	2.0
2000-01-01 00:03:00	3.0

Upsample the series into 30 second bins.

```
>>> df.upsample(freq='30S')
```

	s
2000-01-01 00:00:00	0.0
2000-01-01 00:00:30	NaN
2000-01-01 00:01:00	NaN
2000-01-01 00:01:30	NaN
2000-01-01 00:02:00	2.0
2000-01-01 00:02:30	NaN
2000-01-01 00:03:00	3.0

Upsample again, providing a fill value.

```
>>> df.upsample(freq='30S', fill_value=9.0)
```

	s
2000-01-01 00:00:00	0.0
2000-01-01 00:00:30	9.0
2000-01-01 00:01:00	NaN
2000-01-01 00:01:30	9.0
2000-01-01 00:02:00	2.0
2000-01-01 00:02:30	9.0
2000-01-01 00:03:00	3.0

Upsample again, providing a method.

```
>>> df.upsample(freq='30S', method='bfill')
```

	s
2000-01-01 00:00:00	0.0
2000-01-01 00:00:30	NaN
2000-01-01 00:01:00	NaN
2000-01-01 00:01:30	2.0
2000-01-01 00:02:00	2.0
2000-01-01 00:02:30	3.0
2000-01-01 00:03:00	3.0

## pandas.Panel.asof

`Panel.asof` (where, *subset=None*)

The last row without any NaN is taken (or the last row without NaN considering only the subset of columns in the case of a DataFrame)

New in version 0.19.0: For DataFrame

If there is no good value, NaN is returned for a Series a Series of NaN values for a DataFrame

#### Parameters

**where** [date or array of dates]

**subset** : string or list of strings, default None

if not None use these columns for NaN propagation

#### Returns where is scalar

- value or NaN if input is Series
- Series if input is DataFrame

**where is Index: same shape object as input**

See also:

*merge\_asof*

#### Notes

Dates are assumed to be sorted Raises if this is not the case

### pandas.Panel.astype

`Panel.astype(dtype, copy=True, errors='raise', **kwargs)`  
Cast a pandas object to a specified dtype dtype.

**Parameters dtype** : data type, or dict of column name -> data type

Use a numpy.dtype or Python type to cast entire pandas object to the same type. Alternatively, use {col: dtype, ...}, where col is a column label and dtype is a numpy.dtype or Python type to cast one or more of the DataFrame's columns to column-specific types.

**copy** : bool, default True.

Return a copy when copy=True (be very careful setting copy=False as changes to values then may propagate to other pandas objects).

**errors** : {'raise', 'ignore'}, default 'raise'.

Control raising of exceptions on invalid data for provided dtype.

- `raise` : allow exceptions to be raised
- `ignore` : suppress exceptions. On error return original object

New in version 0.20.0.

**raise\_on\_error** : raise on invalid input

Deprecated since version 0.20.0: Use `errors` instead

**kwargs** [keyword arguments to pass on to the constructor]

#### Returns

**casted** [type of caller]

See also:

`pandas.to_datetime` Convert argument to datetime.

`pandas.to_timedelta` Convert argument to timedelta.

`pandas.to_numeric` Convert argument to a numeric type.

`numpy.ndarray.astype` Cast a numpy array to a specified type.

## Examples

```
>>> ser = pd.Series([1, 2], dtype='int32')
>>> ser
0    1
1    2
dtype: int32
>>> ser.astype('int64')
0    1
1    2
dtype: int64
```

Convert to categorical type:

```
>>> ser.astype('category')
0    1
1    2
dtype: category
Categories (2, int64): [1, 2]
```

Convert to ordered categorical type with custom ordering:

```
>>> ser.astype('category', ordered=True, categories=[2, 1])
0    1
1    2
dtype: category
Categories (2, int64): [2 < 1]
```

Note that using `copy=False` and changing data on a new pandas object may propagate changes:

```
>>> s1 = pd.Series([1,2])
>>> s2 = s1.astype('int64', copy=False)
>>> s2[0] = 10
>>> s1 # note that s1[0] has changed too
0    10
1     2
dtype: int64
```

## pandas.Panel.at\_time

`Panel.at_time` (*time*, *asof=False*)

Select values at particular time of day (e.g. 9:30AM).

### Parameters

**time** [datetime.time or string]

**Returns**

**values\_at\_time** [type of caller]

**Raises** `TypeError`

If the index is not a `DatetimeIndex`

**See also:**

**`between_time`** Select values between particular times of the day

**`first`** Select initial periods of time series based on a date offset

**`last`** Select final periods of time series based on a date offset

**`DatetimeIndex.indexer_at_time`** Get just the index locations for values at particular time of the day

**Examples**

```
>>> i = pd.date_range('2018-04-09', periods=4, freq='12H')
>>> ts = pd.DataFrame({'A': [1,2,3,4]}, index=i)
>>> ts
```

	A
2018-04-09 00:00:00	1
2018-04-09 12:00:00	2
2018-04-10 00:00:00	3
2018-04-10 12:00:00	4

```
>>> ts.at_time('12:00')
```

	A
2018-04-09 12:00:00	2
2018-04-10 12:00:00	4

**pandas.Panel.between\_time**

`Panel.between_time` (*start\_time*, *end\_time*, *include\_start=True*, *include\_end=True*)

Select values between particular times of the day (e.g., 9:00-9:30 AM).

By setting *start\_time* to be later than *end\_time*, you can get the times that are *not* between the two times.

**Parameters**

**start\_time** [datetime.time or string]

**end\_time** [datetime.time or string]

**include\_start** [boolean, default True]

**include\_end** [boolean, default True]

**Returns**

**values\_between\_time** [type of caller]

**Raises** `TypeError`

If the index is not a `DatetimeIndex`

See also:

**`at_time`** Select values at a particular time of the day

**`first`** Select initial periods of time series based on a date offset

**`last`** Select final periods of time series based on a date offset

**`DatetimeIndex.indexer_between_time`** Get just the index locations for values between particular times of the day

## Examples

```
>>> i = pd.date_range('2018-04-09', periods=4, freq='1D20min')
>>> ts = pd.DataFrame({'A': [1,2,3,4]}, index=i)
>>> ts
```

	A
2018-04-09 00:00:00	1
2018-04-10 00:20:00	2
2018-04-11 00:40:00	3
2018-04-12 01:00:00	4

```
>>> ts.between_time('0:15', '0:45')
A
2018-04-10 00:20:00  2
2018-04-11 00:40:00  3
```

You get the times that are *not* between two times by setting `start_time` later than `end_time`:

```
>>> ts.between_time('0:45', '0:15')
A
2018-04-09 00:00:00  1
2018-04-12 01:00:00  4
```

## pandas.Panel.bfill

**`Panel.bfill`** (*axis=None, inplace=False, limit=None, downcast=None*)

Synonym for `DataFrame.fillna(method='bfill')`

## pandas.Panel.bool

**`Panel.bool()`**

Return the bool of a single element PandasObject.

This must be a boolean scalar value, either True or False. Raise a `ValueError` if the `PandasObject` does not have exactly 1 element, or that element is not boolean

## pandas.Panel.clip

**`Panel.clip`** (*lower=None, upper=None, axis=None, inplace=False, \*args, \*\*kwargs*)

Trim values at input threshold(s).

Assigns values outside boundary to boundary values. Thresholds can be singular values or array like, and in the latter case the clipping is performed element-wise in the specified axis.

**Parameters** **lower** : float or array\_like, default None

Minimum threshold value. All values below this threshold will be set to it.

**upper** : float or array\_like, default None

Maximum threshold value. All values above this threshold will be set to it.

**axis** : int or string axis name, optional

Align object with lower and upper along the given axis.

**inplace** : boolean, default False

Whether to perform the operation in place on the data.

New in version 0.21.0.

**\*args, \*\*kwargs**

Additional keywords have no effect but might be accepted for compatibility with numpy.

**Returns** **Series or DataFrame**

Same type as calling object with the values outside the clip boundaries replaced

**See also:**

***clip\_lower*** Clip values below specified threshold(s).

***clip\_upper*** Clip values above specified threshold(s).

## Examples

```
>>> data = {'col_0': [9, -3, 0, -1, 5], 'col_1': [-2, -7, 6, 8, -5]}
>>> df = pd.DataFrame(data)
>>> df
   col_0  col_1
0      9    -2
1     -3    -7
2      0     6
3     -1     8
4      5    -5
```

Clips per column using lower and upper thresholds:

```
>>> df.clip(-4, 6)
   col_0  col_1
0      6    -2
1     -3    -4
2      0     6
3     -1     6
4      5    -4
```

Clips using specific lower and upper thresholds per column element:

```
>>> t = pd.Series([2, -4, -1, 6, 3])
>>> t
0    2
1   -4
2   -1
3    6
4    3
dtype: int64
```

```
>>> df.clip(t, t + 4, axis=0)
   col_0  col_1
0      6      2
1     -3     -4
2      0      3
3      6      8
4      5      3
```

### pandas.Panel.clip\_lower

`Panel.clip_lower` (*threshold*, *axis=None*, *inplace=False*)

Return copy of the input with values below a threshold truncated.

**Parameters** *threshold* : numeric or array-like

Minimum value allowed. All values below threshold will be set to this value.

- float : every value is compared to *threshold*.
- array-like : The shape of *threshold* should match the object it's compared to. When *self* is a Series, *threshold* should be the length. When *self* is a DataFrame, *threshold* should 2-D and the same shape as *self* for *axis=None*, or 1-D and the same length as the axis being compared.

**axis** : {0 or 'index', 1 or 'columns'}, default 0

Align *self* with *threshold* along the given axis.

**inplace** : boolean, default False

Whether to perform the operation in place on the data.

New in version 0.21.0.

#### Returns

**clipped** [same type as input]

**See also:**

**Series.clip** Return copy of input with values below and above thresholds truncated.

**Series.clip\_upper** Return copy of input with values above threshold truncated.

### Examples

Series single threshold clipping:

```
>>> s = pd.Series([5, 6, 7, 8, 9])
>>> s.clip_lower(8)
0      8
1      8
2      8
3      8
4      9
dtype: int64
```

Series clipping element-wise using an array of thresholds. *threshold* should be the same length as the Series.

```
>>> elemwise_thresholds = [4, 8, 7, 2, 5]
>>> s.clip_lower(elemwise_thresholds)
0      5
1      8
2      7
3      8
4      9
dtype: int64
```

DataFrames can be compared to a scalar.

```
>>> df = pd.DataFrame({"A": [1, 3, 5], "B": [2, 4, 6]})
>>> df
   A  B
0  1  2
1  3  4
2  5  6
```

```
>>> df.clip_lower(3)
   A  B
0  3  3
1  3  4
2  5  6
```

Or to an array of values. By default, *threshold* should be the same shape as the DataFrame.

```
>>> df.clip_lower(np.array([[3, 4], [2, 2], [6, 2]]))
   A  B
0  3  4
1  3  4
2  6  6
```

Control how *threshold* is broadcast with *axis*. In this case *threshold* should be the same length as the axis specified by *axis*.

```
>>> df.clip_lower(np.array([3, 3, 5]), axis='index')
   A  B
0  3  3
1  3  4
2  5  6
```

```
>>> df.clip_lower(np.array([4, 5]), axis='columns')
   A  B
0  4  5
```

(continues on next page)

(continued from previous page)

1	4	5
2	5	6

**pandas.Panel.clip\_upper**`Panel.clip_upper` (*threshold*, *axis=None*, *inplace=False*)

Return copy of input with values above given value(s) truncated.

**Parameters****threshold** [float or array\_like]**axis** : int or string axis name, optional

Align object with threshold along the given axis.

**inplace** : boolean, default False

Whether to perform the operation in place on the data

New in version 0.21.0.

**Returns****clipped** [same type as input]**See also:**`clip`**pandas.Panel.compound**`Panel.compound` (*axis=None*, *skipna=None*, *level=None*)

Return the compound percentage of the values for the requested axis

**Parameters****axis** [{items (0), major\_axis (1), minor\_axis (2)}]**skipna** : boolean, default True

Exclude NA/null values when computing the result.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a DataFrame

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

**Returns****compounded** [DataFrame or Panel (if level specified)]

### pandas.Panel.conform

`Panel.conform` (*frame*, *axis*='items')

Conform input DataFrame to align with chosen axis pair.

#### Parameters

**frame** [DataFrame]

**axis** : {'items', 'major', 'minor'}

Axis the input corresponds to. E.g., if *axis*='major', then the frame's columns would be items, and the index would be values of the minor axis

#### Returns

**DataFrame**

### pandas.Panel consolidate

`Panel.consolidate` (*inplace*=False)

Compute NDFrame with “consolidated” internals (data of each dtype grouped together in a single ndarray).

Deprecated since version 0.20.0: Consolidate will be an internal implementation only.

### pandas.Panel.convert\_objects

`Panel.convert_objects` (*convert\_dates*=True, *convert\_numeric*=False, *convert\_timedeltas*=True, *copy*=True)

Attempt to infer better dtype for object columns.

Deprecated since version 0.21.0.

**Parameters** **convert\_dates** : boolean, default True

If True, convert to date where possible. If 'coerce', force conversion, with unconvertible values becoming NaT.

**convert\_numeric** : boolean, default False

If True, attempt to coerce to numbers (including strings), with unconvertible values becoming NaN.

**convert\_timedeltas** : boolean, default True

If True, convert to timedelta where possible. If 'coerce', force conversion, with unconvertible values becoming NaT.

**copy** : boolean, default True

If True, return a copy even if no copy is necessary (e.g. no conversion was done).  
Note: This is meant for internal use, and should not be confused with *inplace*.

#### Returns

**converted** [same as input object]

See also:

[`pandas.to\_datetime`](#) Convert argument to datetime.

`pandas.to_timedelta` Convert argument to timedelta.

`pandas.to_numeric` Return a fixed frequency timedelta index, with day as the default.

## `pandas.Panel.copy`

`Panel.copy(deep=True)`

Make a copy of this object's indices and data.

When `deep=True` (default), a new object will be created with a copy of the calling object's data and indices. Modifications to the data or indices of the copy will not be reflected in the original object (see notes below).

When `deep=False`, a new object will be created without copying the calling object's data or index (only references to the data and index are copied). Any changes to the data of the original will be reflected in the shallow copy (and vice versa).

**Parameters** `deep` : bool, default True

Make a deep copy, including a copy of the data and the indices. With `deep=False` neither the indices nor the data are copied.

**Returns** `copy` : Series, DataFrame or Panel

Object type matches caller.

## Notes

When `deep=True`, data is copied but actual Python objects will not be copied recursively, only the reference to the object. This is in contrast to `copy.deepcopy` in the Standard Library, which recursively copies object data (see examples below).

While `Index` objects are copied when `deep=True`, the underlying numpy array is not copied for performance reasons. Since `Index` is immutable, the underlying data can be safely shared and a copy is not needed.

## Examples

```
>>> s = pd.Series([1, 2], index=["a", "b"])
>>> s
a    1
b    2
dtype: int64
```

```
>>> s_copy = s.copy()
>>> s_copy
a    1
b    2
dtype: int64
```

**Shallow copy versus default (deep) copy:**

```
>>> s = pd.Series([1, 2], index=["a", "b"])
>>> deep = s.copy()
>>> shallow = s.copy(deep=False)
```

Shallow copy shares data and index with original.

```
>>> s is shallow
False
>>> s.values is shallow.values and s.index is shallow.index
True
```

Deep copy has own copy of data and index.

```
>>> s is deep
False
>>> s.values is deep.values or s.index is deep.index
False
```

Updates to the data shared by shallow copy and original is reflected in both; deep copy remains unchanged.

```
>>> s[0] = 3
>>> shallow[1] = 4
>>> s
a    3
b    4
dtype: int64
>>> shallow
a    3
b    4
dtype: int64
>>> deep
a    1
b    2
dtype: int64
```

Note that when copying an object containing Python objects, a deep copy will copy the data, but will not do so recursively. Updating a nested data object will be reflected in the deep copy.

```
>>> s = pd.Series([[1, 2], [3, 4]])
>>> deep = s.copy()
>>> s[0][0] = 10
>>> s
0    [10, 2]
1     [3, 4]
dtype: object
>>> deep
0    [10, 2]
1     [3, 4]
dtype: object
```

## pandas.Panel.count

`Panel.count` (*axis='major'*)

Return number of observations over requested axis.

### Parameters

**axis** [{‘items’, ‘major’, ‘minor’} or {0, 1, 2}]

### Returns

**count** [DataFrame]

**pandas.Panel.cummax**

`Panel.cummax` (*axis=None, skipna=True, \*args, \*\*kwargs*)

Return cumulative maximum over a DataFrame or Series axis.

Returns a DataFrame or Series of the same size containing the cumulative maximum.

**Parameters** *axis*: {0 or 'index', 1 or 'columns'}, default 0

The index or the name of the axis. 0 is equivalent to None or 'index'.

**skipna**: boolean, default True

Exclude NA/null values. If an entire row/column is NA, the result will be NA.

**\*args, \*\*kwargs**:

Additional keywords have no effect but might be accepted for compatibility with NumPy.

**Returns**

**cummax** [DataFrame or Panel]

**See also:**

[`pandas.core.window.Expanding.max`](#) Similar functionality but ignores NaN values.

[`Panel.max`](#) Return the maximum over Panel axis.

[`Panel.cummax`](#) Return cumulative maximum over Panel axis.

[`Panel.cummin`](#) Return cumulative minimum over Panel axis.

[`Panel.cumsum`](#) Return cumulative sum over Panel axis.

[`Panel.cumprod`](#) Return cumulative product over Panel axis.

**Examples****Series**

```
>>> s = pd.Series([2, np.nan, 5, -1, 0])
>>> s
0    2.0
1    NaN
2    5.0
3   -1.0
4    0.0
dtype: float64
```

By default, NA values are ignored.

```
>>> s.cummax()
0    2.0
1    NaN
2    5.0
3    5.0
4    5.0
dtype: float64
```

To include NA values in the operation, use `skipna=False`

```
>>> s.cummax(skipna=False)
0    2.0
1    NaN
2    NaN
3    NaN
4    NaN
dtype: float64
```

### DataFrame

```
>>> df = pd.DataFrame([[2.0, 1.0],
...                    [3.0, np.nan],
...                    [1.0, 0.0]],
...                    columns=list('AB'))
>>> df
   A    B
0  2.0  1.0
1  3.0  NaN
2  1.0  0.0
```

By default, iterates over rows and finds the maximum in each column. This is equivalent to `axis=None` or `axis='index'`.

```
>>> df.cummax()
   A    B
0  2.0  1.0
1  3.0  NaN
2  3.0  1.0
```

To iterate over columns and find the maximum in each row, use `axis=1`

```
>>> df.cummax(axis=1)
   A    B
0  2.0  2.0
1  3.0  NaN
2  1.0  1.0
```

### pandas.Panel.cummin

`Panel.cummin` (*axis=None, skipna=True, \*args, \*\*kwargs*)

Return cumulative minimum over a DataFrame or Series axis.

Returns a DataFrame or Series of the same size containing the cumulative minimum.

**Parameters** `axis`: {0 or 'index', 1 or 'columns'}, default 0

The index or the name of the axis. 0 is equivalent to None or 'index'.

**skipna**: boolean, default True

Exclude NA/null values. If an entire row/column is NA, the result will be NA.

**\*args, \*\*kwargs**:

Additional keywords have no effect but might be accepted for compatibility with NumPy.

**Returns**

**cummin** [DataFrame or Panel]

See also:

*pandas.core.window.Expanding.min* Similar functionality but ignores NaN values.

*Panel.min* Return the minimum over Panel axis.

*Panel.cummax* Return cumulative maximum over Panel axis.

*Panel.cummin* Return cumulative minimum over Panel axis.

*Panel.cumsum* Return cumulative sum over Panel axis.

*Panel.cumprod* Return cumulative product over Panel axis.

## Examples

### Series

```
>>> s = pd.Series([2, np.nan, 5, -1, 0])
>>> s
0    2.0
1    NaN
2    5.0
3   -1.0
4    0.0
dtype: float64
```

By default, NA values are ignored.

```
>>> s.cummin()
0    2.0
1    NaN
2    2.0
3   -1.0
4   -1.0
dtype: float64
```

To include NA values in the operation, use `skipna=False`

```
>>> s.cummin(skipna=False)
0    2.0
1    NaN
2    NaN
3    NaN
4    NaN
dtype: float64
```

### DataFrame

```
>>> df = pd.DataFrame([[2.0, 1.0],
...                    [3.0, np.nan],
...                    [1.0, 0.0]],
...                    columns=list('AB'))
>>> df
   A    B
0  2.0  1.0
```

(continues on next page)

(continued from previous page)

```
1  3.0  NaN
2  1.0   0.0
```

By default, iterates over rows and finds the minimum in each column. This is equivalent to `axis=None` or `axis='index'`.

```
>>> df.cummin()
      A      B
0  2.0   1.0
1  2.0   NaN
2  1.0   0.0
```

To iterate over columns and find the minimum in each row, use `axis=1`

```
>>> df.cummin(axis=1)
      A      B
0  2.0   1.0
1  3.0   NaN
2  1.0   0.0
```

## pandas.Panel.cumprod

`Panel.cumprod(axis=None, skipna=True, *args, **kwargs)`

Return cumulative product over a DataFrame or Series axis.

Returns a DataFrame or Series of the same size containing the cumulative product.

**Parameters** `axis`: {0 or 'index', 1 or 'columns'}, default 0

The index or the name of the axis. 0 is equivalent to None or 'index'.

**skipna**: boolean, default True

Exclude NA/null values. If an entire row/column is NA, the result will be NA.

**\*args, \*\*kwargs**:

Additional keywords have no effect but might be accepted for compatibility with NumPy.

### Returns

**cumprod** [DataFrame or Panel]

See also:

**pandas.core.window.Expanding.prod** Similar functionality but ignores NaN values.

**Panel.prod** Return the product over Panel axis.

**Panel.cummax** Return cumulative maximum over Panel axis.

**Panel.cummin** Return cumulative minimum over Panel axis.

**Panel.cumsum** Return cumulative sum over Panel axis.

**Panel.cumprod** Return cumulative product over Panel axis.

## Examples

### Series

```
>>> s = pd.Series([2, np.nan, 5, -1, 0])
>>> s
0    2.0
1    NaN
2    5.0
3   -1.0
4    0.0
dtype: float64
```

By default, NA values are ignored.

```
>>> s.cumprod()
0    2.0
1    NaN
2   10.0
3  -10.0
4   -0.0
dtype: float64
```

To include NA values in the operation, use `skipna=False`

```
>>> s.cumprod(skipna=False)
0    2.0
1    NaN
2    NaN
3    NaN
4    NaN
dtype: float64
```

### DataFrame

```
>>> df = pd.DataFrame([[2.0, 1.0],
...                    [3.0, np.nan],
...                    [1.0, 0.0]],
...                    columns=list('AB'))
>>> df
   A    B
0  2.0  1.0
1  3.0  NaN
2  1.0  0.0
```

By default, iterates over rows and finds the product in each column. This is equivalent to `axis=None` or `axis='index'`.

```
>>> df.cumprod()
   A    B
0  2.0  1.0
1  6.0  NaN
2  6.0  0.0
```

To iterate over columns and find the product in each row, use `axis=1`

```
>>> df.cumprod(axis=1)
   A    B
0  2.0  2.0
1  3.0  NaN
2  1.0  0.0
```

## pandas.Panel.cumsum

`Panel.cumsum` (*axis=None*, *skipna=True*, *\*args*, *\*\*kwargs*)

Return cumulative sum over a DataFrame or Series axis.

Returns a DataFrame or Series of the same size containing the cumulative sum.

**Parameters** *axis* : {0 or 'index', 1 or 'columns'}, default 0

The index or the name of the axis. 0 is equivalent to None or 'index'.

**skipna** : boolean, default True

Exclude NA/null values. If an entire row/column is NA, the result will be NA.

**\*args, \*\*kwargs** :

Additional keywords have no effect but might be accepted for compatibility with NumPy.

### Returns

**cumsum** [DataFrame or Panel]

See also:

[`pandas.core.window.Expanding.sum`](#) Similar functionality but ignores NaN values.

[`Panel.sum`](#) Return the sum over Panel axis.

[`Panel.cummax`](#) Return cumulative maximum over Panel axis.

[`Panel.cummin`](#) Return cumulative minimum over Panel axis.

[`Panel.cumsum`](#) Return cumulative sum over Panel axis.

[`Panel.cumprod`](#) Return cumulative product over Panel axis.

## Examples

### Series

```
>>> s = pd.Series([2, np.nan, 5, -1, 0])
>>> s
0    2.0
1    NaN
2    5.0
3   -1.0
4    0.0
dtype: float64
```

By default, NA values are ignored.

```
>>> s.cumsum()
0    2.0
1    NaN
2    7.0
3    6.0
4    6.0
dtype: float64
```

To include NA values in the operation, use `skipna=False`

```
>>> s.cumsum(skipna=False)
0    2.0
1    NaN
2    NaN
3    NaN
4    NaN
dtype: float64
```

### DataFrame

```
>>> df = pd.DataFrame([[2.0, 1.0],
...                    [3.0, np.nan],
...                    [1.0, 0.0]],
...                    columns=list('AB'))
>>> df
   A  B
0  2.0  1.0
1  3.0  NaN
2  1.0  0.0
```

By default, iterates over rows and finds the sum in each column. This is equivalent to `axis=None` or `axis='index'`.

```
>>> df.cumsum()
   A  B
0  2.0  1.0
1  5.0  NaN
2  6.0  1.0
```

To iterate over columns and find the sum in each row, use `axis=1`

```
>>> df.cumsum(axis=1)
   A  B
0  2.0  3.0
1  3.0  NaN
2  1.0  1.0
```

### pandas.Panel.describe

`Panel.describe` (*percentiles=None, include=None, exclude=None*)

Generates descriptive statistics that summarize the central tendency, dispersion and shape of a dataset's distribution, excluding NaN values.

Analyzes both numeric and object series, as well as `DataFrame` column sets of mixed data types. The output will vary depending on what is provided. Refer to the notes below for more detail.

**Parameters** `percentiles` : list-like of numbers, optional

The percentiles to include in the output. All should fall between 0 and 1. The default is `[.25, .5, .75]`, which returns the 25th, 50th, and 75th percentiles.

**include** : 'all', list-like of dtypes or None (default), optional

A white list of data types to include in the result. Ignored for `Series`. Here are the options:

- 'all' : All columns of the input will be included in the output.
- A list-like of dtypes : Limits the results to the provided data types. To limit the result to numeric types submit `numpy.number`. To limit it instead to object columns submit the `numpy.object` data type. Strings can also be used in the style of `select_dtypes` (e.g. `df.describe(include=['O'])`). To select pandas categorical columns, use 'category'
- None (default) : The result will include all numeric columns.

**exclude** : list-like of dtypes or None (default), optional,

A black list of data types to omit from the result. Ignored for `Series`. Here are the options:

- A list-like of dtypes : Excludes the provided data types from the result. To exclude numeric types submit `numpy.number`. To exclude object columns submit the data type `numpy.object`. Strings can also be used in the style of `select_dtypes` (e.g. `df.describe(include=['O'])`). To exclude pandas categorical columns, use 'category'
- None (default) : The result will exclude nothing.

## Returns

**summary**: `Series/DataFrame` of summary statistics

See also:

`DataFrame.count`, `DataFrame.max`, `DataFrame.min`, `DataFrame.mean`, `DataFrame.std`, `DataFrame.select_dtypes`

## Notes

For numeric data, the result's index will include `count`, `mean`, `std`, `min`, `max` as well as `lower`, 50 and upper percentiles. By default the lower percentile is 25 and the upper percentile is 75. The 50 percentile is the same as the median.

For object data (e.g. strings or timestamps), the result's index will include `count`, `unique`, `top`, and `freq`. The `top` is the most common value. The `freq` is the most common value's frequency. Timestamps also include the `first` and `last` items.

If multiple object values have the highest count, then the `count` and `top` results will be arbitrarily chosen from among those with the highest count.

For mixed data types provided via a `DataFrame`, the default is to return only an analysis of numeric columns. If the dataframe consists only of object and categorical data without any numeric columns, the default is to return an analysis of both the object and categorical columns. If `include='all'` is provided as an option, the result will include a union of attributes of each type.

The `include` and `exclude` parameters can be used to limit which columns in a `DataFrame` are analyzed for the output. The parameters are ignored when analyzing a `Series`.

## Examples

Describing a numeric Series.

```
>>> s = pd.Series([1, 2, 3])
>>> s.describe()
count      3.0
mean       2.0
std        1.0
min        1.0
25%        1.5
50%        2.0
75%        2.5
max        3.0
```

Describing a categorical Series.

```
>>> s = pd.Series(['a', 'a', 'b', 'c'])
>>> s.describe()
count      4
unique     3
top        a
freq       2
dtype: object
```

Describing a timestamp Series.

```
>>> s = pd.Series([
...     np.datetime64("2000-01-01"),
...     np.datetime64("2010-01-01"),
...     np.datetime64("2010-01-01")
... ])
>>> s.describe()
count              3
unique             2
top      2010-01-01 00:00:00
freq              2
first    2000-01-01 00:00:00
last     2010-01-01 00:00:00
dtype: object
```

Describing a DataFrame. By default only numeric fields are returned.

```
>>> df = pd.DataFrame({ 'object': ['a', 'b', 'c'],
...                     'numeric': [1, 2, 3],
...                     'categorical': pd.Categorical(['d', 'e', 'f'])
... })
>>> df.describe()
           numeric
count           3.0
mean            2.0
std             1.0
min             1.0
25%            1.5
50%            2.0
75%            2.5
max            3.0
```

Describing all columns of a DataFrame regardless of data type.

```
>>> df.describe(include='all')
      categorical  numeric  object
count           3        3.0      3
unique           3        NaN      3
top              f        NaN      c
freq            1        NaN      1
mean            NaN        2.0    NaN
std             NaN        1.0    NaN
min             NaN        1.0    NaN
25%             NaN        1.5    NaN

max             NaN        3.0    NaN
```

Describing a column from a DataFrame by accessing it as an attribute.

```
>>> df.numeric.describe()
count      3.0
mean       2.0
std        1.0
min        1.0
25%        1.5
50%        2.0
75%        2.5
max        3.0
Name: numeric, dtype: float64
```

Including only numeric columns in a DataFrame description.

```
>>> df.describe(include=[np.number])
      numeric
count      3.0
mean       2.0
std        1.0
min        1.0
25%        1.5
50%        2.0
75%        2.5
max        3.0
```

Including only string columns in a DataFrame description.

```
>>> df.describe(include=[np.object])
      object
count      3
unique      3
top         c
freq        1
```

Including only categorical columns from a DataFrame description.

```
>>> df.describe(include=['category'])
      categorical
count           3
unique           3
```

(continues on next page)

(continued from previous page)

top	f
freq	1

Excluding numeric columns from a DataFrame description.

```
>>> df.describe(exclude=[np.number])
           categorical  object
count                3      3

```

## pandas.Panel.div

`Panel.div(other, axis=0)`

Floating division of series and other, element-wise (binary operator *truediv*). Equivalent to `panel / other`.

### Parameters

**other** [DataFrame or Panel]

**axis** : {items, major\_axis, minor\_axis}

Axis to broadcast over

### Returns

**Panel**

**See also:**

`Panel.rtruediv`

## pandas.Panel.divide

`Panel.divide(other, axis=0)`

Floating division of series and other, element-wise (binary operator *truediv*). Equivalent to `panel / other`.

### Parameters

**other** [DataFrame or Panel]  
**axis** : {items, major\_axis, minor\_axis}  
Axis to broadcast over

**Returns**

**Panel**

**See also:**

`Panel.rtruediv`

## **pandas.Panel.dropna**

`Panel.dropna` (*axis=0, how='any', inplace=False*)  
Drop 2D from panel, holding passed axis constant

**Parameters** **axis** : int, default 0

Axis to hold constant. E.g. axis=1 will drop major\_axis entries having a certain amount of NA data

**how** : { 'all', 'any' }, default 'any'

'any': one or more values are NA in the DataFrame along the axis. For 'all' they all must be.

**inplace** : bool, default False

If True, do operation inplace and return None.

**Returns**

**dropped** [Panel]

## **pandas.Panel.eq**

`Panel.eq` (*other, axis=None*)  
Wrapper for comparison method eq

## **pandas.Panel.equals**

`Panel.equals` (*other*)  
Determines if two NDFrame objects contain the same elements. NaNs in the same location are considered equal.

## **pandas.Panel.ffill**

`Panel.ffill` (*axis=None, inplace=False, limit=None, downcast=None*)  
Synonym for `DataFrame.fillna(method='ffill')`

**pandas.Panel.fillna**

`Panel.fillna` (*value=None, method=None, axis=None, inplace=False, limit=None, downcast=None, \*\*kwargs*)

Fill NA/NaN values using the specified method

**Parameters** **value** : scalar, dict, Series, or DataFrame

Value to use to fill holes (e.g. 0), alternately a dict/Series/DataFrame of values specifying which value to use for each index (for a Series) or column (for a DataFrame). (values not in the dict/Series/DataFrame will not be filled). This value cannot be a list.

**method** : {'backfill', 'bfill', 'pad', 'ffill', None}, default None

Method to use for filling holes in reindexed Series pad / ffill: propagate last valid observation forward to next valid backfill / bfill: use NEXT valid observation to fill gap

**axis** : [{0, 1, 2, 'items', 'major\_axis', 'minor\_axis'}]

**inplace** : boolean, default False

If True, fill in place. Note: this will modify any other views on this object, (e.g. a no-copy slice for a column in a DataFrame).

**limit** : int, default None

If method is specified, this is the maximum number of consecutive NaN values to forward/backward fill. In other words, if there is a gap with more than this number of consecutive NaNs, it will only be partially filled. If method is not specified, this is the maximum number of entries along the entire axis where NaNs will be filled. Must be greater than 0 if not None.

**downcast** : dict, default is None

a dict of item->dtype of what to downcast if possible, or the string 'infer' which will try to downcast to an appropriate equal type (e.g. float64 to int64 if possible)

**Returns**

**filled** [Panel]

**See also:**

[\*interpolate\*](#) Fill NaN values using interpolation.

[\*reindex, asfreq\*](#)

**Examples**

```
>>> df = pd.DataFrame([[np.nan, 2, np.nan, 0],
...                    [3, 4, np.nan, 1],
...                    [np.nan, np.nan, np.nan, 5],
...                    [np.nan, 3, np.nan, 4]],
...                    columns=list('ABCD'))
>>> df
   A  B  C  D
```

(continues on next page)

(continued from previous page)

0	NaN	2.0	NaN	0
1	3.0	4.0	NaN	1
2	NaN	NaN	NaN	5
3	NaN	3.0	NaN	4

Replace all NaN elements with 0s.

```
>>> df.fillna(0)
   A    B    C    D
0  0.0  2.0  0.0  0
1  3.0  4.0  0.0  1
2  0.0  0.0  0.0  5
3  0.0  3.0  0.0  4
```

We can also propagate non-null values forward or backward.

```
>>> df.fillna(method='ffill')
   A    B    C    D
0  NaN  2.0  NaN  0
1  3.0  4.0  NaN  1
2  3.0  4.0  NaN  5
3  3.0  3.0  NaN  4
```

Replace all NaN elements in column 'A', 'B', 'C', and 'D', with 0, 1, 2, and 3 respectively.

```
>>> values = {'A': 0, 'B': 1, 'C': 2, 'D': 3}
>>> df.fillna(value=values)
   A    B    C    D
0  0.0  2.0  2.0  0
1  3.0  4.0  2.0  1
2  0.0  1.0  2.0  5
3  0.0  3.0  2.0  4
```

Only replace the first NaN element.

```
>>> df.fillna(value=values, limit=1)
   A    B    C    D
0  0.0  2.0  2.0  0
1  3.0  4.0  NaN  1
2  NaN  1.0  NaN  5
3  NaN  3.0  NaN  4
```

## pandas.Panel.filter

`Panel.filter` (*items=None, like=None, regex=None, axis=None*)

Subset rows or columns of dataframe according to labels in the specified index.

Note that this routine does not filter a dataframe on its contents. The filter is applied to the labels of the index.

**Parameters** *items* : list-like

List of info axis to restrict to (must not all be present)

**like** : string

Keep info axis where “arg in col == True”

**regex** : string (regular expression)

Keep info axis with `re.search(regex, col) == True`

**axis** : int or string axis name

The axis to filter on. By default this is the info axis, 'index' for Series, 'columns' for DataFrame

### Returns

same type as input object

See also:

[`pandas.DataFrame.loc`](#)

### Notes

The `items`, `like`, and `regex` parameters are enforced to be mutually exclusive.

`axis` defaults to the info axis that is used when indexing with `[]`.

### Examples

```
>>> df
one  two  three
mouse    1    2    3
rabbit   4    5    6
```

```
>>> # select columns by name
>>> df.filter(items=['one', 'three'])
one  three
mouse    1    3
rabbit   4    6
```

```
>>> # select columns by regular expression
>>> df.filter(regex='e$', axis=1)
one  three
mouse    1    3
rabbit   4    6
```

```
>>> # select rows containing 'bbi'
>>> df.filter(like='bbi', axis=0)
one  two  three
rabbit   4    5    6
```

## pandas.Panel.first

`Panel.first` (*offset*)

Convenience method for subsetting initial periods of time series data based on a date offset.

### Parameters

**offset** [string, `DateOffset`, `dateutil.relativedelta`]

**Returns****subset** [type of caller]**Raises** **TypeError**If the index is not a *DatetimeIndex***See also:***last* Select final periods of time series based on a date offset*at\_time* Select values at a particular time of the day*between\_time* Select values between particular times of the day**Examples**

```
>>> i = pd.date_range('2018-04-09', periods=4, freq='2D')
>>> ts = pd.DataFrame({'A': [1,2,3,4]}, index=i)
>>> ts
              A
2018-04-09    1
2018-04-11    2
2018-04-13    3
2018-04-15    4
```

Get the rows for the first 3 days:

```
>>> ts.first('3D')
              A
2018-04-09    1
2018-04-11    2
```

Notice the data for 3 first calendar days were returned, not the first 3 days observed in the dataset, and therefore data for 2018-04-13 was not returned.

**pandas.Panel.first\_valid\_index****Panel.first\_valid\_index()**

Return index for first non-NA/null value.

**Returns****scalar** [type of index]**Notes**

If all elements are non-NA/null, returns None. Also returns None for empty NDFrame.

**pandas.Panel.floordiv****Panel.floordiv** (*other*, *axis=0*)Integer division of series and other, element-wise (binary operator *floordiv*). Equivalent to `panel // other`.

**Parameters**

**other** [DataFrame or Panel]

**axis** : {items, major\_axis, minor\_axis}

Axis to broadcast over

**Returns**

**Panel**

**See also:**

[`Panel.rfloordiv`](#)

**pandas.Panel.fromDict**

**classmethod** `Panel.fromDict` (*data*, *intersect=False*, *orient='items'*, *dtype=None*)

Construct Panel from dict of DataFrame objects

**Parameters** **data** : dict

{field : DataFrame}

**intersect** : boolean

Intersect indexes of input DataFrames

**orient** : {'items', 'minor'}, default 'items'

The “orientation” of the data. If the keys of the passed dict should be the items of the result panel, pass 'items' (default). Otherwise if the columns of the values of the passed DataFrame objects should be the items (which in the case of mixed-dtype data you should do), instead pass 'minor'

**dtype** : dtype, default None

Data type to force, otherwise infer

**Returns**

**Panel**

**pandas.Panel.from\_dict**

**classmethod** `Panel.from_dict` (*data*, *intersect=False*, *orient='items'*, *dtype=None*)

Construct Panel from dict of DataFrame objects

**Parameters** **data** : dict

{field : DataFrame}

**intersect** : boolean

Intersect indexes of input DataFrames

**orient** : {'items', 'minor'}, default 'items'

The “orientation” of the data. If the keys of the passed dict should be the items of the result panel, pass 'items' (default). Otherwise if the columns of the values of the passed DataFrame objects should be the items (which in the case of mixed-dtype data you should do), instead pass 'minor'

**dtype** : dtype, default None

Data type to force, otherwise infer

**Returns**

**Panel**

### **pandas.Panel.ge**

`Panel.ge` (*other*, *axis=None*)

Wrapper for comparison method `ge`

### **pandas.Panel.get**

`Panel.get` (*key*, *default=None*)

Get item from object for given key (DataFrame column, Panel slice, etc.). Returns default value if not found.

**Parameters**

**key** [object]

**Returns**

**value** [type of items contained in object]

### **pandas.Panel.get\_dtype\_counts**

`Panel.get_dtype_counts` ()

Return counts of unique dtypes in this object.

**Returns dtype** : Series

Series with the count of columns with each dtype.

**See also:**

[\*dtypes\*](#) Return the dtypes in this object.

### **Examples**

```
>>> a = [['a', 1, 1.0], ['b', 2, 2.0], ['c', 3, 3.0]]
>>> df = pd.DataFrame(a, columns=['str', 'int', 'float'])
>>> df
   str  int  float
0   a    1    1.0
1   b    2    2.0
2   c    3    3.0
```

```
>>> df.get_dtype_counts()
float64    1
int64      1
object     1
dtype: int64
```

**pandas.Panel.get\_ftype\_counts****Panel.get\_ftype\_counts()**

Return counts of unique ftypes in this object.

Deprecated since version 0.23.0.

This is useful for SparseDataFrame or for DataFrames containing sparse arrays.

**Returns dtype** : Series

Series with the count of columns with each type and sparsity (dense/sparse)

**See also:****ftypes** Return ftypes (indication of sparse/dense and dtype) in this object.**Examples**

```
>>> a = [['a', 1, 1.0], ['b', 2, 2.0], ['c', 3, 3.0]]
>>> df = pd.DataFrame(a, columns=['str', 'int', 'float'])
>>> df
   str  int  float
0   a    1    1.0
1   b    2    2.0
2   c    3    3.0
```

```
>>> df.get_ftype_counts()
float64:dense    1
int64:dense      1
object:dense     1
dtype: int64
```

**pandas.Panel.get\_value****Panel.get\_value(\*args, \*\*kwargs)**

Quickly retrieve single value at (item, major, minor) location

Deprecated since version 0.21.0.

Please use .at[] or .iat[] accessors.

**Parameters****item** [item label (panel item)]**major** [major axis label (panel item row)]**minor** [minor axis label (panel item column)]**takeable** [interpret the passed labels as indexers, default False]**Returns****value** [scalar value]

## pandas.Panel.get\_values

`Panel.get_values()`

Return an ndarray after converting sparse values to dense.

This is the same as `.values` for non-sparse data. For sparse data contained in a *pandas.SparseArray*, the data are first converted to a dense representation.

**Returns** `numpy.ndarray`

Numpy representation of DataFrame

**See also:**

**values** Numpy representation of DataFrame.

**pandas.SparseArray** Container for sparse data.

## Examples

```
>>> df = pd.DataFrame({'a': [1, 2], 'b': [True, False],
...                    'c': [1.0, 2.0]})
>>> df
   a      b      c
0  1   True  1.0
1  2  False  2.0
```

```
>>> df.get_values()
array([[1, True, 1.0], [2, False, 2.0]], dtype=object)
```

```
>>> df = pd.DataFrame({"a": pd.SparseArray([1, None, None]),
...                    "c": [1.0, 2.0, 3.0]})
>>> df
   a      c
0  1.0  1.0
1  NaN  2.0
2  NaN  3.0
```

```
>>> df.get_values()
array([[ 1.,  1.],
       [nan,  2.],
       [nan,  3.]])
```

## pandas.Panel.groupby

`Panel.groupby(function, axis='major')`

Group data on given axis, returning GroupBy object

**Parameters** `function` : callable

Mapping function for chosen access

**axis** [{‘major’, ‘minor’, ‘items’}, default ‘major’]

**Returns**

**grouped** [PanelGroupBy]**pandas.Panel.gt****Panel.gt** (*other, axis=None*)

Wrapper for comparison method gt

**pandas.Panel.head****Panel.head** (*n=5*)Return the first *n* rows.

This function returns the first *n* rows for the object based on position. It is useful for quickly testing if your object has the right type of data in it.

**Parameters** *n* : int, default 5

Number of rows to select.

**Returns** *obj\_head* : type of callerThe first *n* rows of the caller object.**See also:**[\*pandas.DataFrame.tail\*](#) Returns the last *n* rows.**Examples**

```
>>> df = pd.DataFrame({'animal': ['alligator', 'bee', 'falcon', 'lion',
...                               'monkey', 'parrot', 'shark', 'whale', 'zebra']})
>>> df
   animal
0  alligator
1      bee
2   falcon
3     lion
4   monkey
5   parrot
6   shark
7   whale
8   zebra
```

Viewing the first 5 lines

```
>>> df.head()
   animal
0  alligator
1      bee
2   falcon
3     lion
4   monkey
```

Viewing the first *n* lines (three in this case)

```
>>> df.head(3)
   animal
0  alligator
1      bee
2    falcon
```

## pandas.Panel.infer\_objects

`Panel.infer_objects()`

Attempt to infer better dtypes for object columns.

Attempts soft conversion of object-dtyped columns, leaving non-object and unconvertible columns unchanged. The inference rules are the same as during normal Series/DataFrame construction.

New in version 0.21.0.

### Returns

**converted** [same type as input object]

See also:

[`pandas.to\_datetime`](#) Convert argument to datetime.

[`pandas.to\_timedelta`](#) Convert argument to timedelta.

[`pandas.to\_numeric`](#) Convert argument to numeric typeR

## Examples

```
>>> df = pd.DataFrame({"A": ["a", 1, 2, 3]})
>>> df = df.iloc[1:]
>>> df
   A
1  1
2  2
3  3
```

```
>>> df.dtypes
A    object
dtype: object
```

```
>>> df.infer_objects().dtypes
A    int64
dtype: object
```

## pandas.Panel.interpolate

`Panel.interpolate` (*method='linear', axis=0, limit=None, inplace=False, limit\_direction='forward', limit\_area=None, downcast=None, \*\*kwargs*)

Interpolate values according to different methods.

Please note that only `method='linear'` is supported for DataFrames/Series with a MultiIndex.

**Parameters** `method`: {'linear', 'time', 'index', 'values', 'nearest', 'zero',

‘slinear’, ‘quadratic’, ‘cubic’, ‘barycentric’, ‘krogh’, ‘polynomial’, ‘spline’, ‘piecewise\_polynomial’, ‘from\_derivatives’, ‘pchip’, ‘akima’}

- ‘linear’: ignore the index and treat the values as equally spaced. This is the only method supported on MultiIndexes. default
- ‘time’: interpolation works on daily and higher resolution data to interpolate given length of interval
- ‘index’, ‘values’: use the actual numerical values of the index
- ‘nearest’, ‘zero’, ‘slinear’, ‘quadratic’, ‘cubic’, ‘barycentric’, ‘polynomial’ is passed to `scipy.interpolate.interpld`. Both ‘polynomial’ and ‘spline’ require that you also specify an *order* (int), e.g. `df.interpolate(method='polynomial', order=4)`. These use the actual numerical values of the index.
- ‘krogh’, ‘piecewise\_polynomial’, ‘spline’, ‘pchip’ and ‘akima’ are all wrappers around the scipy interpolation methods of similar names. These use the actual numerical values of the index. For more information on their behavior, see the [scipy documentation](#) and [tutorial documentation](#)
- ‘from\_derivatives’ refers to `BPoly.from_derivatives` which replaces ‘piecewise\_polynomial’ interpolation method in scipy 0.18

New in version 0.18.1: Added support for the ‘akima’ method Added interpolate method ‘from\_derivatives’ which replaces ‘piecewise\_polynomial’ in scipy 0.18; backwards-compatible with scipy < 0.18

**axis** : {0, 1}, default 0

- 0: fill column-by-column
- 1: fill row-by-row

**limit** : int, default None.

Maximum number of consecutive NaNs to fill. Must be greater than 0.

**limit\_direction** [{‘forward’, ‘backward’, ‘both’}, default ‘forward’]

**limit\_area** : {‘inside’, ‘outside’}, default None

- None: (default) no fill restriction
- ‘inside’ Only fill NaNs surrounded by valid values (interpolate).
- ‘outside’ Only fill NaNs outside valid values (extrapolate).

If limit is specified, consecutive NaNs will be filled in this direction.

New in version 0.21.0.

**inplace** : bool, default False

Update the NDFrame in place if possible.

**downcast** : optional, ‘infer’ or None, defaults to None

Downcast dtypes if possible.

**kwargs** [keyword arguments to pass on to the interpolating function.]

**Returns**

**Series or DataFrame of same shape interpolated at the NaNs**

**See also:**

*reindex, replace, fillna*

**Examples**

Filling in NaNs

```
>>> s = pd.Series([0, 1, np.nan, 3])
>>> s.interpolate()
0    0
1    1
2    2
3    3
dtype: float64
```

**pandas.Panel.isna**

**Panel.isna()**

Detect missing values.

Return a boolean same-sized object indicating if the values are NA. NA values, such as `None` or `numpy.NaN`, gets mapped to `True` values. Everything else gets mapped to `False` values. Characters such as empty strings `' '` or `numpy.inf` are not considered NA values (unless you set `pandas.options.mode.use_inf_as_na = True`).

**Returns NDFrame**

Mask of bool values for each element in NDFrame that indicates whether an element is not an NA value.

**See also:**

**NDFrame.isnull** alias of `isna`

**NDFrame.notna** boolean inverse of `isna`

**NDFrame.dropna** omit axes labels with missing values

*isna* top-level `isna`

**Examples**

Show which entries in a DataFrame are NA.

```
>>> df = pd.DataFrame({'age': [5, 6, np.NaN],
...                    'born': [pd.NaT, pd.Timestamp('1939-05-27'),
...                             pd.Timestamp('1940-04-25')],
...                    'name': ['Alfred', 'Batman', ''],
...                    'toy': [None, 'Batmobile', 'Joker']})
>>> df
   age  born      name      toy
0    5  NaT    Alfred    None
1    6  b'1939-05-27' Batman  Batmobile
2  NaN  b'1940-04-25'     ''    Joker
```

(continues on next page)

(continued from previous page)

0	5.0	NaT	Alfred	None
1	6.0	1939-05-27	Batman	Batmobile
2	NaN	1940-04-25		Joker

```
>>> df.isna()
      age  born  name  toy
0  False  True False  True
1  False False False False
2   True False False False
```

Show which entries in a Series are NA.

```
>>> ser = pd.Series([5, 6, np.NaN])
>>> ser
0    5.0
1    6.0
2    NaN
dtype: float64
```

```
>>> ser.isna()
0    False
1    False
2     True
dtype: bool
```

## pandas.Panel.isnull

`Panel.isnull()`

Detect missing values.

Return a boolean same-sized object indicating if the values are NA. NA values, such as `None` or `numpy.NaN`, gets mapped to `True` values. Everything else gets mapped to `False` values. Characters such as empty strings `' '` or `numpy.inf` are not considered NA values (unless you set `pandas.options.mode.use_inf_as_na = True`).

### Returns NDFrame

Mask of bool values for each element in NDFrame that indicates whether an element is not an NA value.

See also:

**NDFrame.isnull** alias of `isna`

**NDFrame.notna** boolean inverse of `isna`

**NDFrame.dropna** omit axes labels with missing values

[\*isna\*](#) top-level `isna`

## Examples

Show which entries in a DataFrame are NA.

```
>>> df = pd.DataFrame({'age': [5, 6, np.NaN],
...                     'born': [pd.NaT, pd.Timestamp('1939-05-27'),
...                               pd.Timestamp('1940-04-25')],
...                     'name': ['Alfred', 'Batman', ''],
...                     'toy': [None, 'Batmobile', 'Joker']})
>>> df
   age      born  name      toy
0  5.0      NaT  Alfred    None
1  6.0 1939-05-27  Batman  Batmobile
2  NaN 1940-04-25      Joker
```

```
>>> df.isna()
   age  born  name  toy
0  False  True  False  True
1  False  False  False  False
2   True  False  False  False
```

Show which entries in a Series are NA.

```
>>> ser = pd.Series([5, 6, np.NaN])
>>> ser
0    5.0
1    6.0
2    NaN
dtype: float64
```

```
>>> ser.isna()
0    False
1    False
2     True
dtype: bool
```

## pandas.Panel.iteritems

`Panel.iteritems()`

Iterate over (label, values) on info axis

This is index for Series, columns for DataFrame, `major_axis` for Panel, and so on.

## pandas.Panel.join

`Panel.join(other, how='left', lsuffix="", rsuffix="")`

Join items with other Panel either on major and minor axes column

**Parameters** `other` : Panel or list of Panels

Index should be similar to one of the columns in this one

**how** : { 'left', 'right', 'outer', 'inner' }

How to handle indexes of the two objects. Default: 'left' for joining on index,  
None otherwise \* left: use calling frame's index \* right: use input frame's index  
\* outer: form union of indexes \* inner: use intersection of indexes

**lsuffix** : string

Suffix to use from left frame's overlapping columns

**rsuffix** : string

Suffix to use from right frame's overlapping columns

### Returns

**joined** [Panel]

## pandas.Panel.keys

`Panel.keys()`

Get the 'info axis' (see Indexing for more)

This is index for Series, columns for DataFrame and major\_axis for Panel.

## pandas.Panel.kurt

`Panel.kurt(axis=None, skipna=None, level=None, numeric_only=None, **kwargs)`

Return unbiased kurtosis over requested axis using Fisher's definition of kurtosis (kurtosis of normal == 0.0). Normalized by N-1

### Parameters

**axis** [{items (0), major\_axis (1), minor\_axis (2)}]

**skipna** : boolean, default True

Exclude NA/null values when computing the result.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a DataFrame

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

### Returns

**kurt** [DataFrame or Panel (if level specified)]

## pandas.Panel.kurtosis

`Panel.kurtosis(axis=None, skipna=None, level=None, numeric_only=None, **kwargs)`

Return unbiased kurtosis over requested axis using Fisher's definition of kurtosis (kurtosis of normal == 0.0). Normalized by N-1

### Parameters

**axis** [{items (0), major\_axis (1), minor\_axis (2)}]

**skipna** : boolean, default True

Exclude NA/null values when computing the result.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a DataFrame

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

### Returns

**kurt** [DataFrame or Panel (if level specified)]

## pandas.Panel.last

`Panel.last` (*offset*)

Convenience method for subsetting final periods of time series data based on a date offset.

### Parameters

**offset** [string, DateOffset, dateutil.relativedelta]

### Returns

**subset** [type of caller]

### Raises

**TypeError**

If the index is not a *DatetimeIndex*

### See also:

*first* Select initial periods of time series based on a date offset

*at\_time* Select values at a particular time of the day

*between\_time* Select values between particular times of the day

## Examples

```
>>> i = pd.date_range('2018-04-09', periods=4, freq='2D')
>>> ts = pd.DataFrame({'A': [1,2,3,4]}, index=i)
>>> ts
              A
2018-04-09    1
2018-04-11    2
2018-04-13    3
2018-04-15    4
```

Get the rows for the last 3 days:

```
>>> ts.last('3D')
              A
2018-04-13    3
2018-04-15    4
```

Notice the data for 3 last calendar days were returned, not the last 3 observed days in the dataset, and therefore data for 2018-04-11 was not returned.

**pandas.Panel.last\_valid\_index**

`Panel.last_valid_index()`  
Return index for last non-NA/null value.

**Returns**

**scalar** [type of index]

**Notes**

If all elements are non-NA/null, returns None. Also returns None for empty NDFrame.

**pandas.Panel.le**

`Panel.le(other, axis=None)`  
Wrapper for comparison method `le`

**pandas.Panel.lt**

`Panel.lt(other, axis=None)`  
Wrapper for comparison method `lt`

**pandas.Panel.mad**

`Panel.mad(axis=None, skipna=None, level=None)`  
Return the mean absolute deviation of the values for the requested axis

**Parameters**

**axis** [{items (0), major\_axis (1), minor\_axis (2)}]

**skipna** : boolean, default True

Exclude NA/null values when computing the result.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a DataFrame

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

**Returns**

**mad** [DataFrame or Panel (if level specified)]

**pandas.Panel.major\_xs**

`Panel.major_xs(key)`  
Return slice of panel along major axis

**Parameters** **key** : object

Major axis label

**Returns** **y** : DataFrame

index -> minor axis, columns -> items

## Notes

major\_xs is only for getting, not setting values.

MultiIndex Slicers is a generic way to get/set values on any level or levels and is a superset of major\_xs functionality, see [MultiIndex Slicers](#)

## pandas.Panel.mask

`Panel.mask(cond, other=nan, inplace=False, axis=None, level=None, errors='raise', try_cast=False, raise_on_error=None)`

Return an object of same shape as self and whose corresponding entries are from self where *cond* is False and otherwise are from *other*.

**Parameters** **cond** : boolean NDFrame, array-like, or callable

Where *cond* is False, keep the original value. Where True, replace with corresponding value from *other*. If *cond* is callable, it is computed on the NDFrame and should return boolean NDFrame or array. The callable must not change input NDFrame (though pandas doesn't check it).

New in version 0.18.1: A callable can be used as cond.

**other** : scalar, NDFrame, or callable

Entries where *cond* is True are replaced with corresponding value from *other*. If *other* is callable, it is computed on the NDFrame and should return scalar or NDFrame. The callable must not change input NDFrame (though pandas doesn't check it).

New in version 0.18.1: A callable can be used as other.

**inplace** : boolean, default False

Whether to perform the operation in place on the data

**axis** [alignment axis if needed, default None]

**level** [alignment level if needed, default None]

**errors** : str, {'raise', 'ignore'}, default 'raise'

- **raise** : allow exceptions to be raised
- **ignore** : suppress exceptions. On error return original object

Note that currently this parameter won't affect the results and will always coerce to a suitable dtype.

**try\_cast** : boolean, default False

try to cast the result back to the input type (if possible),

**raise\_on\_error** : boolean, default True

Whether to raise on invalid data types (e.g. trying to where on strings)

Deprecated since version 0.21.0.

### Returns

**wh** [same type as caller]

### See also:

`DataFrame.where()`

### Notes

The mask method is an application of the if-then idiom. For each element in the calling DataFrame, if `cond` is `False` the element is used; otherwise the corresponding element from the DataFrame `other` is used.

The signature for `DataFrame.where()` differs from `numpy.where()`. Roughly `df1.where(m, df2)` is equivalent to `np.where(m, df1, df2)`.

For further details and examples see the `mask` documentation in [indexing](#).

### Examples

```
>>> s = pd.Series(range(5))
>>> s.where(s > 0)
0    NaN
1     1.0
2     2.0
3     3.0
4     4.0
```

```
>>> s.mask(s > 0)
0     0.0
1     NaN
2     NaN
3     NaN
4     NaN
```

```
>>> s.where(s > 1, 10)
0     10.0
1     10.0
2     2.0
3     3.0
4     4.0
```

```
>>> df = pd.DataFrame(np.arange(10).reshape(-1, 2), columns=['A', 'B'])
>>> m = df % 3 == 0
>>> df.where(m, -df)
   A  B
0  0 -1
1 -2  3
2 -4 -5
3  6 -7
4 -8  9
```

(continues on next page)

(continued from previous page)

```

>>> df.where(m, -df) == np.where(m, df, -df)
   A      B
0  True  True
1  True  True
2  True  True
3  True  True
4  True  True
>>> df.where(m, -df) == df.mask(~m, -df)
   A      B
0  True  True
1  True  True
2  True  True
3  True  True
4  True  True

```

### pandas.Panel.max

Panel.**max** (*axis=None, skipna=None, level=None, numeric\_only=None, \*\*kwargs*)

**This method returns the maximum of the values in the object.** If you want the *index* of the maximum, use `idxmax`. This is the equivalent of the `numpy.ndarray` method `argmax`.

#### Parameters

**axis** [{items (0), major\_axis (1), minor\_axis (2)}]

**skipna** : boolean, default True

Exclude NA/null values when computing the result.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a DataFrame

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

#### Returns

**max** [DataFrame or Panel (if level specified)]

### pandas.Panel.mean

Panel.**mean** (*axis=None, skipna=None, level=None, numeric\_only=None, \*\*kwargs*)

Return the mean of the values for the requested axis

#### Parameters

**axis** [{items (0), major\_axis (1), minor\_axis (2)}]

**skipna** : boolean, default True

Exclude NA/null values when computing the result.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a DataFrame

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

#### Returns

**mean** [DataFrame or Panel (if level specified)]

### pandas.Panel.median

`Panel.median` (*axis=None, skipna=None, level=None, numeric\_only=None, \*\*kwargs*)

Return the median of the values for the requested axis

#### Parameters

**axis** [{items (0), major\_axis (1), minor\_axis (2)}]

**skipna** : boolean, default True

Exclude NA/null values when computing the result.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a DataFrame

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

#### Returns

**median** [DataFrame or Panel (if level specified)]

### pandas.Panel.min

`Panel.min` (*axis=None, skipna=None, level=None, numeric\_only=None, \*\*kwargs*)

**This method returns the minimum of the values in the object.** If you want the *index* of the minimum, use `idxmin`. This is the equivalent of the `numpy.ndarray` method `argmin`.

#### Parameters

**axis** [{items (0), major\_axis (1), minor\_axis (2)}]

**skipna** : boolean, default True

Exclude NA/null values when computing the result.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a DataFrame

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

### Returns

**min** [DataFrame or Panel (if level specified)]

## pandas.Panel.minor\_xs

`Panel.minor_xs` (*key*)

Return slice of panel along minor axis

**Parameters** **key** : object

Minor axis label

**Returns** **y** : DataFrame

index -> major axis, columns -> items

### Notes

`minor_xs` is only for getting, not setting values.

MultiIndex Slicers is a generic way to get/set values on any level or levels and is a superset of `minor_xs` functionality, see [MultiIndex Slicers](#)

## pandas.Panel.mod

`Panel.mod` (*other*, *axis=0*)

Modulo of series and other, element-wise (binary operator *mod*). Equivalent to `panel % other`.

### Parameters

**other** [DataFrame or Panel]

**axis** : {items, major\_axis, minor\_axis}

Axis to broadcast over

### Returns

**Panel**

**See also:**

[`Panel.rmod`](#)

## pandas.Panel.mul

`Panel.mul` (*other*, *axis=0*)

Multiplication of series and other, element-wise (binary operator *mul*). Equivalent to `panel * other`.

### Parameters

**other** [DataFrame or Panel]

**axis** : {items, major\_axis, minor\_axis}

Axis to broadcast over

### Returns

**Panel****See also:**`Panel.rmul`**pandas.Panel.multiply**`Panel.multiply` (*other*, *axis=0*)Multiplication of series and other, element-wise (binary operator *mul*). Equivalent to `panel * other`.**Parameters****other** [DataFrame or Panel]**axis** : {items, major\_axis, minor\_axis}

Axis to broadcast over

**Returns****Panel****See also:**`Panel.rmul`**pandas.Panel.ne**`Panel.ne` (*other*, *axis=None*)Wrapper for comparison method `ne`**pandas.Panel.notna**`Panel.notna` ()

Detect existing (non-missing) values.

Return a boolean same-sized object indicating if the values are not NA. Non-missing values get mapped to True. Characters such as empty strings `' '` or `numpy.inf` are not considered NA values (unless you set `pandas.options.mode.use_inf_as_na = True`). NA values, such as `None` or `numpy.NaN`, get mapped to False values.

**Returns NDFrame**

Mask of bool values for each element in NDFrame that indicates whether an element is not an NA value.

**See also:****NDFrame.notnull** alias of `notna`**NDFrame.isna** boolean inverse of `notna`**NDFrame.dropna** omit axes labels with missing values**`notna`** top-level `notna`

## Examples

Show which entries in a DataFrame are not NA.

```
>>> df = pd.DataFrame({'age': [5, 6, np.NaN],
...                     'born': [pd.NaT, pd.Timestamp('1939-05-27'),
...                               pd.Timestamp('1940-04-25')],
...                     'name': ['Alfred', 'Batman', ''],
...                     'toy': [None, 'Batmobile', 'Joker']})
>>> df
   age      born    name    toy
0  5.0      NaT  Alfred   None
1  6.0 1939-05-27  Batman  Batmobile
2  NaN 1940-04-25      Joker
```

```
>>> df.notna()
   age  born  name  toy
0  True False  True False
1  True  True  True  True
2 False  True  True  True
```

Show which entries in a Series are not NA.

```
>>> ser = pd.Series([5, 6, np.NaN])
>>> ser
0    5.0
1    6.0
2    NaN
dtype: float64
```

```
>>> ser.notna()
0    True
1    True
2    False
dtype: bool
```

## pandas.Panel.notnull

`Panel.notnull()`

Detect existing (non-missing) values.

Return a boolean same-sized object indicating if the values are not NA. Non-missing values get mapped to True. Characters such as empty strings '' or `numpy.inf` are not considered NA values (unless you set `pandas.options.mode.use_inf_as_na = True`). NA values, such as `None` or `numpy.NaN`, get mapped to False values.

### Returns NDFrame

Mask of bool values for each element in NDFrame that indicates whether an element is not an NA value.

See also:

**NDFrame.notnull** alias of `notna`

**NDFrame.isna** boolean inverse of `notna`

**NDFrame.dropna** omit axes labels with missing values

**notna** top-level notna

## Examples

Show which entries in a DataFrame are not NA.

```
>>> df = pd.DataFrame({'age': [5, 6, np.NaN],
...                     'born': [pd.NaT, pd.Timestamp('1939-05-27'),
...                               pd.Timestamp('1940-04-25')],
...                     'name': ['Alfred', 'Batman', ''],
...                     'toy': [None, 'Batmobile', 'Joker']})
>>> df
   age      born    name      toy
0  5.0      NaT  Alfred     None
1  6.0 1939-05-27  Batman  Batmobile
2  NaN 1940-04-25      Joker
```

```
>>> df.notna()
   age  born  name  toy
0  True False  True False
1  True  True  True  True
2 False  True  True  True
```

Show which entries in a Series are not NA.

```
>>> ser = pd.Series([5, 6, np.NaN])
>>> ser
0    5.0
1    6.0
2    NaN
dtype: float64
```

```
>>> ser.notna()
0    True
1    True
2   False
dtype: bool
```

## pandas.Panel.pct\_change

**Panel.pct\_change** (*periods=1, fill\_method='pad', limit=None, freq=None, \*\*kwargs*)

Percentage change between the current and a prior element.

Computes the percentage change from the immediately previous row by default. This is useful in comparing the percentage of change in a time series of elements.

**Parameters** **periods** : int, default 1

Periods to shift for forming percent change.

**fill\_method** : str, default 'pad'

How to handle NAs before computing percent changes.

**limit** : int, default None

The number of consecutive NAs to fill before stopping.

**freq** : DateOffset, timedelta, or offset alias string, optional

Increment to use from time series API (e.g. 'M' or BDay()).

**\*\*kwargs**

Additional keyword arguments are passed into *DataFrame.shift* or *Series.shift*.

**Returns** **chg** : Series or DataFrame

The same type as the calling object.

**See also:**

***Series.diff*** Compute the difference of two elements in a Series.

***DataFrame.diff*** Compute the difference of two elements in a DataFrame.

***Series.shift*** Shift the index by some number of periods.

***DataFrame.shift*** Shift the index by some number of periods.

## Examples

### Series

```
>>> s = pd.Series([90, 91, 85])
>>> s
0    90
1    91
2    85
dtype: int64
```

```
>>> s.pct_change()
0      NaN
1    0.011111
2   -0.065934
dtype: float64
```

```
>>> s.pct_change(periods=2)
0      NaN
1      NaN
2   -0.055556
dtype: float64
```

See the percentage change in a Series where filling NAs with last valid observation forward to next valid.

```
>>> s = pd.Series([90, 91, None, 85])
>>> s
0    90.0
1    91.0
2     NaN
3    85.0
dtype: float64
```

```
>>> s.pct_change(fill_method='ffill')
0      NaN
1    0.011111
2    0.000000
3   -0.065934
dtype: float64
```

### DataFrame

Percentage change in French franc, Deutsche Mark, and Italian lira from 1980-01-01 to 1980-03-01.

```
>>> df = pd.DataFrame({
...     'FR': [4.0405, 4.0963, 4.3149],
...     'GR': [1.7246, 1.7482, 1.8519],
...     'IT': [804.74, 810.01, 860.13]},
...     index=['1980-01-01', '1980-02-01', '1980-03-01'])
>>> df
```

	FR	GR	IT
1980-01-01	4.0405	1.7246	804.74
1980-02-01	4.0963	1.7482	810.01
1980-03-01	4.3149	1.8519	860.13

```
>>> df.pct_change()
```

	FR	GR	IT
1980-01-01	NaN	NaN	NaN
1980-02-01	0.013810	0.013684	0.006549
1980-03-01	0.053365	0.059318	0.061876

Percentage of change in GOOG and APPL stock volume. Shows computing the percentage change between columns.

```
>>> df = pd.DataFrame({
...     '2016': [1769950, 30586265],
...     '2015': [1500923, 40912316],
...     '2014': [1371819, 41403351]},
...     index=['GOOG', 'APPL'])
>>> df
```

	2016	2015	2014
GOOG	1769950	1500923	1371819
APPL	30586265	40912316	41403351

```
>>> df.pct_change(axis='columns')
```

	2016	2015	2014
GOOG	NaN	-0.151997	-0.086016
APPL	NaN	0.337604	0.012002

### pandas.Panel.pipe

`Panel.pipe(func, *args, **kwargs)`  
 Apply func(self, \*args, \*\*kwargs)

**Parameters** `func`: function

function to apply to the NDFrame. `args`, and `kwargs` are passed into `func`. Alternatively a (callable, data\_keyword) tuple where

`data_keyword` is a string indicating the keyword of `callable` that expects the `NDFrame`.

**args** : iterable, optional

positional arguments passed into `func`.

**kwargs** : mapping, optional

a dictionary of keyword arguments passed into `func`.

### Returns

**object** [the return type of `func`.]

### See also:

*`pandas.DataFrame.apply`, `pandas.DataFrame.applymap`, `pandas.Series.map`*

### Notes

Use `.pipe` when chaining together functions that expect `Series`, `DataFrames` or `GroupBy` objects. Instead of writing

```
>>> f(g(h(df), arg1=a), arg2=b, arg3=c)
```

You can write

```
>>> (df.pipe(h)
...   .pipe(g, arg1=a)
...   .pipe(f, arg2=b, arg3=c)
...   )
```

If you have a function that takes the data as (say) the second argument, pass a tuple indicating which keyword expects the data. For example, suppose `f` takes its data as `arg2`:

```
>>> (df.pipe(h)
...   .pipe(g, arg1=a)
...   .pipe((f, 'arg2'), arg1=a, arg3=c)
...   )
```

## pandas.Panel.pop

`Panel.pop(item)`

Return item and drop from frame. Raise `KeyError` if not found.

**Parameters** `item` : str

Column label to be popped

### Returns

**popped** [Series]

### Examples

```
>>> df = pd.DataFrame([('falcon', 'bird', 389.0),
...                     ('parrot', 'bird', 24.0),
...                     ('lion', 'mammal', 80.5),
...                     ('monkey', 'mammal', np.nan)],
...                     columns=('name', 'class', 'max_speed'))
>>> df
   name  class  max_speed
0  falcon   bird     389.0
1  parrot   bird      24.0
2    lion  mammal     80.5
3  monkey  mammal      NaN
```

```
>>> df.pop('class')
0    bird
1    bird
2  mammal
3  mammal
Name: class, dtype: object
```

```
>>> df
   name  max_speed
0  falcon     389.0
1  parrot      24.0
2    lion     80.5
3  monkey      NaN
```

## pandas.Panel.pow

`Panel.pow(other, axis=0)`

Exponential power of series and other, element-wise (binary operator *pow*). Equivalent to `panel ** other`.

### Parameters

**other** [DataFrame or Panel]

**axis** : {items, major\_axis, minor\_axis}

Axis to broadcast over

### Returns

**Panel**

**See also:**

`Panel.rpow`

## pandas.Panel.prod

`Panel.prod(axis=None, skipna=None, level=None, numeric_only=None, min_count=0, **kwargs)`

Return the product of the values for the requested axis

### Parameters

**axis** [{items (0), major\_axis (1), minor\_axis (2)}]

**skipna** : boolean, default True

Exclude NA/null values when computing the result.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a DataFrame

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

**min\_count** : int, default 0

The required number of valid values to perform the operation. If fewer than `min_count` non-NA values are present the result will be NA.

New in version 0.22.0: Added with the default being 0. This means the sum of an all-NA or empty Series is 0, and the product of an all-NA or empty Series is 1.

### Returns

**prod** [DataFrame or Panel (if level specified)]

### Examples

By default, the product of an empty or all-NA Series is 1

```
>>> pd.Series([]).prod()
1.0
```

This can be controlled with the `min_count` parameter

```
>>> pd.Series([]).prod(min_count=1)
nan
```

Thanks to the `skipna` parameter, `min_count` handles all-NA and empty series identically.

```
>>> pd.Series([np.nan]).prod()
1.0
```

```
>>> pd.Series([np.nan]).prod(min_count=1)
nan
```

### pandas.Panel.product

`Panel.product` (*axis=None*, *skipna=None*, *level=None*, *numeric\_only=None*, *min\_count=0*, *\*\*kwargs*)

Return the product of the values for the requested axis

#### Parameters

**axis** [{items (0), major\_axis (1), minor\_axis (2)}]

**skipna** : boolean, default True

Exclude NA/null values when computing the result.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a DataFrame

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

**min\_count** : int, default 0

The required number of valid values to perform the operation. If fewer than `min_count` non-NA values are present the result will be NA.

New in version 0.22.0: Added with the default being 0. This means the sum of an all-NA or empty Series is 0, and the product of an all-NA or empty Series is 1.

### Returns

**prod** [DataFrame or Panel (if level specified)]

## Examples

By default, the product of an empty or all-NA Series is 1

```
>>> pd.Series([]).prod()
1.0
```

This can be controlled with the `min_count` parameter

```
>>> pd.Series([]).prod(min_count=1)
nan
```

Thanks to the `skipna` parameter, `min_count` handles all-NA and empty series identically.

```
>>> pd.Series([np.nan]).prod()
1.0
```

```
>>> pd.Series([np.nan]).prod(min_count=1)
nan
```

## pandas.Panel.radd

`Panel.radd(other, axis=0)`

Addition of series and other, element-wise (binary operator *radd*). Equivalent to `other + panel`.

### Parameters

**other** [DataFrame or Panel]

**axis** : {items, major\_axis, minor\_axis}

Axis to broadcast over

### Returns

**Panel**

See also:

[`Panel.add`](#)

## pandas.Panel.rank

`Panel.rank` (*axis=0*, *method='average'*, *numeric\_only=None*, *na\_option='keep'*, *ascending=True*, *pct=False*)

Compute numerical data ranks (1 through n) along axis. Equal values are assigned a rank that is the average of the ranks of those values

**Parameters** **axis** : {0 or 'index', 1 or 'columns'}, default 0

index to direct ranking

**method** : {'average', 'min', 'max', 'first', 'dense'}

- average: average rank of group
- min: lowest rank in group
- max: highest rank in group
- first: ranks assigned in order they appear in the array
- dense: like 'min', but rank always increases by 1 between groups

**numeric\_only** : boolean, default None

Include only float, int, boolean data. Valid only for DataFrame or Panel objects

**na\_option** : {'keep', 'top', 'bottom'}

- keep: leave NA values where they are
- top: smallest rank if ascending
- bottom: smallest rank if descending

**ascending** : boolean, default True

False for ranks by high (1) to low (N)

**pct** : boolean, default False

Computes percentage rank of data

### Returns

**ranks** [same type as caller]

## pandas.Panel.rdiv

`Panel.rdiv` (*other*, *axis=0*)

Floating division of series and other, element-wise (binary operator *rtruediv*). Equivalent to `other / panel`.

### Parameters

**other** [DataFrame or Panel]

**axis** : {items, major\_axis, minor\_axis}

Axis to broadcast over

### Returns

**Panel**

See also:

`Panel.truediv`

## pandas.Panel.reindex

`Panel.reindex(*args, **kwargs)`

Conform Panel to new index with optional filling logic, placing NA/NaN in locations having no value in the previous index. A new object is produced unless the new index is equivalent to the current one and `copy=False`

**Parameters** `items, major_axis, minor_axis` : array-like, optional (should be specified using keywords)

New labels / index to conform to. Preferably an Index object to avoid duplicating data

**method** : {None, 'backfill'/'bfill', 'pad'/'ffill', 'nearest'}, optional

method to use for filling holes in reindexed DataFrame. Please note: this is only applicable to DataFrames/Series with a monotonically increasing/decreasing index.

- default: don't fill gaps
- pad / ffill: propagate last valid observation forward to next valid
- backfill / bfill: use next valid observation to fill gap
- nearest: use nearest valid observations to fill gap

**copy** : boolean, default True

Return a new object, even if the passed indexes are the same

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

**fill\_value** : scalar, default np.NaN

Value to use for missing values. Defaults to NaN, but can be any "compatible" value

**limit** : int, default None

Maximum number of consecutive elements to forward or backward fill

**tolerance** : optional

Maximum distance between original and new labels for inexact matches. The values of the index at the matching locations must satisfy the equation `abs(index[indexer] - target) <= tolerance`.

Tolerance may be a scalar value, which applies the same tolerance to all values, or list-like, which applies variable tolerance per element. List-like includes list, tuple, array, Series, and must be the same size as the index and its dtype must exactly match the index's type.

New in version 0.21.0: (list-like tolerance)

**Returns**

**reindexed** [Panel]

## Examples

DataFrame.reindex supports two calling conventions

- (index=index\_labels, columns=column\_labels, ...)
- (labels, axis={'index', 'columns'}, ...)

We *highly* recommend using keyword arguments to clarify your intent.

Create a dataframe with some fictional data.

```
>>> index = ['Firefox', 'Chrome', 'Safari', 'IE10', 'Konqueror']
>>> df = pd.DataFrame({
...     'http_status': [200, 200, 404, 404, 301],
...     'response_time': [0.04, 0.02, 0.07, 0.08, 1.0]},
...     index=index)
>>> df
```

	http_status	response_time
Firefox	200	0.04
Chrome	200	0.02
Safari	404	0.07
IE10	404	0.08
Konqueror	301	1.00

Create a new index and reindex the dataframe. By default values in the new index that do not have corresponding records in the dataframe are assigned NaN.

```
>>> new_index= ['Safari', 'Iceweasel', 'Comodo Dragon', 'IE10',
...             'Chrome']
>>> df.reindex(new_index)
```

	http_status	response_time
Safari	404.0	0.07
Iceweasel	NaN	NaN
Comodo Dragon	NaN	NaN
IE10	404.0	0.08
Chrome	200.0	0.02

We can fill in the missing values by passing a value to the keyword `fill_value`. Because the index is not monotonically increasing or decreasing, we cannot use arguments to the keyword method to fill the NaN values.

```
>>> df.reindex(new_index, fill_value=0)
```

	http_status	response_time
Safari	404	0.07
Iceweasel	0	0.00
Comodo Dragon	0	0.00
IE10	404	0.08
Chrome	200	0.02

```
>>> df.reindex(new_index, fill_value='missing')
```

	http_status	response_time
Safari	404	0.07
Iceweasel	missing	missing
Comodo Dragon	missing	missing
IE10	404	0.08
Chrome	200	0.02

We can also reindex the columns.

```
>>> df.reindex(columns=['http_status', 'user_agent'])
      http_status  user_agent
Firefox          200         NaN
Chrome           200         NaN
Safari           404         NaN
IE10             404         NaN
Konqueror        301         NaN
```

Or we can use “axis-style” keyword arguments

```
>>> df.reindex(['http_status', 'user_agent'], axis="columns")
      http_status  user_agent
Firefox          200         NaN
Chrome           200         NaN
Safari           404         NaN
IE10             404         NaN
Konqueror        301         NaN
```

To further illustrate the filling functionality in `reindex`, we will create a dataframe with a monotonically increasing index (for example, a sequence of dates).

```
>>> date_index = pd.date_range('1/1/2010', periods=6, freq='D')
>>> df2 = pd.DataFrame({"prices": [100, 101, np.nan, 100, 89, 88]},
...                     index=date_index)
>>> df2
      prices
2010-01-01    100
2010-01-02    101
2010-01-03     NaN
2010-01-04    100
2010-01-05     89
2010-01-06     88
```

Suppose we decide to expand the dataframe to cover a wider date range.

```
>>> date_index2 = pd.date_range('12/29/2009', periods=10, freq='D')
>>> df2.reindex(date_index2)
      prices
2009-12-29     NaN
2009-12-30     NaN
2009-12-31     NaN
2010-01-01    100
2010-01-02    101
2010-01-03     NaN
2010-01-04    100
2010-01-05     89
2010-01-06     88
2010-01-07     NaN
```

The index entries that did not have a value in the original data frame (for example, ‘2009-12-29’) are by default filled with `NaN`. If desired, we can fill in the missing values using one of several options.

For example, to backpropagate the last valid value to fill the `NaN` values, pass `bfill` as an argument to the method keyword.

```
>>> df2.reindex(date_index2, method='bfill')
      prices
```

(continues on next page)

(continued from previous page)

2009-12-29	100
2009-12-30	100
2009-12-31	100
2010-01-01	100
2010-01-02	101
2010-01-03	NaN
2010-01-04	100
2010-01-05	89
2010-01-06	88
2010-01-07	NaN

Please note that the NaN value present in the original dataframe (at index value 2010-01-03) will not be filled by any of the value propagation schemes. This is because filling while reindexing does not look at dataframe values, but only compares the original and desired indexes. If you do want to fill in the NaN values present in the original dataframe, use the `fillna()` method.

See the [user guide](#) for more.

### pandas.Panel.reindex\_axis

`Panel.reindex_axis(labels, axis=0, method=None, level=None, copy=True, limit=None, fill_value=nan)`

Conform input object to new index with optional filling logic, placing NA/NaN in locations having no value in the previous index. A new object is produced unless the new index is equivalent to the current one and `copy=False`

**Parameters** `labels` : array-like

New labels / index to conform to. Preferably an Index object to avoid duplicating data

**axis** : [{0, 1, 2, 'items', 'major\_axis', 'minor\_axis'}]

**method** : {None, 'backfill'/'bfill', 'pad'/'ffill', 'nearest'}, optional

Method to use for filling holes in reindexed DataFrame:

- default: don't fill gaps
- pad / ffill: propagate last valid observation forward to next valid
- backfill / bfill: use next valid observation to fill gap
- nearest: use nearest valid observations to fill gap

**copy** : boolean, default True

Return a new object, even if the passed indexes are the same

**level** : int or name

Broadcast across a level, matching Index values on the passed MultiIndex level

**limit** : int, default None

Maximum number of consecutive elements to forward or backward fill

**tolerance** : optional

Maximum distance between original and new labels for inexact matches. The values of the index at the matching locations must satisfy the equation `abs(index[indexer] - target) <= tolerance`.

Tolerance may be a scalar value, which applies the same tolerance to all values, or list-like, which applies variable tolerance per element. List-like includes list, tuple, array, Series, and must be the same size as the index and its dtype must exactly match the index's type.

New in version 0.21.0: (list-like tolerance)

### Returns

**reindexed** [Panel]

### See also:

`reindex`, `reindex_like`

### Examples

```
>>> df.reindex_axis(['A', 'B', 'C'], axis=1)
```

## pandas.Panel.reindex\_like

`Panel.reindex_like` (*other*, *method=None*, *copy=True*, *limit=None*, *tolerance=None*)

Return an object with matching indices to myself.

### Parameters

**other** [Object]

**method** [string or None]

**copy** [boolean, default True]

**limit** : int, default None

Maximum number of consecutive labels to fill for inexact matches.

**tolerance** : optional

Maximum distance between labels of the other object and this object for inexact matches. Can be list-like.

New in version 0.21.0: (list-like tolerance)

### Returns

**reindexed** [same as input]

### Notes

Like calling `s.reindex(index=other.index, columns=other.columns, method=...)`

## pandas.Panel.rename

`Panel.rename` (*items=None, major\_axis=None, minor\_axis=None, \*\*kwargs*)

Alter axes input function or functions. Function / dict values must be unique (1-to-1). Labels not contained in a dict / Series will be left as-is. Extra labels listed don't throw an error. Alternatively, change `Series.name` with a scalar value (Series only).

**Parameters** `items, major_axis, minor_axis` : scalar, list-like, dict-like or function, optional

Scalar or list-like will alter the `Series.name` attribute, and raise on `DataFrame` or `Panel`. dict-like or functions are transformations to apply to that axis' values

**copy** : boolean, default True

Also copy underlying data

**inplace** : boolean, default False

Whether to return a new `Panel`. If True then value of copy is ignored.

**level** : int or level name, default None

In case of a `MultiIndex`, only rename labels in the specified level.

### Returns

**renamed** [`Panel` (new object)]

### See also:

`pandas.NDFrame.rename_axis`

### Examples

```
>>> s = pd.Series([1, 2, 3])
>>> s
0    1
1    2
2    3
dtype: int64
>>> s.rename("my_name") # scalar, changes Series.name
0    1
1    2
2    3
Name: my_name, dtype: int64
>>> s.rename(lambda x: x ** 2) # function, changes labels
0    1
1    2
4    3
dtype: int64
>>> s.rename({1: 3, 2: 5}) # mapping, changes labels
0    1
3    2
5    3
dtype: int64
```

Since `DataFrame` doesn't have a `.name` attribute, only mapping-type arguments are allowed.

```
>>> df = pd.DataFrame({"A": [1, 2, 3], "B": [4, 5, 6]})
>>> df.rename(2)
Traceback (most recent call last):
...
TypeError: 'int' object is not callable
```

DataFrame.rename supports two calling conventions

- (index=index\_mapper, columns=columns\_mapper, ...)
- (mapper, axis={'index', 'columns'}, ...)

We *highly* recommend using keyword arguments to clarify your intent.

```
>>> df.rename(index=str, columns={"A": "a", "B": "c"})
   a  c
0  1  4
1  2  5
2  3  6
```

```
>>> df.rename(index=str, columns={"A": "a", "C": "c"})
   a  B
0  1  4
1  2  5
2  3  6
```

Using axis-style parameters

```
>>> df.rename(str.lower, axis='columns')
   a  b
0  1  4
1  2  5
2  3  6
```

```
>>> df.rename({1: 2, 2: 4}, axis='index')
   A  B
0  1  4
2  2  5
4  3  6
```

See the [user guide](#) for more.

## pandas.Panel.rename\_axis

Panel.rename\_axis (mapper, axis=0, copy=True, inplace=False)

Alter the name of the index or columns.

**Parameters** **mapper** : scalar, list-like, optional

Value to set as the axis name attribute.

**axis** : {0 or 'index', 1 or 'columns'}, default 0

The index or the name of the axis.

**copy** : boolean, default True

Also copy underlying data.

**inplace** : boolean, default False

Modifies the object directly, instead of creating a new Series or DataFrame.

**Returns renamed** : Series, DataFrame, or None

The same type as the caller or None if *inplace* is True.

**See also:**

[`pandas.Series.rename`](#) Alter Series index labels or name

[`pandas.DataFrame.rename`](#) Alter DataFrame index labels or name

[`pandas.Index.rename`](#) Set new names on index

## Notes

Prior to version 0.21.0, `rename_axis` could also be used to change the axis *labels* by passing a mapping or scalar. This behavior is deprecated and will be removed in a future version. Use `rename` instead.

## Examples

### Series

```
>>> s = pd.Series([1, 2, 3])
>>> s.rename_axis("foo")
foo
0    1
1    2
2    3
dtype: int64
```

### DataFrame

```
>>> df = pd.DataFrame({"A": [1, 2, 3], "B": [4, 5, 6]})
>>> df.rename_axis("foo")
      A  B
foo
0     1  4
1     2  5
2     3  6
```

```
>>> df.rename_axis("bar", axis="columns")
bar  A  B
0     1  4
1     2  5
2     3  6
```

## `pandas.Panel.replace`

`Panel.replace` (*to\_replace=None*, *value=None*, *inplace=False*, *limit=None*, *regex=False*, *method='pad'*)

Replace values given in *to\_replace* with *value*.

Values of the NDFrame are replaced with other values dynamically. This differs from updating with `.loc` or `.iloc`, which require you to specify a location to update with some value.

**Parameters** `to_replace` : str, regex, list, dict, Series, int, float, or None

How to find the values that will be replaced.

- numeric, str or regex:
  - numeric: numeric values equal to `to_replace` will be replaced with *value*
  - str: string exactly matching `to_replace` will be replaced with *value*
  - regex: regexs matching `to_replace` will be replaced with *value*
- list of str, regex, or numeric:
  - First, if `to_replace` and *value* are both lists, they **must** be the same length.
  - Second, if `regex=True` then all of the strings in **both** lists will be interpreted as regexs otherwise they will match directly. This doesn't matter much for *value* since there are only a few possible substitution regexes you can use.
  - str, regex and numeric rules apply as above.
- dict:
  - Dicts can be used to specify different replacement values for different existing values. For example, `{ 'a': 'b', 'y': 'z' }` replaces the value 'a' with 'b' and 'y' with 'z'. To use a dict in this way the *value* parameter should be *None*.
  - For a DataFrame a dict can specify that different values should be replaced in different columns. For example, `{ 'a': 1, 'b': 'z' }` looks for the value 1 in column 'a' and the value 'z' in column 'b' and replaces these values with whatever is specified in *value*. The *value* parameter should not be *None* in this case. You can treat this as a special case of passing two lists except that you are specifying the column to search in.
  - For a DataFrame nested dictionaries, e.g., `{ 'a': { 'b': np.nan } }`, are read as follows: look in column 'a' for the value 'b' and replace it with NaN. The *value* parameter should be *None* to use a nested dict in this way. You can nest regular expressions as well. Note that column names (the top-level dictionary keys in a nested dictionary) **cannot** be regular expressions.
- None:
  - This means that the *regex* argument must be a string, compiled regular expression, or list, dict, ndarray or Series of such elements. If *value* is also *None* then this **must** be a nested dictionary or Series.

See the examples section for examples of each of these.

**value** : scalar, dict, list, str, regex, default None

Value to replace any values matching `to_replace` with. For a DataFrame a dict of values can be used to specify which value to use for each column (columns not in the dict will not be filled). Regular expressions, strings and lists or dicts of such objects are also allowed.

**inplace** : boolean, default False

If True, in place. Note: this will modify any other views on this object (e.g. a column from a DataFrame). Returns the caller if this is True.

**limit** : int, default None

Maximum size gap to forward or backward fill.

**regex** : bool or same types as *to\_replace*, default False

Whether to interpret *to\_replace* and/or *value* as regular expressions. If this is True then *to\_replace* must be a string. Alternatively, this could be a regular expression or a list, dict, or array of regular expressions in which case *to\_replace* must be None.

**method** : {'pad', 'ffill', 'bfill', None}

The method to use when for replacement, when *to\_replace* is a scalar, list or tuple and *value* is None.

Changed in version 0.23.0: Added to DataFrame.

### Returns NDFrame

Object after replacement.

### Raises AssertionError

- If *regex* is not a bool and *to\_replace* is not None.

### TypeError

- If *to\_replace* is a dict and *value* is not a list, dict, ndarray, or Series
- If *to\_replace* is None and *regex* is not compilable into a regular expression or is a list, dict, ndarray, or Series.
- When replacing multiple bool or datetime64 objects and the arguments to *to\_replace* does not match the type of the value being replaced

### ValueError

- If a list or an ndarray is passed to *to\_replace* and *value* but they are not the same length.

### See also:

**NDFrame.fillna** Fill NA values

**NDFrame.where** Replace values based on boolean condition

**Series.str.replace** Simple string replacement.

### Notes

- Regex substitution is performed under the hood with `re.sub`. The rules for substitution for `re.sub` are the same.
- Regular expressions will only substitute on strings, meaning you cannot provide, for example, a regular expression matching floating point numbers and expect the columns in your frame that have a numeric dtype to be matched. However, if those floating point numbers *are* strings, then you can do this.
- This method has *a lot* of options. You are encouraged to experiment and play with this method to gain intuition about how it works.

- When dict is used as the *to\_replace* value, it is like key(s) in the dict are the *to\_replace* part and value(s) in the dict are the *value* parameter.

## Examples

### Scalar ‘to\_replace’ and ‘value’

```
>>> s = pd.Series([0, 1, 2, 3, 4])
>>> s.replace(0, 5)
0    5
1    1
2    2
3    3
4    4
dtype: int64
```

```
>>> df = pd.DataFrame({'A': [0, 1, 2, 3, 4],
...                    'B': [5, 6, 7, 8, 9],
...                    'C': ['a', 'b', 'c', 'd', 'e']})
>>> df.replace(0, 5)
   A  B  C
0  5  5  a
1  1  6  b
2  2  7  c
3  3  8  d
4  4  9  e
```

### List-like ‘to\_replace’

```
>>> df.replace([0, 1, 2, 3], 4)
   A  B  C
0  4  5  a
1  4  6  b
2  4  7  c
3  4  8  d
4  4  9  e
```

```
>>> df.replace([0, 1, 2, 3], [4, 3, 2, 1])
   A  B  C
0  4  5  a
1  3  6  b
2  2  7  c
3  1  8  d
4  4  9  e
```

```
>>> s.replace([1, 2], method='bfill')
0    0
1    3
2    3
3    3
4    4
dtype: int64
```

### dict-like ‘to\_replace’

```
>>> df.replace({0: 10, 1: 100})
```

	A	B	C
0	10	5	a
1	100	6	b
2	2	7	c
3	3	8	d
4	4	9	e

```
>>> df.replace({'A': 0, 'B': 5}, 100)
```

	A	B	C
0	100	100	a
1	1	6	b
2	2	7	c
3	3	8	d
4	4	9	e

```
>>> df.replace({'A': {0: 100, 4: 400}})
```

	A	B	C
0	100	5	a
1	1	6	b
2	2	7	c
3	3	8	d
4	400	9	e

### Regular expression 'to\_replace'

```
>>> df = pd.DataFrame({'A': ['bat', 'foo', 'bait'],
...                    'B': ['abc', 'bar', 'xyz']})
>>> df.replace(to_replace=r'^ba.$', value='new', regex=True)
```

	A	B
0	new	abc
1	foo	new
2	bait	xyz

```
>>> df.replace({'A': r'^ba.$'}, {'A': 'new'}, regex=True)
```

	A	B
0	new	abc
1	foo	bar
2	bait	xyz

```
>>> df.replace(regex=r'^ba.$', value='new')
```

	A	B
0	new	abc
1	foo	new
2	bait	xyz

```
>>> df.replace(regex={r'^ba.$': 'new', 'foo': 'xyz'})
```

	A	B
0	new	abc
1	xyz	new
2	bait	xyz

```
>>> df.replace(regex=[r'^ba.$', 'foo'], value='new')
```

	A	B
0	new	abc

(continues on next page)

(continued from previous page)

```
1  new  new
2  bait xyz
```

Note that when replacing multiple `bool` or `datetime64` objects, the data types in the `to_replace` parameter must match the data type of the value being replaced:

```
>>> df = pd.DataFrame({'A': [True, False, True],
...                     'B': [False, True, False]})
>>> df.replace({'a string': 'new value', True: False}) # raises
Traceback (most recent call last):
...
TypeError: Cannot compare types 'ndarray(dtype=bool)' and 'str'
```

This raises a `TypeError` because one of the dict keys is not of the correct type for replacement.

Compare the behavior of `s.replace({'a': None})` and `s.replace('a', None)` to understand the peculiarities of the `to_replace` parameter:

```
>>> s = pd.Series([10, 'a', 'a', 'b', 'a'])
```

When one uses a dict as the `to_replace` value, it is like the value(s) in the dict are equal to the `value` parameter. `s.replace({'a': None})` is equivalent to `s.replace(to_replace={'a': None}, value=None, method=None)`:

```
>>> s.replace({'a': None})
0      10
1     None
2     None
3        b
4     None
dtype: object
```

When `value=None` and `to_replace` is a scalar, list or tuple, `replace` uses the `method` parameter (default 'pad') to do the replacement. So this is why the 'a' values are being replaced by 10 in rows 1 and 2 and 'b' in row 4 in this case. The command `s.replace('a', None)` is actually equivalent to `s.replace(to_replace='a', value=None, method='pad')`:

```
>>> s.replace('a', None)
0      10
1      10
2      10
3        b
4        b
dtype: object
```

## pandas.Panel.resample

`Panel.resample(rule, how=None, axis=0, fill_method=None, closed=None, label=None, convention='start', kind=None, loffset=None, limit=None, base=0, on=None, level=None)`

Convenience method for frequency conversion and resampling of time series. Object must have a datetime-like index (`DatetimeIndex`, `PeriodIndex`, or `TimedeltaIndex`), or pass datetime-like values to the `on` or `level` keyword.

**Parameters** `rule`: string

the offset string or object representing target conversion

**axis** [int, optional, default 0]

**closed** : { 'right', 'left' }

Which side of bin interval is closed. The default is 'left' for all frequency offsets except for 'M', 'A', 'Q', 'BM', 'BA', 'BQ', and 'W' which all have a default of 'right'.

**label** : { 'right', 'left' }

Which bin edge label to label bucket with. The default is 'left' for all frequency offsets except for 'M', 'A', 'Q', 'BM', 'BA', 'BQ', and 'W' which all have a default of 'right'.

**convention** : { 'start', 'end', 's', 'e' }

For PeriodIndex only, controls whether to use the start or end of *rule*

**kind**: {'timestamp', 'period'}, optional

Pass 'timestamp' to convert the resulting index to a `DateTimeIndex` or 'period' to convert it to a `PeriodIndex`. By default the input representation is retained.

**loffset** : timedelta

Adjust the resampled time labels

**base** : int, default 0

For frequencies that evenly subdivide 1 day, the "origin" of the aggregated intervals. For example, for '5min' frequency, base could range from 0 through 4. Defaults to 0

**on** : string, optional

For a DataFrame, column to use instead of index for resampling. Column must be datetime-like.

New in version 0.19.0.

**level** : string or int, optional

For a MultiIndex, level (name or number) to use for resampling. Level must be datetime-like.

New in version 0.19.0.

## Returns

### Resampler object

## See also:

[\*groupby\*](#) Group by mapping, function, label, or list of labels.

## Notes

See the [user guide](#) for more.

To learn more about the offset strings, please see [this link](#).

## Examples

Start by creating a series with 9 one minute timestamps.

```
>>> index = pd.date_range('1/1/2000', periods=9, freq='T')
>>> series = pd.Series(range(9), index=index)
>>> series
2000-01-01 00:00:00    0
2000-01-01 00:01:00    1
2000-01-01 00:02:00    2
2000-01-01 00:03:00    3
2000-01-01 00:04:00    4
2000-01-01 00:05:00    5
2000-01-01 00:06:00    6
2000-01-01 00:07:00    7
2000-01-01 00:08:00    8
Freq: T, dtype: int64
```

Downsample the series into 3 minute bins and sum the values of the timestamps falling into a bin.

```
>>> series.resample('3T').sum()
2000-01-01 00:00:00    3
2000-01-01 00:03:00   12
2000-01-01 00:06:00   21
Freq: 3T, dtype: int64
```

Downsample the series into 3 minute bins as above, but label each bin using the right edge instead of the left. Please note that the value in the bucket used as the label is not included in the bucket, which it labels. For example, in the original series the bucket 2000-01-01 00:03:00 contains the value 3, but the summed value in the resampled bucket with the label 2000-01-01 00:03:00 does not include 3 (if it did, the summed value would be 6, not 3). To include this value close the right side of the bin interval as illustrated in the example below this one.

```
>>> series.resample('3T', label='right').sum()
2000-01-01 00:03:00    3
2000-01-01 00:06:00   12
2000-01-01 00:09:00   21
Freq: 3T, dtype: int64
```

Downsample the series into 3 minute bins as above, but close the right side of the bin interval.

```
>>> series.resample('3T', label='right', closed='right').sum()
2000-01-01 00:00:00    0
2000-01-01 00:03:00    6
2000-01-01 00:06:00   15
2000-01-01 00:09:00   15
Freq: 3T, dtype: int64
```

Upsample the series into 30 second bins.

```
>>> series.resample('30S').asfreq()[0:5] #select first 5 rows
2000-01-01 00:00:00    0.0
2000-01-01 00:00:30   NaN
2000-01-01 00:01:00    1.0
2000-01-01 00:01:30   NaN
2000-01-01 00:02:00    2.0
Freq: 30S, dtype: float64
```

Upsample the series into 30 second bins and fill the NaN values using the `pad` method.

```
>>> series.resample('30S').pad()[0:5]
2000-01-01 00:00:00    0
2000-01-01 00:00:30    0
2000-01-01 00:01:00    1
2000-01-01 00:01:30    1
2000-01-01 00:02:00    2
Freq: 30S, dtype: int64
```

Upsample the series into 30 second bins and fill the NaN values using the `bfill` method.

```
>>> series.resample('30S').bfill()[0:5]
2000-01-01 00:00:00    0
2000-01-01 00:00:30    1
2000-01-01 00:01:00    1
2000-01-01 00:01:30    2
2000-01-01 00:02:00    2
Freq: 30S, dtype: int64
```

Pass a custom function via `apply`

```
>>> def custom_resampler(array_like):
...     return np.sum(array_like)+5

>>> series.resample('3T').apply(custom_resampler)
2000-01-01 00:00:00    8
2000-01-01 00:03:00   17
2000-01-01 00:06:00   26
Freq: 3T, dtype: int64
```

For a Series with a PeriodIndex, the keyword *convention* can be used to control whether to use the start or end of *rule*.

```
>>> s = pd.Series([1, 2], index=pd.period_range('2012-01-01',
                                                freq='A',
                                                periods=2))

>>> s
2012    1
2013    2
Freq: A-DEC, dtype: int64
```

Resample by month using ‘start’ *convention*. Values are assigned to the first month of the period.

```
>>> s.resample('M', convention='start').asfreq().head()
2012-01    1.0
2012-02    NaN
2012-03    NaN
2012-04    NaN
2012-05    NaN
Freq: M, dtype: float64
```

Resample by month using ‘end’ *convention*. Values are assigned to the last month of the period.

```
>>> s.resample('M', convention='end').asfreq()
2012-12    1.0
2013-01    NaN
```

(continues on next page)

(continued from previous page)

```

2013-02    NaN
2013-03    NaN
2013-04    NaN
2013-05    NaN
2013-06    NaN
2013-07    NaN
2013-08    NaN
2013-09    NaN
2013-10    NaN
2013-11    NaN
2013-12    2.0
Freq: M, dtype: float64

```

For DataFrame objects, the keyword `on` can be used to specify the column instead of the index for resampling.

```

>>> df = pd.DataFrame(data=9*[range(4)], columns=['a', 'b', 'c', 'd'])
>>> df['time'] = pd.date_range('1/1/2000', periods=9, freq='T')
>>> df.resample('3T', on='time').sum()

```

	a	b	c	d
time				
2000-01-01 00:00:00	0	3	6	9
2000-01-01 00:03:00	0	3	6	9
2000-01-01 00:06:00	0	3	6	9

For a DataFrame with MultiIndex, the keyword `level` can be used to specify on level the resampling needs to take place.

```

>>> time = pd.date_range('1/1/2000', periods=5, freq='T')
>>> df2 = pd.DataFrame(data=10*[range(4)],
                        columns=['a', 'b', 'c', 'd'],
                        index=pd.MultiIndex.from_product([time, [1, 2]]))
>>> df2.resample('3T', level=0).sum()

```

	a	b	c	d
2000-01-01 00:00:00	0	6	12	18
2000-01-01 00:03:00	0	4	8	12

## pandas.Panel.rfloordiv

`Panel.rfloordiv` (*other*, *axis=0*)

Integer division of series and other, element-wise (binary operator *rfloordiv*). Equivalent to `other // panel`.

### Parameters

**other** [DataFrame or Panel]

**axis** : {items, major\_axis, minor\_axis}

Axis to broadcast over

### Returns

**Panel**

See also:

*Panel.floordiv*

## **pandas.Panel.rmod**

`Panel.rmod(other, axis=0)`

Modulo of series and other, element-wise (binary operator *rmod*). Equivalent to `other % panel`.

### **Parameters**

**other** [DataFrame or Panel]

**axis** : {items, major\_axis, minor\_axis}

Axis to broadcast over

### **Returns**

**Panel**

**See also:**

*Panel.mod*

## **pandas.Panel.rmul**

`Panel.rmul(other, axis=0)`

Multiplication of series and other, element-wise (binary operator *rmul*). Equivalent to `other * panel`.

### **Parameters**

**other** [DataFrame or Panel]

**axis** : {items, major\_axis, minor\_axis}

Axis to broadcast over

### **Returns**

**Panel**

**See also:**

*Panel.mul*

## **pandas.Panel.round**

`Panel.round(decimals=0, *args, **kwargs)`

Round each value in Panel to a specified number of decimal places.

New in version 0.18.0.

### **Parameters** **decimals** : int

Number of decimal places to round to (default: 0). If decimals is negative, it specifies the number of positions to the left of the decimal point.

### **Returns**

**Panel object**

See also:

`numpy.around`

### **pandas.Panel.rpow**

`Panel.rpow` (*other*, *axis=0*)

Exponential power of series and other, element-wise (binary operator *rpow*). Equivalent to `other ** panel`.

#### **Parameters**

**other** [DataFrame or Panel]

**axis** : {items, major\_axis, minor\_axis}

Axis to broadcast over

#### **Returns**

**Panel**

See also:

`Panel.pow`

### **pandas.Panel.rsub**

`Panel.rsub` (*other*, *axis=0*)

Subtraction of series and other, element-wise (binary operator *rsub*). Equivalent to `other - panel`.

#### **Parameters**

**other** [DataFrame or Panel]

**axis** : {items, major\_axis, minor\_axis}

Axis to broadcast over

#### **Returns**

**Panel**

See also:

`Panel.sub`

### **pandas.Panel.rtruediv**

`Panel.rtruediv` (*other*, *axis=0*)

Floating division of series and other, element-wise (binary operator *rtruediv*). Equivalent to `other / panel`.

#### **Parameters**

**other** [DataFrame or Panel]

**axis** : {items, major\_axis, minor\_axis}

Axis to broadcast over

#### **Returns**

## Panel

See also:

`Panel.truediv`

### pandas.Panel.sample

`Panel.sample` (*n=None*, *frac=None*, *replace=False*, *weights=None*, *random\_state=None*,  
*axis=None*)

Return a random sample of items from an axis of object.

You can use *random\_state* for reproducibility.

**Parameters** *n* : int, optional

Number of items from axis to return. Cannot be used with *frac*. Default = 1 if *frac* = None.

**frac** : float, optional

Fraction of axis items to return. Cannot be used with *n*.

**replace** : boolean, optional

Sample with or without replacement. Default = False.

**weights** : str or ndarray-like, optional

Default 'None' results in equal probability weighting. If passed a Series, will align with target object on index. Index values in weights not found in sampled object will be ignored and index values in sampled object not in weights will be assigned weights of zero. If called on a DataFrame, will accept the name of a column when *axis* = 0. Unless weights are a Series, weights must be same length as axis being sampled. If weights do not sum to 1, they will be normalized to sum to 1. Missing values in the weights column will be treated as zero. inf and -inf values not allowed.

**random\_state** : int or numpy.random.RandomState, optional

Seed for the random number generator (if int), or numpy RandomState object.

**axis** : int or string, optional

Axis to sample. Accepts axis number or name. Default is stat axis for given data type (0 for Series and DataFrames, 1 for Panels).

### Returns

**A new object of same type as caller.**

### Examples

Generate an example Series and DataFrame:

```
>>> s = pd.Series(np.random.randn(50))
>>> s.head()
0    -0.038497
1     1.820773
2    -0.972766
3    -1.598270
```

(continues on next page)

(continued from previous page)

```

4    -1.095526
dtype: float64
>>> df = pd.DataFrame(np.random.randn(50, 4), columns=list('ABCD'))
>>> df.head()
   A         B         C         D
0  0.016443 -2.318952 -0.566372 -1.028078
1 -1.051921  0.438836  0.658280 -0.175797
2 -1.243569 -0.364626 -0.215065  0.057736
3  1.768216  0.404512 -0.385604 -1.457834
4  1.072446 -1.137172  0.314194 -0.046661

```

Next extract a random sample from both of these objects...

3 random elements from the Series:

```

>>> s.sample(n=3)
27    -0.994689
55    -1.049016
67    -0.224565
dtype: float64

```

And a random 10% of the DataFrame with replacement:

```

>>> df.sample(frac=0.1, replace=True)
   A         B         C         D
35  1.981780  0.142106  1.817165 -0.290805
49 -1.336199 -0.448634 -0.789640  0.217116
40  0.823173 -0.078816  1.009536  1.015108
15  1.421154 -0.055301 -1.922594 -0.019696
6   -0.148339  0.832938  1.787600 -1.383767

```

You can use *random state* for reproducibility:

```

>>> df.sample(random_state=1)
   A         B         C         D
37 -2.027662  0.103611  0.237496 -0.165867
43 -0.259323 -0.583426  1.516140 -0.479118
12 -1.686325 -0.579510  0.985195 -0.460286
8   1.167946  0.429082  1.215742 -1.636041
9   1.197475 -0.864188  1.554031 -1.505264

```

## pandas.Panel.select

`Panel.select (crit, axis=0)`

Return data corresponding to axis labels matching criteria

Deprecated since version 0.21.0: Use `df.loc[df.index.map(crit)]` to select via labels

**Parameters** `crit`: function

To be called on each index (label). Should return True or False

**axis** [int]

**Returns**

**selection** [type of caller]

## pandas.Panel.sem

`Panel.sem` (*axis=None*, *skipna=None*, *level=None*, *ddof=1*, *numeric\_only=None*, *\*\*kwargs*)

Return unbiased standard error of the mean over requested axis.

Normalized by N-1 by default. This can be changed using the *ddof* argument

### Parameters

**axis** : [{items (0), major\_axis (1), minor\_axis (2)}]

**skipna** : boolean, default True

Exclude NA/null values. If an entire row/column is NA, the result will be NA

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a DataFrame

**ddof** : int, default 1

Delta Degrees of Freedom. The divisor used in calculations is  $N - \text{ddof}$ , where  $N$  represents the number of elements.

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

### Returns

**sem** [DataFrame or Panel (if level specified)]

## pandas.Panel.set\_axis

`Panel.set_axis` (*labels*, *axis=0*, *inplace=None*)

Assign desired index to given axis.

Indexes for column or row labels can be changed by assigning a list-like or Index.

Changed in version 0.21.0: The signature is now *labels* and *axis*, consistent with the rest of pandas API. Previously, the *axis* and *labels* arguments were respectively the first and second positional arguments.

**Parameters** **labels** : list-like, Index

The values for the new index.

**axis** : {0 or 'index', 1 or 'columns'}, default 0

The axis to update. The value 0 identifies the rows, and 1 identifies the columns.

**inplace** : boolean, default None

Whether to return a new %(klass)s instance.

**Warning:** `inplace=None` currently falls back to `True`, but in a future version, will default to `False`. Use `inplace=True` explicitly rather than relying on the default.

**Returns** **renamed** : %(klass)s or None

An object of same type as caller if inplace=False, None otherwise.

**See also:**

`pandas.DataFrame.rename_axis` Alter the name of the index or columns.

## Examples

### Series

```
>>> s = pd.Series([1, 2, 3])
>>> s
0    1
1    2
2    3
dtype: int64
```

```
>>> s.set_axis(['a', 'b', 'c'], axis=0, inplace=False)
a    1
b    2
c    3
dtype: int64
```

The original object is not modified.

```
>>> s
0    1
1    2
2    3
dtype: int64
```

### DataFrame

```
>>> df = pd.DataFrame({"A": [1, 2, 3], "B": [4, 5, 6]})
```

Change the row labels.

```
>>> df.set_axis(['a', 'b', 'c'], axis='index', inplace=False)
  A  B
a  1  4
b  2  5
c  3  6
```

Change the column labels.

```
>>> df.set_axis(['I', 'II'], axis='columns', inplace=False)
  I  II
0  1   4
1  2   5
2  3   6
```

Now, update the labels inplace.

```
>>> df.set_axis(['i', 'ii'], axis='columns', inplace=True)
>>> df
  i  ii
```

### **pandas.Panel.set\_value**

`Panel.set_value (*args, **kwargs)`

Quickly set single value at (item, major, minor) location

Deprecated since version 0.21.0.

Please use `.at[]` or `.iat[]` accessors.

#### **Parameters**

**item** [item label (panel item)]

**major** [major axis label (panel item row)]

**minor** [minor axis label (panel item column)]

**value** [scalar]

**takeable** [interpret the passed labels as indexers, default False]

**Returns** `panel` : Panel

If label combo is contained, will be reference to calling Panel, otherwise a new object

### **pandas.Panel.shift**

`Panel.shift (periods=1, freq=None, axis='major')`

Shift index by desired number of periods with an optional time freq. The shifted data will not include the dropped periods and the shifted axis will be smaller than the original. This is different from the behavior of `DataFrame.shift()`

**Parameters** `periods` : int

Number of periods to move, can be positive or negative

**freq** [DateOffset, timedelta, or time rule string, optional]

**axis** [{ 'items', 'major', 'minor' } or {0, 1, 2}]

**Returns**

**shifted** [Panel]

### **pandas.Panel.skew**

`Panel.skew (axis=None, skipna=None, level=None, numeric_only=None, **kwargs)`

Return unbiased skew over requested axis Normalized by N-1

**Parameters**

**axis** [{items (0), major\_axis (1), minor\_axis (2)}]

**skipna** : boolean, default True

Exclude NA/null values when computing the result.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a DataFrame

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

#### Returns

**skew** [DataFrame or Panel (if level specified)]

### pandas.Panel.slice\_shift

Panel.**slice\_shift** (*periods=1, axis=0*)

Equivalent to *shift* without copying data. The shifted data will not include the dropped periods and the shifted axis will be smaller than the original.

**Parameters** **periods** : int

Number of periods to move, can be positive or negative

#### Returns

**shifted** [same type as caller]

#### Notes

While the *slice\_shift* is faster than *shift*, you may pay for it later during alignment.

### pandas.Panel.sort\_index

Panel.**sort\_index** (*axis=0, level=None, ascending=True, inplace=False, kind='quicksort', na\_position='last', sort\_remaining=True*)

Sort object by labels (along an axis)

#### Parameters

**axis** [axes to direct sorting]

**level** : int or level name or list of ints or list of level names

if not None, sort on values in specified index level(s)

**ascending** : boolean, default True

Sort ascending vs. descending

**inplace** : bool, default False

if True, perform operation in-place

**kind** : { 'quicksort', 'mergesort', 'heapsort' }, default 'quicksort'

Choice of sorting algorithm. See also `ndarray.sort` for more information. *mergesort* is the only stable algorithm. For DataFrames, this option is only applied when sorting on a single column or label.

**na\_position** : { 'first', 'last' }, default 'last'

*first* puts NaNs at the beginning, *last* puts NaNs at the end. Not implemented for MultiIndex.

**sort\_remaining** : bool, default True

if true and sorting by level and index is multilevel, sort by other levels too (in order) after sorting by specified level

#### Returns

**sorted\_obj** [NDFrame]

### pandas.Panel.sort\_values

`Panel.sort_values` (*by=None*, *axis=0*, *ascending=True*, *inplace=False*, *kind='quicksort'*, *na\_position='last'*)

NOT IMPLEMENTED: do not call this method, as sorting values is not supported for Panel objects and will raise an error.

### pandas.Panel.squeeze

`Panel.squeeze` (*axis=None*)  
Squeeze length 1 dimensions.

**Parameters** **axis** : None, integer or string axis name, optional

The axis to squeeze if 1-sized.

New in version 0.20.0.

#### Returns

scalar if 1-sized, else original object

### pandas.Panel.std

`Panel.std` (*axis=None*, *skipna=None*, *level=None*, *ddof=1*, *numeric\_only=None*, *\*\*kwargs*)  
Return sample standard deviation over requested axis.

Normalized by N-1 by default. This can be changed using the *ddof* argument

#### Parameters

**axis** [{items (0), major\_axis (1), minor\_axis (2)}]

**skipna** : boolean, default True

Exclude NA/null values. If an entire row/column is NA, the result will be NA

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a DataFrame

**ddof** : int, default 1

Delta Degrees of Freedom. The divisor used in calculations is  $N - \text{ddof}$ , where  $N$  represents the number of elements.

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

#### Returns

**std** [DataFrame or Panel (if level specified)]

### pandas.Panel.sub

`Panel.sub(other, axis=0)`

Subtraction of series and other, element-wise (binary operator *sub*). Equivalent to `panel - other`.

#### Parameters

**other** [DataFrame or Panel]

**axis** : {items, major\_axis, minor\_axis}

Axis to broadcast over

#### Returns

**Panel**

**See also:**

[`Panel.rsub`](#)

### pandas.Panel.subtract

`Panel.subtract(other, axis=0)`

Subtraction of series and other, element-wise (binary operator *sub*). Equivalent to `panel - other`.

#### Parameters

**other** [DataFrame or Panel]

**axis** : {items, major\_axis, minor\_axis}

Axis to broadcast over

#### Returns

**Panel**

**See also:**

[`Panel.rsub`](#)

### pandas.Panel.sum

`Panel.sum(axis=None, skipna=None, level=None, numeric_only=None, min_count=0, **kwargs)`

Return the sum of the values for the requested axis

#### Parameters

**axis** [{items (0), major\_axis (1), minor\_axis (2)}]

**skipna** : boolean, default True

Exclude NA/null values when computing the result.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a DataFrame

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

**min\_count** : int, default 0

The required number of valid values to perform the operation. If fewer than `min_count` non-NA values are present the result will be NA.

New in version 0.22.0: Added with the default being 0. This means the sum of an all-NA or empty Series is 0, and the product of an all-NA or empty Series is 1.

### Returns

**sum** [DataFrame or Panel (if level specified)]

### Examples

By default, the sum of an empty or all-NA Series is 0.

```
>>> pd.Series([]).sum() # min_count=0 is the default
0.0
```

This can be controlled with the `min_count` parameter. For example, if you'd like the sum of an empty series to be NaN, pass `min_count=1`.

```
>>> pd.Series([]).sum(min_count=1)
nan
```

Thanks to the `skipna` parameter, `min_count` handles all-NA and empty series identically.

```
>>> pd.Series([np.nan]).sum()
0.0
```

```
>>> pd.Series([np.nan]).sum(min_count=1)
nan
```

### pandas.Panel.swapaxes

`Panel.swapaxes` (*axis1*, *axis2*, *copy=True*)

Interchange axes and swap values axes appropriately

### Returns

**y** [same as input]

**pandas.Panel.swaplevel**`Panel.swaplevel (i=-2, j=-1, axis=0)`Swap levels *i* and *j* in a MultiIndex on a particular axis**Parameters** *i, j* : int, string (can be mixed)

Level of index to be swapped. Can pass level name as string.

**Returns****swapped** [type of caller (new object)]**.. versionchanged:: 0.18.1**The indexes *i* and *j* are now optional, and default to the two innermost levels of the index.**pandas.Panel.tail**`Panel.tail (n=5)`Return the last *n* rows.This function returns last *n* rows from the object based on position. It is useful for quickly verifying data, for example, after sorting or appending rows.**Parameters** *n* : int, default 5

Number of rows to select.

**Returns** type of callerThe last *n* rows of the caller object.**See also:**`pandas.DataFrame.head` The first *n* rows of the caller object.**Examples**

```

>>> df = pd.DataFrame({'animal': ['alligator', 'bee', 'falcon', 'lion',
...                               'monkey', 'parrot', 'shark', 'whale', 'zebra']})
>>> df
   animal
0 alligator
1      bee
2   falcon
3     lion
4   monkey
5   parrot
6    shark
7    whale
8    zebra

```

Viewing the last 5 lines

```
>>> df.tail()
  animal
4  monkey
5  parrot
6   shark
7   whale
8   zebra
```

Viewing the last  $n$  lines (three in this case)

```
>>> df.tail(3)
  animal
6  shark
7  whale
8  zebra
```

## pandas.Panel.take

`Panel.take` (*indices*, *axis=0*, *convert=None*, *is\_copy=True*, *\*\*kwargs*)

Return the elements in the given *positional* indices along an axis.

This means that we are not indexing according to actual values in the index attribute of the object. We are indexing according to the actual position of the element in the object.

**Parameters** *indices* : array-like

An array of ints indicating which positions to take.

**axis** : {0 or 'index', 1 or 'columns', None}, default 0

The axis on which to select elements. 0 means that we are selecting rows, 1 means that we are selecting columns.

**convert** : bool, default True

Whether to convert negative indices into positive ones. For example,  $-1$  would map to the `len(axis) - 1`. The conversions are similar to the behavior of indexing a regular Python list.

Deprecated since version 0.21.0: In the future, negative indices will always be converted.

**is\_copy** : bool, default True

Whether to return a copy of the original object or not.

**\*\*kwargs**

For compatibility with `numpy.take()`. Has no effect on the output.

**Returns** *taken* : type of caller

An array-like containing the elements taken from the object.

**See also:**

[`DataFrame.loc`](#) Select a subset of a DataFrame by labels.

[`DataFrame.iloc`](#) Select a subset of a DataFrame by positions.

[`numpy.take`](#) Take elements from an array along an axis.

## Examples

```
>>> df = pd.DataFrame([('falcon', 'bird', 389.0),
...                     ('parrot', 'bird', 24.0),
...                     ('lion', 'mammal', 80.5),
...                     ('monkey', 'mammal', np.nan)],
...                     columns=['name', 'class', 'max_speed'],
...                     index=[0, 2, 3, 1])
>>> df
   name  class  max_speed
0  falcon   bird    389.0
2  parrot   bird     24.0
3   lion  mammal     80.5
1  monkey  mammal      NaN
```

Take elements at positions 0 and 3 along the axis 0 (default).

Note how the actual indices selected (0 and 1) do not correspond to our selected indices 0 and 3. That's because we are selecting the 0th and 3rd rows, not rows whose indices equal 0 and 3.

```
>>> df.take([0, 3])
   name  class  max_speed
0  falcon   bird    389.0
1  monkey  mammal      NaN
```

Take elements at indices 1 and 2 along the axis 1 (column selection).

```
>>> df.take([1, 2], axis=1)
   class  max_speed
0   bird    389.0
2   bird     24.0
3  mammal     80.5
1  mammal      NaN
```

We may take elements using negative integers for positive indices, starting from the end of the object, just like with Python lists.

```
>>> df.take([-1, -2])
   name  class  max_speed
1  monkey  mammal      NaN
3   lion  mammal     80.5
```

## pandas.Panel.to\_clipboard

`Panel.to_clipboard(excel=True, sep=None, **kwargs)`

Copy object to the system clipboard.

Write a text representation of object to the system clipboard. This can be pasted into Excel, for example.

**Parameters** `excel` : bool, default True

- True, use the provided separator, writing in a csv format for allowing easy pasting into excel.
- False, write a string representation of the object to the clipboard.

`sep` : str, default '\t'

Field delimiter.

**\*\*kwargs**

These parameters will be passed to `DataFrame.to_csv`.

See also:

`DataFrame.to_csv` Write a `DataFrame` to a comma-separated values (csv) file.

`read_clipboard` Read text from clipboard and pass to `read_table`.

## Notes

Requirements for your platform.

- Linux : `xclip`, or `xsel` (with `gtk` or `PyQt4` modules)
- Windows : none
- OS X : none

## Examples

Copy the contents of a `DataFrame` to the clipboard.

```
>>> df = pd.DataFrame([[1, 2, 3], [4, 5, 6]], columns=['A', 'B', 'C'])
>>> df.to_clipboard(sep=',')
... # Wrote the following to the system clipboard:
... # ,A,B,C
... # 0,1,2,3
... # 1,4,5,6
```

We can omit the the index by passing the keyword `index` and setting it to false.

```
>>> df.to_clipboard(sep=',', index=False)
... # Wrote the following to the system clipboard:
... # A,B,C
... # 1,2,3
... # 4,5,6
```

## pandas.Panel.to\_dense

`Panel.to_dense()`

Return dense representation of `NDFrame` (as opposed to sparse)

## pandas.Panel.to\_excel

`Panel.to_excel(path, na_rep="", engine=None, **kwargs)`

Write each `DataFrame` in `Panel` to a separate excel sheet

**Parameters** `path` : string or `ExcelWriter` object

File path or existing `ExcelWriter`

`na_rep` : string, default ''

Missing data representation

**engine** : string, default None

write engine to use - you can also set this via the options `io.excel.xlsx.writer`, `io.excel.xls.writer`, and `io.excel.xlsm.writer`.

**Other Parameters float\_format** : string, default None

Format string for floating point numbers

**cols** : sequence, optional

Columns to write

**header** : boolean or list of string, default True

Write out column names. If a list of string is given it is assumed to be aliases for the column names

**index** : boolean, default True

Write row names (index)

**index\_label** : string or sequence, default None

Column label for index column(s) if desired. If None is given, and *header* and *index* are True, then the index names are used. A sequence should be given if the DataFrame uses MultiIndex.

**startrow** [upper left cell row to dump data frame]

**startcol** [upper left cell column to dump data frame]

## Notes

Keyword arguments (and `na_rep`) are passed to the `to_excel` method for each DataFrame written.

## pandas.Panel.to\_frame

`Panel.to_frame (filter_observations=True)`

Transform wide format into long (stacked) format as DataFrame whose columns are the Panel's items and whose index is a MultiIndex formed of the Panel's major and minor axes.

**Parameters filter\_observations** : boolean, default True

Drop (major, minor) pairs without a complete set of observations across all the items

**Returns**

y [DataFrame]

## pandas.Panel.to\_hdf

`Panel.to_hdf (path_or_buf, key, **kwargs)`

Write the contained data to an HDF5 file using HDFStore.

Hierarchical Data Format (HDF) is self-describing, allowing an application to interpret the structure and contents of a file with no outside information. One HDF file can hold a mix of related objects which can be accessed as a group or as individual objects.

In order to add another DataFrame or Series to an existing HDF file please use append mode and a different a key.

For more information see the [user guide](#).

**Parameters** **path\_or\_buf** : str or pandas.HDFStore

File path or HDFStore object.

**key** : str

Identifier for the group in the store.

**mode** : { 'a', 'w', 'r+' }, default 'a'

Mode to open file:

- 'w': write, a new file is created (an existing file with the same name would be deleted).
- 'a': append, an existing file is opened for reading and writing, and if the file does not exist it is created.
- 'r+': similar to 'a', but the file must already exist.

**format** : { 'fixed', 'table' }, default 'fixed'

Possible values:

- 'fixed': Fixed format. Fast writing/reading. Not-appendable, nor searchable.
- 'table': Table format. Write as a PyTables Table structure which may perform worse but allow more flexible operations like searching / selecting subsets of the data.

**append** : bool, default False

For Table formats, append the input data to the existing.

**data\_columns** : list of columns or True, optional

List of columns to create as indexed data columns for on-disk queries, or True to use all columns. By default only the axes of the object are indexed. See [Query via Data Columns](#). Applicable only to format='table'.

**complevel** : {0-9}, optional

Specifies a compression level for data. A value of 0 disables compression.

**complib** : { 'zlib', 'lzo', 'bzip2', 'blosc' }, default 'zlib'

Specifies the compression library to be used. As of v0.20.2 these additional compressors for Blosc are supported (default if no compressor specified: 'blosc:blosclz'): { 'blosc:blosclz', 'blosc:lz4', 'blosc:lz4hc', 'blosc:snappy', 'blosc:zlib', 'blosc:zstd' }. Specifying a compression library which is not available issues a ValueError.

**fletcher32** : bool, default False

If applying compression use the fletcher32 checksum.

**dropna** : bool, default False

If true, ALL nan rows will not be written to store.

**errors** : str, default 'strict'

Specifies how encoding and decoding errors are to be handled. See the errors argument for `open()` for a full list of options.

See also:

**DataFrame.read\_hdf** Read from HDF file.

**DataFrame.to\_parquet** Write a DataFrame to the binary parquet format.

**DataFrame.to\_sql** Write to a sql table.

**DataFrame.to\_feather** Write out feather-format for DataFrames.

**DataFrame.to\_csv** Write out to a csv file.

## Examples

```
>>> df = pd.DataFrame({'A': [1, 2, 3], 'B': [4, 5, 6]},
...                    index=['a', 'b', 'c'])
>>> df.to_hdf('data.h5', key='df', mode='w')
```

We can add another object to the same file:

```
>>> s = pd.Series([1, 2, 3, 4])
>>> s.to_hdf('data.h5', key='s')
```

Reading from HDF file:

```
>>> pd.read_hdf('data.h5', 'df')
A  B
a  1  4
b  2  5
c  3  6
>>> pd.read_hdf('data.h5', 's')
0    1
1    2
2    3
3    4
dtype: int64
```

Deleting file with data:

```
>>> import os
>>> os.remove('data.h5')
```

## pandas.Panel.to\_json

**Panel.to\_json**(*path\_or\_buf=None, orient=None, date\_format=None, double\_precision=10, force\_ascii=True, date\_unit='ms', default\_handler=None, lines=False, compression=None, index=True*)

Convert the object to a JSON string.

Note NaN's and None will be converted to null and datetime objects will be converted to UNIX timestamps.

**Parameters** **path\_or\_buf** : string or file handle, optional

File path or object. If not specified, the result is returned as a string.

**orient** : string

Indication of expected JSON string format.

- Series
  - default is 'index'
  - allowed values are: {'split','records','index'}
- DataFrame
  - default is 'columns'
  - allowed values are: {'split','records','index','columns','values'}
- The format of the JSON string
  - 'split' : dict like {'index' -> [index], 'columns' -> [columns], 'data' -> [values]}
  - 'records' : list like [{column -> value}, ... , {column -> value}]
  - 'index' : dict like {index -> {column -> value}}
  - 'columns' : dict like {column -> {index -> value}}
  - 'values' : just the values array
  - 'table' : dict like {'schema': {schema}, 'data': {data}} describing the data, and the data component is like `orient='records'`.

Changed in version 0.20.0.

**date\_format** : {None, 'epoch', 'iso'}

Type of date conversion. 'epoch' = epoch milliseconds, 'iso' = ISO8601. The default depends on the *orient*. For `orient='table'`, the default is 'iso'. For all other orients, the default is 'epoch'.

**double\_precision** : int, default 10

The number of decimal places to use when encoding floating point values.

**force\_ascii** : boolean, default True

Force encoded string to be ASCII.

**date\_unit** : string, default 'ms' (milliseconds)

The time unit to encode to, governs timestamp and ISO8601 precision. One of 's', 'ms', 'us', 'ns' for second, millisecond, microsecond, and nanosecond respectively.

**default\_handler** : callable, default None

Handler to call if object cannot otherwise be converted to a suitable format for JSON. Should receive a single argument which is the object to convert and return a serialisable object.

**lines** : boolean, default False

If 'orient' is 'records' write out line delimited json format. Will throw ValueError if incorrect 'orient' since others are not list like.

New in version 0.19.0.

**compression** : {None, 'gzip', 'bz2', 'zip', 'xz'}

A string representing the compression to use in the output file, only used when the first argument is a filename.

New in version 0.21.0.

**index** : boolean, default True

Whether to include the index values in the JSON string. Not including the index (index=False) is only supported when orient is 'split' or 'table'.

New in version 0.23.0.

**See also:**

[`pandas.read\_json`](#)

## Examples

```
>>> df = pd.DataFrame([[ 'a', 'b'], [ 'c', 'd']],
...                    index=[ 'row 1', 'row 2'],
...                    columns=[ 'col 1', 'col 2'])
>>> df.to_json(orient='split')
'{"columns": ["col 1", "col 2"],
  "index": ["row 1", "row 2"],
  "data": [{"a", "b"}, {"c", "d"}]}'
```

Encoding/decoding a Dataframe using 'records' formatted JSON. Note that index labels are not preserved with this encoding.

```
>>> df.to_json(orient='records')
'[{"col 1": "a", "col 2": "b"}, {"col 1": "c", "col 2": "d"}]'
```

Encoding/decoding a Dataframe using 'index' formatted JSON:

```
>>> df.to_json(orient='index')
'{"row 1": {"col 1": "a", "col 2": "b"}, "row 2": {"col 1": "c", "col 2": "d"}}'
```

Encoding/decoding a Dataframe using 'columns' formatted JSON:

```
>>> df.to_json(orient='columns')
'{"col 1": {"row 1": "a", "row 2": "c"}, "col 2": {"row 1": "b", "row 2": "d"}}'
```

Encoding/decoding a Dataframe using 'values' formatted JSON:

```
>>> df.to_json(orient='values')
'[["a", "b"], ["c", "d"]]'
```

Encoding with Table Schema

```
>>> df.to_json(orient='table')
'{"schema": {"fields": [{"name": "index", "type": "string"},
                        {"name": "col 1", "type": "string"},
```

(continues on next page)

(continued from previous page)

```

        {"name": "col 2", "type": "string"}],
        "primaryKey": "index",
        "pandas_version": "0.20.0"},
    "data": [{"index": "row 1", "col 1": "a", "col 2": "b"},
              {"index": "row 2", "col 1": "c", "col 2": "d"}]}'

```

## pandas.Panel.to\_latex

`Panel.to_latex` (*buf=None, columns=None, col\_space=None, header=True, index=True, na\_rep='NaN', formatters=None, float\_format=None, sparsify=None, index\_names=True, bold\_rows=False, column\_format=None, longtable=None, escape=None, encoding=None, decimal='.', multicolumn=None, multirow=None*)

Render an object to a tabular environment table. You can splice this into a LaTeX document. Requires `\usepackage{booktabs}`.

Changed in version 0.20.2: Added to Series

*to\_latex*-specific options:

**bold\_rows** [boolean, default False] Make the row labels bold in the output

**column\_format** [str, default None] The columns format as specified in [LaTeX table format](#) e.g. 'rcl' for 3 columns

**longtable** [boolean, default will be read from the pandas config module] Default: False. Use a longtable environment instead of tabular. Requires adding a `\usepackage{longtable}` to your LaTeX preamble.

**escape** [boolean, default will be read from the pandas config module] Default: True. When set to False prevents from escaping latex special characters in column names.

**encoding** [str, default None] A string representing the encoding to use in the output file, defaults to 'ascii' on Python 2 and 'utf-8' on Python 3.

**decimal** [string, default '.'] Character recognized as decimal separator, e.g. ',' in Europe.

New in version 0.18.0.

**multicolumn** [boolean, default True] Use multicolumn to enhance MultiIndex columns. The default will be read from the config module.

New in version 0.20.0.

**multicolumn\_format** [str, default 'l'] The alignment for multicolumns, similar to *column\_format* The default will be read from the config module.

New in version 0.20.0.

**multirow** [boolean, default False] Use multirow to enhance MultiIndex rows. Requires adding a `\usepackage{multirow}` to your LaTeX preamble. Will print centered labels (instead of top-aligned) across the contained rows, separating groups via clines. The default will be read from the pandas config module.

New in version 0.20.0.

**pandas.Panel.to\_msgpack**

`Panel.to_msgpack` (*path\_or\_buf=None, encoding='utf-8', \*\*kwargs*)  
 msgpack (serialize) object to input file path

THIS IS AN EXPERIMENTAL LIBRARY and the storage format may not be stable until a future release.

**Parameters** **path** : string File path, buffer-like, or None

if None, return generated string

**append** : boolean whether to append to an existing msgpack

(default is False)

**compress** : type of compressor (zlib or blosc), default to None (no  
 compression)

**pandas.Panel.to\_pickle**

`Panel.to_pickle` (*path, compression='infer', protocol=4*)  
 Pickle (serialize) object to file.

**Parameters** **path** : str

File path where the pickled object will be stored.

**compression** : {'infer', 'gzip', 'bz2', 'zip', 'xz', None}, default 'infer'

A string representing the compression to use in the output file. By default, infers from the file extension in specified path.

New in version 0.20.0.

**protocol** : int

Int which indicates which protocol should be used by the pickler, default HIGHEST\_PROTOCOL (see [R21] paragraph 12.1.2). The possible values for this parameter depend on the version of Python. For Python 2.x, possible values are 0, 1, 2. For Python >= 3.0, 3 is a valid value. For Python >= 3.4, 4 is a valid value. A negative value for the protocol parameter is equivalent to setting its value to HIGHEST\_PROTOCOL.

New in version 0.21.0.

**See also:**

**`read_pickle`** Load pickled pandas object (or any object) from file.

**`DataFrame.to_hdf`** Write DataFrame to an HDF5 file.

**`DataFrame.to_sql`** Write DataFrame to a SQL database.

**`DataFrame.to_parquet`** Write a DataFrame to the binary parquet format.

**Examples**

```
>>> original_df = pd.DataFrame({"foo": range(5), "bar": range(5, 10)})
>>> original_df
   foo  bar
0    0    5
1    1    6
2    2    7
3    3    8
4    4    9
>>> original_df.to_pickle("./dummy.pkl")
```

```
>>> unpickled_df = pd.read_pickle("./dummy.pkl")
>>> unpickled_df
   foo  bar
0    0    5
1    1    6
2    2    7
3    3    8
4    4    9
```

```
>>> import os
>>> os.remove("./dummy.pkl")
```

## pandas.Panel.to\_sparse

`Panel.to_sparse(*args, **kwargs)`

NOT IMPLEMENTED: do not call this method, as sparsifying is not supported for Panel objects and will raise an error.

Convert to SparsePanel

## pandas.Panel.to\_sql

`Panel.to_sql(name, con, schema=None, if_exists='fail', index=True, index_label=None, chunk-size=None, dtype=None)`

Write records stored in a DataFrame to a SQL database.

Databases supported by SQLAlchemy [\[R22\]](#) are supported. Tables can be newly created, appended to, or overwritten.

**Parameters** **name** : string

Name of SQL table.

**con** : sqlalchemy.engine.Engine or sqlite3.Connection

Using SQLAlchemy makes it possible to use any DB supported by that library. Legacy support is provided for sqlite3.Connection objects.

**schema** : string, optional

Specify the schema (if database flavor supports this). If None, use default schema.

**if\_exists** : { 'fail', 'replace', 'append' }, default 'fail'

How to behave if the table already exists.

- fail: Raise a ValueError.

- `replace`: Drop the table before inserting new values.
- `append`: Insert new values to the existing table.

**index** : boolean, default True

Write DataFrame index as a column. Uses *index\_label* as the column name in the table.

**index\_label** : string or sequence, default None

Column label for index column(s). If None is given (default) and *index* is True, then the index names are used. A sequence should be given if the DataFrame uses MultiIndex.

**chunksize** : int, optional

Rows will be written in batches of this size at a time. By default, all rows will be written at once.

**dtype** : dict, optional

Specifying the datatype for columns. The keys should be the column names and the values should be the SQLAlchemy types or strings for the sqlite3 legacy mode.

**Raises** **ValueError**

When the table already exists and *if\_exists* is 'fail' (the default).

**See also:**

[`pandas.read\_sql`](#) read a DataFrame from a table

## References

[R22], [R23]

## Examples

Create an in-memory SQLite database.

```
>>> from sqlalchemy import create_engine
>>> engine = create_engine('sqlite://', echo=False)
```

Create a table from scratch with 3 rows.

```
>>> df = pd.DataFrame({'name' : ['User 1', 'User 2', 'User 3']})
>>> df
   name
0  User 1
1  User 2
2  User 3
```

```
>>> df.to_sql('users', con=engine)
>>> engine.execute("SELECT * FROM users").fetchall()
[(0, 'User 1'), (1, 'User 2'), (2, 'User 3')]
```

```
>>> df1 = pd.DataFrame({'name' : ['User 4', 'User 5']})
>>> df1.to_sql('users', con=engine, if_exists='append')
>>> engine.execute("SELECT * FROM users").fetchall()
[(0, 'User 1'), (1, 'User 2'), (2, 'User 3'),
 (0, 'User 4'), (1, 'User 5')]
```

Overwrite the table with just df1.

```
>>> df1.to_sql('users', con=engine, if_exists='replace',
...           index_label='id')
>>> engine.execute("SELECT * FROM users").fetchall()
[(0, 'User 4'), (1, 'User 5')]
```

Specify the dtype (especially useful for integers with missing values). Notice that while pandas is forced to store the data as floating point, the database supports nullable integers. When fetching the data with Python, we get back integer scalars.

```
>>> df = pd.DataFrame({"A": [1, None, 2]})
>>> df
   A
0  1.0
1  NaN
2  2.0
```

```
>>> from sqlalchemy.types import Integer
>>> df.to_sql('integers', con=engine, index=False,
...          dtype={"A": Integer()})
```

```
>>> engine.execute("SELECT * FROM integers").fetchall()
[(1,), (None,), (2,)]
```

## pandas.Panel.to\_xarray

`Panel.to_xarray()`

Return an xarray object from the pandas object.

### Returns

- a **DataArray** for a **Series**
- a **Dataset** for a **DataFrame**
- a **DataArray** for higher dims

### Notes

See the [xarray docs](#)

### Examples

```
>>> df = pd.DataFrame({'A' : [1, 1, 2],
...                    'B' : ['foo', 'bar', 'foo'],
```

(continues on next page)

(continued from previous page)

```

'C' : np.arange(4.,7)})

>>> df
   A   B   C
0  1  foo  4.0
1  1  bar  5.0
2  2  foo  6.0

```

```

>>> df.to_xarray()
<xarray.Dataset>
Dimensions:  (index: 3)
Coordinates:
  * index      (index) int64 0 1 2
Data variables:
  A            (index) int64 1 1 2
  B            (index) object 'foo' 'bar' 'foo'
  C            (index) float64 4.0 5.0 6.0

```

```

>>> df = pd.DataFrame({'A' : [1, 1, 2],
                        'B' : ['foo', 'bar', 'foo'],
                        'C' : np.arange(4.,7)})
                        ).set_index(['B', 'A'])

>>> df
      C
B   A
foo 1  4.0
bar 1  5.0
foo 2  6.0

```

```

>>> df.to_xarray()
<xarray.Dataset>
Dimensions:  (A: 2, B: 2)
Coordinates:
  * B          (B) object 'bar' 'foo'
  * A          (A) int64 1 2
Data variables:
  C            (B, A) float64 5.0 nan 4.0 6.0

```

```

>>> p = pd.Panel(np.arange(24).reshape(4,3,2),
                  items=list('ABCD'),
                  major_axis=pd.date_range('20130101', periods=3),
                  minor_axis=['first', 'second'])

>>> p
<class 'pandas.core.panel.Panel'>
Dimensions: 4 (items) x 3 (major_axis) x 2 (minor_axis)
Items axis: A to D
Major_axis axis: 2013-01-01 00:00:00 to 2013-01-03 00:00:00
Minor_axis axis: first to second

```

```

>>> p.to_xarray()
<xarray.DataArray (items: 4, major_axis: 3, minor_axis: 2)>
array([[[ 0,  1],
        [ 2,  3],
        [ 4,  5]],
       [[ 6,  7],
        [ 8,  9]],

```

(continues on next page)

(continued from previous page)

```

        [10, 11]],
        [[12, 13],
         [14, 15],
         [16, 17]]],
        [[18, 19],
         [20, 21],
         [22, 23]]])
Coordinates:
* items          (items) object 'A' 'B' 'C' 'D'
* major_axis     (major_axis) datetime64[ns] 2013-01-01 2013-01-02 2013-01-03_
→ # noqa
* minor_axis     (minor_axis) object 'first' 'second'

```

## pandas.Panel.transpose

Panel.**transpose** (\*args, \*\*kwargs)

Permute the dimensions of the Panel

### Parameters

**args** [three positional arguments: each one of]

**{0, 1, 2, 'items', 'major\_axis', 'minor\_axis'}**

**copy** [boolean, default False] Make a copy of the underlying data. Mixed-dtype data will always result in a copy

### Returns

**y** [same as input]

## Examples

```

>>> p.transpose(2, 0, 1)
>>> p.transpose(2, 0, 1, copy=True)

```

## pandas.Panel.truediv

Panel.**truediv** (other, axis=0)

Floating division of series and other, element-wise (binary operator *truediv*). Equivalent to `panel / other`.

### Parameters

**other** [DataFrame or Panel]

**axis** : {items, major\_axis, minor\_axis}

Axis to broadcast over

### Returns

**Panel**

See also:

[`Panel.rtruediv`](#)

## **pandas.Panel.truncate**

`Panel.truncate` (*before=None, after=None, axis=None, copy=True*)

Truncate a Series or DataFrame before and after some index value.

This is a useful shorthand for boolean indexing based on index values above or below certain thresholds.

**Parameters** **before** : date, string, int

Truncate all rows before this index value.

**after** : date, string, int

Truncate all rows after this index value.

**axis** : {0 or 'index', 1 or 'columns'}, optional

Axis to truncate. Truncates the index (rows) by default.

**copy** : boolean, default is True,

Return a copy of the truncated section.

**Returns** **type of caller**

The truncated Series or DataFrame.

See also:

[`DataFrame.loc`](#) Select a subset of a DataFrame by label.

[`DataFrame.iloc`](#) Select a subset of a DataFrame by position.

## **Notes**

If the index being truncated contains only datetime values, *before* and *after* may be specified as strings instead of Timestamps.

## **Examples**

```
>>> df = pd.DataFrame({'A': ['a', 'b', 'c', 'd', 'e'],
...                    'B': ['f', 'g', 'h', 'i', 'j'],
...                    'C': ['k', 'l', 'm', 'n', 'o']},
...                    index=[1, 2, 3, 4, 5])
>>> df
   A  B  C
1  a  f  k
2  b  g  l
3  c  h  m
4  d  i  n
5  e  j  o
```

```
>>> df.truncate(before=2, after=4)
   A  B  C
2  b  g  l
3  c  h  m
4  d  i  n
```

The columns of a DataFrame can be truncated.

```
>>> df.truncate(before="A", after="B", axis="columns")
   A  B
1  a  f
2  b  g
3  c  h
4  d  i
5  e  j
```

For Series, only rows can be truncated.

```
>>> df['A'].truncate(before=2, after=4)
2    b
3    c
4    d
Name: A, dtype: object
```

The index values in `truncate` can be datetimes or string dates.

```
>>> dates = pd.date_range('2016-01-01', '2016-02-01', freq='s')
>>> df = pd.DataFrame(index=dates, data={'A': 1})
>>> df.tail()
                A
2016-01-31 23:59:56  1
2016-01-31 23:59:57  1
2016-01-31 23:59:58  1
2016-01-31 23:59:59  1
2016-02-01 00:00:00  1
```

```
>>> df.truncate(before=pd.Timestamp('2016-01-05'),
...             after=pd.Timestamp('2016-01-10')).tail()
                A
2016-01-09 23:59:56  1
2016-01-09 23:59:57  1
2016-01-09 23:59:58  1
2016-01-09 23:59:59  1
2016-01-10 00:00:00  1
```

Because the index is a `DatetimeIndex` containing only dates, we can specify *before* and *after* as strings. They will be coerced to `Timestamps` before truncation.

```
>>> df.truncate('2016-01-05', '2016-01-10').tail()
                A
2016-01-09 23:59:56  1
2016-01-09 23:59:57  1
2016-01-09 23:59:58  1
2016-01-09 23:59:59  1
2016-01-10 00:00:00  1
```

Note that `truncate` assumes a 0 value for any unspecified time component (midnight). This differs from partial string slicing, which returns any partially matching dates.

```
>>> df.loc['2016-01-05':'2016-01-10', :].tail()
      A
2016-01-10 23:59:55    1
2016-01-10 23:59:56    1
2016-01-10 23:59:57    1
2016-01-10 23:59:58    1
2016-01-10 23:59:59    1
```

**pandas.Panel.tshift**

`Panel.tshift` (*periods=1, freq=None, axis='major'*)

Shift the time index, using the index's frequency if available.

**Parameters** `periods` : int

Number of periods to move, can be positive or negative

**freq** : DateOffset, timedelta, or time rule string, default None

Increment to use from the tseries module or time rule (e.g. 'EOM')

**axis** : int or basestring

Corresponds to the axis that contains the Index

**Returns**

**shifted** [NDFrame]

**Notes**

If freq is not specified then tries to use the freq or inferred\_freq attributes of the index. If neither of those attributes exist, a ValueError is thrown

**pandas.Panel.tz\_convert**

`Panel.tz_convert` (*tz, axis=0, level=None, copy=True*)

Convert tz-aware axis to target time zone.

**Parameters**

**tz** [string or pytz.timezone object]

**axis** [the axis to convert]

**level** : int, str, default None

If axis is a MultiIndex, convert a specific level. Otherwise must be None

**copy** : boolean, default True

Also make a copy of the underlying data

**Raises** **TypeError**

If the axis is tz-naive.

## pandas.Panel.tz\_localize

`Panel.tz_localize` (*tz*, *axis=0*, *level=None*, *copy=True*, *ambiguous='raise'*)

Localize tz-naive TimeSeries to target time zone.

### Parameters

**tz** [string or pytz.timezone object]

**axis** [the axis to localize]

**level** : int, str, default None

If axis is a MultiIndex, localize a specific level. Otherwise must be None

**copy** : boolean, default True

Also make a copy of the underlying data

**ambiguous** : 'infer', bool-ndarray, 'NaT', default 'raise'

- 'infer' will attempt to infer fall dst-transition hours based on order
- bool-ndarray where True signifies a DST time, False designates a non-DST time (note that this flag is only applicable for ambiguous times)
- 'NaT' will return NaT where there are ambiguous times
- 'raise' will raise an AmbiguousTimeError if there are ambiguous times

### Raises TypeError

If the TimeSeries is tz-aware and tz is not None.

## pandas.Panel.update

`Panel.update` (*other*, *join='left'*, *overwrite=True*, *filter\_func=None*, *raise\_conflict=False*)

Modify Panel in place using non-NA values from passed Panel, or object coercible to Panel. Aligns on items

### Parameters

**other** [Panel, or object coercible to Panel]

**join** : How to join individual DataFrames

{ 'left', 'right', 'outer', 'inner' }, default 'left'

**overwrite** : boolean, default True

If True then overwrite values for common keys in the calling panel

**filter\_func** : callable(1d-array) -> 1d-array<boolean>, default None

Can choose to replace values other than NA. Return True for values that should be updated

**raise\_conflict** : bool

If True, will raise an error if a DataFrame and other both contain data in the same place.

**pandas.Panel.var**

`Panel.var` (*axis=None, skipna=None, level=None, ddof=1, numeric\_only=None, \*\*kwargs*)

Return unbiased variance over requested axis.

Normalized by N-1 by default. This can be changed using the `ddof` argument

**Parameters**

**axis** [{items (0), major\_axis (1), minor\_axis (2)}]

**skipna** : boolean, default True

Exclude NA/null values. If an entire row/column is NA, the result will be NA

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a DataFrame

**ddof** : int, default 1

Delta Degrees of Freedom. The divisor used in calculations is  $N - \text{ddof}$ , where  $N$  represents the number of elements.

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

**Returns**

**var** [DataFrame or Panel (if level specified)]

**pandas.Panel.where**

`Panel.where` (*cond, other=nan, inplace=False, axis=None, level=None, errors='raise', try\_cast=False, raise\_on\_error=None*)

Return an object of same shape as self and whose corresponding entries are from self where *cond* is True and otherwise are from *other*.

**Parameters** **cond** : boolean NDFrame, array-like, or callable

Where *cond* is True, keep the original value. Where False, replace with corresponding value from *other*. If *cond* is callable, it is computed on the NDFrame and should return boolean NDFrame or array. The callable must not change input NDFrame (though pandas doesn't check it).

New in version 0.18.1: A callable can be used as *cond*.

**other** : scalar, NDFrame, or callable

Entries where *cond* is False are replaced with corresponding value from *other*. If *other* is callable, it is computed on the NDFrame and should return scalar or NDFrame. The callable must not change input NDFrame (though pandas doesn't check it).

New in version 0.18.1: A callable can be used as *other*.

**inplace** : boolean, default False

Whether to perform the operation in place on the data

**axis** [alignment axis if needed, default None]

**level** [alignment level if needed, default None]

**errors** : str, {'raise', 'ignore'}, default 'raise'

- **raise** : allow exceptions to be raised
- **ignore** : suppress exceptions. On error return original object

Note that currently this parameter won't affect the results and will always coerce to a suitable dtype.

**try\_cast** : boolean, default False

try to cast the result back to the input type (if possible),

**raise\_on\_error** : boolean, default True

Whether to raise on invalid data types (e.g. trying to where on strings)

Deprecated since version 0.21.0.

### Returns

**wh** [same type as caller]

### See also:

[`DataFrame.mask\(\)`](#)

### Notes

The where method is an application of the if-then idiom. For each element in the calling DataFrame, if `cond` is `True` the element is used; otherwise the corresponding element from the DataFrame `other` is used.

The signature for [`DataFrame.where\(\)`](#) differs from [`numpy.where\(\)`](#). Roughly `df1.where(m, df2)` is equivalent to `np.where(m, df1, df2)`.

For further details and examples see the `where` documentation in [indexing](#).

### Examples

```
>>> s = pd.Series(range(5))
>>> s.where(s > 0)
0    NaN
1    1.0
2    2.0
3    3.0
4    4.0
```

```
>>> s.mask(s > 0)
0    0.0
1    NaN
2    NaN
3    NaN
4    NaN
```

```
>>> s.where(s > 1, 10)
0    10.0
1    10.0
2     2.0
3     3.0
4     4.0
```

```
>>> df = pd.DataFrame(np.arange(10).reshape(-1, 2), columns=['A', 'B'])
>>> m = df % 3 == 0
>>> df.where(m, -df)
   A  B
0  0 -1
1 -2  3
2 -4 -5
3  6 -7
4 -8  9
>>> df.where(m, -df) == np.where(m, df, -df)
   A      B
0  True  True
1  True  True
2  True  True
3  True  True
4  True  True
>>> df.where(m, -df) == df.mask(~m, -df)
   A      B
0  True  True
1  True  True
2  True  True
3  True  True
4  True  True
```

## pandas.Panel.xs

`Panel.xs` (*key*, *axis=1*)

Return slice of panel along selected axis

**Parameters** *key*: object

Label

**axis** [{‘items’, ‘major’, ‘minor’}, default 1/‘major’]

**Returns**

*y* [ndim(self)-1]

## Notes

`xs` is only for getting, not setting values.

`MultiIndex Slicers` is a generic way to get/set values on any level or levels and is a superset of `xs` functionality, see [MultiIndex Slicers](#)

<b>agg</b>	
<b>aggregate</b>	
<b>drop</b>	

### 34.5.2 Attributes and underlying data

#### Axes

- **items**: axis 0; each item corresponds to a DataFrame contained inside
- **major\_axis**: axis 1; the index (rows) of each of the DataFrames
- **minor\_axis**: axis 2; the columns of each of the DataFrames

<i>Panel.values</i>	Return a Numpy representation of the DataFrame.
<i>Panel.axes</i>	Return index label(s) of the internal NDFrame
<i>Panel.ndim</i>	Return an int representing the number of axes / array dimensions.
<i>Panel.size</i>	Return an int representing the number of elements in this object.
<i>Panel.shape</i>	Return a tuple of axis dimensions
<i>Panel.dtypes</i>	Return the dtypes in the DataFrame.
<i>Panel.ftypes</i>	Return the ftypes (indication of sparse/dense and dtype) in DataFrame.
<i>Panel.get_dtype_counts()</i>	Return counts of unique dtypes in this object.
<i>Panel.get_ftype_counts()</i>	(DEPRECATED) Return counts of unique ftypes in this object.

### 34.5.3 Conversion

<i>Panel.astype(dtype[, copy, errors])</i>	Cast a pandas object to a specified dtype dtype.
<i>Panel.copy([deep])</i>	Make a copy of this object's indices and data.
<i>Panel.isna()</i>	Detect missing values.
<i>Panel.notna()</i>	Detect existing (non-missing) values.

### 34.5.4 Getting and setting

<i>Panel.get_value(*args, **kwargs)</i>	(DEPRECATED) Quickly retrieve single value at (item, major, minor) location
<i>Panel.set_value(*args, **kwargs)</i>	(DEPRECATED) Quickly set single value at (item, major, minor) location

### 34.5.5 Indexing, iteration, slicing

<i>Panel.at</i>	Access a single value for a row/column label pair.
<i>Panel.iat</i>	Access a single value for a row/column pair by integer position.

Continued on next page

Table 85 – continued from previous page

<i>Panel.loc</i>	Access a group of rows and columns by label(s) or a boolean array.
<i>Panel.iloc</i>	Purely integer-location based indexing for selection by position.
<i>Panel.__iter__()</i>	Iterate over infor axis
<i>Panel.iteritems()</i>	Iterate over (label, values) on info axis
<i>Panel.pop(item)</i>	Return item and drop from frame.
<i>Panel.xs(key[, axis])</i>	Return slice of panel along selected axis
<i>Panel.major_xs(key)</i>	Return slice of panel along major axis
<i>Panel.minor_xs(key)</i>	Return slice of panel along minor axis

#### 34.5.5.1 pandas.Panel.\_\_iter\_\_

`Panel.__iter__()`

Iterate over infor axis

For more information on `.at`, `.iat`, `.loc`, and `.iloc`, see the [indexing documentation](#).

### 34.5.6 Binary operator functions

<i>Panel.add(other[, axis])</i>	Addition of series and other, element-wise (binary operator <i>add</i> ).
<i>Panel.sub(other[, axis])</i>	Subtraction of series and other, element-wise (binary operator <i>sub</i> ).
<i>Panel.mul(other[, axis])</i>	Multiplication of series and other, element-wise (binary operator <i>mul</i> ).
<i>Panel.div(other[, axis])</i>	Floating division of series and other, element-wise (binary operator <i>truediv</i> ).
<i>Panel.truediv(other[, axis])</i>	Floating division of series and other, element-wise (binary operator <i>truediv</i> ).
<i>Panel.floordiv(other[, axis])</i>	Integer division of series and other, element-wise (binary operator <i>floordiv</i> ).
<i>Panel.mod(other[, axis])</i>	Modulo of series and other, element-wise (binary operator <i>mod</i> ).
<i>Panel.pow(other[, axis])</i>	Exponential power of series and other, element-wise (binary operator <i>pow</i> ).
<i>Panel.radd(other[, axis])</i>	Addition of series and other, element-wise (binary operator <i>radd</i> ).
<i>Panel.rsub(other[, axis])</i>	Subtraction of series and other, element-wise (binary operator <i>rsub</i> ).
<i>Panel.rmul(other[, axis])</i>	Multiplication of series and other, element-wise (binary operator <i>rmul</i> ).
<i>Panel.rdiv(other[, axis])</i>	Floating division of series and other, element-wise (binary operator <i>rtruediv</i> ).
<i>Panel.rtruediv(other[, axis])</i>	Floating division of series and other, element-wise (binary operator <i>rtruediv</i> ).
<i>Panel.rfloordiv(other[, axis])</i>	Integer division of series and other, element-wise (binary operator <i>rfloordiv</i> ).
<i>Panel.rmod(other[, axis])</i>	Modulo of series and other, element-wise (binary operator <i>rmod</i> ).

Continued on next page

Table 86 – continued from previous page

<code>Panel.rpow(other[, axis])</code>	Exponential power of series and other, element-wise (binary operator <i>rpow</i> ).
<code>Panel.lt(other[, axis])</code>	Wrapper for comparison method <code>lt</code>
<code>Panel.gt(other[, axis])</code>	Wrapper for comparison method <code>gt</code>
<code>Panel.le(other[, axis])</code>	Wrapper for comparison method <code>le</code>
<code>Panel.ge(other[, axis])</code>	Wrapper for comparison method <code>ge</code>
<code>Panel.ne(other[, axis])</code>	Wrapper for comparison method <code>ne</code>
<code>Panel.eq(other[, axis])</code>	Wrapper for comparison method <code>eq</code>

### 34.5.7 Function application, GroupBy

<code>Panel.apply(func[, axis])</code>	Applies function along axis (or axes) of the Panel
<code>Panel.groupby(function[, axis])</code>	Group data on given axis, returning GroupBy object

### 34.5.8 Computations / Descriptive Stats

<code>Panel.abs()</code>	Return a Series/DataFrame with absolute numeric value of each element.
<code>Panel.clip([lower, upper, axis, inplace])</code>	Trim values at input threshold(s).
<code>Panel.clip_lower(threshold[, axis, inplace])</code>	Return copy of the input with values below a threshold truncated.
<code>Panel.clip_upper(threshold[, axis, inplace])</code>	Return copy of input with values above given value(s) truncated.
<code>Panel.count([axis])</code>	Return number of observations over requested axis.
<code>Panel.cummax([axis, skipna])</code>	Return cumulative maximum over a DataFrame or Series axis.
<code>Panel.cummin([axis, skipna])</code>	Return cumulative minimum over a DataFrame or Series axis.
<code>Panel.cumprod([axis, skipna])</code>	Return cumulative product over a DataFrame or Series axis.
<code>Panel.cumsum([axis, skipna])</code>	Return cumulative sum over a DataFrame or Series axis.
<code>Panel.max([axis, skipna, level, numeric_only])</code>	This method returns the maximum of the values in the object.
<code>Panel.mean([axis, skipna, level, numeric_only])</code>	Return the mean of the values for the requested axis
<code>Panel.median([axis, skipna, level, numeric_only])</code>	Return the median of the values for the requested axis
<code>Panel.min([axis, skipna, level, numeric_only])</code>	This method returns the minimum of the values in the object.
<code>Panel.pct_change([periods, fill_method, ...])</code>	Percentage change between the current and a prior element.
<code>Panel.prod([axis, skipna, level, ...])</code>	Return the product of the values for the requested axis
<code>Panel.sem([axis, skipna, level, ddof, ...])</code>	Return unbiased standard error of the mean over requested axis.
<code>Panel.skew([axis, skipna, level, numeric_only])</code>	Return unbiased skew over requested axis Normalized by N-1
<code>Panel.sum([axis, skipna, level, ...])</code>	Return the sum of the values for the requested axis
<code>Panel.std([axis, skipna, level, ddof, ...])</code>	Return sample standard deviation over requested axis.
<code>Panel.var([axis, skipna, level, ddof, ...])</code>	Return unbiased variance over requested axis.

### 34.5.9 Reindexing / Selection / Label manipulation

<code>Panel.add_prefix(prefix)</code>	Prefix labels with string <i>prefix</i> .
<code>Panel.add_suffix(suffix)</code>	Suffix labels with string <i>suffix</i> .
<code>Panel.drop([labels, axis, index, columns, ...])</code>	
<code>Panel.equals(other)</code>	Determines if two NDFrame objects contain the same elements.
<code>Panel.filter([items, like, regex, axis])</code>	Subset rows or columns of dataframe according to labels in the specified index.
<code>Panel.first(offset)</code>	Convenience method for subsetting initial periods of time series data based on a date offset.
<code>Panel.last(offset)</code>	Convenience method for subsetting final periods of time series data based on a date offset.
<code>Panel.reindex(*args, **kwargs)</code>	Conform Panel to new index with optional filling logic, placing NA/NaN in locations having no value in the previous index.
<code>Panel.reindex_axis(labels[, axis, method, ...])</code>	Conform input object to new index with optional filling logic, placing NA/NaN in locations having no value in the previous index.
<code>Panel.reindex_like(other[, method, copy, ...])</code>	Return an object with matching indices to myself.
<code>Panel.rename([items, major_axis, minor_axis])</code>	Alter axes input function or functions.
<code>Panel.sample([n, frac, replace, weights, ...])</code>	Return a random sample of items from an axis of object.
<code>Panel.select(crit[, axis])</code>	(DEPRECATED) Return data corresponding to axis labels matching criteria
<code>Panel.take(indices[, axis, convert, is_copy])</code>	Return the elements in the given <i>positional</i> indices along an axis.
<code>Panel.truncate([before, after, axis, copy])</code>	Truncate a Series or DataFrame before and after some index value.

#### 34.5.9.1 pandas.Panel.drop

`Panel.drop(labels=None, axis=0, index=None, columns=None, level=None, inplace=False, errors='raise')`

### 34.5.10 Missing data handling

<code>Panel.dropna([axis, how, inplace])</code>	Drop 2D from panel, holding passed axis constant
---	--

### 34.5.11 Reshaping, sorting, transposing

<code>Panel.sort_index([axis, level, ascending, ...])</code>	Sort object by labels (along an axis)
<code>Panel.swaplevel([i, j, axis])</code>	Swap levels i and j in a MultiIndex on a particular axis
<code>Panel.transpose(*args, **kwargs)</code>	Permute the dimensions of the Panel
<code>Panel.swapaxes(axis1, axis2[, copy])</code>	Interchange axes and swap values axes appropriately
<code>Panel.conform(frame[, axis])</code>	Conform input DataFrame to align with chosen axis pair.

### 34.5.12 Combining / joining / merging

<code>Panel.join(other[, how, lsuffix, rsuffix])</code>	Join items with other Panel either on major and minor axes column
<code>Panel.update(other[, join, overwrite, ...])</code>	Modify Panel in place using non-NA values from passed Panel, or object coercible to Panel.

### 34.5.13 Time series-related

<code>Panel.asfreq(freq[, method, how, normalize, ...])</code>	Convert TimeSeries to specified frequency.
<code>Panel.shift([periods, freq, axis])</code>	Shift index by desired number of periods with an optional time freq.
<code>Panel.resample(rule[, how, axis, ...])</code>	Convenience method for frequency conversion and re-sampling of time series.
<code>Panel.tz_convert(tz[, axis, level, copy])</code>	Convert tz-aware axis to target time zone.
<code>Panel.tz_localize(tz[, axis, level, copy, ...])</code>	Localize tz-naive TimeSeries to target time zone.

### 34.5.14 Serialization / IO / Conversion

<code>Panel.from_dict(data[, intersect, orient, dtype])</code>	Construct Panel from dict of DataFrame objects
<code>Panel.to_pickle(path[, compression, protocol])</code>	Pickle (serialize) object to file.
<code>Panel.to_excel(path[, na_rep, engine])</code>	Write each DataFrame in Panel to a separate excel sheet
<code>Panel.to_hdf(path_or_buf, key, **kwargs)</code>	Write the contained data to an HDF5 file using HDFStore.
<code>Panel.to_sparse(*args, **kwargs)</code>	NOT IMPLEMENTED: do not call this method, as sparsifying is not supported for Panel objects and will raise an error.
<code>Panel.to_frame([filter_observations])</code>	Transform wide format into long (stacked) format as DataFrame whose columns are the Panel's items and whose index is a MultiIndex formed of the Panel's major and minor axes.
<code>Panel.to_clipboard([excel, sep])</code>	Copy object to the system clipboard.

## 34.6 Index

Many of these methods or variants thereof are available on the objects that contain an index (Series/DataFrame) and those should most likely be used before calling these methods directly.

<code>Index</code>	Immutable ndarray implementing an ordered, sliceable set.
--------------------	---

### 34.6.1 pandas.Index

**class** `pandas.Index`

Immutable ndarray implementing an ordered, sliceable set. The basic object storing axis labels for all pandas objects

**Parameters**

**data** [array-like (1-dimensional)]

**dtype** : NumPy dtype (default: object)

If dtype is None, we find the dtype that best fits the data. If an actual dtype is provided, we coerce to that dtype if it's safe. Otherwise, an error will be raised.

**copy** : bool

Make a copy of input ndarray

**name** : object

Name to be stored in the index

**tupleize\_cols** : bool (default: True)

When True, attempt to create a MultiIndex if possible

See also:

**RangeIndex** Index implementing a monotonic integer range

**CategoricalIndex** Index of *Categorical* s.

**MultiIndex** A multi-level, or hierarchical, Index

**IntervalIndex** an Index of *Interval* s.

*DatetimeIndex*, *TimedeltaIndex*, *PeriodIndex*, *Int64Index*, *UInt64Index*,  
*Float64Index*

## Notes

An Index instance can **only** contain hashable objects

## Examples

```
>>> pd.Index([1, 2, 3])
Int64Index([1, 2, 3], dtype='int64')
```

```
>>> pd.Index(list('abc'))
Index(['a', 'b', 'c'], dtype='object')
```

## Attributes

<i>T</i>	return the transpose, which is by definition self
<i>base</i>	return the base object if the memory of the underlying data is shared
<i>data</i>	return the data pointer of the underlying data
<i>dtype</i>	return the dtype object of the underlying data
<i>dtype_str</i>	return the dtype str of the underlying data
<i>flags</i>	

Continued on next page

Table 96 – continued from previous page

<i>hasnans</i>	return if I have any nans; enables various perf speedups
<i>inferred_type</i>	return a string of the type inferred from the values
<i>is_monotonic</i>	alias for <i>is_monotonic_increasing</i> (deprecated)
<i>is_monotonic_decreasing</i>	return if the index is monotonic decreasing (only equal or decreasing) values.
<i>is_monotonic_increasing</i>	return if the index is monotonic increasing (only equal or increasing) values.
<i>is_unique</i>	return if the index has unique values
<i>itemsize</i>	return the size of the dtype of the item of the underlying data
<i>nbytes</i>	return the number of bytes in the underlying data
<i>ndim</i>	return the number of dimensions of the underlying data, by definition 1
<i>shape</i>	return a tuple of the shape of the underlying data
<i>size</i>	return the number of elements in the underlying data
<i>strides</i>	return the strides of the underlying data
<i>values</i>	return the underlying data as an ndarray

#### 34.6.1.1 pandas.Index.T

`Index.T`  
return the transpose, which is by definition self

#### 34.6.1.2 pandas.Index.base

`Index.base`  
return the base object if the memory of the underlying data is shared

#### 34.6.1.3 pandas.Index.data

`Index.data`  
return the data pointer of the underlying data

#### 34.6.1.4 pandas.Index.dtype

`Index.dtype`  
return the dtype object of the underlying data

#### 34.6.1.5 pandas.Index.dtype\_str

`Index.dtype_str`  
return the dtype str of the underlying data

#### 34.6.1.6 pandas.Index.flags

`Index.flags`

### 34.6.1.7 pandas.Index.hasnans

`Index.hasnans`

return if I have any nans; enables various perf speedups

### 34.6.1.8 pandas.Index.inferred\_type

`Index.inferred_type`

return a string of the type inferred from the values

### 34.6.1.9 pandas.Index.is\_monotonic

`Index.is_monotonic`

alias for `is_monotonic_increasing` (deprecated)

### 34.6.1.10 pandas.Index.is\_monotonic\_decreasing

`Index.is_monotonic_decreasing`

return if the index is monotonic decreasing (only equal or decreasing) values.

#### Examples

```
>>> Index([3, 2, 1]).is_monotonic_decreasing
True
>>> Index([3, 2, 2]).is_monotonic_decreasing
True
>>> Index([3, 1, 2]).is_monotonic_decreasing
False
```

### 34.6.1.11 pandas.Index.is\_monotonic\_increasing

`Index.is_monotonic_increasing`

return if the index is monotonic increasing (only equal or increasing) values.

#### Examples

```
>>> Index([1, 2, 3]).is_monotonic_increasing
True
>>> Index([1, 2, 2]).is_monotonic_increasing
True
>>> Index([1, 3, 2]).is_monotonic_increasing
False
```

### 34.6.1.12 pandas.Index.is\_unique

`Index.is_unique`

return if the index has unique values

#### 34.6.1.13 pandas.Index.itemsize

`Index.itemsize`

return the size of the dtype of the item of the underlying data

#### 34.6.1.14 pandas.Index.nbytes

`Index.nbytes`

return the number of bytes in the underlying data

#### 34.6.1.15 pandas.Index.ndim

`Index.ndim`

return the number of dimensions of the underlying data, by definition 1

#### 34.6.1.16 pandas.Index.shape

`Index.shape`

return a tuple of the shape of the underlying data

#### 34.6.1.17 pandas.Index.size

`Index.size`

return the number of elements in the underlying data

#### 34.6.1.18 pandas.Index.strides

`Index.strides`

return the strides of the underlying data

#### 34.6.1.19 pandas.Index.values

`Index.values`

return the underlying data as an ndarray

<b>asi8</b>	
<b>empty</b>	
<b>has_duplicates</b>	
<b>is_all_dates</b>	
<b>name</b>	
<b>names</b>	
<b>nlevels</b>	

### Methods

---

`all(*args, **kwargs)`

Return whether all elements are True.

Continued on next page

Table 97 – continued from previous page

<code>any(*args, **kwargs)</code>	Return whether any element is True.
<code>append(other)</code>	Append a collection of Index options together
<code>argmax([axis])</code>	return a ndarray of the maximum argument indexer
<code>argmin([axis])</code>	return a ndarray of the minimum argument indexer
<code>argsort(*args, **kwargs)</code>	Return the integer indicies that would sort the index.
<code>asof(label)</code>	For a sorted index, return the most recent label up to and including the passed label.
<code>asof_locs(where, mask)</code>	where : array of timestamps mask : array of booleans where data is not NA
<code>astype(dtype[, copy])</code>	Create an Index with values cast to dtypes.
<code>contains(key)</code>	return a boolean if this key is IN the index
<code>copy([name, deep, dtype])</code>	Make a copy of this object.
<code>delete(loc)</code>	Make new Index with passed location(-s) deleted
<code>difference(other)</code>	Return a new Index with elements from the index that are not in <i>other</i> .
<code>drop(labels[, errors])</code>	Make new Index with passed list of labels deleted
<code>drop_duplicates([keep])</code>	Return Index with duplicate values removed.
<code>dropna([how])</code>	Return Index without NA/NaN values
<code>duplicated([keep])</code>	Indicate duplicate index values.
<code>equals(other)</code>	Determines if two Index objects contain the same elements.
<code>factorize([sort, na_sentinel])</code>	Encode the object as an enumerated type or categorical variable.
<code>fillna([value, downcast])</code>	Fill NA/NaN values with the specified value
<code>format([name, formatter])</code>	Render a string representation of the Index
<code>get_duplicates()</code>	(DEPRECATED) Extract duplicated index elements.
<code>get_indexer(target[, method, limit, tolerance])</code>	Compute indexer and mask for new index given the current index.
<code>get_indexer_for(target, **kwargs)</code>	guaranteed return of an indexer even when non-unique This dispatches to <code>get_indexer</code> or <code>get_indexer_nonunique</code> as appropriate
<code>get_indexer_non_unique(target)</code>	Compute indexer and mask for new index given the current index.
<code>get_level_values(level)</code>	Return an Index of values for requested level, equal to the length of the index.
<code>get_loc(key[, method, tolerance])</code>	Get integer location, slice or boolean mask for requested label.
<code>get_slice_bound(label, side, kind)</code>	Calculate slice bound that corresponds to given label.
<code>get_value(series, key)</code>	Fast lookup of value from 1-dimensional ndarray.
<code>get_values()</code>	Return <i>Index</i> data as an <i>numpy.ndarray</i> .
<code>groupby(values)</code>	Group the index labels by a given array of values.
<code>identical(other)</code>	Similar to <code>equals</code> , but check that other comparable attributes are also equal
<code>insert(loc, item)</code>	Make new Index inserting new item at location.
<code>intersection(other)</code>	Form the intersection of two Index objects.
<code>is_(other)</code>	More flexible, faster check like <code>is</code> but that works through views
<code>is_categorical()</code>	Check if the Index holds categorical data.
<code>isin(values[, level])</code>	Return a boolean array where the index values are in <i>values</i> .
<code>isna()</code>	Detect missing values.

Continued on next page

Table 97 – continued from previous page

<code>isnull()</code>	Detect missing values.
<code>item()</code>	return the first element of the underlying data as a python scalar
<code>join(other[, how, level, return_indexers, sort])</code>	<i>this is an internal non-public method</i>
<code>map(mapper[, na_action])</code>	Map values using input correspondence (a dict, Series, or function).
<code>max()</code>	Return the maximum value of the Index.
<code>memory_usage([deep])</code>	Memory usage of the values
<code>min()</code>	Return the minimum value of the Index.
<code>notna()</code>	Detect existing (non-missing) values.
<code>notnull()</code>	Detect existing (non-missing) values.
<code>nunique([dropna])</code>	Return number of unique elements in the object.
<code>putmask(mask, value)</code>	return a new Index of the values set with the mask
<code>ravel([order])</code>	return an ndarray of the flattened values of the underlying data
<code>reindex(target[, method, level, limit, ...])</code>	Create index with target's values (move/add/delete values as necessary)
<code>rename(name[, inplace])</code>	Set new names on index.
<code>repeat(repeats, *args, **kwargs)</code>	Repeat elements of an Index.
<code>searchsorted(value[, side, sorter])</code>	Find indices where elements should be inserted to maintain order.
<code>set_names(names[, level, inplace])</code>	Set new names on index.
<code>set_value(arr, key, value)</code>	Fast lookup of value from 1-dimensional ndarray.
<code>shift([periods, freq])</code>	Shift index by desired number of time frequency increments.
<code>slice_indexer([start, end, step, kind])</code>	For an ordered or unique index, compute the slice indexer for input labels and step.
<code>slice_locs([start, end, step, kind])</code>	Compute slice locations for input labels.
<code>sort_values([return_indexer, ascending])</code>	Return a sorted copy of the index.
<code>sortlevel([level, ascending, sort_remaining])</code>	For internal compatibility with with the Index API
<code>str</code>	alias of <code>pandas.core.strings.StringMethods</code>
<code>summary([name])</code>	(DEPRECATED) Return a summarized representation ..
<code>symmetric_difference(other[, result_name])</code>	Compute the symmetric difference of two Index objects.
<code>take(indices[, axis, allow_fill, fill_value])</code>	return a new Index of the values selected by the indices
<code>to_frame([index])</code>	Create a DataFrame with a column containing the Index.
<code>to_native_types([slicer])</code>	Format specified values of <i>self</i> and return them.
<code>to_series([index, name])</code>	Create a Series with both index and values equal to the index keys useful with map for returning an indexer based on an index
<code>tolist()</code>	Return a list of the values.
<code>transpose(*args, **kwargs)</code>	return the transpose, which is by definition self
<code>union(other)</code>	Form the union of two Index objects and sorts if possible.
<code>unique([level])</code>	Return unique values in the index.
<code>value_counts([normalize, sort, ascending, ...])</code>	Returns object containing counts of unique values.
<code>where(cond[, other])</code>	

### 34.6.1.20 pandas.Index.all

`Index.all(*args, **kwargs)`

Return whether all elements are True.

**Parameters** `*args`

These parameters will be passed to `numpy.all`.

**`**kwargs`**

These parameters will be passed to `numpy.all`.

**Returns** `all` : bool or array\_like (if axis is specified)

A single element array\_like may be converted to bool.

**See also:**

[`pandas.Index.any`](#) Return whether any element in an Index is True.

[`pandas.Series.any`](#) Return whether any element in a Series is True.

[`pandas.Series.all`](#) Return whether all elements in a Series are True.

#### Notes

Not a Number (NaN), positive infinity and negative infinity evaluate to True because these are not equal to zero.

#### Examples

**all**

True, because nonzero integers are considered True.

```
>>> pd.Index([1, 2, 3]).all()
True
```

False, because 0 is considered False.

```
>>> pd.Index([0, 1, 2]).all()
False
```

**any**

True, because 1 is considered True.

```
>>> pd.Index([0, 0, 1]).any()
True
```

False, because 0 is considered False.

```
>>> pd.Index([0, 0, 0]).any()
False
```

### 34.6.1.21 pandas.Index.any

`Index.any(*args, **kwargs)`

Return whether any element is True.

#### Parameters *\*args*

These parameters will be passed to `numpy.any`.

#### *\*\*kwargs*

These parameters will be passed to `numpy.any`.

**Returns** `any` : bool or array\_like (if axis is specified)

A single element array\_like may be converted to bool.

**See also:**

[`pandas.Index.all`](#) Return whether all elements are True.

[`pandas.Series.all`](#) Return whether all elements are True.

#### Notes

Not a Number (NaN), positive infinity and negative infinity evaluate to True because these are not equal to zero.

#### Examples

```
>>> index = pd.Index([0, 1, 2])
>>> index.any()
True
```

```
>>> index = pd.Index([0, 0, 0])
>>> index.any()
False
```

### 34.6.1.22 pandas.Index.append

`Index.append(other)`

Append a collection of Index options together

#### Parameters

**other** [Index or list/tuple of indices]

#### Returns

**appended** [Index]

### 34.6.1.23 pandas.Index.argmax

`Index.argmax(axis=None)`

return a ndarray of the maximum argument indexer

See also:

`numpy.ndarray.argmax`

#### 34.6.1.24 `pandas.Index.argmax`

`Index.argmax` (*axis=None*)

return a ndarray of the minimum argument indexer

See also:

`numpy.ndarray.argmin`

#### 34.6.1.25 `pandas.Index.argsort`

`Index.argsort` (*\*args, \*\*kwargs*)

Return the integer indicies that would sort the index.

**Parameters** *\*args*

Passed to `numpy.ndarray.argsort`.

***\*\*kwargs***

Passed to `numpy.ndarray.argsort`.

**Returns** `numpy.ndarray`

Integer indicies that would sort the index if used as an indexer.

See also:

`numpy.argsort` Similar method for NumPy arrays.

`Index.sort_values` Return sorted copy of Index.

#### Examples

```
>>> idx = pd.Index(['b', 'a', 'd', 'c'])
>>> idx
Index(['b', 'a', 'd', 'c'], dtype='object')
```

```
>>> order = idx.argsort()
>>> order
array([1, 0, 3, 2])
```

```
>>> idx[order]
Index(['a', 'b', 'c', 'd'], dtype='object')
```

#### 34.6.1.26 `pandas.Index.asof`

`Index.asof` (*label*)

For a sorted index, return the most recent label up to and including the passed label. Return NaN if not found.

See also:

`get_loc` asof is a thin wrapper around `get_loc` with `method='pad'`

#### 34.6.1.27 pandas.Index.asof\_locs

`Index.asof_locs` (*where, mask*)

*where* : array of timestamps *mask* : array of booleans where data is not NA

#### 34.6.1.28 pandas.Index.astype

`Index.astype` (*dtype, copy=True*)

Create an Index with values cast to dtypes. The class of a new Index is determined by dtype. When conversion is impossible, a `ValueError` exception is raised.

##### Parameters

**dtype** [numpy dtype or pandas type]

**copy** : bool, default True

By default, `astype` always returns a newly allocated object. If `copy` is set to `False` and internal requirements on dtype are satisfied, the original data is used to create a new Index or the original Index is returned.

New in version 0.19.0.

#### 34.6.1.29 pandas.Index.contains

`Index.contains` (*key*)

return a boolean if this key is IN the index

##### Parameters

**key** [object]

##### Returns

**boolean**

#### 34.6.1.30 pandas.Index.copy

`Index.copy` (*name=None, deep=False, dtype=None, \*\*kwargs*)

Make a copy of this object. Name and dtype sets those attributes on the new object.

##### Parameters

**name** [string, optional]

**deep** [boolean, default False]

**dtype** [numpy dtype or pandas type]

##### Returns

**copy** [Index]

## Notes

In most cases, there should be no functional difference from using `deep`, but if `deep` is passed it will attempt to deepcopy.

### 34.6.1.31 `pandas.Index.delete`

`Index.delete` (*loc*)

Make new Index with passed location(-s) deleted

#### Returns

**new\_index** [Index]

### 34.6.1.32 `pandas.Index.difference`

`Index.difference` (*other*)

Return a new Index with elements from the index that are not in *other*.

This is the set difference of two Index objects. It's sorted if sorting is possible.

#### Parameters

**other** [Index or array-like]

#### Returns

**difference** [Index]

## Examples

```
>>> idx1 = pd.Index([1, 2, 3, 4])
>>> idx2 = pd.Index([3, 4, 5, 6])
>>> idx1.difference(idx2)
Int64Index([1, 2], dtype='int64')
```

### 34.6.1.33 `pandas.Index.drop`

`Index.drop` (*labels*, *errors='raise'*)

Make new Index with passed list of labels deleted

#### Parameters

**labels** [array-like]

**errors**: {'ignore', 'raise'}, default 'raise'

If 'ignore', suppress error and existing labels are dropped.

#### Returns

**dropped** [Index]

#### Raises `KeyError`

If not all of the labels are found in the selected axis

### 34.6.1.34 pandas.Index.drop\_duplicates

`Index.drop_duplicates` (*keep*='first')

Return Index with duplicate values removed.

**Parameters** *keep* : {'first', 'last', False}, default 'first'

- 'first' : Drop duplicates except for the first occurrence.
- 'last' : Drop duplicates except for the last occurrence.
- False : Drop all duplicates.

**Returns**

**deduplicated** [Index]

See also:

*Series.drop\_duplicates* equivalent method on Series

*DataFrame.drop\_duplicates* equivalent method on DataFrame

*Index.duplicated* related method on Index, indicating duplicate Index values.

#### Examples

Generate an pandas.Index with duplicate values.

```
>>> idx = pd.Index(['lama', 'cow', 'lama', 'beetle', 'lama', 'hippo'])
```

The *keep* parameter controls which duplicate values are removed. The value 'first' keeps the first occurrence for each set of duplicated entries. The default value of *keep* is 'first'.

```
>>> idx.drop_duplicates(keep='first')
Index(['lama', 'cow', 'beetle', 'hippo'], dtype='object')
```

The value 'last' keeps the last occurrence for each set of duplicated entries.

```
>>> idx.drop_duplicates(keep='last')
Index(['cow', 'beetle', 'lama', 'hippo'], dtype='object')
```

The value False discards all sets of duplicated entries.

```
>>> idx.drop_duplicates(keep=False)
Index(['cow', 'beetle', 'hippo'], dtype='object')
```

### 34.6.1.35 pandas.Index.dropna

`Index.dropna` (*how*='any')

Return Index without NA/NaN values

**Parameters** *how* : {'any', 'all'}, default 'any'

If the Index is a MultiIndex, drop the value when any or all levels are NaN.

**Returns**

**valid** [Index]

### 34.6.1.36 pandas.Index.duplicated

`Index.duplicated` (*keep*='first')

Indicate duplicate index values.

Duplicated values are indicated as `True` values in the resulting array. Either all duplicates, all except the first, or all except the last occurrence of duplicates can be indicated.

**Parameters** `keep` : { 'first', 'last', False }, default 'first'

The value or values in a set of duplicates to mark as missing.

- 'first' : Mark duplicates as `True` except for the first occurrence.
- 'last' : Mark duplicates as `True` except for the last occurrence.
- False : Mark all duplicates as `True`.

**Returns**

`numpy.ndarray`

See also:

[`pandas.Series.duplicated`](#) Equivalent method on `pandas.Series`

[`pandas.DataFrame.duplicated`](#) Equivalent method on `pandas.DataFrame`

[`pandas.Index.drop\_duplicates`](#) Remove duplicate values from Index

### Examples

By default, for each set of duplicated values, the first occurrence is set to `False` and all others to `True`:

```
>>> idx = pd.Index(['lama', 'cow', 'lama', 'beetle', 'lama'])
>>> idx.duplicated()
array([False, False,  True, False,  True])
```

which is equivalent to

```
>>> idx.duplicated(keep='first')
array([False, False,  True, False,  True])
```

By using 'last', the last occurrence of each set of duplicated values is set on `False` and all others on `True`:

```
>>> idx.duplicated(keep='last')
array([ True, False,  True, False, False])
```

By setting `keep` on `False`, all duplicates are `True`:

```
>>> idx.duplicated(keep=False)
array([ True, False,  True, False,  True])
```

### 34.6.1.37 pandas.Index.equals

`Index.equals` (*other*)

Determines if two Index objects contain the same elements.

### 34.6.1.38 pandas.Index.factorize

`Index.factorize` (*sort=False*, *na\_sentinel=-1*)

Encode the object as an enumerated type or categorical variable.

This method is useful for obtaining a numeric representation of an array when all that matters is identifying distinct values. *factorize* is available as both a top-level function `pandas.factorize()`, and as a method `Series.factorize()` and `Index.factorize()`.

**Parameters** *sort* : boolean, default False

Sort *uniques* and shuffle *labels* to maintain the relationship.

*na\_sentinel* : int, default -1

Value to mark “not found”.

**Returns** *labels* : ndarray

An integer ndarray that’s an indexer into *uniques*. `uniques.take(labels)` will have the same values as *values*.

*uniques* : ndarray, Index, or Categorical

The unique valid values. When *values* is Categorical, *uniques* is a Categorical. When *values* is some other pandas object, an *Index* is returned. Otherwise, a 1-D ndarray is returned.

---

**Note:** Even if there’s a missing value in *values*, *uniques* will *not* contain an entry for it.

---

See also:

`pandas.cut` Discretize continuous-valued array.

`pandas.unique` Find the unique value in an array.

### Examples

These examples all show *factorize* as a top-level method like `pd.factorize(values)`. The results are identical for methods like `Series.factorize()`.

```
>>> labels, uniques = pd.factorize(['b', 'b', 'a', 'c', 'b'])
>>> labels
array([0, 0, 1, 2, 0])
>>> uniques
array(['b', 'a', 'c'], dtype=object)
```

With *sort=True*, the *uniques* will be sorted, and *labels* will be shuffled so that the relationship is the maintained.

```
>>> labels, uniques = pd.factorize(['b', 'b', 'a', 'c', 'b'], sort=True)
>>> labels
array([1, 1, 0, 2, 1])
>>> uniques
array(['a', 'b', 'c'], dtype=object)
```

Missing values are indicated in *labels* with *na\_sentinel* (-1 by default). Note that missing values are never included in *uniques*.

```
>>> labels, uniques = pd.factorize(['b', None, 'a', 'c', 'b'])
>>> labels
array([ 0, -1,  1,  2,  0])
>>> uniques
array(['b', 'a', 'c'], dtype=object)
```

Thus far, we've only factorized lists (which are internally coerced to NumPy arrays). When factorizing pandas objects, the type of *uniques* will differ. For Categoricals, a *Categorical* is returned.

```
>>> cat = pd.Categorical(['a', 'a', 'c'], categories=['a', 'b', 'c'])
>>> labels, uniques = pd.factorize(cat)
>>> labels
array([0, 0, 1])
>>> uniques
[a, c]
Categories (3, object): [a, b, c]
```

Notice that 'b' is in `uniques.categories`, despite not being present in `cat.values`.

For all other pandas objects, an Index of the appropriate type is returned.

```
>>> cat = pd.Series(['a', 'a', 'c'])
>>> labels, uniques = pd.factorize(cat)
>>> labels
array([0, 0, 1])
>>> uniques
Index(['a', 'c'], dtype='object')
```

### 34.6.1.39 pandas.Index.fillna

`Index.fillna` (*value=None, downcast=None*)

Fill NA/NaN values with the specified value

**Parameters** *value* : scalar

Scalar value to use to fill holes (e.g. 0). This value cannot be a list-likes.

**downcast** : dict, default is None

a dict of item->dtype of what to downcast if possible, or the string 'infer' which will try to downcast to an appropriate equal type (e.g. float64 to int64 if possible)

**Returns**

**filled** [%(*klass*)s]

### 34.6.1.40 pandas.Index.format

`Index.format` (*name=False, formatter=None, \*\*kwargs*)

Render a string representation of the Index

### 34.6.1.41 pandas.Index.get\_duplicates

`Index.get_duplicates()`

Extract duplicated index elements.

Returns a sorted list of index elements which appear more than once in the index.

Deprecated since version 0.23.0: Use `idx[idx.duplicated()].unique()` instead

**Returns array-like**

List of duplicated indexes.

**See also:**

[`Index.duplicated`](#) Return boolean array denoting duplicates.

[`Index.drop\_duplicates`](#) Return Index with duplicates removed.

### Examples

Works on different Index of types.

```
>>> pd.Index([1, 2, 2, 3, 3, 3, 4]).get_duplicates()
[2, 3]
>>> pd.Index([1., 2., 2., 3., 3., 3., 4.]).get_duplicates()
[2.0, 3.0]
>>> pd.Index(['a', 'b', 'b', 'c', 'c', 'c', 'd']).get_duplicates()
['b', 'c']
```

Note that for a `DatetimeIndex`, it does not return a list but a new `DatetimeIndex`:

```
>>> dates = pd.to_datetime(['2018-01-01', '2018-01-02', '2018-01-03',
...                          '2018-01-03', '2018-01-04', '2018-01-04'],
...                          format='%Y-%m-%d')
>>> pd.Index(dates).get_duplicates()
DatetimeIndex(['2018-01-03', '2018-01-04'],
              dtype='datetime64[ns]', freq=None)
```

Sorts duplicated elements even when indexes are unordered.

```
>>> pd.Index([1, 2, 3, 2, 3, 4, 3]).get_duplicates()
[2, 3]
```

Return empty array-like structure when all elements are unique.

```
>>> pd.Index([1, 2, 3, 4]).get_duplicates()
[]
>>> dates = pd.to_datetime(['2018-01-01', '2018-01-02', '2018-01-03'],
...                          format='%Y-%m-%d')
>>> pd.Index(dates).get_duplicates()
DatetimeIndex([], dtype='datetime64[ns]', freq=None)
```

### 34.6.1.42 pandas.Index.get\_indexer

`Index.get_indexer(target, method=None, limit=None, tolerance=None)`

Compute indexer and mask for new index given the current index. The indexer should be then used as an input to `ndarray.take` to align the current data to the new index.

**Parameters****target** [Index]**method** : {None, 'pad'/'ffill', 'backfill'/'bfill', 'nearest'}, optional

- default: exact matches only.
- pad / ffill: find the PREVIOUS index value if no exact match.
- backfill / bfill: use NEXT index value if no exact match
- nearest: use the NEAREST index value if no exact match. Tied distances are broken by preferring the larger index value.

**limit** : int, optional

Maximum number of consecutive labels in `target` to match for inexact matches.

**tolerance** : optional

Maximum distance between original and new labels for inexact matches. The values of the index at the matching locations most satisfy the equation  $\text{abs}(\text{index}[\text{indexer}] - \text{target}) \leq \text{tolerance}$ .

Tolerance may be a scalar value, which applies the same tolerance to all values, or list-like, which applies variable tolerance per element. List-like includes list, tuple, array, Series, and must be the same size as the index and its dtype must exactly match the index's type.

New in version 0.21.0: (list-like tolerance)

**Returns** **indexer** : ndarray of int

Integers from 0 to `n - 1` indicating that the index at these positions matches the corresponding target values. Missing values in the target are marked by -1.

**Examples**

```
>>> indexer = index.get_indexer(new_index)
>>> new_values = cur_values.take(indexer)
```

**34.6.1.43 pandas.Index.get\_indexer\_for**`Index.get_indexer_for(target, **kwargs)`

guaranteed return of an indexer even when non-unique This dispatches to `get_indexer` or `get_indexer_nonunique` as appropriate

**34.6.1.44 pandas.Index.get\_indexer\_non\_unique**`Index.get_indexer_non_unique(target)`

Compute indexer and mask for new index given the current index. The indexer should be then used as an input to `ndarray.take` to align the current data to the new index.

**Parameters****target** [Index]

**Returns indexer** : ndarray of int

Integers from 0 to n - 1 indicating that the index at these positions matches the corresponding target values. Missing values in the target are marked by -1.

**missing** : ndarray of int

An indexer into the target of the values not found. These correspond to the -1 in the indexer array

#### 34.6.1.45 pandas.Index.get\_level\_values

`Index.get_level_values (level)`

Return an Index of values for requested level, equal to the length of the index.

**Parameters level** : int or str

level is either the integer position of the level in the MultiIndex, or the name of the level.

**Returns values** : Index

self, as there is only one level in the Index.

**See also:**

[`pandas.MultiIndex.get\_level\_values`](#) get values for a level of a MultiIndex

#### 34.6.1.46 pandas.Index.get\_loc

`Index.get_loc (key, method=None, tolerance=None)`

Get integer location, slice or boolean mask for requested label.

**Parameters**

**key** [label]

**method** : {None, 'pad'/'ffill', 'backfill'/'bfill', 'nearest' }, optional

- default: exact matches only.
- pad / ffill: find the PREVIOUS index value if no exact match.
- backfill / bfill: use NEXT index value if no exact match
- nearest: use the NEAREST index value if no exact match. Tied distances are broken by preferring the larger index value.

**tolerance** : optional

Maximum distance from index value for inexact matches. The value of the index at the matching location must satisfy the equation `abs(index[loc] - key) <= tolerance`.

Tolerance may be a scalar value, which applies the same tolerance to all values, or list-like, which applies variable tolerance per element. List-like includes list, tuple, array, Series, and must be the same size as the index and its dtype must exactly match the index's type.

New in version 0.21.0: (list-like tolerance)

**Returns**

**loc** [int if unique index, slice if monotonic index, else mask]

## Examples

```
>>> unique_index = pd.Index(list('abc'))
>>> unique_index.get_loc('b')
1
```

```
>>> monotonic_index = pd.Index(list('abbc'))
>>> monotonic_index.get_loc('b')
slice(1, 3, None)
```

```
>>> non_monotonic_index = pd.Index(list('abcb'))
>>> non_monotonic_index.get_loc('b')
array([False,  True, False,  True], dtype=bool)
```

### 34.6.1.47 pandas.Index.get\_slice\_bound

`Index.get_slice_bound(label, side, kind)`

Calculate slice bound that corresponds to given label.

Returns leftmost (one-past-the-rightmost if `side=='right'`) position of given label.

#### Parameters

**label** [object]

**side** [{ 'left', 'right' }]

**kind** [{ 'ix', 'loc', 'getitem' }]

### 34.6.1.48 pandas.Index.get\_value

`Index.get_value(series, key)`

Fast lookup of value from 1-dimensional ndarray. Only use this if you know what you're doing

### 34.6.1.49 pandas.Index.get\_values

`Index.get_values()`

Return *Index* data as an *numpy.ndarray*.

#### Returns numpy.ndarray

A one-dimensional numpy array of the *Index* values.

#### See also:

[\*Index.values\*](#) The attribute that `get_values` wraps.

## Examples

Getting the *Index* values of a *DataFrame*:

```
>>> df = pd.DataFrame([[1, 2, 3], [4, 5, 6], [7, 8, 9]],
...                    index=['a', 'b', 'c'], columns=['A', 'B', 'C'])
>>> df
   A  B  C
a  1  2  3
b  4  5  6
c  7  8  9
>>> df.index.get_values()
array(['a', 'b', 'c'], dtype=object)
```

Standalone *Index* values:

```
>>> idx = pd.Index(['1', '2', '3'])
>>> idx.get_values()
array(['1', '2', '3'], dtype=object)
```

*MultiIndex* arrays also have only one dimension:

```
>>> midx = pd.MultiIndex.from_arrays([[1, 2, 3], ['a', 'b', 'c']],
...                                 names=('number', 'letter'))
>>> midx.get_values()
array([(1, 'a'), (2, 'b'), (3, 'c')], dtype=object)
>>> midx.get_values().ndim
1
```

#### 34.6.1.50 pandas.Index.groupby

`Index.groupby` (*values*)

Group the index labels by a given array of values.

**Parameters** `values`: array

Values used to determine the groups.

**Returns** `groups`: dict

{group name -> group labels}

#### 34.6.1.51 pandas.Index.identical

`Index.identical` (*other*)

Similar to equals, but check that other comparable attributes are also equal

#### 34.6.1.52 pandas.Index.insert

`Index.insert` (*loc*, *item*)

Make new Index inserting new item at location. Follows Python list.append semantics for negative values

**Parameters**

`loc` [int]

`item` [object]

**Returns**

`new_index` [Index]

### 34.6.1.53 pandas.Index.intersection

`Index.intersection(other)`

Form the intersection of two Index objects.

This returns a new Index with elements common to the index and *other*, preserving the order of the calling index.

**Parameters**

**other** [Index or array-like]

**Returns**

**intersection** [Index]

#### Examples

```

>>> idx1 = pd.Index([1, 2, 3, 4])
>>> idx2 = pd.Index([3, 4, 5, 6])
>>> idx1.intersection(idx2)
Int64Index([3, 4], dtype='int64')

```

### 34.6.1.54 pandas.Index.is\_

`Index.is_(other)`

More flexible, faster check like `is` but that works through views

Note: this is *not* the same as `Index.identical()`, which checks that metadata is also the same.

**Parameters** **other** : object

other object to compare against.

**Returns**

**True if both have same underlying data, False otherwise** [bool]

### 34.6.1.55 pandas.Index.is\_categorical

`Index.is_categorical()`

Check if the Index holds categorical data.

**Returns** **boolean**

True if the Index is categorical.

**See also:**

[\*CategoricalIndex\*](#) Index for categorical data.

#### Examples

```
>>> idx = pd.Index(["Watermelon", "Orange", "Apple",
...                 "Watermelon"]).astype("category")
>>> idx.is_categorical()
True
```

```
>>> idx = pd.Index([1, 3, 5, 7])
>>> idx.is_categorical()
False
```

```
>>> s = pd.Series(["Peter", "Victor", "Elisabeth", "Mar"])
>>> s
0      Peter
1    Victor
2  Elisabeth
3        Mar
dtype: object
>>> s.index.is_categorical()
False
```

#### 34.6.1.56 pandas.Index.isin

`Index.isin` (*values*, *level=None*)

Return a boolean array where the index values are in *values*.

Compute boolean array of whether each index value is found in the passed set of values. The length of the returned boolean array matches the length of the index.

**Parameters** *values* : set or list-like

Sought values.

New in version 0.18.1: Support for values as a set.

**level** : str or int, optional

Name or position of the index level to use (if the index is a *MultiIndex*).

**Returns** *is\_contained* : ndarray

NumPy array of boolean values.

**See also:**

[\*Series.isin\*](#) Same for Series.

[\*DataFrame.isin\*](#) Same method for DataFrames.

#### Notes

In the case of *MultiIndex* you must either specify *values* as a list-like object containing tuples that are the same length as the number of levels, or specify *level*. Otherwise it will raise a `ValueError`.

If *level* is specified:

- if it is the name of one *and only one* index level, use that level;
- otherwise it should be a number indicating level position.

## Examples

```
>>> idx = pd.Index([1,2,3])
>>> idx
Int64Index([1, 2, 3], dtype='int64')
```

Check whether each index value in a list of values. `>>> idx.isin([1, 4])` `array([ True, False, False])`

```
>>> midx = pd.MultiIndex.from_arrays([[1,2,3],
...                                  ['red', 'blue', 'green']],
...                                  names=('number', 'color'))
>>> midx
MultiIndex(levels=[[1, 2, 3], ['blue', 'green', 'red']],
            labels=[[0, 1, 2], [2, 0, 1]],
            names=['number', 'color'])
```

Check whether the strings in the ‘color’ level of the MultiIndex are in a list of colors.

```
>>> midx.isin(['red', 'orange', 'yellow'], level='color')
array([ True, False, False])
```

To check across the levels of a MultiIndex, pass a list of tuples:

```
>>> midx.isin([(1, 'red'), (3, 'red')])
array([ True, False, False])
```

For a DatetimeIndex, string values in *values* are converted to Timestamps.

```
>>> dates = ['2000-03-11', '2000-03-12', '2000-03-13']
>>> dti = pd.to_datetime(dates)
>>> dti
DatetimeIndex(['2000-03-11', '2000-03-12', '2000-03-13'],
              dtype='datetime64[ns]', freq=None)
```

```
>>> dti.isin(['2000-03-11'])
array([ True, False, False])
```

### 34.6.1.57 pandas.Index.isna

`Index.isna()`

Detect missing values.

Return a boolean same-sized object indicating if the values are NA. NA values, such as `None`, `numpy.NaN` or `pd.NaT`, get mapped to `True` values. Everything else get mapped to `False` values. Characters such as empty strings `''` or `numpy.inf` are not considered NA values (unless you set `pandas.options.mode.use_inf_as_na = True`).

New in version 0.20.0.

**Returns** `numpy.ndarray`

A boolean array of whether my values are NA

**See also:**

[`pandas.Index.notna`](#) boolean inverse of `isna`.

`pandas.Index.dropna` omit entries with missing values.

`pandas.isna` top-level isna.

`Series.isna` detect missing values in Series object.

## Examples

Show which entries in a `pandas.Index` are NA. The result is an array.

```
>>> idx = pd.Index([5.2, 6.0, np.NaN])
>>> idx
Float64Index([5.2, 6.0, nan], dtype='float64')
>>> idx.isna()
array([False, False,  True], dtype=bool)
```

Empty strings are not considered NA values. `None` is considered an NA value.

```
>>> idx = pd.Index(['black', '', 'red', None])
>>> idx
Index(['black', '', 'red', None], dtype='object')
>>> idx.isna()
array([False, False, False,  True], dtype=bool)
```

For datetimes, `NaT` (Not a Time) is considered as an NA value.

```
>>> idx = pd.DatetimeIndex([pd.Timestamp('1940-04-25'),
...                          pd.Timestamp(''), None, pd.NaT])
>>> idx
DatetimeIndex(['1940-04-25', 'NaT', 'NaT', 'NaT'],
              dtype='datetime64[ns]', freq=None)
>>> idx.isna()
array([False,  True,  True,  True], dtype=bool)
```

### 34.6.1.58 pandas.Index.isnull

`Index.isnull()`

Detect missing values.

Return a boolean same-sized object indicating if the values are NA. NA values, such as `None`, `numpy.NaN` or `pd.NaT`, get mapped to `True` values. Everything else get mapped to `False` values. Characters such as empty strings `''` or `numpy.inf` are not considered NA values (unless you set `pandas.options.mode.use_inf_as_na = True`).

New in version 0.20.0.

#### Returns `numpy.ndarray`

A boolean array of whether my values are NA

See also:

`pandas.Index.notna` boolean inverse of `isna`.

`pandas.Index.dropna` omit entries with missing values.

`pandas.isna` top-level isna.

`Series.isna` detect missing values in Series object.

## Examples

Show which entries in a pandas.Index are NA. The result is an array.

```
>>> idx = pd.Index([5.2, 6.0, np.NaN])
>>> idx
Float64Index([5.2, 6.0, nan], dtype='float64')
>>> idx.isna()
array([False, False,  True], dtype=bool)
```

Empty strings are not considered NA values. None is considered an NA value.

```
>>> idx = pd.Index(['black', '', 'red', None])
>>> idx
Index(['black', '', 'red', None], dtype='object')
>>> idx.isna()
array([False, False, False,  True], dtype=bool)
```

For datetimes, *NaT* (Not a Time) is considered as an NA value.

```
>>> idx = pd.DatetimeIndex([pd.Timestamp('1940-04-25'),
...                          pd.Timestamp(''), None, pd.NaT])
>>> idx
DatetimeIndex(['1940-04-25', 'NaT', 'NaT', 'NaT'],
              dtype='datetime64[ns]', freq=None)
>>> idx.isna()
array([False,  True,  True,  True], dtype=bool)
```

### 34.6.1.59 pandas.Index.item

`Index.item()`

return the first element of the underlying data as a python scalar

### 34.6.1.60 pandas.Index.join

`Index.join(other, how='left', level=None, return_indexers=False, sort=False)`  
*this is an internal non-public method*

Compute join\_index and indexers to conform data structures to the new index.

#### Parameters

**other** [Index]

**how** [{ 'left', 'right', 'inner', 'outer' }]

**level** [int or level name, default None]

**return\_indexers** [boolean, default False]

**sort** : boolean, default False

Sort the join keys lexicographically in the result Index. If False, the order of the join keys depends on the join type (how keyword)

New in version 0.20.0.

#### Returns

`join_index, (left_indexer, right_indexer)`

#### 34.6.1.61 `pandas.Index.map`

`Index.map` (*mapper*, *na\_action=None*)

Map values using input correspondence (a dict, Series, or function).

**Parameters** `mapper` : function, dict, or Series

Mapping correspondence.

`na_action` : {None, 'ignore'}

If 'ignore', propagate NA values, without passing them to the mapping correspondence.

**Returns** `applied` : Union[Index, MultiIndex], inferred

The output of the mapping function applied to the index. If the function returns a tuple with more than one element a MultiIndex will be returned.

#### 34.6.1.62 `pandas.Index.max`

`Index.max` ()

Return the maximum value of the Index.

**Returns** `scalar`

Maximum value.

**See also:**

[`Index.min`](#) Return the minimum value in an Index.

[`Series.max`](#) Return the maximum value in a Series.

[`DataFrame.max`](#) Return the maximum values in a DataFrame.

#### Examples

```
>>> idx = pd.Index([3, 2, 1])
>>> idx.max()
3
```

```
>>> idx = pd.Index(['c', 'b', 'a'])
>>> idx.max()
'c'
```

For a MultiIndex, the maximum is determined lexicographically.

```
>>> idx = pd.MultiIndex.from_product([('a', 'b'), (2, 1)])
>>> idx.max()
('b', 2)
```

### 34.6.1.63 pandas.Index.memory\_usage

`Index.memory_usage (deep=False)`

Memory usage of the values

**Parameters** `deep` : bool

Introspect the data deeply, interrogate *object* dtypes for system-level memory consumption

**Returns**

bytes used

**See also:**

`numpy.ndarray.nbytes`

#### Notes

Memory usage does not include memory consumed by elements that are not components of the array if `deep=False` or if used on PyPy

### 34.6.1.64 pandas.Index.min

`Index.min()`

Return the minimum value of the Index.

**Returns** scalar

Minimum value.

**See also:**

**`Index.max`** Return the maximum value of the object.

**`Series.min`** Return the minimum value in a Series.

**`DataFrame.min`** Return the minimum values in a DataFrame.

#### Examples

```
>>> idx = pd.Index([3, 2, 1])
>>> idx.min()
1
```

```
>>> idx = pd.Index(['c', 'b', 'a'])
>>> idx.min()
'a'
```

For a MultiIndex, the minimum is determined lexicographically.

```
>>> idx = pd.MultiIndex.from_product([('a', 'b'), (2, 1)])
>>> idx.min()
('a', 1)
```

### 34.6.1.65 pandas.Index.notna

`Index.notna()`

Detect existing (non-missing) values.

Return a boolean same-sized object indicating if the values are not NA. Non-missing values get mapped to `True`. Characters such as empty strings `' '` or `numpy.inf` are not considered NA values (unless you set `pandas.options.mode.use_inf_as_na = True`). NA values, such as `None` or `numpy.NaN`, get mapped to `False` values.

New in version 0.20.0.

**Returns** `numpy.ndarray`

Boolean array to indicate which entries are not NA.

**See also:**

`Index.notnull` alias of `notna`

`Index.isna` inverse of `notna`

`pandas.notna` top-level `notna`

#### Examples

Show which entries in an `Index` are not NA. The result is an array.

```
>>> idx = pd.Index([5.2, 6.0, np.NaN])
>>> idx
Float64Index([5.2, 6.0, nan], dtype='float64')
>>> idx.notna()
array([ True,  True, False])
```

Empty strings are not considered NA values. `None` is considered a NA value.

```
>>> idx = pd.Index(['black', '', 'red', None])
>>> idx
Index(['black', '', 'red', None], dtype='object')
>>> idx.notna()
array([ True,  True,  True, False])
```

### 34.6.1.66 pandas.Index.notnull

`Index.notnull()`

Detect existing (non-missing) values.

Return a boolean same-sized object indicating if the values are not NA. Non-missing values get mapped to `True`. Characters such as empty strings `' '` or `numpy.inf` are not considered NA values (unless you set `pandas.options.mode.use_inf_as_na = True`). NA values, such as `None` or `numpy.NaN`, get mapped to `False` values.

New in version 0.20.0.

**Returns** `numpy.ndarray`

Boolean array to indicate which entries are not NA.

**See also:**

`Index.notnull` alias of `notna`

`Index.isna` inverse of `notna`

`pandas.notna` top-level `notna`

## Examples

Show which entries in an Index are not NA. The result is an array.

```
>>> idx = pd.Index([5.2, 6.0, np.NaN])
>>> idx
Float64Index([5.2, 6.0, nan], dtype='float64')
>>> idx.notna()
array([ True,  True, False])
```

Empty strings are not considered NA values. None is considered a NA value.

```
>>> idx = pd.Index(['black', '', 'red', None])
>>> idx
Index(['black', '', 'red', None], dtype='object')
>>> idx.notna()
array([ True,  True,  True, False])
```

### 34.6.1.67 pandas.Index.nunique

`Index.nunique` (*dropna=True*)

Return number of unique elements in the object.

Excludes NA values by default.

**Parameters** `dropna` : boolean, default True

Don't include NaN in the count.

**Returns**

`nunique` [int]

### 34.6.1.68 pandas.Index.putmask

`Index.putmask` (*mask, value*)

return a new Index of the values set with the mask

**See also:**

`numpy.ndarray.putmask`

### 34.6.1.69 pandas.Index.ravel

`Index.ravel` (*order='C'*)

return an ndarray of the flattened values of the underlying data

**See also:**

`numpy.ndarray.ravel`

#### 34.6.1.70 pandas.Index.reindex

`Index.reindex` (*target*, *method=None*, *level=None*, *limit=None*, *tolerance=None*)  
Create index with target's values (move/add/delete values as necessary)

**Parameters**

**target** [an iterable]

**Returns** **new\_index** : `pd.Index`

Resulting index

**indexer** : `np.ndarray` or `None`

Indices of output values in original index

#### 34.6.1.71 pandas.Index.rename

`Index.rename` (*name*, *inplace=False*)  
Set new names on index. Defaults to returning new index.

**Parameters** **name** : str or list

name to set

**inplace** : bool

if True, mutates in place

**Returns**

new index (of same type and class...etc) [if inplace, returns None]

#### 34.6.1.72 pandas.Index.repeat

`Index.repeat` (*repeats*, *\*args*, *\*\*kwargs*)  
Repeat elements of an Index.

Returns a new index where each element of the current index is repeated consecutively a given number of times.

**Parameters** **repeats** : int

The number of repetitions for each element.

**\*\*kwargs**

Additional keywords have no effect but might be accepted for compatibility with numpy.

**Returns** **pandas.Index**

Newly created Index with repeated elements.

**See also:**

[`Series.repeat`](#) Equivalent function for Series

[`numpy.repeat`](#) Underlying implementation

## Examples

```
>>> idx = pd.Index([1, 2, 3])
>>> idx
Int64Index([1, 2, 3], dtype='int64')
>>> idx.repeat(2)
Int64Index([1, 1, 2, 2, 3, 3], dtype='int64')
>>> idx.repeat(3)
Int64Index([1, 1, 1, 2, 2, 2, 3, 3, 3], dtype='int64')
```

### 34.6.1.73 pandas.Index.searchsorted

`Index.searchsorted` (*value*, *side*='left', *sorter*=None)

Find indices where elements should be inserted to maintain order.

Find the indices into a sorted `IndexOpsMixin` *self* such that, if the corresponding elements in *value* were inserted before the indices, the order of *self* would be preserved.

**Parameters** *value* : array\_like

Values to insert into *self*.

**side** : {'left', 'right'}, optional

If 'left', the index of the first suitable location found is given. If 'right', return the last such index. If there is no suitable index, return either 0 or N (where N is the length of *self*).

**sorter** : 1-D array\_like, optional

Optional array of integer indices that sort *self* into ascending order. They are typically the result of `np.argsort`.

**Returns** *indices* : array of ints

Array of insertion points with the same shape as *value*.

**See also:**

`numpy.searchsorted`

## Notes

Binary search is used to find the required insertion points.

## Examples

```
>>> x = pd.Series([1, 2, 3])
>>> x
0    1
1    2
2    3
dtype: int64
```

```
>>> x.searchsorted(4)
array([3])
```

```
>>> x.searchsorted([0, 4])
array([0, 3])
```

```
>>> x.searchsorted([1, 3], side='left')
array([0, 2])
```

```
>>> x.searchsorted([1, 3], side='right')
array([1, 3])
```

```
>>> x = pd.Categorical(['apple', 'bread', 'bread',
                       'cheese', 'milk'], ordered=True)
[apple, bread, bread, cheese, milk]
Categories (4, object): [apple < bread < cheese < milk]
```

```
>>> x.searchsorted('bread')
array([1])      # Note: an array, not a scalar
```

```
>>> x.searchsorted(['bread'], side='right')
array([3])
```

### 34.6.1.74 pandas.Index.set\_names

`Index.set_names` (*names, level=None, inplace=False*)

Set new names on index. Defaults to returning new index.

**Parameters** **names** : str or sequence

name(s) to set

**level** : int, level name, or sequence of int/level names (default None)

If the index is a MultiIndex (hierarchical), level(s) to set (None for all levels).  
Otherwise level must be None

**inplace** : bool

if True, mutates in place

**Returns**

**new index (of same type and class...etc) [if inplace, returns None]**

### Examples

```
>>> Index([1, 2, 3, 4]).set_names('foo')
Int64Index([1, 2, 3, 4], dtype='int64', name='foo')
>>> Index([1, 2, 3, 4]).set_names(['foo'])
Int64Index([1, 2, 3, 4], dtype='int64', name='foo')
>>> idx = MultiIndex.from_tuples([(1, u'one'), (1, u'two'),
                                (2, u'one'), (2, u'two')],
                                names=['foo', 'bar'])
>>> idx.set_names(['baz', 'quz'])
MultiIndex(levels=[[1, 2], [u'one', u'two']],
            labels=[[0, 0, 1, 1], [0, 1, 0, 1]],
            names=[u'baz', u'quz'])
```

(continues on next page)

(continued from previous page)

```
>>> idx.set_names('baz', level=0)
MultiIndex(levels=[[1, 2], [u'one', u'two']],
            labels=[[0, 0, 1, 1], [0, 1, 0, 1]],
            names=[u'baz', u'bar'])
```

### 34.6.1.75 pandas.Index.set\_value

`Index.set_value(arr, key, value)`

Fast lookup of value from 1-dimensional ndarray. Only use this if you know what you're doing

### 34.6.1.76 pandas.Index.shift

`Index.shift(periods=1, freq=None)`

Shift index by desired number of time frequency increments.

This method is for shifting the values of datetime-like indexes by a specified time increment a given number of times.

**Parameters** `periods` : int, default 1

Number of periods (or increments) to shift by, can be positive or negative.

**freq** : pandas.DateOffset, pandas.Timedelta or string, optional

Frequency increment to shift by. If None, the index is shifted by its own *freq* attribute. Offset aliases are valid strings, e.g., 'D', 'W', 'M' etc.

**Returns** pandas.Index

shifted index

**See also:**

[`Series.shift`](#) Shift values of Series.

### Notes

This method is only implemented for datetime-like index classes, i.e., `DatetimeIndex`, `PeriodIndex` and `TimedeltaIndex`.

### Examples

Put the first 5 month starts of 2011 into an index.

```
>>> month_starts = pd.date_range('1/1/2011', periods=5, freq='MS')
>>> month_starts
DatetimeIndex(['2011-01-01', '2011-02-01', '2011-03-01', '2011-04-01',
              '2011-05-01'],
              dtype='datetime64[ns]', freq='MS')
```

Shift the index by 10 days.

```
>>> month_starts.shift(10, freq='D')
DatetimeIndex(['2011-01-11', '2011-02-11', '2011-03-11', '2011-04-11',
              '2011-05-11'],
              dtype='datetime64[ns]', freq=None)
```

The default value of *freq* is the *freq* attribute of the index, which is 'MS' (month start) in this example.

```
>>> month_starts.shift(10)
DatetimeIndex(['2011-11-01', '2011-12-01', '2012-01-01', '2012-02-01',
              '2012-03-01'],
              dtype='datetime64[ns]', freq='MS')
```

### 34.6.1.77 pandas.Index.slice\_indexer

`Index.slice_indexer` (*start=None, end=None, step=None, kind=None*)

For an ordered or unique index, compute the slice indexer for input labels and step.

**Parameters** **start** : label, default None

If None, defaults to the beginning

**end** : label, default None

If None, defaults to the end

**step** [int, default None]

**kind** [string, default None]

**Returns**

**indexer** [slice]

**Raises** **KeyError** : If key does not exist, or key is not unique and index is not ordered.

### Notes

This function assumes that the data is sorted, so use at your own peril

### Examples

This is a method on all index types. For example you can do:

```
>>> idx = pd.Index(list('abcd'))
>>> idx.slice_indexer(start='b', end='c')
slice(1, 3)
```

```
>>> idx = pd.MultiIndex.from_arrays([list('abcd'), list('efgh')])
>>> idx.slice_indexer(start='b', end=('c', 'g'))
slice(1, 3)
```

### 34.6.1.78 pandas.Index.slice\_locs

`Index.slice_locs` (*start=None, end=None, step=None, kind=None*)

Compute slice locations for input labels.

**Parameters** **start** : label, default None

If None, defaults to the beginning

**end** : label, default None

If None, defaults to the end

**step** : int, defaults None

If None, defaults to 1

**kind** [{ 'ix', 'loc', 'getitem' } or None]

**Returns**

**start, end** [int]

**See also:**

[`Index.get\_loc`](#) Get location for a single label

#### Notes

This method only works if the index is monotonic or unique.

#### Examples

```
>>> idx = pd.Index(list('abcd'))
>>> idx.slice_locs(start='b', end='c')
(1, 3)
```

### 34.6.1.79 pandas.Index.sort\_values

`Index.sort_values` (*return\_indexer=False, ascending=True*)

Return a sorted copy of the index.

Return a sorted copy of the index, and optionally return the indices that sorted the index itself.

**Parameters** **return\_indexer** : bool, default False

Should the indices that would sort the index be returned.

**ascending** : bool, default True

Should the index values be sorted in an ascending order.

**Returns** **sorted\_index** : pandas.Index

Sorted copy of the index.

**indexer** : numpy.ndarray, optional

The indices that the index itself was sorted by.

See also:

`pandas.Series.sort_values` Sort values of a Series.

`pandas.DataFrame.sort_values` Sort values in a DataFrame.

### Examples

```
>>> idx = pd.Index([10, 100, 1, 1000])
>>> idx
Int64Index([10, 100, 1, 1000], dtype='int64')
```

Sort values in ascending order (default behavior).

```
>>> idx.sort_values()
Int64Index([1, 10, 100, 1000], dtype='int64')
```

Sort values in descending order, and also get the indices *idx* was sorted by.

```
>>> idx.sort_values(ascending=False, return_indexer=True)
(Int64Index([1000, 100, 10, 1], dtype='int64'), array([3, 1, 0, 2]))
```

#### 34.6.1.80 pandas.Index.sortlevel

`Index.sortlevel` (*level=None, ascending=True, sort\_remaining=None*)

For internal compatibility with with the Index API

Sort the Index. This is for compat with MultiIndex

**Parameters** `ascending` : boolean, default True

False to sort in descending order

`level, sort_remaining` are compat parameters

**Returns**

`sorted_index` [Index]

#### 34.6.1.81 pandas.Index.str

`Index.str()`

Vectorized string functions for Series and Index. NAs stay NA unless handled otherwise by a particular method. Patterned after Python's string methods, with some inspiration from R's stringr package.

### Examples

```
>>> s.str.split('_')
>>> s.str.replace('_', '')
```

### 34.6.1.82 pandas.Index.summary

`Index.summary` (*name=None*)

Return a summarized representation .. deprecated:: 0.23.0

### 34.6.1.83 pandas.Index.symmetric\_difference

`Index.symmetric_difference` (*other, result\_name=None*)

Compute the symmetric difference of two Index objects. It's sorted if sorting is possible.

#### Parameters

**other** [Index or array-like]

**result\_name** [str]

#### Returns

**symmetric\_difference** [Index]

#### Notes

`symmetric_difference` contains elements that appear in either `idx1` or `idx2` but not both. Equivalent to the Index created by `idx1.difference(idx2) | idx2.difference(idx1)` with duplicates dropped.

#### Examples

```
>>> idx1 = Index([1, 2, 3, 4])
>>> idx2 = Index([2, 3, 4, 5])
>>> idx1.symmetric_difference(idx2)
Int64Index([1, 5], dtype='int64')
```

You can also use the `^` operator:

```
>>> idx1 ^ idx2
Int64Index([1, 5], dtype='int64')
```

### 34.6.1.84 pandas.Index.take

`Index.take` (*indices, axis=0, allow\_fill=True, fill\_value=None, \*\*kwargs*)

return a new Index of the values selected by the indices

For internal compatibility with numpy arrays.

**Parameters** **indices** : list

Indices to be taken

**axis** : int, optional

The axis over which to select values, always 0.

**allow\_fill** [bool, default True]

**fill\_value** : bool, default None

If `allow_fill=True` and `fill_value` is not None, indices specified by -1 is regarded as NA. If Index doesn't hold NA, raise `ValueError`

**See also:**

`numpy.ndarray.take`

### 34.6.1.85 `pandas.Index.to_frame`

`Index.to_frame(index=True)`

Create a `DataFrame` with a column containing the Index.

New in version 0.21.0.

**Parameters** `index` : boolean, default True

Set the index of the returned `DataFrame` as the original Index.

**Returns** `DataFrame`

`DataFrame` containing the original Index data.

**See also:**

[`Index.to\_series`](#) Convert an Index to a Series.

[`Series.to\_frame`](#) Convert Series to `DataFrame`.

### Examples

```
>>> idx = pd.Index(['Ant', 'Bear', 'Cow'], name='animal')
>>> idx.to_frame()
      animal
animal
Ant      Ant
Bear    Bear
Cow     Cow
```

By default, the original Index is reused. To enforce a new Index:

```
>>> idx.to_frame(index=False)
      animal
0      Ant
1     Bear
2      Cow
```

### 34.6.1.86 `pandas.Index.to_native_types`

`Index.to_native_types(slicer=None, **kwargs)`

Format specified values of *self* and return them.

**Parameters** `slicer` : int, array-like

An indexer into *self* that specifies which values are used in the formatting process.

**kwargs** : dict

Options for specifying how the values should be formatted. These options include the following:

1. **na\_rep** [str] The value that serves as a placeholder for NULL values
2. **quoting** [bool or None] Whether or not there are quoted values in *self*
3. **date\_format** [str] The format used to represent date-like values

### 34.6.1.87 pandas.Index.to\_series

`Index.to_series (index=None, name=None)`

Create a Series with both index and values equal to the index keys useful with map for returning an indexer based on an index

**Parameters** **index** : Index, optional

index of resulting Series. If None, defaults to original index

**name** : string, optional

name of resulting Series. If None, defaults to name of original index

**Returns**

**Series** [dtype will be based on the type of the Index values.]

### 34.6.1.88 pandas.Index.tolist

`Index.tolist ()`

Return a list of the values.

These are each a scalar type, which is a Python scalar (for str, int, float) or a pandas scalar (for Timestamp/Timedelta/Interval/Period)

**See also:**

`numpy.ndarray.tolist`

### 34.6.1.89 pandas.Index.transpose

`Index.transpose (*args, **kwargs)`

return the transpose, which is by definition self

### 34.6.1.90 pandas.Index.union

`Index.union (other)`

Form the union of two Index objects and sorts if possible.

**Parameters**

**other** [Index or array-like]

**Returns**

**union** [Index]

## Examples

```
>>> idx1 = pd.Index([1, 2, 3, 4])
>>> idx2 = pd.Index([3, 4, 5, 6])
>>> idx1.union(idx2)
Int64Index([1, 2, 3, 4, 5, 6], dtype='int64')
```

### 34.6.1.91 pandas.Index.unique

`Index.unique` (*level=None*)

Return unique values in the index. Uniques are returned in order of appearance, this does NOT sort.

**Parameters** **level** : int or str, optional, default None

Only return values from specified level (for MultiIndex)

New in version 0.23.0.

**Returns**

**Index without duplicates**

**See also:**

*unique*, *Series.unique*

### 34.6.1.92 pandas.Index.value\_counts

`Index.value_counts` (*normalize=False, sort=True, ascending=False, bins=None, dropna=True*)

Returns object containing counts of unique values.

The resulting object will be in descending order so that the first element is the most frequently-occurring element. Excludes NA values by default.

**Parameters** **normalize** : boolean, default False

If True then the object returned will contain the relative frequencies of the unique values.

**sort** : boolean, default True

Sort by values

**ascending** : boolean, default False

Sort in ascending order

**bins** : integer, optional

Rather than count values, group them into half-open bins, a convenience for `pd.cut`, only works with numeric data

**dropna** : boolean, default True

Don't include counts of NaN.

**Returns**

**counts** [Series]

### 34.6.1.93 pandas.Index.where

`Index.where` (*cond*, *other=None*)

New in version 0.19.0.

Return an Index of same shape as self and whose corresponding entries are from self where *cond* is True and otherwise are from *other*.

#### Parameters

**cond** [boolean array-like with the same length as self]

**other** [scalar, or array-like]

<b>holds_integer</b>	
<b>is_boolean</b>	
<b>is_floating</b>	
<b>is_integer</b>

## 34.6.2 Attributes

<code>Index.values</code>	return the underlying data as an ndarray
<code>Index.is_monotonic</code>	alias for <code>is_monotonic_increasing</code> (deprecated)
<code>Index.is_monotonic_increasing</code>	return if the index is monotonic increasing (only equal or increasing) values.
<code>Index.is_monotonic_decreasing</code>	return if the index is monotonic decreasing (only equal or decreasing) values.
<code>Index.is_unique</code>	return if the index has unique values
<code>Index.has_duplicates</code>	
<code>Index.hasnans</code>	return if I have any nans; enables various perf speedups
<code>Index.dtype</code>	return the dtype object of the underlying data
<code>Index.dtype_str</code>	return the dtype str of the underlying data
<code>Index.inferred_type</code>	return a string of the type inferred from the values
<code>Index.is_all_dates</code>	
<code>Index.shape</code>	return a tuple of the shape of the underlying data
<code>Index.name</code>	
<code>Index.names</code>	
<code>Index.nbytes</code>	return the number of bytes in the underlying data
<code>Index.ndim</code>	return the number of dimensions of the underlying data, by definition 1
<code>Index.size</code>	return the number of elements in the underlying data
<code>Index.empty</code>	
<code>Index.strides</code>	return the strides of the underlying data

Continued on next page

Table 98 – continued from previous page

<code>Index.itemsize</code>	return the size of the dtype of the item of the underlying data
<code>Index.base</code>	return the base object if the memory of the underlying data is shared
<code>Index.T</code>	return the transpose, which is by definition self
<code>Index.memory_usage([deep])</code>	Memory usage of the values

**34.6.2.1 pandas.Index.has\_duplicates**`Index.has_duplicates`**34.6.2.2 pandas.Index.is\_all\_dates**`Index.is_all_dates`**34.6.2.3 pandas.Index.name**`Index.name = None`**34.6.2.4 pandas.Index.names**`Index.names`**34.6.2.5 pandas.Index.empty**`Index.empty`**34.6.3 Modifying and Computations**

<code>Index.all(*args, **kwargs)</code>	Return whether all elements are True.
<code>Index.any(*args, **kwargs)</code>	Return whether any element is True.
<code>Index.argmin([axis])</code>	return a ndarray of the minimum argument indexer
<code>Index.argmax([axis])</code>	return a ndarray of the maximum argument indexer
<code>Index.copy([name, deep, dtype])</code>	Make a copy of this object.
<code>Index.delete(loc)</code>	Make new Index with passed location(-s) deleted
<code>Index.drop(labels[, errors])</code>	Make new Index with passed list of labels deleted
<code>Index.drop_duplicates([keep])</code>	Return Index with duplicate values removed.
<code>Index.duplicated([keep])</code>	Indicate duplicate index values.
<code>Index.equals(other)</code>	Determines if two Index objects contain the same elements.
<code>Index.factorize([sort, na_sentinel])</code>	Encode the object as an enumerated type or categorical variable.
<code>Index.identical(other)</code>	Similar to equals, but check that other comparable attributes are also equal
<code>Index.insert(loc, item)</code>	Make new Index inserting new item at location.
<code>Index.is_(other)</code>	More flexible, faster check like <code>is</code> but that works through views

Continued on next page

Table 99 – continued from previous page

<i>Index.is_boolean()</i>	
<i>Index.is_categorical()</i>	Check if the Index holds categorical data.
<i>Index.is_floating()</i>	
<i>Index.is_integer()</i>	
<i>Index.is_interval()</i>	
<i>Index.is_lexsorted_for_tuple(tup)</i>	
<i>Index.is_mixed()</i>	
<i>Index.is_numeric()</i>	
<i>Index.is_object()</i>	
<i>Index.min()</i>	Return the minimum value of the Index.
<i>Index.max()</i>	Return the maximum value of the Index.
<i>Index.reindex(target[, method, level, ...])</i>	Create index with target's values (move/add/delete values as necessary)
<i>Index.rename(name[, inplace])</i>	Set new names on index.
<i>Index.repeat(repeats, *args, **kwargs)</i>	Repeat elements of an Index.
<i>Index.where(cond[, other])</i>	
<i>Index.take(indices[, axis, allow_fill, ...])</i>	return a new Index of the values selected by the indices
<i>Index.putmask(mask, value)</i>	return a new Index of the values set with the mask
<i>Index.set_names(names[, level, inplace])</i>	Set new names on index.
<i>Index.unique([level])</i>	Return unique values in the index.
<i>Index.nunique([dropna])</i>	Return number of unique elements in the object.
<i>Index.value_counts([normalize, sort, ...])</i>	Returns object containing counts of unique values.

**34.6.3.1 pandas.Index.is\_boolean**`Index.is_boolean()`**34.6.3.2 pandas.Index.is\_floating**`Index.is_floating()`**34.6.3.3 pandas.Index.is\_integer**`Index.is_integer()`**34.6.3.4 pandas.Index.is\_interval**`Index.is_interval()`**34.6.3.5 pandas.Index.is\_lexsorted\_for\_tuple**`Index.is_lexsorted_for_tuple(tup)`**34.6.3.6 pandas.Index.is\_mixed**`Index.is_mixed()`

### 34.6.3.7 pandas.Index.is\_numeric

`Index.is_numeric()`

### 34.6.3.8 pandas.Index.is\_object

`Index.is_object()`

## 34.6.4 Missing Values

<code>Index.fillna([value, downcast])</code>	Fill NA/NaN values with the specified value
<code>Index.dropna([how])</code>	Return Index without NA/NaN values
<code>Index.isna()</code>	Detect missing values.
<code>Index.notna()</code>	Detect existing (non-missing) values.

## 34.6.5 Conversion

<code>Index.astype(dtype[, copy])</code>	Create an Index with values cast to dtypes.
<code>Index.item()</code>	return the first element of the underlying data as a python scalar
<code>Index.map(mapper[, na_action])</code>	Map values using input correspondence (a dict, Series, or function).
<code>Index.ravel([order])</code>	return an ndarray of the flattened values of the underlying data
<code>Index.tolist()</code>	Return a list of the values.
<code>Index.to_native_types([slicer])</code>	Format specified values of <i>self</i> and return them.
<code>Index.to_series([index, name])</code>	Create a Series with both index and values equal to the index keys useful with map for returning an indexer based on an index
<code>Index.to_frame([index])</code>	Create a DataFrame with a column containing the Index.
<code>Index.view([cls])</code>	

### 34.6.5.1 pandas.Index.view

`Index.view(cls=None)`

## 34.6.6 Sorting

<code>Index.argsort(*args, **kwargs)</code>	Return the integer indicies that would sort the index.
<code>Index.searchsorted(value[, side, sorter])</code>	Find indices where elements should be inserted to maintain order.
<code>Index.sort_values([return_indexer, ascending])</code>	Return a sorted copy of the index.

## 34.6.7 Time-specific operations

<code>Index.shift([periods, freq])</code>	Shift index by desired number of time frequency increments.
---	---

### 34.6.8 Combining / joining / set operations

<code>Index.append(other)</code>	Append a collection of Index options together
<code>Index.join(other[, how, level, ...])</code>	<i>this is an internal non-public method</i>
<code>Index.intersection(other)</code>	Form the intersection of two Index objects.
<code>Index.union(other)</code>	Form the union of two Index objects and sorts if possible.
<code>Index.difference(other)</code>	Return a new Index with elements from the index that are not in <i>other</i> .
<code>Index.symmetric_difference(other[, re-sult_name])</code>	Compute the symmetric difference of two Index objects.

### 34.6.9 Selecting

<code>Index.asof(label)</code>	For a sorted index, return the most recent label up to and including the passed label.
<code>Index.asof_locs(where, mask)</code>	where : array of timestamps mask : array of booleans where data is not NA
<code>Index.contains(key)</code>	return a boolean if this key is IN the index
<code>Index.get_duplicates()</code>	(DEPRECATED) Extract duplicated index elements.
<code>Index.get_indexer(target[, method, limit, ...])</code>	Compute indexer and mask for new index given the current index.
<code>Index.get_indexer_for(target, **kwargs)</code>	guaranteed return of an indexer even when non-unique This dispatches to <code>get_indexer</code> or <code>get_indexer_nonunique</code> as appropriate
<code>Index.get_indexer_non_unique(target)</code>	Compute indexer and mask for new index given the current index.
<code>Index.get_level_values(level)</code>	Return an Index of values for requested level, equal to the length of the index.
<code>Index.get_loc(key[, method, tolerance])</code>	Get integer location, slice or boolean mask for requested label.
<code>Index.get_slice_bound(label, side, kind)</code>	Calculate slice bound that corresponds to given label.
<code>Index.get_value(series, key)</code>	Fast lookup of value from 1-dimensional ndarray.
<code>Index.get_values()</code>	Return <i>Index</i> data as a <i>numpy.ndarray</i> .
<code>Index.set_value(arr, key, value)</code>	Fast lookup of value from 1-dimensional ndarray.
<code>Index.isin(values[, level])</code>	Return a boolean array where the index values are in <i>values</i> .
<code>Index.slice_indexer([start, end, step, kind])</code>	For an ordered or unique index, compute the slice indexer for input labels and step.
<code>Index.slice_locs([start, end, step, kind])</code>	Compute slice locations for input labels.

## 34.7 Numeric Index

<i>RangeIndex</i>	Immutable Index implementing a monotonic integer range.
<i>Int64Index</i>	Immutable ndarray implementing an ordered, sliceable set.
<i>UInt64Index</i>	Immutable ndarray implementing an ordered, sliceable set.
<i>Float64Index</i>	Immutable ndarray implementing an ordered, sliceable set.

### 34.7.1 pandas.RangeIndex

**class** pandas.RangeIndex

Immutable Index implementing a monotonic integer range.

RangeIndex is a memory-saving special case of Int64Index limited to representing monotonic ranges. Using RangeIndex may in some instances improve computing speed.

This is the default index type used by DataFrame and Series when no explicit index is provided by the user.

**Parameters** **start** : int (default: 0), or other RangeIndex instance.

If int and “stop” is not given, interpreted as “stop” instead.

**stop** [int (default: 0)]

**step** [int (default: 1)]

**name** : object, optional

Name to be stored in the index

**copy** : bool, default False

Unused, accepted for homogeneity with other index types.

**See also:**

**Index** The base pandas Index type

**Int64Index** Index of int64 data

#### Attributes

None	
------	--

#### Methods

<i>from_range</i> (data[, name, dtype])	create RangeIndex from a range (py3), or xrange (py2) object
---	--

### 34.7.1.1 pandas.RangeIndex.from\_range

**classmethod** `RangeIndex.from_range` (*data*, *name=None*, *dtype=None*, *\*\*kwargs*)  
 create RangeIndex from a range (py3), or xrange (py2) object

### 34.7.2 pandas.Int64Index

**class** `pandas.Int64Index`

Immutable ndarray implementing an ordered, sliceable set. The basic object storing axis labels for all pandas objects. Int64Index is a special case of *Index* with purely integer labels.

#### Parameters

**data** [array-like (1-dimensional)]

**dtype** [NumPy dtype (default: int64)]

**copy** : bool

Make a copy of input ndarray

**name** : object

Name to be stored in the index

See also:

[\*Index\*](#) The base pandas Index type

#### Notes

An Index instance can **only** contain hashable objects.

#### Attributes

None	
------	--

#### Methods

None	
------	--

### 34.7.3 pandas.UInt64Index

**class** `pandas.UInt64Index`

Immutable ndarray implementing an ordered, sliceable set. The basic object storing axis labels for all pandas objects. UInt64Index is a special case of *Index* with purely unsigned integer labels.

#### Parameters

**data** [array-like (1-dimensional)]

**dtype** [NumPy dtype (default: uint64)]

**copy** : bool

Make a copy of input ndarray

**name** : object

Name to be stored in the index

**See also:**

[\*Index\*](#) The base pandas Index type

### Notes

An Index instance can **only** contain hashable objects.

### Attributes

None	
------	--

### Methods

None	
------	--

## 34.7.4 pandas.Float64Index

**class** pandas.**Float64Index**

Immutable ndarray implementing an ordered, sliceable set. The basic object storing axis labels for all pandas objects. Float64Index is a special case of *Index* with purely float labels.

### Parameters

**data** [array-like (1-dimensional)]

**dtype** [NumPy dtype (default: float64)]

**copy** : bool

Make a copy of input ndarray

**name** : object

Name to be stored in the index

**See also:**

[\*Index\*](#) The base pandas Index type

### Notes

An Index instance can **only** contain hashable objects.

Attributes

None	
------	--

Methods

None	
------	--

<i>RangeIndex.from_range</i> (data[, name, dtype])	create RangeIndex from a range (py3), or xrange (py2) object
--	--

34.8 CategoricalIndex

<i>CategoricalIndex</i>	Immutable Index implementing an ordered, sliceable set.
-------------------------	---

34.8.1 pandas.CategoricalIndex

**class** pandas.CategoricalIndex  
Immutable Index implementing an ordered, sliceable set. CategoricalIndex represents a sparsely populated Index with an underlying Categorical.

Parameters

- data** [array-like or Categorical, (1-dimensional)]
- categories** : optional, array-like  
categories for the CategoricalIndex
- ordered** : boolean,  
designating if the categories are ordered
- copy** : bool  
Make a copy of input ndarray
- name** : object  
Name to be stored in the index

See also:

*Categorical*, *Index*

Attributes

<b>codes</b>	
<b>categories</b>	
<b>ordered</b>	

## Methods

<code>rename_categories(*args, **kwargs)</code>	Renames categories.
<code>reorder_categories(*args, **kwargs)</code>	Reorders categories as specified in <code>new_categories</code> .
<code>add_categories(*args, **kwargs)</code>	Add new categories.
<code>remove_categories(*args, **kwargs)</code>	Removes the specified categories.
<code>remove_unused_categories(*args, **kwargs)</code>	Removes categories which are not used.
<code>set_categories(*args, **kwargs)</code>	Sets the categories to the specified <code>new_categories</code> .
<code>as_ordered(*args, **kwargs)</code>	Sets the Categorical to be ordered
<code>as_unordered(*args, **kwargs)</code>	Sets the Categorical to be unordered
<code>map(mapper)</code>	Map values using input correspondence (a dict, Series, or function).

### 34.8.1.1 pandas.CategoricalIndex.rename\_categories

`CategoricalIndex.rename_categories(*args, **kwargs)`

Renames categories.

**Parameters** `new_categories` : list-like, dict-like or callable

- list-like: all items must be unique and the number of items in the new categories must match the existing number of categories.
- dict-like: specifies a mapping from old categories to new. Categories not contained in the mapping are passed through and extra categories in the mapping are ignored.

New in version 0.21.0.

- callable : a callable that is called on all items in the old categories and whose return values comprise the new categories.

New in version 0.23.0.

**Warning:** Currently, Series are considered list like. In a future version of pandas they'll be considered dict-like.

**inplace** : boolean (default: False)

Whether or not to rename the categories inplace or return a copy of this categorical with renamed categories.

**Returns** `cat` : Categorical or None

With `inplace=False`, the new categorical is returned. With `inplace=True`, there is no return value.

**Raises** `ValueError`

If new categories are list-like and do not have the same number of items than the current categories or do not validate as categories

**See also:**

`reorder_categories`, `add_categories`, `remove_categories`,  
`remove_unused_categories`, `set_categories`

## Examples

```
>>> c = Categorical(['a', 'a', 'b'])
>>> c.rename_categories([0, 1])
[0, 0, 1]
Categories (2, int64): [0, 1]
```

For dict-like `new_categories`, extra keys are ignored and categories not in the dictionary are passed through

```
>>> c.rename_categories({'a': 'A', 'c': 'C'})
[A, A, b]
Categories (2, object): [A, b]
```

You may also provide a callable to create the new categories

```
>>> c.rename_categories(lambda x: x.upper())
[A, A, B]
Categories (2, object): [A, B]
```

### 34.8.1.2 pandas.CategoricalIndex.reorder\_categories

`CategoricalIndex.reorder_categories(*args, **kwargs)`

Reorders categories as specified in `new_categories`.

`new_categories` need to include all old categories and no new category items.

**Parameters** `new_categories` : Index-like

The categories in new order.

**ordered** : boolean, optional

Whether or not the categorical is treated as a ordered categorical. If not given, do not change the ordered information.

**inplace** : boolean (default: False)

Whether or not to reorder the categories inplace or return a copy of this categorical with reordered categories.

**Returns**

**cat** [Categorical with reordered categories or None if inplace.]

**Raises** `ValueError`

If the new categories do not contain all old category items or any new ones

**See also:**

`rename_categories`, `add_categories`, `remove_categories`,  
`remove_unused_categories`, `set_categories`

### 34.8.1.3 pandas.CategoricalIndex.add\_categories

`CategoricalIndex.add_categories(*args, **kwargs)`

Add new categories.

*new\_categories* will be included at the last/highest place in the categories and will be unused directly after this call.

**Parameters** **new\_categories** : category or list-like of category

The new categories to be included.

**inplace** : boolean (default: False)

Whether or not to add the categories inplace or return a copy of this categorical with added categories.

**Returns**

**cat** [Categorical with new categories added or None if inplace.]

**Raises** **ValueError**

If the new categories include old categories or do not validate as categories

**See also:**

*rename\_categories*, *reorder\_categories*, *remove\_categories*,  
*remove\_unused\_categories*, *set\_categories*

#### 34.8.1.4 pandas.CategoricalIndex.remove\_categories

`CategoricalIndex.remove_categories(*args, **kwargs)`

Removes the specified categories.

*removals* must be included in the old categories. Values which were in the removed categories will be set to NaN

**Parameters** **removals** : category or list of categories

The categories which should be removed.

**inplace** : boolean (default: False)

Whether or not to remove the categories inplace or return a copy of this categorical with removed categories.

**Returns**

**cat** [Categorical with removed categories or None if inplace.]

**Raises** **ValueError**

If the removals are not contained in the categories

**See also:**

*rename\_categories*, *reorder\_categories*, *add\_categories*,  
*remove\_unused\_categories*, *set\_categories*

#### 34.8.1.5 pandas.CategoricalIndex.remove\_unused\_categories

`CategoricalIndex.remove_unused_categories(*args, **kwargs)`

Removes categories which are not used.

**Parameters** **inplace** : boolean (default: False)

Whether or not to drop unused categories inplace or return a copy of this categorical with unused categories dropped.

**Returns**

**cat** [Categorical with unused categories dropped or None if inplace.]

**See also:**

*rename\_categories*, *reorder\_categories*, *add\_categories*, *remove\_categories*, *set\_categories*

**34.8.1.6 pandas.CategoricalIndex.set\_categories**

`CategoricalIndex.set_categories(*args, **kwargs)`

Sets the categories to the specified new\_categories.

*new\_categories* can include new categories (which will result in unused categories) or remove old categories (which results in values set to NaN). If *rename==True*, the categories will simply be renamed (less or more items than in old categories will result in values set to NaN or in unused categories respectively).

This method can be used to perform more than one action of adding, removing, and reordering simultaneously and is therefore faster than performing the individual steps via the more specialised methods.

On the other hand this method does not do checks (e.g., whether the old categories are included in the new categories on a reorder), which can result in surprising changes, for example when using special string dtypes on python3, which does not consider a S1 string equal to a single char python string.

**Parameters** *new\_categories* : Index-like

The categories in new order.

**ordered** : boolean, (default: False)

Whether or not the categorical is treated as an ordered categorical. If not given, do not change the ordered information.

**rename** : boolean (default: False)

Whether or not the *new\_categories* should be considered as a rename of the old categories or as reordered categories.

**inplace** : boolean (default: False)

Whether or not to reorder the categories inplace or return a copy of this categorical with reordered categories.

**Returns**

**cat** [Categorical with reordered categories or None if inplace.]

**Raises** `ValueError`

If *new\_categories* does not validate as categories

**See also:**

*rename\_categories*, *reorder\_categories*, *add\_categories*, *remove\_categories*, *remove\_unused\_categories*

**34.8.1.7 pandas.CategoricalIndex.as\_ordered**

`CategoricalIndex.as_ordered(*args, **kwargs)`

Sets the Categorical to be ordered

**Parameters** *inplace* : boolean (default: False)

Whether or not to set the ordered attribute inplace or return a copy of this categorical with ordered set to True

#### 34.8.1.8 pandas.CategoricalIndex.as\_unordered

`CategoricalIndex.as_unordered(*args, **kwargs)`

Sets the Categorical to be unordered

**Parameters** `inplace` : boolean (default: False)

Whether or not to set the ordered attribute inplace or return a copy of this categorical with ordered set to False

#### 34.8.1.9 pandas.CategoricalIndex.map

`CategoricalIndex.map(mapper)`

Map values using input correspondence (a dict, Series, or function).

Maps the values (their categories, not the codes) of the index to new categories. If the mapping correspondence is one-to-one the result is a `CategoricalIndex` which has the same order property as the original, otherwise an `Index` is returned.

If a `dict` or `Series` is used any unmapped category is mapped to `NaN`. Note that if this happens an `Index` will be returned.

**Parameters** `mapper` : function, dict, or Series

Mapping correspondence.

**Returns** `pandas.CategoricalIndex` or `pandas.Index`

Mapped index.

See also:

**`Index.map`** Apply a mapping correspondence on an `Index`.

**`Series.map`** Apply a mapping correspondence on a `Series`.

**`Series.apply`** Apply more complex functions on a `Series`.

#### Examples

```
>>> idx = pd.CategoricalIndex(['a', 'b', 'c'])
>>> idx
CategoricalIndex(['a', 'b', 'c'], categories=['a', 'b', 'c'],
                  ordered=False, dtype='category')
>>> idx.map(lambda x: x.upper())
CategoricalIndex(['A', 'B', 'C'], categories=['A', 'B', 'C'],
                  ordered=False, dtype='category')
>>> idx.map({'a': 'first', 'b': 'second', 'c': 'third'})
CategoricalIndex(['first', 'second', 'third'], categories=['first',
                  'second', 'third'], ordered=False, dtype='category')
```

If the mapping is one-to-one the ordering of the categories is preserved:

```
>>> idx = pd.CategoricalIndex(['a', 'b', 'c'], ordered=True)
>>> idx
CategoricalIndex(['a', 'b', 'c'], categories=['a', 'b', 'c'],
                  ordered=True, dtype='category')
>>> idx.map({'a': 3, 'b': 2, 'c': 1})
CategoricalIndex([3, 2, 1], categories=[3, 2, 1], ordered=True,
                  dtype='category')
```

If the mapping is not one-to-one an *Index* is returned:

```
>>> idx.map({'a': 'first', 'b': 'second', 'c': 'first'})
Index(['first', 'second', 'first'], dtype='object')
```

If a *dict* is used, all unmapped categories are mapped to *NaN* and the result is an *Index*:

```
>>> idx.map({'a': 'first', 'b': 'second'})
Index(['first', 'second', nan], dtype='object')
```

## 34.8.2 Categorical Components

<i>CategoricalIndex.codes</i>	
<i>CategoricalIndex.categories</i>	
<i>CategoricalIndex.ordered</i>	
<i>CategoricalIndex.rename_categories(*args, ...)</i>	Renames categories.
<i>CategoricalIndex.reorder_categories(*args, ...)</i>	Reorders categories as specified in <i>new_categories</i> .
<i>CategoricalIndex.add_categories(*args, **kwargs)</i>	Add new categories.
<i>CategoricalIndex.remove_categories(*args, ...)</i>	Removes the specified categories.
<i>CategoricalIndex.remove_unused_categories(...)</i>	Removes categories which are not used.
<i>CategoricalIndex.set_categories(*args, **kwargs)</i>	Sets the categories to the specified <i>new_categories</i> .
<i>CategoricalIndex.as_ordered(*args, **kwargs)</i>	Sets the Categorical to be ordered
<i>CategoricalIndex.as_unordered(*args, **kwargs)</i>	Sets the Categorical to be unordered
<i>CategoricalIndex.map(mapper)</i>	Map values using input correspondence (a dict, Series, or function).

### 34.8.2.1 pandas.CategoricalIndex.codes

*CategoricalIndex.codes*

### 34.8.2.2 pandas.CategoricalIndex.categories

*CategoricalIndex.categories*

### 34.8.2.3 pandas.CategoricalIndex.ordered

CategoricalIndex.ordered

## 34.9 IntervalIndex

---

*IntervalIndex*

Immutable Index implementing an ordered, sliceable set.

---

### 34.9.1 pandas.IntervalIndex

**class** pandas.IntervalIndex

Immutable Index implementing an ordered, sliceable set. IntervalIndex represents an Index of Interval objects that are all closed on the same side.

New in version 0.20.0.

**Warning:** The indexing behaviors are provisional and may change in a future version of pandas.

**Parameters** **data** : array-like (1-dimensional)

Array-like containing Interval objects from which to build the IntervalIndex

**closed** : { 'left', 'right', 'both', 'neither' }, default 'right'

Whether the intervals are closed on the left-side, right-side, both or neither.

**name** : object, optional

Name to be stored in the index.

**copy** : boolean, default False

Copy the meta-data

**dtype** : dtype or None, default None

If None, dtype will be inferred

New in version 0.23.0.

**See also:**

**Index** The base pandas Index type

**Interval** A bounded slice-like interval; the elements of an IntervalIndex

**interval\_range** Function to create a fixed frequency IntervalIndex

*cut, qcut*

### Notes

See the [user guide](#) for more.

## Examples

A new `IntervalIndex` is typically constructed using `interval_range()`:

```
>>> pd.interval_range(start=0, end=5)
IntervalIndex([(0, 1], (1, 2], (2, 3], (3, 4], (4, 5]]
              closed='right', dtype='interval[int64]')
```

It may also be constructed using one of the constructor methods: `IntervalIndex.from_arrays()`, `IntervalIndex.from_breaks()`, and `IntervalIndex.from_tuples()`.

See further examples in the doc strings of `interval_range` and the mentioned constructor methods.

## Attributes

<code>closed</code>	Whether the intervals are closed on the left-side, right-side, both or neither
<code>is_non_overlapping_monotonic</code>	Return True if the <code>IntervalIndex</code> is non-overlapping (no Intervals share points) and is either monotonic increasing or monotonic decreasing, else False
<code>left</code>	Return the left endpoints of each Interval in the <code>IntervalIndex</code> as an Index
<code>length</code>	Return an Index with entries denoting the length of each Interval in the <code>IntervalIndex</code>
<code>mid</code>	Return the midpoint of each Interval in the <code>IntervalIndex</code> as an Index
<code>right</code>	Return the right endpoints of each Interval in the <code>IntervalIndex</code> as an Index
<code>values</code>	Return the <code>IntervalIndex</code> 's data as a numpy array of Interval objects (with dtype='object')

### 34.9.1.1 pandas.IntervalIndex.closed

`IntervalIndex.closed`

Whether the intervals are closed on the left-side, right-side, both or neither

### 34.9.1.2 pandas.IntervalIndex.is\_non\_overlapping\_monotonic

`IntervalIndex.is_non_overlapping_monotonic`

Return True if the `IntervalIndex` is non-overlapping (no Intervals share points) and is either monotonic increasing or monotonic decreasing, else False

### 34.9.1.3 pandas.IntervalIndex.left

`IntervalIndex.left`

Return the left endpoints of each Interval in the `IntervalIndex` as an Index

#### 34.9.1.4 pandas.IntervalIndex.length

`IntervalIndex.length`

Return an Index with entries denoting the length of each Interval in the IntervalIndex

#### 34.9.1.5 pandas.IntervalIndex.mid

`IntervalIndex.mid`

Return the midpoint of each Interval in the IntervalIndex as an Index

#### 34.9.1.6 pandas.IntervalIndex.right

`IntervalIndex.right`

Return the right endpoints of each Interval in the IntervalIndex as an Index

#### 34.9.1.7 pandas.IntervalIndex.values

`IntervalIndex.values`

Return the IntervalIndex's data as a numpy array of Interval objects (with dtype='object')

### Methods

<code>contains(key)</code>	Return a boolean indicating if the key is IN the index
<code>from_arrays(left, right[, closed, name, ...])</code>	Construct from two arrays defining the left and right bounds.
<code>from_breaks(breaks[, closed, name, copy, dtype])</code>	Construct an IntervalIndex from an array of splits
<code>from_tuples(data[, closed, name, copy, dtype])</code>	Construct an IntervalIndex from a list/array of tuples
<code>get_indexer(target[, method, limit, tolerance])</code>	Compute indexer and mask for new index given the current index.
<code>get_loc(key[, method])</code>	Get integer location, slice or boolean mask for requested label.

#### 34.9.1.8 pandas.IntervalIndex.contains

`IntervalIndex.contains(key)`

Return a boolean indicating if the key is IN the index

We accept / allow keys to be not *just* actual objects.

##### Parameters

**key** [int, float, Interval]

##### Returns

**boolean**

### 34.9.1.9 pandas.IntervalIndex.from\_arrays

**classmethod** `IntervalIndex.from_arrays` (*left*, *right*, *closed*='right', *name*=None, *copy*=False, *dtype*=None)

Construct from two arrays defining the left and right bounds.

**Parameters** *left* : array-like (1-dimensional)

Left bounds for each interval.

*right* : array-like (1-dimensional)

Right bounds for each interval.

*closed* : {'left', 'right', 'both', 'neither'}, default 'right'

Whether the intervals are closed on the left-side, right-side, both or neither.

*name* : object, optional

Name to be stored in the index.

*copy* : boolean, default False

Copy the data.

*dtype* : dtype, optional

If None, dtype will be inferred.

New in version 0.23.0.

#### Returns

**index** [IntervalIndex]

#### Raises ValueError

When a value is missing in only one of *left* or *right*. When a value in *left* is greater than the corresponding value in *right*.

See also:

[\*interval\\_range\*](#) Function to create a fixed frequency IntervalIndex.

[\*IntervalIndex.from\\_breaks\*](#) Construct an IntervalIndex from an array of splits.

[\*IntervalIndex.from\\_tuples\*](#) Construct an IntervalIndex from a list/array of tuples.

#### Notes

Each element of *left* must be less than or equal to the *right* element at the same position. If an element is missing, it must be missing in both *left* and *right*. A `TypeError` is raised when using an unsupported type for *left* or *right*. At the moment, 'category', 'object', and 'string' subtypes are not supported.

#### Examples

```
>>> pd.IntervalIndex.from_arrays([0, 1, 2], [1, 2, 3])
IntervalIndex([(0, 1], (1, 2], (2, 3])
              closed='right',
              dtype='interval[int64]')
```

If you want to segment different groups of people based on ages, you can apply the method as follows:

```
>>> ages = pd.IntervalIndex.from_arrays([0, 2, 13],
...                                     [2, 13, 19], closed='left')
>>> ages
IntervalIndex([[0, 2), [2, 13), [13, 19)]
              closed='left',
              dtype='interval[int64]')
>>> s = pd.Series(['baby', 'kid', 'teen'], ages)
>>> s
[0, 2)      baby
[2, 13)     kid
[13, 19)    teen
dtype: object
```

Values may be missing, but they must be missing in both arrays.

```
>>> pd.IntervalIndex.from_arrays([0, np.nan, 13],
...                               [2, np.nan, 19])
IntervalIndex([(0.0, 2.0], nan, (13.0, 19.0])
              closed='right',
              dtype='interval[float64]')
```

#### 34.9.1.10 pandas.IntervalIndex.from\_breaks

**classmethod** `IntervalIndex.from_breaks` (*breaks*, *closed='right'*, *name=None*, *copy=False*, *dtype=None*)

Construct an IntervalIndex from an array of splits

**Parameters** *breaks* : array-like (1-dimensional)

Left and right bounds for each interval.

**closed** : {'left', 'right', 'both', 'neither'}, default 'right'

Whether the intervals are closed on the left-side, right-side, both or neither.

**name** : object, optional

Name to be stored in the index.

**copy** : boolean, default False

copy the data

**dtype** : dtype or None, default None

If None, dtype will be inferred

New in version 0.23.0.

**See also:**

[`interval\_range`](#) Function to create a fixed frequency IntervalIndex

[`IntervalIndex.from\_arrays`](#) Construct an IntervalIndex from a left and right array

[`IntervalIndex.from\_tuples`](#) Construct an IntervalIndex from a list/array of tuples

## Examples

```
>>> pd.IntervalIndex.from_breaks([0, 1, 2, 3])
IntervalIndex([(0, 1], (1, 2], (2, 3])
              closed='right',
              dtype='interval[int64]')
```

### 34.9.1.11 pandas.IntervalIndex.from\_tuples

**classmethod** `IntervalIndex.from_tuples` (*data*, *closed*='right', *name*=None, *copy*=False, *dtype*=None)

Construct an IntervalIndex from a list/array of tuples

**Parameters** **data** : array-like (1-dimensional)

Array of tuples

**closed** : {'left', 'right', 'both', 'neither'}, default 'right'

Whether the intervals are closed on the left-side, right-side, both or neither.

**name** : object, optional

Name to be stored in the index.

**copy** : boolean, default False

by-default copy the data, this is compat only and ignored

**dtype** : dtype or None, default None

If None, dtype will be inferred

New in version 0.23.0.

See also:

[`interval\_range`](#) Function to create a fixed frequency IntervalIndex

[`IntervalIndex.from\_arrays`](#) Construct an IntervalIndex from a left and right array

[`IntervalIndex.from\_breaks`](#) Construct an IntervalIndex from an array of splits

## Examples

```
>>> pd.IntervalIndex.from_tuples([(0, 1), (1, 2)])
IntervalIndex([(0, 1], (1, 2]),
              closed='right', dtype='interval[int64]')
```

### 34.9.1.12 pandas.IntervalIndex.get\_indexer

`IntervalIndex.get_indexer` (*target*, *method*=None, *limit*=None, *tolerance*=None)

Compute indexer and mask for new index given the current index. The indexer should be then used as an input to `ndarray.take` to align the current data to the new index.

**Parameters**

**target** [IntervalIndex or list of Intervals]

**method** : {None, 'pad'/'ffill', 'backfill'/'bfill', 'nearest'}, optional

- default: exact matches only.
- pad / ffill: find the PREVIOUS index value if no exact match.
- backfill / bfill: use NEXT index value if no exact match
- nearest: use the NEAREST index value if no exact match. Tied distances are broken by preferring the larger index value.

**limit** : int, optional

Maximum number of consecutive labels in `target` to match for inexact matches.

**tolerance** : optional

Maximum distance between original and new labels for inexact matches. The values of the index at the matching locations most satisfy the equation  $\text{abs}(\text{index}[\text{indexer}] - \text{target}) \leq \text{tolerance}$ .

Tolerance may be a scalar value, which applies the same tolerance to all values, or list-like, which applies variable tolerance per element. List-like includes list, tuple, array, Series, and must be the same size as the index and its dtype must exactly match the index's type.

New in version 0.21.0: (list-like tolerance)

**Returns** **indexer** : ndarray of int

Integers from 0 to `n - 1` indicating that the index at these positions matches the corresponding target values. Missing values in the target are marked by -1.

## Examples

```
>>> indexer = index.get_indexer(new_index)
>>> new_values = cur_values.take(indexer)
```

### 34.9.1.13 pandas.IntervalIndex.get\_loc

`IntervalIndex.get_loc` (*key*, *method=None*)

Get integer location, slice or boolean mask for requested label.

**Parameters**

**key** [label]

**method** : {None}, optional

- default: matches where the label is within an interval only.

**Returns**

**loc** [int if unique index, slice if monotonic index, else mask]

## Examples

```
>>> i1, i2 = pd.Interval(0, 1), pd.Interval(1, 2)
>>> index = pd.IntervalIndex([i1, i2])
>>> index.get_loc(1)
0
```

You can also supply an interval or an location for a point inside an interval.

```
>>> index.get_loc(pd.Interval(0, 2))
array([0, 1], dtype=int64)
>>> index.get_loc(1.5)
1
```

If a label is in several intervals, you get the locations of all the relevant intervals.

```
>>> i3 = pd.Interval(0, 2)
>>> overlapping_index = pd.IntervalIndex([i2, i3])
>>> overlapping_index.get_loc(1.5)
array([0, 1], dtype=int64)
```

### 34.9.2 IntervalIndex Components

<code>IntervalIndex.from_arrays(left, right[, ...])</code>	Construct from two arrays defining the left and right bounds.
<code>IntervalIndex.from_tuples(data[, closed, ...])</code>	Construct an IntervalIndex from a list/array of tuples
<code>IntervalIndex.from_breaks(breaks[, closed, ...])</code>	Construct an IntervalIndex from an array of splits
<code>IntervalIndex.contains(key)</code>	Return a boolean indicating if the key is IN the index
<code>IntervalIndex.left</code>	Return the left endpoints of each Interval in the IntervalIndex as an Index
<code>IntervalIndex.right</code>	Return the right endpoints of each Interval in the IntervalIndex as an Index
<code>IntervalIndex.mid</code>	Return the midpoint of each Interval in the IntervalIndex as an Index
<code>IntervalIndex.closed</code>	Whether the intervals are closed on the left-side, right-side, both or neither
<code>IntervalIndex.length</code>	Return an Index with entries denoting the length of each Interval in the IntervalIndex
<code>IntervalIndex.values</code>	Return the IntervalIndex's data as a numpy array of Interval objects (with dtype='object')
<code>IntervalIndex.is_non_overlapping_monotonic</code>	Return True if the IntervalIndex is non-overlapping (no Intervals share points) and is either monotonic increasing or monotonic decreasing, else False
<code>IntervalIndex.get_loc(key[, method])</code>	Get integer location, slice or boolean mask for requested label.
<code>IntervalIndex.get_indexer(target[, method, ...])</code>	Compute indexer and mask for new index given the current index.

## 34.10 MultiIndex

---

*MultiIndex*A multi-level, or hierarchical, index object for pandas objects

---

### 34.10.1 pandas.MultiIndex

**class** pandas.**MultiIndex**

A multi-level, or hierarchical, index object for pandas objects

**Parameters** **levels** : sequence of arrays

The unique labels for each level

**labels** : sequence of arrays

Integers for each level designating which label at each location

**sortorder** : optional int

Level of sortedness (must be lexicographically sorted by that level)

**names** : optional sequence of objects

Names for each of the index levels. (name is accepted for compat)

**copy** : boolean, default False

Copy the meta-data

**verify\_integrity** : boolean, default True

Check that the levels/labels are consistent and valid

**See also:***MultiIndex.from\_arrays* Convert list of arrays to MultiIndex*MultiIndex.from\_product* Create a MultiIndex from the cartesian product of iterables*MultiIndex.from\_tuples* Convert list of tuples to a MultiIndex*Index* The base pandas Index type

#### Notes

See the [user guide](#) for more.

#### Examples

A new MultiIndex is typically constructed using one of the helper methods *MultiIndex.from\_arrays()*, *MultiIndex.from\_product()* and *MultiIndex.from\_tuples()*. For example (using *.from\_arrays()*):

```
>>> arrays = [[1, 1, 2, 2], ['red', 'blue', 'red', 'blue']]
>>> pd.MultiIndex.from_arrays(arrays, names=('number', 'color'))
MultiIndex(levels=[[1, 2], ['blue', 'red']],
```

(continues on next page)

(continued from previous page)

```
labels=[[0, 0, 1, 1], [1, 0, 1, 0]],
names=['number', 'color'])
```

See further examples for how to construct a MultiIndex in the doc strings of the mentioned helper methods.

## Attributes

<i>names</i>	Names of levels in MultiIndex
<i>nlevels</i>	Integer number of levels in this MultiIndex.
<i>levshape</i>	A tuple with the length of each level.

### 34.10.1.1 pandas.MultiIndex.names

`MultiIndex.names`  
Names of levels in MultiIndex

### 34.10.1.2 pandas.MultiIndex.nlevels

`MultiIndex.nlevels`  
Integer number of levels in this MultiIndex.

### 34.10.1.3 pandas.MultiIndex.levshape

`MultiIndex.levshape`  
A tuple with the length of each level.

<b>levels</b>	
<b>labels</b>	

## Methods

<i>from_arrays</i> (arrays[, sortorder, names])	Convert arrays to MultiIndex
<i>from_tuples</i> (tuples[, sortorder, names])	Convert list of tuples to MultiIndex
<i>from_product</i> (iterables[, sortorder, names])	Make a MultiIndex from the cartesian product of multiple iterables
<i>set_levels</i> (levels[, level, inplace, ...])	Set new levels on MultiIndex.
<i>set_labels</i> (labels[, level, inplace, ...])	Set new labels on MultiIndex.
<i>to_hierarchical</i> (n_repeat[, n_shuffle])	Return a MultiIndex reshaped to conform to the shapes given by <code>n_repeat</code> and <code>n_shuffle</code> .
<i>to_frame</i> ([index])	Create a DataFrame with the levels of the MultiIndex as columns.
<i>is_lexsorted</i> ()	Return True if the labels are lexicographically sorted
<i>sortlevel</i> ([level, ascending, sort_remaining])	Sort MultiIndex at the requested level.
<i>droplevel</i> ([level])	Return Index with requested level removed.
<i>swaplevel</i> ([i, j])	Swap level <code>i</code> with level <code>j</code> .
<i>reorder_levels</i> (order)	Rearrange levels using input order.

Continued on next page

Table 118 – continued from previous page

---

<code>remove_unused_levels()</code>	create a new MultiIndex from the current that removing unused levels, meaning that they are not expressed in the labels
-------------------------------------	---

---

#### 34.10.1.4 `pandas.MultiIndex.from_arrays`

**classmethod** `MultiIndex.from_arrays` (*arrays, sortorder=None, names=None*)

Convert arrays to MultiIndex

**Parameters** `arrays` : list / sequence of array-likes

Each array-like gives one level's value for each data point. `len(arrays)` is the number of levels.

**sortorder** : int or None

Level of sortedness (must be lexicographically sorted by that level)

**Returns**

**index** [MultiIndex]

**See also:**

*`MultiIndex.from_tuples`* Convert list of tuples to MultiIndex

*`MultiIndex.from_product`* Make a MultiIndex from cartesian product of iterables

#### Examples

```
>>> arrays = [[1, 1, 2, 2], ['red', 'blue', 'red', 'blue']]
>>> MultiIndex.from_arrays(arrays, names=('number', 'color'))
```

#### 34.10.1.5 `pandas.MultiIndex.from_tuples`

**classmethod** `MultiIndex.from_tuples` (*tuples, sortorder=None, names=None*)

Convert list of tuples to MultiIndex

**Parameters** `tuples` : list / sequence of tuple-likes

Each tuple is the index of one row/column.

**sortorder** : int or None

Level of sortedness (must be lexicographically sorted by that level)

**Returns**

**index** [MultiIndex]

**See also:**

*`MultiIndex.from_arrays`* Convert list of arrays to MultiIndex

*`MultiIndex.from_product`* Make a MultiIndex from cartesian product of iterables

## Examples

```
>>> tuples = [(1, u'red'), (1, u'blue'),
               (2, u'red'), (2, u'blue')]
>>> MultiIndex.from_tuples(tuples, names=('number', 'color'))
```

### 34.10.1.6 pandas.MultiIndex.from\_product

**classmethod** `MultiIndex.from_product` (*iterables, sortorder=None, names=None*)

Make a MultiIndex from the cartesian product of multiple iterables

**Parameters** `iterables` : list / sequence of iterables

Each iterable has unique labels for each level of the index.

`sortorder` : int or None

Level of sortedness (must be lexicographically sorted by that level).

`names` : list / sequence of strings or None

Names for the levels in the index.

**Returns**

`index` [MultiIndex]

See also:

[`MultiIndex.from\_arrays`](#) Convert list of arrays to MultiIndex

[`MultiIndex.from\_tuples`](#) Convert list of tuples to MultiIndex

## Examples

```
>>> numbers = [0, 1, 2]
>>> colors = [u'green', u'purple']
>>> MultiIndex.from_product([numbers, colors],
                             names=['number', 'color'])
MultiIndex(levels=[[0, 1, 2], [u'green', u'purple']],
            labels=[[0, 0, 1, 1, 2, 2], [0, 1, 0, 1, 0, 1]],
            names=[u'number', u'color'])
```

### 34.10.1.7 pandas.MultiIndex.set\_levels

`MultiIndex.set_levels` (*levels, level=None, inplace=False, verify\_integrity=True*)

Set new levels on MultiIndex. Defaults to returning new index.

**Parameters** `levels` : sequence or list of sequence

new level(s) to apply

`level` : int, level name, or sequence of int/level names (default None)

level(s) to set (None for all levels)

`inplace` : bool

if True, mutates in place

**verify\_integrity** : bool (default True)

if True, checks that levels and labels are compatible

#### Returns

**new index (of same type and class...etc)**

### Examples

```
>>> idx = MultiIndex.from_tuples([(1, u'one'), (1, u'two'),
                                (2, u'one'), (2, u'two')],
                                names=['foo', 'bar'])
>>> idx.set_levels(['a', 'b'], [1, 2])
MultiIndex(levels=[[u'a', u'b'], [1, 2]],
            labels=[[0, 0, 1, 1], [0, 1, 0, 1]],
            names=[u'foo', u'bar'])
>>> idx.set_levels(['a', 'b'], level=0)
MultiIndex(levels=[[u'a', u'b'], [u'one', u'two']],
            labels=[[0, 0, 1, 1], [0, 1, 0, 1]],
            names=[u'foo', u'bar'])
>>> idx.set_levels(['a', 'b'], level='bar')
MultiIndex(levels=[[1, 2], [u'a', u'b']],
            labels=[[0, 0, 1, 1], [0, 1, 0, 1]],
            names=[u'foo', u'bar'])
>>> idx.set_levels(['a', 'b'], [1, 2], level=[0, 1])
MultiIndex(levels=[[u'a', u'b'], [1, 2]],
            labels=[[0, 0, 1, 1], [0, 1, 0, 1]],
            names=[u'foo', u'bar'])
```

#### 34.10.1.8 pandas.MultiIndex.set\_labels

`MultiIndex.set_labels` (*labels*, *level=None*, *inplace=False*, *verify\_integrity=True*)

Set new labels on MultiIndex. Defaults to returning new index.

**Parameters** **labels** : sequence or list of sequence

new labels to apply

**level** : int, level name, or sequence of int/level names (default None)

level(s) to set (None for all levels)

**inplace** : bool

if True, mutates in place

**verify\_integrity** : bool (default True)

if True, checks that levels and labels are compatible

#### Returns

**new index (of same type and class...etc)**

## Examples

```
>>> idx = MultiIndex.from_tuples([(1, u'one'), (1, u'two'),
                                (2, u'one'), (2, u'two')],
                                names=['foo', 'bar'])
>>> idx.set_labels([[1,0,1,0], [0,0,1,1]])
MultiIndex(levels=[[1, 2], [u'one', u'two']],
            labels=[[1, 0, 1, 0], [0, 0, 1, 1]],
            names=[u'foo', u'bar'])
>>> idx.set_labels([1,0,1,0], level=0)
MultiIndex(levels=[[1, 2], [u'one', u'two']],
            labels=[[1, 0, 1, 0], [0, 1, 0, 1]],
            names=[u'foo', u'bar'])
>>> idx.set_labels([0,0,1,1], level='bar')
MultiIndex(levels=[[1, 2], [u'one', u'two']],
            labels=[[0, 0, 1, 1], [0, 0, 1, 1]],
            names=[u'foo', u'bar'])
>>> idx.set_labels([[1,0,1,0], [0,0,1,1]], level=[0,1])
MultiIndex(levels=[[1, 2], [u'one', u'two']],
            labels=[[1, 0, 1, 0], [0, 0, 1, 1]],
            names=[u'foo', u'bar'])
```

### 34.10.1.9 pandas.MultiIndex.to\_hierarchical

`MultiIndex.to_hierarchical(n_repeat, n_shuffle=1)`

Return a MultiIndex reshaped to conform to the shapes given by `n_repeat` and `n_shuffle`.

Useful to replicate and rearrange a MultiIndex for combination with another Index with `n_repeat` items.

**Parameters** `n_repeat` : int

Number of times to repeat the labels on self

`n_shuffle` : int

Controls the reordering of the labels. If the result is going to be an inner level in a MultiIndex, `n_shuffle` will need to be greater than one. The size of each label must be divisible by `n_shuffle`.

**Returns**

**MultiIndex**

## Examples

```
>>> idx = MultiIndex.from_tuples([(1, u'one'), (1, u'two'),
                                (2, u'one'), (2, u'two')])
>>> idx.to_hierarchical(3)
MultiIndex(levels=[[1, 2], [u'one', u'two']],
            labels=[[0, 0, 0, 0, 0, 0, 1, 1, 1, 1, 1, 1],
                   [0, 0, 0, 1, 1, 1, 0, 0, 0, 1, 1, 1]])
```

#### 34.10.1.10 pandas.MultiIndex.to\_frame

`MultiIndex.to_frame(index=True)`

Create a DataFrame with the levels of the MultiIndex as columns.

New in version 0.20.0.

**Parameters** `index` : boolean, default True

Set the index of the returned DataFrame as the original MultiIndex.

**Returns**

**DataFrame** [a DataFrame containing the original MultiIndex data.]

#### 34.10.1.11 pandas.MultiIndex.is\_lexsorted

`MultiIndex.is_lexsorted()`

Return True if the labels are lexicographically sorted

#### 34.10.1.12 pandas.MultiIndex.sortlevel

`MultiIndex.sortlevel(level=0, ascending=True, sort_remaining=True)`

Sort MultiIndex at the requested level. The result will respect the original ordering of the associated factor at that level.

**Parameters** `level` : list-like, int or str, default 0

If a string is given, must be a name of the level If list-like must be names or ints of levels.

**ascending** : boolean, default True

False to sort in descending order Can also be a list to specify a directed ordering

**sort\_remaining** [sort by the remaining levels after level.]

**Returns** `sorted_index` : pd.MultiIndex

Resulting index

**indexer** : np.ndarray

Indices of output values in original index

#### 34.10.1.13 pandas.MultiIndex.droplevel

`MultiIndex.droplevel(level=0)`

Return Index with requested level removed. If MultiIndex has only 2 levels, the result will be of Index type not MultiIndex.

**Parameters**

**level** [int/level name or list thereof]

**Returns**

**index** [Index or MultiIndex]

## Notes

Does not check if result index is unique or not

### 34.10.1.14 pandas.MultiIndex.swaplevel

`MultiIndex.swaplevel` (*i*=-2, *j*=-1)

Swap level *i* with level *j*.

Calling this method does not change the ordering of the values.

**Parameters** *i* : int, str, default -2

First level of index to be swapped. Can pass level name as string. Type of parameters can be mixed.

*j* : int, str, default -1

Second level of index to be swapped. Can pass level name as string. Type of parameters can be mixed.

**Returns** `MultiIndex`

A new `MultiIndex`

**.. versionchanged:: 0.18.1**

The indexes *i* and *j* are now optional, and default to the two innermost levels of the index.

**See also:**

[`Series.swaplevel`](#) Swap levels *i* and *j* in a `MultiIndex`

[`Dataframe.swaplevel`](#) Swap levels *i* and *j* in a `MultiIndex` on a particular axis

## Examples

```

>>> mi = pd.MultiIndex(levels=[['a', 'b'], ['bb', 'aa']],
...                     labels=[[0, 0, 1, 1], [0, 1, 0, 1]])
>>> mi
MultiIndex(levels=[['a', 'b'], ['bb', 'aa']],
            labels=[[0, 0, 1, 1], [0, 1, 0, 1]])
>>> mi.swaplevel(0, 1)
MultiIndex(levels=[['bb', 'aa'], ['a', 'b']],
            labels=[[0, 1, 0, 1], [0, 0, 1, 1]])

```

### 34.10.1.15 pandas.MultiIndex.reorder\_levels

`MultiIndex.reorder_levels` (*order*)

Rearrange levels using input order. May not drop or duplicate levels

### 34.10.1.16 pandas.MultiIndex.remove\_unused\_levels

`MultiIndex.remove_unused_levels()`

create a new MultiIndex from the current that removing unused levels, meaning that they are not expressed in the labels

The resulting MultiIndex will have the same outward appearance, meaning the same `.values` and ordering. It will also be `.equals()` to the original.

New in version 0.20.0.

#### Returns

**MultiIndex**

#### Examples

```
>>> i = pd.MultiIndex.from_product([range(2), list('ab')])
MultiIndex(levels=[[0, 1], ['a', 'b']],
            labels=[[0, 0, 1, 1], [0, 1, 0, 1]])
```

```
>>> i[2:]
MultiIndex(levels=[[0, 1], ['a', 'b']],
            labels=[[1, 1], [0, 1]])
```

The 0 from the first level is not represented and can be removed

```
>>> i[2:].remove_unused_levels()
MultiIndex(levels=[[1], ['a', 'b']],
            labels=[[0, 0], [0, 1]])
```

---

*IndexSlice*

Create an object to more easily perform multi-index slicing

---

## 34.10.2 pandas.IndexSlice

`pandas.IndexSlice = <pandas.core.indexing._IndexSlice object>`

Create an object to more easily perform multi-index slicing

#### Examples

```
>>> midx = pd.MultiIndex.from_product([['A0', 'A1'], ['B0', 'B1', 'B2', 'B3']])
>>> columns = ['foo', 'bar']
>>> dfmi = pd.DataFrame(np.arange(16).reshape((len(midx), len(columns))),
                        index=midx, columns=columns)
```

Using the default slice command:

```
>>> dfmi.loc[(slice(None), slice('B0', 'B1')), :]
      foo  bar
A0 B0    0    1
   B1    2    3
```

(continues on next page)

(continued from previous page)

A1	B0	8	9
	B1	10	11

Using the `IndexSlice` class for a more intuitive command:

```
>>> idx = pd.IndexSlice
>>> dfmi.loc[idx[:, 'B0':'B1'], :]
      foo  bar
A0 B0    0    1
   B1    2    3
A1 B0    8    9
   B1   10   11
```

### 34.10.3 MultiIndex Constructors

<code>MultiIndex.from_arrays(arrays[, ...])</code>	<code>sortorder</code>	Convert arrays to MultiIndex
<code>MultiIndex.from_tuples(tuples[, ...])</code>	<code>sortorder</code>	Convert list of tuples to MultiIndex
<code>MultiIndex.from_product(iterables[, ...])</code>		Make a MultiIndex from the cartesian product of multiple iterables

### 34.10.4 MultiIndex Attributes

<code>MultiIndex.names</code>	Names of levels in MultiIndex
<code>MultiIndex.levels</code>	
<code>MultiIndex.labels</code>	
<code>MultiIndex.nlevels</code>	Integer number of levels in this MultiIndex.
<code>MultiIndex.levshape</code>	A tuple with the length of each level.

#### 34.10.4.1 pandas.MultiIndex.levels

`MultiIndex.levels`

#### 34.10.4.2 pandas.MultiIndex.labels

`MultiIndex.labels`

### 34.10.5 MultiIndex Components

<code>MultiIndex.set_levels(levels[, level, ...])</code>	Set new levels on MultiIndex.
<code>MultiIndex.set_labels(labels[, level, ...])</code>	Set new labels on MultiIndex.
<code>MultiIndex.to_hierarchical(n_repeat[, n_shuffle])</code>	Return a MultiIndex reshaped to conform to the shapes given by <code>n_repeat</code> and <code>n_shuffle</code> .
<code>MultiIndex.to_frame([index])</code>	Create a DataFrame with the levels of the MultiIndex as columns.

Continued on next page

Table 122 – continued from previous page

<code>MultiIndex.is_lexsorted()</code>	Return True if the labels are lexicographically sorted
<code>MultiIndex.sortlevel([level, ascending, ...])</code>	Sort MultiIndex at the requested level.
<code>MultiIndex.droplevel([level])</code>	Return Index with requested level removed.
<code>MultiIndex.swaplevel([i, j])</code>	Swap level i with level j.
<code>MultiIndex.reorder_levels(order)</code>	Rearrange levels using input order.
<code>MultiIndex.remove_unused_levels()</code>	create a new MultiIndex from the current that removing unused levels, meaning that they are not expressed in the labels
<code>MultiIndex.unique([level])</code>	Return unique values in the index.

### 34.10.5.1 pandas.MultiIndex.unique

`MultiIndex.unique` (*level=None*)

Return unique values in the index. Uniques are returned in order of appearance, this does NOT sort.

**Parameters** `level` : int or str, optional, default None

Only return values from specified level (for MultiIndex)

New in version 0.23.0.

**Returns**

Index without duplicates

**See also:**

`unique`, `Series.unique`

## 34.10.6 MultiIndex Selecting

<code>MultiIndex.get_loc(key[, method])</code>	Get location for a label or a tuple of labels as an integer, slice or boolean mask.
<code>MultiIndex.get_indexer(target[, method, ...])</code>	Compute indexer and mask for new index given the current index.
<code>MultiIndex.get_level_values(level)</code>	Return vector of label values for requested level, equal to the length of the index.

### 34.10.6.1 pandas.MultiIndex.get\_loc

`MultiIndex.get_loc` (*key, method=None*)

Get location for a label or a tuple of labels as an integer, slice or boolean mask.

**Parameters**

**key** [label or tuple of labels (one for each level)]

**method** [None]

**Returns** `loc` : int, slice object or boolean mask

If the key is past the lexsort depth, the return may be a boolean mask array, otherwise it is always a slice or int.

**See also:**

`Index.get_loc` `get_loc` method for (single-level) index.

**MultiIndex.slice\_locs** Get slice location given start label(s) and end label(s).

**MultiIndex.get\_locs** Get location for a label/slice/list/mask or a sequence of such.

## Notes

The key cannot be a slice, list of same-level labels, a boolean mask, or a sequence of such. If you want to use those, use `MultiIndex.get_locs()` instead.

## Examples

```
>>> mi = pd.MultiIndex.from_arrays([list('abb'), list('def')])
```

```
>>> mi.get_loc('b')
slice(1, 3, None)
```

```
>>> mi.get_loc(('b', 'e'))
1
```

### 34.10.6.2 pandas.MultiIndex.get\_indexer

**MultiIndex.get\_indexer** (*target*, *method=None*, *limit=None*, *tolerance=None*)

Compute indexer and mask for new index given the current index. The indexer should be then used as an input to `ndarray.take` to align the current data to the new index.

#### Parameters

**target** [MultiIndex or list of tuples]

**method** : {None, 'pad'/'ffill', 'backfill'/'bfill', 'nearest'}, optional

- default: exact matches only.
- pad / ffill: find the PREVIOUS index value if no exact match.
- backfill / bfill: use NEXT index value if no exact match
- nearest: use the NEAREST index value if no exact match. Tied distances are broken by preferring the larger index value.

**limit** : int, optional

Maximum number of consecutive labels in *target* to match for inexact matches.

**tolerance** : optional

Maximum distance between original and new labels for inexact matches. The values of the index at the matching locations must satisfy the equation `abs(index[indexer] - target) <= tolerance`.

Tolerance may be a scalar value, which applies the same tolerance to all values, or list-like, which applies variable tolerance per element. List-like includes list, tuple, array, Series, and must be the same size as the index and its dtype must exactly match the index's type.

New in version 0.21.0: (list-like tolerance)

**Returns** **indexer** : ndarray of int

Integers from 0 to  $n - 1$  indicating that the index at these positions matches the corresponding target values. Missing values in the target are marked by -1.

### Examples

```
>>> indexer = index.get_indexer(new_index)
>>> new_values = cur_values.take(indexer)
```

#### 34.10.6.3 pandas.MultiIndex.get\_level\_values

`MultiIndex.get_level_values` (*level*)

Return vector of label values for requested level, equal to the length of the index.

**Parameters** *level* : int or str

*level* is either the integer position of the level in the MultiIndex, or the name of the level.

**Returns** *values* : Index

*values* is a level of this MultiIndex converted to a single *Index* (or subclass thereof).

### Examples

Create a MultiIndex:

```
>>> mi = pd.MultiIndex.from_arrays((list('abc'), list('def')))
>>> mi.names = ['level_1', 'level_2']
```

Get level values by supplying level as either integer or name:

```
>>> mi.get_level_values(0)
Index(['a', 'b', 'c'], dtype='object', name='level_1')
>>> mi.get_level_values('level_2')
Index(['d', 'e', 'f'], dtype='object', name='level_2')
```

## 34.11 DatetimeIndex

---

*DatetimeIndex*

Immutable ndarray of datetime64 data, represented internally as int64, and which can be boxed to Timestamp objects that are subclasses of datetime and carry meta-data such as frequency information.

---

### 34.11.1 pandas.DatetimeIndex

**class** pandas.DatetimeIndex

Immutable ndarray of datetime64 data, represented internally as int64, and which can be boxed to Timestamp objects that are subclasses of datetime and carry metadata such as frequency information.

**Parameters** *data* : array-like (1-dimensional), optional

Optional datetime-like data to construct index with

**copy** : bool

Make a copy of input ndarray

**freq** : string or pandas offset object, optional

One of pandas date offset strings or corresponding objects

**start** : starting value, datetime-like, optional

If data is None, start is used as the start point in generating regular timestamp data.

**periods** : int, optional, > 0

Number of periods to generate, if generating index. Takes precedence over end argument

**end** : end time, datetime-like, optional

If periods is none, generated index will extend to first conforming time on or just past end argument

**closed** : string or None, default None

Make the interval closed with respect to the given frequency to the 'left', 'right', or both sides (None)

**tz** [pytz.timezone or dateutil.tz.tzfile]

**ambiguous** : 'infer', bool-ndarray, 'NaT', default 'raise'

- 'infer' will attempt to infer fall dst-transition hours based on order
- bool-ndarray where True signifies a DST time, False signifies a non-DST time (note that this flag is only applicable for ambiguous times)
- 'NaT' will return NaT where there are ambiguous times
- 'raise' will raise an AmbiguousTimeError if there are ambiguous times

**name** : object

Name to be stored in the index

**dayfirst** : bool, default False

If True, parse dates in *data* with the day first order

**yearfirst** : bool, default False

If True parse dates in *data* with the year first order

See also:

**Index** The base pandas Index type

**TimedeltaIndex** Index of timedelta64 data

**PeriodIndex** Index of Period data

**pandas.to\_datetime** Convert argument to datetime

## Notes

To learn more about the frequency strings, please see [this link](#).

## Attributes

<i>year</i>	The year of the datetime
<i>month</i>	The month as January=1, December=12
<i>day</i>	The days of the datetime
<i>hour</i>	The hours of the datetime
<i>minute</i>	The minutes of the datetime
<i>second</i>	The seconds of the datetime
<i>microsecond</i>	The microseconds of the datetime
<i>nanosecond</i>	The nanoseconds of the datetime
<i>date</i>	Returns numpy array of python datetime.date objects (namely, the date part of Timestamps without time-zone information).
<i>time</i>	Returns numpy array of datetime.time.
<i>dayofyear</i>	The ordinal day of the year
<i>weekofyear</i>	The week ordinal of the year
<i>week</i>	The week ordinal of the year
<i>dayofweek</i>	The day of the week with Monday=0, Sunday=6
<i>weekday</i>	The day of the week with Monday=0, Sunday=6
<i>quarter</i>	The quarter of the date
<i>freq</i>	Return the frequency object if it is set, otherwise None
<i>freqstr</i>	Return the frequency object as a string if it is set, otherwise None
<i>is_month_start</i>	Logical indicating if first day of month (defined by frequency)
<i>is_month_end</i>	Indicator for whether the date is the last day of the month.
<i>is_quarter_start</i>	Indicator for whether the date is the first day of a quarter.
<i>is_quarter_end</i>	Indicator for whether the date is the last day of a quarter.
<i>is_year_start</i>	Indicate whether the date is the first day of a year.
<i>is_year_end</i>	Indicate whether the date is the last day of the year.
<i>is_leap_year</i>	Boolean indicator if the date belongs to a leap year.
<i>inferred_freq</i>	Tries to return a string representing a frequency guess, generated by infer_freq.

### 34.11.1.1 pandas.DatetimeIndex.year

DatetimeIndex.**year**

The year of the datetime

#### 34.11.1.2 pandas.DatetimeIndex.month

`DatetimeIndex.month`

The month as January=1, December=12

#### 34.11.1.3 pandas.DatetimeIndex.day

`DatetimeIndex.day`

The days of the datetime

#### 34.11.1.4 pandas.DatetimeIndex.hour

`DatetimeIndex.hour`

The hours of the datetime

#### 34.11.1.5 pandas.DatetimeIndex.minute

`DatetimeIndex.minute`

The minutes of the datetime

#### 34.11.1.6 pandas.DatetimeIndex.second

`DatetimeIndex.second`

The seconds of the datetime

#### 34.11.1.7 pandas.DatetimeIndex.microsecond

`DatetimeIndex.microsecond`

The microseconds of the datetime

#### 34.11.1.8 pandas.DatetimeIndex.nanosecond

`DatetimeIndex.nanosecond`

The nanoseconds of the datetime

#### 34.11.1.9 pandas.DatetimeIndex.date

`DatetimeIndex.date`

Returns numpy array of python datetime.date objects (namely, the date part of Timestamps without time-zone information).

#### 34.11.1.10 pandas.DatetimeIndex.time

`DatetimeIndex.time`

Returns numpy array of datetime.time. The time part of the Timestamps.

#### 34.11.1.11 pandas.DatetimeIndex.dayofyear

`DatetimeIndex.dayofyear`  
The ordinal day of the year

#### 34.11.1.12 pandas.DatetimeIndex.weekofyear

`DatetimeIndex.weekofyear`  
The week ordinal of the year

#### 34.11.1.13 pandas.DatetimeIndex.week

`DatetimeIndex.week`  
The week ordinal of the year

#### 34.11.1.14 pandas.DatetimeIndex.dayofweek

`DatetimeIndex.dayofweek`  
The day of the week with Monday=0, Sunday=6

#### 34.11.1.15 pandas.DatetimeIndex.weekday

`DatetimeIndex.weekday`  
The day of the week with Monday=0, Sunday=6

#### 34.11.1.16 pandas.DatetimeIndex.quarter

`DatetimeIndex.quarter`  
The quarter of the date

#### 34.11.1.17 pandas.DatetimeIndex.freq

`DatetimeIndex.freq`  
Return the frequency object if it is set, otherwise None

#### 34.11.1.18 pandas.DatetimeIndex.freqstr

`DatetimeIndex.freqstr`  
Return the frequency object as a string if it is set, otherwise None

#### 34.11.1.19 pandas.DatetimeIndex.is\_month\_start

`DatetimeIndex.is_month_start`  
Logical indicating if first day of month (defined by frequency)

### 34.11.1.20 pandas.DatetimeIndex.is\_month\_end

`DatetimeIndex.is_month_end`

Indicator for whether the date is the last day of the month.

**Returns Series or array**

For Series, returns a Series with boolean values. For DatetimeIndex, returns a boolean array.

**See also:**

[`is\_month\_start`](#) Indicator for whether the date is the first day of the month.

#### Examples

This method is available on Series with datetime values under the `.dt` accessor, and directly on `DatetimeIndex`.

```

>>> dates = pd.Series(pd.date_range("2018-02-27", periods=3))
>>> dates
0    2018-02-27
1    2018-02-28
2    2018-03-01
dtype: datetime64[ns]
>>> dates.dt.is_month_end
0    False
1     True
2    False
dtype: bool

```

```

>>> idx = pd.date_range("2018-02-27", periods=3)
>>> idx.is_month_end
array([False,  True, False], dtype=bool)

```

### 34.11.1.21 pandas.DatetimeIndex.is\_quarter\_start

`DatetimeIndex.is_quarter_start`

Indicator for whether the date is the first day of a quarter.

**Returns `is_quarter_start` : Series or DatetimeIndex**

The same type as the original data with boolean values. Series will have the same name and index. `DatetimeIndex` will have the same name.

**See also:**

[`quarter`](#) Return the quarter of the date.

[`is\_quarter\_end`](#) Similar property for indicating the quarter start.

#### Examples

This method is available on Series with datetime values under the `.dt` accessor, and directly on `DatetimeIndex`.

```
>>> df = pd.DataFrame({'dates': pd.date_range("2017-03-30",
...                                           periods=4)})
>>> df.assign(quarter=df.dates.dt.quarter,
...           is_quarter_start=df.dates.dt.is_quarter_start)
   dates      quarter  is_quarter_start
0 2017-03-30         1             False
1 2017-03-31         1             False
2 2017-04-01         2              True
3 2017-04-02         2             False
```

```
>>> idx = pd.date_range('2017-03-30', periods=4)
>>> idx
DatetimeIndex(['2017-03-30', '2017-03-31', '2017-04-01', '2017-04-02'],
              dtype='datetime64[ns]', freq='D')
```

```
>>> idx.is_quarter_start
array([False, False,  True, False])
```

### 34.11.1.22 pandas.DatetimeIndex.is\_quarter\_end

**DatetimeIndex.is\_quarter\_end**

Indicator for whether the date is the last day of a quarter.

**Returns is\_quarter\_end** : Series or DatetimeIndex

The same type as the original data with boolean values. Series will have the same name and index. DatetimeIndex will have the same name.

**See also:**

**quarter** Return the quarter of the date.

**is\_quarter\_start** Similar property indicating the quarter start.

### Examples

This method is available on Series with datetime values under the `.dt` accessor, and directly on `DatetimeIndex`.

```
>>> df = pd.DataFrame({'dates': pd.date_range("2017-03-30",
...                                           periods=4)})
>>> df.assign(quarter=df.dates.dt.quarter,
...           is_quarter_end=df.dates.dt.is_quarter_end)
   dates      quarter  is_quarter_end
0 2017-03-30         1             False
1 2017-03-31         1              True
2 2017-04-01         2             False
3 2017-04-02         2             False
```

```
>>> idx = pd.date_range('2017-03-30', periods=4)
>>> idx
DatetimeIndex(['2017-03-30', '2017-03-31', '2017-04-01', '2017-04-02'],
              dtype='datetime64[ns]', freq='D')
```

```
>>> idx.is_quarter_end
array([False,  True, False, False])
```

### 34.11.1.23 pandas.DatetimeIndex.is\_year\_start

`DatetimeIndex.is_year_start`

Indicate whether the date is the first day of a year.

#### Returns Series or DatetimeIndex

The same type as the original data with boolean values. Series will have the same name and index. DatetimeIndex will have the same name.

See also:

[`is\_year\_end`](#) Similar property indicating the last day of the year.

### Examples

This method is available on Series with datetime values under the `.dt` accessor, and directly on `DatetimeIndex`.

```
>>> dates = pd.Series(pd.date_range("2017-12-30", periods=3))
>>> dates
0    2017-12-30
1    2017-12-31
2    2018-01-01
dtype: datetime64[ns]
```

```
>>> dates.dt.is_year_start
0    False
1    False
2     True
dtype: bool
```

```
>>> idx = pd.date_range("2017-12-30", periods=3)
>>> idx
DatetimeIndex(['2017-12-30', '2017-12-31', '2018-01-01'],
              dtype='datetime64[ns]', freq='D')
```

```
>>> idx.is_year_start
array([False, False,  True])
```

### 34.11.1.24 pandas.DatetimeIndex.is\_year\_end

`DatetimeIndex.is_year_end`

Indicate whether the date is the last day of the year.

#### Returns Series or DatetimeIndex

The same type as the original data with boolean values. Series will have the same name and index. DatetimeIndex will have the same name.

See also:

*is\_year\_start* Similar property indicating the start of the year.

## Examples

This method is available on Series with datetime values under the `.dt` accessor, and directly on `DatetimeIndex`.

```
>>> dates = pd.Series(pd.date_range("2017-12-30", periods=3))
>>> dates
0    2017-12-30
1    2017-12-31
2    2018-01-01
dtype: datetime64[ns]
```

```
>>> dates.dt.is_year_end
0    False
1     True
2    False
dtype: bool
```

```
>>> idx = pd.date_range("2017-12-30", periods=3)
>>> idx
DatetimeIndex(['2017-12-30', '2017-12-31', '2018-01-01'],
              dtype='datetime64[ns]', freq='D')
```

```
>>> idx.is_year_end
array([False,  True, False])
```

### 34.11.1.25 pandas.DatetimeIndex.is\_leap\_year

`DatetimeIndex.is_leap_year`

Boolean indicator if the date belongs to a leap year.

A leap year is a year, which has 366 days (instead of 365) including 29th of February as an intercalary day. Leap years are years which are multiples of four with the exception of years divisible by 100 but not by 400.

#### Returns Series or ndarray

Booleans indicating if dates belong to a leap year.

## Examples

This method is available on Series with datetime values under the `.dt` accessor, and directly on `DatetimeIndex`.

```
>>> idx = pd.date_range("2012-01-01", "2015-01-01", freq="Y")
>>> idx
DatetimeIndex(['2012-12-31', '2013-12-31', '2014-12-31'],
              dtype='datetime64[ns]', freq='A-DEC')
>>> idx.is_leap_year
array([ True, False, False], dtype=bool)
```

```

>>> dates = pd.Series(idx)
>>> dates_series
0    2012-12-31
1    2013-12-31
2    2014-12-31
dtype: datetime64[ns]
>>> dates_series.dt.is_leap_year
0     True
1    False
2    False
dtype: bool

```

### 34.11.1.26 pandas.DatetimeIndex.inferred\_freq

#### DatetimeIndex.inferred\_freq

Tries to return a string representing a frequency guess, generated by `infer_freq`. Returns `None` if it can't autodetect the frequency.

tz	
----	--

#### Methods

<code>normalize()</code>	Convert times to midnight.
<code>strftime(date_format)</code>	Convert to Index using specified <code>date_format</code> .
<code>snap([freq])</code>	Snap time stamps to nearest occurring frequency
<code>tz_convert(tz)</code>	Convert tz-aware DatetimeIndex from one time zone to another.
<code>tz_localize(tz[, ambiguous, errors])</code>	Localize tz-naive DatetimeIndex to tz-aware DatetimeIndex.
<code>round(freq, *args, **kwargs)</code>	round the data to the specified <code>freq</code> .
<code>floor(freq)</code>	floor the data to the specified <code>freq</code> .
<code>ceil(freq)</code>	ceil the data to the specified <code>freq</code> .
<code>to_period([freq])</code>	Cast to PeriodIndex at a particular frequency.
<code>to_perioddelta(freq)</code>	Calculate TimedeltaIndex of difference between index values and index converted to periodIndex at specified freq.
<code>to_pydatetime()</code>	Return DatetimeIndex as object ndarray of date-time.datetime objects
<code>to_series([keep_tz, index, name])</code>	Create a Series with both index and values equal to the index keys useful with map for returning an indexer based on an index
<code>to_frame([index])</code>	Create a DataFrame with a column containing the Index.
<code>month_name([locale])</code>	Return the month names of the DateTimeIndex with specified locale.
<code>day_name([locale])</code>	Return the day names of the DateTimeIndex with specified locale.

### 34.11.1.27 pandas.DatetimeIndex.normalize

`DatetimeIndex.normalize()`

Convert times to midnight.

The time component of the date-time is converted to midnight i.e. 00:00:00. This is useful in cases, when the time does not matter. Length is unaltered. The timezones are unaffected.

This method is available on Series with datetime values under the `.dt` accessor, and directly on `DatetimeIndex`.

#### Returns `DatetimeIndex` or `Series`

The same type as the original data. Series will have the same name and index. `DatetimeIndex` will have the same name.

See also:

[`floor`](#) Floor the datetimes to the specified freq.

[`ceil`](#) Ceil the datetimes to the specified freq.

[`round`](#) Round the datetimes to the specified freq.

#### Examples

```
>>> idx = pd.DatetimeIndex(start='2014-08-01 10:00', freq='H',
...                        periods=3, tz='Asia/Calcutta')
>>> idx
DatetimeIndex(['2014-08-01 10:00:00+05:30',
               '2014-08-01 11:00:00+05:30',
               '2014-08-01 12:00:00+05:30'],
              dtype='datetime64[ns, Asia/Calcutta]', freq='H')
>>> idx.normalize()
DatetimeIndex(['2014-08-01 00:00:00+05:30',
               '2014-08-01 00:00:00+05:30',
               '2014-08-01 00:00:00+05:30'],
              dtype='datetime64[ns, Asia/Calcutta]', freq=None)
```

### 34.11.1.28 pandas.DatetimeIndex.strftime

`DatetimeIndex.strftime(date_format)`

Convert to Index using specified `date_format`.

Return an Index of formatted strings specified by `date_format`, which supports the same string format as the python standard library. Details of the string format can be found in [python string format doc](#)

**Parameters** `date_format`: str

Date format string (e.g. “%Y-%m-%d”).

**Returns** `Index`

Index of formatted strings

See also:

[`pandas.to\_datetime`](#) Convert the given argument to datetime

***DatetimeIndex.normalize*** Return DatetimeIndex with times to midnight.

***DatetimeIndex.round*** Round the DatetimeIndex to the specified freq.

***DatetimeIndex.floor*** Floor the DatetimeIndex to the specified freq.

## Examples

```
>>> rng = pd.date_range(pd.Timestamp("2018-03-10 09:00"),
...                      periods=3, freq='s')
>>> rng.strftime('%B %d, %Y, %r')
Index(['March 10, 2018, 09:00:00 AM', 'March 10, 2018, 09:00:01 AM',
       'March 10, 2018, 09:00:02 AM'],
      dtype='object')
```

### 34.11.1.29 pandas.DatetimeIndex.snap

**DatetimeIndex.snap** (*freq='S'*)

Snap time stamps to nearest occurring frequency

### 34.11.1.30 pandas.DatetimeIndex.tz\_convert

**DatetimeIndex.tz\_convert** (*tz*)

Convert tz-aware DatetimeIndex from one time zone to another.

**Parameters** *tz* : string, pytz.timezone, dateutil.tz.tzfile or None

Time zone for time. Corresponding timestamps would be converted to this time zone of the DatetimeIndex. A *tz* of None will convert to UTC and remove the timezone information.

**Returns**

**normalized** [DatetimeIndex]

**Raises** **TypeError**

If DatetimeIndex is tz-naive.

**See also:**

***DatetimeIndex.tz*** A timezone that has a variable offset from UTC

***DatetimeIndex.tz\_localize*** Localize tz-naive DatetimeIndex to a given time zone, or remove timezone from a tz-aware DatetimeIndex.

## Examples

With the *tz* parameter, we can change the DatetimeIndex to other time zones:

```
>>> dti = pd.DatetimeIndex(start='2014-08-01 09:00',
...                          freq='H', periods=3, tz='Europe/Berlin')
```

```
>>> dti
DatetimeIndex(['2014-08-01 09:00:00+02:00',
               '2014-08-01 10:00:00+02:00',
               '2014-08-01 11:00:00+02:00'],
              dtype='datetime64[ns, Europe/Berlin]', freq='H')
```

```
>>> dti.tz_convert('US/Central')
DatetimeIndex(['2014-08-01 02:00:00-05:00',
               '2014-08-01 03:00:00-05:00',
               '2014-08-01 04:00:00-05:00'],
              dtype='datetime64[ns, US/Central]', freq='H')
```

With the `tz=None`, we can remove the timezone (after converting to UTC if necessary):

```
>>> dti = pd.DatetimeIndex(start='2014-08-01 09:00', freq='H',
...                          periods=3, tz='Europe/Berlin')
```

```
>>> dti
DatetimeIndex(['2014-08-01 09:00:00+02:00',
               '2014-08-01 10:00:00+02:00',
               '2014-08-01 11:00:00+02:00'],
              dtype='datetime64[ns, Europe/Berlin]', freq='H')
```

```
>>> dti.tz_convert(None)
DatetimeIndex(['2014-08-01 07:00:00',
               '2014-08-01 08:00:00',
               '2014-08-01 09:00:00'],
              dtype='datetime64[ns]', freq='H')
```

### 34.11.1.31 pandas.DatetimeIndex.tz\_localize

`DatetimeIndex.tz_localize(tz, ambiguous='raise', errors='raise')`

Localize tz-naive `DatetimeIndex` to tz-aware `DatetimeIndex`.

This method takes a time zone (`tz`) naive `DatetimeIndex` object and makes this time zone aware. It does not move the time to another time zone. Time zone localization helps to switch from time zone aware to time zone unaware objects.

**Parameters** `tz` : string, `pytz.timezone`, `dateutil.tz.tzfile` or `None`

Time zone to convert timestamps to. Passing `None` will remove the time zone information preserving local time.

**ambiguous** : str { 'infer', 'NaT', 'raise' } or bool array, default 'raise'

- 'infer' will attempt to infer fall dst-transition hours based on order
- bool-ndarray where True signifies a DST time, False signifies a non-DST time (note that this flag is only applicable for ambiguous times)
- 'NaT' will return NaT where there are ambiguous times
- 'raise' will raise an `AmbiguousTimeError` if there are ambiguous times

**errors** : { 'raise', 'coerce' }, default 'raise'

- 'raise' will raise a `NonExistentTimeError` if a timestamp is not valid in the specified time zone (e.g. due to a transition from or to DST time)

- ‘coerce’ will return NaT if the timestamp can not be converted to the specified time zone

New in version 0.19.0.

#### Returns DatetimeIndex

Index converted to the specified time zone.

#### Raises TypeError

If the DatetimeIndex is tz-aware and tz is not None.

See also:

[`DatetimeIndex.tz\_convert`](#) Convert tz-aware DatetimeIndex from one time zone to another.

### Examples

```
>>> tz_naive = pd.date_range('2018-03-01 09:00', periods=3)
>>> tz_naive
DatetimeIndex(['2018-03-01 09:00:00', '2018-03-02 09:00:00',
              '2018-03-03 09:00:00'],
              dtype='datetime64[ns]', freq='D')
```

Localize DatetimeIndex in US/Eastern time zone:

```
>>> tz_aware = tz_naive.tz_localize(tz='US/Eastern')
>>> tz_aware
DatetimeIndex(['2018-03-01 09:00:00-05:00',
              '2018-03-02 09:00:00-05:00',
              '2018-03-03 09:00:00-05:00'],
              dtype='datetime64[ns, US/Eastern]', freq='D')
```

With the tz=None, we can remove the time zone information while keeping the local time (not converted to UTC):

```
>>> tz_aware.tz_localize(None)
DatetimeIndex(['2018-03-01 09:00:00', '2018-03-02 09:00:00',
              '2018-03-03 09:00:00'],
              dtype='datetime64[ns]', freq='D')
```

#### 34.11.1.32 pandas.DatetimeIndex.round

`DatetimeIndex.round(freq, *args, **kwargs)`  
round the data to the specified *freq*.

**Parameters** *freq*: str or Offset

The frequency level to round the index to. Must be a fixed frequency like ‘S’ (second) not ‘ME’ (month end). See [frequency aliases](#) for a list of possible *freq* values.

**Returns** DatetimeIndex, TimedeltaIndex, or Series

Index of the same type for a DatetimeIndex or TimedeltaIndex, or a Series with the same index for a Series.

**Raises**

**ValueError if the ‘freq’ cannot be converted.**

## Examples

### DatetimeIndex

```
>>> rng = pd.date_range('1/1/2018 11:59:00', periods=3, freq='min')
>>> rng
DatetimeIndex(['2018-01-01 11:59:00', '2018-01-01 12:00:00',
               '2018-01-01 12:01:00'],
              dtype='datetime64[ns]', freq='T')
>>> rng.round('H')
DatetimeIndex(['2018-01-01 12:00:00', '2018-01-01 12:00:00',
               '2018-01-01 12:00:00'],
              dtype='datetime64[ns]', freq=None)
```

### Series

```
>>> pd.Series(rng).dt.round("H")
0    2018-01-01 12:00:00
1    2018-01-01 12:00:00
2    2018-01-01 12:00:00
dtype: datetime64[ns]
```

### 34.11.1.33 pandas.DatetimeIndex.floor

`DatetimeIndex.floor(freq)`

floor the data to the specified *freq*.

**Parameters** *freq* : str or Offset

The frequency level to floor the index to. Must be a fixed frequency like ‘S’ (second) not ‘ME’ (month end). See [frequency aliases](#) for a list of possible *freq* values.

**Returns** `DatetimeIndex`, `TimedeltaIndex`, or `Series`

Index of the same type for a `DatetimeIndex` or `TimedeltaIndex`, or a `Series` with the same index for a `Series`.

**Raises**

**ValueError** if the ‘freq’ cannot be converted.

## Examples

### DatetimeIndex

```
>>> rng = pd.date_range('1/1/2018 11:59:00', periods=3, freq='min')
>>> rng
DatetimeIndex(['2018-01-01 11:59:00', '2018-01-01 12:00:00',
               '2018-01-01 12:01:00'],
              dtype='datetime64[ns]', freq='T')
>>> rng.floor('H')
DatetimeIndex(['2018-01-01 11:00:00', '2018-01-01 12:00:00',
               '2018-01-01 13:00:00'],
              dtype='datetime64[ns]', freq='H')
```

(continues on next page)

(continued from previous page)

```
'2018-01-01 12:00:00'],
dtype='datetime64[ns]', freq=None)
```

**Series**

```
>>> pd.Series(rng).dt.floor("H")
0    2018-01-01 11:00:00
1    2018-01-01 12:00:00
2    2018-01-01 12:00:00
dtype: datetime64[ns]
```

**34.11.1.34 pandas.DatetimeIndex.ceil****DatetimeIndex.ceil** (*freq*)ceil the data to the specified *freq*.**Parameters** *freq* : str or Offset

The frequency level to ceil the index to. Must be a fixed frequency like ‘S’ (second) not ‘ME’ (month end). See [frequency aliases](#) for a list of possible *freq* values.

**Returns** **DatetimeIndex, TimedeltaIndex, or Series**

Index of the same type for a DatetimeIndex or TimedeltaIndex, or a Series with the same index for a Series.

**Raises****ValueError** if the ‘freq’ cannot be converted.**Examples****DatetimeIndex**

```
>>> rng = pd.date_range('1/1/2018 11:59:00', periods=3, freq='min')
>>> rng
DatetimeIndex(['2018-01-01 11:59:00', '2018-01-01 12:00:00',
              '2018-01-01 12:01:00'],
              dtype='datetime64[ns]', freq='T')
>>> rng.ceil('H')
DatetimeIndex(['2018-01-01 12:00:00', '2018-01-01 12:00:00',
              '2018-01-01 13:00:00'],
              dtype='datetime64[ns]', freq=None)
```

**Series**

```
>>> pd.Series(rng).dt.ceil("H")
0    2018-01-01 12:00:00
1    2018-01-01 12:00:00
2    2018-01-01 13:00:00
dtype: datetime64[ns]
```

### 34.11.1.35 pandas.DatetimeIndex.to\_period

`DatetimeIndex.to_period` (*freq=None*)

Cast to PeriodIndex at a particular frequency.

Converts DatetimeIndex to PeriodIndex.

**Parameters** `freq` : string or Offset, optional

One of pandas' *offset strings* or an Offset object. Will be inferred by default.

**Returns**

**PeriodIndex**

**Raises** `ValueError`

When converting a DatetimeIndex with non-regular values, so that a frequency cannot be inferred.

**See also:**

*pandas.PeriodIndex* Immutable ndarray holding ordinal values

*pandas.DatetimeIndex.to\_pydatetime* Return DatetimeIndex as object

#### Examples

```
>>> df = pd.DataFrame({"y": [1,2,3]},
...                    index=pd.to_datetime(["2000-03-31 00:00:00",
...                    "2000-05-31 00:00:00",
...                    "2000-08-31 00:00:00"]))
>>> df.index.to_period("M")
PeriodIndex(['2000-03', '2000-05', '2000-08'],
            dtype='period[M]', freq='M')
```

Infer the daily frequency

```
>>> idx = pd.date_range("2017-01-01", periods=2)
>>> idx.to_period()
PeriodIndex(['2017-01-01', '2017-01-02'],
            dtype='period[D]', freq='D')
```

### 34.11.1.36 pandas.DatetimeIndex.to\_perioddelta

`DatetimeIndex.to_perioddelta` (*freq*)

Calculate TimedeltaIndex of difference between index values and index converted to periodIndex at specified freq. Used for vectorized offsets

**Parameters**

**freq**: Period frequency

**Returns**

**y**: TimedeltaIndex

### 34.11.1.37 pandas.DatetimeIndex.to\_pydatetime

`DatetimeIndex.to_pydatetime()`

Return `DatetimeIndex` as object ndarray of `datetime.datetime` objects

#### Returns

**datetimes** [ndarray]

### 34.11.1.38 pandas.DatetimeIndex.to\_series

`DatetimeIndex.to_series(keep_tz=False, index=None, name=None)`

Create a `Series` with both index and values equal to the index keys useful with `map` for returning an indexer based on an index

**Parameters** `keep_tz` : optional, defaults `False`.

return the data keeping the timezone.

If `keep_tz` is `True`:

If the timezone is not set, the resulting `Series` will have a `datetime64[ns]` dtype.

Otherwise the `Series` will have an `datetime64[ns, tz]` dtype; the `tz` will be preserved.

If `keep_tz` is `False`:

`Series` will have a `datetime64[ns]` dtype. TZ aware objects will have the `tz` removed.

**index** : Index, optional

index of resulting `Series`. If `None`, defaults to original index

**name** : string, optional

name of resulting `Series`. If `None`, defaults to name of original index

#### Returns

**Series**

### 34.11.1.39 pandas.DatetimeIndex.to\_frame

`DatetimeIndex.to_frame(index=True)`

Create a `DataFrame` with a column containing the Index.

New in version 0.21.0.

**Parameters** `index` : boolean, default `True`

Set the index of the returned `DataFrame` as the original Index.

#### Returns DataFrame

`DataFrame` containing the original Index data.

**See also:**

[`Index.to\_series`](#) Convert an Index to a Series.

[`Series.to\_frame`](#) Convert Series to DataFrame.

## Examples

```
>>> idx = pd.Index(['Ant', 'Bear', 'Cow'], name='animal')
>>> idx.to_frame()
      animal
animal
Ant      Ant
Bear    Bear
Cow     Cow
```

By default, the original Index is reused. To enforce a new Index:

```
>>> idx.to_frame(index=False)
      animal
0      Ant
1     Bear
2      Cow
```

### 34.11.1.40 pandas.DatetimeIndex.month\_name

`DatetimeIndex.month_name(locale=None)`

Return the month names of the DateTimeIndex with specified locale.

**Parameters** `locale` : string, default None (English locale)

locale determining the language in which to return the month name

**Returns** `month_names` : Index

Index of month names

.. versionadded:: 0.23.0

### 34.11.1.41 pandas.DatetimeIndex.day\_name

`DatetimeIndex.day_name(locale=None)`

Return the day names of the DateTimeIndex with specified locale.

**Parameters** `locale` : string, default None (English locale)

locale determining the language in which to return the day name

**Returns** `month_names` : Index

Index of day names

.. versionadded:: 0.23.0

## 34.11.2 Time/Date Components

<code>DatetimeIndex.year</code>	The year of the datetime
<code>DatetimeIndex.month</code>	The month as January=1, December=12
<code>DatetimeIndex.day</code>	The days of the datetime
<code>DatetimeIndex.hour</code>	The hours of the datetime

Continued on next page

Table 127 – continued from previous page

<code>DatetimeIndex.minute</code>	The minutes of the datetime
<code>DatetimeIndex.second</code>	The seconds of the datetime
<code>DatetimeIndex.microsecond</code>	The microseconds of the datetime
<code>DatetimeIndex.nanosecond</code>	The nanoseconds of the datetime
<code>DatetimeIndex.date</code>	Returns numpy array of python datetime.date objects (namely, the date part of Timestamps without timezone information).
<code>DatetimeIndex.time</code>	Returns numpy array of datetime.time.
<code>DatetimeIndex.dayofyear</code>	The ordinal day of the year
<code>DatetimeIndex.weekofyear</code>	The week ordinal of the year
<code>DatetimeIndex.week</code>	The week ordinal of the year
<code>DatetimeIndex.dayofweek</code>	The day of the week with Monday=0, Sunday=6
<code>DatetimeIndex.weekday</code>	The day of the week with Monday=0, Sunday=6
<code>DatetimeIndex.quarter</code>	The quarter of the date
<code>DatetimeIndex.tz</code>	
<code>DatetimeIndex.freq</code>	Return the frequency object if it is set, otherwise None
<code>DatetimeIndex.freqstr</code>	Return the frequency object as a string if it is set, otherwise None
<code>DatetimeIndex.is_month_start</code>	Logical indicating if first day of month (defined by frequency)
<code>DatetimeIndex.is_month_end</code>	Indicator for whether the date is the last day of the month.
<code>DatetimeIndex.is_quarter_start</code>	Indicator for whether the date is the first day of a quarter.
<code>DatetimeIndex.is_quarter_end</code>	Indicator for whether the date is the last day of a quarter.
<code>DatetimeIndex.is_year_start</code>	Indicate whether the date is the first day of a year.
<code>DatetimeIndex.is_year_end</code>	Indicate whether the date is the last day of the year.
<code>DatetimeIndex.is_leap_year</code>	Boolean indicator if the date belongs to a leap year.
<code>DatetimeIndex.inferred_freq</code>	Tries to return a string representing a frequency guess, generated by infer_freq.

### 34.11.2.1 pandas.DatetimeIndex.tz

`DatetimeIndex.tz`

## 34.11.3 Selecting

<code>DatetimeIndex.indexer_at_time(time[, asof])</code>	Returns index locations of index values at particular time of day (e.g.
<code>DatetimeIndex.indexer_between_time(...[, ...])</code>	Return index locations of values between particular times of day (e.g., 9:00-9:30AM).

### 34.11.3.1 pandas.DatetimeIndex.indexer\_at\_time

`DatetimeIndex.indexer_at_time` (*time*, *asof*=False)

Returns index locations of index values at particular time of day (e.g. 9:30AM).

**Parameters** *time* : datetime.time or string

datetime.time or string in appropriate format (“%H:%M”, “%H%M”, “%I:%M%p”, “%I%M%p”, “%H:%M:%S”, “%H%M%S”, “%I:%M:%S%p”, “%I%M%S%p”).

**Returns**

**values\_at\_time** [array of integers]

See also:

*indexer\_between\_time, DataFrame.at\_time*

### 34.11.3.2 pandas.DatetimeIndex.indexer\_between\_time

`DatetimeIndex.indexer_between_time` (*start\_time*, *end\_time*, *include\_start=True*, *include\_end=True*)

Return index locations of values between particular times of day (e.g., 9:00-9:30AM).

**Parameters** *start\_time, end\_time* : `datetime.time`, `str`

`datetime.time` or string in appropriate format (“%H:%M”, “%H%M”, “%I:%M%p”, “%I%M%p”, “%H:%M:%S”, “%H%M%S”, “%I:%M:%S%p”, “%I%M%S%p”).

**include\_start** [boolean, default True]

**include\_end** [boolean, default True]

**Returns**

**values\_between\_time** [array of integers]

See also:

*indexer\_at\_time, DataFrame.between\_time*

### 34.11.4 Time-specific operations

<code>DatetimeIndex.normalize()</code>	Convert times to midnight.
<code>DatetimeIndex.strftime(date_format)</code>	Convert to Index using specified <i>date_format</i> .
<code>DatetimeIndex.snap([freq])</code>	Snap time stamps to nearest occurring frequency
<code>DatetimeIndex.tz_convert(tz)</code>	Convert tz-aware <code>DatetimeIndex</code> from one time zone to another.
<code>DatetimeIndex.tz_localize(tz[, ambiguous, ...])</code>	Localize tz-naive <code>DatetimeIndex</code> to tz-aware <code>Date-timeIndex</code> .
<code>DatetimeIndex.round(freq, *args, **kwargs)</code>	round the data to the specified <i>freq</i> .
<code>DatetimeIndex.floor(freq)</code>	floor the data to the specified <i>freq</i> .
<code>DatetimeIndex.ceil(freq)</code>	ceil the data to the specified <i>freq</i> .
<code>DatetimeIndex.month_name([locale])</code>	Return the month names of the <code>Date-timeIndex</code> with specified locale.
<code>DatetimeIndex.day_name([locale])</code>	Return the day names of the <code>Date-timeIndex</code> with specified locale.

### 34.11.5 Conversion

<code>DatetimeIndex.to_period([freq])</code>	Cast to <code>PeriodIndex</code> at a particular frequency.
<code>DatetimeIndex.to_perioddelta(freq)</code>	Calculate <code>TimedeltaIndex</code> of difference between index values and index converted to <code>periodIndex</code> at specified <i>freq</i> .

Continued on next page

Table 130 – continued from previous page

<code>DatetimeIndex.to_pydatetime()</code>	Return <code>DatetimeIndex</code> as object ndarray of date-time.datetime objects
<code>DatetimeIndex.to_series([keep_tz, index, name])</code>	Create a Series with both index and values equal to the index keys useful with map for returning an indexer based on an index
<code>DatetimeIndex.to_frame([index])</code>	Create a DataFrame with a column containing the Index.

## 34.12 TimedeltaIndex

<code>TimedeltaIndex</code>	Immutable ndarray of timedelta64 data, represented internally as int64, and which can be boxed to timedelta objects
-----------------------------	---

### 34.12.1 pandas.TimedeltaIndex

**class** `pandas.TimedeltaIndex`

Immutable ndarray of timedelta64 data, represented internally as int64, and which can be boxed to timedelta objects

**Parameters** `data` : array-like (1-dimensional), optional

Optional timedelta-like data to construct index with

**unit**: unit of the arg (`D,h,m,s,ms,us,ns`) denote the unit, optional

which is an integer/float number

**freq**: a frequency for the index, optional

**copy** : bool

Make a copy of input ndarray

**start** : starting value, timedelta-like, optional

If data is None, start is used as the start point in generating regular timedelta data.

**periods** : int, optional, > 0

Number of periods to generate, if generating index. Takes precedence over end argument

**end** : end time, timedelta-like, optional

If periods is none, generated index will extend to first conforming time on or just past end argument

**closed** : string or None, default None

Make the interval closed with respect to the given frequency to the 'left', 'right', or both sides (None)

**name** : object

Name to be stored in the index

See also:

**Index** The base pandas Index type

**Timedelta** Represents a duration between two dates or times.

**DatetimeIndex** Index of datetime64 data

**PeriodIndex** Index of Period data

## Notes

To learn more about the frequency strings, please see [this link](#).

## Attributes

<code>days</code>	Number of days for each element.
<code>seconds</code>	Number of seconds ( $\geq 0$ and less than 1 day) for each element.
<code>microseconds</code>	Number of microseconds ( $\geq 0$ and less than 1 second) for each element.
<code>nanoseconds</code>	Number of nanoseconds ( $\geq 0$ and less than 1 microsecond) for each element.
<code>components</code>	Return a dataframe of the components (days, hours, minutes, seconds, milliseconds, microseconds, nanoseconds) of the Timedeltas.
<code>inferred_freq</code>	Tries to return a string representing a frequency guess, generated by <code>infer_freq</code> .

### 34.12.1.1 pandas.TimedeltaIndex.days

`TimedeltaIndex.days`

Number of days for each element.

### 34.12.1.2 pandas.TimedeltaIndex.seconds

`TimedeltaIndex.seconds`

Number of seconds ( $\geq 0$  and less than 1 day) for each element.

### 34.12.1.3 pandas.TimedeltaIndex.microseconds

`TimedeltaIndex.microseconds`

Number of microseconds ( $\geq 0$  and less than 1 second) for each element.

### 34.12.1.4 pandas.TimedeltaIndex.nanoseconds

`TimedeltaIndex.nanoseconds`

Number of nanoseconds ( $\geq 0$  and less than 1 microsecond) for each element.

### 34.12.1.5 pandas.TimedeltaIndex.components

`TimedeltaIndex.components`

Return a dataframe of the components (days, hours, minutes, seconds, milliseconds, microseconds, nanoseconds) of the Timedeltas.

**Returns**

a **DataFrame**

### 34.12.1.6 pandas.TimedeltaIndex.inferred\_freq

`TimedeltaIndex.inferred_freq`

Tries to return a string representing a frequency guess, generated by `infer_freq`. Returns `None` if it can't autodetect the frequency.

#### Methods

<code>to_pytimedelta()</code>	Return <code>TimedeltaIndex</code> as object ndarray of <code>datetime.timedelta</code> objects
<code>to_series([index, name])</code>	Create a <code>Series</code> with both index and values equal to the index keys useful with <code>map</code> for returning an indexer based on an index
<code>round(freq, *args, **kwargs)</code>	round the data to the specified <i>freq</i> .
<code>floor(freq)</code>	floor the data to the specified <i>freq</i> .
<code>ceil(freq)</code>	ceil the data to the specified <i>freq</i> .
<code>to_frame([index])</code>	Create a <code>DataFrame</code> with a column containing the Index.

### 34.12.1.7 pandas.TimedeltaIndex.to\_pytimedelta

`TimedeltaIndex.to_pytimedelta()`

Return `TimedeltaIndex` as object ndarray of `datetime.timedelta` objects

**Returns**

**datetimes** [ndarray]

### 34.12.1.8 pandas.TimedeltaIndex.to\_series

`TimedeltaIndex.to_series(index=None, name=None)`

Create a `Series` with both index and values equal to the index keys useful with `map` for returning an indexer based on an index

**Parameters** `index` : Index, optional

index of resulting `Series`. If `None`, defaults to original index

`name` : string, optional

name of resulting `Series`. If `None`, defaults to name of original index

**Returns**

**Series** [dtype will be based on the type of the Index values.]

### 34.12.1.9 pandas.TimedeltaIndex.round

`TimedeltaIndex.round(freq, *args, **kwargs)`  
round the data to the specified *freq*.

**Parameters** *freq* : str or Offset

The frequency level to round the index to. Must be a fixed frequency like ‘S’ (second) not ‘ME’ (month end). See [frequency aliases](#) for a list of possible *freq* values.

**Returns** `DatetimeIndex`, `TimedeltaIndex`, or `Series`

Index of the same type for a `DatetimeIndex` or `TimedeltaIndex`, or a `Series` with the same index for a `Series`.

**Raises**

**ValueError** if the ‘freq’ cannot be converted.

#### Examples

##### DatetimeIndex

```
>>> rng = pd.date_range('1/1/2018 11:59:00', periods=3, freq='min')
>>> rng
DatetimeIndex(['2018-01-01 11:59:00', '2018-01-01 12:00:00',
               '2018-01-01 12:01:00'],
              dtype='datetime64[ns]', freq='T')
>>> rng.round('H')
DatetimeIndex(['2018-01-01 12:00:00', '2018-01-01 12:00:00',
               '2018-01-01 12:00:00'],
              dtype='datetime64[ns]', freq=None)
```

##### Series

```
>>> pd.Series(rng).dt.round("H")
0    2018-01-01 12:00:00
1    2018-01-01 12:00:00
2    2018-01-01 12:00:00
dtype: datetime64[ns]
```

### 34.12.1.10 pandas.TimedeltaIndex.floor

`TimedeltaIndex.floor(freq)`  
floor the data to the specified *freq*.

**Parameters** *freq* : str or Offset

The frequency level to floor the index to. Must be a fixed frequency like ‘S’ (second) not ‘ME’ (month end). See [frequency aliases](#) for a list of possible *freq* values.

**Returns** `DatetimeIndex`, `TimedeltaIndex`, or `Series`

Index of the same type for a `DatetimeIndex` or `TimedeltaIndex`, or a `Series` with the same index for a `Series`.

**Raises**

**ValueError if the ‘freq’ cannot be converted.**

## Examples

### DatetimeIndex

```
>>> rng = pd.date_range('1/1/2018 11:59:00', periods=3, freq='min')
>>> rng
DatetimeIndex(['2018-01-01 11:59:00', '2018-01-01 12:00:00',
               '2018-01-01 12:01:00'],
              dtype='datetime64[ns]', freq='T')
>>> rng.floor('H')
DatetimeIndex(['2018-01-01 11:00:00', '2018-01-01 12:00:00',
               '2018-01-01 12:00:00'],
              dtype='datetime64[ns]', freq=None)
```

### Series

```
>>> pd.Series(rng).dt.floor("H")
0    2018-01-01 11:00:00
1    2018-01-01 12:00:00
2    2018-01-01 12:00:00
dtype: datetime64[ns]
```

#### 34.12.1.11 pandas.TimedeltaIndex.ceil

`TimedeltaIndex.ceil(freq)`

ceil the data to the specified *freq*.

**Parameters** *freq* : str or Offset

The frequency level to ceil the index to. Must be a fixed frequency like ‘S’ (second) not ‘ME’ (month end). See [frequency aliases](#) for a list of possible *freq* values.

**Returns** `DatetimeIndex`, `TimedeltaIndex`, or `Series`

Index of the same type for a `DatetimeIndex` or `TimedeltaIndex`, or a `Series` with the same index for a `Series`.

**Raises**

**ValueError** if the ‘freq’ cannot be converted.

## Examples

### DatetimeIndex

```
>>> rng = pd.date_range('1/1/2018 11:59:00', periods=3, freq='min')
>>> rng
DatetimeIndex(['2018-01-01 11:59:00', '2018-01-01 12:00:00',
               '2018-01-01 12:01:00'],
              dtype='datetime64[ns]', freq='T')
>>> rng.ceil('H')
DatetimeIndex(['2018-01-01 12:00:00', '2018-01-01 12:00:00',
               '2018-01-01 12:00:00'],
              dtype='datetime64[ns]', freq=None)
```

(continues on next page)

(continued from previous page)

```
'2018-01-01 13:00:00'],
dtype='datetime64[ns]', freq=None)
```

**Series**

```
>>> pd.Series(rng).dt.ceil("H")
0    2018-01-01 12:00:00
1    2018-01-01 12:00:00
2    2018-01-01 13:00:00
dtype: datetime64[ns]
```

**34.12.1.12 pandas.TimedeltaIndex.to\_frame****TimedeltaIndex.to\_frame** (*index=True*)

Create a DataFrame with a column containing the Index.

New in version 0.21.0.

**Parameters** *index* : boolean, default True

Set the index of the returned DataFrame as the original Index.

**Returns** **DataFrame**

DataFrame containing the original Index data.

**See also:*****Index.to\_series*** Convert an Index to a Series.***Series.to\_frame*** Convert Series to DataFrame.**Examples**

```
>>> idx = pd.Index(['Ant', 'Bear', 'Cow'], name='animal')
>>> idx.to_frame()
      animal
animal
Ant      Ant
Bear    Bear
Cow     Cow
```

By default, the original Index is reused. To enforce a new Index:

```
>>> idx.to_frame(index=False)
      animal
0      Ant
1     Bear
2      Cow
```

**34.12.2 Components**

<code>TimedeltaIndex.days</code>	Number of days for each element.
<code>TimedeltaIndex.seconds</code>	Number of seconds ( $\geq 0$ and less than 1 day) for each element.
<code>TimedeltaIndex.microseconds</code>	Number of microseconds ( $\geq 0$ and less than 1 second) for each element.
<code>TimedeltaIndex.nanoseconds</code>	Number of nanoseconds ( $\geq 0$ and less than 1 microsecond) for each element.
<code>TimedeltaIndex.components</code>	Return a dataframe of the components (days, hours, minutes, seconds, milliseconds, microseconds, nanoseconds) of the Timedeltas.
<code>TimedeltaIndex.inferred_freq</code>	Tries to return a string representing a frequency guess, generated by <code>infer_freq</code> .

### 34.12.3 Conversion

<code>TimedeltaIndex.to_pytimedelta()</code>	Return <code>TimedeltaIndex</code> as object ndarray of date-time.timedelta objects
<code>TimedeltaIndex.to_series([index, name])</code>	Create a Series with both index and values equal to the index keys useful with map for returning an indexer based on an index
<code>TimedeltaIndex.round(freq, *args, **kwargs)</code>	round the data to the specified <i>freq</i> .
<code>TimedeltaIndex.floor(freq)</code>	floor the data to the specified <i>freq</i> .
<code>TimedeltaIndex.ceil(freq)</code>	ceil the data to the specified <i>freq</i> .
<code>TimedeltaIndex.to_frame([index])</code>	Create a DataFrame with a column containing the Index.

## 34.13 PeriodIndex

<code>PeriodIndex</code>	Immutable ndarray holding ordinal values indicating regular periods in time such as particular years, quarters, months, etc.
--------------------------	--

### 34.13.1 pandas.PeriodIndex

**class** pandas.**PeriodIndex**

Immutable ndarray holding ordinal values indicating regular periods in time such as particular years, quarters, months, etc.

Index keys are boxed to Period objects which carries the metadata (eg, frequency information).

**Parameters** **data** : array-like (1-dimensional), optional

Optional period-like data to construct index with

**copy** : bool

Make a copy of input ndarray

**freq** : string or period object, optional

One of pandas period strings or corresponding objects

**start** : starting value, period-like, optional

If data is None, used as the start point in generating regular period data.

**periods** : int, optional, > 0

Number of periods to generate, if generating index. Takes precedence over end argument

**end** : end value, period-like, optional

If periods is none, generated index will extend to first conforming period on or just past end argument

**year** [int, array, or Series, default None]

**month** [int, array, or Series, default None]

**quarter** [int, array, or Series, default None]

**day** [int, array, or Series, default None]

**hour** [int, array, or Series, default None]

**minute** [int, array, or Series, default None]

**second** [int, array, or Series, default None]

**tz** : object, default None

Timezone for converting datetime64 data to Periods

**dtype** [str or PeriodDtype, default None]

**See also:**

***Index*** The base pandas Index type

***Period*** Represents a period of time

***DatetimeIndex*** Index with datetime64 data

***TimedeltaIndex*** Index of timedelta64 data

## Examples

```
>>> idx = PeriodIndex(year=year_arr, quarter=q_arr)
```

```
>>> idx2 = PeriodIndex(start='2000', end='2010', freq='A')
```

## Attributes

<i>day</i>	The days of the period
<i>dayofweek</i>	The day of the week with Monday=0, Sunday=6
<i>dayofyear</i>	The ordinal day of the year
<i>days_in_month</i>	The number of days in the month
<i>daysinmonth</i>	The number of days in the month
<i>freq</i>	Return the frequency object if it is set, otherwise None

Continued on next page

Table 137 – continued from previous page

<i>freqstr</i>	Return the frequency object as a string if it is set, otherwise None
<i>hour</i>	The hour of the period
<i>is_leap_year</i>	Logical indicating if the date belongs to a leap year
<i>minute</i>	The minute of the period
<i>month</i>	The month as January=1, December=12
<i>quarter</i>	The quarter of the date
<i>second</i>	The second of the period
<i>week</i>	The week ordinal of the year
<i>weekday</i>	The day of the week with Monday=0, Sunday=6
<i>weekofyear</i>	The week ordinal of the year
<i>year</i>	The year of the period

**34.13.1.1 pandas.PeriodIndex.day**

`PeriodIndex.day`  
The days of the period

**34.13.1.2 pandas.PeriodIndex.dayofweek**

`PeriodIndex.dayofweek`  
The day of the week with Monday=0, Sunday=6

**34.13.1.3 pandas.PeriodIndex.dayofyear**

`PeriodIndex.dayofyear`  
The ordinal day of the year

**34.13.1.4 pandas.PeriodIndex.days\_in\_month**

`PeriodIndex.days_in_month`  
The number of days in the month

**34.13.1.5 pandas.PeriodIndex.daysinmonth**

`PeriodIndex.daysinmonth`  
The number of days in the month

**34.13.1.6 pandas.PeriodIndex.freq**

`PeriodIndex.freq`  
Return the frequency object if it is set, otherwise None

**34.13.1.7 pandas.PeriodIndex.freqstr**

`PeriodIndex.freqstr`  
Return the frequency object as a string if it is set, otherwise None

#### 34.13.1.8 pandas.PeriodIndex.hour

`PeriodIndex.hour`  
The hour of the period

#### 34.13.1.9 pandas.PeriodIndex.is\_leap\_year

`PeriodIndex.is_leap_year`  
Logical indicating if the date belongs to a leap year

#### 34.13.1.10 pandas.PeriodIndex.minute

`PeriodIndex.minute`  
The minute of the period

#### 34.13.1.11 pandas.PeriodIndex.month

`PeriodIndex.month`  
The month as January=1, December=12

#### 34.13.1.12 pandas.PeriodIndex.quarter

`PeriodIndex.quarter`  
The quarter of the date

#### 34.13.1.13 pandas.PeriodIndex.second

`PeriodIndex.second`  
The second of the period

#### 34.13.1.14 pandas.PeriodIndex.week

`PeriodIndex.week`  
The week ordinal of the year

#### 34.13.1.15 pandas.PeriodIndex.weekday

`PeriodIndex.weekday`  
The day of the week with Monday=0, Sunday=6

#### 34.13.1.16 pandas.PeriodIndex.weekofyear

`PeriodIndex.weekofyear`  
The week ordinal of the year

### 34.13.1.17 pandas.PeriodIndex.year

`PeriodIndex.year`

The year of the period

<b>end_time</b>	
<b>qyear</b>	
<b>start_time</b>	

#### Methods

<code>asfreq([freq, how])</code>	Convert the PeriodIndex to the specified frequency <i>freq</i> .
<code>strftime(date_format)</code>	Convert to Index using specified <i>date_format</i> .
<code>to_timestamp([freq, how])</code>	Cast to DatetimeIndex
<code>tz_convert(tz)</code>	Convert tz-aware DatetimeIndex from one time zone to another (using pytz/dateutil)
<code>tz_localize(tz[, ambiguous])</code>	Localize tz-naive DatetimeIndex to given time zone (using pytz/dateutil), or remove timezone from tz-aware DatetimeIndex

### 34.13.1.18 pandas.PeriodIndex.asfreq

`PeriodIndex.asfreq(freq=None, how='E')`

Convert the PeriodIndex to the specified frequency *freq*.

**Parameters** *freq* : str

a frequency

**how** : str {'E', 'S'}

'E', 'END', or 'FINISH' for end, 'S', 'START', or 'BEGIN' for start. Whether the elements should be aligned to the end or start within a period. January 31st ('END') vs. January 1st ('START') for example.

**Returns**

**new** [PeriodIndex with the new frequency]

#### Examples

```
>>> pidx = pd.period_range('2010-01-01', '2015-01-01', freq='A')
>>> pidx
<class 'pandas.core.indexes.period.PeriodIndex'>
[2010, ..., 2015]
Length: 6, Freq: A-DEC
```

```
>>> pidx.asfreq('M')
<class 'pandas.core.indexes.period.PeriodIndex'>
[2010-12, ..., 2015-12]
Length: 6, Freq: M
```

```
>>> pidx.asfreq('M', how='S')
<class 'pandas.core.indexes.period.PeriodIndex'>
[2010-01, ..., 2015-01]
Length: 6, Freq: M
```

### 34.13.1.19 pandas.PeriodIndex.strftime

`PeriodIndex.strftime(date_format)`

Convert to Index using specified date\_format.

Return an Index of formatted strings specified by date\_format, which supports the same string format as the python standard library. Details of the string format can be found in [python string format doc](#)

**Parameters** `date_format` : str

Date format string (e.g. “%Y-%m-%d”).

**Returns** Index

Index of formatted strings

**See also:**

[`pandas.to\_datetime`](#) Convert the given argument to datetime

[`DatetimeIndex.normalize`](#) Return DatetimeIndex with times to midnight.

[`DatetimeIndex.round`](#) Round the DatetimeIndex to the specified freq.

[`DatetimeIndex.floor`](#) Floor the DatetimeIndex to the specified freq.

### Examples

```
>>> rng = pd.date_range(pd.Timestamp("2018-03-10 09:00"),
...                     periods=3, freq='s')
>>> rng.strftime('%B %d, %Y, %r')
Index(['March 10, 2018, 09:00:00 AM', 'March 10, 2018, 09:00:01 AM',
       'March 10, 2018, 09:00:02 AM'],
      dtype='object')
```

### 34.13.1.20 pandas.PeriodIndex.to\_timestamp

`PeriodIndex.to_timestamp(freq=None, how='start')`

Cast to DatetimeIndex

**Parameters** `freq` : string or DateOffset, optional

Target frequency. The default is ‘D’ for week or longer, ‘S’ otherwise

**how** [{‘s’, ‘e’, ‘start’, ‘end’}]

**Returns**

DatetimeIndex

### 34.13.1.21 pandas.PeriodIndex.tz\_convert

`PeriodIndex.tz_convert(tz)`

Convert tz-aware DatetimeIndex from one time zone to another (using pytz/dateutil)

**Parameters** `tz` : string, pytz.timezone, dateutil.tz.tzfile or None

Time zone for time. Corresponding timestamps would be converted to time zone of the TimeSeries. None will remove timezone holding UTC time.

**Returns**

**normalized** [DatetimeIndex]

#### Notes

Not currently implemented for PeriodIndex

### 34.13.1.22 pandas.PeriodIndex.tz\_localize

`PeriodIndex.tz_localize(tz, ambiguous='raise')`

Localize tz-naive DatetimeIndex to given time zone (using pytz/dateutil), or remove timezone from tz-aware DatetimeIndex

**Parameters** `tz` : string, pytz.timezone, dateutil.tz.tzfile or None

Time zone for time. Corresponding timestamps would be converted to time zone of the TimeSeries. None will remove timezone holding local time.

**Returns**

**localized** [DatetimeIndex]

#### Notes

Not currently implemented for PeriodIndex

## 34.13.2 Attributes

<code>PeriodIndex.day</code>	The days of the period
<code>PeriodIndex.dayofweek</code>	The day of the week with Monday=0, Sunday=6
<code>PeriodIndex.dayofyear</code>	The ordinal day of the year
<code>PeriodIndex.days_in_month</code>	The number of days in the month
<code>PeriodIndex.daysinmonth</code>	The number of days in the month
<code>PeriodIndex.end_time</code>	
<code>PeriodIndex.freq</code>	Return the frequency object if it is set, otherwise None
<code>PeriodIndex.freqstr</code>	Return the frequency object as a string if it is set, otherwise None
<code>PeriodIndex.hour</code>	The hour of the period
<code>PeriodIndex.is_leap_year</code>	Logical indicating if the date belongs to a leap year
<code>PeriodIndex.minute</code>	The minute of the period
<code>PeriodIndex.month</code>	The month as January=1, December=12

Continued on next page

Table 139 – continued from previous page

<i>PeriodIndex.quarter</i>	The quarter of the date
<i>PeriodIndex.qyear</i>	
<i>PeriodIndex.second</i>	The second of the period
<i>PeriodIndex.start_time</i>	
<i>PeriodIndex.week</i>	The week ordinal of the year
<i>PeriodIndex.weekday</i>	The day of the week with Monday=0, Sunday=6
<i>PeriodIndex.weekofyear</i>	The week ordinal of the year
<i>PeriodIndex.year</i>	The year of the period

### 34.13.2.1 pandas.PeriodIndex.end\_time

`PeriodIndex.end_time`

### 34.13.2.2 pandas.PeriodIndex.qyear

`PeriodIndex.qyear`

### 34.13.2.3 pandas.PeriodIndex.start\_time

`PeriodIndex.start_time`

## 34.13.3 Methods

<i>PeriodIndex.asfreq</i> ([freq, how])	Convert the PeriodIndex to the specified frequency <i>freq</i> .
<i>PeriodIndex.strftime</i> (date_format)	Convert to Index using specified date_format.
<i>PeriodIndex.to_timestamp</i> ([freq, how])	Cast to DatetimeIndex
<i>PeriodIndex.tz_convert</i> (tz)	Convert tz-aware DatetimeIndex from one time zone to another (using pytz/dateutil)
<i>PeriodIndex.tz_localize</i> (tz[, ambiguous])	Localize tz-naive DatetimeIndex to given time zone (using pytz/dateutil), or remove timezone from tz-aware DatetimeIndex

## 34.14 Scalars

### 34.14.1 Period

<i>Period</i>	Represents a period of time
---------------	-----------------------------

#### 34.14.1.1 pandas.Period

**class** pandas.Period

Represents a period of time

**Parameters** **value** : Period or compat.string\_types, default None

The time period represented (e.g., '4Q2005')

**freq** : str, default None

One of pandas period strings or corresponding objects

**year** [int, default None]  
**month** [int, default 1]  
**quarter** [int, default None]  
**day** [int, default 1]  
**hour** [int, default 0]  
**minute** [int, default 0]  
**second** [int, default 0]

### Attributes

<i>day</i>	Get day of the month that a Period falls on.
<i>dayofweek</i>	Return the day of the week.
<i>dayofyear</i>	Return the day of the year.
<i>days_in_month</i>	Get the total number of days in the month that this period falls on.
<i>daysinmonth</i>	Get the total number of days of the month that the Period falls in.
<i>hour</i>	Get the hour of the day component of the Period.
<i>minute</i>	Get minute of the hour component of the Period.
<i>second</i>	Get the second component of the Period.
<i>start_time</i>	Get the Timestamp for the start of the period.
<i>week</i>	Get the week of the year on the given Period.

### pandas.Period.day

`Period.day`

Get day of the month that a Period falls on.

#### Returns

**int**

**See also:**

*Period.dayofweek* Get the day of the week

*Period.dayofyear* Get the day of the year

### Examples

```
>>> p = pd.Period("2018-03-11", freq='H')
>>> p.day
11
```

## pandas.Period.dayofweek

### Period.dayofweek

Return the day of the week.

This attribute returns the day of the week on which the particular date for the given period occurs depending on the frequency with Monday=0, Sunday=6.

#### Returns Int

Range from 0 to 6 (included).

#### See also:

*Period.dayofyear* Return the day of the year.

*Period.daysinmonth* Return the number of days in that month.

## Examples

```
>>> period1 = pd.Period('2012-1-1 19:00', freq='H')
>>> period1
Period('2012-01-01 19:00', 'H')
>>> period1.dayofweek
6
```

```
>>> period2 = pd.Period('2013-1-9 11:00', freq='H')
>>> period2
Period('2013-01-09 11:00', 'H')
>>> period2.dayofweek
2
```

## pandas.Period.dayofyear

### Period.dayofyear

Return the day of the year.

This attribute returns the day of the year on which the particular date occurs. The return value ranges between 1 to 365 for regular years and 1 to 366 for leap years.

#### Returns int

The day of year.

#### See also:

*Period.day* Return the day of the month.

*Period.dayofweek* Return the day of week.

*PeriodIndex.dayofyear* Return the day of year of all indexes.

## Examples

```

>>> period = pd.Period("2015-10-23", freq='H')
>>> period.dayofyear
296
>>> period = pd.Period("2012-12-31", freq='D')
>>> period.dayofyear
366
>>> period = pd.Period("2013-01-01", freq='D')
>>> period.dayofyear
1

```

## pandas.Period.days\_in\_month

### Period.days\_in\_month

Get the total number of days in the month that this period falls on.

#### Returns

int

#### See also:

**Period.daysinmonth** Gets the number of days in the month.

**DatetimeIndex.daysinmonth** Gets the number of days in the month.

**calendar.monthrange** Returns a tuple containing weekday (0-6 ~ Mon-Sun) and number of days (28-31).

## Examples

```

>>> p = pd.Period('2018-2-17')
>>> p.days_in_month
28

```

```

>>> pd.Period('2018-03-01').days_in_month
31

```

Handles the leap year case as well:

```

>>> p = pd.Period('2016-2-17')
>>> p.days_in_month
29

```

## pandas.Period.daysinmonth

### Period.daysinmonth

Get the total number of days of the month that the Period falls in.

#### Returns

int

#### See also:

*Period.days\_in\_month* Return the days of the month

*Period.dayofyear* Return the day of the year

### Examples

```
>>> p = pd.Period("2018-03-11", freq='H')
>>> p.daysinmonth
31
```

## pandas.Period.hour

**Period.hour**

Get the hour of the day component of the Period.

**Returns int**

The hour as an integer, between 0 and 23.

**See also:**

*Period.second* Get the second component of the Period.

*Period.minute* Get the minute component of the Period.

### Examples

```
>>> p = pd.Period("2018-03-11 13:03:12.050000")
>>> p.hour
13
```

Period longer than a day

```
>>> p = pd.Period("2018-03-11", freq="M")
>>> p.hour
0
```

## pandas.Period.minute

**Period.minute**

Get minute of the hour component of the Period.

**Returns int**

The minute as an integer, between 0 and 59.

**See also:**

*Period.hour* Get the hour component of the Period.

*Period.second* Get the second component of the Period.

## Examples

```
>>> p = pd.Period("2018-03-11 13:03:12.050000")
>>> p.minute
3
```

## pandas.Period.second

Period.**second**

Get the second component of the Period.

**Returns int**

The second of the Period (ranges from 0 to 59).

**See also:**

*Period.hour* Get the hour component of the Period.

*Period.minute* Get the minute component of the Period.

## Examples

```
>>> p = pd.Period("2018-03-11 13:03:12.050000")
>>> p.second
12
```

## pandas.Period.start\_time

Period.**start\_time**

Get the Timestamp for the start of the period.

**Returns**

**Timestamp**

**See also:**

*Period.end\_time* Return the end Timestamp.

*Period.dayofyear* Return the day of year.

*Period.daysinmonth* Return the days in that month.

*Period.dayofweek* Return the day of the week.

## Examples

```
>>> period = pd.Period('2012-1-1', freq='D')
>>> period
Period('2012-01-01', 'D')
```

```
>>> period.start_time
Timestamp('2012-01-01 00:00:00')
```

```
>>> period.end_time
Timestamp('2012-01-01 23:59:59.999999999')
```

## pandas.Period.week

### Period.week

Get the week of the year on the given Period.

#### Returns

**int**

See also:

*Period.dayofweek* Get the day component of the Period.

*Period.weekday* Get the day component of the Period.

### Examples

```
>>> p = pd.Period("2018-03-11", "H")
>>> p.week
10
```

```
>>> p = pd.Period("2018-02-01", "D")
>>> p.week
5
```

```
>>> p = pd.Period("2018-01-06", "D")
>>> p.week
1
```

<b>end_time</b>	
<b>freq</b>	
<b>freqstr</b>	
<b>is_leap_year</b>	
<b>month</b>	
<b>ordinal</b>	
<b>quarter</b>	
<b>qyear</b>	
<b>weekday</b>	
<b>weekofyear</b>	
<b>year</b>	

### Methods

<code>asfreq</code>	Convert Period to desired frequency, either at the start or end of the interval
<code>strftime</code>	Returns the string representation of the <i>Period</i> , depending on the selected <code>fmt</code> .
<code>to_timestamp</code>	Return the Timestamp representation of the Period at the target frequency at the specified end (how) of the Period

**pandas.Period.asfreq**`Period.asfreq()`

Convert Period to desired frequency, either at the start or end of the interval

**Parameters****freq** [string]**how** : { 'E', 'S', 'end', 'start' }, default 'end'

Start or end of the timespan

**Returns****resampled** [Period]**pandas.Period.strftime**`Period.strftime()`

Returns the string representation of the *Period*, depending on the selected `fmt`. `fmt` must be a string containing one or several directives. The method recognizes the same directives as the `time.strftime()` function of the standard Python distribution, as well as the specific additional directives `%f`, `%F`, `%q`. (formatting & docs originally from `scikits.timeries`)

Di- rec- tive	Meaning	Notes
%a	Locale's abbreviated weekday name.	
%A	Locale's full weekday name.	
%b	Locale's abbreviated month name.	
%B	Locale's full month name.	
%c	Locale's appropriate date and time representation.	
%d	Day of the month as a decimal number [01,31].	
%f	'Fiscal' year without a century as a decimal number [00,99]	(1)
%F	'Fiscal' year with a century as a decimal number	(2)
%H	Hour (24-hour clock) as a decimal number [00,23].	
%I	Hour (12-hour clock) as a decimal number [01,12].	
%j	Day of the year as a decimal number [001,366].	
%m	Month as a decimal number [01,12].	
%M	Minute as a decimal number [00,59].	
%p	Locale's equivalent of either AM or PM.	(3)
%q	Quarter as a decimal number [01,04]	
%S	Second as a decimal number [00,61].	(4)
%U	Week number of the year (Sunday as the first day of the week) as a decimal number [00,53]. All days in a new year preceding the first Sunday are considered to be in week 0.	(5)
%w	Weekday as a decimal number [0(Sunday),6].	
%W	Week number of the year (Monday as the first day of the week) as a decimal number [00,53]. All days in a new year preceding the first Monday are considered to be in week 0.	(5)
%x	Locale's appropriate date representation.	
%X	Locale's appropriate time representation.	
%y	Year without century as a decimal number [00,99].	
%Y	Year with century as a decimal number.	
%Z	Time zone name (no characters if no time zone exists).	
%%	A literal '%' character.	

## Notes

1. The %f directive is the same as %y if the frequency is not quarterly. Otherwise, it corresponds to the 'fiscal' year, as defined by the *qyear* attribute.
2. The %F directive is the same as %Y if the frequency is not quarterly. Otherwise, it corresponds to the 'fiscal' year, as defined by the *qyear* attribute.
3. The %p directive only affects the output hour field if the %I directive is used to parse the hour.
4. The range really is 0 to 61; this accounts for leap seconds and the (very rare) double leap seconds.
5. The %U and %W directives are only used in calculations when the day of the week and the year are specified.

## Examples

```
>>> a = Period(freq='Q-JUL', year=2006, quarter=1)
>>> a.strftime('%F-Q%q')
'2006-Q1'
>>> # Output the last month in the quarter of this date
>>> a.strftime('%b-%Y')
'Oct-2005'
>>>
>>> a = Period(freq='D', year=2001, month=1, day=1)
>>> a.strftime('%d-%b-%Y')
'01-Jan-2006'
>>> a.strftime('%b. %d, %Y was a %A')
'Jan. 01, 2001 was a Monday'
```

pandas.Period.to\_timestamp

`Period.to_timestamp()`  
Return the Timestamp representation of the Period at the target frequency at the specified end (how) of the Period

- Parameters** **freq** : string or DateOffset  
Target frequency. Default is 'D' if self.freq is week or longer and 'S' otherwise
- how: str, default 'S' (start)**  
'S', 'E'. Can be aliased as case insensitive 'Start', 'Finish', 'Begin', 'End'

**Returns**  
**Timestamp**

now	
-----	--

34.14.2 Attributes

<code>Period.day</code>	Get day of the month that a Period falls on.
<code>Period.dayofweek</code>	Return the day of the week.
<code>Period.dayofyear</code>	Return the day of the year.
<code>Period.days_in_month</code>	Get the total number of days in the month that this period falls on.
<code>Period.daysinmonth</code>	Get the total number of days of the month that the Period falls in.
<code>Period.end_time</code>	
<code>Period.freq</code>	
<code>Period.freqstr</code>	
<code>Period.hour</code>	Get the hour of the day component of the Period.
<code>Period.is_leap_year</code>	
<code>Period.minute</code>	Get minute of the hour component of the Period.
<code>Period.month</code>	
<code>Period.ordinal</code>	
<code>Period.quarter</code>	
<code>Period.qyear</code>

## 34.14.3 Methods

<i>Period.asfreq</i>	Convert Period to desired frequency, either at the start or end of the interval
<i>Period.now</i>	
<i>Period.strftime</i>	Returns the string representation of the <i>Period</i> , depending on the selected <i>fmt</i> .
<i>Period.to_timestamp</i>	Return the Timestamp representation of the Period at the target frequency at the specified end (how) of the Period

### 34.14.3.1 pandas.Period.now

Period.**now**()

## 34.14.4 Timestamp

<i>Timestamp</i>	Pandas replacement for datetime.datetime
------------------	--

### 34.14.4.1 pandas.Timestamp

**class** pandas.**Timestamp**

Pandas replacement for datetime.datetime

Timestamp is the pandas equivalent of python's Datetime and is interchangeable with it in most cases. It's the type used for the entries that make up a DatetimeIndex, and other timeseries oriented data structures in pandas.

**Parameters** **ts\_input** : datetime-like, str, int, float

Value to be converted to Timestamp

**freq** : str, DateOffset

Offset which Timestamp will have

**tz** : str, pytz.timezone, dateutil.tz.tzfile or None

Time zone for time which Timestamp will have.

**unit** : str

Unit used for conversion if ts\_input is of type int or float. The valid values are 'D', 'h', 'm', 's', 'ms', 'us', and 'ns'. For example, 's' means seconds and 'ms' means milliseconds.

**year, month, day** : int

New in version 0.19.0.

**hour, minute, second, microsecond** : int, optional, default 0

New in version 0.19.0.

**nanosecond** : int, optional, default 0

New in version 0.23.0.

**tzinfo** : datetime.tzinfo, optional, default None

New in version 0.19.0.

## Notes

There are essentially three calling conventions for the constructor. The primary form accepts four parameters. They can be passed by position or keyword.

The other two forms mimic the parameters from `datetime.datetime`. They can be passed by either position or keyword, but not both mixed together.

## Examples

Using the primary calling convention:

This converts a datetime-like string >>> `pd.Timestamp('2017-01-01T12')` `Timestamp('2017-01-01 12:00:00')`

This converts a float representing a Unix epoch in units of seconds >>> `pd.Timestamp(1513393355.5, unit='s')` `Timestamp('2017-12-16 03:02:35.500000')`

This converts an int representing a Unix-epoch in units of seconds and for a particular time-zone >>> `pd.Timestamp(1513393355, unit='s', tz='US/Pacific')` `Timestamp('2017-12-15 19:02:35-0800', tz='US/Pacific')`

Using the other two forms that mimic the API for `datetime.datetime`:

```
>>> pd.Timestamp(2017, 1, 1, 12)
Timestamp('2017-01-01 12:00:00')
```

```
>>> pd.Timestamp(year=2017, month=1, day=1, hour=12)
Timestamp('2017-01-01 12:00:00')
```

## Attributes

<i>tz</i>	Alias for <code>tzinfo</code>
<i>weekday_name</i>	(DEPRECATED) ..

### **pandas.Timestamp.tz**

`Timestamp.tz`  
Alias for `tzinfo`

### **pandas.Timestamp.weekday\_name**

`Timestamp.weekday_name`  
Deprecated since version 0.23.0: Use `Timestamp.day_name()` instead

## Methods

<i>astimezone</i>	Convert tz-aware Timestamp to another time zone.
<i>ceil</i>	return a new Timestamp ceiled to this resolution
<i>combine</i> (date, time)	date, time -> datetime with same date and time fields
<i>ctime</i>	Return ctime() style string.
<i>date</i>	Return date object with same year, month and day.
<i>day_name</i>	Return the day name of the Timestamp with specified locale.
<i>dst</i>	Return self.tzinfo.dst(self).
<i>floor</i>	return a new Timestamp floored to this resolution
<i>fromordinal</i> (ordinal[, freq, tz])	passed an ordinal, translate and convert to a ts note: by definition there cannot be any tz info on the ordinal itself
<i>fromtimestamp</i> (ts)	timestamp[, tz] -> tz's local time from POSIX timestamp.
<i>isocalendar</i>	Return a 3-tuple containing ISO year, week number, and weekday.
<i>isoweekday</i>	Return the day of the week represented by the date.

Continued on next page

Table 148 – continued from previous page

<i>month_name</i>	Return the month name of the Timestamp with specified locale.
<i>normalize</i>	Normalize Timestamp to midnight, preserving tz information.
<i>now([tz])</i>	Returns new Timestamp object representing current time local to tz.
<i>replace</i>	implements datetime.replace, handles nanoseconds
<i>round</i>	Round the Timestamp to the specified resolution
<i>strftime</i>	format -> strftime() style string.
<i>strptime</i>	string, format -> new datetime parsed from a string (like time.strptime()).
<i>time</i>	Return time object with same time but with tzinfo=None.
<i>timestamp</i>	Return POSIX timestamp as float.
<i>timetuple</i>	Return time tuple, compatible with time.localtime().
<i>timetz</i>	Return time object with same time and tzinfo.
<i>to_datetime64</i>	Returns a numpy.datetime64 object with 'ns' precision
<i>to_julian_date</i>	Convert TimeStamp to a Julian Date.
<i>to_period</i>	Return an period of which this timestamp is an observation.
<i>to_pydatetime</i>	Convert a Timestamp object to a native Python datetime object.
<i>today(cls[, tz])</i>	Return the current time in the local timezone.
<i>toordinal</i>	Return proleptic Gregorian ordinal.
<i>tz_convert</i>	Convert tz-aware Timestamp to another time zone.
<i>tz_localize</i>	Convert naive Timestamp to local time zone, or remove timezone from tz-aware Timestamp.
<i>tzname</i>	Return self.tzinfo.tzname(self).
<i>utcfromtimestamp(ts)</i>	Construct a naive UTC datetime from a POSIX timestamp.
<i>utcnow()</i>	Return a new Timestamp representing UTC day and time.
<i>utcoffset</i>	Return self.tzinfo.utcoffset(self).
<i>utctimetuple</i>	Return UTC time tuple, compatible with time.localtime().
<i>weekday</i>	Return the day of the week represented by the date.

**pandas.Timestamp.astimezone****Timestamp.astimezone**

Convert tz-aware Timestamp to another time zone.

**Parameters** *tz* : str, pytz.timezone, dateutil.tz.tzfile or None

Time zone for time which Timestamp will be converted to. None will remove timezone holding UTC time.

**Returns****converted** [Timestamp]**Raises** **TypeError**

If Timestamp is tz-naive.

**pandas.Timestamp.ceil**

`Timestamp.ceil`  
return a new Timestamp ceiled to this resolution

**Parameters**

**freq** [a freq string indicating the ceiling resolution]

**pandas.Timestamp.combine**

**classmethod** `Timestamp.combine(date, time)`  
date, time -> datetime with same date and time fields

**pandas.Timestamp.ctime**

`Timestamp.ctime()`  
Return ctime() style string.

**pandas.Timestamp.date**

`Timestamp.date()`  
Return date object with same year, month and day.

**pandas.Timestamp.day\_name**

`Timestamp.day_name`  
Return the day name of the Timestamp with specified locale.

**Parameters** **locale** : string, default None (English locale)

locale determining the language in which to return the day name

**Returns**

**day\_name** [string]

.. versionadded:: 0.23.0

**pandas.Timestamp.dst**

`Timestamp.dst()`  
Return self.tzinfo.dst(self).

**pandas.Timestamp.floor**

`Timestamp.floor`  
return a new Timestamp floored to this resolution

**Parameters**

**freq** [a freq string indicating the flooring resolution]

### **pandas.Timestamp.fromordinal**

**classmethod** `Timestamp.fromordinal` (*ordinal*, *freq=None*, *tz=None*)

passed an ordinal, translate and convert to a ts note: by definition there cannot be any tz info on the ordinal itself

**Parameters** **ordinal** : int

date corresponding to a proleptic Gregorian ordinal

**freq** : str, DateOffset

Offset which Timestamp will have

**tz** : str, pytz.timezone, dateutil.tz.tzfile or None

Time zone for time which Timestamp will have.

### **pandas.Timestamp.fromtimestamp**

**classmethod** `Timestamp.fromtimestamp` (*ts*)

timestamp[, tz] -> tz's local time from POSIX timestamp.

### **pandas.Timestamp.isocalendar**

`Timestamp.isocalendar()`

Return a 3-tuple containing ISO year, week number, and weekday.

### **pandas.Timestamp.isoweekday**

`Timestamp.isoweekday()`

Return the day of the week represented by the date. Monday == 1 ... Sunday == 7

### **pandas.Timestamp.month\_name**

`Timestamp.month_name`

Return the month name of the Timestamp with specified locale.

**Parameters** **locale** : string, default None (English locale)

locale determining the language in which to return the month name

**Returns**

**month\_name** [string]

.. versionadded:: 0.23.0

### **pandas.Timestamp.normalize**

`Timestamp.normalize`

Normalize Timestamp to midnight, preserving tz information.

### **pandas.Timestamp.now**

**classmethod** `Timestamp.now` (*tz=None*)

Returns new Timestamp object representing current time local to tz.

**Parameters** *tz* : str or timezone object, default None

Timezone to localize to

### **pandas.Timestamp.replace**

`Timestamp.replace`

implements datetime.replace, handles nanoseconds

**Parameters**

**year** [int, optional]

**month** [int, optional]

**day** [int, optional]

**hour** [int, optional]

**minute** [int, optional]

**second** [int, optional]

**microsecond** [int, optional]

**nanosecond**: int, optional

**tzinfo** [tz-convertible, optional]

**fold** : int, optional, default is 0

added in 3.6, NotImplemented

**Returns**

**Timestamp with fields replaced**

### **pandas.Timestamp.round**

`Timestamp.round`

Round the Timestamp to the specified resolution

**Parameters**

**freq** [a freq string indicating the rounding resolution]

**Returns**

**a new Timestamp rounded to the given resolution of ‘freq’**

**Raises**

**ValueError** if the freq cannot be converted

### **pandas.Timestamp.strftime**

`Timestamp.strftime()`  
format -> strftime() style string.

### **pandas.Timestamp.strptime**

`Timestamp.strptime()`  
string, format -> new datetime parsed from a string (like `time.strptime()`).

### **pandas.Timestamp.time**

`Timestamp.time()`  
Return time object with same time but with `tzinfo=None`.

### **pandas.Timestamp.timestamp**

`Timestamp.timestamp()`  
Return POSIX timestamp as float.

### **pandas.Timestamp.timetuple**

`Timestamp.timetuple()`  
Return time tuple, compatible with `time.localtime()`.

### **pandas.Timestamp.timetz**

`Timestamp.timetz()`  
Return time object with same time and `tzinfo`.

### **pandas.Timestamp.to\_datetime64**

`Timestamp.to_datetime64()`  
Returns a `numpy.datetime64` object with 'ns' precision

### **pandas.Timestamp.to\_julian\_date**

`Timestamp.to_julian_date`  
Convert `TimeStamp` to a Julian Date. 0 Julian date is noon January 1, 4713 BC.

### **pandas.Timestamp.to\_period**

`Timestamp.to_period`  
Return an period of which this timestamp is an observation.

**pandas.Timestamp.to\_pydatetime**`Timestamp.to_pydatetime()`

Convert a Timestamp object to a native Python datetime object.

If warn=True, issue a warning if nanoseconds is nonzero.

**pandas.Timestamp.today****classmethod** `Timestamp.today(cls, tz=None)`

Return the current time in the local timezone. This differs from `datetime.today()` in that it can be localized to a passed timezone.

**Parameters** `tz` : str or timezone object, default None

Timezone to localize to

**pandas.Timestamp.toordinal**`Timestamp.toordinal()`

Return proleptic Gregorian ordinal. January 1 of year 1 is day 1.

**pandas.Timestamp.tz\_convert**`Timestamp.tz_convert`

Convert tz-aware Timestamp to another time zone.

**Parameters** `tz` : str, pytz.timezone, dateutil.tz.tzfile or None

Time zone for time which Timestamp will be converted to. None will remove timezone holding UTC time.

**Returns**

**converted** [Timestamp]

**Raises** `TypeError`

If Timestamp is tz-naive.

**pandas.Timestamp.tz\_localize**`Timestamp.tz_localize`

Convert naive Timestamp to local time zone, or remove timezone from tz-aware Timestamp.

**Parameters** `tz` : str, pytz.timezone, dateutil.tz.tzfile or None

Time zone for time which Timestamp will be converted to. None will remove timezone holding local time.

**ambiguous** : bool, 'NaT', default 'raise'

- bool contains flags to determine if time is dst or not (note that this flag is only applicable for ambiguous fall dst dates)
- 'NaT' will return NaT for an ambiguous time

- ‘raise’ will raise an `AmbiguousTimeError` for an ambiguous time

**errors** : ‘raise’, ‘coerce’, default ‘raise’

- ‘raise’ will raise a `NonExistentTimeError` if a timestamp is not valid in the specified timezone (e.g. due to a transition from or to DST time)
- ‘coerce’ will return `NaT` if the timestamp can not be converted into the specified timezone

New in version 0.19.0.

### Returns

**localized** [Timestamp]

### Raises `TypeError`

If the Timestamp is tz-aware and tz is not None.

## `pandas.Timestamp.tzname`

`Timestamp.tzname()`  
Return `self.tzinfo.tzname(self)`.

## `pandas.Timestamp.utctimestamp`

**classmethod** `Timestamp.utctimestamp(ts)`  
Construct a naive UTC datetime from a POSIX timestamp.

## `pandas.Timestamp.utcnow`

**classmethod** `Timestamp.utcnow()`  
Return a new Timestamp representing UTC day and time.

## `pandas.Timestamp.utcoffset`

`Timestamp.utcoffset()`  
Return `self.tzinfo.utcoffset(self)`.

## `pandas.Timestamp.utctimetuple`

`Timestamp.utctimetuple()`  
Return UTC time tuple, compatible with `time.localtime()`.

## `pandas.Timestamp.weekday`

`Timestamp.weekday()`  
Return the day of the week represented by the date. Monday == 0 ... Sunday == 6

isoformat

<code>Timestamp.astimezone</code>	Convert tz-aware Timestamp to another time zone.
<code>Timestamp.ceil</code>	return a new Timestamp ceiled to this resolution
<code>Timestamp.combine(date, time)</code>	date, time -> datetime with same date and time fields
<code>Timestamp.ctime</code>	Return ctime() style string.
<code>Timestamp.date</code>	Return date object with same year, month and day.
<code>Timestamp.day_name</code>	Return the day name of the Timestamp with specified locale.
<code>Timestamp.dst</code>	Return self.tzinfo.dst(self).
<code>Timestamp.floor</code>	return a new Timestamp floored to this resolution
<code>Timestamp.freq</code>	
<code>Timestamp.freqstr</code>	
<code>Timestamp.fromordinal(ordinal[, freq, tz])</code>	passed an ordinal, translate and convert to a ts note: by definition there cannot be any tz info on the ordinal itself
<code>Timestamp.fromtimestamp(ts)</code>	timestamp[, tz] -> tz's local time from POSIX timestamp.
<code>Timestamp.isocalendar</code>	Return a 3-tuple containing ISO year, week number, and weekday.
<code>Timestamp.isoformat</code>	
<code>Timestamp.isoweekday</code>	Return the day of the week represented by the date.
<code>Timestamp.month_name</code>	Return the month name of the Timestamp with specified locale.
<code>Timestamp.normalize</code>	Normalize Timestamp to midnight, preserving tz information.
<code>Timestamp.now([tz])</code>	Returns new Timestamp object representing current time local to tz.
<code>Timestamp.replace</code>	implements datetime.replace, handles nanoseconds
<code>Timestamp.round</code>	Round the Timestamp to the specified resolution
<code>Timestamp.strftime</code>	format -> strftime() style string.
<code>Timestamp.strptime</code>	string, format -> new datetime parsed from a string (like time.strptime()).
<code>Timestamp.time</code>	Return time object with same time but with tz-info=None.
<code>Timestamp.timestamp</code>	Return POSIX timestamp as float.
<code>Timestamp.timetuple</code>	Return time tuple, compatible with time.localtime().
<code>Timestamp.timetz</code>	Return time object with same time and tzinfo.

Continued on next page

Table 150 – continued from previous page

<i>Timestamp.to_datetime64</i>	Returns a <code>numpy.datetime64</code> object with ‘ns’ precision
<i>Timestamp.to_julian_date</i>	Convert <code>TimeStamp</code> to a Julian Date.
<i>Timestamp.to_period</i>	Return an period of which this timestamp is an observation.
<i>Timestamp.to_pydatetime</i>	Convert a <code>TimeStamp</code> object to a native Python <code>datetime</code> object.
<i>Timestamp.today(cls[, tz])</i>	Return the current time in the local timezone.
<i>Timestamp.toordinal</i>	Return proleptic Gregorian ordinal.
<i>Timestamp.tz_convert</i>	Convert tz-aware <code>TimeStamp</code> to another time zone.
<i>Timestamp.tz_localize</i>	Convert naive <code>TimeStamp</code> to local time zone, or remove timezone from tz-aware <code>TimeStamp</code> .
<i>Timestamp.tzname</i>	Return <code>self.tzinfo.tzname(self)</code> .
<i>Timestamp.utctimestamp(ts)</i>	Construct a naive UTC <code>datetime</code> from a POSIX timestamp.
<i>Timestamp.utcnow()</i>	Return a new <code>TimeStamp</code> representing UTC day and time.
<i>Timestamp.utcoffset</i>	Return <code>self.tzinfo.utcoffset(self)</code> .
<i>Timestamp.utctimetuple</i>	Return UTC time tuple, compatible with <code>time.localtime()</code> .
<i>Timestamp.weekday</i>	Return the day of the week represented by the date.

#### 34.14.6.1 pandas.Timestamp.freq

`Timestamp.freq`

#### 34.14.6.2 pandas.Timestamp.freqstr

`Timestamp.freqstr`

#### 34.14.6.3 pandas.Timestamp.isoformat

`Timestamp.isoformat`

### 34.14.7 Interval

<i>Interval</i>	Immutable object implementing an Interval, a bounded slice-like interval.
-----------------	---

#### 34.14.7.1 pandas.Interval

**class** `pandas.Interval`

Immutable object implementing an Interval, a bounded slice-like interval.

New in version 0.20.0.

**Parameters** `left` : orderable scalar

Left bound for the interval.

**right** : orderable scalar

Right bound for the interval.

**closed** : { 'left', 'right', 'both', 'neither' }, default 'right'

Whether the interval is closed on the left-side, right-side, both or neither.

**closed** : { 'right', 'left', 'both', 'neither' }, default 'right'

Whether the interval is closed on the left-side, right-side, both or neither. See the Notes for more detailed explanation.

**See also:**

**IntervalIndex** An Index of Interval objects that are all closed on the same side.

**cut** Convert continuous data into discrete bins (Categorical of Interval objects).

**qcut** Convert continuous data into bins (Categorical of Interval objects) based on quantiles.

**Period** Represents a period of time.

## Notes

The parameters *left* and *right* must be from the same type, you must be able to compare them and they must satisfy `left <= right`.

A closed interval (in mathematics denoted by square brackets) contains its endpoints, i.e. the closed interval `[0, 5]` is characterized by the conditions `0 <= x <= 5`. This is what `closed='both'` stands for. An open interval (in mathematics denoted by parentheses) does not contain its endpoints, i.e. the open interval `(0, 5)` is characterized by the conditions `0 < x < 5`. This is what `closed='neither'` stands for. Intervals can also be half-open or half-closed, i.e. `[0, 5)` is described by `0 <= x < 5` (`closed='left'`) and `(0, 5]` is described by `0 < x <= 5` (`closed='right'`).

## Examples

It is possible to build Intervals of different types, like numeric ones:

```
>>> iv = pd.Interval(left=0, right=5)
>>> iv
Interval(0, 5, closed='right')
```

You can check if an element belongs to it

```
>>> 2.5 in iv
True
```

You can test the bounds (`closed='right'`, so `0 < x <= 5`):

```
>>> 0 in iv
False
>>> 5 in iv
True
>>> 0.0001 in iv
True
```

Calculate its length

```
>>> iv.length
5
```

You can operate with + and \* over an Interval and the operation is applied to each of its bounds, so the result depends on the type of the bound elements

```
>>> shifted_iv = iv + 3
>>> shifted_iv
Interval(3, 8, closed='right')
>>> extended_iv = iv * 10.0
>>> extended_iv
Interval(0.0, 50.0, closed='right')
```

To create a time interval you can use Timestamps as the bounds

```
>>> year_2017 = pd.Interval(pd.Timestamp('2017-01-01 00:00:00'),
...                          pd.Timestamp('2018-01-01 00:00:00'),
...                          closed='left')
>>> pd.Timestamp('2017-01-01 00:00:00') in year_2017
True
>>> year_2017.length
Timedelta('365 days 00:00:00')
```

And also you can create string intervals

```
>>> volume_1 = pd.Interval('Ant', 'Dog', closed='both')
>>> 'Bee' in volume_1
True
```

## Attributes

<i>closed</i>	Whether the interval is closed on the left-side, right-side, both or neither
<i>closed_left</i>	Check if the interval is closed on the left side.
<i>closed_right</i>	Check if the interval is closed on the right side.
<i>left</i>	Left bound for the interval
<i>length</i>	Return the length of the Interval
<i>mid</i>	Return the midpoint of the Interval
<i>open_left</i>	Check if the interval is open on the left side.
<i>open_right</i>	Check if the interval is open on the right side.
<i>right</i>	Right bound for the interval

### pandas.Interval.closed

`Interval.closed`

Whether the interval is closed on the left-side, right-side, both or neither

### pandas.Interval.closed\_left

`Interval.closed_left`

Check if the interval is closed on the left side.

For the meaning of *closed* and *open* see [Interval](#).

**Returns bool**

True if the Interval is closed on the left-side, else False.

**pandas.Interval.closed\_right**

`Interval.closed_right`

Check if the interval is closed on the right side.

For the meaning of *closed* and *open* see [Interval](#).

**Returns bool**

True if the Interval is closed on the left-side, else False.

**pandas.Interval.left**

`Interval.left`

Left bound for the interval

**pandas.Interval.length**

`Interval.length`

Return the length of the Interval

**pandas.Interval.mid**

`Interval.mid`

Return the midpoint of the Interval

**pandas.Interval.open\_left**

`Interval.open_left`

Check if the interval is open on the left side.

For the meaning of *closed* and *open* see [Interval](#).

**Returns bool**

True if the Interval is closed on the left-side, else False.

**pandas.Interval.open\_right**

`Interval.open_right`

Check if the interval is open on the right side.

For the meaning of *closed* and *open* see [Interval](#).

**Returns bool**

True if the Interval is closed on the left-side, else False.

**pandas.Interval.right**`Interval.right`

Right bound for the interval

**34.14.8 Properties**

<code>Interval.closed</code>	Whether the interval is closed on the left-side, right-side, both or neither
<code>Interval.closed_left</code>	Check if the interval is closed on the left side.
<code>Interval.closed_right</code>	Check if the interval is closed on the right side.
<code>Interval.left</code>	Left bound for the interval
<code>Interval.length</code>	Return the length of the Interval
<code>Interval.mid</code>	Return the midpoint of the Interval
<code>Interval.open_left</code>	Check if the interval is open on the left side.
<code>Interval.open_right</code>	Check if the interval is open on the right side.
<code>Interval.right</code>	Right bound for the interval

**34.14.9 Timedelta**

<code>Timedelta</code>	Represents a duration, the difference between two dates or times.
------------------------	---

**34.14.9.1 pandas.Timedelta****class** `pandas.Timedelta`

Represents a duration, the difference between two dates or times.

Timedelta is the pandas equivalent of python's `datetime.timedelta` and is interchangeable with it in most cases.

**Parameters****value** [Timedelta, timedelta, np.timedelta64, string, or integer]**unit** : string, {'ns', 'us', 'ms', 's', 'm', 'h', 'D'}, optional

Denote the unit of the input, if input is an integer. Default 'ns'.

**days, seconds, microseconds,****milliseconds, minutes, hours, weeks** : numeric, optional

Values for construction in compat with `datetime.timedelta`. np ints and floats will be coerced to python ints and floats.

**Notes**

The `.value` attribute is always in ns.

## Attributes

<code>asm8</code>	return a numpy timedelta64 array view of myself
<code>components</code>	Return a Components NamedTuple-like
<code>days</code>	Number of days.
<code>delta</code>	Return the timedelta in nanoseconds (ns), for internal compatibility.
<code>microseconds</code>	Number of microseconds ( $\geq 0$ and less than 1 second).
<code>nanoseconds</code>	Return the number of nanoseconds (n), where $0 \leq n < 1$ microsecond.
<code>resolution</code>	return a string representing the lowest resolution that we have
<code>seconds</code>	Number of seconds ( $\geq 0$ and less than 1 day).

### `pandas.Timedelta.asm8`

`Timedelta.asm8`  
return a numpy timedelta64 array view of myself

### `pandas.Timedelta.components`

`Timedelta.components`  
Return a Components NamedTuple-like

### `pandas.Timedelta.days`

`Timedelta.days`  
Number of days.

### `pandas.Timedelta.delta`

`Timedelta.delta`  
Return the timedelta in nanoseconds (ns), for internal compatibility.

#### Returns `int`

Timedelta in nanoseconds.

## Examples

```
>>> td = pd.Timedelta('1 days 42 ns')
>>> td.delta
86400000000042
```

```
>>> td = pd.Timedelta('3 s')
>>> td.delta
3000000000
```

```
>>> td = pd.Timedelta('3 ms 5 us')
>>> td.delta
3005000
```

```
>>> td = pd.Timedelta(42, unit='ns')
>>> td.delta
42
```

### pandas.Timedelta.microseconds

`Timedelta.microseconds`

Number of microseconds ( $\geq 0$  and less than 1 second).

### pandas.Timedelta.nanoseconds

`Timedelta.nanoseconds`

Return the number of nanoseconds (n), where  $0 \leq n < 1$  microsecond.

**Returns** int

Number of nanoseconds.

**See also:**

***Timedelta.components*** Return all attributes with assigned values (i.e. days, hours, minutes, seconds, milliseconds, microseconds, nanoseconds).

### Examples

#### Using string input

```
>>> td = pd.Timedelta('1 days 2 min 3 us 42 ns')
>>> td.nanoseconds
42
```

#### Using integer input

```
>>> td = pd.Timedelta(42, unit='ns')
>>> td.nanoseconds
42
```

### pandas.Timedelta.resolution

`Timedelta.resolution`

return a string representing the lowest resolution that we have

### pandas.Timedelta.seconds

`Timedelta.seconds`

Number of seconds ( $\geq 0$  and less than 1 day).

<b>freq</b>	
<b>is_populated</b>	
<b>value</b>	

## Methods

<i>ceil</i>	return a new Timedelta ceiled to this resolution
<i>floor</i>	return a new Timedelta floored to this resolution
<i>isoformat</i>	Format Timedelta as ISO 8601 Duration like P[n]Y[n]M[n]DT[n]H[n]M[n]S, where the [n] s are replaced by the values.
<i>round</i>	Round the Timedelta to the specified resolution
<i>to_pytimedelta</i>	return an actual datetime.timedelta object note: we lose nanosecond resolution if any
<i>to_timedelta64</i>	Returns a numpy.timedelta64 object with 'ns' precision
<i>total_seconds</i>	Total duration of timedelta in seconds (to ns precision)
<i>view</i>	array view compat

### pandas.Timedelta.ceil

`Timedelta.ceil`

return a new Timedelta ceiled to this resolution

#### Parameters

**freq** [a freq string indicating the ceiling resolution]

### pandas.Timedelta.floor

`Timedelta.floor`

return a new Timedelta floored to this resolution

#### Parameters

**freq** [a freq string indicating the flooring resolution]

### pandas.Timedelta.isoformat

`Timedelta.isoformat()`

Format Timedelta as ISO 8601 Duration like P[n]Y[n]M[n]DT[n]H[n]M[n]S, where the [n] s are replaced by the values. See [https://en.wikipedia.org/wiki/ISO\\_8601#Durations](https://en.wikipedia.org/wiki/ISO_8601#Durations)

New in version 0.20.0.

#### Returns

**formatted** [str]

**See also:**

*Timestamp.isoformat*

## Notes

The longest component is days, whose value may be larger than 365. Every component is always included, even if its value is 0. Pandas uses nanosecond precision, so up to 9 decimal places may be included in the seconds component. Trailing 0's are removed from the seconds component after the decimal. We do not 0 pad components, so it's ... *T5H...*, not ... *T05H...*

## Examples

```
>>> td = pd.Timedelta(days=6, minutes=50, seconds=3,
...                   milliseconds=10, microseconds=10, nanoseconds=12)
>>> td.isoformat()
'P6DT0H50M3.010010012S'
>>> pd.Timedelta(hours=1, seconds=10).isoformat()
'P0DT0H0M10S'
>>> pd.Timedelta(hours=1, seconds=10).isoformat()
'P0DT0H0M10S'
>>> pd.Timedelta(days=500.5).isoformat()
'P500DT12H0MS'
```

## pandas.Timedelta.round

`Timedelta.round`

Round the Timedelta to the specified resolution

### Parameters

**freq** [a freq string indicating the rounding resolution]

### Returns

a new **Timedelta** rounded to the given resolution of 'freq'

### Raises

**ValueError** if the freq cannot be converted

## pandas.Timedelta.to\_pytimedelta

`Timedelta.to_pytimedelta()`

return an actual datetime.timedelta object note: we lose nanosecond resolution if any

## pandas.Timedelta.to\_timedelta64

`Timedelta.to_timedelta64()`

Returns a numpy.timedelta64 object with 'ns' precision

## pandas.Timedelta.total\_seconds

`Timedelta.total_seconds()`

Total duration of timedelta in seconds (to ns precision)

**pandas.Timedelta.view**

```
Timedelta.view()  
array view compat
```

**34.14.10 Properties**

<i>Timedelta.asm8</i>	return a numpy timedelta64 array view of myself
<i>Timedelta.components</i>	Return a Components NamedTuple-like
<i>Timedelta.days</i>	Number of days.
<i>Timedelta.delta</i>	Return the timedelta in nanoseconds (ns), for internal compatibility.
<i>Timedelta.freq</i>	
<i>Timedelta.is_populated</i>	
<i>Timedelta.max</i>	
<i>Timedelta.microseconds</i>	Number of microseconds ( $\geq 0$ and less than 1 second).
<i>Timedelta.min</i>	
<i>Timedelta.nanoseconds</i>	Return the number of nanoseconds (n), where $0 \leq n < 1$ microsecond.
<i>Timedelta.resolution</i>	return a string representing the lowest resolution that we have
<i>Timedelta.seconds</i>	Number of seconds ( $\geq 0$ and less than 1 day).
<i>Timedelta.value</i>	
<i>Timedelta.view</i>	array view compat

**34.14.10.1 pandas.Timedelta.freq**

```
Timedelta.freq
```

**34.14.10.2 pandas.Timedelta.is\_populated**

```
Timedelta.is_populated
```

**34.14.10.3 pandas.Timedelta.max**

```
Timedelta.max = Timedelta('106751 days 23:47:16.854775')
```

**34.14.10.4 pandas.Timedelta.min**

```
Timedelta.min = Timedelta('-106752 days +00:12:43.145224')
```

**34.14.10.5 pandas.Timedelta.value**

```
Timedelta.value
```

**34.14.11 Methods**

<code>Timedelta.ceil</code>	return a new Timedelta ceiled to this resolution
<code>Timedelta.floor</code>	return a new Timedelta floored to this resolution
<code>Timedelta.isoformat</code>	Format Timedelta as ISO 8601 Duration like P[n]Y[n]M[n]DT[n]H[n]M[n]S, where the [n] s are replaced by the values.
<code>Timedelta.round</code>	Round the Timedelta to the specified resolution
<code>Timedelta.to_pytimedelta</code>	return an actual datetime.timedelta object note: we lose nanosecond resolution if any
<code>Timedelta.to_timedelta64</code>	Returns a numpy.timedelta64 object with 'ns' precision
<code>Timedelta.total_seconds</code>	Total duration of timedelta in seconds (to ns precision)

## 34.15 Frequencies

<code>to_offset(freq)</code>	Return DateOffset object from string or tuple representation or datetime.timedelta object
------------------------------	---

### 34.15.1 pandas.tseries.frequencies.to\_offset

`pandas.tseries.frequencies.to_offset(freq)`

Return DateOffset object from string or tuple representation or datetime.timedelta object

#### Parameters

**freq** [str, tuple, datetime.timedelta, DateOffset or None]

**Returns** `delta` : DateOffset

None if freq is None

**Raises** `ValueError`

If freq is an invalid frequency

**See also:**

`pandas.DateOffset`

#### Examples

```
>>> to_offset('5min')
<5 * Minutes>
```

```
>>> to_offset('1D1H')
<25 * Hours>
```

```
>>> to_offset(('W', 2))
<2 * Weeks: weekday=6>
```

```
>>> to_offset((2, 'B'))
<2 * BusinessDays>
```

```
>>> to_offset(datetime.timedelta(days=1))
<Day>
```

```
>>> to_offset(Hour())
<Hour>
```

## 34.16 Window

Rolling objects are returned by `.rolling` calls: `pandas.DataFrame.rolling()`, `pandas.Series.rolling()`, etc. Expanding objects are returned by `.expanding` calls: `pandas.DataFrame.expanding()`, `pandas.Series.expanding()`, etc. EWM objects are returned by `.ewm` calls: `pandas.DataFrame.ewm()`, `pandas.Series.ewm()`, etc.

### 34.16.1 Standard moving window functions

<code>Rolling.count()</code>	The rolling count of any non-NaN observations inside the window.
<code>Rolling.sum(*args, **kwargs)</code>	Calculate rolling sum of given DataFrame or Series.
<code>Rolling.mean(*args, **kwargs)</code>	Calculate the rolling mean of the values.
<code>Rolling.median(**kwargs)</code>	Calculate the rolling median.
<code>Rolling.var([ddof])</code>	Calculate unbiased rolling variance.
<code>Rolling.std([ddof])</code>	Calculate rolling standard deviation.
<code>Rolling.min(*args, **kwargs)</code>	Calculate the rolling minimum.
<code>Rolling.max(*args, **kwargs)</code>	rolling maximum
<code>Rolling.corr([other, pairwise])</code>	rolling sample correlation
<code>Rolling.cov([other, pairwise, ddof])</code>	rolling sample covariance
<code>Rolling.skew(**kwargs)</code>	Unbiased rolling skewness
<code>Rolling.kurt(**kwargs)</code>	Calculate unbiased rolling kurtosis.
<code>Rolling.apply(func[, raw, args, kwargs])</code>	rolling function apply
<code>Rolling.aggregate(arg, *args, **kwargs)</code>	Aggregate using one or more operations over the specified axis.
<code>Rolling.quantile(quantile[, interpolation])</code>	rolling quantile.
<code>Window.mean(*args, **kwargs)</code>	Calculate the window mean of the values.
<code>Window.sum(*args, **kwargs)</code>	Calculate window sum of given DataFrame or Series.

#### 34.16.1.1 pandas.core.window.Rolling.count

`Rolling.count()`

The rolling count of any non-NaN observations inside the window.

**Returns Series or DataFrame**

Returned object type is determined by the caller of the rolling calculation.

**See also:**

`pandas.Series.rolling` Calling object with Series data

`pandas.DataFrame.rolling` Calling object with DataFrames

`pandas.DataFrame.count` Count of the full DataFrame

## Examples

```

>>> s = pd.Series([2, 3, np.nan, 10])
>>> s.rolling(2).count()
0    1.0
1    2.0
2    1.0
3    1.0
dtype: float64
>>> s.rolling(3).count()
0    1.0
1    2.0
2    2.0
3    2.0
dtype: float64
>>> s.rolling(4).count()
0    1.0
1    2.0
2    2.0
3    3.0
dtype: float64

```

### 34.16.1.2 pandas.core.window.Rolling.sum

Rolling.**sum**(\*args, \*\*kwargs)

Calculate rolling sum of given DataFrame or Series.

**Parameters** \*args, \*\*kwargs

For compatibility with other rolling methods. Has no effect on the computed value.

**Returns** Series or DataFrame

Same type as the input, with the same index, containing the rolling sum.

**See also:**

**Series.sum** Reducing sum for Series.

**DataFrame.sum** Reducing sum for DataFrame.

## Examples

```

>>> s = pd.Series([1, 2, 3, 4, 5])
>>> s
0    1
1    2
2    3
3    4
4    5
dtype: int64

```

```

>>> s.rolling(3).sum()
0    NaN
1    NaN

```

(continues on next page)

(continued from previous page)

```

2      6.0
3      9.0
4     12.0
dtype: float64

```

```

>>> s.expanding(3).sum()
0      NaN
1      NaN
2      6.0
3     10.0
4     15.0
dtype: float64

```

```

>>> s.rolling(3, center=True).sum()
0      NaN
1      6.0
2      9.0
3     12.0
4      NaN
dtype: float64

```

For DataFrame, each rolling sum is computed column-wise.

```

>>> df = pd.DataFrame({"A": s, "B": s ** 2})
>>> df
   A  B
0  1  1
1  2  4
2  3  9
3  4 16
4  5 25

```

```

>>> df.rolling(3).sum()
   A      B
0  NaN  NaN
1  NaN  NaN
2  6.0 14.0
3  9.0 29.0
4 12.0 50.0

```

### 34.16.1.3 pandas.core.window.Rolling.mean

Rolling.**mean**(\*args, \*\*kwargs)

Calculate the rolling mean of the values.

#### Parameters **\*args**

Under Review.

#### **\*\*kwargs**

Under Review.

#### Returns **Series or DataFrame**

Returned object type is determined by the caller of the rolling calculation.

See also:

**Series.rolling** Calling object with Series data

**DataFrame.rolling** Calling object with DataFrames

**Series.mean** Equivalent method for Series

**DataFrame.mean** Equivalent method for DataFrame

## Examples

The below examples will show rolling mean calculations with window sizes of two and three, respectively.

```
>>> s = pd.Series([1, 2, 3, 4])
>>> s.rolling(2).mean()
0      NaN
1      1.5
2      2.5
3      3.5
dtype: float64
```

```
>>> s.rolling(3).mean()
0      NaN
1      NaN
2      2.0
3      3.0
dtype: float64
```

### 34.16.1.4 pandas.core.window.Rolling.median

**Rolling.median** (\*\*kwargs)

Calculate the rolling median.

**Parameters** \*\*kwargs

For compatibility with other rolling methods. Has no effect on the computed median.

**Returns** Series or DataFrame

Returned type is the same as the original object.

See also:

**Series.rolling** Calling object with Series data

**DataFrame.rolling** Calling object with DataFrames

**Series.median** Equivalent method for Series

**DataFrame.median** Equivalent method for DataFrame

## Examples

Compute the rolling median of a series with a window size of 3.

```
>>> s = pd.Series([0, 1, 2, 3, 4])
>>> s.rolling(3).median()
0      NaN
1      NaN
2      1.0
3      2.0
4      3.0
dtype: float64
```

### 34.16.1.5 pandas.core.window.Rolling.var

`Rolling.var(ddof=1, *args, **kwargs)`

Calculate unbiased rolling variance.

Normalized by N-1 by default. This can be changed using the *ddof* argument.

**Parameters** *ddof*: int, default 1

Delta Degrees of Freedom. The divisor used in calculations is  $N - \text{ddof}$ , where  $N$  represents the number of elements.

*\*args, \*\*kwargs*

For NumPy compatibility. No additional arguments are used.

**Returns** **Series or DataFrame**

Returns the same object type as the caller of the rolling calculation.

**See also:**

**Series.rolling** Calling object with Series data

**DataFrame.rolling** Calling object with DataFrames

**Series.var** Equivalent method for Series

**DataFrame.var** Equivalent method for DataFrame

**numpy.var** Equivalent method for Numpy array

### Notes

The default *ddof* of 1 used in `Series.var()` is different than the default *ddof* of 0 in `numpy.var()`.

A minimum of 1 period is required for the rolling calculation.

### Examples

```
>>> s = pd.Series([5, 5, 6, 7, 5, 5, 5])
>>> s.rolling(3).var()
0      NaN
1      NaN
2    0.333333
3    1.000000
4    1.000000
5    1.333333
```

(continues on next page)

(continued from previous page)

```
6      0.000000
dtype: float64
```

```
>>> s.expanding(3).var()
0      NaN
1      NaN
2      0.333333
3      0.916667
4      0.800000
5      0.700000
6      0.619048
dtype: float64
```

### 34.16.1.6 pandas.core.window.Rolling.std

`Rolling.std(ddof=1, *args, **kwargs)`

Calculate rolling standard deviation.

Normalized by N-1 by default. This can be changed using the *ddof* argument.

**Parameters** *ddof* : int, default 1

Delta Degrees of Freedom. The divisor used in calculations is  $N - \text{ddof}$ , where  $N$  represents the number of elements.

**\*args, \*\*kwargs**

For NumPy compatibility. No additional arguments are used.

**Returns** **Series or DataFrame**

Returns the same object type as the caller of the rolling calculation.

**See also:**

**Series.rolling** Calling object with Series data

**DataFrame.rolling** Calling object with DataFrames

**Series.std** Equivalent method for Series

**DataFrame.std** Equivalent method for DataFrame

**numpy.std** Equivalent method for Numpy array

### Notes

The default *ddof* of 1 used in `Series.std` is different than the default *ddof* of 0 in `numpy.std`.

A minimum of one period is required for the rolling calculation.

### Examples

```
>>> s = pd.Series([5, 5, 6, 7, 5, 5, 5])
>>> s.rolling(3).std()
0      NaN
1      NaN
2    0.577350
3    1.000000
4    1.000000
5    1.154701
6    0.000000
dtype: float64
```

```
>>> s.expanding(3).std()
0      NaN
1      NaN
2    0.577350
3    0.957427
4    0.894427
5    0.836660
6    0.786796
dtype: float64
```

### 34.16.1.7 pandas.core.window.Rolling.min

`Rolling.min(*args, **kwargs)`  
Calculate the rolling minimum.

**Parameters** **\*\*kwargs**

Under Review.

**Returns** **Series or DataFrame**

Returned object type is determined by the caller of the rolling calculation.

**See also:**

**Series.rolling** Calling object with a Series

**DataFrame.rolling** Calling object with a DataFrame

**Series.min** Similar method for Series

**DataFrame.min** Similar method for DataFrame

### Examples

Performing a rolling minimum with a window size of 3.

```
>>> s = pd.Series([4, 3, 5, 2, 6])
>>> s.rolling(3).min()
0      NaN
1      NaN
2     3.0
3     2.0
4     2.0
dtype: float64
```

### 34.16.1.8 pandas.core.window.Rolling.max

`Rolling.max(*args, **kwargs)`  
 rolling maximum

**Returns**

same type as input

**See also:**

*pandas.Series.rolling, pandas.DataFrame.rolling*

### 34.16.1.9 pandas.core.window.Rolling.corr

`Rolling.corr(other=None, pairwise=None, **kwargs)`  
 rolling sample correlation

**Parameters** **other** : Series, DataFrame, or ndarray, optional

if not supplied then will default to self and produce pairwise output

**pairwise** : bool, default None

If False then only matching columns between self and other will be used and the output will be a DataFrame. If True then all pairwise combinations will be calculated and the output will be a MultiIndex DataFrame in the case of DataFrame inputs. In the case of missing elements, only complete pairwise observations will be used.

**Returns**

same type as input

**See also:**

*pandas.Series.rolling, pandas.DataFrame.rolling*

### 34.16.1.10 pandas.core.window.Rolling.cov

`Rolling.cov(other=None, pairwise=None, ddof=1, **kwargs)`  
 rolling sample covariance

**Parameters** **other** : Series, DataFrame, or ndarray, optional

if not supplied then will default to self and produce pairwise output

**pairwise** : bool, default None

If False then only matching columns between self and other will be used and the output will be a DataFrame. If True then all pairwise combinations will be calculated and the output will be a MultiIndexed DataFrame in the case of DataFrame inputs. In the case of missing elements, only complete pairwise observations will be used.

**ddof** : int, default 1

Delta Degrees of Freedom. The divisor used in calculations is  $N - \text{ddof}$ , where  $N$  represents the number of elements.

**Returns**

same type as input

See also:

*pandas.Series.rolling, pandas.DataFrame.rolling*

#### 34.16.1.11 pandas.core.window.Rolling.skew

`Rolling.skew(**kwargs)`

Unbiased rolling skewness

**Returns**

same type as input

See also:

*pandas.Series.rolling, pandas.DataFrame.rolling*

#### 34.16.1.12 pandas.core.window.Rolling.kurt

`Rolling.kurt(**kwargs)`

Calculate unbiased rolling kurtosis.

This function uses Fisher's definition of kurtosis without bias.

**Parameters** `**kwargs`

Under Review.

**Returns** **Series or DataFrame**

Returned object type is determined by the caller of the rolling calculation

See also:

**Series.rolling** Calling object with Series data

**DataFrame.rolling** Calling object with DataFrames

**Series.kurt** Equivalent method for Series

**DataFrame.kurt** Equivalent method for DataFrame

**scipy.stats.skew** Third moment of a probability density

**scipy.stats.kurtosis** Reference SciPy method

#### Notes

A minimum of 4 periods is required for the rolling calculation.

#### Examples

The example below will show a rolling calculation with a window size of four matching the equivalent function call using *scipy.stats*.

```

>>> arr = [1, 2, 3, 4, 999]
>>> fmt = "{0:.6f}" # limit the printed precision to 6 digits
>>> import scipy.stats
>>> print(fmt.format(scipy.stats.kurtosis(arr[:-1], bias=False)))
-1.200000
>>> print(fmt.format(scipy.stats.kurtosis(arr[1:], bias=False)))
3.999946
>>> s = pd.Series(arr)
>>> s.rolling(4).kurt()
0      NaN
1      NaN
2      NaN
3    -1.200000
4     3.999946
dtype: float64

```

### 34.16.1.13 pandas.core.window.Rolling.apply

`Rolling.apply` (*func*, *raw=None*, *args=()*, *kwargs={}*)  
 rolling function apply

**Parameters** *func* : function

Must produce a single value from an ndarray input if *raw=True* or a Series if *raw=False*

**raw** : bool, default None

- *False* : passes each row or column as a Series to the function.
- *True* or *None* : the passed function will receive ndarray objects instead. If you are just applying a NumPy reduction function this will achieve much better performance.

The *raw* parameter is required and will show a FutureWarning if not passed. In the future *raw* will default to *False*.

New in version 0.23.0.

**\*args and \*\*kwargs are passed to the function**

**Returns**

same type as input

**See also:**

`pandas.Series.rolling`, `pandas.DataFrame.rolling`

### 34.16.1.14 pandas.core.window.Rolling.aggregate

`Rolling.aggregate` (*arg*, *\*args*, *\*\*kwargs*)

Aggregate using one or more operations over the specified axis.

**Parameters** *func* : function, string, dictionary, or list of string/functions

Function to use for aggregating the data. If a function, must either work when passed a Series/DataFrame or when passed to Series/DataFrame.apply. For a DataFrame, can pass a dict, if the keys are DataFrame column names.

Accepted combinations are:

- string function name.
- function.
- list of functions.
- dict of column names -> functions (or list of functions).

**\*args**

Positional arguments to pass to *func*.

**\*\*kwargs**

Keyword arguments to pass to *func*.

**Returns**

**aggregated** [Series/DataFrame]

**See also:**

`pandas.Series.rolling`, `pandas.DataFrame.rolling`

**Notes**

*agg* is an alias for *aggregate*. Use the alias.

A passed user-defined-function will be passed a Series for evaluation.

**Examples**

```
>>> df = pd.DataFrame(np.random.randn(10, 3), columns=['A', 'B', 'C'])
>>> df
```

	A	B	C
0	-2.385977	-0.102758	0.438822
1	-1.004295	0.905829	-0.954544
2	0.735167	-0.165272	-1.619346
3	-0.702657	-1.340923	-0.706334
4	-0.246845	0.211596	-0.901819
5	2.463718	3.157577	-1.380906
6	-1.142255	2.340594	-0.039875
7	1.396598	-1.647453	1.677227
8	-0.543425	1.761277	-0.220481
9	-0.640505	0.289374	-1.550670

```
>>> df.rolling(3).sum()
```

	A	B	C
0	NaN	NaN	NaN
1	NaN	NaN	NaN
2	-2.655105	0.637799	-2.135068
3	-0.971785	-0.600366	-3.280224
4	-0.214334	-1.294599	-3.227500
5	1.514216	2.028250	-2.989060
6	1.074618	5.709767	-2.322600
7	2.718061	3.850718	0.256446
8	-0.289082	2.454418	1.416871
9	0.212668	0.403198	-0.093924

```
>>> df.rolling(3).agg({'A': 'sum', 'B': 'min'})
```

	A	B
0	NaN	NaN
1	NaN	NaN
2	-2.655105	-0.165272
3	-0.971785	-1.340923
4	-0.214334	-1.340923
5	1.514216	-1.340923
6	1.074618	0.211596
7	2.718061	-1.647453
8	-0.289082	-1.647453
9	0.212668	-1.647453

### 34.16.1.15 pandas.core.window.Rolling.quantile

`Rolling.quantile` (*quantile*, *interpolation*='linear', *\*\*kwargs*)  
rolling quantile.

**Parameters** *quantile* : float

Quantile to compute.  $0 \leq \text{quantile} \leq 1$ .

**interpolation** : {'linear', 'lower', 'higher', 'midpoint', 'nearest'}

New in version 0.23.0.

This optional parameter specifies the interpolation method to use, when the desired quantile lies between two data points *i* and *j*:

- linear:  $i + (j - i) * \text{fraction}$ , where *fraction* is the fractional part of the index surrounded by *i* and *j*.
- lower: *i*.
- higher: *j*.
- nearest: *i* or *j* whichever is nearest.
- midpoint:  $(i + j) / 2$ .

**\*\*kwargs**:

For compatibility with other rolling methods. Has no effect on the result.

**Returns** Series or DataFrame

Returned object type is determined by the caller of the rolling calculation.

See also:

[`pandas.Series.quantile`](#) Computes value at the given quantile over all data in Series.

[`pandas.DataFrame.quantile`](#) Computes values at the given quantile over requested axis in DataFrame.

### Examples

```
>>> s = pd.Series([1, 2, 3, 4])
>>> s.rolling(2).quantile(.4, interpolation='lower')
```

0	NaN
---	-----

(continues on next page)

(continued from previous page)

```
1    1.0
2    2.0
3    3.0
dtype: float64
```

```
>>> s.rolling(2).quantile(.4, interpolation='midpoint')
0    NaN
1    1.5
2    2.5
3    3.5
dtype: float64
```

### 34.16.1.16 pandas.core.window.Window.mean

Window.**mean** (\*args, \*\*kwargs)

Calculate the window mean of the values.

**Parameters** \*args

Under Review.

**\*\*kwargs**

Under Review.

**Returns** Series or DataFrame

Returned object type is determined by the caller of the window calculation.

**See also:**

**Series.window** Calling object with Series data

**DataFrame.window** Calling object with DataFrames

**Series.mean** Equivalent method for Series

**DataFrame.mean** Equivalent method for DataFrame

### Examples

The below examples will show rolling mean calculations with window sizes of two and three, respectively.

```
>>> s = pd.Series([1, 2, 3, 4])
>>> s.rolling(2).mean()
0    NaN
1    1.5
2    2.5
3    3.5
dtype: float64
```

```
>>> s.rolling(3).mean()
0    NaN
1    NaN
2    2.0
3    3.0
dtype: float64
```

### 34.16.1.17 pandas.core.window.Window.sum

`Window.sum(*args, **kwargs)`

Calculate window sum of given DataFrame or Series.

**Parameters** `*args, **kwargs`

For compatibility with other window methods. Has no effect on the computed value.

**Returns** `Series or DataFrame`

Same type as the input, with the same index, containing the window sum.

**See also:**

**Series.sum** Reducing sum for Series.

**DataFrame.sum** Reducing sum for DataFrame.

#### Examples

```
>>> s = pd.Series([1, 2, 3, 4, 5])
>>> s
0    1
1    2
2    3
3    4
4    5
dtype: int64
```

```
>>> s.rolling(3).sum()
0    NaN
1    NaN
2    6.0
3    9.0
4   12.0
dtype: float64
```

```
>>> s.expanding(3).sum()
0    NaN
1    NaN
2    6.0
3   10.0
4   15.0
dtype: float64
```

```
>>> s.rolling(3, center=True).sum()
0    NaN
1    6.0
2    9.0
3   12.0
4    NaN
dtype: float64
```

For DataFrame, each window sum is computed column-wise.

```
>>> df = pd.DataFrame({"A": s, "B": s ** 2})
>>> df
   A  B
0  1  1
1  2  4
2  3  9
3  4 16
4  5 25
```

```
>>> df.rolling(3).sum()
   A    B
0 NaN NaN
1 NaN NaN
2 6.0 14.0
3 9.0 29.0
4 12.0 50.0
```

### 34.16.2 Standard expanding window functions

<i>Expanding.count</i> (**kwargs)	The expanding count of any non-NaN observations inside the window.
<i>Expanding.sum</i> (*args, **kwargs)	Calculate expanding sum of given DataFrame or Series.
<i>Expanding.mean</i> (*args, **kwargs)	Calculate the expanding mean of the values.
<i>Expanding.median</i> (**kwargs)	Calculate the expanding median.
<i>Expanding.var</i> ([ddof])	Calculate unbiased expanding variance.
<i>Expanding.std</i> ([ddof])	Calculate expanding standard deviation.
<i>Expanding.min</i> (*args, **kwargs)	Calculate the expanding minimum.
<i>Expanding.max</i> (*args, **kwargs)	expanding maximum
<i>Expanding.corr</i> ([other, pairwise])	expanding sample correlation
<i>Expanding.cov</i> ([other, pairwise, ddof])	expanding sample covariance
<i>Expanding.skew</i> (**kwargs)	Unbiased expanding skewness
<i>Expanding.kurt</i> (**kwargs)	Calculate unbiased expanding kurtosis.
<i>Expanding.apply</i> (func[, raw, args, kwargs])	expanding function apply
<i>Expanding.aggregate</i> (arg, *args, **kwargs)	Aggregate using one or more operations over the specified axis.
<i>Expanding.quantile</i> (quantile[, interpolation])	expanding quantile.

#### 34.16.2.1 pandas.core.window.Expanding.count

`Expanding.count` (\*\*kwargs)

The expanding count of any non-NaN observations inside the window.

**Returns Series or DataFrame**

Returned object type is determined by the caller of the expanding calculation.

**See also:**

**pandas.Series.expanding** Calling object with Series data

**pandas.DataFrame.expanding** Calling object with DataFrames

**pandas.DataFrame.count** Count of the full DataFrame

## Examples

```
>>> s = pd.Series([2, 3, np.nan, 10])
>>> s.rolling(2).count()
0    1.0
1    2.0
2    1.0
3    1.0
dtype: float64
>>> s.rolling(3).count()
0    1.0
1    2.0
2    2.0
3    2.0
dtype: float64
>>> s.rolling(4).count()
0    1.0
1    2.0
2    2.0
3    3.0
dtype: float64
```

### 34.16.2.2 pandas.core.window.Expanding.sum

Expanding.**sum**(\*args, \*\*kwargs)

Calculate expanding sum of given DataFrame or Series.

**Parameters** \*args, \*\*kwargs

For compatibility with other expanding methods. Has no effect on the computed value.

**Returns** Series or DataFrame

Same type as the input, with the same index, containing the expanding sum.

**See also:**

**Series.sum** Reducing sum for Series.

**DataFrame.sum** Reducing sum for DataFrame.

## Examples

```
>>> s = pd.Series([1, 2, 3, 4, 5])
>>> s
0    1
1    2
2    3
3    4
4    5
dtype: int64
```

```
>>> s.rolling(3).sum()
0    NaN
```

(continues on next page)

(continued from previous page)

```

1      NaN
2      6.0
3      9.0
4     12.0
dtype: float64

```

```

>>> s.expanding(3).sum()
0      NaN
1      NaN
2      6.0
3     10.0
4     15.0
dtype: float64

```

```

>>> s.rolling(3, center=True).sum()
0      NaN
1      6.0
2      9.0
3     12.0
4      NaN
dtype: float64

```

For DataFrame, each expanding sum is computed column-wise.

```

>>> df = pd.DataFrame({"A": s, "B": s ** 2})
>>> df
   A  B
0  1  1
1  2  4
2  3  9
3  4 16
4  5 25

```

```

>>> df.rolling(3).sum()
   A  B
0  NaN NaN
1  NaN NaN
2  6.0 14.0
3  9.0 29.0
4 12.0 50.0

```

### 34.16.2.3 pandas.core.window.Expanding.mean

`Expanding.mean(*args, **kwargs)`

Calculate the expanding mean of the values.

#### Parameters *\*args*

Under Review.

#### *\*\*kwargs*

Under Review.

#### Returns Series or DataFrame

Returned object type is determined by the caller of the expanding calculation.

See also:

**Series.expanding** Calling object with Series data

**DataFrame.expanding** Calling object with DataFrames

**Series.mean** Equivalent method for Series

**DataFrame.mean** Equivalent method for DataFrame

## Examples

The below examples will show rolling mean calculations with window sizes of two and three, respectively.

```
>>> s = pd.Series([1, 2, 3, 4])
>>> s.rolling(2).mean()
0      NaN
1      1.5
2      2.5
3      3.5
dtype: float64
```

```
>>> s.rolling(3).mean()
0      NaN
1      NaN
2      2.0
3      3.0
dtype: float64
```

### 34.16.2.4 pandas.core.window.Expanding.median

**Expanding.median** (\*\*kwargs)

Calculate the expanding median.

**Parameters** \*\*kwargs

For compatibility with other expanding methods. Has no effect on the computed median.

**Returns** Series or DataFrame

Returned type is the same as the original object.

See also:

**Series.expanding** Calling object with Series data

**DataFrame.expanding** Calling object with DataFrames

**Series.median** Equivalent method for Series

**DataFrame.median** Equivalent method for DataFrame

## Examples

Compute the rolling median of a series with a window size of 3.

```
>>> s = pd.Series([0, 1, 2, 3, 4])
>>> s.rolling(3).median()
0      NaN
1      NaN
2      1.0
3      2.0
4      3.0
dtype: float64
```

### 34.16.2.5 pandas.core.window.Expanding.var

Expanding.**var**(*ddof=1, \*args, \*\*kwargs*)

Calculate unbiased expanding variance.

Normalized by N-1 by default. This can be changed using the *ddof* argument.

**Parameters** *ddof*: int, default 1

Delta Degrees of Freedom. The divisor used in calculations is  $N - \text{ddof}$ , where  $N$  represents the number of elements.

**\*args, \*\*kwargs**

For NumPy compatibility. No additional arguments are used.

**Returns** **Series or DataFrame**

Returns the same object type as the caller of the expanding calculation.

**See also:**

**Series.expanding** Calling object with Series data

**DataFrame.expanding** Calling object with DataFrames

**Series.var** Equivalent method for Series

**DataFrame.var** Equivalent method for DataFrame

**numpy.var** Equivalent method for Numpy array

### Notes

The default *ddof* of 1 used in `Series.var()` is different than the default *ddof* of 0 in `numpy.var()`.

A minimum of 1 period is required for the rolling calculation.

### Examples

```
>>> s = pd.Series([5, 5, 6, 7, 5, 5, 5])
>>> s.rolling(3).var()
0      NaN
1      NaN
2    0.333333
3    1.000000
4    1.000000
5    1.333333
```

(continues on next page)

(continued from previous page)

```
6    0.000000
dtype: float64
```

```
>>> s.expanding(3).var()
0      NaN
1      NaN
2    0.333333
3    0.916667
4    0.800000
5    0.700000
6    0.619048
dtype: float64
```

### 34.16.2.6 pandas.core.window.Expanding.std

Expanding.**std**(*ddof=1*, \*args, \*\*kwargs)

Calculate expanding standard deviation.

Normalized by N-1 by default. This can be changed using the *ddof* argument.

**Parameters** *ddof*: int, default 1

Delta Degrees of Freedom. The divisor used in calculations is  $N - \text{ddof}$ , where  $N$  represents the number of elements.

**\*args, \*\*kwargs**

For NumPy compatibility. No additional arguments are used.

**Returns** **Series or DataFrame**

Returns the same object type as the caller of the expanding calculation.

**See also:**

**Series.expanding** Calling object with Series data

**DataFrame.expanding** Calling object with DataFrames

**Series.std** Equivalent method for Series

**DataFrame.std** Equivalent method for DataFrame

**numpy.std** Equivalent method for Numpy array

#### Notes

The default *ddof* of 1 used in Series.std is different than the default *ddof* of 0 in numpy.std.

A minimum of one period is required for the rolling calculation.

#### Examples

```
>>> s = pd.Series([5, 5, 6, 7, 5, 5, 5])
>>> s.rolling(3).std()
0      NaN
1      NaN
2    0.577350
3    1.000000
4    1.000000
5    1.154701
6    0.000000
dtype: float64
```

```
>>> s.expanding(3).std()
0      NaN
1      NaN
2    0.577350
3    0.957427
4    0.894427
5    0.836660
6    0.786796
dtype: float64
```

### 34.16.2.7 pandas.core.window.Expanding.min

`Expanding.min(*args, **kwargs)`  
Calculate the expanding minimum.

**Parameters** **\*\*kwargs**

Under Review.

**Returns** **Series or DataFrame**

Returned object type is determined by the caller of the expanding calculation.

**See also:**

**Series.expanding** Calling object with a Series

**DataFrame.expanding** Calling object with a DataFrame

**Series.min** Similar method for Series

**DataFrame.min** Similar method for DataFrame

### Examples

Performing a rolling minimum with a window size of 3.

```
>>> s = pd.Series([4, 3, 5, 2, 6])
>>> s.rolling(3).min()
0      NaN
1      NaN
2    3.0
3    2.0
4    2.0
dtype: float64
```

### 34.16.2.8 pandas.core.window.Expanding.max

`Expanding.max(*args, **kwargs)`  
expanding maximum

**Returns**

same type as input

**See also:**

*pandas.Series.expanding, pandas.DataFrame.expanding*

### 34.16.2.9 pandas.core.window.Expanding.corr

`Expanding.corr(other=None, pairwise=None, **kwargs)`  
expanding sample correlation

**Parameters** *other* : Series, DataFrame, or ndarray, optional

if not supplied then will default to self and produce pairwise output

**pairwise** : bool, default None

If False then only matching columns between self and other will be used and the output will be a DataFrame. If True then all pairwise combinations will be calculated and the output will be a MultiIndex DataFrame in the case of DataFrame inputs. In the case of missing elements, only complete pairwise observations will be used.

**Returns**

same type as input

**See also:**

*pandas.Series.expanding, pandas.DataFrame.expanding*

### 34.16.2.10 pandas.core.window.Expanding.cov

`Expanding.cov(other=None, pairwise=None, ddof=1, **kwargs)`  
expanding sample covariance

**Parameters** *other* : Series, DataFrame, or ndarray, optional

if not supplied then will default to self and produce pairwise output

**pairwise** : bool, default None

If False then only matching columns between self and other will be used and the output will be a DataFrame. If True then all pairwise combinations will be calculated and the output will be a MultiIndexed DataFrame in the case of DataFrame inputs. In the case of missing elements, only complete pairwise observations will be used.

**ddof** : int, default 1

Delta Degrees of Freedom. The divisor used in calculations is  $N - \text{ddof}$ , where  $N$  represents the number of elements.

**Returns**

same type as input

See also:

*pandas.Series.expanding, pandas.DataFrame.expanding*

#### 34.16.2.11 pandas.core.window.Expanding.skew

`Expanding.skew(**kwargs)`

Unbiased expanding skewness

**Returns**

same type as input

See also:

*pandas.Series.expanding, pandas.DataFrame.expanding*

#### 34.16.2.12 pandas.core.window.Expanding.kurt

`Expanding.kurt(**kwargs)`

Calculate unbiased expanding kurtosis.

This function uses Fisher's definition of kurtosis without bias.

**Parameters** `**kwargs`

Under Review.

**Returns** **Series or DataFrame**

Returned object type is determined by the caller of the expanding calculation

See also:

**Series.expanding** Calling object with Series data

**DataFrame.expanding** Calling object with DataFrames

**Series.kurt** Equivalent method for Series

**DataFrame.kurt** Equivalent method for DataFrame

**scipy.stats.skew** Third moment of a probability density

**scipy.stats.kurtosis** Reference SciPy method

#### Notes

A minimum of 4 periods is required for the expanding calculation.

#### Examples

The example below will show an expanding calculation with a window size of four matching the equivalent function call using *scipy.stats*.

```

>>> arr = [1, 2, 3, 4, 999]
>>> import scipy.stats
>>> fmt = "{0:.6f}" # limit the printed precision to 6 digits
>>> print(fmt.format(scipy.stats.kurtosis(arr[:-1], bias=False)))
-1.200000
>>> print(fmt.format(scipy.stats.kurtosis(arr, bias=False)))
4.999874
>>> s = pd.Series(arr)
>>> s.expanding(4).kurt()
0      NaN
1      NaN
2      NaN
3    -1.200000
4     4.999874
dtype: float64

```

### 34.16.2.13 pandas.core.window.Expanding.apply

`Expanding.apply` (*func*, *raw=None*, *args=()*, *kwargs={}*)

expanding function apply

**Parameters** *func* : function

Must produce a single value from an ndarray input if *raw=True* or a Series if *raw=False*

**raw** : bool, default None

- *False* : passes each row or column as a Series to the function.
- *True* or *None* : the passed function will receive ndarray objects instead. If you are just applying a NumPy reduction function this will achieve much better performance.

The *raw* parameter is required and will show a FutureWarning if not passed. In the future *raw* will default to *False*.

New in version 0.23.0.

**\*args and \*\*kwargs are passed to the function**

**Returns**

same type as input

**See also:**

`pandas.Series.expanding`, `pandas.DataFrame.expanding`

### 34.16.2.14 pandas.core.window.Expanding.aggregate

`Expanding.aggregate` (*arg*, *\*args*, *\*\*kwargs*)

Aggregate using one or more operations over the specified axis.

**Parameters** *func* : function, string, dictionary, or list of string/functions

Function to use for aggregating the data. If a function, must either work when passed a Series/DataFrame or when passed to Series/DataFrame.apply. For a DataFrame, can pass a dict, if the keys are DataFrame column names.

Accepted combinations are:

- string function name.
- function.
- list of functions.
- dict of column names -> functions (or list of functions).

**\*args**

Positional arguments to pass to *func*.

**\*\*kwargs**

Keyword arguments to pass to *func*.

**Returns**

**aggregated** [Series/DataFrame]

**See also:**

`pandas.DataFrame.expanding.aggregate`, `pandas.DataFrame.rolling.aggregate`,  
`pandas.DataFrame.aggregate`

**Notes**

*agg* is an alias for *aggregate*. Use the alias.

A passed user-defined-function will be passed a Series for evaluation.

**Examples**

```
>>> df = pd.DataFrame(np.random.randn(10, 3), columns=['A', 'B', 'C'])
>>> df
```

	A	B	C
0	-2.385977	-0.102758	0.438822
1	-1.004295	0.905829	-0.954544
2	0.735167	-0.165272	-1.619346
3	-0.702657	-1.340923	-0.706334
4	-0.246845	0.211596	-0.901819
5	2.463718	3.157577	-1.380906
6	-1.142255	2.340594	-0.039875
7	1.396598	-1.647453	1.677227
8	-0.543425	1.761277	-0.220481
9	-0.640505	0.289374	-1.550670

```
>>> df.ewm(alpha=0.5).mean()
```

	A	B	C
0	-2.385977	-0.102758	0.438822
1	-1.464856	0.569633	-0.490089
2	-0.207700	0.149687	-1.135379
3	-0.471677	-0.645305	-0.906555
4	-0.355635	-0.203033	-0.904111
5	1.076417	1.503943	-1.146293
6	-0.041654	1.925562	-0.588728
7	0.680292	0.132049	0.548693

(continues on next page)

(continued from previous page)

```
8  0.067236  0.948257  0.163353
9 -0.286980  0.618493 -0.694496
```

### 34.16.2.15 pandas.core.window.Expanding.quantile

`Expanding.quantile` (*quantile*, *interpolation='linear'*, *\*\*kwargs*)  
expanding quantile.

**Parameters** *quantile* : float

Quantile to compute.  $0 \leq \text{quantile} \leq 1$ .

**interpolation** : {'linear', 'lower', 'higher', 'midpoint', 'nearest'}

New in version 0.23.0.

This optional parameter specifies the interpolation method to use, when the desired quantile lies between two data points *i* and *j*:

- linear:  $i + (j - i) * \text{fraction}$ , where *fraction* is the fractional part of the index surrounded by *i* and *j*.
- lower: *i*.
- higher: *j*.
- nearest: *i* or *j* whichever is nearest.
- midpoint:  $(i + j) / 2$ .

**\*\*kwargs:**

For compatibility with other expanding methods. Has no effect on the result.

**Returns** **Series or DataFrame**

Returned object type is determined by the caller of the expanding calculation.

**See also:**

[`pandas.Series.quantile`](#) Computes value at the given quantile over all data in Series.

[`pandas.DataFrame.quantile`](#) Computes values at the given quantile over requested axis in DataFrame.

### Examples

```
>>> s = pd.Series([1, 2, 3, 4])
>>> s.rolling(2).quantile(.4, interpolation='lower')
0    NaN
1    1.0
2    2.0
3    3.0
dtype: float64
```

```
>>> s.rolling(2).quantile(.4, interpolation='midpoint')
0    NaN
1    1.5
2    2.5
```

(continues on next page)

(continued from previous page)

```
3      3.5
dtype: float64
```

### 34.16.3 Exponentially-weighted moving window functions

<code>EWM.mean(*args, **kwargs)</code>	exponential weighted moving average
<code>EWM.std([bias])</code>	exponential weighted moving stddev
<code>EWM.var([bias])</code>	exponential weighted moving variance
<code>EWM.corr([other, pairwise])</code>	exponential weighted sample correlation
<code>EWM.cov([other, pairwise, bias])</code>	exponential weighted sample covariance

#### 34.16.3.1 pandas.core.window.EWM.mean

`EWM.mean(*args, **kwargs)`  
exponential weighted moving average

**Returns**

same type as input

See also:

`pandas.Series.ewm`, `pandas.DataFrame.ewm`

#### 34.16.3.2 pandas.core.window.EWM.std

`EWM.std(bias=False, *args, **kwargs)`  
exponential weighted moving stddev

**Parameters** `bias` : boolean, default False

Use a standard estimation bias correction

**Returns**

same type as input

See also:

`pandas.Series.ewm`, `pandas.DataFrame.ewm`

#### 34.16.3.3 pandas.core.window.EWM.var

`EWM.var(bias=False, *args, **kwargs)`  
exponential weighted moving variance

**Parameters** `bias` : boolean, default False

Use a standard estimation bias correction

**Returns**

same type as input

See also:

`pandas.Series.ewm`, `pandas.DataFrame.ewm`

### 34.16.3.4 pandas.core.window.EWM.corr

`EWM.corr` (*other=None, pairwise=None, \*\*kwargs*)  
exponential weighted sample correlation

**Parameters** *other* : Series, DataFrame, or ndarray, optional

if not supplied then will default to self and produce pairwise output

**pairwise** : bool, default None

If False then only matching columns between self and other will be used and the output will be a DataFrame. If True then all pairwise combinations will be calculated and the output will be a MultiIndex DataFrame in the case of DataFrame inputs. In the case of missing elements, only complete pairwise observations will be used.

**bias** : boolean, default False

Use a standard estimation bias correction

**Returns**

same type as input

**See also:**

`pandas.Series.ewm`, `pandas.DataFrame.ewm`

### 34.16.3.5 pandas.core.window.EWM.cov

`EWM.cov` (*other=None, pairwise=None, bias=False, \*\*kwargs*)  
exponential weighted sample covariance

**Parameters** *other* : Series, DataFrame, or ndarray, optional

if not supplied then will default to self and produce pairwise output

**pairwise** : bool, default None

If False then only matching columns between self and other will be used and the output will be a DataFrame. If True then all pairwise combinations will be calculated and the output will be a MultiIndex DataFrame in the case of DataFrame inputs. In the case of missing elements, only complete pairwise observations will be used.

**bias** : boolean, default False

Use a standard estimation bias correction

**Returns**

same type as input

**See also:**

`pandas.Series.ewm`, `pandas.DataFrame.ewm`

## 34.17 GroupBy

GroupBy objects are returned by groupby calls: `pandas.DataFrame.groupby()`, `pandas.Series.groupby()`, etc.

### 34.17.1 Indexing, iteration

<code>GroupBy.__iter__()</code>	Groupby iterator
<code>GroupBy.groups</code>	dict {group name -> group labels}
<code>GroupBy.indices</code>	dict {group name -> group indices}
<code>GroupBy.get_group(name[, obj])</code>	Constructs NDFrame from group with provided name

#### 34.17.1.1 `pandas.core.groupby.GroupBy.__iter__`

`GroupBy.__iter__()`

Groupby iterator

##### Returns

Generator yielding sequence of (name, subsetted object)  
for each group

#### 34.17.1.2 `pandas.core.groupby.GroupBy.groups`

`GroupBy.groups`

dict {group name -> group labels}

#### 34.17.1.3 `pandas.core.groupby.GroupBy.indices`

`GroupBy.indices`

dict {group name -> group indices}

#### 34.17.1.4 `pandas.core.groupby.GroupBy.get_group`

`GroupBy.get_group(name, obj=None)`

Constructs NDFrame from group with provided name

**Parameters** `name` : object

the name of the group to get as a DataFrame

`obj` : NDFrame, default None

the NDFrame to take the DataFrame out of. If it is None, the object groupby was called on will be used

##### Returns

`group` [type of obj]

<code>Grouper([key, level, freq, axis, sort])</code>	A Grouper allows the user to specify a groupby instruction for a target object
--	--

#### 34.17.1.5 `pandas.Grouper`

**class** `pandas.Grouper` (`key=None, level=None, freq=None, axis=0, sort=False`)

A Grouper allows the user to specify a groupby instruction for a target object

This specification will select a column via the key parameter, or if the level and/or axis parameters are given, a level of the index of the target object.

These are local specifications and will override ‘global’ settings, that is the parameters axis and level which are passed to the groupby itself.

**Parameters** **key** : string, defaults to None

groupby key, which selects the grouping column of the target

**level** : name/number, defaults to None

the level for the target index

**freq** : string / frequency object, defaults to None

This will groupby the specified frequency if the target selection (via key or level) is a datetime-like object. For full specification of available frequencies, please see [here](#).

**axis** [number/name of the axis, defaults to 0]

**sort** : boolean, default to False

whether to sort the resulting labels

**additional kwargs to control time-like groupers (when “freq“ is passed)**

**closed** [closed end of interval; ‘left’ or ‘right’]

**label** [interval boundary to use for labeling; ‘left’ or ‘right’]

**convention** : { ‘start’, ‘end’, ‘e’, ‘s’ }

If grouper is PeriodIndex

**base, loffset**

## Returns

A specification for a groupby instruction

## Examples

Syntactic sugar for `df.groupby('A')`

```
>>> df.groupby(Grouper(key='A'))
```

Specify a resample operation on the column ‘date’

```
>>> df.groupby(Grouper(key='date', freq='60s'))
```

Specify a resample operation on the level ‘date’ on the columns axis with a frequency of 60s

```
>>> df.groupby(Grouper(level='date', freq='60s', axis=1))
```

## Attributes

<b>ax</b>	
<b>groups</b>	

### 34.17.2 Function application

<code>GroupBy.apply(func, *args, **kwargs)</code>	Apply function <code>func</code> group-wise and combine the results together.
<code>GroupBy.aggregate(func, *args, **kwargs)</code>	
<code>GroupBy.transform(func, *args, **kwargs)</code>	
<code>GroupBy.pipe(func, *args, **kwargs)</code>	Apply a function <code>func</code> with arguments to this <code>GroupBy</code> object and return the function's result.

#### 34.17.2.1 pandas.core.groupby.GroupBy.apply

`GroupBy.apply(func, *args, **kwargs)`

Apply function `func` group-wise and combine the results together.

The function passed to `apply` must take a dataframe as its first argument and return a dataframe, a series or a scalar. `apply` will then take care of combining the results back together into a single dataframe or series. `apply` is therefore a highly flexible grouping method.

While `apply` is a very flexible method, its downside is that using it can be quite a bit slower than using more specific methods. Pandas offers a wide range of method that will be much faster than using `apply` for their specific purposes, so try to use them before reaching for `apply`.

**Parameters** `func` : function

A callable that takes a dataframe as its first argument, and returns a dataframe, a series or a scalar. In addition the callable may take positional and keyword arguments

**args, kwargs** : tuple and dict

Optional positional and keyword arguments to pass to `func`

**Returns**

**applied** [Series or DataFrame]

**See also:**

**`pipe`** Apply function to the full `GroupBy` object instead of to each group.

`aggregate`, `transform`

## Notes

In the current implementation `apply` calls `func` twice on the first group to decide whether it can take a fast or slow code path. This can lead to unexpected behavior if `func` has side-effects, as they will take effect twice for the first group.

## Examples

```
>>> df = pd.DataFrame({'A': 'a a b'.split(), 'B': [1,2,3], 'C': [4,6, 5]})
>>> g = df.groupby('A')
```

From `df` above we can see that `g` has two groups, `a`, `b`. Calling `apply` in various ways, we can get different grouping results:

Example 1: below the function passed to `apply` takes a dataframe as its argument and returns a dataframe. `apply` combines the result for each group together into a new dataframe:

```
>>> g.apply(lambda x: x / x.sum())
      B    C
0  0.333333  0.4
1  0.666667  0.6
2  1.000000  1.0
```

Example 2: The function passed to `apply` takes a dataframe as its argument and returns a series. `apply` combines the result for each group together into a new dataframe:

```
>>> g.apply(lambda x: x.max() - x.min())
      B    C
A
a    1    2
b    0    0
```

Example 3: The function passed to `apply` takes a dataframe as its argument and returns a scalar. `apply` combines the result for each group together into a series, including setting the index as appropriate:

```
>>> g.apply(lambda x: x.C.max() - x.B.min())
A
a      5
b      2
dtype: int64
```

### 34.17.2.2 pandas.core.groupby.GroupBy.aggregate

`GroupBy.aggregate(func, *args, **kwargs)`

### 34.17.2.3 pandas.core.groupby.GroupBy.transform

`GroupBy.transform(func, *args, **kwargs)`

### 34.17.2.4 pandas.core.groupby.GroupBy.pipe

`GroupBy.pipe(func, *args, **kwargs)`

Apply a function `func` with arguments to this `GroupBy` object and return the function's result.

New in version 0.21.0.

Use `.pipe` when you want to improve readability by chaining together functions that expect `Series`, `DataFrames`, `GroupBy` or `Resampler` objects. Instead of writing

```
>>> h(g(f(df.groupby('group')), arg1=a), arg2=b, arg3=c)
```

You can write

```
>>> (df.groupby('group')
...   .pipe(f)
...   .pipe(g, arg1=a)
...   .pipe(h, arg2=b, arg3=c))
```

which is much more readable.

**Parameters** **func** : callable or tuple of (callable, string)

Function to apply to this GroupBy object or, alternatively, a (callable, data\_keyword) tuple where data\_keyword is a string indicating the keyword of callable that expects the GroupBy object.

**args** : iterable, optional

positional arguments passed into func.

**kwargs** : dict, optional

a dictionary of keyword arguments passed into func.

**Returns**

**object** [the return type of func.]

**See also:**

***pandas.Series.pipe*** Apply a function with arguments to a series

***pandas.DataFrame.pipe*** Apply a function with arguments to a dataframe

***apply*** Apply function to each group instead of to the full GroupBy object.

## Notes

See more [here](#)

## Examples

```
>>> df = pd.DataFrame({'A': 'a b a b'.split(), 'B': [1, 2, 3, 4]})
>>> df
   A  B
0  a  1
1  b  2
2  a  3
3  b  4
```

To get the difference between each groups maximum and minimum value in one pass, you can do

```
>>> df.groupby('A').pipe(lambda x: x.max() - x.min())
   B
A
a  2
b  2
```

### 34.17.3 Computations / Descriptive Stats

<code>GroupBy.all(skipna)</code>	Returns True if all values in the group are truthful, else False
<code>GroupBy.any(skipna)</code>	Returns True if any value in the group is truthful, else False
<code>GroupBy.bfill(limit)</code>	Backward fill the values
<code>GroupBy.count()</code>	Compute count of group, excluding missing values
<code>GroupBy.cumcount(ascending)</code>	Number each item in each group from 0 to the length of that group - 1.
<code>GroupBy.ffill(limit)</code>	Forward fill the values
<code>GroupBy.first(**kwargs)</code>	Compute first of group values
<code>GroupBy.head(n)</code>	Returns first n rows of each group.
<code>GroupBy.last(**kwargs)</code>	Compute last of group values
<code>GroupBy.max(**kwargs)</code>	Compute max of group values
<code>GroupBy.mean(*args, **kwargs)</code>	Compute mean of groups, excluding missing values
<code>GroupBy.median(**kwargs)</code>	Compute median of groups, excluding missing values
<code>GroupBy.min(**kwargs)</code>	Compute min of group values
<code>GroupBy.ngroup(ascending)</code>	Number each group from 0 to the number of groups - 1.
<code>GroupBy.nth(n[, dropna])</code>	Take the nth row from each group if n is an int, or a subset of rows if n is a list of ints.
<code>GroupBy.ohlc()</code>	Compute sum of values, excluding missing values For multiple groupings, the result index will be a MultiIndex
<code>GroupBy.prod(**kwargs)</code>	Compute prod of group values
<code>GroupBy.rank(method, ascending, na_option, ...)</code>	Provides the rank of values within each group.
<code>GroupBy.pct_change(periods, fill_method, ...)</code>	Calculate pct_change of each value to previous entry in group
<code>GroupBy.size()</code>	Compute group sizes
<code>GroupBy.sem(ddof)</code>	Compute standard error of the mean of groups, excluding missing values
<code>GroupBy.std(ddof)</code>	Compute standard deviation of groups, excluding missing values
<code>GroupBy.sum(**kwargs)</code>	Compute sum of group values
<code>GroupBy.var(ddof)</code>	Compute variance of groups, excluding missing values
<code>GroupBy.tail(n)</code>	Returns last n rows of each group

#### 34.17.3.1 pandas.core.groupby.GroupBy.all

`GroupBy.all(skipna=True)`

Returns True if all values in the group are truthful, else False

**Parameters** `skipna` : bool, default True

Flag to ignore nan values during truth testing

**See also:**

`pandas.Series.groupby`, `pandas.DataFrame.groupby`, `pandas.Panel.groupby`

#### 34.17.3.2 pandas.core.groupby.GroupBy.any

`GroupBy.any(skipna=True)`

Returns True if any value in the group is truthful, else False

**Parameters** `skipna` : bool, default True

Flag to ignore nan values during truth testing

**See also:**

*`pandas.Series.groupby`, `pandas.DataFrame.groupby`, `pandas.Panel.groupby`*

### 34.17.3.3 `pandas.core.groupby.GroupBy.bfill`

`GroupBy.bfill` (*limit=None*)

Backward fill the values

**Parameters** `limit` : integer, optional

limit of how many values to fill

**See also:**

`Series.backfill`, `DataFrame.backfill`, `Series.fillna`, `DataFrame.fillna`

### 34.17.3.4 `pandas.core.groupby.GroupBy.count`

`GroupBy.count` ()

Compute count of group, excluding missing values

**See also:**

*`pandas.Series.groupby`, `pandas.DataFrame.groupby`, `pandas.Panel.groupby`*

### 34.17.3.5 `pandas.core.groupby.GroupBy.cumcount`

`GroupBy.cumcount` (*ascending=True*)

Number each item in each group from 0 to the length of that group - 1.

Essentially this is equivalent to

```
>>> self.apply(lambda x: Series(np.arange(len(x)), x.index))
```

**Parameters** `ascending` : bool, default True

If False, number in reverse, from length of group - 1 to 0.

**See also:**

*`ngroup`* Number the groups themselves.

### Examples

```
>>> df = pd.DataFrame([[ 'a'], [ 'a'], [ 'a'], [ 'b'], [ 'b'], [ 'a']],
...                    columns=[ 'A'])
>>> df
   A
0  a
1  a
2  a
```

(continues on next page)

(continued from previous page)

```

3  b
4  b
5  a
>>> df.groupby('A').cumcount()
0    0
1    1
2    2
3    0
4    1
5    3
dtype: int64
>>> df.groupby('A').cumcount(ascending=False)
0    3
1    2
2    1
3    1
4    0
5    0
dtype: int64

```

### 34.17.3.6 pandas.core.groupby.GroupBy.fffll

GroupBy.fffll (*limit=None*)

Forward fill the values

**Parameters** **limit** : integer, optional

limit of how many values to fill

**See also:**

`Series.pad`, `DataFrame.pad`, `Series.fillna`, `DataFrame.fillna`

### 34.17.3.7 pandas.core.groupby.GroupBy.first

GroupBy.first (\*\*kwargs)

Compute first of group values

**See also:**

`pandas.Series.groupby`, `pandas.DataFrame.groupby`, `pandas.Panel.groupby`

### 34.17.3.8 pandas.core.groupby.GroupBy.head

GroupBy.head (*n=5*)

Returns first n rows of each group.

Essentially equivalent to `.apply(lambda x: x.head(n))`, except ignores `as_index` flag.

**See also:**

`pandas.Series.groupby`, `pandas.DataFrame.groupby`, `pandas.Panel.groupby`

## Examples

```
>>> df = DataFrame([[1, 2], [1, 4], [5, 6]],
                    columns=['A', 'B'])
>>> df.groupby('A', as_index=False).head(1)
   A  B
0  1  2
2  5  6
>>> df.groupby('A').head(1)
   A  B
0  1  2
2  5  6
```

### 34.17.3.9 pandas.core.groupby.GroupBy.last

GroupBy.**last** (\*\*kwargs)  
Compute last of group values

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

### 34.17.3.10 pandas.core.groupby.GroupBy.max

GroupBy.**max** (\*\*kwargs)  
Compute max of group values

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

### 34.17.3.11 pandas.core.groupby.GroupBy.mean

GroupBy.**mean** (\*args, \*\*kwargs)  
Compute mean of groups, excluding missing values  
For multiple groupings, the result index will be a MultiIndex

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

### 34.17.3.12 pandas.core.groupby.GroupBy.median

GroupBy.**median** (\*\*kwargs)  
Compute median of groups, excluding missing values  
For multiple groupings, the result index will be a MultiIndex

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

### 34.17.3.13 pandas.core.groupby.GroupBy.min

GroupBy.min(\*\*kwargs)

Compute min of group values

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

### 34.17.3.14 pandas.core.groupby.GroupBy.ngroup

GroupBy.ngroup(ascending=True)

Number each group from 0 to the number of groups - 1.

This is the enumerative complement of cumcount. Note that the numbers given to the groups match the order in which the groups would be seen when iterating over the groupby object, not the order they are first observed.

New in version 0.20.2.

**Parameters** *ascending* : bool, default True

If False, number in reverse, from number of group - 1 to 0.

**See also:**

*cumcount* Number the rows in each group.

#### Examples

```

>>> df = pd.DataFrame({"A": list("aaabba")})
>>> df
   A
0  a
1  a
2  a
3  b
4  b
5  a
>>> df.groupby('A').ngroup()
0    0
1    0
2    0
3    1
4    1
5    0
dtype: int64
>>> df.groupby('A').ngroup(ascending=False)
0    1
1    1
2    1
3    0
4    0
5    1
dtype: int64
>>> df.groupby(["A", [1,1,2,3,2,1]]).ngroup()
0    0
1    0

```

(continues on next page)

(continued from previous page)

```

2    1
3    3
4    2
5    0
dtype: int64

```

### 34.17.3.15 pandas.core.groupby.GroupBy.nth

`GroupBy.nth(n, dropna=None)`

Take the *nth* row from each group if *n* is an int, or a subset of rows if *n* is a list of ints.

If *dropna*, will take the *nth* non-null row, *dropna* is either Truthy (if a Series) or 'all', 'any' (if a DataFrame); this is equivalent to calling `dropna(how=dropna)` before the groupby.

**Parameters** *n* : int or list of ints

a single *nth* value for the row or a list of *nth* values

**dropna** : None or str, optional

apply the specified *dropna* operation before counting which row is the *nth* row. Needs to be None, 'any' or 'all'

**See also:**

`pandas.Series.groupby`, `pandas.DataFrame.groupby`, `pandas.Panel.groupby`

### Examples

```

>>> df = pd.DataFrame({'A': [1, 1, 2, 1, 2],
...                     'B': [np.nan, 2, 3, 4, 5]}, columns=['A', 'B'])
>>> g = df.groupby('A')
>>> g.nth(0)
      B
A
1  NaN
2  3.0
>>> g.nth(1)
      B
A
1  2.0
2  5.0
>>> g.nth(-1)
      B
A
1  4.0
2  5.0
>>> g.nth([0, 1])
      B
A
1  NaN
1  2.0
2  3.0
2  5.0

```

Specifying *dropna* allows count ignoring NaN

```
>>> g.nth(0, dropna='any')
      B
A
1  2.0
2  3.0
```

NaNs denote group exhausted when using dropna

```
>>> g.nth(3, dropna='any')
      B
A
1  NaN
2  NaN
```

Specifying `as_index=False` in `groupby` keeps the original index.

```
>>> df.groupby('A', as_index=False).nth(1)
      A      B
1  1  2.0
4  2  5.0
```

### 34.17.3.16 pandas.core.groupby.GroupBy.ohlc

`GroupBy.ohlc()`

Compute sum of values, excluding missing values For multiple groupings, the result index will be a `MultiIndex`

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

### 34.17.3.17 pandas.core.groupby.GroupBy.prod

`GroupBy.prod(**kwargs)`

Compute prod of group values

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

### 34.17.3.18 pandas.core.groupby.GroupBy.rank

`GroupBy.rank(method='average', ascending=True, na_option='keep', pct=False, axis=0)`

Provides the rank of values within each group.

**Parameters** `method`: {'average', 'min', 'max', 'first', 'dense'}, default 'average'

- average: average rank of group
- min: lowest rank in group
- max: highest rank in group
- first: ranks assigned in order they appear in the array
- dense: like 'min', but rank always increases by 1 between groups

**ascending**: boolean, default True

False for ranks by high (1) to low (N)

**na\_option** : { 'keep', 'top', 'bottom' }, default 'keep'

- keep: leave NA values where they are
- top: smallest rank if ascending
- bottom: smallest rank if descending

**pct** : boolean, default False

Compute percentage rank of data within each group

**axis** : int, default 0

The axis of the object over which to compute the rank.

**Returns**

—

**DataFrame with ranking of values within each group**

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

#### 34.17.3.19 pandas.core.groupby.GroupBy.pct\_change

`GroupBy.pct_change` (*periods=1, fill\_method='pad', limit=None, freq=None, axis=0*)

Calculate pct\_change of each value to previous entry in group

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

#### 34.17.3.20 pandas.core.groupby.GroupBy.size

`GroupBy.size` ()

Compute group sizes

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

#### 34.17.3.21 pandas.core.groupby.GroupBy.sem

`GroupBy.sem` (*ddof=1*)

Compute standard error of the mean of groups, excluding missing values

For multiple groupings, the result index will be a MultiIndex

**Parameters** **ddof** : integer, default 1

degrees of freedom

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

### 34.17.3.22 pandas.core.groupby.GroupBy.std

GroupBy.**std**(*ddof=1, \*args, \*\*kwargs*)

Compute standard deviation of groups, excluding missing values

For multiple groupings, the result index will be a MultiIndex

**Parameters** **ddof**: integer, default 1  
degrees of freedom

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

### 34.17.3.23 pandas.core.groupby.GroupBy.sum

GroupBy.**sum**(*\*\*kwargs*)

Compute sum of group values

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

### 34.17.3.24 pandas.core.groupby.GroupBy.var

GroupBy.**var**(*ddof=1, \*args, \*\*kwargs*)

Compute variance of groups, excluding missing values

For multiple groupings, the result index will be a MultiIndex

**Parameters** **ddof**: integer, default 1  
degrees of freedom

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

### 34.17.3.25 pandas.core.groupby.GroupBy.tail

GroupBy.**tail**(*n=5*)

Returns last n rows of each group

Essentially equivalent to `.apply(lambda x: x.tail(n))`, except ignores `as_index` flag.

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

#### Examples

```

>>> df = DataFrame([['a', 1], ['a', 2], ['b', 1], ['b', 2]],
                    columns=['A', 'B'])
>>> df.groupby('A').tail(1)
   A  B
1  a  2
3  b  2

```

(continues on next page)

(continued from previous page)

```
>>> df.groupby('A').head(1)
   A  B
0  a  1
2  b  1
```

The following methods are available in both `SeriesGroupBy` and `DataFrameGroupBy` objects, but may differ slightly, usually in that the `DataFrameGroupBy` version usually permits the specification of an axis argument, and often an argument indicating whether to restrict application to columns of a specific data type.

<code>DataFrameGroupBy.agg(arg, *args, **kwargs)</code>	Aggregate using one or more operations over the specified axis.
<code>DataFrameGroupBy.all([skipna])</code>	Returns True if all values in the group are truthful, else False
<code>DataFrameGroupBy.any([skipna])</code>	Returns True if any value in the group is truthful, else False
<code>DataFrameGroupBy.bfill([limit])</code>	Backward fill the values
<code>DataFrameGroupBy.corr</code>	Compute pairwise correlation of columns, excluding NA/null values
<code>DataFrameGroupBy.count()</code>	Compute count of group, excluding missing values
<code>DataFrameGroupBy.cov</code>	Compute pairwise covariance of columns, excluding NA/null values.
<code>DataFrameGroupBy.cummax([axis])</code>	Cumulative max for each group
<code>DataFrameGroupBy.cummin([axis])</code>	Cumulative min for each group
<code>DataFrameGroupBy.cumprod([axis])</code>	Cumulative product for each group
<code>DataFrameGroupBy.cumsum([axis])</code>	Cumulative sum for each group
<code>DataFrameGroupBy.describe(**kwargs)</code>	Generates descriptive statistics that summarize the central tendency, dispersion and shape of a dataset's distribution, excluding NaN values.
<code>DataFrameGroupBy.diff</code>	First discrete difference of element.
<code>DataFrameGroupBy.ffill([limit])</code>	Forward fill the values
<code>DataFrameGroupBy.fillna</code>	Fill NA/NaN values using the specified method
<code>DataFrameGroupBy.filter(func[, dropna])</code>	Return a copy of a DataFrame excluding elements from groups that do not satisfy the boolean criterion specified by func.
<code>DataFrameGroupBy.hist</code>	Make a histogram of the DataFrame's.
<code>DataFrameGroupBy.idxmax</code>	Return index of first occurrence of maximum over requested axis.
<code>DataFrameGroupBy.idxmin</code>	Return index of first occurrence of minimum over requested axis.
<code>DataFrameGroupBy.mad</code>	Return the mean absolute deviation of the values for the requested axis
<code>DataFrameGroupBy.pct_change([periods, ...])</code>	Calculate pct_change of each value to previous entry in group
<code>DataFrameGroupBy.plot</code>	Class implementing the .plot attribute for groupby objects
<code>DataFrameGroupBy.quantile</code>	Return values at the given quantile over requested axis, a la numpy.percentile.
<code>DataFrameGroupBy.rank([method, ascending, ...])</code>	Provides the rank of values within each group.
<code>DataFrameGroupBy.resample(rule, *args, **kwargs)</code>	Provide resampling when using a TimeGrouper Return a new grouper with our resampler appended

Continued on next page

Table 167 – continued from previous page

<code>DataFrameGroupBy.shift([periods, freq, axis])</code>	Shift each group by periods observations
<code>DataFrameGroupBy.size()</code>	Compute group sizes
<code>DataFrameGroupBy.skew</code>	Return unbiased skew over requested axis Normalized by N-1
<code>DataFrameGroupBy.take</code>	Return the elements in the given <i>positional</i> indices along an axis.
<code>DataFrameGroupBy.tshift</code>	Shift the time index, using the index's frequency if available.

### 34.17.3.26 pandas.core.groupby.DataFrameGroupBy.agg

`DataFrameGroupBy.agg` (*arg*, \**args*, \*\**kwargs*)

Aggregate using one or more operations over the specified axis.

**Parameters** *func* : function, string, dictionary, or list of string/functions

Function to use for aggregating the data. If a function, must either work when passed a `DataFrame` or when passed to `DataFrame.apply`. For a `DataFrame`, can pass a dict, if the keys are `DataFrame` column names.

Accepted combinations are:

- string function name.
- function.
- list of functions.
- dict of column names -> functions (or list of functions).

**\*args**

Positional arguments to pass to *func*.

**\*\*kwargs**

Keyword arguments to pass to *func*.

**Returns**

**aggregated** [`DataFrame`]

**See also:**

`pandas.DataFrame.groupby.apply`, `pandas.DataFrame.groupby.transform`, [`pandas.DataFrame.aggregate`](#)

#### Notes

*agg* is an alias for *aggregate*. Use the alias.

A passed user-defined-function will be passed a `Series` for evaluation.

#### Examples

```
>>> df = pd.DataFrame({'A': [1, 1, 2, 2],
...                     'B': [1, 2, 3, 4],
...                     'C': np.random.randn(4)})
```

```
>>> df
   A  B      C
0  1  1  0.362838
1  1  2  0.227877
2  2  3  1.267767
3  2  4 -0.562860
```

The aggregation is for each column.

```
>>> df.groupby('A').agg('min')
   B      C
A
1  1  0.227877
2  3 -0.562860
```

### Multiple aggregations

```
>>> df.groupby('A').agg(['min', 'max'])
   B      C
   min max   min   max
A
1  1  2  0.227877  0.362838
2  3  4 -0.562860  1.267767
```

### Select a column for aggregation

```
>>> df.groupby('A').B.agg(['min', 'max'])
   min  max
A
1     1     2
2     3     4
```

### Different aggregations per column

```
>>> df.groupby('A').agg({'B': ['min', 'max'], 'C': 'sum'})
   B      C
   min max   sum
A
1  1  2  0.590716
2  3  4  0.704907
```

### 34.17.3.27 pandas.core.groupby.DataFrameGroupBy.all

`DataFrameGroupBy.all` (*skipna=True*)

Returns True if all values in the group are truthful, else False

**Parameters** `skipna` : bool, default True

Flag to ignore nan values during truth testing

**See also:**

[`pandas.Series.groupby`](#), [`pandas.DataFrame.groupby`](#), [`pandas.Panel.groupby`](#)

**34.17.3.28 pandas.core.groupby.DataFrameGroupBy.any**

DataFrameGroupBy.**any** (*skipna=True*)

Returns True if any value in the group is truthful, else False

**Parameters** **skipna** : bool, default True

Flag to ignore nan values during truth testing

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

**34.17.3.29 pandas.core.groupby.DataFrameGroupBy.bfill**

DataFrameGroupBy.**bfill** (*limit=None*)

Backward fill the values

**Parameters** **limit** : integer, optional

limit of how many values to fill

**See also:**

*Series.backfill, DataFrame.backfill, Series.fillna, DataFrame.fillna*

**34.17.3.30 pandas.core.groupby.DataFrameGroupBy.corr**

DataFrameGroupBy.**corr**

Compute pairwise correlation of columns, excluding NA/null values

**Parameters** **method** : {'pearson', 'kendall', 'spearman'}

- pearson : standard correlation coefficient
- kendall : Kendall Tau correlation coefficient
- spearman : Spearman rank correlation

**min\_periods** : int, optional

Minimum number of observations required per pair of columns to have a valid result.  
Currently only available for pearson and spearman correlation

**Returns**

y [DataFrame]

**34.17.3.31 pandas.core.groupby.DataFrameGroupBy.count**

DataFrameGroupBy.**count** ()

Compute count of group, excluding missing values

**34.17.3.32 pandas.core.groupby.DataFrameGroupBy.cov**

DataFrameGroupBy.**cov**

Compute pairwise covariance of columns, excluding NA/null values.

Compute the pairwise covariance among the series of a DataFrame. The returned data frame is the **covariance matrix** of the columns of the DataFrame.

Both NA and null values are automatically excluded from the calculation. (See the note below about bias from missing values.) A threshold can be set for the minimum number of observations for each value created. Comparisons with observations below this threshold will be returned as NaN.

This method is generally used for the analysis of time series data to understand the relationship between different measures across time.

**Parameters** `min_periods` : int, optional

Minimum number of observations required per pair of columns to have a valid result.

**Returns** **DataFrame**

The covariance matrix of the series of the DataFrame.

**See also:**

`pandas.Series.cov` compute covariance with another Series

`pandas.core.window.EWM.cov` exponential weighted sample covariance

`pandas.core.window.Expanding.cov` expanding sample covariance

`pandas.core.window.Rolling.cov` rolling sample covariance

## Notes

Returns the covariance matrix of the DataFrame's time series. The covariance is normalized by N-1.

For DataFrames that have Series that are missing data (assuming that data is [missing at random](#)) the returned covariance matrix will be an unbiased estimate of the variance and covariance between the member Series.

However, for many applications this estimate may not be acceptable because the estimate covariance matrix is not guaranteed to be positive semi-definite. This could lead to estimate correlations having absolute values which are greater than one, and/or a non-invertible covariance matrix. See [Estimation of covariance matrices](#) for more details.

## Examples

```
>>> df = pd.DataFrame([(1, 2), (0, 3), (2, 0), (1, 1)],
...                    columns=['dogs', 'cats'])
>>> df.cov()
           dogs      cats
dogs  0.666667 -1.000000
cats -1.000000  1.666667
```

```
>>> np.random.seed(42)
>>> df = pd.DataFrame(np.random.randn(1000, 5),
...                    columns=['a', 'b', 'c', 'd', 'e'])
>>> df.cov()
           a          b          c          d          e
a  0.998438 -0.020161  0.059277 -0.008943  0.014144
b -0.020161  1.059352 -0.008543 -0.024738  0.009826
c  0.059277 -0.008543  1.010670 -0.001486 -0.000271
d -0.008943 -0.024738 -0.001486  0.921297 -0.013692
e  0.014144  0.009826 -0.000271 -0.013692  0.977795
```

**Minimum number of periods**

This method also supports an optional `min_periods` keyword that specifies the required minimum number of non-NA observations for each column pair in order to have a valid result:

```
>>> np.random.seed(42)
>>> df = pd.DataFrame(np.random.randn(20, 3),
...                    columns=['a', 'b', 'c'])
>>> df.loc[df.index[:5], 'a'] = np.nan
>>> df.loc[df.index[5:10], 'b'] = np.nan
>>> df.cov(min_periods=12)
           a          b          c
a  0.316741      NaN -0.150812
b      NaN  1.248003  0.191417
c -0.150812  0.191417  0.895202
```

**34.17.3.33 pandas.core.groupby.DataFrameGroupBy.cummax**

`DataFrameGroupBy.cummax` (*axis=0, \*\*kwargs*)

Cumulative max for each group

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

**34.17.3.34 pandas.core.groupby.DataFrameGroupBy.cummin**

`DataFrameGroupBy.cummin` (*axis=0, \*\*kwargs*)

Cumulative min for each group

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

**34.17.3.35 pandas.core.groupby.DataFrameGroupBy.cumprod**

`DataFrameGroupBy.cumprod` (*axis=0, \*args, \*\*kwargs*)

Cumulative product for each group

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

**34.17.3.36 pandas.core.groupby.DataFrameGroupBy.cumsum**

`DataFrameGroupBy.cumsum` (*axis=0, \*args, \*\*kwargs*)

Cumulative sum for each group

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

### 34.17.3.37 pandas.core.groupby.DataFrameGroupBy.describe

`DataFrameGroupBy.describe` (\*\*kwargs)

Generates descriptive statistics that summarize the central tendency, dispersion and shape of a dataset's distribution, excluding NaN values.

Analyzes both numeric and object series, as well as `DataFrame` column sets of mixed data types. The output will vary depending on what is provided. Refer to the notes below for more detail.

**Parameters** `percentiles` : list-like of numbers, optional

The percentiles to include in the output. All should fall between 0 and 1. The default is `[.25, .5, .75]`, which returns the 25th, 50th, and 75th percentiles.

**include** : 'all', list-like of dtypes or None (default), optional

A white list of data types to include in the result. Ignored for `Series`. Here are the options:

- 'all' : All columns of the input will be included in the output.
- A list-like of dtypes : Limits the results to the provided data types. To limit the result to numeric types submit `numpy.number`. To limit it instead to object columns submit the `numpy.object` data type. Strings can also be used in the style of `select_dtypes` (e.g. `df.describe(include=['O'])`). To select pandas categorical columns, use 'category'
- None (default) : The result will include all numeric columns.

**exclude** : list-like of dtypes or None (default), optional,

A black list of data types to omit from the result. Ignored for `Series`. Here are the options:

- A list-like of dtypes : Excludes the provided data types from the result. To exclude numeric types submit `numpy.number`. To exclude object columns submit the data type `numpy.object`. Strings can also be used in the style of `select_dtypes` (e.g. `df.describe(include=['O'])`). To exclude pandas categorical columns, use 'category'
- None (default) : The result will exclude nothing.

**Returns**

**summary:** `Series/DataFrame` of summary statistics

**See also:**

`DataFrame.count`, `DataFrame.max`, `DataFrame.min`, `DataFrame.mean`, `DataFrame.std`, `DataFrame.select_dtypes`

#### Notes

For numeric data, the result's index will include `count`, `mean`, `std`, `min`, `max` as well as lower, 50 and upper percentiles. By default the lower percentile is 25 and the upper percentile is 75. The 50 percentile is the same as the median.

For object data (e.g. strings or timestamps), the result's index will include `count`, `unique`, `top`, and `freq`. The `top` is the most common value. The `freq` is the most common value's frequency. Timestamps also include the `first` and `last` items.

If multiple object values have the highest count, then the `count` and `top` results will be arbitrarily chosen from among those with the highest count.

For mixed data types provided via a `DataFrame`, the default is to return only an analysis of numeric columns. If the dataframe consists only of object and categorical data without any numeric columns, the default is to return an analysis of both the object and categorical columns. If `include='all'` is provided as an option, the result will include a union of attributes of each type.

The `include` and `exclude` parameters can be used to limit which columns in a `DataFrame` are analyzed for the output. The parameters are ignored when analyzing a `Series`.

## Examples

Describing a numeric Series.

```
>>> s = pd.Series([1, 2, 3])
>>> s.describe()
count      3.0
mean       2.0
std        1.0
min        1.0
25%        1.5
50%        2.0
75%        2.5
max        3.0
```

Describing a categorical Series.

```
>>> s = pd.Series(['a', 'a', 'b', 'c'])
>>> s.describe()
count      4
unique     3
top        a
freq       2
dtype: object
```

Describing a timestamp Series.

```
>>> s = pd.Series([
...     np.datetime64("2000-01-01"),
...     np.datetime64("2010-01-01"),
...     np.datetime64("2010-01-01")
... ])
>>> s.describe()
count      3
unique     2
top        2010-01-01 00:00:00
freq       2
first      2000-01-01 00:00:00
last       2010-01-01 00:00:00
dtype: object
```

Describing a `DataFrame`. By default only numeric fields are returned.

```
>>> df = pd.DataFrame({'object': ['a', 'b', 'c'],
...                    'numeric': [1, 2, 3],
...                    'categorical': pd.Categorical(['d', 'e', 'f'])
...                    })
```

(continues on next page)

(continued from previous page)

```
...    })
>>> df.describe()
      numeric
count      3.0
mean       2.0
std        1.0
min        1.0
25%        1.5
50%        2.0
75%        2.5
max        3.0
```

Describing all columns of a DataFrame regardless of data type.

```
>>> df.describe(include='all')
      categorical  numeric  object
count           3      3.0      3
unique          3      NaN      3
top             f      NaN      c
freq            1      NaN      1
mean           NaN      2.0     NaN
std            NaN      1.0     NaN
min            NaN      1.0     NaN

75%            NaN      2.5     NaN
max            NaN      3.0     NaN
```

Describing a column from a DataFrame by accessing it as an attribute.

```
>>> df.numeric.describe()
count      3.0
mean       2.0
std        1.0
min        1.0
25%        1.5
50%        2.0
75%        2.5
max        3.0
Name: numeric, dtype: float64
```

Including only numeric columns in a DataFrame description.

```
>>> df.describe(include=[np.number])
      numeric
count      3.0
mean       2.0
std        1.0
min        1.0
25%        1.5
50%        2.0
75%        2.5
max        3.0
```

Including only string columns in a DataFrame description.

```
>>> df.describe(include=[np.object])
      object
count      3
unique     3
top        c
freq       1
```

Including only categorical columns from a DataFrame description.

```
>>> df.describe(include=['category'])
      categorical
count          3
unique         3
top            f
freq           1
```

Excluding numeric columns from a DataFrame description.

```
>>> df.describe(exclude=[np.number])
      categorical  object
count           3      3
unique          3      3
top            f      c
freq           1      1
```

Excluding object columns from a DataFrame description.

```
>>> df.describe(exclude=[np.object])
      categorical  numeric
count           3      3.0
unique          3      NaN
top            f      NaN
freq           1      NaN
mean           NaN      2.0
std            NaN      1.0
min            NaN      1.0
25%            NaN      1.5
50%            NaN      2.0
75%            NaN      2.5
max            NaN      3.0
```

### 34.17.3.38 pandas.core.groupby.DataFrameGroupBy.diff

DataFrameGroupBy.**diff**

First discrete difference of element.

Calculates the difference of a DataFrame element compared with another element in the DataFrame (default is the element in the same column of the previous row).

**Parameters** **periods** : int, default 1

Periods to shift for calculating difference, accepts negative values.

**axis** : {0 or 'index', 1 or 'columns'}, default 0

Take difference over rows (0) or columns (1).

New in version 0.16.1..

**Returns****diffed** [DataFrame]**See also:****Series.diff** First discrete difference for a Series.**DataFrame.pct\_change** Percent change over given number of periods.**DataFrame.shift** Shift index by desired number of periods with an optional time freq.**Examples**

Difference with previous row

```
>>> df = pd.DataFrame({'a': [1, 2, 3, 4, 5, 6],
...                    'b': [1, 1, 2, 3, 5, 8],
...                    'c': [1, 4, 9, 16, 25, 36]})
>>> df
   a  b  c
0  1  1  1
1  2  1  4
2  3  2  9
3  4  3 16
4  5  5 25
5  6  8 36
```

```
>>> df.diff()
   a    b    c
0 NaN NaN NaN
1 1.0 0.0 3.0
2 1.0 1.0 5.0
3 1.0 1.0 7.0
4 1.0 2.0 9.0
5 1.0 3.0 11.0
```

Difference with previous column

```
>>> df.diff(axis=1)
   a    b    c
0 NaN 0.0 0.0
1 NaN -1.0 3.0
2 NaN -1.0 7.0
3 NaN -1.0 13.0
4 NaN 0.0 20.0
5 NaN 2.0 28.0
```

Difference with 3rd previous row

```
>>> df.diff(periods=3)
   a    b    c
0 NaN NaN NaN
1 NaN NaN NaN
2 NaN NaN NaN
3 3.0 2.0 15.0
4 3.0 4.0 21.0
5 3.0 6.0 27.0
```

Difference with following row

```
>>> df.diff(periods=-1)
      a      b      c
0 -1.0   0.0  -3.0
1 -1.0  -1.0  -5.0
2 -1.0  -1.0  -7.0
3 -1.0  -2.0  -9.0
4 -1.0  -3.0 -11.0
5   NaN   NaN   NaN
```

### 34.17.3.39 pandas.core.groupby.DataFrameGroupBy.fffll

DataFrameGroupBy.fffll (*limit=None*)

Forward fill the values

**Parameters** *limit* : integer, optional

limit of how many values to fill

**See also:**

Series.pad, DataFrame.pad, Series.fillna, DataFrame.fillna

### 34.17.3.40 pandas.core.groupby.DataFrameGroupBy.fillna

DataFrameGroupBy.fillna

Fill NA/NaN values using the specified method

**Parameters** *value* : scalar, dict, Series, or DataFrame

Value to use to fill holes (e.g. 0), alternately a dict/Series/DataFrame of values specifying which value to use for each index (for a Series) or column (for a DataFrame). (values not in the dict/Series/DataFrame will not be filled). This value cannot be a list.

**method** : {'backfill', 'bfill', 'pad', 'ffill', None}, default None

Method to use for filling holes in reindexed Series pad / ffill: propagate last valid observation forward to next valid backfill / bfill: use NEXT valid observation to fill gap

**axis** [{0 or 'index', 1 or 'columns'}]

**inplace** : boolean, default False

If True, fill in place. Note: this will modify any other views on this object, (e.g. a no-copy slice for a column in a DataFrame).

**limit** : int, default None

If method is specified, this is the maximum number of consecutive NaN values to forward/backward fill. In other words, if there is a gap with more than this number of consecutive NaNs, it will only be partially filled. If method is not specified, this is the maximum number of entries along the entire axis where NaNs will be filled. Must be greater than 0 if not None.

**downcast** : dict, default is None

a dict of item->dtype of what to downcast if possible, or the string 'infer' which will try to downcast to an appropriate equal type (e.g. float64 to int64 if possible)

**Returns**

**filled** [DataFrame]

**See also:**

**interpolate** Fill NaN values using interpolation.

reindex, asfreq

**Examples**

```
>>> df = pd.DataFrame([[np.nan, 2, np.nan, 0],
...                    [3, 4, np.nan, 1],
...                    [np.nan, np.nan, np.nan, 5],
...                    [np.nan, 3, np.nan, 4]],
...                    columns=list('ABCD'))
>>> df
   A    B    C    D
0 NaN  2.0 NaN  0
1  3.0  4.0 NaN  1
2 NaN  NaN NaN  5
3 NaN  3.0 NaN  4
```

Replace all NaN elements with 0s.

```
>>> df.fillna(0)
   A    B    C    D
0  0.0  2.0  0.0  0
1  3.0  4.0  0.0  1
2  0.0  0.0  0.0  5
3  0.0  3.0  0.0  4
```

We can also propagate non-null values forward or backward.

```
>>> df.fillna(method='ffill')
   A    B    C    D
0 NaN  2.0 NaN  0
1  3.0  4.0 NaN  1
2  3.0  4.0 NaN  5
3  3.0  3.0 NaN  4
```

Replace all NaN elements in column 'A', 'B', 'C', and 'D', with 0, 1, 2, and 3 respectively.

```
>>> values = {'A': 0, 'B': 1, 'C': 2, 'D': 3}
>>> df.fillna(value=values)
   A    B    C    D
0  0.0  2.0  2.0  0
1  3.0  4.0  2.0  1
2  0.0  1.0  2.0  5
3  0.0  3.0  2.0  4
```

Only replace the first NaN element.

```
>>> df.fillna(value=values, limit=1)
   A    B    C    D
0  0.0  2.0  2.0  0
1  3.0  4.0  NaN  1
2  NaN  1.0  NaN  5
3  NaN  3.0  NaN  4
```

### 34.17.3.41 pandas.core.groupby.DataFrameGroupBy.filter

DataFrameGroupBy.**filter** (*func*, *dropna=True*, *\*args*, *\*\*kwargs*)

Return a copy of a DataFrame excluding elements from groups that do not satisfy the boolean criterion specified by *func*.

**Parameters** *f*: function

Function to apply to each subframe. Should return True or False.

**dropna**: Drop groups that do not pass the filter. True by default;  
if False, groups that evaluate False are filled with NaNs.

**Returns**

**filtered** [DataFrame]

#### Notes

Each subframe is endowed the attribute ‘name’ in case you need to know which group you are working on.

#### Examples

```
>>> import pandas as pd
>>> df = pd.DataFrame({'A' : ['foo', 'bar', 'foo', 'bar',
...                          'foo', 'bar'],
...                   'B' : [1, 2, 3, 4, 5, 6],
...                   'C' : [2.0, 5., 8., 1., 2., 9.]})
>>> grouped = df.groupby('A')
>>> grouped.filter(lambda x: x['B'].mean() > 3.)
   A    B    C
1  bar  2  5.0
3  bar  4  1.0
5  bar  6  9.0
```

### 34.17.3.42 pandas.core.groupby.DataFrameGroupBy.hist

DataFrameGroupBy.**hist**

Make a histogram of the DataFrame’s.

A **histogram** is a representation of the distribution of data. This function calls `matplotlib.pyplot.hist()`, on each series in the DataFrame, resulting in one histogram per column.

**Parameters** *data*: DataFrame

The pandas object holding the data.

**column** : string or sequence

If passed, will be used to limit data to a subset of columns.

**by** : object, optional

If passed, then used to form histograms for separate groups.

**grid** : boolean, default True

Whether to show axis grid lines.

**xlabelsize** : int, default None

If specified changes the x-axis label size.

**xrot** : float, default None

Rotation of x axis labels. For example, a value of 90 displays the x labels rotated 90 degrees clockwise.

**ylabelsize** : int, default None

If specified changes the y-axis label size.

**yrot** : float, default None

Rotation of y axis labels. For example, a value of 90 displays the y labels rotated 90 degrees clockwise.

**ax** : Matplotlib axes object, default None

The axes to plot the histogram on.

**sharex** : boolean, default True if ax is None else False

In case subplots=True, share x axis and set some x axis labels to invisible; defaults to True if ax is None otherwise False if an ax is passed in. Note that passing in both an ax and sharex=True will alter all x axis labels for all subplots in a figure.

**sharey** : boolean, default False

In case subplots=True, share y axis and set some y axis labels to invisible.

**figsize** : tuple

The size in inches of the figure to create. Uses the value in *matplotlib.rcParams* by default.

**layout** : tuple, optional

Tuple of (rows, columns) for the layout of the histograms.

**bins** : integer or sequence, default 10

Number of histogram bins to be used. If an integer is given, bins + 1 bin edges are calculated and returned. If bins is a sequence, gives bin edges, including left edge of first bin and right edge of last bin. In this case, bins is returned unmodified.

**\*\*kwds**

All other plotting keyword arguments to be passed to `matplotlib.pyplot.hist()`.

#### Returns

**axes** [matplotlib.AxesSubplot or numpy.ndarray of them]

See also:

`matplotlib.pyplot.hist` Plot a histogram using matplotlib.

## Examples

This example draws a histogram based on the length and width of some animals, displayed in three bins

```
>>> df = pd.DataFrame({
...     'length': [1.5, 0.5, 1.2, 0.9, 3],
...     'width': [0.7, 0.2, 0.15, 0.2, 1.1]
... }, index= ['pig', 'rabbit', 'duck', 'chicken', 'horse'])
>>> hist = df.hist(bins=3)
```

### 34.17.3.43 pandas.core.groupby.DataFrameGroupBy.idxmax

DataFrameGroupBy.**idxmax**

Return index of first occurrence of maximum over requested axis. NA/null values are excluded.

**Parameters** `axis` : {0 or 'index', 1 or 'columns'}, default 0

0 or 'index' for row-wise, 1 or 'columns' for column-wise

**skipna** : boolean, default True

Exclude NA/null values. If an entire row/column is NA, the result will be NA.

**Returns**

**idxmax** [Series]

**Raises** **ValueError**

- If the row/column is empty

**See also:**

`Series.idxmax`

## Notes

This method is the DataFrame version of `ndarray.argmax`.

### 34.17.3.44 pandas.core.groupby.DataFrameGroupBy.idxmin

DataFrameGroupBy.**idxmin**

Return index of first occurrence of minimum over requested axis. NA/null values are excluded.

**Parameters** `axis` : {0 or 'index', 1 or 'columns'}, default 0

0 or 'index' for row-wise, 1 or 'columns' for column-wise

**skipna** : boolean, default True

Exclude NA/null values. If an entire row/column is NA, the result will be NA.

**Returns**

**idxmin** [Series]

**Raises** **ValueError**

- If the row/column is empty

**See also:**

`Series.idxmin`

## Notes

This method is the DataFrame version of `ndarray.argmax`.

### 34.17.3.45 `pandas.core.groupby.DataFrameGroupBy.mad`

`DataFrameGroupBy.mad`

Return the mean absolute deviation of the values for the requested axis

#### Parameters

**axis** [{index (0), columns (1)}]

**skipna** : boolean, default True

Exclude NA/null values when computing the result.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a Series

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

#### Returns

**mad** [Series or DataFrame (if level specified)]

### 34.17.3.46 `pandas.core.groupby.DataFrameGroupBy.pct_change`

`DataFrameGroupBy.pct_change` (*periods=1, fill\_method='pad', limit=None, freq=None, axis=0*)

Calculate pct\_change of each value to previous entry in group

**See also:**

`pandas.Series.groupby`, `pandas.DataFrame.groupby`, `pandas.Panel.groupby`

### 34.17.3.47 `pandas.core.groupby.DataFrameGroupBy.plot`

`DataFrameGroupBy.plot`

Class implementing the .plot attribute for groupby objects

### 34.17.3.48 `pandas.core.groupby.DataFrameGroupBy.quantile`

`DataFrameGroupBy.quantile`

Return values at the given quantile over requested axis, a la numpy.percentile.

**Parameters** **q** : float or array-like, default 0.5 (50% quantile)

$0 \leq q \leq 1$ , the quantile(s) to compute

**axis** : {0, 1, 'index', 'columns'} (default 0)

0 or 'index' for row-wise, 1 or 'columns' for column-wise

**numeric\_only** : boolean, default True

If False, the quantile of datetime and timedelta data will be computed as well

**interpolation** : {'linear', 'lower', 'higher', 'midpoint', 'nearest'}

New in version 0.18.0.

This optional parameter specifies the interpolation method to use, when the desired quantile lies between two data points  $i$  and  $j$ :

- linear:  $i + (j - i) * \text{fraction}$ , where *fraction* is the fractional part of the index surrounded by  $i$  and  $j$ .
- lower:  $i$ .
- higher:  $j$ .
- nearest:  $i$  or  $j$  whichever is nearest.
- midpoint:  $(i + j) / 2$ .

**Returns quantiles** : Series or DataFrame

- If  $q$  is an array, a DataFrame will be returned where the index is  $q$ , the columns are the columns of self, and the values are the quantiles.
- If  $q$  is a float, a Series will be returned where the index is the columns of self and the values are the quantiles.

**See also:**

[`pandas.core.window.Rolling.quantile`](#)

## Examples

```
>>> df = pd.DataFrame(np.array([[1, 1], [2, 10], [3, 100], [4, 100]]),
                      columns=['a', 'b'])
>>> df.quantile(.1)
a    1.3
b    3.7
dtype: float64
>>> df.quantile([.1, .5])
      a    b
0.1  1.3  3.7
0.5  2.5 55.0
```

Specifying `numeric_only=False` will also compute the quantile of datetime and timedelta data.

```
>>> df = pd.DataFrame({'A': [1, 2],
                      'B': [pd.Timestamp('2010'),
                           pd.Timestamp('2011')],
                      'C': [pd.Timedelta('1 days'),
                           pd.Timedelta('2 days')]})
>>> df.quantile(0.5, numeric_only=False)
A    1.5
```

(continues on next page)

(continued from previous page)

```
B    2010-07-02 12:00:00
C         1 days 12:00:00
Name: 0.5, dtype: object
```

### 34.17.3.49 pandas.core.groupby.DataFrameGroupBy.rank

DataFrameGroupBy.**rank** (*method='average', ascending=True, na\_option='keep', pct=False, axis=0*)

Provides the rank of values within each group.

**Parameters method** : {'average', 'min', 'max', 'first', 'dense'}, default 'average'

- average: average rank of group
- min: lowest rank in group
- max: highest rank in group
- first: ranks assigned in order they appear in the array
- dense: like 'min', but rank always increases by 1 between groups

**ascending** : boolean, default True

False for ranks by high (1) to low (N)

**na\_option** : {'keep', 'top', 'bottom'}, default 'keep'

- keep: leave NA values where they are
- top: smallest rank if ascending
- bottom: smallest rank if descending

**pct** : boolean, default False

Compute percentage rank of data within each group

**axis** : int, default 0

The axis of the object over which to compute the rank.

**Returns**

—

**DataFrame with ranking of values within each group**

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

### 34.17.3.50 pandas.core.groupby.DataFrameGroupBy.resample

DataFrameGroupBy.**resample** (*rule, \*args, \*\*kwargs*)

Provide resampling when using a TimeGrouper Return a new grouper with our resampler appended

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

### 34.17.3.51 pandas.core.groupby.DataFrameGroupBy.shift

DataFrameGroupBy.**shift** (*periods=1, freq=None, axis=0*)

Shift each group by periods observations

**Parameters** **periods** : integer, default 1

number of periods to shift

**freq** [frequency string]

**axis** [axis to shift, default 0]

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

### 34.17.3.52 pandas.core.groupby.DataFrameGroupBy.size

DataFrameGroupBy.**size** ()

Compute group sizes

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

### 34.17.3.53 pandas.core.groupby.DataFrameGroupBy.skew

DataFrameGroupBy.**skew**

Return unbiased skew over requested axis Normalized by N-1

**Parameters**

**axis** [{index (0), columns (1)}]

**skipna** : boolean, default True

Exclude NA/null values when computing the result.

**level** : int or level name, default None

If the axis is a MultiIndex (hierarchical), count along a particular level, collapsing into a Series

**numeric\_only** : boolean, default None

Include only float, int, boolean columns. If None, will attempt to use everything, then use only numeric data. Not implemented for Series.

**Returns**

**skew** [Series or DataFrame (if level specified)]

### 34.17.3.54 pandas.core.groupby.DataFrameGroupBy.take

DataFrameGroupBy.**take**

Return the elements in the given *positional* indices along an axis.

This means that we are not indexing according to actual values in the index attribute of the object. We are indexing according to the actual position of the element in the object.

**Parameters** `indices` : array-like

An array of ints indicating which positions to take.

**axis** : {0 or 'index', 1 or 'columns', None}, default 0

The axis on which to select elements. 0 means that we are selecting rows, 1 means that we are selecting columns.

**convert** : bool, default TrueWhether to convert negative indices into positive ones. For example, `-1` would map to the `len(axis) - 1`. The conversions are similar to the behavior of indexing a regular Python list.

Deprecated since version 0.21.0: In the future, negative indices will always be converted.

**is\_copy** : bool, default True

Whether to return a copy of the original object or not.

**\*\*kwargs**For compatibility with `numpy.take()`. Has no effect on the output.**Returns** `taken` : type of caller

An array-like containing the elements taken from the object.

**See also:****DataFrame.loc** Select a subset of a DataFrame by labels.**DataFrame.iloc** Select a subset of a DataFrame by positions.**numpy.take** Take elements from an array along an axis.

## Examples

```
>>> df = pd.DataFrame([('falcon', 'bird', 389.0),
...                     ('parrot', 'bird', 24.0),
...                     ('lion', 'mammal', 80.5),
...                     ('monkey', 'mammal', np.nan)],
...                     columns=['name', 'class', 'max_speed'],
...                     index=[0, 2, 3, 1])
>>> df
   name  class  max_speed
0  falcon   bird    389.0
2  parrot   bird     24.0
3   lion  mammal     80.5
1  monkey  mammal      NaN
```

Take elements at positions 0 and 3 along the axis 0 (default).

Note how the actual indices selected (0 and 1) do not correspond to our selected indices 0 and 3. That's because we are selecting the 0th and 3rd rows, not rows whose indices equal 0 and 3.

```
>>> df.take([0, 3])
   name  class  max_speed
0  falcon   bird    389.0
1  monkey  mammal      NaN
```

Take elements at indices 1 and 2 along the axis 1 (column selection).

```
>>> df.take([1, 2], axis=1)
      class  max_speed
0     bird      389.0
2     bird       24.0
3  mammal      80.5
1  mammal       NaN
```

We may take elements using negative integers for positive indices, starting from the end of the object, just like with Python lists.

```
>>> df.take([-1, -2])
      name  class  max_speed
1  monkey  mammal       NaN
3    lion  mammal      80.5
```

### 34.17.3.55 pandas.core.groupby.DataFrameGroupBy.tshift

DataFrameGroupBy.**tshift**

Shift the time index, using the index's frequency if available.

**Parameters** **periods** : int

Number of periods to move, can be positive or negative

**freq** : DateOffset, timedelta, or time rule string, default None

Increment to use from the tseries module or time rule (e.g. 'EOM')

**axis** : int or basestring

Corresponds to the axis that contains the Index

**Returns**

**shifted** [NDFrame]

#### Notes

If freq is not specified then tries to use the freq or inferred\_freq attributes of the index. If neither of those attributes exist, a ValueError is thrown

The following methods are available only for SeriesGroupBy objects.

<i>SeriesGroupBy.nlargest</i>	Return the largest <i>n</i> elements.
<i>SeriesGroupBy.nsmallest</i>	Return the smallest <i>n</i> elements.
<i>SeriesGroupBy.nunique([dropna])</i>	Returns number of unique elements in the group
<i>SeriesGroupBy.unique</i>	Return unique values of Series object.
<i>SeriesGroupBy.value_counts([normalize, ...])</i>	
<i>SeriesGroupBy.is_monotonic_increasing</i>	Return boolean if values in the object are monotonic_increasing
<i>SeriesGroupBy.is_monotonic_decreasing</i>	Return boolean if values in the object are monotonic_decreasing

### 34.17.3.56 pandas.core.groupby.SeriesGroupBy.nlargest

**SeriesGroupBy.nlargest**

Return the largest  $n$  elements.

**Parameters** **n** : int

Return this many descending sorted values

**keep** : {‘first’, ‘last’}, default ‘first’

Where there are duplicate values: - `first` : take the first occurrence. - `last` : take the last occurrence.

**Returns** **top\_n** : Series

The  $n$  largest values in the Series, in sorted order

**See also:**

`Series.nsmallest`

#### Notes

Faster than `.sort_values(ascending=False).head(n)` for small  $n$  relative to the size of the Series object.

#### Examples

```
>>> import pandas as pd
>>> import numpy as np
>>> s = pd.Series(np.random.randn(10**6))
>>> s.nlargest(10)  # only sorts up to the N requested
219921    4.644710
82124     4.608745
421689    4.564644
425277    4.447014
718691    4.414137
43154     4.403520
283187    4.313922
595519    4.273635
503969    4.250236
121637    4.240952
dtype: float64
```

### 34.17.3.57 pandas.core.groupby.SeriesGroupBy.nsmallest

**SeriesGroupBy.nsmallest**

Return the smallest  $n$  elements.

**Parameters** **n** : int

Return this many ascending sorted values

**keep** : {‘first’, ‘last’}, default ‘first’

Where there are duplicate values: - `first` : take the first occurrence. - `last` : take the last occurrence.

**Returns** `bottom_n` : Series

The `n` smallest values in the Series, in sorted order

**See also:**

`Series.nlargest`

## Notes

Faster than `.sort_values().head(n)` for small `n` relative to the size of the Series object.

## Examples

```
>>> import pandas as pd
>>> import numpy as np
>>> s = pd.Series(np.random.randn(10**6))
>>> s.nsmallest(10)  # only sorts up to the N requested
288532    -4.954580
732345    -4.835960
64803     -4.812550
446457    -4.609998
501225    -4.483945
669476    -4.472935
973615    -4.401699
621279    -4.355126
773916    -4.347355
359919    -4.331927
dtype: float64
```

### 34.17.3.58 pandas.core.groupby.SeriesGroupBy.nunique

`SeriesGroupBy.nunique` (`dropna=True`)

Returns number of unique elements in the group

### 34.17.3.59 pandas.core.groupby.SeriesGroupBy.unique

`SeriesGroupBy.unique`

Return unique values of Series object.

Uniques are returned in order of appearance. Hash table-based unique, therefore does NOT sort.

**Returns** `ndarray` or `Categorical`

The unique values returned as a NumPy array. In case of categorical data type, returned as a Categorical.

**See also:**

`pandas.unique` top-level unique method for any 1-d array-like object.

`Index.unique` return Index with unique values from an Index object.

## Examples

```
>>> pd.Series([2, 1, 3, 3], name='A').unique()
array([2, 1, 3])
```

```
>>> pd.Series([pd.Timestamp('2016-01-01') for _ in range(3)]).unique()
array(['2016-01-01T00:00:00.000000000'], dtype='datetime64[ns]')
```

```
>>> pd.Series([pd.Timestamp('2016-01-01', tz='US/Eastern')
...           for _ in range(3)]).unique()
array([Timestamp('2016-01-01 00:00:00-0500', tz='US/Eastern')],
      dtype=object)
```

An unordered Categorical will return categories in the order of appearance.

```
>>> pd.Series(pd.Categorical(list('baabc'))).unique()
[b, a, c]
Categories (3, object): [b, a, c]
```

An ordered Categorical preserves the category ordering.

```
>>> pd.Series(pd.Categorical(list('baabc'), categories=list('abc'),
...                           ordered=True)).unique()
[b, a, c]
Categories (3, object): [a < b < c]
```

### 34.17.3.60 pandas.core.groupby.SeriesGroupBy.value\_counts

`SeriesGroupBy.value_counts` (*normalize=False*, *sort=True*, *ascending=False*, *bins=None*, *dropna=True*)

### 34.17.3.61 pandas.core.groupby.SeriesGroupBy.is\_monotonic\_increasing

`SeriesGroupBy.is_monotonic_increasing`

Return boolean if values in the object are monotonic\_increasing

New in version 0.19.0.

#### Returns

`is_monotonic` [boolean]

### 34.17.3.62 pandas.core.groupby.SeriesGroupBy.is\_monotonic\_decreasing

`SeriesGroupBy.is_monotonic_decreasing`

Return boolean if values in the object are monotonic\_decreasing

New in version 0.19.0.

#### Returns

`is_monotonic_decreasing` [boolean]

The following methods are available only for `DataFrameGroupBy` objects.

---

<code>DataFrameGroupBy.corrwith</code>	Compute pairwise correlation between rows or columns of two DataFrame objects.
<code>DataFrameGroupBy.boxplot([subplots, column, ...])</code>	Make box plots from DataFrameGroupBy data.

---

### 34.17.3.63 pandas.core.groupby.DataFrameGroupBy.corrwith

DataFrameGroupBy.**corrwith**

Compute pairwise correlation between rows or columns of two DataFrame objects.

#### Parameters

**other** [DataFrame, Series]

**axis** : {0 or 'index', 1 or 'columns'}, default 0

0 or 'index' to compute column-wise, 1 or 'columns' for row-wise

**drop** : boolean, default False

Drop missing indices from result, default returns union of all

#### Returns

**correls** [Series]

### 34.17.3.64 pandas.core.groupby.DataFrameGroupBy.boxplot

DataFrameGroupBy.**boxplot** (*subplots=True, column=None, fontsize=None, rot=0, grid=True, ax=None, figsize=None, layout=None, \*\*kwargs*)

Make box plots from DataFrameGroupBy data.

#### Parameters

**grouped** [Grouped DataFrame]

**subplots** :

- False - no subplots will be used
- True - create a subplot for each group

**column** : column name or list of names, or vector

Can be any valid input to groupby

**fontsize** [int or string]

**rot** [label rotation angle]

**grid** [Setting this to True will show the grid]

**ax** [Matplotlib axis object, default None]

**figsize** [A tuple (width, height) in inches]

**layout** : tuple (optional)

(rows, columns) for the layout of the plot

**\*\*kwargs** : Keyword Arguments

All other plotting keyword arguments to be passed to matplotlib's boxplot function

#### Returns

dict of key/value = group key/DataFrame.boxplot return value

or DataFrame.boxplot return value in case subplots=figures=False

#### Examples

```
>>> import pandas
>>> import numpy as np
>>> import itertools
>>>
>>> tuples = [t for t in itertools.product(range(1000), range(4))]
>>> index = pandas.MultiIndex.from_tuples(tuples, names=['lvl0', 'lvl1'])
>>> data = np.random.randn(len(index), 4)
>>> df = pandas.DataFrame(data, columns=list('ABCD'), index=index)
>>>
>>> grouped = df.groupby(level='lvl1')
>>> boxplot_frame_groupby(grouped)
>>>
>>> grouped = df.unstack(level='lvl1').groupby(level=0, axis=1)
>>> boxplot_frame_groupby(grouped, subplots=False)
```

## 34.18 Resampling

Resampler objects are returned by resample calls: `pandas.DataFrame.resample()`, `pandas.Series.resample()`.

### 34.18.1 Indexing, iteration

<code>Resampler.__iter__()</code>	Groupby iterator
<code>Resampler.groups</code>	dict {group name -> group labels}
<code>Resampler.indices</code>	dict {group name -> group indices}
<code>Resampler.get_group(name[, obj])</code>	Constructs NDFrame from group with provided name

#### 34.18.1.1 pandas.core.resample.Resampler.\_\_iter\_\_

`Resampler.__iter__()`

Groupby iterator

#### Returns

Generator yielding sequence of (name, subsetted object)  
for each group

#### 34.18.1.2 pandas.core.resample.Resampler.groups

`Resampler.groups`

dict {group name -> group labels}

### 34.18.1.3 pandas.core.resample.Resampler.indices

`Resampler.indices`

dict {group name -> group indices}

### 34.18.1.4 pandas.core.resample.Resampler.get\_group

`Resampler.get_group(name, obj=None)`

Constructs NDFrame from group with provided name

**Parameters** `name` : object

the name of the group to get as a DataFrame

`obj` : NDFrame, default None

the NDFrame to take the DataFrame out of. If it is None, the object groupby was called on will be used

**Returns**

`group` [type of obj]

## 34.18.2 Function application

<code>Resampler.apply(arg, *args, **kwargs)</code>	Aggregate using one or more operations over the specified axis.
<code>Resampler.aggregate(arg, *args, **kwargs)</code>	Aggregate using one or more operations over the specified axis.
<code>Resampler.transform(arg, *args, **kwargs)</code>	Call function producing a like-indexed Series on each group and return a Series with the transformed values
<code>Resampler.pipe(func, *args, **kwargs)</code>	Apply a function <code>func</code> with arguments to this Resampler object and return the function's result.

### 34.18.2.1 pandas.core.resample.Resampler.apply

`Resampler.apply(arg, *args, **kwargs)`

Aggregate using one or more operations over the specified axis.

**Parameters** `func` : function, string, dictionary, or list of string/functions

Function to use for aggregating the data. If a function, must either work when passed a DataFrame or when passed to DataFrame.apply. For a DataFrame, can pass a dict, if the keys are DataFrame column names.

Accepted combinations are:

- string function name.
- function.
- list of functions.
- dict of column names -> functions (or list of functions).

**\*args**

Positional arguments to pass to `func`.

**\*\*kwargs**Keyword arguments to pass to *func*.**Returns****aggregated** [DataFrame]**See also:**

pandas.DataFrame.groupby.aggregate, pandas.DataFrame.resample.transform,  
[pandas.DataFrame.aggregate](#)

**Notes**

*agg* is an alias for *aggregate*. Use the alias.

A passed user-defined-function will be passed a Series for evaluation.

**Examples**

```
>>> s = Series([1,2,3,4,5],
               index=pd.date_range('20130101',
                                   periods=5,freq='s'))
2013-01-01 00:00:00    1
2013-01-01 00:00:01    2
2013-01-01 00:00:02    3
2013-01-01 00:00:03    4
2013-01-01 00:00:04    5
Freq: S, dtype: int64
```

```
>>> r = s.resample('2s')
DatetimeIndexResampler [freq=<2 * Seconds>, axis=0, closed=left,
                        label=left, convention=start, base=0]
```

```
>>> r.agg(np.sum)
2013-01-01 00:00:00    3
2013-01-01 00:00:02    7
2013-01-01 00:00:04    5
Freq: 2S, dtype: int64
```

```
>>> r.agg(['sum', 'mean', 'max'])
               sum  mean  max
2013-01-01 00:00:00    3   1.5    2
2013-01-01 00:00:02    7   3.5    4
2013-01-01 00:00:04    5   5.0    5
```

```
>>> r.agg({'result' : lambda x: x.mean() / x.std(),
          'total' : np.sum})
               total  result
2013-01-01 00:00:00    3  2.121320
2013-01-01 00:00:02    7  4.949747
2013-01-01 00:00:04    5         NaN
```

### 34.18.2.2 pandas.core.resample.Resampler.aggregate

`Resampler.aggregate` (*arg*, \**args*, \*\**kwargs*)

Aggregate using one or more operations over the specified axis.

**Parameters** *func* : function, string, dictionary, or list of string/functions

Function to use for aggregating the data. If a function, must either work when passed a DataFrame or when passed to DataFrame.apply. For a DataFrame, can pass a dict, if the keys are DataFrame column names.

Accepted combinations are:

- string function name.
- function.
- list of functions.
- dict of column names -> functions (or list of functions).

**\*args**

Positional arguments to pass to *func*.

**\*\*kwargs**

Keyword arguments to pass to *func*.

**Returns**

**aggregated** [DataFrame]

**See also:**

`pandas.DataFrame.groupby.aggregate`, `pandas.DataFrame.resample.transform`,  
[\*pandas.DataFrame.aggregate\*](#)

#### Notes

*agg* is an alias for *aggregate*. Use the alias.

A passed user-defined-function will be passed a Series for evaluation.

#### Examples

```
>>> s = Series([1,2,3,4,5],
               index=pd.date_range('20130101',
                                   periods=5,freq='s'))
2013-01-01 00:00:00    1
2013-01-01 00:00:01    2
2013-01-01 00:00:02    3
2013-01-01 00:00:03    4
2013-01-01 00:00:04    5
Freq: S, dtype: int64
```

```
>>> r = s.resample('2s')
DatetimeIndexResampler [freq=<2 * Seconds>, axis=0, closed=left,
                        label=left, convention=start, base=0]
```

```
>>> r.agg(np.sum)
2013-01-01 00:00:00    3
2013-01-01 00:00:02    7
2013-01-01 00:00:04    5
Freq: 2S, dtype: int64
```

```
>>> r.agg(['sum', 'mean', 'max'])
              sum  mean  max
2013-01-01 00:00:00    3   1.5    2
2013-01-01 00:00:02    7   3.5    4
2013-01-01 00:00:04    5   5.0    5
```

```
>>> r.agg({'result' : lambda x: x.mean() / x.std(),
          'total' : np.sum})
              total  result
2013-01-01 00:00:00    3  2.121320
2013-01-01 00:00:02    7  4.949747
2013-01-01 00:00:04    5         NaN
```

### 34.18.2.3 pandas.core.resample.Resampler.transform

`Resampler.transform(arg, *args, **kwargs)`

Call function producing a like-indexed Series on each group and return a Series with the transformed values

**Parameters** `func` : function

To apply to each group. Should return a Series with the same index

**Returns**

**transformed** [Series]

#### Examples

```
>>> resampled.transform(lambda x: (x - x.mean()) / x.std())
```

### 34.18.2.4 pandas.core.resample.Resampler.pipe

`Resampler.pipe(func, *args, **kwargs)`

Apply a function `func` with arguments to this Resampler object and return the function's result.

New in version 0.23.0.

Use `.pipe` when you want to improve readability by chaining together functions that expect Series, DataFrames, GroupBy or Resampler objects. Instead of writing

```
>>> h(g(f(df.groupby('group')), arg1=a), arg2=b, arg3=c)
```

You can write

```
>>> (df.groupby('group')
...   .pipe(f)
...   .pipe(g, arg1=a)
...   .pipe(h, arg2=b, arg3=c))
```

which is much more readable.

**Parameters** `func` : callable or tuple of (callable, string)

Function to apply to this Resampler object or, alternatively, a (callable, data\_keyword) tuple where data\_keyword is a string indicating the keyword of callable that expects the Resampler object.

**args** : iterable, optional

positional arguments passed into `func`.

**kwargs** : dict, optional

a dictionary of keyword arguments passed into `func`.

**Returns**

**object** [the return type of `func`.]

**See also:**

*[pandas.Series.pipe](#)* Apply a function with arguments to a series

*[pandas.DataFrame.pipe](#)* Apply a function with arguments to a dataframe

*[apply](#)* Apply function to each group instead of to the full Resampler object.

## Notes

See more [here](#)

## Examples

```
>>> df = pd.DataFrame({'A': [1, 2, 3, 4]},
...                    index=pd.date_range('2012-08-02', periods=4))
>>> df
           A
2012-08-02  1
2012-08-03  2
2012-08-04  3
2012-08-05  4
```

To get the difference between each 2-day period's maximum and minimum value in one pass, you can do

```
>>> df.resample('2D').pipe(lambda x: x.max() - x.min())
           A
2012-08-02  1
2012-08-04  1
```

### 34.18.3 Upsampling

<i><a href="#">Resampler.ffill([limit])</a></i>	Forward fill the values
<i><a href="#">Resampler.bfill([limit])</a></i>	Backward fill the new missing values in the resampled data.

Continued on next page

Table 172 – continued from previous page

<code>Resampler.bfill([limit])</code>	Backward fill the new missing values in the resampled data.
<code>Resampler.pad([limit])</code>	Forward fill the values
<code>Resampler.nearest([limit])</code>	Fill values with nearest neighbor starting from center
<code>Resampler.fillna(method[, limit])</code>	Fill missing values introduced by upsampling.
<code>Resampler.asfreq([fill_value])</code>	return the values at the new freq, essentially a reindex
<code>Resampler.interpolate([method, axis, limit, ...])</code>	Interpolate values according to different methods.

### 34.18.3.1 pandas.core.resample.Resampler.ffill

`Resampler.ffi11` (*limit=None*)

Forward fill the values

**Parameters** `limit` : integer, optional

limit of how many values to fill

**Returns**

an upsampled Series

**See also:**

`Series.fillna`, `DataFrame.fillna`

### 34.18.3.2 pandas.core.resample.Resampler.backfill

`Resampler.backfill` (*limit=None*)

Backward fill the new missing values in the resampled data.

In statistics, imputation is the process of replacing missing data with substituted values [R30]. When resampling data, missing values may appear (e.g., when the resampling frequency is higher than the original frequency). The backward fill will replace NaN values that appeared in the resampled data with the next value in the original sequence. Missing values that existed in the original data will not be modified.

**Parameters** `limit` : integer, optional

Limit of how many values to fill.

**Returns** Series, DataFrame

An upsampled Series or DataFrame with backward filled NaN values.

**See also:**

`bfill` Alias of backfill.

`fillna` Fill NaN values using the specified method, which can be ‘backfill’.

`nearest` Fill NaN values with nearest neighbor starting from center.

`pad` Forward fill NaN values.

`pandas.Series.fillna` Fill NaN values in the Series using the specified method, which can be ‘backfill’.

`pandas.DataFrame.fillna` Fill NaN values in the DataFrame using the specified method, which can be ‘backfill’.

## References

[R30]

## Examples

Resampling a Series:

```
>>> s = pd.Series([1, 2, 3],
...                 index=pd.date_range('20180101', periods=3, freq='h'))
>>> s
2018-01-01 00:00:00    1
2018-01-01 01:00:00    2
2018-01-01 02:00:00    3
Freq: H, dtype: int64
```

```
>>> s.resample('30min').backfill()
2018-01-01 00:00:00    1
2018-01-01 00:30:00    2
2018-01-01 01:00:00    2
2018-01-01 01:30:00    3
2018-01-01 02:00:00    3
Freq: 30T, dtype: int64
```

```
>>> s.resample('15min').backfill(limit=2)
2018-01-01 00:00:00    1.0
2018-01-01 00:15:00    NaN
2018-01-01 00:30:00    2.0
2018-01-01 00:45:00    2.0
2018-01-01 01:00:00    2.0
2018-01-01 01:15:00    NaN
2018-01-01 01:30:00    3.0
2018-01-01 01:45:00    3.0
2018-01-01 02:00:00    3.0
Freq: 15T, dtype: float64
```

Resampling a DataFrame that has missing values:

```
>>> df = pd.DataFrame({'a': [2, np.nan, 6], 'b': [1, 3, 5]},
...                     index=pd.date_range('20180101', periods=3,
...                                           freq='h'))
>>> df
              a  b
2018-01-01 00:00:00  2.0  1
2018-01-01 01:00:00  NaN  3
2018-01-01 02:00:00  6.0  5
```

```
>>> df.resample('30min').backfill()
              a  b
2018-01-01 00:00:00  2.0  1
2018-01-01 00:30:00  NaN  3
2018-01-01 01:00:00  NaN  3
2018-01-01 01:30:00  6.0  5
2018-01-01 02:00:00  6.0  5
```

```
>>> df.resample('15min').backfill(limit=2)
              a      b
2018-01-01 00:00:00  2.0  1.0
2018-01-01 00:15:00  NaN  NaN
2018-01-01 00:30:00  NaN  3.0
2018-01-01 00:45:00  NaN  3.0
2018-01-01 01:00:00  NaN  3.0
2018-01-01 01:15:00  NaN  NaN

```

### 34.18.3.3 pandas.core.resample.Resampler.bfill

`Resampler.bfill` (*limit=None*)

Backward fill the new missing values in the resampled data.

In statistics, imputation is the process of replacing missing data with substituted values [R31]. When resampling data, missing values may appear (e.g., when the resampling frequency is higher than the original frequency). The backward fill will replace NaN values that appeared in the resampled data with the next value in the original sequence. Missing values that existed in the original data will not be modified.

**Parameters** `limit` : integer, optional

Limit of how many values to fill.

**Returns** `Series, DataFrame`

An upsampled Series or DataFrame with backward filled NaN values.

**See also:**

**bfill** Alias of backfill.

**fillna** Fill NaN values using the specified method, which can be ‘backfill’.

**nearest** Fill NaN values with nearest neighbor starting from center.

**pad** Forward fill NaN values.

**pandas.Series.fillna** Fill NaN values in the Series using the specified method, which can be ‘backfill’.

**pandas.DataFrame.fillna** Fill NaN values in the DataFrame using the specified method, which can be ‘backfill’.

[R31]

## Examples

Resampling a Series:

```
>>> s = pd.Series([1, 2, 3],
...               index=pd.date_range('20180101', periods=3, freq='h'))
>>> s
```

(continues on next page)

(continued from previous page)

```

2018-01-01 00:00:00    1
2018-01-01 01:00:00    2
2018-01-01 02:00:00    3
Freq: H, dtype: int64

```

```

>>> s.resample('30min').backfill()
2018-01-01 00:00:00    1
2018-01-01 00:30:00    2
2018-01-01 01:00:00    2
2018-01-01 01:30:00    3
2018-01-01 02:00:00    3
Freq: 30T, dtype: int64

```

```

>>> s.resample('15min').backfill(limit=2)
2018-01-01 00:00:00    1.0
2018-01-01 00:15:00    NaN
2018-01-01 00:30:00    2.0
2018-01-01 00:45:00    2.0
2018-01-01 01:00:00    2.0
2018-01-01 01:15:00    NaN
2018-01-01 01:30:00    3.0
2018-01-01 01:45:00    3.0
2018-01-01 02:00:00    3.0
Freq: 15T, dtype: float64

```

Resampling a DataFrame that has missing values:

```

>>> df = pd.DataFrame({'a': [2, np.nan, 6], 'b': [1, 3, 5]},
...                     index=pd.date_range('20180101', periods=3,
...                     freq='h'))
>>> df

```

	a	b
2018-01-01 00:00:00	2.0	1
2018-01-01 01:00:00	NaN	3
2018-01-01 02:00:00	6.0	5

```

>>> df.resample('30min').backfill()

```

	a	b
2018-01-01 00:00:00	2.0	1
2018-01-01 00:30:00	NaN	3
2018-01-01 01:00:00	NaN	3
2018-01-01 01:30:00	6.0	5
2018-01-01 02:00:00	6.0	5

```

>>> df.resample('15min').backfill(limit=2)

```

	a	b
2018-01-01 00:00:00	2.0	1.0
2018-01-01 00:15:00	NaN	NaN
2018-01-01 00:30:00	NaN	3.0
2018-01-01 00:45:00	NaN	3.0
2018-01-01 01:00:00	NaN	3.0
2018-01-01 01:15:00	NaN	NaN
2018-01-01 01:30:00	6.0	5.0
2018-01-01 01:45:00	6.0	5.0
2018-01-01 02:00:00	6.0	5.0

#### 34.18.3.4 `pandas.core.resample.Resampler.pad`

`Resampler.pad` (*limit=None*)

Forward fill the values

**Parameters** `limit` : integer, optional

limit of how many values to fill

**Returns**

an upsampled Series

**See also:**

`Series.fillna`, `DataFrame.fillna`

#### 34.18.3.5 `pandas.core.resample.Resampler.nearest`

`Resampler.nearest` (*limit=None*)

Fill values with nearest neighbor starting from center

**Parameters** `limit` : integer, optional

limit of how many values to fill

New in version 0.21.0.

**Returns**

an upsampled Series

**See also:**

`Series.fillna`, `DataFrame.fillna`

#### 34.18.3.6 `pandas.core.resample.Resampler.fillna`

`Resampler.fillna` (*method*, *limit=None*)

Fill missing values introduced by upsampling.

In statistics, imputation is the process of replacing missing data with substituted values [R32]. When resampling data, missing values may appear (e.g., when the resampling frequency is higher than the original frequency).

Missing values that existed in the original data will not be modified.

**Parameters** `method` : {'pad', 'backfill', 'ffill', 'bfill', 'nearest'}

Method to use for filling holes in resampled data

- 'pad' or 'ffill': use previous valid observation to fill gap (forward fill).
- 'backfill' or 'bfill': use next valid observation to fill gap.
- 'nearest': use nearest valid observation to fill gap.

**limit** : integer, optional

Limit of how many consecutive missing values to fill.

**Returns** Series or DataFrame

An upsampled Series or DataFrame with missing values filled.

**See also:**

**backfill** Backward fill NaN values in the resampled data.

**pad** Forward fill NaN values in the resampled data.

**nearest** Fill NaN values in the resampled data with nearest neighbor starting from center.

**interpolate** Fill NaN values using interpolation.

**pandas.Series.fillna** Fill NaN values in the Series using the specified method, which can be 'bfill' and 'ffill'.

**pandas.DataFrame.fillna** Fill NaN values in the DataFrame using the specified method, which can be 'bfill' and 'ffill'.

## Examples

Resampling a Series:

```
>>> s = pd.Series([1, 2, 3],
...               index=pd.date_range('20180101', periods=3, freq='h'))
>>> s
2018-01-01 00:00:00    1
2018-01-01 01:00:00    2
2018-01-01 02:00:00    3
Freq: H, dtype: int64
```

Without filling the missing values you get:

```
>>> s.resample("30min").asfreq()
2018-01-01 00:00:00    1.0
2018-01-01 00:30:00    NaN
2018-01-01 01:00:00    2.0
2018-01-01 01:30:00    NaN
2018-01-01 02:00:00    3.0
Freq: 30T, dtype: float64
```

```
>>> s.resample('30min').fillna("backfill")
2018-01-01 00:00:00    1
2018-01-01 00:30:00    2
2018-01-01 01:00:00    2
2018-01-01 01:30:00    3
2018-01-01 02:00:00    3
Freq: 30T, dtype: int64
```

```
>>> s.resample('15min').fillna("backfill", limit=2)
2018-01-01 00:00:00    1.0
2018-01-01 00:15:00    NaN
2018-01-01 00:30:00    2.0
2018-01-01 00:45:00    2.0
2018-01-01 01:00:00    2.0
2018-01-01 01:15:00    NaN
2018-01-01 01:30:00    3.0
```

(continues on next page)

(continued from previous page)

```
2018-01-01 01:45:00    3.0
2018-01-01 02:00:00    3.0
Freq: 15T, dtype: float64
```

```
>>> s.resample('30min').fillna("pad")
2018-01-01 00:00:00    1
2018-01-01 00:30:00    1
2018-01-01 01:00:00    2
2018-01-01 01:30:00    2
2018-01-01 02:00:00    3
Freq: 30T, dtype: int64
```

```
>>> s.resample('30min').fillna("nearest")
2018-01-01 00:00:00    1
2018-01-01 00:30:00    2
2018-01-01 01:00:00    2
2018-01-01 01:30:00    3
2018-01-01 02:00:00    3
Freq: 30T, dtype: int64
```

Missing values present before the upsampling are not affected.

```
>>> sm = pd.Series([1, None, 3],
...                 index=pd.date_range('20180101', periods=3, freq='h'))
>>> sm
2018-01-01 00:00:00    1.0
2018-01-01 01:00:00    NaN
2018-01-01 02:00:00    3.0
Freq: H, dtype: float64
```

```
>>> sm.resample('30min').fillna('backfill')
2018-01-01 00:00:00    1.0
2018-01-01 00:30:00    NaN
2018-01-01 01:00:00    NaN
2018-01-01 01:30:00    3.0
2018-01-01 02:00:00    3.0
Freq: 30T, dtype: float64
```

```
>>> sm.resample('30min').fillna('pad')
2018-01-01 00:00:00    1.0
2018-01-01 00:30:00    1.0
2018-01-01 01:00:00    NaN
2018-01-01 01:30:00    NaN
2018-01-01 02:00:00    3.0
Freq: 30T, dtype: float64
```

```
>>> sm.resample('30min').fillna('nearest')
2018-01-01 00:00:00    1.0
2018-01-01 00:30:00    NaN
2018-01-01 01:00:00    NaN
2018-01-01 01:30:00    3.0
2018-01-01 02:00:00    3.0
Freq: 30T, dtype: float64
```

DataFrame resampling is done column-wise. All the same options are available.

```
>>> df = pd.DataFrame({'a': [2, np.nan, 6], 'b': [1, 3, 5]},
...                     index=pd.date_range('20180101', periods=3,
...                     freq='h'))
>>> df
```

	a	b
2018-01-01 00:00:00	2.0	1
2018-01-01 01:00:00	NaN	3
2018-01-01 02:00:00	6.0	5

```
>>> df.resample('30min').fillna("bfill")
```

	a	b
2018-01-01 00:00:00	2.0	1
2018-01-01 00:30:00	NaN	3
2018-01-01 01:00:00	NaN	3
2018-01-01 01:30:00	6.0	5
2018-01-01 02:00:00	6.0	5

### 34.18.3.7 pandas.core.resample.Resampler.asfreq

`Resampler.asfreq` (*fill\_value=None*)

return the values at the new freq, essentially a reindex

**Parameters** *fill\_value*: scalar, optional

Value to use for missing values, applied during upsampling (note this does not fill NaNs that already were present).

New in version 0.20.0.

**See also:**

`Series.asfreq`, `DataFrame.asfreq`

### 34.18.3.8 pandas.core.resample.Resampler.interpolate

`Resampler.interpolate` (*method='linear', axis=0, limit=None, inplace=False, limit\_direction='forward', limit\_area=None, downcast=None, \*\*kwargs*)

Interpolate values according to different methods.

New in version 0.18.1.

Please note that only `method='linear'` is supported for DataFrames/Series with a MultiIndex.

**Parameters** *method*: {'linear', 'time', 'index', 'values', 'nearest', 'zero',

'slinear', 'quadratic', 'cubic', 'barycentric', 'krogh', 'polynomial', 'spline', 'piecewise\_polynomial', 'from\_derivatives', 'pchip', 'akima'}

- 'linear': ignore the index and treat the values as equally spaced. This is the only method supported on MultiIndexes. default
- 'time': interpolation works on daily and higher resolution data to interpolate given length of interval
- 'index', 'values': use the actual numerical values of the index
- 'nearest', 'zero', 'slinear', 'quadratic', 'cubic', 'barycentric', 'polynomial' is passed to `scipy.interpolate.interpld`. Both 'polynomial' and 'spline' require that you also specify an *order* (int), e.g.

`df.interpolate(method='polynomial', order=4)`. These use the actual numerical values of the index.

- 'krogh', 'piecewise\_polynomial', 'spline', 'pchip' and 'akima' are all wrappers around the scipy interpolation methods of similar names. These use the actual numerical values of the index. For more information on their behavior, see the [scipy documentation](#) and [tutorial documentation](#)
- 'from\_derivatives' refers to `BPoly.from_derivatives` which replaces 'piecewise\_polynomial' interpolation method in scipy 0.18

New in version 0.18.1: Added support for the 'akima' method Added interpolate method 'from\_derivatives' which replaces 'piecewise\_polynomial' in scipy 0.18; backwards-compatible with scipy < 0.18

**axis** : {0, 1}, default 0

- 0: fill column-by-column
- 1: fill row-by-row

**limit** : int, default None.

Maximum number of consecutive NaNs to fill. Must be greater than 0.

**limit\_direction** [{ 'forward', 'backward', 'both' }, default 'forward']

**limit\_area** : { 'inside', 'outside' }, default None

- None: (default) no fill restriction
- 'inside' Only fill NaNs surrounded by valid values (interpolate).
- 'outside' Only fill NaNs outside valid values (extrapolate).

If limit is specified, consecutive NaNs will be filled in this direction.

New in version 0.21.0.

**inplace** : bool, default False

Update the NDFrame in place if possible.

**downcast** : optional, 'infer' or None, defaults to None

Downcast dtypes if possible.

**kwargs** [keyword arguments to pass on to the interpolating function.]

### Returns

**Series or DataFrame of same shape interpolated at the NaNs**

See also:

`reindex`, `replace`, `fillna`

### Examples

Filling in NaNs

```

>>> s = pd.Series([0, 1, np.nan, 3])
>>> s.interpolate()
0    0
1    1
2    2
3    3
dtype: float64

```

### 34.18.4 Computations / Descriptive Stats

<i>Resampler.count</i> ([_method])	Compute count of group, excluding missing values
<i>Resampler.nunique</i> ([_method])	Returns number of unique elements in the group
<i>Resampler.first</i> ([_method])	Compute first of group values
<i>Resampler.last</i> ([_method])	Compute last of group values
<i>Resampler.max</i> ([_method])	Compute max of group values
<i>Resampler.mean</i> ([_method])	Compute mean of groups, excluding missing values
<i>Resampler.median</i> ([_method])	Compute median of groups, excluding missing values
<i>Resampler.min</i> ([_method])	Compute min of group values
<i>Resampler.ohlc</i> ([_method])	Compute sum of values, excluding missing values For multiple groupings, the result index will be a MultiIndex
<i>Resampler.prod</i> ([_method, min_count])	Compute prod of group values
<i>Resampler.size</i> ()	Compute group sizes
<i>Resampler.sem</i> ([_method])	Compute standard error of the mean of groups, excluding missing values
<i>Resampler.std</i> ([ddof])	Compute standard deviation of groups, excluding missing values
<i>Resampler.sum</i> ([_method, min_count])	Compute sum of group values
<i>Resampler.var</i> ([ddof])	Compute variance of groups, excluding missing values

#### 34.18.4.1 pandas.core.resample.Resampler.count

`Resampler.count` (*\_method*='count')

Compute count of group, excluding missing values

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

#### 34.18.4.2 pandas.core.resample.Resampler.nunique

`Resampler.nunique` (*\_method*='nunique')

Returns number of unique elements in the group

#### 34.18.4.3 pandas.core.resample.Resampler.first

`Resampler.first` (*\_method*='first', \*args, \*\*kwargs)

Compute first of group values

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

#### 34.18.4.4 pandas.core.resample.Resampler.last

`Resampler.last` (*\_method='last', \*args, \*\*kwargs*)  
Compute last of group values

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

#### 34.18.4.5 pandas.core.resample.Resampler.max

`Resampler.max` (*\_method='max', \*args, \*\*kwargs*)  
Compute max of group values

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

#### 34.18.4.6 pandas.core.resample.Resampler.mean

`Resampler.mean` (*\_method='mean', \*args, \*\*kwargs*)  
Compute mean of groups, excluding missing values  
For multiple groupings, the result index will be a MultiIndex

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

#### 34.18.4.7 pandas.core.resample.Resampler.median

`Resampler.median` (*\_method='median', \*args, \*\*kwargs*)  
Compute median of groups, excluding missing values  
For multiple groupings, the result index will be a MultiIndex

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

#### 34.18.4.8 pandas.core.resample.Resampler.min

`Resampler.min` (*\_method='min', \*args, \*\*kwargs*)  
Compute min of group values

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

#### 34.18.4.9 pandas.core.resample.Resampler.ohlc

`Resampler.ohlc` (*\_method='ohlc', \*args, \*\*kwargs*)  
Compute sum of values, excluding missing values For multiple groupings, the result index will be a MultiIndex

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

#### 34.18.4.10 pandas.core.resample.Resampler.prod

`Resampler.prod(_method='prod', min_count=0, *args, **kwargs)`  
Compute prod of group values

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

#### 34.18.4.11 pandas.core.resample.Resampler.size

`Resampler.size()`  
Compute group sizes

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

#### 34.18.4.12 pandas.core.resample.Resampler.sem

`Resampler.sem(_method='sem', *args, **kwargs)`  
Compute standard error of the mean of groups, excluding missing values  
For multiple groupings, the result index will be a MultiIndex

**Parameters** **ddof**: integer, default 1  
degrees of freedom

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

#### 34.18.4.13 pandas.core.resample.Resampler.std

`Resampler.std(ddof=1, *args, **kwargs)`  
Compute standard deviation of groups, excluding missing values

**Parameters**  
**ddof** [integer, default 1]  
degrees of freedom

#### 34.18.4.14 pandas.core.resample.Resampler.sum

`Resampler.sum(_method='sum', min_count=0, *args, **kwargs)`  
Compute sum of group values

**See also:**

*pandas.Series.groupby, pandas.DataFrame.groupby, pandas.Panel.groupby*

#### 34.18.4.15 pandas.core.resample.Resampler.var

`Resampler.var(ddof=1, *args, **kwargs)`

Compute variance of groups, excluding missing values

##### Parameters

**ddof** [integer, default 1]

**degrees of freedom**

### 34.19 Style

Styler objects are returned by `pandas.DataFrame.style`.

#### 34.19.1 Styler Constructor

---

<code>Styler(data[, precision, table_styles, ...])</code>	Helps style a DataFrame or Series according to the data with HTML and CSS.
<code>Styler.from_custom_template(searchpath, name)</code>	Factory function for creating a subclass of Styler with a custom template and Jinja environment.

---

##### 34.19.1.1 pandas.io.formats.style.Styler

**class** `pandas.io.formats.style.Styler` (*data, precision=None, table\_styles=None, uuid=None, caption=None, table\_attributes=None*)

Helps style a DataFrame or Series according to the data with HTML and CSS.

##### Parameters

**data: Series or DataFrame**

**precision: int**

precision to round floats to, defaults to `pd.options.display.precision`

**table\_styles: list-like, default None**

list of {selector: (attr, value)} dicts; see Notes

**uuid: str, default None**

a unique identifier to avoid CSS collisions; generated automatically

**caption: str, default None**

caption to attach to the table

##### See also:

`pandas.DataFrame.style`

##### Notes

Most styling will be done by passing style functions into `Styler.apply` or `Styler.applymap`. Style functions should return values with strings containing CSS `'attr: value'` that will be applied to the indicated cells.

If using in the Jupyter notebook, Styler has defined a `_repr_html_` to automatically render itself. Otherwise call `Styler.render` to get the generated HTML.

CSS classes are attached to the generated HTML

- Index and Column names include `index_name` and `level<k>` where  $k$  is its level in a MultiIndex
- Index label cells include
  - `row_heading`
  - `row<n>` where  $n$  is the numeric position of the row
  - `level<k>` where  $k$  is the level in a MultiIndex
- Column label cells include `* col_heading * col<n>` where  $n$  is the numeric position of the column  
`* level<k>` where  $k$  is the level in a MultiIndex
- Blank cells include `blank`
- Data cells include `data`

## Attributes

<b>env</b>	(Jinja2 Environment)
<b>template</b>	(Jinja2 Template)
<b>loader</b>	(Jinja2 Loader)

## Methods

<code>apply(func[, axis, subset])</code>	Apply a function column-wise, row-wise, or table-wise, updating the HTML representation with the result.
<code>applymap(func[, subset])</code>	Apply a function elementwise, updating the HTML representation with the result.
<code>background_gradient([cmap, low, high, axis, ...])</code>	Color the background in a gradient according to the data in each column (optionally row).
<code>bar([subset, axis, color, width, align])</code>	Color the background <code>color</code> proportional to the values in each column.
<code>clear()</code>	“Reset” the styler, removing any previously applied styles.
<code>export()</code>	Export the styles to applied to the current Styler.
<code>format(formatter[, subset])</code>	Format the text display value of cells.
<code>from_custom_template(searchpath, name)</code>	Factory function for creating a subclass of <code>Styler</code> with a custom template and Jinja environment.
<code>hide_columns(subset)</code>	Hide columns from rendering.
<code>hide_index()</code>	Hide any indices from rendering.
<code>highlight_max([subset, color, axis])</code>	Highlight the maximum by shading the background
<code>highlight_min([subset, color, axis])</code>	Highlight the minimum by shading the background
<code>highlight_null([null_color])</code>	Shade the background <code>null_color</code> for missing values.
<code>render(**kwargs)</code>	Render the built up styles to HTML
<code>set_caption(caption)</code>	Set the caption on a Styler

Continued on next page

Table 175 – continued from previous page

<code>set_precision(precision)</code>	Set the precision used to render.
<code>set_properties([subset])</code>	Convenience method for setting one or more non-data dependent properties or each cell.
<code>set_table_attributes(attributes)</code>	Set the table attributes.
<code>set_table_styles(table_styles)</code>	Set the table styles on a Styler.
<code>set_uuid(uuid)</code>	Set the uuid for a Styler.
<code>to_excel(excel_writer[, sheet_name, na_rep, ...])</code>	Write Styler to an excel sheet
<code>use(styles)</code>	Set the styles on the current Styler, possibly using styles from <code>Styler.export</code> .
<code>where(cond, value[, other, subset])</code>	Apply a function elementwise, updating the HTML representation with a style which is selected in accordance with the return value of a function.

### **pandas.io.formats.style.Styler.apply**

`Styler.apply(func, axis=0, subset=None, **kwargs)`

Apply a function column-wise, row-wise, or table-wise, updating the HTML representation with the result.

**Parameters** `func` : function

`func` should take a Series or DataFrame (depending on `axis`), and return an object with the same shape. Must return a DataFrame with identical index and column labels when `axis=None`

**axis** : int, str or None

apply to each column (`axis=0` or `'index'`) or to each row (`axis=1` or `'columns'`) or to the entire DataFrame at once with `axis=None`

**subset** : IndexSlice

a valid indexer to limit data to *before* applying the function. Consider using a `pandas.IndexSlice`

**kwargs** : dict

pass along to `func`

**Returns**

`self` [Styler]

### **Notes**

The output shape of `func` should match the input, i.e. if `x` is the input row, column, or table (depending on `axis`), then `func(x.shape) == x.shape` should be true.

This is similar to `DataFrame.apply`, except that `axis=None` applies the function to the entire DataFrame at once, rather than column-wise or row-wise.

## Examples

```
>>> def highlight_max(x):
...     return ['background-color: yellow' if v == x.max() else ''
...            for v in x]
...
>>> df = pd.DataFrame(np.random.randn(5, 2))
>>> df.style.apply(highlight_max)
```

## pandas.io.formats.style.Styler.applymap

**Styler.applymap** (*func*, *subset=None*, *\*\*kwargs*)

Apply a function elementwise, updating the HTML representation with the result.

**Parameters** **func** : function

*func* should take a scalar and return a scalar

**subset** : IndexSlice

a valid indexer to limit data to *before* applying the function. Consider using a `pandas.IndexSlice`

**kwargs** : dict

pass along to *func*

**Returns**

**self** [Styler]

**See also:**

`Styler.where`

## pandas.io.formats.style.Styler.background\_gradient

**Styler.background\_gradient** (*cmap='PuBu'*, *low=0*, *high=0*, *axis=0*, *subset=None*)

Color the background in a gradient according to the data in each column (optionally row). Requires matplotlib.

**Parameters** **cmap**: str or colormap

matplotlib colormap

**low, high**: float

compress the range by these values.

**axis**: int or str

1 or 'columns' for columnwise, 0 or 'index' for rowwise

**subset**: IndexSlice

a valid slice for data to limit the style application to

**Returns**

**self** [Styler]

## Notes

Tune `low` and `high` to keep the text legible by not using the entire range of the color map. These extend the range of the data by `low * (x.max() - x.min())` and `high * (x.max() - x.min())` before normalizing.

## pandas.io.formats.style.Styler.bar

`Styler.bar(subset=None, axis=0, color='#d65f5f', width=100, align='left')`

Color the background `color` proportional to the values in each column. Excludes non-numeric data by default.

**Parameters** `subset`: `IndexSlice`, default `None`

a valid slice for `data` to limit the style application to

**axis**: `int`

**color**: `str` or `2-tuple/list`

If a `str` is passed, the color is the same for both negative and positive numbers. If `2-tuple/list` is used, the first element is the `color_negative` and the second is the `color_positive` (eg: `['#d65f5f', '#5fba7d']`)

**width**: `float`

A number between 0 or 100. The largest value will cover `width` percent of the cell's width

**align** : { 'left', 'zero', 'mid' }, default 'left'

- 'left' : the min value starts at the left of the cell
- 'zero' : a value of zero is located at the center of the cell
- 'mid' : the center of the cell is at  $(\text{max}-\text{min})/2$ , or if values are all negative (positive) the zero is aligned at the right (left) of the cell

New in version 0.20.0.

**Returns**

`self` [`Styler`]

## pandas.io.formats.style.Styler.clear

`Styler.clear()`

“Reset” the styler, removing any previously applied styles. Returns `None`.

## pandas.io.formats.style.Styler.export

`Styler.export()`

Export the styles to applied to the current `Styler`. Can be applied to a second style with `Styler.use`.

**Returns**

`styles`: `list`

See also:

`Styler.use`

### `pandas.io.formats.style.Styler.format`

`Styler.format` (*formatter*, *subset=None*)

Format the text display value of cells.

New in version 0.18.0.

#### Parameters

**formatter:** str, callable, or dict

**subset:** `IndexSlice`

An argument to `DataFrame.loc` that restricts which elements `formatter` is applied to.

#### Returns

**self** [`Styler`]

### Notes

`formatter` is either an `a` or a dict `{column name: a}` where `a` is one of

- str: this will be wrapped in: `a.format(x)`
- callable: called with the value of an individual cell

The default display value for numeric values is the “general” (g) format with `pd.options.display.precision`.

### Examples

```
>>> df = pd.DataFrame(np.random.randn(4, 2), columns=['a', 'b'])
>>> df.style.format("{:.2%}")
>>> df['c'] = ['a', 'b', 'c', 'd']
>>> df.style.format({'c': str.upper})
```

### `pandas.io.formats.style.Styler.from_custom_template`

**classmethod** `Styler.from_custom_template` (*searchpath*, *name*)

Factory function for creating a subclass of `Styler` with a custom template and Jinja environment.

**Parameters** **searchpath** : str or list

Path or paths of directories containing the templates

**name** : str

Name of your custom template to use for rendering

**Returns** **MyStyler** : subclass of `Styler`

has the correct `env` and `template` class attributes set.

### **pandas.io.formats.style.Styler.hide\_columns**

`Styler.hide_columns(subset)`

Hide columns from rendering.

New in version 0.23.0.

**Parameters** `subset: IndexSlice`

An argument to `DataFrame.loc` that identifies which columns are hidden.

**Returns**

`self` [Styler]

### **pandas.io.formats.style.Styler.hide\_index**

`Styler.hide_index()`

Hide any indices from rendering.

New in version 0.23.0.

**Returns**

`self` [Styler]

### **pandas.io.formats.style.Styler.highlight\_max**

`Styler.highlight_max(subset=None, color='yellow', axis=0)`

Highlight the maximum by shading the background

**Parameters** `subset: IndexSlice, default None`

a valid slice for `data` to limit the style application to

**color: str, default 'yellow'**

**axis: int, str, or None; default 0**

0 or 'index' for columnwise (default), 1 or 'columns' for rowwise, or None for tablewise

**Returns**

`self` [Styler]

### **pandas.io.formats.style.Styler.highlight\_min**

`Styler.highlight_min(subset=None, color='yellow', axis=0)`

Highlight the minimum by shading the background

**Parameters** `subset: IndexSlice, default None`

a valid slice for `data` to limit the style application to

**color: str, default 'yellow'**

**axis: int, str, or None; default 0**

0 or 'index' for columnwise (default), 1 or 'columns' for rowwise, or None for tablewise

#### Returns

**self** [Styler]

### pandas.io.formats.style.Styler.highlight\_null

**Styler.highlight\_null** (*null\_color='red'*)

Shade the background *null\_color* for missing values.

#### Parameters

**null\_color:** str

#### Returns

**self** [Styler]

### pandas.io.formats.style.Styler.render

**Styler.render** (*\*\*kwargs*)

Render the built up styles to HTML

#### Parameters **\*\*kwargs**:

Any additional keyword arguments are passed through to *self.template.render*. This is useful when you need to provide additional variables for a custom template.

New in version 0.20.

#### Returns **rendered:** str

the rendered HTML

### Notes

Styler objects have defined the *\_repr\_html\_* method which automatically calls *self.render()* when it's the last item in a Notebook cell. When calling *Styler.render()* directly, wrap the result in *IPython.display.HTML* to view the rendered HTML in the notebook.

Pandas uses the following keys in render. Arguments passed in *\*\*kwargs* take precedence, so think carefully if you want to override them:

- head
- cellstyle
- body
- uuid
- precision
- table\_styles
- caption
- table\_attributes

### pandas.io.formats.style.Styler.set\_caption

`Styler.set_caption(caption)`

Set the caption on a Styler

#### Parameters

**caption:** str

#### Returns

**self** [Styler]

### pandas.io.formats.style.Styler.set\_precision

`Styler.set_precision(precision)`

Set the precision used to render.

#### Parameters

**precision:** int

#### Returns

**self** [Styler]

### pandas.io.formats.style.Styler.set\_properties

`Styler.set_properties(subset=None, **kwargs)`

Convenience method for setting one or more non-data dependent properties on each cell.

#### Parameters

**subset:** IndexSlice

a valid slice for `data` to limit the style application to

**kwargs:** dict

property: value pairs to be set for each cell

#### Returns

**self** [Styler]

### Examples

```
>>> df = pd.DataFrame(np.random.randn(10, 4))
>>> df.style.set_properties(color="white", align="right")
>>> df.style.set_properties(**{'background-color': 'yellow'})
```

### pandas.io.formats.style.Styler.set\_table\_attributes

`Styler.set_table_attributes(attributes)`

Set the table attributes. These are the items that show up in the opening `<table>` tag in addition to the automatic (by default) id.

#### Parameters

**attributes** [string]

**Returns**

**self** [Styler]

**Examples**

```
>>> df = pd.DataFrame(np.random.randn(10, 4))
>>> df.style.set_table_attributes('class="pure-table"')
# ... <table class="pure-table"> ...
```

**pandas.io.formats.style.Styler.set\_table\_styles**

**Styler.set\_table\_styles** (*table\_styles*)

Set the table styles on a Styler. These are placed in a <style> tag before the generated HTML table.

**Parameters** *table\_styles*: list

Each individual *table\_style* should be a dictionary with *selector* and *props* keys. *selector* should be a CSS selector that the style will be applied to (automatically prefixed by the table's UUID) and *props* should be a list of tuples with (*attribute*, *value*).

**Returns**

**self** [Styler]

**Examples**

```
>>> df = pd.DataFrame(np.random.randn(10, 4))
>>> df.style.set_table_styles(
...     [{'selector': 'tr:hover',
...        'props': [('background-color', 'yellow')]}]
... )
```

**pandas.io.formats.style.Styler.set\_uuid**

**Styler.set\_uuid** (*uuid*)

Set the uuid for a Styler.

**Parameters**

**uuid**: str

**Returns**

**self** [Styler]

**pandas.io.formats.style.Styler.to\_excel**

```
Styler.to_excel(excel_writer, sheet_name='Sheet1', na_rep="", float_format=None,
                columns=None, header=True, index=True, index_label=None, startrow=0,
                startcol=0, engine=None, merge_cells=True, encoding=None, inf_rep='inf',
                verbose=True, freeze_panes=None)
```

Write Styler to an excel sheet

New in version 0.20.

**Parameters** **excel\_writer** : string or ExcelWriter object

File path or existing ExcelWriter

**sheet\_name** : string, default 'Sheet1'

Name of sheet which will contain DataFrame

**na\_rep** : string, default ''

Missing data representation

**float\_format** : string, default None

Format string for floating point numbers

**columns** : sequence, optional

Columns to write

**header** : boolean or list of string, default True

Write out the column names. If a list of strings is given it is assumed to be aliases for the column names

**index** : boolean, default True

Write row names (index)

**index\_label** : string or sequence, default None

Column label for index column(s) if desired. If None is given, and *header* and *index* are True, then the index names are used. A sequence should be given if the DataFrame uses MultiIndex.

**startrow** :

upper left cell row to dump data frame

**startcol** :

upper left cell column to dump data frame

**engine** : string, default None

write engine to use - you can also set this via the options `io.excel.xlsx.writer`, `io.excel.xls.writer`, and `io.excel.xlsm.writer`.

**merge\_cells** : boolean, default True

Write MultiIndex and Hierarchical Rows as merged cells.

**encoding**: string, default None

encoding of the resulting excel file. Only necessary for xlwt, other writers support unicode natively.

**inf\_rep** : string, default 'inf'

Representation for infinity (there is no native representation for infinity in Excel)

**freeze\_panes** : tuple of integer (length 2), default None

Specifies the one-based bottommost row and rightmost column that is to be frozen

New in version 0.20.0.

## Notes

If passing an existing ExcelWriter object, then the sheet will be added to the existing workbook. This can be used to save different DataFrames to one workbook:

```
>>> writer = pd.ExcelWriter('output.xlsx')
>>> df1.to_excel(writer, 'Sheet1')
>>> df2.to_excel(writer, 'Sheet2')
>>> writer.save()
```

For compatibility with `to_csv`, `to_excel` serializes lists and dicts to strings before writing.

## pandas.io.formats.style.Styler.use

`Styler.use` (*styles*)

Set the styles on the current Styler, possibly using styles from `Styler.export`.

**Parameters** **styles**: list

list of style functions

**Returns**

**self** [Styler]

**See also:**

`Styler.export`

## pandas.io.formats.style.Styler.where

`Styler.where` (*cond*, *value*, *other=None*, *subset=None*, *\*\*kwargs*)

Apply a function elementwise, updating the HTML representation with a style which is selected in accordance with the return value of a function.

New in version 0.21.0.

**Parameters** **cond** : callable

`cond` should take a scalar and return a boolean

**value** : str

applied when `cond` returns true

**other** : str

applied when `cond` returns false

**subset** : IndexSlice

a valid indexer to limit data to *before* applying the function. Consider using a `pandas.IndexSlice`

**kwargs** : dict

pass along to cond

**Returns****self** [Styler]**See also:***Styler.applymap*

## 34.19.2 Styler Attributes

*Styler.env**Styler.template**Styler.loader*

### 34.19.2.1 pandas.io.formats.style.Styler.env

`Styler.env = <jinja2.environment.Environment object>`

### 34.19.2.2 pandas.io.formats.style.Styler.template

`Styler.template = <Template 'html.tpl'>`

### 34.19.2.3 pandas.io.formats.style.Styler.loader

`Styler.loader = <jinja2.loaders.PackageLoader object>`

## 34.19.3 Style Application

<i>Styler.apply</i> (func[, axis, subset])	Apply a function column-wise, row-wise, or table-wise, updating the HTML representation with the result.
<i>Styler.applymap</i> (func[, subset])	Apply a function elementwise, updating the HTML representation with the result.
<i>Styler.where</i> (cond, value[, other, subset])	Apply a function elementwise, updating the HTML representation with a style which is selected in accordance with the return value of a function.
<i>Styler.format</i> (formatter[, subset])	Format the text display value of cells.
<i>Styler.set_precision</i> (precision)	Set the precision used to render.
<i>Styler.set_table_styles</i> (table_styles)	Set the table styles on a Styler.
<i>Styler.set_table_attributes</i> (attributes)	Set the table attributes.
<i>Styler.set_caption</i> (caption)	Set the caption on a Styler
<i>Styler.set_properties</i> ([subset])	Convenience method for setting one or more non-data dependent properties or each cell.
<i>Styler.set_uuid</i> (uuid)	Set the uuid for a Styler.
<i>Styler.clear</i> ()	“Reset” the styler, removing any previously applied styles.

### 34.19.4 Builtin Styles

<code>Styler.highlight_max([subset, color, axis])</code>	Highlight the maximum by shading the background
<code>Styler.highlight_min([subset, color, axis])</code>	Highlight the minimum by shading the background
<code>Styler.highlight_null([null_color])</code>	Shade the background <code>null_color</code> for missing values.
<code>Styler.background_gradient([cmap, low, ...])</code>	Color the background in a gradient according to the data in each column (optionally row).
<code>Styler.bar([subset, axis, color, width, align])</code>	Color the background <code>color</code> proportional to the values in each column.

### 34.19.5 Style Export and Import

<code>Styler.render(**kwargs)</code>	Render the built up styles to HTML
<code>Styler.export()</code>	Export the styles to applied to the current Styler.
<code>Styler.use(styles)</code>	Set the styles on the current Styler, possibly using styles from <code>Styler.export</code> .
<code>Styler.to_excel(excel_writer[, sheet_name, ...])</code>	Write Styler to an excel sheet

## 34.20 Plotting

The following functions are contained in the `pandas.plotting` module.

<code>andrews_curves(frame, class_column[, ax, ...])</code>	Generates a matplotlib plot of Andrews curves, for visualising clusters of multivariate data.
<code>bootstrap_plot(series[, fig, size, samples])</code>	Bootstrap plot on mean, median and mid-range statistics.
<code>deregister_matplotlib_converters()</code>	Remove pandas' formatters and converters
<code>lag_plot(series[, lag, ax])</code>	Lag plot for time series.
<code>parallel_coordinates(frame, class_column[, ...])</code>	Parallel coordinates plotting.
<code>radviz(frame, class_column[, ax, color, ...])</code>	Plot a multidimensional dataset in 2D.
<code>register_matplotlib_converters([explicit])</code>	Register Pandas Formatters and Converters with matplotlib
<code>scatter_matrix(frame[, alpha, figsize, ax, ...])</code>	Draw a matrix of scatter plots.

### 34.20.1 pandas.plotting.andrews\_curves

`pandas.plotting.andrews_curves` (*frame, class\_column, ax=None, samples=200, color=None, colormap=None, \*\*kws*)

Generates a matplotlib plot of Andrews curves, for visualising clusters of multivariate data.

Andrews curves have the functional form:

$$f(t) = x_1/\sqrt{2} + x_2 \sin(t) + x_3 \cos(t) + x_4 \sin(2t) + x_5 \cos(2t) + \dots$$

Where  $x$  coefficients correspond to the values of each dimension and  $t$  is linearly spaced between  $-\pi$  and  $+\pi$ . Each row of `frame` then corresponds to a single curve.

**Parameters** `frame` : DataFrame

Data to be plotted, preferably normalized to (0.0, 1.0)

**class\_column** [Name of the column containing class names]

**ax** [matplotlib axes object, default None]

**samples** [Number of points to plot in each curve]

**color: list or tuple, optional**

Colors to use for the different classes

**colormap** : str or matplotlib colormap object, default None

Colormap to select colors from. If string, load colormap with that name from matplotlib.

**kwds: keywords**

Options to pass to matplotlib plotting method

**Returns**

**ax: Matplotlib axis object**

## 34.20.2 pandas.plotting.bootstrap\_plot

`pandas.plotting.bootstrap_plot` (*series*, *fig=None*, *size=50*, *samples=500*, *\*\*kwds*)

Bootstrap plot on mean, median and mid-range statistics.

The bootstrap plot is used to estimate the uncertainty of a statistic by relaying on random sampling with replacement [R33]. This function will generate bootstrapping plots for mean, median and mid-range statistics for the given number of samples of the given size.

**Parameters** **series** : pandas.Series

Pandas Series from where to get the samplings for the bootstrapping.

**fig** : matplotlib.figure.Figure, default None

If given, it will use the *fig* reference for plotting instead of creating a new one with default parameters.

**size** : int, default 50

Number of data points to consider during each sampling. It must be greater or equal than the length of the *series*.

**samples** : int, default 500

Number of times the bootstrap procedure is performed.

**\*\*kwds** :

Options to pass to matplotlib plotting method.

**Returns** **fig** : matplotlib.figure.Figure

Matplotlib figure

**See also:**

`pandas.DataFrame.plot` Basic plotting for DataFrame objects.

`pandas.Series.plot` Basic plotting for Series objects.

## Examples

```
>>> import numpy as np
>>> s = pd.Series(np.random.uniform(size=100))
>>> fig = pd.plotting.bootstrap_plot(s)
```

### 34.20.3 pandas.plotting.deregister\_matplotlib\_converters

`pandas.plotting.deregister_matplotlib_converters()`

Remove pandas' formatters and converters

Removes the custom converters added by `register()`. This attempts to set the state of the registry back to the state before pandas registered its own units. Converters for pandas' own types like `Timestamp` and `Period` are removed completely. Converters for types pandas overwrites, like `datetime.datetime`, are restored to their original value.

**See also:**

`deregister_matplotlib_converters`

### 34.20.4 pandas.plotting.lag\_plot

`pandas.plotting.lag_plot(series, lag=1, ax=None, **kws)`

Lag plot for time series.

#### Parameters

**series:** Time series

**lag:** lag of the scatter plot, default 1

**ax:** Matplotlib axis object, optional

**kws:** Matplotlib scatter method keyword arguments, optional

#### Returns

**ax:** Matplotlib axis object

### 34.20.5 pandas.plotting.parallel\_coordinates

`pandas.plotting.parallel_coordinates(frame, class_column, cols=None, ax=None, color=None, use_columns=False, xticks=None, colormap=None, axvlines=True, axvlines_kws=None, sort_labels=False, **kws)`

Parallel coordinates plotting.

#### Parameters

**frame:** DataFrame

**class\_column:** str

Column name containing class names

**cols:** list, optional

A list of column names to use

**ax:** matplotlib.axis, optional

matplotlib axis object

**color:** list or tuple, optional

Colors to use for the different classes

**use\_columns:** bool, optional

If true, columns will be used as xticks

**xticks:** list or tuple, optional

A list of values to use for xticks

**colormap:** str or matplotlib colormap, default None

Colormap to use for line colors.

**axvlines:** bool, optional

If true, vertical lines will be added at each xtick

**axvlines\_kwds:** keywords, optional

Options to be passed to axvline method for vertical lines

**sort\_labels:** bool, False

Sort class\_column labels, useful when assigning colors

New in version 0.20.0.

**kwds:** keywords

Options to pass to matplotlib plotting method

#### Returns

**ax:** matplotlib axis object

### Examples

```
>>> from pandas import read_csv
>>> from pandas.tools.plotting import parallel_coordinates
>>> from matplotlib import pyplot as plt
>>> df = read_csv('https://raw.githubusercontent.com/pandas-dev/pandas/master/
                '/pandas/tests/data/iris.csv')
>>> parallel_coordinates(df, 'Name', color=('#556270',
                '#4ECDC4', '#C7F464'))
>>> plt.show()
```

## 34.20.6 pandas.plotting.radviz

pandas.plotting.**radviz**(frame, class\_column, ax=None, color=None, colormap=None, \*\*kwds)

Plot a multidimensional dataset in 2D.

Each Series in the DataFrame is represented as a evenly distributed slice on a circle. Each data point is rendered in the circle according to the value on each Series. Highly correlated *Series* in the *DataFrame* are placed closer on the unit circle.

RadViz allow to project a N-dimensional data set into a 2D space where the influence of each dimension can be interpreted as a balance between the influence of all dimensions.

More info available at the [original article](#) describing RadViz.

**Parameters** `frame` : *DataFrame*

Pandas object holding the data.

**class\_column** : str

Column name containing the name of the data point category.

**ax** : `matplotlib.axes.Axes`, optional

A plot instance to which to add the information.

**color** : list[str] or tuple[str], optional

Assign a color to each category. Example: ['blue', 'green'].

**colormap** : str or `matplotlib.colors.Colormap`, default None

Colormap to select colors from. If string, load colormap with that name from matplotlib.

**kwds** : optional

Options to pass to matplotlib scatter plotting method.

**Returns**

**axes** [`matplotlib.axes.Axes`]

**See also:**

[`pandas.plotting.andrews\_curves`](#) Plot clustering visualization

## Examples

```
>>> df = pd.DataFrame({
...     'SepalLength': [6.5, 7.7, 5.1, 5.8, 7.6, 5.0, 5.4, 4.6,
...                     6.7, 4.6],
...     'SepalWidth': [3.0, 3.8, 3.8, 2.7, 3.0, 2.3, 3.0, 3.2,
...                     3.3, 3.6],
...     'PetalLength': [5.5, 6.7, 1.9, 5.1, 6.6, 3.3, 4.5, 1.4,
...                     5.7, 1.0],
...     'PetalWidth': [1.8, 2.2, 0.4, 1.9, 2.1, 1.0, 1.5, 0.2,
...                     2.1, 0.2],
...     'Category': ['virginica', 'virginica', 'setosa',
...                  'virginica', 'virginica', 'versicolor',
...                  'versicolor', 'setosa', 'virginica',
...                  'setosa']
... })
>>> rad_viz = pd.plotting.radviz(df, 'Category')
```

### 34.20.7 pandas.plotting.register\_matplotlib\_converters

`pandas.plotting.register_matplotlib_converters` (*explicit=True*)

Register Pandas Formatters and Converters with matplotlib

This function modifies the global `matplotlib.units.registry` dictionary. Pandas adds custom converters for

- `pd.Timestamp`
- `pd.Period`
- `np.datetime64`
- `datetime.datetime`
- `datetime.date`
- `datetime.time`

### 34.20.8 `pandas.plotting.scatter_matrix`

`pandas.plotting.scatter_matrix` (*frame*, *alpha=0.5*, *figsize=None*, *ax=None*, *grid=False*, *diagonal='hist'*, *marker='.'*, *density\_kwds=None*, *hist\_kwds=None*, *range\_padding=0.05*, *\*\*kwds*)

Draw a matrix of scatter plots.

#### Parameters

**frame** [DataFrame]

**alpha** : float, optional

amount of transparency applied

**figsize** : (float,float), optional

a tuple (width, height) in inches

**ax** [Matplotlib axis object, optional]

**grid** : bool, optional

setting this to True will show the grid

**diagonal** : { 'hist', 'kde' }

pick between 'kde' and 'hist' for either Kernel Density Estimation or Histogram plot in the diagonal

**marker** : str, optional

Matplotlib marker type, default '.'

**hist\_kwds** : other plotting keyword arguments

To be passed to hist function

**density\_kwds** : other plotting keyword arguments

To be passed to kernel density estimate plot

**range\_padding** : float, optional

relative extension of axis range in x and y with respect to (x\_max - x\_min) or (y\_max - y\_min), default 0.05

**kws** : other plotting keyword arguments

To be passed to scatter function

### Examples

```
>>> df = DataFrame(np.random.randn(1000, 4), columns=['A', 'B', 'C', 'D'])
>>> scatter_matrix(df, alpha=0.2)
```

## 34.21 General utility functions

### 34.21.1 Working with options

<code>describe_option(pat[, _print_desc])</code>	Prints the description for one or more registered options.
<code>reset_option(pat)</code>	Reset one or more options to their default value.
<code>get_option(pat)</code>	Retrieves the value of the specified option.
<code>set_option(pat, value)</code>	Sets the value of the specified option.
<code>option_context(*args)</code>	Context manager to temporarily set options in the <i>with</i> statement context.

#### 34.21.1.1 pandas.describe\_option

`pandas.describe_option(pat, _print_desc=False)` = `<pandas.core.config.CallableDynamicDoc object>`

Prints the description for one or more registered options.

Call with not arguments to get a listing for all registered options.

Available options:

- `compute.[use_bottleneck, use_numexpr]`
- `display.[chop_threshold, colheader_justify, column_space, date_dayfirst, date_yearfirst, encoding, expand_frame_repr, float_format]`
- `display.html.[border, table_schema, use_mathjax]`
- `display.[large_repr]`
- `display.latex.[escape, longtable, multicolumn, multicolumn_format, multirow, repr]`
- `display.[max_categories, max_columns, max_colwidth, max_info_columns, max_info_rows, max_rows, max_seq_items, memory_usage, multi_sparse, notebook_repr_html, pprint_nest_depth, precision, show_dimensions]`
- `display.unicode.[ambiguous_as_wide, east_asian_width]`
- `display.[width]`
- `html.[border]`
- `io.excel.xls.[writer]`
- `io.excel.xlsm.[writer]`
- `io.excel.xlsx.[writer]`

- `io.hdf.[default_format, dropna_table]`
- `io.parquet.[engine]`
- `mode.[chained_assignment, sim_interactive, use_inf_as_na, use_inf_as_null]`
- `plotting.matplotlib.[register_converters]`

**Parameters** `pat` : str

Regexp pattern. All matching keys will have their description displayed.

`_print_desc` : bool, default True

If True (default) the description(s) will be printed to stdout. Otherwise, the description(s) will be returned as a unicode string (for testing).

**Returns**

None by default, the description(s) as a unicode string if `_print_desc` is False

## Notes

The available options with its descriptions:

**compute.use\_bottleneck** [bool] Use the bottleneck library to accelerate if it is installed, the default is True  
Valid values: False, True [default: True] [currently: True]

**compute.use\_numexpr** [bool] Use the numexpr library to accelerate computation if it is installed, the default is True  
Valid values: False, True [default: True] [currently: True]

**display.chop\_threshold** [float or None] if set to a float value, all float values smaller then the given threshold will be displayed as exactly 0 by repr and friends. [default: None] [currently: None]

**display.colheader\_justify** ['left'/'right'] Controls the justification of column headers. used by DataFrameFormatter. [default: right] [currently: right]

**display.column\_space** No description available. [default: 12] [currently: 12]

**display.date\_dayfirst** [boolean] When True, prints and parses dates with the day first, eg 20/01/2005 [default: False] [currently: False]

**display.date\_yearfirst** [boolean] When True, prints and parses dates with the year first, eg 2005/01/20 [default: False] [currently: False]

**display.encoding** [str/unicode] Defaults to the detected encoding of the console. Specifies the encoding to be used for strings returned by `to_string`, these are generally strings meant to be displayed on the console. [default: UTF-8] [currently: UTF-8]

**display.expand\_frame\_repr** [boolean] Whether to print out the full DataFrame repr for wide DataFrames across multiple lines, `max_columns` is still respected, but the output will wrap-around across multiple “pages” if its width exceeds `display.width`. [default: True] [currently: True]

**display.float\_format** [callable] The callable should accept a floating point number and return a string with the desired format of the number. This is used in some places like SeriesFormatter. See `formats.format.EngFormatter` for an example. [default: None] [currently: None]

**display.html.border** [int] A `border=value` attribute is inserted in the `<table>` tag for the DataFrame HTML repr. [default: 1] [currently: 1]

- display.html.table\_schema** [boolean] Whether to publish a Table Schema representation for frontends that support it. (default: False) [default: False] [currently: False]
- display.html.use\_mathjax** [boolean] When True, Jupyter notebook will process table contents using MathJax, rendering mathematical expressions enclosed by the dollar symbol. (default: True) [default: True] [currently: True]
- display.large\_repr** ['truncate'/'info'] For DataFrames exceeding max\_rows/max\_cols, the repr (and HTML repr) can show a truncated table (the default from 0.13), or switch to the view from df.info() (the behaviour in earlier versions of pandas). [default: truncate] [currently: truncate]
- display.latex.escape** [bool] This specifies if the to\_latex method of a Dataframe uses escapes special characters. Valid values: False,True [default: True] [currently: True]
- display.latex.longtable** :bool This specifies if the to\_latex method of a Dataframe uses the longtable format. Valid values: False,True [default: False] [currently: False]
- display.latex.multicolumn** [bool] This specifies if the to\_latex method of a Dataframe uses multicolumns to pretty-print MultiIndex columns. Valid values: False,True [default: True] [currently: True]
- display.latex.multicolumn\_format** [bool] This specifies if the to\_latex method of a Dataframe uses multicolumns to pretty-print MultiIndex columns. Valid values: False,True [default: l] [currently: l]
- display.latex.mulirow** [bool] This specifies if the to\_latex method of a Dataframe uses multirows to pretty-print MultiIndex rows. Valid values: False,True [default: False] [currently: False]
- display.latex.repr** [boolean] Whether to produce a latex DataFrame representation for jupyter environments that support it. (default: False) [default: False] [currently: False]
- display.max\_categories** [int] This sets the maximum number of categories pandas should output when printing out a *Categorical* or a Series of dtype "category". [default: 8] [currently: 8]
- display.max\_columns** [int] If max\_cols is exceeded, switch to truncate view. Depending on *large\_repr*, objects are either centrally truncated or printed as a summary view. 'None' value means unlimited.
- In case python/IPython is running in a terminal and *large\_repr* equals 'truncate' this can be set to 0 and pandas will auto-detect the width of the terminal and print a truncated object which fits the screen width. The IPython notebook, IPython qtconsole, or IDLE do not run in a terminal and hence it is not possible to do correct auto-detection. [default: 0] [currently: 0]
- display.max\_colwidth** [int] The maximum width in characters of a column in the repr of a pandas data structure. When the column overflows, a "..." placeholder is embedded in the output. [default: 50] [currently: 50]
- display.max\_info\_columns** [int] max\_info\_columns is used in DataFrame.info method to decide if per column information will be printed. [default: 100] [currently: 100]
- display.max\_info\_rows** [int or None] df.info() will usually show null-counts for each column. For large frames this can be quite slow. max\_info\_rows and max\_info\_cols limit this null check only to frames with smaller dimensions than specified. [default: 1690785] [currently: 1690785]
- display.max\_rows** [int] If max\_rows is exceeded, switch to truncate view. Depending on *large\_repr*, objects are either centrally truncated or printed as a summary view. 'None' value means unlimited.
- In case python/IPython is running in a terminal and *large\_repr* equals 'truncate' this can be set to 0 and pandas will auto-detect the height of the terminal and print a truncated object which fits the screen height. The IPython notebook, IPython qtconsole, or IDLE do not run in a terminal and hence it is not possible to do correct auto-detection. [default: 60] [currently: 15]
- display.max\_seq\_items** [int or None] when pretty-printing a long sequence, no more than *max\_seq\_items* will be printed. If items are omitted, they will be denoted by the addition of "..." to the resulting string.
- If set to None, the number of items to be printed is unlimited. [default: 100] [currently: 100]

- display.memory\_usage** [bool, string or None] This specifies if the memory usage of a DataFrame should be displayed when `df.info()` is called. Valid values `True`, `False`, `'deep'` [default: `True`] [currently: `True`]
- display.multi\_sparse** [boolean] “sparsify” MultiIndex display (don’t display repeated elements in outer levels within groups) [default: `True`] [currently: `True`]
- display.notebook\_repr\_html** [boolean] When `True`, IPython notebook will use html representation for pandas objects (if it is available). [default: `True`] [currently: `True`]
- display.pprint\_nest\_depth** [int] Controls the number of nested levels to process when pretty-printing [default: 3] [currently: 3]
- display.precision** [int] Floating point output precision (number of significant digits). This is only a suggestion [default: 6] [currently: 6]
- display.show\_dimensions** [boolean or `'truncate'`] Whether to print out dimensions at the end of DataFrame repr. If `'truncate'` is specified, only print out the dimensions if the frame is truncated (e.g. not display all rows and/or columns) [default: `truncate`] [currently: `truncate`]
- display.unicode.ambiguous\_as\_wide** [boolean] Whether to use the Unicode East Asian Width to calculate the display text width. Enabling this may affect to the performance (default: `False`) [default: `False`] [currently: `False`]
- display.unicode.east\_asian\_width** [boolean] Whether to use the Unicode East Asian Width to calculate the display text width. Enabling this may affect to the performance (default: `False`) [default: `False`] [currently: `False`]
- display.width** [int] Width of the display in characters. In case python/IPython is running in a terminal this can be set to `None` and pandas will correctly auto-detect the width. Note that the IPython notebook, IPython qtconsole, or IDLE do not run in a terminal and hence it is not possible to correctly detect the width. [default: 80] [currently: 80]
- html.border** [int] A `border=value` attribute is inserted in the `<table>` tag for the DataFrame HTML repr. [default: 1] [currently: 1] (Deprecated, use `display.html.border` instead.)
- io.excel.xls.writer** [string] The default Excel writer engine for `'xls'` files. Available options: `auto`, `xlwt`. [default: `auto`] [currently: `auto`]
- io.excel.xlsm.writer** [string] The default Excel writer engine for `'xlsm'` files. Available options: `auto`, `openpyxl`. [default: `auto`] [currently: `auto`]
- io.excel.xlsx.writer** [string] The default Excel writer engine for `'xlsx'` files. Available options: `auto`, `openpyxl`, `xlsxwriter`. [default: `auto`] [currently: `auto`]
- io.hdf.default\_format** [format] default format writing format, if `None`, then put will default to `'fixed'` and append will default to `'table'` [default: `None`] [currently: `None`]
- io.hdf.dropna\_table** [boolean] drop ALL nan rows when appending to a table [default: `False`] [currently: `False`]
- io.parquet.engine** [string] The default parquet reader/writer engine. Available options: `'auto'`, `'pyarrow'`, `'fastparquet'`, the default is `'auto'` [default: `auto`] [currently: `auto`]
- mode.chained\_assignment** [string] Raise an exception, warn, or no action if trying to use chained assignment, The default is warn [default: `warn`] [currently: `warn`]
- mode.sim\_interactive** [boolean] Whether to simulate interactive mode for purposes of testing [default: `False`] [currently: `False`]
- mode.use\_inf\_as\_na** [boolean] `True` means treat `None`, `NaN`, `INF`, `-INF` as `NA` (old way), `False` means `None` and `NaN` are null, but `INF`, `-INF` are not `NA` (new way). [default: `False`] [currently: `False`]

**mode.use\_inf\_as\_null** [boolean] `use_inf_as_null` had been deprecated and will be removed in a future version. Use `use_inf_as_na` instead. [default: False] [currently: False] (Deprecated, use `mode.use_inf_as_na` instead.)

**plotting.matplotlib.register\_converters** [bool] Whether to register converters with matplotlib's units registry for dates, times, datetimes, and Periods. Toggling to False will remove the converters, restoring any converters that pandas overwrote. [default: True] [currently: True]

### 34.21.1.2 pandas.reset\_option

`pandas.reset_option(pat) = <pandas.core.config.CallableDynamicDoc object>`

Reset one or more options to their default value.

Pass "all" as argument to reset all options.

Available options:

- `compute.[use_bottleneck, use_numexpr]`
- `display.[chop_threshold, colheader_justify, column_space, date_dayfirst, date_yearfirst, encoding, expand_frame_repr, float_format]`
- `display.html.[border, table_schema, use_mathjax]`
- `display.[large_repr]`
- `display.latex.[escape, longtable, multicolumn, multicolumn_format, multirow, repr]`
- `display.[max_categories, max_columns, max_colwidth, max_info_columns, max_info_rows, max_rows, max_seq_items, memory_usage, multi_sparse, notebook_repr_html, pprint_nest_depth, precision, show_dimensions]`
- `display.unicode.[ambiguous_as_wide, east_asian_width]`
- `display.[width]`
- `html.[border]`
- `io.excel.xls.[writer]`
- `io.excel.xlsm.[writer]`
- `io.excel.xlsx.[writer]`
- `io.hdf.[default_format, dropna_table]`
- `io.parquet.[engine]`
- `mode.[chained_assignment, sim_interactive, use_inf_as_na, use_inf_as_null]`
- `plotting.matplotlib.[register_converters]`

**Parameters** `pat` : str/regex

If specified only options matching *prefix\** will be reset. Note: partial matches are supported for convenience, but unless you use the full option name (e.g. `x.y.z.option_name`), your code may break in future versions if new options with similar names are introduced.

**Returns**

None

## Notes

The available options with its descriptions:

**compute.use\_bottleneck** [bool] Use the bottleneck library to accelerate if it is installed, the default is True  
Valid values: False,True [default: True] [currently: True]

**compute.use\_numexpr** [bool] Use the numexpr library to accelerate computation if it is installed, the default is True  
Valid values: False,True [default: True] [currently: True]

**display.chop\_threshold** [float or None] if set to a float value, all float values smaller then the given threshold will be displayed as exactly 0 by repr and friends. [default: None] [currently: None]

**display.colheader\_justify** ['left'/'right'] Controls the justification of column headers. used by DataFrameFormatter. [default: right] [currently: right]

**display.column\_space** **No description available.** [default: 12] [currently: 12]

**display.date\_dayfirst** [boolean] When True, prints and parses dates with the day first, eg 20/01/2005 [default: False] [currently: False]

**display.date\_yearfirst** [boolean] When True, prints and parses dates with the year first, eg 2005/01/20 [default: False] [currently: False]

**display.encoding** [str/unicode] Defaults to the detected encoding of the console. Specifies the encoding to be used for strings returned by to\_string, these are generally strings meant to be displayed on the console. [default: UTF-8] [currently: UTF-8]

**display.expand\_frame\_repr** [boolean] Whether to print out the full DataFrame repr for wide DataFrames across multiple lines, *max\_columns* is still respected, but the output will wrap-around across multiple “pages” if its width exceeds *display.width*. [default: True] [currently: True]

**display.float\_format** [callable] The callable should accept a floating point number and return a string with the desired format of the number. This is used in some places like SeriesFormatter. See formats.format.EngFormatter for an example. [default: None] [currently: None]

**display.html.border** [int] A `border=value` attribute is inserted in the `<table>` tag for the DataFrame HTML repr. [default: 1] [currently: 1]

**display.html.table\_schema** [boolean] Whether to publish a Table Schema representation for frontends that support it. (default: False) [default: False] [currently: False]

**display.html.use\_mathjax** [boolean] When True, Jupyter notebook will process table contents using MathJax, rendering mathematical expressions enclosed by the dollar symbol. (default: True) [default: True] [currently: True]

**display.large\_repr** ['truncate'/'info'] For DataFrames exceeding *max\_rows*/*max\_cols*, the repr (and HTML repr) can show a truncated table (the default from 0.13), or switch to the view from `df.info()` (the behaviour in earlier versions of pandas). [default: truncate] [currently: truncate]

**display.latex.escape** [bool] This specifies if the `to_latex` method of a Dataframe uses escapes special characters. Valid values: False,True [default: True] [currently: True]

**display.latex.longtable** :bool This specifies if the `to_latex` method of a Dataframe uses the longtable format. Valid values: False,True [default: False] [currently: False]

**display.latex.multicolumn** [bool] This specifies if the `to_latex` method of a Dataframe uses multicolumns to pretty-print MultiIndex columns. Valid values: False,True [default: True] [currently: True]

**display.latex.multicolumn\_format** [bool] This specifies if the `to_latex` method of a Dataframe uses multicolumns to pretty-print MultiIndex columns. Valid values: False,True [default: 1] [currently: 1]

**display.latex.multirow** [bool] This specifies if the `to_latex` method of a DataFrame uses multirows to pretty-print MultiIndex rows. Valid values: False, True [default: False] [currently: False]

**display.latex.repr** [boolean] Whether to produce a latex DataFrame representation for jupyter environments that support it. (default: False) [default: False] [currently: False]

**display.max\_categories** [int] This sets the maximum number of categories pandas should output when printing out a *Categorical* or a Series of dtype “category”. [default: 8] [currently: 8]

**display.max\_columns** [int] If `max_cols` is exceeded, switch to truncate view. Depending on *large\_repr*, objects are either centrally truncated or printed as a summary view. ‘None’ value means unlimited.

In case python/IPython is running in a terminal and *large\_repr* equals ‘truncate’ this can be set to 0 and pandas will auto-detect the width of the terminal and print a truncated object which fits the screen width. The IPython notebook, IPython qtconsole, or IDLE do not run in a terminal and hence it is not possible to do correct auto-detection. [default: 0] [currently: 0]

**display.max\_colwidth** [int] The maximum width in characters of a column in the repr of a pandas data structure. When the column overflows, a “...” placeholder is embedded in the output. [default: 50] [currently: 50]

**display.max\_info\_columns** [int] `max_info_columns` is used in DataFrame.info method to decide if per column information will be printed. [default: 100] [currently: 100]

**display.max\_info\_rows** [int or None] `df.info()` will usually show null-counts for each column. For large frames this can be quite slow. `max_info_rows` and `max_info_cols` limit this null check only to frames with smaller dimensions than specified. [default: 1690785] [currently: 1690785]

**display.max\_rows** [int] If `max_rows` is exceeded, switch to truncate view. Depending on *large\_repr*, objects are either centrally truncated or printed as a summary view. ‘None’ value means unlimited.

In case python/IPython is running in a terminal and *large\_repr* equals ‘truncate’ this can be set to 0 and pandas will auto-detect the height of the terminal and print a truncated object which fits the screen height. The IPython notebook, IPython qtconsole, or IDLE do not run in a terminal and hence it is not possible to do correct auto-detection. [default: 60] [currently: 15]

**display.max\_seq\_items** [int or None] when pretty-printing a long sequence, no more than *max\_seq\_items* will be printed. If items are omitted, they will be denoted by the addition of “...” to the resulting string.

If set to None, the number of items to be printed is unlimited. [default: 100] [currently: 100]

**display.memory\_usage** [bool, string or None] This specifies if the memory usage of a DataFrame should be displayed when `df.info()` is called. Valid values True, False, ‘deep’ [default: True] [currently: True]

**display.multi\_sparse** [boolean] “sparsify” MultiIndex display (don’t display repeated elements in outer levels within groups) [default: True] [currently: True]

**display.notebook\_repr\_html** [boolean] When True, IPython notebook will use html representation for pandas objects (if it is available). [default: True] [currently: True]

**display.pprint\_nest\_depth** [int] Controls the number of nested levels to process when pretty-printing [default: 3] [currently: 3]

**display.precision** [int] Floating point output precision (number of significant digits). This is only a suggestion [default: 6] [currently: 6]

**display.show\_dimensions** [boolean or ‘truncate’] Whether to print out dimensions at the end of DataFrame repr. If ‘truncate’ is specified, only print out the dimensions if the frame is truncated (e.g. not display all rows and/or columns) [default: truncate] [currently: truncate]

**display.unicode.ambiguous\_as\_wide** [boolean] Whether to use the Unicode East Asian Width to calculate the display text width. Enabling this may affect to the performance (default: False) [default: False] [currently: False]

- display.unicode.east\_asian\_width** [boolean] Whether to use the Unicode East Asian Width to calculate the display text width. Enabling this may affect to the performance (default: False) [default: False] [currently: False]
- display.width** [int] Width of the display in characters. In case python/IPython is running in a terminal this can be set to None and pandas will correctly auto-detect the width. Note that the IPython notebook, IPython qtconsole, or IDLE do not run in a terminal and hence it is not possible to correctly detect the width. [default: 80] [currently: 80]
- html.border** [int] A `border=value` attribute is inserted in the `<table>` tag for the DataFrame HTML repr. [default: 1] [currently: 1] (Deprecated, use `display.html.border` instead.)
- io.excel.xls.writer** [string] The default Excel writer engine for 'xls' files. Available options: auto, xlwt. [default: auto] [currently: auto]
- io.excel.xlsm.writer** [string] The default Excel writer engine for 'xlsm' files. Available options: auto, openpyxl. [default: auto] [currently: auto]
- io.excel.xlsx.writer** [string] The default Excel writer engine for 'xlsx' files. Available options: auto, openpyxl, xlsxwriter. [default: auto] [currently: auto]
- io.hdf.default\_format** [format] default format writing format, if None, then put will default to 'fixed' and append will default to 'table' [default: None] [currently: None]
- io.hdf.dropna\_table** [boolean] drop ALL nan rows when appending to a table [default: False] [currently: False]
- io.parquet.engine** [string] The default parquet reader/writer engine. Available options: 'auto', 'pyarrow', 'fastparquet', the default is 'auto' [default: auto] [currently: auto]
- mode.chained\_assignment** [string] Raise an exception, warn, or no action if trying to use chained assignment, The default is warn [default: warn] [currently: warn]
- mode.sim\_interactive** [boolean] Whether to simulate interactive mode for purposes of testing [default: False] [currently: False]
- mode.use\_inf\_as\_na** [boolean] True means treat None, NaN, INF, -INF as NA (old way), False means None and NaN are null, but INF, -INF are not NA (new way). [default: False] [currently: False]
- mode.use\_inf\_as\_null** [boolean] `use_inf_as_null` had been deprecated and will be removed in a future version. Use `use_inf_as_na` instead. [default: False] [currently: False] (Deprecated, use `mode.use_inf_as_na` instead.)
- plotting.matplotlib.register\_converters** [bool] Whether to register converters with matplotlib's units registry for dates, times, datetimes, and Periods. Toggling to False will remove the converters, restoring any converters that pandas overwrote. [default: True] [currently: True]

### 34.21.1.3 pandas.get\_option

`pandas.get_option(pat) = <pandas.core.config.CallableDynamicDoc object>`

Retrieves the value of the specified option.

Available options:

- `compute.[use_bottleneck, use_numexpr]`
- `display.[chop_threshold, colheader_justify, column_space, date_dayfirst, date_yearfirst, encoding, expand_frame_repr, float_format]`
- `display.html.[border, table_schema, use_mathjax]`
- `display.[large_repr]`

- `display.latex.[escape, longtable, multicolumn, multicolumn_format, multirow, repr]`
- `display.[max_categories, max_columns, max_colwidth, max_info_columns, max_info_rows, max_rows, max_seq_items, memory_usage, multi_sparse, notebook_repr_html, pprint_nest_depth, precision, show_dimensions]`
- `display.unicode.[ambiguous_as_wide, east_asian_width]`
- `display.[width]`
- `html.[border]`
- `io.excel.xls.[writer]`
- `io.excel.xlsm.[writer]`
- `io.excel.xlsx.[writer]`
- `io.hdf.[default_format, dropna_table]`
- `io.parquet.[engine]`
- `mode.[chained_assignment, sim_interactive, use_inf_as_na, use_inf_as_null]`
- `plotting.matplotlib.[register_converters]`

**Parameters** `pat` : str

Regex which should match a single option. Note: partial matches are supported for convenience, but unless you use the full option name (e.g. `x.y.z.option_name`), your code may break in future versions if new options with similar names are introduced.

**Returns**

**result** [the value of the option]

**Raises**

**OptionError** [if no such option exists]

**Notes**

The available options with its descriptions:

**compute.use\_bottleneck** [bool] Use the bottleneck library to accelerate if it is installed, the default is True  
Valid values: False, True [default: True] [currently: True]

**compute.use\_numexpr** [bool] Use the numexpr library to accelerate computation if it is installed, the default is True  
Valid values: False, True [default: True] [currently: True]

**display.chop\_threshold** [float or None] if set to a float value, all float values smaller then the given threshold will be displayed as exactly 0 by repr and friends. [default: None] [currently: None]

**display.colheader\_justify** ['left'/'right'] Controls the justification of column headers. used by DataFrameFormatter. [default: right] [currently: right]

**display.column\_space** No description available. [default: 12] [currently: 12]

**display.date\_dayfirst** [boolean] When True, prints and parses dates with the day first, eg 20/01/2005 [default: False] [currently: False]

**display.date\_yearfirst** [boolean] When True, prints and parses dates with the year first, eg 2005/01/20 [default: False] [currently: False]

- display.encoding** [str/unicode] Defaults to the detected encoding of the console. Specifies the encoding to be used for strings returned by `to_string`, these are generally strings meant to be displayed on the console. [default: UTF-8] [currently: UTF-8]
- display.expand\_frame\_repr** [boolean] Whether to print out the full DataFrame repr for wide DataFrames across multiple lines, `max_columns` is still respected, but the output will wrap-around across multiple “pages” if its width exceeds `display.width`. [default: True] [currently: True]
- display.float\_format** [callable] The callable should accept a floating point number and return a string with the desired format of the number. This is used in some places like `SeriesFormatter`. See `formats.format.EngFormatter` for an example. [default: None] [currently: None]
- display.html.border** [int] A `border=value` attribute is inserted in the `<table>` tag for the DataFrame HTML repr. [default: 1] [currently: 1]
- display.html.table\_schema** [boolean] Whether to publish a Table Schema representation for frontends that support it. (default: False) [default: False] [currently: False]
- display.html.use\_mathjax** [boolean] When True, Jupyter notebook will process table contents using MathJax, rendering mathematical expressions enclosed by the dollar symbol. (default: True) [default: True] [currently: True]
- display.large\_repr** ['truncate'/'info'] For DataFrames exceeding `max_rows/max_cols`, the repr (and HTML repr) can show a truncated table (the default from 0.13), or switch to the view from `df.info()` (the behaviour in earlier versions of pandas). [default: truncate] [currently: truncate]
- display.latex.escape** [bool] This specifies if the `to_latex` method of a Dataframe uses escapes special characters. Valid values: False, True [default: True] [currently: True]
- display.latex.longtable** :bool This specifies if the `to_latex` method of a Dataframe uses the longtable format. Valid values: False, True [default: False] [currently: False]
- display.latex.multicolumn** [bool] This specifies if the `to_latex` method of a Dataframe uses multicolumns to pretty-print MultiIndex columns. Valid values: False, True [default: True] [currently: True]
- display.latex.multicolumn\_format** [bool] This specifies if the `to_latex` method of a Dataframe uses multicolumns to pretty-print MultiIndex columns. Valid values: False, True [default: 1] [currently: 1]
- display.latex.multirow** [bool] This specifies if the `to_latex` method of a Dataframe uses multirows to pretty-print MultiIndex rows. Valid values: False, True [default: False] [currently: False]
- display.latex.repr** [boolean] Whether to produce a latex DataFrame representation for jupyter environments that support it. (default: False) [default: False] [currently: False]
- display.max\_categories** [int] This sets the maximum number of categories pandas should output when printing out a *Categorical* or a Series of dtype “category”. [default: 8] [currently: 8]
- display.max\_columns** [int] If `max_cols` is exceeded, switch to truncate view. Depending on `large_repr`, objects are either centrally truncated or printed as a summary view. ‘None’ value means unlimited.
- In case python/IPython is running in a terminal and `large_repr` equals ‘truncate’ this can be set to 0 and pandas will auto-detect the width of the terminal and print a truncated object which fits the screen width. The IPython notebook, IPython qtconsole, or IDLE do not run in a terminal and hence it is not possible to do correct auto-detection. [default: 0] [currently: 0]
- display.max\_colwidth** [int] The maximum width in characters of a column in the repr of a pandas data structure. When the column overflows, a “...” placeholder is embedded in the output. [default: 50] [currently: 50]
- display.max\_info\_columns** [int] `max_info_columns` is used in `DataFrame.info` method to decide if per column information will be printed. [default: 100] [currently: 100]

- display.max\_info\_rows** [int or None] `df.info()` will usually show null-counts for each column. For large frames this can be quite slow. `max_info_rows` and `max_info_cols` limit this null check only to frames with smaller dimensions than specified. [default: 1690785] [currently: 1690785]
- display.max\_rows** [int] If `max_rows` is exceeded, switch to truncate view. Depending on `large_repr`, objects are either centrally truncated or printed as a summary view. ‘None’ value means unlimited.
- In case python/IPython is running in a terminal and `large_repr` equals ‘truncate’ this can be set to 0 and pandas will auto-detect the height of the terminal and print a truncated object which fits the screen height. The IPython notebook, IPython qtconsole, or IDLE do not run in a terminal and hence it is not possible to do correct auto-detection. [default: 60] [currently: 15]
- display.max\_seq\_items** [int or None] when pretty-printing a long sequence, no more than `max_seq_items` will be printed. If items are omitted, they will be denoted by the addition of “...” to the resulting string.
- If set to None, the number of items to be printed is unlimited. [default: 100] [currently: 100]
- display.memory\_usage** [bool, string or None] This specifies if the memory usage of a DataFrame should be displayed when `df.info()` is called. Valid values True,False,’deep’ [default: True] [currently: True]
- display.multi\_sparse** [boolean] “sparsify” MultiIndex display (don’t display repeated elements in outer levels within groups) [default: True] [currently: True]
- display.notebook\_repr\_html** [boolean] When True, IPython notebook will use html representation for pandas objects (if it is available). [default: True] [currently: True]
- display.pprint\_nest\_depth** [int] Controls the number of nested levels to process when pretty-printing [default: 3] [currently: 3]
- display.precision** [int] Floating point output precision (number of significant digits). This is only a suggestion [default: 6] [currently: 6]
- display.show\_dimensions** [boolean or ‘truncate’] Whether to print out dimensions at the end of DataFrame repr. If ‘truncate’ is specified, only print out the dimensions if the frame is truncated (e.g. not display all rows and/or columns) [default: truncate] [currently: truncate]
- display.unicode.ambiguous\_as\_wide** [boolean] Whether to use the Unicode East Asian Width to calculate the display text width. Enabling this may affect to the performance (default: False) [default: False] [currently: False]
- display.unicode.east\_asian\_width** [boolean] Whether to use the Unicode East Asian Width to calculate the display text width. Enabling this may affect to the performance (default: False) [default: False] [currently: False]
- display.width** [int] Width of the display in characters. In case python/IPython is running in a terminal this can be set to None and pandas will correctly auto-detect the width. Note that the IPython notebook, IPython qtconsole, or IDLE do not run in a terminal and hence it is not possible to correctly detect the width. [default: 80] [currently: 80]
- html.border** [int] A `border=value` attribute is inserted in the `<table>` tag for the DataFrame HTML repr. [default: 1] [currently: 1] (Deprecated, use `display.html.border` instead.)
- io.excel.xls.writer** [string] The default Excel writer engine for ‘xls’ files. Available options: auto, xlwt. [default: auto] [currently: auto]
- io.excel.xlsm.writer** [string] The default Excel writer engine for ‘xlsm’ files. Available options: auto, openpyxl. [default: auto] [currently: auto]
- io.excel.xlsx.writer** [string] The default Excel writer engine for ‘xlsx’ files. Available options: auto, openpyxl, xlsxwriter. [default: auto] [currently: auto]
- io.hdf.default\_format** [format] default format writing format, if None, then put will default to ‘fixed’ and append will default to ‘table’ [default: None] [currently: None]

- io.hdf.dropna\_table** [boolean] drop ALL nan rows when appending to a table [default: False] [currently: False]
- io.parquet.engine** [string] The default parquet reader/writer engine. Available options: 'auto', 'pyarrow', 'fastparquet', the default is 'auto' [default: auto] [currently: auto]
- mode.chained\_assignment** [string] Raise an exception, warn, or no action if trying to use chained assignment, The default is warn [default: warn] [currently: warn]
- mode.sim\_interactive** [boolean] Whether to simulate interactive mode for purposes of testing [default: False] [currently: False]
- mode.use\_inf\_as\_na** [boolean] True means treat None, NaN, INF, -INF as NA (old way), False means None and NaN are null, but INF, -INF are not NA (new way). [default: False] [currently: False]
- mode.use\_inf\_as\_null** [boolean] `use_inf_as_null` had been deprecated and will be removed in a future version. Use `use_inf_as_na` instead. [default: False] [currently: False] (Deprecated, use `mode.use_inf_as_na` instead.)
- plotting.matplotlib.register\_converters** [bool] Whether to register converters with matplotlib's units registry for dates, times, datetimes, and Periods. Toggling to False will remove the converters, restoring any converters that pandas overwrote. [default: True] [currently: True]

#### 34.21.1.4 pandas.set\_option

```
pandas.set_option(pat, value) = <pandas.core.config.CallableDynamicDoc
                        object>
```

Sets the value of the specified option.

Available options:

- `compute.[use_bottleneck, use_numexpr]`
- `display.[chop_threshold, colheader_justify, column_space, date_dayfirst, date_yearfirst, encoding, expand_frame_repr, float_format]`
- `display.html.[border, table_schema, use_mathjax]`
- `display.[large_repr]`
- `display.latex.[escape, longtable, multicolumn, multicolumn_format, multirow, repr]`
- `display.[max_categories, max_columns, max_colwidth, max_info_columns, max_info_rows, max_rows, max_seq_items, memory_usage, multi_sparse, notebook_repr_html, pprint_nest_depth, precision, show_dimensions]`
- `display.unicode.[ambiguous_as_wide, east_asian_width]`
- `display.[width]`
- `html.[border]`
- `io.excel.xls.[writer]`
- `io.excel.xlsm.[writer]`
- `io.excel.xlsx.[writer]`
- `io.hdf.[default_format, dropna_table]`
- `io.parquet.[engine]`
- `mode.[chained_assignment, sim_interactive, use_inf_as_na, use_inf_as_null]`
- `plotting.matplotlib.[register_converters]`

**Parameters** `pat` : str

Regex which should match a single option. Note: partial matches are supported for convenience, but unless you use the full option name (e.g. `x.y.z.option_name`), your code may break in future versions if new options with similar names are introduced.

**value** :

new value of option.

**Returns**

None

**Raises**

**OptionError** if no such option exists

**Notes**

The available options with its descriptions:

**compute.use\_bottleneck** [bool] Use the bottleneck library to accelerate if it is installed, the default is True  
Valid values: False,True [default: True] [currently: True]

**compute.use\_numexpr** [bool] Use the numexpr library to accelerate computation if it is installed, the default is True  
Valid values: False,True [default: True] [currently: True]

**display.chop\_threshold** [float or None] if set to a float value, all float values smaller then the given threshold will be displayed as exactly 0 by repr and friends. [default: None] [currently: None]

**display.colheader\_justify** ['left'/'right'] Controls the justification of column headers. used by DataFrameFormatter. [default: right] [currently: right]

**display.column\_space** No description available. [default: 12] [currently: 12]

**display.date\_dayfirst** [boolean] When True, prints and parses dates with the day first, eg 20/01/2005 [default: False] [currently: False]

**display.date\_yearfirst** [boolean] When True, prints and parses dates with the year first, eg 2005/01/20 [default: False] [currently: False]

**display.encoding** [str/unicode] Defaults to the detected encoding of the console. Specifies the encoding to be used for strings returned by `to_string`, these are generally strings meant to be displayed on the console. [default: UTF-8] [currently: UTF-8]

**display.expand\_frame\_repr** [boolean] Whether to print out the full DataFrame repr for wide DataFrames across multiple lines, `max_columns` is still respected, but the output will wrap-around across multiple “pages” if its width exceeds `display.width`. [default: True] [currently: True]

**display.float\_format** [callable] The callable should accept a floating point number and return a string with the desired format of the number. This is used in some places like `SeriesFormatter`. See `formats.format.EngFormatter` for an example. [default: None] [currently: None]

**display.html.border** [int] A `border=value` attribute is inserted in the `<table>` tag for the DataFrame HTML repr. [default: 1] [currently: 1]

**display.html.table\_schema** [boolean] Whether to publish a Table Schema representation for frontends that support it. (default: False) [default: False] [currently: False]

**display.html.use\_mathjax** [boolean] When True, Jupyter notebook will process table contents using MathJax, rendering mathematical expressions enclosed by the dollar symbol. (default: True) [default: True] [currently: True]

**display.large\_repr** ['truncate'/'info'] For DataFrames exceeding max\_rows/max\_cols, the repr (and HTML repr) can show a truncated table (the default from 0.13), or switch to the view from df.info() (the behaviour in earlier versions of pandas). [default: truncate] [currently: truncate]

**display.latex.escape** [bool] This specifies if the to\_latex method of a Dataframe uses escapes special characters. Valid values: False,True [default: True] [currently: True]

**display.latex.longtable** :bool This specifies if the to\_latex method of a Dataframe uses the longtable format. Valid values: False,True [default: False] [currently: False]

**display.latex.multicolumn** [bool] This specifies if the to\_latex method of a Dataframe uses multicolumns to pretty-print MultiIndex columns. Valid values: False,True [default: True] [currently: True]

**display.latex.multicolumn\_format** [bool] This specifies if the to\_latex method of a Dataframe uses multicolumns to pretty-print MultiIndex columns. Valid values: False,True [default: l] [currently: l]

**display.latex.mulirow** [bool] This specifies if the to\_latex method of a Dataframe uses multirows to pretty-print MultiIndex rows. Valid values: False,True [default: False] [currently: False]

**display.latex.repr** [boolean] Whether to produce a latex DataFrame representation for jupyter environments that support it. (default: False) [default: False] [currently: False]

**display.max\_categories** [int] This sets the maximum number of categories pandas should output when printing out a *Categorical* or a Series of dtype “category”. [default: 8] [currently: 8]

**display.max\_columns** [int] If max\_cols is exceeded, switch to truncate view. Depending on *large\_repr*, objects are either centrally truncated or printed as a summary view. ‘None’ value means unlimited.

In case python/IPython is running in a terminal and *large\_repr* equals ‘truncate’ this can be set to 0 and pandas will auto-detect the width of the terminal and print a truncated object which fits the screen width. The IPython notebook, IPython qtconsole, or IDLE do not run in a terminal and hence it is not possible to do correct auto-detection. [default: 0] [currently: 0]

**display.max\_colwidth** [int] The maximum width in characters of a column in the repr of a pandas data structure. When the column overflows, a “...” placeholder is embedded in the output. [default: 50] [currently: 50]

**display.max\_info\_columns** [int] max\_info\_columns is used in DataFrame.info method to decide if per column information will be printed. [default: 100] [currently: 100]

**display.max\_info\_rows** [int or None] df.info() will usually show null-counts for each column. For large frames this can be quite slow. max\_info\_rows and max\_info\_cols limit this null check only to frames with smaller dimensions than specified. [default: 1690785] [currently: 1690785]

**display.max\_rows** [int] If max\_rows is exceeded, switch to truncate view. Depending on *large\_repr*, objects are either centrally truncated or printed as a summary view. ‘None’ value means unlimited.

In case python/IPython is running in a terminal and *large\_repr* equals ‘truncate’ this can be set to 0 and pandas will auto-detect the height of the terminal and print a truncated object which fits the screen height. The IPython notebook, IPython qtconsole, or IDLE do not run in a terminal and hence it is not possible to do correct auto-detection. [default: 60] [currently: 15]

**display.max\_seq\_items** [int or None] when pretty-printing a long sequence, no more than *max\_seq\_items* will be printed. If items are omitted, they will be denoted by the addition of “...” to the resulting string.

If set to None, the number of items to be printed is unlimited. [default: 100] [currently: 100]

**display.memory\_usage** [bool, string or None] This specifies if the memory usage of a DataFrame should be displayed when df.info() is called. Valid values True,False,’deep’ [default: True] [currently: True]

**display.multi\_sparse** [boolean] “sparsify” MultiIndex display (don’t display repeated elements in outer levels within groups) [default: True] [currently: True]

- display.notebook\_repr\_html** [boolean] When True, IPython notebook will use html representation for pandas objects (if it is available). [default: True] [currently: True]
- display.pprint\_nest\_depth** [int] Controls the number of nested levels to process when pretty-printing [default: 3] [currently: 3]
- display.precision** [int] Floating point output precision (number of significant digits). This is only a suggestion [default: 6] [currently: 6]
- display.show\_dimensions** [boolean or 'truncate'] Whether to print out dimensions at the end of DataFrame repr. If 'truncate' is specified, only print out the dimensions if the frame is truncated (e.g. not display all rows and/or columns) [default: truncate] [currently: truncate]
- display.unicode.ambiguous\_as\_wide** [boolean] Whether to use the Unicode East Asian Width to calculate the display text width. Enabling this may affect to the performance (default: False) [default: False] [currently: False]
- display.unicode.east\_asian\_width** [boolean] Whether to use the Unicode East Asian Width to calculate the display text width. Enabling this may affect to the performance (default: False) [default: False] [currently: False]
- display.width** [int] Width of the display in characters. In case python/IPython is running in a terminal this can be set to None and pandas will correctly auto-detect the width. Note that the IPython notebook, IPython qtconsole, or IDLE do not run in a terminal and hence it is not possible to correctly detect the width. [default: 80] [currently: 80]
- html.border** [int] A `border=value` attribute is inserted in the `<table>` tag for the DataFrame HTML repr. [default: 1] [currently: 1] (Deprecated, use `display.html.border` instead.)
- io.excel.xls.writer** [string] The default Excel writer engine for 'xls' files. Available options: auto, xlwt. [default: auto] [currently: auto]
- io.excel.xlsm.writer** [string] The default Excel writer engine for 'xlsm' files. Available options: auto, openpyxl. [default: auto] [currently: auto]
- io.excel.xlsx.writer** [string] The default Excel writer engine for 'xlsx' files. Available options: auto, openpyxl, xlsxwriter. [default: auto] [currently: auto]
- io.hdf.default\_format** [format] default format writing format, if None, then put will default to 'fixed' and append will default to 'table' [default: None] [currently: None]
- io.hdf.dropna\_table** [boolean] drop ALL nan rows when appending to a table [default: False] [currently: False]
- io.parquet.engine** [string] The default parquet reader/writer engine. Available options: 'auto', 'pyarrow', 'fastparquet', the default is 'auto' [default: auto] [currently: auto]
- mode.chained\_assignment** [string] Raise an exception, warn, or no action if trying to use chained assignment, The default is warn [default: warn] [currently: warn]
- mode.sim\_interactive** [boolean] Whether to simulate interactive mode for purposes of testing [default: False] [currently: False]
- mode.use\_inf\_as\_na** [boolean] True means treat None, NaN, INF, -INF as NA (old way), False means None and NaN are null, but INF, -INF are not NA (new way). [default: False] [currently: False]
- mode.use\_inf\_as\_null** [boolean] `use_inf_as_null` had been deprecated and will be removed in a future version. Use `use_inf_as_na` instead. [default: False] [currently: False] (Deprecated, use `mode.use_inf_as_na` instead.)
- plotting.matplotlib.register\_converters** [bool] Whether to register converters with matplotlib's units registry for dates, times, datetimes, and Periods. Toggling to False will remove the converters, restoring any converters that pandas overwrote. [default: True] [currently: True]

### 34.21.1.5 pandas.option\_context

**class** pandas.option\_context(\*args)

Context manager to temporarily set options in the *with* statement context.

You need to invoke as `option_context(pat, val, [(pat, val), ...])`.

#### Examples

```
>>> with option_context('display.max_rows', 10, 'display.max_columns', 5):  
    ...
```

### 34.21.2 Testing functions

<code>testing.assert_frame_equal(left,</code>	<code>right[,</code>	Check that left and right DataFrame are equal.
<code>...])</code>		
<code>testing.assert_series_equal(left,</code>	<code>right[,</code>	Check that left and right Series are equal.
<code>...])</code>		
<code>testing.assert_index_equal(left,</code>	<code>right[,</code>	Check that left and right Index are equal.
<code>...])</code>		

#### 34.21.2.1 pandas.testing.assert\_frame\_equal

`pandas.testing.assert_frame_equal(left, right, check_dtype=True, check_index_type='equiv',  
check_column_type='equiv', check_frame_type=True,  
check_less_precise=False, check_names=True,  
by_blocks=False, check_exact=False,  
check_datetimelike_compat=False,  
check_categorical=True, check_like=False,  
obj='DataFrame')`

Check that left and right DataFrame are equal.

##### Parameters

**left** [DataFrame]

**right** [DataFrame]

**check\_dtype** : bool, default True

Whether to check the DataFrame dtype is identical.

**check\_index\_type** : bool / string {'equiv'}, default False

Whether to check the Index class, dtype and inferred\_type are identical.

**check\_column\_type** : bool / string {'equiv'}, default False

Whether to check the columns class, dtype and inferred\_type are identical.

**check\_frame\_type** : bool, default False

Whether to check the DataFrame class is identical.

**check\_less\_precise** : bool or int, default False

Specify comparison precision. Only used when `check_exact` is `False`. 5 digits (`False`) or 3 digits (`True`) after decimal points are compared. If `int`, then specify the digits to compare

**check\_names** : bool, default `True`

Whether to check the Index names attribute.

**by\_blocks** : bool, default `False`

Specify how to compare internal data. If `False`, compare by columns. If `True`, compare by blocks.

**check\_exact** : bool, default `False`

Whether to compare number exactly.

**check\_datetimelike\_compat** : bool, default `False`

Compare datetime-like which is comparable ignoring dtype.

**check\_categorical** : bool, default `True`

Whether to compare internal Categorical exactly.

**check\_like** : bool, default `False`

If true, ignore the order of rows & columns

**obj** : str, default `'DataFrame'`

Specify object name being compared, internally used to show appropriate assertion message

### 34.21.2.2 pandas.testing.assert\_series\_equal

```
pandas.testing.assert_series_equal(left, right, check_dtype=True, check_index_type='equiv',
                                   check_series_type=True,      check_less_precise=False,
                                   check_names=True,             check_exact=False,
                                   check_datetimelike_compat=False,
                                   check_categorical=True, obj='Series')
```

Check that left and right Series are equal.

#### Parameters

**left** [Series]

**right** [Series]

**check\_dtype** : bool, default `True`

Whether to check the Series dtype is identical.

**check\_index\_type** : bool / string {'equiv'}, default `'equiv'`

Whether to check the Index class, dtype and inferred\_type are identical.

**check\_series\_type** : bool, default `True`

Whether to check the Series class is identical.

**check\_less\_precise** : bool or int, default `False`

Specify comparison precision. Only used when `check_exact` is `False`. 5 digits (`False`) or 3 digits (`True`) after decimal points are compared. If `int`, then specify the digits to compare

**check\_exact** : bool, default False

Whether to compare number exactly.

**check\_names** : bool, default True

Whether to check the Series and Index names attribute.

**check\_datetimelike\_compat** : bool, default False

Compare datetime-like which is comparable ignoring dtype.

**check\_categorical** : bool, default True

Whether to compare internal Categorical exactly.

**obj** : str, default 'Series'

Specify object name being compared, internally used to show appropriate assertion message

### 34.21.2.3 pandas.testing.assert\_index\_equal

```
pandas.testing.assert_index_equal(left, right, exact='equiv', check_names=True,  
                                  check_less_precise=False, check_exact=True,  
                                  check_categorical=True, obj='Index')
```

Check that left and right Index are equal.

#### Parameters

**left** [Index]

**right** [Index]

**exact** : bool / string { 'equiv' }, default False

Whether to check the Index class, dtype and inferred\_type are identical. If 'equiv', then RangeIndex can be substituted for Int64Index as well.

**check\_names** : bool, default True

Whether to check the names attribute.

**check\_less\_precise** : bool or int, default False

Specify comparison precision. Only used when check\_exact is False. 5 digits (False) or 3 digits (True) after decimal points are compared. If int, then specify the digits to compare

**check\_exact** : bool, default True

Whether to compare number exactly.

**check\_categorical** : bool, default True

Whether to compare internal Categorical exactly.

**obj** : str, default 'Index'

Specify object name being compared, internally used to show appropriate assertion message

### 34.21.3 Exceptions and warnings

<code>errors.DtypeWarning</code>	Warning raised when reading different dtypes in a column from a file.
<code>errors.EmptyDataError</code>	Exception that is thrown in <code>pd.read_csv</code> (by both the C and Python engines) when empty data or header is encountered.
<code>errors.OutOfBoundsDatetime</code>	
<code>errors.ParserError</code>	Exception that is raised by an error encountered in <code>pd.read_csv</code> .
<code>errors.ParserWarning</code>	Warning raised when reading a file that doesn't use the default 'c' parser.
<code>errors.PerformanceWarning</code>	Warning raised when there is a possible performance impact.
<code>errors.UnsortedIndexError</code>	Error raised when attempting to get a slice of a MultiIndex, and the index has not been lexsorted.
<code>errors.UnsupportedFunctionCall</code>	Exception raised when attempting to call a numpy function on a pandas object, but that function is not supported by the object e.g.

### 34.21.3.1 pandas.errors.DtypeWarning

#### exception `pandas.errors.DtypeWarning`

Warning raised when reading different dtypes in a column from a file.

Raised for a dtype incompatibility. This can happen whenever `read_csv` or `read_table` encounter non-uniform dtypes in a column(s) of a given CSV file.

See also:

`pandas.read_csv` Read CSV (comma-separated) file into a DataFrame.

`pandas.read_table` Read general delimited file into a DataFrame.

#### Notes

This warning is issued when dealing with larger files because the dtype checking happens per chunk read.

Despite the warning, the CSV file is read with mixed types in a single column which will be an object type. See the examples below to better understand this issue.

#### Examples

This example creates and reads a large CSV file with a column that contains *int* and *str*.

```
>>> df = pd.DataFrame({'a': ([ '1' ] * 100000 + [ 'X' ] * 100000 +
...                          [ '1' ] * 100000),
...                    'b': [ 'b' ] * 300000})
>>> df.to_csv('test.csv', index=False)
>>> df2 = pd.read_csv('test.csv')
... # DtypeWarning: Columns (0) have mixed types
```

Important to notice that `df2` will contain both *str* and *int* for the same input, '1'.

```
>>> df2.iloc[262140, 0]
'1'
>>> type(df2.iloc[262140, 0])
<class 'str'>
>>> df2.iloc[262150, 0]
1
>>> type(df2.iloc[262150, 0])
<class 'int'>
```

One way to solve this issue is using the *dtype* parameter in the *read\_csv* and *read\_table* functions to explicit the conversion:

```
>>> df2 = pd.read_csv('test.csv', sep=',', dtype={'a': str})
```

No warning was issued.

```
>>> import os
>>> os.remove('test.csv')
```

### 34.21.3.2 pandas.errors.EmptyDataError

**exception** pandas.errors.EmptyDataError

Exception that is thrown in *pd.read\_csv* (by both the C and Python engines) when empty data or header is encountered.

### 34.21.3.3 pandas.errors.OutOfBoundsDatetime

**exception** pandas.errors.OutOfBoundsDatetime

### 34.21.3.4 pandas.errors.ParserError

**exception** pandas.errors.ParserError

Exception that is raised by an error encountered in *pd.read\_csv*.

### 34.21.3.5 pandas.errors.ParserWarning

**exception** pandas.errors.ParserWarning

Warning raised when reading a file that doesn't use the default 'c' parser.

Raised by *pd.read\_csv* and *pd.read\_table* when it is necessary to change parsers, generally from the default 'c' parser to 'python'.

It happens due to a lack of support or functionality for parsing a particular attribute of a CSV file with the requested engine.

Currently, 'c' unsupported options include the following parameters:

1. *sep* other than a single character (e.g. regex separators)
2. *skipfooter* higher than 0
3. *sep=None* with *delim\_whitespace=False*

The warning can be avoided by adding `engine='python'` as a parameter in `pd.read_csv` and `pd.read_table` methods.

See also:

**pd.read\_csv** Read CSV (comma-separated) file into DataFrame.

**pd.read\_table** Read general delimited file into DataFrame.

## Examples

Using a `sep` in `pd.read_csv` other than a single character:

```
>>> import io
>>> csv = u'''a;b;c
...         1;1,8
...         1;2,1'''
>>> df = pd.read_csv(io.StringIO(csv), sep='[;,]')
... # ParserWarning: Falling back to the 'python' engine...
```

Adding `engine='python'` to `pd.read_csv` removes the Warning:

```
>>> df = pd.read_csv(io.StringIO(csv), sep='[;,]', engine='python')
```

### 34.21.3.6 pandas.errors.PerformanceWarning

**exception** `pandas.errors.PerformanceWarning`

Warning raised when there is a possible performance impact.

### 34.21.3.7 pandas.errors.UnsortedIndexError

**exception** `pandas.errors.UnsortedIndexError`

Error raised when attempting to get a slice of a MultiIndex, and the index has not been lexsorted. Subclass of `KeyError`.

New in version 0.20.0.

### 34.21.3.8 pandas.errors.UnsupportedFunctionCall

**exception** `pandas.errors.UnsupportedFunctionCall`

Exception raised when attempting to call a numpy function on a pandas object, but that function is not supported by the object e.g. `np.cumsum(groupby_object)`.

## 34.21.4 Data types related functionality

---

`api.types.union_categoricals(to_union[, ...])`

Combine list-like of Categorical-like, unioning categories.

---

`api.types.infer_dtype`

Efficiently infer the type of a passed val, or list-like array of values.

Continued on next page

Table 184 – continued from previous page

<code>pandas.api.types.pandas_dtype(dtype)</code>	Converts input into a pandas only dtype object or a numpy dtype object.
---	---

### 34.21.4.1 pandas.api.types.union\_categoricals

`pandas.api.types.union_categoricals` (*to\_union*, *sort\_categories=False*, *ignore\_order=False*)  
Combine list-like of Categorical-like, unioning categories. All categories must have the same dtype.

New in version 0.19.0.

**Parameters** *to\_union* : list-like of Categorical, CategoricalIndex,  
or Series with dtype='category'

**sort\_categories** : boolean, default False

If true, resulting categories will be lexicographically sorted, otherwise they will be ordered as they appear in the data.

**ignore\_order**: boolean, default False

If true, the ordered attribute of the Categoricals will be ignored. Results in an unordered categorical.

New in version 0.20.0.

#### Returns

**result** [Categorical]

#### Raises TypeError

- all inputs do not have the same dtype
- all inputs do not have the same ordered property
- all inputs are ordered and their categories are not identical
- *sort\_categories=True* and Categoricals are ordered

#### ValueError

Empty list of categoricals passed

#### Notes

To learn more about categories, see [link](#)

#### Examples

```
>>> from pandas.api.types import union_categoricals
```

If you want to combine categoricals that do not necessarily have the same categories, `union_categoricals` will combine a list-like of categoricals. The new categories will be the union of the categories being combined.

```
>>> a = pd.Categorical(["b", "c"])
>>> b = pd.Categorical(["a", "b"])
>>> union_categoricals([a, b])
```

(continues on next page)

(continued from previous page)

```
[b, c, a, b]
Categories (3, object): [b, c, a]
```

By default, the resulting categories will be ordered as they appear in the *categories* of the data. If you want the categories to be lexicographically sorted, use *sort\_categories=True* argument.

```
>>> union_categoricals([a, b], sort_categories=True)
[b, c, a, b]
Categories (3, object): [a, b, c]
```

*union\_categoricals* also works with the case of combining two categoricals of the same categories and order information (e.g. what you could also *append* for).

```
>>> a = pd.Categorical(["a", "b"], ordered=True)
>>> b = pd.Categorical(["a", "b", "a"], ordered=True)
>>> union_categoricals([a, b])
[a, b, a, b, a]
Categories (2, object): [a < b]
```

Raises *TypeError* because the categories are ordered and not identical.

```
>>> a = pd.Categorical(["a", "b"], ordered=True)
>>> b = pd.Categorical(["a", "b", "c"], ordered=True)
>>> union_categoricals([a, b])
TypeError: to union ordered Categoricals, all categories must be the same
```

New in version 0.20.0

Ordered categoricals with different categories or orderings can be combined by using the *ignore\_ordered=True* argument.

```
>>> a = pd.Categorical(["a", "b", "c"], ordered=True)
>>> b = pd.Categorical(["c", "b", "a"], ordered=True)
>>> union_categoricals([a, b], ignore_order=True)
[a, b, c, c, b, a]
Categories (3, object): [a, b, c]
```

*union\_categoricals* also works with a *CategoricalIndex*, or *Series* containing categorical data, but note that the resulting array will always be a plain *Categorical*

```
>>> a = pd.Series(["b", "c"], dtype='category')
>>> b = pd.Series(["a", "b"], dtype='category')
>>> union_categoricals([a, b])
[b, c, a, b]
Categories (3, object): [b, c, a]
```

#### 34.21.4.2 pandas.api.types.infer\_dtype

`pandas.api.types.infer_dtype()`

Efficiently infer the type of a passed val, or list-like array of values. Return a string describing the type.

##### Parameters

**value** [scalar, list, ndarray, or pandas type]

**skipna** : bool, default False

Ignore NaN values when inferring the type. The default of `False` will be deprecated in a later version of pandas.

New in version 0.21.0.

#### Returns

string describing the common type of the input data.

Results can include:

- string
- unicode
- bytes
- floating
- integer
- mixed-integer
- mixed-integer-float
- decimal
- complex
- categorical
- boolean
- datetime64
- datetime
- date
- timedelta64
- timedelta
- time
- period
- mixed

#### Raises

`TypeError` if ndarray-like but cannot infer the dtype

#### Notes

- ‘mixed’ is the catchall for anything that is not otherwise specialized
- ‘mixed-integer-float’ are floats and integers
- ‘mixed-integer’ are integers mixed with non-integers

## Examples

```
>>> infer_dtype(['foo', 'bar'])
'string'
```

```
>>> infer_dtype(['a', np.nan, 'b'], skipna=True)
'string'
```

```
>>> infer_dtype(['a', np.nan, 'b'], skipna=False)
'mixed'
```

```
>>> infer_dtype([b'foo', b'bar'])
'bytes'
```

```
>>> infer_dtype([1, 2, 3])
'integer'
```

```
>>> infer_dtype([1, 2, 3.5])
'mixed-integer-float'
```

```
>>> infer_dtype([1.0, 2.0, 3.5])
'floating'
```

```
>>> infer_dtype(['a', 1])
'mixed-integer'
```

```
>>> infer_dtype([Decimal(1), Decimal(2.0)])
'decimal'
```

```
>>> infer_dtype([True, False])
'boolean'
```

```
>>> infer_dtype([True, False, np.nan])
'mixed'
```

```
>>> infer_dtype([pd.Timestamp('20130101')])
'datetime'
```

```
>>> infer_dtype([datetime.date(2013, 1, 1)])
'date'
```

```
>>> infer_dtype([np.datetime64('2013-01-01')])
'datetime64'
```

```
>>> infer_dtype([datetime.timedelta(0, 1, 1)])
'timedelta'
```

```
>>> infer_dtype(pd.Series(list('aabc')).astype('category'))
'categorical'
```

### 34.21.4.3 pandas.api.types.pandas\_dtype

pandas.api.types.pandas\_dtype(dtype)

Converts input into a pandas only dtype object or a numpy dtype object.

#### Parameters

**dtype** [object to be converted]

#### Returns

**np.dtype or a pandas dtype**

Dtype introspection

<code>api.types.is_bool_dtype(arr_or_dtype)</code>	Check whether the provided array or dtype is of a boolean dtype.
<code>api.types.is_categorical_dtype(arr_or_dtype)</code>	Check whether an array-like or dtype is of the Categorical dtype.
<code>api.types.is_complex_dtype(arr_or_dtype)</code>	Check whether the provided array or dtype is of a complex dtype.
<code>api.types.is_datetime64_any_dtype(arr_or_dtype)</code>	Check whether the provided array or dtype is of the datetime64 dtype.
<code>api.types.is_datetime64_dtype(arr_or_dtype)</code>	Check whether an array-like or dtype is of the datetime64 dtype.
<code>api.types.is_datetime64_ns_dtype(arr_or_dtype)</code>	Check whether the provided array or dtype is of the datetime64[ns] dtype.
<code>api.types.is_datetime64tz_dtype(arr_or_dtype)</code>	Check whether an array-like or dtype is of a DatetimeTZDtype dtype.
<code>api.types.is_extension_type(arr)</code>	Check whether an array-like is of a pandas extension class instance.
<code>api.types.is_float_dtype(arr_or_dtype)</code>	Check whether the provided array or dtype is of a float dtype.
<code>api.types.is_int64_dtype(arr_or_dtype)</code>	Check whether the provided array or dtype is of the int64 dtype.
<code>api.types.is_integer_dtype(arr_or_dtype)</code>	Check whether the provided array or dtype is of an integer dtype.
<code>api.types.is_interval_dtype(arr_or_dtype)</code>	Check whether an array-like or dtype is of the Interval dtype.
<code>api.types.is_numeric_dtype(arr_or_dtype)</code>	Check whether the provided array or dtype is of a numeric dtype.
<code>api.types.is_object_dtype(arr_or_dtype)</code>	Check whether an array-like or dtype is of the object dtype.
<code>api.types.is_period_dtype(arr_or_dtype)</code>	Check whether an array-like or dtype is of the Period dtype.
<code>api.types.is_signed_integer_dtype(arr_or_dtype)</code>	Check whether the provided array or dtype is of a signed integer dtype.
<code>api.types.is_string_dtype(arr_or_dtype)</code>	Check whether the provided array or dtype is of the string dtype.
<code>api.types.is_timedelta64_dtype(arr_or_dtype)</code>	Check whether an array-like or dtype is of the timedelta64 dtype.
<code>api.types.is_timedelta64_ns_dtype(arr_or_dtype)</code>	Check whether the provided array or dtype is of the timedelta64[ns] dtype.

Continued on next page

Table 185 – continued from previous page

<code>api.types.is_unsigned_integer_dtype(arr_or_dtype)</code>	Check whether the provided array or dtype is of an unsigned integer dtype.
<code>api.types.is_sparse(arr)</code>	Check whether an array-like is a pandas sparse array.

#### 34.21.4.4 pandas.api.types.is\_bool\_dtype

`pandas.api.types.is_bool_dtype(arr_or_dtype)`

Check whether the provided array or dtype is of a boolean dtype.

**Parameters** `arr_or_dtype` : array-like

The array or dtype to check.

**Returns**

**boolean** [Whether or not the array or dtype is of a boolean dtype.]

#### Examples

```
>>> is_bool_dtype(str)
False
>>> is_bool_dtype(int)
False
>>> is_bool_dtype(bool)
True
>>> is_bool_dtype(np.bool)
True
>>> is_bool_dtype(np.array(['a', 'b']))
False
>>> is_bool_dtype(pd.Series([1, 2]))
False
>>> is_bool_dtype(np.array([True, False]))
True
```

#### 34.21.4.5 pandas.api.types.is\_categorical\_dtype

`pandas.api.types.is_categorical_dtype(arr_or_dtype)`

Check whether an array-like or dtype is of the Categorical dtype.

**Parameters** `arr_or_dtype` : array-like

The array-like or dtype to check.

**Returns** **boolean** : Whether or not the array-like or dtype is of the Categorical dtype.

#### Examples

```
>>> is_categorical_dtype(object)
False
>>> is_categorical_dtype(CategoricalDtype())
True
```

(continues on next page)

(continued from previous page)

```
>>> is_categorical_dtype([1, 2, 3])
False
>>> is_categorical_dtype(pd.Categorical([1, 2, 3]))
True
>>> is_categorical_dtype(pd.CategoricalIndex([1, 2, 3]))
True
```

#### 34.21.4.6 pandas.api.types.is\_complex\_dtype

pandas.api.types.**is\_complex\_dtype**(arr\_or\_dtype)

Check whether the provided array or dtype is of a complex dtype.

**Parameters** arr\_or\_dtype : array-like

The array or dtype to check.

**Returns**

**boolean** [Whether or not the array or dtype is of a complex dtype.]

#### Examples

```
>>> is_complex_dtype(str)
False
>>> is_complex_dtype(int)
False
>>> is_complex_dtype(np.complex)
True
>>> is_complex_dtype(np.array(['a', 'b']))
False
>>> is_complex_dtype(pd.Series([1, 2]))
False
>>> is_complex_dtype(np.array([1 + 1j, 5]))
True
```

#### 34.21.4.7 pandas.api.types.is\_datetime64\_any\_dtype

pandas.api.types.**is\_datetime64\_any\_dtype**(arr\_or\_dtype)

Check whether the provided array or dtype is of the datetime64 dtype.

**Parameters** arr\_or\_dtype : array-like

The array or dtype to check.

**Returns**

**boolean** [Whether or not the array or dtype is of the datetime64 dtype.]

#### Examples

```

>>> is_datetime64_any_dtype(str)
False
>>> is_datetime64_any_dtype(int)
False
>>> is_datetime64_any_dtype(np.datetime64) # can be tz-naive
True
>>> is_datetime64_any_dtype(DatetimeTZDtype("ns", "US/Eastern"))
True
>>> is_datetime64_any_dtype(np.array(['a', 'b']))
False
>>> is_datetime64_any_dtype(np.array([1, 2]))
False
>>> is_datetime64_any_dtype(np.array([], dtype=np.datetime64))
True
>>> is_datetime64_any_dtype(pd.DatetimeIndex([1, 2, 3],
                                             dtype=np.datetime64))
True

```

#### 34.21.4.8 pandas.api.types.is\_datetime64\_dtype

`pandas.api.types.is_datetime64_dtype(arr_or_dtype)`

Check whether an array-like or dtype is of the datetime64 dtype.

**Parameters** `arr_or_dtype` : array-like

The array-like or dtype to check.

**Returns** `boolean` : Whether or not the array-like or dtype is of the datetime64 dtype.

#### Examples

```

>>> is_datetime64_dtype(object)
False
>>> is_datetime64_dtype(np.datetime64)
True
>>> is_datetime64_dtype(np.array([], dtype=int))
False
>>> is_datetime64_dtype(np.array([], dtype=np.datetime64))
True
>>> is_datetime64_dtype([1, 2, 3])
False

```

#### 34.21.4.9 pandas.api.types.is\_datetime64\_ns\_dtype

`pandas.api.types.is_datetime64_ns_dtype(arr_or_dtype)`

Check whether the provided array or dtype is of the datetime64[ns] dtype.

**Parameters** `arr_or_dtype` : array-like

The array or dtype to check.

**Returns**

`boolean` [Whether or not the array or dtype is of the datetime64[ns] dtype.]

## Examples

```
>>> is_datetime64_ns_dtype(str)
False
>>> is_datetime64_ns_dtype(int)
False
>>> is_datetime64_ns_dtype(np.datetime64) # no unit
False
>>> is_datetime64_ns_dtype(DatetimeTZDtype("ns", "US/Eastern"))
True
>>> is_datetime64_ns_dtype(np.array(['a', 'b']))
False
>>> is_datetime64_ns_dtype(np.array([1, 2]))
False
>>> is_datetime64_ns_dtype(np.array([], dtype=np.datetime64)) # no unit
False
>>> is_datetime64_ns_dtype(np.array([],
                                dtype="datetime64[ps]")) # wrong unit
False
>>> is_datetime64_ns_dtype(pd.DatetimeIndex([1, 2, 3],
                                                dtype=np.datetime64)) # has 'ns' unit
True
```

### 34.21.4.10 pandas.api.types.is\_datetime64tz\_dtype

`pandas.api.types.is_datetime64tz_dtype(arr_or_dtype)`

Check whether an array-like or dtype is of a DatetimeTZDtype dtype.

**Parameters** `arr_or_dtype` : array-like

The array-like or dtype to check.

**Returns** `boolean` : Whether or not the array-like or dtype is of  
a DatetimeTZDtype dtype.

## Examples

```
>>> is_datetime64tz_dtype(object)
False
>>> is_datetime64tz_dtype([1, 2, 3])
False
>>> is_datetime64tz_dtype(pd.DatetimeIndex([1, 2, 3])) # tz-naive
False
>>> is_datetime64tz_dtype(pd.DatetimeIndex([1, 2, 3], tz="US/Eastern"))
True
```

```
>>> dtype = DatetimeTZDtype("ns", tz="US/Eastern")
>>> s = pd.Series([], dtype=dtype)
>>> is_datetime64tz_dtype(dtype)
True
>>> is_datetime64tz_dtype(s)
True
```

### 34.21.4.11 pandas.api.types.is\_extension\_type

`pandas.api.types.is_extension_type(arr)`

Check whether an array-like is of a pandas extension class instance.

Extension classes include categoricals, pandas sparse objects (i.e. classes represented within the pandas library and not ones external to it like scipy sparse matrices), and datetime-like arrays.

**Parameters** `arr` : array-like

The array-like to check.

**Returns** `boolean` : Whether or not the array-like is of a pandas extension class instance.

#### Examples

```
>>> is_extension_type([1, 2, 3])
False
>>> is_extension_type(np.array([1, 2, 3]))
False
>>>
>>> cat = pd.Categorical([1, 2, 3])
>>>
>>> is_extension_type(cat)
True
>>> is_extension_type(pd.Series(cat))
True
>>> is_extension_type(pd.SparseArray([1, 2, 3]))
True
>>> is_extension_type(pd.SparseSeries([1, 2, 3]))
True
>>>
>>> from scipy.sparse import bsr_matrix
>>> is_extension_type(bsr_matrix([1, 2, 3]))
False
>>> is_extension_type(pd.DatetimeIndex([1, 2, 3]))
False
>>> is_extension_type(pd.DatetimeIndex([1, 2, 3], tz="US/Eastern"))
True
>>>
>>> dtype = DatetimeTZDtype("ns", tz="US/Eastern")
>>> s = pd.Series([], dtype=dtype)
>>> is_extension_type(s)
True
```

### 34.21.4.12 pandas.api.types.is\_float\_dtype

`pandas.api.types.is_float_dtype(arr_or_dtype)`

Check whether the provided array or dtype is of a float dtype.

**Parameters** `arr_or_dtype` : array-like

The array or dtype to check.

**Returns**

**boolean** [Whether or not the array or dtype is of a float dtype.]

### Examples

```
>>> is_float_dtype(str)
False
>>> is_float_dtype(int)
False
>>> is_float_dtype(float)
True
>>> is_float_dtype(np.array(['a', 'b']))
False
>>> is_float_dtype(pd.Series([1, 2]))
False
>>> is_float_dtype(pd.Index([1, 2.]))
True
```

#### 34.21.4.13 pandas.api.types.is\_int64\_dtype

pandas.api.types.**is\_int64\_dtype**(*arr\_or\_dtype*)

Check whether the provided array or dtype is of the int64 dtype.

**Parameters** *arr\_or\_dtype* : array-like

The array or dtype to check.

**Returns**

**boolean** [Whether or not the array or dtype is of the int64 dtype.]

### Notes

Depending on system architecture, the return value of *is\_int64\_dtype*(*int*) will be True if the OS uses 64-bit integers and False if the OS uses 32-bit integers.

### Examples

```
>>> is_int64_dtype(str)
False
>>> is_int64_dtype(np.int32)
False
>>> is_int64_dtype(np.int64)
True
>>> is_int64_dtype(float)
False
>>> is_int64_dtype(np.uint64) # unsigned
False
>>> is_int64_dtype(np.array(['a', 'b']))
False
>>> is_int64_dtype(np.array([1, 2], dtype=np.int64))
True
>>> is_int64_dtype(pd.Index([1, 2.])) # float
False
```

(continues on next page)

(continued from previous page)

```
>>> is_int64_dtype(np.array([1, 2], dtype=np.uint32)) # unsigned
False
```

#### 34.21.4.14 pandas.api.types.is\_integer\_dtype

`pandas.api.types.is_integer_dtype(arr_or_dtype)`

Check whether the provided array or dtype is of an integer dtype.

Unlike in *in\_any\_int\_dtype*, *timedelta64* instances will return False.

**Parameters** `arr_or_dtype` : array-like

The array or dtype to check.

**Returns** `boolean` : Whether or not the array or dtype is of an integer dtype and not an instance of *timedelta64*.

#### Examples

```
>>> is_integer_dtype(str)
False
>>> is_integer_dtype(int)
True
>>> is_integer_dtype(float)
False
>>> is_integer_dtype(np.uint64)
True
>>> is_integer_dtype(np.datetime64)
False
>>> is_integer_dtype(np.timedelta64)
False
>>> is_integer_dtype(np.array(['a', 'b']))
False
>>> is_integer_dtype(pd.Series([1, 2]))
True
>>> is_integer_dtype(np.array([], dtype=np.timedelta64))
False
>>> is_integer_dtype(pd.Index([1, 2.])) # float
False
```

#### 34.21.4.15 pandas.api.types.is\_interval\_dtype

`pandas.api.types.is_interval_dtype(arr_or_dtype)`

Check whether an array-like or dtype is of the Interval dtype.

**Parameters** `arr_or_dtype` : array-like

The array-like or dtype to check.

**Returns** `boolean` : Whether or not the array-like or dtype is of the Interval dtype.

## Examples

```
>>> is_interval_dtype(object)
False
>>> is_interval_dtype(IntervalDtype())
True
>>> is_interval_dtype([1, 2, 3])
False
>>>
>>> interval = pd.Interval(1, 2, closed="right")
>>> is_interval_dtype(interval)
False
>>> is_interval_dtype(pd.IntervalIndex([interval]))
True
```

### 34.21.4.16 pandas.api.types.is\_numeric\_dtype

pandas.api.types.is\_numeric\_dtype(arr\_or\_dtype)

Check whether the provided array or dtype is of a numeric dtype.

**Parameters** arr\_or\_dtype : array-like

The array or dtype to check.

**Returns**

**boolean** [Whether or not the array or dtype is of a numeric dtype.]

## Examples

```
>>> is_numeric_dtype(str)
False
>>> is_numeric_dtype(int)
True
>>> is_numeric_dtype(float)
True
>>> is_numeric_dtype(np.uint64)
True
>>> is_numeric_dtype(np.datetime64)
False
>>> is_numeric_dtype(np.timedelta64)
False
>>> is_numeric_dtype(np.array(['a', 'b']))
False
>>> is_numeric_dtype(pd.Series([1, 2]))
True
>>> is_numeric_dtype(pd.Index([1, 2.]))
True
>>> is_numeric_dtype(np.array([], dtype=np.timedelta64))
False
```

### 34.21.4.17 pandas.api.types.is\_object\_dtype

pandas.api.types.is\_object\_dtype(arr\_or\_dtype)

Check whether an array-like or dtype is of the object dtype.

**Parameters** `arr_or_dtype` : array-like

The array-like or dtype to check.

**Returns**

**boolean** [Whether or not the array-like or dtype is of the object dtype.]

### Examples

```
>>> is_object_dtype(object)
True
>>> is_object_dtype(int)
False
>>> is_object_dtype(np.array([], dtype=object))
True
>>> is_object_dtype(np.array([], dtype=int))
False
>>> is_object_dtype([1, 2, 3])
False
```

#### 34.21.4.18 pandas.api.types.is\_period\_dtype

`pandas.api.types.is_period_dtype(arr_or_dtype)`

Check whether an array-like or dtype is of the Period dtype.

**Parameters** `arr_or_dtype` : array-like

The array-like or dtype to check.

**Returns**

**boolean** [Whether or not the array-like or dtype is of the Period dtype.]

### Examples

```
>>> is_period_dtype(object)
False
>>> is_period_dtype(PeriodDtype(freq="D"))
True
>>> is_period_dtype([1, 2, 3])
False
>>> is_period_dtype(pd.Period("2017-01-01"))
False
>>> is_period_dtype(pd.PeriodIndex([], freq="A"))
True
```

#### 34.21.4.19 pandas.api.types.is\_signed\_integer\_dtype

`pandas.api.types.is_signed_integer_dtype(arr_or_dtype)`

Check whether the provided array or dtype is of a signed integer dtype.

Unlike in `in_any_int_dtype`, `timedelta64` instances will return False.

**Parameters** `arr_or_dtype` : array-like

The array or dtype to check.

**Returns** **boolean** : Whether or not the array or dtype is of a signed integer dtype and not an instance of timedelta64.

### Examples

```
>>> is_signed_integer_dtype(str)
False
>>> is_signed_integer_dtype(int)
True
>>> is_signed_integer_dtype(float)
False
>>> is_signed_integer_dtype(np.uint64)  # unsigned
False
>>> is_signed_integer_dtype(np.datetime64)
False
>>> is_signed_integer_dtype(np.timedelta64)
False
>>> is_signed_integer_dtype(np.array(['a', 'b']))
False
>>> is_signed_integer_dtype(pd.Series([1, 2]))
True
>>> is_signed_integer_dtype(np.array([], dtype=np.timedelta64))
False
>>> is_signed_integer_dtype(pd.Index([1, 2.]))  # float
False
>>> is_signed_integer_dtype(np.array([1, 2], dtype=np.uint32))  # unsigned
False
```

#### 34.21.4.20 pandas.api.types.is\_string\_dtype

`pandas.api.types.is_string_dtype(arr_or_dtype)`

Check whether the provided array or dtype is of the string dtype.

**Parameters** **arr\_or\_dtype** : array-like

The array or dtype to check.

**Returns**

**boolean** [Whether or not the array or dtype is of the string dtype.]

### Examples

```
>>> is_string_dtype(str)
True
>>> is_string_dtype(object)
True
>>> is_string_dtype(int)
False
>>>
>>> is_string_dtype(np.array(['a', 'b']))
True
```

(continues on next page)

(continued from previous page)

```
>>> is_string_dtype(pd.Series([1, 2]))
False
```

#### 34.21.4.21 pandas.api.types.is\_timedelta64\_dtype

`pandas.api.types.is_timedelta64_dtype(arr_or_dtype)`

Check whether an array-like or dtype is of the timedelta64 dtype.

**Parameters** `arr_or_dtype` : array-like

The array-like or dtype to check.

**Returns** `boolean` : Whether or not the array-like or dtype is of the timedelta64 dtype.

#### Examples

```
>>> is_timedelta64_dtype(object)
False
>>> is_timedelta64_dtype(np.timedelta64)
True
>>> is_timedelta64_dtype([1, 2, 3])
False
>>> is_timedelta64_dtype(pd.Series([], dtype="timedelta64[ns]"))
True
>>> is_timedelta64_dtype('0 days')
False
```

#### 34.21.4.22 pandas.api.types.is\_timedelta64\_ns\_dtype

`pandas.api.types.is_timedelta64_ns_dtype(arr_or_dtype)`

Check whether the provided array or dtype is of the timedelta64[ns] dtype.

This is a very specific dtype, so generic ones like `np.timedelta64` will return False if passed into this function.

**Parameters** `arr_or_dtype` : array-like

The array or dtype to check.

**Returns** `boolean` : Whether or not the array or dtype is of the timedelta64[ns] dtype.

#### Examples

```
>>> is_timedelta64_ns_dtype(np.dtype('m8[ns]'))
True
>>> is_timedelta64_ns_dtype(np.dtype('m8[ps]')) # Wrong frequency
False
>>> is_timedelta64_ns_dtype(np.array([1, 2], dtype='m8[ns]'))
True
>>> is_timedelta64_ns_dtype(np.array([1, 2], dtype=np.timedelta64))
False
```

#### 34.21.4.23 pandas.api.types.is\_unsigned\_integer\_dtype

`pandas.api.types.is_unsigned_integer_dtype(arr_or_dtype)`  
Check whether the provided array or dtype is of an unsigned integer dtype.

**Parameters** `arr_or_dtype` : array-like

The array or dtype to check.

**Returns** `boolean` : Whether or not the array or dtype is of an unsigned integer dtype.

##### Examples

```
>>> is_unsigned_integer_dtype(str)
False
>>> is_unsigned_integer_dtype(int)    # signed
False
>>> is_unsigned_integer_dtype(float)
False
>>> is_unsigned_integer_dtype(np.uint64)
True
>>> is_unsigned_integer_dtype(np.array(['a', 'b']))
False
>>> is_unsigned_integer_dtype(pd.Series([1, 2]))    # signed
False
>>> is_unsigned_integer_dtype(pd.Index([1, 2]))    # float
False
>>> is_unsigned_integer_dtype(np.array([1, 2], dtype=np.uint32))
True
```

#### 34.21.4.24 pandas.api.types.is\_sparse

`pandas.api.types.is_sparse(arr)`  
Check whether an array-like is a pandas sparse array.

**Parameters** `arr` : array-like

The array-like to check.

**Returns**

`boolean` [Whether or not the array-like is a pandas sparse array.]

##### Examples

```
>>> is_sparse(np.array([1, 2, 3]))
False
>>> is_sparse(pd.SparseArray([1, 2, 3]))
True
>>> is_sparse(pd.SparseSeries([1, 2, 3]))
True
```

This function checks only for pandas sparse array instances, so sparse arrays from other libraries will return False.

```
>>> from scipy.sparse import bsr_matrix
>>> is_sparse(bsr_matrix([1, 2, 3]))
False
```

Iterable introspection

<code>api.types.is_dict_like(obj)</code>	Check if the object is dict-like.
<code>api.types.is_file_like(obj)</code>	Check if the object is a file-like object.
<code>api.types.is_list_like(obj)</code>	Check if the object is list-like.
<code>api.types.is_named_tuple(obj)</code>	Check if the object is a named tuple.
<code>api.types.is_iterator(obj)</code>	Check if the object is an iterator.

#### 34.21.4.25 pandas.api.types.is\_dict\_like

`pandas.api.types.is_dict_like(obj)`

Check if the object is dict-like.

##### Parameters

**obj** [The object to check.]

**Returns** `is_dict_like` : bool

Whether *obj* has dict-like properties.

##### Examples

```
>>> is_dict_like({1: 2})
True
>>> is_dict_like([1, 2, 3])
False
```

#### 34.21.4.26 pandas.api.types.is\_file\_like

`pandas.api.types.is_file_like(obj)`

Check if the object is a file-like object.

For objects to be considered file-like, they must be an iterator AND have either a *read* and/or *write* method as an attribute.

Note: file-like objects must be iterable, but iterable objects need not be file-like.

New in version 0.20.0.

##### Parameters

**obj** [The object to check.]

**Returns** `is_file_like` : bool

Whether *obj* has file-like properties.

## Examples

```
>>> buffer(StringIO("data"))
>>> is_file_like(buffer)
True
>>> is_file_like([1, 2, 3])
False
```

### 34.21.4.27 pandas.api.types.is\_list\_like

`pandas.api.types.is_list_like(obj)`

Check if the object is list-like.

Objects that are considered list-like are for example Python lists, tuples, sets, NumPy arrays, and Pandas Series.

Strings and datetime objects, however, are not considered list-like.

#### Parameters

**obj** [The object to check.]

**Returns** `is_list_like` : bool

Whether *obj* has list-like properties.

## Examples

```
>>> is_list_like([1, 2, 3])
True
>>> is_list_like({1, 2, 3})
True
>>> is_list_like(datetime(2017, 1, 1))
False
>>> is_list_like("foo")
False
>>> is_list_like(1)
False
```

### 34.21.4.28 pandas.api.types.is\_named\_tuple

`pandas.api.types.is_named_tuple(obj)`

Check if the object is a named tuple.

#### Parameters

**obj** [The object to check.]

**Returns** `is_named_tuple` : bool

Whether *obj* is a named tuple.

## Examples

```

>>> Point = namedtuple("Point", ["x", "y"])
>>> p = Point(1, 2)
>>>
>>> is_named_tuple(p)
True
>>> is_named_tuple((1, 2))
False

```

#### 34.21.4.29 pandas.api.types.is\_iterator

`pandas.api.types.is_iterator(obj)`

Check if the object is an iterator.

For example, lists are considered iterators but not strings or datetime objects.

##### Parameters

**obj** [The object to check.]

**Returns** `is_iter` : bool

Whether *obj* is an iterator.

##### Examples

```

>>> is_iterator([1, 2, 3])
True
>>> is_iterator(datetime(2017, 1, 1))
False
>>> is_iterator("foo")
False
>>> is_iterator(1)
False

```

Scalar introspection

<code>api.types.is_bool</code>	
<code>api.types.is_categorical(arr)</code>	Check whether an array-like is a Categorical instance.
<code>api.types.is_complex</code>	
<code>api.types.is_datetimetz(arr)</code>	Check whether an array-like is a datetime array-like with a timezone component in its dtype.
<code>api.types.is_float</code>	
<code>api.types.is_hashable(obj)</code>	Return True if hash(obj) will succeed, False otherwise.
<code>api.types.is_integer</code>	
<code>api.types.is_interval</code>	
<code>api.types.is_number(obj)</code>	Check if the object is a number.
<code>api.types.is_period(arr)</code>	Check whether an array-like is a periodical index.
<code>api.types.is_re(obj)</code>	Check if the object is a regex pattern instance.
<code>api.types.is_re_compilable(obj)</code>	Check if the object can be compiled into a regex pattern instance.
<code>api.types.is_scalar</code>	Return True if given value is scalar.

#### 34.21.4.30 pandas.api.types.is\_bool

`pandas.api.types.is_bool()`

#### 34.21.4.31 pandas.api.types.is\_categorical

`pandas.api.types.is_categorical(arr)`

Check whether an array-like is a Categorical instance.

**Parameters** `arr`: array-like

The array-like to check.

**Returns**

**boolean** [Whether or not the array-like is of a Categorical instance.]

#### Examples

```
>>> is_categorical([1, 2, 3])
False
```

Categoricals, Series Categoricals, and CategoricalIndex will return True.

```
>>> cat = pd.Categorical([1, 2, 3])
>>> is_categorical(cat)
True
>>> is_categorical(pd.Series(cat))
True
>>> is_categorical(pd.CategoricalIndex([1, 2, 3]))
True
```

#### 34.21.4.32 pandas.api.types.is\_complex

`pandas.api.types.is_complex()`

#### 34.21.4.33 pandas.api.types.is\_datetimetz

`pandas.api.types.is_datetimetz(arr)`

Check whether an array-like is a datetime array-like with a timezone component in its dtype.

**Parameters** `arr`: array-like

The array-like to check.

**Returns** **boolean**: Whether or not the array-like is a datetime array-like with a timezone component in its dtype.

#### Examples

```
>>> is_datetimetz([1, 2, 3])
False
```

Although the following examples are both `DatetimeIndex` objects, the first one returns `False` because it has no timezone component unlike the second one, which returns `True`.

```
>>> is_datetimez(pd.DatetimeIndex([1, 2, 3]))
False
>>> is_datetimez(pd.DatetimeIndex([1, 2, 3], tz="US/Eastern"))
True
```

The object need not be a `DatetimeIndex` object. It just needs to have a `dtype` which has a timezone component.

```
>>> dtype = DatetimeTZDtype("ns", tz="US/Eastern")
>>> s = pd.Series([], dtype=dtype)
>>> is_datetimez(s)
True
```

#### 34.21.4.34 pandas.api.types.is\_float

`pandas.api.types.is_float()`

#### 34.21.4.35 pandas.api.types.is\_hashable

`pandas.api.types.is_hashable(obj)`

Return `True` if `hash(obj)` will succeed, `False` otherwise.

Some types will pass a test against `collections.Hashable` but fail when they are actually hashed with `hash()`.

Distinguish between these and other types by trying the call to `hash()` and seeing if they raise `TypeError`.

#### Examples

```
>>> a = ([],)
>>> isinstance(a, collections.Hashable)
True
>>> is_hashable(a)
False
```

#### 34.21.4.36 pandas.api.types.is\_integer

`pandas.api.types.is_integer()`

#### 34.21.4.37 pandas.api.types.is\_interval

`pandas.api.types.is_interval()`

#### 34.21.4.38 pandas.api.types.is\_number

`pandas.api.types.is_number(obj)`

Check if the object is a number.

Returns `True` when the object is a number, and `False` if is not.

**Parameters** `obj`: any type

The object to check if is a number.

**Returns** `is_number` : bool

Whether *obj* is a number or not.

**See also:**

`pandas.api.types.is_integer` checks a subgroup of numbers

### Examples

```
>>> pd.api.types.is_number(1)
True
>>> pd.api.types.is_number(7.15)
True
```

Booleans are valid because they are int subclass.

```
>>> pd.api.types.is_number(False)
True
```

```
>>> pd.api.types.is_number("foo")
False
>>> pd.api.types.is_number("5")
False
```

#### 34.21.4.39 pandas.api.types.is\_period

`pandas.api.types.is_period(arr)`

Check whether an array-like is a periodical index.

**Parameters** `arr` : array-like

The array-like to check.

**Returns**

**boolean** [Whether or not the array-like is a periodical index.]

### Examples

```
>>> is_period([1, 2, 3])
False
>>> is_period(pd.Index([1, 2, 3]))
False
>>> is_period(pd.PeriodIndex(["2017-01-01"], freq="D"))
True
```

#### 34.21.4.40 pandas.api.types.is\_re

`pandas.api.types.is_re(obj)`

Check if the object is a regex pattern instance.

**Parameters****obj** [The object to check.]**Returns** **is\_regex** : boolWhether *obj* is a regex pattern.**Examples**

```
>>> is_re(re.compile(".*"))
True
>>> is_re("foo")
False
```

**34.21.4.41 pandas.api.types.is\_re\_compilable****pandas.api.types.is\_re\_compilable** (*obj*)

Check if the object can be compiled into a regex pattern instance.

**Parameters****obj** [The object to check.]**Returns** **is\_regex\_compilable** : boolWhether *obj* can be compiled as a regex pattern.**Examples**

```
>>> is_re_compilable(".*")
True
>>> is_re_compilable(1)
False
```

**34.21.4.42 pandas.api.types.is\_scalar****pandas.api.types.is\_scalar** ()

Return True if given value is scalar.

This includes: - numpy array scalar (e.g. np.int64) - Python builtin numerics - Python builtin byte arrays and strings - None - instances of datetime.datetime - instances of datetime.timedelta - Period - instances of decimal.Decimal - Interval - DateOffset

**34.22 Extensions**

These are primarily intended for library authors looking to extend pandas objects.

---

`api.extensions.register_dataframe_accessor(name)` Register a custom accessor on DataFrame objects.

---

`api.extensions.register_series_accessor(name)` Register a custom accessor on Series objects.

---

`api.extensions.register_index_accessor(name)` Register a custom accessor on Index objects.

Continued on next page

Table 188 – continued from previous page

<code>api.extensions.ExtensionDtype</code>	A custom data type, to be paired with an ExtensionArray.
<code>api.extensions.ExtensionArray</code>	Abstract base class for custom 1-D array types.

### 34.22.1 pandas.api.extensions.register\_dataframe\_accessor

`pandas.api.extensions.register_dataframe_accessor` (*name*)

Register a custom accessor on DataFrame objects.

**Parameters** *name* : str

Name under which the accessor should be registered. A warning is issued if this name conflicts with a preexisting attribute.

**See also:**

`register_series_accessor`, `register_index_accessor`

#### Notes

When accessed, your accessor will be initialized with the pandas object the user is interacting with. So the signature must be

```
def __init__(self, pandas_object):
```

For consistency with pandas methods, you should raise an `AttributeError` if the data passed to your accessor has an incorrect dtype.

```
>>> pd.Series(['a', 'b']).dt
Traceback (most recent call last):
...
AttributeError: Can only use .dt accessor with datetimelike values
```

#### Examples

In your library code:

```
import pandas as pd

@pd.api.extensions.register_dataframe_accessor("geo")
class GeoAccessor(object):
    def __init__(self, pandas_obj):
        self._obj = pandas_obj

    @property
    def center(self):
        # return the geographic center point of this DataFrame
        lat = self._obj.latitude
        lon = self._obj.longitude
        return (float(lon.mean()), float(lat.mean()))

    def plot(self):
```

(continues on next page)

(continued from previous page)

```
# plot this array's data on a map, e.g., using Cartopy
pass
```

Back in an interactive IPython session:

```
>>> ds = pd.DataFrame({'longitude': np.linspace(0, 10),
...                    'latitude': np.linspace(0, 20)})
>>> ds.geo.center
(5.0, 10.0)
>>> ds.geo.plot()
# plots data on a map
```

### 34.22.2 pandas.api.extensions.register\_series\_accessor

pandas.api.extensions.**register\_series\_accessor**(*name*)

Register a custom accessor on Series objects.

**Parameters** *name* : str

Name under which the accessor should be registered. A warning is issued if this name conflicts with a preexisting attribute.

**See also:**

*register\_dataframe\_accessor, register\_index\_accessor*

#### Notes

When accessed, your accessor will be initialized with the pandas object the user is interacting with. So the signature must be

```
def __init__(self, pandas_object):
```

For consistency with pandas methods, you should raise an `AttributeError` if the data passed to your accessor has an incorrect dtype.

```
>>> pd.Series(['a', 'b']).dt
Traceback (most recent call last):
...
AttributeError: Can only use .dt accessor with datetimelike values
```

#### Examples

In your library code:

```
import pandas as pd

@pd.api.extensions.register_dataframe_accessor("geo")
class GeoAccessor(object):
    def __init__(self, pandas_obj):
        self._obj = pandas_obj

    @property
```

(continues on next page)

(continued from previous page)

```

def center(self):
    # return the geographic center point of this DataFrame
    lat = self._obj.latitude
    lon = self._obj.longitude
    return (float(lon.mean()), float(lat.mean()))

def plot(self):
    # plot this array's data on a map, e.g., using Cartopy
    pass

```

Back in an interactive IPython session:

```

>>> ds = pd.DataFrame({'longitude': np.linspace(0, 10),
...                    'latitude': np.linspace(0, 20)})
>>> ds.geo.center
(5.0, 10.0)
>>> ds.geo.plot()
# plots data on a map

```

### 34.22.3 pandas.api.extensions.register\_index\_accessor

pandas.api.extensions.register\_index\_accessor(*name*)

Register a custom accessor on Index objects.

**Parameters** *name* : str

Name under which the accessor should be registered. A warning is issued if this name conflicts with a preexisting attribute.

**See also:**

*register\_dataframe\_accessor, register\_series\_accessor*

#### Notes

When accessed, your accessor will be initialized with the pandas object the user is interacting with. So the signature must be

```
def __init__(self, pandas_object):
```

For consistency with pandas methods, you should raise an `AttributeError` if the data passed to your accessor has an incorrect dtype.

```

>>> pd.Series(['a', 'b']).dt
Traceback (most recent call last):
...
AttributeError: Can only use .dt accessor with datetimelike values

```

#### Examples

In your library code:

```
import pandas as pd

@pd.api.extensions.register_dataframe_accessor("geo")
class GeoAccessor(object):
    def __init__(self, pandas_obj):
        self._obj = pandas_obj

    @property
    def center(self):
        # return the geographic center point of this DataFrame
        lat = self._obj.latitude
        lon = self._obj.longitude
        return (float(lon.mean()), float(lat.mean()))

    def plot(self):
        # plot this array's data on a map, e.g., using Cartopy
        pass
```

Back in an interactive IPython session:

```
>>> ds = pd.DataFrame({'longitude': np.linspace(0, 10),
...                    'latitude': np.linspace(0, 20)})
>>> ds.geo.center
(5.0, 10.0)
>>> ds.geo.plot()
# plots data on a map
```

### 34.22.4 pandas.api.extensions.ExtensionDtype

**class** pandas.api.extensions.**ExtensionDtype**

A custom data type, to be paired with an ExtensionArray.

New in version 0.23.0.

#### Notes

The interface includes the following abstract methods that must be implemented by subclasses:

- type
- name
- construct\_from\_string

The *na\_value* class attribute can be used to set the default NA value for this type. `numpy.nan` is used by default.

This class does not inherit from ‘abc.ABCMeta’ for performance reasons. Methods and properties required by the interface raise `pandas.errors.AbstractMethodError` and no `register` method is provided for registering virtual subclasses.

#### Attributes

<i>kind</i>	A character code (one of 'biufcmMOSUV'), default 'O'
<i>name</i>	A string identifying the data type.
<i>names</i>	Ordered list of field names, or None if there are no fields.
<i>type</i>	The scalar type for the array, e.g.

#### 34.22.4.1 pandas.api.extensions.ExtensionDtype.kind

`ExtensionDtype.kind`

A character code (one of 'biufcmMOSUV'), default 'O'

This should match the NumPy dtype used when the array is converted to an ndarray, which is probably 'O' for object if the extension type cannot be represented as a built-in NumPy type.

**See also:**

`numpy.dtype.kind`

#### 34.22.4.2 pandas.api.extensions.ExtensionDtype.name

`ExtensionDtype.name`

A string identifying the data type.

Will be used for display in, e.g. `Series.dtype`

#### 34.22.4.3 pandas.api.extensions.ExtensionDtype.names

`ExtensionDtype.names`

Ordered list of field names, or None if there are no fields.

This is for compatibility with NumPy arrays, and may be removed in the future.

#### 34.22.4.4 pandas.api.extensions.ExtensionDtype.type

`ExtensionDtype.type`

The scalar type for the array, e.g. `int`

It's expected `ExtensionArray[item]` returns an instance of `ExtensionDtype.type` for scalar `item`.

### Methods

<i><code>construct_from_string</code></i> (string)	Attempt to construct this type from a string.
<i><code>is_dtype</code></i> (dtype)	Check if we match 'dtype'.

#### 34.22.4.5 pandas.api.extensions.ExtensionDtype.construct\_from\_string

**classmethod** `ExtensionDtype.construct_from_string(string)`

Attempt to construct this type from a string.

**Parameters**

**string** [str]

**Returns**

**self** [instance of 'cls']

**Raises** **TypeError**

If a class cannot be constructed from this 'string'.

**Examples**

If the extension dtype can be constructed without any arguments, the following may be an adequate implementation.

```
>>> @classmethod
... def construct_from_string(cls, string)
...     if string == cls.name:
...         return cls()
...     else:
...         raise TypeError("Cannot construct a '{}' from "
...                        "'{}'.format(cls, string))
...
```

#### 34.22.4.6 pandas.api.extensions.ExtensionDtype.is\_dtype

**classmethod** `ExtensionDtype.is_dtype(dtype)`

Check if we match 'dtype'.

**Parameters** `dtype` : object

The object to check.

**Returns**

**is\_dtype** [bool]

**Notes**

The default implementation is True if

1. `cls.construct_from_string(dtype)` is an instance of `cls`.
2. `dtype` is an object and is an instance of `cls`
3. `dtype` has a `dtype` attribute, and any of the above conditions is true for `dtype.dtype`.

#### 34.22.5 pandas.api.extensions.ExtensionArray

**class** `pandas.api.extensions.ExtensionArray`

Abstract base class for custom 1-D array types.

pandas will recognize instances of this class as proper arrays with a custom type and will not attempt to coerce them to objects. They may be stored directly inside a `DataFrame` or `Series`.

New in version 0.23.0.

## Notes

The interface includes the following abstract methods that must be implemented by subclasses:

- `_from_sequence`
- `_from_factorized`
- `__getitem__`
- `__len__`
- `dtype`
- `nbytes`
- `isna`
- `take`
- `copy`
- `_concat_same_type`

An additional method is available to satisfy pandas' internal, private block API.

- `_formatting_values`

Some methods require casting the `ExtensionArray` to an `ndarray` of Python objects with `self.astype(object)`, which may be expensive. When performance is a concern, we highly recommend overriding the following methods:

- `fillna`
- `unique`
- `factorize / _values_for_factorize`
- `argsort / _values_for_argsort`

This class does not inherit from `'abc.ABCMeta'` for performance reasons. Methods and properties required by the interface raise `pandas.errors.AbstractMethodError` and no `register` method is provided for registering virtual subclasses.

`ExtensionArrays` are limited to 1 dimension.

They may be backed by none, one, or many NumPy arrays. For example, `pandas.Categorical` is an extension array backed by two arrays, one for codes and one for categories. An array of IPv6 address may be backed by a NumPy structured array with two fields, one for the lower 64 bits and one for the upper 64 bits. Or they may be backed by some other storage type, like Python lists. Pandas makes no assumptions on how the data are stored, just that it can be converted to a NumPy array. The `ExtensionArray` interface does not impose any rules on how this data is stored. However, currently, the backing data cannot be stored in attributes called `.values` or `._values` to ensure full compatibility with pandas internals. But other names as `.data`, `._data`, `._items`, ... can be freely used.

## Attributes

<i>dtype</i>	An instance of <code>'ExtensionDtype'</code> .
<i>nbytes</i>	The number of bytes needed to store this object in memory.

Continued on next page

Table 191 – continued from previous page

<i>ndim</i>	Extension Arrays are only allowed to be 1-dimensional.
<i>shape</i>	Return a tuple of the array dimensions.

**34.22.5.1 pandas.api.extensions.ExtensionArray.dtype**`ExtensionArray.dtype`

An instance of ‘ExtensionDtype’.

**34.22.5.2 pandas.api.extensions.ExtensionArray.nbytes**`ExtensionArray.nbytes`

The number of bytes needed to store this object in memory.

**34.22.5.3 pandas.api.extensions.ExtensionArray.ndim**`ExtensionArray.ndim`

Extension Arrays are only allowed to be 1-dimensional.

**34.22.5.4 pandas.api.extensions.ExtensionArray.shape**`ExtensionArray.shape`

Return a tuple of the array dimensions.

**Methods**

<i>argsort</i> ([ascending, kind])	Return the indices that would sort this array.
<i>astype</i> (dtype[, copy])	Cast to a NumPy array with ‘dtype’.
<i>copy</i> ([deep])	Return a copy of the array.
<i>factorize</i> ([na_sentinel])	Encode the extension array as an enumerated type.
<i>fillna</i> ([value, method, limit])	Fill NA/NaN values using the specified method.
<i>isna</i> ()	Boolean NumPy array indicating if each value is missing.
<i>take</i> (indices[, allow_fill, fill_value])	Take elements from an array.
<i>unique</i> ()	Compute the ExtensionArray of unique values.

**34.22.5.5 pandas.api.extensions.ExtensionArray.argsort**`ExtensionArray.argsort` (*ascending=True*, *kind='quicksort'*, *\*args*, *\*\*kwargs*)

Return the indices that would sort this array.

**Parameters** *ascending* : bool, default True

Whether the indices should result in an ascending or descending sort.

**kind** : { ‘quicksort’, ‘mergesort’, ‘heapsort’ }, optional

Sorting algorithm.

**\*args, \*\*kwargs**:

passed through to `numpy.argsort()`.

**Returns** `index_array` : ndarray

Array of indices that sort `self`.

**See also:**

`numpy.argsort` Sorting implementation used internally.

#### 34.22.5.6 `pandas.api.extensions.ExtensionArray.astype`

`ExtensionArray.astype(dtype, copy=True)`

Cast to a NumPy array with 'dtype'.

**Parameters** `dtype` : str or dtype

Typecode or data-type to which the array is cast.

**copy** : bool, default True

Whether to copy the data, even if not necessary. If False, a copy is made only if the old dtype does not match the new dtype.

**Returns** `array` : ndarray

NumPy ndarray with 'dtype' for its dtype.

#### 34.22.5.7 `pandas.api.extensions.ExtensionArray.copy`

`ExtensionArray.copy(deep=False)`

Return a copy of the array.

**Parameters** `deep` : bool, default False

Also copy the underlying data backing this array.

**Returns**

`ExtensionArray`

#### 34.22.5.8 `pandas.api.extensions.ExtensionArray.factorize`

`ExtensionArray.factorize(na_sentinel=-1)`

Encode the extension array as an enumerated type.

**Parameters** `na_sentinel` : int, default -1

Value to use in the `labels` array to indicate missing values.

**Returns** `labels` : ndarray

An integer NumPy array that's an indexer into the original `ExtensionArray`.

**uniques** : `ExtensionArray`

An `ExtensionArray` containing the unique values of `self`.

---

**Note:** `uniques` will *not* contain an entry for the NA value of the `ExtensionArray` if there are any missing values present in `self`.

---

See also:

`pandas.factorize` Top-level factorize method that dispatches here.

## Notes

`pandas.factorize()` offers a *sort* keyword as well.

### 34.22.5.9 pandas.api.extensions.ExtensionArray.fillna

`ExtensionArray.fillna(value=None, method=None, limit=None)`

Fill NA/NaN values using the specified method.

**Parameters** **value** : scalar, array-like

If a scalar value is passed it is used to fill all missing values. Alternatively, an array-like ‘value’ can be given. It’s expected that the array-like have the same length as ‘self’.

**method** : {‘backfill’, ‘bfill’, ‘pad’, ‘ffill’, None}, default None

Method to use for filling holes in reindexed Series pad / ffill: propagate last valid observation forward to next valid backfill / bfill: use NEXT valid observation to fill gap

**limit** : int, default None

If method is specified, this is the maximum number of consecutive NaN values to forward/backward fill. In other words, if there is a gap with more than this number of consecutive NaNs, it will only be partially filled. If method is not specified, this is the maximum number of entries along the entire axis where NaNs will be filled.

## Returns

**filled** [ExtensionArray with NA/NaN filled]

### 34.22.5.10 pandas.api.extensions.ExtensionArray.isna

`ExtensionArray.isna()`

Boolean NumPy array indicating if each value is missing.

This should return a 1-D array the same length as ‘self’.

### 34.22.5.11 pandas.api.extensions.ExtensionArray.take

`ExtensionArray.take(indices, allow_fill=False, fill_value=None)`

Take elements from an array.

**Parameters** **indices** : sequence of integers

Indices to be taken.

**allow\_fill** : bool, default False

How to handle negative values in *indices*.

- False: negative values in *indices* indicate positional indices from the right (the default). This is similar to `numpy.take()`.
- True: negative values in *indices* indicate missing values. These values are set to *fill\_value*. Any other other negative values raise a `ValueError`.

**fill\_value** : any, optional

Fill value to use for NA-indices when *allow\_fill* is True. This may be `None`, in which case the default NA value for the type, `self.dtype.na_value`, is used.

For many `ExtensionArrays`, there will be two representations of *fill\_value*: a user-facing “boxed” scalar, and a low-level physical NA value. *fill\_value* should be the user-facing version, and the implementation should handle translating that to the physical version for processing the take if necessary.

### Returns

**ExtensionArray**

**Raises** `IndexError`

When the indices are out of bounds for the array.

**ValueError**

When *indices* contains negative values other than `-1` and *allow\_fill* is True.

### See also:

`numpy.take`, `pandas.api.extensions.take`

### Notes

`ExtensionArray.take` is called by `Series.__getitem__`, `.loc`, `iloc`, when *indices* is a sequence of values. Additionally, it's called by `Series.reindex()`, or any other method that causes realignment, with a *fill\_value*.

### Examples

Here's an example implementation, which relies on casting the extension array to object dtype. This uses the helper method `pandas.api.extensions.take()`.

```
def take(self, indices, allow_fill=False, fill_value=None):
    from pandas.core.algorithms import take

    # If the ExtensionArray is backed by an ndarray, then
    # just pass that here instead of coercing to object.
    data = self.astype(object)

    if allow_fill and fill_value is None:
        fill_value = self.dtype.na_value

    # fill value should always be translated from the scalar
    # type for the array, to the physical storage type for
    # the data, before passing to take.

    result = take(data, indices, fill_value=fill_value,
```

(continues on next page)

(continued from previous page)

```
        allow_fill=allow_fill)
    return self._from_sequence(result)
```

#### 34.22.5.12 pandas.api.extensions.ExtensionArray.unique

`ExtensionArray.unique()`

Compute the ExtensionArray of unique values.

**Returns**

`uniques` [ExtensionArray]

#### 34.22.6 pandas.Index.asi8

`Index.asi8 = None`

#### 34.22.7 pandas.Index.holds\_integer

`Index.holds_integer()`

#### 34.22.8 pandas.Index.is\_type\_compatible

`Index.is_type_compatible(kind)`

#### 34.22.9 pandas.Index.nlevels

`Index.nlevels`

#### 34.22.10 pandas.Index.sort

`Index.sort(*args, **kwargs)`

#### 34.22.11 pandas.Panel.agg

`Panel.agg(func, *args, **kwargs)`

#### 34.22.12 pandas.Panel.aggregate

`Panel.aggregate(func, *args, **kwargs)`

#### 34.22.13 pandas.Panel.is\_copy

`Panel.is_copy`

### 34.22.14 pandas.Series.imag

`Series.imag`

### 34.22.15 pandas.Series.real

`Series.real`

This section will focus on downstream applications of pandas.

## 35.1 Storing pandas DataFrame objects in Apache Parquet format

The [Apache Parquet](#) format provides key-value metadata at the file and column level, stored in the footer of the Parquet file:

```
5: optional list<KeyValue> key_value_metadata
```

where KeyValue is

```
struct KeyValue {  
  1: required string key  
  2: optional string value  
}
```

So that a `pandas.DataFrame` can be faithfully reconstructed, we store a pandas metadata key in the `FileMetaData` with the value stored as :

```
{'index_columns': ['__index_level_0__', '__index_level_1__', ...],  
'column_indexes': [<ci0>, <ci1>, ..., <ciN>],  
'columns': [<c0>, <c1>, ...],  
'pandas_version': $VERSION}
```

Here, `<c0>/<ci0>` and so forth are dictionaries containing the metadata for each column. This has JSON form:

```
{'name': column_name,  
'pandas_type': pandas_type,  
'numpy_type': numpy_type,  
'metadata': metadata}
```

`pandas_type` is the logical type of the column, and is one of:

- Boolean: 'bool'
- Integers: 'int8', 'int16', 'int32', 'int64', 'uint8', 'uint16', 'uint32', 'uint64'
- Floats: 'float16', 'float32', 'float64'
- Date and Time Types: 'datetime', 'datetimeetz', 'timedelta'
- String: 'unicode', 'bytes'

- Categorical: 'categorical'
- Other Python objects: 'object'

The `numpy_type` is the physical storage type of the column, which is the result of `str(dtype)` for the underlying NumPy array that holds the data. So for `datetime64[ns]` this is `datetime64[ns]` and for categorical, it may be any of the supported integer categorical types.

The `metadata` field is `None` except for:

- `datetime64[ns]`: {'timezone': zone, 'unit': 'ns'}, e.g. {'timezone': 'America/New\_York', 'unit': 'ns'}. The 'unit' is optional, and if omitted it is assumed to be nanoseconds.
  - categorical: {'num\_categories': K, 'ordered': is\_ordered, 'type': \$TYPE}
    - Here 'type' is optional, and can be a nested pandas type specification here (but not categorical)
  - unicode: {'encoding': encoding}
    - The encoding is optional, and if not present is UTF-8
  - object: {'encoding': encoding}. Objects can be serialized and stored in `BYTE_ARRAY` Parquet columns. The encoding can be one of:
    - 'pickle'
    - 'msgpack'
    - 'bson'
    - 'json'
  - `timedelta64[ns]`: {'unit': 'ns'}. The 'unit' is optional, and if omitted it is assumed to be nanoseconds.
- This metadata is optional altogether

For types other than these, the 'metadata' key can be omitted. Implementations can assume `None` if the key is not present.

As an example of fully-formed metadata:

```
{'index_columns': ['__index_level_0__'],
 'column_indexes': [
   {'name': None,
    'pandas_type': 'string',
    'numpy_type': 'object',
    'metadata': None}
 ],
 'columns': [
   {'name': 'c0',
    'pandas_type': 'int8',
    'numpy_type': 'int8',
    'metadata': None},
   {'name': 'c1',
    'pandas_type': 'bytes',
    'numpy_type': 'object',
    'metadata': None},
   {'name': 'c2',
    'pandas_type': 'categorical',
    'numpy_type': 'int16',
    'metadata': {'num_categories': 1000, 'ordered': False}},
   {'name': 'c3',
    'pandas_type': 'datetime64[ns]',
    'numpy_type': 'datetime64[ns]',
```

(continues on next page)

(continued from previous page)

```
    'metadata': {'timezone': 'America/Los_Angeles'}},  
    {'name': 'c4',  
      'pandas_type': 'object',  
      'numpy_type': 'object',  
      'metadata': {'encoding': 'pickle'}},  
    {'name': '__index_level_0__',  
      'pandas_type': 'int64',  
      'numpy_type': 'int64',  
      'metadata': None}  
  ],  
  'pandas_version': '0.20.0'}
```

## INTERNALS

This section will provide a look into some of pandas internals. It's primarily intended for developers of pandas itself.

### 36.1 Indexing

In pandas there are a few objects implemented which can serve as valid containers for the axis labels:

- `Index`: the generic “ordered set” object, an ndarray of object dtype assuming nothing about its contents. The labels must be hashable (and likely immutable) and unique. Populates a dict of label to location in Cython to do  $O(1)$  lookups.
- `Int64Index`: a version of `Index` highly optimized for 64-bit integer data, such as time stamps
- `Float64Index`: a version of `Index` highly optimized for 64-bit float data
- `MultiIndex`: the standard hierarchical index object
- `DatetimeIndex`: An `Index` object with `Timestamp` boxed elements (impl are the int64 values)
- `TimedeltaIndex`: An `Index` object with `Timedelta` boxed elements (impl are the in64 values)
- `PeriodIndex`: An `Index` object with `Period` elements

There are functions that make the creation of a regular index easy:

- `date_range`: fixed frequency date range generated from a time rule or `DateOffset`. An ndarray of Python datetime objects
- `period_range`: fixed frequency date range generated from a time rule or `DateOffset`. An ndarray of `Period` objects, representing Timespans

The motivation for having an `Index` class in the first place was to enable different implementations of indexing. This means that it's possible for you, the user, to implement a custom `Index` subclass that may be better suited to a particular application than the ones provided in pandas.

From an internal implementation point of view, the relevant methods that an `Index` must define are one or more of the following (depending on how incompatible the new object internals are with the `Index` functions):

- `get_loc`: returns an “indexer” (an integer, or in some cases a slice object) for a label
- `slice_locs`: returns the “range” to slice between two labels
- `get_indexer`: Computes the indexing vector for reindexing / data alignment purposes. See the source / docstrings for more on this
- `get_indexer_non_unique`: Computes the indexing vector for reindexing / data alignment purposes when the index is non-unique. See the source / docstrings for more on this
- `reindex`: Does any pre-conversion of the input index then calls `get_indexer`

- `union, intersection`: computes the union or intersection of two Index objects
- `insert`: Inserts a new label into an Index, yielding a new object
- `delete`: Delete a label, yielding a new object
- `drop`: Deletes a set of labels
- `take`: Analogous to `ndarray.take`

### 36.1.1 MultiIndex

Internally, the `MultiIndex` consists of a few things: the **levels**, the integer **labels**, and the level **names**:

```
In [1]: index = pd.MultiIndex.from_product([range(3), ['one', 'two']], names=['first',
↳ 'second'])

In [2]: index
Out[2]:
MultiIndex(levels=[[0, 1, 2], ['one', 'two']],
            labels=[[0, 0, 1, 1, 2, 2], [0, 1, 0, 1, 0, 1]],
            names=['first', 'second'])

In [3]: index.levels
↳FrozenList([[0, 1, 2], ['one', 'two']])

In [4]: index.labels
↳FrozenList([[0, 0, 1, 1, 2, 2], [0, 1, 0, 1, 0, 1]])

In [5]: index.names
↳FrozenList(['first', 'second'])
```

You can probably guess that the labels determine which unique element is identified with that location at each layer of the index. It's important to note that sortedness is determined **solely** from the integer labels and does not check (or care) whether the levels themselves are sorted. Fortunately, the constructors `from_tuples` and `from_arrays` ensure that this is true, but if you compute the levels and labels yourself, please be careful.

### 36.1.2 Values

Pandas extends NumPy's type system with custom types, like `Categorical` or `datetimes` with a `timezone`, so we have multiple notions of “values”. For 1-D containers (Index classes and `Series`) we have the following convention:

- `cls._ndarray_values` is *always* a NumPy `ndarray`. Ideally, `_ndarray_values` is cheap to compute. For example, for a `Categorical`, this returns the codes, not the array of objects.
- `cls._values` refers to the “best possible” array. This could be an `ndarray`, `ExtensionArray`, or in Index subclass (note: we're in the process of removing the index subclasses here so that it's always an `ndarray` or `ExtensionArray`).

So, for example, `Series[category]._values` is a `Categorical`, while `Series[category]._ndarray_values` is the underlying codes.

## 36.2 Subclassing pandas Data Structures

This section has been moved to *Subclassing pandas Data Structures*.

## EXTENDING PANDAS

While pandas provides a rich set of methods, containers, and data types, your needs may not be fully satisfied. Pandas offers a few options for extending pandas.

### 37.1 Registering Custom Accessors

Libraries can use the decorators `pandas.api.extensions.register_dataframe_accessor()`, `pandas.api.extensions.register_series_accessor()`, and `pandas.api.extensions.register_index_accessor()`, to add additional “namespaces” to pandas objects. All of these follow a similar convention: you decorate a class, providing the name of attribute to add. The class’s `__init__` method gets the object being decorated. For example:

```
@pd.api.extensions.register_dataframe_accessor("geo")
class GeoAccessor(object):
    def __init__(self, pandas_obj):
        self._obj = pandas_obj

    @property
    def center(self):
        # return the geographic center point of this DataFrame
        lat = self._obj.latitude
        lon = self._obj.longitude
        return (float(lon.mean()), float(lat.mean()))

    def plot(self):
        # plot this array's data on a map, e.g., using Cartopy
        pass
```

Now users can access your methods using the `geo` namespace:

```
>>> ds = pd.DataFrame({'longitude': np.linspace(0, 10),
...                    'latitude': np.linspace(0, 20)})
>>> ds.geo.center
(5.0, 10.0)
>>> ds.geo.plot()
# plots data on a map
```

This can be a convenient way to extend pandas objects without subclassing them. If you write a custom accessor, make a pull request adding it to our [pandas Ecosystem](#) page.

## 37.2 Extension Types

New in version 0.23.0.

**Warning:** The `pandas.api.extension.ExtensionDtype` and `pandas.api.extension.ExtensionArray` APIs are new and experimental. They may change between versions without warning.

Pandas defines an interface for implementing data types and arrays that *extend* NumPy’s type system. Pandas itself uses the extension system for some types that aren’t built into NumPy (categorical, period, interval, datetime with timezone).

Libraries can define a custom array and data type. When pandas encounters these objects, they will be handled properly (i.e. not converted to an ndarray of objects). Many methods like `pandas.isna()` will dispatch to the extension type’s implementation.

If you’re building a library that implements the interface, please publicize it on [Extension Data Types](#).

The interface consists of two classes.

### 37.2.1 ExtensionDtype

A `pandas.api.extension.ExtensionDtype` is similar to a `numpy.dtype` object. It describes the data type. Implementors are responsible for a few unique items like the name.

One particularly important item is the `type` property. This should be the class that is the scalar type for your data. For example, if you were writing an extension array for IP Address data, this might be `ipaddress.IPv4Address`.

See the [extension dtype source](#) for interface definition.

### 37.2.2 ExtensionArray

This class provides all the array-like functionality. ExtensionArrays are limited to 1 dimension. An ExtensionArray is linked to an ExtensionDtype via the `dtype` attribute.

Pandas makes no restrictions on how an extension array is created via its `__new__` or `__init__`, and puts no restrictions on how you store your data. We do require that your array be convertible to a NumPy array, even if this is relatively expensive (as it is for `Categorical`).

They may be backed by none, one, or many NumPy arrays. For example, `pandas.Categorical` is an extension array backed by two arrays, one for codes and one for categories. An array of IPv6 addresses may be backed by a NumPy structured array with two fields, one for the lower 64 bits and one for the upper 64 bits. Or they may be backed by some other storage type, like Python lists.

See the [extension array source](#) for the interface definition. The docstrings and comments contain guidance for properly implementing the interface.

We provide a test suite for ensuring that your extension arrays satisfy the expected behavior. To use the test suite, you must provide several pytest fixtures and inherit from the base test class. The required fixtures are found in <https://github.com/pandas-dev/pandas/blob/master/pandas/tests/extension/conftest.py>.

To use a test, subclass it:

```
from pandas.tests.extension import base
```

(continues on next page)

(continued from previous page)

```
class TestConstructors(base.BaseConstructorsTests):
    pass
```

See [https://github.com/pandas-dev/pandas/blob/master/pandas/tests/extension/base/\\_\\_init\\_\\_.py](https://github.com/pandas-dev/pandas/blob/master/pandas/tests/extension/base/__init__.py) for a list of all the tests available.

## 37.3 Subclassing pandas Data Structures

**Warning:** There are some easier alternatives before considering subclassing pandas data structures.

1. Extensible method chains with *pipe*
2. Use *composition*. See [here](#).
3. Extending by *registering an accessor*
4. Extending by *extension type*

This section describes how to subclass pandas data structures to meet more specific needs. There are two points that need attention:

1. Override constructor properties.
2. Define original properties

**Note:** You can find a nice example in [geopandas](#) project.

### 37.3.1 Override Constructor Properties

Each data structure has several *constructor properties* for returning a new data structure as the result of an operation. By overriding these properties, you can retain subclasses through pandas data manipulations.

There are 3 constructor properties to be defined:

- `_constructor`: Used when a manipulation result has the same dimensions as the original.
- `_constructor_sliced`: Used when a manipulation result has one lower dimension(s) as the original, such as `DataFrame` single columns slicing.
- `_constructor_expanddim`: Used when a manipulation result has one higher dimension as the original, such as `Series.to_frame()` and `DataFrame.to_panel()`.

Following table shows how pandas data structures define constructor properties by default.

Property Attributes	Series	DataFrame
<code>_constructor</code>	Series	DataFrame
<code>_constructor_sliced</code>	NotImplementedError	Series
<code>_constructor_expanddim</code>	DataFrame	Panel

Below example shows how to define `SubclassedSeries` and `SubclassedDataFrame` overriding constructor properties.

```

class SubclassedSeries(Series):

    @property
    def _constructor(self):
        return SubclassedSeries

    @property
    def _constructor_expanddim(self):
        return SubclassedDataFrame

class SubclassedDataFrame(DataFrame):

    @property
    def _constructor(self):
        return SubclassedDataFrame

    @property
    def _constructor_sliced(self):
        return SubclassedSeries

```

```

>>> s = SubclassedSeries([1, 2, 3])
>>> type(s)
<class '__main__.SubclassedSeries'>

>>> to_framed = s.to_frame()
>>> type(to_framed)
<class '__main__.SubclassedDataFrame'>

>>> df = SubclassedDataFrame({'A': [1, 2, 3], 'B': [4, 5, 6], 'C': [7, 8, 9]})
>>> df
   A  B  C
0  1  4  7
1  2  5  8
2  3  6  9

>>> type(df)
<class '__main__.SubclassedDataFrame'>

>>> sliced1 = df[['A', 'B']]
>>> sliced1
   A  B
0  1  4
1  2  5
2  3  6
>>> type(sliced1)
<class '__main__.SubclassedDataFrame'>

>>> sliced2 = df['A']
>>> sliced2
0    1
1    2
2    3
Name: A, dtype: int64
>>> type(sliced2)
<class '__main__.SubclassedSeries'>

```

### 37.3.2 Define Original Properties

To let original data structures have additional properties, you should let pandas know what properties are added. pandas maps unknown properties to data names overriding `__getattr__`. Defining original properties can be done in one of 2 ways:

1. Define `_internal_names` and `_internal_names_set` for temporary properties which WILL NOT be passed to manipulation results.
2. Define `_metadata` for normal properties which will be passed to manipulation results.

Below is an example to define two original properties, “internal\_cache” as a temporary property and “added\_property” as a normal property

```
class SubclassedDataFrame2(DataFrame):

    # temporary properties
    _internal_names = pd.DataFrame._internal_names + ['internal_cache']
    _internal_names_set = set(_internal_names)

    # normal properties
    _metadata = ['added_property']

    @property
    def _constructor(self):
        return SubclassedDataFrame2
```

```
>>> df = SubclassedDataFrame2({'A': [1, 2, 3], 'B': [4, 5, 6], 'C': [7, 8, 9]})
>>> df
   A  B  C
0  1  4  7
1  2  5  8
2  3  6  9

>>> df.internal_cache = 'cached'
>>> df.added_property = 'property'

>>> df.internal_cache
cached
>>> df.added_property
property

# properties defined in _internal_names is reset after manipulation
>>> df[['A', 'B']].internal_cache
AttributeError: 'SubclassedDataFrame2' object has no attribute 'internal_cache'

# properties defined in _metadata are retained
>>> df[['A', 'B']].added_property
property
```

## RELEASE NOTES

This is the list of changes to pandas between each release. For full details, see the commit logs at <http://github.com/pandas-dev/pandas>

### What is it

pandas is a Python package providing fast, flexible, and expressive data structures designed to make working with “relational” or “labeled” data both easy and intuitive. It aims to be the fundamental high-level building block for doing practical, real world data analysis in Python. Additionally, it has the broader goal of becoming the most powerful and flexible open source data analysis / manipulation tool available in any language.

### Where to get it

- Source code: <http://github.com/pandas-dev/pandas>
- Binary installers on PyPI: <https://pypi.org/project/pandas>
- Documentation: <http://pandas.pydata.org>

## 38.1 pandas 0.23.2

**Release date:** July 5, 2018

This is a minor bug-fix release in the 0.23.x series and includes some small regression fixes and bug fixes.

See the *full [whatsnew](#)* for a list of all the changes.

### 38.1.1 Thanks

A total of 17 people contributed to this release. People with a “+” by their names contributed a patch for the first time.

- David Krych

## 38.2 pandas 0.23.1

**Release date:** June 12, 2018

This is a minor release from 0.23.0 and includes a number of bug fixes and performance improvements.

See the [full \*whatsnew\*](#) for a list of all the changes.

### 38.2.1 Thanks

A total of 30 people contributed to this release. People with a “+” by their names contributed a patch for the first time.

## 38.3 pandas 0.23.0

**Release date:** May 15, 2018

This is a major release from 0.22.0 and includes a number of API changes, new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

Highlights include:

- *Round-trippable JSON format with ‘table’ orient.*
- *Instantiation from dicts respects order for Python 3.6+.*
- *Dependent column arguments for assign.*
- *Merging / sorting on a combination of columns and index levels.*
- *Extending Pandas with custom types.*
- *Excluding unobserved categories from groupby.*
- *Changes to make output shape of DataFrame.apply consistent.*

See the *full whatsnew* for a list of all the changes.

## 38.4 pandas 0.22.0

**Release date:** December 29, 2017

This is a major release from 0.21.1 and includes a single, API-breaking change. We recommend that all users upgrade to this version after carefully reading the release note.

The only changes are:

- The sum of an empty or all-NA Series is now 0
- The product of an empty or all-NA Series is now 1
- We've added a `min_count` parameter to `.sum()` and `.prod()` controlling the minimum number of valid values for the result to be valid. If fewer than `min_count` non-NA values are present, the result is NA. The default is 0. To return NaN, the 0.21 behavior, use `min_count=1`.

See the [v0.22.0 Whatsnew](#) overview for further explanation of all the places in the library this affects.

## 38.5 pandas 0.21.1

**Release date:** December 12, 2017

This is a minor bug-fix release in the 0.21.x series and includes some small regression fixes, bug fixes and performance improvements. We recommend that all users upgrade to this version.

Highlights include:

- Temporarily restore matplotlib datetime plotting functionality. This should resolve issues for users who relied implicitly on pandas to plot datetimes with matplotlib. See [here](#).
- Improvements to the Parquet IO functions introduced in 0.21.0. See [here](#).

See the [v0.21.1 Whatsnew](#) overview for an extensive list of all the changes for 0.21.1.

### 38.5.1 Thanks

## 38.6 pandas 0.21.0

**Release date:** October 27, 2017

This is a major release from 0.20.3 and includes a number of API changes, deprecations, new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

Highlights include:

- Integration with [Apache Parquet](#), including a new top-level `read_parquet()` function and `DataFrame.to_parquet()` method, see [here](#).
- New user-facing `pandas.api.types.CategoricalDtype` for specifying categoricals independent of the data, see [here](#).
- The behavior of `sum` and `prod` on all-NaN Series/DataFrames is now consistent and no longer depends on whether `bottleneck` is installed, and `sum` and `prod` on empty Series now return NaN instead of 0, see [here](#).
- Compatibility fixes for pypy, see [here](#).
- Additions to the `drop`, `reindex` and `rename` API to make them more consistent, see [here](#).
- Addition of the new methods `DataFrame.infer_objects` (see [here](#)) and `GroupBy.pipe` (see [here](#)).
- Indexing with a list of labels, where one or more of the labels is missing, is deprecated and will raise a `KeyError` in a future version, see [here](#).

See the [v0.21.0 Whatsnew](#) overview for an extensive list of all enhancements and bugs that have been fixed in 0.21.0

## 38.7 pandas 0.20.0 / 0.20.1

**Release date:** May 5, 2017

This is a major release from 0.19.2 and includes a number of API changes, deprecations, new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

Highlights include:

- New `.agg()` API for Series/DataFrame similar to the groupby-rolling-resample API's, see [here](#)
- Integration with the feather-format, including a new top-level `pd.read_feather()` and `DataFrame.to_feather()` method, see [here](#).
- The `.ix` indexer has been deprecated, see [here](#)
- `Panel` has been deprecated, see [here](#)
- Addition of an `IntervalIndex` and `Interval` scalar type, see [here](#)
- Improved user API when grouping by index levels in `.groupby()`, see [here](#)
- Improved support for `UInt64` dtypes, see [here](#)
- A new orient for JSON serialization, `orient='table'`, that uses the Table Schema spec and that gives the possibility for a more interactive repr in the Jupyter Notebook, see [here](#)
- Experimental support for exporting styled DataFrames (`DataFrame.style`) to Excel, see [here](#)
- Window binary `corr/cov` operations now return a `MultiIndexed DataFrame` rather than a `Panel`, as `Panel` is now deprecated, see [here](#)
- Support for S3 handling now uses `s3fs`, see [here](#)
- Google BigQuery support now uses the `pandas-gbq` library, see [here](#)

See the [v0.20.1 Whatsnew](#) overview for an extensive list of all enhancements and bugs that have been fixed in 0.20.1.

---

**Note:** This is a combined release for 0.20.0 and 0.20.1. Version 0.20.1 contains one additional change for backwards-compatibility with downstream projects using pandas' `utils` routines. ([GH16250](#))

## 38.8 pandas 0.19.2

**Release date:** December 24, 2016

This is a minor bug-fix release in the 0.19.x series and includes some small regression fixes, bug fixes and performance improvements.

Highlights include:

- Compatibility with Python 3.6
- Added a [Pandas Cheat Sheet](#). (GH13202).

See the [v0.19.2 Whatsnew](#) page for an overview of all bugs that have been fixed in 0.19.2.

## 38.9 pandas 0.19.1

**Release date:** November 3, 2016

This is a minor bug-fix release from 0.19.0 and includes some small regression fixes, bug fixes and performance improvements.

See the [v0.19.1 Whatsnew](#) page for an overview of all bugs that have been fixed in 0.19.1.

## 38.10 pandas 0.19.0

**Release date:** October 2, 2016

This is a major release from 0.18.1 and includes number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

Highlights include:

- `merge_asof()` for asof-style time-series joining, see [here](#)
- `.rolling()` is now time-series aware, see [here](#)
- `read_csv()` now supports parsing Categorical data, see [here](#)
- A function `union_categorical()` has been added for combining categoricals, see [here](#)
- `PeriodIndex` now has its own `period` dtype, and changed to be more consistent with other `Index` classes. See [here](#)
- Sparse data structures gained enhanced support of `int` and `bool` dtypes, see [here](#)
- Comparison operations with `Series` no longer ignores the index, see [here](#) for an overview of the API changes.
- Introduction of a pandas development API for utility functions, see [here](#).
- Deprecation of `Panel4D` and `PanelND`. We recommend to represent these types of n-dimensional data with the `xarray` package.
- Removal of the previously deprecated modules `pandas.io.data`, `pandas.io.wb`, `pandas.tools.rplot`.

See the [v0.19.0 Whatsnew](#) overview for an extensive list of all enhancements and bugs that have been fixed in 0.19.0.

## 38.11 pandas 0.18.1

**Release date:** (May 3, 2016)

This is a minor release from 0.18.0 and includes a large number of bug fixes along with several new features, enhancements, and performance improvements.

Highlights include:

- `.groupby(...)` has been enhanced to provide convenient syntax when working with `.rolling(...)`, `.expanding(...)` and `.resample(...)` per group, see [here](#)
- `pd.to_datetime()` has gained the ability to assemble dates from a DataFrame, see [here](#)
- Method chaining improvements, see [here](#).
- Custom business hour offset, see [here](#).
- Many bug fixes in the handling of sparse, see [here](#)
- Expanded the *Tutorials section* with a feature on modern pandas, courtesy of @TomAugsburger. (GH13045).

See the [v0.18.1 Whatsnew](#) overview for an extensive list of all enhancements and bugs that have been fixed in 0.18.1.

## 38.12 pandas 0.18.0

**Release date:** (March 13, 2016)

This is a major release from 0.17.1 and includes a small number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

Highlights include:

- Moving and expanding window functions are now methods on Series and DataFrame, similar to `.groupby`, see [here](#).
- Adding support for a `RangeIndex` as a specialized form of the `Int64Index` for memory savings, see [here](#).
- API breaking change to the `.resample` method to make it more `.groupby` like, see [here](#).
- Removal of support for positional indexing with floats, which was deprecated since 0.14.0. This will now raise a `TypeError`, see [here](#).
- The `.to_xarray()` function has been added for compatibility with the `xarray` package, see [here](#).
- The `read_sas` function has been enhanced to read `sas7bdat` files, see [here](#).
- Addition of the `.str.extractall()` method, and API changes to the `.str.extract()` method and `.str.cat()` method.
- `pd.test()` top-level nose test runner is available ([GH4327](#)).

See the [v0.18.0 Whatsnew](#) overview for an extensive list of all enhancements and bugs that have been fixed in 0.18.0.

## 38.13 pandas 0.17.1

**Release date:** (November 21, 2015)

This is a minor release from 0.17.0 and includes a large number of bug fixes along with several new features, enhancements, and performance improvements.

Highlights include:

- Support for Conditional HTML Formatting, see [here](#)
- Releasing the GIL on the csv reader & other ops, see [here](#)
- Regression in `DataFrame.drop_duplicates` from 0.16.2, causing incorrect results on integer values ([GH11376](#))

See the [v0.17.1 Whatsnew](#) overview for an extensive list of all enhancements and bugs that have been fixed in 0.17.1.

## 38.14 pandas 0.17.0

**Release date:** (October 9, 2015)

This is a major release from 0.16.2 and includes a small number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes. We recommend that all users upgrade to this version.

Highlights include:

- Release the Global Interpreter Lock (GIL) on some cython operations, see [here](#)
- Plotting methods are now available as attributes of the `.plot` accessor, see [here](#)
- The sorting API has been revamped to remove some long-time inconsistencies, see [here](#)
- Support for a `datetime64[ns]` with timezones as a first-class dtype, see [here](#)
- The default for `to_datetime` will now be to `raise` when presented with unparseable formats, previously this would return the original input. Also, date parse functions now return consistent results. See [here](#)
- The default for `dropna` in `HDFStore` has changed to `False`, to store by default all rows even if they are all `NaN`, see [here](#)
- Datetime accessor (`dt`) now supports `Series.dt.strftime` to generate formatted strings for datetime-likes, and `Series.dt.total_seconds` to generate each duration of the `timedelta` in seconds. See [here](#)
- `Period` and `PeriodIndex` can handle multiplied freq like `3D`, which corresponding to 3 days span. See [here](#)
- Development installed versions of pandas will now have PEP440 compliant version strings ([GH9518](#))
- Development support for benchmarking with the [Air Speed Velocity](#) library ([GH8316](#))

- Support for reading SAS xport files, see [here](#)
- Documentation comparing SAS to *pandas*, see [here](#)
- Removal of the automatic TimeSeries broadcasting, deprecated since 0.8.0, see [here](#)
- Display format with plain text can optionally align with Unicode East Asian Width, see [here](#)
- Compatibility with Python 3.5 ([GH11097](#))
- Compatibility with matplotlib 1.5.0 ([GH11111](#))

See the [v0.17.0 Whatsnew](#) overview for an extensive list of all enhancements and bugs that have been fixed in 0.17.0.

## 38.15 pandas 0.16.2

**Release date:** (June 12, 2015)

This is a minor release from 0.16.1 and includes a large number of bug fixes along with several new features, enhancements, and performance improvements.

Highlights include:

- A new `pipe` method, see [here](#)
- Documentation on how to use `numba` with `pandas`, see [here](#)

See the [v0.16.2 Whatsnew](#) overview for an extensive list of all enhancements and bugs that have been fixed in 0.16.2.

## 38.17 pandas 0.16.0

**Release date:** (March 22, 2015)

This is a major release from 0.15.2 and includes a number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes.

Highlights include:

- `DataFrame.assign` method, see [here](#)
- `Series.to_coo/from_coo` methods to interact with `scipy.sparse`, see [here](#)
- Backwards incompatible change to `Timedelta` to conform the `.seconds` attribute with `datetime.timedelta`, see [here](#)
- Changes to the `.loc` slicing API to conform with the behavior of `.ix` see [here](#)
- Changes to the default for ordering in the `Categorical` constructor, see [here](#)
- The `pandas.tools.rplot`, `pandas.sandbox.qtpandas` and `pandas.rpy` modules are deprecated. We refer users to external packages like [seaborn](#), [pandas-qt](#) and [rpy2](#) for similar or equivalent functionality, see [here](#)

See the [v0.16.0 Whatsnew](#) overview or the issue tracker on GitHub for an extensive list of all API changes, enhancements and bugs that have been fixed in 0.16.0.

## 38.20 pandas 0.15.0

**Release date:** (October 18, 2014)

This is a major release from 0.14.1 and includes a number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes.

Highlights include:

- Drop support for NumPy < 1.7.0 ([GH7711](#))
- The `Categorical` type was integrated as a first-class pandas type, see [here](#)
- New scalar type `Timedelta`, and a new index type `TimedeltaIndex`, see [here](#)
- New DataFrame default display for `df.info()` to include memory usage, see [Memory Usage](#)
- New datetimelike properties accessor `.dt` for Series, see [Datetimelike Properties](#)
- Split indexing documentation into [Indexing and Selecting Data](#) and [MultiIndex / Advanced Indexing](#)
- Split out string methods documentation into [Working with Text Data](#)
- `read_csv` will now by default ignore blank lines when parsing, see [here](#)
- API change in using Indexes in set operations, see [here](#)
- Internal refactoring of the `Index` class to no longer sub-class `ndarray`, see [Internal Refactoring](#)
- dropping support for PyTables less than version 3.0.0, and numexpr less than version 2.1 ([GH7990](#))

See the [v0.15.0 Whatsnew](#) overview or the issue tracker on GitHub for an extensive list of all API changes, enhancements and bugs that have been fixed in 0.15.0.

## 38.21 pandas 0.14.1

**Release date:** (July 11, 2014)

This is a minor release from 0.14.0 and includes a small number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes.

Highlights include:

- New methods `select_dtypes()` to select columns based on the dtype and `sem()` to calculate the standard error of the mean.
- Support for dateutil timezones (see [docs](#)).

- Support for ignoring full line comments in the `read_csv()` text parser.
- New documentation section on *Options and Settings*.
- Lots of bug fixes.

See the [v0.14.1 Whatsnew](#) overview or the issue tracker on GitHub for an extensive list of all API changes, enhancements and bugs that have been fixed in 0.14.1.

## 38.22 pandas 0.14.0

**Release date:** (May 31, 2014)

This is a major release from 0.13.1 and includes a number of API changes, several new features, enhancements, and performance improvements along with a large number of bug fixes.

Highlights include:

- Officially support Python 3.4
- SQL interfaces updated to use `sqlalchemy`, see [here](#).
- Display interface changes, see [here](#)
- MultiIndexing using Slicers, see [here](#).
- Ability to join a singly-indexed DataFrame with a multi-indexed DataFrame, see [here](#)
- More consistency in groupby results and more flexible groupby specifications, see [here](#)
- Holiday calendars are now supported in `CustomBusinessDay`, see [here](#)
- Several improvements in plotting functions, including: hexbin, area and pie plots, see [here](#).
- Performance doc section on I/O operations, see [here](#)

See the [v0.14.0 Whatsnew](#) overview or the issue tracker on GitHub for an extensive list of all API changes, enhancements and bugs that have been fixed in 0.14.0.

## 38.23 pandas 0.13.1

**Release date:** (February 3, 2014)

### 38.23.1 New Features

- Added `date_format` and `datetime_format` attribute to `ExcelWriter`. ([GH4133](#))

### 38.23.2 API Changes

- `Series.sort` will raise a `ValueError` (rather than a `TypeError`) on sorting an object that is a view of another ([GH5856](#), [GH5853](#))
- Raise/Warn `SettingWithCopyError` (according to the option `chained_assignment` in more cases, when detecting chained assignment, related ([GH5938](#), [GH6025](#)))

- `DataFrame.head(0)` returns self instead of empty frame (GH5846)
- `autocorrelation_plot` now accepts `**kwargs`. (GH5623)
- `convert_objects` now accepts a `convert_timedeltas='coerce'` argument to allow forced dtype conversion of timedeltas (GH5458, :issue:5689)
- Add `-NaN` and `-nan` to the default set of NA values (GH5952). See *NA Values*.
- `NDFrame` now has an `equals` method. (GH5283)
- `DataFrame.apply` will use the `reduce` argument to determine whether a `Series` or a `DataFrame` should be returned when the `DataFrame` is empty (GH6007).

### 38.23.3 Experimental Features

#### 38.23.4 Improvements to existing features

- perf improvements in `Series` datetime/timedelta binary operations (GH5801)
- `option_context` context manager now available as top-level API (GH5752)
- `df.info()` view now display dtype info per column (GH5682)
- `df.info()` now honors option `max_info_rows`, disable null counts for large frames (GH5974)
- perf improvements in `DataFrame.count/dropna` for `axis=1`
- `Series.str.contains` now has a `regex=False` keyword which can be faster for plain (non-regex) string patterns. (GH5879)
- support dtypes property on `Series/Panel/Panel4D`
- extend `Panel.apply` to allow arbitrary functions (rather than only ufuncs) (GH1148) allow multiple axes to be used to operate on slabs of a `Panel`
- The `ArrayFormatter` for datetime and `timedelta64` now intelligently limit precision based on the values in the array (GH3401)
- `pd.show_versions()` is now available for convenience when reporting issues.
- perf improvements to `Series.str.extract` (GH5944)
- perf improvements in `dtypes/ftypes` methods (GH5968)
- perf improvements in indexing with object dtypes (GH5968)
- improved dtype inference for `timedelta` like passed to constructors (GH5458, GH5689)
- escape special characters when writing to latex (:issue: 5374)
- perf improvements in `DataFrame.apply` (GH6013)
- `pd.read_csv` and `pd.to_datetime` learned a new `infer_datetime_format` keyword which greatly improves parsing perf in many cases. Thanks to @lexical for suggesting and @danbirken for rapidly implementing. (GH5490, :issue:6021)
- add ability to recognize '%p' format code (am/pm) to date parsers when the specific format is supplied (GH5361)
- Fix performance regression in JSON IO (GH5765)
- performance regression in Index construction from `Series` (GH6150)

### 38.23.5 Bug Fixes

- Bug in `io.wb.get_countries` not including all countries (GH6008)
- Bug in Series replace with timestamp dict (GH5797)
- `read_csv/read_table` now respects the *prefix* kwarg (GH5732).
- Bug in selection with missing values via `.ix` from a duplicate indexed DataFrame failing (GH5835)
- Fix issue of boolean comparison on empty DataFrames (GH5808)
- Bug in `isnull` handling NaT in an object array (GH5443)
- Bug in `to_datetime` when passed a `np.nan` or integer datelike and a format string (GH5863)
- Bug in groupby dtype conversion with datetimelike (GH5869)
- Regression in handling of empty Series as indexers to Series (GH5877)
- Bug in internal caching, related to (GH5727)
- Testing bug in reading JSON/msgpack from a non-filepath on windows under py3 (GH5874)
- Bug when assigning to `.ix[tuple(...)]` (GH5896)
- Bug in fully reindexing a Panel (GH5905)
- Bug in `idxmin/max` with object dtypes (GH5914)
- Bug in `BusinessDay` when adding `n` days to a date not on offset when `n>5` and `n%5==0` (GH5890)
- Bug in assigning to chained series with a series via `ix` (GH5928)
- Bug in creating an empty DataFrame, copying, then assigning (GH5932)
- Bug in `DataFrame.tail` with empty frame (GH5846)
- Bug in propagating metadata on `resample` (GH5862)
- Fixed string-representation of NaT to be “NaT” (GH5708)
- Fixed string-representation for Timestamp to show nanoseconds if present (GH5912)
- `pd.match` not returning passed sentinel
- `Panel.to_frame()` no longer fails when `major_axis` is a `MultiIndex` (GH5402).
- Bug in `pd.read_msgpack` with inferring a `DateTimeIndex` frequency incorrectly (GH5947)
- Fixed `to_datetime` for array with both Tz-aware datetimes and NaT’s (GH5961)
- Bug in rolling skew/kurtosis when passed a Series with bad data (GH5749)
- Bug in `scipy.interpolate` methods with a datetime index (GH5975)
- Bug in NaT comparison if a mixed `datetime/np.datetime64` with NaT were passed (GH5968)
- Fixed bug with `pd.concat` losing dtype information if all inputs are empty (GH5742)
- Recent changes in IPython cause warnings to be emitted when using previous versions of pandas in QtConsole, now fixed. If you’re using an older version and need to suppress the warnings, see (GH5922).
- Bug in merging `timedelta` dtypes (GH5695)
- Bug in `plotting.scatter_matrix` function. Wrong alignment among diagonal and off-diagonal plots, see (GH5497).
- Regression in Series with a multi-index via `ix` (GH6018)

- Bug in `Series.xs` with a multi-index (GH6018)
- Bug in Series construction of mixed type with datelike and an integer (which should result in object type and not automatic conversion) (GH6028)
- Possible segfault when chained indexing with an object array under NumPy 1.7.1 (GH6026, GH6056)
- Bug in setting using fancy indexing a single element with a non-scalar (e.g. a list), (GH6043)
- `to_sql` did not respect `if_exists` (GH4110 GH4304)
- Regression in `.get(None)` indexing from 0.12 (GH5652)
- Subtle `iloc` indexing bug, surfaced in (GH6059)
- Bug with insert of strings into `DatetimeIndex` (GH5818)
- Fixed unicode bug in `to_html/HTML` repr (GH6098)
- Fixed missing arg validation in `get_options_data` (GH6105)
- Bug in assignment with duplicate columns in a frame where the locations are a slice (e.g. next to each other) (GH6120)
- Bug in propagating `_ref_locs` during construction of a `DataFrame` with dups index/columns (GH6121)
- Bug in `DataFrame.apply` when using mixed datelike reductions (GH6125)
- Bug in `DataFrame.append` when appending a row with different columns (GH6129)
- Bug in `DataFrame` construction with recarray and non-ns datetime dtype (GH6140)
- Bug in `.loc` setitem indexing with a dataframe on rhs, multiple item setting, and a datetimelike (GH6152)
- Fixed a bug in `query/eval` during lexicographic string comparisons (GH6155).
- Fixed a bug in `query` where the index of a single-element `Series` was being thrown away (GH6148).
- Bug in `HDFStore` on appending a dataframe with multi-indexed columns to an existing table (GH6167)
- Consistency with dtypes in setting an empty `DataFrame` (GH6171)
- Bug in selecting on a multi-index `HDFStore` even in the presence of under specified column spec (GH6169)
- Bug in `nanops.var` with `ddof=1` and 1 elements would sometimes return `inf` rather than `nan` on some platforms (GH6136)
- Bug in Series and DataFrame bar plots ignoring the `use_index` keyword (GH6209)
- Bug in groupby with mixed str/int under python3 fixed; `argsort` was failing (GH6212)

## 38.24 pandas 0.13.0

**Release date:** January 3, 2014

### 38.24.1 New Features

- `plot(kind='kde')` now accepts the optional parameters `bw_method` and `ind`, passed to `scipy.stats.gaussian_kde()` (for `scipy >= 0.11.0`) to set the bandwidth, and to `gkde.evaluate()` to specify the indices at which it is evaluated, respectively. See `scipy` docs. (GH4298)
- Added `isin` method to `DataFrame` (GH4211)

- `df.to_clipboard()` learned a new `excel` keyword that let's you paste df data directly into excel (enabled by default). (GH5070).
- Clipboard functionality now works with PySide (GH4282)
- New `extract` string method returns regex matches more conveniently (GH4685)
- Auto-detect field widths in `read_fwf` when unspecified (GH4488)
- `to_csv()` now outputs datetime objects according to a specified format string via the `date_format` keyword (GH4313)
- Added `LastWeekOfMonth` `DateOffset` (GH4637)
- Added `cumcount` `groupby` method (GH4646)
- Added `FY5253`, and `FY5253Quarter` `DateOffsets` (GH4511)
- Added `mode()` method to `Series` and `DataFrame` to get the statistical mode(s) of a column/series. (GH5367)

### 38.24.2 Experimental Features

- The new `eval()` function implements expression evaluation using `numexpr` behind the scenes. This results in large speedups for complicated expressions involving large `DataFrames`/`Series`.
- `DataFrame` has a new `eval()` that evaluates an expression in the context of the `DataFrame`; allows inline expression assignment
- A `query()` method has been added that allows you to select elements of a `DataFrame` using a natural query syntax nearly identical to Python syntax.
- `pd.eval` and friends now evaluate operations involving `datetime64` objects in Python space because `numexpr` cannot handle `NaT` values (GH4897).
- Add `msgpack` support via `pd.read_msgpack()` and `pd.to_msgpack()` / `df.to_msgpack()` for serialization of arbitrary pandas (and python objects) in a lightweight portable binary format (GH686, GH5506)
- Added PySide support for the `qtandas DataFrameModel` and `DataFrameWidget`.
- Added `pandas.io.gbq` for reading from (and writing to) Google BigQuery into a `DataFrame`. (GH4140)

### 38.24.3 Improvements to existing features

- `read_html` now raises a `URLError` instead of catching and raising a `ValueError` (GH4303, GH4305)
- `read_excel` now supports an integer in its `sheetname` argument giving the index of the sheet to read in (GH4301).
- `get_dummies` works with `NaN` (GH4446)
- Added a test for `read_clipboard()` and `to_clipboard()` (GH4282)
- Added `bins` argument to `value_counts` (GH3945), also `sort` and `ascending`, now available in `Series` method as well as top-level function.
- Text parser now treats anything that reads like `inf` ("`inf`", "`Inf`", "`-Inf`", "`iNf`", etc.) to infinity. (GH4220, GH4219), affecting `read_table`, `read_csv`, etc.
- Added a more informative error message when plot arguments contain overlapping color and style arguments (GH4402)
- Significant table writing performance improvements in `HDFStore`

- JSON date serialization now performed in low-level C code.
- JSON support for encoding `datetime.time`
- Expanded JSON docs, more info about orient options and the use of the `numpy` param when decoding.
- Add `drop_level` argument to `xs` ([GH4180](#))
- Can now resample a `DataFrame` with `ohlc` ([GH2320](#))
- `Index.copy()` and `MultiIndex.copy()` now accept keyword arguments to change attributes (i.e., `names`, `levels`, `labels`) ([GH4039](#))
- Add `rename` and `set_names` methods to `Index` as well as `set_names`, `set_levels`, `set_labels` to `MultiIndex`. ([GH4039](#)) with improved validation for all ([GH4039](#), [GH4794](#))
- A `Series` of dtype `timedelta64[ns]` can now be divided/multiplied by an integer series ([GH4521](#))
- A `Series` of dtype `timedelta64[ns]` can now be divided by another `timedelta64[ns]` object to yield a `float64` typed `Series`. This is frequency conversion; astyping is also supported.
- `Timedelta64` support `fillna/ffill/bfill` with an integer interpreted as seconds, or a `timedelta` ([GH3371](#))
- Box numeric ops on `timedelta` `Series` ([GH4984](#))
- `Datetime64` support `ffill/bfill`
- Performance improvements with `__getitem__` on `DataFrames` with when the key is a column
- Support for using a `DatetimeIndex/PeriodsIndex` directly in a datelike calculation e.g. `s.s.index` ([GH4629](#))
- Better/cleaned up exceptions in `core/common`, `io/excel` and `core/format` ([GH4721](#), [GH3954](#)), as well as cleaned up test cases in `tests/test_frame`, `tests/test_multilevel` ([GH4732](#)).
- Performance improvement of timeseries plotting with `PeriodIndex` and added test to `vbench` ([GH4705](#) and [GH4722](#))
- Add `axis` and `level` keywords to `where`, so that the `other` argument can now be an alignable pandas object.
- `to_datetime` with a format of `'%Y%m%d'` now parses much faster
- It's now easier to hook new Excel writers into pandas (just subclass `ExcelWriter` and register your engine). You can specify an engine in `to_excel` or in `ExcelWriter`. You can also specify which writers you want to use by default with config options `io.excel.xlsx.writer` and `io.excel.xls.writer`. ([GH4745](#), [GH4750](#))
- `Panel.to_excel()` now accepts keyword arguments that will be passed to its `DataFrame's to_excel()` methods. ([GH4750](#))
- Added `XlsxWriter` as an optional `ExcelWriter` engine. This is about 5x faster than the default `openpyxl` `xlsx` writer and is equivalent in speed to the `xlwt` `xls` writer module. ([GH4542](#))
- allow `DataFrame` constructor to accept more list-like objects, e.g. `list of collections.Sequence` and `array.Array` objects ([GH3783](#), [GH4297](#), [GH4851](#)), thanks @lgautier
- `DataFrame` constructor now accepts a NumPy masked record array ([GH3478](#)), thanks @jnothman
- `__getitem__` with tuple key (e.g., `[:, 2]`) on `Series` without `MultiIndex` raises `ValueError` ([GH4759](#), [GH4837](#))
- `read_json` now raises a (more informative) `ValueError` when the dict contains a bad key and `orient='split'` ([GH4730](#), [GH4838](#))

- `read_stata` now accepts Stata 13 format ([GH4291](#))
- `ExcelWriter` and `ExcelFile` can be used as contextmanagers. ([GH3441](#), [GH4933](#))
- `pandas` is now tested with two different versions of `statsmodels` (0.4.3 and 0.5.0) ([GH4981](#)).
- Better string representations of `MultiIndex` (including ability to roundtrip via `repr`). ([GH3347](#), [GH4935](#))
- Both `ExcelFile` and `read_excel` to accept an `xlrd.Book` for the `io` (formerly `path_or_buf`) argument; this requires engine to be set. ([GH4961](#)).
- `concat` now gives a more informative error message when passed objects that cannot be concatenated ([GH4608](#)).
- Add `halflife` option to exponentially weighted moving functions (PR [GH4998](#))
- `to_dict` now takes `records` as a possible outtype. Returns an array of column-keyed dictionaries. ([GH4936](#))
- `tz_localize` can infer a fall daylight savings transition based on the structure of unlocalized data ([GH4230](#))
- `DatetimeIndex` is now in the API documentation
- Improve support for converting R datasets to pandas objects (more informative index for timeseries and numeric, support for factors, dist, and high-dimensional arrays).
- `read_html()` now supports the `parse_dates`, `tupleize_cols` and `thousands` parameters ([GH4770](#)).
- `json_normalize()` is a new method to allow you to create a flat table from semi-structured JSON data. *See the docs* ([GH1067](#))
- `DataFrame.from_records()` will now accept generators ([GH4910](#))
- `DataFrame.interpolate()` and `Series.interpolate()` have been expanded to include interpolation methods from `scipy`. ([GH4434](#), [GH1892](#))
- `Series` now supports a `to_frame` method to convert it to a single-column `DataFrame` ([GH5164](#))
- `DatetimeIndex` (and `date_range`) can now be constructed in a left- or right-open fashion using the `closed` parameter ([GH4579](#))
- Python csv parser now supports `usecols` ([GH4335](#))
- Added support for Google Analytics v3 API segment IDs that also supports v2 IDs. ([GH5271](#))
- `NDFrame.drop()` now accepts names as well as integers for the `axis` argument. ([GH5354](#))
- Added short docstrings to a few methods that were missing them + fixed the docstrings for Panel flex methods. ([GH5336](#))
- `NDFrame.drop()`, `NDFrame.dropna()`, and `.drop_duplicates()` all accept `inplace` as a keyword argument; however, this only means that the wrapper is updated inplace, a copy is still made internally. ([GH1960](#), [GH5247](#), [GH5628](#), and related [GH2325](#) [still not closed])
- Fixed bug in `tools.plotting.andrews_curves` so that lines are drawn grouped by color as expected.
- `read_excel()` now tries to convert integral floats (like `1.0`) to `int` by default. ([GH5394](#))
- Excel writers now have a default option `merge_cells` in `to_excel()` to merge cells in `MultiIndex` and Hierarchical Rows. Note: using this option it is no longer possible to round trip Excel files with merged `MultiIndex` and Hierarchical Rows. Set the `merge_cells` to `False` to restore the previous behaviour. ([GH5254](#))
- The FRED `DataReader` now accepts multiple series (:issue‘3413’)
- `StataWriter` adjusts variable names to Stata’s limitations ([GH5709](#))

### 38.24.4 API Changes

- `DataFrame.reindex()` and forward/backward filling now raises `ValueError` if either index is not monotonic ([GH4483](#), [GH4484](#)).
- pandas now is Python 2/3 compatible without the need for 2to3 thanks to @jtratrner. As a result, pandas now uses iterators more extensively. This also led to the introduction of substantive parts of the Benjamin Peterson's `six` library into `compat`. ([GH4384](#), [GH4375](#), [GH4372](#))
- `pandas.util.compat` and `pandas.util.py3compat` have been merged into `pandas.compat`. `pandas.compat` now includes many functions allowing 2/3 compatibility. It contains both list and iterator versions of `range`, `filter`, `map` and `zip`, plus other necessary elements for Python 3 compatibility. `lmap`, `lzip`, `lrange` and `lfilter` all produce lists instead of iterators, for compatibility with `numpy`, subscripting and pandas constructors. ([GH4384](#), [GH4375](#), [GH4372](#))
- deprecated `iterkv`, which will be removed in a future release (was just an alias of `iteritems` used to get around 2to3's changes). ([GH4384](#), [GH4375](#), [GH4372](#))
- `Series.get` with negative indexers now returns the same as `[]` ([GH4390](#))
- allow `ix/loc` for `Series/DataFrame/Panel` to set on any axis even when the single-key is not currently contained in the index for that axis ([GH2578](#), [GH5226](#), [GH5632](#), [GH5720](#), [GH5744](#), [GH5756](#))
- Default export for `to_clipboard` is now `csv` with a sep of `t` for `compat` ([GH3368](#))
- `at` now will enlarge the object inplace (and return the same) ([GH2578](#))
- `DataFrame.plot` will scatter plot `x` versus `y` by passing `kind='scatter'` ([GH2215](#))
- `HDFStore`
  - `append_to_multiple` automatically synchronizes writing rows to multiple tables and adds a `dropna` kwarg ([GH4698](#))
  - handle a passed `Series` in table format ([GH4330](#))
  - added an `is_open` property to indicate if the underlying file handle is `is_open`; a closed store will now report 'CLOSED' when viewing the store (rather than raising an error) ([GH4409](#))
  - a close of a `HDFStore` now will close that instance of the `HDFStore` but will only close the actual file if the ref count (by `PyTables`) w.r.t. all of the open handles are 0. Essentially you have a local instance of `HDFStore` referenced by a variable. Once you close it, it will report closed. Other references (to the same file) will continue to operate until they themselves are closed. Performing an action on a closed file will raise `ClosedFileError`
  - removed the `_quiet` attribute, replace by a `DuplicateWarning` if retrieving duplicate rows from a table ([GH4367](#))
  - removed the `warn` argument from `open`. Instead a `PossibleDataLossError` exception will be raised if you try to use `mode='w'` with an `OPEN` file handle ([GH4367](#))
  - allow a passed locations array or mask as a `where` condition ([GH4467](#))
  - add the keyword `dropna=True` to `append` to change whether ALL nan rows are not written to the store (default is `True`, ALL nan rows are NOT written), also settable via the option `io.hdf.dropna_table` ([GH4625](#))
  - the `format` keyword now replaces the `table` keyword; allowed values are `fixed(f) | table(t)` the `Storer` format has been renamed to `Fixed`
  - a column multi-index will be recreated properly ([GH4710](#)); raise on trying to use a multi-index with `data_columns` on the same axis
  - `select_as_coordinates` will now return an `Int64Index` of the resultant selection set

- support `timedelta64[ns]` as a serialization type (GH3577)
- store `datetime.date` objects as ordinals rather than `timetuples` to avoid timezone issues (GH2852), thanks @tavistmorph and @numband
- `numexpr` 2.2.2 fixes incompatibility in `PyTables` 2.4 (GH4908)
- `flush` now accepts an `fsync` parameter, which defaults to `False` (GH5364)
- `unicode` indices not supported on `table` formats (GH5386)
- pass thru store creation arguments; can be used to support in-memory stores
- JSON
  - added `date_unit` parameter to specify resolution of timestamps. Options are seconds, milliseconds, microseconds and nanoseconds. (GH4362, GH4498).
  - added `default_handler` parameter to allow a callable to be passed which will be responsible for handling otherwise unserializable objects. (GH5138)
- Index and MultiIndex changes (GH4039):
  - Setting `levels` and `labels` directly on `MultiIndex` is now deprecated. Instead, you can use the `set_levels()` and `set_labels()` methods.
  - `levels`, `labels` and `names` properties no longer return lists, but instead return containers that do not allow setting of items ('mostly immutable')
  - `levels`, `labels` and `names` are validated upon setting and are either copied or shallow-copied.
  - inplace setting of `levels` or `labels` now correctly invalidates the cached properties. (GH5238).
  - `__deepcopy__` now returns a shallow copy (currently: a view) of the data - allowing metadata changes.
  - `MultiIndex.astype()` now only allows `np.object_-like` dtypes and now returns a `MultiIndex` rather than an `Index`. (GH4039)
  - Added `is_` method to `Index` that allows fast equality comparison of views (similar to `np.may_share_memory` but no false positives, and changes on `levels` and `labels` setting on `MultiIndex`). (GH4859, GH4909)
  - Aliased `__iadd__` to `__add__`. (GH4996)
  - Added `is_` method to `Index` that allows fast equality comparison of views (similar to `np.may_share_memory` but no false positives, and changes on `levels` and `labels` setting on `MultiIndex`). (GH4859, GH4909)
- Infer and downcast dtype if `downcast='infer'` is passed to `fillna/ffill/bfill` (GH4604)
- `__nonzero__` for all `NDFrame` objects, will now raise a `ValueError`, this reverts back to (GH1073, GH4633) behavior. Add `.bool()` method to `NDFrame` objects to facilitate evaluating of single-element boolean Series
- `DataFrame.update()` no longer raises a `DataConflictError`, it now will raise a `ValueError` instead (if necessary) (GH4732)
- `Series.isin()` and `DataFrame.isin()` now raise a `TypeError` when passed a string (GH4763). Pass a list of one element (containing the string) instead.
- Remove undocumented/unused `kind` keyword argument from `read_excel`, and `ExcelFile`. (GH4713, GH4712)
- The method argument of `NDFrame.replace()` is valid again, so that a a list can be passed to `to_replace` (GH4743).

- provide automatic dtype conversions on `_reduce` operations (GH3371)
- exclude non-numerics if mixed types with datelike in `_reduce` operations (GH3371)
- default for `tupleize_cols` is now `False` for both `to_csv` and `read_csv`. Fair warning in 0.12 (GH3604)
- moved `timedeltas` support to `pandas.tseries.timedeltas.py`; add `timedeltas` string parsing, add top-level `to_timedelta` function
- `NDFrame` now is compatible with Python's `abs()` function (GH4821).
- raise a `TypeError` on invalid comparison ops on `Series/DataFrame` (e.g. `integer/datetime`) (GH4968)
- Added a new index type, `Float64Index`. This will be automatically created when passing floating values in index creation. This enables a pure label-based slicing paradigm that makes `[]`, `ix`, `loc` for scalar indexing and slicing work exactly the same. Indexing on other index types are preserved (and positional fallback for `[]`, `ix`), with the exception, that floating point slicing on indexes on non `Float64Index` will raise a `TypeError`, e.g. `Series(range(5))[3.5:4.5]` (GH263, issue:5375)
- Make Categorical repr nicer (GH4368)
- Remove deprecated `Factor` (GH3650)
- Remove deprecated `set_printoptions/reset_printoptions` (issue:3046)
- Remove deprecated `_verbose_info` (GH3215)
- Begin removing methods that don't make sense on `GroupBy` objects (GH4887).
- Remove deprecated `read_clipboard/to_clipboard/ExcelFile/ExcelWriter` from `pandas.io.parsers` (GH3717)
- All non-Index `NDFrames` (`Series`, `DataFrame`, `Panel`, `Panel4D`, `SparsePanel`, etc.), now support the entire set of arithmetic operators and arithmetic flex methods (`add`, `sub`, `mul`, etc.). `SparsePanel` does not support `pow` or `mod` with non-scalars. (GH3765)
- Arithmetic func factories are now passed real names (suitable for using with `super`) (GH5240)
- Provide NumPy compatibility with 1.7 for a calling convention like `np.prod(pandas_object)` as NumPy call with additional keyword args (GH4435)
- Provide `__dir__` method (and local context) for tab completion / remove `ipython` completers code (GH4501)
- Support non-unique axes in a `Panel` via indexing operations (GH4960)
- `.truncate` will raise a `ValueError` if invalid before and after dates are given (GH5242)
- `Timestamp` now supports `now/today/utcnow` class methods (GH5339)
- default for `display.max_seq_len` is now 100 rather than `None`. This activates truncated display ("...") of long sequences in various places. (GH3391)
- All division with `NDFrame` - likes is now `truedivision`, regardless of the `future` import. You can use `//` and `floordiv` to do integer division.

```
In [3]: arr = np.array([1, 2, 3, 4])
In [4]: arr2 = np.array([5, 3, 2, 1])
In [5]: arr / arr2
Out[5]: array([0, 0, 1, 4])

In [6]: pd.Series(arr) / pd.Series(arr2) # no future import required
Out[6]:
```

(continues on next page)

(continued from previous page)

```

0    0.200000
1    0.666667
2    1.500000
3    4.000000
dtype: float64

```

- `raise/warn SettingWithCopyError/Warning` exception/warning when setting of a copy thru chained assignment is detected, settable via option `mode.chained_assignment`
- test the list of NA values in the csv parser. add N/A, #NA as independent default na values ([GH5521](#))
- The refactoring involving “Series” deriving from `NDFrame` breaks `ipy2<=2.3.8`. an Issue has been opened against `ipy2` and a workaround is detailed in [GH5698](#). Thanks @JanSchulz.
- `Series.argmax` and `Series.argmin` are now aliased to `Series.idxmin` and `Series.idxmax`. These return the *index* of the min or max element respectively. Prior to 0.13.0 these would return the position of the min / max element ([GH6214](#))

### 38.24.5 Internal Refactoring

In 0.13.0 there is a major refactor primarily to subclass `Series` from `NDFrame`, which is the base class currently for `DataFrame` and `Panel`, to unify methods and behaviors. `Series` formerly subclassed directly from `ndarray`. ([GH4080](#), [GH3862](#), [GH816](#)) See *Internal Refactoring*

- Refactor of `series.py/frame.py/panel.py` to move common code to `generic.py`
- added `_setup_axes` to created generic `NDFrame` structures
- moved methods
  - `from_axes`, `_wrap_array`, `axes`, `ix`, `loc`, `iloc`, `shape`, `empty`, `swapaxes`, `transpose`, `pop`
  - `__iter__`, `keys`, `__contains__`, `__len__`, `__neg__`, `__invert__`
  - `convert_objects`, `as_blocks`, `as_matrix`, `values`
  - `__getstate__`, `__setstate__` (compat remains in `frame/panel`)
  - `__getattr__`, `__setattr__`
  - `_indexed_same`, `reindex_like`, `align`, `where`, `mask`
  - `fillna`, `replace` (`Series replace` is now consistent with `DataFrame`)
  - `filter` (also added `axis` argument to selectively filter on a different axis)
  - `reindex`, `reindex_axis`, `take`
  - `truncate` (moved to become part of `NDFrame`)
  - `isnull/notnull` now available on `NDFrame` objects
- These are API changes which make `Panel` more consistent with `DataFrame`
- `swapaxes` on a `Panel` with the same axes specified now return a copy
- support attribute access for setting
- `filter` supports same API as original `DataFrame filter`
- `fillna` refactored to `core/generic.py`, while `> 3ndim` is Not Implemented

- Series now inherits from `NDFrame` rather than directly from `ndarray`. There are several minor changes that affect the API.
- NumPy functions that do not support the array interface will now return `ndarrays` rather than series, e.g. `np.diff`, `np.ones_like`, `np.where`
- `Series(0.5)` would previously return the scalar `0.5`, this is no longer supported
- `TimeSeries` is now an alias for `Series`. the property `is_time_series` can be used to distinguish (if desired)
- Refactor of Sparse objects to use `BlockManager`
- Created a new block type in internals, `SparseBlock`, which can hold multi-dtypes and is non-consolidatable. `SparseSeries` and `SparseDataFrame` now inherit more methods from there hierarchy (`Series/DataFrame`), and no longer inherit from `SparseArray` (which instead is the object of the `SparseBlock`)
- Sparse suite now supports integration with non-sparse data. Non-float sparse data is supportable (partially implemented)
- Operations on sparse structures within `DataFrames` should preserve sparseness, merging type operations will convert to dense (and back to sparse), so might be somewhat inefficient
- enable `setitem` on `SparseSeries` for boolean/integer/slices
- `SparsePanels` implementation is unchanged (e.g. not using `BlockManager`, needs work)
- added `ftypes` method to `Series/DataFrame`, similar to `dtypes`, but indicates if the underlying is sparse/dense (as well as the dtype)
- All `NDFrame` objects now have a `_prop_attributes`, which can be used to indicate various values to propagate to a new object from an existing (e.g. name in `Series` will follow more automatically now)
- Internal type checking is now done via a suite of generated classes, allowing `isinstance(value, klass)` without having to directly import the class, courtesy of @jtratrner
- Bug in `Series` update where the parent frame is not updating its cache based on changes ([GH4080](#), [GH5216](#)) or types ([GH3217](#)), `fillna` ([GH3386](#))
- Indexing with dtype conversions fixed ([GH4463](#), [GH4204](#))
- Refactor `Series.reindex` to `core/generic.py` ([GH4604](#), [GH4618](#)), allow `method=` in reindexing on a `Series` to work
- `Series.copy` no longer accepts the `order` parameter and is now consistent with `NDFrame` copy
- Refactor `rename` methods to `core/generic.py`; fixes `Series.rename` for ([GH4605](#)), and adds `rename` with the same signature for `Panel`
- `Series` (for index) / `Panel` (for items) now as attribute access to its elements ([GH1903](#))
- Refactor `clip` methods to `core/generic.py` ([GH4798](#))
- Refactor of `_get_numeric_data/_get_bool_data` to `core/generic.py`, allowing `Series/Panel` functionality
- Refactor of `Series` arithmetic with time-like objects (`datetime/timedelta/time` etc.) into a separate, cleaned up wrapper class. ([GH4613](#))
- Complex compat for `Series` with `ndarray`. ([GH4819](#))
- Removed unnecessary `rwproperty` from codebase in favor of builtin `property`. ([GH4843](#))
- Refactor object level numeric methods (`mean/sum/min/max...`) from object level modules to `core/generic.py` ([GH4435](#)).

- Refactor cum objects to core/generic.py (GH4435), note that these have a more numpy-like function signature.
- `read_html()` now uses `TextParser` to parse HTML data from `bs4/lxml` (GH4770).
- Removed the `keep_internal` keyword parameter in `pandas/core/groupby.py` because it wasn't being used (GH5102).
- Base `DateOffsets` are no longer all instantiated on importing `pandas`, instead they are generated and cached on the fly. The internal representation and handling of `DateOffsets` has also been clarified. (GH5189, related GH5004)
- `MultiIndex` constructor now validates that passed levels and labels are compatible. (GH5213, GH5214)
- Unity `dropna` for `Series/DataFrame` signature (GH5250), tests from GH5234, courtesy of @rockg
- Rewrite `assert_almost_equal()` in cython for performance (GH4398)
- Added an internal `_update_inplace` method to facilitate updating `NDFrame` wrappers on inplace ops (only is for convenience of caller, doesn't actually prevent copies). (GH5247)

### 38.24.6 Bug Fixes

- `HDFStore`
  - raising an invalid `TypeError` rather than `ValueError` when appending with a different block ordering (GH4096)
  - `read_hdf` was not respecting as passed mode (GH4504)
  - appending a 0-len table will work correctly (GH4273)
  - `to_hdf` was raising when passing both arguments `append` and `table` (GH4584)
  - reading from a store with duplicate columns across dtypes would raise (GH4767)
  - Fixed a bug where `ValueError` wasn't correctly raised when column names weren't strings (GH4956)
  - A zero length series written in Fixed format not deserializing properly. (GH4708)
  - Fixed decoding perf issue on py3 (GH5441)
  - Validate levels in a multi-index before storing (GH5527)
  - Correctly handle `data_columns` with a `Panel` (GH5717)
- Fixed bug in `tslib.tz_convert(vals, tz1, tz2)`: it could raise `IndexError` exception while trying to access `trans[pos + 1]` (GH4496)
- The `by` argument now works correctly with the `layout` argument (GH4102, GH4014) in `*.hist` plotting methods
- Fixed bug in `PeriodIndex.map` where using `str` would return the `str` representation of the index (GH4136)
- Fixed test failure `test_time_series_plot_color_with_empty_kwargs` when using custom matplotlib default colors (GH4345)
- Fix running of stata IO tests. Now uses temporary files to write (GH4353)
- Fixed an issue where `DataFrame.sum` was slower than `DataFrame.mean` for integer valued frames (GH4365)
- `read_html` tests now work with Python 2.6 (GH4351)
- Fixed bug where network testing was throwing `NameError` because a local variable was undefined (GH4381)

- In `to_json`, raise if a passed `orient` would cause loss of data because of a duplicate index (GH4359)
- In `to_json`, fix date handling so milliseconds are the default timestamp as the docstring says (GH4362).
- `as_index` is no longer ignored when doing `groupby` apply (GH4648, GH3417)
- JSON NaT handling fixed, NaTs are now serialized to `null` (GH4498)
- Fixed JSON handling of escapable characters in JSON object keys (GH4593)
- Fixed passing `keep_default_na=False` when `na_values=None` (GH4318)
- Fixed bug with `values` raising an error on a DataFrame with duplicate columns and mixed dtypes, surfaced in (GH4377)
- Fixed bug with duplicate columns and type conversion in `read_json` when `orient='split'` (GH4377)
- Fixed JSON bug where locales with decimal separators other than `'.'` threw exceptions when encoding / decoding certain values. (GH4918)
- Fix `.iat` indexing with a `PeriodIndex` (GH4390)
- Fixed an issue where `PeriodIndex` joining with self was returning a new instance rather than the same instance (GH4379); also adds a test for this for the other index types
- Fixed a bug with all the dtypes being converted to object when using the CSV cparser with the `usecols` parameter (GH3192)
- Fix an issue in merging blocks where the resulting DataFrame had partially set `_ref_locs` (GH4403)
- Fixed an issue where hist subplots were being overwritten when they were called using the top level matplotlib API (GH4408)
- Fixed a bug where calling `Series.astype(str)` would truncate the string (GH4405, GH4437)
- Fixed a py3 compat issue where bytes were being repr'd as tuples (GH4455)
- Fixed Panel attribute naming conflict if item is named `'a'` (GH3440)
- Fixed an issue where duplicate indexes were raising when plotting (GH4486)
- Fixed an issue where `cumsum` and `cumprod` didn't work with bool dtypes (GH4170, GH4440)
- Fixed Panel slicing issued in `xs` that was returning an incorrect dimmed object (GH4016)
- Fix resampling bug where custom reduce function not used if only one group (GH3849, GH4494)
- Fixed Panel assignment with a transposed frame (GH3830)
- Raise on set indexing with a Panel and a Panel as a value which needs alignment (GH3777)
- `frozenset` objects now raise in the `Series` constructor (GH4482, GH4480)
- Fixed issue with sorting a duplicate multi-index that has multiple dtypes (GH4516)
- Fixed bug in `DataFrame.set_values` which was causing name attributes to be lost when expanding the index. (GH3742, GH4039)
- Fixed issue where individual names, levels and labels could be set on `MultiIndex` without validation (GH3714, GH4039)
- Fixed (GH3334) in `pivot_table`. Margins did not compute if values is the index.
- Fix bug in having a rhs of `np.timedelta64` or `np.offsets.DateOffset` when operating with date-times (GH4532)
- Fix arithmetic with series/datetimeindex and `np.timedelta64` not working the same (GH4134) and buggy `timedelta` in NumPy 1.6 (GH4135)

- Fix bug in `pd.read_clipboard` on windows with PY3 ([GH4561](#)); not decoding properly
- `tslib.get_period_field()` and `tslib.get_period_field_arr()` now raise if code argument out of range ([GH4519](#), [GH4520](#))
- Fix boolean indexing on an empty series loses index names ([GH4235](#)), `infer_dtype` works with empty arrays.
- Fix reindexing with multiple axes; if an axes match was not replacing the current axes, leading to a possible lazy frequency inference issue ([GH3317](#))
- Fixed issue where `DataFrame.apply` was reraising exceptions incorrectly (causing the original stack trace to be truncated).
- Fix selection with `ix/loc` and `non_unique` selectors ([GH4619](#))
- Fix assignment with `iloc/loc` involving a dtype change in an existing column ([GH4312](#), [GH5702](#)) have internal `setitem_with_indexer` in `core/indexing` to use `Block.setitem`
- Fixed bug where thousands operator was not handled correctly for floating point numbers in `csv_import` ([GH4322](#))
- Fix an issue with `CacheableOffset` not properly being used by many `DateOffset`; this prevented the `DateOffset` from being cached ([GH4609](#))
- Fix boolean comparison with a `DataFrame` on the lhs, and a list/tuple on the rhs ([GH4576](#))
- Fix error/dtype conversion with `setitem` of `None` on `Series/DataFrame` ([GH4667](#))
- Fix decoding based on a passed in non-default encoding in `pd.read_stata` ([GH4626](#))
- Fix `DataFrame.from_records` with a plain-vanilla `ndarray`. ([GH4727](#))
- Fix some inconsistencies with `Index.rename` and `MultiIndex.rename`, etc. ([GH4718](#), [GH4628](#))
- Bug in using `iloc/loc` with a cross-sectional and duplicate indices ([GH4726](#))
- Bug with using `QUOTE_NONE` with `to_csv` causing `Exception`. ([GH4328](#))
- Bug with `Series` indexing not raising an error when the right-hand-side has an incorrect length ([GH2702](#))
- Bug in multi-indexing with a partial string selection as one part of a `MultiIndex` ([GH4758](#))
- Bug with reindexing on the index with a non-unique index will now raise `ValueError` ([GH4746](#))
- Bug in setting with `loc/ix` a single indexer with a multi-index axis and a NumPy array, related to ([GH3777](#))
- Bug in concatenation with duplicate columns across dtypes not merging with `axis=0` ([GH4771](#), [GH4975](#))
- Bug in `iloc` with a slice index failing ([GH4771](#))
- Incorrect error message with no colspecs or width in `read_fwf`. ([GH4774](#))
- Fix bugs in indexing in a `Series` with a duplicate index ([GH4548](#), [GH4550](#))
- Fixed bug with reading compressed files with `read_fwf` in Python 3. ([GH3963](#))
- Fixed an issue with a duplicate index and assignment with a dtype change ([GH4686](#))
- Fixed bug with reading compressed files in as `bytes` rather than `str` in Python 3. Simplifies bytes-producing file-handling in Python 3 ([GH3963](#), [GH4785](#)).
- Fixed an issue related to `ticklocs/ticklabels` with log scale bar plots across different versions of `matplotlib` ([GH4789](#))
- Suppressed `DeprecationWarning` associated with internal calls issued by `repr()` ([GH4391](#))
- Fixed an issue with a duplicate index and duplicate selector with `.loc` ([GH4825](#))

- Fixed an issue with `DataFrame.sort_index` where, when sorting by a single column and passing a list for ascending, the argument for ascending was being interpreted as `True` (GH4839, GH4846)
- Fixed `Panel.tshift` not working. Added *freq* support to `Panel.shift` (GH4853)
- Fix an issue in `TextFileReader` w/ Python engine (i.e. `PythonParser`) with thousands != “,” (GH4596)
- Bug in `getitem` with a duplicate index when using `where` (GH4879)
- Fix Type inference code coerces float column into datetime (GH4601)
- Fixed `_ensure_numeric` does not check for complex numbers (GH4902)
- Fixed a bug in `Series.hist` where two figures were being created when the `by` argument was passed (GH4112, GH4113).
- Fixed a bug in `convert_objects` for > 2 ndims (GH4937)
- Fixed a bug in `DataFrame/Panel` cache insertion and subsequent indexing (GH4939, GH5424)
- Fixed string methods for `FrozenNDArray` and `FrozenList` (GH4929)
- Fixed a bug with setting invalid or out-of-range values in indexing enlargement scenarios (GH4940)
- Tests for `fillna` on empty `Series` (GH4346), thanks @immerrr
- Fixed `copy()` to shallow copy axes/indices as well and thereby keep separate metadata. (GH4202, GH4830)
- Fixed `skiprows` option in Python parser for `read_csv` (GH4382)
- Fixed bug preventing `cut` from working with `np.inf` levels without explicitly passing labels (GH3415)
- Fixed wrong check for overlapping in `DatetimeIndex.union` (GH4564)
- Fixed conflict between thousands separator and date parser in `csv_parser` (GH4678)
- Fix appending when dtypes are not the same (error showing mixing float/np.datetime64) (GH4993)
- Fix repr for `DateOffset`. No longer show duplicate entries in `kwds`. Removed unused offset fields. (GH4638)
- Fixed wrong index name during `read_csv` if using `usecols`. Applies to `c` parser only. (GH4201)
- `Timestamp` objects can now appear in the left hand side of a comparison operation with a `Series` or `DataFrame` object (GH4982).
- Fix a bug when indexing with `np.nan` via `iloc/loc` (GH5016)
- Fixed a bug where low memory `c` parser could create different types in different chunks of the same file. Now coerces to numerical type or raises warning. (GH3866)
- Fix a bug where reshaping a `Series` to its own shape raised `TypeError` (GH4554) and other reshaping issues.
- Bug in setting with `ix/loc` and a mixed int/string index (GH4544)
- Make sure series-series boolean comparisons are label based (GH4947)
- Bug in multi-level indexing with a `Timestamp` partial indexer (GH4294)
- Tests/fix for multi-index construction of an all-nan frame (GH4078)
- Fixed a bug where `read_html()` wasn't correctly inferring values of tables with commas (GH5029)
- Fixed a bug where `read_html()` wasn't providing a stable ordering of returned tables (GH4770, GH5029).
- Fixed a bug where `read_html()` was incorrectly parsing when passed `index_col=0` (GH5066).
- Fixed a bug where `read_html()` was incorrectly inferring the type of headers (GH5048).
- Fixed a bug where `DatetimeIndex` joins with `PeriodIndex` caused a stack overflow (GH3899).

- Fixed a bug where `groupby` objects didn't allow plots (GH5102).
- Fixed a bug where `groupby` objects weren't tab-completing column names (GH5102).
- Fixed a bug where `groupby.plot()` and `friends` were duplicating figures multiple times (GH5102).
- Provide automatic conversion of `object` dtypes on `fillna`, related (GH5103)
- Fixed a bug where default options were being overwritten in the option parser cleaning (GH5121).
- Treat a list/ndarray identically for `iloc` indexing with list-like (GH5006)
- Fix `MultiIndex.get_level_values()` with missing values (GH5074)
- Fix bound checking for `Timestamp()` with `datetime64` input (GH4065)
- Fix a bug where `TestReadHtml` wasn't calling the correct `read_html()` function (GH5150).
- Fix a bug with `NDFrame.replace()` which made replacement appear as though it was (incorrectly) using regular expressions (GH5143).
- Fix better error message for `to_datetime` (GH4928)
- Made sure different locales are tested on `travis-ci` (GH4918). Also adds a couple of utilities for getting locales and setting locales with a context manager.
- Fixed segfault on `isnull(MultiIndex)` (now raises an error instead) (GH5123, GH5125)
- Allow duplicate indices when performing operations that align (GH5185, GH5639)
- Compound dtypes in a constructor raise `NotImplementedError` (GH5191)
- Bug in comparing duplicate frames (GH4421) related
- Bug in `describe` on duplicate frames
- Bug in `to_datetime` with a format and `coerce=True` not raising (GH5195)
- Bug in `loc` setting with multiple indexers and a rhs of a Series that needs broadcasting (GH5206)
- Fixed bug where inplace setting of levels or labels on `MultiIndex` would not clear cached values property and therefore return wrong values. (GH5215)
- Fixed bug where filtering a grouped `DataFrame` or `Series` did not maintain the original ordering (GH4621).
- Fixed `Period` with a business date freq to always roll-forward if on a non-business date. (GH5203)
- Fixed bug in Excel writers where frames with duplicate column names weren't written correctly. (GH5235)
- Fixed issue with `drop` and a non-unique index on `Series` (GH5248)
- Fixed seg fault in C parser caused by passing more names than columns in the file. (GH5156)
- Fix `Series.isin` with date/time-like dtypes (GH5021)
- C and Python Parser can now handle the more common multi-index column format which doesn't have a row for index names (GH4702)
- Bug when trying to use an out-of-bounds date as an object dtype (GH5312)
- Bug when trying to display an embedded `PandasObject` (GH5324)
- Allows operating of `Timestamps` to return a `datetime` if the result is out-of-bounds related (GH5312)
- Fix return value/type signature of `initObjToJSON()` to be compatible with `numpy's import_array()` (GH5334, GH5326)
- Bug when renaming then `set_index` on a `DataFrame` (GH5344)

- Test suite no longer leaves around temporary files when testing graphics. (GH5347) (thanks for catching this @yarikoptic!)
- Fixed html tests on win32. (GH4580)
- Make sure that head/tail are iloc based, (GH5370)
- Fixed bug for PeriodIndex string representation if there are 1 or 2 elements. (GH5372)
- The GroupBy methods transform and filter can be used on Series and DataFrames that have repeated (non-unique) indices. (GH4620)
- Fix empty series not printing name in repr (GH4651)
- Make tests create temp files in temp directory by default. (GH5419)
- pd.to\_timedelta of a scalar returns a scalar (GH5410)
- pd.to\_timedelta accepts NaN and NaT, returning NaT instead of raising (GH5437)
- performance improvements in isnull on larger size pandas objects
- Fixed various setitem with 1d ndarray that does not have a matching length to the indexer (GH5508)
- Bug in getitem with a multi-index and iloc (GH5528)
- Bug in delitem on a Series (GH5542)
- Bug fix in apply when using custom function and objects are not mutated (GH5545)
- Bug in selecting from a non-unique index with loc (GH5553)
- Bug in groupby returning non-consistent types when user function returns a None, (GH5592)
- Work around regression in numpy 1.7.0 which erroneously raises IndexError from ndarray.item (GH5666)
- Bug in repeated indexing of object with resultant non-unique index (GH5678)
- Bug in fillna with Series and a passed series/dict (GH5703)
- Bug in groupby transform with a datetime-like grouper (GH5712)
- Bug in multi-index selection in PY3 when using certain keys (GH5725)
- Row-wise concat of differing dtypes failing in certain cases (GH5754)

## 38.25 pandas 0.12.0

Release date: 2013-07-24

### 38.25.1 New Features

- pd.read\_html() can now parse HTML strings, files or urls and returns a list of DataFrame s courtesy of @cpcloud. (GH3477, GH3605, GH3606)
- Support for reading Amazon S3 files. (GH3504)
- Added module for reading and writing JSON strings/files: pandas.io.json includes to\_json DataFrame/Series method, and a read\_json top-level reader various issues (GH1226, GH3804, GH3876, GH3867, GH1305)
- Added module for reading and writing Stata files: pandas.io.stata (GH1512) includes to\_stata DataFrame method, and a read\_stata top-level reader

- Added support for writing in `to_csv` and reading in `read_csv`, multi-index columns. The `header` option in `read_csv` now accepts a list of the rows from which to read the index. Added the option, `tupleize_cols` to provide compatibility for the pre 0.12 behavior of writing and reading multi-index columns via a list of tuples. The default in 0.12 is to write lists of tuples and *not* interpret list of tuples as a multi-index column. Note: The default value will change in 0.12 to make the default *to* write and read multi-index columns in the new format. ([GH3571](#), [GH1651](#), [GH3141](#))
- Add iterator to `Series.str` ([GH3638](#))
- `pd.set_option()` now allows N option, value pairs ([GH3667](#)).
- Added keyword parameters for different types of `scatter_matrix` subplots
- A `filter` method on grouped Series or DataFrames returns a subset of the original ([GH3680](#), [GH919](#))
- Access to historical Google Finance data in `pandas.io.data` ([GH3814](#))
- DataFrame plotting methods can sample column colors from a Matplotlib colormap via the `colormap` keyword. ([GH3860](#))

### 38.25.2 Improvements to existing features

- Fixed various issues with internal pprinting code, the `repr()` for various objects including `TimeStamp` and `Index` now produces valid Python code strings and can be used to recreate the object, ([GH3038](#), [GH3379](#), [GH3251](#), [GH3460](#))
- `convert_objects` now accepts a `copy` parameter (defaults to `True`)
- `HDFStore`
  - will retain index attributes (`freq,tz,name`) on recreation ([GH3499](#),:issue:4098)
  - will warn with a `AttributeConflictWarning` if you are attempting to append an index with a different frequency than the existing, or attempting to append an index with a different name than the existing
  - support datelike columns with a timezone as `data_columns` ([GH2852](#))
  - table writing performance improvements.
  - support python3 (via `PyTables 3.0.0`) ([GH3750](#))
- Add modulo operator to Series, DataFrame
- Add `date` method to `DatetimeIndex`
- Add `dropna` argument to `pivot_table` (:issue: 3820)
- Simplified the API and added a `describe` method to Categorical
- `melt` now accepts the optional parameters `var_name` and `value_name` to specify custom column names of the returned DataFrame ([GH3649](#)), thanks @hoechenberger. If `var_name` is not specified and `dataframe.columns.name` is not `None`, then this will be used as the `var_name` ([GH4144](#)). Also support for `MultiIndex` columns.
- clipboard functions use `pyperclip` (no dependencies on Windows, alternative dependencies offered for Linux) ([GH3837](#)).
- Plotting functions now raise a `TypeError` before trying to plot anything if the associated objects have a dtype of `object` ([GH1818](#), [GH3572](#), [GH3911](#), [GH3912](#)), but they will try to convert object arrays to numeric arrays if possible so that you can still plot, for example, an object array with floats. This happens before any drawing takes place which eliminates any spurious plots from showing up.
- Added `Faq` section on `repr` display options, to help users customize their setup.

- where operations that result in block splitting are much faster ([GH3733](#))
- Series and DataFrame hist methods now take a `figsize` argument ([GH3834](#))
- DatetimeIndexes no longer try to convert mixed-integer indexes during join operations ([GH3877](#))
- Add `unit` keyword to `Timestamp` and `to_datetime` to enable passing of integers or floats that are in an epoch unit of `D`, `s`, `ms`, `us`, `ns`, thanks @mtkini ([GH3969](#)) (e.g. unix timestamps or epoch `s`, with fractional seconds allowed) ([GH3540](#))
- DataFrame corr method (`spearman`) is now cythonized.
- Improved network test decorator to catch `IOError` (and therefore `URLError` as well). Added `with_connectivity_check` decorator to allow explicitly checking a website as a proxy for seeing if there is network connectivity. Plus, new `optional_args` decorator factory for decorators. ([GH3910](#), [GH3914](#))
- `read_csv` will now throw a more informative error message when a file contains no columns, e.g., all newline characters
- Added `layout` keyword to `DataFrame.hist()` for more customizable layout ([GH4050](#))
- `Timestamp.min` and `Timestamp.max` now represent valid `Timestamp` instances instead of the default `datetime.min` and `datetime.max` (respectively), thanks @SleepingPills
- `read_html` now raises when no tables are found and `BeautifulSoup==4.2.0` is detected ([GH4214](#))

### 38.25.3 API Changes

- `HDFStore`
  - When removing an object, `remove(key)` raises `KeyError` if the key is not a valid store object.
  - raise a `TypeError` on passing `where` or `columns` to select with a `Storer`; these are invalid parameters at this time ([GH4189](#))
  - can now specify an `encoding` option to `append/put` to enable alternate encodings ([GH3750](#))
  - enable support for `iterator/chunksize` with `read_hdf`
- The `repr()` for (Multi)Index now obeys `display.max_seq_items` rather than NumPy threshold print options. ([GH3426](#), [GH3466](#))
- Added `mangle_dupe_cols` option to `read_table/csv`, allowing users to control legacy behaviour re dupe cols (A, A.1, A.2 vs A, A) ([GH3468](#)) Note: The default value will change in 0.12 to the “no mangle” behaviour, If your code relies on this behaviour, explicitly specify `mangle_dupe_cols=True` in your calls.
- Do not allow astypes on `datetime64[ns]` except to `object`, and `timedelta64[ns]` to `object/int` ([GH3425](#))
- The behavior of `datetime64` dtypes has changed with respect to certain so-called reduction operations ([GH3726](#)). The following operations now raise a `TypeError` when performed on a `Series` and return an *empty* `Series` when performed on a `DataFrame` similar to performing these operations on, for example, a `DataFrame` of `slice` objects: - `sum`, `prod`, `mean`, `std`, `var`, `skew`, `kurt`, `corr`, and `cov`
- Do not allow `datetimelike/timedeltalike` creation except with valid types (e.g. cannot pass `datetime64[ms]`) ([GH3423](#))
- Add `squeeze` keyword to `groupby` to allow reduction from `DataFrame` -> `Series` if groups are unique. Regression from 0.10.1, partial revert on ([GH2893](#)) with ([GH3596](#))
- Raise on `iloc` when boolean indexing with a label based indexer mask e.g. a boolean `Series`, even with integer labels, will raise. Since `iloc` is purely positional based, the labels on the `Series` are not alignable ([GH3631](#))

- The `raise_on_error` option to plotting methods is obviated by [GH3572](#), so it is removed. Plots now always raise when data cannot be plotted or the object being plotted has a dtype of object.
- `DataFrame.interpolate()` is now deprecated. Please use `DataFrame.fillna()` and `DataFrame.replace()` instead ([GH3582](#), [GH3675](#), [GH3676](#)).
- the method and axis arguments of `DataFrame.replace()` are deprecated
- `DataFrame.replace` 's `infer_types` parameter is removed and now performs conversion by default. ([GH3907](#))
- Deprecate `display.height`, `display.width` is now only a formatting option does not control triggering of summary, similar to < 0.11.0.
- Add the keyword `allow_duplicates` to `DataFrame.insert` to allow a duplicate column to be inserted if `True`, default is `False` (same as prior to 0.12) ([GH3679](#))
- io API changes
  - added `pandas.io.api` for i/o imports
  - removed Excel support to `pandas.io.excel`
  - added top-level `pd.read_sql` and `to_sql` `DataFrame` methods
  - removed clipboard support to `pandas.io.clipboard`
  - replace top-level and instance methods `save` and `load` with top-level `read_pickle` and `to_pickle` instance method, `save` and `load` will give deprecation warning.
- the method and axis arguments of `DataFrame.replace()` are deprecated
- set `FutureWarning` to require `data_source`, and to replace year/month with expiry date in `pandas.io` options. This is in preparation to add options data from Google ([GH3822](#))
- the method and axis arguments of `DataFrame.replace()` are deprecated
- Implement `__nonzero__` for `NDFrame` objects ([GH3691](#), [GH3696](#))
- `as_matrix` with mixed signed and unsigned dtypes will result in 2 x the lcd of the unsigned as an int, maxing with `int64`, to avoid precision issues ([GH3733](#))
- `na_values` in a list provided to `read_csv/read_excel` will match string and numeric versions e.g. `na_values=['99']` will match 99 whether the column ends up being int, float, or string ([GH3611](#))
- `read_html` now defaults to `None` when reading, and falls back on `bs4 + html5lib` when `lxml` fails to parse. a list of parsers to try until success is also valid
- more consistency in the `to_datetime` return types (give string/array of string inputs) ([GH3888](#))
- The internal pandas class hierarchy has changed (slightly). The previous `PandasObject` now is called `PandasContainer` and a new `PandasObject` has become the baseclass for `PandasContainer` as well as `Index`, `Categorical`, `GroupBy`, `SparseList`, and `SparseArray` (+ their base classes). Currently, `PandasObject` provides string methods (from `StringMixin`). ([GH4090](#), [GH4092](#))
- New `StringMixin` that, given a `__unicode__` method, gets Python 2 and Python 3 compatible string methods (`__str__`, `__bytes__`, and `__repr__`). Plus string safety throughout. Now employed in many places throughout the pandas library. ([GH4090](#), [GH4092](#))

### 38.25.4 Experimental Features

- Added experimental `CustomBusinessDay` class to support `DateOffsets` with custom holiday calendars and custom weekmasks. ([GH2301](#))

### 38.25.5 Bug Fixes

- Fixed an esoteric excel reading bug, xlrd>= 0.9.0 now required for excel support. Should provide python3 support (for reading) which has been lacking. (GH3164)
- Disallow Series constructor called with MultiIndex which caused segfault (GH4187)
- Allow unioning of date ranges sharing a timezone (GH3491)
- Fix to\_csv issue when having a large number of rows and NaT in some columns (GH3437)
- `.loc` was not raising when passed an integer list (GH3449)
- Unordered time series selection was misbehaving when using label slicing (GH3448)
- Fix sorting in a frame with a list of columns which contains datetime64[ns] dtypes (GH3461)
- DataFrames fetched via FRED now handle '.' as a NaN. (GH3469)
- Fix regression in a DataFrame apply with axis=1, objects were not being converted back to base dtypes correctly (GH3480)
- Fix issue when storing uint dtypes in an HDFStore. (GH3493)
- Non-unique index support clarified (GH3468)
  - Addressed handling of dupe columns in df.to\_csv new and old (GH3454, GH3457)
  - Fix assigning a new index to a duplicate index in a DataFrame would fail (GH3468)
  - Fix construction of a DataFrame with a duplicate index
  - ref\_locs support to allow duplicative indices across dtypes, allows iget support to always find the index (even across dtypes) (GH2194)
  - applymap on a DataFrame with a non-unique index now works (removed warning) (GH2786), and fix (GH3230)
  - Fix to\_csv to handle non-unique columns (GH3495)
  - Duplicate indexes with getitem will return items in the correct order (GH3455, GH3457) and handle missing elements like unique indices (GH3561)
  - Duplicate indexes with and empty DataFrame.from\_records will return a correct frame (GH3562)
  - Concat to produce a non-unique columns when duplicates are across dtypes is fixed (GH3602)
  - Non-unique indexing with a slice via loc and friends fixed (GH3659)
  - Allow insert/delete to non-unique columns (GH3679)
  - Extend reindex to correctly deal with non-unique indices (GH3679)
  - DataFrame.itertuples() now works with frames with duplicate column names (GH3873)
  - Bug in non-unique indexing via iloc (GH4017); added takeable argument to reindex for location-based taking
  - Allow non-unique indexing in series via .ix/.loc and \_\_getitem\_\_ (GH4246)
  - Fixed non-unique indexing memory allocation issue with .ix/.loc (GH4280)
- Fixed bug in groupby with empty series referencing a variable before assignment. (GH3510)
- Allow index name to be used in groupby for non MultiIndex (GH4014)
- Fixed bug in mixed-frame assignment with aligned series (GH3492)

- Fixed bug in selecting month/quarter/year from a series would not select the time element on the last day (GH3546)
- Fixed a couple of MultiIndex rendering bugs in `df.to_html()` (GH3547, GH3553)
- Properly convert `np.datetime64` objects in a Series (GH3416)
- Raise a `TypeError` on invalid datetime/timedelta operations e.g. add datetimes, multiple timedelta x datetime
- Fix `.diff` on datelike and timedelta operations (GH3100)
- `combine_first` not returning the same dtype in cases where it can (GH3552)
- Fixed bug with `Panel.transpose` argument aliases (GH3556)
- Fixed platform bug in `PeriodIndex.take` (GH3579)
- Fixed bud in incorrect conversion of `datetime64[ns]` in `combine_first` (GH3593)
- Fixed bug in `reset_index` with `NaN` in a multi-index (GH3586)
- `fillna` methods now raise a `TypeError` when the `value` parameter is a list or tuple.
- Fixed bug where a time-series was being selected in preference to an actual column name in a frame (GH3594)
- Make `secondary_y` work properly for bar plots (GH3598)
- Fix modulo and integer division on Series/DataFrames to act similarly to `float` dtypes to return `np.nan` or `np.inf` as appropriate (GH3590)
- Fix incorrect dtype on `groupby` with `as_index=False` (GH3610)
- Fix `read_csv/read_excel` to correctly encode identical `na_values`, e.g. `na_values=[-999.0, -999]` was failing (GH3611)
- Disable HTML output in `qtconsole` again. (GH3657)
- Reworked the new repr display logic, which users found confusing. (GH3663)
- Fix indexing issue in `ndim >= 3` with `iloc` (GH3617)
- Correctly parse date columns with embedded (nan/NaT) into `datetime64[ns]` dtype in `read_csv` when `parse_dates` is specified (GH3062)
- Fix not consolidating before `to_csv` (GH3624)
- Fix alignment issue when `setitem` in a DataFrame with a piece of a DataFrame (GH3626) or a mixed DataFrame and a Series (GH3668)
- Fix plotting of unordered `DatetimeIndex` (GH3601)
- `sql.write_frame` failing when writing a single column to `sqlite` (GH3628), thanks to @stonebig
- Fix pivoting with `nan` in the index (GH3558)
- Fix running of `bs4` tests when it is not installed (GH3605)
- Fix parsing of html table (GH3606)
- `read_html()` now only allows a single backend: `html5lib` (GH3616)
- `convert_objects` with `convert_dates='coerce'` was parsing some single-letter strings into today's date
- `DataFrame.from_records` did not accept empty recarrays (GH3682)
- `DataFrame.to_csv` will succeed with the deprecated option `nanRep`, @tdsmith
- `DataFrame.to_html` and `DataFrame.to_latex` now accept a path for their first argument (GH3702)

- Fix file tokenization error with r delimiter and quoted fields ([GH3453](#))
- Groupby transform with item-by-item not upcasting correctly ([GH3740](#))
- Incorrectly read a HDFStore multi-index Frame with a column specification ([GH3748](#))
- `read_html` now correctly skips tests ([GH3741](#))
- PandasObjects raise `TypeError` when trying to hash ([GH3882](#))
- Fix incorrect arguments passed to `concat` that are not list-like (e.g. `concat(df1,df2)`) ([GH3481](#))
- Correctly parse when passed the `dtype=str` (or other variable-len string dtypes) in `read_csv` ([GH3795](#))
- Fix index name not propagating when using `loc/ix` ([GH3880](#))
- Fix groupby when applying a custom function resulting in a returned DataFrame was not converting dtypes ([GH3911](#))
- Fixed a bug where `DataFrame.replace` with a compiled regular expression in the `to_replace` argument wasn't working ([GH3907](#))
- Fixed `__truediv__` in Python 2.7 with `numexpr` installed to actually do true division when dividing two integer arrays with at least 10000 cells total ([GH3764](#))
- Indexing with a string with seconds resolution not selecting from a time index ([GH3925](#))
- csv parsers would loop infinitely if `iterator=True` but no `chunksize` was specified ([GH3967](#)), Python parser failing with `chunksize=1`
- Fix index name not propagating when using `shift`
- Fixed `dropna=False` being ignored with multi-index stack ([GH3997](#))
- Fixed flattening of columns when renaming MultiIndex columns DataFrame ([GH4004](#))
- Fix `Series.clip` for datetime series. NA/NaN threshold values will now throw `ValueError` ([GH3996](#))
- Fixed insertion issue into DataFrame, after rename ([GH4032](#))
- Fixed testing issue where too many sockets were open thus leading to a connection reset issue ([GH3982](#), [GH3985](#), [GH4028](#), [GH4054](#))
- Fixed failing tests in `test_yahoo`, `test_google` where symbols were not retrieved but were being accessed ([GH3982](#), [GH3985](#), [GH4028](#), [GH4054](#))
- `Series.hist` will now take the figure from the current environment if one is not passed
- Fixed bug where a 1xN DataFrame would barf on a 1xN mask ([GH4071](#))
- Fixed running of `tox` under python3 where the pickle import was getting rewritten in an incompatible way ([GH4062](#), [GH4063](#))
- Fixed bug where `sharex` and `sharey` were not being passed to `grouped_hist` ([GH4089](#))
- Fix bug where `HDFStore` will fail to append because of a different block ordering on-disk ([GH4096](#))
- Better error messages on inserting incompatible columns to a frame ([GH4107](#))
- Fixed bug in `DataFrame.replace` where a nested dict wasn't being iterated over when `regex=False` ([GH4115](#))
- Fixed bug in `convert_objects(convert_numeric=True)` where a mixed numeric and object Series/Frame was not converting properly ([GH4119](#))
- Fixed bugs in multi-index selection with column multi-index and duplicates ([GH4145](#), [GH4146](#))
- Fixed bug in the parsing of microseconds when using the `format` argument in `to_datetime` ([GH4152](#))

- Fixed bug in `PandasAutoDateLocator` where `invert_xaxis` triggered incorrectly `MilliSecondLocator` (GH3990)
- Fixed bug in `Series.where` where broadcasting a single element input vector to the length of the series resulted in multiplying the value inside the input (GH4192)
- Fixed bug in plotting that wasn't raising on invalid colormap for matplotlib 1.1.1 (GH4215)
- Fixed the legend displaying in `DataFrame.plot(kind='kde')` (GH4216)
- Fixed bug where Index slices weren't carrying the name attribute (GH4226)
- Fixed bug in initializing `DatetimeIndex` with an array of strings in a certain time zone (GH4229)
- Fixed bug where `html5lib` wasn't being properly skipped (GH4265)
- Fixed bug where `get_data_famafrench` wasn't using the correct file edges (GH4281)

## 38.26 pandas 0.11.0

**Release date:** 2013-04-22

### 38.26.1 New Features

- New documentation section, `10 Minutes to Pandas`
- New documentation section, `Cookbook`
- Allow mixed dtypes (e.g `float32/float64/int32/int16/int8`) to coexist in `DataFrames` and propagate in operations
- Add function to `pandas.io.data` for retrieving stock index components from Yahoo! finance (GH2795)
- Support slicing with time objects (GH2681)
- Added `.iloc` attribute, to support strict integer based indexing, analogous to `.ix` (GH2922)
- Added `.loc` attribute, to support strict label based indexing, analogous to `.ix` (GH3053)
- Added `.iat` attribute, to support fast scalar access via integers (replaces `iget_value/iset_value`)
- Added `.at` attribute, to support fast scalar access via labels (replaces `get_value/set_value`)
- Moved functionality from `irow, icol, iget_value/iset_value` to `.iloc` indexer (via `_ixs` methods in each object)
- Added support for expression evaluation using the `numexpr` library
- Added `convert=boolean` to take routines to translate negative indices to positive, defaults to `True`
- Added `to_series()` method to indices, to facilitate the creation of indexers (GH3275)

### 38.26.2 Improvements to existing features

- Improved performance of `df.to_csv()` by up to 10x in some cases. (GH3059)
- added `blocks` attribute to `DataFrames`, to return a dict of dtypes to homogeneously dtyped `DataFrames`
- added keyword `convert_numeric` to `convert_objects()` to try to convert object dtypes to numeric types (default is `False`)

```
In [2]: p
Out[2]:
<class 'pandas.core.panel.Panel'>
Dimensions: 3 (items) x 4 (major_axis) x 4 (minor_axis)
Items axis: ItemA to ItemC
Major_axis axis: 2001-01-02 00:00:00 to 2001-01-05 00:00:00
Minor_axis axis: A to D
```

	A	B	C	D
2001-01-02	0.469112	-0.282863	-1.509059	-1.135632
2001-01-03	1.212112	-0.173215	0.119209	-1.044236
2001-01-04	-0.861849	-2.104569	-0.494929	1.071804
2001-01-05	0.721555	-0.706771	-1.039575	0.271860

[illegible]

- Improvement to Yahoo API access in `pd.io.data.Options` (GH2758)

- added option `display.max_seq_items` to control the number of elements printed per sequence pprinting it. (GH2979)
- added option `display.chop_threshold` to control display of small numerical values. (GH2739)
- added option `display.max_info_rows` to prevent verbose\_info from being calculated for frames above 1M rows (configurable). (GH2807, GH2918)
- `value_counts()` now accepts a “normalize” argument, for normalized histograms. (GH2710).
- `DataFrame.from_records` now accepts not only dicts but any instance of the collections.Mapping ABC.
- Allow selection semantics via a string with a datelike index to work in both Series and DataFrames (GH3070)

```
In [5]: idx = pd.date_range("2001-10-1", periods=5, freq='M')
In [6]: ts = pd.Series(np.random.rand(len(idx)), index=idx)
In [7]: ts['2001']
Out[7]:
2001-10-31    0.838796
2001-11-30    0.897333
2001-12-31    0.732592
Freq: M, dtype: float64

In [8]: df = pd.DataFrame(dict(A = ts))
In [9]: df['2001']
Out[9]:
           A
2001-10-31  0.838796
2001-11-30  0.897333
2001-12-31  0.732592
```

- added option `display.mpl_style` providing a sleeker visual style for plots. Based on <https://gist.github.com/huyng/816622> (GH3075).
- Improved performance across several core functions by taking memory ordering of arrays into account. Courtesy of @stephenwlin (GH3130)
- Improved performance of groupby transform method (GH2121)
- Handle “ragged” CSV files missing trailing delimiters in rows with missing fields when also providing explicit list of column names (so the parser knows how many columns to expect in the result) (GH2981)
- On a mixed DataFrame, allow setting with indexers with ndarray/DataFrame on rhs (GH3216)
- Treat boolean values as integers (values 1 and 0) for numeric operations. (GH2641)
- Add `time` method to DatetimeIndex (GH3180)
- Return NA when using `Series.str[...]` for values that are not long enough (GH3223)
- Display cursor coordinate information in time-series plots (GH1670)
- `to_html()` now accepts an optional “escape” argument to control reserved HTML character escaping (enabled by default) and escapes `&`, in addition to `<` and `>`. (GH2919)

### 38.26.3 API Changes

- Do not automatically upcast numeric specified dtypes to `int64` or `float64` (GH622 and GH797)

- DataFrame construction of lists and scalars, with no dtype present, will result in casting to `int64` or `float64`, regardless of platform. This is not an apparent change in the API, but noting it.
- Guarantee that `convert_objects()` for Series/DataFrame always returns a copy
- groupby operations will respect dtypes for numeric float operations (`float32/float64`); other types will be operated on, and will try to cast back to the input dtype (e.g. if an int is passed, as long as the output doesn't have nans, then an int will be returned)
- `backfill/pad/take/diff/ohlc` will now support `float32/int16/int8` operations
- Block types will upcast as needed in where/masking operations ([GH2793](#))
- Series now automatically will try to set the correct dtype based on passed datetimelike objects (date-time/Timestamp)
  - `timedelta64` are returned in appropriate cases (e.g. Series - Series, when both are `datetime64`)
  - mixed datetimes and objects ([GH2751](#)) in a constructor will be cast correctly
  - astype on datetimes to object are now handled (as well as NaT conversions to `np.nan`)
  - all timedelta like objects will be correctly assigned to `timedelta64` with mixed NaN and/or NaT allowed
- arguments to `DataFrame.clip` were inconsistent to NumPy and Series clipping ([GH2747](#))
- `util.testing.assert_frame_equal` now checks the column and index names ([GH2964](#))
- Constructors will now return a more informative `ValueError` on failures when invalid shapes are passed
- Don't suppress `TypeError` in `GroupBy.agg` ([GH3238](#))
- Methods return `None` when `inplace=True` ([GH1893](#))
- `HDFStore`
  - added the method `select_column` to select a single column from a table as a Series.
  - deprecated the `unique` method, can be replicated by `select_column(key, column).unique()`
  - `min_itemsize` parameter will now automatically create data\_columns for passed keys
- Downcast on pivot if possible ([GH3283](#)), adds argument `downcast` to `fillna`
- Introduced options `display.height/width` for explicitly specifying terminal height/width in characters. Deprecated `display.line_width`, now replaced by `display.width`. These defaults are in effect for scripts as well, so unless disabled, previously very wide output will now be output as "expand\_repr" style wrapped output.
- Various defaults for options (including `display.max_rows`) have been revised, after a brief survey concluded they were wrong for everyone. Now at `w=80,h=60`.
- HTML repr output in IPython qtconsole is once again controlled by the option `display.notebook_repr_html`, and on by default.

### 38.26.4 Bug Fixes

- Fix seg fault on empty data frame when `fillna` with `pad` or `backfill` ([GH2778](#))
- Single element ndarrays of datetimelike objects are handled (e.g. `np.array(datetime(2001,1,1,0,0))`), w/o dtype being passed
- 0-dim ndarrays with a passed dtype are handled correctly (e.g. `np.array(0.,dtype='float32')`)
- Fix some boolean indexing inconsistencies in `Series.__getitem__/_setitem__` ([GH2776](#))

- Fix issues with DataFrame and Series constructor with integers that overflow `int64` and some mixed typed type lists ([GH2845](#))
- `HDFStore`
  - Fix weird PyTables error when using too many selectors in a where also correctly filter on any number of values in a Term expression (so not using `numexpr` filtering, but `isin` filtering)
  - Internally, change all variables to be private-like (now have leading underscore)
  - Fixes for query parsing to correctly interpret boolean and `!=` ([GH2849](#), [GH2973](#))
  - Fixes for pathological case on `SparseSeries` with 0-len array and compression ([GH2931](#))
  - Fixes bug with writing rows if part of a block was all-nan ([GH3012](#))
  - Exceptions are now `ValueError` or `TypeError` as needed
  - A table will now raise if `min_itemsize` contains fields which are not queryables
- Bug showing up in `applymap` where some object type columns are converted ([GH2909](#)) had an incorrect default in `convert_objects`
- `TimeDeltas`
  - Series ops with a Timestamp on the rhs was throwing an exception ([GH2898](#)) added tests for Series ops with datetimes, timedeltas, Timestamps, and datelike Series on both lhs and rhs
  - Fixed subtle `timedelta64` inference issue on py3 & NumPy 1.7.0 ([GH3094](#))
  - Fixed some formatting issues on `timedelta` when negative
  - Support null checking on `timedelta64`, representing (and formatting) with `NaT`
  - Support `setitem` with `np.nan` value, converts to `NaT`
  - Support `min/max` ops in a DataFrame (`abs` not working, nor do we error on non-supported ops)
  - Support `idxmin/idxmax/abs/max/min` in a Series ([GH2989](#), [GH2982](#))
- Bug on in-place putmasking on an integer series that needs to be converted to float ([GH2746](#))
- Bug in `argsort` of `datetime64[ns]` Series with `NaT` ([GH2967](#))
- Bug in `value_counts` of `datetime64[ns]` Series ([GH3002](#))
- Fixed printing of `NaT` in an index
- Bug in `idxmin/idxmax` of `datetime64[ns]` Series with `NaT` ([GH2982](#))
- Bug in `icol`, `take` with negative indicies was producing incorrect return values (see [GH2922](#), [GH2892](#)), also check for out-of-bounds indices ([GH3029](#))
- Bug in DataFrame column insertion when the column creation fails, existing frame is left in an irrecoverable state ([GH3010](#))
- Bug in DataFrame update, `combine_first` where non-specified values could cause dtype changes ([GH3016](#), [GH3041](#))
- Bug in `groupby` with `first/last` where dtypes could change ([GH3041](#), [GH2763](#))
- Formatting of an index that has `nan` was inconsistent or wrong (would fill from other values), ([GH2850](#))
- Unstack of a frame with no nans would always cause dtype upcasting ([GH2929](#))
- Fix scalar `datetime.datetime` parsing bug in `read_csv` ([GH3071](#))
- Fixed slow printing of large Dataframes, due to inefficient dtype reporting ([GH2807](#))

- Fixed a segfault when using a function as grouper in groupby (GH3035)
- Fix pretty-printing of infinite data structures (closes GH2978)
- Fixed exception when plotting timeseries bearing a timezone (closes GH2877)
- str.contains ignored na argument (GH2806)
- Substitute warning for segfault when grouping with categorical grouper of mismatched length (GH3011)
- Fix exception in SparseSeries.density (GH2083)
- Fix upsampling bug with closed='left' and daily to daily data (GH3020)
- Fixed missing tick bars on scatter\_matrix plot (GH3063)
- Fixed bug in Timestamp(d,tz=foo) when d is date() rather than datetime() (GH2993)
- series.plot(kind='bar') now respects pylab color schem (GH3115)
- Fixed bug in reshape if not passed correct input, now raises TypeError (GH2719)
- Fixed a bug where Series ctor did not respect ordering if OrderedDict passed in (GH3282)
- Fix NameError issue on RESO\_US (GH2787)
- Allow selection in an *unordered* timeseries to work similarly to an *ordered* timeseries (GH2437).
- Fix implemented .xs when called with axes=1 and a level parameter (GH2903)
- Timestamp now supports the class method fromordinal similar to datetimes (GH3042)
- Fix issue with indexing a series with a boolean key and specifying a 1-len list on the rhs (GH2745) or a list on the rhs (GH3235)
- Fixed bug in groupby apply when kernel generate list of arrays having unequal len (GH1738)
- fixed handling of rolling\_corr with center=True which could produce corr>1 (GH3155)
- Fixed issues where indices can be passed as 'index/column' in addition to 0/1 for the axis parameter
- PeriodIndex.tolist now boxes to Period (GH3178)
- PeriodIndex.get\_loc KeyError now reports Period instead of ordinal (GH3179)
- df.to\_records bug when handling MultiIndex (GH3189)
- Fix Series.\_\_getitem\_\_ segfault when index less than -length (GH3168)
- Fix bug when using Timestamp as a date parser (GH2932)
- Fix bug creating date range from Timestamp with time zone and passing same time zone (GH2926)
- Add comparison operators to Period object (GH2781)
- Fix bug when concatenating two Series into a DataFrame when they have the same name (GH2797)
- Fix automatic color cycling when plotting consecutive timeseries without color arguments (GH2816)
- fixed bug in the pickling of PeriodIndex (GH2891)
- Upcast/split blocks when needed in a mixed DataFrame when setitem with an indexer (GH3216)
- Invoking df.applymap on a dataframe with dupe cols now raises a ValueError (GH2786)
- Apply with invalid returned indices raise correct Exception (GH2808)
- Fixed a bug in plotting log-scale bar plots (GH3247)
- df.plot() grid on/off now obeys the mpl default style, just like series.plot(). (GH3233)

- Fixed a bug in the legend of `plotting.andrews_curves()` (GH3278)
- Produce a series on apply if we only generate a singular series and have a simple index (GH2893)
- Fix Python ASCII file parsing when integer falls outside of floating point spacing (GH3258)
- fixed pretty printing of sets (GH3294)
- `Panel()` and `Panel.from_dict()` now respects ordering when give `OrderedDict` (GH3303)
- `DataFrame` where with a datetimelike incorrectly selecting (GH3311)
- Ensure index casts work even in `Int64Index`
- Fix `set_index` segfault when passing `MultiIndex` (GH3308)
- Ensure pickles created in py2 can be read in py3
- Insert ellipsis in `MultiIndex` summary repr (GH3348)
- `Groupby` will handle mutation among an input groups columns (and fallback to non-fast apply) (GH3380)
- Eliminated unicode errors on FreeBSD when using MPL GTK backend (GH3360)
- `Period.strftime` should return unicode strings always (GH3363)
- Respect passed `read_*` chunksize in `get_chunk` function (GH3406)

## 38.27 pandas 0.10.1

**Release date:** 2013-01-22

### 38.27.1 New Features

- Add data interface to World Bank WDI `pandas.io.wb` (GH2592)

### 38.27.2 API Changes

- Restored `inplace=True` behavior returning self (same object) with deprecation warning until 0.11 (GH1893)
- `HDFStore`
  - refactored `HDFStore` to deal with non-table stores as objects, will allow future enhancements
  - removed keyword `compression` from `put` (replaced by keyword `complib` to be consistent across library)
  - warn *PerformanceWarning* if you are attempting to store types that will be pickled by `PyTables`

### 38.27.3 Improvements to existing features

- `HDFStore`
  - enables storing of multi-index dataframes (closes GH1277)
  - support data column indexing and selection, via `data_columns` keyword in `append`
  - support write chunking to reduce memory footprint, via `chunksize` keyword to `append`
  - support automagic indexing via `index` keyword to `append`

- support `expectedrows` keyword in `append` to inform `PyTables` about the expected tablesize
- support `start` and `stop` keywords in `select` to limit the row selection space
- added `get_store` context manager to automatically import with `pandas`
- added column filtering via `columns` keyword in `select`
- added methods `append_to_multiple/select_as_multiple/select_as_coordinates` to do multiple-table `append`/`selection`
- added support for `datetime64` in `columns`
- added method `unique` to select the unique values in an indexable or data column
- added method `copy` to copy an existing store (and possibly upgrade)
- show the shape of the data on disk for non-table stores when printing the store
- added ability to read `PyTables` flavor tables (allows compatibility to other `HDF5` systems)
- Add `logx` option to `DataFrame/Series.plot` ([GH2327](#), [GH2565](#))
- Support reading gzipped data from file-like object
- `pivot_table` `aggfunc` can be anything used in `GroupBy.aggregate` ([GH2643](#))
- Implement `DataFrame` merges in case where set cardinalities might overflow 64-bit integer ([GH2690](#))
- Raise exception in C file parser if integer dtype specified and have NA values. ([GH2631](#))
- Attempt to parse ISO8601 format dates when `parse_dates=True` in `read_csv` for major performance boost in such cases ([GH2698](#))
- Add methods `neg` and `inv` to `Series`
- Implement `kind` option in `ExcelFile` to indicate whether it's an XLS or XLSX file ([GH2613](#))
- Documented a fast-path in `pd.read_csv` when parsing iso8601 datetime strings yielding as much as a 20x speedup. ([GH5993](#))

### 38.27.4 Bug Fixes

- Fix `read_csv/read_table` multithreading issues ([GH2608](#))
- `HDFStore`
  - correctly handle `nan` elements in string columns; serialize via the `nan_rep` keyword to `append`
  - raise correctly on non-implemented column types (unicode/date)
  - handle correctly `Term` passed types (e.g. `index<1000`, when `index` is `Int64`), (closes [GH512](#))
  - handle `Timestamp` correctly in `data_columns` (closes [GH2637](#))
  - contains correctly matches on non-natural names
  - correctly store `float32` dtypes in tables (if not other float types in the same table)
- Fix `DataFrame.info` bug with UTF8-encoded columns. ([GH2576](#))
- Fix `DatetimeIndex` handling of `FixedOffset` tz ([GH2604](#))
- More robust detection of being in IPython session for wide `DataFrame` console formatting ([GH2585](#))
- Fix platform issues with `file:///` in unit test ([GH2564](#))
- Fix bug and possible segfault when grouping by hierarchical level that contains NA values ([GH2616](#))

- Ensure that MultiIndex tuples can be constructed with NAs ([GH2616](#))
- Fix int64 overflow issue when unstacking MultiIndex with many levels ([GH2616](#))
- Exclude non-numeric data from DataFrame.quantile by default ([GH2625](#))
- Fix a Cython C int64 boxing issue causing read\_csv to return incorrect results ([GH2599](#))
- Fix groupby summing performance issue on boolean data ([GH2692](#))
- Don't bork Series containing datetime64 values with to\_datetime ([GH2699](#))
- Fix DataFrame.from\_records corner case when passed columns, index column, but empty record list ([GH2633](#))
- Fix C parser-tokenizer bug with trailing fields. ([GH2668](#))
- Don't exclude non-numeric data from GroupBy.max/min ([GH2700](#))
- Don't lose time zone when calling DatetimeIndex.drop ([GH2621](#))
- Fix setitem on a Series with a boolean key and a non-scalar as value ([GH2686](#))
- Box datetime64 values in Series.apply/map ([GH2627](#), [GH2689](#))
- Upconvert datetime + datetime64 values when concatenating frames ([GH2624](#))
- Raise a more helpful error message in merge operations when one DataFrame has duplicate columns ([GH2649](#))
- Fix partial date parsing issue occurring only when code is run at EOM ([GH2618](#))
- Prevent MemoryError when using counting sort in sortlevel with high-cardinality MultiIndex objects ([GH2684](#))
- Fix Period resampling bug when all values fall into a single bin ([GH2070](#))
- Fix buggy interaction with usecols argument in read\_csv when there is an implicit first index column ([GH2654](#))
- Fix bug in Index.summary() where string format methods were being called incorrectly. ([GH3869](#))

## 38.28 pandas 0.10.0

**Release date:** 2012-12-17

### 38.28.1 New Features

- Brand new high-performance delimited file parsing engine written in C and Cython. 50% or better performance in many standard use cases with a fraction as much memory usage. ([GH407](#), [GH821](#))
- Many new file parser (read\_csv, read\_table) features:
  - Support for on-the-fly gzip or bz2 decompression (*compression* option)
  - Ability to get back numpy.recarray instead of DataFrame (*as\_reccarray=True*)
  - *dtype* option: explicit column dtypes
  - *usecols* option: specify list of columns to be read from a file. Good for reading very wide files with many irrelevant columns ([GH1216](#) [GH926](#), [GH2465](#))
  - Enhanced unicode decoding support via *encoding* option
  - *skipinitialspace* dialect option
  - Can specify strings to be recognized as True (*true\_values*) or False (*false\_values*)

- High-performance *delim\_whitespace* option for whitespace-delimited files; a preferred alternative to the 's+' regular expression delimiter
- Option to skip “bad” lines (wrong number of fields) that would otherwise have caused an error in the past (*error\_bad\_lines* and *warn\_bad\_lines* options)
- Substantially improved performance in the parsing of integers with thousands markers and lines with comments
- Easy of European (and other) decimal formats (*decimal* option) (GH584, GH2466)
- Custom line terminators (e.g. *lineterminator*='~') (GH2457)
- Handling of no trailing commas in CSV files (GH2333)
- Ability to handle fractional seconds in *date\_converters* (GH2209)
- *read\_csv* allow scalar arg to *na\_values* (GH1944)
- Explicit column dtype specification in *read\_\** functions (GH1858)
- Easier CSV dialect specification (GH1743)
- Improve parser performance when handling special characters (GH1204)
- Google Analytics API integration with easy oauth2 workflow (GH2283)
- Add error handling to *Series.str.encode/decode* (GH2276)
- Add *where* and *mask* to *Series* (GH2337)
- Grouped histogram via *by* keyword in *Series/DataFrame.hist* (GH2186)
- Support optional *min\_periods* keyword in *corr* and *cov* for both *Series* and *DataFrame* (GH2002)
- Add *duplicated* and *drop\_duplicates* functions to *Series* (GH1923)
- Add docs for *HDFStore table* format
- ‘density’ property in *SparseSeries* (GH2384)
- Add *ffill* and *bfill* convenience functions for forward- and backfilling time series data (GH2284)
- New option configuration system and functions *set\_option*, *get\_option*, *describe\_option*, and *reset\_option*. Deprecate *set\_printoptions* and *reset\_printoptions* (GH2393). You can also access options as attributes via *pandas.options.X*
- Wide *DataFrames* can be viewed more easily in the console with new *expand\_frame\_repr* and *line\_width* configuration options. This is on by default now (GH2436)
- Scikits.timeseries-like moving window functions via *rolling\_window* (GH1270)

### 38.28.2 Experimental Features

- Add support for *Panel4D*, a named 4 Dimensional structure
- Add support for *ndpanel* factory functions, to create custom, domain-specific N-Dimensional containers

### 38.28.3 API Changes

- The default binning/labeling behavior for *resample* has been changed to *closed*='left', *label*='left' for daily and lower frequencies. This had been a large source of confusion for users. See “what’s new” page for more on this. (GH2410)

- Methods with `inplace` option now return `None` instead of the calling (modified) object ([GH1893](#))
- The special case `DataFrame - TimeSeries` doing column-by-column broadcasting has been deprecated. Users should explicitly do e.g. `df.sub(ts, axis=0)` instead. This is a legacy hack and can lead to subtle bugs.
- `inf/-inf` are no longer considered as NA by `isnull/notnull`. To be clear, this is legacy cruft from early pandas. This behavior can be globally re-enabled using the new option `mode.use_inf_as_null` ([GH2050](#), [GH1919](#))
- `pandas.merge` will now default to `sort=False`. For many use cases sorting the join keys is not necessary, and doing it by default is wasteful
- Specify `header=0` explicitly to replace existing column names in file in `read_*` functions.
- Default column names for header-less parsed files (yielded by `read_csv`, etc.) are now the integers `0, 1, ...`. A new argument `prefix` has been added; to get the v0.9.x behavior specify `prefix='X'` ([GH2034](#)). This API change was made to make the default column names more consistent with the `DataFrame` constructor's default column names when none are specified.
- `DataFrame` selection using a boolean frame now preserves input shape
- If function passed to `Series.apply` yields a `Series`, result will be a `DataFrame` ([GH2316](#))
- Values like YES/NO/yes/no will not be considered as boolean by default any longer in the file parsers. This can be customized using the new `true_values` and `false_values` options ([GH2360](#))
- `obj.fillna()` is no longer valid; make `method='pad'` no longer the default option, to be more explicit about what kind of filling to perform. Add `ffill/bfill` convenience functions per above ([GH2284](#))
- `HDFStore.keys()` now returns an absolute path-name for each key
- `to_string()` now always returns a unicode string. ([GH2224](#))
- File parsers will not handle NA sentinel values arising from passed converter functions

### 38.28.4 Improvements to existing features

- Add `nrows` option to `DataFrame.from_records` for iterators ([GH1794](#))
- Unstack/reshape algorithm rewrite to avoid high memory use in cases where the number of observed key-tuples is much smaller than the total possible number that could occur ([GH2278](#)). Also improves performance in most cases.
- Support duplicate columns in `DataFrame.from_records` ([GH2179](#))
- Add `normalize` option to `Series/DataFrame.asfreq` ([GH2137](#))
- `SparseSeries` and `SparseDataFrame` construction from empty and scalar values now no longer create dense `ndarrays` unnecessarily ([GH2322](#))
- `HDFStore` now supports hierarchical keys ([GH2397](#))
- Support multiple query selection formats for `HDFStore` tables ([GH1996](#))
- Support `del store['df']` syntax to delete `HDFStores`
- Add multi-dtype support for `HDFStore` tables
- `min_itemsize` parameter can be specified in `HDFStore` table creation
- Indexing support in `HDFStore` tables ([GH698](#))
- Add `line_terminator` option to `DataFrame.to_csv` ([GH2383](#))
- added implementation of `str(x)/unicode(x)/bytes(x)` to major pandas data structures, which should do the right thing on both `py2.x` and `py3.x`. ([GH2224](#))

- Reduce `groupby.apply` overhead substantially by low-level manipulation of internal NumPy arrays in DataFrames (GH535)
- Implement `value_vars` in `melt` and add `melt` to pandas namespace (GH2412)
- Added boolean comparison operators to Panel
- Enable `Series.str.strip/lstrip/rstrip` methods to take an argument (GH2411)
- The DataFrame ctor now respects column ordering when given an `OrderedDict` (GH2455)
- Assigning `DatetimeIndex` to `Series` changes the class to `TimeSeries` (GH2139)
- Improve performance of `.value_counts` method on non-integer data (GH2480)
- `get_level_values` method for `MultiIndex` return `Index` instead of `ndarray` (GH2449)
- `convert_to_r_dataframe` conversion for datetime values (GH2351)
- Allow `DataFrame.to_csv` to represent `inf` and `nan` differently (GH2026)
- Add `min_i` argument to `nancorr` to specify minimum required observations (GH2002)
- Add `inplace` option to `sortlevel / sort` functions on DataFrame (GH1873)
- Enable DataFrame to accept scalar constructor values like `Series` (GH1856)
- `DataFrame.from_records` now takes optional `size` parameter (GH1794)
- include iris dataset (GH1709)
- No `datetime64` DataFrame column conversion of `datetime.datetime` with `tzinfo` (GH1581)
- Micro-optimizations in DataFrame for tracking state of internal consolidation (GH217)
- Format parameter in `DataFrame.to_csv` (GH1525)
- Partial string slicing for `DatetimeIndex` for daily and higher frequencies (GH2306)
- Implement `col_space` parameter in `to_html` and `to_string` in DataFrame (GH1000)
- Override `Series.tolist` and box `datetime64` types (GH2447)
- Optimize `unstack` memory usage by compressing indices (GH2278)
- Fix HTML repr in IPython qtconsole if opening window is small (GH2275)
- Escape more special characters in console output (GH2492)
- `df.select` now invokes `bool` on the result of `crit(x)` (GH2487)

### 38.28.5 Bug Fixes

- Fix major performance regression in `DataFrame.iteritems` (GH2273)
- Fixes bug when negative period passed to `Series/DataFrame.diff` (GH2266)
- Escape tabs in console output to avoid alignment issues (GH2038)
- Properly box `datetime64` values when retrieving cross-section from mixed-dtype DataFrame (GH2272)
- Fix concatenation bug leading to GH2057, GH2257
- Fix regression in `Index` console formatting (GH2319)
- Box `Period` data when assigning `PeriodIndex` to frame column (GH2243, GH2281)
- Raise exception on calling `reset_index` on `Series` with `inplace=True` (GH2277)

- Enable setting multiple columns in DataFrame with hierarchical columns (GH2295)
- Respect dtype=object in DataFrame constructor (GH2291)
- Fix DatetimeIndex.join bug with tz-aware indexes and how='outer' (GH2317)
- pop(...) and del works with DataFrame with duplicate columns (GH2349)
- Treat empty strings as NA in date parsing (rather than let dateutil do something weird) (GH2263)
- Prevent uint64 -> int64 overflows (GH2355)
- Enable joins between MultiIndex and regular Index (GH2024)
- Fix time zone metadata issue when unioning non-overlapping DatetimeIndex objects (GH2367)
- Raise/handle int64 overflows in parsers (GH2247)
- Deleting of consecutive rows in HDFStore tables` is much faster than before
- Appending on a HDFStore would fail if the table was not first created via put
- Use col\_space argument as minimum column width in DataFrame.to\_html (GH2328)
- Fix tz-aware DatetimeIndex.to\_period (GH2232)
- Fix DataFrame row indexing case with MultiIndex (GH2314)
- Fix to\_excel exporting issues with Timestamp objects in index (GH2294)
- Fixes assigning scalars and array to hierarchical column chunk (GH1803)
- Fixed a UnicodeDecodeError with series tidy\_repr (GH2225)
- Fixed issued with duplicate keys in an index (GH2347, GH2380)
- Fixed issues re: Hash randomization, default on starting w/ py3.3 (GH2331)
- Fixed issue with missing attributes after loading a pickled dataframe (GH2431)
- Fix Timestamp formatting with tzoffset time zone in dateutil 2.1 (GH2443)
- Fix GroupBy.apply issue when using BinGrouper to do ts binning (GH2300)
- Fix issues resulting from datetime.datetime columns being converted to datetime64 when calling DataFrame.apply. (GH2374)
- Raise exception when calling to\_panel on non uniquely-indexed frame (GH2441)
- Improved detection of console encoding on IPython zmq frontends (GH2458)
- Preserve time zone when .append-ing two time series (GH2260)
- Box timestamps when calling reset\_index on time-zone-aware index rather than creating a tz-less datetime64 column (GH2262)
- Enable searching non-string columns in DataFrame.filter(like=...) (GH2467)
- Fixed issue with losing nanosecond precision upon conversion to DatetimeIndex (GH2252)
- Handle timezones in Datetime.normalize (GH2338)
- Fix test case where dtype specification with endianness causes failures on big endian machines (GH2318)
- Fix plotting bug where upsampling causes data to appear shifted in time (GH2448)
- Fix read\_csv failure for UTF-16 with BOM and skiprows (GH2298)
- read\_csv with names arg not implicitly setting header=None (GH2459)
- Unrecognized compression mode causes segfault in read\_csv (GH2474)

- In `read_csv`, `header=0` and passed names should discard first row (GH2269)
- Correctly route to `stdout/stderr` in `read_table` (GH2071)
- Fix exception when `Timestamp.to_datetime` is called on a `Timestamp` with `tzoffset` (GH2471)
- Fixed unintentional conversion of `datetime64` to `long` in `groupby.first()` (GH2133)
- Union of empty `DataFrames` now return empty with concatenated index (GH2307)
- `DataFrame.sort_index` raises more helpful exception if sorting by column with duplicates (GH2488)
- `DataFrame.to_string` formatters can be list, too (GH2520)
- `DataFrame.combine_first` will always result in the union of the index and columns, even if one `DataFrame` is length-zero (GH2525)
- Fix several `DataFrame.icol/irow` with duplicate indices issues (GH2228, GH2259)
- Use `Series` names for column names when using `concat` with `axis=1` (GH2489)
- Raise `Exception` if `start`, `end`, `periods` all passed to `date_range` (GH2538)
- Fix `Panel` resampling issue (GH2537)

## 38.29 pandas 0.9.1

**Release date:** 2012-11-14

### 38.29.1 New Features

- Can specify multiple sort orders in `DataFrame/Series.sort/sort_index` (GH928)
- New *top* and *bottom* options for handling NAs in `rank` (GH1508, GH2159)
- Add *where* and *mask* functions to `DataFrame` (GH2109, GH2151)
- Add *at\_time* and *between\_time* functions to `DataFrame` (GH2149)
- Add flexible *pow* and *rpow* methods to `DataFrame` (GH2190)

### 38.29.2 API Changes

- Upsampling period index “spans” intervals. Example: annual periods upsampled to monthly will span all months in each year
- `Period.end_time` will yield timestamp at last nanosecond in the interval (GH2124, GH2125, GH1764)
- File parsers no longer coerce to float or bool for columns that have custom converters specified (GH2184)

### 38.29.3 Improvements to existing features

- Time rule inference for week-of-month (e.g. WOM-2FRI) rules (GH2140)
- Improve performance of `datetime` + business day offset with large number of offset periods
- Improve HTML display of `DataFrame` objects with hierarchical columns
- Enable referencing of Excel columns by their column names (GH1936)

- `DataFrame.dot` can accept `ndarrays` (GH2042)
- Support negative periods in `Panel.shift` (GH2164)
- Make `.drop(...)` work with non-unique indexes (GH2101)
- Improve performance of `Series/DataFrame.diff` (re: GH2087)
- Support unary `~` (`__invert__`) in `DataFrame` (GH2110)
- Turn off pandas-style tick locators and formatters (GH2205)
- `DataFrame[DataFrame]` uses `DataFrame.where` to compute masked frame (GH2230)

### 38.29.4 Bug Fixes

- Fix some duplicate-column `DataFrame` constructor issues (GH2079)
- Fix bar plot color cycle issues (GH2082)
- Fix off-center grid for stacked bar plots (GH2157)
- Fix plotting bug if inferred frequency is offset with  $N > 1$  (GH2126)
- Implement comparisons on date offsets with fixed delta (GH2078)
- Handle `inf/-inf` correctly in `read_*` parser functions (GH2041)
- Fix matplotlib unicode interaction bug
- Make WLS r-squared match statsmodels 0.5.0 fixed value
- Fix zero-trimming `DataFrame` formatting bug
- Correctly compute/box `datetime64` min/max values from `Series.min/max` (GH2083)
- Fix unstacking edge case with unrepresented groups (GH2100)
- Fix `Series.str` failures when using pipe pattern `'|'` (GH2119)
- Fix pretty-printing of dict entries in `Series`, `DataFrame` (GH2144)
- Cast other `datetime64` values to nanoseconds in `DataFrame` ctor (GH2095)
- Alias `Timestamp.astimezone` to `tz_convert`, so will yield `Timestamp` (GH2060)
- Fix `timedelta64` formatting from `Series` (GH2165, GH2146)
- Handle `None` values gracefully in dict passed to `Panel` constructor (GH2075)
- Box `datetime64` values as `Timestamp` objects in `Series/DataFrame.i`get (GH2148)
- Fix `Timestamp` indexing bug in `DatetimeIndex.insert` (GH2155)
- Use index name(s) (if any) in `DataFrame.to_records` (GH2161)
- Don't lose index names in `Panel.to_frame/DataFrame.to_panel` (GH2163)
- Work around length-0 boolean indexing NumPy bug (GH2096)
- Fix partial integer indexing bug in `DataFrame.xs` (GH2107)
- Fix variety of `cut/qcut` string-bin formatting bugs (GH1978, GH1979)
- Raise `Exception` when `xs` view not possible of `MultiIndex'd DataFrame` (GH2117)
- Fix `groupby(...).first()` issue with `datetime64` (GH2133)
- Better floating point error robustness in some `rolling_*` functions (GH2114, GH2527)

- Fix ewma NA handling in the middle of Series (GH2128)
- Fix numerical precision issues in diff with integer data (GH2087)
- Fix bug in MultiIndex.\_\_getitem\_\_ with NA values (GH2008)
- Fix DataFrame.from\_records dict-arg bug when passing columns (GH2179)
- Fix Series and DataFrame.diff for integer dtypes (GH2087, GH2174)
- Fix bug when taking intersection of DatetimeIndex with empty index (GH2129)
- Pass through timezone information when calling DataFrame.align (GH2127)
- Properly sort when joining on datetime64 values (GH2196)
- Fix indexing bug in which False/True were being coerced to 0/1 (GH2199)
- Many unicode formatting fixes (GH2201)
- Fix improper MultiIndex conversion issue when assigning e.g. DataFrame.index (GH2200)
- Fix conversion of mixed-type DataFrame to ndarray with dup columns (GH2236)
- Fix duplicate columns issue (GH2218, GH2219)
- Fix SparseSeries.\_\_pow\_\_ issue with NA input (GH2220)
- Fix icol with integer sequence failure (GH2228)
- Fixed resampling tz-aware time series issue (GH2245)
- SparseDataFrame.icol was not returning SparseSeries (GH2227, GH2229)
- Enable ExcelWriter to handle PeriodIndex (GH2240)
- Fix issue constructing DataFrame from empty Series with name (GH2234)
- Use console-width detection in interactive sessions only (GH1610)
- Fix parallel\_coordinates legend bug with mpl 1.2.0 (GH2237)
- Make tz\_localize work in corner case of empty Series (GH2248)

## 38.30 pandas 0.9.0

**Release date:** 10/7/2012

### 38.30.1 New Features

- Add `str.encode` and `str.decode` to Series (GH1706)
- Add `to_latex` method to DataFrame (GH1735)
- Add convenient expanding window equivalents of all rolling\_\* ops (GH1785)
- Add Options class to pandas.io.data for fetching options data from Yahoo! Finance (GH1748, GH1739)
- Recognize and convert more boolean values in file parsing (Yes, No, TRUE, FALSE, variants thereof) (GH1691, GH1295)
- Add Panel.update method, analogous to DataFrame.update (GH1999, GH1988)

### 38.30.2 Improvements to existing features

- Proper handling of NA values in merge operations ([GH1990](#))
- Add `flags` option for `re.compile` in some `Series.str` methods ([GH1659](#))
- Parsing of UTC date strings in `read_*` functions ([GH1693](#))
- Handle generator input to `Series` ([GH1679](#))
- Add `na_action='ignore'` to `Series.map` to quietly propagate NAs ([GH1661](#))
- Add `args/kwds` options to `Series.apply` ([GH1829](#))
- Add `inplace` option to `Series/DataFrame.reset_index` ([GH1797](#))
- Add `level` parameter to `Series.reset_index`
- Add quoting option for `DataFrame.to_csv` ([GH1902](#))
- Indicate long column value truncation in `DataFrame` output with `...` ([GH1854](#))
- `DataFrame.dot` will not do data alignment, and also work with `Series` ([GH1915](#))
- Add `na` option for missing data handling in some vectorized string methods ([GH1689](#))
- If `index_label=False` in `DataFrame.to_csv`, do not print fields/commas in the text output. Results in easier importing into R ([GH1583](#))
- Can pass tuple/list of axes to `DataFrame.dropna` to simplify repeated calls (dropping both columns and rows) ([GH924](#))
- Improve `DataFrame.to_html` output for hierarchically-indexed rows (do not repeat levels) ([GH1929](#))
- `TimeSeries.between_time` can now select times across midnight ([GH1871](#))
- Enable `skip_footer` parameter in `ExcelFile.parse` ([GH1843](#))

### 38.30.3 API Changes

- Change default header names in `read_*` functions to more Pythonic `X0`, `X1`, etc. instead of `X.1`, `X.2`. ([GH2000](#))
- Deprecated `day_of_year` API removed from `PeriodIndex`, use `dayofyear` ([GH1723](#))
- Don't modify NumPy suppress printoption at import time
- The internal HDF5 data arrangement for `DataFrames` has been transposed. Legacy files will still be readable by `HDFStore` ([GH1834](#), [GH1824](#))
- Legacy cruft removed: `pandas.stats.misc.quantileTS`
- Use ISO8601 format for `Period` repr: monthly, daily, and on down ([GH1776](#))
- Empty `DataFrame` columns are now created as object dtype. This will prevent a class of `TypeError`s that was occurring in code where the dtype of a column would depend on the presence of data or not (e.g. a SQL query having results) ([GH1783](#))
- Setting parts of `DataFrame/Panel` using `ix` now aligns input `Series/DataFrame` ([GH1630](#))
- `first` and `last` methods in `GroupBy` no longer drop non-numeric columns ([GH1809](#))
- Resolved inconsistencies in specifying custom NA values in text parser. `na_values` of type dict no longer override default NAs unless `keep_default_na` is set to false explicitly ([GH1657](#))
- Enable `skipfooter` parameter in text parsers as an alias for `skip_footer`

### 38.30.4 Bug Fixes

- Perform arithmetic column-by-column in mixed-type DataFrame to avoid type upcasting issues. Caused downstream DataFrame.diff bug (GH1896)
- Fix matplotlib auto-color assignment when no custom spectrum passed. Also respect passed color keyword argument (GH1711)
- Fix resampling logical error with closed='left' (GH1726)
- Fix critical DatetimeIndex.union bugs (GH1730, GH1719, GH1745, GH1702, GH1753)
- Fix critical DatetimeIndex.intersection bug with unanchored offsets (GH1708)
- Fix MM-YYYY time series indexing case (GH1672)
- Fix case where Categorical group key was not being passed into index in GroupBy result (GH1701)
- Handle Ellipsis in Series.\_\_getitem\_\_/\_setitem\_\_ (GH1721)
- Fix some bugs with handling datetime64 scalars of other units in NumPy 1.6 and 1.7 (GH1717)
- Fix performance issue in MultiIndex.format (GH1746)
- Fixed GroupBy bugs interacting with DatetimeIndex asof / map methods (GH1677)
- Handle factors with NAs in pandas.rpy (GH1615)
- Fix statsmodels import in pandas.stats.var (GH1734)
- Fix DataFrame repr/info summary with non-unique columns (GH1700)
- Fix Series.iget\_value for non-unique indexes (GH1694)
- Don't lose tzinfo when passing DatetimeIndex as DataFrame column (GH1682)
- Fix tz conversion with time zones that haven't had any DST transitions since first date in the array (GH1673)
- Fix field access with UTC->local conversion on unsorted arrays (GH1756)
- Fix isnull handling of array-like (list) inputs (GH1755)
- Fix regression in handling of Series in Series constructor (GH1671)
- Fix comparison of Int64Index with DatetimeIndex (GH1681)
- Fix min\_periods handling in new rolling\_max/min at array start (GH1695)
- Fix errors with how='median' and generic NumPy resampling in some cases caused by SeriesBinGrouper (GH1648, GH1688)
- When grouping by level, exclude unobserved levels (GH1697)
- Don't lose tzinfo in DatetimeIndex when shifting by different offset (GH1683)
- Hack to support storing data with a zero-length axis in HDFStore (GH1707)
- Fix DatetimeIndex tz-aware range generation issue (GH1674)
- Fix method='time' interpolation with intraday data (GH1698)
- Don't plot all-NA DataFrame columns as zeros (GH1696)
- Fix bug in scatter\_plot with by option (GH1716)
- Fix performance problem in infer\_freq with lots of non-unique stamps (GH1686)
- Fix handling of PeriodIndex as argument to create MultiIndex (GH1705)
- Fix re: unicode MultiIndex level names in Series/DataFrame repr (GH1736)

- Handle PeriodIndex in to\_datetime instance method ([GH1703](#))
- Support StaticTzInfo in DatetimeIndex infrastructure ([GH1692](#))
- Allow MultiIndex setops with length-0 other type indexes ([GH1727](#))
- Fix handling of DatetimeIndex in DataFrame.to\_records ([GH1720](#))
- Fix handling of general objects in isnull on which bool(...) fails ([GH1749](#))
- Fix .ix indexing with MultiIndex ambiguity ([GH1678](#))
- Fix .ix setting logic error with non-unique MultiIndex ([GH1750](#))
- Basic indexing now works on MultiIndex with > 1000000 elements, regression from earlier version of pandas ([GH1757](#))
- Handle non-float64 dtypes in fast DataFrame.corr/cov code paths ([GH1761](#))
- Fix DatetimeIndex.isin to function properly ([GH1763](#))
- Fix conversion of array of tz-aware datetime.datetime to DatetimeIndex with right time zone ([GH1777](#))
- Fix DST issues with generating anchored date ranges ([GH1778](#))
- Fix issue calling sort on result of Series.unique ([GH1807](#))
- Fix numerical issue leading to square root of negative number in rolling\_std ([GH1840](#))
- Let Series.str.split accept no arguments (like str.split) ([GH1859](#))
- Allow user to have dateutil 2.1 installed on a Python 2 system ([GH1851](#))
- Catch ImportError less aggressively in pandas/\_\_init\_\_.py ([GH1845](#))
- Fix pip source installation bug when installing from GitHub ([GH1805](#))
- Fix error when window size > array size in rolling\_apply ([GH1850](#))
- Fix pip source installation issues via SSH from GitHub
- Fix OLS.summary when column is a tuple ([GH1837](#))
- Fix bug in \_\_doc\_\_ patching when -OO passed to interpreter ([GH1792](#) [GH1741](#) [GH1774](#))
- Fix unicode console encoding issue in IPython notebook ([GH1782](#), [GH1768](#))
- Fix unicode formatting issue with Series.name ([GH1782](#))
- Fix bug in DataFrame.duplicated with datetime64 columns ([GH1833](#))
- Fix bug in Panel internals resulting in error when doing fillna after truncate not changing size of panel ([GH1823](#))
- Prevent segfault due to MultiIndex not being supported in HDFStore table format ([GH1848](#))
- Fix UnboundLocalError in Panel.\_\_setitem\_\_ and add better error ([GH1826](#))
- Fix to\_csv issues with list of string entries. Isnull works on list of strings now too ([GH1791](#))
- Fix Timestamp comparisons with datetime values outside the nanosecond range (1677-2262)
- Revert to prior behavior of normalize\_date with datetime.date objects (return datetime)
- Fix broken interaction between np.nansum and Series.any/all
- Fix bug with multiple column date parsers ([GH1866](#))
- DatetimeIndex.union(Int64Index) was broken
- Make plot x vs y interface consistent with integer indexing ([GH1842](#))

- `set_index` inplace modified data even if unique check fails (GH1831)
- Only use Q-OCT/NOV/DEC in quarterly frequency inference (GH1789)
- Upcast to `dtype=object` when unstacking boolean DataFrame (GH1820)
- Fix float64/float32 merging bug (GH1849)
- Fixes to `Period.start_time` for non-daily frequencies (GH1857)
- Fix failure when converter used on `index_col` in `read_csv` (GH1835)
- Implement `PeriodIndex.append` so that `pandas.concat` works correctly (GH1815)
- Avoid Cython out-of-bounds access causing segfault sometimes in `pad_2d`, `backfill_2d`
- Fix resampling error with intraday times and anchored target time (like AS-DEC) (GH1772)
- Fix `.ix` indexing bugs with mixed-integer indexes (GH1799)
- Respect passed `color` keyword argument in `Series.plot` (GH1890)
- Fix `rolling_min/max` when the window is larger than the size of the input array. Check other malformed inputs (GH1899, GH1897)
- Rolling variance / standard deviation with only a single observation in window (GH1884)
- Fix unicode sheet name failure in `to_excel` (GH1828)
- Override `DatetimeIndex.min/max` to return Timestamp objects (GH1895)
- Fix column name formatting issue in length-truncated column (GH1906)
- Fix broken handling of copying Index metadata to new instances created by `view(...)` calls inside the NumPy infrastructure
- Support `datetime.date` again in `DateOffset.rollback/rollforward`
- Raise Exception if `set` passed to `Series` constructor (GH1913)
- Add `TypeError` when appending `HDFStore` table w/ wrong index type (GH1881)
- Don't raise exception on empty inputs in EW functions (e.g. `ewma`) (GH1900)
- Make `asof` work correctly with `PeriodIndex` (GH1883)
- Fix extlinks in doc build
- Fill boolean DataFrame with NaN when calling `shift` (GH1814)
- Fix `setuptools` bug causing `pip` not to Cythonize `.pyx` files sometimes
- Fix negative integer indexing regression in `.ix` from 0.7.x (GH1888)
- Fix error while retrieving timezone and utc offset from subclasses of `datetime.tzinfo` without `.zone` and `._utcoffset` attributes (GH1922)
- Fix DataFrame formatting of small, non-zero FP numbers (GH1911)
- Various fixes by upcasting of `date` -> `datetime` (GH1395)
- Raise better exception when passing multiple functions with the same name, such as lambdas, to `GroupBy.aggregate`
- Fix DataFrame `apply` with `axis=1` on a non-unique index (GH1878)
- Proper handling of Index subclasses in `pandas.unique` (GH1759)
- Set index names in `DataFrame.from_records` (GH1744)

- Fix time series indexing error with duplicates, under and over hash table size cutoff ([GH1821](#))
- Handle list keys in addition to tuples in `DataFrame.xs` when partial-indexing a hierarchically-indexed `DataFrame` ([GH1796](#))
- Support multiple column selection in `DataFrame.__getitem__` with duplicate columns ([GH1943](#))
- Fix time zone localization bug causing improper fields (e.g. hours) in time zones that have not had a UTC transition in a long time ([GH1946](#))
- Fix errors when parsing and working with fixed offset timezones ([GH1922](#), [GH1928](#))
- Fix text parser bug when handling UTC datetime objects generated by `dateutil` ([GH1693](#))
- Fix plotting bug when 'B' is the inferred frequency but index actually contains weekends ([GH1668](#), [GH1669](#))
- Fix plot styling bugs ([GH1666](#), [GH1665](#), [GH1658](#))
- Fix plotting bug with index/columns with unicode ([GH1685](#))
- Fix `DataFrame` constructor bug when passed `Series` with `datetime64` dtype in a dict ([GH1680](#))
- Fixed regression in generating `DatetimeIndex` using timezone aware `datetime.datetime` ([GH1676](#))
- Fix `DataFrame` bug when printing concatenated `DataFrames` with duplicated columns ([GH1675](#))
- Fixed bug when plotting time series with multiple intraday frequencies ([GH1732](#))
- Fix bug in `DataFrame.duplicated` to enable iterables other than list-types as input argument ([GH1773](#))
- Fix resample bug when passed list of lambdas as *how* argument ([GH1808](#))
- Repr fix for `MultiIndex` level with all NAs ([GH1971](#))
- Fix `PeriodIndex` slicing bug when slice start/end are out-of-bounds ([GH1977](#))
- Fix `read_table` bug when parsing unicode ([GH1975](#))
- Fix `BlockManager.iget` bug when dealing with non-unique `MultiIndex` as columns ([GH1970](#))
- Fix `reset_index` bug if both `drop` and `level` are specified ([GH1957](#))
- Work around unsafe NumPy object->int casting with Cython function ([GH1987](#))
- Fix `datetime64` formatting bug in `DataFrame.to_csv` ([GH1993](#))
- Default start date in `pandas.io.data` to 1/1/2000 as the docs say ([GH2011](#))

## 38.31 pandas 0.8.1

**Release date:** July 22, 2012

### 38.31.1 New Features

- Add vectorized, NA-friendly string methods to `Series` ([GH1621](#), [GH620](#))
- Can pass dict of per-column line styles to `DataFrame.plot` ([GH1559](#))
- Selective plotting to secondary y-axis on same subplot ([GH1640](#))
- Add new `bootstrap_plot` plot function
- Add new `parallel_coordinates` plot function ([GH1488](#))
- Add `radviz` plot function ([GH1566](#))

- Add `multi_sparse` option to `set_printoptions` to modify display of hierarchical indexes (GH1538)
- Add `dropna` method to Panel (GH171)

### 38.31.2 Improvements to existing features

- Use moving min/max algorithms from Bottleneck in `rolling_min/rolling_max` for > 100x speedup. (GH1504, GH50)
- Add Cython group median method for >15x speedup (GH1358)
- Drastically improve `to_datetime` performance on ISO8601 datetime strings (with no time zones) (GH1571)
- Improve single-key groupby performance on large data sets, accelerate use of groupby with a Categorical variable
- Add ability to append hierarchical index levels with `set_index` and to drop single levels with `reset_index` (GH1569, GH1577)
- Always apply passed functions in `resample`, even if upsampling (GH1596)
- Avoid unnecessary copies in DataFrame constructor with explicit dtype (GH1572)
- Cleaner DatetimeIndex string representation with 1 or 2 elements (GH1611)
- Improve performance of array-of-Period to PeriodIndex, convert such arrays to PeriodIndex inside Index (GH1215)
- More informative string representation for weekly Period objects (GH1503)
- Accelerate 3-axis multi data selection from homogeneous Panel (GH979)
- Add `adjust` option to `ewma` to disable adjustment factor (GH1584)
- Add new matplotlib converters for high frequency time series plotting (GH1599)
- Handling of tz-aware datetime.datetime objects in `to_datetime`; raise Exception unless `utc=True` given (GH1581)

### 38.31.3 Bug Fixes

- Fix NA handling in `DataFrame.to_panel` (GH1582)
- Handle TypeError issues inside `PyObject_RichCompareBool` calls in `khash` (GH1318)
- Fix resampling bug to lower case daily frequency (GH1588)
- Fix kendall/spearman `DataFrame.corr` bug with no overlap (GH1595)
- Fix bug in `DataFrame.set_index` (GH1592)
- Don't ignore axes in boxplot if by specified (GH1565)
- Fix Panel `.ix` indexing with integers bug (GH1603)
- Fix Partial indexing bugs (years, months, ...) with PeriodIndex (GH1601)
- Fix MultiIndex console formatting issue (GH1606)
- Unordered index with duplicates doesn't yield scalar location for single entry (GH1586)
- Fix resampling of tz-aware time series with "anchored" freq (GH1591)
- Fix `DataFrame.rank` error on integer data (GH1589)
- Selection of multiple SparseDataFrame columns by list in `__getitem__` (GH1585)

- Override Index.tolist for compatibility with MultiIndex (GH1576)
- Fix hierarchical summing bug with MultiIndex of length 1 (GH1568)
- Work around numpy.concatenate use/bug in Series.set\_value (GH1561)
- Ensure Series/DataFrame are sorted before resampling (GH1580)
- Fix unhandled IndexError when indexing very large time series (GH1562)
- Fix DatetimeIndex intersection logic error with irregular indexes (GH1551)
- Fix unit test errors on Python 3 (GH1550)
- Fix .ix indexing bugs in duplicate DataFrame index (GH1201)
- Better handle errors with non-existing objects in HDFStore (GH1254)
- Don't copy int64 array data in DatetimeIndex when copy=False (GH1624)
- Fix resampling of conforming periods quarterly to annual (GH1622)
- Don't lose index name on resampling (GH1631)
- Support python-dateutil version 2.1 (GH1637)
- Fix broken scatter\_matrix axis labeling, esp. with time series (GH1625)
- Fix cases where extra keywords weren't being passed on to matplotlib from Series.plot (GH1636)
- Fix BusinessMonthBegin logic for dates before 1st bday of month (GH1645)
- Ensure string alias converted (valid in DatetimeIndex.get\_loc) in DataFrame.xs / \_\_getitem\_\_ (GH1644)
- Fix use of string alias timestamps with tz-aware time series (GH1647)
- Fix Series.max/min and Series.describe on len-0 series (GH1650)
- Handle None values in dict passed to concat (GH1649)
- Fix Series.interpolate with method='values' and DatetimeIndex (GH1646)
- Fix IndexError in left merges on a DataFrame with 0-length (GH1628)
- Fix DataFrame column width display with UTF-8 encoded characters (GH1620)
- Handle case in pandas.io.data.get\_data\_yahoo where Yahoo! returns duplicate dates for most recent business day
- Avoid downsampling when plotting mixed frequencies on the same subplot (GH1619)
- Fix read\_csv bug when reading a single line (GH1553)
- Fix bug in C code causing monthly periods prior to December 1969 to be off (GH1570)

## 38.32 pandas 0.8.0

**Release date:** 6/29/2012

### 38.32.1 New Features

- New unified DatetimeIndex class for nanosecond-level timestamp data
- New Timestamp datetime.datetime subclass with easy time zone conversions, and support for nanoseconds

- New `PeriodIndex` class for timespans, calendar logic, and `Period` scalar object
- High performance resampling of timestamp and period data. New *resample* method of all pandas data structures
- New frequency names plus shortcut string aliases like '15h', '1h30min'
- Time series string indexing shorthand ([GH222](#))
- Add `week`, `dayofyear` array and other timestamp array-valued field accessor functions to `DatetimeIndex`
- Add `GroupBy.prod` optimized aggregation function and 'prod' fast time series conversion method ([GH1018](#))
- Implement robust frequency inference function and *inferred\_freq* attribute on `DatetimeIndex` ([GH391](#))
- New `tz_convert` and `tz_localize` methods in `Series` / `DataFrame`
- Convert `DatetimeIndex`s to UTC if time zones are different in `join`/`setops` ([GH864](#))
- Add `limit` argument for forward/backward filling to `reindex`, `fillna`, etc. ([GH825](#) and others)
- Add support for indexes (dates or otherwise) with duplicates and common sense indexing/selection functionality
- `Series/DataFrame.update` methods, in-place variant of `combine_first` ([GH961](#))
- Add `match` function to API ([GH502](#))
- Add Cython-optimized `first`, `last`, `min`, `max`, `prod` functions to `GroupBy` ([GH994](#), [GH1043](#))
- Dates can be split across multiple columns ([GH1227](#), [GH1186](#))
- Add experimental support for converting pandas `DataFrame` to R `data.frame` via `rpy2` ([GH350](#), [GH1212](#))
- Can pass list of (name, function) to `GroupBy.aggregate` to get aggregates in a particular order ([GH610](#))
- Can pass dicts with lists of functions or dicts to `GroupBy.aggregate` to do much more flexible multiple function aggregation ([GH642](#), [GH610](#))
- New `ordered_merge` functions for merging `DataFrames` with ordered data. Also supports group-wise merging for panel data ([GH813](#))
- Add `keys()` method to `DataFrame`
- Add flexible `replace` method for replacing potentially values to `Series` and `DataFrame` ([GH929](#), [GH1241](#))
- Add 'kde' plot kind for `Series/DataFrame.plot` ([GH1059](#))
- More flexible multiple function aggregation with `GroupBy`
- Add `pct_change` function to `Series/DataFrame`
- Add option to interpolate by Index values in `Series.interpolate` ([GH1206](#))
- Add `max_colwidth` option for `DataFrame`, defaulting to 50
- Conversion of `DataFrame` through `rpy2` to R `data.frame` ([GH1282](#), )
- Add `keys()` method on `DataFrame` ([GH1240](#))
- Add new `match` function to API (similar to R) ([GH502](#))
- Add `dayfirst` option to parsers ([GH854](#))
- Add `method` argument to `align` method for forward/backward fillin ([GH216](#))
- Add `Panel.transpose` method for rearranging axes ([GH695](#))
- Add new `cut` function (patterned after R) for discretizing data into equal range-length bins or arbitrary breaks of your choosing ([GH415](#))
- Add new `qcut` for cutting with quantiles ([GH1378](#))

- Add `value_counts` top level array method ([GH1392](#))
- Added Andrews curves plot tupe ([GH1325](#))
- Add lag plot ([GH1440](#))
- Add autocorrelation\_plot ([GH1425](#))
- Add support for tox and Travis CI ([GH1382](#))
- Add support for Categorical use in GroupBy ([GH292](#))
- Add `any` and `all` methods to DataFrame ([GH1416](#))
- Add `secondary_y` option to Series.plot
- Add experimental `reshape` function for reshaping wide to long

### 38.32.2 Improvements to existing features

- Switch to klib/khash-based hash tables in Index classes for better performance in many cases and lower memory footprint
- Shipping some functions from `scipy.stats` to reduce dependency, e.g. `Series.describe` and `DataFrame.describe` ([GH1092](#))
- Can create MultiIndex by passing list of lists or list of arrays to Series, DataFrame constructor, etc. ([GH831](#))
- Can pass arrays in addition to column names to `DataFrame.set_index` ([GH402](#))
- Improve the speed of “square” reindexing of homogeneous DataFrame objects by significant margin ([GH836](#))
- Handle more dtypes when passed MaskedArrays in DataFrame constructor ([GH406](#))
- Improved performance of join operations on integer keys ([GH682](#))
- Can pass multiple columns to GroupBy object, e.g. `grouped[[col1, col2]]` to only aggregate a subset of the value columns ([GH383](#))
- Add histogram / kde plot options for `scatter_matrix` diagonals ([GH1237](#))
- Add inplace option to `Series/DataFrame.rename` and `sort_index`, `DataFrame.drop_duplicates` ([GH805](#), [GH207](#))
- More helpful error message when nothing passed to `Series.reindex` ([GH1267](#))
- Can mix array and scalars as dict-value inputs to DataFrame ctor ([GH1329](#))
- Use DataFrame columns’ name for legend title in plots
- Preserve frequency in DatetimeIndex when possible in boolean indexing operations
- Promote `datetime.date` values in data alignment operations ([GH867](#))
- Add `order` method to Index classes ([GH1028](#))
- Avoid hash table creation in large monotonic hash table indexes ([GH1160](#))
- Store time zones in HDFStore ([GH1232](#))
- Enable storage of sparse data structures in HDFStore ([GH85](#))
- Enable `Series.asof` to work with arrays of timestamp inputs
- Cython implementation of `DataFrame.corr` speeds up by > 100x ([GH1349](#), [GH1354](#))
- Exclude “nuisance” columns automatically in `GroupBy.transform` ([GH1364](#))
- Support functions-as-strings in `GroupBy.transform` ([GH1362](#))

- Use index name as xlabel/ylabel in plots ([GH1415](#))
- Add `convert_dtype` option to `Series.apply` to be able to leave data as `dtype=object` ([GH1414](#))
- Can specify all index level names in `concat` ([GH1419](#))
- Add `dialect` keyword to parsers for quoting conventions ([GH1363](#))
- Enable `DataFrame[bool_DataFrame] += value` ([GH1366](#))
- Add `retries` argument to `get_data_yahoo` to try to prevent Yahoo! API 404s ([GH826](#))
- Improve performance of reshaping by using  $O(N)$  categorical sorting
- Series names will be used for index of `DataFrame` if no index passed ([GH1494](#))
- Header argument in `DataFrame.to_csv` can accept a list of column names to use instead of the object's columns ([GH921](#))
- Add `raise_conflict` argument to `DataFrame.update` ([GH1526](#))
- Support file-like objects in `ExcelFile` ([GH1529](#))

### 38.32.3 API Changes

- Rename `pandas._tseries` to `pandas.lib`
- Rename `Factor` to `Categorical` and add improvements. Numerous `Categorical` bug fixes
- Frequency name overhaul, `WEEKDAY/EOM` and rules with `@` deprecated. `get_legacy_offset_name` backwards compatibility function added
- Raise `ValueError` in `DataFrame.__nonzero__`, so “if df” no longer works ([GH1073](#))
- Change `BDay` (business day) to not normalize dates by default ([GH506](#))
- Remove deprecated `DataMatrix` name
- Default merge suffixes for overlap now have underscores instead of periods to facilitate tab completion, etc. ([GH1239](#))
- Deprecation of `offset`, `time_rule` `timeRule` parameters throughout codebase
- `Series.append` and `DataFrame.append` no longer check for duplicate indexes by default, add `verify_integrity` parameter ([GH1394](#))
- Refactor `Factor` class, old constructor moved to `Factor.from_array`
- Modified internals of `MultiIndex` to use less memory (no longer represented as array of tuples) internally, speed up construction time and many methods which construct intermediate hierarchical indexes ([GH1467](#))

### 38.32.4 Bug Fixes

- Fix `OverflowError` from storing pre-1970 dates in `HDFStore` by switching to `datetime64` ([GH179](#))
- Fix logical error with February leap year end in `YearEnd` offset
- `Series([False, nan])` was getting casted to `float64` ([GH1074](#))
- Fix binary operations between boolean `Series` and object `Series` with booleans and NAs ([GH1074](#), [GH1079](#))
- Couldn't assign whole array to column in mixed-type `DataFrame` via `.ix` ([GH1142](#))
- Fix label slicing issues with float index values ([GH1167](#))

- Fix segfault caused by empty groups passed to groupby ([GH1048](#))
- Fix occasionally misbehaved reindexing in the presence of NaN labels ([GH522](#))
- Fix imprecise logic causing weird Series results from .apply ([GH1183](#))
- Unstack multiple levels in one shot, avoiding empty columns in some cases. Fix pivot table bug ([GH1181](#))
- Fix formatting of MultiIndex on Series/DataFrame when index name coincides with label ([GH1217](#))
- Handle Excel 2003 #N/A as NaN from xlrd ([GH1213](#), [GH1225](#))
- Fix timestamp locale-related deserialization issues with HDFStore by moving to datetime64 representation ([GH1081](#), [GH809](#))
- Fix DataFrame.duplicated/drop\_duplicates NA value handling ([GH557](#))
- Actually raise exceptions in fast reducer ([GH1243](#))
- Fix various timezone-handling bugs from 0.7.3 ([GH969](#))
- GroupBy on level=0 discarded index name ([GH1313](#))
- Better error message with unmergeable DataFrames ([GH1307](#))
- Series.\_\_repr\_\_ alignment fix with unicode index values ([GH1279](#))
- Better error message if nothing passed to reindex ([GH1267](#))
- More robust NA handling in DataFrame.drop\_duplicates ([GH557](#))
- Resolve locale-based and pre-epoch HDF5 timestamp deserialization issues ([GH973](#), [GH1081](#), [GH179](#))
- Implement Series.repeat ([GH1229](#))
- Fix indexing with namedtuple and other tuple subclasses ([GH1026](#))
- Fix float64 slicing bug ([GH1167](#))
- Parsing integers with commas ([GH796](#))
- Fix groupby improper data type when group consists of one value ([GH1065](#))
- Fix negative variance possibility in nanvar resulting from floating point error ([GH1090](#))
- Consistently set name on groupby pieces ([GH184](#))
- Treat dict return values as Series in GroupBy.apply ([GH823](#))
- Respect column selection for DataFrame in GroupBy.transform ([GH1365](#))
- Fix MultiIndex partial indexing bug ([GH1352](#))
- Enable assignment of rows in mixed-type DataFrame via .ix ([GH1432](#))
- Reset index mapping when grouping Series in Cython ([GH1423](#))
- Fix outer/inner DataFrame.join with non-unique indexes ([GH1421](#))
- Fix MultiIndex groupby bugs with empty lower levels ([GH1401](#))
- Calling fillna with a Series will have same behavior as with dict ([GH1486](#))
- SparseSeries reduction bug ([GH1375](#))
- Fix unicode serialization issue in HDFStore ([GH1361](#))
- Pass keywords to pyplot.boxplot in DataFrame.boxplot ([GH1493](#))
- Bug fixes in MonthBegin ([GH1483](#))

- Preserve MultiIndex names in drop ([GH1513](#))
- Fix Panel DataFrame slice-assignment bug ([GH1533](#))
- Don't use locals() in read\_\* functions ([GH1547](#))

## 38.33 pandas 0.7.3

**Release date:** April 12, 2012

### 38.33.1 New Features

- Support for non-unique indexes: indexing and selection, many-to-one and many-to-many joins ([GH1306](#))
- Added fixed-width file reader, read\_fwf ([GH952](#))
- Add group\_keys argument to groupby to not add group names to MultiIndex in result of apply ([GH938](#))
- DataFrame can now accept non-integer label slicing ([GH946](#)). Previously only DataFrame.ix was able to do so.
- DataFrame.apply now retains name attributes on Series objects ([GH983](#))
- Numeric DataFrame comparisons with non-numeric values now raises proper TypeError ([GH943](#)). Previously raise "PandasError: DataFrame constructor not properly called!"
- Add kurt methods to Series and DataFrame ([GH964](#))
- Can pass dict of column -> list/set NA values for text parsers ([GH754](#))
- Allows users specified NA values in text parsers ([GH754](#))
- Parsers checks for openpyxl dependency and raises ImportError if not found ([GH1007](#))
- New factory function to create HDFStore objects that can be used in a with statement so users do not have to explicitly call HDFStore.close ([GH1005](#))
- pivot\_table is now more flexible with same parameters as groupby ([GH941](#))
- Added stacked bar plots ([GH987](#))
- scatter\_matrix method in pandas/tools/plotting.py ([GH935](#))
- DataFrame.boxplot returns plot results for ex-post styling ([GH985](#))
- Short version number accessible as pandas.version.short\_version ([GH930](#))
- Additional documentation in panel.to\_frame ([GH942](#))
- More informative Series.apply docstring regarding element-wise apply ([GH977](#))
- Notes on rpy2 installation ([GH1006](#))
- Add rotation and font size options to hist method ([GH1012](#))
- Use exogenous / X variable index in result of OLS.y\_predict. Add OLS.predict method ([GH1027](#), [GH1008](#))

### 38.33.2 API Changes

- Calling apply on grouped Series, e.g. describe(), will no longer yield DataFrame by default. Will have to call unstack() to get prior behavior
- NA handling in non-numeric comparisons has been tightened up ([GH933](#), [GH953](#))

- No longer assign dummy names key\_0, key\_1, etc. to groupby index ([GH1291](#))

### 38.33.3 Bug Fixes

- Fix logic error when selecting part of a row in a DataFrame with a MultiIndex index ([GH1013](#))
- Series comparison with Series of differing length causes crash ([GH1016](#)).
- Fix bug in indexing when selecting section of hierarchically-indexed row ([GH1013](#))
- DataFrame.plot(logy=True) has no effect ([GH1011](#)).
- Broken arithmetic operations between SparsePanel-Panel ([GH1015](#))
- Unicode repr issues in MultiIndex with non-ASCII characters ([GH1010](#))
- DataFrame.lookup() returns inconsistent results if exact match not present ([GH1001](#))
- DataFrame arithmetic operations not treating None as NA ([GH992](#))
- DataFrameGroupBy.apply returns incorrect result ([GH991](#))
- Series.reshape returns incorrect result for multiple dimensions ([GH989](#))
- Series.std and Series.var ignores ddof parameter ([GH934](#))
- DataFrame.append loses index names ([GH980](#))
- DataFrame.plot(kind='bar') ignores color argument ([GH958](#))
- Inconsistent Index comparison results ([GH948](#))
- Improper int dtype DataFrame construction from data with NaN ([GH846](#))
- Removes default 'result' name in groupby results ([GH995](#))
- DataFrame.from\_records no longer mutate input columns ([GH975](#))
- Use Index name when grouping by it ([GH1313](#))

## 38.34 pandas 0.7.2

**Release date:** March 16, 2012

### 38.34.1 New Features

- Add additional tie-breaking methods in DataFrame.rank ([GH874](#))
- Add ascending parameter to rank in Series, DataFrame ([GH875](#))
- Add sort\_columns parameter to allow unsorted plots ([GH918](#))
- IPython tab completion on GroupBy objects

### 38.34.2 API Changes

- Series.sum returns 0 instead of NA when called on an empty series. Analogously for a DataFrame whose rows or columns are length 0 ([GH844](#))

### 38.34.3 Improvements to existing features

- Don't use groups dict in `Grouper.size` (GH860)
- Use `khash` for `Series.value_counts`, add `raw` function to `algorithms.py` (GH861)
- Enable column access via attributes on `GroupBy` (GH882)
- Enable setting existing columns (only) via attributes on `DataFrame`, `Panel` (GH883)
- Intercept `__builtin__.sum` in `groupby` (GH885)
- Can pass dict to `DataFrame.fillna` to use different values per column (GH661)
- Can select multiple hierarchical groups by passing list of values in `.ix` (GH134)
- Add `level` keyword to `drop` for dropping values from a level (GH159)
- Add `coerce_float` option on `DataFrame.from_records` (GH893)
- Raise exception if passed `date_parser` fails in `read_csv`
- Add `axis` option to `DataFrame.fillna` (GH174)
- Fixes to `Panel` to make it easier to subclass (GH888)

### 38.34.4 Bug Fixes

- Fix overflow-related bugs in `groupby` (GH850, GH851)
- Fix unhelpful error message in parsers (GH856)
- Better err msg for failed boolean slicing of dataframe (GH859)
- `Series.count` cannot accept a string (level name) in the level argument (GH869)
- Group index platform int check (GH870)
- `concat` on `axis=1` and `ignore_index=True` raises `TypeError` (GH871)
- Further unicode handling issues resolved (GH795)
- Fix failure in multiindex-based access in `Panel` (GH880)
- Fix `DataFrame` boolean slice assignment failure (GH881)
- Fix `combineAdd` `NotImplementedError` for `SparseDataFrame` (GH887)
- Fix `DataFrame.to_html` encoding and columns (GH890, GH891, GH909)
- Fix na-filling handling in mixed-type `DataFrame` (GH910)
- Fix to `DataFrame.set_value` with non-existent row/col (GH911)
- Fix malformed block in `groupby` when excluding nuisance columns (GH916)
- Fix inconsistent NA handling in `dtype=object` arrays (GH925)
- Fix missing center-of-mass computation in `ewmcov` (GH862)
- Don't raise exception when opening read-only HDF5 file (GH847)
- Fix possible out-of-bounds memory access in 0-length `Series` (GH917)

## 38.35 pandas 0.7.1

**Release date:** February 29, 2012

### 38.35.1 New Features

- Add `to_clipboard` function to pandas namespace for writing objects to the system clipboard ([GH774](#))
- Add `itertuples` method to `DataFrame` for iterating through the rows of a dataframe as tuples ([GH818](#))
- Add ability to pass `fill_value` and `method` to `DataFrame` and `Series` `align` method ([GH806](#), [GH807](#))
- Add `fill_value` option to `reindex`, `align` methods ([GH784](#))
- Enable `concat` to produce `DataFrame` from `Series` ([GH787](#))
- Add `between` method to `Series` ([GH802](#))
- Add HTML representation hook to `DataFrame` for the IPython HTML notebook ([GH773](#))
- Support for reading Excel 2007 XML documents using `openpyxl`

### 38.35.2 Improvements to existing features

- Improve performance and memory usage of `fillna` on `DataFrame`
- Can concatenate a list of `Series` along `axis=1` to obtain a `DataFrame` ([GH787](#))

### 38.35.3 Bug Fixes

- Fix memory leak when inserting large number of columns into a single `DataFrame` ([GH790](#))
- Appending length-0 `DataFrame` with new columns would not result in those new columns being part of the resulting concatenated `DataFrame` ([GH782](#))
- Fixed `groupby` corner case when passing dictionary grouper and `as_index` is `False` ([GH819](#))
- Fixed bug whereby bool array sometimes had object dtype ([GH820](#))
- Fix exception thrown on `np.diff` ([GH816](#))
- Fix `to_records` where columns are non-strings ([GH822](#))
- Fix `Index.intersection` where indices have incomparable types ([GH811](#))
- Fix `ExcelFile` throwing an exception for two-line file ([GH837](#))
- Add clearer error message in csv parser ([GH835](#))
- Fix loss of fractional seconds in `HDFStore` ([GH513](#))
- Fix `DataFrame` join where columns have datetimes ([GH787](#))
- Work around NumPy performance issue in `take` ([GH817](#))
- Improve comparison operations for NA-friendliness ([GH801](#))
- Fix indexing operation for floating point values ([GH780](#), [GH798](#))
- Fix `groupby` case resulting in malformed dataframe ([GH814](#))
- Fix behavior of `reindex` of `Series` dropping name ([GH812](#))

- Improve on redundant groupby computation ([GH775](#))
- Catch possible NA assignment to int/bool series with exception ([GH839](#))

## 38.36 pandas 0.7.0

Release date: 2/9/2012

### 38.36.1 New Features

- New `merge` function for efficiently performing full gamut of database / relational-algebra operations. Refactored existing join methods to use the new infrastructure, resulting in substantial performance gains ([GH220](#), [GH249](#), [GH267](#))
- New `concat` function for concatenating `DataFrame` or `Panel` objects along an axis. Can form union or intersection of the other axes. Improves performance of `DataFrame.append` ([GH468](#), [GH479](#), [GH273](#))
- Handle differently-indexed output values in `DataFrame.apply` ([GH498](#))
- Can pass list of dicts (e.g., a list of shallow JSON objects) to `DataFrame` constructor ([GH526](#))
- Add `reorder_levels` method to `Series` and `DataFrame` ([GH534](#))
- Add dict-like `get` function to `DataFrame` and `Panel` ([GH521](#))
- `DataFrame.iterrows` method for efficiently iterating through the rows of a `DataFrame`
- Added `DataFrame.to_panel` with code adapted from `LongPanel.to_long`
- `reindex_axis` method added to `DataFrame`
- Add `level` option to binary arithmetic functions on `DataFrame` and `Series`
- Add `level` option to the `reindex` and `align` methods on `Series` and `DataFrame` for broadcasting values across a level ([GH542](#), [GH552](#), others)
- Add attribute-based item access to `Panel` and add IPython completion (PR [GH554](#))
- Add `logy` option to `Series.plot` for log-scaling on the Y axis
- Add `index`, `header`, and `justify` options to `DataFrame.to_string`. Add option to ([GH570](#), [GH571](#))
- Can pass multiple `DataFrames` to `DataFrame.join` to join on index ([GH115](#))
- Can pass multiple `Panels` to `Panel.join` ([GH115](#))
- Can pass multiple `DataFrames` to `DataFrame.append` to concatenate (stack) and multiple `Series` to `Series.append` too
- Added `justify` argument to `DataFrame.to_string` to allow different alignment of column headers
- Add `sort` option to `GroupBy` to allow disabling sorting of the group keys for potential speedups ([GH595](#))
- Can pass `MaskedArray` to `Series` constructor ([GH563](#))
- Add `Panel` item access via attributes and IPython completion ([GH554](#))
- Implement `DataFrame.lookup`, fancy-indexing analogue for retrieving values given a sequence of row and column labels ([GH338](#))
- Add `verbose` option to `read_csv` and `read_table` to show number of NA values inserted in non-numeric columns ([GH614](#))

- Can pass a list of dicts or Series to `DataFrame.append` to concatenate multiple rows (GH464)
- Add `level` argument to `DataFrame.xs` for selecting data from other MultiIndex levels. Can take one or more levels with potentially a tuple of keys for flexible retrieval of data (GH371, GH629)
- New `crosstab` function for easily computing frequency tables (GH170)
- Can pass a list of functions to aggregate with `groupby` on a `DataFrame`, yielding an aggregated result with hierarchical columns (GH166)
- Add integer-indexing functions `iget` in `Series` and `irow / iget` in `DataFrame` (GH628)
- Add new `Series.unique` function, significantly faster than `numpy.unique` (GH658)
- Add new `cummin` and `cummax` instance methods to `Series` and `DataFrame` (GH647)
- Add new `value_range` function to return min/max of a dataframe (GH288)
- Add `drop` parameter to `reset_index` method of `DataFrame` and added method to `Series` as well (GH699)
- Add `isin` method to `Index` objects, works just like `Series.isin` (GH GH657)
- Implement array interface on `Panel` so that ufuncs work (re: GH740)
- Add `sort` option to `DataFrame.join` (GH731)
- Improved handling of NAs (propagation) in binary operations with `dtype=object` arrays (GH737)
- Add `abs` method to `Pandas` objects
- Added `algorithms` module to start collecting central algos

### 38.36.2 API Changes

- Label-indexing with integer indexes now raises `KeyError` if a label is not found instead of falling back on location-based indexing (GH700)
- Label-based slicing via `ix` or `[]` on `Series` will now only work if exact matches for the labels are found or if the index is monotonic (for range selections)
- Label-based slicing and sequences of labels can be passed to `[]` on a `Series` for both getting and setting (GH86)
- `[]` operator (`__getitem__` and `__setitem__`) will raise `KeyError` with integer indexes when an index is not contained in the index. The prior behavior would fall back on position-based indexing if a key was not found in the index which would lead to subtle bugs. This is now consistent with the behavior of `.ix` on `DataFrame` and friends (GH328)
- Rename `DataFrame.delevel` to `DataFrame.reset_index` and add deprecation warning
- `Series.sort` (an in-place operation) called on a `Series` which is a view on a larger array (e.g. a column in a `DataFrame`) will generate an `Exception` to prevent accidentally modifying the data source (GH316)
- Refactor to remove deprecated `LongPanel` class (GH552)
- Deprecated `Panel.to_long`, renamed to `to_frame`
- Deprecated `colSpace` argument in `DataFrame.to_string`, renamed to `col_space`
- Rename `precision` to `accuracy` in engineering float formatter (GH GH395)
- The default delimiter for `read_csv` is comma rather than letting `csv.Sniffer` infer it
- Rename `col_or_columns` argument in `DataFrame.drop_duplicates` (GH GH734)

### 38.36.3 Improvements to existing features

- Better error message in DataFrame constructor when passed column labels don't match data ([GH497](#))
- Substantially improve performance of multi-GroupBy aggregation when a Python function is passed, reuse ndarray object in Cython ([GH496](#))
- Can store objects indexed by tuples and floats in HDFStore ([GH492](#))
- Don't print length by default in Series.to\_string, add *length* option ([GH](#) [GH489](#))
- Improve Cython code for multi-groupby to aggregate without having to sort the data ([GH93](#))
- Improve MultiIndex reindexing speed by storing tuples in the MultiIndex, test for backwards unpickling compatibility
- Improve column reindexing performance by using specialized Cython take function
- Further performance tweaking of Series.\_\_getitem\_\_ for standard use cases
- Avoid Index dict creation in some cases (i.e. when getting slices, etc.), regression from prior versions
- Friendlier error message in setup.py if NumPy not installed
- Use common set of NA-handling operations (sum, mean, etc.) in Panel class also ([GH536](#))
- Default name assignment when calling reset\_index on DataFrame with a regular (non-hierarchical) index ([GH476](#))
- Use Cythonized groupers when possible in Series/DataFrame stat ops with level parameter passed ([GH545](#))
- Ported skiplist data structure to C to speed up rolling\_median by about 5-10x in most typical use cases ([GH374](#))
- Some performance enhancements in constructing a Panel from a dict of DataFrame objects
- Made Index.\_get\_duplicates a public method by removing the underscore
- Prettier printing of floats, and column spacing fix ([GH395](#), [GH571](#))
- Add bold\_rows option to DataFrame.to\_html ([GH586](#))
- Improve the performance of DataFrame.sort\_index by up to 5x or more when sorting by multiple columns
- Substantially improve performance of DataFrame and Series constructors when passed a nested dict or dict, respectively ([GH540](#), [GH621](#))
- Modified setup.py so that pip / setuptools will install dependencies ([GH](#) [GH507](#), various pull requests)
- Unstack called on DataFrame with non-MultiIndex will return Series ([GH](#) [GH477](#))
- Improve DataFrame.to\_string and console formatting to be more consistent in the number of displayed digits ([GH395](#))
- Use bottleneck if available for performing NaN-friendly statistical operations that it implemented ([GH91](#))
- Monkey-patch context to traceback in DataFrame.apply to indicate which row/column the function application failed on ([GH614](#))
- Improved ability of read\_table and read\_clipboard to parse console-formatted DataFrames (can read the row of index names, etc.)
- Can pass list of group labels (without having to convert to an ndarray yourself) to groupby in some cases ([GH659](#))
- Use kind argument to Series.order for selecting different sort kinds ([GH668](#))

- Add option to `Series.to_csv` to omit the index ([GH684](#))
- Add `delimiter` as an alternative to `sep` in `read_csv` and other parsing functions
- Substantially improved performance of `groupby` on DataFrames with many columns by aggregating blocks of columns all at once ([GH745](#))
- Can pass a file handle or `StringIO` to `Series/DataFrame.to_csv` ([GH765](#))
- Can pass sequence of integers to `DataFrame.irow(icol)` and `Series.iget`, ([GH GH654](#))
- Prototypes for some vectorized string functions
- Add float64 hash table to solve the `Series.unique` problem with NAs ([GH714](#))
- Memoize objects when reading from file to reduce memory footprint
- Can get and set a column of a DataFrame with hierarchical columns containing “empty” (“”) lower levels without passing the empty levels ([PR GH768](#))

### 38.36.4 Bug Fixes

- Raise exception in out-of-bounds indexing of `Series` instead of seg-faulting, regression from earlier releases ([GH495](#))
- Fix error when joining DataFrames of different dtypes within the same typeclass (e.g. `float32` and `float64`) ([GH486](#))
- Fix bug in `Series.min/Series.max` on objects like `datetime.datetime` ([GH GH487](#))
- Preserve index names in `Index.union` ([GH501](#))
- Fix bug in `Index` joining causing subclass information (like `DateRange` type) to be lost in some cases ([GH500](#))
- Accept empty list as input to `DataFrame` constructor, regression from 0.6.0 ([GH491](#))
- Can output `DataFrame` and `Series` with `ndarray` objects in a `dtype=object` array ([GH490](#))
- Return empty string from `Series.to_string` when called on empty `Series` ([GH GH488](#))
- Fix exception passing empty list to `DataFrame.from_records`
- Fix `Index.format` bug (excluding name field) with datetimes with time info
- Fix scalar value access in `Series` to always return NumPy scalars, regression from prior versions ([GH510](#))
- Handle rows skipped at beginning of file in `read_*` functions ([GH505](#))
- Handle improper dtype casting in `set_value` methods
- Unary `'-'` / `__neg__` operator on `DataFrame` was returning integer values
- Unbox 0-dim `ndarrays` from certain operators like `all`, `any` in `Series`
- Fix handling of missing columns (was `combine_first`-specific) in `DataFrame.combine` for general case ([GH529](#))
- Fix type inference logic with boolean lists and arrays in `DataFrame` indexing
- Use centered sum of squares in R-square computation if `entity_effects=True` in panel regression
- Handle all NA case in `Series.{corr, cov}`, was raising exception ([GH548](#))
- Aggregating by multiple levels with `level` argument to `DataFrame`, `Series` stat method, was broken ([GH545](#))
- Fix Cython buf when converter passed to `read_csv` produced a numeric array (buffer dtype mismatch when passed to Cython type inference function) ([GH GH546](#))
- Fix exception when setting scalar value using `.ix` on a `DataFrame` with a `MultiIndex` ([GH551](#))

- Fix outer join between two DateRanges with different offsets that returned an invalid DateRange
- Cleanup DataFrame.from\_records failure where index argument is an integer
- Fix Data.from\_records failure when passed a dictionary
- Fix NA handling in {Series, DataFrame}.rank with non-floating point dtypes
- Fix bug related to integer type-checking in .ix-based indexing
- Handle non-string index name passed to DataFrame.from\_records
- DataFrame.insert caused the columns name(s) field to be discarded (GH527)
- Fix erroneous in monotonic many-to-one left joins
- Fix DataFrame.to\_string to remove extra column white space (GH571)
- Format floats to default to same number of digits (GH395)
- Added decorator to copy docstring from one function to another (GH449)
- Fix error in monotonic many-to-one left joins
- Fix \_\_eq\_\_ comparison between DateOffsets with different relativedelta keywords passed
- Fix exception caused by parser converter returning strings (GH583)
- Fix MultiIndex formatting bug with integer names (GH601)
- Fix bug in handling of non-numeric aggregates in Series.groupby (GH612)
- Fix TypeError with tuple subclasses (e.g. namedtuple) in DataFrame.from\_records (GH611)
- Catch misreported console size when running IPython within Emacs
- Fix minor bug in pivot table margins, loss of index names and length-1 'All' tuple in row labels
- Add support for legacy WidePanel objects to be read from HDFStore
- Fix out-of-bounds segfault in pad\_object and backfill\_object methods when either source or target array are empty
- Could not create a new column in a DataFrame from a list of tuples
- Fix bugs preventing SparseDataFrame and SparseSeries working with groupby (GH666)
- Use sort kind in Series.sort / argsort (GH668)
- Fix DataFrame operations on non-scalar, non-pandas objects (GH672)
- Don't convert DataFrame column to integer type when passing integer to \_\_setitem\_\_ (GH669)
- Fix downstream bug in pivot\_table caused by integer level names in MultiIndex (GH678)
- Fix SparseSeries.combine\_first when passed a dense Series (GH687)
- Fix performance regression in HDFStore loading when DataFrame or Panel stored in table format with datetimes
- Raise Exception in DateRange when offset with n=0 is passed (GH683)
- Fix get/set inconsistency with .ix property and integer location but non-integer index (GH707)
- Use right dropna function for SparseSeries. Return dense Series for NA fill value (GH730)
- Fix Index.format bug causing incorrectly string-formatted Series with datetime indexes (GH726, GH758)
- Fix errors caused by object dtype arrays passed to ols (GH759)
- Fix error where column names lost when passing list of labels to DataFrame.\_\_getitem\_\_, (GH662)

- Fix error whereby top-level week iterator overwrote week instance
- Fix circular reference causing memory leak in sparse array / series / frame, ([GH663](#))
- Fix integer-slicing from integers-as-floats ([GH670](#))
- Fix zero division errors in nanops from object dtype arrays in all NA case ([GH676](#))
- Fix csv encoding when using unicode ([GH705](#), [GH717](#), [GH738](#))
- Fix assumption that each object contains every unique block type in concat, ([GH708](#))
- Fix sortedness check of multiindex in to\_panel ([GH719](#), 720)
- Fix that None was not treated as NA in PyObjectHashtable
- Fix hashing dtype because of endianness confusion ([GH747](#), [GH748](#))
- Fix SparseSeries.dropna to return dense Series in case of NA fill value (GH [GH730](#))
- Use map\_infer instead of np.vectorize. handle NA sentinels if converter yields numeric array, ([GH753](#))
- Fixes and improvements to DataFrame.rank ([GH742](#))
- Fix catching AttributeError instead of NameError for bottleneck
- Try to cast non-MultiIndex to better dtype when calling reset\_index ([GH726](#) [GH440](#))
- Fix #1.QNAN0' float bug on 2.6/win64
- Allow subclasses of dicts in DataFrame constructor, with tests
- Fix problem whereby set\_index destroys column multiindex ([GH764](#))
- Hack around bug in generating DateRange from naive DateOffset ([GH770](#))
- Fix bug in DateRange.intersection causing incorrect results with some overlapping ranges ([GH771](#))

## 38.37 pandas 0.6.1

**Release date:** 12/13/2011

### 38.37.1 API Changes

- Rename *names* argument in `DataFrame.from_records` to *columns*. Add deprecation warning
- Boolean get/set operations on Series with boolean Series will reindex instead of requiring that the indexes be exactly equal ([GH429](#))

### 38.37.2 New Features

- Can pass Series to `DataFrame.append` with `ignore_index=True` for appending a single row ([GH430](#))
- Add Spearman and Kendall correlation options to `Series.corr` and `DataFrame.corr` ([GH428](#))
- Add new *get\_value* and *set\_value* methods to Series, DataFrame, and Panel to very low-overhead access to scalar elements. `df.get_value(row, column)` is about 3x faster than `df[column][row]` by handling fewer cases ([GH437](#), [GH438](#)). Add similar methods to sparse data structures for compatibility
- Add Qt table widget to sandbox ([GH435](#))
- `DataFrame.align` can accept Series arguments, add `axis` keyword ([GH461](#))
- Implement new `SparseList` and `SparseArray` data structures. `SparseSeries` now derives from `SparseArray` ([GH463](#))
- `max_columns` / `max_rows` options in `set_printoptions` ([GH453](#))
- Implement `Series.rank` and `DataFrame.rank`, fast versions of `scipy.stats.rankdata` ([GH428](#))
- Implement `DataFrame.from_items` alternate constructor ([GH444](#))

- `DataFrame.convert_objects` method for inferring better dtypes for object columns ([GH302](#))
- Add `rolling_corr_pairwise` function for computing Panel of correlation matrices ([GH189](#))
- Add `margins` option to `pivot_table` for computing subgroup aggregates ([GH114](#))
- Add `Series.from_csv` function ([GH482](#))

### 38.37.3 Improvements to existing features

- Improve memory usage of `DataFrame.describe` (do not copy data unnecessarily) ([GH425](#))
- Use same formatting function for outputting floating point Series to console as in DataFrame ([GH420](#))
- `DataFrame.delevel` will try to infer better dtype for new columns ([GH440](#))
- Exclude non-numeric types in `DataFrame.{corr, cov}`
- Override `Index.astype` to enable dtype casting ([GH412](#))
- Use same float formatting function for `Series.__repr__` ([GH420](#))
- Use available console width to output DataFrame columns ([GH453](#))
- Accept ndarrays when setting items in Panel ([GH452](#))
- Infer console width when printing `__repr__` of DataFrame to console (PR [GH453](#))
- Optimize scalar value lookups in the general case by 25% or more in Series and DataFrame
- Can pass DataFrame/DataFrame and DataFrame/Series to `rolling_corr/rolling_cov` ([GH462](#))
- Fix performance regression in cross-sectional count in DataFrame, affecting `DataFrame.dropna` speed
- Column deletion in DataFrame copies no data (computes views on blocks) ([GH158](#))
- `MultiIndex.get_level_values` can take the level name
- More helpful error message when `DataFrame.plot` fails on one of the columns ([GH478](#))
- Improve performance of `DataFrame.{index, columns}` attribute lookup

### 38.37.4 Bug Fixes

- Fix  $O(K^2)$  memory leak caused by inserting many columns without consolidating, had been present since 0.4.0 ([GH467](#))
- `DataFrame.count` should return Series with zero instead of NA with length-0 axis ([GH423](#))
- Fix Yahoo! Finance API usage in `pandas.io.data` ([GH419](#), [GH427](#))
- Fix upstream bug causing failure in `Series.align` with empty Series ([GH434](#))
- Function passed to `DataFrame.apply` can return a list, as long as it's the right length. Regression from 0.4 ([GH432](#))
- Don't "accidentally" upcast scalar values when indexing using `.ix` ([GH431](#))
- Fix groupby exception raised with `as_index=False` and single column selected ([GH421](#))
- Implement `DateOffset.__ne__` causing downstream bug ([GH456](#))
- Fix `__doc__`-related issue when converting py -> pyo with `py2exe`
- Bug fix in left join Cython code with duplicate monotonic labels

- Fix bug when unstacking multiple levels described in [GH451](#)
- Exclude NA values in dtype=object arrays, regression from 0.5.0 ([GH469](#))
- Use Cython map\_infer function in DataFrame.applymap to properly infer output type, handle tuple return values and other things that were breaking ([GH465](#))
- Handle floating point index values in HDFStore ([GH454](#))
- Fixed stale column reference bug (cached Series object) caused by type change / item deletion in DataFrame ([GH473](#))
- Index.get\_loc should always raise Exception when there are duplicates
- Handle differently-indexed Series input to DataFrame constructor ([GH475](#))
- Omit nuisance columns in multi-groupby with Python function
- Buglet in handling of single grouping in general apply
- Handle type inference properly when passing list of lists or tuples to DataFrame constructor ([GH484](#))
- Preserve Index / MultiIndex names in GroupBy.apply concatenation step (GH [GH481](#))

### 38.37.5 Thanks

- Ralph Bean
- Luca Beltrame

### 38.38 pandas 0.6.0

**Release date:** 11/25/2011

### 38.38.1 API Changes

- Arithmetic methods like *sum* will attempt to sum dtype=object values by default instead of excluding them (GH382)

### 38.38.2 New Features

- Add *melt* function to *pandas.core.reshape*
- Add *level* parameter to group by level in Series and DataFrame descriptive statistics (GH313)
- Add *head* and *tail* methods to Series, analogous to DataFrame (PR GH296)
- Add *Series.isin* function which checks if each value is contained in a passed sequence (GH289)
- Add *float\_format* option to *Series.to\_string*
- Add *skip\_footer* (GH291) and *converters* (GH343) options to *read\_csv* and *read\_table*
- Add proper, tested weighted least squares to standard and panel OLS (GH GH303)
- Add *drop\_duplicates* and *duplicated* functions for removing duplicate DataFrame rows and checking for duplicate rows, respectively (GH319)
- Implement logical (boolean) operators *&*, *|*, *^* on DataFrame (GH347)
- Add *Series.mad*, mean absolute deviation, matching DataFrame
- Add *QuarterEnd* DateOffset (GH321)
- Add matrix multiplication function *dot* to DataFrame (GH65)
- Add *orient* option to *Panel.from\_dict* to ease creation of mixed-type Panels (GH359, GH301)
- Add *DataFrame.from\_dict* with similar *orient* option
- Can now pass list of tuples or list of lists to *DataFrame.from\_records* for fast conversion to DataFrame (GH357)
- Can pass multiple levels to groupby, e.g. *df.groupby(level=[0, 1])* (GH GH103)
- Can sort by multiple columns in *DataFrame.sort\_index* (GH92, GH362)
- Add fast *get\_value* and *put\_value* methods to DataFrame and micro-performance tweaks (GH360)
- Add *cov* instance methods to Series and DataFrame (GH194, GH362)
- Add bar plot option to *DataFrame.plot* (GH348)
- Add *idxmin* and *idxmax* functions to Series and DataFrame for computing index labels achieving maximum and minimum values (GH286)
- Add *read\_clipboard* function for parsing DataFrame from OS clipboard, should work across platforms (GH300)
- Add *nunique* function to Series for counting unique elements (GH297)
- DataFrame constructor will use Series name if no columns passed (GH373)
- Support regular expressions and longer delimiters in *read\_table/read\_csv*, but does not handle quoted strings yet (GH364)
- Add *DataFrame.to\_html* for formatting DataFrame to HTML (GH387)
- MaskedArray can be passed to DataFrame constructor and masked values will be converted to NaN (GH396)
- Add *DataFrame.boxplot* function (GH368, others)
- Can pass extra args, kwds to DataFrame.apply (GH376)

### 38.38.3 Improvements to existing features

- Raise more helpful exception if date parsing fails in `DateRange` (GH298)
- Vastly improved performance of `GroupBy` on axes with a `MultiIndex` (GH299)
- Print level names in hierarchical index in `Series` repr (GH305)
- Return `DataFrame` when performing `GroupBy` on selected column and `as_index=False` (GH308)
- Can pass vector to `on` argument in `DataFrame.join` (GH312)
- Don't show `Series` name if it's `None` in the repr, also omit length for short `Series` (GH317)
- Show legend by default in `DataFrame.plot`, add `legend` boolean flag (GH GH324)
- Significantly improved performance of `Series.order`, which also makes `np.unique` called on a `Series` faster (GH327)
- Faster cythonized count by level in `Series` and `DataFrame` (GH341)
- Raise exception if `dateutil` 2.0 installed on Python 2.x runtime (GH346)
- Significant `GroupBy` performance enhancement with multiple keys with many “empty” combinations
- New Cython vectorized function `map_infer` speeds up `Series.apply` and `Series.map` significantly when passed elementwise Python function, motivated by GH355
- Cythonized `cache_readonly`, resulting in substantial micro-performance enhancements throughout the codebase (GH361)
- Special Cython matrix iterator for applying arbitrary reduction operations with 3-5x better performance than `np.apply_along_axis` (GH309)
- Add `raw` option to `DataFrame.apply` for getting better performance when the passed function only requires an `ndarray` (GH309)
- Improve performance of `MultiIndex.from_tuples`
- Can pass multiple levels to `stack` and `unstack` (GH370)
- Can pass multiple values columns to `pivot_table` (GH381)
- Can call `DataFrame.delevel` with standard `Index` with name set (GH393)
- Use `Series` name in `GroupBy` for result index (GH363)
- Refactor `Series/DataFrame` stat methods to use common set of NaN-friendly function
- Handle NumPy scalar integers at C level in Cython conversion routines

### 38.38.4 Bug Fixes

- Fix bug in `DataFrame.to_csv` when writing a `DataFrame` with an index name (GH290)
- `DataFrame` should clear its `Series` caches on consolidation, was causing “stale” `Series` to be returned in some corner cases (GH304)
- `DataFrame` constructor failed if a column had a list of tuples (GH293)
- Ensure that `Series.apply` always returns a `Series` and implement `Series.round` (GH314)
- Support boolean columns in Cythonized groupby functions (GH315)
- `DataFrame.describe` should not fail if there are no numeric columns, instead return categorical describe (GH323)

- Fixed bug which could cause columns to be printed in wrong order in *DataFrame.to\_string* if specific list of columns passed (GH325)
- Fix legend plotting failure if DataFrame columns are integers (GH326)
- Shift start date back by one month for Yahoo! Finance API in *pandas.io.data* (GH329)
- Fix *DataFrame.join* failure on unconsolidated inputs (GH331)
- *DataFrame.min/max* will no longer fail on mixed-type DataFrame (GH337)
- Fix *read\_csv / read\_table* failure when passing list to *index\_col* that is not in ascending order (GH349)
- Fix failure passing *Int64Index* to *Index.union* when both are monotonic
- Fix error when passing *SparseSeries* to (dense) DataFrame constructor
- Added missing bang at top of *setup.py* (GH352)
- Change *is\_monotonic* on *MultiIndex* so it properly compares the tuples
- Fix *MultiIndex* outer join logic (GH351)
- Set index name attribute with single-key groupby (GH358)
- Bug fix in reflexive binary addition in Series and DataFrame for non-commutative operations (like string concatenation) (GH353)
- *setuptools.py* will invoke Cython (GH192)
- Fix block consolidation bug after inserting column into *MultiIndex* (GH366)
- Fix bug in join operations between *Index* and *Int64Index* (GH367)
- Handle *min\_periods=0* case in moving window functions (GH365)
- Fixed corner cases in *DataFrame.apply/pivot* with empty DataFrame (GH378)
- Fixed repr exception when Series name is a tuple
- Always return *DateRange* from *asfreq* (GH390)
- Pass level names to *swaplevel* (GH379)
- Don't lose index names in *MultiIndex.droplevel* (GH394)
- Infer more proper return type in *DataFrame.apply* when no columns or rows depending on whether the passed function is a reduction (GH389)
- Always return NA/NaN from *Series.min/max* and *DataFrame.min/max* when all of a row/column/values are NA (GH384)
- Enable partial setting with *.ix / advanced indexing* (GH397)
- Handle mixed-type DataFrames correctly in *unstack*, do not lose type information (GH403)
- Fix integer name formatting bug in *Index.format* and in *Series.\_\_repr\_\_*
- Handle label types other than string passed to groupby (GH405)
- Fix bug in *.ix*-based indexing with partial retrieval when a label is not contained in a level
- Index name was not being pickled (GH408)
- Level name should be passed to result index in *GroupBy.apply* (GH416)

## 38.39 pandas 0.5.0

**Release date:** 10/24/2011

This release of pandas includes a number of API changes (see below) and cleanup of deprecated APIs from pre-0.4.0 releases. There are also bug fixes, new features, numerous significant performance enhancements, and includes a new ipython completer hook to enable tab completion of DataFrame columns accesses and attributes (a new feature).

In addition to the changes listed here from 0.4.3 to 0.5.0, the minor releases 4.1, 0.4.2, and 0.4.3 brought some significant new functionality and performance improvements that are worth taking a look at.

Thanks to all for bug reports, contributed patches and generally providing feedback on the library.

### 38.39.1 API Changes

- *read\_table*, *read\_csv*, and *ExcelFile.parse* default arguments for *index\_col* is now None. To use one or more of the columns as the resulting DataFrame's index, these must be explicitly specified now
- Parsing functions like *read\_csv* no longer parse dates by default (GH [GH225](#))
- Removed *weights* option in panel regression which was not doing anything principled (GH155)
- Changed *buffer* argument name in *Series.to\_string* to *buf*

- *Series.to\_string* and *DataFrame.to\_string* now return strings by default instead of printing to `sys.stdout`
- Deprecated *nanRep* argument in various *to\_string* and *to\_csv* functions in favor of *na\_rep*. Will be removed in 0.6 ([GH275](#))
- Renamed *delimiter* to *sep* in *DataFrame.from\_csv* for consistency
- Changed order of *Series.clip* arguments to match those of *numpy.clip* and added (unimplemented) *out* argument so *numpy.clip* can be called on a Series ([GH272](#))
- Series functions renamed (and thus deprecated) in 0.4 series have been removed:
  - *asOf*, use *asof*
  - *toDict*, use *to\_dict*
  - *toString*, use *to\_string*
  - *toCSV*, use *to\_csv*
  - *merge*, use *map*
  - *applymap*, use *apply*
  - *combineFirst*, use *combine\_first*
  - *\_firstTimeWithValue* use *first\_valid\_index*
  - *\_lastTimeWithValue* use *last\_valid\_index*
- DataFrame functions renamed / deprecated in 0.4 series have been removed:
  - *asMatrix* method, use *as\_matrix* or *values* attribute
  - *combineFirst*, use *combine\_first*
  - *getXS*, use *xs*
  - *merge*, use *join*
  - *fromRecords*, use *from\_records*
  - *fromcsv*, use *from\_csv*
  - *toRecords*, use *to\_records*
  - *toDict*, use *to\_dict*
  - *toString*, use *to\_string*
  - *toCSV*, use *to\_csv*
  - *\_firstTimeWithValue* use *first\_valid\_index*
  - *\_lastTimeWithValue* use *last\_valid\_index*
  - *toDataMatrix* is no longer needed
  - *rows()* method, use *index* attribute
  - *cols()* method, use *columns* attribute
  - *dropEmptyRows()*, use *dropna(how='all')*
  - *dropIncompleteRows()*, use *dropna()*
  - *tapply(f)*, use *apply(f, axis=1)*
  - *tgroupby(keyfunc, aggfunc)*, use *groupby* with *axis=1*

### 38.39.2 Deprecations Removed

- *indexField* argument in *DataFrame.from\_records*
- *missingAtEnd* argument in *Series.order*. Use *na\_last* instead
- *Series.fromValue* classmethod, use regular *Series* constructor instead
- Functions *parseCSV*, *parseText*, and *parseExcel* methods in *pandas.io.parsers* have been removed
- *Index.asOfDate* function
- *Panel.getMinorXS* (use *minor\_xs*) and *Panel.getMajorXS* (use *major\_xs*)
- *Panel.toWide*, use *Panel.to\_wide* instead

### 38.39.3 New Features

- Added *DataFrame.align* method with standard join options
- Added *parse\_dates* option to *read\_csv* and *read\_table* methods to optionally try to parse dates in the index columns
- Add *nrows*, *chunksize*, and *iterator* arguments to *read\_csv* and *read\_table*. The last two return a new *TextParser* class capable of lazily iterating through chunks of a flat file (GH242)
- Added ability to join on multiple columns in *DataFrame.join* (GH214)
- Added private *\_get\_duplicates* function to *Index* for identifying duplicate values more easily
- Added column attribute access to *DataFrame*, e.g. *df.A* equivalent to *df['A']* if 'A' is a column in the *DataFrame* (GH213)
- Added IPython tab completion hook for *DataFrame* columns. (GH233, GH230)
- Implement *Series.describe* for *Series* containing objects (GH241)
- Add inner join option to *DataFrame.join* when joining on key(s) (GH248)
- Can select set of *DataFrame* columns by passing a list to *\_\_getitem\_\_* (GH GH253)
- Can use *&* and *|* to intersection / union *Index* objects, respectively (GH GH261)
- Added *pivot\_table* convenience function to pandas namespace (GH234)
- Implemented *Panel.rename\_axis* function (GH243)
- *DataFrame* will show index level names in console output
- Implemented *Panel.take*
- Add *set\_eng\_float\_format* function for setting alternate *DataFrame* floating point string formatting
- Add convenience *set\_index* function for creating a *DataFrame* index from its existing columns

### 38.39.4 Improvements to existing features

- Major performance improvements in file parsing functions *read\_csv* and *read\_table*
- Added Cython function for converting tuples to ndarray very fast. Speeds up many MultiIndex-related operations
- File parsing functions like *read\_csv* and *read\_table* will explicitly check if a parsed index has duplicates and raise a more helpful exception rather than deferring the check until later

- Refactored merging / joining code into a tidy class and disabled unnecessary computations in the float/object case, thus getting about 10% better performance ([GH211](#))
- Improved speed of *DataFrame.xs* on mixed-type DataFrame objects by about 5x, regression from 0.3.0 ([GH215](#))
- With new *DataFrame.align* method, speeding up binary operations between differently-indexed DataFrame objects by 10-25%.
- Significantly sped up conversion of nested dict into DataFrame ([GH212](#))
- Can pass hierarchical index level name to *groupby* instead of the level number if desired ([GH223](#))
- Add support for different delimiters in *DataFrame.to\_csv* ([GH244](#))
- Add more helpful error message when importing pandas post-installation from the source directory ([GH250](#))
- Significantly speed up DataFrame *\_\_repr\_\_* and *count* on large mixed-type DataFrame objects
- Better handling of pyx file dependencies in Cython module build ([GH271](#))

### 38.39.5 Bug Fixes

- *read\_csv* / *read\_table* fixes
  - Be less aggressive about converting float->int in cases of floating point representations of integers like 1.0, 2.0, etc.
  - “True”/”False” will not get correctly converted to boolean
  - Index name attribute will get set when specifying an index column
  - Passing column names should force *header=None* ([GH257](#))
  - Don’t modify passed column names when *index\_col* is not None ([GH258](#))
  - Can sniff CSV separator in zip file (since seek is not supported, was failing before)
- Worked around matplotlib “bug” in which *series[:, np.newaxis]* fails. Should be reported upstream to matplotlib ([GH224](#))
- *DataFrame.iteritems* was not returning Series with the name attribute set. Also neither was *DataFrame.\_series*
- Can store *datetime.date* objects in *HDFStore* ([GH231](#))
- Index and Series names are now stored in *HDFStore*
- Fixed problem in which data would get upcasted to object dtype in *GroupBy.apply* operations ([GH237](#))
- Fixed outer join bug with empty DataFrame ([GH238](#))
- Can create empty Panel ([GH239](#))
- Fix join on single key when passing list with 1 entry ([GH246](#))
- Don’t raise Exception on plotting DataFrame with an all-NA column ([GH251](#), [GH254](#))
- Bug min/max errors when called on integer DataFrames ([GH241](#))
- *DataFrame.iteritems* and *DataFrame.\_series* not assigning name attribute
- *Panel.\_\_repr\_\_* raised exception on length-0 major/minor axes
- *DataFrame.join* on key with empty DataFrame produced incorrect columns
- Implemented *MultiIndex.diff* ([GH260](#))
- *Int64Index.take* and *MultiIndex.take* lost name field, fix downstream issue [GH262](#)

- Can pass list of tuples to *Series* ([GH270](#))
- Can pass level name to *DataFrame.stack*
- Support set operations between MultiIndex and Index
- Fix many corner cases in MultiIndex set operations - Fix MultiIndex-handling bug with GroupBy.apply when returned groups are not indexed the same
- Fix corner case bugs in DataFrame.apply
- Setting DataFrame index did not cause Series cache to get cleared
- Various int32 -> int64 platform-specific issues
- Don't be too aggressive converting to integer when parsing file with MultiIndex ([GH285](#))
- Fix bug when slicing Series with negative indices before beginning

### 38.39.6 Thanks

- Thomas Kluyver
- Daniel Fortunov
- Aman Thakral
- Luca Beltrame
- Wouter Overmeire

## 38.40 pandas 0.4.3

**Release date:** 10/9/2011

This is largely a bugfix release from 0.4.2 but also includes a handful of new and enhanced features. Also, pandas can now be installed and used on Python 3 (thanks Thomas Kluyver!).

### 38.40.1 New Features

- Python 3 support using 2to3 ([GH200](#), Thomas Kluyver)
- Add *name* attribute to *Series* and added relevant logic and tests. Name now prints as part of *Series.\_\_repr\_\_*
- Add *name* attribute to standard Index so that stacking / unstacking does not discard names and so that indexed DataFrame objects can be reliably round-tripped to flat files, pickle, HDF5, etc.
- Add *isnull* and *notnull* as instance methods on Series ([GH209](#), [GH203](#))

### 38.40.2 Improvements to existing features

- Skip xldr-related unit tests if not installed
- *Index.append* and *MultiIndex.append* can accept a list of Index objects to concatenate together
- Altered binary operations on differently-indexed SparseSeries objects to use the integer-based (dense) alignment logic which is faster with a larger number of blocks ([GH205](#))
- Refactored *Series.\_\_repr\_\_* to be a bit more clean and consistent

### 38.40.3 API Changes

- *Series.describe* and *DataFrame.describe* now bring the 25% and 75% quartiles instead of the 10% and 90% deciles. The other outputs have not changed
- *Series.toString* will print deprecation warning, has been de-camelCased to *to\_string*

### 38.40.4 Bug Fixes

- Fix broken interaction between *Index* and *Int64Index* when calling *intersection*. Implement *Int64Index.intersection*
- *MultiIndex.sortlevel* discarded the level names (GH202)
- Fix bugs in *groupby*, *join*, and *append* due to improper concatenation of *MultiIndex* objects (GH201)
- Fix regression from 0.4.1, *isnull* and *notnull* ceased to work on other kinds of Python scalar objects like *datetime.datetime*
- Raise more helpful exception when attempting to write empty *DataFrame* or *LongPanel* to *HDFStore* (GH204)
- Use *stdlib csv* module to properly escape strings with commas in *DataFrame.to\_csv* (GH206, Thomas Kluyver)
- Fix Python *ndarray* access in Cython code for sparse blocked index integrity check
- Fix bug writing *Series* to CSV in Python 3 (GH209)
- Miscellaneous Python 3 bugfixes

### 38.40.5 Thanks

- Thomas Kluyver
- rsamson

## 38.41 pandas 0.4.2

**Release date:** 10/3/2011

This is a performance optimization release with several bug fixes. The new *Int64Index* and new merging / joining Cython code and related Python infrastructure are the main new additions

### 38.41.1 New Features

- Added fast *Int64Index* type with specialized *join*, *union*, *intersection*. Will result in significant performance enhancements for int64-based time series (e.g. using NumPy's *datetime64* one day) and also faster operations on *DataFrame* objects storing record array-like data.
- Refactored *Index* classes to have a *join* method and associated data alignment routines throughout the codebase to be able to leverage optimized joining / merging routines.
- Added *Series.align* method for aligning two series with choice of join method
- Wrote faster Cython data alignment / merging routines resulting in substantial speed increases
- Added *is\_monotonic* property to *Index* classes with associated Cython code to evaluate the monotonicity of the *Index* values

- Add method *get\_level\_values* to *MultiIndex*
- Implemented shallow copy of *BlockManager* object in *DataFrame* internals

### 38.41.2 Improvements to existing features

- Improved performance of *isnull* and *notnull*, a regression from v0.3.0 ([GH187](#))
- Wrote templating / code generation script to auto-generate Cython code for various functions which need to be available for the 4 major data types used in pandas (float64, bool, object, int64)
- Refactored code related to *DataFrame.join* so that intermediate aligned copies of the data in each *DataFrame* argument do not need to be created. Substantial performance increases result ([GH176](#))
- Substantially improved performance of generic *Index.intersection* and *Index.union*
- Improved performance of *DateRange.union* with overlapping ranges and non-cacheable offsets (like Minute). Implemented analogous fast *DateRange.intersection* for overlapping ranges.
- Implemented *BlockManager.take* resulting in significantly faster *take* performance on mixed-type *DataFrame* objects ([GH104](#))
- Improved performance of *Series.sort\_index*
- Significant groupby performance enhancement: removed unnecessary integrity checks in *DataFrame* internals that were slowing down slicing operations to retrieve groups
- Added informative Exception when passing dict to *DataFrame* groupby aggregation with *axis != 0*

### 38.41.3 API Changes

#### 38.41.4 Bug Fixes

- Fixed minor unhandled exception in Cython code implementing fast groupby aggregation operations
- Fixed bug in unstacking code manifesting with more than 3 hierarchical levels
- Throw exception when step specified in label-based slice ([GH185](#))
- Fix *isnull* to correctly work with *np.float32*. Fix upstream bug described in [GH182](#)
- Finish implementation of *as\_index=False* in groupby for *DataFrame* aggregation ([GH181](#))
- Raise *SkipTest* for pre-epoch *HDFStore* failure. Real fix will be sorted out via *datetime64* dtype

### 38.41.5 Thanks

- Uri Laserson
- Scott Sinclair

## 38.42 pandas 0.4.1

**Release date:** 9/25/2011

This is primarily a bug fix release but includes some new features and improvements

### 38.42.1 New Features

- Added new *DataFrame* methods *get\_dtype\_counts* and property *dtypes*
- Setting of values using *.ix* indexing attribute in mixed-type *DataFrame* objects has been implemented (fixes [GH135](#))
- *read\_csv* can read multiple columns into a *MultiIndex*. *DataFrame*'s *to\_csv* method will properly write out a *MultiIndex* which can be read back ([GH151](#), thanks to Skipper Seabold)
- Wrote fast time series merging / joining methods in Cython. Will be integrated later into *DataFrame.join* and related functions
- Added *ignore\_index* option to *DataFrame.append* for combining unindexed records stored in a *DataFrame*

### 38.42.2 Improvements to existing features

- Some speed enhancements with internal Index type-checking function
- *DataFrame.rename* has a new *copy* parameter which can rename a *DataFrame* in place
- Enable unstacking by level name ([GH142](#))
- Enable sortlevel to work by level name ([GH141](#))
- *read\_csv* can automatically “sniff” other kinds of delimiters using *csv.Sniffer* ([GH146](#))
- Improved speed of unit test suite by about 40%
- Exception will not be raised calling *HDFStore.remove* on non-existent node with where clause
- Optimized *\_ensure\_index* function resulting in performance savings in type-checking Index objects

### 38.42.3 API Changes

### 38.42.4 Bug Fixes

- Fixed *DataFrame* constructor bug causing downstream problems (e.g. *.copy()* failing) when passing a *Series* as the values along with a column name and index
- Fixed single-key groupby on *DataFrame* with *as\_index=False* ([GH160](#))
- *Series.shift* was failing on integer *Series* ([GH154](#))
- *unstack* methods were producing incorrect output in the case of duplicate hierarchical labels. An exception will now be raised ([GH147](#))
- Calling *count* with level argument caused reduceat failure or segfault in earlier NumPy ([GH169](#))
- Fixed *DataFrame.corrwith* to automatically exclude non-numeric data (GH [GH144](#))
- Unicode handling bug fixes in *DataFrame.to\_string* ([GH138](#))
- Excluding OLS degenerate unit test case that was causing platform specific failure ([GH149](#))
- Skip *blosc*-dependent unit tests for *PyTables* < 2.2 ([GH137](#))
- Calling *copy* on *DateRange* did not copy over attributes to the new object ([GH168](#))
- Fix bug in *HDFStore* in which Panel data could be appended to a Table with different item order, thus resulting in an incorrect result read back

### 38.42.5 Thanks

- Yaroslav Halchenko
- Jeff Reback
- Skipper Seabold
- Dan Lovell
- Nick Pentreath

## 38.43 pandas 0.4.0

Release date: 9/12/2011

### 38.43.1 New Features

- *pandas.core.sparse* module: “Sparse” (mostly-NA, or some other fill value) versions of *Series*, *DataFrame*, and *Panel*. For low-density data, this will result in significant performance boosts, and smaller memory footprint. Added *to\_sparse* methods to *Series*, *DataFrame*, and *Panel*. See online documentation for more on these
- Fancy indexing operator on *Series* / *DataFrame*, e.g. via *.ix* operator. Both getting and setting of values is supported; however, setting values will only currently work on homogeneously-typed *DataFrame* objects. Things like:
  - `series.ix[[d1, d2, d3]]`
  - `frame.ix[5:10, ['C', 'B', 'A']], frame.ix[5:10, 'A':'C']`
  - `frame.ix[date1:date2]`
- Significantly enhanced *groupby* functionality
  - Can groupby multiple keys, e.g. `df.groupby(['key1', 'key2'])`. Iteration with multiple groupings products a flattened tuple
  - “Nuisance” columns (non-aggregatable) will automatically be excluded from *DataFrame* aggregation operations
  - Added automatic “dispatching to *Series* / *DataFrame* methods to more easily invoke methods on groups. e.g. `s.groupby(crit).std()` will work even though *std* is not implemented on the *GroupBy* class
- Hierarchical / multi-level indexing
  - New the *MultiIndex* class. Integrated *MultiIndex* into *Series* and *DataFrame* fancy indexing, slicing, `__getitem__` and `__setitem__`, reindexing, etc. Added *level* keyword argument to *groupby* to enable grouping by a level of a *MultiIndex*
- New data reshaping functions: *stack* and *unstack* on *DataFrame* and *Series*
  - Integrate with *MultiIndex* to enable sophisticated reshaping of data
- *Index* objects (labels for axes) are now capable of holding tuples
- *Series.describe*, *DataFrame.describe*: produces an R-like table of summary statistics about each data column
- *DataFrame.quantile*, *Series.quantile* for computing sample quantiles of data across requested axis
- Added general *DataFrame.dropna* method to replace *dropIncompleteRows* and *dropEmptyRows*, deprecated those.

- *Series* arithmetic methods with optional `fill_value` for missing data, e.g. `a.add(b, fill_value=0)`. If a location is missing for both it will still be missing in the result though.
- `fill_value` option has been added to *DataFrame*.{`add`, `mul`, `sub`, `div`} methods similar to *Series*
- Boolean indexing with *DataFrame* objects: `data[data > 0.1] = 0.1` or `data[data > other] = 1`.
- *pytz* / *tzinfo* support in *DateRange*
  - `tz_localize`, `tz_normalize`, and `tz_validate` methods added
- Added *ExcelFile* class to *pandas.io.parsers* for parsing multiple sheets out of a single Excel 2003 document
- *GroupBy* aggregations can now optionally *broadcast*, e.g. produce an object of the same size with the aggregated value propagated
- Added *select* function in all data structures: *reindex* axis based on arbitrary criterion (function returning boolean value), e.g. `frame.select(lambda x: 'foo' in x, axis=1)`
- *DataFrame consolidate* method, API function relating to redesigned internals
- *DataFrame.insert* method for inserting column at a specified location rather than the default `__setitem__` behavior (which puts it at the end)
- *HDFStore* class in *pandas.io.pytables* has been largely rewritten using patches from Jeff Reback from others. It now supports mixed-type *DataFrame* and *Series* data and can store *Panel* objects. It also has the option to query *DataFrame* and *Panel* data. Loading data from legacy *HDFStore* files is supported explicitly in the code
- Added *set\_printoptions* method to modify appearance of *DataFrame* tabular output
- *rolling\_quantile* functions; a moving version of *Series.quantile* / *DataFrame.quantile*
- Generic *rolling\_apply* moving window function
- New *drop* method added to *Series*, *DataFrame*, etc. which can drop a set of labels from an axis, producing a new object
- *reindex* methods now sport a *copy* option so that data is not forced to be copied then the resulting object is indexed the same
- Added *sort\_index* methods to *Series* and *Panel*. Renamed *DataFrame.sort* to *sort\_index*. Leaving *DataFrame.sort* for now.
- Added *skipna* option to statistical instance methods on all the data structures
- *pandas.io.data* module providing a consistent interface for reading time series data from several different sources

### 38.43.2 Improvements to existing features

- The 2-dimensional *DataFrame* and *DataMatrix* classes have been extensively redesigned internally into a single class *DataFrame*, preserving where possible their optimal performance characteristics. This should reduce confusion from users about which class to use.
  - Note that under the hood there is a new essentially “lazy evaluation” scheme within respect to adding columns to *DataFrame*. During some operations, like-typed blocks will be “consolidated” but not before.
- *DataFrame* accessing columns repeatedly is now significantly faster than *DataMatrix* used to be in 0.3.0 due to an internal *Series* caching mechanism (which are all views on the underlying data)
- Column ordering for mixed type data is now completely consistent in *DataFrame*. In prior releases, there was inconsistent column ordering in *DataMatrix*
- Improved console / string formatting of *DataMatrix* with negative numbers
- Improved tabular data parsing functions, *read\_table* and *read\_csv*:

- Added *skiprows* and *na\_values* arguments to *pandas.io.parsers* functions for more flexible IO
- *parseCSV* / *read\_csv* functions and others in *pandas.io.parsers* now can take a list of custom NA values, and also a list of rows to skip
- Can slice *DataFrame* and get a view of the data (when homogeneously typed), e.g. `frame.xs(idx, copy=False)` or `frame.ix[idx]`
- Many speed optimizations throughout *Series* and *DataFrame*
- Eager evaluation of groups when calling *groupby* functions, so if there is an exception with the grouping function it will be raised immediately versus sometime later on when the groups are needed
- *datetools.WeekOfMonth* offset can be parameterized with *n* different than 1 or -1.
- Statistical methods on *DataFrame* like *mean*, *std*, *var*, *skew* will now ignore non-numerical data. Before a not very useful error message was generated. A flag *numeric\_only* has been added to *DataFrame.sum* and *DataFrame.count* to enable this behavior in those methods if so desired (disabled by default)
- *DataFrame.pivot* generalized to enable pivoting multiple columns into a *DataFrame* with hierarchical columns
- *DataFrame* constructor can accept structured / record arrays
- *Panel* constructor can accept a dict of *DataFrame*-like objects. Do not need to use *from\_dict* anymore (*from\_dict* is there to stay, though).

### 38.43.3 API Changes

- The *DataMatrix* variable now refers to *DataFrame*, will be removed within two releases
- *WidePanel* is now known as *Panel*. The *WidePanel* variable in the pandas namespace now refers to the renamed *Panel* class
- *LongPanel* and *Panel* / *WidePanel* now no longer have a common subclass. *LongPanel* is now a subclass of *DataFrame* having a number of additional methods and a hierarchical index instead of the old *LongPanelIndex* object, which has been removed. Legacy *LongPanel* pickles may not load properly
- Cython is now required to build *pandas* from a development branch. This was done to avoid continuing to check in cythonized C files into source control. Builds from released source distributions will not require Cython
- Cython code has been moved up to a top level *pandas/src* directory. Cython extension modules have been renamed and promoted from the *lib* subpackage to the top level, i.e.
  - *pandas.lib.tseries* -> *pandas.\_tseries*
  - *pandas.lib.sparse* -> *pandas.\_sparse*
- *DataFrame* pickling format has changed. Backwards compatibility for legacy pickles is provided, but it's recommended to consider PyTables-based *HDFStore* for storing data with a longer expected shelf life
- A *copy* argument has been added to the *DataFrame* constructor to avoid unnecessary copying of data. Data is no longer copied by default when passed into the constructor
- Handling of boolean dtype in *DataFrame* has been improved to support storage of boolean data with NA / NaN values. Before it was being converted to float64 so this should not (in theory) cause API breakage
- To optimize performance, Index objects now only check that their labels are unique when uniqueness matters (i.e. when someone goes to perform a lookup). This is a potentially dangerous tradeoff, but will lead to much better performance in many places (like *groupby*).
- Boolean indexing using *Series* must now have the same indices (labels)
- Backwards compatibility support for *begin/end/nPeriods* keyword arguments in *DateRange* class has been removed

- More intuitive / shorter filling aliases *ffill* (for *pad*) and *bfill* (for *backfill*) have been added to the functions that use them: *reindex*, *asfreq*, *fillna*.
- *pandas.core.mixins* code moved to *pandas.core.generic*
- *buffer* keyword arguments (e.g. *DataFrame.toString*) renamed to *buf* to avoid using Python built-in name
- *DataFrame.rows()* removed (use *DataFrame.index*)
- Added deprecation warning to *DataFrame.cols()*, to be removed in next release
- *DataFrame* deprecations and de-camelCasing: *merge*, *asMatrix*, *toDataMatrix*, *\_firstTimeWithValue*, *\_lastTimeWithValue*, *toRecords*, *fromRecords*, *tgrouphy*, *toString*
- *pandas.io.parsers* method deprecations
  - *parseCSV* is now *read\_csv* and keyword arguments have been de-camelCased
  - *parseText* is now *read\_table*
  - *parseExcel* is replaced by the *ExcelFile* class and its *parse* method
- *fillMethod* arguments (deprecated in prior release) removed, should be replaced with *method*
- *Series.fill*, *DataFrame.fill*, and *Panel.fill* removed, use *fillna* instead
- *groupby* functions now exclude NA / NaN values from the list of groups. This matches R behavior with NAs in factors e.g. with the *tapply* function
- Removed *parseText*, *parseCSV* and *parseExcel* from pandas namespace
- *Series.combineFunc* renamed to *Series.combine* and made a bit more general with a *fill\_value* keyword argument defaulting to NaN
- Removed *pandas.core.pytools* module. Code has been moved to *pandas.core.common*
- Tacked on *groupName* attribute for groups in *GroupBy* renamed to *name*
- *Panel/LongPanel dims* attribute renamed to *shape* to be more conformant
- Slicing a *Series* returns a view now
- More Series deprecations / renaming: *toCSV* to *to\_csv*, *asOf* to *asof*, *merge* to *map*, *applymap* to *apply*, *toDict* to *to\_dict*, *combineFirst* to *combine\_first*. Will print *FutureWarning*.
- *DataFrame.to\_csv* does not write an “index” column label by default anymore since the output file can be read back without it. However, there is a new *index\_label* argument. So you can do *index\_label='index'* to emulate the old behavior
- *datetools.Week* argument renamed from *dayOfWeek* to *weekday*
- *timeRule* argument in *shift* has been deprecated in favor of using the *offset* argument for everything. So you can still pass a time rule string to *offset*
- Added optional *encoding* argument to *read\_csv*, *read\_table*, *to\_csv*, *from\_csv* to handle unicode in Python 2.x

### 38.43.4 Bug Fixes

- Column ordering in *pandas.io.parsers.parseCSV* will match CSV in the presence of mixed-type data
- Fixed handling of Excel 2003 dates in *pandas.io.parsers*
- *DateRange* caching was happening with high resolution *DateOffset* objects, e.g. *DateOffset(seconds=1)*. This has been fixed
- Fixed *\_\_truediv\_\_* issue in *DataFrame*

- Fixed *DataFrame.toCSV* bug preventing IO round trips in some cases
- Fixed bug in *Series.plot* causing matplotlib to barf in exceptional cases
- Disabled *Index* objects from being hashable, like ndarrays
- Added `__ne__` implementation to *Index* so that operations like `ts[ts != idx]` will work
- Added `__ne__` implementation to *DataFrame*
- Bug / unintuitive result when calling *fillna* on unordered labels
- Bug calling *sum* on boolean *DataFrame*
- Bug fix when creating a *DataFrame* from a dict with scalar values
- `Series.{sum, mean, std, ...}` now return NA/NaN when the whole Series is NA
- NumPy 1.4 through 1.6 compatibility fixes
- Fixed bug in bias correction in *rolling\_cov*, was affecting *rolling\_corr* too
- R-square value was incorrect in the presence of fixed and time effects in the *PanelOLS* classes
- *HDFStore* can handle duplicates in table format, will take

### 38.43.5 Thanks

- Joon Ro
- Michael Pennington
- Chris Uga
- Chris Withers
- Jeff Reback
- Ted Square

## 38.44 pandas 0.3.0

Release date: February 20, 2011

### 38.44.1 New features

- *corrwith* function to compute column- or row-wise correlations between two DataFrame objects
- Can boolean-index DataFrame objects, e.g. `df[df > 2] = 2`, `px[px > last_px] = 0`
- Added comparison magic methods (`__lt__`, `__gt__`, etc.)
- Flexible explicit arithmetic methods (`add`, `mul`, `sub`, `div`, etc.)
- Added *reindex\_like* method
- Added *reindex\_like* method to WidePanel
- Convenience functions for accessing SQL-like databases in *pandas.io.sql* module
- Added (still experimental) HDFStore class for storing pandas data structures using HDF5 / PyTables in *pandas.io.pytables* module
- Added WeekOfMonth date offset
- *pandas.rpy* (experimental) module created, provide some interfacing / conversion between rpy2 and pandas

### 38.44.2 Improvements to existing features

- Unit test coverage: 100% line coverage of core data structures
- Speed enhancement to `rolling_{median, max, min}`
- Column ordering between DataFrame and DataMatrix is now consistent: before DataFrame would not respect column order
- Improved `{Series, DataFrame}.plot` methods to be more flexible (can pass matplotlib Axis arguments, plot DataFrame columns in multiple subplots, etc.)

### 38.44.3 API Changes

- Exponentially-weighted moment functions in *pandas.stats.moments* have a more consistent API and accept a `min_periods` argument like their regular moving counterparts.
- `fillMethod` argument in Series, DataFrame changed to `method`, *FutureWarning* added.
- `fill` method in Series, DataFrame/DataMatrix, WidePanel renamed to `fillna`, *FutureWarning* added to `fill`
- Renamed `DataFrame.getXS` to `xs`, *FutureWarning* added
- Removed `cap` and `floor` functions from DataFrame, renamed to `clip_upper` and `clip_lower` for consistency with NumPy

### 38.44.4 Bug Fixes

- Fixed bug in `IndexableSkiplist` Cython code that was breaking `rolling_max` function
- Numerous `numpy.int64`-related indexing fixes
- Several NumPy 1.4.0 NaN-handling fixes
- Bug fixes to `pandas.io.parsers.parseCSV`
- Fixed `DateRange` caching issue with unusual date offsets
- Fixed bug in `DateRange.union`
- Fixed corner case in `IndexableSkiplist` implementation
